and differs of course in different countries. Not long since a very large proportion of mechanical work was done by hand, and the blind workman found employment in many of the simpler branches; but the rapid and wonderful contrivances by which fingers of iron do the work of fingers of flesh, make it harder and harder for him to earn the whole loaf. That part eked out to him by the hand of charity has to be increased in size. In Great Britain and in this country mechanical improvements went on, straitening and lessening the field of simple handicraft in which the blind man could work. They contributed to the general welfare, because they merely drove the common workman into other fields which require more skill, while they harmed the blind man because those fields were not open to him. Thus the attempt to lift the blind man out of the pauper class had but partial success. He was still dependent, to a considerable degree, on charity, and felt some of the demoralizing effects of dependence.

The attempt was made in the Northern States of the United States under better auspices. As soon as the claims of blind children to a share of the benefit of common-school learning were urged, it was conceded, not as a matter of charity, but of right. Means were contrived to instruct them to get in special schools or institutions; and these were rapidly multiplied. It was assumed that a cultivated brain would make a more cunning hand, and that even women who wash clothes, and men who braid mats, would do so more skillfully and profitably with mental culture than without it.

The general system adopted in these special institutions is: First. To give to all pupils the same sort of instruction, and to the same degree, as is given in the best public common schools. Secondly. To teach them the elements of vocal and instrumental music. Thirdly. To train them in some sort of simple handicraft, on which they were to depend for a livelihood. But special schools for the blind can no more control or direct the future calling of those who leave than common schools can direct the future calling of their graduates. Both classes become subject to prevailing social influences, and their course in life is affected by them.

Blind children get their mental instruction in the institutions; they there receive valuable moral tendencies, and are launched upon the voyage of life in the right direction. But they come immediately under potent social influences, which complete their education and modify their character. Two of these influences especially affect the blind: First. There is in our community a prevailing spirit of independence, and a desire among the young to strike out in new directions. Secondly. Hand-work is considered less respectable than brain-work. Now the blind, without being a whit more foolish than other people, are not a whit less so. Indeed, they, more than others, are justified in seeking "to shirk work," because, under any circumstances, they do mechanical work at a disadvantage compared with others; and, where competition for livelihood is sharp, they go to the wall. They soon find this out, and they catch the prevailing spirit of society; so that out of a thousand graduates who have learned some handicraft in their several institutions, hardly two-tenths practice them for a living. The most of them resort to various branches of the musical profession, teaching the elements of vocal and instrumental music, playing upon organs, or in choirs, tuning pianos, or trading in musical instruments. It is gratifying to note how many succeed in this way, because music furnishes a field of occupation in which they find positive pleasure, that goes far to compensate them for their sad privation of the common means of enjoyment. Other graduates take petty agencies in trade, and with a guide go about the country peddling a little on their own account. Others, favored by friends, contrive to find employment in some of the establishments in which some hand-work and some head-work are required.

A few work diligently at their trade, and earn an honest and comfortable livelihood. The general condition of the graduates is affected by the prevailing feeling of compassion, which leads people to make an exception in their favor, and to give them aid without requiring that they shall aid themselves as far as is possible. Many of the blind take advantage of this feeling and abuse it sadly. They know that people will endure wretched music, accept inferior service, and buy poor wares, thinking to unite charity with business, and they take advantage thereof.

Upon the whole, however, the general result of the attempts made in the score of institutions to lift the blind out of the pauper class has been very satisfactory. Certainly fewer of them come upon the towns for support than would have done so but for these efforts.

There is doubtless a greater proportion of really self-supporting blind persons in the United States than in any other country, and this is owing mainly to the existence of more than a score of public institutions for their instruction and training. There will be a still greater number when the public comes to act upon the principle that while the blind, as a class, have a right to such advantages at the hand of necessity as will tend to equalize their condition as social workers with that of other men, they have also their duties, to the performance of which they should be strictly held.

The most interesting event of the year in connection with the history of blind institutions, was the convention for three days of superintendents and teachers, held in August, at the Perkins Institution, in Boston.

The presence of representatives from so many State institutions, some of which receive beneficiaries from adjoining States, showed how wide-spread is the interest felt in the education of the blind by the people of the United States, and how ready are the legislative bodies to pay liberally for it. There was a general concurrence of opinion upon the following important matters, although no vote was deemed necessary: That mental and instinctive culture should underlie and form an important part of the course of education and training for all the blind, even those destined to mechanical pursuits. That the methods and processes of instruction in schools, and the various means used in education, should conform as nearly as possible to the most approved ones used with ordinary children and youth. That the multiplication of books in raised print, and the improvement of tangible apparatus of instruction, are of great importance. That uniformity in the type is desirable but not essential.

The table in the latter part of this volume shows the changes that have taken place in the various institutions for the blind in the United States since the table published in this report, January, 1871. In three the superintendents have been changed. The total number of inmates is 1,900 against 2,032 last year. This decrease is only apparent, and comes from the fact that in the returns made last year, four more institutions, which receive both mutes and blind, the mutes were included with the blind. The table as corrected gives the actual number of blind pupils. The total valuation of property has increased from $3,201,995.02 to $3,986,678.71. The aggregate of appropriations by the several legislatures was last year $444,985.64 against $403,412.46 in the preceding year. The amount of money paid in wages to blind persons was $35,247.67 against $26,542.11 in 1870.

ANNUAL REVIEW

OF

EDUCATION IN FOREIGN COUNTRIES.

ANNUAL REVIEW OF EDUCATION IN FOREIGN COUNTRIES.

EXTENT OF REVIEW AND SOURCES OF INFORMATION.

In this review are given the most important educational events of foreign countries, together with the latest statistics obtainable.

As in the review in the report for 1871, the official reports transmitted to the Bureau of Education have been consulted as far as possible, and in addition the following periodical publications:

"Lübens's Pädagogischer Jahresbericht," (Lübens's Annual Review of Pedagogics,) published annually at Leipsic.

"Wolfram's Allgemeine Chronik des Volksschulwesens," (Wolfram's General Chronicle of Public Instruction,) published annually at Hamburg.

"Allgemeine Schulzeitung," (General School Journal,) published weekly at Darmstadt.

"The Educational Times," published monthly in London.

The general statistics and the *personnel* of educational authorities are all given according to the Almanach de Gotha for 1873.

In some cases the number of inhabitants given at the head of the country (in every instance the very latest information) will differ from that mentioned in the review, the latter being the number given in the last official report received. Even where absolutely no educational information could be obtained up to the time of the closing of this report, the general statistics and the name of the present minister of public instruction (according to the Almanach de Gotha for 1873) have been given for the sake of completeness.

I.—EUROPE.

AUSTRIAN MONARCHY.

(Area, 227,234 square miles. Population, 35,904,435.)

The Austrian monarchy consists of two distinct parts, viz: the empire of Austria and the kingdom of Hungary, each of which has its own administration and parliament, and is only dynastically united with the other.

1.—EMPIRE OF AUSTRIA.

(Constitutional Monarchy. Area, 108,234 square miles. Population, 20,394,930.)

Minister of public instruction, STREMAYR.

REPORT OF MINISTER OF PUBLIC INSTRUCTION.

During last year Mr. Stremayr, minister of public instruction, published his annual report, which treats chiefly of the school legislation since the abolition of the concordat. The report says: "The new school laws have been very favorably received in the cities and by the whole German population, with the exception of that of Tyrol; while they have met with violent opposition from the clergy in many rural districts where clerical influence is all-powerful. There is this difference observable, that the older clergy have always kept their opposition within certain bounds, while the younger clergy have assailed the laws in the most violent manner and the most unmeasured terms."

The minister finally expresses his conviction "that the consistent but dignified execution of the new laws will gradually conciliate the conflicting parties."

EFFECT OF THE NEW SCHOOL-LAW.

That the views of Mr. Stremayr are correct is plainly seen in the fact that, in spite of innumerable difficulties, the new law is gaining ground every day; teachers' socie-

ties and conferences are constantly increasing. there is a healthy spirit of emulation visible every where, and, according to present appearances, the days of mere mechanical instruction are numbered. As was to be expected, these measures met with violent opposition from the clergy and the ultramontane party, and the teachers were in many places attacked and hindered in the execution of their dutics ; but they did not lose courage, for they knew that the school-law would protect them. But this very law was endangered when, in the beginning of the year 1871, the ministry very suddenly resigned, and was replaced by the Hohenwart ministry, in which Jirecck took his seat as minister of public instruction.

JIRECEK MINISTER OF PUBLIC INSTRUCTION.

In the beginning, Jirecek seemed favorable to the progressive educational movement, but soon strong reactionary tendencies began to show themselves. The minister ordered a revision of the school-laws, and requested school councils of the provinces to send in a complete list of all the objections to the new school-laws, and their suggestions for alterations in the same. This measure elicited unbounded applause from the clerical and ultramontane journals. But the Austrian teachers, almost to a man, frankly and openly opposed it. At a large meeting, at which delegates from all the provinces were present, they unanimously passed a resolution "that in the new school-laws we recognize one of the greatest triumphs of modern education; that we desire that they may soon be established on a firm basis, and that alterations are desirable only in regard to regulations concerning corporal punishment and teachers' salaries." The school councils of the provinces of Lower and Upper Austria, Salzburg, Moravia, Silesia, Carinthia, and Styria most emphatically objected to any alterations.

The ultramontane party endeavored to influence the minister by petitions, setting forth that the new school-law, in depriving the clergy of any and every pretext for interference in school matters, engendered an irreligious spirit, and endangered the whole social and political fabric. Jirecek, according to all accounts, received this petition in the most favorable manner, and encouraged the petitioners in their vain hopes. The whole matter gave rise to violent debates in the imperial Parliament. Fux, a member of Parliament, in a vigorous speech, showed that there was the greatest danger of the progress in education and church being paralyzed by federalistic and reactionary tendencies. "Austria," he said, "especially as regards education, is now passing through a very perilous period, compared with that of its northwestern neighbors. It is not the needle-gun, but the power of the intellect, which in our time gives superiority to one nation over another."

STREMAYR AGAIN MINISTER OF PUBLIC INSTRUCTION.

After a most violent struggle, occasioned not merely by the school question, the Hohenwart ministry was compelled to resign in December, 1871, and its place was taken by the Auersperg ministry, in which Stremayr again became minister of public instruction. What may be expected from the new ministry is indicated by the Emperor's speech from the throne, December 13, 1871. Referring to the school question, he says: "The strict carrying out of the new school-law will form one of the most important duties of my reign."

STATISTICS.

Much remains to be done for education, as will be seen from the official school statistics contained in the Austrian statistical year-book. According to this, the percentage of children attending school as to the total number of children of school age is as follows: Lower Austria, 98.4; Upper Austria, 97.1; Carinthia, 84.1; Carniola, 65.3; Trieste, Istria, Görz, and Gradiska, 51.9; Bohemia, 96.4; Silesia, 95.6; Galicia, 29.7; Bukowina, 20.5; Dalmatia, 28.3. In several provinces, especially in Tyrol, there are, as yet, many schools which are only in operation during half the year. Of such schools there are in the Austrian Empire 1,815; Galicia has 296 such; Moravia, 7; Bohemia, 11; Istria, 1; Carniola, 5; Carinthia, 16; Styria, 8. The total number of public elementary schools is 15,054, and the number of children of school age, 2,600,000. In Tyrol there is one school to every 447 inhabitants; in Galicia, one to 2,286; and in Bukowina, one to 3,116. For the sake of comparison, the following facts are mentioned: In Saxony there are on an average 8 elementary schools to every German square mile, (about 18 English square miles,) and in Austria, 3. In Saxony, 95 per cent. of the children of school age attend school, and in Austria only 75 per cent. In Prussia there are 160 well-educated children to every 1,000 of the population, and in Austria only 84. In Galicia, more than one-half of all the towns and villages have no school at all; this province also has 23 per cent. of all the criminals in the empire, 37 per cent. of all the murders, and exactly one-half of all those condemned to death. In 1865, 29 per cent. of the conscripts were without any education whatever. In 1869, the percentage of illiterate recruits was 4 in Lower Austria, 11 in Upper Austria, 32 in Bohemia, 38 in

Silesia, 40 in Salzburg, 44 in Moravia, 50 in Styria. In Tyrol, Carinthia, Carniola, and Dalmatia, the percentage was even higher. According to the last census, there were in the empire of Austria 31,398 priests and clergymen, and 40,503 teachers; consequently there is one priest or clergyman to every 630 of the population, and one teacher to every 490.

JESUIT GYMNASIA.

Many of the Jesuits failed to organize their gymnasia in accordance with the laws of the empire, and it became necessary to make use of more stringent measures to compel compliance with the laws. In some cases it became necessary to take these institutions entirely away from the Jesuits, and turn them over to the state authorities.

REFORM OF THE REAL-SCHOOLS.

The provincial parliament of the provinces of Salzburg, Styria, Carinthia, Tyrol, Vorarlberg, Moravia, Silesia, and Bukowina resolved upon an entire reform of the real-schools. This reform consisted chiefly in making seven classes, opening them to younger children than hitherto, and making instruction in modern languages obligatory in all classes. This reform has already been carried out. Special attention is paid to the study of the English language, and it now forms an obligatory branch in all the real-schools.

AGRICULTURAL SCHOOLS FOR ADULTS, (LANDWIRTHSCHAFTLICHE FORTBILDUNGS-SCHULEN.)

There are at present in Austria upward of 400 such schools, in most of which agricultural instruction is given by elementary school-teachers, who have attended the annual agricultural courses in Vienna, Graz, &c. It was found impossible for these teachers to acquire a thorough knowledge of agriculture in these courses, and, as a consequence, agriculture has become an obligatory subject of instruction in the teachers' seminaries.

TEACHERS' SALARIES.

Toward the end of the year 1870, the Austrian Parliament passed a law regulating the salaries of teachers in the teachers' seminaries. According to this law, the teachers in the teachers' seminaries at Vienna receive 1,000 florins (1 florin is equal to 50 cents) per annum; in Prague, Lemberg, Brunn, and Trieste, 900 florins, and in all others 800. Every five years the salaries are raised 10 per cent. The salaries of female teachers are only 80 per cent. of that of the males. The General German School Journal very appropriately remarks with regard to the last-mentioned item: "It is strange that the salaries of females should be lower than those of males. Either they do the same amount of work as males, and in that case they ought to have the same salary, or they do less work, and then the school is wronged, which, instead of a good teacher, only has a poor one."

The salaries of teachers in the public elementary schools vary between 700 and 300 florins, with a quinquennial increase of 10 per cent. The teachers of "burgher-schools" (higher elementary schools) receive 800 florins, and the directors of such schools 1,000.

TEACHERS' SOCIETIES.

But a few years ago a teachers' society was a thing utterly unknown in Austria, but since the year 1867 numerous societies have been started all over the country, all of them working in a most praiseworthy manner for the furtherance of educational interests. During 1871 large and well-attended teachers' meetings were held in Linz, (Upper Austria,) Leitmeritz, (Bohemia,) Troppau, (Silesia,) Prerau, (Moravia,) and Laibach, (Carniola.)

PUBLIC DISTINCTIONS CONFERRED ON TEACHERS.

As a characteristic sign of the times, it deserves to be mentioned that during the year 1871 one teacher received the golden cross of merit of the first class, seven the golden cross of merit of the second class, and eight teachers the silver cross of merit of the first class, all for long and faithful services in the cause of education. A few short years ago this would have been impossible in Austria, as the elementary school-teachers were, as a general rule, considered but little better than servants or day-laborers.

MEETING OF THE LIBERAL GERMAN PARTY AT ST. PÖLTEN.

The liberal German party held a large and enthusiastic meeting at St. Pölten, (Lower Austria,) during August, 1871. Although the meeting was of a purely political charac-

ter, it is a significant fact that, after a most lively and interesting discussion, in which a great number of the delegates took part, the following resolutions (of course, not binding resolutions, but, rather, recommendations for the consideration of the ministry of public instruction) were passed: 1. An increase in the salary of public teachers is urgently demanded. 2. Poor communities are to receive aid from the public funds for the building of school-houses. 3. School fees are to be abolished every where. 4. Teachers' societies should be established every where, and it is very desirable also that government officials should join them to make themselves better acquainted with the wants of the schools.

NEED OF TEACHERS.

In Lower Austria alone, about 1,000 teachers are wanting, and in order to supply this want the ministry has shortened the course of studies at the teachers' seminaries by one year, for the classes of 1871, '72, and '73. In Upper Austria there are about 800 teachers wanting, and in Galicia there is need of several thousand. Among the older teachers there is quite a number between 70 and 80 years of age.

RELIGIOUS EXERCISES IN SCHOOLS.

The municipal council of Vienna ordered the following religious observances for all Catholic children attending the public schools: 1. A short prayer before and after school. 2. Mass once a week. 3. Confession and communion once a year, at Easter. 4. Attendance at the religious services held on the Emperor's birth-day. The bishop of St. Pölten, on the other hand, demanded that the children in the public schools should attend mass every day, should partake of the communion five times a year, and attend quite a number of religious services on various festal days. It has been calculated that in this manner each child would participate in 372 religious exercises during the year. The bishop's request was not granted.

EDUCATION IN VIENNA.

Organization of the Vienna school council.—This council consists of three divisions, viz: one for matters of organization, jurisdiction, and personal matters; one for pedagogical, didactic, and scientific matters; and one for administration and economical matters. Every ward in the city has its own school council. In each of these councils one teacher must have a seat.

Want of teachers.—In October last there were still 80 teachers' places vacant.

The study fund.—Since the year 1789 there has existed in Vienna a so-called "study fund," now amounting to 131,820 florins. The interest of this fund is used for enabling poor but talented young men to prepare themselves for the teacher's profession.

The Vienna ladies' society for the industrial education of women, which has property to the amount of 14,820 florins, intends to establish a real-gymnasium (classical and industrial school combined) for ladies. The female business college supported by this society is in a very flourishing condition; the commercial course numbers 72 pupils, the French 140, the English 74, the drawing course 21, and the sewing course 458. Many of the former pupils of this institution have become clerks in the various business houses, and some of them earn as much as 45 florins per month, (a very considerable sum for such a class to receive in Vienna.)

Statistics of Vienna schools.—The 82 public schools of Vienna are almost all overcrowded, and the same can be said of the real-schools and the real-gymnasia, the technical and industrial schools, and the private schools, many scholars coming from all parts of Austria, Hungary, Croatia, and even from Roumania and Servia. There are in Vienna 19 societies for supplying poor children with clothes, text-books, &c.

Society of Children's Friends.—This very active society has more than 800 members. During the last year the society presented a memorial to the ministry, urging detailed legislation with regard to school hygiene. The ministry has willingly entered upon all the proposals contained in the memorial, and has sent detailed orders concerning school hygiene to the provincial councils. The society hopes that at the Vienna Exposition of 1873 they will be able to exhibit a collection of objects for the education of infants, poor children, orphans, &c.

School finances.—The sum appropriated for school purposes in the city of Vienna during the year 1871 amounted to 906,950 florins, viz: for gymnasia and real-schools, 212,980; and for elementary schools, 793,970. The appropriation in 1870 was 17 per cent. more than in 1869, and in 1871, 38 per cent. higher than 1870. Since the abolition of school fees, the school budget has increased from 84,000 to 1,100,000 florins. There is a fund for the widows and orphans of Protestant teachers, amounting to 70,000 florins, and constantly increasing. A widow receives from 420 to 500 florins pension, and orphans below 18 years 105 to 210. Each member on joining the society pays 100 florins, and 6 florins of an annual contribution.

LOWER AUSTRIA.

Private munificence.—Dr. Emil Hardt has donated 10,000 florins for founding two stipends, enabling two talented boys to attend some superior school in the city of Krems. Franz Ritter von Wertheim donated 20,000 florins to his native city for the erection of a new and convenient school-house.

BOHEMIA.

The new school organization.—The new school-laws have been introduced every where. Bohemia (with the exception of Prague) is now divided into 94 school districts, each of which has its own school-district fund for paying teachers' salaries, &c. Seventy districts furnished the necessary money without any opposition; in 11 districts the military had to be called out to enforce the new order of things. The new school-law, which frees the public schools entirely from the control of the clergy, has, of course, met with violent opposition on their part. Thus a Catholic conference was held in April, 1871, in Prague, presided over by Count Schönborn, and attended by a large number of the old aristocracy, the clergy, and members of Catholic political societies, which passed many strongly reactionary resolutions.

School statistics.—Bohemia has 3,766 public elementary schools, (total population, 5,140,544,) viz: 55 of the first class, (teachers' salary 600 florins;) 558 of the second class, (salary 500 florins;) 2,260 of the third class, (salary 400 florins;) and 893 of the fourth class, (salary 300 florins.) The average salary of a Bohemian teacher therefore amounts to 390 florins. As a curious fact, it deserves to be mentioned that, in 1871, among 394 jurymen in the city of Prague there were 32 teachers, which would, but a few years ago, have been impossible.

Teachers' societies.—There are in Bohemia two bitterly opposed nationalities, the Czechs and the Germans. Their mutual hostility does not show itself least on the field of education, each possessing its own teachers' societies, working frequently more for national politics than for educational purposes.

Corporal punishment.—Article 24 of the new school-law forbids all corporal punishments in public schools. Various teachers' societies passed resolutions granting the humane intentions of this article, but considered its execution impossible, at least as long as the schools are so overcrowded, and domestic education so entirely neglected.

UPPER AUSTRIA.

Fourth meeting of the General Austrian Teachers' Union.—In spite of the most violent protest of Bishop Rudiger, this union held its meeting at Linz in August, 1871, and was attended by about 1,400 teachers. All the discussions and the resolutions passed showed the liberal sentiment pervading the assembly, and their determination to oppose clerical control.

MORAVIA.

Statistics.—Moravia, with a population of 2,017,274, has 1,878 public elementary schools, with 258,240 scholars. Of these schools 595 are purely German, with 96,098 scholars; 46 schools are mixed, (German and Bohemian,) and 1,237 are purely Bohemian. The proportion of Bohemians to Germans is as 37.2 to 100.

Teachers' seminaries.—There are two teachers' seminaries in Moravia, one in Brunn for Bohemian, and one in Olmütz for German teachers. The Germans of the province intend to establish another seminary and normal school for Germans at Brunn. It is hoped that these seminaries will in a few years supply the great want of teachers.

School-finances.—The Moravian parliament last year appropriated the sum of 379,582 florins for educational purposes. The teachers are very poorly paid, and have often to wait a long time for their salaries. The pensions are also miserably low. The Olmutz Gazette, on very good authority, communicates that a teacher, 91 years of age, a resident of the village of Moskele, who has faithfully served as teacher for 58 years, now receives a pension of 9½ kreutzers per day, (about 2 cents,) and is therefore obliged to go round begging for alms, in order to save himself and his wife, 79 years old, from starvation.

STYRIA.

Hostility of the clergy to the new school-law.—In Graz, the capital of Styria, the most violent agitation was kept up by the clerical party to hinder the teachers in the execution of their duties, and throw all kinds of difficulties in their way. Both parties held meetings, and the feeling was in many instances imbittered to such a degree that very violent scenes, and even bloodshed, ensued.

Collections and donations for educational purposes.—In Styria, the plan of the so-called "school penny" collections is very favorably received, and even poor people contribute

their mite. This money is applied to the clothing of poor children, and supplying poor schools with apparatus and text-books. In the city of Steyer a manufacturer of arms donated 2,000 florins for the Steyer infant asylum, 1,000 for the children's hospital, and 1,000 for the education of neglected children.

CARINTHIA.

Abolition of school-fees.—The educational committee of the Carinthian provincial parliament unanimously decreed the total abolition of school-fees, as utterly at variance with the principle of compulsory education.

Teachers' club.—At Klagenfurt, the capital of Carinthia, a teachers' club, the "Casino," has been started, where social and scientific meetings are held every week; twenty domestic and foreign educational journals are taken by the club regularly.

TYROL.

Clerical agitations.—In Tyrol the clerical agitation against the new school-law has reached a very high degree of violence. In the village of St. Peter, women raised a regular revolt, and one of these viragoes severely wounded a school-inspector with a club. Her punishment consisted in two months' imprisonment. The liberals, though fewer in numbers, presented an unbroken phalanx, and persons well acquainted with Tyrol say that a reactionary movement in school matters is absolutely impossible.

Want of competent teachers.—There is great want of competent teachers, chiefly on account of the miserable salary. It is asserted on good authority that in the valley of Ulten a man was employed as teacher who had for years traveled round the country as a rope-dancer and minstrel. The salary of this worthy, for the period of about six months, amounted to 10 florins.

SALZBURG.

Lowering of the school-age.—The Salzburg provincial parliament has lowered the school-age from 8 to 6 years.

Petition for the re-opening of the Salzburg university.—The Salzburg municipal council has petitioned the Emperor to re-open the Salzburg university, which, founded in 1623, has been closed for quite a number of years.

GALICIA.

Statistics.—There are in Galicia 1,961 elementary schools, 81 of the higher elementary schools, 54 girls' schools, and 7 convent schools. Besides these, there are 427 so-called "parochial schools," many of which are only nominally in existence. Of 380,530 children of school-age only 169,917 (43 per cent.) attend school. In many parts of this province there are no schools whatever. In Galicia there is one school to every 2,286 inhabitants. Of 100 conscripts only 5 could write, and of 4,998 criminals, 4,666 could neither read nor write.

Secondary and superior instruction.—In Lemberg, the capital of the province, there are three gymnasia: a Polish one, a German, and a Ruthenian. The provincial parliament in October last resolved to transform the German gymnasia in Lemberg and Brody into Polish ones. Since 1870 the Polish language has been introduced as the only language of instruction in the university of Cracow. The conflict between the German and Polish nationalities is very bitter, and so far the Poles have been victorious.

2.—HUNGARY.

(Constitutional Monarchy—Kingdom. Area, 119,000 square miles. Population, 15,509,455.)

Minister of public instruction, Dr. TH. PAULER.

REPORT OF EÖTVÖS, LATE MINISTER OF PUBLIC INSTRUCTION.

Baron Joseph Eötvös, one of the noblest and most patriotic characters in modern Hungarian history, and for several years minister of public instruction, died in the beginning of 1871. His death was sincerely mourned throughout the whole of Hungary. A monument is to be erected in his honor in the city of Pesth, and the Hungarian teachers, whose best friend Eötvös was, have contributed a considerable sum for this purpose. From Eötvös's last report we gather the following facts; this report embraced 11,903 communities in Hungary and Transylvania. Of 2,284,741 children of school-age, only 1,152,115 attended school, and of this number about one-half only during the winter months. Two hundred thousand children had no text-books what-

ever. The school-houses were in a deplorable condition; 1,712 communities were without school-houses, and in many places 150 or 200 children were crowded together in narrow, damp, and filthy rooms. The teachers are in many cases utterly incompetent: thus, there were in one single district 17 teachers who could not write. Hungary and Transylvania, together, have only 13,798 schools. Under these circumstances, it is not at all astonishing that of the children who have finished their schooling, 15.24 per cent in Transylvania, and 16 per cent. in Hungary, are unable to read and write. The standard of education is somewhat higher in the German and the Protestant Hungarian communities, but very low among the Slavonians, Ruthenians, and Roumanians, and wherever the Roman Catholic or Greek Church prevails. If one were to count 80 children to one teacher, Hungary ought to have 28,000 teachers, while it has only 17,700, many of whom are very ignorant. The number of government schools has increased from 479 to 658. Thirty-nine courses of instruction for elementary school teachers were held during the year. Two years ago 1,000 teachers participated in these courses; one year ago, 1,500; and last year, 4,200. The sum of 116,000 florins was expended for new school-houses.

ACTION OF DR. PAULER, THE NEW MINISTER OF PUBLIC INSTRUCTION.

Dr. Th. Pauler, soon after his appointment, delivered a speech at Buda, in which he promised a thorough reform of the educational system, embracing complete religious liberty and government supervision for all schools. Soon after he appointed three elementary school teachers as school inspectors. It is the intention of the minister to create a council of instruction, which is to devote its whole attention to public education, propose new laws and regulations, to pass an opinion on all educational questions, new methods and systems, text-books, rules for examinations, establishment of new schools, &c., and to assist the minister generally by their counsel. This council of instruction is to be composed of 26 members, appointed by the minister, and is to have four subdivisions, viz, for university, secondary, primary, and technical education. It is to have its seat at Pesth. There is no doubt that these measures will be carried out very shortly.

EDUCATION OF TEACHERS.

During the last three years the Hungarian government has expended 75,000 florins for raising the standard of education among the teachers, by enabling some of them to take a journey, and make themselves acquainted with the system of instruction in other provinces and foreign countries, and to study at certain foreign seminaries. In 1868 5 students of teachers' seminaries were thus sent out, in 1869, 24, and in 1870, 25, with an annual stipend of 1,000 florins each. In 1869, 36 teachers received a traveling stipend of 300 florins each. Twenty new seminaries are to be established, and those gentlemen who have returned from such educational journeys will be appointed professors. The reason that, in spite of all these efforts, there are several thousand teachers wanting, is simply the insufficient salary, varying between 200 and 300 florins. Unless the salaries are raised no improvement in this respect can be looked for.

EDUCATION OF ADULTS.

During last winter no less than 84,000 adults were instructed in reading and writing. The instruction was mostly given by the elementary school teachers in the evenings and on Sunday afternoons. The eagerness to learn was perfectly astonishing, and, in many places, old peasants, who had wives and children at home, and had to get up early to follow their daily avocation, sat in the village school till midnight. In one village some thoughtless persons ridiculed the idea of old people going to school. When the oldest inhabitant, a worthy peasant, 76 years old, heard of this, he got himself a slate, with the inscription "76 years old," and with this slate slung over his back marched to school every Sunday afternoon. Soon all the other peasants followed his example, and became attentive scholars. From a great many places votes of thanks for this institution have been sent to the minister of public instruction.

RECENT EDUCATIONAL STATISTICS AND FACTS.

No full statistics of the whole of Hungary have lately been published; only some of the districts have published such. Thus, in the district of Bacs-Bodrogh, of 89,768 children of school age only 56,616 attended school; 36 per cent., therefore, received no instruction. According to religious divisions, 37 per cent. of the Roman Catholic children were without instruction; 55 per cent. of the Greek Oriental Church, 12 of the Lutheran, 21 per cent. of the Reformed, 23 of the Greek Catholic Church, and 8 per cent. of the Jews. According to national divisions, 39 per cent. of the Hungarian children received no instruction, 14 per cent. of the German, 55 per cent. of the Servian, 66

per cent. of the Bunyevaczs, 25 per cent. of the Slovacks, and 23 per cent. of the Rusnyacks. The causes for this must be sought for in the past, for recently the greatest interest in education is shown in this district, and during one year (1871) more new schools were established than during the twenty years previous. Thus, in the city of Theresiopal, (population 56,269,) 16 new schools were established, in Zanta 13, and in Baja 8. The smallest country schools are now well furnished with apparatus, maps, and text-books. It can not be denied, however, that in some villages reactionary tendencies prevailed, chiefly encouraged by the clergy. Thus, in the village of Rohrbach the women attacked the school-house and drove the new teacher out, belaboring him with clubs and ropes. The cause of this proceeding was that, in their opinion, the new teacher was too liberal and irreligious in his views. The district judge, with five policemen, in vain endeavored to reinstate the teacher, for the women who held the school-house put him and his assistants to flight. It was finally found necessary to send a company of cavalry to the village to protect the teacher in the exercise of his functions.

TEACHERS' CONFERENCE.

The fifth teachers' conference of Southern Hungary was, on the 22d August, held in Temesvar. Among the subjects discussed there were: 1. The organization of girls' schools and the better education of women; 2. School hygiene; 3. The relation between the parents and the school.

EDUCATIONAL INTELLIGENCE IN NEWSPAPERS.

The most widely circulated newspaper, the Posti Naplo, has adopted a means for awakening greater interest in educational matters which deserves to be imitated. In its Sunday edition it has a regular educational column, giving the most recent educational intelligence, statistics, and essays on educational subjects.

EDUCATIONAL MUSEUM.

The "Society for the furtherance of education" in the city of Pesth has resolved to establish an educational museum, containing models, apparatus, and all the different aids to education. The public takes a lively interest in this project; money has already been collected, and the government has promised its hearty co-operation.

EDUCATION IN THE CITY OF PESTH.

Pesth, the capital of Hungary, with a population of 201,911, annually expends 660,264 florins for educational purposes. The school income (from fees and voluntary contributions) amounts to 213,569 florins, and the remainder is paid from the city treasury. Of this sum, 9,200 florins were expended for drawing-schools and educational apparatus, 4,000 for gymnastic apparatus, and 141,500 for new school-houses.

TRANSYLVANIA.

First Transylvania teachers' conference.—Among the subjects discussed at the first meeting of this conference in August, 1871, the following were of special interest: Absolute separation of church and state; the social position of teachers; the education of women; the means of awakening a healthy patriotic sentiment among our youth; the use of the Bible in religious instruction; gymnastics; the insufficiency of teachers' salaries.

Course of instruction for elementary school-teachers.—As yet Transylvania possesses no teachers' seminary. To supply this want, a course of instruction for teachers was held in Klausenburg, attended by 83 Hungarian and 87 Roumanian teachers. Among them there were many whose annual salary was 5 florins and 30 quarts of corn!

CROATIA.

Educational publications.—The Croatia teachers show great activity. Since 1859 they have had their own journal, the "Napredak." In 1868 another journal appeared, called the "Skolski Prijately." Besides these, there are two other Croatian educational journals published outside of Croatia, viz: the "Skola," at Belgrad, Servia, and the "Srbskanarodna-Skola," at Buda, Hungary. In 1870 the Croatian teachers formed a society for the reproduction of standard educational works in the Croatian language. The first volume, containing the "Didactics" of Komensky, has appeared.

Teachers' conference.—The Croatian teachers' conference at Agram was well attended. Among the subjects discussed, we mention the organization of the elementary schools; privileges and duties of teachers; education of teachers; the proper education of women, one of the greatest demands of our time; means for furthering national patriotic sentiment; agricultural instruction; educational publications, &c., &c.

MILITARY FRONTIER.

Teachers.—The position of teachers has been regulated by a new law, which, among the rest, demands a certificate of competency issued by the president of a teachers' seminary, as a condition for all applicants for teachers' places. Vacancies are published in the official journals of the province, and the appointment is made by the provincial authorities. The salaries of the teachers vary between 300 and 200 florins, besides lodging and fuel. After having served 40 years, a teacher can retire and receive a pension equal to his full salary; in case of sickness he may retire sooner, but receives a smaller pension. Teachers' widows also receive a pension if their late husband had served for 10 years. There are two pension funds toward which every teacher is obliged to contribute.

Teachers' conference.—The first teachers' conference was held in September, 1871. It was well attended, and all subjects pertaining to the furtherance of education thoroughly discussed.

BELGIUM.

(Constitutional Monarchy—Kingdom. Area, 11,313 square miles. Population, 5,021,336.)

Minister of public instruction, THE MINISTER OF THE INTERIOR.

GENERAL REMARKS.

The conflict between the liberal and the clerical parties in the chambers is still raging with great bitterness on both sides, and, in spite of the great exertions made by the government, public education does not advance as desired by its friends.

PARLIAMENTARY DISCUSSIONS.

The discussions in the Belgian Parliament at Brussels on the educational question became very violent, but there was a want of thoroughness displayed on both sides, the lay and the clerical. A report says: "Some consider the Jesuits and nuns as the best educators, while others strongly object to the growing generation being delivered into the hands of the enemies of religious and political liberty, who use their position as educators to further their political schemes. Many again endeavor to interpret the existing laws in accordance with their own individual wishes, and to influence the schools and the teachers, as well as the educational authorities, by their own personal views. Of true appreciation of the irreconcilable and absolute differences between clerical and liberal education, but little is found in the discussions of Parliament."

POSITION OF TEACHERS.

The Belgian government has taken a lively interest in the teachers, and endeavors to ameliorate their position by presenting to Parliament the draught of a new law, according to which the provincial pension funds of teachers are to be united into one common fund, and the contributions are to be raised considerably, while the number of years entitling to a pension is to be lessened. The ministry of the interior, at the same time, recommended strongly an increase in the salaries. Much good is expected from the new ministry that entered upon its functions toward the end of 1871. This ministry is composed entirely of Roman Catholics, but, at the same time, men of well-known liberal principles. Its president is the venerable Count de Theu, one of the veterans of Belgium's political independence, and, since 1831, a member of the chamber of representatives. Delcour, the new minister of the interior, was professor at the University of Louvain.

BELGIAN TEACHERS' SOCIETY.

This society held its session on the 25th and 26th of September, 1871. The following subjects were discussed: 1. What are the results of the adult schools recently introduced into Belgium? 2. Which is the best system for these schools? 3. In how far are these schools to divide their subjects between the day and evening schools? 4. The prize essays of the day and evening schools. 5. The order of rank of the Belgian elementary teachers.

This teachers' society has two divisions, a Flemish and a French, and has branch societies in all parts of Belgium.

FLEMISH LANGUAGE.

Hitherto French maintained a supremacy in Belgium as the language of instruction, but a strong party is endeavoring to gain a more prominent position for the Flemish language. Their aim is to have more hours of instruction in Flemish, and to make it an obligatory study, while hitherto it has only been optional. It is likewise demanded to make acquaintance with this language a condition for public offices and for professorships in superior and professional schools.

LUXEMBURG TEACHERS' SOCIETY.

The province of Luxemburg occupies a semi-independent position, and has its own teachers' society, which held its meeting on the 27th September, 1871. The most important subjects of instruction were: 1. The French language in the elementary schools. 2. The classification of schools according to the salaries of teachers. 3. The irregular payment of salaries. The meeting resolved to retain French as a subject of instruction in the elementary schools, but either to limit its extent or to confine it to the fourth year at school.

APPOINTMENT AND DISMISSAL OF TEACHERS IN LUXEMBURG.

In the province of Luxemburg, teachers are appointed by the town authorities, who regulate their appointments according to certificates given by the school inspector of the province. But the dismissal of teachers is likewise in the hands of these same authorities, which often leads to the most unjust and arbitrary measures. The Luxemburg educational journal, the Progress, says in regard to this: "The villagers as a general rule consider the teachers as no better than a day-laborer, who at the end of the year can be dismissed without receiving any special reason. Thus every autumn a peculiar and lamentable spectacle is witnessed. Like the birds of passage, which then seek a more genial clime, every autumn a large number of our teachers are seen wandering from village to village, to seek their scanty livelihood for another year in some more promising place. Thus there were 95 changes last year among a total number of teachers of 637, and the year before 127 changes among 628 teachers. And what causes do frequently determine such a change? In some villages it has actually happened that a prominent member of the town-council, whose daughter was in love with the young teacher, contrary to the will and wishes of her parents, for this reason advocated the dismissal of a worthy and efficient man. In other places the teacher was dismissed because he did not visit the taverns and cultivate the acquaintance of the worthy frequenters of these places, whose influence was strong in the town. In a great many cases the reasons for dismissal are still more frivolous, and the poor teacher does not get to know them. It is to be hoped that such mediæval institutions may soon entirely disappear."

OFFICIAL REPORT ON PRIMARY SCHOOLS.

Through the kindness of the Belgian legation at Washington, the official report on primary schools for the triennial period 1867, 1868, 1869 has been received. It is published at Brussels in 1871. All the Belgian educational reports are published triennially, in three separate volumes, viz: Primary, secondary, and superior education. Neither of the two latter being at hand, only the leading statistics of primary instruction for the period 1867–'69 can here be given.

SUMMARY OF PUBLIC AND PRIVATE SCHOOLS.

On the 31st December, 1869, the total number of schools under inspection, and the entirely free private schools, including the boarding-schools, was 5,641. The number of communal schools has, since 1866, increased by 219, and that of the entirely free boarding-schools by 15; on the other hand, the number of subsidized schools (*écoles adoptées*) has diminished by 56, that of the private schools by 2, that of the boarding-schools under inspection by 3, and that of the entirely free day-schools by 162. The total number of schools exclusively for girls, including boarding-schools, has increased by 149; there are now, 1854, of which 1,156 are under government inspection.

COMMUNAL SCHOOLS.

The total number of communal schools is 3,730, of which 1,169 are for boys, 765 for girls, and 1,796 for both sexes. Compared with the statistics of 1866, there has been an increase of 118 schools for boys, 144 for girls, and a diminution of 43 in the schools for both sexes. The total increase therefore is 219.

PRIMARY SCHOOLS OF A HIGHER GRADE FOR GIRLS.

Of this class of schools there are twelve, viz: 9 communal schools, 2 private schools under inspection, and 1 entirely free private school.

PRIVATE SUBSIDIZED SCHOOLS.

The number of private subsidized schools (*écoles adoptées*) is 508, viz: 28 for boys, 349 for girls, and 131 for both sexes; 56 have become extinct since 1866.

PRIVATE SCHOOLS UNDER INSPECTION; ENTIRELY PRIVATE FREE SCHOOLS.

The number of private schools under inspection is 22, that of entirely free private schools 1,114, and that of primary boarding-schools 267, of which 36 are under government inspection.

COURSE OF INSTRUCTION IN PRIMARY SCHOOLS.

The following subjects are taught in all the primary schools: Religion, morals, reading, writing, legal system of weights and measures, elements of arithmetic, and rudiments of grammar. Besides these subjects, many schools included others in their course of instruction, viz: 1,426, some other language; 3,930, elements of history; 3,961, geography; 2,262, linear drawing; 568, book-keeping; 410, elements of surveying; 436, elements of natural sciences; 593, horticulture; 654, elements of the constitution; 1,878, vocal music; and 684, gymnastics.

INFANT SCHOOLS.

The infant schools, left hitherto entirely to the support and management of the different communities and private individuals, have developed but slowly. On the 31st December, 1869, the number of infant schools was 609, of which number 119 were communal schools, 235 were private schools under inspection, and 255 were entirely free private schools. On the 31st of December, 1866, their number was 564, viz: 106 of the first grade, 186 of the second, and 272 of the third. The whole increase therefore is 45. The number of teachers is 944, viz: 16 males and 928 females. There were 60,570 infants attending these schools, of whom 43,133 were received free of charge. The increase in the number of pupils since 1866 is 9,689. The central government in 1869 paid a sum of 50,131 francs, and the provincial authorities 19,018, making a total of 69,149 francs. Since the end of 1866, the total sum paid to these schools was 205,386 francs 50 centimes, viz: 66,933 francs 50 centimes by the provincial authorities, and 138,453 francs by the central government.

SCHOOLS FOR ADULTS.

These schools are nearly all established by different communities, by manufacturing corporations, and private individuals. At the end of the year 1867 the number of schools for adults was 866, increased by 214 during the year 1868, and by 623 during the year 1869, making a total of 1,703 such schools at the end of the year 1869. In most of them, the elementary branches, reading, writing, and arithmetic, as well as some history, geography, and elements of natural sciences, are taught, and the results in nearly all the provinces are exceedingly encouraging.

CHARITABLE WORKSHOPS AND TRADE-SCHOOLS.

These institutions leave much to be desired, both in the point of hygiene and instruction. The number of these establishments has decreased by 87 since 1866, and their number is now 514, attended by 26,183 pupils, viz: 1,310 boys and 25,873 girls. Of this number 20,750 are less than 15 years of age.

SCHOOLS UNDER THE DEPARTMENT OF JUSTICE.

The total number of these schools is 94, with 207 teachers and 6,564 pupils.

STATISTICS OF ILLITERACY.

The official report embraces statistics of the illiteracy of militia-men, as follows:

Character of education.	Years.		
	1867.	1868.	1869.
Militia-men unable to read and write	10,369	10,255	10,943
Militia-men able to read only	1,960	2,300	2,626
Militia-men able to read and write	13,248	13,186	13,811
Militia-men having a better education	14,005	14,919	16,337
Militia-men whose standard of education could not be ascertained	574	574	462
Total of militia-men on rolls	40,156	41,234	44,179
Percentage of militia-men unable to read and write	25.8	24.8	24.8

The number of illiterate militia-men is continually decreasing; thus, in 1864 the percentage of illiterates was 29.6, in 1865 it was 29.4, in 1866, 24.8, and in 1869 again 24.8; so that since 1864 the percentage has decreased by 5 per cent.

GENERAL STATISTICS OF PRIMARY SCHOOLS.

In the following table the statistics of primary schools are given according to provinces; the population of the provinces is of course that of 1869. These statistics embrace the primary schools of all kinds—public, private, private subsidized, and entirely free:

Province.	No. of townships.	Population.	No. of primary schools of all kinds.	No. of teachers, male and female.	No. of scholars, boys and girls.	Total expenditures for primary schools by the central government, the provincial and commercial authorities.
						Francs.
Antwerp	150	485, 883	446	925	57, 689	267, 280
Brabant	339	862, 982	809	1, 317	99, 316	476, 350
West Flanders	250	660, 029	665	1, 401	66, 906	198, 066
East Flanders	294	829, 387	734	1, 508	91, 527	534, 577
Hainaut	434	884, 319	1, 057	1, 669	112, 328	620, 268
Liege	334	584, 718	638	1, 069	66, 760	609, 891
Limburg	205	198, 727	263	380	24, 344	88, 380
Luxemburg	205	204, 326	492	563	33, 990	295, 479
Namur	349	310, 965	537	642	40, 519	288, 205
Total	2, 560	5, 021, 336	5, 641	9, 528	593, 379	3, 378, 497

NORMAL SCHOOLS.

There are three kinds of normal schools in Belgium, viz: government normal schools, 2; normal courses, (*sections normales primaires,*) 5; and normal schools not supported by the government, (*écoles normales agréées,*) 7; making the total number of normal schools 14. The students in all these normal schools number 1,192, viz: 286 in the state normal schools, 335 in the normal courses, and 571 in the normal schools not supported by the government.

DENMARK.

(Constitutional Monarchy—Kingdom. Area, 14,553 square miles, exclusive of Iceland and the colonies. Population, 1,784,741, exclusive of Iceland and the colonies.)

Minister of public instruction, C. C. HALL.

SECONDARY INSTRUCTION.

After lengthy disputes between the government and the Parliament, (Rigsdag,) a final solution of the vexed question of secondary instruction was arrived at. The government has yielded and has placed the "realia" (natural science, modern languages, &c.) in so far on an equal footing with the ancient languages as that in the four lower classes scholars are, according to the career they wish to pursue, exempt from certain branches of instruction, and have others substituted; while in the two upper classes the whole instruction is divided into two co-ordinate divisons, viz: one the philological and historical, and the other the mathematical and natural science division. Latin, Greek, and natural philosophy are now taught in the first division, and mathematics in the second. Old Norse, Danish, French, and history are taught in common in both divisions. Scholars who have satisfactorily passed the final examination can enter the university without undergoing any entrance examination, as was formerly required. Those scholars who have passed the philological and historical examination can, after having passed the philosophical examination at the university, become candidates for the so-called "Faculty examination," *i. e.*, the examination which gives them a certificate for practice as physician, lawyer, &c.

FARMERS' HIGH SCHOOLS.

During the last year the government appropriated 14,000 Danish rigsdalers (1 rigsdaler is equal to 50 cents) for these schools, which were to be distributed in shares varying from 2,000 to 75 rigsdalers.

EDUCATION IN ICELAND.

In Iceland, where every person can read and write, public instruction has an almost patriarchal character. Public schools, in the proper sense of the word, there are none. The head of a family instructs his children and servants, and every year the pastor comes twice to examine the progress they have made. He also continues the education received at the parental home, and thus it is no rare case to find farmers well versed in natural sciences and even in foreign languages. In Iceland, knowledge is considered the best and most valuable property a man can possess, and the long and gloomy winter evenings are in most of the farm-houses spent in reading the best authors of all nations and ages.

The clergymen, who are much loved and respected by their parishioners, receive their education at the only college of the island, at Reykjavik, (formerly in Bessastadir.) This institution contains a college and a theological seminary, and the number of students is about 40. Talented boys are frequently prepared by some clergyman for the ministerial career, and wealthy people send their children to the University of Copenhagen. The Danish government favors this, and frequently bestows the best offices on persons educated in Denmark.

STATISTICS.

There is no later educational census than that of 1867, and as no Danish educational statistics have been published hitherto, we give the following table, which, by its comparison with the census of 1857, will prove interesting:

*Statistics of elementary education in Denmark, 1857 and 1867.**

Amounts, (subdivisions.)	School population.		No. attending the public schools.		Instructed in some other way.		Total under instruction.		Number of public schools.		Number of teachers.

FRANCE.

(Republic, since September 4, 1870. Area, 201,804 square miles. Population, 36,594,845.)

Minister of public instruction, JULES SIMON.

POLITICAL STATE.

The unsettled state of politics still continues, and naturally does not favor any sound development of public education. The republic having been declared, Thiers, the venerable old statesman, became its president, and a national assembly was elected. In opposition to this assembly the Paris commune rose in sanguinary revolution and repeated the terrible scenes of 1793. Church and school did not escape the fury of the communists. From the church of Sainte Geneviève they took down the cross and put in its place the red flag. They passed a decree separating the church and state, and abolished the portion of the annual budget appropriated for religious purposes. In education they pretended to have a great interest. When a society in Paris made an application to the communist authorities to retain religious instruction in the public schools, and to have the expenses of this instruction defrayed by a special tax, they hypocritically replied that they in principle were favorably disposed toward this application; but about the very same time (April 17, 1871) they closed several schools conducted by religious societies and imprisoned the directors and teachers. In May the commune published the following decree: "Religious instruction will soon have disappeared entirely from the Paris schools. The teachers are requested to remove all crucifixes and other symbols of mental oppression from the school-rooms, and send all those which are of precious metal to the mint."

JULES SIMON ON SCHOOL REFORM.

In the very midst of this most fearful internal struggle, Jules Simon, the minister of public instruction, endeavored to prepare the way for a reform of education of all grades. His views on the subject will best be seen from his letter addressed to one of the maires of Paris:

"SIR: A committee has been appointed to examine into every thing pertaining to elementary instruction in the department of the Seine. This committee will no doubt propose measures to bring to school all the children of Paris and the suburbs, and to give them a solid, manly, and earnest education, such as a republic ought to give them. I desire that this committee should turn their attention to the following important questions: Gratuitous instruction; compulsory education; privileges and duties of women; manner of appointing teachers; teachers' salaries and pensions; course of instruction; gymnasties, which have been hitherto much neglected; means of enabling poor but talented scholars to enter superior or professional schools; regulation of laws regarding the age of children to be employed in factories.

"I have myself used every free moment to prepare a general draught of a new law. Though your committee is only a local one, I have no doubt that it will furnish me with the most valuable suggestions and assistance for the measures which I intend to propose to my colleagues.

"In my capacity of minister, I thank you for the step you have taken; in my capacity of citizen, I congratulate you that, in the moment when Paris is nothing but a large fortified camp, you strongly express your conviction that the sacred interests of education must not be neglected. France can only be saved, the republic can only be firmly established, if, through unceasing exertions, we succeed in restoring the moral and intellectual grandeur of our country. That will be our work, our joy, the aim of our whole life, when this fearful and sanguinary tragedy will have passed away. We shall create a generation inaccessible to fear, enlightened with regard to public and private duties, freed from the old prejudices, which enervate character and obscure reason—a generation which, by its enlightened character, its patriotism, its virtue, has become worthy to put an end to the two great plagues of humanity—privilege and war!"

COLONEL STOFFEL'S STATEMENTS.

What M. Simon hinted at in a mild manner had already been expressed more vigorously by Colonel Stoffel, in his famous reports made to the French ministry of foreign affairs, in his capacity as military attaché of the French embassy at Berlin. He says, among the rest:

"There is no country where perverted and erroneous ideas are more widely spread than France. The chief cause for this must be sought in the manner in which public instruction is conducted. * * * Is the education which French youth have received since the commencement of this century anything else but an enormous lie, which is continued when we have reached the years of manhood, and which only ceases with the end of our existence? * * * But of all the lies the most serious and

stubborn is the education which we receive in our youth; an education which teaches us the exclusive admiration of our own selves, of France; an education which only tends to further develop our national faults, and completely stifles every desire to become more perfect."

VIEWS OF PHILARÈTE CHASLES.

When, on March 8, 1871, Professor Philarète Chasles, of the Collége de France, delivered his famous lecture on "The Prussian race," he ascribed the German victories partly to the precision of the military movements and the excellent army organization, but also, partly, to the superiority of German popular education over the French system.

He praised the wide-spread knowledge of foreign languages and geography in Germany, and bewailed the exceeding neglect with which such knowledge was treated in France, mentioning the interesting fact that, among all the members of the Academy of France, there were only three who could speak English and German. He said that he had considered the cause of France lost at the very beginning of the war; and added, that what had ruined France was the utter incompetency of the nation and its leaders.

His numerous hearers, among whom were the very *élite* of Paris society, greeted his words with the warmest applause.

VIEWS OF GAMBETTA.

On June 26, 1871, Gambetta made a speech at Bordeaux, in which he also referred to the subject of education. He said: "Above every thing else, this radical evil of all the sufferings of France, ignorance, must disappear. This has been, alternately, the source of despotism and demagogism, and the only means to remedy this evil is education. France has allowed herself to be outdone by other nations, which did not possess the natural advantages of the French, but who progressed, while France remained stationary. It is so self-evident as scarcely to require an argument that the inferiority of our national education has brought most of the present misfortunes on us. We have been defeated by enemies who were aided by clear insight, discipline, and science."

STATISTICS OF ILLITERACY.

Like every thing else, statistics, especially statistics of education and illiteracy, have, since the war, been in a somewhat disorganized state. All that can be given are the statistics of criminals during 1871. Of 4,189 criminals, 1,515 could neither read nor write; 1,835 only possessed a very imperfect knowledge of both; 684 could read and write well; and 155 had a superior education.

PRESENT STATE OF EDUCATION IN FRANCE.

A great deal remains to be done for the improvement of public education in France. The teachers in the elementary schools are themselves but very imperfectly prepared for their important calling; their salaries are small, and consequently many of them, after teaching a few years, turn to some more profitable employment. In the elementary schools the mode of instruction is entirely mechanical; attendance is very irregular; aids to instruction and educational apparatus are very scarce, (there are some villages where it is hard to find a book or a newspaper;) seminaries are scarce, and good directors are still scarcer; female education is very backward. Thus, it may well be asked, Whence is a better state of education to come? The secondary and higher schools are not much better, with but few exceptions, such as the Collége de France.

A serious cause of almost all these evils is the lack of school-houses; and where there is a sufficient number of school-houses, the rooms are entirely unsatisfactory. In many places the distances are so great that children can not possibly attend school regularly. It is estimated that to remedy all these evils the sum of 150,000,000 francs would be required.

Even in Paris much remains to be done. During the reign of the late Emperor many millions were spent for beautifying the city, while in this grand metropolis there were 67,000 children who did not receive any proper education, simply from the want of school-houses.

Every one now feels thoroughly convinced that the empire neglected public education in the most shameful manner, and the departmental councils are zealously discussing the best means of producing a better state of affairs. The general council of the department of the Seine unanimously declared in favor of compulsory education; with 48 against 27 votes they declared in favor of entirely free instruction; while only 37 against 41 voted for taking the religious instruction in the public schools out of the hands of the clergy. The prefect presented the departmental budget, showing a surplus of 1,400,000 francs, and urged the establishment of a normal school in the department of the Seine, asking for a preliminary appropriation of 115,000 francs, and means for educating orphans and idiots.

STUDY OF THE GERMAN LANGUAGE.

M. Jules Simon urgently recommended the rectors of the French universities to introduce as much as possible the study of the German language into all the lyceums of the republic. He said, in connection with this recommendation, "If the rising generation is to oppose successfully the victorious march of the German race, it must learn to understand the German race; and nothing will tend to further this more than a thorough study of the language of our enemies."

The minister of war, General Cissey, also endeavored to raise the standard of education among the soldiers. Thus he published an order in September last, to make out lists of all those officers who have a sufficient knowledge of German and appoint them as teachers of that language in their respective regiments and divisions.

JULES SIMON'S LAW REGARDING COMPULSORY EDUCATION.

In December, 1871, Jules Simon notified the members of the national assembly that he would soon lay the draught of the new school-law before the assembly. This draught had been previously discussed in the council of ministers. Owing to the pressure of business of a purely political character, nothing has as yet been done in regard to this law, but as there is every probability that in its essential features it will finally be adopted, we give its important articles:

1. Every child, male or female, between the ages of 6 and 13, must receive a minimum of education, either in the public or private schools. This minimum of education is to embrace the obligatory branches of instruction, and its existence is, at the end of the period of schooling, to be certified by the ministry of public instruction through its subordinates in the departments. 2. A school committee, consisting of delegates from the canton, the maire, the clergyman, and three heads of families appointed by the municipal council, has to watch over attendance at school. 3. The government inspector in each district has a seat and vote in this committee. 4. If a child misses school three times during a month without excuse, the father or guardian is summoned before the school committee and is warned. If the case recurs his name is placarded at the maire's office, and his family is deprived of all aid from the public funds. If this does not induce him to send his child to school a fine not exceeding 100 francs is imposed, and finally he can be deprived of his rights as a citizen for a period of three years. 5. The school committee issues certificates to children 13 years of age, after having passed a public examination, to which all must submit, whether educated in public or private schools. If, at this examination, it becomes evident that a child, who was supposed to receive private instruction, has in reality not received instruction in the obligatory branches, legal proceedings are instituted against the father or guardian. 6. From the 1st of January, 1880, no citizen 21 years old will be registered as an elector who does not possess the above-mentioned certificate from his local school committee, or give sufficient proof of being able to read and write. Articles 7 and 8 refer to the appointment of teachers, which is to be preliminary by the inspector of the academy, but definitely only after having passed an examination. The inspector of the academy is also intrusted with the inspection of elementary schools. 9. As soon as a teacher's place becomes vacant the municipal council has to decide whether the school is to be intrusted to a clergyman or layman. This decision is then communicated to the departmental council, which, in conjunction with the inspector of the academy, makes the final decision. If the departmental council and the inspector of the academy can not agree, the matter is laid before the educational committee of the department, which settles it definitely. Articles 10 and 11 define the duties of the school-inspectors. Article 12 places the school-houses under the supervision of cantonal committees, which, according to detailed arrangements, are appointed for three years. 16. From January 1, 1876, no one is to be intrusted with the management of a school who can not show the certificate required by the law of March 15, 1850. The members of religious sisterhoods who, on the 1st January, 1876, have already taught school for four years, are exempted from this. 17. The expenses for elementary education must, in the first place, be met by the municipalities and the departments. Only in extraordinary cases the central government grants aid. 18. In every department there will be established a teachers' seminary, for the education of male and female teachers. These seminaries will be entirely supported by the central government, and the departments will only have to supply the buildings. Article 19 specifies the expenses of the municipalities for education. Article 20 extends this law also to Algeria. Article 21 obliges the minister of public instruction to make an annual report every March to the national assembly on the state of public instruction in the whole of the republic.

OPPOSITION OF THE CLERICAL PARTY.

The clerical party of course violently opposed this law. According to the "Opinion Nationale," the Bishop of Orleans declared in a letter to President Thiers, that any law

making education compulsory would be considered as a declaration of war by the clergy. It may therefore be expected that when this law will be discussed in the national assembly the fight will be a bitter one, especially as the majority of the members of the right, under the leadership of Dupanloup, de Corcelles, and de Richemont, will oppose lay instruction to the very utmost.

SEPARATION OF CHURCH AND STATE.

The Evangelical National Conference of France, which held its sessions at Nismes during October, 1871, adopted the following resolutions: "The ministers and elders of the Evangelical National Conference desire that the national assembly will vote in favor of gratuitous, compulsory education." The conference at the same time passed a resolution urging the insertion of an article in the future constitution of France separating church and state entirely. The united committee of the Rue Bréda and the workingmen of Paris charged its candidates to the national assembly to urge "gratuitous, obligatory, and secular instruction, absolute separation of church and state, and the complete abolition of all state support to any religious creed."

SECONDARY EDUCATION.

Lyceums.—According to a late decree of President Thiers, (September 26, 1872,) the salaries of the teachers in the lyceums are regulated. The lyceums (79 in number) are, with the exception of the 7 Paris and Versailles lyceums, classed in four grades, viz: 7 of the first grade, 6 of the second grade, 18 of the third grade, and 41 of the fourth grade. The salaries of teachers of the Paris lyceums vary between 9,000 and 5,500 francs; those of the Versailles lyceums between 9,000 and 4,500. Of the departmental lyceums the salaries of the first grade vary between 7,500 and 2,500, those of the second grade between 7,000 and 2,000, those of the third grade between 6,500 and 1,800, and those of the fourth grade between 6,000 and 1,800 francs. In a circular addressed to the head-masters of lyceums, (dated September 27, 1872,) M. Jules Simon acknowledges the necessity of great and sweeping reforms, but deems it prudent to tread the path of progress slowly and gradually, but all the more surely. In his circular, M. Simon dwells on eighteen points, viz:

1. *Periodical conferences of professors.*—The professors of each lyceum are to assemble once a month, under the presidency of the head-master, and discuss the affairs of the lyceum, plans of studies, disciplinary measures, &c. This conference will, at its first session, elect by absolute majority of votes from among its members a council of 8 in those lyceums that have only 20 professors, of 10 in those with more than 30 professors, and of 12 in those of more than 35. This council will be presided over by the head-master, and administer the laws and regulations of the lyceum.

2. *Gymnastics.*—Gymnastics are to form an obligatory branch of instruction in all the lyceums. The normal school of gymnastics at La Faisanderie, administered by the ministry of war, will continue to furnish teachers. Besides this school, a special committee has been appointed, before which any person may be examined in gymnastics, and, if successful, receive a certificate as teacher.

3. *Military exercises, riding, fencing, swimming.*—Military drill will be taught in all lyceums by competent masters; in garrison towns riding will be taught by cavalry officers, and fencing and swimming will be taught wherever it is practicable.

4. *Excursions.*—Excursions are to be made from time to time by the scholars, accompanied by some of the teachers. The topography and history of the place to which the excursion is made are to be studied beforehand, and such excursions shall embrace ancient castles, important ruins, famous battle-fields, museums and factories, or shall simply be of a botanical or mineralogical character.

5. *Lessons in hygiene.*—A course of six lessons in hygiene, the programme of which is to be drawn up by the Academy of Medicine, is to be gone through in every lyceum.

6. *Modern languages.*—One modern language (either English or German) must be studied by every scholar. The minister deems this branch of instruction highly important, and considers it a great disgrace for France that hitherto so little has been done in this direction.

7. *History and geography.*—A thorough study of these two sciences is strongly urged. In geography, there is not only to be a full course of geography of foreign countries, but more particularly geography of France, aided by excursions and accurate sectional maps. In history, the professor ought certainly to be patriotic, and infuse noble, patriotic sentiments into his pupils, but he should never distort or falsify facts. This passage is so characteristic and new for France that we give M. Simon's own words:

"History ought to give to the scholar a taste for accuracy and veracity. If, *e. g.*, a teacher says in his class that neither army was defeated at Waterloo, he may draw applause from his pupils; but it is of greater importance to tell them that the French were defeated at Waterloo, and inquire into the causes of this defeat; and if we deserved to be defeated it ought to be openly acknowledged."

8. *Modification in the teaching of Latin and Greek.*—In view of the constantly increasing matter of instruction, (natural sciences, modern languages, &c.,) a modification with regard to ancient languages is urgently demanded. There are many different opinions as to how this had best be done, and this whole subject is therefore referred to the immediate consideration of the professors' conferences, who will report to the ministry.

9. *Elementary classes.*—The minister recommends that the greatest care be bestowed on the elementary classes, which form the connecting link between the primary school and the lyceum, as it is important that a good foundation should be laid in these classes.

10. *Recitations.*—The minister strongly urges that there shall be less of mere mechanical work of learning by heart and mere hearing of lessons, but more explanations. The teacher is not to content himself till he has made his pupils *understand* their lessons thoroughly.

11. *Written exercises, (le thème.)*—There should be much less of these; especially not so many translations from French into Latin.

12. *Latin verses.*—The exercises in writing Latin verses, though pleasant in themselves, are to be entirely discontinued, as utterly useless for any practical purpose.

13. *Translations (versions)* from Latin and Greek into French are likewise to be curtailed. Though interesting and important to persons intending to make philology a specialty, they take away by far too much time from other and more useful studies.

14. *The interrogating method, and the explanation of authors.*—The minister draws attention to the fact that most teachers in their classes confine themselves to speaking all the time, without asking their pupils any questions. All lessons ought to be given in the form of dialogues. This applies to all sciences, but particularly to classical authors.

15. *French language and literature.*—The minister very truly says that when the classical studies shall have been curtailed in the manner described above, there will be some time left for the study of French. It has been one of the singular mistakes of our classical education to drill a boy in Latin and Greek translations, exercises, and rhetoric before he is firmly grounded in his native tongue. He was scarcely permitted to express a thought in writing except through the medium of Latin verse or prose. This must necessarily produce a vague way of thinking, must favor imitation, decrease originality, and in most cases extinguish the bright flame of original and enthusiastic youthful thought. In the lowest class as well as in the highest, the greatest attention ought to be bestowed on the study of the French language, and also, in the higher classes, on that of French literature. This, more than any other measure, will tend to introduce a healthful tone into our secondary instruction.

16. *Use of the library.*—Greater liberty ought to be given to pupils in using the works of the library connected with each lyceum.

17. *Résumé of observations regarding the teaching of Latin and Greek.*—The leading principle of all reforms in these studies ought to be the following: "Modern languages are studied in order to speak them; ancient languages, to read the writings of famous authors."

18. *Examinations.*—The minister touches on two points, viz: the general competitive examinations, and the examinations required for passing from one class to the other. There are to be four examinations per year in every class, held by two professors under the presidency of the rector and the inspector of the academy. These examinations ought to be partly oral and partly written; more oral than hitherto, in order to practice the pupils in preserving their presence of mind and in collecting their thoughts rapidly. The general competitive examinations ought to be curtailed considerably.

GERMANY.

(Constitutional Monarchy—Empire. Area, 210,035 square miles. Population, 40,107,428.)

ABSENCE OF NATIONAL SYSTEM.

Germany has no national system of education, and no central educational authority; each state managing its own educational affairs.

SOCIETY FOR THE FURTHERANCE OF EDUCATION.

After the German nation had brought the war against France to a victorious close, and had obtained the ardently desired end to have the whole of Germany united under one head, the wish was felt and uttered to draw all the German tribes more intimately together, especially by working in common for the cause of national education. For this purpose a number of prominent educators from all parts of Germany united and founded the "Society for the furtherance of popular education." After having organized, they published as their aim: 1. To found schools for persons beyond the school-age, beginning with schools for apprentices in cities, and as far as possible also schools for young farmers, on the model of the farmers' high-schools in Denmark. 2. To

draw all the different German societies for educational purposes closer together, and unite them to common activity. 3. To establish a journal which should be exclusively devoted to the furtherance of liberal education, and which should also contain full educational statistics. 4. To appoint itinerant teachers, who are to hold lectures on important educational and social questions. Branch societies have been established in all parts of Germany.

ORGANIZATION OF THE GERMAN SCHOOLS.

At the same time demands were raised on all sides for a uniform organization of the German schools, comprising a uniformity in the plan of instruction, the central, provincial, and local administration, examinations, education of teachers, salaries, and pensions.

GERMAN TEACHERS' SOCIETY FOR RAISING THE STANDARD OF THE PUBLIC SCHOOLS.

In order to further this object, the above-mentioned society was organized at Berlin. Their aim is: 1. To organize a course of instruction in conformity with the present standard of pedagogics. 2. To furnish the schools with better and more modern apparatus, furniture, &c. 3. The better education of teachers. 4. To raise the salaries of the teachers to a sum corresponding with the importance of the profession. 5. The supervision of schools by men properly qualified for this important office. 6. The establishment of adult schools (*Fortbildungsanstalten*) throughout the country. 7. The establishment of public libraries. The society hopes to reach its aim by influencing the legislative powers, by establishing societies for the furtherance of education, and by spreading, through journals, pamphlets, and lectures, correct views regarding the aim of the German public schools.

GENERAL EDUCATIONAL SOCIETY.

A similar society was organized at Dresden, under the presidency of Professor Leonhardi, of Prague. Its aim is to spread those general principles of education by which the German nation may become a nation of morally free, religious, and practical men. This society, too, has organized branches in different parts of Germany.

UNIFORM GERMAN SCHOOL LEGISLATION.

The frequently expressed wish for a uniform German school legislation must be considered as premature, as the difference between the various German states in this respect is as yet very great.

ADULT SCHOOLS.

During the last year a great many adult schools have been established in Middle and North Germany, which hitherto had been outnumbered in this respect by South Germany.

GENERAL ATTENDANCE AT SCHOOL.

It is estimated that of the whole number of youth of school-age in the German Empire, from 96 to 97 per cent. attend the elementary schools. The higher schools are only attended by 2 per cent.

THE INFALLIBILITY DOGMA AND EDUCATION.

The great excitement produced by the dogma of the Pope's infallibility made itself also felt in the educational sphere. Many professors, directors, and teachers were excommunicated and discharged by their clerical superiors because they refused to accept and teach this dogma; but in most cases they secured protection from the secular authorities; in this they were assisted by the "Old Catholic" party.

Toward the end of the year (1871) the arbitrary measures of the clergy, and especially of the Roman Catholic priests, toward teachers, and their violent denunciations of the secular schools, were discussed in the German Parliament. On motion of the Bavarian minister of public instruction, Von Lutz, Parliament, on the 28th November, passed the following resolution: "Any clergyman or priest who, in the exercise of his functions, publicly, before an assembly, in a church, or any other locality used for divine worship, makes the affairs of state the subject of his discourse, or touches thereon in a manner tending to disturb the public peace, is punishable by imprisonment or close confinement in a fortress for a period not exceeding two years."

The Roman Catholic clergy, however, continued in their violent course, persecuting and excommunicating teachers who would not adhere to the new dogma. Matters were brought to a climax by the appointment of Prince Hohenlohe as German ambassador to the Holy See. Prince Hohenlohe was of a noble family, a cardinal of the Roman Catholic Church, and reputed to be liberal or moderate in his religious views. His appointment was said to be made for the sake of appearing to be on good terms with the Pope. Pius IX refused to receive Prince Hohenlohe as ambassador, declaring "that, in the present circumstances of the Holy See, it is impossible to authorize a cardinal of the church to accept a charge of so much delicacy and responsibility."

At the same time it was claimed that it was the policy of the Jesuits so to use the doctrine of the Pope's infallibility as to sow discord within the empire, to prevent its consolidation, to thwart Prussian influence, and to embarrass the state with religious controversies.

The matter was now brought before the imperial German Parliament. The key-note had already been sounded, when, on the 14th May, 1872, Prince Bismarck declared in Parliament: "In Germany there can be, and must be, but one sovereignty, and that uniform and absolute—*the sovereignty of the laws*;" and in another speech in the Prussian Parliament: "This is a *constitutional*, not a *confessional*, government." The strife waxed hot and bitter, and after the most violent discussions the German Parliament, in July, passed the law, promulgated July 25, banishing the Jesuits entirely from Germany, and ordering them to break up all their educational establishments, leaving them six months' time to carry out the necessary preparations. On this occasion Bismarck made his famous speech, in which, alluding to the humiliation of the German Emperor, Henry IV, before Pope Gregory VII, at Canossa, in the year 1077, he said: "Gentlemen, *we* shall *not* go to Canossa." The war between church and state, carried on chiefly on the battle-ground of education, has only just commenced, and it is difficult to foretell to what complications it may yet lead.

FEMALE TEACHERS.

The question of female teachers was much discussed, especially in the larger cities, but no result was reached, as the views were so conflicting. Regarding the appointment of females as teachers in the public elementary schools, the weightiest voices among the German educators all pronounced against it, on the ground that women, in accordance with their natural capacities, were well fitted for teachers in kindergartens, but that they could not be recommended for the school work proper. It is maintained that, in spite of all knowledge and skill, women but rarely possess that amount of energy, earnestness, and consistency which is absolutely necessary for the teacher and disciplinarian that he may prepare the pupils of the German public schools for independent mental activity and true independence. Is is also maintained that by employing female teachers a purely mechanical method of instruction is favored, and the thorough and harmonious formation of character is lost sight of. Whatever may be the experience of other countries in this respect, the employment of female teachers in the public schools will never here be a popular measure.

TEACHERS' SEMINARIES.

That there is a great difference between the state of Germany with regard to teachers' seminaries will be seen from the following table, (in which Alsace-Lorraine is not shown.)

State.	Population, 1871.	Number of teachers' seminaries.	One teachers' seminary to how many inhabitants.	Average number of—		Direction of course.
				Teachers.	Students.	
						Years.
Anhalt	197,041	2	98,520	6	40	3
Baden	1,434,970	3	478,323	5	70	3

SCHOOL HYGIENE.

The importance of school hygiene is being more and more acknowledged, and this subject is discussed in many journals and periodicals and at nearly all the teachers' meetings. In large school-houses, Bacon's hot-water heating-apparatus has found universal favor. It is a saving of fuel and labor, produces a pleasant, even temperature, and prevents much disturbance, disorder, and filthiness.

SCHOOL-FEES.

The abolition of school-fees has been advocated in many German states, and in some cities, Munich, Darmstadt, Gladbach, Dantzic, &c., this measure has been carried out, while it has been proposed, and will no doubt be carried out, in Dresden, Leipsic, Passau, Ingolstadt, Elberfeld, Ansbach, &c. In the Bavarian chambers, the liberal members unanimously voted in favor of a resolution to abolish school-fees in all the public schools of the kingdom, and to appropriate ten millions of florins from the French indemnification for a permanent school-fund. In all probability, this and similar measures will gain ground, and school-fees will gradually be abolished in the whole of Germany.

THE SOCIETY OF GUSTAVUS ADOLPHUS.

This society was founded on the 6th of November, 1832, (in commemoration of the heroic death of Gustavus Adolphus, two hundred years ago,) with the aim of aiding poor evangelical communities throughout Germany in the erection of churches and schools. Since its commencement it has distributed a total sum of 3,200,565 Prussian thalers among 2,106 communities. During the year 1871, the society received the sum of 68,000 thalers in donations; but there are still 1,050 poor evangelical communities looking toward the society for aid.

TEACHERS' PENSIONS.

Much has been done during the last few years to increase the pensions of superannuated teachers. Data could be obtained only from a few German states, which are given in the following table:

States.	*Pensions (in thalers) paid to teachers after a service of—									
	5 years.	10 years.	15 years.	20 years.	25 years.	30 years.	35 years.	40 years.	45 years.	50 years.

PESTALOZZI SOCIETIES.

These societies extend through the whole German Empire; thus, the Prussian province of Saxony alone has eighty-seven such societies. Their aim is to grant aid to the widows and orphans of poor teachers. The activity of these societies is truly admirable.

GENERAL GERMAN TEACHERS' CONFERENCE.

The twentieth general German teachers' conference was held May 20–23 in Hamburg. About 5,000 teachers, from all parts of Germany and from the German provinces of Austria, attended the meeting. The following subjects were discussed: 1. The organization of the general German teachers' society. 2. Corporative self-aid of teachers. 3. The German national-school system. 4. The German Empire and its relations to education. 5. The Protestant union and education. 6. Means of preventing the inner and outer dangers threatening the German public schools. 7. The appointment of teachers. 8. The general and spreading dissatisfaction of teachers. 9. The errors of the public schools. 10. The influence of the present political, ecclesiastical, and social relations of Germany on education. 11. Mistakes of modern education. 12. The natural enemies and the natural friends of the public school. 13. The press in the service of education. 14. Leading features of plan for a uniform German school-law. 15. In

what respects should the cause of instruction in the public schools be limited and in what extended to conform to the demands of our age. 16 and 17. Religious instruction in the public schools. 18. German orthography. 19. Chemistry in the public schools. 20. The central pedagogical library. After these general remarks a *résumé* of the most important educational events during the year, in the different states of Germany, is given in alphabetical order.

ALSACE-LORRAINE.

(Area, 5,075 square miles. Population, 1,549,459.)

The government of these provinces, acquired by Germany by the treaty of Frankfort, has not yet been definitely settled. They are meanwhile under the control of the administrative authorities of the German empire.

RE-ORGANIZATION OF THE SCHOOL SYSTEM.

The first care of the German authorities was to re-organize the school system after the Prussian model. In its leading features this re-organization may now be considered completed. The French were astonished at the rapid progress of the work, and some of their prominent journals openly applauded the measure. Thus, the "*Opinion Nationale*" said:

"The departments which Germany has robbed from us are now enjoying compulsory education, and the first work of the victors was to care for the schools. How long, yet, will our own departments have to wait for this? When, two years ago, in our dear, gallant Alsace, a movement was set on foot for a re-organization of the system of public instruction, who could then have prophesied that a foreign government would carry out this movement, and that the introduction of compulsory education in our eastern provinces would heighten the humiliation which the criminal negligence of that government to which France had committed her fortunes has brought over us?"

COUNTER ACTION OF THE CLERGY.

The Roman Catholic clergy in Alsace sent a petition to the German Emperor, which contained six points: 1. To free the Catholic press of Alsace in such a manner that it may truly express the wishes of the Roman Catholic population. 2. To protect the religious orders in the exercise of their salutary functions, and to guard their corporative privileges. 3. To let the communal councils elect their teachers, as heretofore. 4. To protect the Sisters of Charity. 5. To guard sacredly the religious character of the public schools, *i. e.*, to have separate schools for Catholics and Protestants. 6. To protect the teachers in the public schools against the pernicious influence of the secret societies.

EDUCATION IN THE IMPERIAL PARLIAMENT.

In Parliament, Mr. Thomas and Dr. Köchly (from Alsace) proposed a resolution to re-organize the whole system of public instruction in Alsace-Lorraine, from the primary school to the university, having the greatest possible regard to local peculiarities, to create a provincial school-council, to establish a new university at Strasburg, and to restore the Strasburg library, destroyed during the siege. This motion led to long and violent discussions, but was finally lost.

The primary schools, of which there are in Alsace, 2,440, (1,964 Catholic, 422 Protestants, and 54 Jewish,) are in a good condition, as also the infant schools; but it is necessary to introduce the German language as the language of instruction. The secondary schools are likewise in a tolerably good condition. The private schools must be placed under government supervision. There are too few gymnasia, and more should be established. The re-organization of the educational system in the new provinces is difficult, and it is impossible to lay down absolute and definite rules. The new library must be a university library.

STATISTICS.

The statistics given by Mr. Wehrenpfennig differ somewhat from the official statistics published about two years ago. According to these there are in Alsace 1,123 public and 86 private schools, with 95,222 scholars, (48,608 boys and 46,614 girls.) Seven hundred and thirty-four scholars were Roman Catholic, 400 Protestant, 55 Jewish, and 11 with no denominational character. About one-third of all the schools were administered by religious societies. In 262 girls' schools members of religious sisterhoods were teachers. The total number of teachers was 1,590. The average annual salary of male lay teachers was 640 francs, that of female lay teachers 680, that of the male clerical teachers 730 francs, and that of female clerical teachers 450. Of 735 schools taught, 159 were on examination found excellent, 351 good, 174 satisfactory, and 51 poor or unsatisfactory.

CONFERENCE OF SCHOOL INSPECTORS.

In order to accomplish the re-organization of the school-system in Alsace-Lorraine on a safe basis, the newly appointed school-inspectors of the different districts were commissioned to inform themselves accurately as to the actual state of education and the wants of the population. After this had been done satisfactorily, an inspectors' conference was called together at Strasburg. This conference, to which also the teachers of the normal schools had been called, met on the 26th and 27th July, 1871, and was presided over by School-Counselor Arnold. The whole system of elementary instruction was thoroughly discussed, and rules and regulations for further action were laid down.

COMPULSORY EDUCATION.

By order of the governor of Alsace, education is henceforth to be compulsory for all boys between the ages of 6 and 14, and all girls between the ages of 6 and 13. For the present, this law only applies to public schools, and to private schools for children working in factories.

APPOINTMENT OF TEACHERS.

The appointing power has been given by the governor to Government President von Kühlwetter, in Strasburg, for Alsace, and to Government President Count von Villers, at Metz, for Lorraine. According to reliable authority, the government intends at an early date to raise the salaries of all the teachers in the public schools.

TEACHERS' SEMINARIES.

In April, 1871, two teachers' seminaries were opened—a Catholic one at Strasburg and a Protestant one at Colmar. The course of instruction in these seminaries lasts three years, and embraces religion, history, geography, German, pedagogics, vocal and instrumental music, gymnastics, and horticulture. The language of instruction is German. There are normal classes connected with these seminaries, where students engage in practical exercises. According to a recent decree of the chancellor of the German empire, (Prince Bismarck,) the seminaries in Alsace-Lorraine have been entirely deprived of their confessional character, and students are admitted to either of them irrespective of religious creed.

SECONDARY INSTRUCTION.

The former lyceum at Colmar has been discontinued, and in its stead a gymnasium on the plan of the Prussian gymnasia, with several real-classes, was opened on the 3d October, 1871. The Strasburg lyceum had already been changed into a gymnasium on the 1st of May. According to recent statistics the attendance at the secondary schools has been exceedingly satisfactory. Thus the gymnasium at Strasburg numbered 170 students, (40 from Alsace;) the gymnasium at Buchsweiler 102, (101 from Alsace;) Mühlhausen 80, (60 from Alsace;) and Metz 87, (mostly sons of German officials.)

THE STRASBURG UNIVERSITY.

The Strasburg University, founded in the year 1538, was closed during the first French revolution, but was re-established by Napoleon in 1808, but was never a full university in the German sense of the word. After the close of the war of 1870–'71 it was the unanimous and loudly uttered wish of the whole German nation to see the Strasburg University restored to its pristine glory, and become, as of old, the nurse of famous German writers and thinkers. The imperial government gladly seconded this wish, and appropriated a large sum (about 1,000,000 Prussian thalers) for buildings, laboratories, apparatus, &c., and an annual sum of 220,000 thalers. Large contributions of money and books passed in from all sides, so that soon the library possessed a larger number of volumes than before the siege, and on the 1st May, 1872, the University of Strasburg was solemnly opened in the presence of the civic and military authorities of Alsace, and delegations of professors and students from nearly all the German universities. The new university opened with 47 professors—among them some of the most famous men of science and letters—and several hundred students.

SCHOOL OF PHARMACY AT STRASBURG.

The school of pharmacy at Strassburg had to be discontinued, as nearly all the teachers left. The pharmaceutical society of Strasburg, however, took the matter in hand, chose competent teachers from among their own number, and the school has been opened again and is in a flourishing condition.

EDUCATIONAL JOURNAL.

On the 1st April, 1871, the first number of an educational journal for Alsace appeared at Colmar, called "*Das Elsässische Schulblatt*," (The Alsace School Journal.) It is edited by Professor Hass, director of the higher burgher schools at Münster, (Upper Alsace.)

ANHALT.

(Nominally a Constitutional Monarchy—Duchy. Area, 869 square miles. Population, 203,354.)

The educational affairs of the duchy are administered by a director, (consistorial-rath.)

No report has been received for this year.

BADEN.

(Constitutional Monarchy—Grand Duchy. Area, 5,904 square miles. Population, 1,461,428.)

The educational department is under the ministry of the interior.

Director of the department (superior council of education,) L. RENK.

SCHOOL ADMINISTRATION.

In May, 1871, the Roman Catholic archi-episcopal vicariate (the highest Roman Catholic authority of the grand duchy) resolved to make use of its right (secured by law) of taking a share in the administration of schools, and to guard the right of the clergyman to take his seat in the local school board. This resolution was received in a very different manner by the various organs of the press; the liberal journals almost unanimously condemning the measure, while the conservative and orthodox journals warmly defended it. The teachers openly expressed themselves against the participation of the clergy in the school administration, and several teachers' conferences passed resolutions asking the central teachers' conference to petition the chambers for an abolition of the odious measure.

COMMUNAL NON-CONFESSIONAL SCHOOLS.

In quite a number of communities non-confessional schools have been established, in most cases by Protestants and Jews.

WANT OF TEACHERS.

There are still many teachers wanted. In some cases teachers have from 150 to 170 scholars; in others they have to attend to two schools, so that each of these schools has only three days' instruction per week. The three teachers' seminaries are entirely insufficient to provide for this want. Many young men are deterred from entering the seminary on account of the small salary they have to expect when teachers, as they have to teach ten or twelve years before their salary is raised to 400 florins.

TEACHERS' READING-ROOMS.

The teachers in the city of Constance (9,000 inhabitants) have clubbed together, and have established a reading-room, where all the recent educational publications and journals are taken.

BAVARIA.

(Constitutional Monarchy—Kingdom. Area, 29,617 square miles. Population, 4,861,402.)

Minister of public instruction, J. VON LUTZ.

INCREASE OF TEACHERS' SALARY.

In the appropriation bill laid before the Bavarian chambers special regard was paid to the increase in the salary of teachers. The minister of public instruction, in recommending the measure, remarked that "it would be an unjustifiable harshness to console teachers, when complaining of their miserable pittance, by the promise of some future school law which would improve their position. What was wanted was action and immediate aid." The government intends to remedy this evil by increasing the

salaries of all teachers in active service, by granting an increase of salary after several years of service, by giving pensions to superannuated teachers, and by taking care of the widows and orphans of teachers. The annual sum demanded by the minister for these purposes amounts to 1,294,196 florins. The provincial authorities have set a praiseworthy example in this respect by appropriating large sums for the same purpose; thus Upper Bavaria voted 30,000 florins, and Middle Franconia 44,550. The same has been done by the municipal authorities in most of the cities, such as Munich, Nuremberg, Worms, Nördlingen, Kulmbach, &c.

STATISTICS.

In the public elementary schools there are employed 26 clergymen, 8,309 male teachers, 93 lay female teachers, and 87 assistant teachers. The number of teachers' widows is 2,198, and the number of teachers' orphans 1,328.

EDUCATION IN MUNICH.

In Munich special classes are to be established for children whose mental development has been retarded; children of poor abilities are assisted by receiving extra instruction after school hours, and poor children are afforded an opportunity of studying their lessons undisturbed in the school-house. Gymnastics, drawing, and vocal music are obligatory studies in all the elementary schools. French teachers may be employed in girls' schools, and, in exceptional cases, in the two lower classes of boys' schools. Poor children are supplied with text-books and stationery at the expense of the city. There are no school-fees whatever. The number of hours per week for each teacher varies between 20 and 28. In appointing new teachers the magistrate has the right of recommending persons, and the district authorities (district is the subdivision of province) have the right of appointment. The city in 1871 appropriated 200,300 florins for school purposes, 50,000 of which sum were for teachers' salaries.

THE INFALLIBILITY DOGMA AND EDUCATION.

After Professor Döllinger, Professor Friedrich, and Professor Silbernagel, of Munich, had decidedly expressed themselves against the dogma of infallibility the students of the Gregorian theological seminary were forbidden by their clerical superiors to attend the lectures of the above-mentioned professors. In consequence of this prohibition a large meeting of citizens addressed a petition to the government, asking that the infallibility dogma might be rejected, and that the relation between church and school might soon be definitely regulated. The magistrate resolved to recommend only such persons as religious instructors in public schools as would sign a protest against the dogma. There were, however, several cases in which the archbishop claimed the right to appoint teachers in elementary schools. This induced the magistrate to protest emphatically against all such intermeddling in communal affairs and to enter complaints with the government. On the 14th of October, 1871, von Lutz, the minister of public instruction, made a speech of two hours and a quarter in the Bavarian chambers, defining the position of the government toward the infallibility dogma, declaring that the only safety for the future was to be found in the separation of church and state, and promising that the government would abolish the concordat, and would uphold perfect religious liberty also in the educational field. The archbishop of Munich was officially informed by the minister that the infallibility dogma was endangering the fundamental laws of Bavaria and the constitution of the country; that consequently the government could lend no aiding hand in the spread of the new dogma, and would, if necessary, protect citizens against the encroachments of the ecclesiastical authority.

NON-CONFESSIONAL SCHOOLS.

In a great many cities, such as Nuremberg, Speyer, Munich, and others, the municipal councils have established non-confessional schools, which have received many contributions from private citizens, and which, as a general rule, are well attended.

STUDY OF PEDAGOGICS AT THE ERLANGEN UNIVERSITY.

At the university of Erlangen, two professors, Dr. von Zezschwitz and Dr. Schmidt have commenced to deliver lectures on pedagogics. The latter, who is also director of the recently established pedagogical-faculty seminary at the university, has started a philosophical-pedagogical society, called the "Sunflower."

DISTINCTION CONFERRED ON A WORTHY TEACHER.

The father of the present minister of public instruction lives at Würzburg as a simple elementary teacher. On the 12th September, 1871, he celebrated the fiftieth anni-

versary of his having entered the teacher's profession, in which he, during this long period, had been an untiring and enthusiastic worker. On this occasion he was decorated with the Ludwig's Order, and was honored by a congratulatory letter from the King's own hand.

BREMEN.

(Republic—Free City. Area, 106 square miles. Population, 122,565.)

Highest educational authority, The Mayor of the City of Bremen, C. F. G. Mohr.

TEACHERS' SEMINARY.

A movement has been set on foot by a number of citizens to raise the standard of education in the teachers' seminary, and to make some modern language (either English or French) an obligatory subject of instruction. So far, however, this law has not led to any definite result.

TEACHERS' SALARIES.

The government has resolved to lower the salaries of teachers from 500 Prussian thalers to 400, and to raise them gradually every five years, till they have reached the sum of 600 thalers, which is to be the maximum salary. A short time before this resolution was passed, the salary of the head-butler in the famous old restaurant "Rathskeller," (in the cellar or basement of the ancient town-hall,) was fixed at 1,500 thalers per annum.

The assistant teachers are to have better opportunities in future to be promoted and become regular teachers. Their salaries in the city vary between 350 and 400 thalers, and in the country districts between 250 and 300.

BRUNSWICK.

(Constitutional Monarchy—Duchy. Area, 1,526 square miles. Population, 311,715.)

Highest educational authority, Dr. H. T. L. C. Ernesti.

TEACHERS' CONFERENCE.

The fortieth annual meeting of the Brunswick teachers' conference discussed the following subjects: 1. The preparation of the teacher for his important duties as instructor and educator. 2. The work of the teacher and the best means for bettering his position. 3. The absolute necessity for raising the teachers' salaries. 4. A comparison of the teachers' salaries with those of other officers in the service of the government.

EDUCATION IN THE BRUNSWICK CHAMBERS.

One delegate moved a resolution to reserve 250,000 thalers from the income from the railroads, (which are government property,) the interest of which sum was to be used for increasing the salaries of teachers. During the same session another delegate moved to petition the ministry to consider whether, and in how far, instruction in the public elementary schools could be made gratuitous, and to prepare the draught of a law to that effect.

TRUANCY LAW.

The law, passed in 1867, endeavors to remedy the evil in truancy in an energetic manner. According to this law, for every day missed at school a fine must be paid of 2½ silbergroschen, (about 6 cents;) if the number of missed days during one single month amounts to 5, the fine is raised to 5 silbergroschen, (12 cents.) In case of inability to pay, imprisonment takes the place of the fine. Any person employing a child of school age in a factory or any other business during school-hours is to be fined by a sum not exceeding 20 thalers, ($14.40, gold,) or imprisonment for a period not exceeding two weeks.

MEETING OF TEACHERS OF THE DEAF AND DUMB.

August 20–22, 1871, the society of teachers of the deaf and dumb of Northwestern Germany held its fifth annual meeting at Brunswick. Ten deaf and dumb institutions were represented by 24 teachers. The following subjects were discussed: 1. The urgent necessity of a normal school for teachers of the deaf and dumb. 2. Drawing instruction in deaf and dumb institutions. 3. Instruction in speaking. 4. The best mode of placing the teachers in institutions of more than one class.

HAMBURG.

(Republic—Free City. Area, 148 square miles. Population, 338,974.)

President of the superior school council, THE MAYOR OF THE CITY OF HAMBURG, DR. G. H. KIRCHENPAUER.

INTRODUCTION OF THE NEW SCHOOL-LAW.

The introduction of the new school-law has been hailed with universal and unfeigned joy. It is based on sound educational views, secures the independence of the school from the clergy, and gives a uniform organization to the whole system of public instruction. By this school-law a superior school-council has been created as the highest educational authority. The members are at certain stated periods elected by the city council. The law also provides for a teachers' seminary—an institution the want of which has been keenly felt. An annual sum of 16,000 Prussian thalers has been appropriated for this institution; there are to be only day scholars, and English and French are to be made obligatory studies.

EDUCATIONAL SOCIETIES.

The "Society of the Friends of Education in Hamburg," existing for sixty-five years, numbers 596 members. It endeavors to further education by lectures, a library, a reading-room, and normal school, and likewise grants financial aid to poor, sick, and superannuated teachers, teachers' orphans and widows.

The Educational Society, founded in 1869, numbers 200 members, and follows the same aims as the before-mentioned society.

SCHOOL HYGIENE.

In Hamburg, following the example of Switzerland, experiments have been made to ascertain the amount of carbonic acid gas contained in school-rooms. The maximum was found to be about 5 per cent., which is altogether too much. As the pure air of the atmosphere only contains 0.004 per cent., and as 1 per cent. is really injurious to health, endeavors are being made to remedy this evil by a better system of ventilation.

STATISTICS.

During 1871 the total number of teachers was 1,805, viz, 878 females and 927 males Of this number, 42 males and 131 females were about 18 years old, 237 males and 301 females varied in age between 19 and 28; and 152 males and 86 females were between 29 and 38 years.

HESSE.

(Constitutional Monarchy—Grand Duchy. Area, 3,240 square miles. Population, 852,843.)

Superintendent of public instruction, G. WILLICH.

TEACHERS' SALARIES.

The Hessian chambers, in September, 1871, discussed the position of the elementary teachers,and almost unanimously resolved to urge the government to raise the decidedly insufficient salaries, and the pensions of teachers' widows. In some of the towns the evil was so apparent that the municipal authorities raised the salaries from the town treasury. That the salaries were really utterly inadequate, is seen from a fact like the following, which has been communicated by a Hessian teacher: A young man about 16 years of age was recommended by him to an engineer, to assist him in carrying and placing surveying instruments, who received daily, Sundays included, 1 florin 12 kreutzers, making an annual salary of 438 florins. This same teacher only receives an annual salary of 300 florins, although he has served 30 years.

TEACHERS' SOCIETIES.

The Ludwig and Alice Society, established seven years ago, for aiding teachers' widows and orphans, numbers 1,341 members, all teachers, (the total number of teachers in the grand duchy is about 1,700,) and its funds amount to 15,493 florins; during the last year 1,040 florins were distributed. In two districts there are district teachers widows' societies, to give aid only to the widows of teachers who have taught

in the district. The Jewish society, Achawa, for aiding poor Jewish teachers, their widows and orphans, has been in existence for six years; its funds amount to 10,628 florins, and during the last year 967 florins were paid to poor teachers, orphans, and widows.

The Hessian Teachers' Society, numbering 1,125 members, met in May, 1871, in Oppenheim. Only 280 members attended the meeting. Various subjects were discussed, and resolutions passed to urge upon the government the necessity of a new school-law, the chief features of which are to be: entire separation of church and school; compulsory, gratuitous education; non-confessional teachers' seminaries; higher standard of education in the seminaries, &c.

AGRICULTURAL COURSE FOR ELEMENTARY TEACHERS.

Every year during the summer vacation an agricultural course of about six weeks is held at Darmstadt, the capital of the grand duchy, for the benefit of elementary teachers. This course has two divisions, one for those who attend for the first time, and one for those who have already attended it during the previous year. The course embraces lectures on chemistry, natural philosophy, mineralogy, geography, botany, zoölogy, geometry, agriculture, book-keeping, horticulture, &c.

INSTITUTIONS FOR YOUNG PERSONS WHO HAVE LEFT SCHOOL.

Three years ago there were 87 such institutions, but since then their number has increased considerably, especially in the rural districts. These schools are supported by the towns themselves. The instruction is mostly given in the evening or on Sunday afternoon, by the regular teachers, and embraces drawing, natural history, natural philosophy, history, geography, arithmetic, &c. The Roman Catholic clergy have violently denounced these schools as a desecration of the Sabbath-day; the well-known Bishop Kettler, of Mayence, calling them, in a confirmation speech held in the Mayence cathedral on the 29th May, 1871, "institutions of the devil."

BUSINESS COLLEGE AT OFFENBACH.

In Offenbach (population about 25,000) there is a very excellent private business college under the superintendence of Dr. Nägler. Both discipline and instruction enjoy a very high reputation, and among the pupils there are several from Italy, England, and America.

LIPPE-DETMOLD.

(Constitutional Monarchy—Principality; (Fürstenthurm.) Area, 445 square miles. Population, 111,153.)

Director of ecclesiastical and school affairs, PRIVY COUNSELOR MEYER.

No report has been received for this year.

LUBECK.

(Republic—Free City. Area, 109½ square miles. Population, 52,158.)

Highest educational authority, SENATOR DR. TH. CURTIUS.

No report has been received for this year.

MECKLENBURG-SCHWERIN.

(Feudal Monarchy—Grand Duchy. Area, 4,834 square miles. Population, 557,897.

Highest educational authority, THE MINISTER OF JUSTICE, ECCLESIASTICAL AND SCHOOL AFFAIRS, STATE COUNSELOR DR. H. BUCHKA.

EDUCATIONAL SOCIETIES.

The general Mecklenburg teachers' society held its annual meeting at Wismar, and passed resolutions to urge the authorities to establish schools for young persons who have finished their schooling in the primary schools. The course of instruction, according to these resolutions, is to embrace drawing, modeling, embossing, German, natural philosophy, history, geography, arithmetic, book-keeping, rudiments of law, and political economy In Schwerin there is an "educational society" with several sections, *i. e.*, for mathematics, history of pedagogics, &c.

The Teacher's Life Insurance Society has been in existence for 11 years. The funds

amount to 28,398 Prussian thalers. During the last year the expenditure was 4,482 thalers, and the income 4,721. The number of members is 958. In 1871 a Pestalozzi society was started, which already has distributed 218 thalers to 18 teachers' widows.

A TEACHER IN THE CITIZENS' COUNCIL.

In Schwerin a teacher was elected a member of the citizens' council, a committee of citizens whose function it is to form a sort of advisory board to the municipal council. The municipal council did not consider this election valid, but the university, on being appealed to, decided that the election was entirely valid.

COMPULSORY SERVICE (SPANNDIENST) FOR TEACHERS.

In the rural districts the farmers are obliged to till the ground for the teacher, as part of the latter's salary consists in a tract of land. This institution has led to many quarrels between teachers and farmers, and it is the unanimous wish of the teachers that this antiquated institution may soon be abolished.

MECKLENBURG-STRELITZ.

(Feudal Monarchy—Grand Duchy. Area, 997 square miles. Population, 96,982.

Highest educational authority, ECCLESIASTICAL COUNSELOR (Consistorialrath) Dr. H. OHL.

No report has been received for this year.

OLDENBURG.

(Constitutional Monarchy—Grand Duchy. Area, 2,417 square miles. Population, 316,641.)

Highest educational authority, THE MINISTER OF STATE, JUSTICE, AND FOREIGN AFFAIRS, BARON P. F. L. DE ROESSING.

There are two school-boards—one for the Protestant and one for the Catholic schools. President of the school-board for Protestant schools, Erdmann; president of the school-board for Roman Catholic schools, Reismann. No report has been received for this year.

PRUSSIA.

(Constitutional Monarchy—Kingdom. Area, 137,066 square miles. Population, 24,691,203.)

Minister of public instruction, Dr. FALK.

CHANGE OF MINISTRY.

Von Mühler, who has been Prussian minister of public instruction since 1862, had made himself so obnoxious by his re-actionary measures, all tending to give greater power to the clergy, and to increase their influence in school affairs, that a change was urgently demanded by the public, the press, and the Prussian Parliament. He was, consequently, permitted to resign on the 17th of January, 1872, and on the 22d of January Dr. Falk was appointed in his place, a choice which met with universal approbation. Dr. Falk was born in the Prussian province of Silesia in the year 1827, received a classical education, and studied law at the University of Breslau. In 1857 he was elected a member of the Prussian Parliament, where he voted with the liberal conservatives.

EDUCATION IN THE PRUSSIAN PARLIAMENT.

Education has formed a frequent subject of discussion in the Prussian Parliament. In 1870, several members introduced resolutions to ameliorate the teachers' position, but without leading to any result. During these discussions, a member from the province of Prussia showed that in the district of Gumbinnen, in his province, in 1837, there were 10½ per cent. of all the recruits entirely illiterate, while in 1827 the percentage had only been 6; but that during the administration of Raumer and Mühler, (1860-'65,) the percentage had again risen to 10½. He considered the miserable financial position of the teachers as the chief cause of this deplorable condition. Other members entirely coincided with his views, but nothing was done to remedy the evil.

At the opening of Parliament, November 27, 1871, King William, in his speech from the throne, referred to education in the following words: "Public instruction will this year require a larger appropriation than heretofore, in order to satisfy all the just demands of teachers and schools. The draught of a new school law will be introduced during the present session, which it is hoped will remedy many of the existing evils." This draught of a new law, looking chiefly to a complete separation of church and school, was introduced, and after considerable discussion was passed in both houses; in the lower house on the 11th March, 1872, by a vote of 125 ayes to 76 noes.

THE NEW PRUSSIAN SCHOOL LAW OF 1872.

The following is a literal translation of the new Prussian school-law of March 11, 1872, assigning the superintendence of all the schools, private and public, to the state, that is to say, to the political society, and withdrawing this superintendence from the clergy as clergy or priests, although the latter might be, and indeed are, largely appointed by the state as school superintendents:

LAW CONCERNING SUPERINTENDENCE OF INSTRUCTION AND EDUCATION.

"We, William, by the grace of God, King of Prussia, &c., &c., ordain, in conformity with article 23 of the constitution of January 31, 1850, with the consent of both houses of Parliament, for the whole monarchy, as follows:

"SECTION 1. Abolishing every decree or direction in single portions of the land to the contrary, the superintendence over all institutions of instruction and education, private and public, belongs to the state.

"SECTION 2. The appointment of local and district school inspectors belongs to the state alone. The commission given to the state inspectors of primary schools can be recalled at any time, if it be a secondary and additional, or an honorary, office.

"SECTION 3. This law does not touch the participation in the superintendence of schools belonging to the communes, nor article 24 of the constitution of January 31, 1850.

"SECTION 4. The minister of public instruction is charged with the execution of this law.

"Given, &c., &c., Berlin, March 11, 1872.

"WILLIAM.

"BISMARCK, *and the seven ministers of the Prussian cabinet.*"

THE INFALLIBILITY DOGMA AND EDUCATION.

During the early part of 1871, Dr. Triebel, director of the teachers' seminary at Braunsburg, in the province of Prussia, and Dr. Wollman, teacher of religion at the gymnasium in the same town, who refused to accept the new dogma, were suspended from office by Dr. Krementz, bishop of Ermeland, while Dr. Braun, director of the gymnasium at Braunsberg, was without further ado suspended from office and excommunicated. Although the ministry of public instruction reminded the bishop of the illegality of his course of action, Dr. Krementz nevertheless demanded unconditional obedience to his orders by all the teachers of his diocese. Thereupon, the ministry commissioned the provincial school-council of the province of Prussia to issue the following order:

"As Dr. Wollman has been appointed by the government, it alone has the right to suspend him from office, if such a step should be deemed necessary. The bishop has no right whatever to meddle with the affairs of the gymnasium, much less to discharge any teacher. If the bishop believes that Dr. Wollman has become incapacitated for his office, he must first ascertain the exact facts of the case, and must then refer the whole matter to the government. In no case has the teacher of religion to obey any orders except those of the government."

Similar orders were issued with regard to Dr. Triebel and Dr. Braun. The bishops of Bonn and Breslau, who pursued the same course as Dr. Krementz, were likewise, by energetic orders from the university, reminded of their position. All the Roman Catholic bishops of the kingdom thereupon, on the 13th September, 1871, addressed a petition directly to the King, asking him to protect the oppressed Catholics in their rights.

SCHOOL FINANCES.

During the year 1871 the sum of 6,311,463 Prussian thalers (about $4,544,253.36 gold) was expended for public instruction. The following are the most important items of expenditure: Ministry of public instruction, 149,260 thalers; provincial school councils, 77,630; examining committees, 12,797; the universities, 889,815; gymnasia and real-schools, 572,429; scientific and artistic institutions, 317,660; elementary instruction,

1,339,009; with the following items: teachers' seminaries, 392,025; elementary schools, 837,616; gymnasia, 12,160; institutions for the deaf and dumb and the blind, 21,139; orphan schools, 76,065, &c.

TEACHERS' SEMINARIES.

There is a great lack of teachers in nearly all the provinces, owing partly to the low salary paid, and partly to the insufficient number of teachers' seminaries. In the course of the year a number of new seminaries have been opened, and others will soon be opened, especially in the provinces acquired by the war of 1866.

TEACHERS' SALARIES.

The salaries have hitherto been entirely insufficient, especially in the rural districts. While a number of cities, particularly in the western portion of the kingdom, have made praiseworthy efforts to make the position of their teachers more comfortable, a petition, signed by thousands of teachers, has been addressed to the Prussian Parliament, asking for an addition to their salaries, a regular increase at stated intervals, and a regulated system of pensions. Slowly but surely this end will be reached.

TEACHERS' SOCIETIES.

There are teachers' societies in all the provinces, district societies in the district, and city societies in most of the larger cities. The Prussian societies have, during the last year, displayed a great activity, in the way of meetings, lectures, discussions, &c.; but few practical results have been reached. The two favorite subjects of discussion were the separation of church and school, and the formation of a general German teachers' society.

SCHOOLS FOR YOUNG PERSONS WHO HAVE FINISHED THEIR SCHOOLING, (FORTBILDUNGSCHULEN.)

Of these schools there are a great number throughout the whole monarchy, and of all kinds and grades, to suit the most varied demands. A model school of this kind for ladies is the Victoria Lyceum, in Berlin, which is under the special patronage of the crown princess. The teachers are all men of standard excellence in their respective subjects, and lectures are delivered on general history, history of Germany, German literature, history of music, history of the fine arts, French and English literature, botany and chemistry. Other schools are more devoted to industrial pursuits, and might well be termed industrial schools; while some only go over the elementary branches, with the addition of some mathematics, natural sciences, &c. Some are devoted to drawing; others to agriculture, &c. These schools are open mostly in the evening, and are attended by apprentices and other young persons in business. Many of these schools are private establishments; some are municipal, while others are supported by various societies.

GYMNASTICS.

Gymnastics is taught in almost all the schools, and the government encourages it in every way. In a recent circular the minister says: "It is acknowledged everywhere, by soldiers and civilians, that the astonishing accomplishments of our armies in the late war, especially their thorough discipline, exhibited in the most cheerful and self-sacrificing manner, their skill in overcoming natural and artificial hinderances in the enemy's country, their courage and calmness in battle, the calmness with which they bore pain and privations, must, in a large measure, be attributed to their gymnastic education."

Special zeal is displayed in the province of Prussia, where, in the five districts of Königsberg, Gumbinnen, Danzig, Marienwerder, and Bromberg, there are 34 gymnastic societies, with 3,062 members. The provincial gymnastic society employs a migratory teacher of gymnastics, who makes his regular rounds. In the city of Osnabrück (province of Hanover) the system of gymnastics has been introduced in the two upper classes of the city schools, and the results have been interesting. In all cases the children of the poorer classes showed less nimbleness than those of the rich. The most extensive and magnificent arrangements for instruction in gymnastics are to be found in the city of Breslau, (province of Silesia,) where there are most perfect arrangements for female gymnastics.

SCHOOL HYGIENE.

In February, 1871, a "medico-pedagogical society" was formed in Berlin, consisting of educators and physicians. Its aim is to further school hygiene in all its branches. In one of the last sessions the feasibility of a reliable school-pathology was discussed; and, as a step in this direction, the keeping of accurate tables was recommended, in which all cases of sickness of school-children are to be entered. The society is young; but some of the best educators and the most eminent men of science are among its members, and good results from its activity may confidently be looked for.

STATISTICS OF ILLITERACY.

The following are accurate statistics of the illiteracy among the Prussian conscripts:

Provinces.	Percentage of conscripts unable to read and write.				
	1841.	1846–'49.	1851–'52.	1866–'67.	1869–'70.
Prussia	15.33	9.24	10.04	12.28	11.00
Posen	41.00	18.22	20.67	13.80	14.38
Brandenburg	2.47	1.10	0.76	0.84	0.59
Pomerania	1.23	1.01	0.93	1.19	1.08
Silesia	9.22	5.88	4.78	3.42	2.86
Saxony	1.19	0.37	0.64	0.17	0.37
Westphalia	2.14	1.69	2.11	1.63	1.03

SCHOOL STATISTICS OF BERLIN.

The following are the official school statistics of Berlin (population about 900,000) for the year 1871: Number of elementary schools 218, with 1,982 classes and 93,198 scholars, (49,446 boys and 43,752 girls.) Of these scholars, 7,371 were older than 14, and 85,627 younger. Of the schools, 93 private schools were under the supervision of the municipal authorities, and 64 schools were supported by, as well as under the supervision of, the same authorities; 53,515 children were instructed at the expense of the city. The teachers are classed according to their salary, in the following manner: 16 with 900 thalers each; 16 with 850; 57 with 800; 13 with 700; 92 with 650; 91 with 500; 123 with 450; 238 with 400; 43 with 350; 75 with 300; 209 with 72; 15 with 60. Total number of teachers 957, (596 males and 361 females.) The expenditure for the municipal schools amounted to 475,762 thalers, and that for the private schools to 116,085. Fines for truancy were imposed to the number of 16,639, amounting, in all, to 2,379 thalers. In 1,560 cases the punisment consisted in imprisonment.

REUSS-GREIZ.

(Absolute Monarchy—Principality. Area, 148 square miles. Population, 45,094.)

Highest educational authority, THE PRESIDENT OF THE GOVERNMENT, O. MEUSEL.

No report has been received for this year.

REUSS-SCHLEIZ.

(Constitutional Monarchy—Principality. Area, 297 square miles. Population, 89,032.)

Highest educational authority, THE PRESIDENT OF THE MINISTRY, DR. VON HARBOU.

ACTION OF THE CHAMBERS WITH REGARD TO EDUCATION.

The chambers, which assembled at Gera, adjourned on the 29th November, 1871, after having passed all the bills relating to education, the most important one being a bill granting government subsidies toward the building of new school-houses.

SCHOOL DISTRICTS.

The whole country is divided into 3 dioceses, with 15 school districts. Every district has its school-inspector, appointed by the government, who presides at the annual teachers' conferences of his district. So far there is no general teachers' society, but energetic endeavors are being made to establish one.

SAXE-ALTENBURG.

(Constitutional Monarchy—Duchy. Area, 509 square miles. Population, 142,122.)

Highest educational authority, THE PRESIDENT OF THE MINISTRY, F. L. VON GERSTENBERG, EDLER VON ZECH.

TEACHERS' SALARIES.

The salaries of teachers were entirely inadequate, and many teachers had, therefore,

to resort to some other means of earning money. By a bill introduced in the chambers, which doubtless will become a law, the lowest salary will be 250 Prussian thalers, and the highest 400.

NUMBER OF CLASSES IN SCHOOLS.

In the whole duchy there is not a single school with only one class; all the schools having at least two classes.

SAXE-COBURG-GOTHA.

(Constitutional Monarchy—Duchy. Area, 509 square miles. Population, 174,339.)

Highest educational authority for Gotha, PRESIDENT OF THE MINISTRY VON SEEBACH.
Highest educational authority for Coburg, MINISTERIAL COUNSELOR H. ROSE.

CHANGE IN THE SCHOOL-LAW.

The Gotha school-law, dated July 1, 1863, is to undergo a change. The change will refer chiefly to disciplinary measures, the preparation of teachers, the regulation concerning private schools, the maximum and minimum of children in one class, and a stricter separation of ecclesiastical and school affairs. The teachers' seminary will have a preparatory class added to it.

GYMNASTICS.

Since 1863 gymnastics forms an obligatory branch of instruction in all the schools of the duchy. During the months of July and August, a professor of gymnastics was commissioned by the government to make a tour of inspection through the whole country, and prepare a report on the state of instruction in gymnastics.

SAXE-MEININGEN.

(Constitutional Monarchy—Duchy. Area, 933 square miles. Population, 187,884.)

Minister of justice, ecclesiastical affairs, and public instruction, PRIVY COUNSELOR F. VON UTTENHOVEN.

STATISTICS.

The teachers' seminary at Hildburghausen had 1 director, 6 teachers, 4 assistant teachers, and 74 students. Connected with the seminary there is a very excellent normal school and an institution for the deaf and dumb.

The gymnasium at Meiningen had 205 students, the gymnasium at Hildburghausen 116, and the real-school at Meiningen 146. Evening and Sunday schools, in which education is compulsory, have been established by 20 (chiefly rural) communities. The town of Sonneberg (population, 4,000) has established an industrial school with a one-year's course, embracing German, French, English, history, geography, mathematics, natural sciences, drawing, modeling, vocal music, and gymnastics.

SAXE-WEIMAR.

(Constitutional Monarchy—Grand-Duchy. Area, 1,421 square miles. Population, 286,183.)

Highest educational authority, PRIVY COUNSELOR Dr. G. T. STICHLING.

TEACHERS' SOCIETIES.

There are quite a number of teachers' societies, prominent among which are the Pedagogical Seminary, under the leadership of Dr. Stoy, at Jena, and the Pedagogical Society, at the same place, numbering among its members nearly all the teachers of the higher elementary schools, and the Pedagogical Society at Eisenach. The latter usually holds twelve sessions every winter.

PRIVATE SCHOOLS.

Among the private schools of the grand-duchy and of Germany, the boys' boarding-school of Dr. Käferstein, at Jena, occupies a high rank. It has 3 gymnasium-classes, 4 real-classes, and 2 elementary classes, and is therefore a combination of gymnasium, real-school, and elementary school. Instruction in Latin commences in the third year, French in the fifth year, Greek and English in the sixth year.

TEACHERS' SALARIES.

The salaries of teachers were, in a great many cases, entirely too small. The government has taken the matter in hand, and intends, in consideration of the very favorable financial condition of the country, to raise the salaries considerably.

SAXONY.

(Constitutional Monarchy—Kingdom. Area, 6,777 square miles. Population, 2,556,244.)

Highest educational authority, THE MINISTER OF PUBLIC INSTRUCTION, Dr. C. F. W. GERBER.

SCHOOL FINANCES.

The appropriation for educational purposes for 1872 amounted to 774,000 thalers, (one thaler=72 cents, gold,) being 169,599 more than the preceding year. The increase is to serve in raising the teachers' salaries. The items of the appropriation are distributed in the following manner: University at Leipzig, 164,857; for the gymnasia, 112,308; for industrial schools, 22,000; for the schools for toy manufacture, weaving-schools, sewing-schools, schools of embroidering, straw-plaiting schools, spinning-schools, navigation-schools, (for river navigation,) drawing and Sunday schools, 2,250; special higher schools for the above-mentioned branches of industry, 16,250; business-colleges, 1,000; teachers' seminaries, 105,338; institutions for the deaf and dumb, 30,751; elementary schools, 160,825; for a new polytechnic school at Dresden, 400,000, &c.

THE NEW SCHOOL-LAW DISCUSSED BY THE LUTHERAN SYNOD.

The government had already in 1870 prepared the draught of a new school-law, which, however, was not discussed by the chambers till this present (1872) session. Its fate so far is not known. As the new law proposed to define more clearly the relation of the school to the church and the state, the ministry of public instruction deemed it advisable first to hear the opinion of the Saxon Lutheran synod, which met in Dresden in May, 1871. The most important subject of discussion was the following paragraph of the new law: "All the functions of the Evangelical-Lutheran church authorities which hitherto have been exercised by the ministry of ecclesiastical and school affairs pass over into the hands of a new ecclesiastical board, (*Oberconsistorium.*) The highest authority in educational matters remains with the ministry of public instruction, with the exception of religious instruction, which is under the superintendence of the *Oberconsistorium,* the new ecclesiastical board." The majority of the synod supported the government, but a strong minority openly expressed themselves against the new law. After long and violent discussion, it was resolved to lay the new school-law in full before the synod before it was laid before the chambers.

REAL-SCHOOLS.

By a ministerial decree of December 2, 1870, the course of instruction in the real-schools of the higher grade was raised from six to seven years. All the scholars in these real-schools are obliged to study Latin, so as to be able to read Livy, Sallust, and Cicero, in the first (highest) class. In the real-schools of the lower grade, two foreign languages must be studied. The number of real-schools is constantly increasing, and all of them are filled to their utmost capacity.

TEACHERS' SEMINARIES.

The Saxon teachers' seminaries enjoy a well-merited reputation. Their course of instruction embraces the following subjects: Religion, (dogmatically,) exegesis of the most important books of the Old and New Testaments, church history; German grammar and literature, (also ancient German and Gothic;) arithmetic, geometry, geography, history, natural history, natural philosophy, pedagogics, history of education, catechetics, psychology, penmanship, drawing, gymnastics, piano, organ, and violin, vocal music, and thorough-base. Connected with every seminary there is a practice-school. In some seminaries one or two foreign languages are taught.

WANT OF TEACHERS.

The number of teachers' places in the kingdom of Saxony is 4,549, while the number of teachers is only 4,411; so that, in spite of the numerous and well-attended seminaries, there are 138 teachers wanting. In view of this want, the government contemplates the establishment of another new seminary in the district of Zwickau, (one was established a few years ago at Zschoppau.)

SCHOOL-HYGIENE.

At the sixth annual meeting of the Saxon Medical Society, held at Dresden in November, 1871, a resolution was moved to petition the government to place all the schools under medical supervision; but as Dr. Hübel declared, in the name of the ministry, that by the new school-law all school-houses would be placed under medical supervision, and that the district-physicians were to become members of the regular conferences of district-school inspectors, the motion was taken back. It was resolved to petition the ministry to introduce instruction in hygiene, at least in all the higher schools: and this petition will in all probability be granted.

All teachers have to keep a regular account of the vaccination of their scholars. According to the accounts sent to the ministry, 46,884 children out of 51,980 who entered school during the year had been vaccinated. Of those that had not been vaccinated 36.6 per cent. were attacked by the small-pox, while of those that had been vaccinated only 1.2 per cent. had the disease.

EVENING AND SUNDAY SCHOOLS.

There is in Saxony a very large number of such schools, to suit all demands. In the Dresden district there were 23 Sunday-schools, with 1,953 scholars; in the Zittau district there were 12 Sunday-schools, with 910 weaving-machines; in the Plauen district there were 20 Sunday schools, with 2,110 scholars; in the Chemnitz district 54, with 6,897 scholars. In many of these schools French, English, book-keeping, arithmetic, penmanship, drawing, and natural sciences are taught, and all of them are well attended by apprentices, clerks, &c. Recently, also, an agricultural Sunday and evening school has been started near Bautzen, attended by teachers and young persons between the ages of 15 and 32, to the number of 72.

PRIVATE SCHOOLS.

Saxony possesses a great number of very excellent private schools of all grades, especially in the cities of Dresden and Leipzig. A peculiar school is the private school for girls, founded by Miss Grossmann in Dresden. All the studies in this school are taught by three teachers, a German, a Frenchman, and an Englishman. Every subject is first taught in German, then the same subject in French, and lastly in English.

GYMNASTICS.

At Dresden there is a famous normal school of gymnastics. The number of scholars was 1,769, among whom there were 458 who prepared themselves for the profession of teacher of gymnastics. Some of the pupils came from Hanover, Hesse, Brunswick, Lippe-Detmold, Finland, and Hungary.

TEACHERS' SOCIETIES.

Since April, 1870, there has existed in Dresden a society of drawing-teachers, which has already held ten meetings, and discussed the whole subject in its various aspects. A peculiar institution is the Teachers' Fire Insurance Society, numbering 2,237 members. The capital of this society amounts to 2,109,610 thalers, and during the last year 5,704 thalers were paid. There are numerous other teachers' societies, for scientific purposes and for mutual relief.

EDUCATION OF IDIOTS.

The institution for idiots at Hubertsburg, which has been in existence for 25 years, has been very successful. During this period 221 persons were admitted, (168 boys and 53 girls,) of whom the greater majority have become useful citizens. The institution was opened with 10 boys, and numbers now 46 inmates, (33 boys and 13 girls,) between the ages of 6 and 17. The number of idiots, however, is greater than the institution can accommodate; for while in Saxony there is only one blind person to every 1,385 of the population, one deaf-mute to every 1,636, there is one idiot to every 497. The largest percentage of idiots (0.5 per cent.) is in the cities of Dresden, Leipzig, Chemnitz, and in the valleys of the Erzgebirge.

VITAL STATISTICS.

According to careful statistics, the total age of 100 teachers and 100 clergymen who died during the years 1861–'63 was 6,392 for the clergymen and 5,391 for the teachers, making the average age of a clergyman 63.92 years, and that of a teacher 53.91, (10.01

years less.) With regard to the ages at the time of death, they are grouped in the following manner:

Ages at time of death.	Clergymen.	Teachers.	Ages at time of death.	Clergymen.	Teachers.
Between 20 and 30	.....	8	Between 60 and 70	24	25
Between 30 and 40	2	15	Between 70 and 80	26	11
Between 40 and 50	12	14	Between 80 and 90	4	2
Between 50 and 60	32	25			

SCHAUMBURG-LIPPE.

(Constitutional Monarchy—Principality. Area, 212 square miles. Population, 32,051.)

Highest educational authority, THE PRESIDENT OF THE COUNCIL OF MINISTERS, (vacant.)

[No report has been received this year.]

SCHWARZBURG-RUDOLSTADT.

(Constitutional Monarchy—Principality. Area, 340 square miles. Population, 75,523.)

Minister of finance, ecclesiastical affairs, and public instruction, PRIVY COUNSELOR BARON J. A. KETELHODT.

EDUCATION IN THE CHAMBERS.

During the last session of the chambers, held at Rudolstadt, the majority, with regard to the relation between church and school, expressed the opinion that the church had no authority whatever over the public schools.

TEACHERS' CONFERENCE.

The general teachers' conference of Schwarzburg-Rudolstadt held its twenty-first annual session at Schwarzburg in July, 1871. Two subjects were especially discussed—the study of the German classics and poets in the public schools and in the teachers' seminaries as the best means of awakening a noble patriotism, and to develop mind and character; and the subject of punishments. On the first subject several enthusiastic speeches were made, and all the members were in favor of introducing these studies.

SCHWARZBURG-SONDERSHAUSEN.

(Constitutional Monarchy—Principality. Area, 318 square miles. Population, 67,191.)

Minister of justice, ecclesiastical affairs, and public instruction, PRIVY COUNSELOR G. BLEY.

TEACHERS' SALARIES.

In the last session of the Schwarzburg-Sondershausen chambers the government proposed an increase of teachers' salaries, which was passed, so that since January 1, 1872, the minimum salary of elementary teachers has been 275 thalers in the three principal cities, 250 in the smaller cities, and 200 in the rural districts. Every five years the salary is to be raised 25 thalers, till, after having taught 15 years, the salary is respectively 350, 325, 275 thalers, the maximum.

MEETING OF KINDERGARTEN-TEACHERS.

On the 28th September, 1871, a conference of kindergarten-teachers from all parts of Central Germany was held at Arnstadt. Rev. Steinacker spoke on Froebel's system as the "Preliminaries of peace between the parental home, the school, the infant-school, and the kindergarten."

WALDECK.

(Constitutional Monarchy—Principality. Area, 466 square miles. Population, 56,218.)

President of the council of public instruction, COUNCILOR G. GLEISNER.

TEACHERS' CONFERENCE.

The Teachers' Society of Waldeck held its annual meeting at Sachsenhausen during April, 1871. Twenty different subjects were discussed, and a progressive spirit manifested itself. All agreed that church and school must be separated; that the teacher should have the same privilege as all the other civil officers of the government; and that nothing should be more avoided by teachers than a mere mechanical method of instruction.

WÜRTEMBERG.

(Constitutional Monarchy—Kingdom. Area, 7,840 square miles. Population, 1,818,541.)

Minister of ecclesiastical affairs and public instruction, DR. VON GESSLER.

STATISTICS.

The number of elementary teachers is 3,671, viz, 2,474 Protestants and 1,197 Roman Catholics. The salaries vary between 700 and 180 florins. Most of the schools are very much crowded, and there is such a want of teachers that, although last year 113 teachers left the seminaries after having finished their studies, there were a great many vacancies.

TEACHERS' SOCIETIES.

The Würtemberg Teachers' Society held its annual meeting at Ludwigsburg in August, 1871. The chief subjects of discussion were: German education as it should be to correspond to the grandeur and glory of the new German empire, especially by making the teacher's position more honorable in society; the necessity of an increase of the salaries of teachers and the pensions to teachers' widows.

SUNDAY AND EVENING SCHOOLS.

Würtemberg was the first German state where such schools were established, and their number is now very large. Recently an ineffectual attempt was made to make attendance in the schools compulsory. As it is, attendance is entirely voluntary, a small school-fee is charged, and scholars who manifest a want of diligence or talent are discharged; but, nevertheless, these schools are all crowded to their utmost capacity.

SCHOOL-HYGIENE.

The ministry has published a decree, giving special sanitary regulations for schools. Each school must have a play-ground and gymnastic apparatus, and separate rooms for the two sexes; the length of the school-rooms must not exceed 12 meters, and the height must be at least 3.4 meters. Great care is recommended as to the paint used for walls and furniture, that it does not contain any poisonous matter. Earthenware stoves are recommended in preference to iron stoves. In every school there is to be a separate room for the teacher, and in larger schools a room for scientific collections. Every school-room must have a wash-bowl and towel and a cloak-room. Rooms, stair-cases, and entries must be swept daily, and scoured at least four times a year; there must be good light and ventilation; and the temperature of the school-room is never to be less than about 62 degrees. If in summer the thermometer shows 77 degrees in the shade during the forenoon, there is to be no school in the afternoon. The scholars should be afforded an opportunity of changing their position by letting them sit and stand alternately. The means of punishing is to be a thin switch, which must have the prescribed length of half a meter.

GERMAN EDUCATIONAL LITERATURE.

No material being at hand to give an accurate exhibit of the educational literature of Germany for the year 1871, an exhibit for the preceding year, 1870, is given. The number of educational works published during the year was 1,174. This number only includes text-books for schools and private study, books for children, and the history

of education, as well as works on special educational questions. According to subjects, the educational literature of 1870 is grouped in the following manner:

Subjects.	No. of works.	Subjects.	No. of works.
Music	384	Readers	37
Mathematics	132	Modern languages	33
Gymnastics	118	History of education, &c.	31
Natural sciences	80	German literature	25
History	76	Drawing	25
Geography	64	Penmanship	13
Religion	58	Total	1,174
Books for children	57		
German grammar	41		

SCHOOL-PROGRAMMES.

A peculiar feature of German educational literature are the school-programmes, published annually by the gymnasia and the real-schools. It is an ancient and time-honored custom, that every year the director or one of the professors writes a scientific essay on a subject chosen by himself. Many of these essays possess the highest literary merit, and the authors not infrequently publish a collection of their essays in book-form. Some of them are of considerable length, (upward of 100 closely-printed pages,) and they embrace the most varied subjects, as the following table for the year 1870 will show:

Subjects.	No. of essays.	Subjects.	No. of essays.
Philology	245	Philosophy	11
Education	208	Geography	7
History	76	History of art	4
Natural sciences	69	Bibliography	2
Mathematics	47		
Theology	18	Total	687

EDUCATIONAL JOURNALS AND PERIODICALS.

The number of educational journals and periodicals published in Germany is 67, viz, 62 Protestant and 5 Roman Catholic. Distributed according to states, they are grouped in the following manner:

States.	No. of journals.	States.	No. of journals.
Prussia	30	Saxe-Weimar	1
Saxony	15	Brunswick	1
Würtemberg	8	Hamburg	1
Bavaria	2	Oldenburg	1
Hesse	3	Alsace	1
Baden	2		
Reuss-Schleiz	2	Total	67

STATISTICS OF THE GERMAN UNIVERSITIES IN 1871–'72.

In the following table the statistics of the universities of the German empire are first given by themselves, and then the statistics of those universities in Switzerland, Austria, and Russia where German is exclusively used as the language of instruction, and which are justly considered as homesteads of German science and German culture.

UNIVERSITIES.	PROFESSORS.						STUDENTS.							
							Theology.							
	Ordinary.	Extraordinary.	Honorary.	Private, (Privat docenten.)	Tutors.	Total.	Protestant.	Catholic.	Law and political economy.	Medicine, surgery, and pharmacy. GREAT BRITAIN AND IRELAND.

(Constitutional Monarchy—Kingdom. Area, 20,879 square miles. Population, 31,817,108.)

Lord president of the council on education, EARL OF RIPON; *vice-president of the committee of the council on education*, WILLIAM EDWARD FORSTER.

I.—ENGLAND AND WALES.

(Population, 22,704,108.)

CODE (1872) OF MINUTES OF THE EDUCATION-DEPARTMENT.*

1. A sum of money is annually granted by Parliament "for public education in Great Britain."

2. This grant is administered by the education-department.

3. The object of the grant is to aid local exertion, under certain conditions, to maintain—

a. Elementary schools for children; and

b. Training-schools for teachers.

4. An elementary school is a school or department of a school at which elementary

*The education-department administers the schools in England, Wales, and Scotland.

education is the principal part of the education there given, and does not include any school or department of a school at which the ordinary payments, in respect of the instruction, from each scholar exceed ninepence a week.

5. Aid to maintain schools is given by annual grants to the managers, conditional upon the attendance and proficiency of the scholars, the qualifications of the teachers, and the state of the schools.

6. No grants are made to elementary schools which are not public elementary schools.

7. No grant is made in respect of any instruction in religious subjects.

8. Officers are employed to verify the fulfillment of the conditions on which grants are made, to collect information, and to report the results to the education-department.

9. These officers are inspectors appointed by Her Majesty, on the recommendation of the education-department, and persons appointed by the department, as occasion requires, in the capacity of acting inspectors, or inspectors' assistants.

10. No grant is paid except on a report from an inspector, showing that the conditions of the grant have been fulfilled. The inspector may delegate to an assistant the duty of examining into the attendance and proficiency of the scholars.

11. The education-department, at the time of agreeing to make grants to an elementary school, informs the managers in what month to look for the inspector's annual visit. This month remains the same from year to year, unless the department informs the managers of a change. Notice of the day of the inspector's annual visit is given beforehand to the managers.

12. An inspector may visit any public elementary school at any other time without notice.

13. Grants are issued to each elementary school only once per annum. The year for this purpose is reckoned as ending with the last day (inclusive) of the month preceding that fixed for the inspector's annual visit.

14. No undertaking should be commenced in general reliance upon aid from the parliamentary grant. An application for such aid should, in the first instance, be addressed to the secretary of the education-department, London. Full instructions are thereupon issued according to the particulars of the case.

15. The managers of a school must appoint a correspondent with the education-department, and must give notice of any change of correspondent. Teachers cannot act as managers of, or correspondents for, the schools in which they are employed.

16. After May 31, 1871, no grant shall be made to any elementary school which is not a public school, and no grant shall be made except in pursuance of a memorial duly signed and containing the information required by the education-department for enabling them to decide on the application.

ANNUAL GRANTS—PRELIMINARY CONDITIONS.

17. Before any grant is made to a school, the education-department must be satisfied that—

a. The school is conducted as a public elementary school, and no child is refused admission to the school on other than reasonable grounds.

b. The school is not carried on with a view to private emolument.

c. The school-premises are healthy, well lighted, drained, and ventilated, properly furnished, supplied with suitable offices, and contain in the principal school-room at least 80 cubic feet of internal space, and in the school-room and class-rooms at least 8 square feet of area for each child in average attendance.

d. The principal teacher is certificated, (article 43.)

Exception: Evening-schools may be taught by pupil-teachers who have completed their engagement with credit, (article 79.)

e. Notice is immediately given to the department of the date at which the teacher enters on the charge of the school, from which date the grant is computed.

f. The girls in the school are taught plain needle-work and cutting out as part of the ordinary course of instruction.

g. The infants, if any, attending the school are instructed suitably to their age, and in a manner not to interfere with the instruction of the older children.

h. Registers of admission and daily attendance and accounts of income and expenditure are accurately kept and duly audited, and all statistical returns and certificates of character (articles 67, 77, and 80) may be accepted as trustworthy.

i. Three persons have designated one of their number to sign the receipt for the grants on behalf of the school.

Exception: The treasurer of a school-board signs the receipt for grants to schools provided by the board.

18. The grant may be withheld if, on the inspector's report, there appears to be any serious *prima-facie* objection. A second inspection, wherein another inspector takes part, is made in every such instance; and if the grant be finally withheld, a special minute of the case is made and recorded.

GRANTS TO DAY-SCHOOLS.

19. The managers of a school which has met not less than 400 times, in the morning and afternoon, in the course of a year, as defined by article 13, may claim at the end of such year—

A. The sum of 6*s.* per scholar, according to the average number in attendance throughout the year, (article 26.)

B. For every scholar present on the day of examination who has attended not less than 250 morning or afternoon meetings of the school:

1. If above four and under seven years of age at the end of the year, article 13:
   a. 8*s.*; or
   b. 10*s.* if the infants are taught as a separate department by a certificated teacher of their own, in a room properly constructed and furnished for their instruction.
2. If more than 7 years of age 12*s.*, subject to examination, (article 28,) viz:
   4*s.* for passing in reading;
   4*s.* for passing in writing; and
   4*s.* for passing in arithmetic.

20. 150 attendances (article 23) qualify for examination:

a. Scholars attending school under any half-time act; and

b. Boys above 10 attending school in a rural district.

21. If the time-table of the school, in use throughout the year, has provided for one or more specific subjects of secular instruction beyond article 28,

A grant of 3*s.* per subject may be made for every day-scholar, presented in standards IV-VI, (article 28,) who passes a satisfactory examination in not more than two of such subjects.

No grant may be claimed under this article on account of any scholar who has been examined, in the same subject, within the preceding year, by the department of science and art.

GRANTS TO EVENING-SCHOOLS.

22. The managers of a school which has met not less than 80 times in the evening, in the course of a year, as defined by article 107, may claim:

a. The sum of 4*s.* per scholar, according to the average number in attendance throughout the year, (article 26.)

b. For every scholar who has attended not less than 50 evening-meetings of the school, 7*s.* 6*d.*, subject to examination, (article 28,) viz: 2*s.* 6*d.* for passing in reading, 2*s.* 6*d.* for passing in writing, and 2*s.* 6*d.* for passing in arithmetic.

CALCULATION OF ATTENDANCE.

23. Attendance at a morning or afternoon meeting may not be reckoned for any scholar who has been under instruction in secular subjects less than two hours, nor attendance at an evening-meeting for any scholar who has been under similar instruction less than one hour and a half.

24. Attendance of boys at drill, under a competent instructor, for not more than two hours a week, and 20 weeks in the year, may, in a day-school, be counted as school attendance.

25. Attendance may not be reckoned for any scholar above 18, or in a day-school under 3, or in an evening-school under 12 years of age.

26. The average number of scholars in attendance for any period is found by adding together the attendances of all the scholars for the same period, and dividing the sum by the number of times the school has met within the same period; the quotient is the average number in attendance.

27. In calculating the average number in attendance, the attendances of half-time scholars reckon for no more than those of other scholars.

Standards of examination.

28.	Standard I.	Standard II.	Standard III.	Standard IV.	Standard V.	Standard VI.
Reading	One of the narratives next in order after monosyllables in an elementary reading-book used in the school.	A short paragraph from an elementary reading-book.	A short paragraph from a more advanced reading-book.	A few lines of poetry or prose, at the choice of the inspector.	A short ordinary paragraph in a newspaper or other modern narrative.	To read with fluency and expression.
Writing	Copy in manuscript character a line of print, and write from dictation a few common words.	A sentence from the same book, slowly read once, and then dictated in single words.	A sentence slowly dictated once by a few words at a time from the same book.	A sentence slowly dictated once, by a few words at a time, from a reading-book, such as is used in the first class of the school.	Another short ordinary paragraph in a newspaper or other modern narrative, slowly dictated once by a few words at a time.	A short theme or letter or an easy paraphrase.
Arithmetic	Simple addition and subtraction of numbers of not more than four figures, and the multiplication-table to multiplication by six.	The multiplication-table, and any simple rule as far as short division inclusive.	Long division and compound rules, (money.)	Compound rules, (common weights and measures.)	Practice and bills of parcels.	Proportions and fractions, vulgar and decimal.

29. No scholar may be presented a second time for examination—
a. Under a lower standard; or
b. Under the same standard.
30. After March 31, 1873, no day-scholar above 9 years of age and no evening-scholar above 13 will be examined in standard I.
31. After March 31, 1874, no day-scholar above 9 years of age and no evening-scholar above 14 will be examined in standard II.

REDUCTION OF GRANT.

32. The grant is reduced—
a. In the year defined by article 13, by its excess above—
1. The income of the school from fees, rates, and subscriptions;
2. The rate of 15*s*. per scholar, according to the average number in attendance;
3. One-half the expenditure on the annual maintenance of the school.
b. By not less than one-tenth nor more than one-half in the whole, upon the inspector's report, for faults of instruction or discipline on the part of the teacher, or (after six months' notice) for failure on the part of the managers to remedy any such defect in the premises as seriously interferes with the efficiency of the school, or to provide proper furniture, books, maps, and other apparatus of elementary instruction. If the inspector at a visit of surprise, (article 12,) not less than six months after notice has been given of the requirements of the education-department, reports that they have not been carried into effect, a deduction may be made from the next grant to the school.
c. At the rate of £20 per year for every 40 scholars, after the first 20, of the average number in attendance, unless there has been during the year one pupil-teacher fulfilling the conditions of article 70, for every such 40 scholars. A certificated (article 43) assistant teacher, or an assistant fulfilling the conditions of article 79, is equivalent to two pupil-teachers. The forfeiture may be reduced from £20 to £10 if a pupil-teacher fails in examination but produces the prescribed certificates, (article 77.) This reduction of the forfeiture is made only for the same pupil-teacher, and not in successive years for the same school.
d. By 1*s*. per scholar, according to the average number in attendance throughout the year, unless vocal music forms a part of the ordinary course of instruction.
33. If the excess of scholars has arisen from increased attendance of children since the last settlement of the school-staff, (article 39,) the grant is not reduced under article 32.

SCHOOL-DIARY, OR LOG-BOOK.

34. In every school receiving annual grants, the managers must provide out of the school-funds, besides registers of attendance, (article 17,)
a. A diary, or log-book;
b. A portfolio to contain official letters, which should be numbered (1, 2, 3, &c.) in the order of their receipt.
35. The diary, or log-book, must be stoutly bound, and contain not less than 500 ruled pages.
36. The principal teacher must make, at least once a week, in the log-book, an entry which will specify ordinary progress and other facts concerning the school or its teachers, such as the dates of withdrawals, commencements of duty, cautions, illness, &c., which may require to be referred to at a future time, or may otherwise deserve to be recorded.
37. No reflections or opinions of a general character are to be entered in the log-book.
38. No entry once made in the log-book may be removed or altered otherwise than by a subsequent entry.
39. The summary of the inspector's report, and any remarks made upon it by the education-department, when communicated to the managers, must be copied *verbatim* in the log-book, with the names and standing of all teachers, to be continued on, or added to, or withdrawn from, the school-staff, according to the decision of the education-department upon the inspector's report. The correspondent of the managers must sign this entry, which settles the school-staff for the year.
40. The inspector will call for the log-book at every visit, and will report whether it appears to have been properly kept. He will specially refer to the entry made pursuant to article 39, and he will require to see entries accounting for any subsequent change in the school-staff. He will also note in the log-book every visit of surprise, making an entry of such particulars as require the attention of the managers.

TEACHERS REFERRED TO IN THE PRECEDING SECTIONS.

41. The recognized classes of teachers are:
a. Certificated teachers.
b. Pupil-teachers.
c. Assistant teachers.
42. Lay persons alone can be recognized as teachers in elementary schools.

CERTIFICATED TEACHERS.

43. Teachers, in order to obtain certificates, must be examined, (article 44,) and must undergo probation by actual service in school, (article 51.)

EXAMINATION.

44. Examinations are held in December of each year at the several training-schools under inspection, (article 100.)
45. A syllabus of the subjects of examination for male and female candidates, respectively, may be had on application to the education-department.
46. The names of teachers desiring to be examined must be notified by the managers of their schools to the education-department before the first day of October preceding the examination.
47. Candidates admissible to be examined for certificates must be—
a. Students who have resided for one year in training-schools under inspection; or,
b. Teachers of elementary schools, (article 4,) to which annual grants are or may be made, who are upward of 21 years of age, and have either—
1. Completed an engagement as pupil-teacher satisfactorily; or
2. Obtained a favorable report from an inspector.
48. Teachers attending the examination may, at their option, take the papers of the first or second year's students, (article 102.)
49. A list is published, showing the successful candidates of each year, whether students or acting teachers, arranged in four divisions.
50. The relative proficiency of the candidates according to examination is recorded upon their certificates.

PROBATION.

51. Candidates for certificates, after successfully passing their examination, must, as teachers continuously engaged in the same schools, obtain two favorable reports from an inspector, with an interval of one year (article 13) between them; and if the first of these reports be not preceded by a service of three months, at the least, since the examination, a third report, at an interval of one year after the second report, is required. If the second (or third) report is favorable, a certificate is issued.
52. Teachers under probation satisfy the conditions which require that schools shall be kept by certificated teachers.

CERTIFICATES.

53. Certificates are of three classes. No certificate is originally issued above the second class. The third (lowest) class includes special certificates for teachers of infants and of small schools.

CERTIFICATES OF THE FIRST AND OF THE SECOND CLASS.

54. Candidates who are placed by examination in any of the first three divisions (article 49) receive certificates of the second class, which can be raised to the first class by good service only.
55. Certificates of the second class remain in force for ten years from the date of their issue, after which interval they are open to revision according to the intermediate reports.

CERTIFICATES OF THE THIRD CLASS.

56. Candidates who are placed by examination in the fourth division (article 49) receive certificates of the third class.
57. Certificates of the third class do not entitle teachers to have the charge of pupil-teachers.
58. Certificates of the third class can be raised only by examination.

59. During the three years ending December, 1873, certificates of the third class may be granted without examination, upon the report of an inspector, to acting teachers who satisfy the following conditions:

1. They must, at the date of the inspector's report—
   a. Be above 35 years of age;
   b. Have been teachers of elementary schools for at least 10 years; and
   c. Present certificates of good character from the managers of their schools.
2. The inspector must report—
   a. That they are efficient teachers;
   b. That not less than 30 children who had been under instruction in their schools during the preceding six months were individually examined, (article 28;) and
   c. That at least 20 of the "passes" of these scholars in reading, writing, or arithmetic were made in the second or some higher standard.

59, (*a.*) In schools attended by infants only, (under 7 years of age,) 30 years will be accepted as the limit of age for the teacher, under article 59, (1, *a*,) and the conditions of article 59, (2, *b* and *c*) are not required to be fulfilled.

60. Pupil-teachers who have completed their engagement with credit may, upon special recommendation by the inspector, and upon consideration of their examination-papers, be provisionally certificated in the third class, for immediate service in charge of schools (article 4) which have an annual average attendance of less than 60 scholars.

61. After their 25th year of age (completed) their provisional certificates must have been exchanged for permanent certificates (article 43) or are *ipse facto* canceled.

62. The provisional certificate is confined to an entry of the pupil-teacher's name in a register kept by the education-department, and does not involve the issue of any certificate to the pupil-teacher.

FUTURE RATING OF EXISTING CERTIFICATES.

63. Existing certificates of the first or second class are rated as of the first class.

64. Existing certificates of the third class, or upper grade of the fourth class, and infant-school certificates of the first class, are rated as of the second class. Such certificates will be open to revision at the end of 10 years from the date of their issue or of their last revision.

65. Existing certificates of the lower grade of the fourth class, and infant-school certificates of the second class, are rated as of the third class.

66. The class of any certificates not yet issued will be fixed by articles 54 and 56.

REPORTS OF THE MANAGERS AND OF THE INSPECTOR.

67. The managers must annually state whether the teacher's character, conduct, and attention to duty have been satisfactory.

68. The inspector reports of each school visited by him whether it is efficient in organization, discipline, and instruction.

69. Certificates may, at any time, be recalled, suspended, or reduced, under articles 67 and 68.

PUPIL-TEACHERS.

70. Pupil-teachers are boys or girls employed to serve in a school on the following conditions, viz:

a. That the school is reported by the inspector to be—
   1. Under a duly-certificated teacher;
   2. Held in suitable premises;
   3. Well furnished and well supplied with books and apparatus;
   4. Properly organized and skillfully instructed;
   5. Under good discipline; and
   6. Likely to be maintained during the period of engagement;

b. That the pupil-teachers be not less than 13 years (completed) of age at the date of their engagement.

c. Be of the same sex as the certificated teacher under whom they serve; but in a mixed school-female pupil-teachers may serve under a master, and may receive instruction from him out of school-hours, on condition that some respectable woman, approved by the managers, be invariably present during the whole time that such instruction is being given.

d. Be presented to the inspector for examination at the time and place fixed by his notice, (article 11.)

e. Pass the examinations and produce the certificates specified above.

f. That the managers enter into an agreement in terms specially specified.

g. That not more than four pupil-teachers are engaged in the school for every certificated teacher serving in it.

71. The education-department is not a party to the engagement, and confines itself to ascertaining, on the admission of the pupil-teacher, and at the end of each year of the service—

a. Whether the prescribed examination is passed before the inspector; and

b. Whether the prescribed certificates are produced from the managers and teachers.

72. Whatever other questions arise upon the engagement may be referred to the education-department, (provided that all the parties agree, in writing, to be bound by the decision of the department as final,) but, otherwise, must be settled as in any other hiring or contract.

73. Vacancies in the office of pupil-teacher which occur in the course of any year must not be filled up until after the next examination by the inspector.

74. The candidate or candidates for such vacancies must be engaged in the mean time by the week only as monitors, and the memorandum of agreement will not be issued by the education-department to the managers until the inspector's report has been examined.

75. Temporary monitors, engaged by the week, for the supply of vacant pupil-teacherships, during a current year, satisfy article 32, *c*, provided—

a. That a sufficient number of candidates to complete the requisite proportion of teachers to scholars pass the next examination for admission (article 77) to permanent engagements; and

b. That the vacancies have been occasioned by causes which are accepted by the education-department as satisfactory.

76. Except in the cases provided for by article 75, each vacancy in a pupil-teachership during a current year works a forfeiture under article 32, *c*.

77. The qualifications and certificates required of candidates for admission, and of pupil-teachers in each year of their service, are regulated by special schedules.

PUPIL-TEACHERS WHO HAVE SUCCESSFULLY COMPLETED THEIR ENGAGEMENT.

78. At the close of their engagement, pupil-teachers are perfectly free in the choice of their employment. If they wish to continue in the work of education, they may become assistants in elementary schools, (article 79,) or may be examined for admission into a training-school, (article 91,) or may be provisionally certificated for immediate service in charge of small schools, (article 60.)

ASSISTANT TEACHERS.

79. Pupil-teachers who have completed their engagement with credit, and candidates for admission into training-schools who have passed with success (article 94) the examination referred to in article 91, may serve as assistants in schools in place of pupil-teachers, without being required to be annually examined.

80. Such assistants cease to fulfill the conditions of article 32, *c*, if at any time the inspector reports them to be inefficient teachers, or if they fail to produce from the managers and from the principal teacher of their school the same certificates of conduct, attention to duty, and obedience as are required from pupil-teachers.

81. A vacancy caused by the withdrawal of an assistant in the course of any school-year (article 13) may be supplied by the appointment of temporary monitors, pursuant to articles 74, 75, or of another assistant, qualified according to article 79.

82. Assistants make their own terms with the managers, both as to hours and wages.

a. Assistants are counted as part of the school-staff (article 39) from the date at which their appointments are notified to, and approved by, the education-department.

TRAINING-SCHOOLS.

83. A training-school includes—

a. A college for boarding, lodging, and instructing candidates for the office of teachers in elementary schools; and

b. A practicing-department, in which such candidates may learn the exercise of their position.

84. No grant is made to a training-school unless the education-department is satisfied with the premises, management, and staff.

GRANTS TO TRAINING-SCHOOLS.

85. Annual grants are made to the practicing-departments on the same conditions as to other public elementary schools.

86. Grants are placed to the credit of each college, of £100 for every master and of

£70 for every mistress, who, having been trained in such college during two years, has since December, 1862—

a. Completed the prescribed period of probation (article 51) and become qualified to receive a certificate as a teacher in a public elementary school or in a training-college; and

b. Been reported by the proper department in each case to have completed a like period of good service as an elementary teacher in the army, or in the royal navy, or (within Great Britain) in poor-law schools, certified industrial schools, or certified reformatories.

87. Teachers who have been trained for one year only may obtain certificates after probation (article 51) or may be reported by the proper department upon the same terms as others; and grants of half the amounts specified in article 86 may be placed to the credit of the colleges in which they are trained, provided—

a. They completed their training before January 1, 1864; or

b. Are teachers of infants having—

1. Received a complete and special course of training for that service in their colleges, which must have been previously recognized by the education-department as providing such a course; and
2. Undergone their probation in infant-schools.

88. Grants of half the amounts specified in article 86 may also be placed to the credit of their colleges on account of teachers trained during the years 1870, 1871, and 1872, who, having been admitted to a training-college under article 93, *b*, leave, with the consent of the authorities of such college, after one year's residence, to take charge of schools.

89. The annual grant to each college is paid out of the sums placed to its credit (articles 86 to 88) and must not exceed—

a. 75 per cent. of the expenditure of the college for the year, certified in such manner as their lordships may require;

b. £50 for each male and £35 for each female Queen's scholar (article 93) in residence for continuous training throughout the year for which it is being paid.

90. The annual grant to each college is paid as follows:

a. An installment of £12, male, or £8, female, is paid on 1st March, 1st June, and 1st September in respect of every Queen's scholar (article 96) in residence for continuous training throughout the year.

b. The balance is adjusted as soon as the college-accounts for the year have been closed, audited, and approved by the education-department.

ADMISSION INTO TRAINING-SCHOOLS.

91. An examination of candidates for admission into training-schools is annually held at each college in December, during the week following the examination for certificates, (article 100.)

92. The examination extends to the subjects required in the course of a pupil-teacher's engagement.

93. The candidates are selected and admitted to the examination by the authorities of each training-school on their own responsibility, subject to no other conditions on the part of the education-department than that the candidates—

a. Intend *bona fide* to adopt and follow the profession of teacher in schools fulfilling the conditions of article 86, *a* or *b*;

b. Having been pupil-teachers, have successfully completed their engagement; or,

c. Not having been pupil-teachers, will be more than 18 years of age on 1st January next following the date of the examination.

94. The successful candidates are arranged in two classes in order of merit.

95. The authorities of each training-school may propose to the education-department, for admission, any candidate declared to be admissible pursuant to article 94.

96. Such candidates, when admitted, are termed *Queen's scholars.*

97. Before candidates are admitted—

a. The medical officer of the training-school must certify the state of their health to be satisfactory, and that they are free from serious bodily defect or deformity; and

b. They must sign a declaration signifying their intention, conformably to article, 93 *a.*

98. The authorities of each college settle their own terms of admission.

99. Upon proof by the authorities of any college that candidates have not fulfilled the conditions signed by them on admission into the college, the education-department will refuse to grant teachers' certificates (article 53) to such candidates, or to admit them to probation for certificates, (article 51.)

EXAMINATION OF STUDENTS IN TRAINING-SCHOOLS.

100. An examination of the resident students is held in December at the several colleges. The day fixed for the commencement of this examination is printed on the syllabus (article 45) from year to year.

101. No students may be presented for examination except such as, at the date of their admission, satisfied article 93, and have been resident throughout the whole year. No such students may be left out.

102. The students have a different examination according as they are males or females or are at the end of the first or second year of residence.

103. The first year's syllabus for females includes special subjects for the teachers of infants. Candidates who pass in these subjects, and complete their probation (article 51) in schools for infants, receive special mention thereof (*stamps*) on their certificates.

104. Students who pass successfully through two years of training receive special mention thereof (*stamp*) on their certificates.

105. Students who fall into the fourth division at the end of the first year's residence are required to take up the first year's subjects again at the end of their second year.

EVENING-SCHOLARS.

106. The managers of any school to which annual inspection has already been promised (article 11) may apply, in writing, before the 1st February, to the inspector of the district for an examination of their evening-scholars, (article 22.)

107. Only one examination is held per annum of evening-scholars in the same school, and it may be held on any day, between the 1st March and 30th April, that may be arranged with the inspector, provided that the school has met the required number of times (article 22) since the date of the last examination.

108. If the evening-school is connected with a day-school in receipt of annual grants, the grant for the examination of the evening-scholars is paid as part of the next annual grant to the whole school, (article 13.)

109. If the evening-school is not connected with a day-school in receipt of annual grants, the grant is paid as soon as possible after the 30th April, at which date, in such cases, the evening-school year is considered to end.

110. The inspector may make arrangements for the examination, at some convenient center, of the evening-scholars of several schools.

111. A separate examination will not be held for any school unless twenty scholars are to be presented; they can be examined only at a collective examination, (article 110,) or at the same time with the day-scholars.

112. The inspector may either hold the examination himself, or intrust it to an assistant approved by the department.

REVISION OF THE CODE.

113. The education-department, as occasion requires, may cancel or modify articles of the code, or may establish new articles, but may not take any action thereon until the same shall have been submitted to Parliament, and shall have lain on the table of both houses within one calendar-month from the meeting of Parliament.

II.—SCOTLAND.

(Population, 3,358,613.)

CHILDREN IN RECEIPT OF EDUCATION.

At the census of 1861, a return was procured of the number of children from 5 to 15 years of age *attending school*; but, partly from the working of the act itself, partly, also, from the directions in the householders' schedule, the return procured was found to give comparatively little information from which practical results could be deduced. All this was amended in 1871, the act being drawn up so as to bring out the points which were embodied in the Scottish education-commissioners' report of 1867.

SCOTTISH EDUCATION-COMMISSIONERS' REMARKS REGARDING AGE OF CHILDREN ATTENDING SCHOOL.

The commissioners remark: "Any attempt at school-legislation must fail unless legislators take into account the period of life which can be spared for educational purposes. From these facts it appears that in Scotland education does not begin much

earlier than 6 years. It has already been observed that comparatively few children remain at school after 12 years of age, and the question arises whether school-attendance can be prolonged beyond this period. It may be assumed, therefore, that a large majority of the scholars attend school for some time between the ages of 6 and 12."

INQUIRY LIMITED TO CHILDREN BETWEEN FIVE AND THIRTEEN YEARS OF AGE.

"The census-act of 1871, therefore, very properly directed that when the householder filled up the other particulars required by the act, he should also state whether any, and how many, of such persons, being of the age from 5 to 13 years, were in regular attendance at school, or were in the receipt of education at home under tutors and governesses.' As the instructions as to ages printed in the householders' schedules were to the effect that the age should be entered as at last birthday, every child was entered in the education-column whose age was above 5 years last birthday, up to and including all those who were entered as 12 years of age last birthday. This excluded all those who had completed their thirteenth year. From the circumstances of the ages of children entered in the education-column being different from those required by the list of 1861, no comparison is possible between the education-returns of 1861 and 1871."

NUMBER OF CHILDREN FIVE TO THIRTEEN YEARS OF AGE RECEIVING EDUCATION, AND PROPORTION TO POPULATION.

"When the census was taken in 1871, it was found that in Scotland, out of a total population of 3,360,818 persons, 494,860 children of from 5 to 13 years of age were in receipt of education. This gives what may be considered the high proportion of 14.72 per cent. of the population in the receipt of education even at these early years. We cannot yet tell the total number of persons at all ages who are in the receipt of education; but in 1861 they amounted to 15.4 per cent. of the total population; and from the numbers above ascertained the total proportion of scholars in 1871 will probably be above that of 1861. The above numbers and proportions, therefore, for 1871, though not including any who are in receipt of the higher branches of education, may be favorably compared with the educational statistics of even the best-educated nation in Europe—the German empire. Thus, in the whole German empire, including all their schools, gymnasia, and universities, it was found that 15 per cent. of the population were in the receipt of education, rising to 17 per cent. in Brunswick, Saxony, Oldenburg, and the Saxe duchies, but falling to 12.6 per cent. in Bavaria, and to 12 per cent. in Mecklenburg. Taking it, therefore, for granted that the mere proportion of children in the receipt of education in Scotland is satisfactory, let us look at the proportion in the different counties, and see whether the conclusions to be drawn from them at all correspond with those arrived at in Germany."

PROPORTION OF CHILDREN FIVE TO THIRTEEN YEARS OF AGE RECEIVING EDUCATION IN THE SEVERAL COUNTIES.

"Of all the counties of Scotland, the insular county of Shetland had the lowest proportion of children in the receipt of education, viz, 12.03 per cent. Seven counties, (Lanark, Renfrew, Nairn, Dumbarton, Inverness, Ross and Cromarty, and Bute) had above 13 and under 14 per cent. of their children at the ages of 5 to 13 in the receipt of education. Six counties (Sutherland, Edinburgh, Forfar, Orkney, Selkirk, and Argyle,) had above 14 and under 15 per cent. of children in the receipt of education. Six counties (Wigtoun, Ayr, Perth, Peebles, Stirling, and Kinross) had above 15 and under 16 per cent. of children in the receipt of education. Eleven counties (Roxburgh, Caithness, Berwick, Kincardine, Haddington, Fife, Aberdeen, Dumfries, Kirkcudbright, Clackmannan, and Elgin) had above 16 and under 17 per cent. of children in the receipt of education. Two counties alone (Banff and Linlithgow) had above 17 per cent. of children at the ages specified in the receipt of education.

"Unless we know something positive as to the religious denominations of the people, it would be vain to attempt to draw any positive conclusions from the above statistics. The educational statistics of the German empire and of the nations of Europe have clearly shown that just in proportion to the number of Protestants in the population is a greater proportion of the children in the receipt of education, and that that education is of a much higher class than that supplied to or by Roman Catholics; while in purely Roman Catholic countries, such as Austria and Italy, education is discouraged by the priesthood, is of the most elementary and imperfect description, and often little better than a teaching of the church's dogmas. Though we have not the means of showing it, seeing that the government did not insist on every one returning in the householders' schedule the name of the religious denomination to which he or she belonged, it cannot be doubted that religious sect has much to do even with the proportion of children in the receipt of education in Scotland."

PROPORTION LOWEST WHERE ROMAN CATHOLICS MOST NUMEROUS.

"Of our native population it is believed that the county of Inverness contains the highest proportion of Roman Catholics, and it certainly seems corroborative of the continental educational conclusions to find that it is one of the counties of Scotland which has the smallest proportion of children in the receipt of education.

"But several of our counties contain a very large proportion of Roman Catholic Irish; and they also to a great extent corroborate the continental educational statistics. Thus, Lanark in 1861 had 14.5 per cent., Renfrew 14.7 per cent., and Dumbarton 11.9 per cent. of their populations composed of persons born in Ireland; and these are other three of the counties of Scotland which contain the smallest proportion of children in the receipt of education. We do not yet know the proportion of Irish in these counties for 1871, but it was probably larger than in 1861.

"It is deeply to be regretted that we have not the means of tracing the influence of religious denominations in the various counties of Scotland. The most important question of the present day is the education of the rising generation; but here, when much light might have been thrown on it, by comparing the proportion of children in the receipt of education with that of the various religious denominations in each county, we can do no more than gather whatever information we may obtain from other sources. Some light, however, may be thrown on this subject by taking the proportion of men and of women belonging to the different religious denominations who, when they were married, were able to sign their names in the marriage-register. The following table, prepared for the next report of the registrar-general on the marriages in Scotland, discloses a state of matters well worthy of the serious consideration of all thinking men."

PROPORTION OF DIFFERENT RELIGIOUS DENOMINATIONS ABLE TO SIGN THEIR NAMES IN THE MARRIAGE-REGISTERS.

"By this table it appears that of persons married according to the rites of the Established Church, 7 per cent. of the men and 16½ per cent. of the women, not being able to write their names, were obliged to sign by appending a mark. On the other hand, of the persons married according to the rites of the Roman Catholic Church, so few were able to write their names that 46 per cent. of the men and 16.7 per cent. of the women who married were obliged to sign the register by a mark. Few as the Episcopalians are in Scotland, it is seen that 9.7 per cent. of the men and 20.9 per cent. of the women, not being able to write, were obliged to sign by a mark; while of all the Protestant sects, the United Presbyterians showed the highest amount of elementary education in so far as this test can indicate such a fact, for only 3.8 per cent. of the men and 11.8 per cent. of the women signed by a mark."

The full details will be found in the following table:

Religious denominations.	Total marriages.	Signed by mark.		Proportion in every 100 marriages who signed by mark.	
		Men.	Women.	Men.	Women.
Established Church	9,761	687	1,614	7.04	16.53
Free Church	5,095	341	800	6.69	15.70
United Presbyterians	3,277	126	388	3.84	11.84
Episcopal	450	44	94	9.78	20.93
Roman Catholic	2,043	941	1,261	46.06	61.72
Other denominations	1,393	86	246	6.17	17.65
Denominations not stated	56	7	11	12.50	20.10
Irregular marriages	69	1	7	1.45	10.14

"To ascertain, however, the true proportion of children between certain ages who are in the receipt of education, it is not sufficient to show what proportion they constitute of the total population, but what proportion of the children who are at these ages are actually in the receipt of education."

The abstracts were sufficiently advanced to give the information as contained in the following tables:

Total number of children from 5 to 13 years of age, and the proportion of such in the receipt of education, 1871.

Total population	3,360,018
Total number of children 5 to 13 years of age	629,235
Percentage of children 5 to 13 years of age to total population	18.72
Number of children 5 to 13 years of age in receipt of education	494,860

Percentage of children 5 to 13 years of age in receipt of education to total children at same ages	78.64
Percentage not in receipt of education	21.36
Percentage of children 5 to 13 years of age in receipt of education to total population	14.72

WHETHER THE EDUCATION OF CHILDREN HAS ADVANCED SINCE 1861.

"It is always of importance to ascertain whether we are advancing or retrograding in the matter of education. Unfortunately for strict comparison, the educational statistics of 1861 were taken up at different ages from those of 1871, including two years more of the life of the children, viz, from 5 to 15 years. They thus include the number of children from 13 to 15 years of age who were not included in the educational returns of the census of 1871. Still, though not rigidly comparable, they may be compared in a general way, and show in a very favorable light the educational statistics of 1871."

Educational statistics of Scotland, 1861.

Total population	3,062,294
Total number of children 5 to 15 years of age	685,912
Percentage of children 5 to 15 years of age to total population	22.40
Number of children 5 to 15 years of age in receipt of education	439,388
Percentage of children 5 to 15 years of age in receipt of education to total of children at same ages	64.06
Percentage not in receipt of education	35.94
Percentage of children 5 to 15 years of age in receipt of education to total population	14.34

"When the number in receipt of education is compared with the number of children actually living at the same age, the comparison in favor of 1871 is still more satisfactory. In 1861, of the children between 5 and 15 years of age, only 64.06 per cent. were in the receipt of education, while 35.94 per cent. did not appear to be receiving any instruction. But in 1871, of the children between the ages of 5 and 13 years, 78.64 per cent. were in the receipt of education, while only 21.36 appeared to be receiving no instruction."

Proportion of children from 5 to 13 years of age in the several counties who were in the receipt of education.

III.—IRELAND.

(Population, 5,402,759.)

PROGRESS OF EDUCATION FROM 1861–'71.

The commissioners of national education in Ireland have just issued their report; and if the national-school system in Ireland can be estimated merely by the number of children on the rolls, according to the method of enumeration officially adopted, then its success may be said to be great.

The commissioners consider, in the first place, the change that has been wrought in the interest felt by the Irish in educational matters between the years 1861 and 1871. In 1861 the population of Ireland, we are told, was found to be 5,799,000, and the children on the national-school rolls 803,364; in 1871 the population had declined, being then only 5,402,759, but the enrolled children had increased as much as 23 per cent.; they were enumerated as 2,021,700. In 1861, 14 per cent., or very nearly one in seven of the population, were on the school-roll; in 1871 the ratio had risen to 19 per cent., or nearly to one in five of the population. The commissioners thus strongly mark the progress made. But the average number of children under daily instruction and the number of children on the rolls are two entirely different things. The average attendance in 1871, we are informed, was 363,850, or little more than one-third of the children enrolled. The commissioners admit, however, that their system of enrollment has a tendency to exaggerate the score somewhat.

EDUCATION IN THE DIFFERENT PROVINCES OF IRELAND.

Taking the four provinces of Ireland, we find that in Munster the average daily attendances are 40 per cent. on the enrollments; in Connaught they only amount to 31 per cent.; the averages in Ulster and Leinster being between the two.

RELIGIOUS PERSUASION OF SCHOLARS AND TEACHERS.

Considerable care is taken by the commissioners to show the religious persuasion of both scholars and teachers. Roman Catholic pupils are more than fourfold those of all the other denominations put together, and even in Ulster, the province in which Protestantism holds the greatest sway in Ireland, the Roman Catholic pupils outnumber all the scholars of other denominations. The question of a national system of elementary education has been so far successfully grappled with, that we find that no less than 3,948 out of 6,914, or considerably more than one-half the schools, are mixed schools, where Protestant and Roman Catholic children mingle. The majority of these so-called "mixed" schools are under Roman Catholic teachers; more than one-fourth of them are under Protestant teachers exclusively. It is a noticeable fact that, using round numbers, 27,000 Protestant children are under Roman Catholic teachers, and 28,000 Roman Catholic children are under Protestant teachers; and that in the schools where the teachers belong to the two denominations the number of children is not very unequally divided, the majority being Protestant. Mixed schools show the largest percentage in Protestant Ulster; the smallest in Munster, in the latter province the proportion not being one-half what it is in the former. In what numbers the Protestant and the Roman Catholic children frequent the different mixed schools is exhibited by the following synopsis: (*a.*) Roman Catholic teachers exclusively, instructing 26,863 Protestant and 364,347 Roman Catholic pupils; (*b.*) Protestant teachers exclusively, instructing 126,785 Protestant and 28,285 Roman Catholic pupils; (*c.*) Protestant and Roman Catholic teachers conjointly, instructing 15,397 Protestant and 12,119 Roman Catholic pupils.

Of the statistical tables in the report we give the following, as being of special interest:

Religious denominations of the scholars in the national schools.

Provinces.	Religious denominations.				Total number of pupils returned for year ended Dec. 31, 1871.
	Established Church.	Roman Catholic.	Presbyterian.	Other persuasions.

AGRICULTURAL-SCHOOL FARMS.

The total number of school-farms in connection with the national system of education, on the 31st December, 1871, was 165, of which 22 were school-farms of the first class, under the exclusive management of the national board of school commissioners, and 14 were school-farms of the first class, under local management. Of the remaining number, 115 were ordinary school-farms, and 14 were school-gardens, one of the latter being under the management of the board.

WORK-HOUSE SCHOOLS AND ATTENDANCE.

The number of work-house schools in connection with the board, on the 31st December, 1871, was 148. Of these schools 35 are in Ulster, 49 in Munster, 35 in Leinster, and 29 in Connaught. The total number of pupils appearing on the rolls of these 148 work-house schools for the year ending December, 1871, was 15,798, and the average daily attendance 7,681.

DISTRICT AND MINOR MODEL-SCHOOLS.

The number of district and minor model-schools in operation at the end of the year was 26; this number is exclusive of the model-schools in the metropolitan district. These schools continue to maintain their high character. The total number of pupils on the rolls of these schools for the year ended the 31st of December, 1871, was 19,121, and the average daily attendance 8,595. The number for the year 1870 was 17,700 on the rolls, and the average daily attendance 8,162.

Of the 19,121 pupils on the rolls of the metropolitan and the district and minor model-schools for the year ended December 31, 1871, 6,505 were of the Established Church, 5,932 were Roman Catholics, 5,342 were Presbyterians, and 1,342 belonged to other religious persuasions.

GREECE.

(Constitutional Monarchy—Kingdom. Area, 19,941 square miles. Population, 1,457,894.)

Minister of public instruction, A. PETMESAS.

UNIVERSITY OF ATHENS.

According to the "Revue de l'instruction publique," the University of Athens has grown very rapidly. It was founded in the year 1835, with 35 students, while the number last year was 1,205. There are 16 gymnasia to prepare young men for the university.

ELEMENTARY SCHOOLS.

The number of elementary schools is constantly increasing, but it is safe to say that of the 240,000 children of school-age scarcely one-third attend school. The first school for girls (the *Arakion*) was established in 1835, and later, through the aid of an association, became a normal school for female teachers. Private individuals have done a great deal for education, by erecting school-houses and museums, and by donating collections of books and apparatus. Thus a butcher at Athens, John Barikaz, a native of Epirus, testated 250,000 francs for the Athens University.

CATHOLIC SCHOOLS ON THE IONIAN ISLANDS.

The question concerning the Catholic schools on the Ionian Islands has been solved favorably to the Greek government and the laws of the country. The Roman Catholic bishop of Corfu demanded the same privileges for the Catholic schools which they had enjoyed under the British protectorate. The Greek government could not yield to these demands, and after some struggling the bishop was obliged to submit. Since that time all the schools directed by Jesuits, Sisters of Mercy, or some other religious order, are under the supervision of the government.

DEATH OF MINISTER CHRISTOPULOS.

In April, 1870, Christopulos, minister of foreign affairs, died at Athens. His death was caused by a sad mistake of his nurse, who, instead of his medicine, gave him a strong dose of laudanum. Greece owes much to this man on account of the improvements in church and school which he introduced while minister of public instruction in 1855. He died poor, but highly respected as an honest and talented man, who was highly esteemed even by his political enemies.

RECENT STATISTICS.

From the Greek government, the Greek census of 1870, published at Athens in 1872, has been received at the Bureau of Education. Greece is divided into 13 departments, viz: 1. Attica and Bœotia; 2. Eubœa; 3. Phiotis and Phocis; 4. Acarnania and Ætolia; 5. Achaia and Elis; 6. Arcadia; 7. Laconia; 8. Messenia; 9. Argolis and Corinth; 10. Cyclades; 11. Corfu; 12. Cephalonia; 13. Zante. These departments are subdivided into provinces to the number of 59, and these provinces are again subdivided into communes to the number of 351.

The following are the educational statistics contained in this census:

Statistics of public schools.

Provinces.	Scholars.			Teachers.			Public schools.			Population.
	Boys.	Girls.	Total.	Male.	Female.	Total.	For boys.	For girls.	Total.

ITALY.

(Constitutional Monarchy—Kingdom. Area, 103,675 square miles. Population, 25,944,543.)

Minister of public instruction, SCIALOJA.

REPORT OF THE LATE MINISTER OF PUBLIC INSTRUCTION, C. CORRENTI.

Through the kindness of the Italian legation at Washington, the annual report of the Italian minister of public instruction for 1871–'72 has been received. It is a handsome quarto volume of 597 pages, printed at Rome, the new capital of the kingdom of Italy. It is admirably arranged, and might well serve as a model for reports of this kind. The following statistics are gathered from it:

THE MINISTRY OF PUBLIC INSTRUCTION.

The ministry of public instruction was created by royal decree of November 30, 1847, at that time of course only for the kingdom of Sardinia. Victor Emanuel, on the 17th of March, 1861, declared himself King of Italy, and the first minister of public instruction of the new kingdom was Count Mamiani della Rovere, who, however, resigned on the 22d March, 1861, and was followed by Professor de Sanctis; since that time ten different persons have held this office, the last of these being C. Correnti, who, in July, 1872, was followed by Scialoja. The ministry employs, including the minister, 101 clerks and officials, and has six divisions or bureaus; the first is the financial bureau, through which the payments to all the institutions dependent on the ministry are made; the second has the administration, and gathers the statistics of all the institutions for the fine arts and antiquities, the musical institutions, the libraries, archives, the scientific and literary academies; the third has the superior instruction, universities, schools for engineers, schools for veterinary surgery, and the astronomical observatories; the fourth the institutions for secondary instruction; the fifth the institutions for primary instruction; and the sixth the auditor's office, through which also all communications to and from the royal court of accounts are transmitted. There is no lack of door-keepers in the ministry, their number being 13.

The minister is assisted in the exercise of his functions by the superior council of public instruction, of which he is the president, and whose members are appointed by the King at the suggestion of the minister. They have only advisory powers; but, as they are all men of science, all new measures are discussed in this council, are then put in shape in the bureaus of the university, are from there transmitted to the Parliament, and, if passed and sanctioned by the King, are promulgated by the minister.

An interesting feature of the report is a chronological table of all the official acts concerning public instruction. From May 16, 1871, to May 9, 1872, 84 decrees were promulgated by the minister.

SCHOOL-FINANCES.

The report of the minister contains a detailed account of the annual governmental expenditure for educational purposes, of which the following is the recapitulation:

Objects of expenditure.	Amount.
	* *Lire.*
I. Ordinary expenses:	
Central administration	359, 500
Provincial administration	535, 000
Superior instruction	6, 227, 633
Archives	230, 551
Scientific and literary academics	879, 638
Fine arts	2, 070, 341
Secondary instruction	5, 098, 034
Primary instruction	3, 167, 388
Sundries	142, 624
Total	18, 710, 709
II. Extraordinary expenses	446, 579
Grand total expended by the government	†19, 157, 288

* One lira = 19 cents. † Equal to $3,639,884.74, gold.

PROVINCIAL ADMINISTRATION.

With the exceptions of the institutions for superior instruction, which range directly under the ministry, each province has its own provincial administration, composed of the prefect of the province, the school-superintendent appointed by the minister, and six counselors, two of whom are appointed by the minister, two by the provincial chambers, and two by the municipal council of the capital of the province. Each province is subdivided into districts, each of which has its inspector.

SPECIAL FEATURES.

Festival days commemorative of famous Italians.—By royal decree of March 4, 1865, festival days, commemorative of famous Italians, have been appointed, on which days orations on these men are delivered by a professor of the lyceum. The list is changed every year. Thus, during the last year, festivals were celebrated in memory of Silvio Pellico, Giuseppe Giusti, Torquato Tasso, Marco Polo, Giocomo Leopardi, Galileo Galilei, Alfieri, &c.

Societies for the study of Italian history.—But a few years ago Italy was divided into different kingdoms, duchies, and principalities, which, except the language, had no common interests. After Italy had become a kingdom and all Italian-speaking nations had been united under the scepter of Victor Emanuel, with Rome, the Eternal City, as its capital, it was deemed advisable to form societies for the study of Italian history, in order to strengthen and intensify the national feeling in opposition to the many particularistic tendencies. These societies, nine in number, do not confine themselves to national history, but also make local history the subject of their investigation. They collect documents, publish pamphlets, and by lectures and journals endeavor to spread a knowledge of the Italian history.

STATISTICS.

1.—SUPERIOR INSTRUCTION.

The institutions comprised under this head are: 21 universities; the Royal Institution for Superior Practical Studies, at Florence; the Academy of Sciences and Literature, at Milan; 2 schools of engineering, at Turin and Naples; the Superior Technical School, at Milan; the Superior Normal School, at Pisa; and 3 schools of veterinary surgery, at Milan, Naples, and Turin; 3 astronomical and meteorological observatories, (independent of the observatories connected with universities,) at Milan, Naples, Forli, and Venice—total, 33 institutions, with 8,688 students.

3.—PRIMARY SCHOOLS.

The most recent statistics are those of 1870–'71, which are given below:
Number of public schools, 32,782, (17,749 for boys and 12,099 for girls.)
Number of private schools, 6,876, (2,966 for boys and 3,007 for girls.)
Total number of schools, 39,658, (20,715 for boys and 15,106 for girls.)
Number of scholars in public schools, 1,458,604, (843,704 boys and 614,900 girls.)
Number of scholars in private schools, 146,404, (64,898 boys and 81,506 girls.)
Total number of scholars, 1,608,008, (908,602 boys and 696,406 girls.)
Number of teachers in public schools, 33,290, (19,003 males and 14,287 females.)
Number of teachers in private schools, 7,684, (3,424 males and 4,260 females.)
Total number of teachers, 40,974, (22,427 males and 18,547 females.)
Total expenditure for primary schools, 19,555,095 lire.
Number of schools still wanting, 6,718.
Number of royal normal schools, 47, (21 for males, 25 for females, and 1 for both sexes.)
Number of private normal schools, 19.
Number of private female schools of a higher grade, 158.
Number of deaf-mute institutes, 20.

LIBRARIES.

Total number of public libraries, including university, lyceum, gymnasium, and former convent libraries, 687. The number of volumes in these libraries is not given, but there are statistics of 29 of the most important libraries, showing the number of regular readers and the character of the books read.

Number of daily readers in 29 libraries, 657,156.

Number of weekly readers, (*i. e.* taking out books by the week,) 100,578. Total number of readers, 757,734.

The books read were distributed as follows: Theology, 36,380 volumes; natural sciences, 95,302; mathematical sciences, 75,115; medical sciences, 92,229; law, 118,975; statistics, 43,363; history and biography, 125,507; philosophy and social science, 54,036; geography and travels, 46,465; technology, 18,599; fine arts, 49,037; literature and philology, 181,981; education, 16,229; romances and novels, 50,440; pamphlets, periodicals, and sundries, 113,468.

Total number of works read in 1871, 1,098,104, [1,057,230.]

ACADEMIES AND SCHOOLS OF THE FINE ARTS AND OF MUSIC.

Academies of the fine arts, 21.
Schools of drawing and the fine arts, 18.
Academies or conservatories of music, 7.
Schools of music, 44.

MUSEUMS.

The total number of museums (containing paintings, sculpture, and antiquities) in the whole kingdom of Italy is 150, many of which are world-renowned, such as the museums in Rome, Florence, Naples, Venice, and many other cities. There are forty-four societies for the preservation of works of art and antiquities and for the encouragement of the fine arts.

ACADEMIES OF SCIENCE, LITERATURE, ETC.

These are societies for the furtherance of scientific, literary, &c., investigations, which hold sessions at regular stated times and publish reports or journals of their proceedings. There are eighty-eight such academies devoted to literature, the fine arts, agriculture, horticulture, medicine, philosophy, philology, music, geography, history, political economy, and natural sciences. Among the members there are many distinguished foreign scientists and artists.

ARCHIVES.

There is a general superintendent of archives, of which there are nine, containing the most invaluable documents regarding Italian history.

COURSES OF STUDY.

1. *In the secondary schools.*—The gymnasia have 5 classes, and the course of instruction embraces Greek, Latin, Italian, history, geography, arithmetic and geometry, and gymnastics.

The lyceums have three classes, and the course of instruction embraces Greek, Latin,

and Italian literature, history and geography, philosophy, mathematics, natural philosophy, chemistry and natural history, and gymnastics.

The technical schools correspond in some degree to the German real-schools, and prepare pupils for an industrial, commercial, or mechanical career. There are two kinds, higher and lower; most of them have three classes, and the course of instruction embraces penmanship, French, Italian, history, geography, arithmetic, book-keeping, drawing, elements of mathematics, mechanics, and natural sciences.

2. *In the normal schools.*—The normal schools have three classes, and the course of instruction embraces religion, morals, pedagogics, Italian, grammar and composition, history and geography of Italy, arithmetic and elements of geometry, elements of physical and natural sciences, hygiene, penmanship, linear drawing, vocal music, gymnastics, and military exercises.

CLOSING OF CONVENTS.

In order to give room to the government departments, at their transfer from Florence to Rome, the King of Italy ordered the closing of a number of convents in the new capital. An interest of 5 per cent. will be paid to the church on the real estate, and the monks and nuns will be transferred to other convents.

RE-OPENING OF THE ROMAN UNIVERSITY.

November 17, 1870, the Roman University was solemnly re-opened in the presence of a highly-educated and appreciative public. The marvelous changes that have taken place in Italy during the last few years gave extraordinary significance to this solemnity, which was very effectively dwelt on by Professor Moriggia, in his inaugural speech. In place of the dark mediæval spirit which till quite recently pervaded this university, and hindered every progressive movement, free science is to be cultivated and a new field opened to the Roman youth.

LYCEUM AND GYMNASIUM AT ROME.

Immediately after taking possession of the Papal States, the Italian government established a lyceum, a gymnasium, and an industrial school in the city of Rome. These institutions had scarcely been opened when 656 persons applied for admission, who had previous to this studied at the so-called "technical schools," which, however, were in a very miserable condition.

SEPARATION OF CHURCH AND STATE.

Already in April, 1870, news came from Florence that the minister of justice announced to the senate that the government intended to lay before the chambers a new law, looking toward a complete separation between church and state. The speech from the throne at the opening of the Italian Parliament in November of the same year alluded to this separation, and laid special stress on the fact that the new legislation would regulate the relations of religious bodies to the state, but would leave those religious institutions untouched which belonged to the government of the whole church. All this will not remain without influence on Italian education, and there will be no law forbidding the establishment of Protestant schools.

FIRST PROTESTANT CHURCH IN ROME.

On the 12th January last the first Protestant church was opened in Rome. Over its entrance is written: "The Free Church in the Free State."

ABOLISHING RELIGIOUS INSTRUCTION IN ALESSANDRIA.

In consequence of a petition signed by three hundred citizens, the municipal council of Alessandria resolved to urge the government to abolish religious instruction entirely in the elementary schools, and instead of it to introduce instruction in morals and the rights and duties of citizens.

PREVAILING IGNORANCE.

The commissioners intrusted with a revision of the Italian system of education, in their tour of examinations through the country, found in most places a mere mechanical method of instruction, and in consequence the most glaring ignorance. Counselor Brioschi found young people of from 15 to 18 years of age who did not know what the word "geography" meant, although they assured him that they had studied geog-

raphy for two years. Some called in their answers Sardinia and Sicily cities, and Milan the capital of Sicily. In history none of the scholars could answer properly. Some called Brutus a tyrant; others, Dante a French poet; others, again, Petrarca a lady. One scholar called Columbus an apostle; another thought him the Holy Ghost, evidently confounding it with "columbajo," the dove.

STATISTICS OF ILLITERACY.

More than one-half of the Italian soldiers are illiterate. Of 81,181 born in 1848, only 2,736, *i. e.*, 3.4 per cent., could read and write; 3,466, *i. e.*, about 4 per cent., could only read, and 50,355, *i. e.*, 62 per cent., could neither read nor write. This, however, is an improvement on the preceding year.

THE KINDERGARTEN IN ITALY.

After encountering innumerable difficulties, a kindergarten on Froebel's plan has been started in Venice. As early as 1860, Professor Adolf Pick, in connection with the enthusiastic friends of education, Matteucci, Cattaneo, and the two De Castros, father and son, labored for the establishment of such an institution. The "Associazione Nazionale Pedagogica" worked in the same direction, and even the ministry of public instruction took an interest in the matter, but without any apparent result. When Professor Pick, in one of the weekly meetings of the Atheneum of Venice, had delivered a very excellent lecture on the kindergarten, the interest in this matter began to revive; a committee of experienced educators was appointed to discuss the matter and draw up a report. Although, in spite of the favorable report made by these men, nothing was done, Professor Pick neither lost courage nor patience, but endeavored to influence the Italian public by a journal, *L'Educazione Moderna*, and requested the Baroness Marenholz-Bülow, in Berlin, to send him a lady trained in her kindergarten normal school. The lady chosen was Miss Elisabeth Salomon, and in the year 1870 Professor Pick established the first kindergarten in Venice, with Miss Salomon as teacher, assisted by an Italian lady, Miss Adele Levi della Vida. The result of this first attempt surpassed all expectations, and in the following year (1871) it was resolved to establish a second kindergarten in Venice, this time in connection with a kindergarten normal school. Professor Pick now commenced to lecture on his favorite subject in Milan, Turin, Treviso, and Florence, and soon kindergartens were established in these cities. This whole movement was strongly encouraged by the late minister of public instruction, Correnti.

INFANT-ASYLUM IN ROME.

Some noble Roman ladies formed a committee, with the plan of holding a fair for the benefit of the new Roman infant-asylum. This plan was entirely successful. Soon more than fifty thousand objects, some of them very valuable, were sent to the committee, and the fair was held in the Corea Amphitheater, and opened by the Princess Margarita, accompanied by the Marchese Calabrini and the Duke of Fiana.

FESTIVAL OF THE PLEBISCITE.

The anniversary of the Roman plebiscite was celebrated on the 2d of October, 1871, by a grand school-festival at the capital, where prizes were distributed to the best pupils of the public schools, in the presence of an immense assembly, comprising the *élite* of Roman society. Such a thing would have been impossible two years ago. *Tempora mutantur.*

NETHERLANDS.

(Constitutional Monarchy—Kingdom. Area, 10,905 square miles. Population, 3,688,337.)

Minister of public instruction, THE MINISTER OF THE INTERIOR.

SECULAR SCHOOLS.

The present system of public instruction dates from the year 1857. According to this, all the elementary schools are either under the direct administration or the supervision of the state, and are entirely secular, so that in one and the same school one finds children of Jews, Roman Catholics, and Protestants. The people seem to be well satisfied with this arrangement, as but few complaints have been raised either by Protestants or Catholics, and the ministry sees to it that the school-laws are faithfully executed.

EDUCATIONAL SOCIETY.

As attendance at school is not made obligatory, many children attended school but irregularly. To remedy this, a number of prominent men founded an educational society (*school verband*) whose expressed aim it is to use all moral means possible to induce parents to send their children to school. This society rapidly increased in numbers, founded branch-societies all over the country, and its beneficial effect is felt in many localities. Its last meeting was held in June, and from the published report it appears that during the last year the number of members has increased from 8,500 to 9,400, and that an immense amount of work has been done, especially in the way of gathering and publishing educational statistics, and combating the negligence in attending school. The assembly passed the following resolutions:

"1. This assembly expresses the wish that the society, by its central and by its branch-societies, should aim at having a law passed prohibiting children from being employed in factories below the age of 12, and, if possible, not to be employed below the age of 14.

"2. The central society will draw up schedules for educational statistics, which must be adopted by all the branch-societies."

In an evening-session the assembly discussed the importance of school-libraries, and finally entered upon the discussion of the question, "Is our elementary instruction perhaps not practical enough, and may not this be the cause of irregular attendance?" Many interesting remarks were made, but owing to lack of time no positive result was arrived at.

INDUSTRIAL SCHOOLS FOR THE INDIGENT.

Such schools have, during the last year or two, been founded in some of the larger cities, particularly in Amsterdam, Rotterdam, Groningen, &c. In the Amsterdam school there are at present 104 scholars, (all boys;) these receive an education which will enable them to earn a living immediately on leaving the school. The hours of instruction are from 8 a. m. till 8 p. m., with an intermission of two hours at noon. Fourteen hours a week are set apart for instruction in arithmetic, writing, mathematics, geography, chemistry, and natural philosophy; 16 hours for instruction in cabinet-making, blacksmith's work, turning, telegraphy, &c.; 18 hours for drawing, designing, and modeling. The whole course occupies three years. The annual expense for each scholar is 18 gilders, (about $7,) which sum is partly paid by the parents, and partly raised by subscriptions.

The King takes a great interest in this school, and visits it every time he comes to Amsterdam. One large room is entirely occupied by a very fine collection of tools, models, and different apparatus, a gift of the King.

There is likewise at Amsterdam an industrial school for poor girls, where for 20 gilders a year (about $8) girls are instructed in drawing, music, sewing, knitting, embroidering, nursing of the sick, and the elements of medicine and pharmacy.

JEWISH ORPHAN ASYLUM.

In July last the great Central Jewish Orphan Asylum of the Netherlands was solemnly opened at Utrecht. Its object is to receive and educate all Jewish orphans, both from the Netherlands and from the colonies.

SCHOOL REPORT FOR 1869–'70.

Through the kindness of the representative of the Netherlands at Washington, the last report (for 1869–'70) on education in the Netherlands has been received. All the schools are grouped in three classes, viz:

1. *Superior instruction,* (*Hooger Ondervijs,*) embracing the universities, atheneums, Latin schools, and gymnasia.

2. *Secondary instruction,* (*Middelbaar Ondervijs,*) embracing the burgher-schools, the higher burgher-schools, agricultural schools, polytechnic schools, navigation-schools, institutions for deaf-mutes and blind, schools for nurses, and schools of veterinary surgery.

3. *Primary instruction,* (*Lager Ondervijs,*) embracing the elementary schools of various grades, and the normal schools, evening-schools, &c.

A separate group is formed by the schools and academies for the army and navy, another by the prison-schools, and still another by the infant-schools.

1.—*Superior instruction.*

There are three universities, Utrecht, Leyden, and Groningen; two atheneums, Amsterdam and Deventer; and fifty-five gymnasia and Latin schools, (the same kind of institution, the difference being only in the name.) These last mentioned are, accord-

ing to provinces, distributed in the following manner: North Brabant, (population, 440,302,) 11; Gelderland, (population, 439,715,) 13; South Holland, (population, 711,437,) 9; North Holland, (population, 602,018,) 3; Zealand, (population, 181,471,) 2; Utrecht, (population, 176,868,) 2; Friesland, (population, 304,702,) 4; Overyssel, (population, 260,680,) 6; Groningen, (population, 234,303,) 3; Drenthe, (population, 108,056,) 1; Limburg, (population, 228,785,) 1.

Universities.

Faculties.	Number of students.			
	Leyden.	Utrecht.	Groningen.	Total.
Theology	75	191	34	300
Law	359	148	51	558
Medicine	123	72	37	232
Mathematics and natural sciences	84	57	16	157
Literature	89	20	8	117
Total	730	488	146	1,364

Atheneums.—The atheneums have the same course of instruction as the universities, the only difference being that they are not government, but municipal institutions, though under government supervision. The Amsterdam Atheneum numbers 228 students, viz: theology, 40; law, 37; medicine, 105; literature, 14; philosophy, 9. The Deventer Atheneum is small, having but 3 students and a preparatory class of 30 scholars.

Gymnasia and Latin schools.—These schools give a classical and mathematical education to prepare scholars for the universities and professional schools. The number of these institutions is 55, with a total of 213 teachers and 1,079 scholars.

Expenses for superior instruction.

	*Guilders.
Government expenditures for three universities	507,954
Government expenditure for the Museum of Natural History at Leyden	20,276
Government expenditure for the Museum of Ethnology at Leyden	6,745
Government expenditure for the Botanical Museum at Leyden	2,309
Subsidy to Amsterdam Atheneum	3,000
Stipends for talented students at the universities	2,900
Subsidy to the practical course of medicine at Amsterdam	3,000
Subsidy to the Latin schools and gymnasia	40,722
Total government expenditure for superior instruction	586,906
Expended by the provincial government of North Holland for the Amsterdam Atheneum	10,000
Expended by the municipal government of Amsterdam for the atheneum	130,853
Expended by the municipal government of Deventer for the atheneum	3,775
Total expenditure for superior instruction	731,534

Or $292,613.60, gold.

The total income of the Latin schools and the gymnasia, from subsidies, school-fees, and other sources, was 101,640 guilders.

2.—*Secondary instruction.*

Burgher-schools.—Of these there are 44, among which there are 5 day-schools, 26 evening-schools, 2 business-colleges, 4 drawing-schools, 2 industrial schools, and 6 preparatory schools, with a total of 305 teachers and 3,283 scholars.

Higher burgher-schools.—Of these there are 41, viz, 15 government schools; 25 municipal schools; and 1 private school, with a total of 484 teachers and 3,201 scholars.

The course of instruction in these two classes of institutions is very similar, only that the course in the higher burgher-schools is fuller than that of the burgher-schools. The higher burgher-schools have three classes, and the following is the plan of instruction:

* The guilder is equal to about 40 cents.

Plan of instruction in the higher burgher-schools.

Agricultural schools.—The Netherlands, being chiefly a commercial country, possess but one agricultural school at Groningen. There are 7 professors and 15 students during the winter-term, and 4 during the summer-term. The course of instructions embraces agriculture, mathematics, natural philosophy, chemistry, natural history, and political economy. The Horticultural Society supports a school of horticulture at Watergraafsmeer, numbering 28 students. During the years 1868 and 1869, Mr. De Beucker delivered 141 lectures on horticulture and fruit-culture in 34 cities and towns.

The Polytechnic School.—The number of students during the year 1869–'70 was 168, and the number of professors 21. The course of instruction is the following:

These schools have all a more or less theoretical and practical course, every scholar making one or two voyages, which form an essential part of his studies, some of these voyages being only coast-voyages, and others voyages across the Atlantic.

Institutions for the deaf-mutes and blind.—Institution for Deaf-Mutes at Groningen, 165 inmates—88 males, 77 females; Deaf-Mute College at Rotterdam, 95 students—52 males, 43 females; Asylum for Deaf-Mutes at St. Michiels-Gestel, 120 inmates—66 males, 54 females; Institution for the Blind at Amsterdam, 49 inmates—33 males, 16 females; Asylum and College for the Blind at Amsterdam, 43 inmates—17 males, 26 females; Mr. Kingma's school for deaf-mutes and neglected children at Amsterdam, 45 inmates.

Institutions for the preparation of civil officers for Dutch India.—1. *Government institution at Leyden:* The course of instruction embraces Javan language; Malay language; Mohammedan law; laws and institutions of Dutch India; geography, history, ethnology, and statistics of Dutch India; the religions of Dutch India. The number of students during the last year was 30. 2. *Municipal institution at Delft*: Course of studies the same as at the Leyden school. Number of students, 48.

Miscellaneous secondary schools.—The number of these schools supported entirely by the municipal authorities of the towns or cities where they are located is 40, viz: 21 drawing-schools, 15 industrial schools, 1 school for the study of mathematics, 1 school for the study of natural sciences, 2 schools of gymnastics, and 1 singing-school.

School for nurses.—This school is a government institution, with 21 students. It is both theoretical and practical, about 150 pregnant women of the poorer classes having been delivered in this institution during the year.

School of veterinary surgery.—This school has a three-years' course, and was attended by 23 students, 9 in the first, 6 in the second, and 8 in the third class. Connected with the school is a hospital for animals, in which 880 animals were treated during the year, viz: 167 horses, 98 oxen and cows, 32 sheep and goats, 30 hogs, 385 dogs, 25 cats, and 43 birds. Of these, 559 were cured, 50 died, and 271 were convalescent.

Income and expenditure of scondary instruction.

A.—EXPENDITURE.

Evening-schools.—In all the provinces of the Netherlands there are a great number of evening-schools, kept mostly by the teachers of the public day-schools, partly for the benefit of pupils of the day-schools who wish to have more opportunities of studying, partly for the benefit of young persons employed in stores and factories. On the 15th October, 1869, the evening-schools were attended by 36,944 scholars of the day-schools, viz, 25,637 boys and 11 307 girls, and by 8,735 young persons, viz, 5,189 boysand 3,546 girls.

* The population given here is from the Dutch report, while the dates given before are from the Almanach de Gotha for 1872, both claiming to be official publications.

Number of children that were instructed cost free.—As a general rule a regular school-fee is paid in all the private and public day-schools, but in the case of poor parents an exception is made. Thus, on the 18th October, (the day when the census was taken,) in all the day-schools, (public and private,) 206,724, or about one-half of all the children attending these schools, were instructed cost free. Of this number 107,699 were boys and 99,025 girls.

Schools for adults.—The number of schools for adults is 210, (71 public, 24 private subsidized schools, and 115 non-subsidized schools.) The number of teachers in these schools is 484, viz, 392 males and 92 females. The number of scholars is 11,446, viz, 6,329 males and 5,117 females.

Normal schools.—There are both government and private normal schools and normal classes. The number of government normal schools is 3, viz, Hertogenbosch, Haarlem, and Groningen, with a total number of students, 114. The course of instruction takes up four years, and is somewhat differently arranged in the different schools.

The following is the course of instruction of the school at Hertogenbosch:

Studies.	Hours per week.			
	1st year.	2d year.	3d year	4th year.
Penmanship	2	2	2	2
Arithmetic	5	5	3	4
Grammar	1	1	1	1

French	....	3	2	2
German	....	....	2	1
Horticulture	....	....	2	2
Anatomy, physiology, and hygiene	....	1	1	2
Total	39	44	40	39

The normal courses are chiefly supported by the communities where they are located, or by the provinces; but most of them enjoy a government subsidy, are under government supervision, and have a very similar course of instruction to that of the government normal schools. The number of these courses is 27, with 831 students.

With quite a number of the elementary schools, normal classes for the practical education of teachers are connected. Such classes are connected with 56 schools, and number 509 students.

There are 12 normal schools and normal courses for female teachers, all private, or provincial or municipal, but most of them subsidized by the government. The number of students during the last year was 262.

Teachers' societies.—The number of teachers' societies during the year 1869 was 247, with a total of 3,834 members.

Income and expenditure of primary instruction.—Expenditure by the central government: 479,734 guilders, or $191,893.60 gold.

Income and expenditure of the various communities.

Objects of expenditure.	Amount.	Sources of income.	Amount.
	Guilders.		*Guilders.*
Teachers' salaries	2, 676, 134	School-fees	793, 361
Teachers' lodging and rent of school-houses	73, 116	Subsidy by the central government	169, 260
New buildings	718, 983	Contributions by the communities	20, 797
Repairs, &c	258, 668	Contributions by the provincial government	4, 521
Furniture and apparatus	321, 036	Income from special funds	60, 741
Light and fuel	104, 788		
School-committees	16, 247		
Teachers' pensions	44, 751		
Subsidies to different schools	56, 704		
Education of teachers	13, 690		
Paid to other communities	20, 737		
Sundries	67, 084		
Total	4, 372, 003	Total	1, 048, 681

Grand total expenditure for education (superior, secondary, and primary) *by the central government, the provinces, and the communities*, 6,621,079 guilders, or $2,648,431.60, gold.

4.—*Educational institutions for the army and navy.*

Royal Military Academy.—The number of cadets in 1869 was 185. The course lasts three years, and during the last year 72 of the cadets became officers, viz, 45 in the home service, 26 in Dutch India, and 1 in the West Indies.

Staff-School.—This school has 3 professors. Generally 4 lieutenants are sent to this school per annum from each of the arms, (infantry, cavalry, artillery, and engineers.) The course embraces mathematics, natural sciences, geodesy, history of the military sciences, geography, French, German, and English, free-hand drawing, plan and map drawing, surveying, tactics, fortification, and military law.

Instruction-battalion.—On the 15th October, 1870, this battalion numbered 31 officers and 476 non-commissioned officers and privates. The course is both theoretical and practical.

Artillery instruction-company.—For the education of non-commissioned officers for the artillery. On the 1st November, 1869, this company numbered 175.

Scientific courses in the different army-corps.—Intended for the further education of non-commissioned officers. In 1869, 102 took part in these courses, (infantry, 74; cavalry, 15; and artillery, 13.)

Corps-schools.—Each army-corps has elementary schools. The number of teachers in these schools in 1869–'70 was 201, mostly officers, and the number of scholars 7,553, (infantry, 6,299; cavalry, 519; artillery, 596; engineers, 139.)

Royal Naval Academy at Willemsoord.—The number of cadets in 1869 was 68. The course is both theoretical and practical, and embraces a cruise of about a year.

School for officers of the marine-corps at Amsterdam.—The course lasts three years. The number of cadets in 1869 was 9.

Instruction for naval machinists.—This instruction is both theoretical and practical, and is given on board a man-of-war at Hellevoetsluis. The course lasts 2 years, and was in 1869 attended by 43 scholars.

Instruction for steersmen.—Two ships are used for this instruction, one at Amsterdam and the other at Willemsoord; at the former place there were 109 scholars, and at the latter about 80.

Army and Navy Medical School.—The number of students in 1869 was 84; 5 left the school during the year and received places as physicians, (1 in the home service, 1 in the navy, and 3 in India.)

School for Military Druggists in India and the West Indies.—The course of study lasts 4 years, and the number of students in 1869–'70 was 12.

5.—*Prison-schools.*

During the year 1869, instruction (chiefly in the elementary branches) was given in 8 penitentiaries, 13 municipal and military jails, and in 23 prisons. The following are the statistics:

Statistics of prison-schools.

Character of institution.	Total number of prisoners.	Took part in the course of instruction.	Did not take part in the course of instruction.		
			On account of old age and sickness.	As being sufficiently educated.	Total.
Penitentiaries	3,600	1,113	536	951	1,687
Municipal and military jails	7,632	1,638	1,614	4,380	5,994
Prisons	7,279	1,773	2,825	2,681	5,506
Total	17,511	4,524	4,975	8,012	12,987

With all these institutions, there are libraries for the use of the prisoners, with a total of 10,385 volumes. These libraries are used by 9,965 prisoners. Of the prisoners who took part in the course of instruction, 1,527 were below 20 years of age, 1,745 were between 20 and 30 years, 804 between 30 and 40, and 448 above 40.

6.—*Infant-schools.*

These schools, either public or private, are for children between the ages of 4 and 6; the number of the public schools being 78, with 371 teachers, (5 males, 107 females, and 259 assistants—sex not stated,) and 12,834 pupils, (6,531 boys, 6,303 girls,) and the number of the private schools being 579, with 1,633 teachers, (24 males, 735 females, and 874 assistants—sex not stated,) and 50,435 pupils, (22,934 boys, 27,501 girls;) making a total of 657 schools, with 2,004 teachers and 63,269 pupils, (29,465 boys, 33,804 girls.)

STATISTICS OF ILLITERACY.

These statistics, contained in the official report on education, 1869–'70, refer only to the military conscripts. Of 2,227 conscripts 803 could neither read nor write, and 1,424 possessed only a very insufficient knowledge of reading and writing.

PORTUGAL.

(Constitutional Monarchy—Kingdom. Area, 36,510 square miles. Population, 4,360,974.)

Highest educational authority, THE MINISTER OF THE INTERIOR, A. RODRIGUES DE SAMPAIO; *General director of public instruction*, COUNSELOR C. B. DA SILVA.

STATISTICS.

No second report having been received from Portugal, the statistics of January 1, 1870, are given here from the official paper "O Diario do Governo," as already published in the circular of information for February, 1872:

Districts.	Schools.			Scholars.		
	For boys.	For girls.	Total.	Boys.	Girls.	Total.
Aveiro	111	17	128	7,455	996	8,451
Beja	57	42	99	3,081	667	3,748
Braga	99	9	108	6,943	413	7,361
Bragança	100	14	114	4,531	735	5,266
Castello Branco	94	13	107	4,258	690	4,948
Coimbra	125	13	138	7,307	638	7,945
Evora	38	10	48	1,670	626	3,296
Faro	49	4	53	2,163	276	2,439
Guarda	168	25	193	7,902	1,679	9,581
Leiria	77	10	87	3,259	427	3,686
Lisboa	115	33	148	6,273	1,798	8,071
Porta Allegre	52	11	63	2,024	729	2,753
Porto	122	21	143	8,106	1,226	9,332
Santarem	84	14	98	3,811	625	4,436
Vianno de Castello	71	5	76	4,791	450	3,241
Villa Real	137	15	152	8,090	835	8,923
Vizen	206	23	229	11,544	1,301	12,845
Angra	32	6	38	1,683	326	2,009
Funchal	25	9	34	1,088	380	1,468
Horta	26	11	37	1,483	801	2,284
Ponta Delgada	22	9	31	1,743	1,124	2,867
Total	1,807	314	2,121	99,205	6,927	106,132

At the end of the year 1869, 6,001 boys and 654 girls (in all 6,655 children) had finished their education.

RUSSIA.

(Absolute hereditary Monarchy—Empire. Area, about 7,225,374 square miles. Population, 82,159,630.)

Minister of public instruction, COUNT D. TOLSTOI.

RE-ORGANIZATION OF SECONDARY AND OTHER SCHOOLS.

Count Tolstoi, the minister of public instruction, has drawn up the draught of a law re-organizing the gymnasia and other secondary schools. The Emperor has appointed a committee for examining this draught, with General Count Stroganow as president, and the prince imperial, Prince Peter of Oldenburg, the minister of public instruction, war, and finance, as well as some other prominent counselors of the empire, as members. This committee is to have the powers of a government department.

Count Tolstoi and the minister of the interior are likewise commissioned to establish new elementary schools in all parts of the empire where they are wanted, and procure the necessary funds. Count Tolstoi spent part of the month of August in Berlin, in order to make himself personally acquainted with the Prussian school-system.

PRIVATE EDUCATIONAL ENTERPRISES.

Great zeal is manifested by the provincial and city authorities for the furtherance of education. Thus the municipal council of St. Petersburg (*Duma*) has appropriated an annual sum of 75,000 roubles (3 francs 75 centimes each) for the establishment and maintenance of 28 new elementary schools. The city of Riga has also appropriated a sum of money sufficient to found and maintain 6 new elementary schools.

RUSSIANIZING THE BALTIC PROVINCES.

The national Russian party is still zealously engaged in spreading the Russian language further in church and school in the Baltic provinces. The orthodox seminary of the ancient city of Riga got as its president a general, and the director of the German gymnasium was obliged to introduce the Russian language as the language of instruction. The Livonian chambers passed a protest against the introduction of the Russian language in the secondary schools of Livonia. The Esthonian chambers sent a deputation to St. Petersburg to protest against the encroachments on their native language. They were assured by the Emperor that the privileges of the Esthonian population with regard to the use of their native language in church and school should not be touched, and that the schools, with the sole exception of technical and professional schools, should retain the Esthonian language as the language of instruction.

UKASE OF THE EMPEROR REGARDING INSTRUCTION IN GERMAN.

Immediately on his return from a journey to Germany during the summer of 1871, the Emperor published a ukase (order) directing the ministry of public instruction to see to it that the German language should have more hours of instruction than the French or any other modern language in all the privileged private day and boarding schools.

EDUCATIONAL MUSEUM.

The national Russian industrial exposition at St. Petersburg, in which educational apparatus was also represented, first caused the authorities and educators of the country to conceive the idea of an educational museum. This idea was soon carried out in the most liberal manner and on a grand scale, so that now there is, besides the many other attractions of St. Petersburg, a great educational museum, containing a very complete collection of apparatus, text-books, school-furniture, &c., used in the educational institutions of the country from the lowest grade to the highest. The section containing aids for the domestic education of children between the ages of 6 and 15 is particularly rich.

READING-ROOMS.

An extraordinary sitting, has recently taken place in St. Petersburg, of the committee on primary instruction, the object of which was to consider the report on the establishment of popular reading-rooms. The project proposes 1,220 roubles (3 francs 75 centimes each) as the cost of installation, and 2,700 roubles for the expenses of maintenance. The expected receipts are 400 roubles; therefore, evidently, gifts or subscriptions

will be required. The Order of Advocates has already offered 1,000 roubles. The plan has two peculiarities: reading out loud is to be introduced for those persons who are instructed; children are to be admitted free, and adults enter on payment of one copeck, (equal to four centimes.)

GENERAL INTEREST TAKEN IN EDUCATION.

The district authorities of the district of Samara resolved to establish an annual teachers' conference at Samara, to give the elementary teachers from the rural districts an opportunity to become acquainted with the best modern methods of instruction. The representatives of the district of Odessa had, at their last session, a very lively discussion on the question of compulsory attendance, and finally unanimously decided in favor of the measure, pledging themselves to press the matter with the national educational authorities. As an interesting fact, it may also be mentioned here that during the last year more than a hundred ladies attended the lectures on natural science at the University of Kiew.

EDUCATION IN POLAND.

The latest educational statistics of the kingdom of Poland, now completely absorbed by the Russian empire, are of the year 1870. The number of elementary schools maintained by the government was in that year 2,115, viz: 1,462 for Roman Catholics; 376 for United Greeks; 218 for Protestants; 29 for Russian Orthodox; and 30 for Jews. All these schools were attended by 121,613 children. The total population of the kingdom is 5,705,607, viz: 76,823 boys and 44,810 girls. During the last year 57 new schools were established. From the beginning of the year 1872, the Russian language is to form the chief language of instruction in all the elementary schools of the kingdom of Poland.

FEMALE GYMNASIUM IN MOSCOW.

According to the Moscow Gazette, it is the intention of some wealthy private individuals to establish in that city a gymnasium for young ladies, not merely a higher school for girls, but an institution like the German gymnasia, paying special attention to ancient languages and mathematics. The Northern Press says with regard to this project: "As every gymnasium may be viewed from a twofold stand-point, viz, as a school giving a general humane education, and as an institution preparing for the special university studies, thus the idea of a female gymnasium may also be viewed in these two different aspects. If we consider the gymnasium merely as a stepping-stone to the university, a female gymnasium must consistently be followed by a female university. We believe we are not mistaken in saying that the number of ladies in Russia (and we presume all over the world) who would study a science for the sake of the science is remarkably small. As far as we are able to judge, such an idea is very far removed from the present generation of young ladies in Russia. The question is a different one with regard to those ladies who consider science merely as a means of earning some livelihood and entering some profession; for these we find a great number of foreign universities and technical schools, especially in Switzerland. For such the question of establishing a female university forms an integral part of the question of women's labor, and the solution of this question will depend on what so-called learned professions will, with the present social and political organization of Russia, be open to women. Till that question is decided no female university is wanted, and a female gymnasium can till then only be considered as an institution imparting a general education of a higher character than that of the present superior schools for young ladies."

WANT OF TEACHERS FOR THE SECONDARY AND SUPERIOR SCHOOLS.

The somewhat anomalous condition of public instruction of the higher grades is shown by the constantly growing want of teachers for the gymnasia and the universities. According to authentic information for the year 1871, there were at the University of St. Petersburg 61 professorships filled and 14 vacant; in Moscow, 72 filled and 19 vacant; in Charkow, 46 filled and 45 vacant; in Kasan, 53 filled and 38 vacant; in Odessa, 31 filled and 27 vacant; in Dorpat, 47 filled and 7 vacant; in Warsaw, 61 filled and 10 vacant. Thus, the total number of professorships filled in the above 7 Russian universities was 420, and that of vacant ones 202, therefore more than one third of all the professorships was vacant.

In the gymnasia the want of teachers was felt just as keenly. Of all the teachers' places established by law, there were, in 1871, 200 vacant, *i. e.*, about 10 per cent. A great hinderance of a sound development of the Russian gymnasia is the frequent

change of teachers from one gymnasium to the other. Thus, of the total number of teachers in 1867, scarcely 47 per cent. were at their old places at the end of 1871, and in the district of Odessa the percentage was only 13.

TECHNICAL REAL-SCHOOLS.

Some time ago the minister of public instruction laid before the council of the empire a plan of reform, according to which the real-gymnasia should be transformed into technical real-schools, *i. e.*, instruction in ancient languages should be almost entirely dropped in these institutions, and modern languages and natural sciences introduced instead. This plan was rejected by the council by 27 votes against 19, and the Emperor published a decree ordering the carrying out of this plan. The same was done, when last year a similar majority of the council declared themselves against the plan proposed by the minister to establish purely classical gymnasia by the side of the real-gymnasia. Both these imperial decrees are of great importance, as they insure greater thoroughness in both branches of instruction, the classical and the technical. The funds for the maintenance of the new technical real-schools are to be supplied from the national treasury.

RE-ORGANIZATION OF DISTRICT-SCHOOLS.

The Emperor and the council of the empire have sanctioned the re-organization of the district-schools proposed by the ministry of public instruction. The existing district-schools, (higher elementary schools,) 402 in number, are to be re-organized gradually, as fast as the teachers' seminaries can supply the necessary teachers. It is expected that the work of reform will be commenced in 1874. Seminaries are first to be established in the districts of St. Petersburg and Moscow, to be followed by the districts of Kasan, Charkow, Odessa, Wilna, and Kiew.

ENDEAVORS OF THE GOVERNMENT TO RAISE THE GENERAL STANDARD OF EDUCATION.

The chief of police of St. Petersburg, General Trepow, a man of high education and untiring in his efforts to raise its standard among the lower classes of the capital, starting from the idea that drunkenness and rowdyism among the lower classes are so prevalent because they have no chance to enjoy any rational amusements, instituted a course of popular lectures, meeting the expenses connected therewith from the funds of the police department. He engaged for these lectures the very best men of the country, and made the price of admission merely nominal. These lectures on various subjects, such as sacred and profane history, hygiene, geography, natural sciences, were kept in the most popular style, and made attractive by charts, maps, diagrams, pictures, and experiments. The result has surpassed all expectations, and many of the lectures had to be given repeatedly. The interest taken in these lectures is, according to the most reliable information, not based on a mere passing enthusiasm, but is firmly rooted in the populace.

COMPULSORY EDUCATION AMONG THE COSSACKS.

In the St. Petersburg Gazette we find the following interesting communication: "According to official information, there were among the Cossacks in the province of Orenburg, numbering 248,000 persons, 179 elementary schools, viz, 129 for boys and 50 for girls, attended by 3,760 scholars. Considering this number of schools entirely insufficient, and the attendance unsatisfactory, Major-General Boborykin, on the 19th August, 1871, published a decree, ordering the sub-hetmans to establish elementary schools in every village, and to enforce attendance at school for every boy from the age of 8 or 9. The Orenburg Cossacks are distributed through 401 towns and villages, and in every one of these a school-house and house for the teacher are to be built immediately at the expense of the town. In order to procure the required number of teachers, the non-commissioned officers, who all have a good elementary education, are to act as teachers. As it is supposed that but few of them possess any skill in teaching, regular pedagogical courses for them are to be held every year by experienced pedagogues appointed by the minister of public instruction. These courses are to last one month, usually during the summer, while the children are enjoying their vacation. The results have been so excellent that it is intended to hold six such courses per annum, three for male and three for female teachers. Since the publication of the above-mentioned order by the hetman, 118 new schools have been established, viz, 50 for boys and 68 for girls, so that the total number of schools is now 297. At the same time Sunday-schools have been established for adults between the ages of 17 and 19."

FINLAND.

For the following article on education in Finland we are indebted to Professor Felix Heikel, of the University of Helsingfors, Finland, now on a visit to this country:

EDUCATION IN FINLAND—AREA AND POPULATION.

Finland is bounded by the Gulf of Bothnia on the west, the Gulf of Finland and Lake Ladaga on the south, and stretches so far north as to embrace a portion of Lapland. Its area is about 107,000 English square miles, and the population, according to the census of 1870, was 1,733,612. Of these about 250,000 speak Swedish, and the rest Finnish, a Mongolian language, the only European language to which it bears any relation being the Hungarian.

HISTORY AND GOVERNMENT.

It is generally supposed that the Fins emigrated to Finland from Eastern Europe and Asia about A. D. 700. They were a heathenish and barbarous race till the end of the twelfth century, when the country was conquered by the Swedes, who introduced Christianity and civilization. In 1809 Finland was conquered by Russia, but, in accordance with a generous assurance of Emperor Alexander given to its first parliament, its Swedish laws, liberties, and privileges were fully confirmed by Russia's present sovereign, the Emperor Alexander II. Finland is, therefore, a separate grand-duchy, dynastically united with Russia, whose emperor is its grand-duke. Its legislative power is a parliament, (*Landdag,*) which assembles at least every 5 years; the executive power is vested in a governor-general appointed by the grand-duke, and a senate of 16 members. All government officials, with the exception of the governor-general, are natives. The official government and school language is Swedish or Finnish.

SCHOOL-LAWS AND GOVERNMENT.

The oldest school-law dates from the year 1611. The law at present in force for the primary schools (*Folksskolorna*) dates from 1866, and for the lyceums or Latin schools (*Lærdaskolorna*) from 1872. Till 1869 the schools were all under the superintendence of the church (Lutheran) authorities, but in that year the schools were placed under a separate administration, consisting of a president and six members.

PRIMARY SCHOOLS.

Instruction in reading and writing has from time immemorial been given in the family or in the rural districts by migratory village-schools, and in the cities in private or public primary schools. No person who cannot read is confirmed by the church or can obtain municipal or political privileges. The knowledge of reading is therefore universal throughout the whole country.

SECONDARY OR INTERMEDIATE SCHOOLS.

These schools have only been established within a few years, but their number is constantly increasing. In 1866 there were in operation 7 such schools, while in 1872 their number was upward of 200. The course of instruction embraces religion, reading, writing, arithmetic, history, geography, natural philosophy, singing, drawing, and gymnastics, and in the girls' schools, in addition, needle-work. The proportion between the female and male teachers is about that of two to three.

NORMAL SCHOOLS.

There are two normal schools—one with separate departments for gentlemen and for ladies, and one exclusively for ladies. The former was opened in 1864, and in 1871 had 156 students; the latter was opened in 1870, with 30 students. The course of instruction embraces four years, of which the first three are devoted to theoretical studies, while the last is devoted to practical exercises in the model-school and kindergarten connected with each school.

REAL-SCHOOLS OR HIGH SCHOOLS.

For every one of the thirty-three cities in Finland there is a high school for boys, with a two to four years' course. The number of ladies' high schools, each with from four to six classes, in the whole grand-duchy, is 7. The course of studies embraces the same subjects as in the secondary schools, but is more thorough, including two or more modern languages. The number of pupils in the high school for boys was, in 1871, 2,212, and in the high schools for ladies 753.

THE POLYTECHNIKUM.

The Polytechnikum, or Polytechnic School, is located at Helsingfors. The condition of admission is the completion of the course at a real-school. After a two-years' pre-

paratory course in mathematics and drawing, the studies branch off in four departments, viz: one for civil engineers, (railroad and canal engineers;) one for machinists; one for architects; and one for chemists. The whole course embraces four to six years. In 1871 the number of professors was 16 and the number of students about 105.

"LYCEUMS," OR LATIN SCHOOLS.

These schools are the oldest public schools in Finland. Originally founded for ecclesiastical purposes, they have now been changed into institutions for a higher general or classical education. They embrace the American grammar-schools, high schools, and at least the two lower classes of colleges. Pupils are usually admitted at an age varying between 9 and 12 years. The course lasts from eight to nine years, and embraces religion, Latin in all classes, Greek, modern languages, mathematics, natural sciences, history, geography, vocal music, drawing, and gymnastics. In 1871 there were in operation 10 complete lyceums, with 7 classes each, and 12 having only the 4 lower classes. The total number of pupils in all the lyceums was 2,575. The lyceum at Helsingfors is called the Normal Lyceum, as candidates for teachers' places at lyceums or real-schools, after having finished their studies at the university, here receive a practical instruction for their profession by a university professor of pedagogics and four teachers.

THE UNIVERSITY.

The university was founded in the year 1640 in Abo, and after the conflagration of that city in 1828 was transferred to Helsingfors, the present capital of Finland. It has four faculties, or schools, viz, theology, law, medicine, and philosophy.

The number of "ordinary professors" in 1871 was 33, who, in order to obtain such a place, must give sufficient proof of having followed independent scientific investigations, and are obliged to lecture four times a week. Besides these there are 35 "extraordinary professors" and tutors. Condition of admission is the completion of a full course at a lyceum. The number of students is about 750. With regard to the selection of studies the greatest liberty prevails. The university library, which is open to the general public, embraces 140,000 volumes. The students have a special "students' library," with about 15,000 volumes, and a reading-room containing journals and periodicals from almost all civilized countries. Connected with the university there is an astronomical and magnetic observatory, a large chemical laboratory, a botanical garden, anatomical, zoological, mineralogical, numismatic, and historical collections, &c. The income of the university in 1871 was 1,162,000 marks, (mark, a Finnish coin, equal to 1 franc.) A large number of free places are annually distributed, and every year young men of talent are sent out to study at foreign universities or to study the educational institutions of other countries.

OTHER PUBLIC EDUCATIONAL INSTITUTIONS.

One agricultural institute, with 11 professors.
Three lower agricultural schools.
One military academy, with 120 students.
Six schools of navigation.
Several evening and drawing schools.
Four schools for deaf and dumb, with 10 teachers and 107 pupils.
Two schools for blind.

SUPPORT OF THE SCHOOLS.

The public schools are for the greater part supported by the government of Finland, which for this purpose annually expends about two and a quarter million marks. All schools charge a small school-fee, varying between 2 and 100 marks annually. The annual fee in the military academy is 560 marks. There are free places for indigent scholars in all schools. Instruction at the university is entirely free of charge.

DURATION OF SCHOOL-YEAR AND VACATION.

The school-year, which in most schools begins on the 1st September, is divided into two terms, the first from September 1 till December 15; the second from January 15 till June 15.

SPAIN.

(Constitutional Monarchy—Kingdom. Area, 182,738 square miles. Population, 16,641,980.)

Minister of public works and public instruction, (fomento,) SEÑOR ECHEGARAY.

No report has been received for this year, and it is therefore impossible to give many items of interest.

STATE OF EDUCATION.

Since the year 1845, the number of scholars in the public schools of Spain has doubled. Although a great deal has been done, and much zeal is manifested in the cause of education, much remains yet to be done to place the Spanish nation on a level with the more advanced nations of Europe. But now, since Spain has complete religious liberty, it is to be hoped that education and general enlightenment will advance more rapidly. The number of illiterate persons is still very large, as, according to good authority, only 3,129,421 persons (2,414,055 men and 715,366 women) are able to read and write.

NOBLE SENTIMENT EXPRESSED BY THE KING.

When, in January, 1871, King Amadeus had a conversation with his minister of finance, in which the latter informed him that the salaries of teachers had not been paid for quite a while, the King declared: "I shall not take any payment myself till these men have been granted their just dues."

SWEDEN AND NORWAY.

(Constitutional Monarchy—Kingdom. Area, 250,555 square miles. Population, 5,898,573.)

Minister of public instruction in Sweden, DR. G. WENNERBERG; *Minister of public instruction in Norway,* H. RIDDERWOLD.

MIGRATORY SCHOOLS.

In many parts of Sweden there are no regular schools, but teachers wander from place to place, keeping school for one week or longer in this farm-house, the next week in another. The Swedish government has during the last year made the most strenuous exertions to diminish the number of these schools, and soon they will have entirely disappeared.

TEACHERS AND TEACHERS' SEMINARIES.

In the instruction of small children female teachers are preferred to males; and in Stockholm the number of female teachers exceeds that of the males. In the seminaries for the education of female teachers there are also female professors employed. The seminary course occupies three years.

SALARIES AND FINANCES.

The salaries of Swedish teachers are divided into three classes, viz: class 1, $360, $60 for lodging and $30 for fuel; class 2, one-fourth less than class 1; class 3, $112 salary, $30 for lodging and $10 for fuel.

The Parliament annually appropriates $71,400 for teachers' seminaries, for the support of elementary schools in poor districts, and for educational purposes generally.

STATISTICS.

The total number of public schools in the kingdom of Sweden, with the exception of Stockholm, (4,168,882 inhabitants,) is 7,118; viz: 10 higher schools; 3,432 elementary schools, properly so called; and 3,676 small schools. The number of children of school-age is 682,623, of whom 664,245 attended school, viz, 210 in the higher schools, 361,512 in the elementary schools, 186,885 in the small schools, 7,302 in other public institutions, 22,395 in private schools, while 85,943 received their instruction at their parental homes; 18,878 children received no instruction at all, viz, 2,537 on account of sickness, and 15,841 from other causes.

SCHOOL-STATISTICS OF STOCKHOLM.

The report of the Stockholm schools for 1870 shows that the great exertions made for spreading education by the city authorities and by private individuals have been rewarded by good results. The city of Stockholm, with a total population of 135,920, has 16,843 children of school-age, (between 7 and 14;) of this number 12,849 received daily instruction; 2,313 attended schools that were not open every day, or, at any rate, the whole day; 1,681 were either instructed at their homes or received no instruction at all; of these 116 were prevented by sickness, and 970 were engaged as servants. In the public schools 7,655 children were instructed by 208 teachers, (male and female.)

Cases of non-attendance were comparatively rare, viz, about 9.6 per cent.; of these 1.2 per cent. without sufficient cause, 4 per cent. on account of sickness, 1.2 per cent. on account of want of decent clothes, 3.2 per cent. with valid excuses. Of the scholars 99.9 per cent. were instructed in religion, Swedish, writing, and arithmetic; 62.6 per cent., in geography and history; 52.7 per cent., in natural sciences; 9 per cent., in mathematics; 52.7 per cent., in drawing; 56 per cent., in vocal music; 56 per cent., in gymnastics. The number of girls instructed in needle-work was 2,180. Arboriculture was taught in 2 schools. The total expense of the public schools of Stockholm during the year was 185,775 rigsdaler, (about $53,470 in gold.)

SWITZERLAND.

(Federal Republic. Area, 15,233 square miles. Population, (1870,) 2,669,095.)

Switzerland possessing no national system of education, each of the twenty-two cantons is treated separately.

ARGOVIA.

(Area, 502 square miles. Population, 198,873.)

STATISTICS.

The number of elementary schools is 527, and besides these are 26 repetition-schools, (schools for young people who have left the elementary schools.) The number of children attending school was 29,069. The attendance at school was, generally speaking, satisfactory; still there were 6,627 cases of absenteeism, of which 1,584 were punished with incarceration. The number of teachers was 530, (498 males and 32 females.) The highest salary paid was 2,200 francs, and the lowest 800 francs. The total sum expended for teachers' salaries was 495,200 francs, toward which the state contributed 186,460 francs.

According to the law, the course of instruction in the "repetition-school" (*Fortbildungsschule*) has to embrace all the subjects taught in the elementary schools, and continue them to a higher grade, with special reference to the various trades and to agriculture; instruction is also to be given in French.

The number of female industrial schools (*Arbeitsschulen*) was 298, with 293 (female) teachers and 11,740 scholars. The highest salary paid to teachers in these schools was 800 francs, and the lowest 100 francs. The total sum paid for teachers' salaries was 55,800 francs, toward which the state contributed 18,700.

The cantonal reform-school at Olsberg had 42 scholars. During the last ten years 52 have left the institution, of whom 44 have become useful members of society. The school for poor girls at Friedberg had 8 scholars, the school for indigent children at Kastelen had 30, and three institutions for deaf-mutes at Aarau, Baden, and Zofingen had 52 inmates.

Voluntary schools for adults were held in twenty places; a course of agricultural lectures was held at Muri for teachers of such schools, toward which the state contributed 300 francs.

The examination of the recruits for military service showed that of 664 who were examined 91 had to attend the "*Strafschule*," (literally, "punishment-school.")

The 23 district-schools (schools intended to prepare for the secondary schools) were attended by 1,397 scholars, (1,306 boys and 91 girls,) varying in age from 11 to 21 years. The number of teachers was 69, and 72 assistants. The highest salary is 2,500 francs, and the lowest 2,000. The sum contributed by the state amounts to 70,600 francs. In most of these schools, Latin, Greek, English, and Italian are taught.

The "cantonal school" (highest secondary school) had 143 scholars, viz, 21 in the progymnasium, 81 in the gymnasium, and 41 in the industrial school. There are 17 teachers and 5 assistants. The teachers' seminary had 62 students in 3 classes, and the model-school connected with it 60 scholars. The total sum expended for the seminary was 47,500 francs, of which the state paid 29,200. The charges for board for each student amounted to 4½ francs per week.

The total state expenditure for education was 464,800 francs. The school-property of the whole canton was valued at 5,130,100 francs.

The public schools of Argovia are among the best-organized and best-managed of the whole of Switzerland.

AGRICULTURAL SCHOOL AT MURI.

Director Römer, of this school, resigned his position, and it seemed doubtful whether the institution would be continued. The matter formed the chief subject of discussion at the meeting of the agricultural society of the canton, and it was resolved to make

the utmost exertions for the continuation of this important institution, to extend the course of the school by making a third class, and by lowering the fees as much as possible. A motion brought forward in the cantonal council to unite the agricultural school with the teachers' seminary was lost.

TEACHERS' CONFERENCE.

During the month of September the Argovian Teachers' Conference assembled at Baden, about 250 being present. The chief subject of discussion was the continuation of youths that had left the school, in accordance with the demands of the time.

The conference almost unanimously voted that the following be recommended to the authorities: The establishment of obligatory "continuation-schools," (*Fortbildungsschulen*) for boys and girls till the age of 17, viz: 1. In every district (subdivision of the canton) from 1 to 2 schools for apprentices, where instruction could be given in drawing, business correspondence, book-keeping, arithmetic, mensuration, constitution of Switzerland. 2. In every town a similar school, with three hours' instruction per week; in these schools agriculture should form an additional subject of instruction. 3. In every town a similar school for girls, where instruction would be given in female work, housekeeping, horticulture, nursing infants and sick persons. The estimated expenses of all these schools would be 20,000 francs, of which the state would have to pay 12,000 and the town the remainder. There is every prospect that within a few years these measures will be carried out.

A TEACHERS' JUBILEE.

At the town of Bremgarten, Mr. Kottmann celebrated the fiftieth anniversary of his having entered the teachers' profession. It is of rare occurrence that a man will be able to stand the wear and tear of fifty years' service as a teacher, and it was, therefore, but a fit tribute that the whole town united in doing honor to this veteran on his festival day.

APPENZELL.

(Area, 152 square miles. Population, 60,635.)

STATISTICS.

This canton has, since 1597, been subdivided into two half-cantons, viz, Appenzell-Exterior, with 48,726 inhabitants, mostly Protestants, and Appenzell-Interior, with 11,909 inhabitants, mostly Roman Catholics. The former has a well-regulated system of public schools, while the latter for a long time had only one elementary school, the scattered population (there being no towns or villages scarcely, but scattered farm-houses) being unfavorable to an organized system of schools. Of late years great exertions have been made in Appenzell-Interior for the improvement of public instruction. Since 1857 attendance at school has been made compulsory, the salaries of the teachers have been raised, and school-regulations published. According to last accounts the number of obligatory schools was 20, with 1,180 scholars. The salaries of the teachers vary between 850 and 300 francs. The examination of recruits showed the following results:

The total number of recruits examined was 77; the subjects of examination were reading, writing, and arithmetic. The result was the following:

	Reading.	Writing.	Arithmetic.
Good	9	15	14
Tolerable	19	20	22
Poor	32	28	27
Utterly ignorant	17	14	14

In Appenzell-Exterior the total number of scholars was 9,538, viz: 6,142 in the elementary schools; 2,867 in the repetition-schools; 390 in the real-schools; and 139 in the orphan-school. The cantonal school (secondary) had 70 scholars. There is at present no teachers' seminary in the canton, but 12 students are sent to the seminary of Kreuzlingen, canton of Thurgovia.

The total number of recruits examined was 154

The result of the examination was the following:

	Reading.	Writing.	Arithmetic.
Very good	79	59	33
Good	48	41	40
Tolerable	22	47	34
Poor	5	27	21
Ignorant	0	0	26

GENERAL TEACHERS' CONFERENCE.

At the general teachers' conference, held in May, it was resolved to petition the government, 1. To lengthen the time of the elementary school; 2. To establish more repetition-schools, with a longer and more thorough course.

BASLE.

(Area, 184 square miles. Population, 101,887.)

Since 1833 this canton is subdivided into two half-cantons, viz: Basle, city, and Basle, country, which will be treated separately.

A.—Basle, city, 47,760 *inhabitants.*

STATISTICS.

Primary schools.—The elementary boys' schools comprised 19 classes, with 965 pupils, and the elementary girls' schools, 34 classes, with 1,519 pupils. The country districts (3 townships) numbered 16 classes, with 429 pupils, (186 boys and 243 girls.) Besides these public schools, there were the following private institutions: A Catholic boys' school, with 6 classes and 373 pupils; a Catholic girls' school, with 5 classes and 399 pupils; a factory-school, with 75 scholars; a French repetition-school, with 36 pupils; an agricultural elementary school for indigent children, with 22 pupils; 13 private elementary schools, mostly for girls, with 417 pupils; and the city orphan-school, with 102 pupils, 51 boys and 51 girls.

Secondary schools.—The classical gymnasium (*humanistisches Gymnasium*) has 6 classes and 383 pupils; the real-gymnasium, 5 classes, with 410 pupils; the real-school, 4 classes, with 483 pupils; the high school for ladies, 6 classes, with 464 pupils.

Superior schools.—The pedagogium, 3 classes, with 62 students, varying in age from 14 to 20 years; the industrial school, 4 classes, with 129 students; the university, 129 students, instructed by 41 professors.

Total of persons under instruction in Basle, city, 6,250.

SCHOOL-FINANCES.

Amount of university-fund, 1,790,000 francs; value of university buildings and collections, 504,000 francs; annual expenditure for the university, 204,300 francs, of which sum the state pays 128,800 francs; total annual expenditure of Basle, city, for public instruction, 363,377 francs, or one quarter of the whole annual expenditure of the state.

TEACHERS' PENSIONS.

Basle, city, pays the largest pensions to teachers' widows and orphans. The pensions vary from 150 francs to 450 francs annually, according to length of service. The total sum paid for pensions was 6,009 francs.

SCHOOL-HYGIENE.

A special committee was appointed during the year to examine the sanitary condition of the schools. The result of their investigations was published, and treats of the school-benches, size of the school-rooms, lighting, ventilating, and heating. The committee condemned the use of iron stoves and recommended heating by warm water.

B.—Basle, country, population, 54,127.

DRAUGHT OF A NEW SCHOOL-LAW.

A draught of a new school-law was prepared by School-Director E. Frey. It is very elaborate, was universally considered eminently practical and progressive, and there is every probability that it will be adopted by the legislative assembly of the canton. The school-age of boys will be from 6 to 18, and that of girls from 6 to 11 years.

CANTONAL TEACHERS' UNION.

This union celebrated the twenty-fifth anniversary of its existence. It numbers 119 members. It is a peculiar feature of this union that all the clergymen of the canton are members; and that, in spite of this canton having been the first to introduce the separation of church and school, there exists the utmost harmony between teachers and clergymen.

SCHOOL-EXPENDITURE.

The annual expenses for public instruction amounted to 31,700 francs, the greater part of which is borne by the towns themselves.

ILLITERACY OF CONSCRIPTS.

During the year 209 conscripts were examined. Not one of them was unable to read fluently. As regards writing, 23 could only write very poorly, 96 tolerably well, 78 well, and 12 very well. There was not one who was entirely ignorant of writing. In arithmetic 43 did poorly, 76 tolerably well, 68 well, and 14 very well.

BERNE.

(Area, 2,561 square miles. Population, 506,455.)

GENERAL STATISTICS.

Teachers' seminaries.—Two for male teachers, with 160 students, and 2 for female teachers, with 45 students. Besides the teachers coming from these seminaries, 48 persons who had studied at other institutions received teachers' certificates.

Primary schools.—One thousand five hundred and forty-two, with 88,645 scholars and 1,530 teachers, (1,077 males and 453 females.) The highest number of scholars in one school is 116, the smallest 12, and the average 57.

Secondary schools.—Thirty-seven secondary schools, with 2,153 scholars, (939 girls and 1,214 boys,) and 100 teachers, (male and female;) 5 progymnasia, with 373 scholars and 42 teachers; 3 cantonal schools, with 622 scholars.

Superior schools.—One university, with 282 students, (theology, 31; law, 66; medicine, 108; philosophy, 53; veterinary surgery, 24.)

Special schools.—Ten industrial schools, with 350 scholars and 40 teachers; 42 infant-schools; and 80 private schools, with 4,687 scholars.

ILLITERACY OF CONSCRIPTS.

Of 1,441 conscripts that were examined, 2.8 per cent. were unable to read; 2.7 per cent., unable to write; 7 per cent., unable to cipher.

TEACHERS' UNION.

At a meeting of the Berne Teachers' Union, the following were among the subjects discussed: Every school should be thoroughly examined at least once a year; the school-inspectors and the teachers of the seminaries should hold conferences from time to time, &c.

SCHOOL-EXPENDITURE.

The total sum expended during the year for educational purposes amounted to 1,207,600 francs, viz: 597,500 francs for primary schools, 95,600 for teachers' seminaries, &c. The total expenditure of the canton was 11,450,000 francs, so that more than one-tenth was appropriated for school-purposes.

ELECTION OF TEACHERS.

The election of teachers by the people took place for the first time in Berne last year. The daily press strongly exhorted the people not to be led by any political reasons in this election, but, in spite of this, several excellent teachers were not re-elected, thus again showing the injustice of such an election.

THE VICTORIA INSTITUTION.

The Victoria Institution for Poor Girls at Wabern, near Berne, a private establishment founded by J. R. Schnell von Burgdorff, celebrated its tenth anniversary. During the ten years of its existence, 138 poor girls had been educated there, and the property of the institution amounted to 692,000 francs.

FRIBOURG.

(Area, 563 square miles. Population, 110,822.)

NORMAL SCHOOL AT HAUTERIVE.

According to the last programme received from this school, it combines a teachers' seminary and an agricultural school. The only education demanded from scholars entering is that received at the primary schools. The course of instruction embraces two years. Till quite recently the school had no special "practice-school," and if a repetition-course is to be held, the teachers are combined with the first class of the scholars. There were 62 students, of whom 19 participated in the repetition-course. The number of teachers was 3. The monthly fee for board and tuition is 30 francs for those that intend to become teachers, while others have to pay 50 francs. The privilege of the smaller fee obliges a ten-years' service as teacher.

GENEVA.

(Area, 91 square miles. Population, 93,195.)

PROPOSED REVISION OF THE PUBLIC-SCHOOL LAW.

The cantonal council has taken the necessary steps for the draught of a new school-law. The first step was to get the views of the teachers on the subject, and for this purpose each teachers' conference throughout the whole canton had one chapter of the draught sent to it for discussion and suggestions. According to the old law, instruction in the elementary schools was gratuitous and non-obligatory. A great number of schoolmen now demand the same for all the schools, (also the secondary and superior,) which, if carried out, would involve an increased expenditure of 400,000 francs per annum. Another new proposition is to take the superintendence of education entirely out of the hands of the government and give it to a number of fathers of families especially elected for that purpose. So far no definite result has been arrived at.

GLARIS.

(Area, 279 square miles. Population, 35,151.)

SCHOOL-EXPENDITURE.

The expenses for educational purposes only amount to 16,000 francs, while the total state expenditure was 152,000 francs. Most of the school-expenses in this canton are met by the towns themselves.

TEACHERS' PENSION-FUND.

The cantonal school-board resolved to discontinue the system of paying pensions to teachers from the cantonal treasury, but to make the existing Teachers' Widows and Orphans' Union more useful by making it obligatory for all teachers to join this union, and by raising the amount of contributions.

GRISONS.

(Area, 2,968 square miles. Population, 91,782.)

SCHOOL-EXPENDITURE.

The annual expenditure for public instruction during the last year amounted to 119,748 francs.

SECONDARY INSTRUCTION.

The cantonal school consists of a preparatory school, a gymnasium, and a real-school. The preparatory school numbered 13 pupils, the gymnasium 49, and the real-school 114. The teachers' seminary connected with the institution numbered 70 students.

LUCERNE.

(Area, 587 square miles. Population, 132,338.)

STATISTICS.

The number of primary schools is 249 and the number of teachers 246, (234 males and 12 females.) The lowest salary paid to teachers is 650 francs, and the highest 850; this is an improvement, as in former years the lowest salary paid was but 450 francs. The Teachers' Widows and Orphans' Society numbers 265 members and its funds amounted to 58,800 francs. The government annually contributes 1,500 francs. The total annual government expenditure for educational purposes was 209,138 francs.

THE NEW SCHOOL-LAW.

The new school-law, adopted in 1869, has gone into practical operation. It extends the school-age from the sixth to the fifteenth year, makes gymnastics obligatory, and entirely re-organizes the girls' industrial schools. Instead of the former cantonal school-inspector there are now four district school-inspectors for the four districts of the canton. Of the 114 school-counselors, 73 are laymen and 41 clergymen. In 1870 a normal course of gymnastics was instituted for teachers in primary schools, as likewise a normal course for teachers in girls' industrial schools. There is also a so-called recruit-school where an opportunity is offered to recruits to gain the necessary rudiments of learning. The result is satisfactory, and there are at present but few recruits who can neither read nor write.

NEUCHATEL.

(Area, 280 square miles. Population, 97,284.)

TEACHERS' SALARIES.

According to the new school-law the maximum salary of teachers has been fixed at 2,100 francs, and the minimum at 1,200; for female teachers the maximum is 1,300 and the minimum 1,000. In discussing the question of salaries, several speakers strongly advocated an equality of salaries, so as to make no difference between male and female teachers, but, the majority being of an opposite opinion, the motion was lost.

SCHAFFHAUSEN.

(Area, 119 square miles. Population, 37,721.)

COURSES OF INSTRUCTION FOR TEACHERS.

A peculiar sign of the times are the instruction-courses for teachers who are already employed as such. These courses are essentially different from the former "repetition-courses," in which subjects taught at the teachers' seminary were merely repeated by introducing new subjects. Besides this, there have been special courses in vocal music, and courses of instruction in female work for teachers in the female industrial schools. The expenses occasioned by these courses are borne in common by the cantonal and communal authorities. It is now intended to appoint itinerant lecturers, who are to hold a two-weeks' course of lectures on agriculture in various places, for the special benefit of teachers.

SCHWYZ.

(Area, 338 square miles. Population, 47,705.)

GRATUITOUS INSTRUCTION.

The question of abolishing all school-fees was pending before the cantonal council, but no definite result had been arrived at. Various petitions were made to the council in this direction, some of the petitioners advocating entire abolition of school-fees, while others proposed a graduated scale of school-fees, according to the pecuniary means of the parents, letting the children of the indigent attend school without any payment whatever, while the others would have to pay from 2 to 60 francs.

STATISTICS.

The number of elementary schools is 103, with 5,915 pupils; the number of teachers is 97, (61 males and 36 females;) of these 60 are laymen, 4 clergymen, and 33 members of religious sisterhoods. The teachers' seminary numbered 27 students.

SOLEURE.

(Area, 254 square miles. Population, 74,713.)

EXPENDITURE FOR EDUCATION.

The sum appropriated for educational purposes by the cantonal authorities amounted to 167,803 francs, (while the total cantonal expenses were 1,410,000,) divided as follows: administration, 6,788 francs; cantonal school, (secondary school,) 53,855; district-schools, (higher elementary schools,) 25,500; primary schools, 69,800; teachers' seminary, 11,860.

STATISTICS OF ILLITERACY.

Of 397 recruits who were examined, 316 wrote tolerably, 73 wrote poorly, and 8 could not write at all; in arithmetic, 189 could do a sum in fractions correctly, 182 incorrectly, and 46 could not do it at all; 351 could read well.

PRIVATE EDUCATIONAL ESTABLISHMENT.

Since 1865 Soleure possesses a most excellent boarding-school for youths between the ages of 9 and 18, in the institution of M. W. Breidenstein, in Grenchen, near the city of Soleure. This school, sanctioned by the cantonal authorities, is conducted in the true Pestalozzian manner, and its pupils come from all parts of the civilized world. It is one of those schools which can safely be recommended to American parents who wish to give to their children a liberal European education. The terms of this school are 1,500 francs ($300) per annum, everything included except piano-lessons.

ST. GALL.

(Area, 747 square miles. Population, 191,015.)

CITY OF ST. GALL.

This city, of 10,000 inhabitants, expended 137,000 francs annually for her schools, and the school-property amounted to 1,554,000 francs.

TEACHERS' SALARIES.

The salaries of teachers being in most cases very insufficient, endeavors were made in the various district conferences to raise them, but these endeavors were only successful in a few isolated cases; thus, some villages in the district of Toggenburg voluntarily raised their teachers' salary from 1,000 francs to 1,200.

TESSIN.

(Area, 1,034 square miles. Population, 119,620.)

STATISTICS.

The number of elementary schools is 467, with 15,021 scholars, while the number of children of school-age is 18,895. The number of teachers is 467, viz: 240 males and 227 females. The salaries of the teachers are entirely insufficient, so that during the last three years 150 teachers left the profession and sought other employment. The teachers' courses, held every year for the benefit of elementary teachers, were attended by 110, viz: 30 males and 80 females. During the years 1857 to 1869, these courses were attended by 2,247 persons, viz: 1,156 males and 1,091 females, and of this number 1,787 obtained teachers' certificates. The cantonal government during this same period expended about 100,000 francs for these courses, so that the average expenditure for the education of one teacher was about 56 francs.

Besides the primary schools there are 62 so-called "repetition-schools," (for the ben-

efit of adults;) 22 private schools, with 44 teachers; 6 infant-schools, with 10 teachers; 5 gymnasia, with 26 professors and 293 scholars; 9 drawing-schools, with 12 teachers and 395 scholars; 8 higher schools for boys, with 10 teachers, and 10 higher schools for girls, with 10 teachers, with a total of 484 scholars; and 1 lyceum, (superior school,) with 16 students. The total number of teachers of all grades is 614, or 1 to every 190 inhabitants. The annual expenditure for the lyceum and for gymnasia was 44,400 francs, and that for the higher schools 16,000 francs. The salaries of teachers in the elementary schools vary between 300 and 600 francs; those of the higher schools, between 1,300 and 500 francs; those of the gymnasia, between 1,100 and 1,600 francs; and those of the lyceum, between 1,600 and 2,000.

TEACHERS' SEMINARY.

The teachers of the canton all receive their education in the above-mentioned courses, but the establishment of a teachers' seminary is seriously contemplated; and in order to carry out this plan it is proposed to abolish one gymnasium and use the money thus saved for a seminary.

THURGOVIA.

(Area, 268 square miles. Population, 93,300.)

NEW SCHOOL-LAW.

The draught of a new school-law, approved by the teachers' conference of Thurgovia, was discussed by the cantonal council, without any definite result as yet, but there is every probability that the law will be passed. The chief points are: attendance at school is made obligatory for all children between the ages of 6 and 15; in special cases parents are permitted to retain their children at home till the age of 7; from the age of 6 till 12 every child must attend the every-day elementary school, and from the age of 12 to 15 the "repetition-school" in summer, and the every-day school in winter. Girls may leave school at the age of 14, but must, during the remaining year, attend the classes in singing and female work; six hours a week are devoted to instruction in the latter. No pupil is permitted to enter a higher school unless he has spent six years at an elementary school. The annual schooling is not to be less than 40 weeks, and not more than 42. During the first year at school, children are not to have more than 4 hours' school per day. The children of indigent parents are instructed gratis.

UNTERWALD.

(Area, 262 square miles. Population, 26,116.)

DEATH OF AN EMINENT FRIEND OF EDUCATION.

On the 2d of June, 1871, there died, at the village of Emmeten, the Rev. Niederberger. He spent his whole life as a simple country-parson, in the seclusion of an Alpine valley, but his influence was felt far beyond the narrow confines of his congregation. Poor himself, and with but a small salary, he was obliged to turn to others for money to carry out his benevolent plans, and for many years all his spare time was employed in wandering from town to town to collect money for the schools of his native canton. Thus he collected a sum of upward of 30,000 francs, which he used in endowing poor schools, founding new ones, for text-books and apparatus, and for assisting indigent teachers. The cantonal government honored him by passing a special vote of thanks to him, and by presenting him with a gold medal.

URI.

(Area, 422 square miles. Population, 16,107.)

THE CANTONAL SCHOOL AT ALTORF.

According to the last report, this school had two divisions, viz: a gymnasium with 5 classes and 15 scholars, and a real school with 3 classes and 20 scholars. Some branches of instruction are common to both. There are 4 teachers and 1 assistant. Instruction in Italian, drawing, penmanship, and singing is optional.

VALAIS.

(Area, 1,661 square miles. Population, 96,887.)

No report has been received from this canton.

VAUD.

(Area, 1,181 square miles. Population, 231,760.)

TEACHERS' SEMINARY.

The canton possesses a teachers' seminary (*école normale*) at Lausanne, in two divisions, viz: one for males and one for females. The course in the male division occupies four, and the one of the female division two years. No person is admitted as a student who is younger than 16 years of age. There are stipends varying between 20 centimes and 1 franc per day. Persons enjoying such stipends are obliged to go through the whole prescribed course, and afterward teach for at least two years in some public school. If these conditions are not complied with, half of the stipend must be refunded. There is no regular practice-school connected with the seminary, but opportunity is given to the students of the highest class for practicing teaching in the lowest class of the seminary. Great attention is paid to the instruction in modern languages, and agriculture and hygiene are combined with the instruction in natural sciences. The school-plan is arranged in the following manner:

	Male-teachers' division.					Female-teachers' division.		
	Class I.	Class II.	Class III.	Class IV.	Total.	Class I.	Class II.	Total.
	Hours.	*Hours.*	*Hours.*	*Hours.*	*Hours.*	*Hours.*	*Hours.*	*Hours.*

ZUG.

(Area, 85 square miles. Population, 20,993.)

STATISTICS.

The number of primary schools is 51, with 2,212 scholars and 55 teachers, viz: 34 male and 21 female. Of this number 25 are lay and 30 clerical, so that the schools are pretty well under the influence of the clergy. The cantonal government contributes annually 3,419 francs toward the primary schools. The number of "repetition-schools" is 19, with 486 scholars. Of secondary schools there are 4, with 14 teachers and 130 scholars. There is one cantonal school, comprising a gymnasium, with 20 scholars, and a real-school with 32 scholars. The total number of teachers of all grades is 97, and the sum-total of their salaries amounts to 37,700 francs per annum. Toward the total sum expended for public instruction, the towns contributed 40,330 francs and the cantonal government 13,450 francs. The school-funds of all the towns amounted to 428,545 francs, of which 243,933 belonged to the city of Zug, with about 4,000 inhabitants.

ZURICH.

(Area, 685 miles. Population, 284,786.)

STATISTICS.

The number of primary schools is 366, attended by 32,466 scholars, and with 571 teachers; there are 334 female industrial schools, with 348 teachers and 9,860 scholars. The number of secondary schools is 59, with 92 teachers and 2,606 scholars, viz: 1,786 boys

and 820 girls. Besides these there are 25 industrial schools for apprentices, subsidized by the cantonal government, 24 private schools for adults, 31 private schools of different grades, (among which there are 3 reformatories.) There is also 1 teachers' seminary, with 131 students. The cantonal school numbered 348 scholars, viz: 206 in the gymnasium, and 142 in the real-school. The university had 352 students and 78 professors. Thus the total of teachers of all grades is about 1,000, and that of scholars 69,252.

The primary-school fund amounts to 5,262,000, and the secondary-school fund to 581,000 francs, making a total school-fund of 5,843,000 francs. The cantonal government contributes 271,216 toward the primary schools, 15,812 toward the secondary schools, and 17,202 francs toward teachers' pensions; 3,575 francs were appropriated for the education of teachers in secondary schools.

STATISTICS OF ILLITERACY.

The annual examination of recruits showed the following results: Of 1,440 recruits who were examined 301 could read very well, 634 well, 414 indifferently, 83 but poorly, and 8 could not read at all; 167 could write very well, 461 well, 562 indifferently, 245 but poorly, and 5 could not write at all; 302 could do arithmetic very well, 582 well, 391 indifferently, 160 but poorly, and 5 had no knowledge of it at all.

OBJECT-LESSONS.

The educational council of the canton had determined some time ago to publish a large work on the subject, comprising about 100 plates, and Mr. Wettstein was commissioned to prepare it. The work was completed in July, 1871, and is divided into three parts, viz: Botany, zoology, and natural philosophy. The price of the work is 45 francs.

PESTALOZZI SOCIETIES.

The Pestalozzi Society at Schlieren, which aims at a reform of morally-neglected children, numbered 26 pupils in its institution, which has two divisions, viz, a primary and a secondary one.

The Pestalozzi Society in Waedensweil, existing for twenty-five years, has for its object the clothing of poor children of school-age. The society has 377 members, and has, during the twenty-five years of its existence, distributed clothes to 2,754 poor children, amounting in value to 21,600 francs.

FEMALE STUDENTS AT THE UNIVERSITY.

There are at present 20 female students at the Zurich University, most of whom study medicine.

THE FEDERAL POLYTECHNIC SCHOOL.

The only educational institution which is under the authority of the federal government is the Federal Polytechnic School at Zurich, founded in 1855, and located in a magnificent building on a height overlooking the city. The school undoubtedly ranks among the best in Europe, both by the large number of prominent men of science among its teachers and by its very excellent apparatus and libraries.

SCHOLASTIC YEAR.

The scholastic year commences in the middle of October, and is divided into two terms, the winter-term lasting till the end of March, and the summer-term commencing about the middle of April.

CONDITIONS OF ADMISSION.

Every candidate for admission must, by the 10th of October at the latest, hand in to the director the following papers:

1. A written application for admission, containing full name and birthplace of the candidate, and the studies he wishes to pursue.
2. A written permit from parents or guardians.
3. A passport or certificate of birth, showing that the candidate is 17 years of age.
4. A certificate of good moral conduct, signed by the authorities of the school or college which the candidate has attended.
5. Certificates regarding the studies hitherto pursued.

FEES.

Every student on entering must, without fail, pay the following fees to the treasurer in the week between the 23d and 28th of October: 100 francs lecture-fees; 5 francs for the library; 5 francs for the sick-fund; 5 francs inscription fee; 40 francs for use of the laboratory; 10 francs for the metallurgic laboratory; 5 francs for the model-workshop; and from 12 to 20 francs for the physical cabinet—total, from 182 to 190 francs.

DIFFERENT SCHOOLS.

The polytechnic school is subdivided into the following 8 schools:

1. School of architecture, with a course of three years.
2. School of engineering, with a course of three years and a half.
3. Mechanico-technical school, with a course of three years and a half.
4. Chemico-technical school, with a course of two years and a half.
5. School of agriculture and forestry, in two divisions:
   - *a.* School of forestry, with a course of two years.
   - *b.* School of agriculture, with a course of two years.
6. School of mathmatics and natural sciences, in two divisions:
   - *a.* School of mathematics, with a course of three years.
   - *b.* School of natural sciences, with a course of three years.
7. General school of philosophy and political economy, in five divisions:
   - *a.* Natural sciences.
   - *b.* Mathematical sciences.
   - *c.* Philology and literature.
   - *d.* Historical and political sciences.
   - *e.* Fine arts.

To give a better idea of the subjects lectured on in this seventh division, we extract from the programme of the school for the winter-term of 1871–'72 the subjects of subdivisions *c*, *d*, and *e*.

c. Philology and literature.

History of the German theater, with a comparative view of the modern stage of other nations, 2 hours per week.
Reading and explanation of the second part of Göthe's Faust, 1 hour per week.
The works of the modern Italian poets Leopardi and Niccolini, 2 hours per week.
Italian language, 4 hours per week.
The English literature of the present century, 1 hour per week.
Shakespeare's "Merchant of Venice," 2 hours per week.
Wordsworth's poems, 1 hour per week.
English language, 2 hours per week.
Modern French historical and poetical writers, 2 hours per week.
French language, 3 hours per week.
Shakespeare's great dramas, (by another professor,) 3 hours per week.

d. Historical and political sciences.

History of the age of Frederick the Great and of the French revolution, (1740–1800,) 3 hours per week.
History of the French-German war of 1870–'71, 2 hours per week.
History of ancient art from Egypt to Pompeii, 4 hours per week.
History of modern painting from the discovery of oil-painting, 2 hours per week.
Political economy, 3 hours per week.
Financial science, 2 hours per week.
History of commerce and industry during the last one hundred years, 1 hour per week.
Swiss constitution, 2 hours per week.
History of Swiss art, 2 hours per week.
History of Hungary from the battle of Mohacs (1526) till the complete expulsion of the Turks, 1 hour per week.
Commerce, industry, and private and social life in Rome during the time of the emperors, 2 hours per week.

e. Fine arts.

Ornamental drawing and decorations, 4 hours per week.
Landscape-drawing in water-colors, Indian ink, and lead-pencil, 4 hours per week.
Figure-drawing, 9 hours per week.
Exercises in modeling and stone-cutting, 9 hours per week.

8. Preparatory class of mathematics, with a course of one year.

STATISTICS.

The number of professors and private professors (*Privatdocenten*) is 64. The total number of matriculated students was 648, besides 281 "*Auditoren*," *i. e.*, persons attending some special lectures. The students were distributed in the following manner:

Name of school.*	Swiss.	Foreigners.	Total.
School of architecture	20	5	25
School of engineering	53	177	230
Mechanico-technical school	59	82	141
Chemico-technical school	28	48	76
School of agriculture and forestry	15	2	17
School of mathematics and natural sciences	34	2	36
Preparatory class	23	100	128
Total	232	416	648

*The general school of philosophy and political economy has not been mentioned in the above table, as students from all the other schools, enumerated at the same time, attend lectures in this school.

Of the 232 Swiss students, the largest number (64) are from the canton of Zurich; Argovia follows next with 24 students; and the smallest number (1) is from the canton of Uri.

The foreigners are distributed in the following manner:

Country.	School of architecture.	School of engineering.	Mechanico-technical school.	Chemico-technical school.	School of agriculture and forestry.	School of mathematics and natural sciences.	Preparatory class.	Total.
Germany		14	11	13		1	12	51
Austria	5	92	42	16			40	195
Russia		34	8	7	1		20	70

FEDERAL ACTION WITH REGARD TO THE JESUITS AND OTHER RELIGIOUS SOCIETIES.

On the 11th May, 1871, the federal revision-committee (to revise the federal constitution) passed the following resolutions: "No person is obliged to pay anything for church-purposes to any sect or religion of which he is not a member. Religious dogmas do not free any one from the fulfillment of his duties toward the state. The federal and cantonal authorities are empowered to uphold peace between the different religious denominations, and to protect officers of the government and private citizens against any encroachments on their rights by the ecclesiastical authorities. The Order of the Jesuits and the religious societies affiliated with it cannot reside in any portion of Switzerland, and their members are forbidden any and every interference in church and school. The establishment of new convents and the re-establishment of defunct convents are forbidden."

COMPULSORY EDUCATION.

The national council (the legislative power) at Berne, after a lengthy discussion, on the 22d December, 1871, passed a resolution that the cantonal authorities should be

obliged to introduce compulsory and gratuitous instruction in all the primary schools, but that the federal authorities should be empowered to fix the minimum of education in the primary schools of all the cantons by suitable laws.

TURKEY.

(Absolute Monarchy—Empire, (Sultanate.) Area: Turkey in Europe, 207,438 square miles; Turkey in Asia, 660,870 square miles; Turkey in Africa, 943,740 square miles—total, 1,812,048 square miles. Population: Turkey in Europe, 16,035,000; Turkey in Asia, 16,463,000; Turkey in Africa, 10,000,000—total, 42,498,000.)

Minister of public instruction, AHMED VEFIK-EFFENDI.

LECTURES ON TURKISH LAW.

In order to further a higher standard of education, the government has established an annual course of lectures on Turkish law.

PRIZES FOR TURKISH TEXT-BOOKS.

The government has likewise set prizes for the best text-books written in the Turkish language. The highest prize ($576, gold) will be given for a Turkish grammar; 11 first prizes and 11 second prizes will be given for text-books on morals, history, biography, geography, poetry, orthography, reading, and writing. The lowest prize is to be $144, gold. It is the intention of the government to make the schools more and more national, and to abolish the old Arabian system. It is hoped that thereby the historical, biographical, and poetical works of Turkish literature will be made more popular, which hitherto were only known and read in the houses of the rich.

THE IMPERIAL LYCEUM.

The Imperial Turkish Lyceum at Galata-Serai, founded by the present Sultan, Abd-ul-Aziz, is under the direction of M. de Salve, formerly director of the College of Marseilles, France. The language of instruction is French. The scholars, who are admitted irrespective of religious creed, are to receive a higher scientific education, so as to prepare them for all branches of the civil service. The course of studies lasts 10 years, 3 of which are spent in the preparatory classes, 6 in the course proper, and 1 in a special course. The number of professors, exclusive of the director, is 40. The organization is entirely military, and all the students are uniformed.

EDUCATION IN SERVIA.

Servia is a tributary state, with a population of 1,216,186. It is an almost independent principality, with a ministry and an army of its own. The Servians are a very promising race, and Servia is by many considered the "state of the future" of the Balcan Peninsula—the nucleus of a future great empire. The minister of ecclesiastical affairs and public instruction is D. Matitch. The Servian congress, in May, 1871, unanimously passed the new school-law, re-organizing the whole system of public instruction from the highest to the lowest grade, making education compulsory, and establishing several teachers' seminaries. The first seminary has been established in Kragujevacs, and Stephen Popovits, a gentleman who has received his education in Germany, was appointed director. Two more seminaries are to be established at Zombor and Pakracz, both of which are to be for male and female students. Congress has, in the most liberal manner, appropriated the necessary sums of money to carry out all these measures.

AMERICAN MISSIONARY COLLEGES.

New colleges are springing up now, about as common schools did a century ago, and they are now the cheering signs of advancing civilization and intelligence, just as common schools were once. The missionaries are about to establish a college for Armenians at Aintab, in addition to the two which they have in flourishing progress, Roberts College, in Constantinople, and Syrian College, at Beirut.

THE TURKISH PRESS.

From a very interesting letter, by Dr. A. D. Mordtmann, in Constantinople, written in November, 1872, to the weekly journal Ueber Land und Meer, (Over Land and Sea,)

published at Stuttgart, Germany, we gather the following facts concerning the Turkish press:

Formerly the periodical press of Turkey was under the strictest government supervision, (*Censur.*) In 1865 a new press-law was promulgated, fashioned after the French imperial model, according to which journals, in case of giving offense to the government, were first warned, then suspended, and finally suppressed. This law was, however, again declared null and void during the Cretan insurrection, in 1867, and since then the Turkish press is exposed to the most arbitrary measures.

The oldest of all the journals is the official government paper, Takvim ül Vakajé, published entirely in the Turkish language, and appearing at very irregular intervals, sometimes not oftener than once a month.

There are other government papers, viz: Hakaik ül Vakajé, (The Truth of Events,) a semi-official paper, likewise in the Turkish language; Dsheri dé-i Askerié, (The Military Journal,) the official organ of the war ministry; and Dsheri dé-i Tibbié-i Askerié, (Journal of Military Surgery and Medicine,) published monthly.

Opposition papers in the Turkish language are Bassiret, (Wit,) Dsheri de-i Havadic, (Journal of News,) Ibret, (The Model,) and Devr, (The Epoch.) Of these the Ibret is at present suspended, and the Devr, which on the 29th August, 1872, appeared for the first time, was immediately suspended, on the following day, for one month, so that, in the full sense of the word, it can be called ephemeral. All the above-mentioned journals are published in Turkish. There are several journals published in Turkish and some other European language: the official journal of the ministry of commerce, published weekly under the double title Takoim ül Tydsharet and Moniteur du commerce, and Diogenes, a weekly satirical journal, published once a week in French, once in Armenian, once in Greek, and once in Turkish. El Dshewaib (The News) is a paper published in Arabic, and edited in a very able manner by a Syrian, Ahmed Faris Shiddiak Effendi; in Constantinople it is read but little, but has a large circulation in Syria, Egypt, and Tunis.

Of considerable importance are the journals published in French and English. The oldest of the former is the Courier d'orient, established in the first quarter of the present century. It is the organ of the French legation, and is edited in an ultramontane Roman Catholic spirit. The Turquie (formerly Journal de Constantinople) is a semi-official government paper, edited by a Roumanian, Mr. Bordeano. The Phare du Bosphore, edited by a Greek from Alexandria, Mr. Kyriakopulo, is an able paper; it is decidedly anti-French, favoring Germany, an enthusiastic defender of the Greek interests, and untiring in its warfare against the Roman Catholic church and the Jesuits. The Union d'orient, edited by a French physician, Napoléon Delonguy, is an insignificant paper. The Orient illustré is a weekly illustrated journal, edited by a Greek, de Roïdi, and two French Jesuits, Portier and Bouge. It is difficult to decide which is worse in this journal, the reading-matter or the illustrations (lithographic.) The Gazette médicale is a good scientific journal, the organ of the Medical Society of Constantinople, and is published monthly.

Of English papers there are two, viz: The Levant Herald, published daily, half in English and half in French, but every Wednesday entirely in English. It was formerly edited by an English lawyer, McCoan, who, in September, 1872, sold it to a bank in Constantinople. Its present editor is Mr. Whitacker. It is undoubtedly one of the best journals published in Turkey. The Levant Times is likewise published in English and French. Its editor is Mr. Laffan Hanly, and it is mainly devoted to the shipping interest.

The following are the journals published in the Greek language: Ἀνατολικὸς Ἀστηρ, (The Star of the Orient,) the official organ of the patriarch of the Greek church at Constantinople; and Βυζάντις, a semi-official government paper. All the other Greek journals, viz, Κωνσταντινούπολις, Νεόλογος, Τύπος, (The Press,) and Θεάτης, (The Spectator,) are more or less opposition papers. Another journal, Ἀνατολὴ, is published in the Turkish language, but in Greek letters; it is a well-edited journal, and is the organ of the Greeks in Asia Minor. Ευρυδικη is a literary journal.

The Armenian press of Constantinople is exceedingly active, and has contributed much toward the general progress of the nation. The Armenian journals are: Massis, (Ararat,) the official organ of the Armenian patriarch at Constantinople, The Ararat, (Ararat,) The Orakir, (The Journal,) The Pogh, (The Trumpet,) the Jeprat, (The Euphrates,) the Mamul, (The Press,) the Meghu, (The Bee;) both the last-mentioned are satirical journals; the Manzumi-i-Efkiar, (The Order of Opinions,) and the Medshmua-i-Havadis, (The Collection of News,) are both published in the Turkish language, but with Armenian letters. Many, chiefly scientific articles, are however printed entirely in Armenian.

There are two journals in the Bulgarian language, viz: Turcia, a semi-official paper, and Makedonia, edited in the Pan-Slavistic interest, and lately suspended on that account.

There is finally a Jewish journal, the Journal Israilié, published in Spanish, but with Hebrew letters. It represents the Jewish interests, and is ably edited.

Some years ago there appeared in Constantinople a journal in the Persian language, the Türkistan, which, however, soon became defunct. The same fate befell a small German paper started a few years ago.

APPENDIX I.

GENERAL STATISTICS OF ILLITERACY ACCORDING TO MR. MANIER.

Mr. J. Manier, of Strasburg, has published a map showing the general illiteracy of Europe in different colors. Seven countries are very dark, viz: Russia, Poland, Moldavia, Wallachia, Spain, Portugal, and the late Papal Dominion.

In Russia there are 996 illiterates among every thousand of the population; in Poland, only 9 out of every 100 can read and write; in Spain, only 35 out of every 100 men and 14 out of every 100 women; in Italy, 32 out of every 100 men and 19 out of every 100 women; in Hungary, more than half of all the children of school-age do not attend any school at all; in Croatia, only 20 out of every 100 children of school-age attend school. The following countries are of a lighter color: Great Britain, Belgium, and France; the average of illiterates in these countries was below 50 per cent. Germany, Switzerland, the Netherlands, Denmark, Norway, and Sweden have the lightest color, for in these countries but few children can be found who do not attend school.

Comparative expenditure for war and education.

Country.	Out of every 1,000 francs of the annual expendture, there are paid—	
	For the army.	For education.
France	395	11
Prussia	276	14
Austria	270	19
Bavaria	219	22
Würtemberg	218	47
Saxony	214	37
Baden	182	33
Canton de Vaud, Switzerland	150	110

Sums expended for education per individual.

	Francs.
Russia expends for the education of each individual	0.29
Spain expends for the education of each individual	0.40
Italy expends for the education of each individual	0.41
France expends for the education of each individual	0.55
Great Britain expends for the education of each individual	1.19
Switzerland expends for the education of each individual	1.79

APPENDIX II.

COURSES OF INSTRUCTION IN VARIOUS SPECIAL SCHOOLS IN EUROPE.

Some of the countries of Europe possess various very excellent special schools, which are either entirely unknown with us, or exist only in a very imperfect condition. To illustrate the manner in which some of these schools are managed, the courses of instruction in some of the best of them are given below.

SCHOOLS OF FORESTRY.

Most European countries possess one or more of these important schools, which more than anything else have contributed toward the preservation and better cultivation of forests. Among the best schools of this kind are those of Austria, which possesses vast public and private forests. Instruction in forestry is divided into three grades, viz, lower, middle, and superior.

1. *Lower instruction.*—The aim of the schools of this grade is to prepare young men for assistant foresters and for superintendents of smaller private or communal forests. The instruction is given by an experienced forester and an assistant teacher. The course of instruction lasts from one to two years, and embraces the following subjects: forest calculations, practical geometry, botany, knowledge of animals useful and hurtful to forests, knowledge of game, arboriculture, most profitable methods of managing a forest, and composition. Five hours a day are devoted to theoretical instruction in the house, and at least ten hours to practical instruction in the forest. Conditions of admission are a good elementary education, age more than fifteen, good health, and moral conduct. Examinations are held in each study at the end of the course; if passed satisfactorily, a certificate to this effect is given. The fees for one year for board and instruction are 250 florins, and 10 florins extra for excursions—altogether, 260 florins.

2. *Middle instruction.*—The aim of these schools, of which there are two, is to prepare competent foresters and hunters. The course of instruction lasts two years and embraces the following subjects:

1*st year.*—History of forestry, arithmetic, algebra, theoretical geometry, trigonometry, stereometry, drawing of plans and maps, forestry, knowledge of game, entomology, botany, natural philosophy, chemistry, geology and mineralogy, natural and artificial cultivation of forests, practical exercises in making ocular estimates of the value of forests, forest business correspondence and book-keeping.

2*d year.*—Practical geometry, forest architecture, drawing of maps and plans, forest technology, knowledge of game, physiology of plants, forest business correspondence and book-keeping, forest and game laws.

The conditions of admission are, at least, an education as acquired in the lower classes of a gymnasium and a real-school, a satisfactory apprenticeship of at least one year with some practical forester, the age of 18, bodily health, good moral conduct, and written consent of parents or guardians. Examinations are held in each study every half-year, for each of which certificates are given. At the end of the whole course each student must pass a rigorous examination, for which a certificate is given, which enables him to enter the public or private forest-service. The annual fee for instruction alone is 40 florins.

3. *Superior instruction.*—This is given at the Imperial Academy of Forestry at Mariabrunn.

The aim of this academy is to give a thorough theoretical and practical instruction in forestry. It is under the immediate administration of the ministry of agriculture, and has one director and four professors. The course of instruction lasts three years, and embraces the following subjects:

1*st year.*—Mathematics, (5* hours per week;) descriptive geometry, (I, 6, II, 8;) chemistry, (10;) botany, (II, 6;) cultivation of forests, (*Forstbenutzung,*) (I, 5;) surveying of forests, (II, 6;) knowledge of game, (I, 4;) drawing maps of forests, (I, 4.)

2*d year.*—Mechanics and machinery, (7;) geodesy, (II, 9;) entomology, (I, 3;) knowledge of soil and climatology, (I, 5;) forest technology, (II, 5;) preservation of forests, (*Forstschutz,*) (I, 2;) cultivation of forests, (II, 9;) calculation of profits from forests, (I, 9;) forest-laws, (2;) drawing maps of forests, (I, 4.)

3*d year.*—Geodesy, (II, 11;) architecture, (7;) organization of forest administrations and calculations of value of forests, (I, 7;) arrangement of *personnel* of forest administrations, their duties, &c., (I, 2;) forest business-routine, (II, 4;) forest book-keeping, (I, 2;) drawing maps of forests, (I, 4;) political economy, (3;) agriculture, (2.)

The academy possesses a very valuable library, containing nearly all the works ever published on the subject of forestry, a chemical laboratory, a museum of natural history, a museum of forestry, a botanical and propagating garden, and the very extensive imperial forests in the immediate neighborhood for practical exercises.

The conditions of admission are as follows: All the students are either termed "ordinary" or "extraordinary" students, the former going regularly through the complete course of studies as prescribed in the programme, the latter only attending those lectures they wish to hear. The conditions for admission for students are a completed course in a real-school or a gymnasium, age 18, one year's apprenticeship with some forester, and pupils of gymnasium, besides sufficient advancement in geometrical and free-hand drawing. The fees are 50 florins per annum for instruction for ordinary students, or 1 florin 50 kreutzers per week for each lecture. The examinations are oral and written, embrace all the subjects taught at the academy, and are very strict. The final examination for office in the forest-service is made in two parts, between which there must be an interval of three months.

* There are two classes or divisions; where there is only one figure given the hours of instruction are in common to both; the figures I, II, denote that there is a difference in the number of hours of instruction for each class, as shown by the following figure.

SCHOOLS OF VETERINARY SURGERY.

As a good example of this kind of schools, we select the Imperial School of Veterinary Surgery at Vienna. The aim of this school is to educate veterinary surgeons for the army and the civil service, to further the science of veterinary surgery, to treat sick animals of every kind in its large and well-appointed hospital, and to be highest scientific authority in all legal cases where there is any question of veterinary surgery to be decided.

Course of studies.—The course of studies for students lasts three years, and for doctors of medicine and surgery who have obtained their degree at some university only two years. The course differs accordingly.

a. Course for students:

1*st year.*—Introduction to the study of veterinary surgery, (5 hours a week for 2 weeks;) descriptive, topographical, and surgical zootomy of all the domestic animals, and short review of the most important functions of the different organs, (5 hours;) natural philosophy and chemistry applied to veterinary surgery, (5 hours;) natural history, dietetics, and difference of races of all the domestic animals, (3 hours;) botany, as applied to veterinary surgery, (II*, 5;) theory of horseshoeing, (I, 2;) practical exercises in the dissecting-room and in the shop for horseshoeing.

2*d year.*—General pathology and pathological zootomy, (I, 5;) zoophysiology, (I, 2;) pharmacognosy and writing prescriptions, (I, 5;) breeding and raising of domestic animals, (II, 5;) use of instruments, methods of bandaging and harnessing, (II, 3;) agriculture, practical exercises in dissecting and horseshoeing.

3*d year.*—Special medical and surgical pathology and therapeutics, and attendance in the hospital for at least 1½ hours every day; operations and obstetrics, with practical exercises, (3;) veterinary surgical jurisprudence, and exercises in drawing up reports, (I, 2;) epidemics and sanitary precautions, with practical exercises in the hospital, (II, 5;) history and literature of veterinary surgery, (II, 1;) practical exercises.

b. Course for physicians and surgeons:

1*st year.*—Introduction to the study of veterinary surgery, zootomy, and zoophysiology; natural history, dietetics, and knowledge of the different races of domestic animals; botany applied to veterinary surgery; pharmacognosy; writing of prescriptions; use of instruments and bandages; agriculture; horseshoeing; breeding and raising of domestic animals; practical exercises in the dissecting-room and the horseshoeing-shop.

2*d year.*—General pathology and pathological zootomy; special medical and surgical pathology; therapeutics and clinics; operations; veterinary surgical jurisprudence; epidemics and sanitary precautions; history and literature of veterinary surgery; practical exercises.

The conditions of admission are Austrian citizenship; age not less than 17 and not more than 24; health and good moral conduct; a course satisfactorily completed at a lower gymnasium or a lower real-school. There are examinations at the end of every year and a rigorous examination at the end of the whole course, for which certificates are given, which entitle the student to a place as veterinary surgeon in the army or in the civil service. A special course of horseshoeing for private cavalry and artillery soldiers is connected with the school. Conditions of admission are only reading and writing and some little knowledge of horseshoeing. The course lasts two years; if completed satisfactorily, a certificate of "privileged horseshoer" is given.

SCHOOLS OF NAVIGATION.

All the sea-faring nations of Europe possess a number of these schools of different grades. We give below the organization of the School of Navigation at Stettin, Prussia.

This school is intended to train mariners and masters of merchant-vessels. It has a director, two professors, and an assistant, who teaches drawing. To be admitted to the lowest class, the candidate must be able to read and write, be acquainted with elementary mathematics, and must be able to write a fair composition in German. The lessons are given during 32 hours a week, and during three years, the first year being a course for pilots, while during the last two is taught the art of navigating the high seas. The course in pilotage embraces the following subjects: arithmetic, plane geometry, carpentering, plane and spherical trigonometry, navigation, terrestrial and astronomical observations, drawing of sea-charts and astronomical maps, and English. That of the higher division comprises the preceding studies carried further, rigging, drawing the different parts of a vessel, the commercial rules relative to ships' papers, and to the course of exchange at the principal commercial ports, &c.

On leaving school an examination is held, and a certificate of proficiency awarded to

*There are, as in the school of forestry, 2 classes or divisions; where there is only one figure, the hours are the same for both classes, and where there are two, the first indicates what class has the instruction, and the second how many hours.

those who pass it in a satisfactory manner. This certificate is the basis of all promotion to any of the different stations of command of a merchant-vessel. The fees, paid quarterly, are six thalers for the pilot's course, and ten for the higher course in navigation.

SCHOOLS FOR NURSES, (MIDWIVES.)

Of these, most countries of Europe possess a number, and no woman is allowed to practice as midwife unless she can show a certificate from one of these schools. Austria alone possesses eight such schools, and instruction of the same kind is also given to women at the faculties of medicine in the universities and at the schools of surgery. A large number of apprentice-midwives receive considerable pecuniary assistance during their studies from the provinces and townships. Candidates must be at least 24 years of age, and less than 50; must be able to read and write; be of good reputation, and of healthy constitution. The course of instruction occupies, according to circumstances, four, five, or six months. It is both theoretical and practical, and is given by a professor of obstetrics, aided by a midwife and a nurse. In most of the schools there are two promotions yearly. On leaving, the pupils have to undergo a severe examination, for which those who have the means pay a fee of 30 florins. In the Austrian schools for midwives more than 1,200 midwives are instructed every year.

II.—ASIA.

CHINA.

(Absolute Monarchy—Empire. China proper, area, 1,297,999 square miles. Population, 420,000,000.)

No report has been received this year.

INDIA.

(Area, 1,553,136 square miles. Population, 201,593,978.)

No proper report has been received, but from other reliable sources a few interesting facts are given.

STATE OF EDUCATION.

In India much has been done for an improvement in the state of public instruction, but by no means sufficient; for among a population of about 190,000,000 (in British India) only 622,342 children received instruction, which was given in public, semi-public, (subsidized by the government,) and private schools. Some rich Parsees, in Bombay, have spent considerable sums for benevolent and educational purposes. Sir Jamsetjee Jejeeeboy gave £200,000, and Mr. Kustumjee Jamsetjee £10,000, for furthering English education in Bombay and Guzerat.

The education of females was hitherto very much neglected, but of late a great improvement is taking place. Thus there were, in 1861, in Calcutta, only 16 schools for native girls, with 395 scholars; in 1870 there were 284 schools for girls, with 6,569 scholars. Among the better classes of Hindoos in the cities, many highly-educated ladies are found, so that now a special ladies' journal, the "*Behamabodhini Pattrica*," appears at Calcutta, and has quite an extensive circulation. It often contains very valuable contributions, in prose and verse, on historical, social, and literary questions, by native ladies.

JAPAN.

(Absolute Monarchy—Empire. Area, about 156,604 square miles. Population, about 35,000,000.)

Minister of public instruction, OKI.

Through the kindness of Mr. Mori, Japanese minister at Washington, we are enabled to give an outline of the new Japanese school-law, which, though perhaps not yet actually carried out, will no doubt soon be in force.

AIM OF THE NEW SCHOOL-LAW.

There have been schools in Japan for many years, but, from their imperfection or misdirection, they benefited the upper classes only. Farmers, mechanics, traders, and

women were left in ignorance. Even among the upper classes education was very imperfect, and more devoted to art, literature, and useless discussions than to anything practical. The new school-law aims at leaving none in ignorance in any class, male or female.

HIGHEST EDUCATIONAL AUTHORITY.

The management of educational affairs throughout the whole country shall be in the hands of one central authority, the department of education.

EDUCATIONAL DIVISIONS OF THE COUNTRY.

It is proposed to divide the empire into eight grand divisions, called collegiate divisions. Each division has a central office, located in some large city, with an officer in charge.

The eight grand divisions are made up of 72 provinces and 3 cities. Each grand division or collegiate district is divided into 32 academical districts, each to contain a middle or high school; and each academical district is subdivided into 210 school-districts, each to contain one school. There being 256 academical districts, the whole number of school districts is 53,760. The exact localities of the school-districts are to be determined according to the population and convenience of access.

SCHOOL-ADMINISTRATION.

There shall be appointed in every academical district by the local authorities from 10 to 13 directors, (superintendents,) each to superintend and control from 20 to 30 schools. The salary of these superintendents shall be paid out of the fund derived from local taxes. If this is impossible, it shall be paid out of the treasury of the central government for the present.

Every child, male and female, of all classes, is to be sent to school from the age of 6 years, and must attend school long enough, at least, to finish the course in the elementary schools.

The rules and by-laws of all schools, public and private, must be submitted to the educational department every year, as also a report of the number of scholars and their progress.

Every collegiate division shall have one bureau, with a director and a sufficient force of clerical assistants, who shall watch the progress of the scholars and observe the practical working of the system. In consultation with the local authorities, the director may so modify or amend the rules as to suit the particular locality, but such amendments must be limited to unimportant matters, and be reported to the department of education.

The director of each collegiate division shall transmit all the reports from the school-superintendents to the department of education, where these reports will be printed for the public use.

DIFFERENT KINDS OF SCHOOLS.

There are to be three classes of schools, viz: great learning, (superior;) middle learning, (secondary;) and small learning, (elementary.)

ELEMENTARY SCHOOLS.

The different grades of elementary schools are: common schools, girls' schools, village-schools, charity-schools, private-schools, infant-schools, evening-schools, and schools for imbeciles, &c.

Infant-schools are for children under 6 years of age, both male and female.

Private schools must have a license.

Charity-schools are for the children of indigent parents.

Village-schools are to be established where the population is sparse, and in these schools the rules may be somewhat modified to suit the condition of the people.

Evening-schools may be provided for those who cannot afford to attend school during the day.

The girls' schools, besides the regular studies, will embrace in their course some of the domestic arts especially appropriate for females.

The common (public) schools shall have two grades, the lower and upper.

In the lower grade the following branches shall be taught: Spelling, writing, conversation, vocabularies, reading, morality, letter-writing, grammar, arithmetic as far as division, instruction by lectures upon health, outline of geography, outline of natural philosophy, gymnastic exercises, singing, (the last-mentioned not for the present.)

In the upper grade the following subjects will be taught: Outline of history, geometry, trigonometry, outline of botany, chemistry, physiology. According to the wants

of particular localities the following four subjects may be added: One or two foreign languages, book-keeping, drawing, and constitution of government, (political economy.) The lower grade is for children between 6 and 9 years, and the upper for those between 10 and 13.

SECONDARY SCHOOLS, (MIDDLE LEARNING.)

In the secondary schools, (academies,) scholars are admitted who have received the education prescribed for public schools; and these shall be divided into two grades, upper and lower.

Lower-grade academies will teach the following subjects: Japanese language, arithmetic, writing, geography, history, foreign languages, natural philosophy, drawing, ancient Japanese words, geometry, algebra, book-keeping, natural history, chemistry, moral science, physiology, constitution of government, statistics of the country, music, (the last not for the present.)

Upper-grade academies will teach the following subjects: Japanese language, foreign languages, natural philosophy, trigonometry, ancient Japanese words, geometry, algebra, book-keeping, chemistry, moral science, surveying, political economy, zoology, botany, geology, mineralogy, mental philosophy, astronomy.

The lower grade is for scholars between the ages of 14 and 16, and the upper for those between 17 and 18.

Private schools which receive a certificate giving permission to teach an academical course may be called private academies.

Agricultural academies are those specially designed for instruction in agriculture.

Academies for foreign languages are for those who are to enter into commercial business. All the schools which teach languages only may be placed in this class.

Commercial or business academies are purely for commercial purposes, and shall be established in cities.

Industrial academies shall teach all kinds of industrial arts.

SUPERIOR SCHOOLS, (GREAT LEARNING.)

These schools will teach professional branches, viz: Logic, literature, law, and medicine.

NORMAL SCHOOLS.

Normal schools are to be established to provide the teachers required for the public schools.

TEACHERS.

Teachers in the public schools are to be selected from those above 20 years of age, irrespective of sex, who have a certificate that they are graduates of a normal school, or have graduated from an academy.

Teachers in academies must be over 25 years of age, and must present a college certificate of graduation.

Teachers in colleges must have obtained the title of "professor."

SCHOLARS AND EXAMINATIONS.

All scholars are required to go through the regular course; and in passing from one grade to another they must be subjected to examinations. Examinations must also be undergone before passing from one class of schools to another.

Poor scholars of decided ability will be pecuniarily assisted by the government, and obliged to refund the sums advanced in course of time.

STUDENTS ABROAD.

All students sent abroad at the public expense shall be under the control of the central department of education. There shall be two classes of students sent abroad; one shall be called freshmen or the second class, and the other the first class; the former to be selected from among the graduates of academies, and the latter from among the graduates of colleges. In order to become a student abroad an examination is to be passed and certificates of good moral character must be produced. The limit of the period for students abroad of the second class shall be five years, and that of the first, three years. The number of second-class students is limited to 150, and that of the first class to 30. While abroad, such students will be under the supervision of the minister resident in the respective countries.

GENERAL EXPENSES FOR EDUCATION.

The public money for the purposes of education shall be exclusively controlled by the department of education. The government will assist as much as possible all classes impartially in gaining an education.

The public support of education shall be in accordance with the following conditions for the present:

1. For the salaries of foreign teachers and other incidental expenses.
2. For buildings and repairs of school-houses and colleges, books and apparatus, &c.
3. For academic buildings, repairs, books, apparatus, &c.
4. For the educational fund to be advanced to poor students.
5. For the expenses of the various bureaus of school-superintendents.

In every class of schools a tuition-fee has to be paid.

PERSIA.

(Absolute Monarchy—Kingdom. Area, 648,000 square miles. Population, about 5,000,000.)

Minister of commerce and public instruction, PRINCE ALI-KAULI-MIRZA.

No report has been received.

SIAM.

(Feudal and absolute Monarchy—Kingdom. Area, about 250,000 square miles. Population, 6,300,000.)

No report has been received.

III.—AFRICA.

ALGIERS.

(French colony. Area, 150,576 square miles. Population, 2,921,246.)

SCHOOL-ORGANIZATION.

The primary-school system of Algiers has been regulated by the law of July 14, 1850. According to this law, primary schools for instructing Mohammedan children in French and Arabic were to be established in the cities of Algiers, Constantine, Bona, Oran, Blidah, and Mostaganem, and likewise in some other cities if there should be any demand for them. Instruction is given free of charge, and comprises reading and writing of Arabic, reading and writing of French, French grammar, arithmetic, weights and measures. At the head of every school there is a French director, who is recommended by the prefect of the district, and appointed by the governor-general. He must possess a certificate as primary-school teacher, and a certificate that he is conversant with Arabic. He is assisted by a Mohammedan teacher, who is appointed by the prefect on the recommendation of the local mufti, or kadi. The salary of the director is 1,200 francs, and that of the assistant, 600. Besides this, they divide the school-fees, (1 franc per month for every scholar,) so that the director receives two-thirds and the teacher one-third. All these schools were only for boys.

By the same law, the establishment of girls' schools was decreed in the cities of Algiers, Constantine, and Bona. They are similarly organized as the boys' schools, only that needle-work also is taught. The salary of the directress is 1,000 francs, and that of the assistant teacher, 500.

The same law also provided for adult schools in Algiers, Oran, and Constantine. Instruction is given in these schools entirely free of charge, and the teachers receive a salary varying between 600 and 1,000 francs. The course of instruction embraces elements of the French language, arithmetic, history, and geography, and instruction is given at least three times a week. Pupils who distinguish themselves by their diligence and their application to studies receive annual rewards from the prefect.

The superintendence of schools in every city or town is in the hands of a local com-

mittee, consisting of the prefect, the mufti, and a citizen appointed by the prefect. The inspection of primary and adult schools is usually in the hands of some French officer. In the capital of every province there is an examining committee, which issues certificates to candidates for the teacher's profession. The highest educational authority is the governor-general, who is assisted in his functions by the rector of the Academy of Algiers.

THE NORMAL SCHOOL AT ALGIERS.

The normal school at Algiers was established by a law of March 4, 1865. According to this law 30 non-paying pupils, viz, 20 born in France and 10 natives, may be admitted. Six of these free places are disposed of by the ministry of public instruction in Paris, 6 by the governor-general of Algiers, and 18 by the provincial authorities of Algiers, Oran, and Constantine. The school has two special teachers of religion, one a Mohammedan and the other a Roman Catholic. The salary of the director amounts to 4,500 francs; that of the teachers varies between 3,000 and 500. The course of instruction is arranged in the following manner:

Studies.	Number of hours per week.		
	First year.	Second year.	Third year.
Religion	2	2	2
Pedagogics	1	1	1
Penmanship	5	3	3
Reading	5	3	3
French language and literature	5	5	3
Arithmetic	5	4	3
Linear drawing	3	3	3
Geography and history	2	2	2
Natural history	1	1	1
Natural philosophy	.....	2	2
Mechanics	.....	.....	2
Agriculture	1	1	1
Arabic	3	3	3
Civil and commercial administration	.....	.....	1
Gymnastics	1	1	1
Total	34	31	31

STATISTICS.

Of the 218 townships, (communes,) 128 have at least one public school, 14 have a private school, and 76 are without schools. The total number of primary schools is 233, viz, 186 public schools and 47 private schools. Of this number, 130 are boys' schools and 103 mixed schools, (for boys and girls.) One hundred and ninety schools are under the direction of laymen, and 43 under the direction of priests. Of the public schools, 80 are free schools, *i. e.*, in which instruction is given entirely free of charge. The public schools are attended by 14,037 scholars, viz, 12,265 boys and 1,772 girls. Of the whole number, only 3,537 pay for their instruction. The private schools were attended by 2,062 scholars. Thus the total number of scholars in the primary schools of Algiers is 16,099, viz, 12,480 Roman Catholics, 3,130 Jews, and 489 Protestants. The average length of annual attendance is 7½ months for boys, and somewhat less for girls. The last annual expenditure for the public schools amounted to 429,751 francs.

The course of instruction has not been uniform in all the schools; for example, geography was only taught in 32 schools, linear drawing in 14, elements of agriculture in 11. Only 63 schools carried out the prescribed programme in full. As regards the ecclesiastical schools, geography was taught in 41 and linear drawing in 9.

No later statistics of illiteracy being obtainable, we give those of 1863. During that year, of all the scholars who left the secular public schools, 5 could not read, 15 could only read, 36 could read and write, 34 had a knowledge of reading, writing, and arithmetic, and 10 had an excellent knowledge in all the branches taught. In the ecclesiastical schools, 6 could neither read nor write, 14 could read, 31 could read and write, 38 had a knowledge of reading, writing, and arithmetic, and 11 had an excellent knowledge of all the branches taught.

Sixty-three townships (communes) have at least one public girls' school each, and 3 have private girls' schools. Altogether there are 151 girls' schools, viz: 81 secular

schools and 70 ecclesiastical schools. One hundred and thirty-nine schools are Roman Catholic, 6 Protestant, and 5 Jewish, and 1 common to all religious creeds.

The public girls' schools were attended by 7,074 girls, of whom eight-ninths were instructed free of charge. The private girls' schools were attended by 4,028 girls, of whom 45 were instructed free of charge. There are consequently in the whole of Algiers 11,102 girls attending school, viz: 10,370 Roman Catholics, 290 Protestants, and 442 Jews. The average length of annual schooling is 7 months and 18 days. The expenditure for the public girls' schools amounted to 38,055 francs, of which sum 1,044 francs were received as school-fees; the remainder was paid by the townships.

The number of infant schools in 66 townships (communes) is 86, attended by 9,636 children, of whom 939 are paying and 8,697 non-paying scholars. The annual expenditure for these schools was 94,549 francs.

LIBERIA.

(Republic. Area, about 60,000 square miles. Population, about 718,000.)

No report has been received this year.

MADAGASCAR.

(Absolute Monarchy—Kingdom. Area, about 220,000 square miles. Population, about 5,000,000.)

STATE OF EDUCATION.

Education generally is very backward. The only schools that deserve the name are under the direction of French missionaries. At the town of St. Marie there are two such schools, one for boys and one for girls. The former has 376 scholars, viz: 76 boarders and 300 day-scholars, all natives; the latter, 550 scholars, viz: 50 boarders and 500 day-scholars, likewise natives. The course of instruction in these schools embraces French, reading, writing, arithmetic, history, and geography.

The government has also founded several institutions where boys and girls can acquire an elementary industrial education. In these schools there are 80 free places, viz: 40 for boys and 40 for girls.

MOROCCO.

(Absolute Monarchy—Sultanate. Area, not definitely known. Population, about 2,750,000.)

No report has been received.

ORANGE.

(Republic. Area, about 40,000 square miles. Population, upward of 100,000.)

No report has been received.

SIERRA LEONE.

(British Colony. Area, 468 square miles. Population, 37,089.)

STATE OF EDUCATION.

British missionaries, chiefly of the Church of England, have, since 1804, worked here very successfully in the cause of education. As soon as a missionary came to a village, a school was established. As far back as 1815, a high school was founded in Leicester Mountains, and latterly transferred to Fura Bay. This institution has a preparatory class, and a high school proper. In the preparatory school all the elementary English branches are taught, besides mathematics, Latin, and Greek. In the high school the same studies are carried further, and Hebrew and theology are added. Among the former pupils of this school, there was the well-known colored man Crowther, who rendered very efficient services in the Niger expedition of 1841, and was, in 1864, appointed bishop of the mission.

In Freetown, the capital, there is also a higher school for native girls.

SENEGAMBIA.

(French Colony. Area, not definitely known. Population, about 20,000.)

STATE OF EDUCATION.

There are in Senegal and Goré 12 boys' schools and 4 girls' schools, the former with 999 scholars, and the latter with 390. There are also 2 infant schools with 36 pupils.

These schools are all primary schools, and special attention is paid to instruction in the French language. The children in all these schools were partly French, partly natives. In Gabon there are two private schools, one of them under the direction of French Roman Catholic missionaries; this is a boys' school, and numbers 80 scholars; the other is a girls' school, and has 74 scholars. The course of instruction in these two schools embraces religion, sacred history, geography, reading, writing, arithmetic, and French. In Glass there is a school kept up by American missionaries, where English is taught.

TRANSVAAL.

(Republic. Area, not definitely known. Population, about 30,000.)

No report has been received.

IV.—AMERICA.

A.—NORTH AMERICA.

DOMINION OF CANADA.

(British Colony. Area, 3,127,045 square miles. Population, 4,311,044.)

The Dominion of Canada now includes the various provinces of North America, formerly known as Upper and Lower Canada, New Brunswick, Nova Scotia, British Columbia, and the extensive regions long under the *quasi*-government of the Hudson's Bay Company; in fact, the whole of British North America except Prince Edward's Island and Newfoundland. No report for this year has up to this date (December 31, 1872) been received from any portions of the Dominion, but below an extract is given from the Saint Stephen Journal of New Brunswick, containing a criticism on the new school law.

THE NEW SCHOOL LAW OF NEW BRUNSWICK.

"The new law contemplates the extending of the benefits of education to all alike, rich and poor. We have always been of opinion that a state owes every child within its bounds a thorough education, and we believe in direct taxation for the support of schools. But if people are to be taxed for the support of schools, let them have them. In our peregrinations through the country during the last few weeks, we find very few schools in operation. We are informed by a gentleman, whose word is beyond doubt, that in the parish in which he resides there are only four schools, where under the old law there were sixteen. It may well be inquired whether this scarcity of schools arises from the fault of the new law or of the people. We do not hold the people faultless; at the same time there is too much machinery about the law. For instance, the annual meeting for the election of trustees, &c., must be held in January, on a certain day, at a certain hour, &c., &c. In January, almost all the live schoolmen in a country school-district are in the woods, and a failure is likely to occur through a want of proper parties to perform the duties required. If a failure occur in any of the formalities, the non-contents find a way to upset the whole.

"The most serious difficulty is the size of some of the districts, some of which are five and some six miles in length.

"What we have said above regarding the election of school trustees by dissentients is, we admit, liable to the objection that such an amendment as we have proposed might open a loop-hole to the establishing of sectarian schools. Now we have no intention of advocating the establishing of sectarian schools with special grants. Were the Episcopalians, the Baptists, the Methodists, the Presbyterians, the Roman Catholics, &c., allowed the privilege of opening such schools, the working of the law would be crippled and the whole rendered null and void. All that we contend for is that some amendment be made to the law whereby in the simplest manner possible a sufficient number of parents, whether Catholic or Protestant, may without due formalities, or regard to holding a meeting this day or that day, elect trustees at any time and carry on a school under the law for the education of their children. Of course, as under the old law, the average attendance would always have to reach a certain number before the teacher could obtain the part of his salary paid by the government."

The Saint John Daily Telegraph and Morning Journal, of November 30, 1872, in which the above article is cited, very truly remarks: "We shall be pleased to see the

Journal point out a practical remedy for each of the grievances to which it refers. It is some service to indicate a grievance. It is a greater one to point out a remedy. Then the 'bane and antidote' will be both before us."

MEXICO.

(Federal Republic. Area, 846,615 square miles. Population, 9,173,052.)

Through the kindness of Mr. J. C. Rodrigues, the editor of the illustrated journal *O Novo Mundo*, published in New York, the following facts regarding education in Mexico are furnished:

PRIMARY EDUCATION.

In almost every State of the Mexican Republic there are primary schools, where gratuitous education is given to pupils of both sexes. The number of these establishments is unknown. They are maintained partially by the federal government, partially by the State governments, private donations, and benevolent societies, (*sociedades de beneficencia.*) In the State of Mexico there is a *Compañia Lancasteriana,* which maintains 8 schools, viz, 2 for boys, attended by 859 pupils; 3 for girls, with a regular attendance of 635 pupils; and 3 for adults, with 319 pupils. Another corporation, the *Sociedad de Beneficencia,* keeps several schools for both sexes, attended by about 5,000 pupils.

Throughout the republic there is a good number, perhaps 1,509, private schools, for primary and secondary instruction. It is calculated that the number of their pupils is about 200,000.

SECONDARY EDUCATION.

Secondary education, properly so called, is given: 1st, in seminaries, maintained by the clergy; 2d, in the national colleges in the capital of the republic; 3d, in colleges, institutes, and academies, in the several States.

There are 10 seminaries in the country, 1 in the archbishopric of Mexico, and 9 in 9 of the 13 bishoprics. The courses of study in these institutions comprise: Latin, normal philosophy, ecclesiastical law, Roman law, scholastic theology, dogmatics, and natural law, (*derecho natural.*)

The number of students in these seminaries is as follows:

Locality.	Number of students.
Mexico	488
Puebla	599
Morelia	330
Guadalajara	730
Monterey	250
Oajaca	200
Merida	239
Durango	173
Chiapa	24
Culiacan	30
Total	3,083

In the capital of Mexico there is 1 university and 9 national colleges, viz: San Ildefonso, San Juan de Latran, San Gregorio, (Jesuit,) the Medical School, the School of Mines, the Academy of Fine Arts, the Military School, and 2 agricultural and business schools.

The two colleges mentioned first are the best. They have four courses of studies, viz: philosophy, grammar, law, and literature. The course of philosophy comprises ideology, logic, metaphysics, morals, mathematics, natural philosophy, cosmography, and geography; that of grammar comprises Spanish, Latin, and French; that of law embraces natural, civil, criminal, Roman, and canonic law; the course of literature embraces universal history, history of Mexico, ancient and modern classics, rhetoric, and composition. The courses in the other colleges are not so full.

The students in these 9 colleges are distributed as follows:

Colleges.	Number of students.
San Juan de Latran	571
San Gregorio	340
San Ildefonso	240
Medical school	306
Mining school	428
Academy of fine arts	274
Military school	197
Agricultural school	345
Business college	187
Total	2,888

In the several States of the country there are the following colleges: In Mexico, 1; in Puebla, 1; in Oajaca, 1; in Vera Cruz, 4; in Yucatan, (the University of Merida,) 1 college, and a naval school in Campeche; in Michoacan, 2; in Guanajuato, 1; in Durango, 1; in Zacatecas, 1, (besides a school of mines;) in Aguas Calientes, 1; in Jabisco, 2; in San Luis Potosi, 1; in the island of Carmen, 1; in Chiapa,1; in Chihuahua, 1; in Queretaro, 2—total, 24 colleges. The number of students is not known.

SCIENTIFIC SOCIETIES, LIBRARIES, ETC.

In the capital of Mexico there are three literary and scientific societies, viz: *La Sociedad de Jeografia i Estadistica*, (Geographical and Statistical Society;) *El Ateneo;* and *La Sociedad Promovedora de Mejoras materiales i intelectuales*, (Society for Promoting Material and Intellectual Improvement.)

In Merida there is an *Academia de Ciencias Literature*, (Scientific and Literary Academy.)

Mexico City has three public libraries, viz, the Cathedral library, with 13,000 volumes and manuscripts; the library of the University, with 9,000 volumes; and the library of San Gregorio, with about 5,000 volumes.

B.—CENTRAL AMERICA AND THE WEST INDIES.

No report on education has been received from any of the states of Central America, so that only the general statistics are given.

COSTA RICA.

(Republic. Area, 16,250 square miles. Population, 165,000.)

GUATEMALA.

(Republic. Area, 15,000 square miles. Population, 1,180,000.)

Minister of the interior, of justice, of ecclesiastical affairs, and of public instruction, J. M. SAMAGOA.

HAYTI.

(Republic. Area, 28,000 square miles. Population, 572,000.)

Minister of public instruction, justice, and ecclesiastical affairs, B. LALLEMAND.

HONDURAS.

(Republic. Area, 43,000 square miles. Population, 350,000.)

Minister of marine and public instruction, C. CELIO ARIAS.

NICARAGUA.

(Republic. Area, 57,000 square miles. Population, 400,000.)

Minister of public instruction, Fr. Barbareus.

SAN DOMINGO.

(Republic. Area, 18,000 square miles. Population, 136,500.)

SAN SALVADOR.

(Republic. Area, 7,230 square miles. Population, 600,000.)

C.—SOUTH AMERICA.

ARGENTINE REPUBLIC.

(Federal Republic. Area, 1,100,000 square miles. Population, 1,877,490.)

Minister of justice, worship, and public instruction, Dr. N. Avellaneda.

From an article by Dr. George A. Stearns, principal of the normal school at Parana, the following facts concerning education in the Argentine Republic are gathered:

HISTORY OF EDUCATION IN THE ARGENTINE REPUBLIC.

The revolution of 1816, which separated this country from Spain and made it an independent republic, of course left its animosities behind as regards the mother country. Up to this time all the education obtainable was that communicated by the priesthood. The country needed men capable of directing its affairs. Its language was Spanish, but it did not want Spaniards. The few whom the country offered were soon employed in devising plans for its future development and prosperity.

In September, 1860, was adopted the constitution which to-day rules the country. Among its first provisions is one for assuring primary education in every province of the republic, making this an essential obligation. Another provision gives to the general government the power to dictate plans of general and university instruction, and another establishes a ministry of justice, worship, and public instruction, the minister being one of the first cabinet counselors of the president. From this point we may date the active progress of education in this country. The previous progress, which was preparatory, manifested itself in the provisions of the national constitution which I have cited. If any doubt existed about the point, I think it would be satisfactorily answered by the fact that in 1860 there was not in the republic a single national institution of learning, and in Buenos Ayres alone could be found provincial schools of any importance. Isolated facts—private enterprises—might be found, but nothing tending to a system of public instruction. In 1867, the minister of public instruction complained that there were 300,000 children in the country who received no instruction of any kind, the whole population at that time not being over 1,500,000.

The crying necessity for intelligent men to guide the affairs of government led the nation to direct its attention first to supplying this want by establishing institutions for secondary and university education, such as the national colleges of the republic. But here it met with that old difficulty, the apathy and indifference of the people. It was not enough to offer instruction, books, and all necessaries free; it was necessary also to pay the pupils for the trouble of attending school and studying their lessons, and this was done.

The National College of Buenos Ayres was founded shortly after the adoption of the present constitution. Scholarships, under the name of "*becas,*" were established, giving to the student a monthly allowance of from 10 to 15 dollars gold, and the new institution set to work.

About the same time were nationalized and placed upon a similar basis three other institutions, which previously had eked out an existence under the protection of provincial governments. These were, the College of the Uruguay, the College of Cordoba, and the University of Cordoba; the first in the province of Entre Rios, and the others in the province of Cardoba.

Up to 1868 there were established 5 other similar institutions, one each in Tucuman, Salta, Catamarca, San Juan, and Mendoza. In 1868, 5 more similar institutions were added in San Luis, La Riojá, Jujuy, Santiago, and Corrientes.

At the present time each province has an institution of this kind, supported by the national government, and visited by an inspector of national colleges, who is himself a government employé. Thus the national government has provided for secondary education in each province. The time must soon come when the government will withdraw a part of its financial support from these institutions, offering, at most, no more than free instruction with free books, &c. What has been accomplished by these institutions may be inferred from the fact that the number of students in 1870 was twice as large as in 1868.

In 1865 the national government made its first movement in favor of primary instruction, distributing $22,000 in gold among the various provinces, for the purpose of promoting a popular movement in this direction. In 1866 and 1867 the same amount was voted by the national congress for this purpose. In 1868 the amount voted was only $11,000 for general purposes, with a special appropriation of $25,000 for the province of Rioja, which was in a most lamentable condition. The result of this was quickly manifested, for the province of Rioja in 1870 had 4,184 scholars in her schools, while the population was less than 50,000.

In August, 1868, began the present administration, under President Sarmiento, whose motto is "Education for all." The progress made in the few years past is truly wonderful. The new administration enters upon its office with a programme of reforms.

The new minister of public instruction, Dr. Nicolas Avellaneda, gives a more extended interpretation to the clauses in the constitution respecting public instruction In his first report to congress (1869) he earnestly advocates sweeping reforms. The work of carrying out these reforms has begun energetically.

For the last year of the previous administration (1868) $36,000 in gold were voted for encouraging primary instruction, viz: $11,000 for distribution among the provinces, and $25,000 for the single province of Rioja. For 1869 $115,000 were voted, viz: $100,000 for distribution among the provinces, and $15,000 for the province of Rioja.

In 1870 the government was involved in an expensive war to establish law and order in Entre Rios. But this same year there were voted for primary instruction $80,000 for distribution in the provinces, and $15,000 for Rioja; in all, $95,000. In 1871, notwithstanding the expenditure for the war in Entre Rios, $215,000 were voted, viz: $200,000 for distribution among the provinces, and $15,000 for Rioja. In this same year (1871) a law was passed creating a special and independent fund for the purposes of primary instruction, distributing the proceeds among the various provinces in proportion to the efforts which they themselves make. This law, a translation of which is given below, takes effect in January, 1873.

LAW FOR THE DISTRIBUTION OF PUBLIC FUNDS IN AID OF PRIMARY INSTRUCTION.

1. From the termination of the investment of the estimates of the year 1872, the national subsidies for the encouragement of primary instruction in the provinces shall be awarded subject to the conditions and formalities established by the present law.

2. The provinces which, in virtue of law sanctioned by their legislatures, shall destine special funds for the support of popular education, and which shall express by an explicit declaration a desire to recur to the protection of this law, shall receive from the national treasury subsidies for the following purposes: construction of edifices for public schools, furniture, books and apparatus, teachers' salaries.

3. The subsidies shall be awarded by the national executive in the following form and proportions: to the provinces of Rioja, San Luis, and Jujuy, three-fourths; to those of Santiago, Tucuman, Salta, Catamarca, Mendoza, San Juan, and Corrientes, one-half; and to those of Buenos Ayres, Cordoba, Entre Rios, and Santa Fé, the third part of the whole amount that may be expended for the purposes enumerated in the previous article.

4. The subsidies for primary instruction in the province of Rioja shall be determined in an especial manner in the annual estimates of the general expenses of the nation, until it shall be in condition to be regulated by the present law.

5. No sum shall be allowed for the construction of a school-house, unless the plan and estimate for the building shall have been previously submitted to the minister of public instruction, together with a report from the governor of the respective province, certifying that the money is ready, which, together with the national subsidy, will cover the cost of construction. The minister of public instruction will circulate, in all the provinces, plans for school-houses of approved style, recommending their adoption.

6. The national aid for the purchase of furniture, books, and apparatus, destined for the use of the public schools shall be distributed by a committee appointed by the executive, consisting of at least three members and a secretary, who shall be paid a salary of $1,500 per year; provided that the provinces prefer to obtain by this means the articles mentioned. This committee will take charge of the purchase and shipment of all orders which may be sent to it for the use of the public schools; provided there be sent, at the same time, the proportion of money for the whole amount of the order as determined in article 3.

7. Half of the salary of one of the inspectors appointed by each province to watch over its schools shall be paid by the national treasury, to the amount of $80 monthly, on condition that he accept the obligation to furnish the statistics and perform the inspections which may be required of him by the minister of public instruction.

8. The eighth part of the proceeds of the sale of national lands shall be set apart to meet the exigencies of the present law.

9. The executive is authorized to use that part of the national income which may be necessary to cover the expenses of this law, until such time as the sale of the public lands shall have provided sufficient funds.

10. The executive will adopt measures to guarantee the faithful application of the funds which may be distributed among the provinces in virtue of this law, as well as the exact compliance of the conditions upon which they are distributed, and still further using his influence to have the fund destined for the support of schools administered by committees elected by the neighborhood.

NORMAL SCHOOL.

In August, 1871, the first national normal school was established, which is now in a flourishing condition, giving instruction to 45 young men, who will shortly respond to the growing necessities of the country.

WORK OF THE YEAR 1871.

The year 1871 was a very remarkable one for the general awakening of nearly all the provinces to the necessity of doing more for educational interests, and this even in the remotest parts of the republic. The province of Catamarca has set apart a special fund for primary education, and has, as well as Rioja, made education compulsory. The other provinces are moving in the same direction, and we may expect to see established in most of the provinces a permanent school fund before the close of President Sarmiento's administration.

An appropriation of $12,000 was made during the year for establishing public libraries, and local committees are already at work in almost every province helping along this great work. At the present writing (August 15, 1872) this fund is exhausted, and more has been asked for. Fifty public libraries have been established during the year, one-half the expenses being paid by the national government and one half by popular subscription. Agricultural colleges have been attached to various national colleges, with the object of stimulating the agricultural interests of the different provinces.

EDUCATION IN THE PROVINCES—BUENOS AYRES.

The public schools of this province may be divided into two great classes—the schools of the city of Buenos Ayres, and the schools of the interior. They may also be divided into three classes—the schools of the municipality, the schools of the provincial government, and the schools of the benevolent society (*sociedad de beneficencia.*)

The schools of the municipality are, of course, limited to the city of Buenos Ayres; the other two classes extend also to the interior. In these schools the boys and girls are generally separate; there are, however, schools for both sexes, but these do not generally receive children over 8 or 9 years of age. The schools of the benevolent society are schools for girls, and those of the municipality are of both classes. The benevolent society is a society of ladies, established by the provincial government, January 2, 1823, under whose administration in the beginning all the girls' schools were placed, while the funds were furnished by the government.

The three administrations are entirely independent of each other. There are in the city municipal schools, society schools, and provincial schools. There are frequent clashings between the administrations, and of course there is no general system. In the interior these administrations are reduced to two, and there seems to be a much better result. In another respect the schools of the interior have the advantage, as they have in many cases school-houses, while in the city, to my knowledge, all the schools are kept in dwelling-houses. Graded schools are of course unknown in the city.

The schools of the province are in general under the supervision of the department of schools. Owing to the low salaries, there is a great deficiency of good teachers, and many of them have to devote nearly all their time to other occupations in order to make a living.

In 1822 the university at Buenos Ayres was organized and divided into six departments, viz: Primary department, preparatory department, department of exact sciences, department of medicine, department of jurisprudence, department of theology.

In the primary department were included all the primary schools of the province. On the 7th of January, 1828, however, they were separated from the university and placed under the superintendence of an inspector-general.

A summary of the provincial schools in 1871 shows that there are 72 in the city, viz: 17 for boys, 24 for girls, and 31 for both sexes. In the rural districts there are 54 public schools, viz: 26 for boys, 20 for girls, and 8 for both sexes. Of private schools there are in the city 114, viz: 38 for boys, 16 for girls, and 60 for both sexes. In the interior there are 42 private schools, viz: 12 for boys, 10 for girls, and 20 for both sexes. The total number of teachers is 1,050.

ENTRE RIOS.

The population in this province is very scattered, and it is only in the villages that schools are to be found. It has recently suffered the evils incidental to a civil war, but is rapidly repairing the damages. The schools are under the supervision of an inspector-general, and there is at the present time a great activity in this department. There is little or no co-operation, and all must be done by the government.

SANTA FÉ.

This province is one of the most backward in respect of education, and at the present day there is less movement there than in any other province. In Rosario, the principal city, there is at the present time a local movement in favor of education.

CORRIENTES.

This province has very recently had to suffer from a revolution, and is still in a very unsettled state.

CORDOBA.

This province is one of the most backward of the republic in respect to schools.

SAN LUIS.

See statistical table at the end of this article.

SANTIAGO.

This province is considered one of the most backward of the republic, having been ruled for years by a sort of military despotism, and there is very little local interest in the subject of education. There is only one girls' school in the province, which has a new building, constructed in 1871. Last year the school was supported by the scholars, but is now sustained by the national government.

MENDOZA.

This is one of the provinces in which there is a movement favorable to education. Although its present statistics are not very favorable, the efforts now making can not but give a desirable result. This year a new school-house has been built, destined for a girls' school, at a cost of $30,000. An agricultural college has been established, under the joint auspices of the national and provincial governments.

SAN JUAN.

This province is considered the one most advanced in the matter of education. The national government has for three years past offered a premium of $10,000 to that province whose statistics should show one child in school for every ten inhabitants, and to San Juan this premium has been awarded for three years in succession.

RIOJA.

This province is the poorest in resources and most backward in respect to education of any in the republic. It is dependent almost entirely upon the national government, even for the means of carrying on its civil government. In 1867 there was not a single school in the whole province; now there are 40.

CATAMARCA.

Perhaps in no province in the republic is there so general a movement in favor of education as in this, yet its actual condition is far from satisfactory. This province has 11 pupils in the national normal school in Parana, and these are the most promising young men in the institution. Catamarca has set apart a special and very liberal fund for school purposes and has divided the province into 15 school districts, appointing a local school board in each district. The duties of this school board are: 1st, to administer and distribute that part of the school fund which corresponds to the district; 2d, to establish schools where it deems expedient; 3d, to nominate and remove all

employés in its schools; 4th, to contract for new school-buildings or for improvements in old ones; 5th, to propose the new taxes by which it deems expedient to augment the school fund of its respective district; 6th, to watch over the schools and see that all general orders are faithfully executed. The school board is elected anew each year. There is also a law to aid in establishing public libraries, which allows certain small incomes to each library established, and, besides this, augments from the provincial treasury, by 25 per cent., the amount subscribed by individuals.

TUCUMAN.

The city of Tucuman is designated as the site of the second national normal school.

SALTA AND JUJUY.

(See table of statistics below.)

STATISTICS.

For the sake of completeness and to enable a just comparison, the statistics of 1869 are given, although there are later statistics of some of the provinces.

Number.	Provinces.	Total population according to the census of 1869.	Number of persons able to read and write.	Number of children between the ages of 6 and 15.	Average number of children attending school.	Number of schools.		
						Public.	Private.	Total.
1	Buenos Ayres	495,107	148,324	.....	18,220	126	156	282
2	Entre Rios	134,271	25,843	.....	7,188	.....	.....	91
3	Santa Fé	89,117	18,453	23,138	4,186	62	23	85
4	Corrientes	129,023	.....	37,213	6,569	96	25	121
5	Cordoba	210,508	29,668	62,221	10,003	41	69	110
6	San Luis	53,294	5,261	29,220	2,210	47	.....	47
7	Santiago	132,898	8,990	35,704	3,684	96	.....	96
8	Mendoza	65,413	8,924	18,213	2,132	42	25	57
9	San Juan	60,319	10,915	15,387	5,091	44	49	93
10	Rioja	48,746	5,392	14,503	3,000	37	3	40
11	Catamarca	79,962	8,597	22,868	2,622	33	24	57
12	Tucuman	108,953	10,235	31,964	3,219	73	23	96
13	Salta	88,933	9,121	24,024	2,885	68	10	78
14	Jujuy	40,379	3,376	10,433	1,383	31	.....	31
	Total	*1,736,923	293,099	324,888	72,392	796	407	1,203

*This number does not comprise the army in Paraguay, the inhabitants of the Pampas and Patagonia, the Gran Chaco, the Missions, and the Argentine citizens temporarily living in foreign countries, amounting in all to 140,567; making the total population of the Argentine Republic in 1869 1,877,490.

BOLIVIA.

(Republic. Area, 374,480 square miles. Population, 1,987,352.)

Minister of justice, worship, and public instruction, Dr. M. TERRAZAS.

No report has been received.

BRAZIL.

(Constitutional Monarchy—Empire. Area, 3,000,000 square miles. Population, 11,780,000.)

Minister of public instruction, THE MINISTER OF THE INTERIOR, Dr. J. A. CORREA DE OLIVEIRA.

SUPERIOR INSTRUCTION.

The minister, in his report to the legislature for 1872, urgently recommends the establishment of a university, since there has been a very evident decadence in the schools of law and the schools of medicine, the only institutions for superior instruction. Meanwhile a decree has been published, making the examinations at these schools more strict, so as to raise the standard of superior education somewhat.

Law schools.—Of these there are two, viz, at Recife, with 348 students, and at San Paulo, with 194; making the total number of law students in the empire 542.

Schools of medicine.—Of these there are also two, viz, at Rio de Janeiro, with 583 stu-

dents, (467 studying medicine 114 pharmaceutics, and 2 obstetrics,) and at Bahia, with 285 students, 215 studying medicine, and 70 pharmaceutics; making the total number of medical students in the empire 868.

SECONDARY INSTRUCTION.

1. *In Rio de Janeiro.—The Imperial College of Pedro II.*—This is a college with an academical course; some of the students board in the college building, while others are day-scholars. The number of students is 351, viz, 221 day-scholars and 130 boarders.

Private secondary schools.—Of these there are in the city of Rio de Janeiro 60, viz, 30 for boys, 25 for girls, and 5 for both sexes. Of only 49 of these institutions could reliable statistics be obtained, according to which the number of scholars was 2,911, viz, 2,196 boys and 715 girls. The course of instruction in these institutions of course varies somewhat, but in most of them the following subjects are taught: Portuguese, Latin, French, English, natural philosophy, arithmetic, algebra, geometry, history, geography, rhetoric, and poetry.

2. *In the provinces.*—The number of public institutions is 107, viz, 95 for boys, 5 for girls, and 7 for both sexes, with an attendance of 2,994 scholars, viz, 2,916 boys and 78 girls.

The number of private institutions is 123, viz, 84 for boys and 39 for girls, with an attendance of 5,089 scholars, viz, 3,852 boys and 1,237 girls.

PRIMARY INSTRUCTION.

1. *In Rio de Janeiro.*—The number of public primary schools is 111, with 6,149 scholars, viz, 3,900 boys and 2,249 girls. The number of private primary schools can not be exactly ascertained.

2. *In the provinces.*—The number of public primary schools is 3,491, viz, 2,343 for boys and 1,148 for girls, attended by 106,705 scholars, viz, 75,594 boys and 29,096 girls, and 2,015 whose sex is not specified. The number of private primary schools is 711, viz, 458 for boys and 253 for girls, with 19,162 pupils, viz, 10,211 boys and 5,967 girls, and 2,984 whose sex is not specified.

EXPENDITURE FOR PUBLIC INSTRUCTION.

The total annual sum expended in the provinces is 3,362,687 milreis 522 reis, (one milreis, about 56 cents,) while the total annual income of the provinces is 20,973,299 milreis 58 reis.

THE BUSINESS COLLEGE.

This institution has a four years' course, embracing the following subjects: French, English, German, arithmetic, algebra, geometry, geography, commercial statistics, book-keeping, business correspondence, commercial law, penmanship, and drawing The number of students was 36.

INSTITUTION FOR THE BLIND.

The course of instruction in this institution embraces the following subjects, distributed over a space of eight years: Ancient history, history of the middle ages, modern history, sacred history, physical, political, and astronomical geography, arithmetic, algebra up to equations of the second degree, geometry, natural philosophy, elements of chemistry, and natural history, Portuguese, French, English, and religion. The number of students is 29, viz, 20 males and 9 females; 28 were Brazilians, and 1 was from Germany. The annual income of the institution amounted to 5,707 milreis 204 reis.

INSTITUTION FOR DEAF-MUTES.

The course of instruction embraces all the subjects of a good primary and secondary education, and special regard is paid to instruction in morals and religion. The number of students is 19, viz, 14 males and 5 females, all Brazilians. According to the law of September 26, 1857, the institution enjoys an annual subsidy of 5,000 milreis, and 500 milreis for distribution among 10 poor students.

SCIENTIFIC, LITERARY, AND ARTISTIC ESTABLISHMENTS.

The Imperial Academy of Medicine.—This scientific association has, during the last year, continued its important labors, by discussing medical subjects in forty sessions, by giving valuable advice to the government on important sanitary questions, and by publishing its well edited periodical, *Annaes Brazilienses de Medicina*, (Brazilian Annals of Medicine.) The association receives an annual subsidy of 2,000 milreis from the government.

Historical and Geographical Institute.—This association has held fifteen sessions during the year, and discussed important historical and geographical questions. It publishes a valuable quarterly review, (*Revista Trimensal,*) containing accounts of the proceedings and historical and geographical essays. The association possesses a library of 3,605 volumes, 193 maps, and 272 volumes of manuscript. The government grants an annual subsidy of 7,000 milreis.

The Public Library of Rio de Janeiro.—The increase during the last year was 757 volumes. The number of visitors during the year was 2,834, certainly a small number compared to the population of the city of Rio de Janeiro, which is 420,000.

Various libraries.—There are in the city of Rio de Janeiro ten other libraries, with an aggregate of 121,792 volumes, the largest being the Portuguese reading-room, founded in 1837, with 50,000 volumes, and the smallest that of the Imperial Typographical Association, founded in 1854, with 557 volumes. In the provinces there are fourteen public libraries, with about 25,000 volumes. There are also libraries connected with most of the convents and other religious institutions, but their exact extent can not be ascertained.

Dramatic Conservatory and National Theater.—The first-mentioned institute is a committee for examining dramatic pieces before they can be represented at the theater. During the last year the committee examined 385 dramas, of which 361 received a license for representation, 21 received the same after altering and suppressing some passages, and 3 were rejected.

ACADEMY OF FINE ARTS.

The number of students was 187. The academy possesses an art-museum and a library of 834 volumes, many of these being very valuable illustrated works.

CONSERVATORY OF MUSIC.

This institution for higher musical instruction was, during the past year, attended by 139 students, viz, 57 males and 82 females.

IMPERIAL LYCEUM OF ARTS AND INDUSTRY OF THE SOCIETY FOR PROMOTING FINE ARTS.

This is a sort of polytechnic school, in which the following subjects are taught free of charge: arithmetic, algebra up to equations of the second degree, geometry, drawing of figures and ornaments, geometrical drawing, machine drawing, civil architecture, sculpture of ornaments and statuary, music, penmanship, Portuguese, French, and English. The number of students during the last year was 1,233, and during the same year 37 medals were conferred on deserving students.

Statistical table of primary schools.

Provinces.	Population according to the work "L'Empire du Brésil."	Number of schools.			Total number of scholars.
		Public.	Private.	Total.	
City of Rio de Janeiro	420,000	111	.....	111	6,149

All the foregoing facts regarding education in Brazil are gathered from the annual report of the minister of public instruction for 1872, kindly furnished this office by the Brazilian minister at Washington.

CHILI.

(Republic. Area, 249,952 square miles. Population, 1,972,483.)

Minister of public instruction, SEÑOR ABDON CIFUENTES.

ACTUAL STATE OF EDUCATION IN CHILI.

Public instruction in Chili is under the direction of a ministry or special secretaryship of state, and by express recommendation of the constitution forms a special object of attention to the government.

On the ministry of public instruction devolves the duty of inspecting all the schools and colleges supported by the national treasury, of appointing all their teachers and employés, of demanding from Congress the necessary sums for supporting them, and of presenting every year a report on the state and progress of education.

At present there is at the head of this department of the government a very honest man, of lofty views, Señor Abdon Cifuentes, who displays great zeal in the discharge of his duties, and who has introduced important reforms, tending to advance education at no very distant period, by all means and in all parts of the country.

This ministry serves as an aid and counselor to the university of Chili. This body proposes the proper measures for regulating the studies and examinations, through which candidates for the different scientific careers have to pass, examines the textbooks and sanctions them, makes out the programmes of examination, &c. The primary schools and the statistical department are, moreover, under the immediate direction of a general visitor of schools, who has deputies in all the provinces, and whose central office is in Santiago. His duty is to visit the schools constantly, and to receive detailed information regarding the number of pupils, the conduct of the teachers, and the financial status.

The municipalities of each province also exercise a vigilant inspection, and aid according to the extent of their local treasuries in supporting the educational institutions.

SUPERIOR SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

In Chili every scientific profession or career requires a certificate, issued by the university, after a satisfactory examination, and, moreover, a recognition or approbation by the competent authority in each branch of study. Thus, lawyers pass a special examination before any of the three courts of appeal; doctors of medicine before the office of the first physician (*proto-medicato*) of Santiago; clergymen before committees appointed by the authorities of the dioceses.

The preparatory instruction for the special study of law or theology takes up six years; while mathematics or medicines only requires five.

These preparatory or primary studies comprise penmanship, reading, political, descriptive and physical geography, Castilian grammar, ancient history, history of Rome, history of the middle ages, modern history, history of America, history of Chili, history of religion, catechism on the Christian doctrine, the principles of faith, elements of astronomy, natural philosophy, chemistry, natural history, elements of algebra, geometry, arithmetic, philosophy, and literature, Latin, and some modern language.

Latin is not obligatory in the study of mathematics. The subjects which have been enumerated are studied separately, and are distributed throughout the six or five years, forming each the subject of a special examination, which must be passed in order to follow the career.

The institutions supported by the state or by private individuals in which there are complete courses for all these studies are properly called colleges. The state supports fourteen of these institutions, one in the capital of each province, (which correspond with the number of provincial lyceums,) and in addition the Institute of Santiago, which is the most important of all the educational establishments of the state.

Lyceums exist in all the chief cities. Five of them actually contain between 100 and 300 students, the rest less than that number. All of them take both boarders and day-scholars. Attendance at the lectures and the instruction are entirely free of charge, but boarders pay for board and lodging a sum varying according to the different places, but in no place more than 180 pesos (about $180) per year for each student. For the use of professors and students, each of these lyceums has a library; they all, by the earnest desire of Minister Cifuentes, have lately been much enriched, and render special service by being thrown open to the general public.

The Library of Santiago contains 45,500 volumes, and was during the past year visited by three thousand readers.

The Institute of Santiago at present contains 1,162 students, of whom 282 are boarders.

There are theological seminaries in the cities of La Serena, Santiago, Concepcion, and Ancud. In these there is not only a complete course of theology, but there are also excellent colleges, in which secondary instruction is given, and from which come very good lawyers, mathematicians, &c.

All of the secondary instruction given in the lyceums, colleges, and seminaries embraces in the whole republic at present about 5,553 youths.

Superior and scientific instruction is chiefly given in the halls of the University of Santiago by professors who depend directly on this corporation. These studies are free of charge, and the professors are paid from the national treasury.

During the year 1871 235 degrees in the different faculties were conferred by the university in the following manner:

Bachelors of Classical Studies, (*humanidades*)	94
Bachelors of Medicine	18
Bachelors of Law	52
Licentiates of Medicine	10
Licentiates of Law	57
Mining Engineers	1
Surveyors, (*ingenieros geógrafos*)	3

There are also special establishments such as the military academy, the naval school, seminaries for male and female teachers, a school of arts, &c.

The school of arts numbers 102 pupils, who all live in the school, and who learn the construction of machinery, casting, and carpentering. It possesses five workshops, from which already perfect steam-engines and other machinery, furniture, &c., have been turned out. Although these articles sell very well, it costs the government not less than 33,000 pesos per year to support this school. To enter this school it is necessary to give proofs of good capacity and conduct by means of a previous competitive examination.

PRIMARY AND POPULAR EDUCATION.

The munificence of private individuals, the generosity of the clergy, and the general enthusiasm have contributed, no less than the government, to the advancement of popular education, which is, without dispute, the first need of a nation and the first duty which fellow-citizens owe to each other. The last report made to the national congress by Señor Cifuentes, inspired by this universal sentiment, is full of patriotic echoes, which show that the education of the children is of the greatest interest to the people. The capital, above all, sets a worthy example in this matter. There are in this city (Santiago) various private societies which support numerous schools. Not only do they contribute of their wealth, but many of the members gratuitously give some hours' instruction in the above-mentioned schools. These societies visit the schools which they support, and administer them by assembling from time to time to discuss improvements and to consider the applications. There is not a youth in Santiago who does not personally contribute to the several permanent committees on education already existing. At one of these colleges, in which those favored by fortune study, the students are in the habit of collecting among themselves small sums, which they devote toward the education of the poor.

The law requires every convent to maintain a public school, and some of them voluntarily maintain more than one. The government furnishes all this class of institutions very liberally with books.

The schools supported by private philanthropy, and those in which the pupils pay some fee, are all included under the designation of private schools, in contradistinction to those supported by the government, which are properly called public schools, and numbered, in the present year, 451. In the same year the free schools of the state numbered 706.

The ministry of public instruction, during the first eight months of 1872, expended the sum of $542,254.25. In this sum is comprised the expense not only for the schools, but also for the institute, the lyceums, the normal schools, the school of agriculture, the school of arts, the university, &c. During the same period the regular income of the republic amounted to $9,574,398.10.

There are at present educated in the schools of the State 54,821 children, and it is calculated that the annual expense for each one of these averages 8 pesos 98 centavos.

The actual proportion between the inhabitants of the country and the children attending school is 25 inhabitants to every scholar.

The number of public and private schools, distributed according to provinces, and the proportion of children attending school to the population, are shown in the following table:

Provinces.	Population according to the census of 1865.	Scholars in—		Total.	Proportion of inhabitants to each scholar.
		Private schools.	Public schools.		
Atacama	78,972	940	2,681	3,801	20
Coquimbo	145,895	1,140	3,793	4,937	29
Aconcagua	124,828	242	4,310	4,552	27
Valparaiso	142,629	2,720	6,519	9,239	15
Santiago	341,683	6,264	11,285	17,549	19
Colchagua and Curico	233,045	616	6,197	6,813	34
Talca	100,575	558	2,174	2,932	37
Maule	187,983	418	3,894	4,312	43
Nuble	125,409	996	2,821	3,817	32
Concepcion	146,056	951	4,190	5,141	28
Arauco	71,901	453	2,198	2,651	27
Valdivia	23,429	178	1,107	1,285	18
Llanquihe	307,601	654	1,419	2,073	18
Chiloé	59,022	1,976	2,053	4,029	14
Total	1,819,028	18,310	54,821	73,131	25

The course of instruction embraces the following subjects: Reading, writing, arithmetic, catechism of religion, Castilian grammar, geography, cosmography, history of Chili, sacred history, elements of geometry, linear drawing, music, needle-work.

It must be mentioned here that of the number of schools enumerated, much less than one-half are schools for girls; there are also some mixed schools. It is to be lamented that in Chili people are not of the same opinion as in the United States, that a woman is better adapted than a man to the education of children of tender age, but it is to be hoped that this conviction will finally gain ground.

The school-hours are generally between 10 a. m. and 4 p. m. All those which have a yard give the children one or two hours' recreation.

The minister, Señor Cifuentes, has, among the important reforms which he has proposed and to a great extent realized, adopted two, which will revolutionize the system and produce excellent results. The first is an improvement of the teachers' condition. The relative poverty of the national treasury did not permit a decent remuneration to those engaged in teaching, and this has been the cause that generally their existence was a very sad one and that they had but little encouragement in their work. Not ashamed to burden the nation with an increase of pay, which amounts to a very considerable sum, Señor Cifuentes has created rewards for the teachers, which consist in an increase of pension for every six years of service, which increase is progressive.

Till the last year there existed a prejudicial monopoly in favor of the state colleges. Not only did the university issue certificates, but its classes were the only places where law, medicine, &c., could be studied. A private individual could not separately study a code of law or some branch of medicine unless he intended to undergo an examination in those studies. The university not only fixed the programmes indicating what must be known in each branch of study, but also prescribed the text-books; thus private colleges could neither try new systems, nor private professors teach according to their own ideas. All the examinations, moreover, in every lecture must be undergone before the professors of the institute or the lyceums, in order to be valid. It was therefore not possible to have in education that competition which is the origin of new discoveries in the better systems. The private colleges were at the mercy of the institute, which fixed the time of the examinations, their extent, the mode in which they were to be carried on, &c. Frequent rivalries occurred. The examinations were not always just, and the boys went to them with much vexation and with a terrible fear. Señor Cifuentes, who has visited the United States and Europe, and has therefore learned to know the advantages of a liberal administration, to his glory and the greater glory of the country, has abolished this odious monopoly. Education now advances rapidly, and will make still greater progress.

The foregoing report on education in Chili has kindly been furnished by the Chilian minister at Washington.

UNITED STATES OF COLOMBIA.

[Federal Republic. Area, 330,000 square miles. Population, 2,900,633.]

Minister of public instruction, THE MINISTER OF THE INTERIOR, DR. GIL. COLUNJE.

No report has been received.

ECUADOR.

(Republic. Area, about 300,000 square miles. Population, 1,108,082.)

Minister of public instruction, THE MINISTER OF THE INTERIOR, A. LEON.

Through the kindness of Señor Don Antonio Flores, the following recent facts regarding education in Ecuador have been furnished, from the journal La Prensa, (The Press,) published at Guayaquil, numbers of March 12 and May 25, 1872.

GENERAL PROGRESS OF EDUCATION.

An injustice which has long oppressed a large portion of the population of the republic is at last to be reformed. The indigenous classes, so long neglected, except by the task-master and tax-collector, are to receive a solid education, which will lift them from the brutish condition in which up to this time they have been submerged, either from the want of funds on the part of the government to instruct them, or because of the abject state in which they have existed since the conquest. A stimulus has been wanted to inspire them to compete with the descendants of Europeans, who alone have, up to the present time, received the benefit of instruction, though even this has been most superficial.

With such a laudable end, the Christian Brothers have established in the capital of the republic a normal school, where, at the expense of the nation, aborigines will receive a useful education, with the obligation on their part of transmitting the knowledge they receive to the people of their tribes.

Many obstacles will present themselves to the realization of this work, as this unfortunate class resist accepting every kind of instruction, believing that the benefits which they will obtain are but a pretext for exacting greater services of them, and more especially military duty, toward which they show an invincible repugnance. The judgment, however, with which this affair is managed will gradually conquer every resistance, and little by little the aborigines will learn to appreciate the value of education, which will place them on an equal footing with civilized men.

Apart from the very marked protection of the government, we feel confident in the good results of the institution, because of the undeniable competence of the directors, already proved in the many establishments which they have hitherto managed in the republic.

Another school for children has been opened in Jipijapa (province of Manabi) on the 1st February, 1872, under the direction of the same society of Brothers. The ceremony took place with all the pomp which republican countries, understanding the importance of the diffusion of knowledge, give to the establishment of educational institutions, in which is the best hope of the progress and future of the state.

The government has ordered the purchase of two farms for a practical school of agriculture, and has directed that a number of articles for the school of arts and sciences be purchased in the United States. Brother Felier, in charge of organizing the establishment, has proceeded to New York in fulfillment of this purpose.

The education of women likewise improves daily among us, and we can now add to the colleges directed by the Sisters of the Sacred Heart those under the supervision of the Sisters of Providence and the Sisters of the Good Shepherd, who, among other beneficial objects, propose one interesting to our society, the want of which has been keenly felt, namely, an education for females adapted to all classes of society and to the different conditions of life. With the decided patronage given to establishments of education, making them more general, the most positive and durable good is obtained.

We can not do less than congratulate ourselves on seeing the flattering picture which Ecuador now presents, where the national schools are superior to those of other Hispano-American republics, excepting only Chili.

Since the 3d of April, in the canton of Amboto, 14 primary schools for children have been established, with 907 scholars.

SCHOOL OF FINE ARTS.

The school of fine arts was opened in the capital, Quito, on the 2d May, 1872, with 13 students, and increased to a larger number in a few days. The kindly disposition of the inhabitants of Quito toward all the arts, and more especially painting, of which they have always given excellent proof, is well known, and we believe that this new institute will efficaciously develop so as to deserve the consideration of the most civilized nations and contribute to the country's glory.

GUIANA, (BRITISH.)

(British Colony. Area, 76,000 square miles. Population, 193,491.)

Inspector of schools, W. G. G. AUSTIN.

From Mr. Austin's report for 1870, published at Demerara in 1871, the following facts are gathered:

TEACHERS.

As a rule the teachers are all colored, and are either native creoles or foreigners from the British West Indies. In the city of Georgetown, the capital, there is a normal school, bearing the name of Bishop's College, at which most of the native teachers are trained. The faculty of this institution consists of a warden, a sub-warden, and a training-master. The regular time for admission is in September, and candidates are obliged to pass an elementary examination. As there are seldom more than four or five vacancies at the close of the academic year, the examination is usually competitive. Students have board and lodging free at the institution, and those who are in connection with the Church of England receive £10 a year, or £4 a month, to assist in defraying the necessary expenses. The course of instruction embraces the usual branches of a common English education, Latin and algebra being the only extra branches. At the semi-annual examinations various classes of merit are awarded. At the first examination only common English branches, with music and drawing as optional subjects, are required; at the second, algebra, and book-keeping also, to which such moment is attached that in case of failure in either, despite having obtained the number of marks necessary, no certificates are conferred. Pupil-teachers have also to pass an annual examination in August, somewhat similar to that of the teachers, though more elementary.

The system upon which teachers are paid is in the highest degree calculated to draw out the energy and teaching-power of the master. Salaries are dependent upon two conditions: the efficiency of the pupils, as exhibited at each yearly examination by the inspector of schools, and the annual averages returned. The consequence is that the salaries are continually varying.

SCHOOLS.

The schools are divided, according to the results of the examination, into five classes, A, B, C, D, and E, with a *per capita* allowance of 8, 7, 6, 5, or 4 dollars, respectively, as a government grant. This grant, however, constitutes only two-thirds of the sum allowed to schools, the other third being supposed to be raised by school-fees. In case these fees do not amount to one-third of the government allowance, the latter is, by a regulation of the education committee, subject to a reduction. Hitherto, however, it has been found impracticable to carry this rule into effect, as very few schools succeed in raising the required third. The amount of fee paid by each child is rather left to the discretion of the teacher; usage, however, has fixed it at from 4 to 8 cents a week.

School-houses are, with few exceptions, erected at the expense of the various religious denominations, they deriving aid from the government when asked for. Schools, therefore, are under the immediate control of the clergy, who are termed their patrons, and in whom is vested the power of appointing or dismissing the teacher at pleasure, as also the division of the grant among the various school officers.

SCHOOL-INSPECTION.

The inspector pays a visit to every school once a year, for the purpose of holding examinations. Three or four days previous to his coming the patron is officially notified in a printed letter, accompanied by a number of schedules to be filled out by the teacher. On these schedules are entered all the names on the register for the quarter; those presented for examination arranged in standards according to their attainments. Against each name are placed the age, index number, time of admittance, and number of times present at school during the preceding six months. No child is eligible for examination who has not attended at least one hundred times during the preceding six months. The examination embraces reading, writing, arithmetic, and dictation. There are six standards of merit. In order that a school should pass satisfactorily in any class, it is necessary that 60 per cent. of the average for the year should be able to pass in standard I, which is the lowest. For a school to be placed in either of the classes A, B, C, or D, it is necessary that 8 per cent. of the average should pass in standard VI, 10 per cent. in standard V, 14 per cent. in standard IV, and 20 per cent. in standard III.

IRREGULARITY OF ATTENDANCE.

The irregularity of attendance, particularly in the rural districts, is a great drawback to the efforts of the teacher. Here the parents work on the sugar-plantations, and as they have their own farms usually at a great distance from their houses, Monday is the day which they regularly set apart for bringing home provisions to serve the family during the week; and, generally speaking, all the children who are able to assist are carried "aback," as it is called. So it frequently happens that Monday's attendance bears a proportion of not more than one-fourth or one-fifth that of Wednesday. If, on the day of the inspector's visit, all whose names are on the schedules for examination are not present, the inspector usually makes a second visit, when such absences can be satisfactorily accounted for.

SCHOOL-HOURS.

The schools are open at 9 a. m. and 1 p. m. The hour from 12 to 1 is given for recreation. At 10 a. m. and at 2 p. m. the register is called, and children coming after these hours are not included in the numbers, which are put down immediately on summing up those present. A child regularly attending for ten weeks is eligible for examination, so far as the requirement of "time" can qualify him.

STANDARDS OF MERIT.

Standards.	Reading.	Writing.	Arithmetic.	Dictation.
Standard I..	Monosyllables	Monosyllables, or letters from a copy set on a slate.	Notation up to 20.	
Standard II..	Third book of any revised series.	Words as above.....	Any of the lower rules of arithmetic.	
Standard III.	Third book of any revised series.	Writing from a copy set on the slate or on the blackboard.	Substraction and long multiplication.	
Standard IV.	The Irish fourth book, or that of any revised series.	A plain, legible, round hand as above.	Long division and the compound rules up to compound multiplication; notation to millions.	A passage, similar to that read, written on slate.
Standard V..	The Irish fifth book, or that of any revised series.	A neat, round hand as above.	The compound rules, including reduction and notation up to billions.	A passage, similar to that read, written on paper.
Standard VI.	Reading from the sixth standard of any revised code of school books, or from a newspaper.	A fine and neat round hand from Darnell's course, or any other standard copy-book.	Proportion and practice, or bills of parcels and notation.	A passage, similar to that read, written on paper.

STATISTICS.

The number of schools, exclusive of Indian missions, aided by government was 149, 10 of which received grants for the first time in 1870. The number of children on the 31st December was 15,669, exclusive of a few schools from which no returns have yet been sent in; and the average attendance was 8,894. These schools belonged to the following denominations: Church of England, Church of Scotland, Roman Catholic, Wesleyan, London Missionary, and Congregational.

The expenditure of the board of education in aid of salaries, rents, repairs, books, and other school-requisites, during 1870, was $63,747.06.

PARAGUAY.

(Republic. Area, about 80,000 square miles. Population, about 1,000,000.)

No report has been received.

PERU.

(Republic. Area, 558,000 square miles. Population, 3,374,000.)

Minister of public instruction, THE MINISTER OF THE INTERIOR, F. ROSAS.

No report has been received.

URUGUAY.

(Republic. Area, 75,000 square miles. Population, 350,000.)

Minister of public instruction, THE MINISTER OF THE INTERIOR, Dr. C. REGUNAGA.

No report has been received.

VENEZUELA.

(Federal Republic. Area, 426,712 square miles. Population, 1,594,433.)

Minister of public instruction, M. SANAVRIA.

No report has been received.

V.—AUSTRALASIA.

No recent educational reports having been received from any of the British colonies or any other portion of Australasia, with the exception of the Sandwich Islands, a brief exhibit of education in those islands is given below.

SANDWICH ISLANDS, OR KINGDOM OF HAWAII.

(Constitutional Monarchy—Kingdom. Area, about 6,000 square miles. Population, 57,145.)

The government of these islands is at present somewhat unsettled, as the King (Kamehameha V) died very recently, without leaving any offspring.

STATEMENT OF M. DE VARIGNY.

M. de Varigny, late counselor of education, minister of finance, and privy counselor of King Kamehameha V, has recently published a statement on education in the Sandwich Islands, in the well-known Paris paper, Le Temps, from which the following facts are gleaned:

The education department is not subordinate to any of the ministries, but to a special educational council. Parliament has never yet either refused or reduced the appropriation, which was for the financial period April 1, 1870, to March 31, 1872, $88,348, although the total annual receipts of the kingdom during the same period only amounted to $964,956.

A wealthy native recently made the following characteristic speech in Parliament: "Some of you seem to show hesitation in voting for the educational appropriation. As for me, I do not feel any hesitation on this point. I would rather pay the schoolmaster than the police-officer; the latter protects my property, but the former teaches to respect it. Every dollar we pay for education is an insurance premium paid to the future. Compare the large sums we had to pay for our police in our department of justice with the small amount paid now for the same purpose. The more we pay for education, the less we shall have to pay for the other."

Education is compulsory and free of charge. Parents are obliged to have their children instructed in reading, writing, and arithmetic. In every district there are one or more schools for boys and girls. The teachers are appointed in each district by a permanent district committee, consisting of the justice of the peace of the district, a private citizen of the district, appointed by the educational department at Honolulu, and one citizen who must be a father of a family, who is elected by absolute majority of votes by all the fathers of families in the district. This district committee superintends all the schools, sees to it that the attendance is regular, and every month sends a detailed report to the education department at Honolulu.

Religious instruction is entirely separate from secular instruction, and teachers are strictly forbidden to speak of religion in school, or to teach any religious doctrines, religious instruction being left entirely to the parents and clergy. Outside of the school hours, which are from 9 a. m. to 2 p. m., the school-house may be used by the clergymen, or any teacher of religion, for giving religious instruction.

The district schools are primary schools, but there are also a few secondary schools, in which poorer scholars are instructed free of charge.

In the city of Lahaina (population, 3,581) there is a normal school, with about 120 students, which supplies almost all the teachers for the country.

Besides the public schools there is also a number of private schools, as every one is at liberty to establish a school, and as the government does not oblige parents to send their children to the public schools, but merely insists on having their children instructed in reading, writing, and arithmetic.

It would be difficult to find in the whole kingdom ten persons, men or women, at the age of 20 who are not thoroughly versed in these three elements of education. There may be but few natives who possess a higher or classical education, but likewise very few who do not possess a very good elementary education. People read a great deal, especially newspapers, whose number and circulation are very large compared with the number of inhabitants. The two chief papers are printed in the Hawaiian language at Honolulu; they are papers of considerable size and are generally well edited. One of them, the "Kuokoa," (the Independent,) is the organ of the opposition, and has a circulation of at least 5,000. The other paper, the "Auokoa," (the New Era,) is the government organ, and advocates the national independence. It has about the same number of subscribers as the "Kuokoa." Other papers are published in English, and are likewise read a great deal by the natives. Besides the political journals, which enjoy all the privileges of an entirely free press, there are several religious papers published by the different religious denominations.

OBITUARY OF FOREIGN EDUCATORS, AUTHORS, AND MEN OF SCIENCE.

From September 1, 1871, *to November* 1, 1872.

1871.

SEPTEMBER.

Th. Schliephake, professor of philosophy in Heidelberg, died September 5.

Th. Leykant, professor of chemistry in Nuremberg, September 14.

C. Süpfle, philologist, in Baden-Baden, September 15.

Bernhard, president of the school-council of the canton of Grisons, Switzerland, at Chur, September 15.

Richard Bentley, well-known English publisher, in London, September 15.

Dr. Hertz, professor of anatomy at Erlangen, Bavaria, September 27. He was the first Israelite who received a government appointment in Bavaria.

Cipriani Potter, director of the academy of music in London, a friend and pupil of Beethoven, in London, September 29.

OCTOBER.

Arvid August Afzelius, Swedish poet and historian, at Enköping, Sweden, October 1.

Dr. J. B. Baltzer, professor of dogmatics at Breslau, Prussia, October 2. He was a Catholic theologian of high repute, and wrote numerous theological works, of a liberal and philosophical character, for which he in 1860 was suspended from office by the archbishop of Breslau.

Charles Babbage died about the middle of October, in England. He was born in Devonshire, December 26, 1792, studied at Cambridge, and devoted himself entirely to the study of mathematics. He is the inventor of the calculating-machine, and wrote numerous works, the most important of which are "Tables of Logarithms" and "Economy of Manufactures," besides numerous essays for scientific journals.

Sir Roderick Murchison died in London about the middle of October. He was one of the greatest geologists of our time. Born February 19, 1792, he entered the army in 1807, and took part in the Peninsular war, but left the service in 1816, in order to devote himself entirely to the pursuit of science. His most famous works are "The Silurian System" and "Geology of Russia in Europe and the Ural Mountains."

Dr. M. E. A. Naumann, professor of medicine and natural sciences at Bonn, October 19. He was born at Dresden, October 7, 1798, studied at Leipzig and Berlin, and was professor at Berlin, from whence in 1828 he was called to Bonn. Naumann was one of the most eminent teachers Germany possessed, and wrote many works, the most important of which are, "Manual of Medical Clinics" and "General Pathology and Therapeutics."

NOVEMBER.

Professor Peter Hjort, famous Danish philologist, November 11, in Copenhagen.

Nicolai Turgenjew, near Paris, November 13. He was a Russian writer of liberal tendencies, well known through his work, "La Russie et les Russes."

DECEMBER.

Dr. Franz Sanchaber, professor of Roman law in Würzburg, Bavaria, December 10.

Dr. Baumann, December 15, at Berlin; a pupil of Hegel, and author of many critical and philosophical essays.

Henrick Allen, professor of history at the university of Copenhagen, December 27. A famous Danish historian and author of the best and most critical history of Denmark.

Maurus Schinagl, professor at the Schotten-gymnasium at Vienna, well known philologist, December 28.

1872.

JANUARY.

Ludolf Wienbarg, well-known German liberal author, critic, and journalist, at Altona, January 2.

Dr. Ernest Büchner, distinguished professor of medicine in Munich, January 2.

Christian Petersen, professor and librarian of the city library in Hamburg, January 16.

Franz Grillparzer, famous German dramatist in Vienna, January 21.

A. Trendelenburg, professor of philosophy at the Berlin University, in Berlin, January 26. He wrote numerous works, chiefly on ancient philosophy, but also works of a political, historical, and educational character.

FEBRUARY.

J. W. Kaltschmied, professor in Leipzig, well-known author of dictionaries of the French and English languages, about the middle of February.

Dr. Von Oehler, professor of theology in Tübingen, Würtemberg, February 20.

Dr. M. A. Levy, professor of archæology and philology in Breslau, author of a dictionary of the Phœnician language, February 22.

MARCH.

Johann Carsten Hauch, one of Denmark's greatest poets and dramatists, professor of literature and æsthetics; for many years director of the Royal Theater, Copenhagen, in Rome, March 4.

Dr. Dietsch, professor of theology, at Bonn, March 5.

Professor Goldstücker, well-known orientalist, in London, March 6.

Giuseppe Mazzini, well-known Italian patriot, who also took the greatest interest in educational matters, at Pisa, March 10.

APRIL.

H. Von Mohl, professor of botany in Tübingen, Würtemberg, April 1.

Martin Ohm, famous mathematician and professor at the Berlin University, in Berlin, April 1.

Pictet de la Rive, zoölogist and paleontologist, in Geneva, beginning of April.

Von Schreiner, professor at the University of Graz, Austria, April 2.

A. E. T. Langier, astronomer, member of the French Academy in Paris, beginning of April.

Dr. Max. Friedländer, distinguished Austrian journalist, editor of the "New Press" in Vienna, April 20.

Dr. F. L. A. Schweiger, librarian and professor of the history of literature, at Göttingen, April 23.

MAY.

Flodoard Geyer, professor of music, at Berlin, beginning of May.

Dr. Ludwig Kaiser, professor of philology, at Heidelberg, May 5.

Dr. N. A. Von Müller, orientalist, in Lundenburg, near Vienna, May 16.

Dr. Hans Pfaff, professor of mathematics at the University of Erlangen, in Erlangen, May 20.

Otto, Baron Von Hingenau, authority in mining matters, in Vienna, May 23.

Schnorr Von Carolsfeld, one of the greatest German painters of modern times, in Dresden, May 24.

Sir Henry Lytton Bulwer, English diplomatist, traveler, and author, brother of the well-known poet and novelist, author of the interesting works "France; Social, Liter-

ary, and Political," "The Monarchy of the Middle Classes" &c., &c., in London, May 27.

Dr. Adolf Solbrig, professor of psychiatry at the University of Munich, in Munich, May 31.

Friedrich Gerstäcker, Germany's greatest traveler, author of many works of travel, especially in North and South America, in Brunswick, May 31.

JUNE.

Charles Lever, well-known English novelist, for many years British consul in Trieste, in Trieste, June 1.

Dr. Hundeshagen, professor of church history and dogmatics at the University of Bonn, author of many standard theological works, at Bonn, June 1.

Dr. J. F. Hessel, professor of mineralogy and technology at the University of Marburg, in Marburg, June 3.

Dr. Thorbecke, famous Dutch statesman, author of works on political economy, and a great friend of education, at the Hague, June 3.

Dr. Robert Prutz, German poet and litterateur, author of many works on the history of literature, at Stettin, June 21.

Dr. E. F. Souchay, historian, in Frankfort-on-the-Main, June 30.

Dr. F. Kampe, author of many free religious and philosophical works, in Wildbad, June 30.

JULY.

Dr. Karl Jäger, oldest professor at the Vienna University, (91 years old,) famous oculist, at Vienna, July 2.

Dr. W. Eisenlohr, professor at the Polytechnic School at Carlsruhe, July 10.

Dr. Eugene Rosshirt, professor of obstetrics in Berlin, July 13.

Benito Juarez, president of the Mexican Republic, in Mexico, July 15.

Dr. Emil Seidl, professor of medicine at Prague.

Dr. E. Hauschild, professor of music at the University of Basle, author of standard works on the history of music. at Basle, July 29.

F. A. Kaiser, Holland's greatest astronomer, professor at the University of Leyden, at Leyden, end of July.

C. F. Appun, well-known German traveler and scientist at Georgetown, Guinea.

AUGUST.

Philipp Nathusius, editor of popular German journals at Lucerne, August 16.

SEPTEMBER.

Nicolai Frederik Severin Grundtvig, famous Danish theological, educational, and political author and poet, and bishop of the Danish church. He was born in 1783, in the parsonage of Udby, in the south of Zealand. Both on the father's and mother's side the family had been Danes, of the most Danish intensity, for long generations. He was therefore strongly national in all his writings, and of all the northern writers not one has so exclusively been a man of the people. He never cared to address the polite world of letters; he wrote poems for the people, and in return there is no poet in our time whose works have been so read and loved in the homes of the peasants as his have been. In his later years he spent much labor in advocating a new scheme of education for the poor and the rural population, by means of the so-called "farmers' high schools." He died at Copenhagen, September 2.

Dr. Koch, professor and philologist at Eisenach, September 5.

Don Manuel Mendez, minister of public instruction of the republic of San Salvador, murdered in Salvador, September 7.

Von Denis, technologist and architect, who built the first German railroad, at Dürkheim, September 9.

Dr. Georg Phillips, professor of the history of law and author of works on this subject, at Aigen, Austria.

Dr. Riedel, keeper of the royal archives and historian of the province of Brandenburg, at Berlin, September 8.

Dr. Ludwig Feuerbach, famous German philosopher. He was born at Landshut, Bavaria, July 28, 1806, and studied philosophy at Heidelberg and Berlin. For some time professor at Erlangen, he soon retired to private life and devoted himself entirely to philosophical studies. In the beginning a follower of Hegel, he soon showed himself as an independent thinker, in his first work, "Thoughts on Death and Immortality," which appeared in 1830. He boldly attacked the belief in the immortality of the human soul, and broke entirely with all philosophical and theological traditions. This

first work was followed by many others. He died in great poverty in the village of Rechenberg, near Nuremberg, September 13.

Charles XV, King of Sweden and Norway, the grandson of Marshal Bernadotte; a most enlightened and liberal monarch and great promoter of education in his country. He was the author of a number of military works, and as a poet takes high rank among the Swedish classical authors. He died at Malmö, September 18.

Christian Pessler, Leipzig's oldest bookseller, owner of the oldest publishing house in Leipzig, September 25.

Dr. Ferdinand Ludwig Stolle, well-known German author and journalist, in Dresden, September 29.

Wilhelm Bär, chemist and author of chemical works, in Reudnitz, Saxony, September 30.

OCTOBER.

Carl Liebig, director of the royal orchestra in Berlin, who very successfully worked for raising the musical taste of the Berlin public, in Berlin, October 6.

Dr. Karl Spurzheim, director of the imperial insane asylum, at Vienna, October 9.

Wladimir Dal, Russian author, under the *nom de plume*, *Kosack Luganski*. His most famous work is a Russian dictionary. He died at Moscow, October 4.

Jacques Babinet, eminent French scientist and astronomer, author of many works on astronomy, physics, and meteorology, in Paris.

Baron von Fircks, author of many works on political economy, at Dresden, October 22.

Theophile Gautier, famous French author in Paris, October 23.

Dr. Otto Fock, well-known German historian, at Stralsund, October 24.

Dr. Charles Daremberg, professor of medicine in Paris, author of standard works on the history of medicine, in Paris, end of October.

SPECIAL ARTICLES.

EDUCATION IN THE HAWAIIAN ISLANDS.

BY C. J. LYONS.

The first establishment of common schools in the Hawaiian Islands was effected under the direct supervision of the governing chiefs, between the years 1823 and 1827. After much persuasion by the American missionaries, the chiefs, together with their immediate followers, placed themselves under instruction. It is related that, at first, the King directed two or three of his more intelligent subjects to try this matter of learning to read, and see if it were safe, in which case he himself, and others of rank, would follow. In the course of time the new accomplishment became so popular that the adherents of the chiefs and others were sent all over the group to establish schools, which were attended by nearly the whole population. The schools were several hundred in number—at one time nearly nine hundred—composed mostly of adults, and, in their highest prosperity, were reported to contain 52,000 pupils. It was a remarkable instance of a body of despotic chiefs seeking, under the movement of Christian influence, to educate the masses of their barbarous people. The scholars assembled for instruction during an hour or two in the early forenoon, probably as soon as 7 or 8 o'clock, in most cases, and then dispersed to meet again, for a like period, at 3 o'clock, or thereabouts, in the afternoon.

The method of study was of the rudest kind, and the matter of discipline but little thought of. The teachers were under the patronage of the chiefs, who ordered the people to provide for their wants. In many cases they seem to have furnished the teachers with land to cultivate.

Besides reading and writing, some teaching in arithmetic and geography was attempted. Both these branches of study have always been favorites with the Hawaiians.

In a few years the larger part of the people had acquired the art of reading, and the schools, not being thoroughly established, especially for children, suffered a great decline.

From 1830 to 1840 the American missionaries sustained at each of their stations (which at the latter period were eighteen in number) schools intended as models, for which purpose small grants of money were made each year by the American Board of Missions, and valuable assistance rendered by the chiefs.

The schools in the outlying districts were kept up or not, according as there was more or less energy on the part of the people, or district head-men, (chief agents,) the schools being always under the direction of the missionaries.

After the French Roman Catholic mission was firmly established in the group, which was in 1839, its own schools were also set in operation, and furnished with school-books, prepared and printed by the same organization. These schools were not as numerous as the others, but have always been an important element.

FIRST SCHOOL-LAW.

In 1840 the first written constitution and laws were promulgated.

Among the latter was a school-law, further amended in 1841. By this law, which has a strong tinge of Massachusetts ideas, or something akin to them, in its composition, the parents in any district where the children outnumbered fifteen were empowered to meet and choose three of their number as school-officers. These were to act in conjunction with the superintendent for each island, who was appointed by the assembly of chiefs, (which was the then existing government,) in securing teachers. They were to provide for the support of the teachers from the avails of the old feudal-law-tax, (a labor-tax,) and the chief of the district was to provide a piece of land upon which the older scholars were expected to labor for the benefit of the teacher. The teacher, moreover, was entitled to freedom from taxation. Teachers were obliged, even at that early day, to have certificates. Attendance was made compulsory. To persons born after 1820, ability to read and write was made a condition of marriage, or of holding any office.

The schools do not appear to have thoroughly flourished under this system until 1846, when the departments of the government were organized, a minister of public instruction appointed by law, and authorized to draw upon the government revenues for the support of schools. He was directed to take the entire charge of the common-school system of the group; to make frequent tours of the different islands; to hold examinations; and to infuse energy and a spirit of order generally. In 1850 a regular school-tax of $2 upon each taxable individual was imposed, and the tax-collectors in

the different districts authorized to transfer the amount to a district-treasurer, who acted as paymaster to the teachers. This tax has been kept up to the present time. Efforts have been made to exempt parents sending their children to private schools, but, fortunately, without success.

The office of minister of public instruction was afterward changed to that of president of the board of education; the board consisting of three members.

By the act of 1865, which, with slight modification, is the present school-law, the board of education consists of five members, appointed by the King, to serve without pay. The prominence of the president of the board ceased by the creation of the office of inspector-general, whose duties are nearly those formerly imposed upon the minister of public instruction.

THE INSPECTOR-GENERAL.

He is appointed by the board, acts under the authority of that body, but has large discretionary powers permanently conferred upon him by resolution of the board. He is required by law to visit all the schools; to direct as to what studies shall be pursued, and in what proportions; to grant certificates of competency to teachers, and is empowered to cancel the same. He directs the repairs on school-houses; examines the accounts of the district-officers hereafter specified. Until recently, the appointment as well as the removal of teachers was in his hands. By the act of 1870 this was placed in the hands of a school-board to be noticed hereafter. No person in holy orders, or minister of religion, is eligible to this office. The position is now (1872) filled by H. R. Hitchcock, a son of an American missionary. Salary of the office, $2,000.

OFFICE OF BOARD OF EDUCATION.

The board of education keep an office in the government buildings. In attendance, the clerk of the bureau; salary, $1,500. Supplies of school-books and stationery are forwarded to the different schools from this office. No regular time of meeting of the board is imposed by law. Any appeal from the action of the inspector-general is made to the board. A biennial report is prepared, signed by the president of the board, and laid before the legislature at each session, containing all statistics, and such information as may be necessary. A sextennial census, counting from 1860, is ordered by law, and its duties committed to the board of education. In addition to this a complete registry of births, deaths, and marriages is provided for, to be kept by the sub-officers of the board, and reported biennally to the legislature.

DISTRICTS.

The islands, for all purposes pertaining to educational matters, are divided into districts, coincident with the taxation-districts. By the act of 1865, these are 25 in number.

In each district, the board appoints a school-agent. He is the local executive officer of the board for that district, acting as treasurer, trustee of school-property, registrar of births, &c., and performs whatever other duties of this nature that may be required. As attendance at school is compulsory, it is generally expected that the agent will make complaints for truancy.

In conjunction with the district-justice and an elective member, yearly balloted for by the parents and guardians of the children in actual attendance, the school-agent is member of a district school-board. This board has the power of appointing and removing teachers, subject to appeal to the board of education. It has no especial powers in addition, but is expected to assist and co-operate with the school-agent as he may need such assistance and co-operation.

TEACHERS

The usual pay of teachers in common schools is 50 cents per day. The actual amount is determined by the board of education.

Male teachers are mostly employed, it being only of late, and in cases where the sexes are separated, that female Hawaiian teachers have been employed.

School-hours are from 9 o'clock a. m. until 2 o'clock p. m., with one recess of 15 and one of 30 minutes. Teachers are required to have a certificate of competency from the inspector-general. They are now expected to attend the teachers' institutes, which are generally held once a quarter, one on each island, excepting Hawaii, where there are three. There is no normal school, but most of the teachers have received their education at the Lahainaluna Seminary. They are required to keep a register of scholars, and to give a certificate of dismissal to those leaving their school for another.

ATTENDANCE.

Attendance is compulsory upon all between the ages of six and fourteen. Parents or guardians are fined five dollars in case of absenteeism. Should parental authority prove powerless, a term at the reform-school, or labor otherwise enforced, is provided as a penalty. Teachers are now directed to make complaints for truancy to the district-justice.

SCHOOL-TERMS.

The vacations are fixed by the board of education; forty weeks, or ten weeks per quarter, being, by the present rule, the school-term for the year. The number of children requisite in each district to authorize the continuance of a school is also at the option of the same body, as well as the number of school-hours each day. The tendency among Hawaiians is to begin early and dismiss early.

SUPPORT.

The regular school-tax of $2 proving inadequate in many thinly-settled districts to keep up the schools during the whole school-year, a special appropriation from the general revenue was made in 1868, and has been since continued from year to year. For school-houses, the same has been done; the parents, however, in many instances co-operating with the government in repairing and building, when requested.

STUDIES AND SCHOOL-BOOKS.

In all schools known as common schools where tuition is free the instruction is entirely in the Hawaiian language. There is one exception to this in the Hilo (Hawaii) union school, the first attempt to establish a graded school on the islands. In this school, at a certain stage of advancement, scholars are admitted to the English department.

At Honolulu there are two schools attended by Hawaiians, (the royal school for boys and the Mililani school for girls,) where a fee of $5 per year is required of each scholar. In these schools competent teachers are employed, at salaries from $1,500 down, and the English language is made the vehicle of instruction. For many years the American Protestant mission furnished school-books in the Hawaiian language at a price below cost, prepared by its own members.

The Catholic mission furnished its own school-books. The scarcity of school-books, consequent upon the expense of preparing them where only small additions are necessary, had proved a great drawback.

Lately Thomson's Higher Arithmetic has been translated and published by the government. A reading-book modeled after the Progressive Third Reader of Town and Holbrook's series, but containing much original matter, succeeded this. An edition of 7,000 was printed of each.

Two geographies are now in course of preparation. Colburn's Mental Arithmetic, which has long been the standard, has been translated and reprinted. One cannot but sympathize with the Hawaiians in their efforts to keep up their own language, which to them cannot be replaced. The impossibility of obtaining at low wages teachers competent to introduce English as a common-school branch is the principal reason for its non-introduction.

A government day-school for English-speaking children is maintained at Honolulu; salary of head teacher, $1,500, with two assistant teachers. The distinction between this and the other high-grade schools already mentioned consists in the ability to use the English language previous to entrance, as no race distinctions are allowed.

In this connection may be mentioned two quite prominent independent day-schools in Honolulu, where English is taught by native Hawaiians.

LAHAINALUNA SEMINARY.

This is the national college for native male Hawaiians. It is not, however, a chartered institution, but is supported directly by government appropriations. It was established in 1831 by the American mission, near Lahaina, or Maui, which was then the second place of importance on the islands. It is modeled somewhat after the American college, the course of study requiring four years. Average number of students, 90; in attendance at the last report, 103. A valuable piece of arable land being attached to the institution, the pupils labor regularly for their own support. No tuition-fees are expected. In 1849, the government assumed the support and control of this seminary, under the stipulation, however, that no religious teaching should be introduced contrary, in its principles, to the previous teachings of the American mission.

Two foreign instructors with their families are sustained here at present—both sons of missionaries—and a Hawaiian assistant. The English language is taught as a branch, not as a medium of instruction. It is noteworthy that at this school was published in Hawaiian the first newspaper of the Pacific Ocean. This was in 1831.

OAHU COLLEGE.

This college occupies as leading a position as the Lahainaluna Seminary, and is the principal institution for English-speaking youths of both sexes. It is situated at the foot of the hills two miles east of Honolulu; was originally founded in 1841 by the American missionaries for their own children; and was chartered in 1849. In 1853 a new charter was granted, with a view to remodeling the institution after the pattern of an American college, at which time the present title was adopted. It has never maintained a permanent stand beyond that of a first-class academy. In most instances such young persons as have been desirous of obtaining a liberal education have, with good reason, been anxious to obtain at the same time the social advantages and experience only attainable in older and larger countries. In its proper character, however, of a high school, it has had a prosperous career, as a large portion of the better-educated members of the island community have received most of their education at this school. The present endowment is about $30,000, bestowed partly by the Hawaiian government, partly by the American board, and partly by individual donors, here and abroad. The government appoints two out of fifteen trustees. Principal's salary, $1,500. Three or four assistant teachers are generally employed. Present number of pupils, 75, of which 18 are boarders. A large tract of land belongs to the college. Manual labor is expected of the boarding-scholars. Summer-vacation, about twelve weeks.

OTHER GOVERNMENT SCHOOLS.

The Hilo (Hawaii) Boarding-School may be regarded as a government school to the extent that the sum of $1,200 a year for teachers' salaries, &c., is drawn from the public revenue.

It is a boarding-school for boys, numbering at last report seventy-three pupils. It furnishes a large proportion of teachers for common schools. The boys have regular working-hours.

The other government schools of higher class are the Haleakala Industrial School for Boys, at Makawao, Maui; teacher's salary, $1,200; number of pupils, 40; and the Reform School at Honolulu, established by the act of 1865; teacher's salary, $1,200; inmates, 60 to 70. In the latter, only the boys' department is kept up. A good piece of ground for cultivation belongs to this. Older boys are now often sent to the plantation to work.

FEMALE SEMINARIES.

The plan of assistance adopted by the government for this class of schools, which are more or less denominational, is by means of what is called the "capitation-fee." From $25 to $50 per year, according to advancement in the course of study, is allowed to each scholar who shall have remained after the first year. This assistance, however, is not by any means always asked for, especially in the case of the largest school of this class, viz, that of the Sisters of the Sacred Heart, (Catholic mission,) at Honolulu. They have 51 boarders and 55 day-scholars; total, 106.

Connected with the English Episcopal mission are two schools of this sort—Saint Andrew's Priory, at Honolulu; pupils, 67: and Saint Cross Seminary, at Lahaina; pupils, 58.

The American Protestant mission to the islands was discontinued by the American Board of Commissioners for Foreign Missions in the year 1863, on the ground that a formal connection with the board was no longer necessary. There are three female seminaries not under the control of any religious body, but the instructors are mainly descendants of the members of the said mission. These are the Makawao Female Seminary, on Maui, with 46 pupils, and possessing the finest school-building on the islands; the Kawaiahao Female Seminary, at Honolulu, with 51 pupils, established in 1867; and the Waialua Female Seminary, also on Oahu, established in 1865, with 30 pupils. These are all more or less modeled after schools of the same character in the United States.

OTHER INSTITUTIONS.

The Catholic mission, at an early date in its history, established a high school for boys, known as Ahuimana College, on the northeast side of Oahu. The pupils are said to be well drilled in habits of industry. The present number is 38. The French language is one of the branches of study.

The English missions are the especial supporters of Iolani College, Honolulu, which has made a prosperous beginning with 30 foreign and native pupils. The government maintain 11 scholarships in this school.

There are a number of independent schools in different places, as will be seen from the figures in the table following; but the above list includes all the important institutions of learning in the Hawaiian Islands.

CONCLUDING REMARKS.

The above summary may, after all, fail of conveying a correct impression of the actual amount of school-learning. A serious difficulty, in the way of progress in educational respects on the islands, is the co-existence of two languages. This stands in the way of a graded school at Honolulu. The progress of the native Hawaiians, if studying in English, is hindered by their non-familiarity with the words used, and, if instructed in Hawaiian, by the paucity of literature in that tongue. To counterbalance this, however, some of the evils of large and crowded public schools are avoided, and (may it not be added?) the evils of the modern system of cramming too much book-knowledge into youthful brains. Nor is the rigid discipline of colder climates possible, except in rare cases, with those who have felt no climatic influence, save that of the tropics. As a result of educational efforts, there exists probably no community in the world with so large a proportion of its inhabitants able to read and write. Though there are no published figures on the subject, it is known to be a rare thing to find a native unable to read. The newspapers that are published in the Hawaiian tongue are perused with the utmost avidity, and a remarkable familiarity with passing events is noticeable among all classes.

STATISTICS.

The following table is from the educational report for 1872:

Schools and school-attendance of the kingdom in 1872.

	Number.	Boys.	Girls.	Total.
Common schools	202	3,574	2,700	6,274
Government boarding-schools	3	205	.....	205
Government day-schools	5	344	148	492
Boarding-schools aided by government	9	170	197	367
Day-schools aided by government	8	168	106	274
Independent boarding-schools	4	18	78	96
Independent day-schools	14	312	267	579
Totals	245	4,791	3,496	8,287

The following figures show in round numbers the amounts expended by the government for educational purposes in 1871:

Avails of school-tax expended in districts where collected	$36,000
Special appropriation for common schools	8,500
For building school-houses	1,500
For school-books	2,500
Reform-school	7,800
Higher-grade schools	20,500
Total annual government expenditure	76,800

This is about one-sixth of the total revenue.

THE VALUE OF COMMON-SCHOOL EDUCATION TO COMMON LABOR.

BY EDWARD JARVIS, M. D., DORCHESTER, MASS.

The object of common-school edueation is ordinarily supposed to be simply the aequisition of knowledge, reading, writing, arithmetie, geography, grammar, &e. These are the simple elements which most children aequire in various degrees of fullness and aeeuraey. They are generally considered sufficient to fit men and women for the eommon responsibilities of life. These enable the possessor to transact the usual business of the world, and every one should be required to understand them before he enters upon maturity.

Beyond the mere knowledge of faets and prineiples, there are other advantages equally important and valuable, that grow out of the proeess of study and acquisition. The training and diseipline of the school quicken and energize the whole mental nature, and give it a faeility of applying itself and its varied faeulties to manifold purposes.

The new energy given to the pereeptive and refleetive powers, by study in the schools, remains a permanent possession after the period of edueation shall have eeased, even though the lessons may have been forgotten. The boy in his plays abroad, men and women in all their pursuits, find ceaseless oeeasion for their use, and pleasure as well as profit in their exercise. The eyes are opened; the dull vision becomes keen; the edueated boy or girl beeomes an observer, and sees things whieh the unawakened eye and untrained mind pass by without notiee.

The reasoning faculty is also quiekened, and the nature, relations, and purposes of things are studied. Thus people become uneonscious philosophers, in their several ways, with various depths of insight into the character of the matters that eome before them.

Life is a perpetual opportunity of study, presented to our attention. The earth and all surrounding objeets, the world and its cireumstances, are or may be uneeasing subjeets of observation and refleetion. People and animals, and their eonditions and relations, are ever offered for our thought. The mind pereeives these, with more or less eare and aeeuraey, aecording to its edueation and habit; one that is developed and trained to aetivity sees more than another that has not been quiekened nor aeeustomed to aetion.

Two persons, one edueated in the common school and the other untaught and undeveloped, may travel along the same road or over the same field. The same objeets and events may be presented to the physical eyes of both, but they make widely different impressions on their mental eyes. To the one whose mind has been enlivened the way is filled with objects of interest. His retina and brain are impressed with the images of things that are before and around him, and his journey, however short, offers him pleasant and profitable lessons for study. His aetive brain is oceupied with the sight of men, ehildren, houses, trees, flowers, cattle, carriages, teams, events, that pass before him. These he sees, perceives, and understands. His reasoning powers, equally aetive, reeognize the relations, causes, and purposes of things: the meadows overflowed by the reeent rains, the vines eut down by the last night's frost, the heavy carts drawn by oxen for farm-work, the lighter carriages for business or pleasure, the long and slender poles by the house for fishing, the shorter and larger poles for support of beans in the garden, the longer stakes for support of grape-vines, and the heavier stakes or posts for the fenee; his busy perceptive and refleetive faculties notiee these and manifold other things along the course of travel, and beyond their outward appearanee discover the causes that produeed them and the purposes for whieh they were made. So his life is a continued suecession of observation and reasoning. Whether he have an objeet or not, whether mere euriosity or business impel him, his brain is eontinually at work, and gathering strength by exereise, and faeility of applieation to any purpose that he may wish to accomplish.

To the other and duller traveler, whose mental eye has not been opened, and whose reasoning faeulties are yet dormant, the way and the field are blank and uninteresting. He sees little or nothing, and draws few or no eonelusions. His mind is exeited to little aetion, performs no labor, and gathers no strength from observation of the scenes and events that pass before his untrained physical eye.

OBSERVING CHILDREN.

A sagaeious teacher of a country-school required eaeh child to make or write something on a slate every day—a mark, a letter, a word, sentenee, or a eomposition, aeeording to his or her capaeity. One morning a girl of ten years wrote a history of her jour-

ney from her home to the school-house. She wrote this as rapidly as her pencil could form the words, for her mind was filled with the things which she had noticed on the way, and the reflections and emotions that they had excited. The journey was full of interest, and observation of the people, cattle, dogs, birds, insects, fields, corn, rye, flowers, wagons, &c., that she had passed in the few minutes' walk from her home.

She said, coming by the grist-mill, she noticed the pond, which was full the day before, was now empty, although a plenty of water was running through the channel, and through a sluice-gate in the dam. She concluded that it was drawn down by design. Seeing men at work with axes, saws, and hammers under the hill, she inferred that they were repairing the water-wheel. Soon after, she met a farmer going toward the mill with some large bags, well filled, in his wagon. She then thought that he was carrying grain to the mill to be ground, and felt a pity for him, as he would be disappointed, for that day, at least. She carried her sympathy to the farmer's home, and hoped that he had not waited until they were out of meal, and that the family would not have to wait for bread until the water-wheel should be repaired. Passing a house, she saw bundles of shingles in the yard, and a ladder raised to the eaves; she concluded that the roof was to be shingled, and, soon meeting a man with a hatchet in one hand, and a box of tools in the other, she supposed he was the carpenter going to do this work on that house.

Seeing a hen in a farmer's yard with only five chickens, she remembered that she had six the day before, and suspected that the fox, skunk, or other wild animal that was supposed to have destroyed some of her father's and other neighbors' chickens, had been at work here also, and was still too cunning to be caught in the traps that had been set for it. Seeing a robin fluttering about a tree, manifesting by her manner and her cries great distress, she looked under the tree and saw a cat looking very intently upward; she inferred that the bird had a nest with her young there, and was fearful that the cat had a design to destroy them.

With these and other observations and reflections on the things and events which she had seen on the way, she filled two sides of a large slate. She was an observer and a reasoner. Her mind and its elements had been quickened into life, and had found a plenty of occupation in this simple way. But another, with more torpid reasoning and duller perceptions, might have passed over the same road at the same time and seen little or nothing. With few or no facts, and no conclusions, the whole history of the journey would be that she walked from home to the school.

Thus boys and girls who are educated and trained to observe and reflect by the studies of the school carry their power and habit of mental action with them wherever they go. In the sports of childhood and youth, in the various employments of maturer life, whether they are laborers, farmers, mechanics, or workers in any other sphere, whatever may be the material on which they may operate, whatever may be the changes they may desire to effect, or results they may attempt to produce, they enlist the co-operation of their sharpened perceptions and disciplined reason in the plan and performance of their undertakings.

MUSCULAR FORCE.

The bones of the animal frame are covered with a great variety of muscles. They are the lean meat and constitute a large portion of the body. By their contractions they bend the joints and move the limbs. By these we walk, we strike blows, we lift, draw, and push, we use tools, move machines, we cut, saw, hoe, and dig, we make the rough smooth, and the smooth uneven, we alter the form and condition of things, and produce other effects and changes in external matter as occasion may require.

It is not sufficient for these purposes that man is endowed with this great force, however varied and versatile it may be. It needs to be directed and measured, so that a blow shall be in the proper direction, reach the intended point, and produce the desired effect. The hammer must hit the head of the nail, the ax the place where the wood is to be divided, the spade the rail that is to be moved. The blow must be struck with the appropriate momentum, not too great, which may crush and injure, nor too little, which will fail of effect and be lost.

TRIP-HAMMER.

The old-fashioned trip-hammer always struck its blows in one invariable course, and inevitably reached its object if it was in the line of motion. It dealt its blows with unvarying force upon whatever was in its way, whether it was the largest bloom or the smallest wire. The later improvements of lifting, by steam, enable the workman to measure and control the momentum, but the direction is ever the same.

LIVING WORKER.

The living worker has no such limit as to direction of movement, or as to momentum. But he can vary the first indefinitely, and the last within the limit of his strength. The muscles are so distributed and arranged that man can move his limbs in any line.

He can strike upward and downward, forward and backward, to the right and to the left, and at any angle between them. He can give these movements any degree of force, between that which is only sufficient to produce the slightest touch and that which is given with all his might.

All this animal force is under the control of the brain and the mind. These, through the nervous system, govern the contraction of the muscles and guide the movements of the hands and the feet in any desired direction, and measure the force of blows, and apply them to all purposes.

It is this control of the brain and muscular force that gives the limbs of the animal the superiority over the trip-hammer. It is the control of the mind over the brain that makes the hand of man more effective than the foot of the lion. It is the mental development and culture, the discipline and certainty of physical actions, that make the skillful workman superior to the awkward and unskillful, in the application of muscular force to the business of life.

CONDITIONS OF SUCCESSFUL LABOR.

In the performance of all labor of the body, there are two things to be considered: 1. The nature and character of the material on which the operation is to be done; 2. The force by which this is to be effected. It is necessary to adapt the force to the condition of the matter in which changes are to be made, and to apply it in such a way and manner as to produce the desired results, without injury to the operator or the subject of the work.

The carpenter works on wood; the smith, on metals; the brick-maker, on clay; and the farmer, on the earth. Each must comprehend the nature and condition of the substance to which he applies his hands or his tools, and the best way of making this application in order to accomplish his purposes. This necessity is attached to all the labor of the world. Mechanics of every grade, the coarsest as well as the most refined, the wood-sawyer, the coal-heaver, the shoveler of gravel, all come under this law, all need to study, observe, and reflect, and in proportion as their minds co-operate with the hands, in ratio of the activity and correctness of their perceptive powers and the carefulness of their conclusions, will they succeed in their attempts at work. The difference in the degree of this co-operation of brain with muscle or the habits of observation and reasoning with the physical movement constitutes the difference between the successful and the unsuccessful, in every sphere of employment.

Intelligent workmen, with their eyes ever open, clearly comprehending the nature and character of the materials on which they are to operate, and the changes that they are to make, next consider the manner in which they can best apply their powers for this purpose. Having thus laid their plans, they use their power discreetly and effectively. They strike their blows where and in the direction that will give them the best effect. They waste no time nor strength in striking where no change can or need to be made.

When a succession of blows is needed to produce a definite result, they are so given that their effect is accumulative. Each adds to the effect of the preceding. The skillful wood-cutter strikes the second blow with his ax in the plane and the place of the first. The third and the fourth follow in the same plane, until the parts are severed.

The observant workmen run against no needless obstructions; or, if they meet them, at once they discover whether they can be overcome; and if not, they expend no force in the struggle to remove the immovable. They arrange and perform the successive processes of their work with appropriateness. Each exertion seems to grow necessarily out of its predecessor and to add to its effect. As soon as one process is completed the next suggests itself, with a manifest fitness. No time is lost in doubt as to what shall be done next, or in the transition from one step to another. No mistakes are made in the order or propriety of these movements.

Such men do not depend merely upon their bodily force in effecting their purposes. They take advantage of all the natural aids which are offered in the position and relation of the substance on which they wish to operate. They take hold of things in the way they can be most conveniently moved. They do their work easily and with comparative grace. They are what are commonly called handy men. They have an aptitude for whatever they undertake to do. Without superior strength, they use what they have with such tact that they accomplish large results.

A skillful builder of rude stone walls in a rural district was rather a slight man as to stature and weight, yet he was noted for his power to place on a wall, unaided, a larger stone than any other man in his town. His neighbors said he knew how to take advantage of it, and could handle heavy stones easily. Unconsciously, he was a practical natural philosopher in his work. He availed himself of the facilities of means and position that nature afforded him, the lever, inclined plane, &c. Such men in their several ways expend and apply their forces economically and successfully, without exhaustion or even great fatigue.

The unthinking, unskillful worker may be larger and heavier; he may be able to

lift greater weights and strike harder blows, yet his exertions are uncertainly directed and may be misapplied, and consequently partially or entirely lost. While this paper was in preparation, two untaught laborers were seen endeavoring to lift out of its bed in a quarry a large stone loosened by powder. They placed their iron bars in such a manner that nearly the whole of their force was expended in pressing the loose stone against the fixed ledge on the opposite side, and no part of it would tend to lift the stone from its place. A better observer then removed the bars to another side of the fragment of rock, where their movement would be in the only line in which the stone could be taken from its position. These are awkward and comparatively unprofitable laborers. They may be very strong, and expend more force, and become more fatigued, and yet, with all their great endeavors, they accomplish less than their more intelligent associates.

These differences in the application of personal force may be seen everywhere in the world, in all departments of labor, among mechanics of every occupation, cultivators of the earth, the hewers of wood, all who use their hands, tools, or machines to effect changes in the position, relation, or condition of material substance. Even the laborer, whose occupation would seem to require no thought nor skill, the scavenger who scrapes the mud in the streets, the shoveler who fills a cart with gravel or manure, the man who digs the garden with his spade, the boy that turns a grindstone to sharpen an ax—among all, there is a manifest and practical difference as to the manner of applying their forces to their work, and as to the effect of their exertions, between the thoughtful and the thoughtless, between those whose quickened mind lends its aid to their muscular efforts, and the duller workmen, whose hands alone are given to their possessor, and take their chance of moving in the best and easiest, or in the harder and less appropriate way.

ANALYSIS OF PROCESSES OF LABOR.

In this view of the matter, it is interesting and profitable to watch the movements of workmen, mechanics, farmers, laborers, and analyze their successive processes, and see their relations to each other, to the material on which they operate, and to the result which they attempt to produce.

WOOD-SAWYER.

It seems to be a very simple matter to saw wood for fuel. Anybody, without intellect apparently, can do this work. Nevertheless, the intelligent and thoughtful can do it better and more rapidly than the ignorant and careless. The saw-horse must stand firmly on all its four legs. The log or stick must be placed securely in it, well balanced and supported; otherwise it yields, rolls, shakes, or recedes before the pressure of the saw. If it be so placed that the cut is in the middle of the horse, between the legs, when the division is nearly made the stick bends downward, the two inner ends of the partially divided parts are brought together, they press upon the saw and render its movements very difficult and often impossible. If the stick be so placed that the cut is made outside of the horse, unless the part that rests upon the horse is long and heavy and is held firmly in its place by its own weight or by the foot of the sawyer, or unless the saw is run close to the horse, the pressure will turn the outer part of the stick downward and bend or twist the saw and prevent its running. By proper movement of the saw, forward and backward, the teeth cut off particles of the fibers of the wood and make a narrow fissure through the log. The power that does this is the result of the twofold force—that which would move the saw in the direct line of its length, and that which would press it into the wood. If the first act alone, the saw moves over the log without cutting; if the second act alone, the saw is immovable. It is therefore needful to combine these forces in such proportions, and to bear upon the saw at such an angle, that the teeth be pressed sufficiently into the wood to cut off the superficial particles, but not sufficiently to arrest its movement.

The thoughtful workman recognizes all these necessities, and makes his arrangements accordingly. He finds no difficulty in sawing his wood; he meets with no accidents, loses no time nor force in restoring his disturbed log, or in difficult motion of the saw, nor does he injure it by endeavoring to push it when pressed, bent, or twisted. All his exertions are made with advantage. Every movement of his saw deepens the fissure in the log. He works rapidly and without needless fatigue.

The duller workman does not understand these conditions, or comprehend their connection with his purpose. He places his horse at random, and his wood upon it as it may happen to fall. So his horse may shake, his log may roll, his sticks tip up, his saw may be impeded, and the labor increased or even suspended. He has frequent difficulties. His work is interrupted. His progress is slow. He expends needless force, and his tools require more frequent reparation than those of the more observing and more successful wood-cutter.

WOOD-SPLITTER.

There are great differences in the divisibility of logs of wood, and equally great in the manner of men's attempts to divide them. They must rest on firm foundation of earth or other logs; for otherwise they tremble or give way beneath the ax, and the blows are partly or entirely wasted. The log is more easily split in one side and at one end than the other, in the line of the knots rather than across their fibers. The intelligent splitter comprehends all these conditions and makes suitable preparations, and then he strikes in the place and direction that gives the best promise of division. If the first blow with the ax is insufficient to sever the parts, he follows it with others in the same line, so that the effect shall be accumulative, until the log shall be divided.

The thoughtless splitter has no such comprehension of the best means of applying his forces to their work. He begins without guide. He places his log on whatever foundation may be at hand, whether suitable or not. He strikes his ax into any part that chance may present. If the first blow fails to sever the parts, he may strike again in the same place, and complete the division, or in other places, and lose the advantage of adding the effects of successive blows to those which he had previously struck. He may make as great efforts as the better workman. He may strike as heavy blows, but, for want of intelligent direction, some are wasted, and some produce little effect.

GRINDSTONE-TURNER.

Turning a grindstone is among the labor that requires apparently no mental co-operation. So it is with the dull turner. When the crank is uppermost, he pushes it from him and downward, until it reaches its most distant point. Then he draws it toward himself and downward, until it is at its lowest point. Then he lifts and draws it, until it is nearest to his body, and lastly he lifts and pushes it to the highest elevation. These efforts are repeated at every revolution, by the unbroken strain of the muscles of the arms, back, and legs, through the successive circles of motion.

The brighter turner soon discovers that the weight of his body pressing on the crank in its downward course will not only carry the stone through that part of the revolution, but will give so much momentum to the movement of the stone that, with but little aid from the muscles, it completes the revolution. So he makes gravitation do most of the work, and his principal labor is in lifting his body to the erect position and in throwing it on the descending crank.

COAL-HEAVER—SHOVELER.

The coal-heaver, the digger of the earth, the shoveler of gravel at the bank or of manure in the barn-yard, seem to need more muscular force for their work, and to do it without assistance of the intellect. But watching the movements of men of various degrees of mental development and discipline while performing these simple operations, it is easy to see that there is a great difference in their manner of working, and in the effectiveness of their exertions. And a careful analysis of their processes makes it plain that it must be so; for with equal expenditure of physical force, the thoughtful laborer throws more gravel into the cart, or digs more ground in a given time, than another, whose mind is dormant, while his hands alone are busy.

The intelligent shoveler, who brings quickened perceptive and reasoning faculties to his work, first surveys the whole premises, and determines the condition and bearings of all the circumstances. He places the cart which he intends to fill at such a distance from the materials that he is to put into it that, with the least effort, he can transfer the gravel from the ground into the vehicle.

Ordinarily he meets no difficulty in loading his shovel by inserting it into the bank or heap of material that is to be moved. But if he encounters any resistance to this process, his quick sensibilities at once discover the obstacle, and his ready reason determines its character. If it be mere compactness of the gravel, he applies his foot to the shovel and presses it into the mass; but if it be a stone, he sees in a moment that it is impenetrable and it is useless to press in that line. If the stone be small, he changes the direction of his tool to a lower line, and, passing it under the obstacle, takes it up. If the stone be large he digs in another place. In this manner he loses no time in useless struggles to effect the impossible.

The duller workman, meeting the same obstacle, if he thinks at all, only supposes it needful to add more force to overcome it, and therefore pushes again and again with his hands and foot, until, after loss of time and force, he slowly comes to the conclusion that his shovel cannot pass in that direction.

INTELLIGENT SHOVELER.

Having filled his shovel with gravel or manure, the laborer's next object is to deposit it in the vehicle for transportation. This seems to be so simple a process that all

men alike, whether bright or dull, would throw it into the cart with equal certainty. Watch, then, these classes of shovelers, and it will be seen that they differ in their manner and success in this operation. The observant one holds his shovel at arm's length, with his elbows slightly bent, and the handle of the shovel at a large obtuse angle with the forearm, and the blade of the shovel is at right angles with the plane of motion. Then he swings the loaded tool, making an arc of a circle, the radius of which is the direct line from the shoulder to the end of the shovel. He makes this movement quickly through a proper part of the circle and then suddenly stops. The vigor of this movement is sufficient to give the load an impulse that will carry it from the shovel, after it stops, to the point desired. The load passes in a tangent from the inverted arc. The centrifugal force tends to carry it directly in this tangential line; but the force of gravitation intervenes, and under the influence of both the gravel moves in a curve, with its apex upward.

The discreet shoveler carries his shovel to a point in the circle whence the tangential movement, modified by gravitation, shall describe a curve which at its highest part is above the cart-wheel, if he fill at the side, and as high as the top of the load if he throw in at the end. As the blade of the shovel is held at right angles with the plane of the curve of motion, all the contents are carried in a curve of the same radius, all pass off at the end of the shovel, all receive the same impulse, and are driven by the same centrifugal force in the same tangential line, and all fall together into the vehicle in a compact mass; none fall to the ground, none are lost on the way.

CARELESS SHOVELER.

On the contrary, the thoughtless workman, unaccustomed to noticing the exact relation of things, and having no comprehensive plan of his operations, places his cart by accident. He may place his cart at the proper distance from the bank, where he can throw the gravel with the least cost of force, and with no loss by dropping on the way. It may be so near that he has insufficient room for the free movement of his hands and tools. In that position he is obliged to bend his elbow and move his shovel in a smaller curve, and he must use greater force to throw the gravel over the wheel in this short space than if he had opportunity to swing his shovel at full length of the arm. The cart may be even so near as to make it necessary to lift the shovel directly upward at the greater cost of strength, and with the danger of hitting the vehicle on the outside, and shaking off a part or the whole of the contents of the shovel.

Or, as chance, not intelligent observation, governs this matter, the receptacle may be so far off as to require the workman to walk a step or two or more, carrying his loaded shovel in his hands, to get within throwing reach of its place of deposit; or, if not so distant as to compel him to move himself toward it, still it may be so far that the impulse given by an easy swing of the arms will not carry the gravel into it. Then it is necessary to exert a greater force for this purpose.

Nor is this dull laborer always mindful of the position of his shovel when he throws its contents. He may hold the blade at right angles with the plane of motion, and at other times at an oblique angle with this plane. In this position, the oblique surface of the shovel, acting as an inclined plane to the line of movement, causes the contents to slide toward the lower side, and some to drop off in that direction. The upper and lower parts of the shovel move in curves with different radii; their tangents in which the gravel moves from the shovel are in different lines; the curves produced by the combined centrifugal and gravitating forces, acting on the contents of the upper and lower parts of the shovel, reach different elevations, and, though the main part may pass over the wheel to its destination, there is a shower of particles dropping to the ground all the way from the shovel to the cart.

In these and other ways the laborer whose hands are not guided by quickened perceptive and reasoning faculties loses a part of his exertions, and accomplishes less than his better-trained fellow-worker.

SPREADING GRAVEL OR MANURE.

The farmer takes his compost from the heap in the barn-yard, and spreads it over the surface of his field. The last is often done with the shovel directly from the cart. The manner of removing the matter from the cart is the reverse of that of placing it there. In the first operation the workman wishes to throw his shovel-loads in compact masses into the vehicle. In the other he wishes to spread the matter widely and thinly over the ground. In loading he holds the blade of the shovel at right angles with the plane of motion, which is generally nearly or quite vertical. In spreading he holds the blade at an oblique angle with the plane of motion, which is never vertical, but oblique, or nearly or quite horizontal. This manner of holding and carrying the shovel throws the compost in successive and diverging particles from the end around the circle of movement, and scatters them like a shower from a water-pot when swung around in circular direction.

The laborer of lower intelligence goes through the same work of spreading in different manner and with different success. He takes the compost from the cart, shovelful by shovelful. But when he wishes to scatter it over the ground he may hold and swing the shovel in the easiest and best manner, or, as he works at random, he may carry the blade at right angles with the plane of motion. Then the contents move in a compact mass and fall in a heap on the ground, and another labor is necessary to spread these heaps evenly and thinly over the surface.

The thoughtful and successful workman whose movements have been herein described knows nothing of natural philosophy as a science from books, yet he acts upon its principles, and, obeying its laws, he avails himself of their aid to the manifest advantage of his work. He may have never heard of circles, tangent, or centrifugal and graviating forces, yet he knows the use that can be made of them in his ordinary operations. If asked to explain his method of labor, he is at loss. He can only say that this is the best and easiest way. But he is none the less a practical natural philosopher, in his way and for his purposes, albeit he may be ignorant of the terms and principles.

THE SCAVENGER.

The scavenger with his hoe scrapes up the mud, dirt, filth in the street, or sweeps the pavement with his broom. This is mere hand-labor. Can the brain lend any aid in his processes? Will culture of any of the mental faculties help his work? The world seems to think that, in this occupation, education is a wasted investment. Nevertheless, it is worth while to watch the street-cleaner in his work, to analyze his processes, and see how far discretion and judgment may be of use to him and profitable to those who employ him.

The surface of the street may be of hard, well-beaten gravel or loam, or it may be macadamized, stone, wood, iron, or other pavement. If of stone, it may be of cobbles or square blocks. It is desirable to remove all the mud, dirt, filth, and other accumulation, without disturbing the substance of the street itself, by removing any of its gravel or loam, or by loosening any of its pavement. For this purpose it is necessary that the scraper should carry his hoe sufficiently near to the surface to take hold of and remove all the loose particles, and yet not so near as to catch or loosen or remove any parts that are fixed and should remain. He must hold his instrument suspended in his hands just touching the smooth surface without pressing upon it, and raise it carefully over any projection of wood, iron, or stone in the pavement sufficiently high to pass over it without disturbing it, but not so high as to lose any of the burden which had thus far been gathered.

The thoughtful scavenger has these conditions constantly in mind, and governs the movement of his hands in accordance with them. He removes the accumulations upon the surface without disturbing any part of the street itself. His quick sensibilities, by the slightest touch of the hoe, reveal the pressure of an obstacle that cannot and should not be removed or loosened before he strikes with violence or draws with energy against it. He makes no useless expenditure of force in scraping up any of the road-bed, or in drawing against the immovable projections of the pavement.

The careless scavenger gives no thought to these conditions of his work. He lets his hoe rest upon the ground, or sometimes presses it downward in order to be certain that he scrapes clean. His only effort is to drag the hoe over the ground. He draws not only the mud and dirt that should be removed, but also some of the loamy or gravelly surface of the road. He hits against projections, and then struggles with more force to draw the hoe through them, and expends useless strength before he discovers the impossibility of drawing in that direction, or perhaps removes some part of the pavement. After making this tardy discovery he lifts the hoe, not cautiously to lose as little of its load as possible, but freely and high, leaving some of the gathered burden behind.

So his careless and unskillful manner of cleaning the streets impairs the pavement, leaves it still uncleansed, injures his tools, and the friction of the hoe on the ground and the striking and drawing against the projecting pavement demand a greater outlay of force than is needful for the best performance of the work.

USE OF MACHINERY.

Machinery is sometimes said to take the place of intelligence, and its manager is thought by some to be reduced to its level, a mere automaton to complete the unthinking work; and the two machines, one dead, composed of wood and metal, and the other living composed of bone and muscle, make but one complete whole, and they together perform one work.

Very far from this is the truth. The management of a machine requires more intelligence and more mental co-operation than the simple processes performed by the hands alone. The more complicated the machine the more need is there of observation, reflection, and concentration in those who manage it.

WEAVER.

The weaver puts into the power-loom warp sufficient for the proposed piece of cloth. The filling is wound upon the bobbins, which are placed in the shuttle. The loom is put in motion, and, apparently, may continue to weave the whole warp into cloth without interruption, except the replacement of the bobbins as often as the thread is used from the one in the shuttle. The attendant or weaver seems to have nothing to do but to put the full bobbin in place of the empty one as often as is necessary. This the quick-witted weaver does promptly. She knows how long a full bobbin will last in the shuttle and has another ready. She watches the time of its exhaustion and at once makes the change. Hardly a moment is lost by this interruption. This is a necessary part of the process of weaving, for the way has not yet been discovered of connecting with the loom an indefinite amount of filling as well as of warp.

But this change of bobbins is only a part, and with some only a small part, of the responsibility of the manager of the loom and of the interruption to the work. Threads, both of warp and filling, are liable to break. Bands may slip from the wheels, and other accidents happen to parts of the machine. These require constant attention to recognize them as soon as they occur, to make the needful repairs and restore the disturbed elements to order.

To the unused spectator the running loom sends forth a complication of mingled and undistinguishable sounds, a mere confusion of rattle. But the intelligent operative soon analyses these confused elements of noise and discriminates the several parts which each portion of the loom contributes to the whole. She refers one to the beam, one to the shuttle, one to this wheel, and another to that wheel, &c. To her perceptions every one of these sounds has its origin in a recognized part of the perfect loom. Each element of the noise thus represents to her understanding the correct movement of its own part, and the whole represents to her the healthy running of the complete machine in good order.

Familiar with the whole and with the several component elements, she readily detects any variation, any excess or deficiency, or any new and strange sound. Her quick perceptions recognize the disorder, and her reason as readily refers it to its source.

ORCHESTRA.

The music of an orchestra is composed of a variety of sounds sent forth from many kinds of instruments. The ordinary untrained ear only knows the several sounds as one whole, and finds pleasure from the resulting harmony. But the cultivated leader analyzes the various sounds and refers each to its origin in its appropriate instrument. If any player fail of his due note, or if his instrument give forth any discordant note, he at once perceives the difficulty and refers it to its cause.

STRAUSS.

At the late musical jubilee in Boston, 1872, Strauss, the celebrated composer and leader, was conducting a rehearsal of an orchestra, said to be composed of a thousand instruments; suddenly, when to the common ear everything was going on in complete harmony, the leader arrested the whole proceeding. The audience were taken by surprise, for all was apparently satisfactory; but the intensely acute ear of the accomplished conductor had discovered an imperfection among the immense volume of sounds. He went directly to one of the performers, and, pointing to a note in his score, said, "Fortissimo," and then returned to his post. The musicians then went over that part again, and without the failure that had before disturbed the acute sensibility of Strauss.

So the trained ear of the thoughtful weaver discovers any variation of the proper sounds of the loom, and quickly, before the disturbance has time to increase, she stops the machine, if it do not stop itself, and finds the cause—it may be a broken thread in the warp, a knot in the filling, a band out of place—and immediately makes the needed reparation. This is the work of but a few moments. The interruption is very slight.

DULL WEAVER.

The unintelligent, thoughtless weaver brings no such quick perceptions and analytical power to learn the sounds of the loom and to refer them to their several parts. She has no comprehension to determine what each element of the noise represents. To her the whole is a mere confused medley of noise. Her ear does not, then, detect variations or the signs of disturbance; still less can she refer them to their appropriate source in the elements of the loom.

When any disorder happens, a thread breaks, a band slips, the shuttle falls out of place, or other irregularity, it may be several seconds before she discovers it. It is still

longer before her dull reason comprehends the difficulty and comes to a conclusion that the machine must be stopped. While she is waiting for her tardy thoughts and equally slow hand, the disturbance increases and more mischief is done, more threads are broken before the loom is still. Then the mental process of finding the cause of the trouble, and in determining how it shall be repaired, and the work of reparation, all these consume much time, during which the weaving is necessarily suspended.

She takes no exact note of time, she is not conscious of the period a bobbin will last in the shuttle, but makes a new discovery of its emptiness when its thread is gone; then she remembers that the shuttle must be taken out and another with a full bobbin put in. All these processes of mind and hand—the dull perception, the hesitating conclusion, the tardy reparation—consume several seconds, perhaps minutes, and cause perceptible suspension of the work.

If there were none of these interruptions except for the replacement of the bobbin, and the weaver had equal mental and bodily activity, all the looms, of the same construction and propelled by the same power, and with the same warp and filling, would weave the same quantity of cloth in a day. But there are great differences in these results. These are caused mainly by the varying stoppages of the looms, and this is due to the difference in the skill and activity of the loom-tenders. Some have more accidents than others, and some require longer time for repairs.

An overseer in a cotton-mill, pointing to a room in which the weavers were well educated, said to a visitor, those looms weave 20 to 25 per cent. more than those in another room, which are managed by girls that have some slight education, and 50 per cent. more than those in the room below, where the operatives have received no education, and can neither read nor write. In another factory, where operatives of various degrees of intelligence and culture are employed and paid by the piece, a similar difference is shown by their earnings. Their machines, motive power, and threads are alike. But their wages vary from $7 to $11 a week. The highest, which was 57 per cent. over the lowest, and all the intermediate wages, indicate the differences of amount of cloth woven, and of intelligence and skill brought to the work.

Similar differences are found in other branches of manufacture of cloth—in the spinning, carding, and other processes—that require human supervision and direction. All are benefited by the quick eye, the ready comprehension, and the sure reason of the educated operative.

CARPENTER—NAIL-DRIVING.

The skillful mechanic has necessarily a quick discerning eye. He comprehends the nature and character of the materials on which he is to operate, and the means and processes by which he can make changes in their condition.

The successful carpenter adapts his tools, planes, saws, augers, chisels, &c., with exact precision to his lumber, and thus produces new forms and combinations. His processes of labor may seem very simple, and some of them apparently to need no co-operation of the brain. Any person, even the least taught, can drive a nail.

But here as well as elsewhere is a great difference in the work of men of different degrees of mental activity and discipline.

Whatever may be the intended direction of a nail that is to be driven into wood, it is actually carried in the direction of the blow that is struck upon it. If the line of the nail be coincident with the direction of the blow, it is driven longitudinally in its intended course, and all the momentum of the hammer is applied to its purpose. But if the movement of the hammer be oblique to the nail in either direction, to the right or to the left, forward or backward, the nail is turned in that way, and is not carried lengthwise into the wood. That exertion is lost.

The observing carpenter understands these conditions and adapts his movements to them. He carries the hammer in the same plane as the line of the nail. The impulse of the blow, the line of the nail, and its intended course are coincident, and each represents a tangent to the curve made by the hammer. Every blow moves the nail inward in ratio to its momentum.

Without these mental aids of understanding and discipline, the unskillful workman is ever in danger of failing to adapt the movements of his hands to his purpose. He lacks precision in his plans and exactness in his execution. It is, therefore, but a matter of chance that his blows hit the nail on the head, and in the line of its length and intended direction. The plane of the circle in which he moves his hammer may be parallel with the line of the nail; if so, he drives in the right course. And it may vary to the right or to the left. Whatever may be this obliquity, the blow falls in that line and turns the nail so far from its intended way. That blow is lost: it does not carry the nail lengthwise into the wood. Moreover, it necessitates the loss of another blow to restore the nail to its erect position, if it is not broken. While the intelligent shingler may drive his nails with two blows, the careless workman may sometimes need to expend four blows for the same purpose.

There is a difference in the force of the blows between these two classes of workmen

due to the same cause. The disciplined and thoughtful, having the direction clearly in his mind, and knowing that the blow will advance his object, strikes boldly and effectively; but the awkward nailer, lacking the sure confidence that knowledge gives, feels uncertain whether he may do good or harm with his hammer, and therefore strikes timidly, less effectively, and needs more repetitions to complete the work.

HEAVY AND LIGHT TOOLS.

In all endeavors to effect purposes by the means or intervention of tools, implements, machines, or vehicles, the first part of the motive power is expended on the instrumentality in wielding the tool, running the machine, moving the vehicle, wagon, or carriage, and all the force that is expended in this manner is lost to the object of the exertion. A child that has just strength sufficient to lift a basket or trundle a wheelbarrow can carry nothing in it unless the vehicle be lightened. But in proportion as its weight is diminished, load can be added.

All these instrumentalities are made light and delicate, or strong, coarse, and heavy, according to the work which is to be done with them and the way they are to be used. A carriage that is to be driven carefully and on smooth roads may be light and easy to be moved, and one that is to be driven recklessly and over rough, stony roads must be strong and heavy, and require more power to move it. The same horse can draw more freight in the light than in the heavy vehicle on the same road. The difference in the loads is equal to the difference of power required to move the carriage alone.

Ignorant and coarse workmen need to have strong and heavy tools to sustain their rough handling without being broken.

The hoes which the ignorant scavenger used to clean the streets in a southern city were enormously thick and heavy. The handles were very large poles in their natural state, taken from the forest, with the branches trimmed off. The reason given for their clumsiness was that these heavy tools were necessary for the rude laborers on the farm and the street-cleaners of the same want of culture. No others would be safe in their hands. The light hoe, which skillful men use with safety and advantage, would be broken by the rough usage of the ignorant and careless workman. On further testing them it was found that the coarse hoes, with their huge handles, weighed twelve pounds each, while the more graceful tools of cast steel, with turned handles, weighed less than two pounds.

Here was a great difference in the amount of force that must be expended in moving the instrument before it could effect its purpose—six times as great for the laborer who worked with his muscles alone as for him who could bring his brain and intelligence to aid and direct his physical exertions.

Suppose that two scavengers of equal bodily strength, but with different mental activity, could make the same bodily exertions through the day. Suppose that they were employed side by side cleaning the street, the intelligent using the light hoe and the ignorant man using the heavy instrument, and that each could haul twenty pounds at a time, and could make the same number of strokes; then the load which was hauled by the duller workman would consist of twelve pounds of hoe and eight pounds of mud, while that drawn by his brighter associate would consist of two pounds of hoe and eighteen pounds of mud. The results of the same expenditure of force would be more than twice as great when guided by intelligence as when left to the hand alone.

There is another consideration connected with the expenditure of force. The two scavengers are supposed to use the same exertion in hauling the mud to the heap, but when they throw their implements back for another load, one carries twelve pounds, thereby expending six times as much strength as the other whose hoe weighs only two pounds.

A manufacturer of scythes, in Massachusetts, visited a dealer in agricultural implements in one of the Southern States, many years ago, to see his wares. The dealer at once told him that "if he had bought such scythes as were made for and used by the northern farmers, they could not be sold for or used by southern slaves. The delicate tools which are easily and safely handled by the intelligent laborers of the North would be readily broken by the ignorant and awkward laborers of the South. They use their implements carelessly and roughly. They strike against stones, roots, bushes, hassocks, and often into the ground, and so they bend, twist, and break their scythes. They must have short, heavy, stubbed scythes, that will bear the hard usage of our men."

With such scythes as these men can use safely, they cut narrower swaths and less at a clip, and consequently mow less in a given time. They cannot cut the grass as evenly or as closely to the ground as skillful mowers with the best scythes. They leave a higher stubble to be wasted, and obtain less hay from a crop of grass equally heavy, than the intelligent workman.

In every stage and relation of the labor in the hands of ignorance there is a tax, in injury to the material operated on, in the increased wear and breakage of tools and implements, in the greater expenditure of force, in the diminished production. The cost is greater and the profits are less.

COMPREHENSIVE PLAN OF LABOR—RAPID SUCCESSION OF PROCESSES.

Labor, however simple, is a succession of processes, passing from object to object, from movement to movement, to produce a definite result. In these changes or passages from one to another the brain guides the hand, and in proportion to the activity and discretion of this mental co-operation is the work rapidly or slowly performed. The intelligent worker first surveys and comprehends all the details of the business before him, and the processes needed for his purpose. He arranges these in proper order in his mind, and determines the plan of execution. This gives him mental decision, promptness in action, and correctness in the adaptation of his forces to his work. When one process is completed the next is present to his thought, and the ready hand simultaneously follows the mental direction.

The skillful shingler makes all his preparatory arrangements to facilitate his final work. He lines the roof, lays the shingles in heaps along the course, fills his pocket or apron with nails, then, with a glance of his eye, he measures the vacant place that is next to be covered, selects a shingle of proper width to break or cover the joint in the course that was last laid. He trims and shapes it, if need be, to fit the place, takes the nail from his pocket and drives it in, in the proper position, where no dampness, even by capillary absorption, shall reach it and cause rust and remotely a leak. He goes through all these mental and bodily processes in due succession. He performs each one completely, and then passes instantaneously to the next, with no interval of doubt or hesitancy, and no loss of time.

The duller mechanic has no such clear comprehension of the whole character and detail of his work; he makes no such plan of the order and succession of his processes. When one is completed, he is often at loss as to what should follow, and hesitates a moment, looking vacantly to find direction. His dull eye does not measure at sight the relative width of the place to be covered and of the shingle before him. He needs often to lay it down to see if it will break the joint. In his transitions from process to process, from selection to fitting, from fitting to nailing, with their subordinate details, there is a want of that versatile mobility which a quick eye and thoughtful mind give to the hand of a rapid workman. He is slow in his movements, loses time in his changes, and is therefore unprofitable.

HOEING CORN.

When the intelligent farmer hoes corn in his field, or beans in his garden, he surveys each hill as he comes to it, and sees at a glance what should be done, the weeds and the grass to be killed and buried, the part that needs to be banked up, and where he shall find the loose earth to fill the low place. He begins his work on one side, and passes around to the other and to the place where he began, completing in each part, before he proceeds to the next, what is necessary to give the hill its proper form to support the corn and allow it the best opportunity for growth. Having finished a hill, he passes at once to the next; using there the same judgment and decision, and the same diligence in execution, he goes through his field without loss of time or interruption of labor, or misapplication of force.

Another laborer in the same field, destitute of this ready perception and discretion, neither comprehends nor plans his processes from the beginning. He strikes his hoe at hap-hazard, digging here a little and on the other side a little, leaping from part to more distant part, and at length looks over the field to see whether any part has been omitted; and if he finds any weed yet standing or low places unfilled, he makes the suitable repairs, and then takes another survey, with the possible need of further labor to complete his work. Then, after striking more blows with his hoe than the better educated co-operator, but with not more complete hill, he is about ready to pass on to another, which he digs about with the same irregularity and order of processes. Not infrequently, after he has gone to a second hill, he looks back over the row which he supposed he had finished, and, seeing some parts omitted, returns to complete his work there.

HAY-RAKING.

It is seemingly a very simple matter to rake hay in the field in the summer. Nevertheless, the observing and the thoughtful only rake the ground clean and rapidly. The careless raker applies the whole breadth of his rake to the hay spread before him. As he draws this, he leaves a line of straw which falls out at the side, and finds it needful to go back and rake the ground over a second time to make his work complete.

The careful hay-maker leaves sufficient of the breadth of his rake outside of the hay to catch all parting straws and leave none behind. With little increase of labor, he gathers all, and leaves the field with no loss of hay.

ECONOMY OF TIME AND FORCE.

The wise and intelligent ever economize in time and labor. They study and plan their operations in advance, and do their work well. When once done it is complete, and there is no necessity for doing any part of it over again. The ignorant and unwise act differently. They have not full comprehension of their purposes, nor of the way of executing them. Their work is often incomplete. They leave parts to be done over. The careless shoveler spills some of his gravel on the ground, which must be again taken up and thrown. The unthinking plowman leaves balks in the field that must, at much greater cost of time and labor, be turned over by the shovel or hoe. The awkward tailor needs to spend much time in altering the garments that he has carelessly failed to fit the frame of his customer.

No small proportion of the laboring force of the world is expended in correcting mistakes, in compensating for deficiencies, in repair of damages that arise from accidents, which are generally but another name for carelessness in somebody. A sagacious owner of steamboats on the Mississippi River, after long experience and observation in the management of this property, and as a master of his own vessels, said, "that all accidents were due to careless inattention, unfaithfulness, or ignorance somewhere. Sometimes they were caused by those in whose immediate management they happened, and sometimes by those who preceded them. A boiler-explosion may be due to the negligence of the engineer, or to the imperfect workmanship of the maker, or, still further back, to the one who prepared the iron. A carriage may be overthrown by the ignorance of the driver, the want of skill in the manufacture of the vehicle, or the incompetence of the road-builder. And if all who had had any part in the preparation of these means of transit had been intelligent in their occupation, and faithful, no accident could have occurred."

A skillful worker so arranges his exertions as to expend no force without producing a proportionate effect. He does his work in the time and circumstances when and where he can do it with the least cost of strength. He takes advantage of opportunities and makes them subserve his purposes. If he is a carrier, passing from place to place and returning, he takes from the first what is not wanted there and carries it to the second, where it will be of use, and returning, he brings from the second what is not wanted there to the first where it is needed. In this way he accomplishes a double purpose in each journey. But some thoughtless persons sometimes travel to carry matter from A to B, and return empty, and again they go empty from A to B, in order to bring matter from B to A.

Much of the work of the untaught and untrained is tentative. A guess or conjecture directs the efforts, and the worker feels his way and determines whether he is right or wrong as he proceeds. He is consequently correcting his errors continually or suffering from them. A careless joiner cuts his mortise at random and his tenon in the same uncertain way. It is accident if they fit each other. His doors and windows, and shelves and their incasings, are subject to the same chance of fitting or unfitting adaptation.

COOKING.

Unfortunately, the preparation of our food, the nutriment that is to be converted into our own flesh, and be made a part of our living bodies, is often consigned to the hands of the least intelligent, whose want of education, and whose loose habits of observation and imperfect reasoning, preclude precision of calculation and adaptation and exactness of proportion of materials. Hence there is uncertainty in the results of their labors. Neither they nor their employers seem to expect that the bread and other mixtures sent from the kitchen will be suited to the wants and powers of the inner man, with the confidence that they do, that the preparation of the skillful tailor or dress-maker will be fitted to the outward form. With such cooks, chance controls the culinary processes, and the language of the housekeeper not infrequently acknowledges the power of this principle. If the food is prepared so as to be acceptable to the stomach, and easily convertible into living flesh, she felicitates herself on her good cook, and her friends congratulate her on being so favored by fortune. But if, on the contrary, the bread is heavy, the pastry hard to be borne in the digestive organs, and the meats unfitted for nourishing the animal body, she offers the apology that the cook was unlucky, and this is presumed to be sufficient explanation of the unpleasant circumstances.

LABOR THE MAIN SOURCE OF WEALTH.

With small exception, all the wealth of the world is the creation of human labor, the product of muscular exertion. The original material elements of wealth in manifold forms are found abundantly in and upon the earth and its waters, but they are useless and have no value until their position, condition, and form or character are changed and adapted to man's wants by labor.

MINERAL ORES.

The mineral ores buried beneath the ground have no available value until they are taken out of the earth and turned through manifold processes to use. The laborer who digs the shaft to the mine adds his quota to its value, inasmuch as the ore, when made accessible, is worth more than it is when out of reach. The miner who loosens the ore with his pick adds another item to its value. The workmen who transport it to the surface, the men in the smelting-furnace, every man who works upon it, from its natural condition as ore and position in the earth to the last finish of the iron or steel products, adds his due proportion to its worth, and the changes in position and character produced by their labors constitute nearly all of that final value.

The bloom is worth more than the iron ore, the bar more than the bloom, steel more than the iron bar, and the finished cutlery more than the steel; but to all this final value that of the original undisturbed ore in the earth contributes very little. Appleton's Cyclopedia (vol. ix, p. 584) says: "A bar of iron worth $5, it is stated, is worth $10.50 when made into horseshoes; $55 in the form of needles; $3,285 in penknife-blades; $29,480 in shirt-buttons." It is not easy to determine what the ore from which this bar was made was worth when it was in the mine, before a shovel had been struck into the earth that covered it. Probably a few cents only, or even a few mills, would have bought it. And this is all that unassisted nature contributed to this capital of over $3,000 in knife-blades or over $29,000 in shirt-buttons.

WOOD IN THE FOREST.

Wood, as it stands in its natural position in the forest, has only a prospective value, as labor shall be added to it to convert it into fuel or lumber fit for use. A mahogany, rosewood, or black-walnut tree must be submitted to many blows and pass through many changes from its living state before it becomes of practical value. The woodman cuts it down in the forest and adds his labor to its worth. The teamster hauls it to the railway or shipping-place and adds another increase to its value. The ship-master or railway company carry it to the place where it will be converted into articles of use, and to that extent increases it worth. The sawyer divides it into boards or parts of such shape and size as may be wanted. Finally, the cabinet-maker converts it into chairs, bureaus, tables, &c. The value of this wood in the living tree constitutes but a small proportion of its worth when manufactured into furniture and offered for sale in the warehouses.

HOUSES.

Buildings, public and private, churches, court-houses, dwellings, factories, shops, stores, and others, constitute a large part of the capital of the nation; yet they owe a very small portion of their value to nature. The wood in the forest, the clay in the pit which supplies the material of the bricks, the stones, marble, slate in the quarry, the mineral ores in the earth—iron, lead, tin, copper—that are ultimately converted into nails, locks, hinges, roofing, pipe, &c., have a very small value in their natural state, compared with their final worth, when put together in the form of a building, by the manifold and varied processes of human industry.

LANDS.

The value of wild, untouched land in the forest is estimated to be $1.25 an acre. This, however, is its prospective value, for until the hand of man makes it accessible and improves it it is worthless; but when it is cleared and cultivated, when roads, canals, or railways bring it within reach of the civilized world, when population gathers around it, and society makes the place attractive, and a market is created within reach, the value increases with these added advantages, until it may be tenfold, a hundred-fold, a thousand-fold the original price.

LABOR BECOMES CAPITAL.

Through all these transitions from the natural condition of these elements of property to their finished artificial state, each successive process adds to their value. In each process, labor is converted into capital. Every judicious blow is wealth the moment it is struck. The woodman strikes his ax into the tree. If that blow is a part of the division of the trunk from the stump, the value of the tree is increased by it. When blows sufficient to cut the tree down and to divide the trunk and branches into firewood have been struck, they become capital, equal to the difference between the value of the standing tree and marketable fuel. So, also, all other labor that is properly applied to the wood—the teamsters who take it to the mill, the sawyers who cut it into boards, laths, or shingles, the carpenter who shapes, fits, and combines them into

buildings—their blows and exertions, by which the position, condition, or relation of the wood is changed and its worth increased, are converted successively into capital.

It is manifest that as human effort creates wealth, the more rapid the movements are made the greater the accumulation. The active carpenter drives more nails than the slow workman, and creates more value in a day. But it is only the judicious, well-directed blow that becomes wealth. The blow that is struck on the nail in the line of its direction adds to its worth, for the driven nail is worth more than one outside the wood; but an oblique blow that turns the nail to one side adds nothing to its value, but, on the contrary, lessens it, inasmuch as a crooked nail is worth less than a straight one. When the blow of the wood-cutter falls successively in the plane of its predecessor and enlarges the division, it increases the worth of the wood; but when it falls to one side or the other without carrying the division deeper into the log, it leaves no more wealth behind.

EFFECT OF EDUCATION ON LABOR.

The value that is created and added to matter by labor is in ratio of the skill of the worker, or the appropriateness of his exertions, and the rapidity with which they are made. The degree of these is in proportion to the mental co-operation with the movements of the hands.

When the mind is torpid the hand works alone, and for want of a watchful guide it moves in uncertain manner and with doubtful effect; but in as far as it is quickened by education, the perceptive faculties are sharpened, the reflective faculties strengthened, and the movements of the hand are directed to their purpose. They strike in proper direction, and with appropriate momentum. All the force is expended to advantage. None of the blows are lost. Each one produces changes that add to the value of the material operated upon. Education, then, is the economy of force, and gives it a greater power to create value. It enables the intelligent and skillful to add more to the worth of matter than the ignorant.

The cost of educating a laborer—of setting him to think, and fitting him to expend his forces to advantage—is very small. The few years of youth when the body is comparatively weak, the expense of teachers, books, &c., are but small sacrifices compared with the gain. The return in increased productive power is great and permanent. It is the difference between the skillful and quickly moving and the unskillful and slow workman, between the large and certain and the comparatively small and uncertain producer.

NATIONAL WEALTH.

The wealth and income of the nation is but the aggregate of the wealth and income of all its members. If a man adds to his private capital or to his power of production, the capital and income of the state are increased to that extent. If he loses or extinguishes any part of his fortune or fails to earn, the same loss falls on the commonwealth. Individual wealth collectively is public wealth; personal impoverishment is public poverty. The total financial, physical, and mental power of a community is no more nor less than the sum of its elements. The body-politic has then an interest in everything that tends to increase the productive power of the people. As education has this effect by sharpening the perceptive and strengthening the reasoning faculties, as it sets people to observing and thinking, and thereby enlists the quickened and energized mind as a co-operator and aid to muscular action, and enlarges men's capacity of creating value, so it is both the interest and the duty of the Government to see that none be allowed to enter the responsible period of life without this means of doing the best for himself and for the state.

The late Earl of Carlisle, a man of unusual acuteness of observation and of generous, comprehensive sympathies, traveled several years ago through most of the States of this country. He took great pains to inquire into the domestic and social condition of the people, their education, their habits, and manner of working and of living. After all his experience and study here, he said to a friend, "If every man and woman in your country were educated as are the natives of Massachusetts, there is no telling the power and the wealth of your nation."

THE RELATION BETWEEN CRIME AND EDUCATION.

BY EDWARD D. MANSFIELD, LL. D.

Quetelet, the most philosophical statistician of Europe, says that "society prepares the crime which the criminal commits."

This is true, in not only a real, but most profoundly moral and philosophical sense. Then what is society, or what is its preparation for individuals? And how? We may imagine a single person, or, rather, a single family of persons, living alone upon earth without any other law than their natural instincts. They are a law unto themselves. But we do not now find such persons. In fact, history knows mankind only as an association of many individuals, allied together by some common laws. This association we call civil society, and it is defined by laws, civil, social, and natural; and it acts upon individuals as the great forces of nature act upon the particles of matter. But as society is a moral and not a physical being, it is responsible for the forces it puts in motion and the direction they take. It is responsible for the civil laws and the social laws it creates and enforces. It is bound to recognize the natural laws of human action. It is bound to know that want creates temptation; that passions must be restrained; that ignorance is blind and weak.

Society must recognize these facts, and it is bound to provide against the evils which result from them. If it fails to do this, it fails not only in its obligations to the law of God, but to the laws of its own existence. But if Quetelet's proposition be true, and we hold it is strictly so, then society has failed in some of these obligations. How does it fail? In what has it prepared crime? If we were to examine the apparent or superficial elements of crime only, we might imagine that society has done all it could for its prevention. Does not the statute law name and affix a punishment to every conceivable crime? Are not the officers of justice in pursuit of the criminal? Do not the courts condemn him? Is he not sent to prison or to death? Certainly. But in all this we see rather the revenge of society than either prevention or reform. Prevention there is, to the extent of a salutary fear of punishment; but has society sought prevention to the extent of its power? Unquestionably, it will be agreed on all hands that prevention is the thing to be sought. If all crimes could be prevented, there would be no need of either punishment or reform. But we find that in all the earlier ages of civilization prevention of crime was never sought except by the fear of punishment, and reform not at all. In the last century, especially within a few years, reform has been the special object of inquiry in the criminal system, and particularly in regard to human regulations. But great humanity to prisoners is only merciful to them, not society; and if it were possible to reform all the criminals in the country, it would be nothing to the great column of advancing criminals continually pressing forward. When we have reformed every criminal—an obvious impossibility—how shall society prevent crimes? That is the only real problem presented in the philosophy of criminal jurisprudence.

Quetelet says, "Society prepares the crime which the criminal commits." What does he mean? How does it prepare it? The influences of society are both positive and negative. When society enacts criminal laws, punishes crimes, erects penitentiaries, and endeavors to reform the criminal, it acts by positive means, and by those only. But where are its negative influences, on one side or the other? Let us illustrate this idea. A B was born into this world, not under advantageous circumstances. First of all, he was born poor. Secondly, because he was poor he was uneducated to a large degree, and therefore knew little of right or wrong. Thirdly, he saw just before him on the street a "coffee-house," "restaurant," "saloon," and he felt despondent and entered, becoming a regular customer. Was that his fault? Thus we see that A B was the victim of the negative influences of society. Society did not educate him. Society did not require that he should have any religious education. Society did not furnish him with work. Society did offer him the tempation of drink, and did not supply his wants. Thus society, in any fair and honest meaning of the word, did prepare the crimes which the criminal committed. What has society to say to this fact? Simply, and it is the truth, that society has not arrived at its perfection, that its progress is slow, and that this grand result of prevention must be among the last achievements of human progress.

One of the great facts revealed by statistics is, that in the same moral condition of society the same proportion of crimes will be brought out. And why not? This was proved by Quetelet, in his statistics; was observed by Madam De Staël; and is made much of by Buckle, in his "History of Civilization." Buckle and others have made use of this to prove the very reverse of what is the fact; that is, they assume it as a law of fatality, which is just contrary to the fact. Quetelet makes no such mistake. He admits, and so states, that this apparently invariable proportion will

depend upon the condition of society. If the moral condition of society changes, then this apparently uniform proportion will change also.

In the report for 1861 of the commissioner of statistics for the State of Ohio we find the following: "The great mass of crimes, however, keeps an exact proportion to the population, and, unless the moral condition of society is changed, will continue to do so. Each year will reproduce the same amount of folly, immorality, and physical excitement, and from this again the same amount of crime. There is no department of statistics which has brought out more remarkable facts or more valuable results than this. It would scarcely be credible, if it were not absolutely proved by the statistics of France, Germany, and the United States, that a community having once subjected itself to certain vicious temptations and influences, must thenceforth produce and endure the same annual amount of crime, suffering, and injury against the happiness of society, in spite of all laws and all the machinery of restraint which can be invented or enforced. The condition of society remaining the same, the same crimes must result. It is, however, a most mischievous fallacy to suppose that, therefore, these results can not be changed, and that there is an inscrutable fate reproducing the same social evils, without any human power to change results. They will return with the same social condition, but there is no necessity that the same social condition should remain. Society has the power of self-reform.. It has the power to take away temptation; to reward virtue; to encourage industry; and to restrain vice. It has the power to defend the individual against social wrongs and temptations which impair his peace and prosperity, quite as much as to embody armies and defend property. For what other purpose was government formed or law enacted?"

In the report of the Bureau of Education for 1871, it was shown that in New England a large number of crimes were caused by ignorance, and a large number by intemperance. On this state of facts, the question comes squarely up: "Has society a right to allow ignorance and intemperance, when they cause crime; when, in fact, they are the great causes of crime?" Society contents itself with punishing crimes, and with making a feeble attempt to reform the criminal. But while it is doing this, it prepares the crime for the criminal to commit. How? By its negative influence. It refuses to prevent crime. How? Society knows that ignorance is blind; that the poor, ignorant man rushes into crime, as he rushes into any thing before him, in total ignorance of the results. Hence the fear of punishment does not deter him, for he hardly ever knows any thing of the law, and is too ignorant of consequences to be afraid. So, also, society knows that the temptations of the "saloon," the grog-shop, (by whatever name called,) will tempt the weak and ignorant till their inflamed passions lead to crime.

Thus society prepares the crime by its negative influences—its refusal to prevent the causes of crime. So long as society presents the same moral conditions, so long it will present the same proportion of crime; but society has the moral power of self-reform. Shall it be said that society refuses to exercise this power?

The only part of this question we propose to consider here directly is that of education.

All civilized nations are now convinced of the necessity of education, if it were only as a measure of defense. But if it were not so, a mere glance at the comparative conditions, in regard to crime, of educated and barbarous nations, would strike the inquiring mind with conviction. If we go to any barbarous people, such as the rude tribes of Africa, or the aboriginals of the South Sea, we find that such crimes as stealing, homicide, and impurity, are the rule, not the exception. Neither property nor person is safe in such countries beyond the restraint which fear and necessity impose upon such barbarous peoples.

The case is not much better in China, which, apparently more civilized, is, nevertheless, deficient in moral education.

The general fact is apparent that education is a force restraining vice and crime. Where it is purely intellectual, it restrains by teaching the truth expressed in the homely proverb, that "honesty is the best policy." Where it rises to the dignity of a Christian education, it teaches not only the restraint of the intellect, but the higher restraint of the conscience. In either case it is a restraining force, a moral power, over the appetites and passions of men.

Such being the general fact, we shall endeavor to demonstrate it by the statistics both of Europe and America, the latter being derived directly from the prisons, jails, and reformatories of the several States.

THE RELATION OF CRIME TO EDUCATION IN EUROPE.

For the power to exhibit this subject as regards Europe, we are indebted to Dr. E. C. Wines, who, as commissioner of the United States Government to organize the International Prison Congress, propounded a series of questions while traveling in Europe during 1871. Many of the reports were made under the direct supervision of the Government, and the figures may be taken as thoroughly reliable. We shall use here

only the totals, disregarding minor details. In this way we shall present the relation of crime to education in Europe in the most striking view.

FRANCE.

Of this country, Malte Brun, the scientific geographer, begins his account thus: "The influence of France may be compared to that which ancient Greece possessed over the civilized world. The French language has become the language of courts and embassadors; the literature of the same people has been admired by the enlightened of every nation. The inference of the reader from this declaration must be that the French are really an educated people, and producing the highest results of education in the fruits of humanity and civilization. But if this were said of what is really the nation, that is, of a great mass of the people, it would be entirely untrue, and furnish a signal proof of the superficial manner in which history is written."

In another part of his work, Malte Brun (quoting the tables of Balbi) shows the number of scholars (pupils in school) to be 1 in 23 of the population. The number of children and youth in the public schools of Ohio is rather more than 1 in 4 of the whole population. The number in the schools of France was at that time (1832) only one-sixth the number in proportion to the State of Ohio, or, in other words, of the number that ought to be in school in order to educate the whole people. This is corroborated by another statement, that, in 1833, out of 38,000 French communities, 14,000 were without any schools! In the mean time, great efforts were made to increase popular education; but in 1870 there were still 800 communities totally without schools.

It is said there are now 5,000,000 children attending school, but as the population of France is now 37,000,000, even all that are now claimed to be in school is only 1 in 7.4—that is to say, only about one-half of what would be if the whole people were educated.

In 1856 there were only 63,000 primary schools, which, at the usual proportion of pupils, would give about 4,500,000 pupils, which corresponds with what has been stated, allowing for the increase of 1,200,000 since 1856, as stated by the French government.

Looking then to the facts above given, that in 1832 only one-sixth of the French people were educated at all; that in 1856, less than one-half were educated, and that in 1870, only a half, we shall be within bounds when we say that in 1870 more than half the French nation were not educated at all. Now let us look at the number and proportion of crimes committed in such a population. Let us take such general facts as we have, without reference to details.

Malte Brun gives the average number of births annually at about 900,000, of which 74,000 were illegitimate. This is over 8 per cent. of the whole. If we were to go into any neighborhood we should find each thirteenth child illegitimate. This shows how far ignorance has depraved the morals of the lower classes of the people. But as late as the past year (1871) it is stated in the papers that there had been 4,500 suicides in the city of Paris, which is two hundred fold the proportion which is found in the State of Ohio. If we suppose this to be exaggerated, or as a consequence of the recent war, there will be enough of this tremendous fact remaining to show how the want of the restraining force of education (especially of moral education) affects the very life of society.

Let us now proceed to trace the effect of this great ignorance in France on the number and character of crimes. The record is the most startling and convincing of any thing we have seen in the annals of statistics. Dr. E. C. Wines gives this statement, derived from the best authorities:

Whole number of persons under arrest from 1867 to 1869	444,133
Number unable to read	442,194
Or	95.63 per cent.
Average number of convicts from 1866 to 1868	18,643
Number unable to read	16,015
Or	87.28 per cent.
Average number of juvenile prisoners from 1866 to 1868	8,139
Number unable to read	6,607
Or	81.14 per cent.

We have shown above that at least half of the French people is in a state of total ignorance. Let us assume it as just half. At that time France had, in round numbers, 36,000,000 of people. Then we find these proportions; viz:

In 18,000,000 of people "unable to read and write" there were 442,194 arrests; that is, 1 in 41.

In 18,000,000 of people who were commonly educated there were 1,939 arrests; that is, 1 in 9,291.

Thus proving the proportion of criminals in the uneducated classes to be two hundred and twenty-six times as great as that of the educated classes.

The reader may say, "This is an exaggerated case, and, while the facts are apparently true, this proportion will not hold good in other countries."

We shall show in the sequence that the same general principle is true, and that when the people of different countries are more and more educated, then this proportion diminishes, until, if we could imagine such a thing, society would present itself on the one hand thoroughly educated, and on the other hand without crime and without reproach.

ENGLAND.

Our mother country is, in every just sense of the word, England. We therefore look with curious interest to the condition of her education, and its influence upon the production or the cure of crime. Let us look at the facts.

Dr. Wines gives the following figures:

Committed to county or borough prisons	157,223
Could neither read nor write	53,265
Proportion of totally ignorant	34 per cent.

IRELAND.

Wholly illiterate, or very imperfectly educated:

Males	21.74 per cent.
Females	63.24 per cent.

BELGIUM.

Unable to read	49 per cent.

SWITZERLAND.

Average of criminals unable to read through all prisons	83 per cent.

The prisons of Lenzbourg, Saint Galle, Neuchatel, give these special figures:

Illiterate	25.3 per cent.
Inferior education	36.9 per cent.
Passable education	30.4 per cent.
Good education	4.3 per cent.

ITALY.

Illiterate in ordinary prisons	40 per cent.
Illiterate in bagnios, (prisons of high grade)	30 per cent.

NETHERLANDS.

Unable to read	35 to 38 per cent.

From the above we find that the proportion of criminals totally ignorant varies in different countries of Europe from 35 to 95 per cent.; but this does not show the whole truth; for, in the reports from prisons in the United States, it is almost universally said that but few of the whole number have any thing more than the lowest kind of education; and doubtless this is true of Europe. These statistics prove that in Europe ignorance among criminals is the rule, and education the exception.

Let us now examine this question more minutely in regard to our own country.

THE RELATION OF CRIME TO EDUCATION IN THE UNITED STATES.

Mr. F. B. Sanborne, of Massachusetts, in a report prepared for the International Prison Congress, has made some general remarks upon the statistics of American prisoners, which are very correct. He says: "The general condition of American prison-

ers, in point of education, is low, yet they are not so extremely illiterate as criminals are in many countries, if we except the colored criminals of the South.

"In Massachusetts, for a period of eight years past, the statistics show very *nearly one-third* of all prisoners to be wholly illiterate, yet, in the highest prison, at Charlestown, the proportion of illiterate convicts, since the beginning of 1864, has been scarcely more than 1 in 10."

What Mr. Sanborne has remarked of Massachusetts is in the main true of the whole United States, as will be seen from the numerous tables hereto annexed.

In the great aggregate of criminals the number of the *totally illiterate* is very large, but is by no means so large as in Europe, for the reason that no part of our country is so densely ignorant as many parts of Europe. So also, on the other hand, there are some prisons where the number of the illiterate is small, because they are special prisons of cities, where the better educated criminals are apt to be confined. But we need not remark upon these facts till we exhibit the great mass of prison statistics we have gathered from the Middle and Western States.

The statements following give partial returns from seventeen States; all of them but three from the Middle and Western States. The aggregates, in regard to education, sum up as follows, viz:

Aggregate of prisoners	110,538
Aggregate of whites	91,427
Aggregate of blacks	6,396
Aggregate of foreign-born	57,824
Aggregate of native-born	41,942
Aggregate of those who can read and write	82,812
Aggregate of those who can read only	5,931
Aggregate of those who have no education	21,650

The discrepancies between the general aggregates and those for color and nativity are caused by the fact that, in some prisons, no record was kept of sex, color, or nativity. And here we take leave to make a general remark on the value of statistics.

All the advances in statesmanship (and it must be admitted there have been great advances in the last century) are due wholly (in connection with the more enlightened teachings of Christianity) to the advance of the science of statistics. If all the legislators, statesmen, and preachers in the world knew precisely the state of facts in society, they could legislate and preach with vastly more effect. Hence, in reference to the subject before us, if we had the exact statistics in regard to the whole prior condition of the criminals, we should know almost exactly how crime was caused, and what measures would, if possible, prevent it. But the statistics of prisons are not only defective in many particulars, but they are inconsistent. One prison gives the statistics of one set of elements, and another of another, and no one of all that ought to be given.

When a prisoner enters a prison, the keeper of that prison should define him exactly as a man of science defines a mineral, an animal, or a bug. He should describe his physical characteristics; his previous social status in regard to parentage, color, condition, and education, moral, religious, and intellectual; his religious, or his want of religious, education, and his habits of life in regard to temperance or intemperance; his industry or idleness. These facts may be obtained, and they would be invaluable. They would show all the causes of crime, and, in showing them, would show the only means of prevention. In regard to the above aggregate facts, it may be observed—

1. That the whole number of those who can "read only" is described in the reports as in fact "very ignorant." To have learned to spell out words and read a little gives no real knowledge.

2. That the prison reports almost uniformly speak of the great number of those who "can read and write" as very deficient in education.

The general conclusion is that the great mass of prisoners is very ignorant; but, in order to see this more clearly and understand it more thoroughly, we shall analyze in the sequel the special reports of the prisons. In the mean while the general conclusions of the aggregates above, including the observations of the prison-keepers, are as follows:

The totally ignorant, as shown by those having no education, are	22 per cent.
The totally ignorant and very ignorant	25 per cent.
The very deficient, including these and a large share of those who can read and write	50 per cent.

These proportions are, in regard to the ignorant, much below those of Europe; and they ought to be, for it is beyond all doubt that, except the negroes of the South, the mass of the people of the United States is much better educated than in Europe. This is especially the case in New England, New York, and the central States of the Northwest. But in either case the general fact is shown, beyond doubt or controversy, that ignorance is one great cause of crime, and that, in elevating the education of society, both religious and intellectual, we advance the interests of society by diminishing crime.

Just so far, therefore, as society neglects to educate the people, just so far does it prepare the crime which the criminal commits.

Let us now examine our statistics in detail, with regard to color, nativity, and religious education.

In regard to sections of the country, taking the State prisons and jails of New York and Pennsylvania (deducting the metropolitan police reports) as representatives of the Middle States, we have these results, viz:

Aggregate number	12,772
Aggregate number of whites	11,268
Aggregate number of colored	1,465
Aggregate number of foreign-born	4,658
Aggregate number of native-born	8,003
Aggregate number of those who can read and write	8,501
Aggregate number of those who can read only	1,774
Aggregate number of those who have no education	2,360

The proportions are:

The totally ignorant	19 per cent.
The totally ignorant and very ignorant	33 per cent.
The very deficient, at least	60 per cent.

Let us take now the prisons and jails of the central Northwest, which includes the States of Ohio, Indiana, Illinois, Michigan, and Wisconsin.

Here we have the statistics of thirty penitentiaries, work-houses, and jails, a sufficient number and variety to give a complete view of the subject in those States. The results are as follows, viz:

Aggregate number	18,931
Aggregate number of whites	14,362
Aggregate number of colored	1,524
Aggregate number of foreign-born	4,078
Aggregate number of native-born	4,851
Aggregate number of those who can read and write	8,722
Aggregate number of those who can read only	935
Aggregate number of those who have no education	6,565

The proportions are—

Totally ignorant	40 per cent.
Totally and very ignorant	46 per cent.
The very deficient, at least	75 per cent.

Let us now take the States west of the Mississippi to the Pacific. Of these we have the reports of four State-prisons in the States of Minnesota, Iowa, Kansas, and California. The results are—

General aggregate	1,957
General aggregate of whites	1,187
General aggregate of colored	205
General aggregate of foreign-born	503
General aggregate of native-born	696
General aggregate of those who can read and write	1,353
General aggregate of those who can read only	221
General aggregate of those who have no education	403

The proportions are—

Totally ignorant	21 per cent.
Totally and very ignorant	31 per cent.
The very deficient, at least	50 per cent.

Now, let us take the only States that we have of those formerly slave States, where the negro population prevails, viz, Maryland, Kentucky, Tennessee, Georgia, South Carolina. In these States the results are—

Aggregate number of prisoners	4,087
Aggregate number of whites	1,997
Aggregate number of colored	2,090
Aggregate number of foreign-born	267
Aggregate number of native-born	3,485
Aggregate number of those who can read and write	965
Aggregate number of those who can not read and write	1,435

The States of Georgia and Tennessee, having 1,124 prisoners, made no return of the state of education, and were otherwise defective. In the 2,400 returned, the following are the proportions of educated and uneducated, viz:

Totally ignorant	60 per cent.
Very deficient, fully	85 per cent.

Thus we see that in the midst of the South, where the colored population is almost totally ignorant, we have the first approach in the United States to the educational condition of France in 1832, and of much of Europe now. Comparing the several sections of the country as presented in the above tables, and including those who can read only (and that is usually very little) among the totally ignorant, we have these proportions. Those called "very deficient" are put down in a low estimate, made from universal testimony of prison-keepers:

Totally ignorant—very deficient.

In New York and Pennsylvania	33 per cent. to 60 per cent.
Central Northwest	46 per cent. to 75 per cent.
West and Pacific	31 per cent. to 50 per cent.
The South	60 per cent. to 85 per cent.

The returns from the "West and Pacific" are deficient, and therefore not a fair test. This, and the fact that the great body of miners are really intelligent men, make the reasons why that section seems to have less ignorance among criminals.

THE PROPORTION OF CRIMINALS TO THE ILLITERATE POPULATION IN REGARD TO EDUCATION.

Here we come to test facts in regard to the influence of ignorance in producing crime. If the proportion of ignorant criminals to the whole number should prove greatly above that of the illiterate to the whole population, it will be a fact conclusive that ignorance is one great cause of crime. Fortunately the returns of education and illiteracy embodied in the census of 1870 will enable us to examine this question and obtain reliable results.

Taking the returns of the census of 1870 in connection with the tables we have above given, we have the proportions below, premising, however, that, as all prisoners are above 10 years of age, so we have taken from the "illiterate" in the census only those above 10 years of age.

Illiterate criminals.

In New York and Pennsylvania	4 per cent. to 33 per cent.
In Central West	3½ per cent. to 46 per cent.
In West and Pacific	3 per cent. to 31 per cent.
In the South	22 per cent. to 60 per cent.

It appears, therefore, that in the Middle States the proportion of illiterate criminals is eightfold the proportion of illiterate people; in the Central West it is thirteenfold; and in the West and Pacific States it is tenfold. In the South it is only *threefold;* but this is caused by the great mass of colored people, who make up a large portion of the whole people, and, being nine-tenths of them wholly ignorant, furnish the great mass of criminals. When the still larger white population is counted in it makes the disproportion of the illiterate criminals less. As to colored people only it is very great. But we see in the above proportions the great fact that ignorance is one of the great causes of crime. We do not seek to exaggerate that fact. The figures we give show it in its naked deformity, and we leave the fact to the contemplation of our readers. But in the mean time let us look at how this fact will operate in an intelligent American community. Let us see exactly how it will operate in New York or Pennsylvania. Let us take 10,000 people as the unit of measure. The result will be, according to the above proportions:

People	10,000
Illiterate	400
Estimated prisoners	40
Prisoners illiterate	35
Others	5

The "others" means only a very common education. What, then, is the practical result? That because 400 persons out of 10,000 have been kept *totally* ignorant, the county or municipality has seven times as many criminals as it need have, and seven times as much expense and evil of all kinds resulting from it.

Having thus established certain general principles by the incontrovertible testimony of statistics, it will not be inconsequential or uninteresting to give the testimony of some of those who are engaged in the actual management of prisons.

The following statement, made by the superintendent of the Detroit House of Correction, gives the general facts and causes of crime nearly as correctly as can be obtained from the general averages of the most extended table of statistics:

"Of the 8,744 prisoners, 44 per cent. were under 30 years of age; 65 per cent. acknowledged themselves habitually intemperate; 65 per cent. were living out of the family rela-

tion; only 57 per cent. claimed to be able to read and write; 43 per cent. acknowledging themselves without any education at all. The whole 8,744, almost without exception, were poor and generally penniless on their admission to the institution. This fact, so generally true of criminals, must bear relation to their criminality. The improvidence that makes the spendthrift and pauper produces also the sensuality and selfishness that seek the means of indulgence without self-denial or regard for consequences."

Professor Tarbell, who has the school in the Detroit House of Correction, says:

"Of the 150 men who have been examined individually on entering the school during the past six months, 23 were entirely ignorant of reading; 30 could read a little, but not well enough to use text-books; while 97 could read with tolerable readiness, and some of them with intelligence and expression. From this it appears that 35 per cent. of those admitted were practically illiterate. In 1869 there were 29 per cent. of this class, and in 1870, 33 per cent. Whether this apparently increasing illiteracy on the part of those committed to the house of correction be due to the demoralizing effect of the late war on many men of intelligence, and that we are now returning to the more usual state of society in which the vicious are the ignorant, I will not say."

If the censuses of 1850, 1860, and 1870 be compared, would not the whole country show the same result in regard to illiterates; and can any other result be obtained without compulsory education?

Mr. Cummings, the moral instructor of the California State Prison, says:

"A great majority of the prisoners on their commitment are illiterate; others have acquired merely the elements of knowledge, without being able to turn their slight educational acquirements to any practical use; while the number who have acquired a systematic or liberal education is so extremely limited that it has been found difficult to supply the classes with suitable teachers. Hence, when these unfortunate men have been approached in a kind and conciliatory spirit, very few have failed to respond in a similar spirit; and when the means of instruction have been provided for them they have eagerly availed themselves of the privileges of the prison school. The progress that many have made in their studies has been truly gratifying, and has demonstrated, not only the practicability, but the great importance, of furnishing educational facilities to prisoners."

The fact that most of those who say they can read and write are "not able to turn their slight educational acquirements to any practical use" is a fact which mere statistics do not show, but which the warden or chaplain at once discovers; and that fact is simply, that nine-tenths of prisoners have literally no useful education. Mr. Cummings further says:

"The educational acquirements of prisoners here do not differ materially from a general statement that would apply to most prisons in other States. Of 478 prisoners committed from April 11, 1870, to July 1, 1871, 232 were entirely illiterate; 95 could read and write; 120 could read and write very imperfectly, while but 31 were liberally educated."

Those who could read and write "very imperfectly" may without error be put down as uneducated. So that, practically, four-fifths of all the California State prisoners were uneducated; and yet this fact does not half appear in the table of statistics.

The board of inspectors of the State penitentiary of Tennessee say: "One out of every 25 of the entire population of Great Britain is a juvenile delinquent—a destitute vagabond, abandoned, and, in many cases, a law-breaking child before the age of 17. While the same proportion of such a class can not be supposed to exist in this State, still the number is very large, and augmented daily with our increasing population. While no section of the State is entirely free from their presence, our larger cities swarm with them. They are found at every corner, and in every alley; at the doors of the saloon and the theater; at our depots and wharves; here their faces greet you with features pinched by their necessities into expression of premature shrewdness, bordering on villany, totally foreign to the faces of well-cared-for childhood. From the teeming crop of ignorant, neglected, and criminal children is produced the large majority, if not all, of the thieves, counterfeiters, forgers, burglars, robbers, and murderers who fill our penitentiaries; as also those subjects for seduction, and consequent prostitution, who fill the brothels of our cities."

Here is society preparing the crime which the criminal commits. Here is the negative preparation of non-education, and the positive one of temptation.

Mr. Darnell, keeper of the Georgia penitentiary, says:

"Of all reformatory agencies, religion is first in importance, because most potent in its action on the human heart and life. Education is also one of the vital powers in the reformation of fallen men and women, who have generally sinned through the influences of some form of ignorance conjoined with vice. Its tendency is to quicken the intellect, expel old thoughts, give new ideas, supply material for meditation, inspire self-respect, support pride of character, excite to higher aims, open fresh fields of ertion, minister to social and personal improvement, and afford a healthful substitute for low and vicious amusements.

"It is, therefore, a matter of primary importance in the prevention of crime and the

improvement of society, as well as the avoiding of that combat between crime and law which, in this country, has been the bane of our prosperity."

We need not cite any further testimony of this kind; this is in substance the testimony of all the keepers and officers of penitentiaries, prisons, jails, and reformatories in the country. It is the testimony of human experience on one of the most important points which concern human society. The evidence upon the intimate relation of crime and ignorance is clear, complete, and ample. It may be comprised in two general propositions:

First. That one-third of all criminals are totally uneducated, and that four-fifths are practically uneducated.

Secondly. That the proportion of criminals from the illiterate classes is at least tenfold as great as the proportion from those having some education.

If these proportions are true, (and we have made rather an underestimate,) then, after making due allowance for crimes committed from passion, without regard to education, and crimes, such as forgery, frauds, &c., which require some education, we must come to the conclusion that two-thirds of crimes might be avoided by education, but more especially by religious training. Against this fact some one will reply that so also a large number of criminals are intemperate, and, therefore, we may attribute to intemperance a large number of the crimes we now attribute to ignorance. True, if these were parallel causes, but they are not. In the first place, a large number of the intemperate are such from want of education, and especially from want of moral and religious training. We see a great many educated persons (that is, commonly educated) who are intemperate, but they seldom commit crime. Secondly, many of those committed to prison have become intemperate on account of previous criminal and vicious habits. But we shall not discuss this topic, except so far as to present some statistics both upon intemperance and upon color.

We give the following examples of the traits of prisoners in regard to temperance and intemperance, in some of the principal prisons, viz:

Institution.	Temperate.	Intemperate.
Northern Indiana Prison	105	104
Iowa State Penitentiary	122	158
Minnesota State Prison	41	46
Illinois State Penitentiary	672	743
Kentucky State Penitentiary	814	1,033
Detroit House of Correction	3,045	5,655
Total	4,799	7,739

Or in proportions—

Temperate	38 per cent.
Intemperate	62 per cent.

This proportion is rather larger than that which the statistics show as the *totally ignorant*, but not nearly so large as the *very ignorant* are reported to be by the keepers of penitentiaries, prisons, and jails.

Probably if we had the statistics of every prison and jail in the United States the result would not be materially different from what we have given above. Let us now look a little at the proportions of the colored people in relation to crime and ignorance, remembering their long enslavement and the prohibition of letters to slaves:

Section.	Population.		Prisoners.	
	White.	Colored.	White.	Colored.
New York and Pennsylvania	1,786,826	117,375	11,268	1,465
Central Northwest	8,987,572	130,437	14,362	1,524
West and Pacific	2,720,272	29,393	1,187	205
South	3,568,901	1,680,888	2,058	2,414
Totals	23,063,511	1,957,873	28,875	5,608

The above does not contain the population of all the States in those sections, nor by any means all the prisoners, but it does show the proportions of white and colored people, and the proportions of white and colored prisoners; and this is the only purpose for which we have prepared this table.

In New York and Pennsylvania the proportion of colored population to colored prisoners is 80 to 1; but of white population to white prisoners it is 700 to 1.

In the central Northwest the proportion of colored population to colored prisoners is 90 to 1; but of white population to white prisoners, 700 to 1.

In the West and Pacific, the proportion of colored population to colored prisoners is 140 to 1; but of white population to white prisoners, it is 2,300 to 1.

In the South, the proportion of colored population to colored prisoners, is 700 to 1, but of white population to white prisoners, 1,784 to 1.

The only value attached to these proportions is to show that the negro population, being almost entirely ignorant, presents far the larger proportion of criminals. This we might anticipate, but it is one of many great facts which show that ignorance is really the greatest cause of crime.

The nativity of criminals in the foregoing table is—

Foreign-born	57,818
Native-born	42,495

The foreign-born in the United States are to the native population as 1 to 7. Hence, the foreign-born criminals are to natives nearly in the proportion of 10 to 1. If, then, society suffers a large portion of its people to be ignorant; if it offers temptation to intemperance; if it neglects to encourage industry; is not the proposition of Quetelet most emphatically proved, that society prepares the crime which the criminal commits?

Can we have a more serious testimony to the duties of society on one hand, or the only means by which society now can be preserved from the destruction which has overtaken all the older nations of the earth?

THE RELATION BETWEEN EDUCATION AND PAUPERISM.

BY E. D. MANSFIELD, LL. D.

Pauperism may be defined as a disease of society—permanent in some measure—because, in the language of scripture, the poor are "always" with us. Because it is a disease of society, we may and ought to ask, how far is society responsible for it? And how far can society prevent it? The same scripture which says that these are always with us says also that society is responsible for all its evils, and that there may be a state of society in which even this disease shall cease.

In addition to this, we find by our own observation that there are communities in which pauperism as a social disease does not exist at all. These are small communities, it is true, but they show the possibility of a state of society in which this great disease will not exist. Then the practical question is, *how* shall we arrive at that result? Can we prevent pauperism? Modern physicians, as well as statisticians, have arrived at the conclusion that a large number of diseases incident to personal humanity are preventable. Is not this equally as true of the diseases of society? Looking upon pauperism as we did upon crimes, is not Quetelet's proposition almost as true of pauperism as of crimes—that society prepares the causes of pauperism? The close and careful observer of society will acknowledge that to be a melancholy fact. If that be so, is it not the first duty of society to consider *how* it *prepares* for crime and pauperism? And if it does so prepare crime and pauperism, how can it avoid doing that, and how it can prevent the disease?

What do you find to be the actual measures of society in the cases of crime and pauperism? Why the actual measures of society are to make a prison to put criminals in, a jail for the accused, a poor-house for the pauper, and a house of refuge for vagabond children. But not one of these is a *preventive*. Society, by these measures, is trying to compromise its own wrongs. It made a criminal, and then tries, first to punish him and then to prevent his doing any more mischief.

This is all well, provided we admit that society has any right to cause or permit the causes of crime and pauperism. It is no doubt true that there are natural causes of pauperism which can not be avoided; and it is equally true that society has provided for these in other ways than those which it provides for pauperism, and ways which neither infer the disgrace of crime nor the reproach of poverty. Happily those whom nature has deprived of faculties or of mind are insensible to the defects of either, and thus the asylums which hold them may be regarded as the depositories of human charity.

Before we go into statistics, let us for a moment look at the causes of pauperism.

1. The greatest natural cause of pauperism is, undoubtedly, infirmities or diseases of the body; but when we look at it carefully we find that this cause makes comparatively few of those in the almshouses and infirmaries, for the reason that society has provided for these in separate institutions. The sick have the hospital; the lunatics, the idiots, the blind, the deaf and dumb, and the maimed soldier, all have institutions expressly provided for them. In such a State as Ohio, for example, there are all of these provisions for infirmities of every kind. There are five lunatic asylums, and there is a provision for every kind of human infirmity. In the infirmaries there are some of the *naturally* disabled, but not very many.

2. The number of those who become paupers from unavoidable misfortunes is small. There are, doubtless, some of these; but, when we take from persons in the infirmaries who claim to be unfortunates those who are intemperate, or very ignorant, or naturally disabled, we shall find very few left.

3. One of the greatest causes of pauperism, as it often is of lunacy and of crime, is something which is called, generally, "imbecility," but which it is impossible to define accurately, both because these persons often appear to have good sense and because this imbecility is natural as well as acquired. Perhaps in the majority of cases it is wholly acquired. There are vices, such as intemperance, which impair the judgment and the capacity for useful work; and there is also the negative imbecility which arises from ignorance. When ignorance has left the faculties of the mind totally undeveloped, they may have been naturally as good as others, yet they are almost useless in actual work. So long as such a person has an able body, and can find work, he will get along as an animal machine, directed. When he gets out of the employment in which others have placed him he becomes bewildered and often unable to help himself. Here society has caused pauperism by allowing ignorance.

4. Another great cause of pauperism, but far less in our own country than in Europe, is want of employment. This is not the cause of permanent but rather of temporary or occasional pauperism. Its consequences to society, and often to the individual, are precisely the same. In Cincinnati, for example, there are on an average

10,000 persons each year who receive what is called "outdoor relief." These are entirely outside of and independent of any public institution. They appear to be casual and temporary; but there will be just as many next year. Thus this temporary relief or casual pauperism becomes in fact permanent and an increasing charge upon the community. This kind of pauperism is largely due to the *want of employment*, and especially among the ignorant classes—and among these more largely among women. It exists especially during the winter months. Here arises the question, which, if not practical to-day, will certainly become so in a few years: Is not society bound by moral and by prudential considerations to prevent this kind of pauperism? You may say, How? Natural infirmities, diseases, and calamities, we are bound to provide for in the best way we can, and it may be admitted that they will always exist and be unavoidable. But these do not make up the great body of paupers, and we may affirm positively that the great body of pauperism is avoidable, preventable. How? We see that what we have called "imbecility" and misfortune are due to three main causes: 1. Ignorance. 2. Intemperance. 3. Want of employment. To a very great extent all of these causes may be prevented; ignorance certainly may be prevented; the temptations to intemperance may be prevented; and society can and ought to furnish employment to those who can not get it.

In Europe it is understood and admitted that on the question of employment depends mainly the question of pauperism, considered as a general disease. At present Great Britain is very prosperous; and we are told, in recent accounts, that paupers in Great Britain are 100,000 fewer in 1872 than in 1871. This is because all industries are active and prosperous. Several years since appeared a work entitled "Pauperism," by the Viscount de Bargemont. He had been prefect in several provinces of France, and was familiar with the subject. He informed the government of Louis Philippe that there were so many thousands of people out of employment in the province of Lisle; and as that was general, if the government would not employ the people there would be a revolution, and there was. The government of Louis Philippe was overthrown. In Europe this question is now well understood, but Europe is far behind this country in another form of this subject, education. The greater part, nearly the whole, of the paupers of Europe are totally ignorant, and clearly that ignorance was one great cause why they could not find employment. When a man has nothing but his arms and legs to offer for service, with a mind almost totally blank, there is very little for him to do. He can not enter upon any of the new employments which society is constantly creating, and the result is that when clear naked labor fails, he fails also. This form of pauperism has not yet very largely affected our country; but it certainly will, unless the laborers of this country shall be educated up to the point at which they shall be able to enter, at least as laborers, upon all the new channels of employment.

It is this question of education, as a *prevention* of pauperism, which concerns us here. Society has made and always will make ample provision for all those who are naturally disabled. Asylums for every species of infirmity are rising on all sides; but that sort of imbecility which arises from a total want of knowledge, or of discipline of mind, has no asylum but the almshouse. And there it reacts upon society in two ways—one by imposing upon society the necessity of supporting it, and the other by withdrawing so many persons and so much labor which might have been available both to subsistence and the increase of wealth.

These general views of pauperism are obviously true. Let us now see if specific facts do not correspond with and prove the general principles.

1. Let us first take up the statistics of Europe, as far as we can get them.

We can not bring down the statistics to the present date; but, as the value of such facts depends only upon the *proportions* between the paupers, population, and education, they can be shown by any recent tables. We will first look at pauperism in Great Britain. Its condition in 1859 was thus:

Estimated population of England and Wales in 1859	19,578,000
Whole number of paupers	902,052
Per cent. of paupers	4.6
Of these in union poor-houses	107,050
Of these, outdoor poor	692,384
Of these in hospitals, dispensaries, &c	102,618
In the city of London in 1859	106,140
Population of London	2,362,236
Per cent. of paupers to population	4.7

The condition in 1867 was:

Estimated population of England and Wales	21,320,000
Whole number of paupers	931,546
Per cent. of paupers to population	4.4

In the eight years from 1859 to 1867 there was little variation in the proportion of paupers to population.

Pauperism seems to exist in Great Britain as a *permanent* disease of society, which

includes and occupies (including all officers and attendants) just about 5 per cent. of the whole population.

If we take with the general fact another one, what is the proportion of people educated in even reading and writing—the commonest of education—we should be able to draw some proportion as between Great Britain and other countries. But, in fact, the enlightened government of England does not exhibit such statistics, except in partial fractions. All that we have are—

In 1867 the number of inspected schools was	9,340
Number of pupils which could be accommodated	1,837,307

The population of the United Kingdom was then nearly 30,000,000. But there were also great numbers of church schools, high schools, colleges, universities, &c., so that from these statements we can not get an accurate idea of the education of Great Britain; but we get enough of facts to see that it is very defective; in fact it can not possibly reach more than half the people.

But the following paragraph from the statistics of the "Edinburgh Almanac" for 1869 sums up all the facts we can get there on the subject: "But according to the estimate of the assistant commissioners, the 70 schools from which returns were obtained supply instruction to more than two-thirds of the middle class of population of the country. If this estimate be correct, there is 1 in every 140 of the population in Scotland on the roll of some secondary school; and there is 1 in every 205 of the population in public secondary schools. In the universities and colleges there were 1 in 1,000."

But these were all of the secondary and higher class, and do not include the primary schools, which ought to have the great body of pupils. The report of 1851, which is sufficiently near to determine ratios, gives the following facts:

Number of pupils attending public schools of all kinds	280,045
Number attending private schools	88,472
Total	368,517

Proportion to population, 1 to 7.84.

In round numbers, Scotland, the *best educated country in Europe*, has in school 1 to 8, The State of Ohio has at any one time as many as 1 to 3½ of the people in course of education.

The proportion of popular education in Ohio to that of Scotland is more than 2 to 1.

At the same period (1851) there were in England—

In day-schools	2,144,378
Population	16,921,888

This gives a ratio to population of 1 in 8.

It is slightly less, but we may suppose the ratio will be fully made out by the higher schools. The result of these statistics is, that in 1851 the number of youth in the schools of Great Britain did not exceed half of those who ought to have been in school.

Let us now, while we have these figures, compare them with similar results for Ohio. In his report for 1871, the secretary of state of Ohio returned 5,600 paupers—that is, "indoor" poor in Ohio; sometimes there were in round numbers 10,000 "outdoor" poor in Cincinnati; and there were in Cleveland, Toledo, and other large towns, nearly or quite 4,000 "outdoor" poor. The aggregate of these is 20,000 of the same class of paupers which are returned in Great Britain. Then we have these general results:

Population of England and Wales in 1851	17,927,609
In school	1 in 8
Number of paupers	902,052
Per cent. of paupers	4.6
Population of Ohio in 1870	2,665,000
In school	1 in 3.5
Per cent. of paupers	.7

With double the proportion of education, the proportion of paupers in Ohio is only one-sixth of that in England and Wales. If, then, all other conditions were the same, the conclusion is inevitable that universal education had reduced pauperism to one-twelfth. But, undoubtedly, this is an exaggerated view of the subject, because the conditions are not the same. This is a new country, with political institutions adapted to develop the faculties of, and furnish employment to, the people. There is, however, an important view in which the conditions are nearer than might be supposed. Ohio has just *one-third* of its population in cities and large towns; and England has little, if any, larger proportions, but it is the condition of these large towns which creates the great body of paupers. Hence the inequality of conditions is not so great as might be supposed. After allowing for all these inequalities, it is evident that the defect of education has had a great deal to do with the pauperism of England.

Let us now look at France. The returns of 1851 will show the proportion, viz:

Population of France in 1851	35,781,628
Average number assisted	982,516
Per cent. of paupers	2.78

This was the number aided among the *healthy* poor, but does not include the large mass of the sick and infirm poor, which make the full half of all paupers, in the infirmaries of the United States. We must, therefore, add them in. The statistics of these were:

Total number of hospitals and asylums in France in 1852	1,324
Number of beds in all	131,016

But this number was quadrupled by the discharge of the recovered and the entry of others. A greater part of these we have.

In 1,035 of these institutions there were in 1853 as follows:

Males	285,188
Females	162,885
Adults	404,447
Children	42,926

Making a proportion for the remaining institutions, we have at least 560,000 of the sick and infirm poor. Adding these to the healthy poor supported, we have—

Total number of paupers	1,542,516
Proportion to population	1 in 23

When we come to the ultimate, we find there is very little difference between the proportion of pauperism in England and France, but there is an immense difference between the proportion of pauperism there and in the United States. In the city of Paris the proportions were—

Population of Paris at that time	996,067
Paupers "indoor" and "outdoor"	95,169
Proportion of paupers in Paris	1 in 11
Per cent. of paupers in France	4.3
Per cent. of paupers in Paris	9.5

The proportion of pauperism in Paris is nearly double that in France generally, and that in the whole of France is double that in the State of Ohio. We may stop here for a moment to compare these proportions with those of Massachusetts. Here all conditions, except those of education, are nearly the same. Massachusetts has a *civic* (that is town) population equal to that of France; and a very large share of foreign emigrants. The comparison between France and Massachusetts is therefore quite fair.

Population of Massachusetts in 1852	1,040,000
Whole number of paupers in the State	31,400
Proportion of paupers to population	1 in 35
Percentage of paupers	3.5

Here we have a direct and fair comparison of the results in Europe compared with those of the United States, under nearly the same conditions:

Paupers in France	1 in 23
Paupers in Massachusetts	1 in 35
Per cent. of paupers in France	4.3
Per cent. of paupers in Massachusetts	3.5

Now, the difference is not so great as many might expect, but *all* that difference is due to education.

Return again to Ohio:

Proportion of paupers to population	1 in 35
Percentage of paupers	.7

Ohio is a fair representative State of this country. One-third of its population is in large towns—a proportion not exceeded by more than three or four States in the whole country. Three-fourths of all the States have a less proportion of paupers than Ohio. But, in order to put the case in the fairest possible attitude for Europe, let us combine the proportion of Massachusetts and Ohio together. The result will be this:

Population of Massachusetts and Ohio in 1852	3,030,000
Number of paupers	50,000
Proportion of paupers	1 in 61
Per cent. of paupers	1.70

The proportion of paupers in France is more than double, and, as the civic population is as large, and the number of foreign immigrants of the poor classes very great, the comparison is a fair one; and the difference in the proportion of pauperism is undoubtedly due to education.

2. Let us now look at the statistics of the United States, and see if we can ascertain whether ignorance has caused pauperism.

In the table at the end of this report we have given the results which we have obtained by hundreds of inquiries addressed to the infirmaries and charitable institutions of the country, but which were not answered in more than one case out of three. There are still answers enough to give us a definite view of this subject and establish certain proportions which would not be varied materially by more extended observations; and here we remark that full and accurate statistics would enable us to establish definitely the principles or social influences by which "pauperism," that is, dependent poverty, is evolved from society. We see arising in our country, in a smaller degree, but with equal regularity and certainty, the same kind of pauperism which is one distinguishing mark of society in Europe. We are apt to think that England and France are the most civilized countries in the world; at least they are those from which we take our ideas of what is called "civilization." But what do we find in this civilization? Why, that in 1869, there were in England and France together 2,600,000 paupers out of a population of 65,000,000! That is, 1 in 25 of the people is dependent upon public support. This is startling. It is enough to make any humane man—more, any Christian, and still more, any Christian statesman—pause and inquire whether this is really the necessary result of Christian civilization. But these are the countries to which we have looked for the highest standard of civilization. Here we inquire again, Must our country follow this kind of civilization? Is there no remedy for this tremendous evil? At least, is there not a partial remedy, so that we may keep our country from advancing further in the scale of pauper civilization?

Let us now return to the results of our own tables:

Number of States reporting	16
Number of institutions reporting	276
Number of paupers reported	12,159
Number of white males	6,251
Number of white females	5,245
Number of colored males	287
Number of colored females	279
Number of foreign-born	3,757
Number of native-born	5,827
Number who can read and write	3,071
Number who can read only	1,521
Number who can neither read nor write	2,801

The proportions deduced from these aggregates as follows:

The proportion of males to females is	54 to 46
The proportion of white to colored is	95 to 5
The proportion of foreign-born to native	40 to 60
The proportion of those who can read only to those who can neither read nor write is	52 to 48

If we add those who can read only to those who can do neither, which we should do, as it is well known that those who can read only are almost absolutely ignorant, we shall have this result:

Those who have some education to those who have none	60 to 40
Foreign-born to native	39 to 61
Whites to blacks	95 to 5
Totally ignorant among paupers	60 per cent.
Foreign-born	39 per cent.
Colored	5 per cent.

To compare these proportions with the proportions of these classes in the several States we have these results, derived from the census of the illiterates in the census of 1870:

Adult illiterates in New England States to their total population	4.6 per cent.
In Pennsylvania, New Jersey, and New York	4.9 per cent.
In Ohio, Indiana, and the Central West	4.8 per cent.

This proportion is for the whole population, and not for adults only; in the latter the proportion of illiterates would be much greater. We may assume 4.5 per cent. as the proportion of the illiterates in the Northern, Middle, and Western States, excluding the South, or former slave States. We have, then:

Totally ignorant among paupers	60 per cent.
Totally ignorant among the whole people	4.5 per cent.

Let us take a given number of people, say a million of persons, in Pennsylvania, Ohio, and Illinois, States not inferior to any in popular education. The result will be (on the average) very nearly this:

Population	1,000,000
Paupers	8,000
Illiterate people, (total)	45,000
Illiterate paupers	4,800
Of total illiterates there are paupers	13 per cent.
Of all population there are paupers	8 per cent.

In other words, the proportion of paupers among the illiterates is sixteen times as great as among those of common education. The results demonstrate what reason should infer from the facts. The want of education is the lack of faculties and talents to acquire employments and to work profitably in them; and this is one of the great causes of pauperism. Let us now look to the proportion of foreign-born to native; for this is involved in an inquiry into the relations of ignorance to pauperism. A great many of the foreign-born who come to this country come very ignorant and also very poor, so that they are in a condition to recruit the ranks of pauperism largely, unless they are able to get into agricultural employments, which only a small portion does. The result is evident in the pauperism of large cities. If the infirmaries, hospitals, and asylums of New York, Cincinnati, Saint Louis, and other cities be examined, it will be seen that by far the larger proportion of paupers is in the large towns, and that the larger part of them is foreign-born. Taking the proportions above given, let us examine their relation to the whole population.

	Per cent.
In Connecticut the proportion of foreign-born is	21
In Pennsylvania the proportion of foreign-born is	15
In Ohio the proportion of foreign-born is	14
In Indiana the proportion of foreign-born is	8
In Illinois the proportion of foreign-born is	20

In the whole United States the proportion is about 12 per cent., but in the South it is much less. In the States from which our tables are taken an average of 16 per cent. is quite enough. We have, then, for a given population, the following results:

Population	1,000,000
Paupers	8,000
Foreign-born	160,000
Foreign-born paupers, (39 per cent.,)	3,120

Of all foreign-born, there are paupers 2 per cent.

Of the whole population, there are paupers 8 per cent. In other words, the proportion of foreign-born paupers is three times as great as the proportion of natives.

The proportion of native paupers is as follows:

Native population, deducting foreign-born, as above	840,000
Native paupers, as above	4,880
Proportion to whole population	5 per cent.
Proportion of foreign to native paupers	4 to 1

The number of colored paupers is not large, (except in the South,) and there is no evidence that they are more inclined to pauperism than the whites. The returns from several of the almshouses and infirmaries show that there is a large share of intemperance; but, as we have remarked in relation to crimes, intemperance is often the *consequence* as well as the cause of crime and pauperism. It is one of the common sayings of intemperate men, as well as their friends, that "He was unfortunate, and then got to drinking." We must go farther than we have yet been able to do into the origin of cases of pauperism before we can safely pronounce how far intemperance has caused it. We now know that the largest element of character which accompanies pauperism is *ignorance*. The proportions above given are enormous, and should arouse those who seek a broad, popular education to greater zeal and energy.

Although the effect of ignorance in producing crime is very great, yet its effect in producing pauperism is greater. If, then, society has to pay so heavily for keeping a part of its people in ignorance, would it not be wise and prudent to educate them?

The State commissioners of public charities in Illinois report the case so clearly and strongly that we make the following extracts from their report for 1871:

"*Ninth.* The tendency of education to prevent pauperism is more apparent than its tendency to prevent crime. Estimating the pauper children at one-tenth of the whole number, and leaving them out of calculation, 40 per cent. of the inmates of the almshouses could not write, and 25 per cent. could not even read.

"*Tenth.* Pauperism and crime are so closely allied that the same individuals belong to both fraternities. Five per cent. of the county paupers acknowledge to have been in jail. The same man is a criminal or pauper, according to circumstances. He steals when he can not beg, and begs when he can not steal."

Cicero, in his oration for the poet, (Archias,) says that all arts are kindred. We see above that the vices and crimes are kindred also; but whatever they *are*, society should rather inquire how they *came* than what they *are*. Vice, crime, and imbecility, when they have once seized upon a human being, are rarely cured. The preventive is a far more possible process than the curative; hence society is under the greatest obligations, as well as moved by the strongest interests, to take all possible preventive measures. It has two directly within its power. One is positive, by educating the people thoroughly. The other is negative, by withdrawing the open temptations to intemperance. Every Christian and patriotic motive impels us to *prevent* crime and pauperism by every human means.

The statistics from which we have drawn our conclusions are limited, compared with what they may be made; but while more extensive tables might enlarge the details they would probably in no way change the result. While the great social facts remain, the evil, as well as the good, which attended them, will also remain.

Condition of education in almshouses and infirmaries.

Institutions or States.	Number of poor-houses.	Number of persons.	White.		Colored.		Nativity.		Education.		
			Male.	Female.	Male.	Female.	Foreign.	Native.	Read and write.	Read only.	None.

SUGGESTIONS RESPECTING ART-TRAINING IN AMERICAN COLLEGES.

BY M. B. ANDERSON, LL. D., PRESIDENT OF THE ROCHESTER (NEW YORK) UNIVERSITY.

It is the province of an institution for higher education to furnish a course of instruction which shall include the elementary principles of all the great departments of human thought. It should be the aim of such a course to secure the highest culture which the pupil is capable of receiving, and also to make him in some degree familiar with the mental processes of those men who mark in their epochs the culmination of the world's moral and intellectual life.

Upon the principles here stated all courses of study designed for liberal education have been framed. These courses have varied with the intellectual progress of successive ages. The culture of each generation is represented in its curriculum of educational studies. A nation's ideal is shown in what it attempts to do for the young. The more cultivated the people the greater the anxiety manifested to perpetuate the highest types of the present in the generations to come.

ATHENIAN CULTURE.

The Athenians thought it a shame that the free citizen should be ignorant of any one of the forms in which the Greek mind had found expression. Consequently, no great genius among them could fail of a fit audience or due appreciation among the average free-born citizens. All the capacity and achievement of the few were made available for the cultivation of the many.

DEFICIENCIES IN MODERN EDUCATION.

Modern education, especially that of our own country, has strangely neglected some of the noblest forms of human thought. Especially is this statement true in respect to the fine arts. With the exception of the study of elegant literature, very little connected with these arts enters into our course of education. It must be conceded that all literature cast into rhythmical forms, or whose aim it is to address and affect primarily the æsthetic capacity, should be put in the same class with the arts of design. The end of the poem, the novel, and a large proportion of essays and occasional addresses, are designed, in the first instance, to give pleasure, however much of moral effect may be indirectly aimed at.

A KNOWLEDGE OF THE GREAT WORKS OF LITERATURE INDISPENSABLE.

By common consent, the highest forms of æsthetic literature in three or four languages are considered as indispensable elements in every course of education which can claim to be liberal. The essential principles of literary and art criticism are identical. Homer and Shakespeare are artists by the same title as are the world's painters, sculptors, and architects.

LIBERAL CULTURE DEMANDS SIMILAR KNOWLEDGE OF ART.

The study of literature, having been so universally adopted as a means of culture, is itself a concession of the value, and even the necessity, of art-education within a certain narrow range. The value of art-training being conceded in principle, there can be no good reason given for selecting one branch of artistic creation and the exclusion of others, equally elevated, from our courses of liberal study.

Considered as mere knowledge, or as a means of discipline for the mind and character, some degree of attention to art would seem to be almost indispensable. With the exception of literature, already referred to, and some unsystematic attempts in the direction of music, very little has been done in this direction. The young are left in substantial ignorance of whole branches of art-expression and are expected to acquire a knowledge of them by the accidents of general reading, travel, and intermittent observation. Under such conditions, those only who have the strongest natural drift in the direction of æsthetic pursuits are likely to make any definite and thorough acquisitions. Those in whom the æsthetic sense is least developed and who, consequently, most need the elevating and refining influence of art-culture, are likely to obtain little or none of it. Persons whose tastes are severe and critical in literature are often utterly ignorant of all that pertains to the plastic arts.

DEFICIENCY OF ART-CULTURE IN AMERICA.

The great majority of educated Americans who travel abroad for improvement are so deficient in elementary art-knowledge that the best opportunities are lost upon them. As they carry no æsthetic conceptions abroad with them, they bring little art-knowledge home. The blank and wearied expression on the faces of the crowds who, in obedience to fashion and the guide-books, drag themselves through the European galleries, is a telling index to the average ignorance on art-topics on the part of the traveling public. Not seldom do we see a well-filled library, or an elegantly furnished parlor, whose art-decorations are strangely out of harmony with the surroundings. In furnishing dwellings, we are a people singularly regardless of expense, but we pay little attention to harmony of color or beauty of form. In our monuments to the dead, and our public buildings, we spare no expense; but tawdry ornamentation too often takes the place of solidity, proportion, and harmony of parts. In those manufactures which demand beauty in form and color we are as much behind Europeans as we excel them in ingenuity and adaptation of means to ends in mechanical construction. We have a body of able artists in the departments, especially, of painting and sculpture. In landscape, our place is relatively high. But a serious obstacle to the progress of American art is the want of an educated and discriminating body of patrons among the educated and wealthy. When the hard-working artist sees tons of marble and acres of canvas, worthless originals and more worthless copies, the work of journeymen painters and stone-cutters, purchased abroad by men of wealth, while honest and real home-production is neglected, he loses faith in his countrymen, and even in art itself. While it may be true that this state of things is passing away, it must be admitted that the great need of American artists is a community of critical and intelligent judges, who will buy with discrimination, expose charlatanry, and patronize real genius and intelligent labor. If we would hold the same high rank among the nations in the elegant arts that we do in practical energy and inventive capacity, we must take measures to meet the deficiency we have alluded to, the reality of which all thoughtful persons must admit. The remedy, we submit, must be sought in art-education for the young. All experience shows that improvements in education must begin in its highest forms. The stream can not rise higher than its fountain. The teachers and leaders of society must be first taught. It is not enough that the elements of drawing are taught in our public schools. This is well, but it will never create a body of connoisseurs to whom the artist can appeal for recognition and appreciation. Nor will schools for the training of artists meet our difficulty. These, also, we need; but the educating force which these will bring to bear on the community of critics and patrons of art is remote and indirect. We need an art-training for colleges which shall be given as a constituent element of general liberal culture, and not for a merely professional end.

SUGGESTIONS FOR ART-CULTURE IN COLLEGES.

I now beg leave to give some hints upon what is possible and practicable in promoting art-study in liberal education. Such a course of instruction must be short, for the curriculum is already crowded, and new sciences and literatures are constantly demanding recognition. It must be accomplished by means of cheap illustrations and appliances. The meager incomes of American colleges in general forbid any large and expensive galleries of art

LAWS OF SOUND.

The laws of harmony among sounds are taught in every course of physics. Some explanation of the acoustic principles which affect the production of musical sounds might naturally and easily be given. Such discussion might be followed by the principal facts in the history of music leading to an account of its marvelous development in modern times, showing it to be the earliest cultivated among the arts, while it has been the latest in reaching maturity. This might be followed by the discussion of the laws which underlie musical criticism and composition, together with some characteristics of the world's great musical composers and performers. It may be said that such instruction must be superficial and worthless. We answer that all elementary instruction must be superficial as compared with the attainments of experts. It is also true that no instruction, however incomplete, can be called superficial which is founded upon universal laws.

LAWS OF COLOR.

Harmony in color depends upon laws similar to those which regulate the relations of sound-waves. The principles of harmony in color are of necessity taught with the elements of optics. The application of these laws to the production of pleasing effects upon the eye is simple and easy. The commonest illustrations of the modes in which contiguous colors heighten or diminish the effect of each other would be sufficient to set the student who was not color-blind upon a course of self-education

which, in the end, might make him a critical judge of all the beautiful effects of harmony and contrast in colors. "Chevreul on Color," a work which grew out of a series of lectures to the decorative artists of Paris, who were engaged in the construction of patterns for various kinds of manufactures, is an example of what may be done in this direction.

LAWS OF PERSPECTIVE AND OF ARCHITECTURE.

Some idea of the laws of perspective and shadow might be given in connection with geometry. In the study of statics, examples may be selected from buildings which would show the relations between the solidity demanded by physical laws and the production of the emotion of the beautiful and sublime in architectural construction. In the study of the different branches of natural history, attention might be drawn to the laws of strength, symmetry, and proportion which are every where united in animals and plants.

BEAUTY AN EVER-PRESENT ATTRIBUTE OF NATURE.

In the general analysis of natural objects, a competent teacher will the better secure his end if he directs his pupil to the fact that beauty, as well as adjustment of means to ends, pervades all the kingdoms of nature. Instruction in literature is of course largely æsthetic in its character. This will be much more effective when literature is seen to be but part of a grand system of æsthetic creations. When a student has thus been furnished with elementary critical conceptions, and has been made familiar with those faculties in his own mind which render him capable of enjoying the beautiful and the sublime, he has a ground-work of preparation which enables him readily to profit by whatever of instruction in the departments of plastic art he may be able to obtain.

All instruction upon these subjects should of course be accompanied by illustrations addressed to the eye. As the expense of collecting a complete representation of the progress of art through actual masterpieces is beyond the reach of any treasury but that of a nation, we must set aside all hope of seeing such collection in connection with an institution of learning. Indeed, such immense galleries would be more likely to confuse and burden than to assist a young learner. It is, however, comparatively easy to make a collection of illustrations of art which would answer all the purposes which we have in view.

NECESSARY ART-MODELS, CASTS, AND PLANS.

First.—There should be provided a series of models in plaster of Paris and cork, of celebrated monuments of architecture, which should be so selected as to illustrate the development of orders, types, and styles in themselves and in their relation to nations and periods. To these should be added casts of the details of ornament, such as capitals, moldings, and sculpture, whether serious or grotesque. Stained-glass windows could be represented by chromo-lithographs, as also celebrated interiors, with their general decorations in color. In addition to these, models, photographs, and engravings of buildings and their ornaments might be made extremely useful.

Secondly.—For sculpture, a similar collection of casts in plaster of Paris, zinc, or parian would serve to illustrate the progress of the art and represent the masterpieces of different nations and periods. These casts, as in the case of architecture, might be supplemented largely by photographs and engravings.

Thirdly.—To illustrate ceramic art, reproductions of ancient vases of Greek, Etruscan, and oriental origin could be procured at a slight expense. To these might be added photographs and engravings which would give the student a tolerably clear idea of the gradual development of this branch of art, in which the useful and ornamental are brought in so close a connection.

Fourthly.—To represent ancient pictorial art, a collection of engravings and chromo-lithographs of the extant fragments of Greek, Etruscan, and Roman paintings—such, for example, as have been found in Etruscan and Roman tombs, in the baths of Titus, and at Pompeii—might be made available. To these might be added copies of early church mosaics and frescoes, which would illustrate the transition from heathen to Christian art. For this purpose the publications of the Arundel Society would be found trustworthy and valuable.

Fifthly.—For an illustrative art collection, nothing is more valuable than well-selected engravings. Engraving is itself a branch of art, while at the same time it represents the sister arts. The composition, outline, and distribution of light and shade, the general expression of a picture, indeed every thing except color, can be set forth by a skillful engraver. Etchings, of which the early painters were so fond, will give us the autograph expression of an artist's thought. Where the etcher is also the designer, and an artist of reputation, his work will give us a real and trustworthy idea of his genius, and will approach a painting in its value for art-instruction. An etching by Rembrandt, Salvator Rosa, or Waterloo, brings us face to face with the artist's thought

set forth in his own language. An engraver of real power, like Marc Antonio, Raphael Morghen, or Frederick Müller, can interpret the spirit of his original with greater success than the most skillful translator in literature. Without attempting to obtain etchings or engravings which are costly by mere rarity, or indulging in the luxury of proof impressions, a collection can be made, at a moderate outlay, which will serve a twofold purpose. They enable us to study the art of engraving in its completeness and the most significant elements of the art of painting. Under the skillful manipulation of artists like Kellerhoven we are, in addition, given admirable representations of color. When a collection of engravings is arranged by schools, and in a historical order, it can be made to illustrate successfully the growth of culture and the progress of art. Such a collection would naturally be supplemented, in time, by copies in oil and original paintings. Every good collection of engravings would furnish by its presence a strong argument for its enlargement by original paintings.

Sixthly.—A collection of wooden models and drawings representing the progress of naval architecture, and its present condition, though not so immediately and exclusively bearing on art-culture, would be an appropriate pendant to the illustrations of architecture, properly so called. The graceful curves and free, bold outlines necessary to naval construction give scope for æsthetic effects which are worthy to be compared with the highest results of the sister art. The value of such models for the illustration of the laws of hydrostatics and hydrodynamics is obvious.

Seventhly.—These illustrations might be extended so far as to include the weapons, utensils, and ornaments of savage races and prehistoric times, inasmuch as they show tendencies to regard beauty of form and finish in construction. In like manner, whatever specimens of handicraft combine the elegant with the useful in any remarkable degree would be serviceable for the general purpose we have in view. One of the surest marks of advancing civilization is the tendency to mold articles, designed for purely practical ends, into forms of beauty.

ARRANGEMENT OF ART-COLLECTIONS.

A collection of art-illustrations should be displayed in an appropriate room and classified into departments formed on scientific principles. So far as possible, they should be so arranged as to show by their relation to each other the progress of artistic development, and set forth the leading facts in the history of art. They should be as carefully arranged as a cabinet of natural history. A well-selected library of books on the theory, practice, and history of art should be readily accessible to the pupil. They will sustain the same relation to the illustrations that scientific treatises do to cabinets of minerals and fossils.

ART-LECTURES.

In connection with these illustrations a course of lectures should be given founded upon the actual presentation to the eye of the object to be explained. Opportunity should be given for repeated examination of the illustrations in the teacher's presence, and for the free interchange of questions and answers. A short time thus devoted to art-study under an intelligent instructor would give a class the initial conceptions which reading, travel, and observation will mature into capacity for intelligent enjoyment and enlightened criticism of art.

ADVANTAGE TO THE GENERAL PUBLIC OF ELEMENTARY ART-CULTURE.

It would aid in the elevation of the public taste by gradually educating a body of connoisseurs capable of purchasing art-objects wisely, and by giving tone and character to the judgments of the periodical press. Adequate preparation, so far as art is concerned, would be secured for profitable foreign travel, and the moral advantage would be obtained which always arises from increasing the public capacity for distinguishing the false from the true. Domestic life would be made more attractive and, at the same time, less costly. The tone of dress and furniture would be less under the control of vulgar wealth, and the tact and skill which produce beautiful effects from a slight outlay would come to be properly appreciated. The pleasures arising from cultivated taste would tend to take the precedence of those vulgar amusements which degrade alike the mind and morals of society.

The strongest argument for art-culture is, however, found in the fact that it is the natural complement to the study of science and literature, and is indispensable to the completion of a broad, liberal, and justly proportioned education.

KNOWLEDGE OF ART ESSENTIAL TO A JUST KNOWLEDGE OF HISTORY.

The growth of art is so closely interwoven with all civilization and intellectual progress that it is impossible to separate them from each other without making all our ideas of human history disproportioned, vague, and inadequate. The titanic civilizations of Egypt and Assyria are revealed most distinctly and emphatically in their art.

All the productions of the Greek mind bore a definite relation to each other. They are each part and parcel of a common intellectual, moral, and physical life. He whose knowledge of the Grecian mind is drawn from literature alone, will fail to grasp a well-rounded idea of its many-sided and all-embracing power. The molding influence of the Greek upon the Roman mind is nowhere so conspicuous as in the art-treasures with which the very soil of Rome is filled. The earlier Italian art indigenous to the Etruscan and Roman mind is peculiarly indicative of national character. The introduction of Greek art into Rome after the conquest of Sicily and Greece was both cause and consequence of the wonderful change in the Roman character in the later days of the republic. Greek sculpture changed the religion of Rome, as really as Greek philosophy changed its law when the speculations of the Porch and the Academy replaced the narrow and oppressive technicalities of the Twelve Tables. The gods of Homer and Hesiod were naturalized in Rome by the silent power of plastic art. The arch, and its modification in the dome—the great contribution of the Roman mind to architecture—furnish an index to the movement of Roman influence over the Christian world. This influence determined the distinctive features of Byzantine architecture in the East, and the Romanesque in the North and West. The stiff and angular drawing of the mediæval Greek mosaics, the growth of an age of superstition and decadence, repeats itself in the early religious painting of Italy and Germany, and shows the constant intercourse between the East and the West. The art-remains of the catacombs illustrate the early growth of Christianity, and give indications, by no means unworthy of attention, of doctrinal belief at the period of catacomb construction. The rise of modern Italian art under Giotto and his pupils marks the commencement of the intellectual and moral changes which led the way to modern civilization. All through the creative period of the Italian mind, literature, science, and art received their impulse from similar forces, and each illustrates and completes the conception of the other. Even Dante can not be adequately understood without reference to the art of his time, nor can Italian art since be understood in the largest sense without the study of Dante. "The Last Judgment" seems little else than a portion of the "Inferno," translated into outlines and colors. The semi-heathenism of the Renaissance is as clearly portrayed in art as in the speculations of the Neo-Platonic scholars who graced the symposia of the Medicean court. The architecture of the Middle Ages alone is sufficient to extirpate the vulgar prejudice which assumes that the European mind lay dormant from the downfall of the Roman empire till the revival of learning. There is no monument of human genius more impressive than Strasburg minster, or that vast truncated mountain of arches, buttresses, and spires which rises from the valley of the lower Rhine amid the bustle and traffic of Cologne. The "stone books" sculptured on the cathedral walls of Rheims and Chartres are a more significant type of the nascent social order of mediæval Europe than any of its monuments of literature. The inner life of the Hanse towns—those wonderful outgrowths of civic life, at once so concentrated and so expansive—is nowhere so clearly expressed as in those monumental town halls, whose towers and bells were alike the emblems of municipal sovereignty and the landmarks, amid feudal barbarism, of civil liberty and commercial life. Illustrations of the value of the instruction we advocate crowd upon the attention; but mention has been made of sufficient for our purpose.

ART-TRAINING ECONOMICAL AND FEASIBLE.

The question naturally arises, What will this cost, and how can the result be accomplished? We believe (and we speak from some experience) that useful instruction can be given with a very small collection of illustrations. One thousand dollars, judiciously expended, can be made to accomplish valuable results. Five thousand dollars would purchase a fair collection. Ten thousand dollars (a part expended at once and a part put at interest) would soon meet all the most pressing needs of an institution. Of course such a collection can be profitably enlarged in any direction and to any degree, in proportion to the provision made for it. But public benevolence is not likely to go astray in this direction.

Again, it may be asked, where shall we procure competent teachers? We answer that wherever an endowment for a collection and a lectureship shall be provided there will be no lack of men. If there shall be no fund to pay a special lecturer, there certainly ought to be found in every college faculty one or more capable of giving the very elementary instruction required. If a lecturer, profoundly learned in the subject of art, were endowed, the time for an elaborate and detailed course of lectures could not and ought not to be spared. In this, as in every thing else, we ought to aim at the practicable and possible, and learn not to despise the day of small things.

HOW CERTAIN SCIENCES WERE FIRST TAUGHT IN AN AMERICAN COLLEGE.

Benjamin Silliman began teaching mineralogy and geology with one small box of illustrative specimens, which he was hardly competent to classify. But it was a beginning out of which great things have grown. It is clear that some degree of art-culture is desirable and attainable, and that it may be accomplished by an outlay for illustrations and teaching capacity not beyond the reach of any well-organized institution of learning.

REMARK.—It will be noticed that a few of the States do not give the total expenditure for the year. It is probable that the expenditure varied little from the total income for school purposes.

a For the year 1870. Outstanding claims, $750,000.
b Including repairs.
c School-bonds not included.
d For the year 1870.
e Including repairs and furniture.
f Not including State-fund of $2,233,350.
g Including rent and repairs.
h Including miscellaneous expenses.

TABLE II.—*Statistics of school systems of the States and Territories, showing the income, expenditure, &c.*—Continued.

States and Territories.	Date of report.	EXPENDITURE—Continued.							Amount of permanent school-fund.

* Changed in 1872 to Girls' High School.

a Total attendance for the year 1871.

b Students for 1871–'72.

NOTE.—*New York:* Teachers' classes, for training in the "science of common-school teaching," were maintained during the year 1871 in 90 academies designated for that purpose by the board of regents. The attendance of pupils so instructed is reported to have been 582 males and 959 females; total, 1,541. (From report of State superintendent of public instruction for 1871.)

NOTE.—For city normal schools and normal classes see Table III—School systems of cities.

TABLE IV.—*Statistics of normal schools for* 1872—Continued.

Number.	Name.	Location.	Date of organization.	Principal.	Number of years in course.	Number of weeks in scholastic year.	Volumes in library.		Educational journals taken.	Annual expense to each student.	Is drawing taught?	Has the school a collection of models, casts, apparatus, and examples for free-hand drawing?	Is vocal music taught?	Is instrumental music taught?	Does the school possess a chemical laboratory?	Does the school possess a philosophical cabinet and apparatus?	Does the school possess a cabinet of natural history?

* From report of the United States Bureau of Education for 1871.

† From report of the regents of the University of the State of New York for 1871. The number of students is the total for the year.

‡ Teachers' classes for instruction in the "science of common-school teaching" were maintained during the year 1871 in ninety (90) academies designated for that purpose by the board of regents of the university. The attendance of pupils so instructed is reported to have been 582 males and 959 females; total, 1,541. These academies are indicated thus (‡). From report of the New York State superintendent of public instruction for 1871.

e From report of the State superintendent of public instruction.

f From report of the State superintendent of common schools.

NOTE.—While this report is going through the press, four noteworthy gifts for educational purpose have been announced:

A gift of $500,000, by Cornelius Vanderbilt, of New York, to establish the "University of the Methodist Episcopal Church South."

Also a gift of $500,000, by the same gentleman, to establish a seminary for young ladies at New Dorp, Staten Island.

NOTE.—By act of the legislature of Pennsylvania, the State superintendent of public instruction assumed control of the schools for soldiers' orphans, June 31, 1871.
The number of this class of orphans admitted into schools and homes since that date was 6,429.
The total cost of the system to May 31, 1872—$3,467,543.81.
Number of orphans in school for 1872—4,235.
Number remaining in schools and homes, May 31, 1872—3,527.
Cost of the system for the year ending May 31, 1872—$475,245.47.

[From report of Hon. J. C. Wickersham, superintendent of soldiers' orphans.]

TABLE XXII.—*Showing improvements in school furniture, apparatus, ventilation, &c., patented in the United States for the year ended June 30, 1872.*

Names of patentees.	Residence.	No.	Titles of patents.
Geo. F. Perkins	San Francisco, Cal	121810	Improvement in pendent reading-desks.
Wiley Watson	Visalia, Cal	121070	Improvement in school desks and seats.
Jas. S. Smith	Middletown, Conn	119891	Improvement in office time-indicators.
Wm. A. Slaymaker	Atlanta, Ga	123796	Improvement in school-desks.
Do	do	123797	Improvement in school-desks.
Francis R. Goulding	Roswell, Ga	117273	Improvement in pencil-cases.
Joseph Troll	Bellville, Ill	117579	Improvement in tellurians.
Jno. C. Jensen	Chicago, Ill	125682	Improvement in paper-fasteners.
Wesley C. Carter and Jas. P. Emery.	Galva, Ill	119316	Improvement in desks for school-teachers, &c.
Alpheus B. Manard	Rockford, Ill	121291	Improvement in copy-holders.
Thos. A. Galt and Geo. S. Tracy.	Sterling, Ill	118773	Improvement in joints for school-desks.
John L. Riter	Brownsville, Ind	125411	Improvement in school-desk brackets.
Do	do	119882	Improvement in frames for school desks and seats.
Wesley H. Davis	Hartsville, Ind	126448	Improvement in pencil-cases.
James Russel	Plymouth, Ind	117467	Improvement in school-desks.
James Smith	Richmond, Ind	118161	Improvement in school-desks.
Jas. F. Bigger and Wm. A. Pugh.	Rushville, Ind	122511	Improvement in blackboard-rubbers.
Nathan V. Evans	Winslow, Ind	122763	Improvement in composition for covering blackboards, &c.
John J. Orr	Carrollton, Ky	123578	Improvement in post-office letter-stamping apparatus.
Wm. Knight	Covington, Ky	119368	Improvement in slate-frames.
Jas. R. Cole	Paducah, Ky	125024	Improvement in writing-apparatus for the blind.
Benj. F. Smith	New Orleans, La	117572	Improvement in refrigerating and ventilating apparatus.
Lyman Pettigrew	Gardiner, Me	123045	Improvement in writing-tablets.
Edw. M. Greenway, jr.	Baltimore, Md	123301	Improvement in ventilators.
Lewis Kelley	Boston, Mass	124687	Improvement in ventilators.
Reuben White	do	120138	Improvement in ventilators.
Thos. J. Mayall	do	125973	Improvement in inkstands.
Hugh M. Sweeney	do	125500	Improvement in book-stands.
Franklin L. Bailey	do	124655	Improvement in hand-stamps.
John W. Carter	do	124544	Improvement in the manufacture of writing-ink.
John M. Batchelder	Cambridge, Mass	127949	Improvement in rulers.
Josiah S. Elliott, John F. Wood	Chelsea, Mass., Everett, Mass.	128218	Improvement in inkstands made from composition-stone.
Edson P. Clark	Holyoke, Mass	4899	Improvement in composition for indelible pencils.
John W. Dodge	Malden, Mass	122817	Improvement in stamping-presses.
Charles W. Russell	Milford, Mass	126094	Improvement in compound implements.
Wm. N. Bartholomew	Newton, Mass	125519	Improvement in slate-frames.
William McAdams	do	119381	Improvement in calendars.
Wm. N. Bartholomew	Newton Centre, Mass	121982	Improvement in rubber erasers.
Elisha Morgan	Springfield, Mass	128163	Improvement in inkstands.
Benj. B. Hill	do	121286	Improvement in hand-stamps.
Josiah B. Anderson	Wakefield, Mass	122694	Improvement in envelopes and letter-sheets combined.
Alonzo Whitcomb	Worcester, Mass	116781	Improvement in copying-presses.
A. P. M. Jeffers	Allegan, Mich	120072	Improvement in panoramic school-apparatus.
Alrick M. Bodwell	Ann Arbor, Mich	118187	Improvement in school desks and seats.
Amos W. Price	Detroit, Mich	126123	Improvement in arithmetical sum-letters.
Jas. S. Rankin	Minneapolis, Minn	122909	Improvement in inkstands.
Do	do	121470	Improvement in school desks and seats.
Do	do	121471	Improvement in devices for supporting and connecting school-desks.
Wendell P. Hood	Winona, Minn	121287	Improvement in school desks and seats.
Daniel Shryock	Hannibal, Mo	119054	Improvement in chart-holders.
George G. Thomas	Saint Louis, Mo	116887	Improvement in chimney-cowls.
Ambrose Marriott	do	121639	Improvement in ventilators.
Jacob McClure	Nashua, N. H	116732	Improvement in combined knife and pencil sharpeners.
Edw. Weissenborn	Hudson City, N. J	125359	Improvement in holders and adjusters for lead-pencils, &c.
Do	do	125360	Improvement in machines for coloring and polishing lead-pencils, &c.
Do	do	125361	Improvement in machines for forming lead and other pencils.
Do	do	125362	Improvement in machines for varnishing or coloring lead-pencils, &c.
Samuel E. Harrison	Jersey City, N. J	126053	Improvement in paper-files.
Isidor Popper	Phillipsburgh, N. J	125077	Improvement in compounds for writing-fluid.
Frank G. Johnson	Brooklyn, N. Y	123149	Improvement in blackboard erasers.
Do	do	125960	Improvement in map and chart racks.
August Schlag	do	119794	Improvement in school-desks.
Daniel M. Somers	do	126339	Improvement in pen-holders.

TABLE XXII.—*Showing improvements in school furniture, &c.*—Continued.

Names of patentees.	Residence.	No.	Titles of patents.
Wm. F. Baade	Buffalo, N. Y	118180	Improvement in reading and drawing cases.
Chamberlayne Phelps	Clayton, N. Y	126901	Improvement in book-holders.
Henry L. De Zeng	Geneva, N. Y	123462	Improvement in pencil-sharpeners.
Jay Densmore	Holley, N. Y	124423	Improvement in book-supports.
John Charles Sparr	Irondequoit, N. Y	123205	Improvement in inkstands.
Bloomfield Brower	New York, N. Y	126260	Improvement in rulers.
Edm'nd D. Chamberlain	do	125788	Improvement in hand-stamps.
Max Claver	do	118909	Improvement in spring-locks for ventilating-sashes.
John Cockburn	do	122708	Improvement in pen and pencil cases.
Wm. J. Dewey	do	125443	Improvement in pen-holders.
Wm. K. Evans	do	126792	Improvement in detachable erasers for pencils.
Alexander H. Fatzinger	do	124429	Improvement in mucilage-holders.
Addison C. Fletcher	do	127330	Improvement in letter-sheet blanks.
George Harvey	do	122461	Improvement in portfolios.
George F. Hawkes	do	125291	Improvement in fountain pens.
Wm. S. Hicks	do	120520	Improvement in pen and pencil cases.
Do	do	122169	Improvement in pen and pencil cases.
John H. Knapp	do	123486	Improvement in pencil-cases.
Do	do	123485	Improvement in pencil-cases.
Julius Kircher	do	119154	Improvement in inks for printing.
Arthur Le Clercq	do	122265	Improvement in copying-presses.
Azel S. Lyman	do	4683	Improvement in methods of cooling and ventilating rooms.
George S. McKenzie	do	122954	Improvement in tellurians.
Joseph Monaghan	do	122047	Improvement in pen and pencil cases.
Charles M. O'Hara	do	123288	Improvement in paper-files.
John Peard	do	124152	Improvement in inkstands.
John G. Roth	do	119885	Improvement in chimney-cowls.
Walter Shriver	do	123584	Improvement in copying-presses.
Jas. W. Tallmadge	do	122867	Improvement in ink-erasers.
Jerome L. Tarbox	do	126501	Improvement in marking-pots.
Arthur Von Briesen	do	121026	Improvement in writing-apparatus for the blind.
John Long and Eugene Convers.	Oswego, N. Y	117090	Improvement in school-desks.
Teile H. Müller	Yonkers, N. Y	124374	Improvement in rubber erasers.
Do	do	126224	Improvement in attaching rubber erasers to lead-pencils.
Do	do	126980	Improvement in lead-pencils.
Do	do	127633	Improvement in lead-pencils.
Do	do	122904	Improvement in vulcanized rubber pencil-mark erasers.
David E. Morgan	Cincinnati, Ohio	122957	Improvement in book-supports.
Theodore H. Lee	do	125580	Improvement in suspension-clips.
Reinhold Lanstrom	do	117084	Improvement in composition steatite-pencils.
Seth C. Catlin	Cleveland, Ohio	121233	Improvement in sponge-cups.
William M. Brooke	Eaton, Ohio	122221	Improvement in school-desks.
Junius F. Whiting and Elam Fisher.	do	118765	Improvement in school desks and seats.
George C. Smith	Hamilton, Ohio	128256	Improvement in slate-frames.
Ferdinand Soehner	do	125763	Improvement in implements for ruling slates.
Levi M. Knisely	New Philadelphia, O.	123263	Improvement in fountain pens.
John A. Shannon	Perrysburgh, Ohio	121671	Improvement in paper-files.
Marcellus F. Cowdery	Sandusky, Ohio	123456	Improvement in blackboards.
Do	do	123457	Improvement in blackboards.
A. Ogden Huffman	Springfield, Ohio	117633	Improvement in school-desks.
Alex. W. Brinkerhoff	Upper Sandusky, O	126514	Improvement in inkstands.
Thomas Gregg	Danville, Pa	119515	Improvement in joints for school-desks, &c.
Henry M. Clay	Easton, Pa	120039	Improvement in slate-frames.
Jerome W. Wetmore	Erie, Pa	126659	Improvement in desk paper-cutters.
Samuel M. Davis and Charles P. Elliott.	Norristown, Pa	121996	Improvement in pencil-sharpeners.
Thomas M. Davis	Philadelphia, Pa	123460	Improvement in fountain-pens.
Freeman D'Ossone	do	119332	Improvement in slates.
Charles McIlvaine	do	117314	Improvement in copying-inks for ruling and printing.
Do	do	117313	Improvement in printers' ink.
Herman A. Oesterle	do	121191	Improvement in portable book-holders.
Isaac Newton Pierce	do	121543	Improvement in school-desks.
Henry J. Asthalter	Pittsburgh, Pa	120227	Improvement in paper-files.
Edw. A. Franklin	Brenham, Tex	127472	Improvement in paper-clips.
Lawson P. Keech	Washington, D. C	124961	Improvement in paper-files.
Thos. J. W. Robertson	do	4675	Improvement in hand-stamps.
Charles W. Seaton	do	127435	Improvement in tabulating devices.
Eldridge J. Smith and Benj. H. Cheever.	do	4864	Improvement in paper-files.
Edward H. Thompson	do	118757	Improvement in paper-files.
William C. Tilden	do	126348	Improvement in inkstands.
Lewis Cohn	Montreal, Canada	121993	Improvement in paper-files.
John Fenson	Toronto, Canada	116824	Improvement in copying-presses.

* It would appear that some assistant marshals committed the fault of returning as illiterate the Chinese who could not write English, although they were able to read and write their own language.

TABLE E.—*From the United States Census of* 1870, *showing for each State and Territory the population and number of illiterates at various ages, and the percentage of illiteracy to population of corresponding age.*

[NOTE.—The columns in this table marked * * * were computed and inserted by the United States Bureau of Education.]

	State.	Total population, 10 and over.			Illiterates, 10 and over.			Per cent. of illiterates, 10 and over, to total population of same age.			Poeulation, 10–21.		
		Total.	Male.	Female.	Total.	Male.	Female.	Total.	Male.	Female.	Total.	Male.	Female.

TABLE F.—PART I.—*From the United States Census of 1870, showing for each State and Territory the number of universities, of colleges, of academies, and of schools of law, the number and sex of instructors and pupils, and the income from various sources.*

[NOTE.—Each university has been treated as a group of classical and professional or technical schools. Its statistics have been twice inserted: once in parts distributed among such special schools, and included in the totals of "all classes;" again, in entirety, under "universities," the figures not being included in such totals.]

a Income included in that of "other public schools." *b* Statistics included in "other public schools."

c The public school law of Mississippi was passed in June, 1870. The public funds given to the private schools would seem to be on account of the tuition of indigent pupils under the provisions of the law relative to the Chickasaw school fund.

d Includes 1 State reform school with 10 male teachers, 150 male pupils, and $25,000 income from public funds.

e Includes 1 State reform school with 1 male and 1 female teacher, 129 male pupils, and $6,132 income from public funds.
