REPORT.

DEPARTMENT OF THE INTERIOR, BUREAU OF EDUCATION,
Washington, D. C., November 15, 1873.

SIR: I have the honor to submit my fourth annual report. The disasters which have fallen upon the finances and industries in portions of the country have, in some instances, embarrassed the progress of education by delaying the payment of teachers and by depriving many poor children of the opportunity of attending school; but, on the whole, the year has been one of substantial progress in this important interest. Especially is this true as respects the work assigned this Office.

The facts now ready for use present, as respects amount, definiteness, and freshness, a striking contrast to the condition of educational information when my first report was commenced, in 1870.

Doubtless we cannot expect that the result of efforts in this direction for any year will be wholly satisfactory until every child is brought under the influence of elementary instruction and there is a sufficient number of youth in the secondary, superior, and special grades of training to assure the progress of the Republic in the improvement of all its vast opportunities.

At present, however, these facts cannot be fully, accurately, and promptly collated; yet any report of them must carry with it a certain useful impression, as it reveals the extent of ignorance that prevails in quarters and the evils that flow from it to individuals, society, and the state. It is of interest to the sailor to know whether his chart and his observations enable him to compute accurately his position and bearings. It is of no less consequence to the patriot to know whether his country is responding to the necessary conditions of growth and perpetuity. This he can never know if he leaves out of view what is transpiring with the rising generation. He may compare the facts relating to the material condition of his country with those respecting other nationalities, and may find them flattering to his pride; and yet, if he has not taken into consideration the educational factors—the efforts for the culture of the young—and their effects, and the other facts which may be definitely known, showing whether ignorance or intelligence, vice or virtue, crime or justice, honesty or dishonesty, are on the increase, he has left out the one element most essential to a correct conclusion.

Commerce, industry, legislation, and administration would go back towards barbarism, if the care of the young were neglected for a single generation. The lack of these data for our whole country has for a long period been a standing complaint among students of American civilization. No officer could make satisfactory replies to foreign inquiries. No statesman could find facts for the formation of his opinions or the guidance of his conduct. There was much pompous boasting of American intelligence, but nobody could exactly describe it.

The most eminent investigators in this field had confessed their embarrassment. The demand for something comprehensive and complete was increasing from every quarter and every interest. Leading minds in other countries, as they saw the restored Union rise above the commotions which had been thought by monarchists certainly fatal to it and to republicanism, more universally accepted education as the primal cause of national safety as well as of national progress and in this belief came here to study it anew. At the same time the transition through which our own society was passing, especially in those sections where slavery had been abolished, increased the public solicitude in this direction. The desire for information was not satisfied with the

opinions of the most eminent educators, nor with local experiences, records, and statistics, nor with the widest theoretical generalization.

Almost every one who endeavored to understand the diverse facts in connection with education in this country complained of the lack of a general summary. Great and noble efforts had been made to supply this desideratum; particular features, methods, or systems had been examined; some very valuable special statements had been published; but there was no report for my guidance. There was not anywhere in existence any complete list of colleges, academies, or high schools; there was no summary of the work accomplished by the several State- and city-systems. Forty years ago, Jared Sparks had sought to make out a list of colleges, to show the annual work done by them; thirty-five years ago, Dr. Henry Barnard secured the insertion of some inquiries respecting the intelligence of the people in the schedules of the census; yet, in 1870, when engaged on my first report, I was told by persons of great intelligence that they considered the reports of Dr. Fraser and M. Hippeau the best to be found on the subject of American education. The preparation of the report for that year was like cutting a path through an untrodden forest.

The law indeed required this Office to collect such statistics and facts as would show the condition and progress of education in the several States and Territories; but it will be readily seen that under these requirements many serious questions arose as to how the collection should be made and what class of facts and statistics should be included. I could not divest my mind of that comprehensive conception of education suggested by a most eminent philosopher, who declared that "education, in its larger sense, is one of the most inexhaustible of all topics. Though there is hardly any subject on which so much has been written, by so many of the wisest men, it is as fresh to them who come to it with a fresh mind, a mind not hopelessly filled with other people's conclusions, as it was to the first explorer of it; and, notwithstanding the great mass of excellent things which have been said respecting it, no thoughtful person finds any lack of things, both great and small, still waiting to be said or waiting to be developed and followed out to their consequences. Education, moreover, is one of the subjects which most essentially require to be considered by various minds and from a variety of points of view; for, of all many-sided subjects, it is the one which has the greatest number of sides. Not only does it include whatever we do for ourselves and whatever is done for us by others, for the express purpose of bringing us somewhat nearer to the perfection of our nature; it does more; in its largest acceptation, it comprehends even the indirect effects produced on character and on the human faculties by things of which the direct purposes are quite different: by laws, by forms of government, by the industrial arts, by modes of social life; nay, even by physical facts not dependent on human will: by climate, soil, and local position. Whatever helps to shape the human being—to make the individual what he is or hinder him from being what he is not—is part of his education."*

I decided that it would be inadmissible to treat in a national Office education in any partial or limited sense of the word and that it was proper to seek first those results least liable to future modification. In carrying out this purpose, it seemed to me that certain limitations were absolutely essential for the proper conduct of the Office, and I have endeavored to have them ever present for the guidance of whatever was undertaken in it. I felt that a work coming into so close relations to the instrumentalities for the training of the youth of the nation should regard most scrupulously all the great principles on which depends the perpetuity of our institutions and of the spirit which leads and assures the progress of our civilization, such as that sacred privacy and responsibility of individuals and localities and institutions, in which none should intermeddle.

Resolving that no effort of the Office should with my consent infringe this freedom, I saw, or seemed to myself to see, in the facts and experiences which each institution,

*Address on "Literary and scientific education," by J. Stuart Mill, delivered at the University of St. Andrews, February 1, 1867

system, or educator thought it desirable to make public, either for self-benefit or the good of others, an ample field for the collation of results which would be most useful for all to know.

SOURCES OF MATERIAL.

It has been found impossible to give credit to each source of information from which the first portion of the appendix to this report was compiled.

Every State now, except Delaware, makes some kind of periodical report on education. These and other official reports are, of course, our first sources of information and are formally credited. It would, doubtless, be well if every State- and territorial report included all the items mentioned in our abstracts; but in many instances they do not. In regard to several States, no summary of information similar to those given in the appendix can be found; though brief, they require great labor in preparation and are made as comprehensive as possible. In comparing the abstracts of this year in detail with those of 1870, great differences will be recognized. It will be noticed that the amount of information drawn from city-reports, which is not contained in State-reports, is increasing year by year. The practice of permitting a municipal school-system to be in action for several years, without the publication of complete reports for the information of the people, is becoming less and less common.

In addition to these sources of information there are very many facts communicated directly to this Office by letters from State-, city-, and county-superintendents, members of boards of education, teachers, and by the heads of the different institutions for superior, secondary, professional, or special instruction. Moreover, the tabulated summaries in regard to superior, secondary, and professional instruction, which will be found in the abstracts, are drawn from returns made by these institutions directly to this Office, and the information will be found in full in the tables at the end of the appendix. These tables are brought up as closely as possible to the date when the report passes through the hands of the printer.*

In order that the increased value of the statistical portion of the present report over that of past years may be more clearly understood, the number of institutions, instructors, and students reported in several tables in the reports for 1870, 1871, and 1872, and in the appendix to this volume, have been brought together in the following statistical summary to present to the eye the growth of this material in a single view, as follows:

* In my last report there was an effort made to describe the condition of educational reports and information in the country: what the officers of the State- and city-systems and institutions knew about their condition and were able to include in their reports. This some writers interpreted to mean a disinclination on the part of educational officers to report to a central national Office; but the fact is that none are so well aware of these deficiencies as the superintendents and officers themselves, and none are more earnest or determined to correct them; and as for readiness to report to this Bureau and to render it any assistance in gathering information, the greatest willingness and kindness have been manifested by every State-, county-, and city-, or town-school-officer, from the highest to the lowest, without exception. The summary then presented, so surprising to many, was only the gathering-up in a single statement of certain deficiencies, which all efforts had so far failed to remedy, and was done solely as a means of awakening more general convictions of the necessity of, and arousing the public mind to, greater efforts in this direction. It will be impossible to find better appreciation of these efforts than is presented in the general improvement of these reports

* Previously included in the academies; so that the real increase of these is as follows: 219 institutions, 1,247 teachers, and 32,128 pupils.

† Including schools of pharmacy and dentistry.

As these reports go on improving in completeness and accuracy, it is easily seen how changes, whether indicating loss or gain, for the whole country, will readily appear.

I am assured by officers of different systems and institutions of education that, during the four years these collections have been in progress, their methods of keeping records have become much improved and that their knowledge of the history of their own experiences has greatly increased. The publication of educational statistics in journals and newspapers has also very manifestly increased.

There is a danger of setting a wrong value on these statistics, against which all especially familiar with work in this direction are likely to be on guard. It has been our aim always neither to overestimate nor to undervalue the exact lessons of these statistics. Equal care must be exercised in using figures in commerce or geography.

Scientific men are well aware how difficult it has been to agree upon the exact heights of mountains. A writer of a recent English work on navigation is only just now prepared to agree that the longitude of the Capitol at Washington and of the observatory at Cambridge, after decades of most accurate observation, can be taken as settled with sufficient accuracy for the use of sailors. With much less time for observation, we are rapidly approaching a condition of educational statistics in which we may, and with equal safety, trust our efforts to calculate the bearings of the movements in our systems and methods. Social science in this country and elsewhere is attracting increased attention. Its discussions and publications so far are largely speculative, and yet have been useful in arousing and directing public attention. Already here and there the necessary basis of fact is appearing. A greater effort on the part of those appreciating the value of this science to secure proper record by civil government in its various organizations—municipal, State, and national—would, doubtless, hasten the attainment of accurate and trustworthy results.*

Clearly, individual observation is not sufficient; government or the civil organization alone has the instrumentalities and the power to obtain such record of facts that the report of them from year to year and month to month may form solid ground upon which to rear beneficial theories in regard to health, disease, political economy, education, &c. In no department of social science perhaps are the records so far advanced as in that of education. The day is rapidly passing away when mere statement of opinion will suffice, however eminent the author. Generally, in the past, even since the revival of education in the generation now passing away, the declaration of an eminent educator would pass unchallenged as an argument. Now, its weight is determined by the array of facts with which it can be found to tally. We are told that the word "philosophy" and its cognates do not occur in Homer or Hesiod. They used a word which implied that the individual to which it referred was distinguished from the mass of men by some kind of art or skill. The growth of human history alone renders possible that accumulation of facts upon which great generalizations may be based. Bacon's method has greatly quickened the use of facts in all reasoning for the guidance of human conduct, individual or civil. The spirit of the times clearly points to educators, a class of intelligent observers, as leaders in this department of science. The process of scientific elimination may be slow, but in the United States there is great encouragement. The field is wide, our great freedom affords the largest room for diverse methods, and thus for the most varied experience and application of tests. It is the conviction that this Office is for the benefit of all in recording the observations and comparing the deductions made by individuals in their various localities and under various conditions, which is really the secret of the great harmony existing between it and all the great active educational forces in the country.

TABLE I.—STATE-SYSTEMS OF PUBLIC INSTRUCTION.

I have alluded to the growing interest in educational statistics and to the progress of this Office, year by year, towards greater completeness in the statistics presented in its annual reports. The comparative statement for the years 1871, 1872, and 1873 following will show what success has attended its efforts to give a full exhibit of the public-school-systems of the several States and Territories:

* The following letter, said to have been received by Mr. Layard, the eastern explorer, from a Mohammedan official, whom he had asked for some statistics of the city in which he lived, well illustrates the spirit of a civilization opposed to our own, too much of which spirit exists among us:

"MY ILLUSTRIOUS FRIEND AND JOY OF MY LIVER: The thing you ask of me is both difficult and useless. Although I have passed all my days in this place, I have neither counted the houses, nor have I inquired into the number of inhabitants; and as to what one person loads on his mules and the other stows away in the bottom of his ship, this is no business of mine. But, above all, as to the previous history of this city, God only knows the amount of dirt and confusion that the infidels may have eaten before the coming of the sword of Islam. It were unprofitable for us to inquire into it. O my soul! O my lamb! Seek not after the things which concern thee not. Thou comest unto us, and we welcome thee. Go in peace."

In 1871, information respecting the school-population of only twenty-nine States could be obtained from school-officers; in 1872, thirty-seven States and seven Territories reported this item, and in the present year (1873) thirty-seven States and eleven Territories give a pretty accurate statement of their school-population. In 1871, twenty-eight States reported the children enrolled in the public schools; in 1873, thirty-five States and ten Territories; in 1871, twenty-five States reported the average attendance of enrolled pupils; in 1873, thirty-one States and five Territories. The number able to report pupils in private elementary schools has increased from fourteen States, in 1871, to twenty-two States and five Territories, in 1873. In 1871, thirty States reported their public-school-income; in 1873, thirty-five States and ten Territories; in 1871, twenty-four States reported total expenditure for public schools; and, in 1873, thirty-six States and ten Territories.

It was sought in the inquiries sent out this year to the State-superintendents of public instruction to elicit the approximate number of persons in the several States and Territories between 6 and 16 years of age, included in the school-censuses. So long as the present diversity of ages in the enumeration prevails, no very trustworthy comparative estimates can be made of the relative effectiveness of our school-systems. Only six States could respond to the inquiry, viz: Connecticut, Florida, and Wisconsin, giving the number under 6 years of age and the number over 16 in the enumeration; Minnesota, Missouri, and Ohio, the number over 16 years of age. It is believed, however, that school-officers of all the States recognize the importance of a census which shall be substantially uniform in respect to the ages embraced therein, so far as necessary for purposes of comparison, and that measures will soon be taken to secure it.*

The following table shows the ages enumerated in the school-censuses:

States and Territories.	School-age.	States and Territories.	School-age.
Rhode Island	4-15	Missouri	5-21
Connecticut	4-16	Nebraska	5-21
Utah	4-16	New York	5-21
Oregon	4-20	Virginia	5-21
Wisconsin	4-20	Colorado	5-21
Florida	4-21	Dakota	5-21
Maine	4-21	Idaho	5-21
New Hampshire	4-21	South Carolina	6-16
Montana	4-21	Indian	6-16
Washington	4-21	District of Columbia	6-17
California	5-15	Georgia	6-18
Massachusetts	5-15	Nevada	6-18
New Jersey	5-18	Tennessee	6-18
Maryland	5-20	Texas	6-18
Michigan	5-20	Kentucky	6-20
Vermont	5-20	Illinois	6-21
Wyoming	5-20	Indiana	6-21
Alabama	5-21	Louisiana	6-21
Arkansas	5-21	North Carolina	6-21
Delaware	5-21	Ohio	6-21
Iowa	5-21	Pennsylvania	6-21
Kansas	5-21	West Virginia	6-21
Minnesota	5-21	Arizona	6-21
Mississippi	5-21	New Mexico	(†)

* On page xxvi of my report for 1872, I observed as follows: "It is not necessary, of course, that the legal school-age in any two States or cities should be the same for this purpose. If it should be agreed by city- or State-officers to report all persons between the ages of 6 and 16, inclusive, and then by years whatever number there might be below 6 to the lowest limit of school-age, and the number by years of those above 16 to the upper limit of school-age, and following the same principle in regard to enrollment and average, all of the conditions necessary for purposes of comparison would be secured."

† Not reported

Arkansas, Oregon, and Wyoming do not report pupils enrolled in public schools. Delaware, Kentucky, Nebraska, South Carolina, Tennessee, Arizona, Dakota, New Mexico, and Wyoming do not report average daily attendance of pupils. Arkansas, Minnesota, Nevada, and Arizona do not report number of public schools. Alabama, Maryland, Tennessee, Arizona, Dakota, Idaho, and New Mexico do not report duration of schools in days. Alabama, Arkansas, Delaware, Indiana, Kansas, Kentucky, Maine, Maryland, North Carolina, South Carolina, Tennessee, Texas, Vermont, Virginia, West Virginia, Dakota, Idaho, New Mexico, Utah, and Washington do not report the number of pupils in private schools corresponding in grade with the public schools. Delaware, Georgia, Arizona, Dakota, Idaho, Washington, and Wyoming do not report the number of teachers in the public schools. Delaware, Georgia, Indiana, Kentucky, Vermont, Idaho, New Mexico, and Washington do not report the average monthly salary of teachers.

Alabama, Delaware, Georgia, Kentucky, Nevada, Oregon, Tennessee, West Virginia, Dakota, Montana, New Mexico, Washington, and Wyoming do not specifically report expenditure for sites and buildings. Alabama, Delaware, Georgia, Kansas, Kentucky, Nevada, New Hampshire, Tennessee, Dakota, District of Columbia, Montana, New Mexico, and Wyoming do not specifically report the expenditure for salaries of teachers. Tennessee and Wyoming do not report total expenditure for schools. Alabama, Delaware, Georgia, Louisiana, Pennsylvania, South Carolina, Tennessee, and Vermont do not report amount of school-fund. Colorado is the only Territory reporting a school-fund.

The following is a statement of the amount expended in the several States and Territories, (1873,) *per capita* of population of legal school-age, and also the expense *per capita* of the estimated population between the ages of 6 and 16. I estimate the population between these ages at 10,103,115, for the thirty-seven States, and 114,710, for the eleven Territories, reporting their scholastic population. It will be observed that the column "estimated expenditure *per capita* of population between 6 and 16 years old," presents a uniform standard of comparison and brings out more strikingly the actual differences between the educational efforts of the respective States.

Statistical summary of public-school-expenditure in the several States and Territories per capita of legal school age and per capita of population between 6 and 16.

States and Territories.	*Per capita* of school-population, (State enumeration.)	*Per capita* of population between 6 and 16, (estimated.)	States and Territories.	*Per capita* of school-population, (State enumeration.)	*Per capita* of population between 6 and 16, (estimated.)

Oregon	47 54	43 70			

SUMMARY OF EDUCATIONAL CONDITION IN THE STATES FOR 1873.—SOUTHERN STATES.

In Alabama, the board of education has labored under great embarrassment, from the difficulty of securing from an impoverished people the needful funds for the support of free schools. As a consequence of this, teachers have in many instances had to wait months for the payment of salaries due them, and a large number of the free schools in country-districts have been closed.

In the large towns, aid from the Peabody fund and the American Missionary Association has kept schools still in successful operation. The lack of funds has of course affected the high schools under the State-system, but a promising State normal school has been established ; the University and State Agricultural College have continued operations and the condition of the Institution for the Deaf and Dumb and Blind appears to have improved.

Arkansas has labored under the same embarrassment as Alabama with respect to funds. The State-certificates, with which taxes and teachers have been too generally paid, having fallen to less than half their face-value, school-sessions have had to be cut down to three months, and teachers, unable to secure even half their salaries, have very often abandoned the profession or left the State. Fifteen towns have, however, organized town-school-systems, under a special act, and in these, the schools "are believed to be doing reasonably well." Interest in the public-school-system seems to increase among the people; the new Industrial University is so well advanced as to give promise of improvement in superior education, the State-institutes for the blind and for deaf mutes continue to give good instruction in their special lines, and measures are on foot to give greater advantages for education to the colored people.

Louisiana has struggled through the year under kindred financial troubles with the two neighboring States just named, and as, by an unfortunate change in the school-law of Texas, the public-school-system in that State has been almost broken up, the outlook for education in the Southwest is not encouraging, except in Mississippi, where opposition to the free-school-system seems to have greatly diminished, where popular interest in it has obviously much increased, where facilities for normal and secondary

education are enlarging, and where, in the State University and State-School for the Deaf and Dumb, superior and special training shows signs of advancing thoroughness.

The new State-superintendent of instruction in Florida reports an increase of 56 schools in 1873, making, with 113 added in 1872, an addition of 169 to the 331 previously existent. The increase of attendance in two years has been 4,000, while reports from leading schools indicate an advance in methods of instruction as well as in results. A site for the State Agricultural College has at last been agreed upon in Alachua County, (including 20,000 acres,) and $50,000 cash secured by that location, a fair course of collegiate study mapped out by the trustees, and steps towards the organization of a corps of instructors taken. The laying of foundations for a university for colored students is another mark of progress here.

Georgia, after a cessation of public-school-teaching for a year, (except in certain towns,) has again set her schools in operation, and an earnest superintendent is doing obviously his best to make the new effort a success. In the larger towns, school-systems including all grades have been established, with normal classes every Saturday for the whole body of teachers in each town; 109 academies and high schools report generally fair courses for secondary education; and an effort is on foot to unify throughout the State the whole system of superior instruction by a compact between the university and the colleges.

South Carolina, in spite of great discouragements, shows an increase of 98 free schools and 147 new school-houses over 1872, with an additional school-attendance of 7,431 and an additional expenditure of $113,981.37 for public schools, while her university has been made practically free to all by the remission of professorial fees and room-rent.

North Carolina, though embarrassed by a poor school-law and by restrictions on local taxation for school-purposes, has increased by about 74 per cent. her receipts for free schools and by about 190 per cent. the attendance on them.

Kentucky, hampered by financial trials, has friends of education who have pressed forward, under an energetic superintendent, amending her school-law, advancing the qualifications of her teachers, improving her school-houses, and taking steps towards a general education of her colored population. "With rare exceptions," says the State-report, "the reports from different counties present evidences of an educational revival pervading almost every section of the State."

In Virginia, though there has been a slight falling-off in receipts and expenditures for school-purposes, as well as in enrollment and average attendance, there are 501 new schools, while a great number of school-houses built during the year and a large increase in the value of school-property combine with the declarations of both political parties in the last canvass to show that the purpose of the people is to build up the public-school-system solidly and permanently. Institutions for secondary instruction are numerous throughout the State; provision for scientific training has been made in the new agricultural colleges and the State Military Institute; and, through the fostering influence of two universities and six colleges, superior education is so well advanced that, in proportion to population, Virginia compares favorably with any of the States as respects the number of students in college.

The returns from Tennessee are imperfect, but enough appears to indicate that the organization of the State-system has gone steadily forward under the direction of the superintendent, receiving deservedly the support of the State Teachers' Association and friends of education generally, and the almost unanimous aid of the newspaper-press. All the embarrassments appear to be yielding; in some counties, to be sure, slowly and reluctantly. That greatest difficulty, lack of means, and the consequent depreciation of teachers' orders for pay, appears to be approaching a termination. The effect of the Peabody aid, bestowed through Dr. Sears, in Tennessee, has been particularly conspicuous, and this hardly less in the results of his addresses than from the money bestowed. The attention of the whole South has been turned to Tennessee by the establishment during the year of the Vanderbilt University at Nashville and of the Methodist Episco-

pal University at Knoxville, intended to be institutions representing respectively the great religious interests of the two branches of the Methodist Church in the South and to receive their support.*

MIDDLE AND NORTHERN STATES.

In the States north of the Potomac and East of the great lakes, the condition of educational interests has much in it that is encouraging, with but one marked exception.

Maryland, *e. g.*, has lengthened her school-year 16 days; expended for teachers' salaries $14,000 more than in 1872; for school-houses $7,000 more, and for general school-purposes $97,083 more; at the same time adding 12,198 to her school-enrollment and making fair beginnings in an effort to give her colored children equal advantages for education with the whites.† The feeling in favor of public schools is reported to be "more unanimous and decided than at any previous time," and a serious defect in the working of the free system in the State has been amended by the establishment of several new high schools, the change of several pay-academies into public high schools, and the elevation of many graded schools to such a pitch as promises to make them high schools before long.

Delaware still remains without any State-supervision of schools, and in her two lower counties some improvement is observable. In Wilmington, her chief town, a well-organized school-board reports 1 new school-house, 300 additional sittings for pupils, an increase of 6 teachers, and considerable improvement in methods of instruction and provision for the education of colored children. There is no provision in the State-law for the education of these children.

Pennsylvania shows an increase of 22 school-districts, of 306 schools, of 309 more graded schools, of 721 teachers, and of 6 days in the average duration of her school-term, with an aggregate of school-property estimated at $21,750,209 and a total expenditure, for school-purposes, of $8,812,969.25. A large new normal school, with capacity for boarding 300 pupils and instructing 800, has been added to the 6 previously existent, and 3 more are in progress. Numerous institutions for secondary instruction report nearly 9,000 pupils, and full returns would probably largely increase this number. The State-college of agriculture is reported to have much improved and at least 3 of her 17 universities and colleges have much enlarged their means for imparting a high order of instruction. Lehigh University has been enabled, by its generous founder, to make instruction free.

New Jersey reports 83 new school-houses, with great improvement in the condition of the older ones; an increase of 3 days in the average school-term; a liberal advance

* Two institutions, the Normal Institute, located at Marysville, and Fisk University, at Nashville, have received considerable aid from English friends.

A large addition to the means of educating the colored people in this State has been made by the jubilee-singers of Fisk University. Prompted and trained by the treasurer of the institution, which was wholly unable to accommodate the multitudes of colored students crowding to it for admission, they set out, two years ago, to raise by concerts the needful funds for buildings which were imperatively demanded. The sweetness of their simple and yet touching melodies immediately awakened interest, while the good cause for which they sang drew towards them hearty sympathy. A tour through the United States secured $40,000 for the university, enabling the trustees to purchase an extensive site and begin the erection of the greatly-needed buildings. To finish these, if possible, they went to England, met with an enthusiastic reception from British audiences, as well as from noble families in the Three Kingdoms, and, through the seconding of such influential men as Mr. Spurgeon, Earl Shaftesbury, Hon. W. E. Gladstone, and others, added about $50,000 to their previous earnings for the cause, a generous member of the Society of Friends adding to this, by individual collections, $1,500 for the purchase of apparatus. They have thus, as one of them said in London, capped American greenbacks with British gold; and, as the result of their efforts, the university has, free from debt, twenty-five acres of land. The foundation of Jubilee Hall, a noble building, is laid, and paid for as far as built, its walls now reaching almost to the roof, while, at the laying of the corner-stone, October 21, 1873, there were on hand, above all current bills, about $6,000 towards the completion of the work.

† Since the above was penned, news has come that the legislature has doubled its appropriation for colored schools, making it $100,000 instead of $50,000, at the same time appropriating $100,000 for a new normal-school-building and making such addition to the annual allowance for it as to enable the principal to devote more time to his superintendence of the State-schools.

in teachers' salaries; $74,244.74 beyond 1872 for building and repairing schools; $233,998.13 beyond, for general school-purposes, and $588,040 beyond, for the estimated value of school-property. In five years nearly $3,000,000 have been expended in this comparatively small State on its public-school-buildings, with at least one-third as much on private academies, scientific schools, and colleges. The new John C. Green School of Science at Princeton, the now well-established Stevens Institute of Technology at Hoboken, and the scientific department of Rutgers College place New Jersey among the most favored of the States in its advantages for scientific training.

New York reports a receipt of $11,556,037.80 for public-school-purposes and an expenditure of $10,416,588 for the same, with a total expenditure of $116,652,930.57 in twelve years past.

Of the grand annual expenditure, nearly $7,000,000 have gone for the salaries of teachers; nearly $2,000,000 for building and improving school-houses; $174,339.23 for supporting eight normal schools, and $7,690.94 for supply of school-instruction to the few Indians in the State. Normal-school-training in New York City has the great additional facility of a new normal-college-building, costing $350,000 and accommodating 1,500 pupils. Secondary instruction has been encouraged by an allowance by the State of $41,746.50 * to 218 academies, in which 6,123 pupils out of 31,421 pursue classical or higher English studies; superior is given by 25 universities and colleges, which number 3,529 students in college-classes proper and 1,507 in preparatory. Professional is provided for in 14 theological, 14 medical, 6 scientific, and 4 law-schools, with 3,507 students.

The Southern New England States present like encouraging statistics:

Connecticut publishes a decade-table, showing that, though the number of children enumerated has increased only 21,257 in ten years, the increase of interest in public schools has been such as to raise the amount secured for them by district-tax from $96,964 ten years ago to $485,523.56 in 1873, that by town-tax from $75,213 in 1864 to $642,194.11 in 1873, and that from all sources to $1,442,669.01 in 1873 against $390,454.20 in 1864.

Rhode Island shows, too, that in 1863 her towns raised nearly $100,000 for the support of schools and that in 1873 the same towns raised over $300,000 for the same purpose, more than three for one, or over 200 per cent. increase; and this, too, without reckoning nearly $200,000 expended in 1873 in the building and repair of school-houses. The increase of schools in the same time was 207; of teachers, 98.

The returns from Massachusetts for 1873 are not complete at the time of preparing this report. Those for the school-year of 1871–'72 show $5,476,927.65 raised by taxation for public schools alone, being $19.39 for each child of school-age (5–15) and $3.76 for each member of the population. If to this be added voluntary contributions, income from trust-funds, legislative appropriations for normal schools, expenses of board of education, tuition paid in private schools, academies, colleges, &c., the secretary thinks the whole amount expended during the year for popular education would reach $6,350,000, or $22.85 for each school-child and $4.36 for each person in the population. The estimated value of school-houses in the State was over $20,000,000 at the close of 1873 against $13,770,069 at the beginning of 1870; 176 high schools and 58 incorporated academies are returned, while in normal, technical, and art-training there has been a great advance,† a new normal school, a new normal art-school, and industrial drawing in all the common schools being the signs of this advance.

* Increased, at a succeeding session of the legislature, to $125,000 for 1873.

† In January, 1874, the executive committee of the Massachusetts board of education addressed to the State-legislature the following memorial in favor of more thorough supervision of the schools:

To the honorable senate and house of representatives in general court convened.

GENTLEMEN: The board of education respectfully represent that the best interests of the public schools of the State require a more extended, intelligent, and critical supervision than at present obtains, and the fostering care of the Commonwealth in various other ways. They pray, therefore, that your honorable bodies will ordain:

1. That the State be districted by the board of education, for the purpose of supplementing the existing State- and municipal supervision of schools.

Maine shows a smaller number enrolled in schools, but a decidedly better average attendance, an increase of $311,129 in the amount raised for school-purposes, a very large addition to the number of its high schools, more vigor in many instances of local action, and a better adjustment of the parts of the State-system, calculated to promote the advance of all the interests of culture.

New Hampshire presents 222 new or newly-repaired school-houses, 44 new schools, 67 additional graded schools, but a diminished average attendance. Of its 227 towns, 96 either failed to report to the State-superintendent or reported lack of interest. "The remaining 131, comprising three-fourths of theschool-population, present reports interesting and encouraging, containing unmistakable evidences of improvement and progress; teachers are approved; the different branches have never been so well taught; elementary drawing and vocal music have been introduced into many schools. Many of the larger towns are considering the question of establishing town high schools." The efforts to establish a normal school deserve special commendation, as well as those seeking to give greater efficiency to agricultural and scientific instruction.

Vermont, reporting biennially, makes no statement as to public schools for 1873; but the reports from institutions for secondary and superior instruction show improvement.

As a rule throughout the New England States, the condition of secondary, scientific, and collegiate instruction appears to be not only fully up to the standard of preceding years, but even in some respects beyond it, the colleges and scientific schools endeavoring to meet the current call for higher culture and the academies and high schools striving to come up to the rising requirements of the colleges.

GREAT LAKE AND NORTHERN MISSISSIPPI STATES.

In all these States, except Ohio, there prevails a nearly uniform school-system, in which county-superintendents, subordinate to a State-superintendent of public instruction, oversee schools graded up from elementary to a respectable secondary training, a State-university crowning the whole with its scientific and classical departments. Illinois has to a certain extent stood apart from the others in this last respect; but the State Industrial University, of great proportions, is putting her substantially in line with them, especially as regards scientific studies. A few statistics will best show the progress of common schools in all these States.

2. That in general each city shall constitute one of such districts and shall appoint and employ at least one superintendent of schools, who shall devote his whole time to the business of his office.

3. That the rest of the State, not included in the cities, be divided into districts containing about two hundred teachers in each.

4. That for such district outside the cities, a district-superintendent or commissioner of schools be appointed by the board of education.

5. That the salaries of the district-superintendents and their powers and duties be determined by the board of education, who shall prescribe rules and regulations for their guidance and the character and form of their reports to the board.

6. That the salaries of the district-superintendents be paid out of the income of the school-fund belonging to the respective districts.

7. That the board of education be authorized to provide, through these superintendents or otherwise, at their discretion, for the examination and certification of candidates for the office of teacher in the various grades of public schools in the State, and that the certificates, thus furnished, and the diplomas of the graduates of the several normal schools may be accepted by the various municipal authorities, when they shall so elect, as a full compliance with law in this respect.

8. That for the purpose of furnishing adequate resources for these various measures, meeting the growing demands of our normal schools, including the normal art-school—lengthening the school-terms in the more sparsely-populated portions of the State and otherwise improving the facilities of such schools, thus recognizing public instruction as a more immediate care of the State and making possible the adoption, from time to time, of such improved methods and instrumentalities as the growing experience of the State shall suggest—the board renew their recommendation of previous years, that a half-mill-tax be laid upon the property of the Commonwealth and that the proceeds thereof be added to the income of the school-fund.

Ohio, for example, having changed the legal school-age from 5 to 21 to 6 to 21, exhibits probably from this cause and greater accuracy in reports, an apparent falling-off in school-population of 81,566, the enrollment in schools differing, however, by only about 4,000 and the average attendance being about the same in 1873 as in 1872. She raised in 1873, for school-purposes, $7,505,603, against $7,420,338 in 1872, an increase of $285,265, and expended on school-sites and buildings $1,437,655.

Michigan, with about half the population of Ohio, raised, for school-purposes, in 1873 $3,939,528, against $3,563,479 in 1872. Her expenditures for sites and buildings in 1873 were $597,006. The condition of the public schools is reported to have much improved under county-supervision, and graduates from inspected and approved high schools are now received without further examination into the freshman-class of the State-university, which rejoices in a grand new central building costing $125,000 and in a body of students numbering about 1,200.

Indiana, without giving full statistics for 1873, claims a net increase of school-revenue amounting to $165,581 over 1872, with 465 new school-houses, built at a cost of $872,900. As respects general condition, the superintendent writes: "Almost every department of our school-system indicates progress during the past year. The permanent school-fund has been augmented and more than the usual amount raised by taxation. The school-houses erected have been more substantial and more accordant with architectural taste. The schools have been better attended, graded, and organized. The teachers have been better qualified and better paid. The average length of schools, too, has been increased nearly a month."*

Illinois shows a school-population larger by 27,135 than in 1872, a smaller enrollment in schools, but an average attendance about the same. Her school-revenue, $9,259,441, has been $1,759,319 beyond that of the preceding year. For sites and buildings she has expended $952,075 and for repairs $454,846, making a total of $1,406,921.

Wisconsin has only about half the school-population of Illinois and a smaller proportionate enrollment in schools, perhaps due to the greater breadth of her waste places. Still, for a comparatively new State, without the aid of large and wealthy cities, she has raised for school-purposes $2,628,027 and expended for repair of school-houses $307,934. The retiring State-superintendent, Rev. Dr. Fallows, says: "Substantial progress has been made in every department of educational work."

Minnesota, out of 196,075 children scattered over her great surface, shows the fair proportion of 124,583 enrolled in her free schools, with about 3,358 more in pay-schools. During the year past, 228 new school-houses have been erected, at a cost of $203,311. A city-school, at St. Paul, built in the same year, cost $45,000. The quality and aspect of school-buildings, too, have been improved, and 284 additional winter-schools have been maintained, in spite of the terrible severity of winter-weather in this region. The State has three normal schools and a university now well established, besides two colleges.

Iowa reports $4,519,688 raised to instruct a school-population numbering 491,344, of whom 347,572 are enrolled in public schools and 12,132 in private ones. The sum of $1,163,954 has been expended in this State in the erection of new school-houses and supply of libraries and apparatus. This makes the amount devoted to educational purposes upwards of $3 for each inhabitant and upwards of $10 for each child enrolled in school. The number of school-buildings has been increased by 1,246 in two years past; the value of them, allowing for deteriorations, by $1,391,308; and the value of school-apparatus by $122,337. The average attendance on public schools is 83 per cent. greater than ten years ago, exceeding considerably the increase of school-population and showing that to make schools attract pupils the way is to spend enough on them to make them good.

MISSOURI RIVER STATES.

The system in these States is essentially the same as throughout the Northwest: a

* Substantially the same arrangement as in Michigan respecting the admission of high-school-graduates to the university has been made here, but with slighter guards on it.

State-university, waiting to receive the graduates of graded and high schools, with State- and county-superintendents in all cases.

In Missouri, the oldest and greatest of these States, the enrollment in public schools is 389,956, out of 673,493 children of school-age, and the amount raised for the support of schools is $1,790,314. It has, however, six schools for training teachers, one of which is for colored pupils.

Kansas, still comparatively new, has 121,690 in her schools, out of a school-population reaching only 184,957, and has devoted to the education of this number $1,863,098, with $515,071 for school-building and repairs, the increase of school-houses for 1873 being 696 and that of enrollment in them 15,027. There are three State normal schools. Its agricultural college and State-university appear to be both in good condition.

Nebraska, with a school-population of 63,108, has on her school-rolls 37,872 and has raised for school-purposes $798,660. Nebraska has, too, a flourishing normal school at Peru.

STATES ON THE PACIFIC SLOPE.

Nevada still struggles with the difficulties incident to a vast surface and a small and scattered population busy with mining, which tempts many from the schools; she returns 5,675 children of school-age and in her 76 schools 3,478. Her State-university is to be at Elko, provided the citizens there secure it 20 acres and a building to cost not less than $10,000, furnished for the accommodation of 100 pupils.

Educational activity in Oregon has been very greatly stimulated during this the first year of the service of the State-superintendent. The establishment of graded-school-systems in the towns has not advanced as rapidly as could be desired; and, although superior instruction is receiving increased attention, the number of young persons prepared to take a full collegiate and professional course of instruction is not so great as might be reasonably expected. This, it is hoped, the general improvement of the educational system and sentiment will speedily remedy.

The schools of the city of Portland and of the county of which it is the seat still hold their position at the head of the system in the State.*

Five colleges, inclusive of the State Agricultural College, report 763 preparatory students and 298 collegiate. The building for the State-university at Eugene is in course of erection.

California, new as she still is, justifies the general sense of her importance by reporting a school-population of 141,610 and a school-enrollment of 107,593, her school-revenue reaching $2,551,799, or about $23.70 for each enrolled child. Clear evidence of popular favor towards her public schools comes in the fact that within eight years 15,294 children have been transferred from private schools to them. And yet ample room remains for great private schools, one reporting 400 pupils, another 300, a third 258, while upwards of 6,000 attend about 80 pay-schools in San Francisco. Twelve denominational colleges show an aggregate of 838 preparatory students and 545 collegiate, while the State-university at Berkely, near Oakland, gives promise of affording high advantages for superior instruction.

THE TERRITORIES.

For the first time reports, more or less complete, have been received from all the Territories. The exhibition is encouraging, evincing desire for educational advantages and efforts to secure them, even where present circumstances are unfavorable. In three of the Territories the influences of pre-existent institutions have somewhat

* Of all the reports of the county-superintendents, those of Mr. Eliot, of Portland, are the most valuable. We are under obligation to Hon. S. C. Simpson for special efforts to furnish this Office the latest information in regard to the progress of education in the State. We are also under obligation to Rev. George H. Atkinson, D.D., of Portland, for valuable facts in regard to the progress of education in Oregon and the Territories of Washington and Idaho.

obstructed the introduction of free schools; and in all the Rocky Mountain and west-coast-regions extent of area and scantiness of population have made general education very difficult. But in the former instances, persistent effort has removed many obstacles and in the latter the difficulty has been lessened by the tendency of population to settle around certain centers; so that now a system of free schools forms the rule, instead of the exception, in the Territories.

Excluding Alaska, the returns from which are narrative rather than statistical, the Territories give an aggregate of 69,638 children in the schools and of $838,826 for the instruction of them.

The District of Columbia stands first among the Territories as respects the number enrolled as scholars, 16,770; Utah comes next in this respect, reporting 15,839; while in the amount raised for educational purposes Colorado heads the list, her school-revenue, for a school-enrollment of 7,456, being $257,557, against $220,514 in the District of Columbia.

The most striking progress is presented in New Mexico. It will be remembered that in 1867 the question of the establishment of common schools in the Territory was submitted to a vote of the population, and received 37 ayes and 5,016 noes. The correspondence between the citizens of the Territory and this Office has been full of interest, and the appendix of this report shows the gratifying fact that the Territory is able to report 5,304 scholars in the schools.

CONFIRMATION OF PUBLIC HIGH SCHOOLS.

These institutions come each year into greater prominence. In many of the States they form the recognized and legal link between the grammar-schools and universities. In many more they are rapidly assuming that work of preparation for university- and college-training which has been wont to be performed by pay-academies. And that in the year past they have been doing noble service in completing, for ordinary business-purposes, the education given in the lower schools, as well as in preparing many students for the colleges, is obvious from the returns received at this Bureau. But in some parts of the Northwest the question of the right of States to carry free education into the high schools has been considerably agitated, and in Illinois and Michigan no little opposition to the exercise of such a right has been displayed.

In Michigan this opposition has based itself mainly on the asserted illegality of high schools, the law in terms appearing to make no provision for any but elementary and university-education. It has hence been argued that, at the point where primary training ends, the university and its branches must take up the work, and that out of its funds only, or out of these with some aid from pay-pupils—not out of the taxes for common schools—should come the means for sustaining secondary education. But as this, with partial local taxation for high schools, had been once tried and found impracticable, and as the funds allowed the university were barely sufficient for its expanding higher work, there was at one time obvious danger that the high-school-link between elementary and superior training might be broken and secondary instruction be relegated to the pay-academies again. The matter was eventually referred to the supreme court of the State; and its decision, recently pronounced, is that high schools form a proper part of the educational system under the law.

In Illinois the opposition to these schools was based upon another ground, the alleged injustice of taxing the whole population for schools whose benefits are enjoyed by comparatively few. To this, one obvious reply was that, if the principle should be adopted of taxing for school-purposes only the ones that availed themselves of school-advantages, the rich, who rarely send children to the common schools, would have to be released from taxation for support of them and the burden of that support be imposed mainly on the classes least able to endure it. Another answer was that, as far as could be ascertained, the amount of public funds required for the support of high schools was not in undue proportion to the taxation of the citizens whose children might be expected to attend these schools. And still a third was that in such a matter the

question of proportion was ungenerous and hard; that all citizens were taxed for general school-purposes; that all had equal privileges as to sending to the schools; that the whole State reaped advantages from a general education; that the keeping of precise accounts of the proportion of these advantages to the contributions towards them was impossible; and that a large and liberal public spirit should lead all heartily and ungrudgingly to aid in sustaining a system which, from its lowest to its highest privileges, was entirely free to every child. Such considerations have sufficiently prevailed to keep in check the opposition to these institutions, and there has been no confinement of the State-provision to the rudimentary and lower schools—no stopping at "the point where, to the poor man, the question of expense obliges him to arrest the further progress of his children." It may be hoped that there will be none.

TABLE II.—SCHOOL-STATISTICS OF CITIES, ETC.

An effort was made to ascertain the extent of the graded-school-system of the cities and more populous towns in the country, the results of which will be found in the table of the appendix. School-officers of 533 localities furnished information in respect to their school-systems. Many of the returns, however, were very incomplete, indicating great imperfection of method as well as inexperience in keeping school-statistics. Of the 533 localities, 320 reported primary-, intermediate-, grammar-, and high-school-grades; 76 primary-, grammar-, and high-school-grades; 41 primary-, intermediate-, and grammar-school-grades; 16 primary-, intermediate-, and high-school-grades; 11 primary grade only; 10 primary and intermediate, and 10 primary and grammar-grades; 9 primary- and high-school-grades; 4 grammar and high, and 4 high schools only; 1 reported only intermediate schools and 31 did not report any grades.

The following summary of the table shows that of the 533 localities, having a total population of over ten millions, 508 of the same reported a school-population of 2,448,719; 518 reported an aggregate enrollment in the schools of 1,564,663; 260 reported an enrollment of 51,557 pupils under 6 years of age; 427 an enrollment of 51,431 over 16 years; 502 reported 11,558 public schools; 514 reported 24,642 public-school-teachers; 462 reported 871,201 pupils in average attendance in the public schools. The whole number of public and private schools reported was 13,275, with 27,726 teachers and an average attendance of pupils of 945,793.

Private schools in cities.—It will be noticed that the statistics of private schools in cities are very incomplete. School-officers of 266 of the localities in question reported only 1,717 of these schools, with 168,968 pupils, while the officers of the remaining 267 localities were unable to give either the number of the schools or the approximate number of pupils under private tuition.

There is no law or regulation in any State or city requiring from proprietors of private schools periodical reports of the number and grade of their pupils. Such a law is a desideratum. It is not seen how a legal requirement of this sort could be onerous to the teachers or any invasion of private right. At present it is impossible to determine what proportion of the youth of school-age in the large cities are under school-tuition. Annual reports from teachers of private schools of the various grades to the State- or local superintendents would supply a great defect in school-reports and throw much light on the necessity or expediency of compulsory laws.

Summary of school-statistics of cities—population, school-enrollment, and average attendance.

SCHOOL-STATISTICS OF FIFTY PRINCIPAL CITIES.

The following table, drawn from Table II of the appendix, exhibits the leading statistics of the public schools in 50 principal cities in the country, embracing a population of over 6,000,000 and a school-population of 1,724,114. It is not possible to go into any comparative analysis of the statistics, on account of diversity of systems and the want of complete uniformity in the reports where the systems are identical. The greatest hinderance, however, to any comparative estimates arises from the diversity of ages embraced in the enumeration of the school-population, 15 of the cities in question enumerating children between 6 and 21 years of age; 10 between 5 and 21; 9 between 5 and 15; 4 between 5 and 18; 2 between 4 and 16; 2 between 6 and 16; and the remaining 8 cities enumerating children between the following ages respectively, viz: 4 and 20, 4 and 21, 5 and 20, 6 and 15, 6 and 16, 6 and 18, 6 and 20, and 7 and 21.

Summary of the population, school-age, and enrollment of fifty principal cities.

* Average.

Enrollment in public schools.—The total enrollment reported in the public schools of these cities, including evening- and normal schools, was 1,012,035, or 58 per cent. of the whole enumeration, 43 cities reporting an enrollment of 495,781 in the primary grade; 24 reporting an enrollment in intermediate schools of 51,093; 42 reporting an enrollment in grammar-schools of 213,248; 43 reporting an enrollment in high schools of 37,315; 35 reporting evening-schools with an enrollment of 65,758. The aggregate enrollment in public schools and in private schools corresponding in grade with the public schools was reported to be 1,114,723; 35 cities reported 319,840 pupils in drawing.

Parochial and private schools.—It will be observed that 25 of the cities, of which St. Louis is the chief, report 102,688 pupils in parochial and private schools, the number of such pupils in St. Louis being 17,346, or about 14 per cent. of the number of children of school-age. It is estimated that the number of pupils annually attending these schools some portion of the time, in the cities embraced in the table, would not fall far short of 450,000. If the enumeration of the school-population for all the cities were confined to the population between 6 and 16 years of age and the number of pupils in parochial and private schools were fully reported, the total enrollment in the public and private schools would probably cover about 90 per cent. of the youths between these ages.

High Schools—preparatory students.—Twenty-eight cities report 609 pupils in high schools preparing for colleges of liberal arts and 18 report 309 pupils in schools (presumably of the same grade) preparing for scientific schools or colleges. Several of these cities have normal schools, the statistics of which will be found in the table of the appendix. The pupils in these are also included in the total enrollment of the public schools.

School-expenditure.—The total expenditure of the fifty cities (with the exception of Indianapolis) for public schools in 1873 was $17,335,519, the current expenditure being $13,996,284, or an average expenditure of $13.91 *per capita* of the enrollment in public schools.

TABLE III.—NORMAL SCHOOLS.

The table shows steady and hopeful progress in the growth of special schools for the training of teachers for our public schools. The following is a comparative summary of schools, instructors, and pupils, reported to the Bureau for the years 1870, 1871, 1872, and 1873:

	1870.	1871.	1872.	1873.
Number of institutions	53	65	98	113
Number of instructors	178	445	773	887
Number of students	10,028	10,922	11,778	16,620

The table shows an increase, over those reporting in 1872, of 15 schools, 114 teachers, and 4,842 pupils. Eleven of the 113 schools reporting were established or organized in 1873, notable among these being the Massachusetts State Normal Art-School, "intended as a training-school for qualifying teachers and masters of industrial drawing, its specific aim at present being to prepare teachers for the industrial drawing-schools of the State, who shall also be able to direct and superintend the instruction in this branch in the public schools."

Within the past five years, the number of schools established, wholly or in part devoted to training public-school-teachers, is 59. The following are the summaries by States of the schools reporting, the details of which will be found in Table III of the appendix.

Summary of normal schools, showing the number of instructors and students, the number in which drawing is taught, &c.

States.	Total.			No. of schools in which drawing is taught.	No. of collections of models, casts, apparatus, &c., for free-hand-drawing.	No. in which vocal music is taught. a Also aided by the city or town.

One normal school in Louisiana, 1 in Pennsylvania, 2 in Vermont, and 1 in West Virginia are also aided by the county.

The States which cannot report schools of this kind are Florida, Nevada, and Texas.

It will be seen by referring to the table that 58 of the schools, having 530 instructors and 9,538 students, are under State-supervision and aided or sustained by State-appropriations; 2 schools, having 10 instructors and 223 students, are aided or sustained by county-tax; 5 schools, having 53 instructors and 1,259 students, are aided or supported by cities; the remaining 48 schools, having 284 instructors and 5,600 students, are either normal departments of colleges or academies or are private schools.

Ninety provide instruction in drawing; 39 have models, charts, &c., for free-hand-drawing; vocal music is taught in 96, instrumental music in 60; 68 possess chemical laboratories and apparatus; 81 possess cabinets and apparatus for illustrating the laws of physics; 45 possess cabinets of natural history, and 68 have model or practice-schools.

TEACHERS REQUIRED.

If we allow 40 pupils to each teacher, the number required to teach the youths between 6 and 16 years of age would be, on a moderate estimate, 260,000. Where are these teachers prepared? While the number trained more or less thoroughly in the normal schools shows a favorable increase for several years past, the fact still remains that comparatively few of the teachers in our public schools have received any special training for their work. How, then, can the number of trained teachers be increased? The class from which the great majority of our public-school-teachers come is not provided with the means for securing the advantages of a thorough normal training, and few would have the hardihood to say that good thorough work in teaching gets adequate compensation. It would therefore seem to be a wise policy to make the normal schools a part of the State-systems of public instruction, with free tuition. Few, not intending to teach, would seek this kind of training, and diplomas or certificates should not be given, except on condition that the recipient bind himself or herself to render appropriate service in the schools of the Commonwealth.

It is estimated that the public-school-teachers in Massachusetts teach on an average three years. Perhaps this period of service would give a high average for the whole country. Hence, confining the estimate to the school-population between 6 and 16 years of age, the number of new teachers which should be prepared each year to take up the work would be 86,666. So that at present all classes of our normal schools, containing 16,620 pupils in their first, second, and third years of instruction, could not probably furnish more than 5,200 teachers for the public schools in 1873.

NORMAL INSTRUCTION IN ACADEMIES.

The above summaries embrace the statistics of nearly all special schools for normal training. In the State of New York, however, the work of the training-schools is supplemented by normal instruction in 90 of the academies and union schools. The law provides that the sum of $10 shall be paid to each pupil, not exceeding twenty to each academy, instructed under a course prescribed by the regents of the university, during at least one-third of the academic year, in the science of common-school-teaching. The number in training-classes for teachers in the academies in 1872–'73 was 1,589.

The following table shows the number of pupils enrolled in the State normal schools in 1873 and the ratio of appropriation to enrollment:

Summary of normal schools—appropriations, &c., in 1873.

Locality.	Enrollment, 1873.	Appropriation, 1873.	Amount *per capita.*	Locality.	Enrollment, 1873.	Appropriation, 1873.	Amount *per capita.*

a This is a county-school.
b From State, county, and city.
c A special appropriation.
d $600 of this is a city-appropriation.
e $2,500 from State; $2,700 from county.
f $2,000 from State; $2,500 from county.
g $2,000 from State; $1,500 from city.
h $150 of this from county.
i $100 of this from county.

TABLE IV.—COMMERCIAL AND BUSINESS-COLLEGES.

The following is a comparative exhibit of colleges for business-training, as reported to this Bureau from 1870 to 1873:

	1870.	1871.	1872.	1873.
Number of institutions	26	60	53	112
Number of instructors	154	168	263	514
Number of students	5,824	6,460	8,451	22,397

The table shows an increase in the number reported in 1873 over that of the preceding year of 59 colleges, 251 instructors, and 13,946 pupils. The whole number of pupils reported in attendance during the year was 22,397.

The following is a summary of Table IV, for which see appendix.

Summary of commercial and business-colleges.

State.	Number of schools.	Number of instructors.	Number of students.	State.	Number of schools.	Number of instructors.	Number of students.
California	1	15	472	New Jersey	1	5	254
Georgia	4	10	619	New York	13	73	2,747
Illinois	14	62	2,221	North Carolina	1	1	8
Indiana	6	25	996	Ohio	12	43	2,813
Iowa	7	25	1,435	Oregon	1	1	74
Kansas	2	3	376	Pennsylvania	7	40	1,579
Kentucky	2	9	240	Rhode Island	1	8	125
Louisiana	2	15	600	Tennessee	4	12	291
Maine	1	3	79	Texas	1	3	27
Maryland	1	7	389	Virginia	1	1	62
Massachusetts	4	32	1,425	Wisconsin	7	22	1,291
Michigan	8	25	1,248	District of Columbia	2	12	195
Minnesota	1	6	246	Utah Territory	1	7	381
Missouri	6	47	1,828				
New Hampshire	1	2	376	Total	112	514	22,397

The names of eight colleges from which no statistics have been received will also be found in the table.

The rapid growth of these schools and the large number of pupils seeking the special training afforded by them sufficiently attest that they meet a want which is supplied by no other schools in an equal degree. The object aimed at being simple and direct, they are calculated to supplement in special departments the instruction of the public schools and academies. In their peculiar province they should present advantages similar to those of other special schools, viz: those of directing the energy and industry of the pupils to the mastery of those branches of study necessary to insure business-success, as well as the forms, methods, and principles of business-transactions.

Hence it would seem that there could be no question of their utility and importance nor of their title to recognition and encouragement. One of the obvious needs of the colleges is material for illustration in the way of museums or cabinets of commerce and manufactures, embracing the chief products and articles of exchange of the leading commercial nations. Such museums would be no less valuable as aids in the instruction given in these colleges than the museums of natural history in the instruction of schools of science or the museums of art in schools which aim to teach the theory and practice of art.

The following remarks are extracted form an address, "Business as a learned profession," delivered by General R. D. Mussey, at the commencement-exercises of the Washington Business-College, June 18, 1873:

I confront to-night young men and women who are not certified to have read Latin and Greek and studied mathematics, but to have completed a *course of business-education*. The tongue of these diplomas is that of the people and the certificate is of practical training. This change challenges attention and provokes comparison and reflection. It is significant of the breadth of modern civilization, indicative of its needs and the provision to meet them, and anticipatory of the larger future awaiting educational institutions. The vocations of university-graduates—law, medicine, theology—have had in the popular mind heretofore a certain exclusiveness attached to them. They have been called the learned professions. This scene to-night accumulates proof that education is not to be confined to three out of the thousand pursuits necessary to secure for us the comfort, the help, the security of our social system. * * * It is one of the signs—this fitting for business by imparting culture—that the future of our race is not to be an unstable equilibrium between discordant forces—thought and

action—but the firm resultant of their harmonious co-operation. * * * It was redolent with the exclusiveness of class, that division of human pursuits which gave to three the title "learned professions" and lumped all the rest under the phrases "occupations," "trade," "labor." It came to us Americans honestly enough from our mother-countries, but it is not consonant with our ideas, either political or social, and it should perish from our speech. Ours is a Republic; and among those really at work for the common weal there is no precedence because of the employment. * * * The dignity of labor is not an empty phrase. It expresses a profound truth. And I read this lesson here to-night: that business has its dignity. * * * And I have received another lesson to-night, namely, that we are recognizing the mutuality of help which men and women can give, and that it is no disgrace to be a "business-woman;" not only no disgrace, but that it in no wise derogates from the fine charms of womanhood. * * * If it were true that all women should be wives and mothers, a business-training would make them more helpful as wives, more capable as mothers. * * * To many women the winning of bread, as well as the making of it, becomes a duty, a necessity. It is wise to admit this fact, to provide for this exigency; nay, rather it is criminal not to do so. * * * A business-education is also to be commended for the so-called professional man. * * There is no minister, no lawyer, no doctor, but will better reach his people, his clients, his patients, if he understands business-forms, business-necessities, business-experiences. There is this general principle running through all affairs, that knowledge of the many fits for practice of one.

TABLE V.—SECONDARY INSTRUCTION.

The results of the efforts of this Bureau to collect full statistics of secondary instruction are as yet far from satisfactory. The table, however, shows a large increase in the number of institutions over the number reporting in 1872. The following comparative summary exhibits the gain in the work since 1871:

	1870.	1871.	1872.	1873.
Number of institutions	.....	638	811	944
Number of instructors	.....	3,171	4,501	5,058
Number of students	.....	80,227	98,929	118,570

Difficulty of obtaining full statistics.—It should be borne in mind that: first, institutions of this class are mainly endowed academies and private schools; secondly, in a majority of the States they are under no State-supervision and do not report concerning themselves to any public officer; thirdly, from the greater proportion no catalogues or printed programmes are obtainable; fourthly, the annual or biennial reports of the State-superintendents of public instruction, with few exceptions, make no specific mention of them.

For ascertaining the names, location, &c., of institutions claiming this rank, the Office has therefore but one resource, viz, correspondence with State-, county-, and city-superintendents, school-principals,* and others interested in educational work. When it is considered, therefore, that the work of collecting these statistics was first begun in 1871 and that the report of that year contained the names of 638 institutions, with 80,227 pupils, while the tables for this year contain the names of 944 institutions, (exclusive of those in Table VI, academies having collegiate-preparatory departments,) with 118,570 pupils, there would seem to be good ground for hoping that sufficient data will soon be in possession of the educator for a more intelligent and thorough review and discussion of secondary education in the United States than is now possible.

Classification of schools, (co-education, &c.)—For convenience of comparison between those of like character, the 944 institutions in the table have been put in three classes, the first comprising schools for boys only, the second for girls only, and the third for both sexes. It will be observed that 596 institutions, with 2,779 instructors and 88,444 pupils, belong to this latter class. This shows that co-education of the sexes is a predominant feature of secondary instruction among us. The following summary of the

*J. J. Rucker, principal of Georgetown Female Seminary, of Kentucky, and W. E. Ward, principal of Ward's Seminary, of Tennessee, have furnished us with valuable information respecting institutions in their respective States.

three classes shows for each State and Territory the number of institutions, the number and sex of instructors, the number and sex of students, the number preparing for classical and scientific courses in college, and the number of volumes in libraries. The summary also shows the amount of property and funds of a large number of the institutions. It should be said, however, that many of them furnished no statements under this head of the inquiries.

Summary of Table V, Part 1, *(schools for boys,) showing number of instructors and students.*

Four hundred and twenty-two cities and villages reported schools of this grade, with 1,613 instructors and 45,302 students. To these are to be credited most of the 4,198 students reported in public schools as preparing for the colleges and schools of science.

It will be seen, therefore, that many of the high schools rank, in the training afforded, with the private schools for secondary instruction usually denominated academies. Indeed, in some sections of the country, as in Maine, many of the time-honored academies are being merged in the high schools.

But what shall be said of the very small per cent. of the pupils enrolled in the city schools reported in this grade? Hon. J. D. Philbrick, superintendent of schools of Boston, a city making as ample provision as any for carrying pupils through the primary-, grammar-, and high-school-grades of instruction, remarks, in his last semi-annual report, of the grammar-school-grade:

If we go down to the third class in the grammar-schools, we find that it contains only a little more than half the number of pupils admitted in a single year from the primary schools. This shows that only about half the pupils ever reach this class. Certainly this fact cannot be contemplated with satisfaction. The cause of this unsatisfactory state of things is found, in part, in the unwillingness or inability of parents to allow their children to remain long enough at school. But this cause equally affects all schools, which are alike in respect to the social condition of the population from which their pupils are drawn.

The tables of the superintendent's report show that, while the whole number of pupils in the grammar-schools of the city in July, 1872, was 17,102, the number of pupils admitted to the high schools from the grammar, in July of the same year, was only 879, or only about 5 per cent. of the number of pupils reported in the next subordinate grade. Hence it appears that the schooling of the great majority of the boys and girls, in one of our oldest and most favored cities, ceases with the second-grade- or grammar-school. And the branches taught in this grade, at least up to the third form, are, for the most part, those generally denominated elementary English studies. This is doubtless true, with equal or greater force, of other cities.

The following exhibit, drawn from Table II, shows the proportion of enrollment in high schools of cities in several States, to the total enrollment in the city-schools :

States.	No. of cities reporting.	No. enrolled in city-schools, all grades.	No. in 1,000 enrolled in high schools.
California	11	41,129	23
Connecticut	11	26,486	47
Illinois	44	97,106	40
Indiana	28	39,883	57
Iowa	21	22,775	60
Kansas	9	12,233	40
Maine	15	25,533	61
Maryland	1	28,329	39
Massachusetts	63	155,843	49
Michigan	31	51,879	55
Minnesota	11	14,398	43
New Hampshire	7	12,537	54
New Jersey	11	54,540	21
Ohio	40	105,966	40
Pennsylvania	36	160,413	23
Rhode Island	3	11,850	38
Virginia	4	9,668	43
Wisconsin	15	22,779	65

Pupils leaving the schools at the age of 12 or under have pretty surely failed to acquire what any system of education should aim to give. They have dropped their studies just at the point where studies begin to have some shaping power on the future man or woman. Primary training does little, often nothing, towards forming intellectual tastes. The perception of principles does not come in early years of instruction.

Habits of mind which lead one to find pleasure in intellectual pursuits are not formed at this early age. Thus the great body of our youth leave the school with memories crammed, it may be, with a multitude of facts, isolated, unconnected, but without that training necessary for understanding or appreciating either the leading activities of their own times or the rich and varied stores of the literature and science of their native tongue.

TABLE VI.—PREPARATORY SCHOOLS.

It seemed desirable, in view of the prevalent discussion by the college-faculties of the subject of preparatory training, to present some statistics of schools devoted wholly or in part to the training of young men for the colleges and scientific schools. Inquiries in regard to the number of students thus preparing, and the number sent up to the colleges and scientific schools in 1872, were also extended to the schools for secondary instruction reported in Table V, as well to the city high schools reported in Table II. There are doubtless quite a number of private fitting-schools in the country from which no information has been received, but it is probable that the three tables indicated show pretty nearly the extent of the facilities now afforded for preparatory training outside of the classical and scientific colleges.

It will be seen, however, by referring to Table VI, that there are but few schools distinctively and exclusively of this class, by far the larger number included therein having both classical and English departments, and the number of students in the classical section being in many instances smaller than that in the English section. In the 86 schools reporting, there were 690 instructors and 12,487 pupils. Of the 12,487 pupils, 4,992 were stated to be in classical-preparatory, 2,274 in scientific, and 3,716 in English studies; the remaining 1,505 pupils were unclassified in the returns.

The following is a summary of Table VI:

Summary of number of instructors, students, &c., in preparatory schools.

State.	Number of schools in each State.	Number of instructors.	Students.			
			Whole number.	Number in classical department.	Number in scientific department.	Number in English department, exclusive of classical and scientific.

COLLEGIATE-PREPARATORY STUDENTS IN THE SEVERAL STATES.

The following table will bring into a connected view the number of pupils preparing in the several classes of schools in each State for the universities and colleges and for the scientific schools during the year 1873. The total number reported in courses preparatory to the classical colleges was 38,875. Of this number 2,965 were in high schools, (public;) 5,753 were in academies and other private schools; 4,992 were in the preparatory schools embraced in Table VI, and 25,165 were in the preparatory departments of colleges.

Summary of students in classical and scientific preparatory courses.

Total	2,965	5,753	4,992	25,165	38,875	1,233	1,544	2,274	1,426	6,477

The total number reported in courses preparatory to the scientific schools or to the scientific departments of colleges was 6,477. Of this number, 1,233 were in the city high schools, (public,) 1,544 were in academies, 2,274 were in other preparatory schools embraced in Table VI, and the remaining 1,426 were in preparatory departments of scientific schools or of colleges. The whole number of the two classes reported was 45,352.

It will be seen, by referring to the summaries of the tables of colleges and of scientific schools, that in 1873 there were in collegiate courses 25,010 classical and 3,414 scientific students. Perhaps one-third of these would represent the number in the preparatory courses who will be sent up to the colleges and scientific schools in 1874. In what stage of their preparation the 45,000 students reported as in preparatory classes were cannot be determined.*

A cursory examination of the preceding summary develops some instructive facts: In the six New England States the city high schools are preparing 664 students, the academies are preparing 985 students, and the special preparatory schools and preparatory departments 2,586 students, while the colleges themselves are preparing only 40.

In other words, the academies of New England are preparing 3,571, or more than 83 in 100 of students being fitted for superior classical instruction. The case is very different in other portions of the Union. For example, in the States of Ohio, Indiana, Illinois, Michigan, and Wisconsin the city high schools are preparing 1,213 students; the ordinary academies, 791; other preparatory schools, 731, and the preparatory departments of the colleges, 9,472; that is to say, 12½ per cent. of this work is done by the academies and preparatory schools and 77½ per cent. by the colleges themselves; only about 10 per cent. are preparing in the city high schools. It thus appears that out of every 100 students preparing for college in New England, the colleges of New England are only burdened with the care of 1, while 83 out of every 100 students preparing in the Northwestern States mentioned must be drilled by the colleges. It is obvious that until institutions of secondary instruction are able to supply a sufficient number of prepared students to the colleges or until the city high schools regularly give opportunity for acquiring the rudiments of classical training, American colleges in the West and South must directly or indirectly prepare at least 75 per cent. of their students. Of course there are exceptional cases in which this necessity does not exist, but this burden on secondary instruction borne by institutions chartered as colleges, though unavoidable under existing circumstances, is nevertheless a very grievous one. Such a condition of affairs tends to a low standard of scholarship in the colleges, impairs the energies of the teachers, and fails to arouse and foster a love of high and thorough culture among students.

Of the 949 students in New England reported as preparing for scientific colleges, 165 were in city high schools, 768 in academies and special preparatory schools, and 16 in preparatory departments of colleges; while, in the Northwestern States before mentioned, of the 1,278 students thus preparing, 489 were in city high schools, 497 in academies and special preparatory schools, and 292 in preparatory departments of colleges.†

RELATIONS OF SECONDARY SCHOOLS TO THE COLLEGES AND SCHOOLS OF SCIENCE.

The past few years have been fruitful in discussions of the higher education, both classical and scientific, the results of which are seen in the new vigor, in the improved

* *College-entrance-examinations.*—No statistics have been collected in respect to the proportion of applicants annually rejected on examination for admission to the colleges since the effort made by this Office in 1871, which resulted chiefly in showing that few colleges kept any record of these examinations and that very few examined the candidates respecting their knowledge of the English language. The Military and Naval Academies are the only institutions of superior instruction in regard to which we have official annual data of this character. It is questionable whether these would afford a very accurate criterion for the universities and colleges.—(See extracts from report of Board of Visitors of Military Academy, under "Military and Naval Academies," p. lxxxvii of this report.)

† For Harvard entrance-examinations for 1876, see summary under the head of "Colleges."

methods, and in the wider and higher aims of the better class of our colleges and schools of science.

These discussions have incidentally thrown much light on the present condition of secondary instruction, and the relations of secondary schools to the colleges and schools of science have become in turn the subject of a good deal of thought and discussion among educators.

Academies and high schools.—It is from the academies and endowed schools embraced in Tables V and VI that the colleges and schools of science in the North and East receive the majority of their students. It will be seen, by referring to the summary under the head of preparatory schools, that in 1873 there were, in academies and other secondary schools not belonging to the public-school-system, 14,563 pupils reported in courses of study preparatory to the colleges and schools of science, while in the public high schools there were of this class but 4,198.

Present condition of the schools.—While many of these schools are of a high order of merit and afford excellent training for the colleges and schools of science, it is nevertheless the common observation of experienced educators that a large proportion of the class do not meet present requirements, either in the quality or extent of training, whether the destination of their pupils be the college, the school of science, or business. Many of them are doing the work of the primary school; in a great number, the variety of classes and the great multiplicity of studies are out of all proportion to the teaching force. Even in many of the long-established schools, the old routine of studies is kept up, notwithstanding the changes in the curriculum of the classical colleges and the special requirements of the schools of science. The frequent changes of teachers and the insufficient inducements for well-trained graduates of the colleges and schools of science to adopt teaching as a profession serve to keep many of the schools at a low standard. Hence the superficiality of much of the so-called secondary instruction; hence the little uniformity of standard in schools nominally of the same general class; hence, too, the little philosophical arrangement or co-ordination of studies and the general lack of the due co-operation with the aims of advanced instruction.

Entrance-examinations at West Point.—In their report for 1873 the visitors of the Military Academy call the attention of all school-officers and teachers to the surprising fact that, of the 134 appointees of the year, 49, or 38 per cent., were rejected on the scholastic examination, and express the opinion that this result was mainly due to the want of thoroughness in the schools. As the candidates must be between 17 and 22 years of age, the majority of the failures are to be attributed to the low standard in schools for secondary instruction.

Sheffield Scientific School.—The report of the committee on the Latin entrance-examination of the Sheffield Scientific School holds the following language on the causes of the inefficiency of the secondary and preparatory schools in classical, especially Latin, instruction. Much of the criticism would doubtless apply with equal truth to other subjects which it is the business of these schools to teach.

In the large majority of cases it is believed that the teachers are young graduates of college, who for ulterior objects spend two, three, and four years in teaching, and who are usually so pressed with work that they cannot if they would make up to any considerable extent their own deficiencies. The consequence frequently is that the student is put over precisely the same course, good or bad, that his teacher had pursued, and thus many defective and even pernicious methods have been perpetuated by a long succession of *pro-tempore* teachers and the student's time and the cause of classical education have often been sacrificed. Even among unquestionably competent Latin scholars, tradition and fashion have often had undue influence, and their own narrow-mindedness has sometimes been one cause of the failure, partial or complete, of classical studies to secure a really good education. Methods and objects, proper and useful enough in the sixteenth century, have been held on to in some places with almost religious bigotry; reasons for classical study, which in fact are chiefly historical, have been invented, of a necessary and *a priori* character; and the growth of modern literatures, the advance of science, and in particular of the science of language, have often failed to open the eyes of the classical zealot to the changed position of classical studies in the sum total of human knowledge.

The wide incompetence of classical teachers is another cause, temporary probably,

but very much to be regretted, of unsuccessful classical study. Only those, perhaps, who have had considerable experience in conducting college-entrance-examinations can realize this in its full extent; but the knowledge of the fact is by no means confined to them. Able and experienced scholars, who are at the head of various preparatory schools scattered throughout the land, find this one of the most formidable difficulties they are obliged to encounter in giving efficiency to the institutions under their charge. Of course this state of things cannot be so noticeable in New England as in other parts of the country. Aside from the fact intimated above, that so many classical teachers are young college-graduates, there are many academies, select schools, and public schools in which the bulk of the higher teaching is done by one man. He does this, perhaps, year after year, beginning probably with only general attainments, which subsequent reading does little to advance. It cannot be expected that much efficient teaching of any kind can be done under such circumstances, still less in a language so difficult as the Latin, and where such wide and varied reading is necessary for the elucidation and illustration of a single author.

Massachusetts Institute of Technology.—Mr. W. P. Atkinson, A. M., professor of English and history in the Massachusetts Institute of Technology, says:

The question of the best method of adjusting my instruction to the real wants of the students of the institute has been from the outset a very perplexing one. The imperfect preparation for the scientific studies of the course which the students bring with them lays a heavy pressure upon them in that direction; and, on the other hand, the deficiencies of too many of them in English studies require an attention to rudimentary drill, especially in composition, which should properly have been completed before admission.

Elementary deficiencies are very general. I have taken the ground that, while the Institute of Technology does not offer itself as a teacher of writing, spelling, punctuation, and the rudiments of the art of composition, it will give all the incidental help it can to its students for the making-up of such deficiencies in their school-education, but should refuse to give a degree or diploma to any student who, by the end of the four years, has not acquired, directly or indirectly, a satisfactory proficiency in them.

Endowed, chartered, and private secondary schools.—In the census of 1870 there were in the whole country over 1,500 schools reported under the head of academies. It is evident that most of those for the superior instruction of women, reported in Table VII of the appendix, were included by the census in this class. The number of secondary schools embraced in Tables V, VI, and VII of the appendix of this report is 1,235. The number exclusive of those embraced in Table VII is 1,030, of which number 447 are chartered schools. Of these 1,030, 193 are boys' schools, 186 are girls' schools, and 651 are for boys and girls.

Denominational schools.—Of the 1,030 secondary institutions above indicated, 440 were reported under the patronage of religious denominations and were distributed as follows, viz: Roman Catholic, 100; Presbyterian, 69; Protestant Episcopal, 63; Congregational, 47; Baptist, 34; Methodist Episcopal, 20; Methodist, 19; Friends, 16; Free-will Baptist, 11; Lutheran, 10; Universalist, 7; Reformed, 6; Christian, 5; American Missionary Association, 4; Methodist Episcopal South, 4; Union, 4; New Jerusalem, 3; Evangelical, 3; Moravian, 3; United Presbyterian, 2; Orthodox, 2; and the remaining 8 under the following denominations, respectively: Reformed Dutch, Reformed German, Unitarian, Independent, Seventh-Day Baptist, Cumberland Presbyterian, United Brethren, and Protestant. Two hundred and ninety were reported as non-sectarian and 300 did not report at all upon this point.

Teachers.—The number of teachers reported in Table V was 5,058, of whom 2,029 were men and 3,029 were women. The number of teachers in preparatory schools and preparatory departments, Table VI, was 690.

Endowments.—The schools in several States reporting more than nominal endowments are as follows: In Connecticut, the Morgan School, Clinton, $50,000; Bacon Academy, Colchester, $16,000; Hartford Public High School, $30,000; Buckley School, New London, $50,000; Norwich Free Academy, $90,000; Connecticut Literary Institution, Suffield, $22,000; Woodstock Academy, $16,000: in Delaware, Middletown Academy, at Middletown, $8,000: in Georgia, Hearn Manual-Labor School, Cave Spring, $7,500; Martin Institute, Jefferson, $17,000: in Illinois, Grand Prairie Seminary and Commercial College, Onarga, $20,000: in Indiana, St. Mary's Academy, La Fayette, $25,000; Vincennes University, $48,000: in Kentucky, Mt. St. Benedict's Academy, Portland, $10,000;

Shelby Graded School, Shelbyville, $11,000: in Maine, East Maine Conference Seminary, Bucksport, $30,000; Westbrook Seminary, Deering, $25,000; Lincoln Academy, Newcastle, $10,300; Bridgeton Academy, North Bridgeton, $14,000; Maine Central Institute, Pittsfield, $12,000: in Maryland, McDonogh Institute, Owing's Mills, $680,000: in Massachusetts, Punchard Free School, Andover, $60,000; Phillips Academy, Andover, $93,500; Hitchcock Free High School, Brimfield, $76,277; Williston Seminary, Easthampton, $100,000; Dean Academy, Franklin, $180,000; Lawrence Academy, Groton, $80,000; Putnam Free and Brown High School, Newburyport, $41,351; Wesleyan Academy, Wilbraham, $70,000; Worcester Academy, $100,000: in New Hampshire, Pinkerton Academy, Derry, 20,000; Phillips Exeter Academy, Exeter, $225,000; Kimball Union Academy, Meriden, $38,000; New Hampton Literary and Biblical Institute, $20,000; New Ipswich Appleton Academy, $25,000; Christian Institute, Wolfboro', $15,000: in New Jersey, Farnum Preparatory School, Beverly, $20,000; Princeton Preparatory School, $30,000; Trenton Academy, $11,500: in New York, Clinton Liberal Institute, Clinton, $36,650; S. S. Seward Institute, Florida, $30,000; Ten Broeck Free Academy, Franklinville, $50,000; Gouverneur Seminary, $19,500; Colgate Academy, Hamilton, $30,000; Cook Academy, Havana, $45,135; Lowville Academy, $15,000; Cary Collegiate Institute, Oakfield, $20,000; Evans Academy, Peterboro', $15,082; Chamberlin Institute, Randolph, $42,291; De Veaux College, Supension Bridge, $190,645: in Ohio, Grand River Institute, Austinburg, $15,000; Gallia Academy, Gallipolis, $11,000; Rayen High School, Youngstown, $70,000: in Oregon, Bishop Scott Grammar and Divinity School, Portland, $7,000: in Pennsylvania, Academy of the Protestant-Episcopal Church, Philadelphia, $15,000: in Rhode Island, New England Yearly Meeting Boarding School of Friends, Providence, $125,000; Lapham Institute, North Scituate, $10,000: in Tennessee, Le Moyne Commercial School, Memphis, $11,000: in Vermont, Episcopal Institute, Burlington, $10,000; Castleton Seminary, $30,000; Burr and Burton Seminary, Manchester, $40,000; Beeman Academy, New Haven, $11,420; Caledonia County Grammar School, Peacham, $16,000; St. Johnsbury Academy, $10,000; Green Mt. Perkins Academy, Woodstock, $12,000: in Wisconsin, Albion Academy and Normal Institute, $5,000; German and English Academy, Milwaukee, $6,000.

Many other schools report small funds varying from $3,000 to $10,000.

Insufficient endowments.—It will be observed that the endowments of only a very small number, and these mostly in the Middle and New England States, are sufficient to sustain the necessary teaching force of a well-appointed academy. In the great majority of cases the revenues from tuition-fees constitute the main fund for the payment of teachers' salaries and current expenses. Hence the financial results are often viewed as the measure of success of the schools. Salaries are generally too low to secure highly-trained men for head masters and assistants. It is true that men of superior qualifications are often found in them, but the business of teaching is often taken up by these as a mere temporary resource. As a general thing, the schools are sadly deficient in suitable apparatus for teaching physical science; many of them possess none whatever. It is no doubt partly owing to the inferior quality of instruction given in these institutions as a class that so small a proportion of pupils pass into them from the lower schools. The statistics collected by the Bureau show that the number of pupils in the secondary schools of all classes, including city high schools (public) and those for the superior instruction of women, was, on an average for the whole country, 50 to each 1,000 of the population between the ages of 14 and 18. Even this ratio is doubtless quite too large for those who were in secondary courses of instruction. The following table will show the like proportion of pupils in secondary schools for the several States:

Statistical summary showing proportion of pupils in secondary schools.

State.	Number of population between 14 and 18 years of age, (estimated.)	Total number enrolled in secondary schools.	Number preparing for colleges and schools of science.	Number enrolled in secondary schools, in 1,000 of population, between 14 and 18 years of age.

Elevation of standard.—There are grounds for believing that, unless secondary instruction receives a better organization, raises its standard, and modifies its aims so as to secure a more real and systematic co-operation with the higher classical and scientific education, the better class of colleges will be obliged in the end to recede from the advanced positions already taken. Such a result could not fail to have a deplorable influence on every grade of instruction. Many of the leading schools, especially in the Northern and Eastern States, already recognize the necessity of preparing to meet the new and increased demands upon them, especially in the departments

of elementary science, modern languages, and English studies, by instituting thorough scientific preparatory courses to run parallel with the course in classical studies.

Additional endowments needed.—As has been said, an obvious hinderance to the thorough reorganization and improvement of a great majority of the schools is the lack of pecuniary means. They need additional resources, and measures should at once be taken for increasing existing endowments. New schools should be established and endowed in the South, where at present there is a great lack of provision for secondary instruction. The colleges and professional schools have hitherto been most favored in respect to gifts and legacies. Only here and there have the wealthy bestowed of their abundance on the academies and high schools. When it is more fully understood how dependent the colleges are for success and efficiency on the secondary schools, the secondary schools will become more frequently the objects of private and associated munificence. Even when considered apart from their relations to the higher institutions, our endowed schools are worthy of every kind of aid and encouragement. Arguments against private endowments for the furtherance of education and culture are out of place in America. The wide publicity of every interest, the slight influence of traditions and old customs, and the disposition of society to find in present conditions of life the rule of judgment in respect to the utility of political and social arrangements are sufficient guarantees against abuse of foundations for such ends. It is, moreover, desirable that, in addition to the public high school, where a thoroughly good education can be acquired, there should exist a class of endowed and chartered schools of the same general rank, not under the immediate control of the State nor dependent on it, for the sake of variety of means and modes of education and of the mutual influence of schools differently organized in competition for excellence. It is not well that the schools should be all of one uniform type, nor that all youths should be trained and molded in one way. The high school is usually the home-school. It is often a great advantage to the young student to be thrown during some portion of his secondary schooling into new scenes and new associations, among youths gathered from various communities, under teachers having new and important relations to him. In these new circumstances many narrow, home-bred fancies, unfavorable to intellectual development, are dispelled, and the youth receives perhaps his first impressive discipline in manliness and self-control.

Harvard examinations in 1876, *as a basis for the reorganization of secondary instruction.*—The Harvard entrance-examination for 1876 points to a course of studies which will commend itself to educators and which will doubtless be adopted as the basis of the reorganization or modification of the present curriculum of the best-appointed schools. In addition to the requirements in the classics, in French or German, and in English, all candidates will be required to pass an examination in one of the three following branches of elementary science: Elementary botany, rudiments of physics and of chemistry, or rudiments of physics and descriptive anatomy. The curriculum here outlined harmonizes essentially with that of some of the best-organized high schools, especially those of the New England cities, of St. Louis, and of a few other western cities. It aims to secure a thoroughly good education for young men in English, classics, history, modern languages, and in the subject-matter of elementary science. Although the aim of the university in the changes and additional requirements has been "to make the preparatory course correspond more nearly with the best possible course of study for young men up to an average age of 18, who purpose to pursue non-professional studies four years more, it will probably be found that such a course, with the exception of a portion of the classics, would prove to be best for those whose instruction terminates with the secondary or preparatory school.

President Eliot, in his report for 1872–'73, says:

That teachers and pupils in preparatory schools should direct their efforts mainly to meeting these specific demands of the colleges, [in classics,] and should subordinate the intrinsic importance of studies to their serviceableness in securing admission to college, is the only result that could be expected. Neither teacher nor pupil could be much blamed, for instance, for practically setting the writing of good Latin above the writ-

ing of good English. It is plain that the only remedy for this grave evil is for the colleges to show by the nature of their admission-examinations that they will not accept the rudiments of scholarship as amends for deficiencies in the rudiments of education. The colleges, as the representatives of the value of the study of the classics, should be especially careful not to give plausibility, by any act or neglect of theirs, to the groundless assumption that the discipline of mind secured by the preliminary classical training must be purchased by the sacrifice of some knowledge which a well-educated young man of 18 ought to possess.

Secondary technical schools.—The changed and rapidly changing conditions of productive industry, involving the applications of scientific processes to every department of labor, and the confessed unsuccessful competition of our artisans with the large number annually coming to us who have been trained in the industrial schools of Europe, are awakening educators and others to the need of a class of technical or semi-technical secondary schools for teaching the elements of the sciences which underlie the industries and the arts, as well as their practical application.

Steps have already been taken in several of our cities, especially in Boston, Philadelphia, Toledo, and San Francisco, for establishing such schools, those in Boston and Philadelphia to be supported by city-appropriations, those in Toledo and San Francisco by individual gifts or endowments. It is to be hoped that the other cities and more populous towns may speedily follow the example and secure, either through municipal appropriation or individual liberality, one or more technical schools where youths may have the opportunity of discovering and developing their special aptitudes—nature's appointment to the avocations of life.

Connection of high schools with State-universities.—In the West the experiment instituted in 1871, of admitting to the University of Michigan the graduates of State high schools, without other examination than an inspection by the faculty of the course and methods of instruction in these schools, has been watched with interest. And as the report of the results of this experiment has been quite favorable, there has been a kindred linking of the high school with the university in Indiana and Wisconsin, though apparently without the careful guarding of it that prevails in Michigan. The educational reports and journals from Minnesota, Nebraska, Missouri, and Kansas indicate that the same system is either adopted or likely to be adopted in those States, the idea being that the State-university is the climax of the State-schools and that all in these schools who may be certified by competent authority to have mastered the studies which fit them for the university should be admitted to it without further questioning.

TABLE VII.—SUPERIOR INSTRUCTION OF WOMEN.

Statistics in detail of schools for the superior education of women will be found in Table VII of the appendix. In respect to this class of institutions, the work of the Office shows most gratifying progress. Statistics of only 33 were given in the report of 1870. The number of institutions reporting in 1873 was 205, with 2,120 instructors and 24,613 students. The following is a comparative summary of institutions, instructors, and pupils, from 1870 to 1873, inclusive:

	1870.	1871.	1872.	1873.
Number of institutions	33	136	175	205
Number of instructors	378	1,163	1,617	2,120
Number of students	5,337	12,841	11,288	24,613

Of the students reported, 6,321 were in preparatory departments, 17,267 were reported to be in regular or advanced courses of study, and 1,025 in special and post-graduate-courses. The number of volumes reported in the libraries was 213,675.

Statistical summary of Table VII, showing number of instructors and students.

State.	Number in each State.	Instructors.			Students.				
		Total.	Male.	Female.	Total.	Number in preparatory department.	Number in regular course.	Number in special or partial course.	Number of post-graduates.

NOTE.—The names of 17 schools from which no statistics have been received will be found in Table VII. They are not included in the summary.

It should be remarked here that the five colleges for women in the State of New York, being included in the institutions composing the university of the State, are not embraced in this summary. The statistics of these will be found in Table VIII.

Organization of the schools.—These schools, like those for secondary instruction, are for the most part private incorporated institutions. Those having endowments or permanent funds received them mainly from individuals and societies. They are sustained partly from the permanent funds, partly from individual contributions, and from tuition, and have not been aided to so great an extent as the institutions embraced in Table VIII. They are not subject, generally speaking, to supervision by the State-school-boards, nor to visitation other than such as may be provided by the order of the trus-

tees, and the character of degrees, diplomas, or certificates awarded is at the discretion of the heads of the institutions.

Being therefore free from civil control, each institution takes its own course and develops itself in its own way, adding the contribution of its own experience to the solution of the problem of women's superior education.

Variety of standard.—Hence is found among these institutions professing like aims and claiming like rank a great diversity of standards, the standards varying with sections and localities and with the intelligence and culture of communities in which they are found. Hence also the great freedom in selecting names. Of the 205 reporting, 107 are designated as *colleges*. But it is evident that but a small proportion, if any, of these exercise as yet functions strictly and appropriately academic or collegiate.

Degrees, &c.—The annexed statement shows by States the number of degrees reported as conferred by these schools in 1873. The names of the degrees are almost as various as the names of the institutions conferring them. Of course their value must vary as the standard of culture in the schools.

It is noticeable that the New England schools for women included in this table, although ranking probably with the best in the country, only in one instance report academic degrees.

Institutions for the superior instruction of women, in Table VII.

State.	No. of degrees.	State.	No. of degrees.	State.	No. of degrees.	State.	No. of degrees.
Alabama	27	Kansas	....	Nebraska	....	South Carolina	16
Arkansas	....	Kentucky	27	Nevada	....	Tennessee	75
California	3	Louisiana	2	New Hampshire	....	Texas	16
Connecticut	....	Maine	8	New Jersey	8	Vermont	....
Delaware	6	Maryland	10	New York	....	Virginia	....
Florida	....	Massachusetts	....	North Carolina	6	West Virginia	12
Georgia	52	Michigan	....	Ohio	62	Wisconsin	....
Illinois	23	Minnesota	....	Oregon	....		
Indiana	5	Mississippi	39	Pennsylvania	17	Total	424
Iowa	....	Missouri	10	Rhode Island	....		

Corporate property, &c.—It will be observed that a large number of the institutions did not respond to these inquiries. Of the 205 embraced in the table, only 66 schools gave the amount of corporate property; 147 reported value of grounds, buildings, and apparatus; only 15 reported amount of productive funds; only 13 reported income from productive funds; and 79 reported receipts from all other sources during the year.

New colleges for women.—The Sage College for Women, at Cornell, has not yet developed its plan of management; but from the hints given in the circular it may be supposed that it will be not unlike the one at Evanston. It will be opened in 1874.

Two new institutions in Massachusetts, the Smith College, at Northampton, and the Wellesley College, Needham, both having about $1,000,000 to begin with and both designed to afford to women the opportunity for a large and liberal education, with fair attention to the specialties of their sex and to good physical, as well as mental, training, will probably open in 1874.

Co-education.—The foregoing summary, however, does not exhibit the total provision for the higher education of women. Several universities and colleges recently organized admit both young men and young women to their halls, while quite a number of colleges, which formerly admitted young men only, have now thrown open their doors to women. The number of these in New England is 5, which reported 25 women-stu-

dents, all in regular collegiate courses; in the Middle States 8, with 632 students, of whom 370 were in preparatory departments, and 262 in regular college-course; in the Western States 67 institutions claiming collegiate rank reported 5,505 female students, of whom 4,223 were in preparatory and 1,282 in regular college-courses; and in the Southern States 17 such institutions reported 1,195 female students, of whom 817 were in preparatory and 378 in regular college-courses; making a total in these institutions of 7,357 female students, of whom 5,410 were reported in preparatory departments and 1,947 in regular college-courses.

Women are also admitted to several of the agricultural and mechanical colleges and other schools of science, (see Table IX of the appendix.) The number reported in these was 784, of whom 212 were in preparatory departments and 572 in the regular course; making a total of female students in mixed colleges in 1873 of 8,141, of whom 5,622 were in preparatory departments and 2,519 in regular collegiate courses.

Harvard examinations for women.—The admission of young women to their curriculum on an equality with young men by several old and well-established colleges and the examinations for women recently instituted by Harvard University on the plan of the local examinations carried on by the Universities of Oxford, Cambridge, and London are destined to raise the standard as well as to modify in no small degree past theories and methods of woman's education. These examinations, the first of which is to be held in June, 1874, are of two grades: (1) a general or preliminary examination for young women who are not less than 17 years old; (2) an advanced examination for young women who have passed the preliminary examination and are not less than 18 years old.

I. Preliminary examinations.—The preliminary examination will embrace the following subjects: English, French, physical geography, either elementary botany or elementary physics, arithmetic, algebra through quadratic equations, plane-geometry, history, and any one of the three languages German, Latin, and Greek. Candidates for the preliminary examination must specify which of the elective studies (German, Latin, or Greek) they will take.

II. Advanced examinations.—The advanced examinations will be divided into five sections, in one or more of which the candidate may present herself. No person will be admitted to the advanced examination till she has passed the preliminary examination; but in 1874 candidates can pass both examinations in the same year. Candidates for the advanced examination must specify which section and which subjects they select. These sections are as follows:

(1) *Languages.*—Candidates may offer any two of the following languages: English, French, German, Italian, Latin, Greek.

(2) *Natural science.*—Candidates may offer any two of the following subjects: Chemistry, physics, botany, mineralogy, geology.

(3) *Mathematics.*— Candidates must present solid geometry, algebra, logarithms, and plane-trigonometry, and one of the four following subjects: Analytic geometry, mechanics, spherical trigonometry, and astronomy.

(4) *History.*—In 1874, candidates may offer either of the two following subjects: The history of Continental Europe during the period of the Reformation, 1517–1648, or English and American history from 1688 to the end of the eighteenth century.

(5) *Philosophy.*—Candidates may offer any three of the following subjects: Mental philosophy, moral philosophy, logic, rhetoric, political economy.

Pamphlets are printed containing full lists of books and specimen examination-papers on the work required.

Forms of certificate to be given by the university.

HARVARD UNIVERSITY.

Preliminary examination for women.

A. B. has passed (passed with distinction) (passed with the highest distinction) the preliminary examination, held at ———, on the ——— of ———, 1874, under the direction of the faculty of Harvard College, and is entitled to proceed to the advanced examination.

———— ————, *President.*

CAMBRIDGE, *August* 1, 1874.

HARVARD UNIVERSITY.

Advanced examination for women.

A. B., having duly passed the preliminary examination on the ——— of ———, 1874, has been admitted to the advanced examination in the section (sections) of ———, and has passed (passed with distinction) (passed with the highest distinction) the prescribed examinations in ———, held at ———, under the direction of the faculty of Harvard College, on the ——— of ———, 1875.

———— ————, *President.*

CAMBRIDGE, *August* 1, 1875.

TABLE VIII.—UNIVERSITIES AND COLLEGES.

The following is a statement of the aggregate number of this class of institutions, with instructors and students, as reported to this Bureau each year from 1870 to 1873, inclusive.

	1870.	1871.	1872.	1873.
Number of institutions	266	290	298	323
Number of instructors	2,823	2,962	3,040	3,106
Number of students	49,163	49,827	45,617	52,053

It is believed that the table of the present report (Table VIII) embraces nearly all institutions claiming collegiate rank in the several States and Territories, with the exception of schools of science and colleges for women, for which see Tables VII and IX. Several of them are of recent establishment; others of older date do not appear to have thus far assumed full collegiate functions; in the case of several, these functions are for the present suspended. The following analysis presents some items serving to show the status of the institutions, by States and Territories.

Summary of universities and colleges.

State or Territory.	No. of colleges reported.	No. reporting date of charter.	No. not reporting date of charter.	No. reporting only preparatory students.	No. reporting collegiate students.	No. not reporting students by classes.	No. not reporting libraries.	Years in course.

Total	323	282	41	28	287	2	34	37	211	17	6	52

It will be observed that of the 323 colleges in the table 41 do not report date of charter; 6 do not report the number of students; 28 report preparatory students only; 2 do not report students by classes; 34 do not report libraries; 37 do not report the number of years in the collegiate course; 17 report a collegiate course of three years, and 6 report a course of two years.

The number reporting academic degrees conferred in course in 1873 was 226, (see Table XIII, appendix.) The number of first degrees conferred in course was 2,432.

Catalogues and registers.—No annual catalogues or registers have been issued by 55 of these colleges; at least, such publications have not been received at this Bureau. Hence, (assuming that official statements of this kind afford any criterion of the relative status of institutions,) no comparisons can be made between these and the well-established colleges, in respect either to requirements for admission, the character and extent of the course of studies, or the discipline and culture implied in the degrees conferred by them in the arts and sciences.

Number of colleges.—The above analysis, as well as other particulars as given in the table, would indicate that quite a number of the so-called colleges do not reach the standard. They assume the name, having as yet insufficient facilities for doing the work of a college. Hence the frequent remark of educators that many of our colleges in name are not to be compared for thoroughness and extent of discipline with our leading collegiate preparatory schools.

The number of institutions purporting to belong to this class embraced in Table VIII is 323. This would give on an average nearly nine colleges to each of the 37 States, not counting the colleges of agriculture and the mechanic arts and colleges for women.

When it is considered what is required in the way of professors and division of professorial work, endowments, buildings, libraries, apparatus, museums, &c., to equip

a college to meet the demands of modern education and modern culture, the question is seriously suggested whether there is not great waste both of money and effort in the struggle to keep life in a large number of these institutions. It cannot be doubted that it would be far better for the interests of higher education if many of them were to convert themselves into thorough-paced preparatory schools. The multitude of such institutions creates competition and rivalry for mere numbers of students and degrades instead of advances the scholastic standard.

Concentration of means.—Do not the statistics clearly indicate that what is needed is concentration and combination of means and energies? A small number of vigorous colleges in a State, even in germ, would be of more value than a dozen or a score of feeble ones. They would not only raise the standard and character of collegiate training, but would also exercise a powerful influence for good on every grade of instruction, even to the lowest. Still, in all discussions of these statistics, due consideration should be had for the necessities and embarrassments of institutions in pioneer communities.

Table VIII of the appendix exhibits in detail the statistics reported by these institutions. The following summaries show for each State the number of professors and instructors in the colleges, the number of students, preparatory and collegiate, the number of volumes in college-libraries, the increase in libraries for the year, the amount of endowments, value of corporate property, &c. It will be noticed, however, that many of the colleges do not report any items under some of the heads above indicated.

Preparatory departments of colleges and preparatory students.—It is not possible here to examine the above statistics much in detail. Those relating to students in the preparatory and collegiate courses of the colleges are worthy of notice. In comparing the respective numbers of these classes of students in the colleges in various sections of the country great differences will be found to exist. The colleges in the States of Alabama, Georgia, Kentucky, Mississippi, North Carolina, Tennessee, Virginia, and West Virginia report 2,667 preparatory and 6,235 collegiate students; the colleges in the States of Illinois, Indiana, Michigan, Ohio, and Wisconsin report 9,472 preparatory students and 6,403 collegiate students; the colleges in the States of New Jersey, New York, and Pennsylvania report 3,728 preparatory and 5,686 collegiate students; the colleges of the New England States have only 40 preparatory students and 3,201 collegiate students.

The colleges in Massachusetts have 1,502 collegiate students out of 1,542 in attendance; the colleges of Michigan have only 741 collegiate students out of 1,792 persons in attendance.

How can the collegiate revenues of Michigan be directed to their proper object, viz, superior instruction, as they are in Massachusetts? What measures can the colleges and the State of Michigan take to obtain as large a number of collegiate students in proportion to population as Massachusetts has? But it is not necessary to multiply questions on this subject. Massachusetts has a large number of schools for training students for the colleges. These schools have been wisely fostered. The West and South have comparatively few schools of this class, and here doubtless is one of the main causes of the disproportion above indicated. It would seem, therefore, the obvious policy of the colleges of the South and West to encourage the establishment and generous endowment of collegiate training-schools, both public and corporate. Why cannot Michigan, Virginia, and the other States South and West have schools similar to the Phillips Academy at Andover or the Williston Seminary at East Hampton? The establishment of such schools would relieve the colleges of the burden of preparatory training and largely increase the number of collegiate students proper.

Of the 323 colleges, 289 report libraries, the aggregate number of volumes being 1,930,124; 159 report increase in libraries during the year of 85,092 volumes. The aggregate amount of corporate property reported by 170 colleges was $44,813,876; the aggregate endowments reported by 157 colleges was $20,232,511; the value of grounds,

buildings, and apparatus reported by 256 colleges was $29,178,080; the amount of productive funds reported by 144 colleges was $21,960,322; the income of productive funds reported by 144 colleges was $1,876,873; the aggregate receipts for the year reported by 195 colleges (exclusive of that from productive funds) was $2,718,506; and the amount of scholarship-funds reported by 49 colleges was $1,641,743.

Material prosperity—benefactions.—The aggregate of benefactions to universities and colleges within the period covered by this report was $8,238,141. A detailed statement of them will be found in Table XXIV of the appendix.

This statement shows how largely the working means of the higher schools of learning have been increased during the year past by the generous bequests and gifts of liberal citizens. Contributions ranging from a few hundred dollars up to one bequest of

of about $3,000,000, have come in to extend their buildings, augment their endowments, and enable them to offer wider advantages than ever previously could be presented.

Even the generally impoverished South gives evidence of sharing this advancement. Thus Richmond College, Va., holds $70,000 in hand for a new and elegant building which it is erecting, with nearly $200,000 more subscribed. Wake Forest, N. C., has had $40,000 given it; Emory College, Ga., $20,000; the University of Georgia $28,000; Center College, Ky., $80,000; Berea, Ky., $26,000; Vanderbilt University, Nashville, Tenn., $511,000. The President of Emory College states indeed that "within the past five years more has been done for the endowment of southern colleges than within the twenty years immediately preceding. The tokens of this general prosperity are various in kind. Trinity College, Hartford, Conn., besides receiving $60,000 as a gift, has disposed of its old location in the city for (it is said) $400,000, with which sum it is preparing to erect an elegant new building on a commanding site near by. The University of Pennsylvania, Philadelphia, receiving also $60,000, has erected for itself a fine new college-edifice in West Philadelphia, disposing of its old site to the United States for upwards of $600,000. The Northwestern Christian University, at Indianapolis, gains $150,000 by a like removal. Cornell has added to its previously large accommodations the new Sage College for Women, at a cost of $150,000. La Fayette, (Pa.,) Princeton, (N. J.,) and Yale, (Conn.,) have had erected for them each a noble building for its scientific school, costing, in the first-named, $250,000;* in the second, $100,000; and in the third, $110,000. The University of Michigan has linked its two extensive wings together with a great central hall costing $125,000. The Northwestern University, of Evanston, Ill., has had its property in Chicago so enhanced in value by the rebuilding of the burned portion of the city, as to be in the way to a prospective wealth which will possibly make it the wealthiest in the State, if not in the United States, the estimate reaching from $10,000,000 to $20,000,000.

The exceptions to this general prosperity are found chiefly in the South, where the prevalent impoverishment has caused the closing of six colleges, and in the West, where, amid the almost superabundant institutions of this kind, six that have died and three that are suspended can hardly be missed.

Degrees.—For a detailed exhibit of the number and kinds of degrees conferred by the colleges in 1873, see Table XIII of the appendix.

Following the example of the University of Virginia and of Harvard University, many of the colleges have recently announced that degrees of bachelor of arts or of master of arts will only be conferred on candidates who shall have passed special examinations for such degrees.

Museums.—The statistics of museums of natural history and of art and archæology, connected with these institutions, will be found in Tables XVII and XVIII of the appendix.

Co-education in colleges.—The number of institutions embraced in Table VIII, which reported women in preparatory or regular collegiate classes, or in both, was 97, not including the five colleges for women in the State of New York, to which young men are not admitted as students. Of this number, 67 are situated in the Western, 17 in the Southern, 8 in the Middle, and 5 in the New England States. The total number of women reported in these 97 colleges was 7,357, of whom 5,410 were in preparatory studies and 1,947 in collegiate classes. The number of students in the five colleges for women in New York was 788, of whom 370 were in preparatory sections and 418 in the regular collegiate courses. For further statistics relating to superior instruction of women and for the Harvard examinations for women, see the preceding summary of Table VII.

*Pardee Hall, the new scientific school of La Fayette College, Pennsylvania, a generous gift from Mr. Ario Pardee, of that State, must rank among the finest buildings of its kind in the United States. Its cost of $250,000, added to Mr. Pardee's previous gifts, makes the aggregate of his benefactions to the college $500,000.

The rise of colleges for colored people.—The claim of our colored citizens to an education which may fit them for the full privileges and high responsibilities of their new position is leading to increasing openings for their entrance on a course of collegiate and professional instruction. Yale will graduate in 1874 one colored student from her academic department and one from her theological school. Lincoln University, Pennsylvania, especially designed to meet the wants of this race, reports now 81 students in its preparatory school and 94 in its college-classes. Howard University, District of Columbia, reports 60 unclassified and 36 collegiate, besides law-, medical, and normal students. Berea College, Kentucky; Fisk University, Tennessee; Alcorn University, Mississippi; and Straight University, New Orleans, La., have all opened their doors to students "without distinction of sex or race," and at Berea the experiment of uniting the colored and white races appears to be an entirely successful one. In the others colored students in large numbers are availing themselves of the opportunities for education and demonstrating their capacity to make rapid and encouraging advance.

Nor are these the only institutions open to them. The Hampton Institute, Virginia; the Freedmen's College, Tennessee; Tougaloo University, Mississippi; Talladega College, Alabama; and Atlanta University, Georgia, have been established for their especial benefit, mainly by northern friends; while Brown's University, Florida, and the new University of New Orleans have grown out of the efforts of the Baptist Church for their improvement. The Clark Theological School, South Carolina, is also meant to be the basis of a university for colored men. We have thus twelve existing institutions for their higher education and at least one more in prospect.

Elevation of standard, new departments, &c.—It is gratifying to note a constant and well-directed effort in most of the leading colleges to raise the standard of admission to the college-curriculum as well as the standard for the several degrees conferred.* The scope of studies is being widened; more prominence than ever before is given to English and modern studies; special and post-graduate-courses have already been established in several of the larger institutions, while in others initiatory steps have been taken for instituting similar courses; new and improved buildings are taking the places of the old structures, and the means of illustration, in the way of museums and cabinets of natural history and of art and archæology, are rapidly accumulating.

Harvard entrance-examinations.—Several important changes in the requirements for admission to Harvard University in 1875 and 1876 are set forth in the appended extracts from the president's report for 1872–'73. These new requisitions by our oldest university, designed to secure a more thorough preparation of students in English subjects, (including some branch of elementary science,) cannot fail to produce a most beneficial effect on all grades of lower schools, both public and private. The reasons for the changes will commend themselves to every class of educators.

In the year 1875 the additional requisition will be made upon all candidates for admission that they shall be able to translate easy French prose at sight, with the option of substituting German for French. Already about one-half of the students come to college qualified to pass such an examination, and those who are not able to pass it are required to study French in their sophomore year in addition to the regular work of that year.

In the year 1876 all candidates for admission will be required to pass an examination in one of the following subjects of elementary science: Elementary botany, rudiments of physics and of chemistry, or rudiments of physics and descriptive anatomy, the selection of the subject being left to the candidate.

In all changes in the preparatory course of study which have been here set forth, the single aim of the faculty has been to make that course correspond more nearly wth the best possible course of study for young men, up to an average age of 18, who purpose to pursue non-professional studies for four years more. As the learning given in American colleges has been predominantly classical and mathematical, it is not surprising that the proficiency of a candidate in the classics and in mathematics has been the point chiefly considered in examinations for admission. That teachers and

* The preparatory schools are already striving to grade up their classes to a meeting of these new requirements, the means of doing which occupied attention in the Classical Teachers' Association in 1873 and will further occupy it in 1874. Even so far west as Cincinnati we read of a city-school proposing to make its course correspond with the Harvard elevation.

pupils in preparatory schools should direct their efforts mainly to meeting these specific demands of the colleges, and should subordinate the intrinsic importance of studies to their serviceableness in securing admission to college, is the only result that could be expected. Neither teacher nor pupil could be much blamed, for instance, for practically setting the writing of good Latin above the writing of good English. It is plain that the only remedy for this grave evil is for the colleges to show, by the nature of their admission-examinations, that they will not accept the rudiments of scholarship as amends for deficiences in the rudiments of education. The colleges, as the representatives of the value of the study of the classics, should be especially careful not to give plausibility, by any act or neglect of theirs, to the groundless assumption that the discipline of mind secured by the preliminary classical training must be purchased by sacrifice of some knowledge which a well-educated young man of 18 ought to possess. Co-operation on the part of the leading colleges is much needed in enforcing upon teachers, and in enabling them to enforce upon their pupils, the necessity of thorough training in all the elements of a sound education. As soon as those colleges unite in demanding of candidates for admission a thoroughly good training in English no less than in classical subjects, the schools which feed the colleges will in turn be able to exact from the lower schools an efficiency which they now greatly lack. The service which American colleges could thus indirectly render to American education it is difficult to overestimate. Were a good degree of proficiency in a well-constructed course of English studies strictly enforced as a condition of admission into our leading colleges, the quality of education received by all pupils in all schools directly or remotely affected by such action would be sensibly improved. Hitherto a too exclusive concern for preliminary training in the classics and mathematics has cut off the higher institutions for education in this country from a part of that influence upon the lower, which it is both their interest and their duty to exercise.

Students in institutions for superior instruction.—The following table shows the estimated population in each State between 16 and 20 years of age, the number of students reported in the colleges, in schools of science, and in institutions for the superior instruction of women, and the number of these students in the several States to each thousand of the population between the stated ages.

Statistical summary of number of students, &c., in institutions for superior instruction.

State.	No. of population between 16 and 20 years of age, (estimated.)	No. of students in colleges.	No. of students in schools of science.	No. of students in schools for the superior instruction of women.	Total number of students reported in these institutions.	No. of such students in 1,000 population between 16 and 20 years of age.

TABLE IX.—SCHOOLS OF SCIENCE.

The following statement shows the number of institutions and departments of this class, with instructors and students, as reported to this Office, in each year from 1870 to 1873, inclusive. The numbers under 1873 include the National Military and Naval Academies:

	1870.	1871.	1872.	1873.
Number of institutions	17	41	70	70
Number of instructors	144	303	724	749
Number of students	1,413	3,303	5,395	8,950

The following are summaries of the statistics as reported in Table IX of the appendix:

a See Table VIII—Colleges.
b One school not yet organized.
c Two schools do not give statistics.
d One school does not give statistics; only one gives instructors.

Part 1 of Table IX relates to the colleges endowed by the national land-grant. The number of these reporting was 39; number of instructors, 399; number of students, 4,911; of students in regular course, 3,414; in special courses, 392; in post-graduate courses, 67; and in preparatory course, 1,038.

Part 2 of Table IX relates to schools of science not so endowed. The number of these reporting, not including the National Military and Naval Academies, was 29; number of instructors, 251; number of students, 3,542; of students in regular course, 2,982; in special courses, 141; in post-graduate-courses, 31; and in preparatory course, 388.

Graduates in 1873.—The number of degrees conferred in course by institutions embraced in Part 1 was 266, (see Table XIII.) The number of degrees conferred in other scientific colleges (Part 2 of Table IX) was 171. Total number of degrees in science by colleges embraced in Table IX, 437.

For detailed statement of degrees conferred, see Table XIII of the appendix.

For museums and cabinets of natural history, &c., connected with any of these institutions, see Table XVII of the appendix.

Benefactions.—Table XXIV exhibits the benefactions to the agricultural and mechanical colleges and schools of science during the past year.

Date of organization.—Of the 39 institutions reported established under the grant, 3 were organized in 1863, 3 in 1864, 5 in 1865, 4 in 1866, 2 in 1867, 4 in 1868, 1 in 1869, 3 in 1870, and 7 in 1872. Six of the colleges have not yet effected their organization and the date of organization of one is not reported. Three States, viz, Florida, Louisiana, and Nevada, have not yet established colleges under the grant.

The agricultural and mechanical colleges (15) in the following-named States have severally independent charters and are not connected with State-universities or other colleges: Alabama, Arkansas, Illinois, Indiana, Iowa, Kansas, Louisiana, Maine, Maryland, Massachussetts, (2,) Michigan, Ohio, Pennsylvania, Texas, and Virginia.

The colleges on the foundation of the land-grant in these States severally form departments of State-universities or colleges: California, Connecticut, Delaware, Georgia, Kentucky, Minnesota, Mississippi, (2,) Missouri, (2,) Nebraska, Nevada, New Hampshire, New Jersey, New York, North Carolina, Oregon, Rhode Island, South Carolina, Tennessee, Vermont, Virginia, West Virginia, and Wisconsin.

Finances.—An effort was made to present a full statement of the endowments and other property of the colleges, the results of which will be found in the summary. It will be seen that many of them were unprepared to respond fully to these inquiries. It is hoped that future efforts of this nature may be more successful.

Preparatory training.—The statistics show that nearly one-fourth of the total number of students in these colleges were in the preparatory sections. As in the case of the classical colleges in some parts of the country, colleges of agriculture and the mechanic arts are also obliged to bear the burden of preparing pupils for the scientific curriculum. This evil, if so it may be called, must be borne with, until either the higher grades of the public schools or the private schools and academies afford the facilities for the requisite preparatory training. The academies and high schools, as will be seen by referring to the tables, report 2,777 in preparatory scientific courses. It may be doubted, however, whether any considerable number of these students receive special preparation fitting them for the colleges. The colleges themselves complain that a large proportion of the pupils sent up to them from the lower schools are poorly prepared; that in some necessary branches they are totally unfitted, and that a great deal of time must be devoted to making up the students' deficiencies in mere elementary branches. (See remarks on this subject under "Secondary schools," p. xxxvi of this report.) There are, however, indications that in some of the States these hinderances will soon cease to exist. As the number of graduates of the scientific colleges increases, it is to be expected that many of them will take up the business of scientific instruction in the higher grades of the public schools, as well as in the academies and other private institutions. What is urgently needed is a class of schools specially devoted to this preliminary work. Gifts and endowments might be most usefully bestowed for the building-up of institutions which should be

directly subsidiary to the scientific colleges. Already in the New England States, and in a few States outside of New England, schools are being established which shall do for the scientific colleges what their classical preparatory schools are doing for the colleges of liberal arts.

The standard of admission.—The requirements for admission to the colleges having no preparatory course must, in most cases, be called very moderate. These are: In Kentucky, "a fair knowledge of arithmetic, grammar, and elements of algebra. In Maine, "a satisfactory examination in arithmetic, geography, grammar, United States history, algebra to quadratics, and five books in geometry." In the Massachusetts Agricultural College, "a written examination in arithmetic and algebra through simple equations, geography, English grammar, and history of the United States." In the Massachusetts Institute of Technology, "a satisfactory examination in arithmetic, (including the metric system of weights and measures,) algebra through equations of the second degree, plane- and solid geometry, French grammar through regular and irregular verbs, English grammar and composition, rhetoric, (so much as is included in the first part of Bain's Rhetoric, or its equivalent,) and geography. In Minnesota, "a satisfactory examination in reading, writing, spelling, English grammar, United States history, geography, arithmetic, and elementary algebra." In the Sheffield Scientific School, Connecticut, "a thorough examination in arithmetic, including the metric system; in Davies's Bourdon's algebra as far as the general theory of equations, or in its equivalent; in geometry in the nine books of Davies's Legendre, or their equivalent; in plane-trigonometry, analytical trigonometry inclusive; in geography, United States history, and English grammar, (including spelling,) and in Latin. In this last, six books of Cæsar's Commentaries, or their equivalent—as, for example, the prose of the first portion of Allen's Latin Reader, closing with Sallust—is the least amount which will be accepted in the examination."

Recent organization.—Reference has been made above to the fact that many of the colleges on the foundation of the national grant of 1862 have been but recently organized; 7 of them were opened in 1872, and 18 of the 39 embraced in the table have been in operation about five years only. In several of the States it has not, thus far, been possible to fully equip and organize colleges on account of the political and social conditions resulting from the civil war.

The law of Congress.—There seems to be in the popular mind a misapprehension of the scope of the law of 1862, providing for the establishment of these institutions. The law reads as follows: "The proceeds of the grant shall be applied to the endowment, support, and maintenance of at least one college where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts, in such manner as the legislatures of the States may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions." At the time of the passage of the act there were in America very few instrumentalities for adequate instruction in either theoretical or applied science, while in Europe the schools of science had already reached a high degree of development, and were exercising a far-reaching influence, not only on all the professions outside of the theological and legal, and in all departments of arts and manufactures, but also greatly modifying theories and methods of education in nearly all its phases. The international expositions had opened the eyes of our educators and scientists to the inferiority of our country in almost all departments of applied science. Our students were resorting to the European schools for scientific training. Few original scientific works of authority were produced or could be produced here, from the lack of the requisite opportunities for scientific culture. The country abounded in material wealth; it was poor and provincial in the sciences and arts. What was demanded for our country was, therefore, a class of schools or colleges combining in their curriculum means for thorough education in the sciences, both theoretical and applied, and in all the elements of true modern culture. Such appears to have been the intention of the act of

1862. Its spirit was broad and liberal, excluding nothing which experience had shown to be valuable in modern education, while expressly providing for means of scientific instruction in agriculture and the mechanic arts.

Further provisions of the act.—The act provided that "the proceeds of the land-grant should constitute a perpetual endowment-fund, and that no portion of the fund or the interest thereon should be applied, directly or indirectly, to the purchase, construction, preservation, or repair of any building or buildings; that the annual interest should be applied without diminution to the purposes mentioned in the fourth section, except that a sum not exceeding 10 per centum of the proceeds of the land-scrip received by any State might be expended for the purchase of lands for sites or experimental farms whenever authorized by the respective legislatures of said States."

Time required.—It is no less true of educational than of political institutions: they are not wholly made; they are mainly a growth. It could hardly be expected that these colleges, having so wide an educational scope, making new demands on subordinate grades of instruction, requiring a new order of trained professors and teachers, besides large outlay in buildings, laboratories, museums, cabinets, libraries, and apparatus, would, under the most favorable circumfstances, attain a very complete development in the course of a decade. There are doubtless great deficiencies to be supplied in many of them. It is believed that these deficiencies are fully recognized by the faculties of the institutions in which they exist and that measures are in progress to supply them. It is for the interest of all that a considerate policy should prevail; that there should be a gradual, sure development, rather than a hasty and forced one. The colleges have apparently pursued this policy, sedulously working to fulfill the end of their establishment and studiously avoiding unfounded claims and excessive pretensions.

Agricultural and mechanic arts.—The colleges which have organized their curriculum claim to have provided for special instruction of students in agriculture and in the mechanic arts. What would constitute a liberal and practical education in agriculture and the mechanic arts? It would probably be admitted to comprise, besides a respectable knowledge of the vernacular and of its literature, a knowledge of the laws of mechanics and physics; a knowledge of natural history and of geology and botany; of experimental chemistry, both organic and inorganic; of engineering and surveying as related to irrigation and the reclaiming of waste lands; of political, rural, and domestic economy. Every one of these branches of knowledge is intimately related to scientific agriculture and the mechanic arts. Certainly the demands of modern science in either or both of these fields far outrun the usual popular and superficial estimate of them. But while science was appointed to be the leading aim of the schools, there was to be no exclusion of other studies which are suited "to bring the light of general culture to illuminate the technicalities of special pursuits." The interest of the country and its honor alike require that the colleges should be thoroughgoing and maintain courses of instruction in all departments of science. Thus only can they meet the exigencies of the times and place our country in these respects on a par with European nations.

Graduates in agricultural science.—The colleges have been sometimes criticised on the ground that their graduates in agricultural science have been comparatively few, or rather that few of their graduates have become practical farmers. If the colleges made no provision or insufficient provision for instruction in this department, there might be some justification for this criticism. It is believed, however, that all the colleges have provided for special instruction in agricultural science and that the graduates therein bear a fair proportion to those in other specialties. Still, it is not quite logical to blame the colleges for the choice of professions or callings of their graduates. No one would think of reproaching the classical colleges because they do not make all their graduates lawyers, or doctors, or clergymen. What has distinguished our country is the freedom which all enjoy in choosing their callings. Guilds, class-prejudices, systems of caste, do not operate here, as in older countries, to keep the sons in the same paths which their fathers trod. All thinkers on political and social science have recognized in this unrestricted freedom one of the chief causes of the wide general intelligence, the intellectual activity and enterprise of our people.

Tendencies of the last thirty years.—In the absence of all statistics on this head it might have been reasonably assumed, in view of the political and social tendencies of the period, that no great number of educated young men would resort to the business of scientific agriculture. Emerson said thirty years ago, at a literary festival, "Whatever events in progress shall go to disgust men with cities and infuse into them the passion for country-life and country-pleasures will render a service to the whole face of the continent and will further the most poetic of all the occupations of real life." Whatever tendencies were visible then to such a result, new counteracting events have led away from, rather than to, scientific agriculture. The energies of the nation have been absorbed for the last twenty years, more than ever before, in commercial speculations, in the development of trade and manufactures, in carrying forward vast systems of public works, in the exploration of a continent. All the tendencies of the times have contributed to the concentration of the population in towns and cities. Young men of education have flocked to the market and the forum; neither personal predilections "nor paternal acres" have turned many to the "sanative and tranquillizing influences" of agricultural life. The most eloquent commendations of agricultural pursuits, from Zenophon and Cicero down to our times, have come from those who knew little practically of the mattock and the plow. These things, combined with the large returns on capital, with the comparatively easy condition of the working classes, the semi-commercial spirit of the agricultural class, and the persistent inculcation by some leaders of opinion of the pleasant doctrine that anybody without training is good for anything or everything, have conspired to a tardy appreciation of the value of scientific methods and processes, both in agriculture and the mechanic arts. Especially is this the case where the results of these methods are such as do not quickly obtrude themselves on the mind. The colleges came into being amid these tendencies; they have been obliged in some sense to struggle against them. But there are indications that other tendencies are beginning to operate. The results of scientific methods in their applications to commerce, manufactures, mining, agriculture, &c., are becoming more widely known and more fully appreciated, the demand for men educated in these methods and processes is annually increasing, and a greater number of students are seeking the advantages of the best-appointed colleges.

Gifts, endowments, and proceeds of sale of land-scrip, &c.—Individual benefactions and State- and other appropriations to these colleges are an earnest of the growth of a healthy public sentiment in respect to them. Since their establishment more than $6,000,000 have been given for buildings, apparatus, and for endowments of professorships, scholarships, &c. Individual gifts alone reach the sum of $3,363,350. The amount received thus far from the sale of agricultural-college-scrip has reached the sum of $6,567,720. It will be seen that the colleges in many of the States have received from State-, county-, and municipal appropriations and from individual benefactions sums largely in excess of the proceeds of the land-scrip. The receipts of each, so far as has been ascertained, from proceeds of land-scrip and from other sources, (*i. e.*, donations, appropriations, &c.,) are as follows: Alabama, $216,000 from land-scrip $102,700, from other sources; Arkansas, $135,000 from land-scrip, $217,000 from other sources; California, $750,000 from land-scrip; Connecticut, $135,000 from land-scrip, $350,000 from other sources; Delaware, $83,000 from land-scrip; Georgia, $243,000 from land-scrip, $28,400 from other sources; Illinois,* $319,494 from land-scrip, $685,300 from other sources; Indiana, $212,238 from land-scrip, $295,000 from other sources; Iowa,* $11,742 from land-scrip, $21,385 from other sources; Kansas, $190,000 from land-scrip; Kentucky, $165,000 from land-scrip, $210,012 from other sources; Louisiana, $182,600 from land-scrip, $10,000 from other sources; Maine, $116,359 from land-scrip, $133,000 from other sources; Maryland, $112,500 from land-scrip, $45,000 from other sources; Massachusetts Agricultural College, $157,538 from land-scrip, $441,186 from other sources; Massachusetts Institute of Technology, $78,769 from land-scrip, $511,026 from other sources; Michigan,* $207,500 from land-scrip; Minnesota,* $168,681 from land-scrip, $195,500 from other sources; Uni-

* Land not all sold.

versity of Mississippi, $75,600 from land-scrip; Alcorn University, Mississippi, $113,400 from land-scrip, $105,000 from other sources; Missouri, $261,795 from donations, appropriations, &c.; New Hampshire, $80,000 from land-scrip, $114,000 from other sources; New Jersey, $116,000 from land-scrip, $93,000 from other sources; New York, $602,792 from land-scrip, $1,114,909 from other sources; North Carolina, $135,000 from land-scrip, Ohio, $342,450 from land-scrip, $384,215 from other sources; Oregon, $10,000 from donations, appropriations, &c.; Pennsylvania, $439,186 from land-scrip, $117,699 from other sources; Rhode Island, $50,000 from land-scrip; South Carolina, $130,500 from land-scrip; Tennessee, $271,875 from land-scrip, $131,085 from other sources; Vermont, $122,626 from land-scrip, $49,359 from other sources; Hampton Normal and Agricultural Institute, Virginia, $95,000 from land-scrip, $250,376 from other sources; Virginia Agricultural and Mechanical College, $190,000 from land-scrip, $36,683 from other sources; West Virginia, $90,000 from land-scrip, $183,970 from other sources; Wisconsin,* $228,870 from land-scrip, $40,000 from other sources.

Free scholarships.†—These collegeshave already afforded to a great number of youths means of education, which, without the national grant, they never would have obtained. The number of free scholarships in the colleges already organized is at present over 2,700.

Local influences.—The type of development of the colleges in the departments of science must in some degree be modified by geographical position, natural products, and dominant industrial interests. The colleges in the agricultural States would be likely to have more students and graduates in scientific and practical agriculture; in the non-agricultural States, more of the graduates would be divided among other technical pursuits and professions. Although present statistics are incomplete on this head, it will be seen that they point to this result.

Graduates and former students.—Of students who have been connected with the Agricultural and Mechanical College of Alabama, 58 are reported as engaged in agricultural and mechanical pursuits. The college in Arkansas has no graduates as yet. The Sheffield School of Yale College has educated, in whole or in part, 75 professors in science who are now in places of responsibility in colleges in different parts of the country, besides many who are serving the Government in the Coast Survey, Hydrographic Bureau, National Observatory, and as geologists, explorers, and topographers. Many hundred students have also pursued special courses in this school.

In Delaware, it is estimated that two-thirds of those who have been connected with the college are engaged in agricultural and mechanical occupations. The college in Georgia has as yet no graduates. Of 51 former students of the college in Illinois whose present occupations are known, 30 are engaged in agriculture, 4 in manufacturing, 7 in teaching, 4 in mercantile pursuits, and 6 in law and other professions. The mechanical and engineering departments were slower in developing, and not so large a proportion of the students are yet in the field. Nearly 100 of those who have been students in the college in Iowa are engaged in agriculture. Of those who have attended courses in the Agricultural and Mechanical College of Kentucky, between 40 and 50 per cent. are engaged in agricultural and mechanical occupations. Of the 13 graduates of the college in Maine, 4 are civil engineers, 2 farmers, 1 manufacturer, 1 fish-breeder, and the others are teaching temporarily. Of 34 who left before graduating, several have become farmers, others teachers, &c. Of the graduates of the Massachusetts Agricultural College, 66 are engaged in agriculture and 37 in mechanical occupations. The Massachusetts Institute of Technology has graduated 9 in the department of mechanical engineering, 7 in the department of civil and topographical engineering, 8 in that of geology and mining engineering, 8 in the department of mining engineering, 22 in the department of civil engineering, 13 in the department of chemistry, 2 in the department of science and literature, and 1 in the department of architecture. Besides these, a large number

* Land not all sold.

† Doubtless much of the complaint that has been heard in reference to the colleges would never have arisen if the States had restricted a certain proportion of free scholarships to such students only as purposed to devote themselves to practical agriculture.

of students have taken special courses in the institute. Of the 73 graduates of the college in Michigan down to 1872, inclusive, 21 are farmers, 7 are fruit-growers, 4 are engineers, 2 are mechanics, 7 are professors, and 5 are teachers; 5 are students of special science, the remainder are engaged in various professions. The faculty estimates that more than half of the students who have been connected with the college in Minnesota are now engaged in agricultural occupations. The agricultural and mechanical college in Mississippi has as yet no graduates. The college in Missouri graduated its first class in 1873. Of the 5 graduates, one is assistant professor, the others are engaged in agriculture. The college in Nebraska has as yet no graduates. All the graduates of the New Hampshire college are engaged in agricultural and mechanical occupations except one, who is teaching. Of the 47 students who graduated between 1868 and 1871 from the agricultural and mechanical department of Rutgers College, New Jersey, whose occupations are known, 57 per cent. are civil engineers, architects, and manufacturers, and 8½ per cent. are engaged in agriculture. The occupations of the graduates of the agricultural and mechanical department of Cornell University, New York, are not known to the college. The college in Ohio is not fully organized and has no graduates. The college in Oregon has no graduates. About one-third of the graduates of the Agricultural and Mechanical College of Pennsylvania have engaged in agricultural and mechanical pursuits. Of the 15 graduates of the college in Tennessee, 2 are farmers, 1 is a civil engineer, 1 is a mechanic, 6 are teachers, 1 at West Point, the others in various colleges. Of the graduates of the college in Vermont, 9 are engaged in agriculture and 21 in mechanical occupations. The Agricultural and Mechanical College at Blacksburg, Va., has as yet no graduates. The graduates of the Hampton Normal and Agricultural Institute (for colored students) are, with few exceptions, engaged in teaching for six months in the year; for the remainder of the time, in farming or mechanical occupations. A large number of the graduates of the college in West Virginia (West Virginia University) are reported as engaged in agricultural or mechanical pursuits. The faculty reports that one-fourth of the former male students of the college in Wisconsin (University of Wisconsin) are engaged in agricultural and mechanical occupations.

The remarks of Governor Jewell in transmitting to the legislature the last annual statement of the governing-board of the Sheffield Scientific School may without impropriety be applied to several of the more thoroughly-organized colleges:

The benefit which the scientific school has conferred upon the State, in turning out young men who, on leaving the institution, are enabled to assume the position of leaders in their several callings and of educators of the people to a higher grade of culture, increasing the productive brain-capacity as well as the material wealth of the country, cannot be estimated in dollars and cents. From all parts of the country come back most favorable reports of the graduates who have been sent out, and their influence, already great, is constantly on the increase.

TABLE X.—SCHOOLS OF THEOLOGY.

The following is a comparative statement of the number of schools of theology (including theological departments) reporting to this Bureau each year, from 1870 to 1873 inclusive, with the number of professors and number of students:

	1870.	1871.	1872.	1873.
Number of institutions	80	94	104	110
Number of instructors	339	369	435	573
Number of students	3,254	3,204	3,351	3,838

For statistics in detail of each school reference is made to Table X of the appendix. The following summary shows the number of schools in the several States, the number of volumes in libraries, the increase in libraries during the year; also the amount of endowment-funds and the value of other corporate property.

Summary of number of schools of theology, with number of volumes in libraries, amount of corporate property, &c.

State.	Number in each State.	Volumes in library.		Corporate property, &c.				
		Whole number.	Increase since October 15, 1872.	Amount of property of corporation.	Value of grounds and buildings.	Amount of productive funds.	Income of productive funds.	Receipts from all other sources.
Alabama	1	1,000	20	.....	$75,000	.....	.....	.....
California	2	5,000	540	$250,000	75,000	$46,000	$5,520	.....
Connecticut	3	23,000	.....	309,984	.....	.....	.....	.....
Illinois	10	36,442	4,292	1,005,000	578,850	1,059,104	110,662	$44,308

West Virginia	1	3,000	.....	20,000	.....	.....	.....	.....
Wisconsin	3	12,800	660	120,000	100,000	30,600	3,000	33,306
District of Columbia	2	1,100	700	.....	15,000	.....	.....	.....
Total	110	562,484	36,393	7,768,498	5,190,737	5,455,097	362 712	385,128

The number of schools pertaining to the several religious denominations, with the number of professors and students therein, is shown in the appended abstract.

Statistical summary of theological seminaries.

Denomination.	Number of seminaries.	Number of professors.	Number of students.
Roman Catholic	16	123	603
Baptist	14	65	567
Presbyterian	14	74	532
Lutheran	13	53	487
Protestant Episcopal	8	28	313
Congregational	8	51	324
Methodist Episcopal	5	45	207
Reformed	4	16	109
United Presbyterian	4	12	70
Methodist	3	19	126
Christian	2	6	110
Episcopal	2	9	12
Free-Will Baptist	2	9	28
Unsectarian	2	9	58
United Brethren	2	4	28
Universalist	2	13	35
African Methodist Episcopal	1	2	20
Cumberland Presbyterian	1	2	47
German Reformed	1	3	10
Methodist Episcopal, (South)	1	3	17
Moravian	1	3	29
New Jerusalem	1	3	.....
Presbyterian, (South)	1	4	60
Union Evangelical	1	6	28
Unitarian	1	11	18
Total	110	573	3,838

The number of degrees or diplomas conferred in theology in 1873 was 683. A detailed statement of these will be found in Table XIII of the appendix.

Benefactions.—The amount of benefactions to schools of theology from October 15, 1872, to October 15, 1873, was reported to be $619,801. For further information in respect to these benefactions, see Table XXIV of the appendix.

TABLE XI.—SCHOOLS OF LAW.

The following is a statement of the number of schools of law reporting to this Bureau each year, from 1870 to 1873 inclusive, with the number of instructors and number of students:

	1870.	1871.	1872.	1873.
Number of institutions	28	39	37	37
Number of instructors	99	129	151	158
Number of students	1,653	1,722	1,976	2,174

Statistics in detail of these schools will be found in Table XI of the appendix. The following summary shows the number of schools in the several States, the number of instructors and students, volumes in libraries, and increase in libraries during the year:

Statistical summary of number of schools of law, &c.

State.	No. of schools.	No. of instructors.	No. of students.	Volumes in library.	
				Whole number.	Increase since October 15, 1872.
Connecticut	1	5	46	7,000	.....
Georgia	1	3	17	700	153
Illinois	2	5	35	350	.....
Indiana	3	7	53	2,400	.....
Iowa	2	9	96	2,500	500
Kentucky	1	3	26	3,000	30
Louisiana	1	4	39	.....	.....
Massachusetts	2	17	192	16,200	200
Michigan	1	4	331	3,000	.....
Mississippi	1	1	7	500	.....
Missouri	2	16	68	4,000	.....
New York	4	19	547	8,000	500
North Carolina	1	2	25	.....	.....
Ohio	3	14	56	3,050	.....
Pennsylvania	2	11	64	190	.....
South Carolina	1	4	16	.....	.....
Tennessee	1	2	103	600	.....
Virginia	3	6	101	.....	.....
Wisconsin	1	7	23	500	.....
District of Columbia	4	19	329	1,000	100
Total	37	158	2,174	52,990	1,483

Two of the schools, viz, the Ohio State and Union Law College and the law-department of Richmond College, did not report the number of students for the year.

Degrees.—The number of graduates of the schools in 1873 was reported to be 706. The number of degrees conferred by the several schools, so far as reported, will be found in Table XIII of the appendix.*

TABLE XII.—SCHOOLS OF MEDICINE.

The following is a comparative statement of the number of schools of medicine, dentistry, and pharmacy reported to the Office each year, from 1870 to 1873 inclusive, with the number of instructors and students:

	1870.	1871.	1872.	1873.
Number of institutions	63	82	87	94
Number of instructors	588	750	726	1,148
Number of students	6,943	7,045	5,995	8,681

The annexed summary of Table XII (to which reference is made for further and detailed statistics) shows by States the number of schools of each class, the number of students, and the number of graduates in 1873, the number of volumes in libraries and increase in libraries for the year; also the number of alumni and the amount of property, funds, &c., of institutions, so far as these items were reported:

*Nearly all of these schools being departments of universities and colleges, it was found inconvenient to present separate statements of endowments and other property.

Summary of number of schools of medicine, &c.

State.	Number of schools.	Number of instructors.	Number of students.	Graduates at commencement of 1873.	Number of alumni.	Volumes in library.		Corporate property, &c.				
						Whole number.	Increase since October 15, 1872.	Amount of property of corporation.	Value of grounds, buildings, and apparatus.	Amount of productive funds.	Income from productive funds.	Receipts for the last year from all other sources.

Degrees.—The number of graduates in medicine and surgery in 1873 (including 176 in dental surgery) was reported to be 2,567. The number of graduates in pharmacy was 183. The number of degrees conferred by the several schools will be seen by reference to Table XIII of the appendix.

Benefactions.—The amount of benefactions to schools of medicine from October 15, 1872, to October 15, 1873, was reported to be $78,600, (see Table XXIV of the appendix.)

TABLE XIII.—DEGREES.

The table of the appendix shows the number and kind of degrees conferred in course and *honoris causa* by the universities, colleges, and professional schools in 1873. The following summary exhibits the number of degrees of each kind conferred by institutions in the several States and the total of the same for all the States and the District of Columbia.

Classification of degrees.—The number of degrees of all classes conferred in course was 8,563; honorary, 460. These were distributed as follows: In letters, 3,599 in course, 141 honorary; in science, 777 in course, 11 honorary; in philosophy, 141 in course, 20 honorary; in art, 7 in course, 1 honorary; in theology, degrees and diplomas in course 683, 172 honorary; in medicine, 2,612 in course, 4 honorary; in law, 706 in course, 108 honorary; others, (including 174 in pharmacy,) 238 in course, 3 honorary.

Institutions and degrees.—The number of institutions of the several classes embraced in the summary, with the number of degrees conferred by each class, is as follows: Universities and colleges of liberal arts, 226; degrees conferred in course, 3,446; *honoris causa*, 457. Colleges of agriculture and the mechanic arts and schools of science, 43; degrees conferred in course, 437. Colleges, &c., for the superior instruction of women, 54; degrees conferred in course, 505; *honoris causa*, 3. Total number of degrees conferred on women in institutions embraced in Tables VII and VIII of the appendix, 564 in course; *honoris causa*, 4. Schools and departments of theology, 60; degrees conferred in course, 683. Schools and departments of law, 30; degrees conferred in course, 706. Schools and departments of medicine and pharmacy, 84; degrees conferred in course, 2,786.

TABLE XIV.—MILITARY AND NAVAL ACADEMIES.

Special attention is invited to the details of the examinations of applicants for admission to these Academies in 1873, as presented in Table XIV of the appendix. Coming from all parts of the United States, as these lads do, for examination, the result is very suggestive in regard to the condition of elementary education.

The following extract from the report of the Board of Visitors of the United States Military Academy for the year 1873 refers pointedly to the lack of thoroughness of instruction in our public schools:

The fact that of 134 appointees so large a number as 49 were rejected on the literary examination was a surprise to the board, as no doubt it will be to the country. This board takes occasion to say, from its own observation on the spot, that this result is due, not to any undue elevation of the standard of admission, nor to any excessive severity in the examination, but in some cases to inconsiderateness in making appointments; in others, to the failure of the appointee to appreciate the honor and duty to which he is called; in a few others, to the lack of facilities for preliminary education; and, most of all, to want of thoroughness in the schools of the country with respect to their primary work. This Academy owes it to itself, and to its influence as a national institution on the whole system of popular education, to render and publish to the world this honest verdict. If our school-boards and superintendents and teachers, in the North and in the South, in the East and in the West, will but heed the verdict and use due diligence to correct this great defect, some abiding good may come from the mortifying experience of this year's examination of candidates for admission to the Academy. * * * * With the appointment announced a year beforehand and the intervening time wisely improved, no candidate of ordinary mental capacity need fail to pass the examination here.

There having been various inquiries about these examinations, and a disposition manifested to complain of their severity, I insert the following letter from Colonel Ruger, Superintendent of the Academy at West Point. The limited requirements for admission will be a surprise to those not acquainted with the facts.

United States Military Academy,
West Point, N. Y., November 24, 1873.

Dear Sir: I have the honor to acknowledge receipt of your letter of the 22d instant, in which you state that the reports of failures in the examinations for admission to the Military Academy are attracting more and more attention and that inquiries are made as to whether the questions asked of candidates are more difficult than those asked fifteen, twenty, or thirty years ago, and to state in reply that, prior to the year 1866, candidates were examined for admission under the requirements of section 3, chapter 72, act of Congress approved April 29, 1812, by which it is prescribed that "each cadet, previous to his appointment by the President of the United States, shall be well versed in reading, writing, and arithmetic," and that, since 1866, the examinations have

been in conformity with section 2, joint resolution of June 16, 1866, by which it is prescribed, "and in addition to the requirements for admission as prescribed by section 3, chapter 72, of act of April 29, 1812, candidates shall be required to have a knowledge of the elements of English grammar, descriptive geography, (particularly of our country,) and of the history of the United States." There is a greater number of rejections comparatively of late years, owing to a difference of requirement as prescribed by law.

Very respectfully, your obedient servant,

THOS. H. RUGER,
Colonel Eighteenth Infantry, Superintendent.

Hon. JOHN EATON,
Commissioner of Education, Washington, D. C.

TABLES XV AND XVI.—LIBRARIES.

Table XIV of the report for 1872 gave detailed statistics respecting 306 important libraries in the United States. Table XV, in the appendix to this report, furnishes statistics respecting the growth of 230 of these collections. Table XVI of the appendix is a continuation of the library-table of last year and gives similar information respecting 144 additional libraries, which contain 1,202,301 volumes, 147,293 pamphlets, and 1,929 manuscripts.

The following summary shows the distribution of these additional libraries among the States and Territories :

Statistical summary of number of additional libraries, &c.

The increase during the year 1873 of the libraries mentioned in Table XIV of the report of 1872, being added to the summary of that table, enables us to present the following interesting summary, by States, of the condition at the present time of the 450 libraries above referred to. It will be observed that they contain 6,420,993 volumes, 1,134,463 pamphlets, and 16,329 manuscripts.

On comparison of Table XIV, 1872, with Table XV in the appendix of this volume, it will be observed that the following important libraries have received accessions as specified: Mercantile Library, San Francisco, 3,683 volumes; the Chicago Public Library, 6,000 volumes and 2,722 pamphlets; the Peabody Institute, at Baltimore, 2,986 volumes and 341 pamphlets; the Boston Public Library, by absorbing the Charlestown and Brighton Public Libraries, gains 26,000 volumes and 5,000 pamphlets, while its other increase by purchase and donation is 2,400 volumes and 20,000 pamphlets; the Boston Athenæum, 3,652 volumes and 2,861 pamphlets; the Mechanic Apprentices' Library, of Boston, 5,000 volumes; the Free Public Library of New Bedford, Mass., 3,000 volumes and 433 pamphlets; the Essex Institute, of Salem, 632 volumes and 6,905 pamphlets; the Free Public Library, of Worcester, Mass., 3,074 volumes;

the State Library, Albany, N. Y., 2,535 volumes; the Grosvenor Library of Buffalo, N. Y., 3,000 volumes; the Apprentices' Library of New York City, 2,500 volumes; the Astor Library, 2,375 volumes; the Mercantile Library Association, New York City, 4,920 volumes; the Public Library, Cincinnati, O., 10,059 volumes and 1,555 pamphlets; the Public Library, Cleveland, O., 4,000 volumes; the Mercantile Library, Philadelphia, Pa., 15,000 volumes and 500 pamphlets; the State Historical Society, Madison, Wis., 2,166 volumes and 1,528 pamphlets; the Library of Congress, 12,407 volumes and 5,436 pamphlets; the Library of the Surgeon-General's Office, 5,500 volumes and 8,000 pamphlets.

Referring to the benefaction-table, No. XXIV, in the appendix to this report, it will be seen that $379,011 have been given to libraries during the year 1873. Among the most interesting dedications of library-buildings during the year, that of the Concord (Mass.) Free Library, in September, is noteworthy. This munificent gift of Mr. William Munroe will accommodate about 35,000 volumes. At its consecration to the service of learning the following remarks were made by Hon. E. R. Hoar, chairman of the board of trustees:

The library has been for years an object of much interest in our little community, while it grew from small beginnings, and, as it were, "dwelt in tabernacles." It will be, I hope, still more our pride and delight in its stately and enduring temple. It may not be generally known, and it may interest this audience to know, how early Concord stands among New England towns as the owner of a town-library. I do not refer to the establishent of the present library in 1851, though that was early among the towns; nor to the social library incorporated under the act of 1806, upon which this was founded; nor to the library company, whose constitution, in the handwriting of Dr. Ripley, and dated February, 1784, is preserved in the volume which I hold in my hand. Our antiquity is much greater, and goes back at least two hundred years. If any other town or city can claim precedence of us, they are invited to show their title. In 1672, just two centuries before Mr. Munroe laid the foundation of his new building, a committee, consisting of Nehemiah Hunt, John Flint, John Miles, William Hartwell, Thomas Wheeler, Joshua Brooks, Joseph Haywood, Gershom Brooks, Humphrey Barrett, and John Billings were chosen to give instructions to the selectmen, and of the seventeen articles which they prepared the third read as follows:

"That care be taken of the books of marters, and other bookes that belong to the Towne, that they be kept from abusive usage, and not be lent to persons more than one month at one time."

So long ago was the possession and lending of good books recognized here as an object of public concern; and the instruction contains all that is essential for the management of a library in our time.

* * * * * * *

It only remains for me, in the name and in behalf of the town and its inhabitants, to give some slight expression of their respect and gratitude to their benefactor. We thank you, sir, not only for the magnitude of the gift in its pecuniary value, but for the wise and thoughtful spirit which planned the benefaction and has watched over every detail of its completion. You have given to your native town something which shall make it henceforth a town better worth living in. We are glad to think that this is an expression of kind feeling and regard to us, the present inhabitants of Concord, and that you feel the interest of personal acquaintance in our welfare. In that touching story of the olden time, when the elders of the people went to invoke the Master's aid for the centurion, the affectionate phrase of their intercession was that "he is *worthy*, for he loveth our nation and he hath built us a synagogue." But we recognize in your bounty not merely kindness to your friends and neighbors, to the generation which you know and by which you are known, but something fruitful and perennial. We are passing away with you; but the town, this Concord that we love, is to last and for an indefinite future to be elevated and enriched by means of what you have done. It is enriched, indeed, by your example. To do something for the permanent benefit of mankind is the purest, as it is the highest, object of human ambition.

Ralph Waldo Emerson, esq., followed with characteristic remarks, from which extracts are here given:

That town is attractive to its native citizens and to immigrants which has a healthy site, good land, well-constructed sidewalks, and good hotels. More attractive is it if it have a fine town-hall, good churches, good preachers, good schools; but still more if it has availed itself of the act of the legislature authorizing towns to tax themselves for the support of public libraries; happier yet if it have citizens who cannot wait for the slow growth of the town to make this adequate to the desire of the

people, but bestow at once, as in the act which we have met to witness and acknowledge to-day. I think we cannot easily esteem the benefit conferred in this, as I foresee, great benefit from it to this noble town. We have a splendid library, which will make readers of those who are not readers, scholars of those who do not study. * * * If you consider what has befallen you when reading a poem, a history, or a novel even—how you forgot the time of day, the person sitting in the room with you, your engagements for the evening—you will easily admit that books make all towns equal. With Concord a library makes it as good as London, Paris, or Rome. Robinson Crusoe, if he had a shelf of books, could easily have dispensed with even his man Friday. Every faculty casts itself into an art, and memory into writing—that is, into books. The plant papyrus, which gave the name to paper, is of more importance in history than silver or gold. Its first use for writing is between three and four thousand years old. * * * I know the word "literature" has in many ears a hollow sound. It is thought to be the entertainment of a few fanciful persons—not to be of and for the multitudes. But this comes from those who think everything is useless that cannot in some way add to their physical comforts. There are utilitarians who prefer that Jesus should have wrought as a carpenter and Paul as a tent-maker.

Books are a record of the best thought. The river of thought is constantly running from the invisible world into the minds of men. Such was the symbolic custom of the ancient priests of Mexico to obtain fire and distribute it to every hearth in the nation. The influence of a book may extend to those who have never seen it. Shakespeare and Milton and Pindar have, through others, affected the minds of men who never heard of them. What they have in them cannot be contained in a cup; it runs over into all the minds that will have it. Consider that it is our own state of mind in time that makes our own estimate of life and the world. If you sprain your foot, you will think that nature has sprained hers; and so when you sprain your mind you have a bad opinion of life. If you can kindle imagination, you see more, because more active. Music does this for some, poetry for others, and a good book will do it for a reader.

Many a time a book has decided a man's life. A book makes friends for you, for there is an acquaintanceship between you and the man who reads the same book. Dr. Johnson, hearing that a man read Burton's Analysis of Melancholy, exclaimed, "If I knew that man I could hug him." We expect a great man to be a great reader. There is a wonderful similarity between great men in their estimate of books. Cæsar, when shipwrecked and in danger of drowning, did not try to save his gold, but he took his Commentaries between his teeth and swam for the shore. The Duke of Marlborough would not encamp without a copy of Shakespeare. The Duchess d'Abrantes tells us that the first Napoleon cast books and papers out of his carriage while traveling, as fast as he read them, so that they would strew the road. We expect great men to be great readers, for in proportion to the diffusing power should be the receiving power.

The fine building of the Cincinnati Public Library is nearly ready for occupation. Wm. F. Poole, esq., the librarian, thus remarks on this collection and its habitation:

Among the accessions of the year were 1,645 volumes of German publications. The call for German and French literature is steadily increasing, and, excepting English prose-fiction and juveniles, this is by far the largest demand made upon the circulating department. A considerable increase of the department of German literature ought to be made during the next year. The press of this country and of England has issued during the past year a smaller number than usual of new books of marked interest. * * * For the consultation of books and periodicals, the library and reading-rooms have been accessible every day in the year. For the circulation of books, the library has been open three hundred and eight days. The number of volumes taken out for home-reading has been 239,487. The number reported last year was 190,880, and the year previous 100,256. The increase of circulation for the past year was 48,607 and the per cent. 25.5. The largest weekly issue was 6,202 volumes, from March 3 to 8. The largest daily issue was 1,679 volumes, on Saturday, January 25. The average issues on all the Saturdays of the year was 1,103 volumes. For six consecutive weeks, from February 2 to March 8, the average daily circulation was more than 1,000 volumes. The smallest weekly issue was 3,360 volumes, from June 30 to July 6. The smallest daily issue was 381, on September 24. * * * The classification of the circulation for the past and previous year has been as follows:

	1873.	1872.
History and biography	6.4	6.5
Voyages and travels	1.9	1.8
Science and arts	2.5	2.5
Poetry and drama	1.7	1.4
German and French literature	11.2	10.5
English prose-fiction and juveniles	73.8	74.8
Miscellaneous	2.5	2.5

Of the persons who have drawn books from the library, 55.6 per cent. have been males and 44.4 per cent. have been females, while, of the fiction and juveniles taken out, 50.6 per cent. have been taken by males and 49.4 per cent. have been taken out by females, showing that the latter take out a larger proportion of novels and juveniles than the former. It will be seen that the rates per cent. in the classification are substantially the same year by year, and they are similar to the statistics of all public libraries. Nothing seems more like an accident than the selection of books from a well-furnished public library; yet there is a hidden law which determines that selection, as fixed as the law which determines year by year the average temperature of our climate. Statistics show that the taste for reading in one community is the same as that of every other community in similar social conditions. Statistics here, in New England, and in Old England show, in the main, the same results. About three-quarters of the selections will be prose-fiction and juveniles. If a library should report a much lower ratio than this, the necessary inference would be that the library was not well furnished in this department, that there was some restriction on the use of these books or that the statistics were not accurately kept. * * * *

As I stated in my last report, I am not disposed to mourn over or to apologize for these facts. In the personal experience of all who attain to literary culture there is a time when they read novels, and perhaps too many novels. In passing through this stage of their mental development, which usually lasts but for a short period, they acquire a habit of reading and a facility of thought and expression which are of great benefit to them in their later studies. With many persons the alternative is not whether they will read fiction or something better, but whether they will read fiction or nothing. As a rule, people read books of a higher intellectual and moral standard than their own, and hence are benefited by reading. Novels of an immoral tendency, or even of an equivocal character, are excluded from the collection. * * * *

An inquiry has recently been made to ascertain the proportion of youth below the age of 16 who take books from the library. The result is that of all persons taking books those below the age of 12 years are 2.9 per cent., those between the ages of 12 and 16 are 19.4 per cent., and those above the age of 16 are 77.7 per cent. * * *

The project of opening the reading-rooms of a public library on Sunday, which elsewhere had been long discussed, but which was first carried into execution in Cincinnati more than two years ago, can no longer be regarded as an experiment. It has been adopted in nearly all the large cities of our country, by the free library of Birmingham, in England, and is now being considered, if it is not already adopted, in the free libraries of Liverpool, Manchester, and other English towns. If there was any opposition to the measure here in Cincinnati two years ago, it seems wholly to have vanished, and now its most zealous supporters are religious men who have most at heart the welfare of the community. I am informed by the president and superintendent of the Young Men's Christian Association of our city that they are not only earnestly in favor of the public library being open on Sunday, but they know of no opposition to it among the evangelical clergymen and laymen who belong to the Christian Association. The perfect order and decorum which have always prevailed in our reading-rooms would be creditable in a Sunday-school. The attendance and issues on Sunday during the past year have exceeded those of the previous year, although from the contracted space in our temporary reading-room such increase seemed to be impossible. * * * The room especially fitted up for the safe preservation of valuable illustrated books, and with proper appliances for their exhibition, was opened to the public in November last. It has been under charge of an attendant during the regular library-hours on secular days—from 8 a. m. to 10 p. m.—and on Sundays from 3 to 10 p. m. The room has been visited by a large number of citizens and of visitors from abroad, who have uniformly expressed their surprise, as well as satisfaction, in finding in our city so fine and valuable a collection of illustrated books, and which are so freely accessible to the public. The collection has been largely used by architects, civil-engineers, mechanics, artists, students in the fine-arts, and by the pupils of the McMicken Art-School. * * *

In this room is a complete collection of the reports, specifications, and drawings of the United States Patent-Office, and it is much used by inventors and patentees. Sets of the British and French patents are greatly needed, there being no sets in the State of Ohio. The ample accommodations which the library is soon to have makes it now practicable to procure these sets. The British government has presented its patent-publications to institutions in some of the large cities of our country where they have been needed, the libraries to which they are presented bearing the expense of binding. The binding of the set alone will cost about ten thousand dollars. * * * With the completion and occupancy of the new building, the library will enter upon a new phase in its history. It will attract the attention of our own citizens as it has never yet done. Regarded simply for its architectural features, the public-library-building will be the most attractive edifice in the city. That Cincinnati should have the largest, the best-arranged, the most elegant, and the only fire-proof public-library-building in the country will be the occasion of no small amount of local pride. When the building is finished and opened for inspection, its immense capacity, its beautiful

proportions, its well-planned arrangements, and its tasteful details will surprise our own citizens even more than strangers, for the work has gone on behind barricades and so quietly that few persons have watched it while in progress. Up to this time, with the exception of one bequest of $5,000 from Mrs. Sarah Lewis—which has been funded and only its interest expended for the purchase of books—the library has depended wholly on public money for its growth and support. Other public libraries have received large donations of money from noble-minded individuals of wealth. With a capacity of 250,000 volumes in the main building, we shall have for some years an array of empty shelves to beg for us; and may we not hope that these quiet appeals will be heard? * * * The board of education in erecting this building has done its work nobly and generously. It remains for the public-spirited citizens of Cincinnati to second these results and speedily make this library equal, at least in its resources, to any in the land.

The Chicago public library, by an arrangement with the Federal Government, has received the large square of land known as the Custom-House lot.

Allusion has been made before to the increase of the Library of Congress. In connection with the subject of library-buildings, the following statements by A. R. Spofford, esq., Librarian of Congress, on the immediate necessity for a new structure, are worthy of quotation:

The urgent necessity for more room for the protection and arrangement of the great and overflowing Library under my charge is again brought to the attention of the committee. The large additions of the past year are not exceptional, but are likely to be repeated, if not exceeded, in the annual growth of this Library, which is the only one national in its character and enjoying the benefit of steadily-increasing accessions through the law of copyright, as well as the deposits of the library of the Smithsonian Institution. * * * The accommodation of a collection of books now numbering over a quarter of a million, and which in less than twenty years will outnumber half a million, while at no remote period it will very largely exceed one million volumes, together with the annually increasing importance of the copyright-department as an office of public record, plainly demands the erection of a separate building specially designed for a great public library and adequate to the requirements of its manifold departments. * * * The importance of a prompt provision for the commencement of a new Library-building will be apparent when it is considered that the increasing accumulation of books is such that the alcoves in all departments of the Library are already overflowed, that the one hundred supplementary cases of shelving introduced two years ago to accommodate the surplus are nearly all filled, that the grievous necessity of piling up books on the floors in many quarters has already been reached, and that it will not be possible much longer to provide any space for the thousands of volumes of new accessions constantly wanted for the use and reference of Congress in any quarter where they can be systematically arranged and produced with the necessary promptitude.

Perhaps the best appointed public library in the United States is that of Boston. The monthly reports of the superintendent, Justin Winsor, esq., are specially noteworthy.

TABLE XVII.—MUSEUMS OF NATURAL HISTORY.†

My report for 1872 contained a table of museums and cabinets of natural history, with some items serving to show the general nature of the several collections. It

---

* Each contains information respecting the numbers of volumes used during the month, the largest daily issue, the total delivery during the month, the use of the periodicals on week-days and on Sundays, the accessions to the library of volumes and its extent, the numbers of books condemned and lost, the progress in cataloguing, the gain in pamphlets and engravings, the service of the employés, and the receipts from fines and sale of catalogues.

Monthly report No. 42, for December, 1873, states that during the month 54,757 volumes and 35,192 periodicals were used, 1,512 volumes and 1,801 pamphlets were added; that the library and its branches contained 245,447 volumes, and that 6,356 cards for the catalogue were numbered.

† The following letter, the last received at this the Bureau from our lamented naturalist, is of interest in this connection:

MUSEUM OF COMPARATIVE ZOÖLOGY,
Cambridge, Mass., November 5, 1873.

DEAR SIR: I have tried earnestly to give you a trustworthy statement of the condition of the museum; but it is growing so rapidly that, while preparing my report, it became incorrect, and to do justice to our institution would require more time than I am able to give to such a work. I inclose the statement of our librarian; other departments shall be filled as fast as possible. I would only say that

seemed desirable, however, to bring out more distinctly, if possible, the means possessed by our colleges, scientific schools, and natural-history-societies for illustrating instruction in the several departments of natural history. To this end the Office obtained the co-operation of Prof. Theo. Gill, M. D., Ph. D., of the Smithsonian Institution, a gentleman well known for his scientific attainments and possessing special qualifications for the work, who prepared a series of inquiries designed to elicit such information as would clearly indicate the character and extent of the collections of the institutions to which the inquiries were addressed, as well as the special facilities afforded by each in aid of scientific inquiries.* The results of the inquiries having been carefully tabulated were submitted with the returns to Prof. Gill, who comments upon them as follows:

It will be observed that no returns were received from several quite prominent institutions and that those from a considerable portion reporting are vague, and therefore unsatisfactory in some respects. This defect is especially evident in the returns respecting the numbers of species of the respective branches. In the circulars calling for information, blanks were provided for returns as to the numbers of species and specimens of each branch or comprehensive group of the animal-kingdom (as indicated in the table) as well as for the classes generally recognized by American naturalists under those branches. The returns, however, were limited in so many cases to the numbers of specimens combined solely under the more comprehensive groups, that all the others have been reduced in the same manner in the present tables. As the inability to give definite figures respecting the numbers of species of those groups or the included classes may surprise many, some remarks relative thereto seem to be demanded.

---

we have now ten laboratories, in which twenty-two assistants and fourteen sub-assistants are engaged, and that our pay-roll this year amounts to $34,000, exclusive of collections bought and material used, as alcohol, glass jars, &c., &c. At this rate, our museum must rapidly overtake all others.

Very truly, yours,

L'S AGASSIZ.

General EATON, *Commissioner of Education.*

Statement of librarian.—The library contains at present 8,175 volumes and parts of volumes, of which there are in round numbers—

On zoölogy, including anatomy and embryology	1,475
Geology and palæontology	3,000
General natural history, including travels and explorations	700
Periodicals and transactions of learned societies, about	3,000
Total number of volumes	8,175

*The schedule of inquiries prepared by Prof. Gill having been frequently called for by superintendents and curators of museums, it is thought that it may be useful to append it in full:

[FORM 21.]

BUREAU OF EDUCATION.

1873.

INQUIRIES RESPECTING MUSEUMS OF NATURAL HISTORY.

Name of museum?

Location— { City? County? State?

By whom now owned?

When founded?

By whom founded?

For what purpose?

Nature of collections?

How governed?

Title of governing board?

Title of chief officer?

Titles of assistants?

Contrary to prevalent ideas, there is in no class of animals or plants a definite number of forms, concerning which there is unanimity of opinion as to their classificatory value; that is, whether they are generic, specific, varietal, or even individual. The latitude of opinion in regard thereto, is indeed, very considerable, and the transition of individual variations into more definite or limited "varieties," and those into "species," is so marked as to constitute a very important element in the appreciа-

Income for past year—
- From endowments?
- From State, or municipal grants?

  - Mollusks?
  - Radiates?
  - Protozoans?
  - Botany?
  - Palæontology?
  - Mineralogy?

How are curators appointed?

Are curators paid?

Is admission restricted? And, if so, how?

Is admission allowable at night?

Number of visitors last year—
- General?
- College- and school-students?
- Special scientists?

Are there special rooms for study? And, if so, how many?

What principles or systems of classification are adopted in the arrangement of specimens?

Are lectures delivered in connection with the museum? And, if so—
- What number?
- On what subjects?
- How many on each subject?
- Terms of admission?
- Season of year?
- Are the palæontological collections arranged with the geological or zoölogical and botanical series?

* Indicate by brackets classes or branches in charge of one curator or committee of curators, and number in each committee.

tion of the statiscal tables of the naturalist. As a rule, it may be assumed that the naturalist with limited materials, and therefore without the transition-forms between dissimilar individuals, is apt to magnify the number of species, while he who has large numbers of individuals from a great extent of country is compelled to admit a wider range of specific variation, and consequently a reduction of the number of species. Nevertheless, definite statistics respecting numbers of species ought to be available, and the difficulty alluded to would not be apt to recur often except in the largest museums. We are, indeed, obliged to accept one of two alternatives in the appreciation of the returns, viz:

First. The size of a museum is in excess of the power of management, and the working power is therefore too small; or,

Secondly. The scope of the museum or curriculum is beyond the capability of the administrative power, and therefore the educational appliances are, to a greater or less degree, inefficient or useless.

How many species of fossils are arranged in systematic order, (*i. e.*, according to structure?)
How many species of fossils are arranged in chronological order, (*i. e.*, according to stratigraphical distribution?)
How many bottles of alcoholic specimens are in museum?
How many species are in alcohol?
How many species are in skins, unmounted?
How many species are in skins, mounted?
How many species are anatomical preparations?
Particularize under following heads, giving first the number of species, then the number of specimens, thus: 808 | 4014, (*i. e.*, 808 species, 4014 specimens.)

Vertebrates.	Species.	Skins, mounted.	Alcoholic.	Skeletons.	Fossils.
Mammals					
Birds					
Reptiles					
Batrachians					
Fishes					

Articulates.	Species.	Pinned and dried.	Alcoholic.	Anatomical preparations.	Fossils.
Insects					
Myriapods					
Arachnoids					
Crustaceans					
Worms					
Scolecids					

Mollusks.	Species.	Shells.	Anatomical preparations.	Fossils.
Cephalopods				
Gasteropods				
Conchifers				

Molluscoids.	Species.	Shells.	Anatomical preparations.	Fossils.
Tunicates				
Brachiopods				
Bryozoans				

Echinoderms.	Species.	Dried.	Alcoholic.	Anatomical preparations.	Fossils.
Echinoderms					

A collection of a few hundred or even thousand specimens can scarcely be considered a formidable number, and as such small collections are generally obtained from a restricted geographical area, the difficulties referred to in respect to the appreciation of species would be rarely encountered; the statistics concerning such collections should, therefore, under proper management, be definite and precise; and such are the returns from several of the reporting institutions. In respect to the value of the collections generally, however, the superintendents are allowed to speak for themselves.

But one thing cannot be too much insisted upon, and that is that an undetermined collection is comparatively valueless for educational purposes and greatly inferior to a much smaller well-named collection, and that a collection respecting which only the numbers of specimens can be returned cannot belong to the latter category, and must therefore have comparatively little value, the value in great part being expressed by the correctness of the classification. Perhaps no more apt illustrations of the two classes of collections thus referred to—that is, the unarranged and the arranged—can be cited than two contrasted by the juxtaposition as establishments in the same city, viz, the Academy of Natural Sciences of Philadelphia and the Wagner Free Institute of Science. In the one case we have definite figures for species as well as specimens, (at least so far as regards the more comprehensive groups,) while in the other we have only the statements that there is "a large number" or "a large collection;" and, where definite numbers are supplied, as in the case of the mollusks, the discrepancies in the returns on different pages—*e. g.*, 40,000 specimens on one and 250,000 on the

Coelenterates.	Species.		Alcoholic.		Glycerine.		Anatomical preparations.		Fossil.

(Date:) ———, ———.

N. B.—The classification adopted is not intended to be an expression of natural relations, but is only used because of its convenience from a conventional point of view.

* Please specify the publications as fully as possible, giving exact transcripts of title-pages.

other—throw doubts on the reliability of the figures; and, accepting either, we have a contrast between the collection and that of the academy, (which latter returns 76,479 specimens, exclusive of duplicates, representing 14,161 nominal species.) Here, notwithstanding the larger number of specimens returned by the institute, the collection is of slight value compared with that of the academy. When, indeed, it is remembered that specimens may be readily obtained by the thousands, as in the case of oysters, clams, unionidæ, fresh-water univalves, &c., it must be evident that more definite information than as to the numbers of specimens must be given before we have the elements for the estimation of the value of any collection.

THE RELATION OF ART TO EDUCATION.*

In my report for 1870 an attempt was made to collect from those best qualified to judge evidence as to the influence of such knowledge as can be acquired by the pupils in the public schools of the country upon their value as workmen in every kind of productive industry. The replies to the questions addressed to workmen, employers, and competent observers are full of interest in themselves and significant in the almost unanimous expression of the opinion that *every* advance in learning gives corresponding advantage to the laborer; the testimony being that a mere knowledge of the rudiments adds 25 per cent. to the earning capacity of the individual.

In the rapidly-changing circumstances of the present age the competition between the producers of the world grows ever more intense and demands watchfulness and energy on the part of every country, unless it is willing to fall behind in progress and in power. In addition to this fact a new complication has arisen, owing to the abandonment of the old system of apprenticeship, by which young persons were trained to become skillful workmen, and from the opposition of trades-unions to the training of youth in their various occupations, so that it has become almost impossible to procure for children such industrial training as will make them skillful artisans.

In consequence of these difficulties in the way of parents securing for their children training in remunerative labor, it is felt that the public schools must give instruction that will fit the children for work; that something more and other than the present training is now necessary. Special schools of training for special professions and industries will doubtless be provided as the need arises, but the great bulk of the population is to be trained for usefulness in the public schools of the country; and the obvious duty of those in whose charge these schools are placed is to devise a plan by which, during the few years of average attendance, the pupils may be so trained as to be best prepared for the duties of life. It is found that merely to read, to write, and to cipher does not do this. Indispensable as this preliminary is to the acquisition of other knowledge, something more is requisite, if, as a manufacturing and commercial people, we are to hold our own among the nations. In addition to the increased competition arising from steam-carriage, new and cheaper methods of manufacture, and increased productiveness, another element of value has rapidly pervaded all manufactures, an element in which the United States has been and is wofully deficient: the art-element. The element of beauty is found to have pecuniary as well as esthetic value. The training of the hand and eye which is given by drawing is found to be of the greatest advantage to the worker in nearly every branch of industry. Whatever trade may be chosen, knowledge of drawing is an advantage and in many occupations is rapidly becoming indispensable.

While the United States lack many things that give to the nations of Europe great advantage in art-culture, they possess, on the other hand, in their system of free public schools admirable facilities for the speedy, general, and efficient introduction of any desirable system of training.

Drawing easily taught in public schools.—As to the difficulty of acquiring a knowledge of drawing, "whoever," says a competent authority, "can learn to write can learn to draw;" and it has been shown that the teachers of the public schools are very readily qualified to teach the first lessons in drawing. This training is of value to all the chil-

*For statistics of museums of archæology and art, see Table XVIII of the appendix.

dren and offers to girls as well as to boys opportunity for useful and remunerative occupation, for drawing in the public schools is not to be taught as a mere accomplishment: the end sought is not to enable the scholar to draw a pretty picture, but to so train the hand and eye that he may be better fitted to become a bread-winner.

As to the importance of the study, the French imperial commission, in its summary of the inquiry on professional education, says: "Among all the branches of instruction which, in different degrees from the highest to the lowest grade, can contribute to the technical education of either sex, *drawing, in all its forms and applications, has been almost unanimously regarded as the one which it is most important to make common.*"

In Great Britain and in the leading countries of the Continent the governments are making strenuous efforts to train their citizens in all those kinds of knowledge which will make them more skillful artisans and add to the value of their productions. The contests between nations have become largely industrial, and while the commerce and trade of the world are the prize for which they contend, the great international industrial exhibitions are the arenas in which they measure their progress and note their deficiencies. It may be worth our while to observe the methods by which they seek to remedy these deficiencies and to judge of their value by recorded results. The effect of the first world's fair, held at London, in 1851, was to satisfy the English manufacturers and people that, in all that related to the application of art, of beauty to manufactures, they were completely distanced; only one nation, the United States, among the civilized nations being below England in this respect.

Technical art-schools in Great Britain.—"The first result of this discovery was the establishment of schools of art in every large town. At the Paris Exposition of 1867 England stood among the foremost and in some branches of manufacture distanced the most artistic nations. It was the school of art and the great collection of works of industrial art at the South Kensington Museum that accomplished this result. The United States still held her place at the foot of the column."—(Papers on Drawing, by Prof. Ware, of the Boston Institute of Technology.)

At the English International Exhibition of 1862 the enormous strides which art-education had made in England since the previous great exhibition of 1851, and which was reflected in every object of industrial art, set the French manufacturers at work inquiring the cause, fearful that their own industrial-art-supremacy was endangered. A French commission was at once sent over to find out how it had been done, and the city of Paris, upon the report of the commission, began at once to reorganize the municipal art-schools by adopting many of the features of the South Kensington Museum and Training School for Art-Masters.

European nations competing in establishment of art-schools.—The French imperial commission in 1865, in their report, after proposing oral lectures for the instruction of apprentices and workingmen, say that "drawing, with all its applications to the different industrial arts, should be considered as the principal means to be employed in technical instruction." To the fact that drawing has been heretofore so generally taught in France, they attribute the superiority of a large portion of the manufactures of the country. Referring to the efforts made by England, and to the Art-Museum at South Kensington, they say:

By the extent of the resources placed at the disposal of this special and new department, created for the purpose of enabling English industry to compete with ours, an opinion may be formed of the importance rightly attributed in England to the participation of the art of design in all industrial productions.

They also report upon the condition of technical education on the continent. They find that drawing is generally taught in Germany, Switzerland, Austria, Bavaria, and Würtemberg. As showing the extraordinary attention given to drawing in this small kingdom, they remark:

There have been established in the kingdom of Würtemberg more than four hundred drawing-schools; and this organization, which does not date back more than ten years, has already led to very decided improvement in the manufactures of the country.

Our facilities for art-training.—While in the countries of Europe whatever relates

to the people in education, as in other matters, is under the control and general direction of the central government, so that what the central power decides to do is readily and immediately set in motion throughout the entire country, in the United States there is wisely no such central control. This power inheres to the States and to the local communities within the States. This very circumstance, though somewhat, it may be, delaying the adoption of useful measures, yet renders the wise adaptation of training to the peculiar industries and needs of the various parts of the country far more probable. It is readily seen that the kind of special technical training would vary as it was applicable to a manufacturing, a mechanical, a farming, or a mining community. Indeed, this has already been exemplified in a marked degree in the different developments of the schools of science in the several States, adapting themselves, in their chief courses of instruction, to the industrial demands of their localities. So we may hope to have, in the art-future of this country, as have the different European countries, art-capitals famous for their peculiar developments.

Why public schools should teach drawing.—Now, drawing is the very alphabet of art, (for art is but a language,) the one essential requisite preliminary to any artistic or technical training; and if it is desirable that the children of the public schools shall be fitted to become, if they wish it, skilled workmen in any branch of industry, it is necessary that they shall be taught to draw correctly. To those to whom art means higher things, as they suppose, than its application to every-day-utensils and mere manufactures—who look for grand galleries of pictures and statues and to all the higher refinements of cultured art—it may be a suggestive reflection that among a people ignorant of drawing, and whose daily surroundings, as is true of the American people, afford few suggestions of art in any of its forms, high art must ever remain an exotic and native artists be rarer than the fabled phœnix. Great collections, museums, art-galleries, much as they may contribute to the self-satisfaction of cliques and cities, will be of the slightest possible value and barren of results, either upon the industries of the people or their art-culture, so long as drawing is not generally understood.

Whoever succeeds in having all the public-school-children of the country properly trained in elementary drawing will have done more to advance the manufactures of the country, and more to make possible the art-culture of the people, than could be accomplished by the establishment of a hundred art-museums without this training. Just as libraries are worthless to those who cannot read, so are art-galleries to those who cannot comprehend them. Just as all literature is open to him who has learned to read, so is all art to him who has learned to draw, whose eye has been trained to see, and his fingers made facile to execute.

We have begun at the wrong end. We asked for art-galleries, when we needed drawing-schools; but the evil is not irremediable. Let drawing be generally taught, and our art-galleries and museums, poor as they are, will at once grow more and more valuable, for they will then begin to be of use.

Already many cities and towns have awakened to the necessity of some art-training, and some teaching of drawing has been attempted in the public schools so that several of the cities sent specimens of the drawing of their public-school-children to be exhibited at Vienna, and these attracted much attention from foreign observers, as, in fact, did everything relating to our system of public free education.

Drawing taught in the schools of Massachusetts.—The legislature of Massachusetts passed an act in 1870 making drawing one of the studies of the public schools and also making the establishment of free drawing-classes for adults obligatory upon all towns and cities containing over ten thousand inhabitants. In pursuance of this law, Mr. Walter Smith, art-master, London, late head master of the Leeds School of Art and Science and Training School for Art-Teachers, was invited both by the city of Boston and by the State of Massachusetts to come from England and introduce the new study into the schools of the city and of the Commonwealth. He was appointed State-director of art-education, and has been unremitting in his efforts to introduce drawing

into the public schools and to foster the establishment of classes for adults. He published in 1872 a large illustrated work upon art-education,* which is indispensable to a thorough investigation of the subject and will be found full of practical suggestions to those wishing to introduce the study into the schools.

Mr. Smith was also appointed general supervisor of art in the Boston schools.

The annual report of the committee on drawing, published June 10, 1873, contains 28 pages of heliotype fac-similes of drawings made in the ordinary course of instruction by pupils in the public schools and free industrial night-classes, which were exhibited at the annual exhibition. There are drawings from pupils in the primary, grammar-, and high schools, and of children of all ages, from 8 years upwards. The ages of the pupils of the evening-classes whose drawings are given are from 14 to 25. These drawings are made by mechanics, clerks, wood-engravers, carpenters, and shipwrights. Certainly, as showing the result of but two years' instruction, these drawings are remarkable and full of encouragement to those who hope so much from the experiment.

Two difficulties have been met: the want of persons qualified to teach the public-school-teachers and the want, in the advanced classes, of pupils who had had the benefit of proper elementary training.

The general supervisor gives normal instruction to the teachers, and his lessons are repeated by two assistants; 500 city-school-teachers attended these lessons in 1872 and 620 in 1873.

Massachusetts Normal Art-School.—The need of some provision for the art-training of teachers became so evident that the legislature made a small appropriation for that purpose, Mr. Walter Smith being appointed director and an able corps of instructors secured. In their first annual report the board of visitors say: "The most important event of the past year connected with the educational interests of the Commonwealth was, doubtless, the establishment of the State Normal Art-School." After expressing in the strongest terms the importance, in their judgment, to the State of general artistic and technical training, they say: "The special purpose of this school is to train teachers of drawing and the arts of design. It is the first institution of the kind established in the country. The necessity of providing this new educational instrumentality became apparent as soon as the attempt was made to carry out the provisions of the law requiring the teaching of industrial drawing." The report, after declaring there is no longer any question but that this school is demanded, closes by saying:

As Americans, we are apt to boast of our enterprise, especially in all matters pertaining to popular education, but it is a fact which ought to moderate our disposition to indulge in self-complacency that, since the movement was begun in this State in 1869 in favor of industrial-art-education, in several European cities very large and costly establishments for this purpose have been built and equipped in the amplest manner.

The following extract from a letter recently received at this Bureau from Mr. Smith is of interest in this connection:

Called by the city of Boston and the State of Massachusetts to organize a system of industrial drawing in both, the first thing I discovered with certainty was that qualified teachers of drawing did not exist in this country, and after a careful examination of all the drawing-classes in the State, I saw the one thing necessary to make success possible was to train teachers. * * * I have had over two hundred applications for admission to the Normal Art-School, and if proper convenience were given—I judge that a great training-school is essentially needed in this country—such a school can open with 500 students next year. It has been terribly uphill-work, and is so now, the appropriation being entirely insufficient. * * * Still, the best work ever done in this country, the authorities tell me, is being done in the school. * * * I have on my desk applications from many colleges and universities in several States for accomplished teachers of art. I don't know one. It will take us four years to make one, and then we may make perhaps from ten to twenty. I wish that America could have, as every European country has, an industrial-art-school, which should by its graduates affect the value and beauty of every branch of industry.

* Art-Education, Scholastic and Industrial, with illustrations, James Osgood & Co., Boston, 1872, pp. 398.

In his report for 1873 Mr. Smith dwells upon the importance of enforcing the provisions of the law requiring drawing to be taught in all the public schools, and especially in the teaching of drawing in the primary schools, and remarks that the usefulness of the free industrial classes is much impaired by the need of teaching the primary lessons in drawing, a difficulty which existed in England and on the Continent so that "the success of the art-schools was limited and their influence on manufactures inappreciable." The remedy there was found in teaching every child to draw in the public schools; and in a few years the effect was marked, so that in England, instead of there being less than a score of schools, barely supported by the public, as was the case in 1851, there are now in the United Kingdom nearly 800 schools of art and evening-classes at which instruction is given in industrial drawing.

The agency in popularizing drawing, next in importance to the normal art-school, is the drawing-class in each normal school. Here the teachers of the public schools will be prepared for teaching drawing as one of the elementary subjects of general education.

Exhibition of art-work done by the Massachusetts free industrial classes.—At the second exhibition of works from the free industrial classes of the State of Massachusetts, in 1873, there were exhibited 1,209 drawings made by the pupils in these schools, (nearly double the number exhibited in 1872;) the classes of architectural and industrial design in the Massachusetts Institute of Technology exhibited some 40 architectural drawings, chiefly original designs, and 150 industrial drawings in color, partly copies and partly original designs, of muslins, cashmeres, carpets, paper-hangings, and oil-cloths. This latter school, called the Lowell Free School of Industrial Design, is intended to train young men and women in practical designing for manufactures.

So much space has been given to the progress in art-education in Massachusetts, because there the experiment is being tried for the whole country. It will require several years to produce the fullest results, to show the effect of a course of such training carried through the entire school-life of the pupil, but it will be hardly necessary for experienced educators to wait until the completion of this experiment to judge accurately of its relative value. The verdict thus far in Massachusetts seems wholly favorable.

Mr. Smith, in his Art-Education, speaks of the insensible art-education given by the noble buildings and the public art-collections of the old countries. Of the almost immediate deterioration suffered by an art-designer from a deprivation of these familiar art-surroundings he gives a striking instance. Of all this kind of art-training Americans are and must be long deprived, which is in itself an argument for giving special attention in school to securing some art-training.

Industrial importance of a knowledge of drawing.—The inventions which result in the machines and mechanical contrivances of which the American mind is so prolific must all take shape on paper before they can take other form; they must be drawn before they can be made. In all things which are made by man, in all manufactures, a knowledge of drawing and the possession of the skill which artistic and technical training give are useful to workmen and to master. To all makers of textile fabrics art has significant words to say about designs and hues.

In seeking to show clearly the usefulness of a knowledge of drawing and its application to so many forms of industry, I have thus far failed to notice the higher and more ennobling influence of art, not only upon the manufactures of a people, but upon their character—the latter preceding the former; for until the workman becomes refined, until his eye is sensitive to see and his hand facile to reproduce the finer lines of form, the more delicate shades of color, his work cannot improve.

That general art-training, beginning with the teaching of drawing to school children and faithfully followed out in the different industries and professions where it is applicable, will accomplish this, the experience of Great Britain has demonstrated; and, further, that whatever of money, of labor, and of time has been expended to accomplish this result has been more than repaid by the products of the industries created and improved, Mr. Smith, in the following statement, affirms:

He says that, while, owing to labor-saving processes, &c., the cost of production has

diminished one-half, the value of the manufactured article has nearly doubled. He accounts for this by stating that every manufactured article has three elements of value: first, the raw material; secondly, the labor of production; thirdly, the art-character. In a vast majority of the manufacturing-products of every country the elements of cost of material and cost of labor are insignificant in comparison with the third element, viz, art-character. It is this which makes the object attractive and pleasing or repulsive and undesirable, and is, consequently, of commercial value. In many objects, where the material is of little or no intrinsic worth, the taste displayed in their design forms the sole value or the principal; and it has been the general elevation of that element which has nearly doubled the commercial value of English manufactures.

Facilities for art-education now existing in the United States.—In order to ascertain what opportunities are afforded for art-training and what public art-collections are at present existent in this country, a schedule of inquiries was prepared and sent out from this Bureau, the returns to which, so far as they admit of tabulation, will be found among the statistical tables in the appendix.

As the result of these inquiries, we find that, in addition to the introduction of drawing in the public schools of Massachusetts and the establishment of a State Normal Art-School at Boston, drawing has been taught in the public schools of quite a number of cities and towns in different States; that in all the schools of science in the country mechanical drawing at least is taught.

The Worcester Free Institute, at Worcester, Mass., offers a three-years course of theoretical and practical training in those branches of knowledge that underlie the industrial arts.

In schools for the practical teaching of art as applied to industry and manufactures, the free industrial classes for adults, in Massachusetts; the Lowell Free School of Industrial Design at the Boston Institute of Technology; the schools of Cooper Union, New York; the School of Design of the University of Cincinnati, and the Philadelphia School of Design for Women complete the list as comprised in the information in possession of this Bureau. It is probable that there may be private schools or classes giving this instruction which are not yet known to this Bureau; but, making all allowance for the existence of a few sporadic schools, the contrast is sufficiently marked between the "four hundred similar schools" in the little kingdom of Würtemberg, with its population of 2,000,000, and the few scattered schools we have enumerated, which are the only provision for industrial- and technical-art-education made in this great country for its 40,000,000 people.

For the special training of artists we have the schools of the National Academy of Design, New York; those of the Pennsylvania Academy of Fine Arts, Philadelphia; the schools of the Academy of Design, Brooklyn; the Yale School of Fine Arts, New Haven; the new College of Fine Arts in the Syracuse University—which comprise all at present existing. The San Francisco school is soon to open.

Several of the colleges of the country have introduced some instruction in the history of art and have made a beginning in the way of an art-collection, believing that some knowledge at least of the history of art was requisite, if their graduates were to possess an education that could be properly termed liberal.

Of the colleges possessing any special collections or facilities for giving any instructions in art, even the most general, we find, excepting Yale and Syracuse, with their special art-departments, only Harvard, the University of Michigan, Cornell, Rochester University, the College of Notre Dame, (Indiana,) and Vassar College, out of the 323 colleges of the country, that either give any art-training or possess any art-collections, however small.

Of public art-institutions there are in the country the Metropolitan Museum of New York, the Boston Art-Museum, the Corcoran Art-Gallery, (Washington,) the Art-Association of San Francisco, and the valuable collection of the Pennsylvania Academy, soon to be reopened to the public in the galleries of their new building. The Metropolitan Museum of New York, which awakens interest and hope rather by reason of the possibilities of future usefulness suggested than by its own collection, has

already demonstrated that the general public take interest in art-museums when the collections are worthy of interest and when access to them can be had without charge, as it can to the leading galleries and museums of Europe, the visitors averaging 1,000 a day on Monday, the "free day," and 60 a day on other days, when an admission-fee is charged. The loan-collection of this museum has shown the great and unsuspected wealth of the community in rare, costly, and curious works of art.

While I have recorded the paucity of institutions capable of giving a thorough art-training and the few public art-collections now in this country, it is nevertheless apparent that there already exists in the leading cities the material which needs only to be made available to afford all necessary facilities for general- and technical-art-training; and if it shall be undertaken *in earnest*, there is possible in this country a development both in industrial art and in what are called the higher branches of art, which at the end of twenty-five years will render obsolete the verdict passed upon us at the World's Fair in 1851, and never yet reversed. What England has done in this direction we can do. No time nor force need be wasted. We have but to adopt and modify the methods so thoroughly tested there to the different conditions that may exist in our several communities.

I commend this subject of the relation of art to education to the consideration, not only of all educators, but to all who are interested in the varied manufacturing-industries of our many States. Skill is the modern secret of success. Science becomes ever more certainly the measure of prosperity. Science underlies and must precede art. In the common schools the children of America must be trained to draw, if her artisans are to hold their own in the world's contests and if her artists are to enshrine her history.

TABLE XIX.—SCHOOLS FOR THE DEAF AND DUMB.

Table XIX of the appendix embraces statistics in detail of all schools in this country for the instruction of deaf mutes. The following summary shows by States the number of institutions, the number of instructors, and the number of pupils under instruction during the year. Reference is made to the abstracts of educational progress of the several States for information in respect to organization, means of support of the institutions, methods of training, courses of study, &c.

Statistical summary of institutions for the instruction of the deaf and dumb.

TABLE XX.—SCHOOLS FOR THE BLIND.

The following summary of Table XX of the appendix shows by States the number of institutions for the instruction of the blind, the number of instructors, and the number of pupils in 1873. Reference is made to the table for detailed statistics of each. A particular statement of the condition of the several institutions, methods of instruction and discipline, employments of pupils, &c., will be found under the appropriate heading in the abstract of educational progress in the several States.

Statistical summary of schools for the blind.

State.	Number of institutions in each State.	Number of instructors and employés.	Number of inmates.	State.	Number of institutions in each State.	Number of instructors and employés.	Number of inmates.

TABLE XXI.—ASYLUMS FOR ORPHANS.

The following summary of Table XXI of the appendix exhibits the statistics of 178 asylums for orphans and homeless youths. They are under the supervision of 1,484 persons and contain over 22,000 inmates. As this Office has the names of more than 200 other such asylums it is believed that this class of institutions in the United States shelters at least 45,000 unfortunate children.

Statistical summary of institutions for the instruction of orphans and homeless youths.

The following review of the special educational and reformatory features of several of these charities was prepared by the lady* in charge of the work in this Office pertaining to institutions of this character:

The information afforded by statistics concerning the large proportion of criminals who become such through a neglected, vagrant, and untaught childhood serves to elevate to a high position in the scale of educational and reformatory agencies that class of institutions especially devoted to the care and instruction of friendless children.

These, under their different names of orphan- and half-orphan-asylums, childrens' homes, juvenile-asylums, nurseries, childrens-'friend-societies, homes for the friendless, soldiers' and sailors' orphans' homes, industrial schools, farm-schools, truant-homes, and houses of refuge, are all doing essentially the same work, taking children from their vagrant life in the street, with their inheritance of idleness and viciousness; giving them homes, protection, guardianship, and instruction; forming habits of industry and accustoming them to such work as will enable them to earn a livelihood, and carrying them up to a manhood and womanhood of assured respectability and self-depend-

* Mrs. S. A. Martha Canfield.

ence. The records of most of these institutions show that very few of the inmates who have been under their influence for several years fall into evil courses after leaving. The most unfavorable reports on this head are from the truant-homes, the reason being, as stated in the report of the Truant-Home of Brooklyn, N. Y., that frequently, "after children have been fairly started in the right road, they have been discharged at the request of their parents, and the subsequent management of them has been such as to again allow them to become idle and truant."

Of these institutions, orphan- and half-orphan-asylums and homes are the most numerous. Seventy-seven of these were last year reported to the Bureau from twenty States and the District of Columbia. This undoubtedly falls far short of the true number, since Pennsylvania, which has over twenty orphan-asylums, (twelve of them for soldiers' orphans,) reported only four. It may be mentioned here that Pennsylvania last year educated 4,235 soldiers' orphans, at a cost of over $475,000, and has spent upon these homes since their establishment nearly $4,000,000. The grade of instruction in these schools is much higher than that usually given in homes and asylums.

The benevolent institutions for the care of children in Pennsylvania, as reported, are: soldiers' orphans' homes, 12; orphan-asylums, 7, (6 of which are denominational;) homes for friendless children, 9, (1 of which is for colored and 1 for Jewish children—the latter supported entirely by that denomination;) homes for the friendless, 2; industrial home, 1; farm-school, 1, (denominational;) house of refuge, 1—total, 33.

Especially worthy of mention, as having a distinctive character and aim, are the Burd Orphan Asylum and Lincoln Institution, both located in Philadelphia. The former is for girls only, who are admitted between the ages of 4 and 8 years, kept until they are 18 and, as far as practicable, educated as teachers. The Lincoln Institution receives only boys, and (though it is not classed with the soldiers' orphans' homes) the greater number admitted have been soldiers' orphans. The boys are taken care of during the time they are learning a trade. Their whole time in the day seems to be given to this, but they enjoy the advantage of an evening-school. "Every boy who graduates at the institution is in a position to support himself respectably." At the Educational Home for Boys, a branch of this institution, boys from 3 to 10 years are received, kept until 12 years of age, and then transferred to the institution for more advanced training.

The reports received from New York represent but a small fraction of the charities of the State. Only twelve institutions for children are reported: orphan- and half-orphan-homes and asylums, 7, (of which 1 is for colored children;) home and school for soldiers' orphans, 1; juvenile-asylum, 1; truant-home, 1; and 2, which, from their peculiar character, cannot be classified: The Sheltering Arms and the Society for the Relief of the Ruptured and Crippled, both located in the city of New York. The former of these receives children for whom provision is made in no other institution; unfortunates of all classes, until the age at which they can be received into the asylums especially devoted to them; crippled children past hope of cure, who for this reason would not be admitted to other homes and asylums; children whose parents have been obliged to enter a hospital; children rendered temporarily homeless from any cause. Children placed in this institution are not surrendered to it, but are held subject to the order of parents and relatives. The object of the Society for the Relief of the Ruptured and Crippled is sufficiently indicated by its name. Medical and surgical treatment and all the mechanical appliances and apparatus for the cure of cripples are placed within reach of the very poorest. Children are received from the age of 4 to 14, and the design is to cure them rather than to provide a home for incurables. This institution is believed to be entirely unique in its character. The New York Juvenile-Asylum, in making its twenty-first annual report, states that there have been under its care since its opening 16,909 children.

Ohio reports childrens' charities as follows: orphan-asylums, 5, (of which one is Jewish;) children's homes, 2; industrial school and children's home, 1. The Cincinnati Orphan Asylum, one of the oldest charities in the State, reports over 16,000

orphaned children as having been educated under its care and started on the road to respectability and independence. The system of training in the Jewish Orphan Asylum is of a high order and presents some peculiar features. "Special attention is given to each child to direct its studies to that vocation which in its future life it is expected to follow."

From Baltimore, Md., is reported a charity of a peculiar and interesting character. Its object is to provide a home for youths between the ages of 10 and 20, for whom, on account of the high cost of living and the low value of their unskilled labor, the work of maintaining themselves honestly and respectably is rendered exceedingly difficult, not to say impossible. In former years boys of 10 and upwards were apprenticed to tradesmen and mechanics to learn some useful handicraft; but this system has fallen into disuse, being practically prohibited by the trades-unions and other associations. To most boys of this age who try to maintain themselves, life is a very unequal fight, and no wonder if, borne down by discouragements, they fall into evil ways. To such as these in Baltimore the Boys' Home Society extends a helping hand. It is conducted on much the same principle as the Newsboy's Lodging-Houses in New York. The boys all work and contribute a certain proportion of their weekly earnings towards the support of the home. The boys are surrounded with the comforts and influences of a home, are given the elements of an English education, and a library of 500 volumes is provided for their use.

A large proportion of the institutions devoted to the care of children are thoroughly catholic in their charity, asking only the question "Is the child friendless?" But catholic or denominational, they are doing essentially the same work, and through their instrumentality "a large average of muscle, brain, and soul is trained and molded and returned to the community in a few years in the form of educated labor." One defect alone seems apparent in their administration: this lies in the fact that in but very few are industrial pursuits carried to any extent beyond the necessary requirements of the institution. When children arrive at the age of 10 or 12 an effort is generally made to procure suitable homes for them, where employment will be given or a trade taught, but only three institutions have been heard from where any systematic "industrial training" is attempted. Girls are usually instructed in housework, cooking, and sewing; boys are employed in the shoe-shop, broom-factory, garden, and on the farm connected with the institution. But these occupations, while forming habits of industry which are invaluable, do not assure a maintenance for the future. This, the Wilson Industrial School, in New York, and the industrial school connected with the Brooklyn Female Employment Society—both for girls—and the Episcopal Orphan Home, of Brooklyn—for boys and girls—aim to supply. In the latter, the art of printing is thoroughly taught. Job-printing is done, and two books, one of 160, the other of 400, pages have been stereotyped. A monthly paper—a double-sheet—15½ by 11 inches, is issued by the institution. The orphans remain until the age of 16 or 18 and then go into the world with such a knowledge of a skilled industry as will insure them a comfortable maintenance.

The industrial school connected with the Brooklyn Female Employment Society is conducted as follows: Children begin in a sewing-class, where they are instructed in plain needle-work. From this they graduate into the fine-work-room, where they at once begin to earn wages. After becoming proficient in this they can secure situations outside or remain in the employment of the society at remunerative wages. Those who show any special aptitude, and who wish to do so, graduate from the fine-work-room into the dressmaking-department, where they are taught the trade thoroughly and fitted to do business for themselves, while at the same time they are paid for what they do. The superiority of this system over the ordinary apprentice-system is apparent. Dressmakers' apprentices are paid nothing and those who are really poor cannot afford the time necessary to become thoroughly skilled in their trade. The industrial school, while giving the girls a means of support, affords them at the same time much better facilities for learning.

The Wilson Industrial School, in the city of New York, is conducted on essentially the same plan, with the addition of a "house-work-class," in which girls are trained in the different kinds of house-work for situations in families. In both these schools the fine-work- and the dressmaking-departments are self-sustaining. The Wilson School has been in operation twenty-one years.

TABLE XXII.—REFORM-SCHOOLS.

Detailed information concerning these schools will be found in Table XXII of the appendix and under the appropriate heading in the abstracts of educational progress in the several States. The following is a summary by States of the number of schools, the number of superintendents and assistants, the number of youths committed to the schools during the year, the number of inmates, the number of inmates instructed, and the number of volumes in libraries.

Statistical summary of reform-schools.

Two schools do not report the number of assistants and three schools do not report number of inmates.

TABLE XXIII.—SUMMARY OF SCHOOLS FOR THE FEEBLE-MINDED.

Table XXIII of the appendix presents statistics of schools for the instruction of feeble-minded youth, of which the following is a summary:

Statistical summary of schools for the instruction of the feeble-minded.

State.	Number of institutions in each State.	Number of instructors and employés.	Number of inmates.
Connecticut	1	10	57
Illinois	1	22	100
Kentucky	1	.....	.....
Massachusetts	3	73	202
New York	1	49	176
Ohio	1	.....	.....
Pennsylvania	1	59	223
Total	9	213	758

TABLE XXIV.—BENEFACTIONS.

The following summary, drawn from Table XXIV of the appendix, exhibits the total of donations and legacies by individuals in aid of education from October 15, 1872, to October 15, 1873, so far as reported to this Office, and the classes of institutions in the several States which are the objects of the benefactions. The total amount of these reported was $11,226,977. The amount reported for the preceding year was $9,957,494. The above figures, however, do not adequately represent the total gifts for educational objects for the year. The Office has no precise data for estimating numerous minor gifts by individuals and societies, but it is probable that these would aggregate at least two millions of dollars.

Statistical summary of benefactions, by institutions.

	Total.	Endowment and general purposes.	Grounds, buildings, and apparatus.	Professorships.	Fellowships, scholarships, and prizes.	Library and museum.
Colleges	$8,238,141	$6,075,325	$1,272,902	$578,575	$244,295	$67,044
Schools of science	780,658	521,112	178,681	65,600	14,765	500
Schools of theology	619,801	219,258	33,200	340,000	26,843	500
Medical colleges, &c	78,600	66,100	6,000	.....	1,000	5,500
Institutions for the superior instruction of women	252,005	221,425	11,500	2,500	16,000	580
Secondary instruction	575,241	357,606	209,885	.....	7,500	250
Libraries	379,011	188,011	150,000	.....	.....	41,000
Museums of natural history	131,680	.....	.....	.....	.....	131,680
Deaf and dumb	4,000	3,500	.....	.....	.....	500
Blind	15,000	.....	15,000	.....	.....	.....
Peabody fund	135,840	135,840	.....	.....	.....	.....
Miscellaneous	17,000	17,000	.....	.....	.....	.....
Total	11,226,977	7,805,177	1,877,168	986,675	310,403	247,554

The following table shows the aggregate of benefactions to the several classes of institutions and to what uses the same are to be applied:

Statistical summary of benefactions, by States.

State.	Total.	Universities and colleges.	Schools of science.	Schools of theology.	Schools of medicine.
Alabama	$4,000				
Arkansas					
California	348,555	$12,500	$150,000	$14,841	
Connecticut	603,821	455,784			
Delaware	600		600

TABLE XXV.—EDUCATIONAL PUBLICATIONS.

The table of the appendix presents a list of original and new editions of works on educational and related topics which issued from the press of the country in 1873. It will be found useful to educators for purposes of reference.

The annexed is a summary of the works by classes:

Summary of the number of educational publications.

Number of firms, 169; number of books, 727:

On art	30
Biography	32
Education	95
Geography and travels	33
History	72
Law	85
Mathematics	20
Mechanics	26
Medicine	84
Natural sciences	88
Philology and translations	54
Political economy and social science	10
Theology and religion	74
Miscellaneous	24
Total	727

TABLE XXVI.—KINDERGÄRTEN IN THE UNITED STATES.

The subject of Kindergarten-culture is receiving more general and more intelligent attention than ever before and the number of Kindergärten is rapidly increasing. The number in each State, as reported, is as follows:

Kentucky	2	New York	11
Maryland	1	Ohio	2
Massachusetts	10	Pennsylvania	2
Michigan	3	Rhode Island	1
Missouri	1	Wisconsin	1
New Jersey	6	District of Columbia	2
United States	42		

Others are supposed to be in existence, but no reports have been received from them

A great hinderance to the general establishment of Kindergarten is the difficulty of obtaining properly-trained teachers. The only normal Kindergarten in the country is the one established about five years since, in Boston, by Mrs. Kriege.

Results of the method.—It is claimed that, wherever the Kindergarten-idea has been faithfully carried out, the most satisfactory results have been achieved. Prof. Hailman, of Louisville, says:

The effect of the system upon the physical and mental development is more than satisfactory. The children grow strong, vigorous, energetic; they attain full and conscious control of their muscles; become nimble and skillful; the glow of health upon their cheeks, the fire of energy in their eyes, elasticity and decision in their movements. Mentally, they become so far the superiors of children who have not enjoyed Kindergarten-culture that, for the first four years, at least in the elementary school, they accomplish fully twice as much. * * * This is due, not only to their greater physical vigor and to the knowledge and skill imparted by the Kindergarten, but more particularly to the habits of attention, concentration, industry, and free obedience, which they owe to Fröbel's system.

Testimony of teachers.—All the reports received from teachers who have taken pupils from the Kindergarten mention the superiority of these children over others in their capacity for learning, owing to the careful cultivation of all their capabilities, particularly their observing faculties. They show great quickness of mental perception and advance rapidly in the studies they undertake. The foundations of mathematical science are so well laid in the occupations and lessons of the Kindergarten, that geometry will not be to them the dry, unmeaning study it is to most, but becomes an old, familiar friend when met with in the text-book.

The scope for invention given in the exercises of the Kindergarten tends to awaken the faculties and develop individual talent. There is no art, science, or industry, which, in its first principles, is not represented in the occupations of the Kindergarten. It may well be said that the method of the Kindergarten gives the starting-point for each science and each profession.

Public Kindergärten in Boston and in St. Louis.—Boston and St. Louis have established public Kindergarten. Of the Boston Kindergarten Miss Elizabeth Peabody says:

The primary teachers who have received the children prepared in this Kindergarten find them so much more intelligent, capable, and well behaved than the ordinary run of children that they express great hope that the city will establish Kindergärten in all the wards.

Hon. William T. Harris, the superintendent of the public schools of St. Louis, says of the public Kindergarten in that city: "The experiment is a remarkably successful one." The results during the short time this Kindergarten has been in operation have been so satisfactory that the public-school-teachers desire nothing more heartily than to see the Kindergarten-idea prevail in all the primary schools. The testimony of all who have a practical knowledge of the Kindergarten-method is unanimous that as a means to an end nothing can be better and that it will be found a matter of economy to make it a part of the public-school-system.

Plato, in the Laws, speaking of the "divine necessities of knowledge"—the disciplines which lie at the foundation of all true knowledge, "against which no god contends or ever will contend"—sketches the Egyptian system of training for "every child"—a plan quite analogous to the Kindergarten of our day.

All freemen, I conceive, should learn as much of these various disciplines as every child in Egypt is taught when he learns his alphabet. In that country, systems of calculation have been actually invented for the use of children, which they learn as a pleasure and amusement. They have to distribute apples and garlands, adapting the same number either to a larger or less number of persons; and they distribute pugilists and wrestlers as they follow one another, or pair together by lot. Another mode of amusing them is by taking vessels of gold, and brass, and silver, and the like, and mingling them or distributing them without mingling. As I was saying, they adapt to their amusement the numbers in common use, and in this way make more intelligible to their pupils the arrangements and movements of armies and expeditions, and in the management of a household they make people more useful to themselves and more wide-awake; and again, in measurements of things which have length and breadth and depth, they free us from that ludicrous and disgraceful ignorance of all these things which is natural to man.—Jowelt's Plato's Dialogues, vol. iv, book vii, p. 356.

TABLE XXVII.—PATENTS FOR IMPROVEMENTS IN SCHOOL-FURNITURE.

The material for this statement was kindly furnished by the Commissioner of Patents. The following summary shows for what descriptions of furniture, &c., patents were granted during the year, and the residences, by States, of the patentees:

Number of patents	33
From California	1
From Illinois	4
From Indiana	3
From Iowa	1
From Kentucky	1
From Maine	1
From Maryland	1

From Massachusetts	3
From Michigan	1
From Missouri	1
From New Jersey	1
From New York	9
From Pennsylvania	5
From Colorado Territory	1
Total	33

Improvements in desks and seats	13
Improvement in blackboard-erasers	1
Improvements in slates, slate-frames, &c	5
Improvements in slate-cleaners	2
Improvement in guide and blotter for writing-books	1
Improvement in musical blackboards	1
Improvements in blackboards	2
Improvements in drawing-boards, &c	5
Improvement in book-cover-protectors	1
Improvements in book-covers	2
Total	33

COMPARISON OF RESULTS.

Having considered the statistical tables of the appendix in detail, it will be interesting to compare (so far as the classification admits of it) the number of instructors and of pupils in the several classes of institutions as reported to this Office in 1873, with the numbers as given by the census of 1870.

CENSUS OF 1870.

The classification of institutions by the census and the number of instructors and of pupils in each class were as follows:

	Instructors.	Pupils.
Colleges, for men and for women	3,902	73,844
Academies	6,190	129,404
Schools of law	78	1,673
Schools of medicine	599	6,746
Schools of theology	357	4,095
Schools of science and agriculture	149	1,790
Commercial schools	478	19,163
Schools of art and music	440	10,498
Asylums for the blind	147	1,403
Asylums for the deaf and dumb	232	3,552
Asylums for idiots	28	686
Schools of dentistry	22	170
Schools of mining	30	114
Other technical schools	115	2,052
Other private schools	25,077	726,688
Normal schools	582	18,592
Other public schools	182,616	6,209,468
Grand total	221,042	7,209,938

STATISTICS COLLECTED BY THE BUREAU OF EDUCATION IN 1873.

The following summary is a recapitulation of instructors and pupils in the various public and private schools included in the statistical tables of the appendix.*

Where reported.	Instructors.	Pupils.
In public-school-systems of States, &c., Table I	216, 721	7, 935, 596
In private elementary schools, Table I	*a*12, 100	480, 342
In normal schools, Table III	887	16, 620
In business-colleges, Table IV	514	22, 397
In academies and seminaries, Table V	5, 058	118, 570
In special preparatory schools, Table VI	690	12, 487
In colleges for women, Table VII	2, 120	24, 613
In colleges, (classical and preparatory departments,) Table VIII	3, 106	52, 053
In colleges, (scientific and preparatory departments,) Table IX	747	8, 950
In schools of theology, Table X	573	3, 838
In schools of law, Table XI	158	2, 112
In schools of medicine, dentistry, and pharmacy, Table XII	1, 148	8, 681
In schools for deaf mutes, Table XIX	289	4, 534
In schools for blind, Table XX	545	1, 916
In schools for orphans, Table XXI	*b*1, 484	22, 107
In reform-schools, Table XXII	*b*579	8, 371
In schools for feeble-minded, Table XXIII	213	758
Grand aggregate reported in 1873	246, 932	8, 723, 945

a Estimated. *b* Superintendents and assistants.

SCHOOL-SUPERINTENDENCE.

The importance of intelligent oversight of schools finds continually increasing recognition with our people. In some form, almost every State and Territory in the Union has now both general and local superintendence. The system abides where it has already found a lodgment and steadily makes its way to points beyond. Arkansas has in 1873, exchanged its former circuit-supervision for the closer inspection of county-superintendency. Indiana has put county-superintendents in place of the county-examiners it had before. North Carolina is calling for a kindred change and Maine desires the restoration of the superintendency it had. Tennessee, after abolishing it, has restored it. And although, from false ideas of economy or from discontent with the imperfect work which small salaries secure, there have been mutterings against it in some quarters, good supervision abundantly justifies itself by its effects, wherever a judicious liberality provides salaries sufficient to secure the proper kind of men and enable them to give their undivided time to the performance of the duties of their office. A universal adoption of the system on this liberal plan would probably do more than another single thing to promote the interests of education in the States.

That there shall be some sort of supervision is decided by the general suffrage above indicated. Headship and oversight, in one form or another, are, indeed, essential to every organization. Order comes constantly from settled law; and law, men perceive, must not only have an authoritative source, but also some executive direction. Hence heads for every household, engineers for every machine, officers for every society, and governments to enact regulations for communities and see that these regulations are enforced. No farm without some head farmer; no factory without its foreman; no commonwealth without a line of associated agencies to look after the administration of the laws. The idea of experienced supervision meets us everywhere; that of abandonment of valuable interests to mere blind impulse, nowhere.

* This summary does not include pupils in city-school-systems, as they are presumed to be included in the State-systems.

And in the case of the public schools such supervision is called for by peculiar circumstances. Our educational systems are yet comparatively new and need skilled watching to prevent friction in their working and bring all parts in harmonious accord. Our territorial limits are immense; and, without this skillful watching, incompetence, mismanagement, or petty tyranny may easily be hidden in the remoter country schools and in the intense life of cities, and work out miserable issues. We have, moreover, in our States and Territories, upwards of 200,000 teachers. These are of all degrees of qualification for their work; some especially and laboriously educated for it; some with but just the ordinary training of elementary and grammar-schools. Great numbers of them have had little opportunity for witnessing the best methods of management and teaching; others, whatever their natural or acquired capacities, enter the ranks each year as raw recruits, to take the places of retired or dying veterans. With such material, some oversight and guidance, in the great task of forming the minds, manners, and morals of our youth, are obviously a necessity.

Of course, this necessity existing, the more experienced, able, active, and continuous the oversight and guidance can be made, the better it must be for all concerned. A man that undertakes a superintendency of schools with little preparation for it duties, and gives these only such time as he can spare from more absorbing occupations, can hardly exercise a permanently beneficial influence. The flutter excited by his hasty entrances and hurried examinations soon vanishes, and schools sink back into the old routine, with a sigh of relief or of exhaustion. But let one, energetic, scholarly, judicious, with thorough knowledge of the subjects to be taught and of the happiest methods of instruction, give his whole time and heart to this great work, and there will be a leverage beneath the schools to lift them to a higher elevation. Moving continuously, among the teachers and pupils, in thorough sympathy with them and with their work, he will animate the despondent, stimulate the slow, enlighten the inexperienced, show this one how to manage, that one how to teach, and, cheering skill by kind encouragement, aiding uncertainty with wise advice, will infuse a life not previously existent, bring order out of whatever confusion may have reigned, and mold the various elements beneath his influence into an accordant and harmoniously-working whole. His worth with parents and citizens is equally effective. The general securing of such men for superintendents would introduce a new era in the school-history of the United States. To get them, however, to anything like the extent that is desirable, there will need to be, in many quarters, a large increase of salaries and greater care in the selection of the men. Men of high character and liberal culture are too much in demand in other lines to give themselves to the superintendency of schools, without the means of such comfortable livelihood as will relieve them from oppressive family-care and enable them to give to the employment sufficient time to make it a success. But, except in cities, the offered compensation is now below $1,000 almost everywhere. New York alone appears to actually reach that rate throughout her counties, though Pennsylvania approaches it with her least salaries and in many cases goes beyond it. In Texas the rate has been nominally $1,200, but in fact much less. In Kansas it comes down to $900; in New Jersey the average is below $800; in California, about $620; in Nevada, $575; in Arkansas, $400; in Illinois and Kentucky, apparently about the same; in Iowa, $390; in West Virginia, $254; in Tennessee, $228; in Virginia, $217, with the possibility of increase from the county-treasury, of which increase as an actuality there appears no trace. In almost all our older States such sums are wholly insufficient for effective family-support. As long as only such continue to be paid, the superintendents must either be unmarried men, (which is not generally desirable,) or must have private means to supplement their salaries, or must devote their main time to other business and give just occasional spare hours to the schools. Efficient, energetic supervision is hardly to be hoped for in these circumstances. A first requisite in order to this is an extensive increase of salaries, enabling men of proper character to make the superintendency their only work and stimulating them to the bestowment on it of their highest powers and energies. The larger towns and cities wisely bid for the best talent with salaries of $2,000 to $5,000 and find it pay to do so.

A lengthening of the term of office would be another means to the same end. In by far the greater portion of the States the superintendents are chosen to serve for only one- and two-year-terms. This may be long enough for men that have other occupations to fall back on, and doubtlesss seems to good school-teachers too long to endure the mismanagement of ignorant or tyrannical incumbents; but it is too short to win from more permanent employments a sufficient number of really first-class men. Such can make more at other work than can be made from a superintendency of schools, and, though they may be willing to forego prospective gains for the sake of exerting an influence for good, must have more time than just a year or two for the exercise of a far-reaching influence. They must have this time to form full acquaintance with their fields, to sow in them the good seed of a thorough education, and to develop from it the harvests they desire. They must have it to weed out incompetent school-teachers, to bring those of higher qualifications to the front, to thoroughly test any new system of instruction, to accomplish from it the best possible results, to see the completion of large plans for school-improvement, and to leave some permanently visible impression of their having lived and labored in these fields. And since this cannot be, with such short terms, unless through frequent re-elections, of which one always must stand painfully in doubt, a large proportion of the scholarly and able men that ought to be in the superintendency of schools drift off from this useful and honorable occupation to others that give prospects of more settled homes and more visible reward for their exertions. To remedy the loss which hence ensues and to secure the most valuable style of service, will it not pay—besides increasing salaries—to lengthen out the term of office generally to the three years of New Jersey, New York, Pennsylvania, and Virgina, or the four years of Florida, Georgia, Illinois, and Texas, with such prospects of a re-election upon good behavior as shall encourage hope of a still greater permanency?

Till something like this comes to be the case, the counties will have to be content with less than the highest measure of efficiency—with service snatched from other occupations and sandwiched in between engagements here and there—with men, too, who, however conscientious and inherently able they may be, still must quite often lack the rounded education, finished culture, and well-proved powers which only long terms and fair salaries can command.

Supervision of public schools in the

States.	Designation of officers.	Modifications.
Alabama	County-superintendents	With two school-directors for each county.
Arkansas	County-superintendents	With school-trustees in districts
California	County-superintendents	With county-boards of examination
Connecticut	Town-school-visitors	With acting school-visitors and city-superintendents.
Delaware	County-superintendents	With a city-superintendent in Wilmington.
Florida	County-superintendents	Members and secretaries of county-boards of public instruction.
Georgia	County-commissioners	Members and secretaries of county-boards of public instruction.
Illinois	County-superintendents	With township-boards of trustees and school-directors.
Indiana	County-superintendents	With township-boards of trustees and school-directors.
Iowa	County-superintendents	With township-boards of directors
Kansas	County-superintendents	With county-boards of examiners
Kentucky	County-commissioners	With district-trustees
Louisiana	Division-superintendents	With school-directors in the parishes
Maine	Superintending school-committees	Of towns or school-districts
Maryland	County-commissioners, (three to five for each county.)	With a county-examiner
Massachusetts	Town-school-committees	With town- and city-superintendents.
Michigan	County-superintendents	With district-school-boards
Minnesota	County-superintendents	With district-school-boards
Mississippi	County-superintendents	With district-school-boards
Missouri	County-superintendents	With township-school-boards
Nebraska	County-superintendents	With district-school-boards
Nevada	County-superintendents	With district-school-boards
New Hampshire	Town-school-committees	Town-superintendents allowed
New Jersey	County-superintendents	With district-school-trustees
New York	County-commissioners	With sixteen city-superintendents
North Carolina	County-commissioners	With county-examiners
Ohio	District- and city-boards of education, with their respective presidents; district- and city-superintendents.	With both State- and county-examiners and district-boards of education.

* Examiners.

several States and Territories, 1873–'74.

Mode of election.	Time of service.	Compensation for services.
	Years.	
By the people	2	Five per cent. of school-moneys disbursed and $3 per diem for actual service. "Not less than $300."
By county-school-officers	1	From $300 to $500 per annum.
By the people	2	For each school-district, $20. Average, $620 per annum.
By the people	3	School-visitors, $3 per diem for actual service.
Appointed by the governor	1	Postage, traveling-charges, and expense of distributing forms.
Elected by the county-boards	4	From nothing up to $800.
Elected by the county-boards	4	From $3 to $5 per diem for actual service.
Elected by the people	4	From $400 to $1,000 per annum.
Elected by township-trustees	2	For actual service, $4 per diem.
Elected by the people	2	For actual service, $3 per diem. Average, about $390.
Elected by the people	2	From $3 per diem to $1,500 per annum, according to school-population.
Appointed by county-courts of claims	2	$100 per annum, with $3 for each school-district, $3 for each colored-school visited, and 1 per cent. on moneys disbursed.
Appointed by governor on nomination by State-superintendent.	.....	$2,500 per annum; in New Orleans, (sixth division,) $4,000.
Elected by the people	3	$1.50 per diem for services, with traveling-expenses.
Appointed by judges of circuit courts	*2	Commissioners, "not over $100;" examiners, from $500 to $2,300.
Superintendents by school-committees; school-committees by the people.	†1	Committee-men, $1.50 per diem for actual service; superintendents, different rates, according to population, &c.
Elected by the people	2	From $3 to $5 per diem for actual service.
Elected by county-commissioners	2	For each school-district, $10. In larger counties, $1,000 to $1,200 per annum.
Appointed by State-board of education	2	For actual service, $5 per diem.
Elected by the people	2	For actual service, $5 per diem.
Elected by the people	2	For actual service, $3 to $5 per diem.
Elected by the people	2	"Such compensation as shall be allowed by the board of commissioners of county;" "at least all necessary traveling-expenses." Average, $795.
Elected by the people	1	"Such reasonable compensation as the town may determine."
Appointed by State-board of education, subject to approval by board of county-freeholders.	3	Ten cents for each child of school-age in the county. Not less than $500 nor more than $1,200 per annum. Average, about $795.
Elected by the people	3	From State, $800 per annum for salary; from county, $200 for expenses.
Commissioners by the people; examiners by commissioners.	*1	Examiners $2 per diem for actual service.
The State-examiners (3) by State-school-commissioner.	2	District- and city-superintendents, $800 to $4,000 per annum; county-examiners, $2 per diem for actual service.
The county (3) by the probate-judge of each county.	3

answering to these, in all the States and Territories, except Delaware and Alaska, with State-boards Connecticut, Florida, Georgia, Indiana, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, South Carolina, Vermont, and Virginia. A territorial board of education exists also in Arizona.

COST OF EDUCATION AND OF POLICE.

It has been impossible during the past year to give any special attention to the prosecution of the inquiry into the relation of ignorance* to crime or of education to morals and public order.

Particular attention, however, is invited to the following very valuable and instructive summary of facts in regard to a number of our cities:

Table showing the cost of police-department and of public schools for one year in several cities.

	Date of report.	Cost of police-department.	Expenditure for public schools.
Mobile, Ala	1873	$76,572	$53,253
New Haven, Conn	1873	90,000	149,444
Chicago, Ill	1873	505,327	736,190
Baltimore, Md	1873	549,974	547,911

*For 9 months.

* Rev. Eleazer Smith, for a dozen years chaplain of the New Hampshire State-Prison at Concord, declares that, of the three hundred prisoners who have entered the institution during his official term, about one in six could not read when they were committed. Of the three hundred, not one has been taken from any of the learned professions—not one lawyer, or physician, or clergyman, known and recognized as such by any of their professions, and not one editor or school-teacher. "I have been," says Mr. Smith, "so long connected with the prison and its records and history, that I can pretty confidently affirm that from its opening, some sixty years, there has not been among its inmates one clergyman, lawyer, physician, editor; not one deacon, steward, church-warden or class-leader; nor one son of a clergyman; and I have been able to learn of but two persons who, at the time of the commission of the crime, were members of any church."

* Given as minors.
† Convictions.
‡ Of whom 49 were under 10 and 460 between 10 and 15.
§ Of whom 118 were under 10.

The percentage of arrests of persons under 20 years of age to the whole number of arrests was, in Detroit, 14.4; in Chicago, 12.5; in St. Louis, 9.2; in Memphis, 8; in Albany, 6.2; in Buffalo, 5.7; in Boston 5.33; in the District of Columbia, 4.87.

Of the 12,535 persons arrested in Buffalo, 1,414 could neither read nor write and 133 could read only; of 11,781 persons arrested in the District of Columbia, 4,227 could neither read nor write; of 6,273 persons arrested in Albany, 532 could neither read nor write and 93 could read only; of 4,861 persons arrested in Detroit, 668 could neither read nor write and 55 could read only.

The police-records of Boston show that "the increase of minors among the arrests nearly keeps pace with the increase of population."

The San Francisco police-report for 1871–'72, while finding cause for congratulation in the fact that, while the population has largely increased during the past three years, the number of arrests has greatly diminished, mentions with regret the increasing evil of "juvenile ruffianism" as the most difficult matter with which the police-department has to deal.

VENTILATION OF SCHOOL-HOUSES.

The increased attentions given to this subject are especially gratifying.

Deeming it very important that this report should carry with it some indication of the progress of inquiries in this direction, I include the following *résumé* of opinions and facts:

In a notice in the Sanitarian for May, 1873, of a treatise on ventilation, by Lewis W. Leeds, it is remarked that—

The greatest sanitary want everywhere is ventilation, to be supplied in all existing tenant-houses, work-rooms, school-rooms, and all places of assemblage. Many children are taken from school in consequence of headaches, fever, sore throats, and weak eyes, "caused by too close attention to study," when, if the cause be investigated, it will be found that they have been confined in a close room, with perhaps fifty other living, breathing creatures, where there is no ventilation. Consequently they are inhaling over and over again the same impure breath.

In the Sanitarian for January, 1874, the following "life-problem" is presented:

Every full-grown adult throws out by respiration about four and a half gallons of deleterious gas and watery vapor per hour; and the children of school-age average,

each one, about three gallons per hour. Suspended in this deleterious respired air and vapor, there is in every 1,000 gallons 3 gallons of *dead decomposing animal matter!* * * * Now, if one person throws out four and a half gallons of poisonous air every hour, how long will it take 1,000 persons to fill a church full; fifty children to fill a school-room full?

An article quoted from the Pall Mall Gazette in the Sanitarian for June, 1873, says:

The marvel is not how many children die, but how many escape. Work-houses are under (assumed) competent supervision; so are mad-houses; so are prisons; but schools, where the young receive their life's permanent impress, are left out as beyond the range of inquiry altogether, save in that queer jumble of inconsistent half-truths we call education; and the master and mistress may kill the children intrusted to their care with untroubled consciences.

The report of the board of health of the city of Boston for the year 1873 speaks as follows of the defective ventilation of the school-houses of that city:

Let some person who never has thought of it go into some of our school-rooms, even in our own city, about 12 at noon, on a moist winter-day, where some 60 to 100 pupils are climbing the wearisome heights, and the darkest troglodytic dormitories of our city have something of the scent of an orange-grove in full blossom in comparison. You ask about the ventilation, and your eye is directed to two or three holes in the wall, near the ceiling, but you are not told whether moral suasion is to coax, or corporal punishment drive, the deadly poison up there, nor who or what does the coaxing or driving. But you must be persuaded to believe that a mastodon crawls out of a gimlet-hole, when no inducement is offered him to go.

Dr. C. R. Agnew, in an article in the Sanitarian for April, 1873, says:

In the city of New York, with its boasted public-school-system, there is room for reform from the primary schools up to the New York College. I quote from a recent report:

"Seventeen school-buildings have been inspected, against all of which reports are made of bad sanitary condition. Six of them have class-rooms so damp and dark that they are declared to be unfit for school-purposes and in one case it is recommended that the entire building be vacated. * * * * One of the principals of one of the largest of those public schools has told me that they get on with the primary children very well in the morning, but that it is almost impossible to keep them awake in the afternoon from the effect of mental strain and bad air."

In the Sanitarian for April, 1873, Dr. Jaynes, city sanitary inspector of New York City, details the results of some experiments with the air in the public schools:

From our public schools Dr. Endemann obtained seventeen samples of air, the examination of which determined the presence of carbonic acid, varying in amounts from 9.7 to 35.7 parts in 10,000; or, in other words, from more than twice to nearly nine times the normal quantity. The ventilation in these buildings is generally faulty and can be obtained only by opening the windows—a practice detrimental to the health of the children who sit near or directly under them. The following experiment made in the Roosevelt Street school shows the inefficiency of ventilating-flues in the wall, unprovided with means for creating an upward current. An examination of the air in one of the class-rooms provided with a ventilating-flue was made while one of the windows was opened, and yielded 17.2 parts of carbonic acid in 10,000. The window was then closed, and after the lapse of ten minutes another examination gave 32.2 parts of carbonic acid, or an increase of 15.6 parts. The experiment now became to the teacher and children so oppressive that it was not continued. Dr. Endemann says: "If the accumulation of carbonic acid had been allowed to continue, we might have reached within one hour the abominable figure of 110." The following is a statement of the average result obtained from the several experiments made in each school:

School.	Experiments.	Carbonic acid.
Elm street	3	14.6
Roosevelt street	2	19.5
Thirteenth street, near Sixth avenue	2	28.1
Thirteenth street, near Seventh avenue	2	21.3
Greenwich street	2	17.6
Vandewater street	2	14.7
Madison street, near Jackson	4	24.2

As expired air contains, not only this poisonous gas, but also effete animal matter escaping from the bodies of those present, and in quantities in proportion to the amount of carbonic acid exhaled, it follows that air vitiated by respiration is far more deleterious than air vitiated by the same amount of carbonic acid from other sources; and

as the standard of permissible impurity has been placed by high sanitary authority (Dr. Parkes and others) at 6 parts of carbonic acid in 10,000 of air, it is evident that the best practical talent should be engaged in designing and perfecting means for securing to our public schools adequate and thorough ventilation.

The Sanitarian for August, 1873, contains the report of Mr. Lewis W. Leeds concerning the ventilating and warming arrangements of some of the school-houses in the city of New York. An examination of two of the *best* gave the following results:

In No. 35 the windows in all the class-rooms were found pulled down from the top, for the purpose of relieving the rooms of a condition which the teachers termed "blaziness." The ventilators for the exhaustion of the foul air are all near the floor and many of them communicating with flues in the outside walls. On testing these flues there was little or no motion of air in them, and as commonly into as out of the room. A considerable number of wrought-iron radiators had recently been placed in various rooms to assist in warming and for the purpose of establishing an air-current. This combination of direct radiation and currents of partially-warmed air is an excellent one when properly carried out. But in this case there seemed to be a total want of knowledge of the subject in the executive head of the work. The arrangement as a whole is imperfect and inefficient.

No. 47 had been passed by the sanitary inspector without criticism, and a better condition was anticipated. It is warmed by seven hot-air-furnaces. All the warmed air is brought into the class-rooms through registers on the interior or warmest side of the room, directly against the teachers' backs and the ventilator for the escape of the foul air is placed directly above the registers, thus submitting the teacher, who sits on the warm side of the room, to a perfect blast of hot air, which, after roasting him or her, rises immediately to the ceiling and escapes. But the children sitting on the opposite and cold side of the room, with their backs to the windows, have to suffer for the teachers' roasting by the open windows, exposing them to cold draughts upon their backs and shoulders and contributing in no small degree to their frightful mortality. * * * One only of the seven furnaces had a good supply of fresh air. Five of the others were wholly devoid of fresh-air-entry from the external atmosphere, while they counterfeited the appearance by the show of large registers from the cellar. These contained an accumulation of dirt, flavored with the odor of the *hen-coop, into which the fresh-air-supply-box of the seventh furnace had been converted*, the mouth being shut off by a damper—*not odor-tight*—veritable *foul* air where fresh was most to be expected. The ventilating-flues, instead of being carried out separately as chimneys, and each communicating with an open ventilator, (as had been represented,) were found gathered together on each side of the house into large cupolas. One of these cupolas was found boarded over so as completely to obstruct the air. This had been done for the purpose of using it as a *pigeon-house*.

Thus there are in one of the *first-class schools* in the city of New York about 1,200 children "tortured by the most unscientific and villainous appliances for warming and ventilation that the human mind can conceive of. If the very converse of warming and ventilation were desired, this system could scarcely be excelled for producing alternate blasts of hot, foul air around the head for breathing, and cold, chilly draughts against the back and feet for killing."

Two new school-houses, "supposed to embody the most perfect system of ventilation and warming," were also examined. In the words of the report:

There is not one single foot of fresh-air-supply in either of these buildings. The only dependence for fresh air is the pernicious system of opening the windows; and the radiators are commonly placed opposite the windows, so that the cold air has to be blown across the room before it comes in contact with them. There is some little show in some of the rooms of an attempt to carry off the foul air, but in reality it is wholly ineffective. There are small, rough flues in the brick wall, into which registers are placed, with the worthless object of conducting the foul air into a large exposed space under the roof and allowing it to escape under well-displayed cowls. Some of the overheated air possibly ascends at times up the hottest of these flues, but it is so quickly cooled by contact with the cold roof that it falls back again into other rooms where the flues are less heated. And thus, at best, *a current of foul air only* is established, without any means of escape.

In the Sanitarian for November, 1873, Mr. Leeds gives the results of an examination of ten additional school-houses, some of them recently erected in the city of New York. Of two of these it is said, "There is not a sign of a register for fresh-air-supply or escape of foul air in the whole building;" and of four others, "No attempt whatever to provide a regular supply of fresh air." Only one has "ample fresh-air-boxes in good condition;" and in this, and in every other building examined, the provision for the

exhaustion of foul air is defective and insufficient. "A few small registers near the floor open into small rough flues in the cold outside walls," in one case only "about four inches square—a perfect farce. These flues empty into the large space under the roof, where the air, becoming chilled, is quite as likely to fall down into the rooms as to flow out; consequently such registers are almost always closed to avoid the cold on the feet of those who sit near them."

In one building "the handsome show of ventilators on the roof and the ventilating-registers in the rooms are mere *shams* and *deceptions*, for *they do not* communicate;" in another, "the ventilating-caps on the roof *are not connected in any way with the ventilating-flues* in the outside walls." In a third, "attempts have been made to connect the flues from the rooms with the ventilating-caps on the ridge by wooden boxes under the roof, *but a space of two or three feet in length is left open near the center, breaking the connection.*"

Of one building it is said: "The aggregate capacity of the foul-air-openings, provided they prove efficient, is about one-tenth that provided in first-class buildings in other cities;" of the ventilating-flues in another, "they are of no earthly use except, perhaps, it might be a slight relief to the consciences of those whose business it should be to provide these children and teachers with pure air." Not one building was found where a sufficient supply of fresh air could be secured without opening the windows. Many teachers "have frequent complaints from parents that their children take cold by sitting in the draughts from open windows; but they cannot get along at all without having the windows open. In cold and stormy weather, when the windows cannot be kept open, the air soon becomes filthy. It is perfectly horrid to keep *children* confined in such an atmosphere; indeed it would be shameful cruelty to animals."

In this examination was included the new building of the Normal College of New York, of which it is said:

Here we have a splendid new building, where the greatest attention has been given to secure the latest and most perfect ideas that the board could command for the instruction of the teachers themselves in all that belongs to the most perfect development of the body and mind of the young citizens of New York. The heating-apparatus alone must have cost from $30,000 to $40,000. Radiators scattered around in great profusion in proper and improper places, but *there is not one single foot of regular fresh-air-supply* provided for in the entire building. Innumerable handsome ventilating-registers ornament the walls at the top, in the middle, and at the bottom of the rooms, but the current is as likely to be *into* as *from* the room. All the flues terminate in the vacant space under the roof, so that the warmed air that may, at times, go up the flues on one side of the building, will be cooled by contact with the cold roof and fall down the flues on the other side. There are a few little ventilating-cowls on the roof, with a crack of two or three inches around the top, which is probably about *one-fortieth part* of the open space that makes such a splendid show in all the rooms.

Thus, by a careful examination of all classes of buildings belonging to the board, we find that much expense has been incurred in the name of ventilation, and a goodly show of ventilating-cowls ornament the exterior of many of these buildings; and yet we do not find *one single building properly ventilated.* There appears to be an entire absence of any comprehensive or practical system of warming in connection with the ventilation, which is so essential in producing the most satisfactory results.

The construction of school-houses so as to furnish a "grand collecting-room," Mr. Leeds utterly condemns. In the Sanitarian for December, 1873, he asks:

Is this exhibition-room worth what we pay for it? Is it worth sacrificing the comfort and health of both teachers and pupils by cutting off the fresh-air-supply from the class-rooms, where the real labor of the school is performed? In short, is this exhibition worth *four or five hours of the most shameful and disgraceful poisoning*, by keeping the delicate lungs and bodies of teachers and children charged with the foul and fetid atmosphere of a close and crowded room, aggravated, too, by alternate blasts of dry air from red-hot furnaces and cold, damp air from open windows? Or, again, is this condition improved upon by the substitution of a large steam-radiator in one corner of the room, in immediate proximity to which—owing to the very crowded condition of these class-rooms—some of the children must sit?

Mention is made, as an example, of a Brooklyn school-house—

A new and costly building, which probably fairly represents the best modern school-houses. Here we have twelve class-rooms on each of two floors. Eight of these on

each floor can all be overlooked at one time. But close the glass partitions, and we find 50 or 60 children, with their teachers, crowded into comparatively small class-rooms, and for the most part without sunshine and pure air. Two only out of the twelve rooms have sunshine and pure air on two sides. And this is not the worst: six of the class-rooms are surrounded by other foul class-rooms on three sides. After half an hour's study the air is disgusting in the extreme, especially on the leeward side of the building. On the windward side the air is better, but it is too often from open windows, blowing directly on the backs of the children, now doubly susceptible to such an influence for evil.

Still worse than this is the plan of a number of splendid brown-stone buildings that have been recently erected in Philadelphia. Here, added to the great sin of massing all the collecting-rooms together, is the still worse blunder of cutting off so large a portion of the light and air by the stairs, committee-rooms, and water-closets. These are splendid new buildings, for which millions of dollars of the people's money have been spent and in which their children will undoubtedly be tortured for many long years, before they will have the courage to do what they ought to do at once, *tear them down*. Thus we find in so many cases the collecting-room-system so materially interfering with the sanitary conditions of the class-rooms that it should be greatly modified or entirely abandoned. And the adoption of the arrangement suggested by the Vienna premium-plan, would, in the author's judgment, fully justify the omission.

Here we have that great desideratum, a free exposure to the external atmosphere and sunshine on every side of each class-room; and, still better, no two class-rooms join, so that the foul air from one cannot be blown into another with any direction of the wind. The object is to imitate, as nearly as possible, the natural effect of a bright, sunshiny day. It will be observed that the sun rapidly heats all solid objects upon which it shines. These solid substances, thus pleasantly warmed by the sun's rays, form heaters in addition to the direct heat from the sun, thus warming the ground under us and surrounding our bodies with hot substances, but leaving the air around our heads cold and invigorating. We should, therefore, have the floors and sides of our class-rooms warmed to just what they would be if the sun was shining upon them—say 85° F. or 90° F. for the floors and 110° F. for the sides of the rooms. It is a near approach to an even distribution of the heat to place the steam-radiators immediately under the windows, the excess of heat from the radiators being nearly balanced by the excess of cold from the windows. The cold air should not be allowed to get near the floor, but should be deflected upward as it enters, which is done by a curved sill, and the warmed air rising from the radiator mingles with the inflowing cold air, which is thus thrown to the ceiling and falls in imperceptible currents. It is very desirable, however, in small, crowded class-rooms to have a still more evenly diffused heat. This can be effectually secured by moderately warming the whole wainscoting on the colder sides of the room. This may be accomplished by making the wainscoting of iron, slate, or of plaster upon iron lath, with the steam-pipes behind it. The warming of the floors can be secured by cross-furring on top of the beams and allowing the hottest air (and that is generally the foulest air when warming by direct radiation) from the rooms below to pass underneath the floor to the ventilating-flues. Additional heat may be secured by running one or more steam-pipes through this air-channel. The means for exhausting the foul air consist of two large air-shafts centrally located, into which the various foul-air-ducts lead. The temperature of this shaft must be constantly above that of the external atmosphere, which may be secured by the smoke-pipe of the heating-apparatus or by coils of steam-pipes or a stove.

Nature's great means of purifying the air and supplying it fresh to all living things is agitation. The gentle agitation of the air in the school-room is of the first importance. This is very naturally and beautifully accomplished by having the floors warmed to 80° F. or 90° F. and the air above only 50° F. or 60° F. This would set the whole air of the room in motion, like water in a pot over the fire. With this constant agitation of the air and the diffused warmth, partially from radiation and partially from moderately-warmed air-currents, it is quite possible to maintain a uniform temperature of the whole room and to preserve a pure, vigorous atmosphere in a room constantly crowded with human beings, and that, too, without producing the cold, unpleasant draught, so bitterly complained of in crude and imperfect attempts at ventilation.

The annual report of the State-board of health of Massachusetts contains a paper on "School-hygiene," by Frederick Winsor, M. D., in which the following testimony is presented concerning the ventilation of schools in Massachusetts:

Defective ventilation is very generally and very emphatically complained of, and such expressions as follow are common: "We have no tolerable system of ventilation." "School-ventilation is thus far a failure." "The air in our school-houses is simply execrable." "The stench of a primary school has become proverbial." One of the school-houses presented in the report of the State-board of education for 1873 as a *model*, large and expensive, on the warming and ventilating of which "much thought and

care have been bestowed," was visited in December, 1873, and this is the report: "I visited several of the rooms and found the air offensive in all to the smell, the odor being such as one would imagine old boots, dirty clothes, and perspiration would make if boiled down together. The master says he knows of no school-house where good ventilation is secured. Our superintendent of schools says the same. In the new *model* school-house the hot air enters at two registers in the floor on one side, and makes (or is supposed to make) its exit by a ventilator at the floor on the other side of the room. The master said the air was supposed to have some degree of intelligence and to know that the ventilator was its proper exit."

The difficulties to be overcome in ventilating school-rooms are very great, but not too great to be conquered by intelligence and money, both of which are at our disposal, but neither of which is willingly applied to the problem of ventilation by building-committees, with whom, rather than with architects, the responsibility seems to lie. * * * * The trouble is that every *tolerable* system of ventilation is expensive and those having the matter in charge cannot bring themselves to lay out much money on that which will make no show whatever. Nevertheless it is the fact that in our climate for seven months in every year *fresh air* cannot be had within doors without paying money for it. Not only does it presuppose a somewhat expensive arrangement of ducts and flues, but it requires for the efficient working of these more fuel than we like to pay for. Three things must be done: *first*, supply fresh air; *secondly*, warm it before bringing it into the room; *thirdly*, get rid of it after it has been breathed *once*. In rooms heated by stoves or by steam-pipes in the room, the first and second demands cannot be met except by transforming them into portable furnaces. To meet the third requires both larger, more numerous, and differently-placed openings and ducts than are to be found in one school-house in a hundred, and in addition to these a shaft or flue of ample size and *well heated*. And these all cost money. But then pure air is a necessity to health. No State or town can afford to allow its school-children to be slowly poisoned by breathing foul air. If we are wise we shall be less lavish of expenditure on showy exteriors and lofty halls and more ready to spend on thorough ventilation. In every school-house which cost $20,000 enough might have been saved, by making the ceilings two feet lower, to pay the cost of supplying the building with pure air, while at the same time the labor of going up stairs would be sensibly less. * * * * As to the practice of ventilating in winter by opening windows, we say, in the words of Dr. Angus Smith, "though foul air is a slow poison, we must not forget that *a blast of cold air may slay like a sword.*"

In the thirty-sixth report of the State-board of education is a report by a special agent of the board, who investigated the condition of schools and school-buildings in the four western counties. He visited 368 schools in 73 towns, and reports that "the *larger number* of the schools are kept in houses either badly located, incommodious, poorly furnished, inadequately lighted, or without proper means of ventilation. * * * School-houses are often made too large, (*i. e.*, made to include too many scholars.) They are often made too high: two stories are better than three; one story better than two. The rooms are often *too high in the walls*, a fault which makes them hard to heat and necessitates long flights of stairs, to ascend and descend which many times a day is not only laborious but mischievous to all the older girls and to every feeble child, while the height is not required for ventilation. * * * * Every city should have a sanitary inspector and instructor of schools, who should be a physician. Every town-board of health should have among its number a physician, whose duty it should be to pay a monthly visit to every scholar in town and make a monthly sanitary report to his board and a yearly report to his board and to the State-board of health. * * Thus, upon the local boards of health and upon the towns, something definite and permanently open to reference in relation to school-hygiene would be brought to bear. Public attention would be drawn to whatever mistakes and evils of this order might be shown to exist, and, when this great point can be gained, the evils will certainly be abated."

The report of the State-board of health of Michigan contains the following remarks concerning the "hygiene of school-buildings:"

In these days, when the very foundations of our republican Government are claimed to rest upon our school-system, which includes much of the mental training of those who are soon to be "the people" of the State, and when it is considered how much time the young spend in school-buildings; that during the school-ages the physical system is also being formed for life, and that upon this physical structure the intellect is dependent for its force and endurance, one may then, to some extent, realize the very great importance of any and all questions which relate to the conditions which prevail in our schools and which thus control the immediate future of the race.

From the report of R. C. Kedzie, M. D., chairman of the committee on buildings, the following extracts are taken:

By securing the best possible conditions for the health of the young, we most effect-

ually secure the well-being of the State; and any cause which saps the vigor of childhood is a blow at the common weal. The public school is almost the only place where the law may directly interpose to secure for the people the conditions of health. By law we have made attendance on school compulsory; by the potent law of an enlightened public opinion we should also make compulsory the conditions necessary for vigorous health during their attendance at school. By placing them, during the most formative period of their existence, in school-buildings which combine all the best conditions of physical existence, as well as intellectual development, we do much to mold the character and modify the home-life of coming generations. Every consideration, therefore, demands that we give most earnest heed to the conditions which influence the health of the children, the men and women of the immediate future of our State.

In examining the school-houses of our State, the first prominent fault in construction observed was that the rooms are too small for the number of scholars. The lowest estimate would require 300 cubic feet of space and 25 feet of floor-space for each scholar. Thus a room, 30 by 30 feet and 12 feet high, might contain thirty-five scholars and the teacher; but this is a minimum space, even for small scholars, and can be safely used only in connection with good ventilation. Some persons seem to think that small scholars require but small breathing-space, but this is a grave mistake. Mr. Simon says, "Even healthy children, in proportion to their respective bodily weights, are twice as powerful as adults in deteriorating the air which they breathe. I think it best that children and adults should be deemed to require equal allowances of air and ventilation." The rapidity of the processes of waste and repair in childhood forbid the use of less space. Yet, when we measure the size of school-rooms and count the number of scholars, we see that the space for each scholar is much below this estimate. * * * The economy which hazards the health and life of the pupil to save the expense of additional buildings is an economy which borders on recklessness or crime. The evil of this system is especially manifest in the stinting of floor-space. The seats are placed as close as the scholars can conveniently sit and the space for the alleys is as small as will allow the scholars to pass single file. For the health of the scholar, the floor-space is almost as important as the cubic space in the room.

School-houses three and four stories in height are utterly condemned, on account of the amount of stair-climbing which they necessitate and the influence of such stair-climbing on the health of female pupils, both during their school-days and in after life.

Shall a city aim to have a few large schools or many small ones? It seems to me that too little thought has been given to the influence of large schools on the health of scholars; that the sanitary condition of a child in a school of 1,000 or 1,500 scholars is very different from that of a child in a school of 100 or 200. * * * * *

Adequate ventilation and satisfactory heating can be more easily secured in buildings of moderate size than in very large buildings. The same can be said in regard to the sewerage and insolation, or the needed exposure to sunlight. A large number of medium-sized schools would be considered far preferable to a small number of colossal schools. Could not the sanitary conditions be better observed in these smaller schools? * * * I am aware how pleasing is the sight of a vast crowd of scholars and how beautiful is the sight of a sea of eager, upturned little faces; but is there not danger of sacrificing their well-being to our love of spectacular show?

The proper warming of a school-building is a matter of great importance. The mass of the scholars are young, and it is well known that the young of all animals, especially when not taking active exercise, require a higher temperature than adults. Much of the difficulty in warming school-rooms arises from defective ventilation, as it is almost impossible to properly warm the air of a room which is not ventilated. In every room heated by artificial means, a lake of cold air tends to form on the floor; and, if this is left undisturbed by ventilating currents, the result in a hygienic point of view is very undesirable. * * * In examining the school-rooms in this State I found, as a general rule, that where the rooms were not ventilated at the floor-level, and when this lake of cold air was not drained off, the difference between the temperature at the floor and the desk—that is, the difference in temperature at the feet and the chest of the scholar—was seldom less than 6 to 8 degrees, and often much in excess of these figures; in one instance 19 degrees and in another 21 degrees. * * * The warming of a room is so intimately associated with its ventilation that it is impossible to properly warm a room in cold weather without also ventilating it. * * * The plan of warming the floor and walls (Mr. Leeds's plan) strikes me as excellent in theory, and I should be very glad to see it practically tested. * * * If Mr. Leeds's plan shall effectually replace the present faulty system, and especially the *no system* now in use, the world will have taken an important step in a very desirable direction. * * * *

Radiation from steam-coils placed in the room is probably the worst method of heating, because it does not provide for any renewal of air, and hence ventilation is

practically impossible as steam-coils are ordinarily used. But when steam-coils are placed in a furnace-chamber and the air is heated by flowing over these coils before it enters the room, the method becomes a very good one. * * * A furnace, if rightly constructed and rightly used, is a very good means of heating a school-building, because it assists in ventilation. Nearly all the furnaces I have examined are very objectionable, because they are too small and have too little radiating surface to heat the necessary amount of air unless they are excessively heated. It is simply impossible that air heated by passing over such red-hot surface should be healthful. * * * The object aimed at should be to introduce a large volume of air moderately heated, and not a small quantity of air excessively heated. To this end the furnaces should be of large size, with a large amount of heating-surface kept moderately heated, and the access of pure air to the furnace and its passage thence to the school-room should be abundant. * * * The air of our school-rooms is almost uniformly too dry. * * * The influence of excessively dry air on the naturally moist mucous surfaces is injurious: the nostrils become dry and irritable and a tendency to catarrh is established. The influence of too dry air on the eye is also injurious, from the unnatural drying of the normal secretions for moistening the eye.

Rev. Daniel Leach, superintendent of schools in Providence, R. I., writes: "I was rejoiced to hear that the Michigan State Medical Society had taken up the subject of ventilating and warming school-houses. There is no subject connected with the cause of education so important and none that has been so neglected. I have given attention to the subject for more than twenty years, and I firmly believe, from careful observation, that very many cases of consumption, heart-disease, and kindred diseases have had their origin in the foul air that is breathed in school-rooms and other crowded places." * * * I might fill pages with quotations from medical authorities to show how intimate is the relation between tubercular diseases and foul air. But these diseases of degraded tissues are only one class in a score of diseases caused by breathing foul air. The limit of impurity in air as affected by respiration should not exceed the presence of 8 parts of carbonic acid in 10,000 of air. Many place the limit lower than 8 parts; it certainly should never be higher. Persons may, and do, live in an atmosphere less pure, but it is at the expense of present and future vitality. Sickness must be viewed, not solely as involving the suffering and danger of the patient, but also as a loss to the State. This consideration bears with especial force upon the sanitary condition of the young, because they are peculiarly liable to the action of depressing causes. The State is rich and strong in its healthy men and women and is impoverished by its weak and sickly ones. In laying our hands upon the sanitary condition of our public schools, we touch the very fountains of the prosperity of the Commonwealth.

To preserve the air of a room in such state of purity that the carbonic acid shall never exceed 8 parts in 10,000 of air, 2,000 cubic feet of air must be admitted every hour for each person in the room. In a room 30 by 30 by 12, and containing 36 persons, 72,000 cubic feet of air an hour must be introduced, and the entire air of the room changed six times an hour. If we allow ten square inches of sectional area in ventilating shaft for each person, this number of scholars would require a ventilating shaft 19 by 19 inches; the air must move through it at the rate of 5½ miles an hour; if the shaft is 20 feet long it will require a permanent elevation of temperature 15° above outside air. * * * I consider it very desirable to ventilate from the floor-level; not because the air is fouler at that level than at the ceiling, but because, being equally foul, it is colder than air near the ceiling, and therefore less fitted for the comfort and health of the occupants of the room, and also because the strong tendency to accumulate a lake of cold air at the floor can usually be obviated in no other way. It is not a matter of indifference whence the air is withdrawn at the floor-level. It should be withdrawn at many points in the body of the room, by openings into foul-air-ducts beneath the floor. The experiment performed in a school in Kalamazoo, of gathering the air for analysis during recess, while the scholars stood around me in a dense throng to witness the operation, this air, containing a large excess of carbonic acid, shows the necessity of withdrawing the air from those portions of the room where the scholars most congregate. If the spaces between the floor-joists are all made foul-air-ducts, it would be a matter of very small expense to ventilate from as many points in the room as we desire. * * * In my opinion, no ventilation is good which requires the opening of doors and windows at any time. Window-ventilation is better than no ventilation, but it is not good ventilation. * * * Ventilation should, as far as possible, be automatic, and should be beyond the control of every one except the person who has it in charge. This self-acting ventilation may best be secured by combining the ventilating-system with the the warming-apparatus, so that the active condition of the warming-apparatus shall necessitate an active ventilation. * * * The air-ducts should be abundant, but should be kept out of sight. The most natural and economical position for the foul-air-ducts is the space beneath the floor between the joists. These can all be connected with the ventilating-shaft by having

the joists all lead toward the shaft and the spaces all connected with the shaft. * * * The ventilating-shaft should be well constructed, so as to be air-tight, if possible. As ordinarily constructed they are very porous, so that a large portion of the air discharged at their top is not derived from the rooms to be ventilated, so that a brisk current may be found issuing from the top of the shaft, while no no corresponding current enters at the bottom. * * * The shaft should be placed entirely within the building—in its center, if practicable. * * * To estimate the size of the shaft I have taken the estimate adopted for ventilation in the barracks of the British army, viz, ten square inches of sectional space in the shaft for each person. In the center of the shaft I would place the pipe to convey away the smoke from the furnace, and thus utilize the waste heat to warm the shaft. In order that each room may receive its own share of ventilation and to prevent the foul air of one room from being driven into another room when high winds prevail, I would divide the shaft-space outside the smoke-pipe into two or four shafts, by having sheet-iron plates passing from the whole length of the smoke-pipe radially, till they strike the sides of the shaft. * * * Each one of these shafts may be devoted to ventilating one room or floor. * * * The inlet-ducts to admit fresh air, whether *hot* or *cold*, should have the same sectional area as the educt-pipes for foul air, viz, ten square inches for each person. The practice is altogether too common of making the registers for admitting warm air much smaller than this and of admitting the air at a very high temperature, *i. e.*, a small amount of very hot air instead of a large amount of warm air. * * * A proper temperature as the first condition of mental activity and the removal of carbonic acid, which "lowers the vitality and kills with indefinite warning," are essential conditions for the development of the nation. We have abolished the choking of our worst criminals by the hangman's rope, let us abolish the strangling of the innocent children by viewless ropes of poisoned air.

WOMEN AS SCHOOL-OFFICERS.

The difficulty experienced in finding fully-educated men for the various departments of school-work has for some years past led to an engagement of women in this work. In the Northern States, Indiana and Missouri alone excepted, the number of female teachers greatly exceeds that of males. The ability and intelligence which many of these display, combined with a delicate tact in management, have induced in several quarters the idea of employing women in the higher offices of government: for example, as school-visitors, members of school-committees, and county-superintendents. The New Hampshire legislature, by an act in 1872, authorized the election of them to the prudential committees of districts or school-committees of cities or towns within the State. The State-reports of both Connecticut and Rhode Island for 1873 decidedly advocate the employment of them as school-visitors on the ground of their special fitness for the office, as well as on the ground that cultivated women are more frequently available for the performance of such duty than equally cultivated men. The people of Massachusetts, under the same impression, have lately employed women in their school-committees. Lynn and Concord both have ladies so engaged. In the latter place a daughter of Ralph Waldo Emerson has been for several years on the committee, and is said to have done valuable service. In Brookline the school-committee itself has constituted an advisory board of ladies, by whom much of the work of the committee has been done. At the last election of school-officers in Massachusetts four ladies were chosen members of the school-committee of Boston and several others in the western portion of the State; and the Springfield Republican, generally well informed on such points, expresses the decided judgment that many more will be elected in another year.

When such movements occur in conservative New England, they may naturally be looked for also in the flexible and sometimes impulsive West. Accordingly the twenty-eighth general assembly of Illinois declared by law that any woman, married or single, might be elected to school-office, if over 21 years of age and possessed of the qualifications prescribed for men. Under this law 34 ladies in thirty counties ran for the office of county-superintendent in 1873, and of these 11 were elected. In Iowa, under a similar provision, 9 ladies came upon the superintendent-list and in Kansas 3. In Michigan the recently-revised State-constitution provides for the admission of

women to any school-office and in the constitutional convention of Ohio the majority of the committee on education have reported a kindred provision for adoption. Pennsylvania has moved in the same direction, her just-adopted constitution making women eligible to any office of control or management under the school-laws of the State.

As officers of colleges, also, women are beginning to appear. The new Boston university, as elsewhere noted, has opened its chairs to them, and two ladies already act as instructors in the school of medicine. Vassar, besides a lady principal, has numerous ladies on its staff of instruction, one of whom is eminent in the scientific world. St Lawrence University presents one on its faculty-list in the chair of French and as assistant instructor in Latin. Antioch College has a lady professor of mathematics; the Ladies' College at Evanston, Ill., like Vassar, a lady principal; and the University of Missouri four ladies as instructors in languages and mathematics, one of whom, recently returned from Europe, is said to have been appointed professor of French and German.

It is, perhaps, too early yet for the expression of decided judgments as to the expediency or inexpediency of this elevation of women to school-offices. Experience only can fully decide such points. The fact that they are coming to be so employed is presented as an interesting phase of existing educational experiments, and the hope may be indulged that their quick perceptions and instructive tact will enable them to justify their election to offices of higher power and influence. In Dayton, Ohio, where they have been employed during the past year as principals of public schools, the city-superintendent says that the results have "more than justified the change. Instead of the insubordination and disorder predicted, there has been improved order. Details of school-management have been attended to with scrupulous care. Subordinate teachers have yielded the respect due to the position of the lady principals, and notwithstanding the fact that these principals have for the first time taught the subjects of the highest grade, attending also to the general order of the building, the teaching has been as thorough as in former years." A kindred testimony comes from Cleveland. If it be given elsewhere, an increase of women as school-officers is sure.

THE EDUCATION OF WOMEN.

Educators, like all other workers in the field of modern civilization, must make use of facts for their guidance. Mere speculative theories have been too much followed heretofore in all subjects connected with education, and in none more than in that having reference to the position of woman as scholar, teacher, and worker. A gross conservatism on one side has naturally given rise to immoderate theory on the other. It is only by a philosophical study of accumulated facts and human experience that society can arrive at any judicious modification of woman's education and occupation or correct what is false in any of the numerous theories and plans proposed for her benefit. Should the fact of sex make any difference in the relation of individuals to education either as trainer or trained? In the education of the young has one sex any work to do which the other sex cannot equally well perform, and are the children in our schools trained actually so different, on account of the difference of sex, as to render modifications in their respective trainings necessary? Are the essential duties of life different for each sex; and, if so, what correspondences and differences must be made in their respective physical and moral training? These questions at the very threshold of this inquiry point to vast fields of thought. Nothing can be more useful for the progress of human society than their judicious discussion; nothing more harmful than vague declamation and passionate rhapsody. Every community after learning the general facts must take into consideration its own special circumstances. Of these the preponderance in number of one sex over another is the most powerful in effect. The following statistics respecting the populations of certain European countries show instances where the females are in excess:

Summary of populations in countries in which women are in excess of the men.

Name of state or nation.	Year of census.	Population.				Excess of females over males in every 1,000 of the population.
		Total.	Male.	Female.	Excess of female over male.	
Great Britain	1871	26, 215, 517	12, 726, 789	13, 488, 728	761, 939	29
Ireland	1871	5, 402, 759	2, 634, 123	2, 768, 636	134, 513	24
Great Britain and Ireland	1871	31, 618, 276	15, 360, 912	16, 257, 364	896, 452	28
Prussia	1871	24, 693, 066	12, 174, 774	12, 518, 292	343, 518	13
Sweden	1871	4, 204, 177	2, 034, 396	2, 169, 781	135, 385	32

A similar excess of the female population as existing in certain parts of our own country is exhibited in the following table:

Summary of populations of States in which women are in excess of the men.

Name of State or Territory.	Year of census.	Population.				Excess of females over males in every 1,000 of the population.
		Total.	Male.	Female.	Excess of female over male.	
Alabama	1870	996, 992	488, 738	508, 254	19, 516	19
Connecticut	1870	537, 454	265, 270	272, 184	6, 914	12
Georgia	1870	1, 184, 109	578, 955	605, 154	26, 199	22
Louisiana	1870	726, 915	362, 165	364, 750	2, 585	3
Maine	1870	626, 915	313, 103	313, 812	709	1
Maryland	1870	780, 894	384, 984	395, 910	10, 926	13
Massachusetts	1870	1, 457, 351	703, 779	753, 572	49, 793	34
Mississippi	1870	827, 922	413, 421	414, 501	1, 080	1
New Hampshire	1870	318, 300	155, 640	162, 660	7, 020	22
New Jersey	1870	906, 096	449, 672	456, 424	6, 752	7
New York	1870	4, 382, 759	2, 163, 229	2, 219, 530	56, 301	12
North Carolina	1870	1, 071, 361	518, 704	552, 657	33, 953	31
Pennsylvania	1870	3, 521, 951	1, 758, 499	1, 763, 452	4, 953	1

Tennessee	1870	1, 258, 520	623, 347	635, 173	11, 826	9
Virginia	1870	1, 225, 163	597, 058	628, 105	31, 047	25
District of Columbia	1870	131, 700	62, 192	69, 508	7, 316	55

On the other hand the other States and Territories of our Union present an excess of males over females as shown in the following table. It will be observed that our country as a whole has conditions of population directly opposite to those present in Great Britain, Sweden and Prussia, there being 19,493,565 males and 19,064,806 females, or an excess of 428,759 males; in other words, an excess of 11 males in every 1,000 of the population.

Summary of populations of the States and Territories in which men are in excess of women.

Name of State or Territory.	Year of census.	Population.				Excess of males over females in every 1,000 of the population.
		Total.	Male.	Female.	Excess of male over female.

The recent establishment of our political communities, the manner of their settlement, and other causes have produced this latter condition; and these causes have modified the education, the labor, and the position of woman in a corresponding degree. These conditions in every community act in some degree on other communities.

Other elements of great importance are the physical conditions under which the races inhabiting our country live. So powerful are these that, two hundred and fifty years after the first white settlements on our Atlantic coast, our climate, our food, our habitations, our customs, and our physique are markedly different from those of any one country in Europe. Our political theories and institutions have helped to intensify the conditions out of which they arose. These conditions of life—social, political, and physical—have acted with double intensity in modifying the physical and mental conditions of the American woman. These modifications are too self-evident in some respects to need recapitulation here. But the deterioration in the health of Caucasian women is so alarming in its extent and in its consequences, present and potential, that I feel it necessary to record some important facts respecting it.

The Circular of Information of this Bureau for March, 1872, contained an article on the vital statistics of the country, by J. M. Toner, M. D., from which the following extracts are made:

With a desire to view this question of birth-rate from a standpoint that would be sufficiently comprehensive and yet free from even the appearance of preconceived notions or sectional partiality, I have made something of a study of what the records of the United States census teach upon the subject of population, in its enumeration by ages; also of births, deaths, &c. From this source I find undoubted evidence of a gradual decline in the proportion of children under 15 to the number of women between 15 and 50 years of age in our country. * * * *

Summary showing the number of white children of both sexes under the age of 15 *to* 1,000 *females (white) between the ages of* 15 *and* 50 *years in the United States.*

[Compiled from the several census-reports.]

* The ages in the census of 1800, 1810, and 1820 are for children under 16 and women between 16 and 45. This gives one year more to the children and six years less to the women than in the following decades and accounts for the greatness of the decline between 1820 and 1830.

Physiologists and others capable of understanding the meaning of the above table will hardly need further proof, but the personal evidence of an accomplished and acutely-observing woman, who has made the health of her sex of this country a subject of special inquiry, may serve a good purpose. The following testimony was published by Miss Catharine E. Beecher in her "Letters to the people on health and happiness," and republished substantially in her recent work on Woman Suffrage and Woman's Profession:

I am not able to recall, in my immense circle of friends and acquaintances all over the Union, so many as *ten* married ladies born in this century and country who are perfectly sound, healthy, and vigorous. Not that I believe there are not more than this among the friends with whom I have associated; but among all whom I can bring to mind of whose health I have any accurate knowledge, I cannot find this number of entirely sound and healthy women.

In confirmation of her own testimony Miss Beecher presents the statistics of 260 cases from 26 towns. Only 38 of these are reported to be in a satisfactory state of health. In 450 cases from 45 other towns, respecting the correctness of which she is not so well satisfied, 106 are satisfactorily healthy; while 72 out of 150 cases from 15 towns, respecting which the information is still less certain, are reported as well. Miss Beecher claims that the stricter she made the scrutiny of individual cases, the less frequent did she find perfect or even tolerable health.

The duty of educators under these circumstances is quite evident. They must appreciate these evils, and must, by every means in their power, attempt to overcome them. The clergyman, the physician, the journalist, and the teacher should unite in the work of correcting them. Whatever teachers and school-officials can do by proper ventilation, heating, and lighting of school-rooms; the use of school-furniture of the most studied fitness; the proper arrangement of study-hours—sufficient intervals for recreation—should be done as the first duty of their work. No accomplishments and no knowledge can compensate either the pupil, her family, or the State for the loss of health. If she is taught how to live healthily, she has learned something on which her future happiness and usefulness, and nearly all her future powers of acquiring other knowledge, depend.

When the education of our girls takes into proper account this important element in their training, all the considerations—physical, social, moral, and political—to which I have alluded should be remembered in determining the method, quantity, and character of the instruction to be given. We have boasted that in our country women are more free, and yet more reverenced—better schooled, but not less womanly; but how much common sense and real wisdom has been applied to the spirit and manner of their training for the duties of their life? Have the parents and the educators of the country taken peculiar pains to guard their health against the peculiar vicissitudes of our climate? Are the customary diet and dress of American girls such as a wise physiology would prescribe for them? Are the subjects of instruction on which most pains are taken and most money expended the subjects a knowledge of which will render them most useful to the communities in which they live, the society in which they move, and the families of which they are to be the head? Great Britain and Ireland have 514 women and girls and 486 men and boys in every 1,000 of their population. We have 505 men and boys and 495 women and girls in every 1,000 of our population. Is it not evident that with us the demand for women healthy in body, happy in disposition, trained for the duties of womanhood, and competent to perform them, are, to use a commercial phrase, at a premium? Does the education we give our girls endeavor to make them more strong to withstand our climate and better trained for the performance of those domestic duties to which custom and their own natures invite them?

From this standpoint let educators test dispassionately the efforts now being made in the education of women, both in the direction of superior culture and in that of industrial training. I am a firm believer in the propriety and necessity of both. Whatever culture brightens the mind, widens the vision, enlarges the sympathies, increases the usefulness, or adds another grace to my countrywomen has had my hearty approval and shall receive my most earnest co-operation. But if the true object of education be to so train a human being as to preserve health, prepare for usefulness, and provide for mental and moral growth, certainly care should be taken that these essentials be not lost sight of in any method adopted, any subject studied, or any other object sought.

THE HIGHER EDUCATION OF WOMEN IN OTHER COUNTRIES.

ENGLAND.

The National Union for Improving the Education of Women is spoken of by the London Times as "representing one of the most valuable and characteristic movements of the time. Though it aims at improving the education of women of all classes, it is practically a movement for the better education of the middle classes and for giving women opportunities for the highest educational training. It is a strange proof

of the backwardness of female-education in this country that one of the late Mr. Mill's bequests, which was meant to help in this matter, should go a-begging. Mr. Mill left £3,000 to that university in the United Kingdom which should first open its doors to women. The University of London examines ladies in science and literature, but gives them no degree; and the Oxford and Cambridge examinations include girls, though both universities exclude them. The question raised by the national union is not so much that of professional education as of general culture. One of its objects is, we understand, the creation of centers of higher training for women all over the country. Girton College, near Cambridge; Bedford College, in Bedford Square; and the Camden Collegiate Schools are, perhaps, among the best examples of what is needed."

Girton College has been specially selected for the higher education of women. Its professors are all senior wranglers of Cambridge University. The following extracts, taken from a reliable educational journal, will be of interest in this connection:

The college for women at Cambridge, England, is now established, Girton College—a substantial building amidst pleasant grounds—having been opened this week, and the tutorial staff, with their girl students, having come into residence and commenced the collegiate year. The college begins its career under favorable auspices, its principal promoters including the Bishops of Carlisle, St. Davids, and Peterborough, the Dean of Chichester, Lord Lyttleton, several ladies of high rank, Sir James Paget, Sir J. Pakington, M. P., with Professors Adams, Humphrey, Liveing, and Seely. The movement which has culminated in the opening of Girton College originated some four years ago, when a temporary college was opened in a hired house, where instruction has been given in the following subjects: Divinity, classics, German, mathematics, chemistry, physiology, geology, logic, political economy, mental philosophy, part-singing, &c. During the above-mentioned period eleven students have passed informally the Cambridge previous examination, or "little go," as it is called, nine of whom obtained a standard required for a first class. Nine students also satisfied the examiners in the additional subjects required in that examination from candidates for honors examined. The course, like that of the university, occupies about three years, half of each year being spent in the college in three terms. The college-expenses, which include board, lodging, and instruction, are £35 per term each. The first mistress of the college is Miss Emily Davies, a member of the London school-board, from which she is retiring in order to take the office of mistress of this college.—(College Courant, November 15, 1873.)

A kindred institution, the Alexandra College, Dublin, affords to Irish ladies the same facilities for higher culture which are afforded at Girton to the ladies of the sister isle.

The London Daily News states that the report of the Cambridge syndicate on the education of women presents many more interesting and satisfactory features than usual. The examinations, as compared with those of 1872, show a larger number of candidates and a higher average of work. About two hundred ladies came forward for examination, and, although the number of failures in the elementary subjects was exceptionally large, a very good average of success was attained in the higher branches, some of which lie rather beyond the reach of what has hitherto been considered a sound female education. In mathematics, which last year produced no successful candidates, all have this year been successful. There was but "little Latin and less Greek" among the young ladies, but their French, German, and English obtained excellent reports. The examiners in the English history and composition of the young ladies say that along with a certain amount of proficiency there is exhibited a tendency to rest satisfied with very incomplete information and very loose modes of expression. The examiners have not taken the trouble to record any of the curiosities of the examination, but they speak of "very prevalent inaccuracy," of flippancy, and even of slang. On the other hand, it is distinctly stated that the best essays were better than those of male students writing on the same subject in similar circumstances and that the worst faults of the women were eclipsed by the worst faults of the men.—(College Courant, December 6, 1873.)

SPECIAL INSTRUCTION FOR FEMALES.

INDUSTRIAL TRAINING IN THE BOSTON PUBLIC SCHOOLS.

The Winthrop School, in Boston, begun last October an experiment of a most important character in the industrial education of girls. A sewing-teacher was employed, who was paid the maximum salary given to other teachers and whose whole time was

devoted to giving instruction in family-sewing. The results have been in the highest degree satisfactory and successful. Two hours each week are devoted to this study. Each class receives separate instruction suited to its advancement and all grades of work are carried on from simple hemming to cutting and fitting a dress. In teaching cutting, the pattern is drawn upon the blackboard and the several measurements are given. The diagrams are drawn and properly marked by the pupils, who submit them to the teacher for approval before cutting the cloth. All the work is supervised by the sewing-teacher and class-teacher, and the pupils obtain marks for progress as in other studies.

WORK-SCHOOLS OF SWITZERLAND.

[From Guide and Manual for Work-Schools, by J. Kettiger, director of the Teachers' Seminary at Wettingen, Canton of Argovia.]

The female-work-schools in Switzerland, started about twenty-five or thirty years ago by private individuals in the larger villages, as sewing-schools and knitting-schools, are becoming more and more an essential part of the public system of education. The need of the knowledge which they impart is so universally felt and understood that the work-schools enjoy the general favor of the rural population, and very few villages or towns where they exist would think of dispensing with them.

As a first condition of the usefulness and success of these work-schools, it is imperatively demanded that they shall be *schools*, and not *workshops*. A workshop rests satisfied with what is called mechanical training. It does not instruct, in the higher sense of the word. Its object is accomplished when the scholar becomes able to imitate skillfully a certain manipulation. Imitative skill possesses a certain undeniable value; but the clearest possible understanding of the object of the work will not only further the work itself, but will also prove a better educational element. These work-schools must not give instruction which aims merely at the acquiring of a certain degree of skill, but an instruction which enables the scholar to account for everything he does, which clearly answers the why and wherefore in every case.

The chief aim of these schools is the teaching of useful work—knitting, all kinds of plain sewing, mending, (torn clothing may be taken to the school to be mended,) making over garments, and cutting and fitting clothing of every description. In cutting it is not sufficient that the patterns are correctly followed, but pupils are carefully instructed in the art of arranging them so as to secure the greatest economy in the use of material. These schools are graded. Thoroughness is absolutely insisted upon, and no scholar is allowed to advance beyond any grade until able to perform with a certain degree of skill all the work of that grade. The teacher prescribes the kind of work which shall be done, and parents are not allowed do interfere, for they would be likely to consider their own wants and comfort rather than a regular and gradual development of the child's capacities, and in this way the schools would very soon degenerate into mere workshops.

Instruction in various branches of housekeeping is not obligatory in the work-schools, but it is introduced in many, and its introduction, whenever practicable, is considered very desirable. This knowledge is, of course, only imparted theoretically, and special care is taken that the why and wherefore are in every case properly answered. The guide for instruction of this kind, prepared by Mr. J. Kettiger, director of the Teachers' Seminary, canton of Argovia, takes up the following subjects: Food—its sources, uses, various uses of the same article and of its different parts; preserving food—as salting, drying, canning, making preserves, &c.; methods of cooking different articles and of the same article under different conditions—as fresh, salted, or dried; the preparation of various dishes; getting up simple dinners; the digestibility and healthfulness of certain articles of food; cleanliness, order, system, and economy—as the basis of domestic well-being, particular attention being given under the latter head to a careful calculation of how incomes of various amounts can be used so as to secure the greatest comfort for the household and the avoidance of debt. A girl thus trained knows, when she marries, just what her husband's income will do and how to use it to the best advantage, and the great evil of the present day, living beyond one's means, is thus entirely avoided.

An interesting history of the female-work-schools in the canton of Aargau, or Argovia, has been translated and furnished by Mr. Henri Erni, United States consul at Basel, Switzerland. The original work received a diploma of honor at the Vienna Exposition. The school-law of 1835 made attendance upon work-schools obligatory throughout the canton in winter. The attendance in summer is voluntary. The schools met with considerable opposition at first, and each of the communes had to be forced by law to provide a suitable locality and capable teachers. They developed slowly, and their advantages were fully appreciated by the people only after the lapse of some years.

Instruction is gratuitous, and embraces knitting, sewing, mending, cutting and fitting, common housekeeping, the principles of economy and sanitary laws. Poor scholars are provided by the communal authorities with working-material and all the needful apparatus. Assistance is granted by the state to the amount of 20 to 40 francs for each commune, according to the number of lessons given; *i. e.*, 200 to 400. When a school is not regularly maintained and properly conducted this aid is forfeited. These schools are under the superintendence of the school-trustees and subject to their visitation and inspection, and the school-law recommends that they shall be assisted in this duty and in the examination of teachers for the work-schools by "able experts among the housewives of the commune." In 1871 a general plan for schools of this kind was published, and there is now a uniformity among the working schools of the canton which, it is hoped, will eventually reach the same degree of perfection as in the district-schools. This can only be attained by regular class-instruction. All the members of a class must do the same kind of work, and the teacher must be provided with patterns, apparatus, and directions, so that the whole class may be instructed at once. The means for instruction, as used in many of the schools of the canton, are as follows: "For teaching knitting, tables showing the position of the hands and fingers, of the arm and needles, a drawing of a pattern-stocking, a large slate on the wall divided into squares for the drawing of patterns and forms of knitting. To instruct in sewing and marking linen a frame is used. A large slate exhibts the manner of cutting dresses and another is used to draw different patterns for cutting. To teach different styles of mending, darning, &c., a slate and sewing-frame are used. To teach how to distinguish and judge of different materials, an album containing specimens of goods is employed." The teachers of work-schools are unanimous in the opinion that such apparatus is indispensable to thorough and uniform instruction. When the number of scholars exceeds thirty, two classes are to be formed. The school-law of 1865 requires that every girl after her third school-year shall attend the work-school and remain there until she leaves the district-school.

EDUCATION OF WOMEN IN WÜRTEMBERG.

I. FEMALE INDUSTRIAL SCHOOLS.

Origin and development of female industrial schools.—Industrial schools are of tolerably old date in Würtemberg. As early as the last decades of the eighteenth century the central school-authorities exhorted the provincial and city-authorities to establish such schools. This was especially done in the Catholic school-regulations of 1808 and the Protestant regulations of 1810. That people even in those times understood the true character of these schools is evident, from the fact that these regulations mention their intimate connection with the primary schools.

These regulations say that gradually an industrial or working school should be established in connection with every one of these schools.

These regulations were certainly not merely to be found on paper, though we possess no information concerning their practical working. They were truly a seed sown in hope. Absolute necessity and the motherly interest of an august princess made this seed grow into a strong and flourishing tree.

The second decade of the nineteenth century was in many respects a critical period for Würtemberg. In 1817 the suffering reached its highest point. Led by her feelings of compassion and guided by a rare discrimination, the late Queen Catherine saw clearly that it was not sufficient to bring momentary relief by contributions of different kinds, but that it was necessary to stop the sources of this misery and open up new ways of earning a living. Besides many other benevolent institutions which owe their origin to the late queen and her husband, industrial schools were at their suggestion and with their assistance established in several towns, where poor children, mostly girls, but also boys, were instructed in needlework and other useful arts, thus earning a scanty living, but at any rate being removed from the evil influences of the street, idleness, beggary, &c. The Würtemberg Benevolent Society from among its members appointed a committee—called the committee of the poor—which was to superintend these schools. As the majority of all the industrial schools, either directly or indirectly, owe their origin to this committee, people became accustomed to consider this whole branch of popular education as belonging to the above-mentioned committee, no matter whether these schools were founded in the interest of the poor or in the general educational interest.

During the following years of prosperity these schools were kept up, but did not increase and flourish as much as might have been desired, although they continued to enjoy the royal and governmental patronage. The question began to be raised whether these schools had not better be transferred from the committee of the poor to the general educational authorities.

The time had not yet arrived for answering this question satisfactorily, for if the educational authorities took the management of these schools and made, as was then inevitable, attendance in them compulsory for all female children, it became their duty to provide competent teachers; and this they were not able to do. This question was again raised about the year 1850, and though many prominent educators pronounced themselves in favor of compulsory attendance, the royal government, basing its views on the existing school-laws, (of 1836,) rightly judged that attendance could not be made compulsory and that the time had not yet come for making any changes in the existing laws.

Meanwhile the number of industrial schools was constantly increasing, and, up to the year 1857, such schools had been established in 1,383 towns and were attended by 64,733 children.

The question of transferring these schools to the minstry of public instruction could be no longer delayed, and assumed a more definite form, negotiations being entered upon in 1853 between the ministry of the interior and the ministry of public instruction, tending towards the definite solution of the question "shall these schools be closely connected with the primary schools and be treated according to the same principles; *i. e.*, shall attendance be made compulsory?" After dragging their slow and often interrupted course through eleven long years, these negotiations were brought to an end by the ministerial decree of January 16, 1864, by which these schools were entirely transferred to the ministry of public instruction, and there, however, making attendance compulsory.

The institution for industrial-school-teachers at Ludwigsburg.—(1) Its origin and development. The principal problem was now solved on a basis which guaranteed a healthy development in the future. But there arose new duties and problems for the authorities, consisting in the systematic organization of these schools and in supplying them with competent teachers. There was, in spite of all the praiseworthy efforts that had been made, a deplorable lack of method, and the only way to remedy this was to appoint competent teachers by the state-authorities, teachers who had been technically and pedagogically prepared for their calling and who were properly remunerated for their services. The man who urged these considerations on the government was John Buhl, president of the Teachers' Seminary at Ludwigsburg. After a good deal of hard work he succeeded in inducing the government to establish a six-months course for industrial-school-teachers in connection with the Teachers' Seminary at Ludwigsburg. During the first years, these courses were not as successful as was anticipated, owing to a want of public confidence. Buhl himself died in 1868, but his work was continued and gradually reached a more flourishing condition, so that, up to 1871, 128 teachers had been educated at the institution, who are now in active employment in different parts of Würtemberg. Besides this teachers' seminary, courses for industrial-school-teachers have been held in a number of towns, thus extending the advantages of such a preparation to those who were unable to attend the seminary. Many persons educated through these courses are now employed as teachers in industrial schools.

(2) Course of instruction, &c. Persons desiring to be admitted to the seminary must not be younger than 17 and not older than 28, and must possess a degree of knowledge giving a fair promise of success.

The technical instruction embraces the following subjects: Knitting, sewing, embroidering, darning, mending, dress-making, working the sewing- and knitting-machine.

The pedagogical or methodical portion of instruction is partly practical and partly theoretical. The students are taught the general principles of all education, and

especially of industrial education, the means of maintaining discipline. There is connected with the seminary a practice-school for industrial instruction, where, under the guidance of experienced teachers, they make their first practical experiments in teaching.

Besides needle-work, &c., the following subjects are taught: Drawing, (with special regard to industry,) embroidering, &c., arithmetic, (2 hours a week,) penmanship, (2 hours a week,) composition, (1 hour a week, embracing also letter-writing, making out of bills, &c.) Book-keeping is shortly to be introduced; religion, (2 hours per week,) history and geography, (2 hours per week.) Instruction in vocal music will in the future also be given, as likewise instruction in the elements of natural philosophy.

At the end of every course (average length about nine months) two members of the central school-authorities and a member of the royal bureau of industry and commerce hold a practical and theoretical examination and give certificates to the successful candidates, which serve as recommendations for their finding employment in one of the industrial schools of the country.

The students live and board in the school, and have to live according to the regulations of the same, thus accustoming them to habits of regularity, order, and punctuality.

Instruction commences at 7 a. m. in summer, at 8 a. m. in winter, and, with a break of 20 minutes, lasts till 12 m., and from 2 to 6 in the afternoon.

The total expense of the institution is met by the state, the annual average sum expended being $2,035.

II. "FORTBILDUNGSCHULEN"—ADULT-SCHOOLS.

Schools for girls who have finished their studies at the elementary schools in Würtemberg. (Fortbildungschulen: literally, continuation-schools.)—These schools owe their origin to a desire of further educating girls who have left school (in their fourteenth year) for practical life, so as to enable them to keep books in their parents' business or in that of their husbands or their own; to make themselves useful in the telegraph-, postal, and railroad-service, or to earn a living by drawing and painting.

The advantages of such an education are self-evident. By educating girls in the above-mentioned subjects, a working force is gained which can attend to business as well as men, and which, as active members of a family, do not involve any extra expense. By also instructing them in hygiene, they become impressed with the importance of a well-regulated mode of life and the raising of a healthy offspring, so that the family-life can only gain thereby; but, even outside of the family-circle, it will give to women a worthier and more advantageous position, and in many cases such an education will even be considered as a valuable marriage-portion.

The beginning of such an education in Würtemberg was made about 20 years ago by the late Mr. Beger, in Stuttgart, who, encouraged by the royal bureau of industry and commerce, opened private courses in Stuttgart. These courses, however, were not confined to the capital, for he was soon called by the various industrial societies all over the country to hold courses in book-keeping, &c., in different cities, at which, in some places, girls and women attended. The government encouraged this instruction by paying the school-fees demanded by Beger for indigent pupils, through the bureau of industry and commerce, and by exercising the inspection.

The next step was the establishment of a special division for girls in the industrial "Fortbildungschule," at Stuttgart, in 1861, the original course of instruction embracing book-keeping, German composition and business-correspondence, industrial arithmetic, and penmanship, to which were added at a later period drawing, painting, English, French, German literature, geography, and hygiene, and still more recently physics and knowledge of goods, (for housekeeping-purposes.) This division was opened January 12, 1861, with 63 pupils, which number increased from year to year, so that in 1872 it was 177, of whom 96 were younger than 17 and 81 older; 134 were natives of Stuttgart, 32 from other parts of Würtemberg, and 11 from abroad.

Instruction is given during the six winter-months (November to April) every week-day from 9 to 12 a. m. and from 2 to 7 p. m. The fee for the common course is (arithmetic, composition, book-keeping, and penmanship) $2.50, the fee for extra subjects being $1 to $1.50 each.

III. NORMAL SCHOOL FOR FEMALE TEACHERS.

The Würtemberg Normal School for Female Teachers is located at Ludwigsburg, not far from Stuttgart. It owes its origin to the indomitable energy of Mr. Buhl. It was opened in 1859 with 9 students; and, up to 1872, 83 students have graduated from the institution, most of whom are now successfully employed as teachers in the primary schools of Würtemberg.

Organization and course of instruction.—The length of course is three years; age of admission, 16 years; conditions of admission, good moral character, bodily health, and proficiency in all the subjects taught in primary schools. The first half year is considered a time of probation, and those who at the end of this half year do not advance as much as is deemed desirable must leave. In connection with the seminary there is a practice-school of three classes.

The course of instruction embraces: Religion, German, arithmetic, geometry, history, geography, natural history, natural philosophy, penmanship, drawing, vocal music, piano, (sometimes also violin,) needle-work, pedagogics, practical methods of instruction.

Results of ten years' experience in the employment of female teachers, by Rev. E. Hory, president of the normal school at Ludwigsburg.—It has been said that, by her whole organization, woman is not fit for public activity and that, whenever cases occur where women are successful, they must be said to be exceptional and to have crossed the limits which nature in her wisdom has set. At first sight this argument seems very plausible. A young woman, who, with a self-complacent air, stands before the public in the capacity of teacher, is not a very pleasant object to look at. But is the school to such an extent a public place as to justify the above-mentioned objection? It is natural that a woman will feel somewhat nervous in the presence of men at examinations, &c., but this may only be considered as a hint to examiners, urging them to avoid anything in their words or bearing which would tend to increase this natural feeling of shyness.

Another objection is of a much more serious nature, viz, that it may be more difficult for a female teacher to maintain the proper discipline, especially in a large school and that, even if successful, she will be so at the expense of her health and strength. It is true that, as far as our experience goes, this objection has proved unfounded. In this, as in so many other regards, much depends on the individual character of the teacher. Many a teacher finds no difficulty whatever in maintaining the proper discipline, while others do not succeed in spite of their most earnest and persevering efforts. But this does not exclude the fact that in large classes, especially where boys and girls are together, it will be a difficult and exhausting task for a lady to maintain the proper degree of discipline.

The proper field for female teachers is undoubtedly schools for females.

THE VIENNA EXPOSITION.

In August, 1872, Hon. John Jay, American minister at Vienna, wrote as follows to Hon. Hamilton Fish, Secretary of State:

His Excellency Baron Schwarz-Senborn expressed his earnest desire that the United States Government would present at the Vienna Exposition a perfect representation of the system of common-school-instruction adopted in the United States—a system, the result of which, he said, had been so wonderful. * * * And he prayed me to believe that an exposition of that system, illustrated by a school-house and its appurtenances, and its statistical results, would be a matter of profound interest and importance, not only to Austro-Hungary, but to the eastern peoples who adjoin this empire. * * * A similar hope has since been expressed to me by the Count Andrassy and other influential gentlemen connected with this government.

Upon receipt of this letter the Acting Secretary of State wrote to me, as follows:

This Department is anxious that the wishes of the Austrian government in this matter should be gratified, as it would, no doubt, have a very beneficial effect upon the general interests of education and would reflect credit and honor upon those interests as developed in this country; and it is hoped that you will promote the object in view so far as it may be in your power to do so.

Baron Schwarz-Senborn, General Director of the Exposition, also personally addressed me as follows:

SIR: The Hon. John Jay informs me that you have kindly consented to co-operate with the Hon. General Thomas B. Van Buren, with the view to rendering, at the Universal Exposition of 1873 in Vienna, the representation of the American educational system as complete as possible.

Allow me to tender you my best thanks for the interest you are taking in this all-important subject, the more so, as I feel confident that, with your able assistance, we shall have a most successful development of the progress and results of your common-school-system at our great Exhibition next year.

For the furtherance of this object I sought to obtain the co-operation of the various State-authorities, and with this view a circular-letter was sent to all State-superintendents and many superintendents of cities, asking them to meet in conference in the city of Washington on the 13th of November. A number of gentlemen assembled in response to this call, and resolutions were adopted calling upon all State-, county-, and city-school-officials to co-operate in this matter, and requesting officers in charge of colleges, professional schools, technical schools, libraries, museums, and reformatory and benevolent institutions to lend their assistance. It was also resolved that the Annual Report of the Commissioner of Education should be forwarded as a summary of the educational statistics of the country, and that there should be forwarded, bound in uniform style, the school-laws and latest school-reports from States, cities, and towns, as well as catalogues of the various educational, reformatory, and benevolent institutions and associations of the country. The following resolutions, reported by the committee on "city-school-systems," were adopted unanimously:

That the superintendents of cities and the larger towns be requested to make out, in such form as the United States Bureau of Education shall devise, charts showing, for each grade of their school-systems, the subjects of study by topics, the time occupied, the number of teachers, the number of pupils, the average salary of teachers, the average age of pupils, and a statement showing the entire income and expenditure for school-purposes, the income from local taxation only, the average cost per scholar for tuition, and the average total cost per scholar, and of such peculiarities (excellent or otherwise) of the system as they may deem necessary for a thorough understanding of the same; that superintendents be also requested to send to the Bureau of Education samples of writing, drawing, and map-drawing from some entire class or school in each grade, each specimen to be marked with the name, age, and grade of the producer, and to conform with the requirements of the management of the Exposition; that superintendents be also requested to send to the United States Bureau of Education a model of their best school-building and views and ground-plans of such others as they may deem fit, with items of information as to the cost, date, and material of construction, their size, furniture, method of ventilation, &c.; that superintendents be requested to co-operate with the Bureau of Education in obtaining a full exhibit, by writing and otherwise, of all educational institutions and instrumentalities not comprehended in the public-school-system, including Kindergärten, private schools, academies, business-colleges, &c.; that superintendents be also urged to procure a copy of each text-book, map, chart, and other school-publication, and of every article of school-furniture produced in their respective cities; that superintendents be especially recommended, in view of the official character of the United States Bureau of Education and its general utility, to furnish that Office duplicates of the information, plans, &c., contributed to the Exposition, as the nucleus of an educational museum at Washington.

General Van Buren, United States commissioner to Vienna, was present at this meeting, and stated that "he had received a very large number of letters on the subject from Baron Schwarz-Senborn. Without an exception, every communication from him, upon whatever subject connected with the Exposition, contained a clause on the educational subject, and he begged, in the strongest terms, not to omit a full representation of American education, whatever else might be omitted. He said the little exhibition made of it at Paris, in 1867, so interested Europe that he was called upon

by the people of Austria and Hungary, from all quarters, not to fail to have a good, thorough representation of our system there."

With a view to securing the fullest possible representation of the American system of education in all those phases which admitted of such representation at Vienna, the following gentlemen were requested to assist the Commissioner of Education: A. R. Spofford, esq., librarian of Congress, in the preparation of material from libraries; Dr. J. M. Toner, in the preparation of material showing the condition and progress of medical education; Prof. Joseph Henry, secretary of the Smithsonian Institute, in the preparation of matter respecting museums and scientific associations; Prof. Fay, acting president of the National Deaf-Mute College, Washington, D. C., and Dr. S. G. Howe, superintendent of the Perkins Institute for the Blind, Boston, Mass., in the preparation of a representation of the instruction of deaf mutes and the blind. The following committee was appointed to assist the Commissioner in the selection and preparation of material for the general representation: State-superintendents, Hon. J. P. Wickersham, Pennsylvania; Hon. M. A. Newell, Maryland; Hon. T. W. Harvey, Ohio; Hon. Newton Bateman, Illinois; Hon. W. H. Ruffner, Virginia. City-superintendents, Hon. J. D. Philbrick, Boston, Mass.; Hon. J. O. Wilson, Washington, D. C.; Hon. Duane Doty, Detroit, Mich.; Hon. W. T. Harris, St. Louis, Mo.; Hon. Henry Kiddle, New York City.

In accordance with the expressed wishes of the Department of State and of the General Director of the Vienna Exposition, this Bureau made such efforts to secure a representation of the school-systems of the several States, cities, and towns of the country as were possible: first, by the preparation of a circular of information, with suggestions for uniform plans and charts, which was extensively circulated; and, secondly, by taking charge of and forwarding to the Exposition specimens of school-books, charts, school-furniture; models, photographs, and plans of school-buildings; educational reports; catalogues of libraries, and other appropriate material. There were exhibited in Group XXVI of the Exposition, the group devoted to educational materials, according to the official catalogue, 285 separate entries from the United States. Forty-eight diplomas and medals were distributed to the United States for article in this group, while only 30 were given to the United States for its exhibition in all the other groups. Of the 48 awards made to the United States for Group XXVI, there were 4 grand diplomas of honor, 6 medals for progress, 21 medals for merit, and 18 diplomas of merit.

The following list of awards to American educational exhibitors is taken from the published official list of prizes:

*Grand diplomas of honor.**—The National Bureau of Education, Washington, D. C. for distinguished services in the cause of education and for important contributions to the Exposition; the State of Massachusetts, for valuable reports and documents and for the enterprise shown by its organized personal representation at Vienna; the city of Boston, for its full and complete illustration of its school-system and schools; the Smithsonian Institution, Washington, D. C., for its efficient labors in the advancement and diffusion of knowledge.

Medals for progress.—Guyot, Prof., Princeton, N. J., wall-maps; Howe, Dr. S. G., Boston, Mass., publications for the blind; National Educational Association, successful efforts in promoting the advancement of education; Ohio State-department of public instruction, T. W. Harvey, commissioner, Columbus, Ohio, school-reports, statistics &c.; Prang, L., & Co., Boston, Mass., chromo-lithographs; Washington, D. C., J. O Wilson, superintendent, progress in education and in school-architecture.

Medals for merit.—Appleton, D., & Co., New York, wall-maps; American Printing-House for the Blind, Louisville, Ky., books for the blind; Astor Library, New York; Barnard, Dr. Henry, Hartford, American Journal of Education; Brewer & Tileston, Boston, Mass., school-publications; Chicago, Ill., public schools, J. L. Pickard, superin-

*The diploma of honor was designed to bear the character of a peculiar distinction for eminent merits in the domain of science and its applications to the education of the people and the advancement of the intellectual, social, and material welfare of man, and was awarded exclusively by the council of presidents upon the proposition of the international jury.

tendent, school-reports, examination-papers, and statistics; Cincinnati, Ohio, public schools, John Hancock, superintendent, reports, examination-papers, and educational statistics; Cooper Union, New York, for labors in the interest of the working classes; Cowperthwait & Co., Philadelphia, Warren's wall-maps and books; Grossins, John, Cincinnati, Ohio, patent ventilating school-house-stove; Harper Brothers, New York, school-books, school-slates, tablets, and charts; Lea, H. C., Philadelphia, Pa., medical text-books, American Journal of Science; National School-Furniture Co., New York City, school-furniture; New York City department of public instruction, Prof. Kiddle, superintendent, school-books, school-reports, photographic views of schools, &c., and specimens of school-labors; Ross, Joseph L., Boston, Mass., school-furniture; Schedler, Joseph, Jersey City Heights, N. J., terrestrial and celestial globes; Steiger, Ernest, New York, 7,000 specimens of different American newspapers and periodicals, school-publications; Toner, Dr. J. M., Washington, D. C., collection of the reports of medical, institutions, hospitals, &c.; Wait, William B., educational apparatus; Wilson, Hinkle & Co., Cincinnati, Ohio, school-atlases and other school-publications.

Diplomas of merit or honorable mention.—Baltimore, Md., public schools, reports of the board and of superintendent, examination-papers in departments of writing and drawing; Barnes, A. S., & Co., New York, school-publications; Bridges, Lyman, for building the American school-house; Canton City, Ohio, school-reports and examination-papers in educational department; Cleveland, Ohio, public schools, school-reports and statistical chart of education in Cleveland; Columbus, Ohio, public schools, school-reports and papers; Dayton, city of, Ohio, school-reports and examination-papers; Enthoffer, J., United States Coast-Survey, Washington, D. C.; Fremont, Ohio, public schools, school-reports and examination-papers; Leeds, Lewis W., New York, drawing for ventilation and heating of school-houses; Lippincott, J. B., & Co., Philadelphia, Pa., school-publications; Lowell Institute, in Boston, Mass., dissemination and promotion of science; Newton, Mass., school-reports and educational statistical charts; Scribner, Armstrong & Co., publishers of Guyot's Maps; Shattuck, G. M., Boston, Mass., school-desks and seats; Springfield, Ill., school-reports, educational statistics; Toledo, Ohio, department of public schools, D. F. De Wolf, superintendent, school-reports, educational statistics and examination-papers; Worcester City, Mass., schools, (A. P. Marble, superintendent,) school and statistical reports.

In referring to the Exposition at Vienna, I have thought it far more useful to the educators of the country to print a variety of opinions expressed by others than to give them only my own. On my arrival at Vienna Dr. J. W. Hoyt, originally appointed as an honorary commissioner, had, by the faithfulness and efficiency of his services, been selected as one of the special commissioners, and was the only one present; having in addition acted as chairman of the jury on education, he was specially familiar with whatever there was in the Exposition bearing on this subject, and gave me all the aid which his position and familiarity with this subject in the Exposition put at his control. I am also under special obligation to Baron Schwarz-Senborn, General Director of the Exposition, and to numerous other officers representing our own and other countries, who spared no pains to make my visit pleasant and profitable. By means of the advantages thus afforded, I was able to reach the points of interest with the least possible inconvenience and loss of time, and study the most valuable and essential features of this Exhibition, in the opinion of those best qualified to judge, unequaled in vastness and instructiveness as an epitome of the world's condition and progress by any previous attempt of the kind.

Comments of the press.

American educational exhibition.—A writer in the Freie Pädagogische Blätter of June 21, 1873, says:

I have traveled a great deal and have seen many rural school-houses, have taught in several myself, but such a school-room as this I have never before seen anywhere. It is almost provoking to see how the Americans produce something so beautiful from such a cheap and simple material, (wood,) and then to remember how insufficient our school-houses are, which often are erected at a considerable expense. The Americans

are very practical in the erection of their school-houses and are masters in combining the beautiful with the useful. This school-room is calculated for forty-eight children; and how roomy, how airy! It does an old teacher's heart good to see this, and he sighs, "Alas, if this were so everywhere!" * * * The only fault to be found with the American school-benches is that there is no difference in size and in the relative position of their different parts. * * * The physical geography is excellently represented on large maps, to the great honor of M. Guyot, whose name they bear. * * * In the text-books, which lie about on the desks, we were particularly pleased with the good, thick paper, something which our own "blotting-paper-text-book publishers" might make note of.

This writer also expresses his admiration of the colored natural-history-charts, the charts showing the different colors, "something new to the German schools," and the calculating-machine; but confesses his surprise "that America, the home of machinery, in its rural school does not exhibit a single physical instrument, not even a thermometer."

A subsequent number of the same journal speaks admiringly of the "large photographs, representing truly palatial school-houses, from different States of the Union," and of the stereoscopic views showing the interior of the school-rooms, with the children in their seats; thus we get a vivid picture of American school-life, and a picture of the most cheerful description." Prang's natural-history-series is highly commended; also the photographic views used as a means of imparting geographical instruction. The style and arrangement of the Boston slates are considered worthy of special attention and commendation and the single Boston desk and seat is highly praised. The mathematical objects are considered "too small;" but the writer "left the educational exhibit of the United States very well pleased on the whole."

The Neue Freie Presse, of Vienna, says of the American school-house:

We have before us a "model school," an ideal which the majority of American rural school-houses, many of which are as yet only log-houses, will, in all probability, not attain for a long time to come. * * * The chairs are constructed in a very practical manner. * * * In the educational department in the Exposition-building, the variety and the beauty of the apparatus and text-books on exhibition, the magnificence of the city school-houses, as shown by models and photographs, excite our admiration, which, however, is considerably diminished by looking at the work done by the scholars. For this convinces us that the results obtained by the American schools bear no proportion to the vast amount of money spent for them, and that they are far behind the European schools. The written essays from a German-school in Ohio actually swarm with calligraphic, orthographic, and grammatical mistakes.

(This is illustrated by a number of examples.)

The Vienna Volksblatt says:

The arrangement of a separate seat for each scholar, and the shape of the desks, which prevents any crippling of the tender bodies of the children, deserve the highest praise. Worthy of admiration also are the maps exhibited, from which the more mature youth learns to know his native land. We note especially an atlas of Pennsylvania, which, in completeness, clearness, and fullness of explanation, is quite superior to what we are accustomed to place in the hands of our children. The principle "For children only the best is good enough" finds its happy realization in the American school-house. Not less instructive and worthy of admiration are the maps from which the younger ones are taught to know the earth and its inhabitants. * * * Prominent among the charts and tablets is "An analysis of the Constitution of the United States," which on the other side of the ocean is counted as a part of the teaching-apparatus. When will *our* children learn, while yet in school, what are the rights and duties of a good citizen and what it means to live in a constitutional state?

The Vienna Tagesblatt praises the arrangement of seats and desks and the character and variety of the school-utensils, these "giving a wonderful illustration of the excellent school-regulations of the United States. The school-house is the bright spot in the American exhibition."

The London Engineering says of American school-furniture:

There is no luxury whatever in the accommodations, though elegance and comfort are not entirely eliminated. Our schools and colleges would greatly gain in appearance if a little more attention were only paid to those two points. Austerity and gloom, almost proverbial, seem to be the leading features of our school-system; and it would doubtless be a progressive step to borrow a little of the American amenity.

The Danube speaks in the following terms of the American school-house:

It is composed of a study-room and recitation-room. These things should serve us as models for our schools; for, what with their lighting, ventilation, and healthfulness, they leave absolutely nothing to be desired. The books, the maps, and other instruments of teaching are also perfect. They prove conclusively that primary instruction in the United States has been developed to an extent unknown in Europe.

Foreign educational exhibitions.—"The English educational exhibition," the Freie Pädagogische Blätter says, "is even less than unassuming and really offers next to nothing." A series of maps intended as aids for instruction in natural sciences, some geographical maps, and particularly a geological map of Queensland are highly commended. A mineralogical collection is considered worthy of mention; also an exhibition of Bibles printed in all the different languages of the world.

The London Engineering says of the French exhibition:

The French gallery shows that much attention and a large share of talent are concentrated upon devising the best means of primary instruction, of smoothing the asperities and rendering the first stages of learning easy and agreeable to youth. We know no country in which more vigorous and successful efforts are made to encourage and stimulate the young student. There are arithmometers, to facilitate the simple rules; geographical reliefs in plaster, to give accurate notions of the fundamental definitions; variously-colored maps, showing by their difference of shades the altitudes of countries above the sea-level; and models of solids, with sections, to render tangible the principles of practical geometry. After a careful examination of the various systems of drawing, we think that the French department is pre-eminently the best. We mean the course of linear drawing, with zinc- and plaster- models of penetrations and architectural designs, as well as the card-board-arrangements for descriptive geometry, of he Christian Brothers.

The Bund remarks:

The final impression made upon our mind on leaving the French exhibition is about the following: Higher instruction, as far as it can be judged by such an exhibition, seems to flourish, also the elementary schools of the city of Paris, while in the provinces both higher and elementary instruction seem to be neglected.

Of the German exhibition the Freie Pädagogische Blätter says: "The German educational exhibition is—next to the Austrian, which, of course, from local causes was especially favored—the most complete of the whole Exposition." Regret is expressed that it was not arranged on a uniform plan. "Objects from one and the same state are placed in different parts of the building, which prevents a clear and comprehensive view of the whole." Among the aids to instruction especially commended are "the pasteboard-models of blossoms and other portions of plants on a very large scale, exceedingly useful in classes where it is impossible to procure fresh plants for every scholar; * * * the physiological and anatomical models of Fleischmann, of Nürnberg, and Ziegler, of Freiberg; the physical apparatus for elementary schools; colored charts for the illustration of botany and natural history, all on a very large scale; the globes, telluria, maps, and other aids to geographical instruction; the drawing-copies and models; and the chemical laboratory exhibited by Hagersdorff, one of the finest objects in the educational exhibition." The work done by scholars in Realschools and industrial schools is highly commended. Among the specimens of women's work, the amount of useless embroidery is commented upon somewhat severely, and it is remarked that "this branch of instruction is in most cases far from being what it ought to be."

The Bund, an official Swiss paper, in noticing the German exhibition, makes special mention of the collections of ores, minerals, and fossil-plants; the new apparatus for instruction in mathematical geography, which meets a long-felt want; the aids to object-teaching, with a view to instruction in natural sciences in elementary and secondary schools; the wall-charts, for instruction in botany and zoölogy; and the aids to instruction of the blind. Of the work performed by scholars this paper says, (referring especially to the industrial schools of Hamburg and Würtemberg:) "the drawings, plaster-casts, &c., show us what the youth of our age are learning and how greatly the community is profited by creating such institutions. We know full well that the work of the scholars which is on exhibition is not in every respect the proper criterion for the standard of excellence of a school, for talented scholars will produce

astonishing results, even in a badly-conducted school; but the mass and variety of the work on exhibition nevertheless shows that a great deal is taught and a great deal is learned." The drawings from several industrial schools in Bavaria are excellent and great admiration is expressed for the work done by the Munich Kindergarten.

The same paper also says of the Swiss educational exhibition:

The preliminary exhibition held in Winterthür, in February, 1873, was far more imposing than the one at Vienna. Many very valuable educational objects, collections, apparatus, maps, &c., have been sent to Vienna in vain, because they have either not been unpacked or are totally hidden from view. The most significant feature of the exhibition, as illustrating the progress of education and the changes in the character of instruction during the last few years, is the collection of text-books, apparatus, and charts for instruction in natural science. A set of these charts, adapted for every grade of instruction, attracted universal attention in Vienna. The Zürich exhibition displayed a collection of these objects for primary and secondary schools as complete as we have not seen them in any other canton or country.

The Bund, speaking of what has been done for education in Zürich during the last few years, says:

The authorities have thoroughly understood the spirit of the times. They have succeeded in bringing the great achievements of science into a happy relation with the elementary schools, and thereby with the education of the whole nation. A healthy and beneficial mutual relation has been established between the university and the primary school, such as is scarcely found anywhere else.

The Freie Pädagogische Blätter says:

We must make special mention of all the aids for instruction in natural sciences, for these are truly admirable in their selection and arrangement, all of the three natural kingdoms being well represented by a school-collection and by a scholar's collection. The object of the former is explained by its name, the latter is collected by the scholars themselves. Exact rules regulate the manner of making these collections. The collection of physical apparatus seems to have been made on the principle "little, but good." The aids for geographical instruction are equal to the demands of the time. Also by magnificent illustrations are the young made acquainted with the history of their nation.

The Bund pronounces the Austrian educational exhibition "magnificently gotten up and beautifully arranged. The material for every grade of instruction is exhibited in natural divisions and groups corresponding with each other. The only novelty in the primary division is a rotating-slate of galvanized rubber, which, if durable, will doubtless be introduced into many schools. The herbaria of the scholars in an elementary school in Styria are highly praised. The collection of physical apparatus is very fine; also the anatomical preparations for superior schools. For the first instruction in geology and paleontology the geological pictures will render good service."

This paper says of the schools in Vienna:

All the city-schools are well managed, have excellent text-books and apparatus and, in most cases, energetic and enlightened teachers. In the infants' pavillion we read a placard telling us the following: "Crèche, where poor parents, during their hours of work, (from 6 a. m. to 7 p. m.,) can take their children aged between two weeks and two years for a daily charge of 3 to 5 kreuzers," (1½ cents to 2½ cents.) Then follow the addresses of seven such crèches in different parts of Vienna.

The Freie Pädagogische Blätter calls special attention to the maps of the Imperial Geological Institute and to the collections of minerals, crystals, plants, and prepared insects, of which, as in nearly all the European exhibitions, there were a number. "All the aids for instruction in mineralogy, geology, zoölogy, anthropology, botany, &c., were brilliantly represented by the famous public and private institutions of the city of Vienna." "There was a perfect wealth of aids to instruction in physics and chemistry. The number of globes was also very large. The maps of Fuchs, on black-slated paper and printed dimly in colors, were much admired. They are of decided value just because one can write on them, and that thus the dumb map gradually becomes a living and speaking one." A collection of drawing-models and utensils is highly commended.

This journal also finds especially admirable the geographical part of the Hungarian exhibition. The maps are "in the highest degree creditable." The "relief-maps" are particularly excellent. "Illustrations of natural history in the shape of charts show that the study of nature is not neglected in the Hungarian schools. Collections of "admirably-prepared insects, anatomical specimens, and elegantly-finished

physical apparatus complete the aids for instruction in natural sciences." "For object-lessons there are a few, but very useful, pictures. In some of these we see an idea which a future time will carry out—group-pictures executed in a truly artistic manner." Mention is made of "two-seated school-benches," "drawing-copies," and "a rich collection of needle-work done by scholars." "In quantity Hungary might have given us more, but as regards the quality we must express our entire satisfaction."

The Blätter commends the simplicity and practical character of the Swedish school-house, and says:

The Swedish government does more than almost any other European government for good school-houses, especially in a sanitary point of view. The Swedish government not only distributes plans of school-houses, but accompanies these by a printed pamphlet, giving numerous and valuable hints as regards the location and surroundings of the school, the quantity of space to be allowed to each scholar, the different methods of ventilation, &c. A very important problem, the construction of school-benches, may be almost considered as satisfactorily solved in the Swedish school-house. The seats which are exhibited have, it is true, as yet, only flat boards, which deny the scholar every comfort, and the slightly slanting position of the board does not compensate for this defect; but not one of the seats is without a back, which, although essential to a comfortable seat, is found in but very few of our school-houses. We must draw special attention to the fact that in the Swedish school-house there is a separate seat for each child. The long school-bench should not be tolerated anywhere, but separate seats should be introduced into all schools, as the Swedes and Americans have done. A peculiar feature of the school-room is a number of guns and a drum, used in the military gymnastics and the practice of arms, which forms an important branch of instruction in all the elementary schools. Religious instruction is obligatory and occupies a considerable number of hours every week. Of the 212 objects exhibited in the Swedish school-house, no less than 20 have reference to religious instruction. The only object among them deserving attention is a collection of pictures for instruction in biblical history, which are really valuable. All the books in the Swedish school-house are got up in the most practical manner; the binding is elastic and cannot be torn. This also applies to the people's library, which, numbering several hundred volumes, forms a specialty of the Swedish school-house. Fifteen years ago the first people's libraries were established in Sweden, and now, in accordance with the regulations of the Swedish school-law, nearly every village possesses one. No better place could be found for it than the school-house and no better librarian than the teacher. Among the aids for instruction in natural history the glass cases with insects deserve special mention on account of their practical arrangement. These cases have not only glass lids and sides, but also glass bottoms, and the insect can, therefore, be inspected from all sides. The physical apparatus which is exhibited excels through accuracy and the greatest possible simplicity. We were struck with a large drawing-slate made of dull glass, which forms an excellent drawing-surface for colored pencils. A part of the drawing-copies are in the shape of gigantic wall-maps. The calculating-machines are few in number, which may be accounted for by the circumstance that instruction in arithmetic in Sweden aims more at rapid skill than at a clear understanding of the arithmetical process; but a calculating-machine illustrating the decimal system is considered worthy of mention. An interesting feature of the exhibition is a collection of aids for instruction in vocal music, which is much cultivated in Sweden.

The same journal remarks that—

On entering the Belgian educational exhibition, one sees at once that in Belgium, with its busy marts of industry, but little has been done for the education of the masses. The Belgian department excels in the many mathematical objects made of tin. The collection of apparatus for perspective drawing is of real value, as well as the wire network, also for drawing-purposes. In a calculating-machine we were struck with the combination of vertical and horizontal wires. A beautiful map of West Flanders, in relief, painted blue and the towns marked by shining white spots, which can be seen from afar, is extremely useful for large classes. The female-work exhibited is characterized by simplicity and usefulness. Besides the objects mentioned we find nothing in the Belgian department which is worthy our attention.

Of Italy it also says:

The Italian educational exhibition shows us more than anything else the transalpine superior and special schools. The technical schools particularly are represented in a brilliant manner. This is not astonishing, for, in a country which has produced the men who pierced Mont Cénis, we expect to find a high degree of technical education. The elementary schools are not so well represented. A school-bench is exhibited with a movable seat. We saw a similar arrangement in the French exhibition, but we cannot admire it. There is absolutely no necessity for turning seats. The finest part of the Italian elementary-school-exhibition is the female-work. Here we see the artistic trait

of the Italian nation. A great plastic model of Vesuvius deserves special mention. A skillful hand planned it, and it is in every way a most interesting object.

Widely varying opinions are expressed by the Swiss Bund and the Vienna Freie Pädagogische Blätter concerning the Russian educational exhibition. The former says: "The Russian educational exhibition is a mere rudiment compared with the other civilized States of Europe," and finds nothing worthy of remark but a series of "object-lessons for the school and family." The latter paper remarks:

On visiting the Russian educational exhibition we find occasion to rid ourselves of many a prejudice. Russia here appears very respectable, not by the number of objects exhibited, but by their excellence. The object-lessons for the school and family are truly admirable. The work done by the inmates of the Warsaw Institute for the Blind deserves to be mentioned, as well as two models of school-desks. A box with arithmetical blocks is very practical, and it is only astonishing to find it in the Russian department, because the Russians are particularly fond of complicated calculating-machines. Russia has a great future, and even its small educational exhibition is a grain of seed from which much may be expected.

Of Portugal the Freie Pädagogische Blätter says:

The Portuguese school-house makes a very pleasant impression from the outside, but inside it looks very empty. On the walls there are photographic views of school-houses, which show that the school-house exhibited cannot be considered a model. Among the few objects exhibited our attention is first of all attracted by the school-desks, in which there is nothing remarkable, except that there are two seats screwed firmly to the floor belonging to every desk. Some pictures of parts of the human body elicit the inquiry whether in Portugal drawing consists merely in copying and whether in mathemetical instruction no natural bodies are employed. Neither the one nor the other awakens a favorable opinion of the method of Portuguese educators. The cartagraphic exhibition comprised two maps, both of Portugal, one of them lithographed, the other drawn by hand.

EUROPEAN TOUR.

On the first day of August I received your instructions to visit the various states in Europe to observe their educational systems, especially to study the representation of education at the Exposition in Vienna, and gather such facts and suggestions as would better enable this Office to meet the demands upon it for information in regard to education in foreign countries. I sailed on the 3d instant and returned in November, having been as far north as Edinburgh and Glasgow, as far south as Rome, and as far east as Vienna and Berlin. My attention was directed chiefly to the organization of educational systems and institutions, but including, as far as circumstances permitted, the minutest details in methods of instruction and discipline, from the professional or university-training through all grades, down to the plays of the Kindergarten and the nursing of the crèches; tracing, as far as lay in my power, the effect of differences in system and method upon the condition of the people, their comforts, their industries, their vices, crimes, and virtues. Reports and documents bearing upon all the phases of education were collected as far as was possible. Nothing so complete on the present condition of foreign education has ever been gathered in this country in a single year as has by this and other means come to this Office during the past year. It is impossible to bring out in a single report all of this information that would be valuable to American educators. I include here only the baldest statement of figures and facts in regard to the countries visited, and some others from which officials reports have been received. The great mass of suggestion and information can only come out in special publications as opportunity offers in the future.

During the past year an unprecedented number of American educators, induced by the opportunities afforded by the Vienna Exposition for comparing the different systems of education and of conveniently observing the methods and apparatus used in the various European countries, visited Europe. Many of them have brought home more or less valuable observations; all desire what may be gathered from official sources. The inquiries of these educators and of other persons whose desire for information has been stimulated by converse with them have made the demands on this Office very great, perhaps greater than it can fully meet, but I propose to do all that the means placed at the command of the Office will allow. It has been estimated that American educators expended in foreign travel last year not less than $500,000.

I ought not to dismiss this subject without expressing the satisfaction I received from meeting so many eminent gentlemen who have been in correspondence with this Office. The cordiality and consideration extended to me by every minister or official of public systems or institutions of education on whom I had occasion to call, were altogether too great to be appropriated to my own personality, and could only be received as the expression of their feelings towards the country that it was my privilege to represent in my travels.

This interest in the educational work and progress in foreign countries, which is thus strikingly shown, has been long apparent in the correspondence of this Office, and to meet this the abstracts of foreign educational progress have been prepared and inserted in the appendix to my annual reports. Want of space compels me, in my present report, to substitute for the extended abstract prepared for the appendix the following statistical summary:

LATEST STATISTICS OF EDUCATION IN FOREIGN COUNTRIES.

I.—EUROPE.

Austro-Hungarian monarchy: Area, 226,406 square miles; population, 35,904,435.

Since the year 1867, the Austro-Hungarian monarchy forms a bipartite state, consisting of a German, or "cisleithan," monarchy, and a Magyar, or "transleithan," kingdom, the former officially designated as Austria and the latter as Hungary. Each of the two countries has its own parliament, ministers, and government, while the connecting ties between them consist in the person of the hereditary sovereign, in a common army, navy, and diplomacy, and in a controlling body known as the delegation, half of whom are chosen by Austria and half by Hungary.

1. AUSTRIA, constitutional monarchy: Area, 108,234 square miles; population, 20,394,980. Capital, Vienna; population, 834,284. Minister of worship and public instruction, C. V. Stremayr.

Administration.—The highest authority is the ministry of public instruction, established in 1848; subordinate are the provincial school-council in each province, the district-school-council in each school-district—of which there are 363—and the municipal school-council in each municipality.

The ministry of public instruction has the supervision of educational institutions of every grade, the provincial school-council of all except the universities; the district school-council of all institutions of primary instruction, with the exception of the normal schools, which belong to the former council, and the municipal school-council of all public schools in the municipality. Each council reports to the next highest authority and the ministry publishes (since 1870) an annual report.

Primary instruction.—Primary instruction has been considered compulsory since 1781 for all children between the ages of 6 and 14. The school-law in force is that of 1869. The sums needed for maintaining primary schools are raised by the township and district, and in cases of necessity the province grants subsidies. The normal schools are supported by the general government.

In 1873 the total expenses for primary instruction were $7,660,305, gold, of which $580,350 were raised by the general government and $7,079,955 by the townships, districts, and provinces.

Statistics of primary schools: Number of public schools, 13,815; number of private schools, 954—total number of primary schools, 14,769.

Connected with these schools are 71 infant-asylums, 73 Kindergärten, 10,277 repetition-courses, 108 agricultural courses, and 49 industrial courses. Number of male teachers, 20,994; number of female teachers, 3,445; number of assistant teachers, 910—total number of teachers, 25,259. Number of boys of school-age, 1,701,000; number of girls of school-age, 1,709,100—total number of children of school-age, 3,419,100. Number of boys attending school, 942,497; number of girls attending school, 428,316—total number of children attending school, 1,370,813. Number of normal schools for males, 40; number of normal schools for females, 20—total number of normal schools, 60. Number of teachers in male normal schools, 381; number of teachers in female normal

schools, 200—total number of teachers in normal schools, 581. Number of students in male normal schools, 1,978; number of students in female normal schools, 1,307—total number of students in normal schools, 3,285.

Secondary instruction.—The institutions representing secondary instruction are gymnasia, realschools, and realgymnasia, (a combination of the two.) The total expenditure for secondary instruction in 1873 was $2,168,513, gold, of which sum the general government contributed $1,273,950, gold, and the provinces and municipalities $1,168,513.

Number of gymnasia, 93; number of realgymnasia, 48; number of realschools, 64—total number of secondary schools, 205. Number of teachers in gymnasia, 1,667; number of teachers in realgymnasia, 571; number of teachers in realschools, 1,069—total number of teachers in secondary schools, 3,307. Number of students in gymnasia, 24,429; number of students in realgymnasia, 7,042; number of students in realschools, 18,349—total number of students in secondary schools, 49,820.

Superior instruction.—The institutions grouped under this head are universities and technical high schools or polytechnic schools, all under the supervision of the ministry of public instruction. During the scholastic year 1872-'73 the expenses for superior instruction amounted to $1,386,900, gold, viz, $990,700 for the universities, paid entirely by the central government, and $396,200 for the polytechnic schools—$258,700 by the central government and $137,500 by the provinces.

Universities:

Special instruction.—Theological seminaries, 44, with 254 professors and 1,847 students. Of these seminaries, 39, with 229 professors and 1,616 students, are Roman Catholic; 3, with 16 professors and 92 students, are Greek; 1, with 3 professors and 2 students, is Armenian, and 1, with 6 professors and 37 students, is Protestant. Schools of surgery, 3, with 35 professors and 602 students. Schools of mining, 4, with 25 professors and 352 students. Schools of forestry, 5, with 28 professors and 352 students. School of veterinary surgery, 1. Schools of agriculture, 35. Schools of navigation, 5. Business-colleges, 6. Schools for nurses, 12. Schools of music, 3. Academies of fine arts, 3. Industrial schools, 31. Military schools, 13.

The theological seminaries are supported by the different religious denominations; the schools of surgery and of navigation, the schools for nurses, the business-colleges, the schools of music, the academies of fine arts, and the industrial schools, by the ministry of public instruction; the schools of agriculture and of forestry, by the ministry of agriculture; the schools of mining, by the ministry of finance; the school of veterinary surgery and the military schools, by the ministry of war.

2. HUNGARY, constitutional monarchy: Area, 118,172 square miles; population, 15,509,455. Capital, Buda-Pest; population, 256,488. Minister of worship and public instruction, A. Trefort.

School-legislation.—The school-law which is in force dates from the year 1867. According to this law all the schools, public and private, are under the supervision of the ministry of public instruction. The expenses are met by the municipalities and in cases of extreme need a subsidy is granted by the general government. Education is compulsory for all children between the ages of 6 and 12 in the primary schools and between the ages of 12 and 15 in the repetition-courses.

Primary instruction.—Number of public schools, 14,550; number of teachers, 19,297; number of children of school-age, 2,206,187; number of children attending school, 1,233,500. Number of state normal schools, 20; number of denominational normal schools, 40—total number of normal schools, 60; total number of professors in normal schools, 368; total number of students in normal schools, 1,786; number of adults receiving instruction, 55,000.

Secondary instruction.—Number of gymnasia, 146; number of realschools, 28—total number of secondary schools, 174. Number of students in gymnasia, 30,992; number of students in realschools, 5,472—total number of students in secondary schools, 36,464. Number of teachers in gymnasia, 1,624; number of teachers in real schools, 267—total number of teachers in secondary schools, 1,891.

Superior instruction.—Number of universities, 2, with 149 professors and 2,375 students; number of polytechnic schools, 1, with 42 professors and 451 students.

Special instruction.—Number of theological seminaries, 41, with 231 professors and 1,660 students; number of law-schools, 15, with 102 professors and 2,074 students; 1 school of veterinary surgery; 2 schools of mining; several schools of agriculture, industrial schools, and business-colleges.

Total expenditure for public instruction, $2,632,628, gold.

BELGIUM, constitutional monarchy, (kingdom:) Area, 11,313 square miles; population, 5,021,336. Capital, Brussels; population, 314,077. Minister of public instruction, the minister of the interior, C. Delcour; director-general of public instruction, J. Sauveur.

Administration.—The bureau of public instruction is a bureau in the ministry of the interior. Most of the public schools, with the exception of some under the ministry of justice and the ministry of war, are under its supervision, as also those private or municipal schools which receive aid from the government. Education is not compulsory. The whole country is divided into school-districts, each with an inspector appointed by the government. The basis of the present system of primary instruction is the law of 1842.

Primary instruction.—Schools under the ministry of the interior: number of primary schools, (1869,) 5,641; number of pupils, 593,379; number of teachers, 10,576; number

of adult-schools, 2,620; number of pupils, 217,168; number of infant-schools, 609; number of pupils, 60,570.

Schools under the ministry of justice: Prison-schools, hospital-schools, almshouse-schools, 6,564.

Schools under the ministry of war: Schools for illiterate soldiers and soldiers' children, attended by 2,782 pupils.

Number of normal schools for males, 14; number of normal schools for females, 23—total number of normal schools, 37. Number of male students, 1,192; number of female students, 704—total number of students in normal schools, 1,896.

Total expenditure for primary instruction, $1,600,408, gold.

Secondary instruction.—The basis of secondary instruction is the organic law of June 1, 1850, modified by succeeding laws. The secondary schools are either government-schools (those of a higher grade being called royal atheneums and those of a lower grade called intermediate schools—écoles moyennes) or provincial and municipal schools, (those of the higher grade being called colleges and those of the lower grade intermediate schools.) Royal atheneums, 10; intermediate government-schools, 50; municipal schools aided by the government, 30; municipal schools, 3; secondary schools supported by religious corporations, 64; secondary schools supported by private individuals, 4—total number of secondary schools, 161. Number of students in the 93 government- and municipal schools, 15,822; number of normal schools for secondary instruction, 4, with 38 students.

Superior instruction.—The institutions for superior instruction are four universities, two supported by the government, at Ghent and Liége, and two free universities, at Brussels and Louvain. Each of these universities has four faculties, viz, of philosophy and literature, of mathematical and natural sciences, of law and of medicine, and in one case of theology.

Annual expenditure for the two state-universities, $172,123.

Universities.	Number of students.					
	Philosophy and literature.	Mathematical and natural sciences.	Law.	Medicine.	Theology.	Total.
State-universities:						
Ghent	31	35	73	71	.....	210
Liége	81	96	124	117	.....	418
Total	112	131	197	198	.....	628
Free universities:						
Brussels	62	103	229	141	.....	535
Louvain	106	165	207	227	142	847
Total	168	268	436	368	142	1,382
Grand total	280	399	633	566	142	2,010

Special instruction.—The special schools are either connected with the universities or are government, provincial, or municipal establishments. Special school of civil engineering, university of Ghent, 173 students; school of arts and manufactures, university of Ghent, 63 students; school of arts and manufactures, university of Liége, 211 students; special school of mines, university of Liége, 35 students; state agricultural school at Gembloux, 79 students; two schools of horticulture, 39 students; school of veterinary surgery at Cureghem, near Brussels, 78 students; Royal Academy of the Fine Arts at Antwerp, 1,588; 69 drawing academies and schools, 9,389 students; Con

servatory of Music at Brussels, 538 students; Conservatory of Music at Liége, 811 students; military school at Brussels, 97 students; two schools of navigation, (Antwerp and Ostende,) 70 students. Total number of special schools, 82, with 13,171 students.

DENMARK, constitutional monarchy, (kingdom:) Area of Denmark proper, 14,533 square miles; population, 1,784,741. Area of the colonies, (Færoer, Iceland, Greenland, West Indies,) 55,580 square miles; population, 125,891. Capital, Copenhagen; population, 181,291. Minister of worship and public instruction, C. C. Hall.

Primary instruction.—The basis of the present system is the school-law of 1814, with several additions and modifications made in 1818, 1844, 1855, 1856, 1863, and 1864.

Education is compulsory for all children between the ages of 7 and 13.

The sums required for the support of primary schools are chiefly raised by the municipalities by a small school-fee, a school-fund, and by subsidies from the central government. The whole country is divided into school-districts, which have the following statistics for 1867:

Number of public schools, 2,781; number of male teachers, 2,929; number of female teachers, 59—total number of teachers, 2,988; number of children of school-age, 200,761; number of children attending public schools, 194,198; number of children attending private schools, 13,994—total number of children under instruction, 208,192; number of normal schools, 5, with 233 students.

Secondary instruction.—The laws in force are those of 1805 and 1809, though considerably amended and modified. The secondary schools are both private and public, and, so far as their course of instruction is regarded, are either so-called cathedral- or learned schools, classical colleges, or higher realschools.

Number of public cathedral-schools, 15; number of public higher realschools, 5; number of private schools, 6—total number of secondary schools, 26; number of teachers in public cathedral-schools, 163; number of teachers in public higher real schools, 6; number of teachers in private schools, 145; number of teachers in secondary schools, 314; number of students in public cathedral-schools, 1,629; number of students in public higher real schools, 410; number of students in private schools, 1,437; total number of students in secondary schools, 3,476.

Superior instruction.—The University of Copenhagen, with five faculties, viz: theology, with 5 professors; law, with 6; medicine, 11; philosophical sciences, 19, and mathematical and natural sciences, 10; making a total of 51 professors and attended by about 1,200 students.

Special instruction.—Royal polytechnic school, with 13 professors; the school of agriculture, veterinary surgery, and forestry, with 16 professors; the military school; the naval school; a number of schools of navigation; the academy of fine arts.

GERMANY, constitutional monarchy, (empire:) Area, 212,091 square miles; population, 41,060,695. Capital, Berlin; population, 826,341.

Germany has no national system of education, but each of the twenty-six states composing the empire has its own ministry or bureau of public instruction and manages its own educational affairs. Education is compulsory in all the states.

Primary instruction, statistics of 1871.—Number of public primary schools, 60,000; number of pupils attending, 6,000,000; number of normal schools, 152.

Secondary instruction.—Number of gymnasia, 330; number of realgymnasia, 14; number of progymnasia and Latin schools, 214; number of real schools and higher burgher-schools, 485—total number of secondary schools, 1,043; total number of students in secondary schools, 177,379.

Superior instruction.—Number of universities, 21; number of students, 15,587; number of professors, 1,655; number of polytechnic schools, 10; number of students, 360; number of professors, 4,500.

The detailed statistics of the German universities for the academic term 1872–'73 show the following:

Universities.	Professors.	Students.				
		Theology.	Law.	Medicine.	Philosophy.	Total.
1. Berlin	181	227	574	404	713	1,918
2. Bonn	88	160	202	164	226	752
3. Breslau	103	167	276	185	334	962
4. Erlangen	53	162	35	104	70	371
5. Freiberg	50	95	43	78	45	261
6. Giessen	52	13	101	78	112	461
7. Göttingen	101	95	233	162	433	923
8. Greifswald	57	26	58	316	95	495
9. Halle	87	241	134	187	475	1,037
10. Heidelberg	108	25	313	105	290	733
11. Jena	62	98	76	81	119	374
12. Kiel	61	51	11	62	25	149

14. Leipzig	143	421	904	515	810	2,650
15. Marburg	66	47	16	148	124	335
16. Munich	109	74	335	409	401	1,219
17. Münster	28	209	.....	.....	174	383
18. Rostock	34	49	46	38	18	151
19. Strasburg	71	49	116	113	112	390
20. Tübingen	75	384	147	203	62	796
21. Würzburg	62	126	106	441	130	803
Total	1,665	2,788	3,913	3,951	4,935	15,587

Special instruction.—Number of industrial and drawing-schools, 253; number of schools of agriculture, 97; schools for nurses, 45; military-schools, 39; business-colleges, 37; schools of architecture, 30; schools of navigation, 24; schools of mining, 19; schools of music, 18; schools of forestry, 10; schools of veterinary surgery, 9; schools of gymnastics, 6; schools of surgery, 6—total number of special schools, 593.

GREAT BRITAIN AND IRELAND, constitutional monarchy, (kingdom:) Area, 121,114 square miles; population, 31,817,108.

1. ENGLAND AND WALES: Area, 58,673 square miles; population, 23,055,756. Capital, London; population, 3,883,092. Lord president of the council on education, the Earl of Ripon; vice-president of the committee of the council on education, Hon. William Edward Forster.

Primary instruction.—The basis of the present system is the "elementary-education-act" of 1870, by which it is provided that "there shall be for every school-district a sufficient amount of accommodation in public elementary schools available for all the children resident in such district for whose elementary education efficient and suitable provision is not otherwise made." It is enacted further that all children attending these "public elementary schools," whose parents are unable, from poverty, to pay anythings towards their education, shall be admitted free, and the expenses so incurred be discharged from local rates. The new schools are placed in each district under "school-boards," invested with great powers, among others that of making it compulsory upon parents to give all children between the ages of 5 and 13 the advantages of education.

Since August, 1872, Scotland has a separate committee of council on education, the bill "to amend and extend the provisions of the law of Scotland on the subject of edu-

cation" having become law on the 6th of August, 1872. The parliamentary grants for popular education in England, Wales, and Scotland, in 1872, amounted to £1,551,560.

Statistics of elementary schools in England and Wales in 1871 *and* 1872.

Higher elementary and secondary instruction.—It is difficult to draw the dividing line, but in nearly all the schools, under this head, at least Latin is taught, in most of them Latin, Greek, and mathematics. They are either public schools or endowed and private schools.

The six great public schools are Eton, Winchester, Westminster, Charterhouse, Harrow, and Rugby, with a total of about 2,600 scholars. The number of endowed and private schools, in 1872, was (according to Our Schools and Colleges, by F. S. de Carteret-Bisson) 2,160; of this number 1,254 are simply called schools or institutes, 603 grammar-schools, 153 colleges, 92 academies, and 58 classical and commercial schools.

Superior instruction.—The number of universities is six, viz: Oxford, Cambridge, Durham, London, University College, (London,) and King's College, (London.)

Special instruction.—Military schools, 7; Royal Military College, Sandhurst; Staff College, Sandhurst; Royal Military Academy, Woolwich; Indian Civil-Engineering College, Cooper's Hill, Middlesex; Army Medical School, Netley; Royal Military Asylum Model Schools, Chelsea; Royal Military Asylum, Duke of York's schools, Chelsea. Number of medical colleges, 18; number of theological colleges, 33; number of naval schools, 5; miscellaneous, technical, and art-schools, Royal School of Mines, Royal College of Chemistry, Royal Veterinary College, Royal Academy of Arts. Number of art-schools under the art- and science-department, 122, with 22,854 students.

2. SCOTLAND: Area, 30,686 square miles; population, 3,358,613. Capital, Edinburgh; population, 196,979. Committee of council on education, the Duke of Argyle, Hon. Henry Austin Bruce, Right Hon. George Young.

The Scotch education-bill.—The bill "to amend and extend the provisions of the law of Scotland on the subject of education" became law on the 6th August, 1872, and on the 9th day of August, 1872, the Queen, in council, appointed the above-mentioned men a committee of council on education in Scotland.

Statistics of elementary schools.

	Years ended August 31.

Special instruction.—Royal institution for higher technical studies at Florence, 214 students; academy of sciences and literature at Milan, 26 students; royal school of engineering at Turin, 173 students; royal higher technical school at Milan, 209 stu-

dents; royal school of engineering at Naples, 185 students; superior normal school at Pisa, 41 students; three schools of veterinary surgery, (Milan, Turin, Naples,) 295 students; royal superior school of agriculture at Milan, 52 students.

Evangelical school-work, by Rev. Mr. Van Meter.—Rev. Mr. Van Meter is carrying on a very successful evangelical school-work in Rome and the neighborhood, under appointment of the Bible and Publication Society of Philadelphia. The last report that has come to hand is for the quarter October 1, 1873, to January 1, 1874.

In the city of Rome there are 3 schools, viz, two for girls, only day-schools, with 110 scholars registered and an average attendance of 55. The boys' school is a day-, night-, and Sunday-school, the first with 72 scholars registered and an average attendance of 31, the second with 86 scholars registered and an average attendance of 30, and the last mentioned with 142 registered and an average attendance of 60. The totals for the three schools in the city of Rome are, therefore, registered, 410; average attendance, 176.

In the town of Frascati, near Rome, there are two schools, viz, one for boys and one for girls, the former being a day-, night-, and Sunday-school, the latter only a day- and Sunday-school. The boys' day-school has 74 scholars registered and an average attendance of 56; the boys' night-school, registered, 30; average attendance, 22. The boys' Sunday-school, registered, 65; average attendance, 45. The girls' day-school, registered, 35; average attendance, 28. The girls' Sunday-school: registered, 26; average attendance, 19. The totals for the two schools in the town of Frascati are, therefore, registered, 230; average attendance, 170. Totals registered in Rome and Frascati, 640; average attendance, 346.

NETHERLANDS, constitutional monarchy, (kingdom:) Area, 13,464 square miles; population, 3,674,402. Capital, The Hague; population, 92,785. Minister of public instruction, the minister of interior, Dr. J. H. Geertsema.

Primary instruction.—The basis of the present system is the law of August 13, 1857. Education is not compulsory.

The statistics for 1871 are: Number of schools, public, 2,625; private, 1,109—total number of primary schools, 3,734. Number of teachers: male teachers in public schools, 6,484; female teachers in public schools, 535—total number of teachers in public schools, 7,019. Male teachers in private schools, 2,278; female teachers in private schools, 1,570—total number of teachers in private schools, 3,848; total number of teachers in all primary schools, 10,867.

Number of pupils: boys in public schools, 205,006; girls in public schools, 159,388—total number of pupils in public schools, 364,394. Boys in private schools, 49,077; girls in private schools, 60,977—total number of pupils in private schools, 110,054; total number of scholars in primary schools, 474,458. Number of children attending the evening-schools exclusively, 24,536; number of pupils of primary schools attending evening-schools, 55,706; adult-schools, 221, with 481 teachers and 10,178 pupils Teachers' seminaries, 3, with 94 students. Normal schools in connection with primary schools, 27, with 659 students. Expenditures for primary instruction in 1870. $2,152,559.58, gold. Of this sum the central government pays $181,067.08; the provinces, $24,142.50; the municipalities, $1,550,425; the school-funds, $27,974.58; school fees, $348,141.67; teachers, $20,808.75.

Secondary instruction.—The basis of the present system is the law of May 2, 1863. Under this head are classed the burgher-schools, the higher burgher-schools, the polytechnic school, the schools of agriculture, the schools of navigation, commercial schools, drawing-schools, secondary schools for girls, and secondary schools for mechanics.

Number of schools: burgher-schools, 43; higher burgher-schools and commercial schools, 47; polytechnic school, 1; schools of agriculture, 4; schools of navigation, 9; drawing-schools 30; secondary schools for girls, 7; secondary schools for mechanics, 78—total number of secondary schools, 219.

Number of teachers: In burgher-schools, 338; in higher burgher-schools, 542; in the polytechnic school, 18; in the schools of agriculture, 18; in the schools of navigation, 20; in the drawing-schools, 108; in the secondary schools for girls, 74; in the secondary schools for mechanics, 272—total number of teachers in secondary schools, 1,390.

Number of scholars: In burgher-schools, 3,801; in higher burgher-schools, 3,285; in polytechnic schools, 189; in schools of agriculture, 53; in schools of navigation, 200; in drawing-schools, 2,500; in secondary schools for girls, 472—total number of scholars in secondary schools, 10,500.

Expenditures for secondary instruction, $557,002.50. Of this sum the central government pays $278,192.92; the provinces, $4,845.83; the municipalities, $190,945.42; the school-fees, $83,018.33.

Superior instruction.—The institutions under this head are universities, atheneums, and gymnasia or Latin schools.

Statistics of universities: Number of universities, 3, viz, Leyden, Utrecht, and Groningen.

Universities.	Students.					
	Law.	Theology.	Medicine.	Natural sciences.	Literature.	Total.
Leyden	359	77	123	84	89	732
Utrecht	148	191	72	57	20	488
Groningen	51	34	37	16	8	146
Total	558	302	242	157	117	1,366

Number of atheneums, 2, viz, Deventer and Amsterdam, with 261 students.

Number of gymnasia or Latin schools, 55, with 978 professors and 1,079 students.

PORTUGAL, constitutional monarchy, (kingdom:) Area, 36,510 square miles; population, 4,367,882. Capital, Lisbon; population, 224,063. Minister of public instruction, the minister of the interior, A. Rodrigues Sampaio.

Primary instruction.—The superintendence of public instruction is under the management of a superior council of education, at the head of which is the minister of the interior. Public education is entirely free from the supervision and control of the church. By a law enacted in 1844 it is compulsory, but this prescription is far from being enforced.

Statistics for 1869.—Number of schools for boys, 1,997; number of schools for girls, 362—total number of schools, 2,359. Number of pupils enrolled: boys, 99,358; girls, 17,947—total, 117,305. Number of pupils attending: boys, 52,720; girls, 10,217—total, 62,937. Number of normal schools for males, 5, with 100 students; number of normal schools for females, 1, with 20 students—total number of normal schools, 6, with 120 students.

Secondary instruction.—Number of lyceums, 21; number of students, 3,126. Besides these public institutions there are quite a number of colleges, privaie or municipal, in the principal cities.

Superior instruction.—One university, at Coimbra; the polytechnic school, at Lisbon; the polytechnic academy, at Oporto; three schools of medicine and surgery, at Lisbon, Oporto, and Funchal.

Special instruction.—Two industrial schools, at Lisbon and Oporto; school of agriculture, at Lisbon, with a model farm at Cintra; the army-school; the military college; the naval academy; the school of navigation; two academies of fine arts, Lisbon and Oporto; the royal conservatory of music, Lisbon.

SPAIN, republic since February 11, 1873: Area, 182,758 square miles; population, 16,835,506. Capital, Madrid; population, 332,024. Minister of public instruction, (Fomento,) July, 1873, Don José Fernando Gonzales.

Primary instruction.—Primary instruction in Spain is considered compulsory since 1857 and free of charge since 1869. The statistics are of 1872. Public schools for males, (infants, boys, and adults,) 16,294; public schools for females, (infants, girls, and adults,) 6,331—total number of public schools, 22,625. Private schools for males, (infants, boys, and adults,) 2,901; private schools for females, (infants, girls, and adults,) 2,234—total number of private schools, 5,135; grand total of primary schools, 27,760. Male pupils in public schools, 745,686; female pupils in public schools, 441,773—total number of pupils in public schools, 1,187,459. Male pupils in private schools, 96,753; female pupils in private schools, 97,760—total number of pupils in private schools, 194,513; grand total of pupils in primary schools, 1,381,972. Number of normal schools, 30.

Secondary instruction.—The schools under this head are called "institutos;" their number is 62.

Superior instruction.—The institutions under this head are universities, numbering 10. The statistics are of 1873:

Universities.	Students.							Professors.
	Law.	Philosophy and literature.	Medicine.	Pharmacy.	Natural sciences.	Notary's course.	Total.	
1. Barcelona	559	95	1,250	236	169	131	2,440	55
2. Granada	584	117	489	131	38	45	1,404	47
3. Madrid	1,647	184	2,894	1,050	435	145	6,375	74

9. Valladolid	.....	.....	.....	.....	.....	.....	.....	32
10. Saragossa	310	145	249	.....	126	.....	830	49

Special instruction.—School of agriculture near Madrid, school of architecture at Madrid, school of fine arts at Madrid, school of commerce at Madrid, school of engineering at Madrid, school of mining at Madrid, school of forestry at Villaviciosa de Odon, conservatory of music at Madrid, four schools of veterinary surgery at Madrid Cordova, Leon, and Saragossa, with a total of 1,372 students.

SWEDEN AND NORWAY, constitutional monarchy, (kingdom:) Area, 288,771 square miles; population, 6,013,402.

Sweden and Norway are united only by a dynastic union, each of these two countries having its own constitution, parliament, laws, army, navy, &c.

1. SWEDEN: Area, 168,042 square miles; population, 4,250,402. Capital, Stockholm; population 143,735. Minister of education and ecclesiastical affairs, Gunnar Wennerberg.

Primary instruction.—The basis of the present system is the law of 1842. Education is compulsory. The statistics are of 1871. Total number of primary schools, 7,528; number of children of school-age, 712,520; number of children receiving instruction 693,822. Number of male teachers, 5,039; number of female teachers, 2,776—total number of teachers, 7,815. Number of normal schools, 9, viz, 7 for males and 2 for females. Total expenditure for primary instruction, $1,605,328, gold; of this sum the

government pays $511,411, the remainder being paid by the provinces and municipalities.

Secondary instruction.—Number of secondary schools of various grades, 103, with 11,874 pupils.

Superior instruction.—There are two universities, viz, Upsala and Lund.

Universities.	Professors.	Students.				
		Theology.	Law.	Medicine.	Philosophy.	Total.
Upsala	107	309	142	155	930	1,536
Lund	61	100	65	33	346	544
Total	168	409	207	188	1,276	2,080

Special instruction.—Two academies of agriculture, (Ultuna and Alnarp,) with 124 students; lower agricultural schools, 27, with 367 students; academy of forestry, with 8 students; lower schools of forestry, 7, with 76 students; schools of navigation, 9; the industrial school at Stockholm, with 1,765 students; five technical schools, with 781 students; four elementary technical schools, with 230 students; the Royal Technical Institute, at Stockholm, with 124 students; two elementary schools of mining; Chalmer's industrial school at Göteborg, with 149 students; the College of Pharmacy at Stockholm, with 60 students; two schools for nurses, with 100 students; two schools of veterinary surgery, with 60 students; the Royal College of Surgery at Stockholm, with 108 students; the Academy of Fine Arts at Stockholm, with 22 professors; the Royal Conservatory of Music at Stockholm, with 21 professors and 239 students; various military schools.

2. NORWAY: Area, 120,729 square miles; population, 1,763,000. Capital, Christiania; population, 80,000. Chief of the department of education and ecclesiastical affairs, Peter Parelius Essendrop.

Primary instruction.—Education is compulsory.

Statistics for 1870.—Number of primary schools, 7,189; number of pupils, 250,735; number of teachers, 3,796; expenditure, $184,622, gold.

Secondary instruction.—Number of public schools, 16; teachers in public schools, 195; scholars in public schools, 2,122; expenditure for public schools, $122,471; number of private schools, 130; teachers in private schools, 722; scholars in private schools, 6,858; total number of secondary schools, 146; total number of teachers, 917; total number of scholars, 8,980.

Superior instruction.—One university at Christiania, with 42 professors and 1,026 students; total expenditure, $86,929.

SWITZERLAND, federal republic: Area, 15,233 square miles; population, 2,669,147. Capital, Berne; population, 36,601.

Switzerland has no national system of education, but each of the twenty-two cantons manages its own affairs. Education is compulsory in all the cantons, with the exception of Uri and Geneva.

Primary instruction.—Number of schools, 7,000; number of teachers, 6,600; number of pupils, 400,000; total expenditure, $416,224; number of normal schools, 16.

Secondary instruction.—Number of secondary schools, 275; number of gymnasia and cantonal industrial schools, 47, with 500 professors and 7,000 students; expenditure, $227,232.

Superior instruction.—Three universities, (Basel, Berne, Zürich;) statistics of 1872–'73:

Universities.	Professors.	Students.				
		Theology.	Law.	Medicine.	Philosophy.	Total.
Basel	56	36	13	73	32	154
Berne	67	15	56	142	34	244
Zürich	78	43	30	271	93	437
Total	201	94	99	486	159	835

The Federal Polytechnic School at Zürich, with 73 professors and 675 students; three academies, at Geneva, Lausanne, and Neufchâtel.

II.—ASIA.

BRITISH INDIA, British colony: Area, 935,628 square miles; population, 151,467,436.* Capital, Calcutta; population in 1866, 616,249.

The executive authority of British India is vested in a governor-general, appointed by the Crown and acting under the orders of the secretary of state for India. The government in India is exercised by the council of the governor-general, consisting of five ordinary members and one extraordinary member, the latter the commander-in-chief. The provinces of British India with their area and population are the following:

Provinces.	Area.	Population.
Bengal	239,591	40,352,960
Madras	141,746	26,539,052

The schools of British India are either purely native schools, not improved up to the government-standard, or schools that are improved up to that standard.

I. *Indigenous schools.*—As far as known the number of indigenous schools is 14,921, with 204,265 pupils.

II. Schools improved up to the government-standard, statistics of 1870–'71:

1. *Lower-class schools.*—Number of government-schools: for boys, 8,369: for girls, 947—total, 9,316. Number of private and aided schools: for boys, 5,620; for girls, 775—total, 6,395. Number of private and only inspected schools: for boys, 172; for girls, 38—total, 210. Total number of lower-class schools: for boys, 14,161; for girls, 1,760—total, 15,921. Pupils in government-schools: boys, 319,843; girls, 19,359—total, 339,202. Pupils in private and aided schools: boys, 149,718; girls, 21,275—total,

*These statistics are given in order to agree with the educational statistics. According to the census of 1872 the area was 966,936 square miles and the population 190,278,644.

170,993. Pupils in private and only inspected schools: boys, 6,245; girls, 1,134—total, 7,379. Total number of pupils in lower-class schools: boys, 475,806; girls, 41,768—total, 517,574. Expenditure on government lower-class schools: imperial, $243,166.25; local, $632,693—total, $875,859.25. Expenditure on lower-class aided schools: imperial, $182,133; local, $247,395.25—total, $429,528.25; total expenditure on lower-class schools, $1,305,387.50.

2. *Middle-class schools.*—Number of government-schools: for boys, 699—total, 699. Number of private and aided schools: for boys, 2,024; for girls, 133—total, 2,157. Number of private and only inspected schools: for boys, 17—total, 17. Total number of middle-class schools: for boys, 2,740; for girls, 133—total, 2,873. Pupils in government-schools: boys, 55,807—total, 55,807. Pupils in private and aided schools: boys, 94,581; girls, 7,072—total, 101,653. Pupils in private and only inspected schools: boys, 1,268—total, 1,268. Total number of pupils in middle-class schools: boys, 151,656; girls, 7,072—total, 158,728.

Expenditure for government middle-class schools: imperial, $251,342.25; local, $150,290.25—total, $401,632.50. Expenditure for aided middle-class schools: imperial, $349,104; local, $506,819.25—total, $855,923.25; total expenditure for middle-class schools, $1,257,546.75.

3. *High-schools.*—Number of government-schools, 114. Number of private and aided schools: for boys, 158; for girls, 1—total, 159. Number of private and only inspected schools—none. Total number of high schools: for boys, 272; for girls, 1—total, 273. Pupils in government-schools, 21,286. Pupils in private and aided schools: boys, 26,148; girls, 138—total, 26,286. Pupils in private and only inspected schools—none. Total number of pupils in high schools, 26,286.

Expenditure on government high-schools: imperial, $357,085.25; local, $205,574.25—total, $562,659.50. Expenditure on aided high schools: imperial, $141,142; local, $231,389—total, $372,531; total expenditure on high schools, $935,190.50.

4. *Normal schools.*—Number of government-schools: for males, 58; for females, 12—total, 70. Number of private and aided schools: for males, 29; for females, 5—total, 34. Total number of normal schools: for males, 87; for females, 17—total, 104. Students in government-schools: male, 2,853; female, 184—total, 3,037. Students in aided schools: male, 1,227; female, 82—total, 1,309. Total number of students in normal schools: male, 4,080; female, 266—total, 4,346.

Expenditure on government normal schools: imperial, $150,253; local, $44,189—total, $194,442. Expenditure on aided normal schools: imperial, $24,480; local, $38,715—total, $63,195; total expenditure on normal schools, $257,637.

5. *Special schools.*—Number of art-schools, 3; viz: Calcutta, with 50 students and an annual expenditure of $9,806.25; Madras, with an annual expenditure of $13,706; and Bombay, with 99 students and an annual imperial grant of $5,500. Besides this school of art there is at Bombay the David Sassoon Industrial School, with 101 students and an annual imperial grant of $6,721.

6. *Colleges.*—*A.* General colleges: Number of government-colleges, 24; number of private and aided colleges, 20—total number of general colleges, 44. Students in government-colleges, 1,854; students in private and aided colleges, 2,140—total number of students in general colleges, 3,994.

Expenditure on government general colleges: imperial, $237,343.25; local, $82,992.25—total, $320,335.50. Expenditure on aided general colleges: imperial, $43,145.25; local, $87,997.25—total, $131,142.50; total expenditure on general colleges, $451,478.

B. Special colleges. Number of law-colleges, 10, with 684 students and a total cost of $22,596.25.

Number of colleges of medicine, 5, with 893 students and a total cost of $170,551. Number of colleges of civil engineering, 4, with 549 students and a total cost of $110,641. Total number of special colleges, 19, with 2,126 students and a total cost of $303,788.25. Grand total of colleges of every kind: Number of colleges, 63; number of students, 6,120. Total cost, $755,266.25.

7. *Universities.*—There are three universities, all established in 1857, viz: Calcutta, Madras, and Bombay.

Comparative statistics of university-examinations in 1870–'71.

III.—AMERICA.

DOMINION OF CANADA, British colony: Area, 3,481,779 square miles; population, 3,657,887. Capital, Ottawa; population, 21,545.

The Dominion of Canada consists of the provinces of Ontario, Quebec, (formerly Upper and Lower Canada,) Nova Scotia, New Brunswick, Manitoba, and British Columbia. They were united under the provisions of an act of the Imperial Parliament, passed in March, 1867. The act orders that the constitution of the Dominion shall be "similar in principle to that of the United Kingdom;" that the executive authority shall be vested in the sovereign of Great Britain and Ireland, and carried on in her name by a governor-general and privy-council; and that the legislative power shall be exercised by a Parliament of two houses. Provision is made for the admission of Newfoundland and Prince Edward's Island, still independent provinces of British North America. The six provinces forming the Dominion have each a separate parliament and administration, with a lieutenant-governor at the head of the executive. They

have full powers to regulate their own local affairs, dispose of their revenues, and enact such laws as they may deem best for their own internal welfare, provided only they do not interfere with, or are not adverse to, the action of the central administration. Reports on the state of education in the provinces of Quebec, Nova Scotia, New Brunswick, and British Columbia have been received, abstracts of which are given below.

ONTARIO, British colony: Area, 121,260 square miles; population, 1,620,842. Capital, Toronto; population, 46,092. Chief superintendent of education, E. Ryerson.

Statistics for 1872.—Schools: Number of public schools, 4,661; number of high schools, 104; number of other institutions, 277—total number of educational institutions, 5,042.

Pupils and teachers: School-population between 5 and 16 years of age, 388,195; number of pupils in public schools, 454,662; number of pupils in high schools, 7,968; number of pupils in other institutions, 10,170; total number of pupils, 472,800. Total number of public-school-teachers, 5,476—males, 2,626; females, 2,850.

Expenditures: Amount expended for public-school-purposes, $2,270,648.03; amount expended for high-school-purposes, $214,005.20; amount expended by other educational institutions, $335,572.57—total amount expended for educational purposes, $2,820,225.80.

QUEBEC, British colony: Area, 210,020 square miles; population, 1,191,505. Capital, Quebec; population, 59,699. Minister of public instruction, P. J. O. Chauveau.

Primary instruction.—Number of schools, 4,028; number of scholars, 217,504. Total sum levied for public instruction, $976,788.61. Three normal schools, with 252 students—123 males and 129 females. Number of dissentient schools, 215, with 7,468 scholars, viz: 162 Protestant schools, with 5,428 scholars, and 53 Catholic schools, with 2,040 scholars.

Secondary instruction.—Number of classical colleges, 16, with 3,028 students and 239 professors; number of industrial colleges, 13, with 1,974 students and 99 professors; academies for boys and mixed, 66, with 6,501 students and 158 professors; academies for girls, 72, with 13,145 students and 611 professors; model schools, 252, with 28,710 students and 618 professors—total number of secondary schools, 419, with 53,358 students and 1,725 professors.

Superior instruction.—Three universities, viz: McGill College, Bishop's College, and Laval University, with 546 students and 51 professors.

Special instruction.—Number of schools, 5, with 16 professors and 233 students.

NEW BRUNSWICK, British colony: Area, 27,105 square miles; population, 285,777. Capital, Fredericton; population, 5,000. Chief superintendent of education, Theodore H. Rand.

Common schools.—The date of the common-school-act is 1871. Number of schools, 664; number of pupils, 28,756; number of teachers, 655. Grants in aid of common schools, October 1, 1871, to April 30, 1872, $35,165.33. One training and model school, with 4 teachers and 101 students and pupils.

Superior and grammar-schools.—Superior schools, 32, with 44 teachers and 2,183 pupils. Grammar-schools, 14, with 22 teachers and 898 pupils.

NOVA SCOTIA, British colony: Area, 18,660 square miles; population, 387,800. Capital, Halifax; population, 29,582. Superintendent of education, A. S. Hunt.

Primary instruction.—Number of schools, 1,487; number of teachers, 1,535; number of pupils registered, 76,496; number of pupils, 42,433. Normal and model school, with 525 students and pupils.

Secondary and superior instruction.—County-academies, 10, with 42 teachers and 2,548 students. Special academies, 7, with 33 teachers and 616 students. Colleges, 6, with 40 professors and 182 undergraduates.

BRITISH COLUMBIA, British colony: Area, 213,000 square miles; population, 50,000. Capital, Victoria. Superintendent of education, John Jessop.

Date of public-school-act, April 11, 1872. Number of public schools, 18, with 18 teachers. School-population between 5 and 16 years of age, 534. Total number of pupils attending, 374. Denominational and private schools, 17.

PRINCE EDWARD'S ISLAND, British colony: Area, 2,173 square miles; population, 94,021. Capital, Charlottetown; population, 8,807. Secretary of the board of education, J. McNeile.

Total number of common schools and grammar-schools, 382, with 347 teachers and 23,185 pupils. There is one normal school.

JAMAICA, British colony: Area, 6,400 square miles; population, 441,264. Capital, Kingston; population, 40,000. Inspector of schools, John Savage.

Number of children of school-age, (5 to 15,) 123,824. Total number of children going to school, 46,000. Number of elementary schools, 486; model schools, 3, with 179 pupils; endowed schools, 25, with 1,704 pupils; normal schools, 7, with 124 pupils. Total expenditure for education, £37,444 19*s.* 10*d.*

MEXICO, federal republic: Area, 1,030,442 square miles; population, 9,176,082. Capital, Mexico; population, 200,000.

Mexico has no national system of public instruction, but each of the States manages its own educational affairs. The statistics of 1873, for the federal district, including the city of Mexico, with a population of 275,996, are the following:

Primary instruction.—Number of schools, 338; number of pupils, 22,407.

Secondary, superior, and special instruction.—Secondary schools for girls, 99 pupils; preparatory school, 602 pupils; business-college, 640 pupils; law-school, 158 students; school of medicine, 126 students; school of engineering, 58 students; school of the fine arts, 600 students; industrial school, 157 students; school of agriculture and veterinary surgery, 29 students; school for deaf mutes, 24 students.

ARGENTINE CONFEDERATION, federal republic: Area, 515,700 square miles; population, 1,877,490. Capital, Buenos Ayres; population, 177,787. Minister of justice, worship, and public instruction, Dr. D. Nicolas Avellaneda.

Primary instruction, statistics of 1872.—Number of schools: Public, 1,088; private, 566—total, 1,644. Number of scholars: Children of school-age, (6 to 15,) 468,987. Number attending school, 97,549. Number of teachers: Male, 1,558; female 1,408—total, 2,966. Expenditure for primary instruction, $1,564,350.13.

Secondary instruction.—One university at Cordoba, with 103 students and 14 professors; thirteen colleges, with 3,697 students and 162 professors; one normal school at Parana, with 285 students and 6 professors—total, 15 institutions, with 4,085 students and 182 professors.

BRAZIL, constitutional monarchy, (empire:) Area, 3,100,104 square miles; population, 10,095,978. Capital, Rio de Janeiro; population, 420,000. Minister of public instruction, the minister of the interior, Dr. João Alfredo Corrêa de Oliveira.

Primary instruction.—The report contains only the statistics for 1872 of the city of Rio de Janeiro; 65 public schools of the first degree, with 5,622 pupils; 99 private schools, with 5,323 pupils; municipal schools, with 554 pupils.

Secondary, superior, and special instruction.—In Rio de Janeiro: Imperial College of Pedro II, with 240 students; private secondary schools, 54, with 2,027 pupils; medical school, 583 students, (medicine, 470; pharmacy, 113;) business-college, 43 students. In the provinces: Law-school at Recife, 300 students; law-school at San Paulo, 147 students; medical school at Bahia, 262 students, (medicine, 193, and pharmacy, 69.)

UNITED STATES OF COLOMBIA, federative republic: Area, 432,400 square miles; population, 2,894,992. Capital, Bogota; population, 50,000.

The federative republic of Colombia, officially styled the United States of Colombia, formerly New Granada, was formed by the convention of Bogota, concluded September

20, 1861. It consists of nine sovereign States, each managing its own educational affairs.

Education in the State of Cundinamarca.—Through the kindness of Mr. Thomas Herran, of the University of the State of Antióquia, located at Medellin, a report has been received on education in the State of Cundinamarca, containing the federal capital, Bogota. The population of the State is 409,602. The statistics are of 1873. Number of boys below the age of 7, 32,664; number of boys between the ages of 7 and 15, 33,951—total number of boys below the age of 15, 66,615. Number of girls below the age of 7, 31,152; number of girls between the ages of 7 and 15, 27,410—total number of girls below the age of 15, 58,562. Total population below the age of 7, 63,816; total population between the ages of 7 and 15, 61,361—total population below the age of 15, 125,177. Number of schools, public and private, 338; number of teachers, 363; number of pupils, 16,489. Expenditure for public instruction, $131,875.77. Normal school for males, 1, with 36 students; normal school for females, 1, with 29 students—total number of normal schools, 2, with 65 students.

ECUADOR, republic: Area, 218,984 square miles; population, 1,300,000. Capital, Quito; population, 76,000. Minister of public instruction, the minister of the interior, Don Francisco Xavier Leon.

Primary instruction.—Number of public schools, 244; number of private schools, 176; number of schools supported by corporations, 11; total number of schools, 431. Number of scholars in public schools, 17,661; number of scholars in private schools, 3,966; number of scholars in schools supported by corporations, 837—total number of scholars, 22,464.

Secondary, superior, and special instruction.—Six colleges, with 59 professors and 757 students; one female college, with 4 professors and 153 students. Faculty of law and medicine, with 12 professors and 94 students. School of arts and industry, with 22 professors. The polytechnic school, with 13 professors and 59 students. The military academy, with 5 professors and 23 cadets. Seven seminaries supported by the clergy, with 47 professors and 227 students. The academy of fine arts, with 2 professors and 22 students. The conservatory of music, with 8 professors and 39 students.

IV.—AUSTRALASIA.

QUEENSLAND, British colony: Area, 678,600 square miles; population, 125,146. Capital, Brisbane; population, 19,413. Secretary of the board of education, R. MacDonnell.

The present system of public instruction has been in operation since 1860.

Statistics for 1871.—Number of schools in operation, 136; number of teachers, 325; aggregate attendance of children, 18,963; average attendance, 9,711; total expenditure for education, £35,411 4*s.* 1*d.*

SOUTH AUSTRALIA, British colony: Area, 760,000 square miles; population, 190,676. Capital, Adelaide; population, 27,208. Secretary of the board of education, James Bath.

Statistics for 1872.—Number of schools, 307; children enrolled, 15,123; daily attendance, 11,844; children of school-age, (5 to 14,) 53,114; children instructed at home and in private schools, 18,591; number of teachers, 299; expenditure for education, £18,337 8*s.* 5*d.*

VICTORIA, British colony: Area, 88,198 square miles; population, 752,287. Capital, Melbourne; population, 193,698. Secretary of the board of education, Benjamin Francis Kane.

Statistics for 1871.—Number of children of school-age, (5 to 15,) 197,490; children enrolled, 114,000; average daily attendance, 67,233; children attending private schools, 27,375; children attending industrial schools and reformatories, 2,648; number of schools, 988; number of teachers, 1,710; one training institution, with 99 students; expenditure for education, £204,074 18*s.* 1*d.*

NEW SOUTH WALES, British colony : Area, 323,437 square miles; population, 519,182. Capital, Sidney; population, 134,756.

Number of schools, 878; number of scholars, 87,313; amount of government-grant, £110,000.

WESTERN AUSTRALIA, British colony: Area, 978,000 square miles; population, 25,353. Capital, Perth. Colonial secretary, Fred. P. Barlee.

Statistics for 1872—Number of schools, 77; average number of scholars in daily attendance, 2,400.

TASMANIA, British colony: Area, 26,215 square miles; population, 100,675. Capital, Hobart Town; population, 19,092. Chairman of the board of education, Henry Butler.

Statistics for 1872—Number of schools, 139; number of children on the rolls, 10,491; average daily attendance, 5,209; expenditure for education, £12,342 7*s.* 9*d.*

NEW ZEALAND, British colony: Area, 102,000 square miles; population, 256,393. Capital, Auckland; population, 20,425.

Number of schools, 193; number of scholars, 14,632; amount of government-grant, £33,701.

In endeavoring, as far as possible, to bring together the facts by which to test the respective systems of education by their effects upon the welfare of individuals and people affected by them, the following statistics, from reports obtained in Great Britain, Ireland, and Italy, are presented without comment:

Crime and education, (Great Britain, Ireland, and Italy,) criminal statistics.

England and Wales, 1871–'72; population, 22,712,266.

Criminal classes, 46,877.

Proportion of criminal classes: in London, 3,139, or 1 in 1,237.8; decrease since last year, 11.4 per cent. In Pleasuretown, 613, or 1 in 411.3; decrease, 17.2 per cent. In towns depending upon agricultural districts, 540, or 1 in 383; decrease, 4.4 per cent. Commercial ports, 2,340, or 1 in 536.7; decrease, 11.5 per cent. Seats of cotton and linen manufacture, 1,927, or 1 in 492.1; decrease, 4.2 per cent. Seats of woolen and worsted manufacture, 1,447, or 1 in 417.9; decrease, 23.1 per cent. Seats of small and mixed textile fabrics, 624, or 1 in 508.2; decrease, 23.1 per cent. Seats of hardware-manufacture, 1,387, or 1 in 470; decrease, 8.8 per cent. Smallest proportion in London. Largest proportion in towns depending upon agricultural districts. Total proceeded against, 559,929; convicted, 423,581; discharged, 136,348.

Degree of instruction of those committed during the year, (excepting debtors and those committed for naval and military offenses.)

Educational standing of prisoners.	Males.	Females.	Total.	Proportion per cent.		
				Males.	Females.	Males and females to total number.
Neither read nor write	31,969	17,376	49,345	31.1	39.3	33.6

Instruction not ascertained	203	284	487	0.2	0.7	0.3
Total	102,855	44,218	147,073	100	100	100

Ireland, 1872; population, 5,368,696.

Number of jails, 39; number of bridewells, 91; number of prisoners in jails December 31, 1872, 2,477. Total number of prisoners committed during the year, 30,222, viz: males, 18,772; females, 11,450. Summary convictions, 23,612; males, 14,324; females, 9,288. Lunatics, 27; males, 24; females, 3. Persons confined in bridewells for drunkenness, 3,537.

Ages of prisoners.	Male.	Female.	Total.
Under 10 years	40	6	46
10 and not exceeding 16 years	1,039	265	1,304
Above 16 to 21 years	3,921	1,090	5,011
Above 21 to 31 years	7,449	5,210	12,659
Above 31 to 41 years	3,519	2,904	6,423
41 years and upwards	2,704	1,943	4,647
Not ascertained	100	32	132

Education on commitment.	Male.	Female.	Total.
Read and write	8,777	2,469	11,264
Read imperfectly	2,642	2,382	5,024
Knew spelling	575	280	855
Knew alphabet	455	162	617
Wholly illiterate	6,164	6,097	12,261
Not ascertained	159	60	219

Number of individuals who attended prison-schools, 4,346; males, 3,242; females, 1,104. Average daily number of pupils, 509; males, 380; females, 129. Number of teachers, 59; males, 36; females, 23.

Religious professions.	Male.	Female.	Total.
Protestant Episcopalians	2,188	1,311	3,499
Presbyterians	704	259	963
Roman Catholics	15,697	9,839	25,536
Other professions	24	.....	24
Not ascertained	159	41	200

Total expenditure of jails, £88,070 15*s.* 3*d.* Average total cost of each prisoner per annum, £35 15*s.* 9*d.*

Scotland, 1871–'72; population, 3,399,226.

State of instruction of criminal prisoners received during the year.

Educational standing of prisoners.	Males.	Females.	Total.
Could not read	3,871	3,034	6,905
Read with difficulty	10,505	7,994	18,499
Read well	4,679	1,644	6,323
Could not write	7,130	6,809	13,939
Could sign merely	1,012	160	1,172
Write with difficulty	9,080	5,348	14,428
Write well	1,833	355	2,188
Had learned more than mere reading and writing	555	64	619
Have improved in reading or writing or both	1,801	944	2,745
Have improved in arithmetic or other branches of instruction	818	236	1,054
Have learned a trade in prison	234	103	337

Italy, 1871; population, 26,801,154.

Number of establishments and number of inmates:

Bagni penali, the galleys, 28; average number of inmates, 13,910. Carceri giudiziare, prisons in which are confined the accused until removed to the prisons to which they are condemned and debtors, 238; average number of inmates, 32,433.

Educational status of condemned prisoners.—Number of prisoners condemned to one year and less, 5,362, (5,117 men, 245 women.) Entirely illiterate: In the bagni, 883; in the case di pena for men, 2,576; in the case di pena for women, 221—total illiterates, 3,680. Able to read: In the bagni, 5; in the case di pena for men, 31; in the case di pena for women, 2—total number able to read, 38. Able to read and write: In the bagni, 316; in the case di pena for men, 1,198; in the case di pena for women, 21—total number able to read and write, 1,535. Having a superior education: In the bagni, 2; in the case di pena for men, 45; in the case di pena for women, none—total number having a superior education, 47.

Number of prisoners not of full age: Males, 960; females, 135—total, 1,095. Entirely illiterate: Males, 397; females, 78—total, 475. Able to read: Males, 67; females, 19—total, 86. Able to read and write: Males, 421; females, 22—total, 443. State of education not ascertained: Males, 75; females, 16—total, 91.

In the carceri giudiziare.—Attended prison-schools: Males, 5,533; females, 186—total, 5,719. Percentage of inmates: Males, 16 per cent.; females, 8 per cent. Learned to read: Males, 1,676; females, 64—total, 1,740. Learned to read and write: Males, 2,490; females, 42—total, 2,532. Remained illiterate: Males, 1,367; females, 80—total, 1,447.

Educational status of prisoners, (total number.)—Entirely illiterate: In the bagni, total, 799; in the case di pena, males, 1,709; females, 182—total, 1,891. Able to read: In the bagni, total, 175; in the case di pena, males, 657; females, 95—total, 752. Able to read and write: In the bagni, 424; in the case di pena, males, 1,607; females, 60—total, 1,667. Able to read, write, and cipher: In the bagni, total, 65; in the case di pena, males, 417; females, 11—total, 428. Total illiterate, 2,690; total number able to read, 927; total number able to read and write, 2,091; total number able to read, write, and cipher, 493. Of the number of illiterates there learned to read: In the bagni, 55 per cent.; in the case di pena, men, 38 per cent.; women, 68. Of the number of illiterates there learned to read and write: In the bagni, 36 per cent.; in the case di pena, men, 50; women, 25 per cent. Of the number of illiterates there learned to read, write, and cipher: In the bagni, 9 per cent.; in the case di pena, men, 12 per cent.; women, 7 per cent. There remained illiterate: In the bagni, 6 per cent.; in the case di pena, men, 10 per cent.; women, 9 per cent.

Number of volumes read in the bagni, 718; in the case di pena, 11,939.

Case di custodia per minorenni—prisons for the custody of those not of full age.

January 1: Illiterates, males 111, females 5—total 116; able to read, males 259, females 11—total 270; able to read and write, males 270, females 14—total 284; able to read, write, and cipher, males 43, females 32—total 75; having a superior education, male 1, female 0—total 1.

Entered during the year: Illiterates, males 227, females 17—total 244; able to read, males 28, females 6—total 34; able to read and write, males 152, females 13—total 165; able to read, write, and cipher, males 33, females 2—total 35; having a superior education, males 2, females 0—total 2.

December 31: Illiterates, males 60, females 11—total 71; able to read, males 109, females 8—total 117; able to read and write, males 154, females 23—total 177; able to read, write, and cipher, males 349, females 33—total 382; having a superior education, males 2, female 0—total 2.

THE OFFICE LIBRARY.

The library of the Office has received during the year exceedingly valuable series of reports from foreign ministries of instruction; it exchanges with all the departments of public instruction in all the States of the Union—with the colleges, libraries, and other institutions of learning. From these sources and from purchase, it has already become the most valuable pedagogic library in the country. Much is yet needed to make it complete, however.

CIRCULARS OF INFORMATION, 1873.

During the present year the following circulars of information have been published and distributed by this office:

No. 1. Historical summary and reports of the system of public instruction in Spain, Bolivia, Uruguay, and Portugal, 8°, pages 66.

No. 2. Schools in British India, 8°, pages 30.

No. 3. Account of college-commencements for the summer of 1873, in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania, 8°, pages 118.

No. 4. List of publications by members of certain college-faculties and learned societies in the United States, 1867–'72, 8°, pages 72.

No. 5. Account of college-commencements during 1873, in the Western and Southern States, 8°, pages 155.

These pamphlets have received continuous numbering at the bottom of their pages, and it is designed to publish a general title, introduction, and index, so that they may be bound into one volume.

OFFICE-CORRESPONDENCE.

The correspondence of the Office has steadily increased since the date of the last report.

The lack of sufficient clerical force has not permitted the recording of the correspondence as promptly as could be desired and the permanent records are not in as favorable a condition as at the time of making my last report.

Amidst the extensive correspondence conducted with school-officials of all grades and with workers in collateral branches, many interesting letters—foreign and domestic—have been received, from which the lack of space forbids extended extracts. I take pleasure in acknowledging the receipt of many letters, both from State-superintendents and many other educators, both official and private, scattered over the whole country, showing an intelligent comprehension of the duties of this Office and a hearty co-operation with it. For these many expressions of encouragement and praise I am deeply grateful, and am by them confirmed in the belief that the Office is in a measure fulfilling its purpose.

Of the few extracts from correspondence given below, the first refer to the report of this Office for 1872:

[From John F. Moss, esq., clerk of school-board, Sheffield, England.]

Permit me to remark that the report has proved very instructive and is of particular value to us at this time, when so much attention is being given to the subject of national education, with the especial view of improving the schools for the people.

[From Charles F. Dennet, esq., Brighton, England.]

I consider the volume of 1872 as one of the most valuable public documents ever issued in America, and it must tell on the world. At this moment, when the battle of education is being fought out as it is in England, the volume has an intrinsic value, and I believe its circulation among the liberal-minded in power and authority in this kingdom must do good and help on the good work.

[From J. J. Ribon, consul-general of Salvador, New York City.]

The government of Ecuador has instructed this consulate to obtain all possible information respecting the organization, management, and methods of teaching which have brought the school-system of the United States to its present state of efficiency. I therefore take the liberty of requesting from you a copy of your valuable report for 1872.

[From John Jessup, superintendent of education, Victoria, British Columbia.]

I herewith acknowledge the receipt of your report for 1872. The very large amount of interesting information which it contains cannot but be useful and instructive to educationists throughout the civilized world who may have the good fortune to obtain a copy.

The Austrian minister, Baron Lederer, through Hon. Hamilton Fish, Secretary of State, notified this Office as follows:

I have the honor to inform you that His Majesty the Emperor and King, my august sovereign, has just founded a university at Klausenburg, in Transylvania, and to beg you at the same time to have the kindness to bring this fact to the notice of the Department of Public Instruction, requesting said department to transmit information thereof to the presidents of universities in the United States.

The following extracts will explain themselves:

[From the Secretary of State.]

The syllogos of Epiros have requested of Mr. Boker, the minister of the United States at Constantinople, a statistical work on the schools of this country, of which they say they have heard. As it is supposed that the work referred to may be a report of your Office, at least in part, I will thank you, should this be in your power, to enable me to comply with the request adverted to.

[From Prof. Geo. A. Stearns, director of the National Normal School of the Argentine Republic.]

I venture to suggest that a document on the public-school-system of the United States would be of great service to this country, if not to other parts of the world. It is a subject very little understood here and needs the authority of your Bureau to correct false impressions.

[From Fujimoro Tanaka, second assistant minister of the department of education of Japan, transmitting certain photographs.]

These two pictures are photographs of the Imperial University in Tokei, taken on the occasion of opening its new buildings by the presence of His Imperial Majesty the Tenno of Japan.

[From Prof. C. O. Thompson, of the Free Institute of Industrial Science, Worcester, Mass.]

In studying the high-school-problem I cannot find any statistics showing the percentage of graduates, nor the percentage of boys in the graduating classes. This is a point of vital importance. May I venture to suggest that this information would be worth enough to warrant a special search for it.

[From J. C. Jillson, esq., of the Central High School, Pittsburg, Pa.]

I wish to make some experiments on the ventilation of our school-rooms, more particularly on the amount of carbonic acid and other ingredients present. Have you any printed directions or can you suggest any simple method of conducting the same?

[From A. J. Schem, esq., chief editor of the Deutsch-Amerikanisches Conversations-Lexicon.]

As the German-American cyclopedia, a work which chiefly intends to diffuse full and correct knowledge of all American affairs among the Germans of this country and in Germany, has reached the article "United States," I am very anxious to obtain the latest official documents, and therefore ask you the favor to send me the reports of your Department.

RECOMMENDATIONS.

I would most respectfully but earnestly urge the following recommendations:

First. An increase of the permanent force of this Office commensurate with the increasing amount of work to be done.

Secondly. An appropriation sufficient to pay for suitable cases for the books and records of the Office, and for preserving the models of school-apparatus, &c., presented to it.

Thirdly. Additional funds for the publication of circulars of information, to meet the increasing demand for the same.

Fourthly. The enactment of a law requiring that all facts in regard to national aid to education, and all facts in regard to education in the Territories and the District of Columbia, necessary for the information of Congress, be presented through this Office. For the purpose of enabling the Government to meet its responsibilities with respect to the education of the people in the Territories, I recommend that the office of superintendent of public instruction for each Territory be created, to be filled by appoint-

ment by the President, and his compensation to be fixed and paid as in the case of other Federal appointees for the Territories.

Fifthly. In view of the appalling number of children growing up in ignorance on account of the impoverished condition of portions of the country in which slavery has been lately abolished, and in view of the special difficulties in the way of establishing and maintaining therein schools for universal education, and in consideration of the imperative need of immediate action in this regard, I recommend that the whole or a portion of the net proceeds arising from the sale of public lands shall be set aside as a special fund, and its interest be divided annually, *pro rata*, between the people of the several States and Territories and the District of Columbia, under such provisions, in regard to amount, allotment, expenditure, and supervision, as Congress in its wisdom may deem fit and proper.

Sixthly. I respectfully recommend that such provision as may be seen best in the wisdom of Congress be made for the publication of ten thousand copies of the annual report of this Bureau, immediately on its completion, to be put at the control of the Bureau for distribution among its correspondents and the educators of the country, however many may be ordered for distribution by members of the Senate and House.

CONCLUSION.

The chief clerk, Dr. Charles Warren, is especially deserving of my commendation for his faithful conduct of the Office in my absence.

It is always a great pleasure to acknowledge the efficient services of my several assistants in the Office. This year especially, they have relieved me of much work that probably would have been left undone, on account of my health becoming seriously impaired. Indeed, during no year of my duties here has the organization of the Office been able to accomplish so much in itself; and this is largely due to the fact that the members of the force have become more familiar with the principles upon which the Office is conducted and with the educational details of the country and the wants of the people.

I am greatly indebted for valuable aid to many whom it is impossible to mention in each case, also to the Commissioner of Patents, the Commissioner of Indian Affairs, the Congressional Printer, and the Chief of the Bureau of Statistics.

Among the most gratifying experiences in this Office is the fact that each year adds to my obligations to your Assistant Secretary, yourself, and to the President, for wise direction and hearty co-operation in the performance of its duties.

I am, sir, very respectfully, your obedient servant,

JOHN EATON,
Commissioner.

Hon. C. DELANO,
Secretary of the Interior.

ANNUAL STATEMENT

OF THE

PROGRESS OF EDUCATION IN THE UNITED STATES.

NOTE.

The following abstracts, from the reports of the several State-superintendents and other authoritative sources, designed to show the condition of educational matters in the different States and Territories, are prepared substantially, as far as may be, in accordance with the schedule given below:

GENERAL PLAN OF ABSTRACT.

1. ELEMENTARY INSTRUCTION.....(*a*) Statistics.
   (*b*) Public-school-systems, marking specially anything new and noteworthy.
   (*c*) City systems and their peculiarities.
2. SECONDARY INSTRUCTION .....(*a*) Academies.
   (*b*) High schools.
   (*c*) Preparatory schools.
3. TRAINING OF TEACHERS.....(*a*) Normal schools and normal departments.
4. SUPERIOR INSTRUCTION .....(*a*) Colleges for males, with universities.
   (*b*) Colleges for females.
   (*c*) Resident graduate courses.
5. PROFESSIONAL INSTRUCTION.....(*a*) Theological training.
   (*b*) Legal training.
   (*c*) Medical training.
   (*d*) Training of engineers and agriculturists.
6. SPECIAL INSTRUCTION.....(*a*) Deaf, dumb, and blind.
   (*b*) Musical conservatories.
   (*c*) Art-training, beyond that in the schools.
7. EDUCATIONAL CONVENTIONS.....(*a*) Meetings of State-associations.
   (*b*) Teachers' institutes.
8. SPECIAL NOTEWORTHY BENEFACTIONS.
9. OBITUARY RECORD .....(*a*) Brief memorials of educators deceased during the year.
10. LIST OF SCHOOL-OFFICIALS.....(*a*) Boards of education, or State-superintendents.
    (*b*) County- or town-superintendents.

*APPENDIX.

ABSTRACTS FROM THE OFFICIAL REPORTS OF THE SCHOOL-OFFICERS OF STATES, TERRITORIES, AND CITIES, WITH ADDITIONAL INFORMATION FROM VARIOUS SOURCES.

ALABAMA.

[From report of Hon. Joseph Hodgson, State-superintendent of public instruction, for the scholastic year which ended September 30, 1872.]

RECEIPTS.

Annual interest on $1,729,817.04, (sixteenth-section-fund,) at 8 per cent	$138,385 36
Annual interest on $97,091.21, (valueless sixteenth-section-fund)	7,767 30
Annual interest on $669,086.80, (surplus-revenue-fund)	53,526 94
One-fifth annual aggregate revenue, (1871)	235,524 54
Special assessment for schools, (poll-tax)	113,505 00
Alabama Mutual-Aid Association	2,000 00
Amount appropriated under section 957, revised code	54,269 36
Unapportioned balance, (1871)	2,082 47
Total	607,060 97

EXPENDITURES.

Apportioned among counties	$553,067 65
Pay of county-superintendents	35,000 00
Pay of county-directors	4,000 00
Pay of clerk of department	1,500 00
Contingent fund	1,000 00
For normal schools	12,000 00
Library-fund	50 00
Total expenditures	606,517 65

SCHOOL-POPULATION.

Total number of children between ages of 5 and 21 years, (males, 204,416; females, 199,319)	403,735

SCHOOL-ATTENDANCE.

Number of white children enrolled, (males, 32,766; females, 29,176)	61,942
Number of colored children enrolled, (males, 20,125; females, 21,548)	41,673
Total enrollment	103,615

* The statistics of city-schools, tabulated from returns made by the city-superintendents, and also the names of the presidents and full statistics of the higher educational institutions of each State will be found in their appropriate places among the statistical tables at the end of this volume. Lists of the universities, colleges, and professional schools in each State are also given in the abstracts of their respective States. The statistical tables of the schools, colleges, and public educational institutions embody the information given, in response to the circulars of inquiry sent out from this Bureau, by those in charge of the institutions.

Owing to want of space reference is made in the text only to institutions from which the Bureau possesses printed or written information relating to matters of special interest.

Average number of white children attending, (males, 23,871; females, 21,650)	45,521
Average number of colored children attending, (males, 14,371; females, 14,035)	28,406
Total average attendance	73,927

TEACHERS.

Number of teachers for white-schools, (males, 1,176; females, 644)	1,820
Number of teachers for colored-schools, (males, 620; females, 210)	830
Total number of teachers	2,650

SCHOOLS.

Number of primary schools, (for white children, 287; for colored, 547)	834
Number of intermediate schools, (for white children, 563; for colored, 229)	792
Number of grammar-schools, (for white children, 732; for colored, 39)	771
Number of high schools, (for white children, 162; for colored, 2)	164
Total number of schools	2,561

FINANCIAL.

In consequence of the failure of a number of counties to forward proper annual reports within the time required, a fair comparison of the statistics of the year with those of the year previous has been impossible; yet, notwithstanding the fact that the failure of the treasury to cash school-warrants had a depressing effect upon all the township-schools, the number of children in attendance—and the time during which the schools were open—does not vary materially, it is thought, from that of the preceding year.

It has been impossible for county-superintendents to balance their accounts with the department of education, from the fact that large amounts of warrants remain in their hands unpaid; and, in the judgment of the retiring superintendent, Hon. Joseph Hodgson, the affairs of the department cannot be satisfactorily administered until the general assembly shall provide money to meet the annual educational apportionments; and to this end he advises that a sale of State-bonds be ordered sufficient to liquidate every cent of indebtedness to the public schools and that the school-revenues be henceforth kept separate and distinct from all other funds, in accordance with that provision of the constitution which says that they "shall be inviolably appropriated to educational purposes, and no other purposes whatever." Notwithstanding this express command of the constitution, every dollar of the public-school-fund and of the university-fund given the State by the General Government has been either squandered or lost, so that the entire amount expended annually for the public schools and the State University has to be raised each year by direct taxation on people already groaning under heavy taxes and indebtedness. The new State superintendent, (Hon. Joseph H. Speed) in an address to the board of education, advises that all defaulting officers and all officers in arrears be sought out and compelled to account for every dollar of public-school-money that has gone into their hands or be made to suffer the severest penalties of the law.

COUNTY-SUPERINTENDENTS.

Superintendent Speed advises, also, the enactment of a law requiring county-superintendents to reside at the county-seat of each county and keep their offices open on certain days of each week, since their residence in remote corners of counties having a large area compels teachers, trustees, and other school-officers having business with them to travel a great distance, at the risk, even then, of finding the county-superintendent absent. He further recommends the enactment of a law providing for the removal of county-superintendents for grossly immoral conduct and drunkenness.

TEACHERS.

A revision of the school-laws is considered necessary, so as to prohibit the employment of teachers in the public schools until the money is in hand to pay them. Such teachers are generally poor, and nine-tenths of them have to rely entirely upon their pay to support themselves and their families. To employ them, poor as they are, secure their time and services, and then compel them to wait six or twelve months for their pay, is not only unwise, but unjust and cruel, and entails much suffering on a worthy class of citizens, who, moreover, render more service for less compensation than any other public servants. There are hundreds of poor teachers throughout the State, who have served faithfully and laboriously, whose wives and children suffer for want of food and raiment because they have failed to receive the amounts due for work done many months ago.

PECULIARITY OF THE SCHOOL-SYSTEM.

The most noticeable feature in the school-system of this State is the fact that it is the creation of the constitution, and not of the legislature, and that the power to enact school-laws is taken from the latter and given to the State-board of education. The general assembly has power to repeal these laws, and that is all. In a decision of the supreme court of Alabama it is said: "The new system has not only administrative, but full legislative, powers as to all matters having reference to the common schools and the public educational interests of the State. It cannot be destroyed nor essentially changed by legislative authority."

The governor of the State is, *ex-officio*, a member of the board, but with no power beyond that of debate and advice. The State-superintendent of public instruction is its presiding officer, as well as the executive officer of all school-laws; and thus both the school- and the State-authorities have a voice in its proceedings and an opportunity to shape its legislation. This system, in the opinion of both the present and the retiring superintendents, needs revision, having failed to meet the expectations of its friends and the demands of popular education. The superintendent, therefore, suggests to the board of education, as well worthy its consideration, whether the old plan was not more successful and beneficial.

MONTGOMERY.

The total population of the State capital is given at 15,000; the number of children of school age, (5–21,) 3,327; number enrolled in schools, 878; number of weeks in scholastic year, 38; number of schools, 13; of teachers, 13, (2 male and 11 female;) number of scholars enrolled as above, 878; number in average attendance, 631.* The salaries of teachers in primary schools (all females) are from $40 to $50 a month; of those in intermediate schools (all females) $50 to $60; of the male principal in grammar-schools, $75 to $100; of the female, $60 to $65; of the male principal in high schools, when existent, $100 to $120. The income for the year 1872–'73 is: from last year, $2,223.10; from State-apportionment, $3,742.87; from city-appropriation, $4,000; from Peabody fund, $1,500—total, $11,465.97. The expenditures for the same time were, for salaries of superintendents, nothing, several serving gratuitously; for salaries of teachers, $6,308.35; for fuel and lights, $24.03; for rent of buildings, $350; for repairs, $183.47; for stationery, $25; for discount on warrants, $555.60—total, $7,665.42; leaving an apparent balance of $3,800.55. Neither Latin, Greek, German, nor French is taught in the public schools and drawing is only in its elements; but vocal music is attended to in all.

OPELIKA.

Population of the city, 4,800; children of school-age, 715; number enrolled in schools, 380; average attendance, 300; school-year, 40 weeks. The schools are: (1) 1 public school, with 2 male and 2 female teachers, 275 pupils on the rolls, and 220 in average attendance; (2) 1 "mixed" school, with 1 male and 1 female teacher, and 60 pupils; and (3) 1 young ladies' school, with 2 teachers and 45 pupils. The income for the public school is: from State-fund, when collected, $800; from local fund, $1,000; from other sources, ($1,000 from Peabody fund,) $2,000—total, $3,800. Expenditures not given, but said, in the application for aid from the Peabody fund, to be $3,000 for teachers alone. Opelika is a new town, which has sprung up within the last seven years, and has not yet reached full order in its school-appointments. Latin and Greek, however, are taught; there are 20 pupils in drawing, 75 in vocal music, and 30 in instrumental.

SELMA.

Whole population, 8,000; children of school-age, 2,067; enrolled in public schools, 739; in private schools, 30; school-year, 40 weeks. The public schools are 2, of which 1 is for whites, the other for colored youth. Each of these is divided into 7 grades, with a teacher for each grade. In one of the schools, a boys' grade is separate. In the white division there is also a high-school for girls. The teachers are (male 4, female 14) 18. The average attendance of pupils is said to be 737, (442 whites, 295 blacks,) which, if correct, is very high, reaching within two of the whole number enrolled. There are also evening-schools for colored pupils; number attendant not given. In the private schools are 3 male and 6 female teachers, with an average attendance of 150 pupils. The income of the public schools is given as $12,659, of which, $1,659 comes from the State, $9,500 from local fund, and $1,500 from the Peabody fund. Expenditures not stated. Latin and Greek are taught, drawing and vocal music "to some extent," and there are a few pupils in French.

SECONDARY INSTRUCTION.

Information respecting schools for secondary instruction in this State is very incomplete. While the superintendent of public instruction reports 164 high schools, two of which are for the education of colored children, no means are afforded for judging of their efficiency.

* The above statistics are for the public schools. Besides these, there are in private schools 20 teachers, (4 males and 16 females,) with over 500 scholars.

Of private or denominational schools for secondary training, reports are at hand from: (1) the Greene Springs school, Hale County, of which Henry Lutwiler, LL. D., is principal, with 2 male instructors and 1 female, 49 male and 6 female students. The ancient languages, mathematics, German, and French are taught and instrumental music to the female pupils. The school possesses apparatus for the illustration of the natural sciences, also a general library of 2,000 volumes, with 1,000 additional in the libraries of two societies; (2) the Hamner Hall high school, in a pleasant grove near Montgomery, principal, F. Key Meade, of the University of Virginia, and 3 other male instructors, 70 male pupils, with an academic course, comprising Latin, German, French, Spanish, Italian, mathematics, chemistry, higher English, and book-keeping; (3) the Park high-school, Tuskegee, James F. Park, principal, with 2 male instructors, 93 male pupils, of whom 55 are in the English course and 38 in the classical. Number preparing for college, 30; buildings new and sufficient for the accommodation of 150 students; Latin, Greek, and French in course; and (4) the Burrell school, Selma, principal, John M. Cumings, with 6 female assistants, 175 male and 225 female pupils, none thus far advanced beyond the first year in grammar-school, a small apparatus for philosophical illustration, and "no library to speak of." Monthly written examinations have been used in the higher classes, with good success.

From such other institutions as the high school for males, Montgomery, the Lafayette male-high school, Chambers C. H.; Theodore Hunter's school, Montgomery; the Southwood select school, Talladega, or the Ursuline Convent, and Academy of St. John the Baptist, Tuscaloosa, there are no returns to show their present condition.

NORMAL TRAINING.

Normal departments exist in connection with Talladega College and the State University. The returns from the former show a division of the department into "common-school normal," and "higher normal." "Above 8" are in the first year of the higher normal; in the two divisions, 39. From the university normal school there are no returns.

"Graded schools with normal departments" are also reported by the American Missionary Association office 50 Reade street, New York, as follows: (1) Emerson institute, Mobile, with 2 instructors, and 135 pupils; (2) Swayne school, Montgomery, with 8 instructors and 612 pupils; (3) Lincoln school, Marion, with 5 instructors and 300 pupils; (4) Trinity school, Athens, with 2 instructors and 163 pupils; and (5) the Burrell school, Selma, previously referred to. In none of these schools, however, are the number of pupils in normal classes indicated or any means afforded for judging of the extent of the normal course.

UNIVERSITY OF ALABAMA.

The academic department of this university embraces six courses of study, either of which the applicant may select: five parallel courses for undergraduates and one post-graduate-course for master of arts, embracing extensive studies in any three of the schools into which the academic department is divided, the degree of master of arts not being conferred in course on bachelors of arts of three years' standing, as has been common at the North.

The department of professional education embraces the school of law, requiring one year and a half for its completion, and the normal school, which is intended to prepare young men for teaching and embraces a three years' course of study. Certificates of proficiency received by those who complete the course in this department secure their admission into the public schools as teachers without examination.

Military training.—All students are subjected to military drill and discipline, and are styled the "Alabama Corps of Cadets." The school of military sciences embraces instruction in military art and science, military law, and elementary tactics.

Finances of the university.—From a statement of the superintendent of public instruction made to the board of regents, it appears that the expenditures of the university for the year 1871–'72 considerably exceeded the amount annually furnished it by the State, $38,000 having been disbursed during the year in question, while the annual appropriation is only $24,000. Adding the amount realized from board, tuition, and other fees charged the students to that supplied by the State, he estimated that the expenses of the institution for the year were not less than $43,500, and, moreover, that in the future the entire amount would necessarily be defrayed by the State, since the board had just passed a law rendering tuition in the university free.* The conviction was expressed that this outlay might be considerably reduced and the university, at the same time, be rendered more useful and efficient.

It was stated, for instance, that the professor of moral and mental philosophy, who received a salary of $2,500, had only 4 pupils in his department, making the cost for instructing one pupil in that single branch $700, while a similar state of things existed in the department of mineralogy and geology. It was therefore recommended that the two professorships of moral and mental philosophy and natural history be abolished,

*It was doubtless this suggestion which influenced a subsequent action of the board of regents in the abolition of the law providing for free tuition.

the duties of the former being discharged by the president of the institution, as was the case for 40 years; that two other chairs be consolidated, and the salaries of professors reduced to $2,000 per annum. While these changes would not diminish the efficiency of the faculty they would effect a saving of $12,000 annually, which sum could be applied to the completion of the university-buildings, to the purchase of scientific apparatus, to increasing the library, and to payment of the debts of the institution. He further recommended the establishment of a department of law, which could be done without additional expense to the university, the tuition-fees of students being an ample resource for its support.

HOWARD COLLEGE, MARION.

The professed aim here is to make the instruction in every department practical. In all sciences the students are required to use the apparatus and instruments provided for them. Original problems are solved and much attention paid to original essays. Lectures are occasionally given on the subjects studied, but the rule is that the students themselves perform in the class-room, the object being to make them proficient in demonstration and explanation and keep constantly in exercise the knowledge they acquire.

The faculty offers for competition to the sophomore-class a gold medal for excellence in elocution.

SPRING HILL COLLEGE, (*near* MOBILE.)

The plan of instruction at this college embraces a preparatory, a classical, and a commercial course; the first of one year, the second of six, and the third of three. At the end of the sixth year of the classical course, the degree of A. B. is conferred on those who pass the requisite examination. To attain the further degree of A. M. there must be either an additional year of philosophic study at the college or a two years' devotion to the studies of a learned profession.

TALLADEGA COLLEGE, TALLADEGA.

This is one of several collegiate institutions established by the American Missionary Association for the benefit of the colored race especially, though not limited to them. It is yet in its infancy, but has in all 13 instructors and 268 pupils, classed, thus far, only in primary, intermediate, normal, and preparatory departments. It is said thus far to have proved eminently successful in the training of its pupils.

COLLEGES FOR WOMEN.

Eight institutions for the higher instruction of women make returns for 1873. These returns show, in the 8 colleges and collegiate seminaries mentioned, an aggregate of 78 teachers, of whom 20 are males and 58 females, nearly all resident in the institutions with which they are connected. There are 955 pupils; 233 of these in preparatory departments, 44 in partial courses, 662 in collegiate courses of from four to five years, and 16 post-graduates still prosecuting studies. In all these schools, drawing and painting, music, (vocal and instrumental,) and French are taught, besides the other studies of a ladies' college-course. In all but one, German is added to the French; in two, Spanish also; and in one, Italian forms a further addition to the course. Four have chemical laboratories; 6, philosophical apparatus or cabinet; 4, at least the beginnings of an art-gallery, and the same number some means for physical culture. One makes no report of any library; one has 400 volumes; the others from 1,000 to 3,000 volumes each.

The following table exhibits, in brief form, the condition of the various institutions for superior instruction in the State:

Statistical summary of universities and colleges.

Names of universities and colleges.	Corps of instruction.	Endowed professorships.	Number of students.		Corporate property, &c.						Number of volumes in library.

AGRICULTURAL AND MECHANICAL COLLEGE OF ALABAMA, AUBURN, LEE COUNTY.

This institution was established by act of the State-legislature, under the congressional provision for the benefit of agriculture and the mechanic arts. The amount realized by the State from the sale of the lands donated by Congress for this purpose was $218,000. To this has been added, by donation from the trustees of the East Alabama College, at Auburn, in consideration of the establishment of the university at that place, all the buildings, property, and lands of said college, the value of such lands, (200 acres,) with the buildings, amounting to over $100,000.

The institution "holds its leading object to be to afford the most thorough instruction which its means will allow in the branches of learning pertaining to the industrial arts or necessary to the liberal and practical education of the industrial classes in the several pursuits or professions in life." There are three special courses of study which are elective, namely, those of scientific agriculture, civil and mining engineering, and literature and science. There is also a required course of three years for all students, beginning with elementary studies and so arranged as to furnish training for the active business-concerns of life or for the special and higher courses of study pursued in the college.

Military training.—Although military science is required to be and is taught in the institution and the government and discipline are modeled after those of military schools, it is not made a leading object of the course, since the aim of the college is not to make proficients in arms, but simply to teach the tactics and improve both the health and bearing of the students.

Free scholarships.—Each county of the State is, by law, entitled to send two students to this college.

During the first session of seven months, closed October 30, 1872, there were in attendance 103 students, of whom 6 graduated. The same numbers appear in the returns for 1873.

ALABAMA INSTITUTION FOR THE DEAF, DUMB, AND BLIND.

The annual appropriation for the support of this institution is said by the secretary, in his report for 1873, to amount to $18,000. The buildings and grounds are reported by the president to be kept with a degree of neatness and care seldom found anywhere, the groves and lawns improving in appearance yearly, the walks and carriage-ways graded, and drainage secured as far as there have been means to carry on the work. The garden and tillable lands have been cultivated and fertilized, and have produced abundant crops, the labor, except hauling, being all done by the male pupils. The mechanical department, closed for want of means, was to be partially re-opened in October, 1873, competent teachers in this line having been secured.

The whole number present last year was 70; for the year which ended September, 1873, 60. Of this last number 46 were mutes and 14 blind. In the mute-department 4 teachers have been employed; in the blind, 2—1 in the intellectual, 1 in the musical instruction. The advancement of the pupils is said to have been satisfactory—in several instances highly encouraging—though the appliances for the instruction of the blind are poor, there being no means to increase the supply of school-apparatus, maps, globes, &c., which, in their raised forms, are expensive.

MISCELLANEOUS.

The Industrial Home, near Mobile, the Church Home for Orphans, Mobile, and The Sheltering Arms, in the same city, an asylum for the indigent, are all institutions semi-educational in character, under the charge of churches of the Protestant-Episcopal communion; but as no report has been received from them the extent of their educational work cannot be stated.

LIST OF SCHOOL-OFFICIALS IN ALABAMA.

MEMBERS OF THE STATE-BOARD OF EDUCATION.

Hon. JOSEPH H. SPEED, *superintendent of public instruction, ex-officio, president, Montgomery.*

County.	Name and district.	Post-office.

ARKANSAS.

[From biennial report of Hon. Thomas Smith, State-superintendent of public instruction, for the term ended September 1, 1872, published in 1873.]

FINANCIAL STATEMENT.

Amount raised for public schools.

From State-school-tax of 1870	$167,973 70
From district-tax of 1870	320,810 00
From State-school-tax of 1871	212,376 06
From district-tax of 1871	193,089 71
Total receipts for 1871 and 1872	894,249 47

Amount expended.

Teachers' wages	$696,881 85
Building school-houses and purchasing sites and houses	76,610 06
Furniture, repairing school-houses, &c	46,621 35
Paying school-trustees	11,825 22
* Total expenditure for 1871 and 1872	970,306 74
Balance on hand September 30, 1872	38,684 14

SCHOOL-STATISTICS.

Concerning these the State-superintendent remarks: "The reports of the circuit-superintendents are so imperfect that it is utterly impossible to exhibit the true condition of education in the State."

Number of white children between 5 and 21 years, 1871	128,641	
Number of colored children between 5 and 21 years, 1871	41,655	
Total scholastic population for 1871		196,237
Number of white children between 5 and 21 years, 1872	96,149	
Number of colored children between 5 and 21 years, 1872	16,417	
Total scholastic population for 1872		194,314
Decrease from 1871		1,923

Attendance.

Number of white children attending school, 1871	56,787	
Number of colored children attending school, 1871	13,210	
Total attendance for 1871		69,927
Number of white children attending school, 1872	20,363	
Number of colored children attending school, 1872	2,500	
Total attendance for 1872		32,863
Decrease from 1871		37,064

Teachers and teachers' institutes.

Number of teachers employed in 1871	2,128
Number of teachers employed in 1872	2,035
Decrease from 1871	93

* All the figures in these statements are given as printed in the report. A glance will show that there is an error somewhere, the items as they stand really amounting to $831,938.48 for expenditures, leaving an apparent balance of $62,310.99, instead of $38,684.14. The present State-superintendent thinks that this discrepancy may have arisen from an unmentioned item of the salaries of ten circuit-superintendents at $3,000 per annum, with their postage.

Whole amount paid teachers in 1871	$424,443 00
Whole amount paid teachers in 1872	355,624 90
Decrease from 1871	68,818 10
Number of teachers holding first-grade-certificates, (1872)	188
Number of teachers holding second-grade-certificates, (1872)	423
Number of teachers holding third-grade-certificates, (1872)	546
Number of teachers' institutes held during 1871	31
Number of teachers' institutes held during 1872	25
Decrease from 1871	6
Number attending institutes in 1871	651
Number attending institutes in 1872	323
Decrease from 1871	328

School-houses.

Number of school-houses previous to 1871	1,037
Value of school-houses previous to 1871	$131,456 98
Number of school-houses erected during 1871	302
Value of school-houses erected during 1871	$67,676 30
Number of school-houses erected during 1872	187
Value of school-houses erected during 1872	$55,913 50
Whole number of school-houses, September 30, 1872	1,292
Number of school-houses with inclosed grounds	85

CONDITION OF PUBLIC SCHOOLS.

At the date of the last report, (September 30, 1870,) the free-school-system had been in successful operation rather more than two years. During that time many difficulties had been surmounted: the prejudice which at first existed in the minds of the people, especially with regard to the education of colored children, had been overcome, and schools had been established in nearly all the counties in the State; many excellent teachers had been attracted from the older States, and vigorous efforts were being put forth to build suitable school-houses and keep schools open for a longer time than three months during the year.

During the years 1871 and 1872 various influences and agencies have operated most disastrously against the free-school-system, so that it has been not only greatly hindered and embarrassed, but well-nigh destroyed; and the vigorous growth of popular sentiment in favor of the system has declined into almost total indifference.

WANT OF FUNDS.

One of the chief causes of this state of things has been the want of adequate funds, occasioned, in great measure, by the action of the legislature in limiting the amount of local tax that might be levied in country districts to one-half of 1 per cent. and in cities and towns to three-fourths of 1 per cent. on the taxable property of the district. In many neighborhoods no provision for schools had previously existed, and considerable expense was necessarily incurred in getting them into operation for the first time. The people, however, relying on the provisions of the constitution for "levying such tax as may be deemed proper" to make up deficiencies in the public-school-fund, zealously engaged in the work and incurred the liability, expecting, by imposing on themselves a little heavier tax for a year or two, to be able to liquidate their indebtedness and still carry on their schools. In a few instances, perhaps through ignorance and inexperience in such matters, an exorbitant rate of taxation was authorized by district-meetings. This excess was seized upon by the enemies of free schools and exaggerated to such an extent as to induce the legislature to limit the amount of local tax. In addition to this, the legislature authorized the issue of interest-bearing certificates and made them receivable for school-taxes.*

TEACHERS PAID IN DEPRECIATED SCRIP.

The payment of the school-fund in this depreciated paper, worth but little more during the past year than half its par value, with the curtailment of local taxation, so

*A decision of the supreme court, in its session of January, 1873, puts an end to this abuse by declaring that these taxes must be paid in currency. This, if carried out, will add about two-fifths to the school-fund of each county and enable the authorities to do justice to the teachers they engage.

crippled a large portion of the school-districts that it was impossible for them to support even a three-months school; and teachers receiving their pay in scrip, and finding that they could not dispose of it except at a ruinous discount, left the State. The schools have thus lost many of their most valuable teachers.

The opinion is expressed that, as the chief dependence for the support of schools in the several districts must, until the State-fund shall become much larger than at present, be on local taxation, by the voluntary action of the people, as few restraints as possible should be imposed on this action. It is strongly urged that the act restricting the amount of local tax to be levied be repealed, and that there be a provision of law that these taxes be collected and paid over in current funds. An opposite condition has brought ruin and discredit on the free-school-system in many counties of the State.

SCHOOL-REVENUES AND SCHOOL-FUND.

As the law now stands, there is a levy of one-fifth of 1 per cent. by the State for school purposes, which is collected and paid into the State-treasury as other State-taxes are; and this, together with the accrued interest on the vested school-fund and the poll-tax, is apportioned to the several counties according to the number of children of school age, leaving the people of the several school-districts at liberty, within certain limits, to levy a local tax for the additional support of schools.

All fines, penalties, forfeitures, &c., belong to the common-school-fund; but the arrangements for their collection are not satisfactory, and but a small portion of the fines reaches the State-treasury.

Of the two townships of land originally granted for the purpose of establishing a seminary, but afterward appropriated for the benefit of the common schools in the State, about 1,000 acres remain unsold. The remainder has been disposed of at the price of $4 per acre, on a credit of one, two, three, four, and five years from date of sale, the notes bearing interest at the rate of 10 per cent. per annum. The outstanding amount of principal of the notes given for these lands was, in 1870, about $35,000.

Of the seventy-two sections of saline lands, about 20,000 acres remain unsold. The remainder was sold at about $1.25 per acre. The amount of the notes given for these lands was, in 1870, about $10,000.

DIVERSION OF SCHOOL-FUND TO OTHER PURPOSES.

The last distribution of the funds arising from the seminary and saline lands was in January, 1861. After that date most of the money coming from these funds was appropriated for general State-expenditures. There was thus transferred to the general revenue from the seminary-fund $7,260.81 and from the saline-fund $4,633.13. In view of these facts the question arises whether the State should not be considered as indebted to these funds for the amounts thus diverted from their legitimate object.

Of the 928,000 acres of the sixteenth-section-lands, about 122,000 have been sold and patents granted by the State. A large quantity was sold that has not been paid for and for which no patents have been issued. The claims of the State, in the form of notes and bonds for school-lands sold and moneys loaned, amount, perhaps, with the accrued interest, to half a million of dollars. Strenuous efforts have been made to secure the collection of these outstanding claims as far as possible. Where purchasers of land make no effort to settle their indebtedness, steps are being taken to forfeit the purchases and take possession of the lands on the part of the State. Efforts are also being made to collect a reasonable rental for the time improved lands have been occupied by parties failing to comply with their contracts of purchase.

The taxes collected on lands belonging to the sixteenth sections should be paid into the common-school-fund, but for several years past have been merged in the general revenue of the State. The question hence arises whether the State does not stand indebted to the school-fund in an amount equal to the sum of taxes thus misapplied.

The amount of permanent school-fund on hand October 1, 1872, was:

In United States currency	$14,510 84
In 5-20 United States bonds	24,186 25
In State-scrip	56,804 22
Total	95,501 31

Amount of common-school-fund:	
In United States currency	$3,024 24
In State scrip	36,852 51
Total	39,876 75

PEABODY FUND.

Among the educational agencies of the State special mention is made of the aid afforded by Dr. Sears, agent of the Peabody educational fund. The donations to different schools during the past year amounted altogether to $8,950.

SUPERINTENDENCE.

The plan of county-supervision has been much discussed and seems to be gaining in favor. It is believed, however, that this system, though well adapted to older States, will not, for the present, subserve the educational interests of Arkansas nearly so well as circuit-supervision properly carried out. It is admitted that the latter system has, from various causes, been made productive of but little good, if not of positive evil. So great were the complaints that both political parties in the recent campaign deemed it politic to make special reference to it in their platforms. This failure, however, is ascribed rather to abuses of the system than to the faults of the system itself. It is suggested that the circuit-superintendents be made more directly responsible to the people or to the head of the school-department; also, that the school-law be so amended as to prevent their devoting their time to other business, and to exact more rigidly a thorough and punctual discharge of their official duties. The superintendent remarks that, although the want of efficiency on the part of circuit-superintendents has undoubtedly been one cause of failure in the school-work, still, no energy that might have been put forth by these officers could have compensated entirely for the severe blow the system received from causes previously mentioned.

EDUCATIONAL JOURNAL.

The Arkansas Journal of Education, edited by the State-superintendent, has been in existence three years and has proved a valuable auxiliary. Its influence has been widely felt, creating a public sentiment in favor of the free-school-system and prompting teachers to professional excellence and pride. It has, as yet, received no aid from the State, not even pay for publishing official advertisements. Something in the way of financial aid is needed to make the enterprise successful.

SCHOOLS IN CITIES AND TOWNS.

Fifteen cities and towns have organized under the special act "for the better regulation of schools in cities and towns," approved February 4, 1869. In these several places a board of directors has been elected and the schools put in operation under the provisions of said act. No official reports from these districts have been received, but in most, if not all of them, the schools are believed to be doing reasonably well. In the city of Little Rock, especially, they are pronounced a decided success, though the management by the school-board is regarded by many as extravagant.

ANOTHER VIEW OF EDUCATIONAL EMBARRASSMENTS.

Hon. J. C. Corbin, present State-superintendent of public instruction, gives the following additional view of the difficulties under which the public-school-system is laboring. His testimony both corroborates the statements made in the published report of Superintendent Smith and gives later information, his communication bearing date November 15, 1873. He says:

"The condition of the schools generally is not hopeful, and the cause is easily understood. It is as follows: In all cases where the contrary is not directly stated, the word 'dollar,' in a statute of Arkansas, means not the old dollar spoken of in our arithmetics, which was equal in value to one hundred cents, but so much State-scrip or treasurer's certificates on bank-note-paper, which, for the last three months, has been worth only from 35 to 45 cents on the dollar. A portion of the State and local taxes is paid in United States currency; but such is the laxity of the laws that when it is paid out it is almost invariably State-scrip. This not only deprives the schools of a large proportion of their legitimate resources, but exasperates the people and impoverishes the teachers, so that those of superior grade cannot easily be obtained or retained, and the effect upon the public schools is almost fatal."

DISTRIBUTABLE FUND DIMINISHED.

"Heretofore, under the law, the State superintendent has twice a year apportioned among the various counties what is usually termed 'the distributable school-fund.' This fund was composed of the proceeds of the three following items, viz:

"(*a*) The State tax of two mills on the dollar.

"(*b*) Per-capita tax.

"(*c*) Six per cent. interest paid by the State for the use of the permanent school-fund.

"The total of these three items, constituting the distributable fund for the last apportionment, amounted to about $210,000, which was apportioned according to the school-law. But the last general assembly incorporated in the 'general-revenue-law' a section denying to the State-auditor any power to draw a warrant for the benefit of common schools on 'the general revenue of the State,' and the attorney-general decided that this cut off the item '*a*,' which constituted about three-fourths of the distributable

fund, and left $55,000 in State-scrip, at 35 per cent., as the only amount for which the auditor could draw his warrants. Several of the county-treasurers, as custodians of the apportioned fund, propose to go into the supreme court and apply for a mandamus to compel the auditor to draw his warrants for the full amount apportioned, but with little prospect of success." "But in reality the paying out of the distributable fund would have been of but little benefit to the schools, as the throwing of $210,000 in State scrip on a market already glutted with that security would have reduced its value to almost nothing, for during the last few months very often there was 'no sale' at any figures for even so small an amount as two or three thousand dollars."

PROVISIONS OF NEW SCHOOL-LAW.

"The last general assembly repealed the old and enacted a new school-law. The new law is substantially the same as the old, with but few changes, but these few changes were of a very important character:

"(1) Under the old law the various school-districts had the power to tax themselves as heavily as they chose for school-purposes; the new law fixed the maximum of local taxation at five mills.

"(2) Under the old law the schools were managed by ten circuit-superintendents, who also constituted the State-board of education. The new law provides for county-superintendents, and makes the board of trustees of the Arkansas Industrial University the State-board of education. The first set of county-superintendents was, under the law, appointed by the governor, upon the recommendation of the State-superintendent; the succeeding sets are to be elected by an annual convention of the school-trustees of each county. The salary of the county-superintendents is to be fixed by the county-boards of supervisors, and is to be from $300 to $500, payable, I presume, in county-scrip. Despite the small salary, the county-superintendents are, almost universally, men of high character and, in many cases, of fine scholarship.

"(3) Under the old law a school-trustee received as compensation for his services $2 per day for every day 'actually and necessarily spent' in his official duties; under the new the only compensation he receives is being exempted from working on the roads and from serving on juries.

"(4) Another matter affecting the schools very materially was the creation by the last legislature of nine new counties, thereby dividing some fifty or sixty of the old school-districts. Besides this, the boundaries of quite a number of the other counties were changed, by which a still larger number of the districts was affected, as, under the law, a school-district must be entirely comprised in one county. The amount of confusion that has resulted from this cause is almost incalculable.

"(5) The depreciation in the State-securities and the fact that they have almost no market-value abroad render it difficult for even the State-superintendent to obtain such stationery (for instance, school-registers) as, from the fact of its being copyright-property, can be purchased only from the owners.

"(6) The difficulty last specified is increased by the meager appropriation for carrying on school-operations, made by the last general assembly. The appropriations were made on the presumption of an advance in the value of State-scrip; but, instead, there has been a material decline.

"It would not, perhaps, be correct to conclude from the above statement that our schools are in an absolutely hopeless condition, as I am satisfied that a large portion of the people of Arkansas are friends of common schools and that the numbers of this class are continually increasing."

INTEREST FELT IN COMMON SCHOOLS.

"The common-school-law and the condition of our public-school-system are attracting a great amount of attention from our best minds, and I confidently hope that our next general assembly will be prepared to act in such a manner as to remedy the defects of the former and insure the prosperity of the latter. Any improvement in the financial condition of the State will produce a corresponding one in the schools, and such improvement is hoped for."

UNIVERSITIES AND COLLEGES.

Unlike most of her sister-States in the West and South, Arkansas has hitherto been without a recognized State university. The Industrial University, opened in 1872, gives good promise of usefulness and may become the head of the educational system of the State. Besides this, the only institutions for collegiate culture at present existing appear to be Cane Hill College, Boonsboro', and St. John's College, Little Rock.

At Cane Hill, the professors in the college teach also the students in the preparatory school, so that the instruction is uniform throughout.

St. John's is under the care of the Masonic fraternity and devoted mainly to the education of the children of its members. It suffered much from the disastrous influences of the war and is only beginning to recover from these.

The table here given shows the main points reported by the two, illustrative of their condition:

Statistical summary of colleges.

Names of colleges.	Corps of instruction.	Endowed professorships.	Number of students.		Corporate property, &c.						Number of volumes in library.
			Preparatory.	Collegiate.	Amount of property of corporation.	Value of grounds, buildings, and apparatus.	Amount of endowment.	Amount of productive funds.	Income from productive funds.	Receipts for last year from all other sources.	
Cane Hill College	3	....	101	23	.....	$5,000	.....	.....	.....	.....	101
St. John's College	6	....	50	71	.....	50,000	$105,000	$35,000	$3,500	$6,500	100

Arkansas College, Batesville, although chartered as a college in 1872, still exists only as a preparatory school.

THE INDUSTRIAL UNIVERSITY.

This institution, from its large endowment and fair prospect of continued State-aid, stands so prominently forth above the struggling and enfeebled colleges as to deserve special notice. Established in accordance with an act of Congress, making a grant of 150,000 acres of land as an endowment for it, and in accordance with an act of the general assembly, passed to effect the object of this grant, its leading purpose is to teach such branches of learning as are related to agriculture and the mechanic arts, and thus promote the liberal education of the industrial classes in the several pursuits of life. In its circular for 1873–'74, its full aims are said to be: (1) to impart a knowledge of science and its application to the arts of life; (2) to afford to students that may desire it the benefit of manual labor, not so much to lessen expenses as to preserve health and cultivate a taste for agriculture and mechanic employments; (3) to prosecute experiments for the promotion of both garden- and field-culture; (4) to provide the means of instruction in military science; and (5) to afford the opportunity for a general and thorough education, classical as well as scientific, not inferior to that in the best colleges.

The location of the university is within the corporate limits of the town of Fayetteville, Washington County, within the Pea Ridge region, one of the most salubrious, beautiful, and fertile portions of the State. Here, on an ample domain, bestowed upon the institution by the citizens, buildings have been erected to accommodate 300 students, while contracts have been entered into for a noble permanent edifice five stories high and 214 feet in length, with wings 122 feet in depth. This is to be completed by September, 1875, and will afford accommodation for 700 students.

The trustees have made provision for 237 beneficiary scholarships, which will entitle those admitted to them to four years' free tuition. These are to be apportioned to the several counties according to their population.

A normal department, with two courses, one of three and one of two years, is open in the university to male students of 16 and females of 14 years of age, of good character, who can pass a satisfactory examination in the common English branches. Those who will enter into a written obligation to teach in the common schools of the State for the two years succeeding the completion of their course are admitted free of tuition.

The university proper is to embrace four colleges, with thirteen subordinate schools, as follows:

I. The college of agriculture, including (1) the school of agriculture and (2) the school of horticulture.

II. The college of engineering, including (1) the school of mechanical engineering, (2) that of mining engineering, (3) that of civil engineering, (4) that of architecture.

III. The college of natural science, including (1) the school of chemistry—agricultural, technologic, pharmaceutic, and metallurgic—and (2) the school of natural history.

IV. The college of general science and literature, including (1) the school of English and modern languages and literature, (2) the school of ancient languages and literature, and (3) the school of mathematics. This college includes also courses in natural history and chemistry, in history and social science, and in mental and moral philosophy. "A preparatory department has been established in connection with the university, with a full course of five years."

Besides the above colleges and schools there will be (1) the school of military science and (2) the school of commerce.

In accordance with this outline there have been appointed, for the year 1873–'74, the following professors and instructors: (1) A president and professor of mental and moral philosophy, (2) a professor of ancient languages and literature, (3) a professor of theoretical and applied chemistry, (4) a professor of mathematics and engineering, (5)

a professor of military science and tactics, (6) a professor of practical and theoretical agriculture and horticulture, (7) a principal of the normal department, (8) a preceptress in the same, (9) an instructress of the training-school connected with this department, and (10) a professor of music.

Statistical summary of Arkansas Industrial University.

* Buildings not yet completed.

ARKANSAS INSTITUTE FOR THE BLIND.

Located at Little Rock, five acres of ground have been purchased for the institution, and a substantial brick-building has been erected. The number of blind persons that have received instruction during the last two sessions is 50. The number in the institution, October 1, 1872, was 41—males 13, females 28. The institution is open to both white and colored persons. The school has a good assortment of apparatus and the pupils are reported as making excellent progress. The school is in a healthy and prosperous condition.

Fifty pupils are reported as receiving instruction in the last two sessions, 41 being on the list at one time, about as many as the building will accommodate. Larger accommodations are called for, as there are 187 blind persons in the State of legal age to be in the institution. All the pupils, embracing males and females from early childhood to full manhood and womanhood—the white and colored in separate divisions—are taught not only primary and high-school branches of instruction, with vocal and instrumental music, but also handicraft to both sexes. They are taught thus to be a help and comfort to their families, instead of a burden and a care, while their individual capacities for happiness and usefulness are of course immeasurably enlarged.

ARKANSAS DEAF-MUTE INSTITUTE.

This school is located a short distance from the city of Little Rock. The number of pupils in 1873 was 72—males 39, females 33. The buildings are sufficient for the accommodation of only about 75, and it is desirable that steps should be at once taken to increase their capacity, as at least twice that number in the State require instruction. The school is in charge of a corps of competent teachers and the pupils are reported to be making good progress.

For two years there has been no change of principal, matron, or teacher, though one teacher has been added to the list.

As a school the inmates are appropriately classified, each class having its own teacher, an arrangement which secures greater attachment between teacher and pupil, as well as greater general progress. Manual labor is taught, together with the sign-language and the usual branches in the public schools, every effort being made to improve, not the mind only, but the character, the efforts often issuing in a gladdening success.

PROPOSED AMENDMENT OF SCHOOL-LAW.

At a meeting of the board of education, held January 13, 1873, a committee of four was appointed—the State-superintendent being one—to prepare and submit to the general assembly such amendments to the existing school-law as should be found or thought to be necessary.

PROPOSED NORMAL SCHOOL FOR COLORED PEOPLE.

At the same meeting it was resolved that, whereas an industrial university was located on one border of the State, while the colored population was almost exclusively on the opposite border, it should be recommended to the State to establish a normal school at some point convenient for the colored masses of the State and for the special benefit of that class of citizens.

LIST OF SCHOOL-OFFICIALS IN ARKANSAS.

Hon. J. C. CORBIN, *State-superintendent of public instruction, Little Rock.*

COUNTY-SUPERINTENDENTS.

County.	Name.	Post-office.
Arkansas	John McLauchlan	De Witt.
Ashley	R. S. Curry	Hamburg.
Baxter	A. J. Truman	Mountain Home.
Benton	J. W. Hobbs	Bentonville.
Boone	M. Shelby Kennard	Warren.
Bradley	John W. Wofford	Lead Hill.
Calhoun	Willis Robertson	Hampton.
Carroll	William R. Belding	Carrollton.
Chicot	W. H. Benton	Lake Village.
Clark	A. P. Searle	Arkadelphia.
Clayton	T. P. McGovern	Corning.
Columbia	J. T. Story	Magnolia.
Conway	John H. Carse	Springfield.
Craighead	John D. Hillis	Jonesboro'.
Crawford	W. T. Bowland	Van Buren.
Crittenden	Daniel W. Lewis	Marion.
Cross	Briton Rolesen	Wittsburg.
Dallas	William R. Harley	Princeton.
Desha	Jacob S. Ross	Laconia.
Dorsey	Malcom Currie	Toledo.
Drew	Charles W. Preddy	Monticello.
Faulkner	J. M. Clifton	Conway Station.
Franklin	W. H. Martin	Ozark.
Fulton	Stephen F. Dykes	Salem.
Garland	Henry P. Smith	Hot Springs.
Grant	John W. Harrison	Sandy Springs.
Greene	James R. Snodgrass	Gainsville.
Hempstead	Charles Goldburgh	Washington.
Hot Springs	Hugh McCallum	Rockport.
Howard	W. P. McDonald	Center Point.
Independence	William H. Bayne	Batesville.
Izard	J. M. Stackpole	Mount Olive.
Jackson	W. A. Monroe	Jacksonport.
Jefferson	M. W. Martin	Pine Bluff.
Johnson	J. C. Littlepage	Clarksville.
Lafayette	N. T. Little	Lewisville.
Lawrence	Jasper N. Hillhouse	Powhatan.
Lee	J. T. Lamm	Mariana.
Lincoln	D. H. Rosseau	Star City.
Little River	Charles B. Wells	Rocky Comfort.
Lonoke	John S. Spinks	Lonoke.
Madison	Lee Prather	Huntsville.
Marion	James R. Dowd	Sherman.
Mississippi	Leon Roussan	Osceola.
Monroe	H. E. Pinn	Clarendon.
Montgomery	Z. L. Cotton	Mount Ida.
Nevada	W. H. Prescott	Rosston.
Newton	John W. Coen	Jasper.
Ouachita	M. A. Elliott	Camden.
Perry	J. L. W. Mathews	Perryville.
Phillips	Maurice Savage	Helena.
Pike	Moses Hyde	Murfreesboro'.
Poinsett	John H. Levesque	Harrisburg.
Polk	S. H. Kelly	Dallas.
Pope	Robert W. Moses	Russellville.
Prairie	M. M. Yeakle	Prairie Centre.
Pulaski	Dickison Brugman	Little Rock.
Randolph	J. C. Putnam	Pocahontas.
St. Francis	Samuel Liddell	Forrest City.
Saline	Finis Leach	Benton.
Sarber	J. F. Allen	Ellsworth.
Scott	H. Palmer	Waldron.
Searcy	H. N. Davis	Lebanon.
Sebastian	William M. Colby	Fort Smith.
Sevier	H. H. Cleary	Locksburg.
Sharp	Samuel Davidson	Evening Shade.
Stone	John F. Patterson	Riggsville.
Union	W. H. Goodwin	El Dorado.
Van Buren	Peter A. Moses	Quitman.
Washington	George Grace	Fayetteville.
White	Leroy Bates	Judsonia.
Woodruff	Frank W. Meyers	Augusta.
Yell	John Piper	Dardanelle.

CALIFORNIA.

[From report of Hon. Henry N. Bolander, State superintendent of public instruction, for the scholastic year ended June 30, 1873, and from other sources, prepared by Mrs. S. B. Cooper, San Francisco, California.]

FINANCIAL STATEMENT.

Receipts.	1872.	1873.
From State-apportionments	$424,021 85	$430,219 60
Increase over 1871		6,068 71
From county-apportionments	988,636 21	1,179,072 45
Increase over 1871		229,449 59
From district-taxes	261,306 90	362,529 05
Increase over 1871		218,230 12
From rate-bills, subscriptions, and miscellaneous sources	232,075 22	310,592 30
Increase over 1871		98,350 70
Total receipts, including balance on hand	2,131,783 58	2,551,799 07
Increase over 1871		667,192 23

Expenditures.	1872.	1873.
For teachers' salaries	$1,282,799 15	$1,434,366 93
For rent, repairs, fuel, and contingent expenses	277,900 99	275,674 70
For school-libraries and apparatus	30,513 67	29,245 18
For sites, buildings, and school-furniture	290,119 01	374,069 44
Total expenditure for school-purposes	1,881,332 82	2,113,356 25
Increase over 1871		412,147 67

	1872.	1873.
SCHOOL-POPULATION.		
Number of white children between 5 and 15	135,198	139,596
Number of colored children between 5 and 15	874	944
Number of Indian children between 5 and 15	1,279	1,070
Total	137,351	141,610
Increase since 1871		11,494
SCHOOL-ATTENDANCE.		
Number of white children attending public schools at some time in year	92,255	97,018
Number of colored children attending public schools at some time in year	385	458
Number of Indian children attending public schools at some time in year	144	205
Total	92,784	97,681
Increase over 1871		14,053
Average number of census-children belonging to public schools	72,972	78,395
Average number of census-children attending daily	65,709	69,461
Percentage of the total number enrolled	67.55	68.96
Percentage of the average number belonging	53.13	55.35
Percentage of the daily attendance	47.83	49.05
Number of pupils in private schools	13,787	12,507
Decrease in these since 1871		3,017
TEACHERS AND TEACHERS' PAY.		
Number of male teachers	881	882
Number of female teachers	1,420	1,454
Total number of teachers	2,301	2,336
Increase from 1871		284

Average pay per month for males, $84.28; for females, $63.37.

	1872.	1873.
STATISTICS OF SCHOOLS.		
Whole number of school-districts	1,395	1,462
Increase over 1871		136
Number of districts maintaining schools eight months or over		637
Number of districts maintaining schools less than eight months		825
Number of first-grade-schools	318	465
Number of second-grade-schools	643	761
Number of third-grade-schools	693	642
Total number of schools	1,654	1,868
Increase over 1871		318

COMPULSORY EDUCATION.

In his report upon the condition and progress of the public schools of the State, Superintendent Bolander has given special attention to the collecting and collating of data necessary to the consideration of two questions, to which he calls the serious attention of the people and legislature of California.

The first, one of the most important school-questions of modern times, he states as follows:

"How shall we arrest the evils of non-attendance and truancy and secure to every child of the State the rights and benefits of education?" "From a carefully-compiled table of statistics, showing the attendance at public and private schools and the non-attendance and truancy of census-children for a period of eight years, two facts are brought prominently to view, viz, the steadily increasing popularity of public schools with the better portion of the people and the almost inappreciable abatement of the evils of non-attendance and truancy on the part of children that most need them."

PUPILS CHANGING FROM PRIVATE TO PUBLIC SCHOOLS.

"In eight years the attendance at private schools has decreased 21.08 per cent., and 15,294 children, in a total of 141,610, have been transferred from private to public schools. No greater tribute could be paid to the popularity of our public-school-system."

INCREASED RATIO OF NON-ATTENDANCE.

"But, while we are steadily gaining for our public schools the support of those who were at first opposed to them or indifferent, we have signally failed to impress that large class of people who, through self-interest, carelessness, or ignorance, ignore the claims of their children to the rights and benefits of at least a common-school-education. To have reduced in eight years the non-attendance only 3.38 per cent., or by 4,786 in a total of 141,610, and to find that truancy has increased 2.24 per cent., and now amounts to 19,259 in a total of 141,610, is a very discouraging showing for the State."

To the question "What is the remedy?" the superintendent replies:

"Admitted that education forms the only secure foundation and bulwark of a republican form of government, if not of every form of government; admitted that the universality of education becomes thus of vital importance to the State; and admitted that the exigencies of the case not only empower, but compel, the State to provide all the facilities necessary to enable every child to acquire at least a common-school-education, and we are forced to the conclusion that it is not only the privilege but the duty of the State to compel every parent to bestow upon his children at least the education which the State places within his reach."

TEACHERS' CERTIFICATES.

On entering upon his official duties, the State-superintendent appointed a State-board of examination, composed of teachers who were residents of San Francisco. The business of this board was transacted very satisfactorily until the office of the State-superintendent was removed to Sacramento. Then meetings became irregular, and delays almost necessarily occurred in the dispatch of business. The superintendent, hence, had to re-organize the board by appointing teachers resident at Sacramento. Of this board he is, *ex officio*, chairman, and to his office all applications for State-certificates or diplomas must be sent. The qualifications of the higher class of teachers come thus under his observation and he has an opportunity to select the best material for his purposes.

THE SUPPORT OF OUR COMMON SCHOOLS.

The second question to which Superintendent Bolander calls attention relates to the ways and means of providing for every district of the State sufficient and equal educa-

tional advantages. The summaries of statistical information show that, of the 1,462 school-districts in the State in 1873, only 637, or 43.57 per cent., maintained public schools for eight months or more, and the remainder, 825 districts, or 56.43 per cent., maintained them for less than eight months. Thus, while in the centers of wealth and population the children have the advantages of a full year's instruction, for the more remote and sparsely-settled districts of the State the present system proves wholly inadequate, since many districts can maintain schools only from three to six months in the year. During these short school-terms the pupils of such schools only get fairly started in their studies, and, after a ruinous interval, come back to commence again, too often at the former starting-place.

DEFECTS OF THE PRESENT SYSTEM.

The present system goes even further in its injustice: it determines when a district is to be thrust without the pale of the common-school-system; for, should the number of census-children fall below a certain figure—twenty for some counties, up to as high as thirty for others—the present system does not provide funds enough to support in the district a school for three months in every year. Over a hundred districts in the State are thus stricken from the list of school-districts under the law, and this when in many counties the maximum rate allowed by law is levied for school-purposes and when in every county more than the minimum amount of county-school-money is raised.

As the school-law stands at present, the public schools derive their funds, first, from State apportionments, the amounts of which, per census-child, are decreasing in proportion to the increase in the number of census-children; secondly, from county-apportionments, yielding in many counties the largest amounts which the law allows or the people well can bear; thirdly, from special taxes voted by the district.

The superintendent, in considering the disabilities of the law, esteems it not so much inadequate as discriminating most unjustly against the thinly-populated districts of the State in not providing for an equitable apportioning of the funds. At present, the number of census-children belonging to a district determines the amount of funds apportioned to the district, while within a certain limit the number of census-children does not determine the expenses of maintaining a public school: as, for instance, one district may have fifteen census-children, another fifty, still the same amount is needed by each district to maintain a school for a definite length of time; yet the former district may not obtain funds for a three-months school, while the latter, perhaps, receives enough for an eight-months school. In short, the largest schools, the best schools, the best teachers, and the best and most complete furniture, apparatus, and library are given to the district having a sufficient number of census-children, while a district wanting these is proportionally curtailed in its educational facilities. Now, except there is an inherent right in numbers to warrant it, such discrimination is a blot upon the school-system, and should if possible, be immediately removed, or the system fails in the object by reason of which alone it can claim recognition and support, for that object is surely the free and equal education of all the children of the State.

REMEDY PROPOSED.

To get at the matter in the most feasible way, Superintendent Bolander proposes the following method of apportioning State- and county-school-funds, viz: "That for every hundred census-children, or fraction thereof, one teacher be allowed to a district, and for every teacher a certain amount of school-funds." In apportioning according to the number of census-children, he would take as a basis the number of census-children represented by the average attendance at school, not as between counties, but applied only to the districts of a county, so that no injustice be done to those counties which contribute more toward the school-fund than they receive in apportionments; for the fact is, no matter how accounted for, that the average attendance is less than the number of census-children in proportion to the density of population and the length of school-terms.

REPORT OF THE STATE NORMAL SCHOOL.

Number of pupils in attendance, aside from training-school, 118. The board of trustees have ordered an addition to the training-school of two classes of 40 each. The attendance now for the month is 40. In addition to the studies prescribed for the senior-year, the seniors are studying Methods of Teaching, devoting one exercise each day to purely professional preparation. The trustees have determined to connect with the institution a preparatory class. Provision has also been made for a post-graduate-course, open to graduates of this or other normal schools, high schools, colleges, or academies who may present satisfactory evidence of having taught successfully for one year. The instruction here will be, in the main, professional, and to those graduating from this class a professional diploma will be granted. This course will afford to teachers an opportunity to review their studies, to become acquainted with the most approved methods of instruction, and, by the aid of the apparatus with which the school is to be supplied, become more familiar with the means of scientific illustration.

SAN FRANCISCO.

The school-accommodations of this city comprise 46 school-buildings, many of which are substantial, commodious, and handsome edifices, with all the modern improvements in school-architecture. Besides these, the department has 56 rented rooms. The average number of pupils belonging to public schools is 19,720; number of teachers employed in the department, 505, at salaries amounting to $455,976.27. The total annual expenditure for school-purposes was $607,889.34; annual cost per pupil for tuition, $23.12. The estimated expenditures for the coming year are put down at $671,000. The estimated cost of additional school-buildings, which are needed at once, is $352,500. About 3,000 pupils now in attendance at the public schools have to be accommodated in rented buildings, at an advanced rate of tuition per pupil. Superintendent Widber, in his late report, says: "To provide accommodation for these pupils, application ought to be made to the legislature for authority to issue bonds to the amount of $300,000, payable in twenty or thirty years. To prevent the necessity of having to rent in the future, an annual building-fund of about $60,000 ought to be provided, in order to accommodate the yearly increase of school-children."

Comparative number taught.—The estimated population of the city is 175,000; whole number of children under 15 years of age, according to the last school-census, is 54,469; whole number between 6 and 15, (legal school-age,) 32,387; average number belonging to public schools, 19,720; number attending private and church-schools, 5,285—making the total of 25,948 attending school, leaving the approximate number not attending any school, 5,000.

Examinations.—From the annual report of Deputy-Superintendent Swett the following information in regard to the schools is collated:

Two trial-examinations of all the classes of the grammar-grades were held during the year. These examinations were held in writing, on questions prepared by the deputy-superintendent. As a general rule the classes acquitted themselves admirably and the results stimulated the pupils to greater earnestness in study.

A thorough system of oral examinations by experienced examiners has also been pursued during the past year, with the most satisfactory results. Detailed reports in writing were made to the committee concerning the standing of each class in the more important studies, the general order and discipline of the class, and the apparent merits or demerits of the teacher. This was the first official oral examination made in the city of each grammar-class in the department. The information thus obtained was so valuable and the results were so satisfactory, that at the close of the school-year a regular examining teacher-at-large was elected. Written examinations may serve as a basis for annual promotions, but oral examinations have a marked effect in stimulating and encouraging both teachers and pupils. A good oral examiner is a traveling normal-school-instructor, suggesting methods of teaching, and his salary is a trifling expense compared with the substantial educational benefits resulting to the school-department from his services.

Graduation from grammar-schools.—The standard of graduation from the grammar-schools and for admission to the high schools was 70 per cent. of credits on the whole examination. Of the 247 girls that graduated from the grammar-schools, 211 entered the girls' high school; of the 166 boys, 130 entered the boys' high school. The unusually large number of graduates from the grammar-schools the present year furnishes conclusive evidence of the thorough manner in which the first-grade-classes were trained by principals, vice-principals, and head-assistants.

Arithmetic.—The percentages on this study ranged unusually high: 44 pupils gained 100 per cent. of credits and 72 obtained from 90 to 99 per cent. The papers were characterized by remarkable exactness in answers and by good methods of analysis.

Grammar.—In this study about 100 pupils obtained from 90 to 100 per cent. The papers, for the most part, were well written, and many classes ranked exceedingly high.

Geography.—The examination in physical geography was quite thorough, but the pupils stood the test well; 55 gained from 90 to 100 per cent.

History.—The written papers on this study were remarkably good. Nearly 200 pupils obtained from 90 to 100 per cent.

Spelling and reading.—The spelling, both in words dictated from the reader and in all the written exercises, was remarkably good. The mistakes were most numerous, not in the regular spelling-exercises, but in the composition-exercises. The examination in word-analysis was difficult, yet many pupils were perfect and nearly all stood well. The reading, judging by the credits given, was only moderately good. In fact, on account of the number of studies pursued, it is impossible for teachers to give special attention to elocutionary training.

Penmanship.—The specimens of writing from some classes were exceedingly fine and poor hand-writing was an exception. In all grades, from the highest to the lowest, penmanship is very thoroughly taught. Even the children in the lowest grade, at the end of their first year at school, are able to write quite well on their slates.

Composition.—The exercises in this important branch of instruction were quite thorough. Some pupils acquitted themselves well, but few reached a very high standard of excellence. They were generally better in technical grammar—in analyzing sentences and in parsing—than in actually writing English. Training pupils to clearly express their thoughts in correct English is one of the most difficult tasks of the teacher. It requires practice, skill, and patience, and it must be done without the aid of text-books. If less attention were devoted to the abstractions of technical grammar and more care given to plain and practical composition, the study of language would be more interesting and profitable to pupils.

Drawing and music.—Many of the specimens of drawing were exceedingly well done, but some were very poor. On the whole, the examination showed a marked advance over the results of previous years. The first- and second-grade-classes of boys have made good progress in architectural drawing, and the corresponding classes of girls presented fine specimens of perspective drawing at the end of the year. The primary schools have made a good beginning. The school-room-blackboards, covered with well-executed drawings, furnish conclusive evidence of the interest which the children take in their work. The new graded course of instruction in drawing, if properly carried out, cannot fail to result in great practical good. Skill in this line will be of practical value to every boy who may engage in the mechanic arts, and, apart from this, as a means of cultivating taste, this branch of school-study is of great importance. The classes in industrial drawing are in need of charts and models, which can be provided at an expense of a few hundred dollars.

The examination in music was quite satisfactory. The instruction in this branch is so systematically given in the primary grades and lower grammar-grades that most pupils have a fair knowledge of music when they graduate from the grammar-schools.

French and German.—The examination of pupils from the cosmopolitan schools in these two languages exhibited a decided improvement. The questions were very thorough, but many pupils passed creditably in both, and also stood high in their English studies. There were, in all, 60 pupils that passed in one or both of these languages. Ever since the establishment of the cosmopolitan schools there has been a strong tendency to centralize pupils in those schools. Partly to prevent the transfer of pupils from other schools and partly in compliance with the expressed wishes of parents, during the past year a special teacher of French or German has been appointed in several of the grammar and primary schools.

Modern languages in public schools.—There is a difference of opinion as to the extent to which the study of the modern languages can be advantageously pursued in the public schools. In St. Louis, Cincinnati, Cleveland, and many other Western cities, the study of the German language has been extensively introduced. In this city, on account of the cosmopolitan population, instruction in both French and German has been strongly demanded. Some schools are needed for this purpose, but the attempt to introduce instruction in French in many primary schools has proved a failure. This instruction interferes with the English course, and, to a majority of the pupils, the smattering of the language acquired is of no practical benefit.

Phonography.—About one year ago the committee on classification reported in favor of the appointment of a teacher of phonography for a period of three months, on trial, in the first-grade grammar-classes and the boys' high school. As a general rule, the boys have pursued the study with interest and thorough instruction has been given; but it is yet too soon to judge of practical results. Out of the three or four hundred pupils that take up the study it is not probable that many will continue it long enough to become practical phonographic reporters, and consequently there is room for doubt as to the desirability of making it a compulsory study in the common-school-course.

Evening-schools.—These schools have now become an indispensable part of the public-school-system. They confer great benefits on boys who are compelled to leave the day-schools at an early age and on working men who wish to avail themselves of the opportunity of acquiring the rudiments of an education. In these schools hundreds of boys are kept from idling away their evenings on the streets or in low places of amusement. The evening-schools must be fostered and encouraged in every way possible.

During the past year, the average number belonging, in all the evening-classes taken together, was 668, with an average daily attendance of 541. The whole number registered was 746 boys and men and 121 girls and young women. The classes in industrial drawing have been well attended. Suitable models, casts, and charts are needed in these classes.

City evening normal school.—This school was organized about one year ago, mainly for the purpose of aiding teachers already employed in the department to secure certificates meeting all the legal requirements of the new standard required by law. The school opened with an attendance of about 150, which, during the rainy season, fell to 100. The principal studies pursued have been arithmetic, algebra, and grammar, with occasional review-lessons on other topics required in examination. In connection with the regular studies, some attention has been given to methods of teaching; but now that most of the teachers have secured regular certificates it will be possible to give more attention to practical methods of instruction and less to the studies of the schools.

There should be a class in drawing and one for instruction in methods of teaching vocal music.

Changes in text-books.—The school-law passed by the State-legislature, 1868–'69, required San Francisco to conform to a uniform series of text-books. The city-board of education has carried into effect the changes made compulsory by the action of the State-board of education and by State-law.

Some changes were also made in the high-school text-books in order to conform to the series used in the State University, and a few changes were made in scientific books to secure the benefits of modern scientific researches. These changes, however, were comparatively unimportant, on account of the small number of pupils affected by them.

Changes in the course of study.—Several amendments to the course of study were made by the committee on classification and submitted to the board of education for adoption. Some of the features of the revised course, as finally adopted, are as follows:

On account of the time given to industrial drawing, music, and phonography, and in the cosmopolitan schools to the French and German languages, there had been, during the year, a standing complaint of too much work for pupils. For the purpose of simplifying the course it was decided to cut off McGuffey's Sixth Reader in the first-grade-classes, supplying its place by a review of the Fifth Reader used in the second grade, thus saving the cost of one large text-book.

Change in method of teaching geography.—It was the opinion of many teachers, after a trial of several years in the use of these text-books on geography, that too much time was devoted to memorizing lessons from the text-books. Changes have been made to obviate this. In many eastern cities a reduction has been made in the number of text-books on geography, on account of the growing conviction that memorizing hundreds of pages of map-questions and descriptive text is not the best method of acquiring a practical knowledge of the subject. But if, at the end of the year, the teachers think that the method of teaching physical geography by means of relief-globes, maps, charts, and oral lessons, is too difficult or is impracticable, the course will, doubtless, be modified so as to allow the Monteith's Physical Geography to be continued in the two higher grades. Grammar is to be commenced in the second grade, instead of the third, the elements of grammar taught orally in connection with reading-lessons and practical exercises in writing English being held more useful to beginners than the memorized definitions of the text-book.

Similar changes have been made in the matter of spelling, distributing the work of two years through four years, and so diminishing the amount of work to be done each year.

Pupils fail in English composition.—The examination-papers from our schools for several years past have shown conclusively that, while many pupils are well up in definitions, parsing, and analysis, comparatively few are able to write English with even a tolerable degree of accuracy or elegance.

Introduction of the Grube system of teaching arithmetic.—In arithmetic, the new course, in addition to the former text-book-work, includes a course of oral instruction in the various combinations of small numbers, according to what is known as the "Grube system." During the year one or two low-grade-classes in each of the large primary schools were trained according to this method, with the most unqualified success. The main object of this method is to teach the four elementary rules by keeping the pupils limited to small numbers within the range of their comprehension. It requires the use of no text-book by either teacher or pupil, but does require some effort and originality on the part of the teacher. Provision is also made in the primary grades for instruction in the use of decimal and common fractions, limited to small numbers.

Greater attention given to English composition.—Exercises in writing English are introduced at an early age and are continued throughout the whole course. The necessity for greater attention to composition will be evident from reference to the examination-questions on grammar and composition, in which specimen-sentences, selected from compositions written at trial-examinations, are given to be corrected.

These changes have been made after a careful examination of the revised courses of study for eastern cities, and, if carried out in the right spirit, will unquestionably result in pleasanter and more profitable work, both for pupils and teachers.

School-directors.—The method of choosing school-directors has been a notable improvement during the past year upon the old plan. The new law provides for their election at large from the whole city, instead of choosing them from each separate district or ward. This reform is in consonance with the idea that each school-director owes his allegiance and service primarily and pre-eminently to all the public schools of the city, rather than to the particular schools that constitute his own district. It is a safeguard, too, against unjust political control, which works injury to the public-school-system.

Co-education of the sexes.—There is a perceptible movement of public opinion toward the natural association of the sexes in the different grades of all the schools. Present appearances indicate the gradual extension of mixed schools, and, at no remote day, it is confidently hoped they will include all the departments.

Salaries.—During the year, the pay of primary as well as grammar-assistants, after four years' approved service, has been increased from $67.50 to $70 a month, an advance of $30 a year upon previous rates. This exceeds the salaries paid to similar positions in any other city of the Union.

Could the requirements for admission to the teachers' corps be correspondingly raised and the time of probation proportionally extended, the raising of the salaries of the lady teachers would become still more equitable in itself and profitable to the public, whose money pays such salaries.

New course of study.—The features of the new course are fewer topics in each principal branch and more thorough work upon each. It steadily progresses with increasing satisfaction.

In connection with this, President Gilman, of the State University, with the anxiety for thorough foundation-work which ever characterizes the true educator, has conferred with the principals of the public schools, with a view to secure a still more progressive and symmetric arrangement of the course of study in all the public schools, that it may become more harmonious and practical, from the lowest primary grade to the highest department in the university-course.

Private educational institutions.—The total number of colleges and private schools in the city of San Francisco is about 75. Of these 17 are under the control of the Roman Catholics. Many of these schools are in a very flourishing condition. Total number of children between 6 and 15 years of age that have attended private schools for the year, 5,005. The number attending public schools for the same period, 20,202. There are also about 1,100 under 6 years of age at the different infant-schools and about 900 at the higher private schools and colleges.

SACRAMENTO.

The value of school-lots, furniture, and fixtures is estimated at $118,000. The schools consist of one high, one grammar, four intermediate, two ungraded, (one of them for colored children,) and nine primary. The schools are kept open ten months in the year, at an annual cost of $53,215. Total number of children under 15 years of age, 6,099. Total number of scholars enrolled, 2,421. Average daily attendance, 1,949. Number of scholars studying German, 149.

Private schools.—The German-Lutheran school, Rev. Matthias Göthe, principal, is in a most flourishing condition. It numbers some 160 scholars between the ages of 6 and 15.

The Sacramento Seminary is a school for young ladies, established in 1863, Mr. and Mrs. Hermon Perry, principals and proprietors. It is well patronized and flourishing.

OAKLAND.

The school-department has grown very rapidly within the last year. Children between 5 and 15, entitled to State apportionment, 2,292. Children under 5 years, 1,110. Attending public schools, 1,241; attending private schools, 289; attending no school, 410.

There are one high school, two grammar-schools, four primary schools, one cosmopolitan school, and one ungraded school, with a total of 35 classes. The average monthly enrollment is 1,462; average number belonging to the schools, 1,359; average daily attendance, 1,266. Number of pupils examined, 1,263; number promoted, 737.

SECONDARY EDUCATION.

Information has been received in regard to the following institutions:

(1) The Mills Seminary, Brooklyn, Alameda County, opened in 1871, with pupils from three-fourths of the States of the Union, with some from Mexico, the Sandwich Islands, England, Germany, and France. Twenty-three instructors have had here under their training more than 400 pupils in the last two years and a class of 35 young ladies has been graduated. It has recently received from W. H. Raymond, esq., $5,000 for the endowment of two free scholarships.

(2) Young Ladies' Seminary, Benicia, established in 1852. It has been the pioneer-school of Protestant California and still prospers. Number of instructors, 8, and of students, 72, of whom 30 are in a preparatory and 42 in a collegiate course.

(3) San José Institute and Business-College. This is mainly a day- and boarding-school for both sexes, having an academic department and business-college in addition to primary, intermediate, and grammar-schools. Number of teachers, 8; of pupils in the academic department, not given. The business-college is conducted on the now established plan of actual business-transactions and is said to rank in efficiency with the best in the State.

(4) The Golden Gate Academy, Oakland, especially intended as a training-school for those who wish to enter first-class colleges or the University of California, as well as for those who propose to enter, without collegiate instruction, the Pacific Theological Seminary, near which it is located. Although in operation but two years, it has 90 students, under the care of 4 resident teachers, besides supplementary instructors in drawing, music, and modern languages. It is the aim of the trustees to make this an

academy of the same high grade as the Phillips Academy at Andover, Massachusetts, or the Williston Seminary at East Hampton.

(5) Urban Academy, San Francisco. In operation for 9 years. A preparatory school for college; much attention is also given to modern languages. Teachers, 5; number of scholars, not given.

(6) Napa Collegiate Institute, Napa City, with 4 male and 4 female teachers, 3 years in its course, and 130 pupils. Drawing and music are taught; 30 pupils in the classical course; 10 in that of modern languages. There is a small chemic laboratory and cabinet of philosophic apparatus, with a library of 300 volumes.

(7) Notre Dame Academy, Mission Dolores, San Francisco, with 11 female teachers and an average of 300 scholars. Nine years in course; drawing, music, and modern languages embraced in it. Library, 1,000 volumes.

(8) Laurel Hall, San Mateo, with 2 male and 5 female teachers and 35 female pupils. Course, 4 years, embracing English, French, and German, of which last two languages 30 of the pupils are students; drawing and music taught; there is a small collection of philosophic apparatuses and a library of 250 volumes.

(9) Grass Valley High School, with 2 male and 2 female teachers and 70 male and 50 female scholars. Three years course, embracing the classical and modern languages, 15 being engaged in the study of the former and 5 of the latter. A chemic and philosophic apparatus and a library of about 300 volumes.

(10) The Vallejo High School, with 2 male teachers, 16 male and 24 female pupils. Course, 3 years, embracing classical and modern languages, 25 students being in the former. Library, 50 books of reference.

PREPARATORY INSTITUTIONS.

For the preparation of students for colleges, universities, or scientific schools, there are the California Military Academy at Oakland and the Oakland High School, with an aggregate of 258 students, 182 in scientific and 76 in classical studies. The 133 students in the military academy all pursue a scientific course, the first (or highest) class numbering 10, the second 42, the third 53, and the fourth 28. There are 10 instructors. The value of grounds and buildings is $85,000; the school has a library, a chemic laboratory, a cabinet of natural history, a philosophic cabinet and apparatus, and a gymnasium. Oakland High School has 125 pupils, 49 in scientific and 76 in classical studies; there are 3 years in course; the advanced class numbers 22; in the senior grade are also 22; in the junior, 28; and in the third, 53. There are 3 regular and 3 special instructors. The library numbers 400 volumes; there is a small cabinet of natural history and a philosophic apparatus.

CALIFORNIA INSTITUTION FOR EDUCATION OF THE DEAF, DUMB, AND BLIND.

The receipts here from all sources to August, 1873, have been $89,389.38; the expenditures, $89,190.62. The deaf and dumb pupils received have been 13; the blind, 17; discharged, of the former, 8; of the latter, 7; died, 1; remaining number, 93. The inmates are now clothed, as well as fed and taught, at State-expense; an organ has been put up in the chapel from a fund contributed by private persons and efforts are in progress to beautify the grounds and improve the entrance to the building. Mechanical and musical training are added to the literary, the musical being of course for the blind alone; and it is said that there is every reason to be satisfied with the progress of the pupils in their studies, the deaf and dumb having gone from Peet's Elementary Lessons up to algebra and natural theology through the various intermediate books and the blind through written and mental arithmetic to algebra and geometry, with history, physiology, political economy, mental philosophy, &c.

UNIVERSITY OF CALIFORNIA.*

This institution entered upon its fifth annual session September 23, 1873, in the occupancy of the halls erected for it by legislative grants, on the hills at Berkeley, overlooking San Francisco.

The courses of study at Berkeley are divided between two faculties, closely co-operative with one another and usually meeting as a single body.

I. *The College of Letters.*—This includes the usual classical course, with instruction in Greek, Latin, German, French, mathematics, and the elements of natural science. The degree to which it leads is that of bachelor of arts. A modification may be made in this course, substituting for one or both of the ancient languages certain other studies in modern literature and science, and the degree for this course will be bachelor of philosophy.

II.—*The Colleges of Science and the Arts.*—These include colleges of agriculture, engineering, and chemistry. They provide an introductory course of two years in mathematics and the elements of natural science, and in German, French, and English, with advanced courses of two years each, in which the studies are chiefly in the spe-

* A larger space than can usually be given to a single institution is bestowed on this, (1) because of its importance as the university of the chief Pacific State and (2) because it seems likely to become a pattern of the highest style of training for the whole group of the Pacific States.

cialties first named. Other specialties, such as mining and mechanical engineering, will from time to time be added. The degree in the colleges of science and the arts is bachelor of philosophy. The students in the several courses are required to obtain knowledge of other subjects than those which distinctively pertain to their specialty, the object being to provide a liberal culture, adapted to the various callings of modern society.

Special students, properly qualified, may pursue the study of particular branches without following in full any prescribed course; but this permission is accorded only to those who have already attained to a considerable proficiency in knowledge. When such students give all their time to study in the university, they are distinguished by the designation of "students-at-large" and are subject to all the regulations of the university.

Courses of instruction.—The courses of instruction may be grouped briefly as follows:

Military science, including tactical instruction in the field and lectures on the art of war.

Physics and mechanics, by means of lectures and recitations, accompanied by experimental demonstrations and the solution of practical problems.

Geology and natural history, commencing in the sophomore-class with botany, followed by the physiology of vegetable growth and reproduction, zoölogy, and geology.

Mathematics, which includes algebra, geometry, trigonometry and mensuration, analytic geometry, differential and integral calculus.

Agriculture and agricultural chemistry, by experimental and illustrated lectures, recitations, essays, and class-discussions, and in the practical application of principles upon the university-grounds. The university-domain is being developed, with a view to illustrate every capability of the State for special culture, whether of forests, fruits, or field-crops. It will be the station where new plants and processes will be tested, and the results made known to the public.

Latin and Greek, in which Professor Kellogg, with aid from Professor Bunnell, will aim to bring out the relations of those languages to our own, prominence being given in the classical course to such works, preceptive or illustrative, as bear on the art of public speaking.

Modern languages, in which the study of French and German is required of all the candidates for a bachelor's degree, while the study of Spanish and Italian is optional.

English language, rhetoric, and history, including the Anglo-Saxon tongue and the history of English literature, the science of rhetoric, the practice of composition, and the study of ancient and modern history.

Civil engineering and astronomy, by means of recitations, lectures, and the use of text-books, globes, charts, and works of reference, instruction in the engineering department being strongly re-enforced by the employment of valuable models of bridges, trusses, arches, topography, &c., and numerous diagrams and photographs of the most important and celebrated engineering structures throughout this country and Europe.

Chemistry and metallurgy, the course in chemistry extending through three years, students of the junior and senior classes pursuing the general principles of the science and their application to analytic and metallurgic chemistry and to mineralogy, and spending fifteen to twenty hours a week in the laboratory.

Geodesy and astronomy, including the theory and use of astronomic instruments and the solution of the various problems arising in practical astronomy.

College of law.—Professor Field will have charge of this department when the full organization of the university shall have been completed.

Fine arts, (optional studies.)—Students already proficient in the studies laid down in the general scheme, who have extra time at their disposal, may, with the permission of the faculty, pursue, under competent instructors, a further course in drawing, German, Spanish, and Hebrew.

Lectures.—During the winter, a special course of lectures is annually given by the president and professors of the university, under the auspices of the Mechanics' Institute of San Francisco.

Library, collections, and gifts.—The library of the university numbers over eleven thousand volumes. It has been largely increased by generous donations during the past year.

President Gilman.—To the indefatigable efforts of its laborious president the university is largely indebted for its success. A recent article in the Overland Monthly, which has been from the beginning the exponent of whatever was best in the literary influences of the Pacific coast, says of him:

"There are some men who have a talent for turning everything touched by them into gold. All ventures turn out fortunately There is a better gift than this: it is the half-unconscious power of influencing other men to bestow their wealth wisely and beneficently, the faculty of enlisting the interest of others in a good cause. When the University of California found such a man, it was started on a new career of prosperity. There was no perfunctory begging to be done, no preachments

about the value of a liberal education, and no poor face to be made up. Busy men lent a willing ear when there were a few quiet utterances from a full and generous mind. It never before seemed so good and grand a thing to put broad shoulders to this and that plan for helping the university, and to push these plans up to a successful termination. A suggestion dropped here and there wisely was enough. A strong man, who puts his soul into the work, carries with him the inspiration of hopefulness. Every body else is made hopeful, and out of this spring plans, suggestions, and quiet benefactions. The hearts of many have hence warmed toward the university as never previously and a growing interest has been manifested by a large increase of gifts. When Agassiz wanted money for his museum, he had only to name the necessary sum to find it at his disposal; so President Gilman asks for nothing in vain."

SANTA BARBARA COLLEGE.

This institution was organized in 1869. It contains a school for both sexes. Special attention is given to physical culture, as it has an excellent gymnasium, fitted up with all the apparatus necessary for practicing both heavy and light gymnastics. Modern languages, music, natural sciences, philosophy, history, Latin, Greek, and mathematics are taught by the best instructors.

FRANCISCAN COLLEGE.

Location, Santa Barbara. Opened for students 1868. Affords a good English and classical education at the lowest possible cost. Library of 2,500 volumes. Expenses for session of ten months, $200.

COLLEGE OF ST. AUGUSTINE.

Located at Benicia. The aim of the college is to give a thorough physical, mental, and religious training: health, learning, and a Christian character. Military instruction is given daily, and all cadets are required to participate in the drill. Number of students, 124; number of instructors, 10. Two terms of twenty weeks each; $175 per term.

COLLEGE OF NOTRE DAME.

It is located at San José, with 2 male and 21 female teachers; 350 students in a preparatory course and 36 in a collegiate, which latter includes music, drawing, painting, French, German, and Spanish. A philosophic cabinet, natural-history-museum and gymnasium are possessed, and a library of 2,000 volumes.

PACIFIC METHODIST COLLEGE.

Location, Santa Rosa. In a prosperous condition; 259 students in attendance the past year. The faculty consists of six professors and four instructors. A. L. Fitzgerald, principal.

The following table embodies the latest returns for 1873:

Statistical summary of universities and colleges.

Names of universities and colleges.	Corps of instruction.	Endowed professorships.	Number of students.		Corporate property, &c.						Number of volumes in library.
			Preparatory.	Collegiate.	Amount of property of corporation.	Value of grounds, buildings, and apparatus.	Amount of endowment.	Amount of productive funds.	Income from productive funds.	Receipts for last year from all other sources.

*No report for 1873.

PACIFIC THEOLOGICAL SEMINARY.

This seminary commenced its work of instruction in San Francisco, in 1869; in 1871 took possession of the property which it now holds in the city of Oakland. It has graduated two classes in the full course of three years and one in a two-years course. It has two professors, who give their whole time to instruction.

Besides this institution, nearly $70,000 is pledged toward the endowment of a Presbyterian theological seminary in San Francisco.

MEDICAL COLLEGE.

The real estate and other property of the Toland Medical College has been donated recently, by its founder, to the State University, under whose auspices its operations will hereafter be conducted.

The Medical College of the Pacific is now the medical department of University College, and numbers, in its efficient corps of professors, some of the most eminent physicians in the State.

HEALD'S BUSINESS-COLLEGE.

The leading commercial school of the Pacific coast. Over 600 pupils in attendance during the past year. Until recently, ladies have not been received into the college, but they are now admitted into all the school-departments. There are now 25 ladies in attendance. A telegraph-institute is connected with the college; number of instructors, 14. The system of instruction is so thorough and practical that the graduates are fitted to pass from the school-room to the counting-room.

SACRAMENTO BUSINESS-COLLEGE.

Founded 1873. A practical business-training school for the young and middle-aged of either sex. Open day and evening throughout the year. Scholarship for full course, good for one year, $75; number of students in attendance, 150; number of teachers, 4.

PACIFIC BUSINESS-COLLEGE.

Located in San Francisco. Founded in February, 1865, by Prof. M. K. Landen; faculty numbers 14. The college embraces five departments: commercial, assaying, telegraphy, academic, and preparatory; number of students, 453. Both sexes admitted.

CALIFORNIA ACADEMY OF SCIENCES.

Organized in 1853. President, George Davidson. Renewed interest has been awakened among those of scientific instincts by a visit from Professor Agassiz during the past year. His stirring appeal in behalf of science at the reception given him by the academy aroused an extensive desire for scientific study and investigation. As a consequence, an addition of 78 resident and corresponding members and 11 life-mem-

bers has been made to the academy, making a total of 175 members, and Mr. James Lick, a pioneer of the State, who has amassed a princely fortune, has made it a generous gift of land. He also proposes the magnificent scheme of erecting an observatory upon the Sierra Nevada, 10,000 feet above the sea, with every variety of apparatus commensurate therewith, including a telescope of the largest size and most consummate workmanship, with masters of observation and with ample funds reserved to devise other instruments and methods. Years hence the James Lick Observatory may be not only the pride of the State, but of the nation.*

Additions to the museum of the academy have been liberal and are of great value and interest. Harry Edwards, esq., has made rare and valuable gifts to this department. The library, however, is still sadly deficient. Much material collected on the coast cannot be described for want of works of reference, and, of necessity, must await description or identification or be sent East, when the credit accrues to others. The academy is about to secure more commodious quarters.

THE SAN FRANCISCO ART-ASSOCIATION.

The San Francisco Art-Association has recently received from Europe casts from the antique, with other models and studies, intended for the use of the school of design to be established under its care. The school will soon be in operation. Properly managed, under competent teachers, it will mark a new era in the educational history of California; will develop and utilize a great deal of nascent capacity, not to say genius; will increase the amenities of local society and elevate the character, while enhancing the rewards, of local industry. The laws of the State have long made provision for elementary art-instruction. Drawing is, and has been for many years, taught in the public schools, though only to a slight extent outside of the cities. There is, of course, a deficiency of skilled teachers in this specialty, and the tendency has been toward mere conventional work after formal copies, whence little originality and nature-work have resulted. Still, any instruction in an art which trains the fingers and eyes, and makes the mind more observant of form, is better than none. Common-school drawing-tuition is improving, and the extension of its advantages in decorative, architectural, and mechanical branches to the night-schools is especially gratifying. Still, with every improvement of the common-school elementary system, there must be needed an academy exclusively devoted to art-tuition, aiming at fine art, at high art even, and meant to develop designing capacity in various departments. The common schools cannot well have casts; hence drawing from the round, and ultimately from life, must be done in the academy of the art-association, which will also be able to command the services of teachers experienced in the foreign schools and methods, who are both good draughtsmen and good colorists. Upon the employment of such teachers will depend the success and merit of the San Francisco school of design.

Growth of the association.—Thus far, the association has advanced with wise and well-considered steps toward its grand aim. Organized on a very popular plan, which attracts members from the class that aims at social enjoyment or display, it has been able to accumulate the nucleus for both a library and a school. With only a score or two of members at its start, two years ago, and no rooms but what it leased occasionally for a single night, it soon made its receptions the most refined social events and attracted a membership sufficient to justify it in having permanent and convenient rooms. In these quarters it has been able to give several fine public exhibitions, embracing numerous admirable foreign pictures in addition to the increasingly good work of resident artists. Latterly, the artists have formed the Graphic Club in connection with the association, and meet in its rooms weekly for impromptu sketching on a given theme. The efforts of the association have given a higher status to the profession of art, have fostered good feeling, fellowship, and healthy competition among the artists, and have awakened a wide interest in the subject of art-education.

Membership and resources.—Its membership numbers now over 600, of whom about 80 are life-members, whose fees of $100 each have helped to pay for fitting up rooms and starting an art-library, leaving a balance of $5,000, which is drawing interest at the rate of 1 per cent. a month. The monthly dues meet all current expenses and the exhibitions, although the admission-fee has been hitherto very small, afford a small profit. Through the friendly influence of the French consul, the French Government was led to present the association with a very valuable set of casts, which, with other casts and flat studies bought by the association, will serve to equip a school of design. The association also possesses a valuable small library of text-books on art, partly the gifts of liberal friends and partly bought. It will need both more material and more money to put its school on the right basis; but it can hardly be that it will fail of all the support it requires. Many of its members are wealthy and influential, and, besides what they may do, the legislature may make an appropriation in furtherance of its important objects. The school of design may be made an adjunct of the State University, without

*In the New York School Journal of November 22, it is stated that a site for this observatory has been selected on a promontory running out into Lake Tahoe, 6,518 feet above the sea-level, within thirty hours' travel from San Francisco, and where there is never more than 4 feet of snow.

either saddling it upon the latter or destroying the mobility of its plan or the individuality of its management. Aided by the State, as one of the colleges forming the university, it would be open to the students of the latter, as well as to the drawing pupils of the common schools who had sufficiently advanced in the simple elements. Public and private means and influence would thus be combined to make an efficient institution, which might still be kept under the management of adepts and disinterested friends. Until such an arrangment can be made, the school of design must exact fees from pupils sufficient to meet the costs of tuition; for, after fitting up and furnishing the schoolroom and providing casts and studies, the most the association can afford to do from its present income is to give rent and gas free and supervise the business, though in addition it may have to meet any deficiency in the pupilage fees and guarantee to teachers the payment of their salaries.

SCHOOL OF MECHANIC ARTS, SAN FRANCISCO.

President Gilman, of the University of California, delivered on the evening of January 3, 1874, before the Mechanics' Institute of San Francisco, a lecture on "The modes of promoting scientific and industrial education in large towns," describing the systems of the Massachusetts Institute of Technology, the Worcester Free Institute of Science, the art-schools of Boston, and the Cooper Union, New York. In concluding he read an interesting correspondence between himself and certain leading citizens of San Francisco, in which, on his part, was stated the need of establishing in the city a school of the mechanic arts and on their part was pledged the sum of $15,000 annually for two years for the establishment of such a school. After reading the two letters, the president said: "Gentlemen, the thing is done. It will not be long before plans will be drawn, and we shall witness the aspirations of our hearts. I hope you will appreciate the enterprise and help it."

The money pledged is, according to a plan of President Gilman, to be deposited with three or five trustees, who, with the advice of a council of seven, shall disburse it and manage the whole enterprise. A man of scientific education, acquainted with the industrial applications of science, is to be made director of the school, with a corps of from five to ten assistants in the various branches of industrial science and art. Popular lectures on the most recent and useful discoveries in these lines are also to be provided for, these lectures to be delivered in the evenings, or early mornings, or holiday-times, at which the industrial classes can attend. The instruction given is to embrace chemistry, mechanics, industrial drawing, the study of the earth and its resources, and, in domestic and political economy, the conditions of social and individual happiness.

HANDEL AND HAYDN SOCIETY.

The Handel and Haydn Society was organized in 1866 and incorporated under the code in 1873. Ira B. Rankin is president.

The membership, exclusive of life and honorary members, is 186. The average attendance at weekly rehearsals is about 100. The society is out of debt, with a fund of upwards of $2,000 in bank. Its library consists of the oratorios of Elijah, The Creation, The Messiah, David, Sampson, The Hymn of Praise, and St. Peter, from 100 to 150 numbers of each.

EDUCATION OF THE CHINESE.

Neither the State nor the city of San Francisco does anything for the education of the Chinese. There are no public schools for them. There are some twelve thousand in the city of San Francisco alone and several times that number in the State. The number of Chinese children in the city is estimated at about two hundred. The Chinese pay something like one-twentieth part of the tax of the city, of which a proportion is for schools; yet for their benefit there is no public school, either day or evening. The teaching of the Chinese is confined entirely to the work of benevolent institutions.

PRESBYTERIAN MISSION FOR CHINESE.

This mission is in charge of Rev. A. W. Loomis, D. D., and Rev. I. M. Condit. It was established some twenty years ago and is supported by the Missionary Society of the Presbyterian Church. It is an evening-school for adults and boys. The average number in attendance the present year is nearly one hundred. These are in all grades of advancement, from alphabet-scholars to such as read intelligently. There are also classes in grammar, geography, arithmetic, and history. The Chinese are all eager to learn English and many of them show much facility in acquiring it. These pupils are of various grades, some connected with business-houses, some in work-shops, and some servants in families. There is a growing inclination with those who have been longer under educational training to conform to American ways and customs. There are connected with this school religious services in their own language, which are largely attended and by which many are brought to understand our religion.

But, after all, the great instrumentalities for bringing this people to a higher state of

26578

civilization come from contact with our enlightenment and a knowledge of our language, arts, and sciences. Much can be accomplished among the adult portion of this people, but the great work must be done among the young. This feature of the work is improving, as the number of children is on the increase and more and more of these attend the schools. The increase must be necessarily slow, as there are yet but few Chinese families. The Sabbath-schools for the Chinese connected with the churches are having a marked effect upon their improvement, as well as the day-schools.

MISSION DAY-SCHOOL FOR CHINESE.

In charge of Mrs. C. H. Cole and under the direction of the Ladies' Union Society of San Francisco. There are 54 children of Chinese parentage, ages ranging from 5 to 16 years. The school has two daily sessions, English being taught in the morning by Mrs. Cole and Chinese in the afternoon by a native teacher. Both sexes are in daily attendance.

METHODIST MISSION FOR CHINESE.

Mission-house erected in 1870. On the main floor are three school-rooms; on the second floor, two. The third floor contains four fine rooms, used as an asylum for Chinese women and girls who may be saved from lives of slavery and shame. Total cost of property, $32,000. The schools are graded into four classes, employing four experienced teachers, and are open every evening of the week, except Saturday. Tuition, $1 per month.

BAPTIST MISSION FOR CHINESE,

Rev. John Francis, of the American Baptist Home Mission Society, is in charge of this school, with one Chinese and six American assistants.

EDUCATION OF THE SOLDIERS OF THE UNITED STATES ARMY.

The report from headquarters Military Division of the Pacific, General Schofield commander, says: "Each post in the Army has a post-fund, which accrues from the savings of the post-bakery. A council consisting of the three officers next in rank to the commander controls this fund, one authorized expenditure for which is post-schools. The chaplain of the post is the school-master, and where there is no chaplain, a non-commissioned officer is appointed school-master by the council. The children of the soldiers can go to this school and any of the soldiers, but attendance is not compulsory. There are no data giving the number of scholars in actual attendance upon these schools."

MECHANICS' DELIBERATIVE ASSEMBLY.

Location, San Francisco. The objects of this association, as stated by the president, are: "to discuss labor-reforms, and more particularly a system of labor-schools, wherein boys and girls may labor and learn a trade as part of their education in the common schools; to prepare bills for laws to carry out their conclusions and to present them to the legislature for adoption."

In pursuance of these ideas, Hon. E. D. Sawyer, chairman of the assembly's committee on education, reported, on May 14, 1873, resolutions recommending the establishment of a training-ship, where boys may be sent and daily instructed in the rudiments of an English education and in seamanship, to be thereafter shipped, as soon as practicable, into the marine service. On the 28th of May, Col. J. C. Zabriskie offered resolutions in relation to labor-schools to embrace both male and female pupils, which were referred to the committee on education. The resolutions of Judge Sawyer had meanwhile, at his request, been referred to a committee, who reported that they had an interview with the city-board of supervisors, a majority of whom were favorably impressed with the proposal to establish a training-ship in the bay of San Francisco. The committee had also opened, through Senator Sargent, a correspondence with the Navy Department, at Washington, and found that the proposition met with favor there. On the 22d of October, a committee, to whom the preparation of bills upon the subject had been referred, reported back two bills, one giving the city-board of supervisors charge of the training-ship and the other giving the board of education charge of the labor-system in the common schools. The report of the committee was accepted and it was instructed to consult with members of the legislature and endeavor to secure the passage of these bills.

PROTESTANT ORPHAN ASYLUM.

During the year 244 children have found a home in this pioneer-charity of the State. During this period 67 have been removed by friends, 27 have been placed in families, and 7 have been adopted, leaving 143 at present as inmates of the asylum. Of this number, 125 attend school. This institution has been the recipient of several handsome legacies during the year: one of $25,000, from Abner Barker, esq.; one of $3,000, from C. J. E. Fahlstein; another of $3,000 from William Pierce.

PACIFIC HEBREW ORPHAN ASYLUM AND HOME SOCIETY.

Total number of children in the asylum, 25, 3 being provided for in private families. The affairs of the home are in a most favorable condition, the members and patrons having nearly doubled during the past year.

LADIES' PROTECTION AND RELIEF SOCIETY.

The present year has been a prosperous one with this noble charity. There are 134 pupils in the school, which is divided into three departments, viz: infant, intermediate, and grammar. The most advanced classes in the highest grade study mental and written arithmetic, physical geography, word-analysis, grammar, and composition. There are singing-lessons to all the pupils twice every week.

SACRAMENTO PROTESTANT ORPHAN ASYLUM.

The buildings have been greatly improved during the year. The family, at the commencement of the year, numbered 60. During the year 36 have entered and 25 have been provided with homes. There are at present in the institution 55 orphans.

ST. JOSEPH'S DAY-SCHOOL AND HALF-ORPHANAGE.

Location, Sacramento. This institution is under the management of the Sisters of Mercy and provides, in the course of the year, for a large number of unfortunate children.

GOOD TEMPLARS' HOME FOR ORPHANS.

Location, Vallejo. Property valued at $40,000. It shelters 60 children. It is open to the homeless children from all portions of the States of California and Nevada. It is in no sense exclusive: it receives all. A school, under the management of a competent teacher, is one of the features of the institution.

ROMAN-CATHOLIC ORPHAN ASYLUM.

Location, Bay View, near San Francisco. In charge of the Sisters of Charity. There is a farm of 53 acres, on which is established, also, a branch institution for very young children, called the St. Joseph's Infant-Asylum. This charity accommodates about 800 children. The comfortable appearance of the several hundred little ones provided for by this institution and the care given to their education and development speak audibly of the benign influence of the guardian sisters and of the true liberality of the community in their noble efforts to lend a helping hand to the fatherless.

INDUSTRIAL SCHOOL.

The City and County Industrial School, located in San Francisco, has had under its charge 440 boys and girls during the past year. There are connected with the school a shoe-shop, a tailor-shop, a seamstress-department, and a laundry. The division of time is as follows: work, 4 hours; school, 4½ hours; sleep, 9 hours, and the remainder of the 24 hours is left for meals and recreation. The institution was turned over to the city in 1872 and is now in good order.

LIBRARIES OF CALIFORNIA.

The table of the libraries of the State does not include the many small libraries attached to public and Sunday-schools, nor the large private libraries of individuals, by including which the figures would be greatly enlarged, the number aggregating over 200,000 volumes. The many different associations maintaining libraries are very noticeable, among which the Odd-Fellows show most prominently, the library of that society in San Francisco being one of the largest and best selected in the State.

Expenditures.

For teachers' wages	$888,871 89
For fuel and incidentals	110,202 90
For sites and buildings	319,025 55
For repairs	65,224 56
For libraries and apparatus	7,945 80
For other school-purposes	137,169 37
Total expenditures for public schools	1,528,440 07
Increase over the preceding year	31,459 12

The figures given above are from special returns to the Bureau in 1873, but cover the same ground as those in the State-report for the year ended August 31, 1872, and exactly correspond with them.

The amount of revenue from school-fund distributed Feb. 28, 1873, was	$132,943 00
Dividend per child, as before, about	1 00

SCHOOL-ATTENDANCE.

Number of children of school-age, (4–16)	131,748
Number registered in winter-schools	94,787
Number registered in summer-schools	83,874
Number of different scholars registered in the year	114,805
Increase over last year	1,217
Number registered who were over 16 years of age	3,642
Number in other than public schools	9,029
Number between 4 and 16 in no school	13,512
Number in schools of all kinds	123,834
Average attendance in winter-schools	67,599
Average attendance in summer-schools	58,113
Percentage of school-population registered	87.14
Percentage of school-population registered in winter	73.49
Percentage of school-population registered in summer	63.66
Percentage of school-population in schools of all kinds	93.99

TEACHERS AND TEACHERS' PAY.

Number of teachers in winter—males, 715; females, 1,762	2,477
Increase for the year—males, 16; females, 41	57
Number of teachers in summer—males, 198; females, 2,240	2,438

Increase for the year—males, 12; females, 46	58
Number of teachers continued in the same school	1,508
Number of teachers who never taught before	580
Average wages per month of male teachers	$67 01
Average wages per month of female teachers	$34 09

SCHOOL-DISTRICTS AND SCHOOLS.

Number of towns in the State	166
Number of school-districts	1,521
Decrease for the year	14
Number of public schools	1,638
Increase for the year	8
Number of departments in public schools	2,348
Increase for the year	58
Number of schools of two departments	104
Number of schools of more than two	128
Whole number of graded schools	232
Increase of these three classes for the year	14
Average length of winter-schools in days	98.44
Average length of summer-schools in days	74.90
Average length of public schools for the year	8 mos. 13½ days.
Increase for the year	1 day.

SCHOOL-HOUSES.

Number of new school-houses erected in the year	42
Number reported in good condition	873
Decrease for the year	20
Number reported in fair condition	520
Increase for the year	18
Number reported in poor condition	254
Decrease for the year	14

STATISTICS.

The statistics of the report from which this abstract is compiled relate to the school-year closed August 31, 1872, and were presented to the general assembly in May, 1873. They furnish clear evidence of popular interest in public schools. A decade-table included in them, and reaching from 1864 to 1873, is specially significant. During the period covered by this table the increase in the number of children enumerated was 21,257; in the amount raised by town-tax, $566,981.11; in the amount raised by district-tax, $388,559.56; in the amount from all sources, $1,052,214.81. Ten years ago the amount raised per child was $3.54; now it is $10.95. This advance has been steady, each year witnessing a marked increase in the amount for schools raised by taxation. The average length of the school-session is now eight months thirteen and one-half days, being an increase of one day.

POPULARITY OF THE SCHOOL-SYSTEM.

The board of education says that "the year under review has furnished ample evidence that the public-school-system is highly valued by the people. The interest generally manifested in the new school-law during the last session of the general assembly, the desire to learn what its provisions were to be, and the constant demand for copies of the pamphlet containing it are so many proofs that legislation pertaining to schools interests deeply a large proportion of the people.

"One test of the estimation in which the people hold any public institution is their willingness to expend what is needed for maintaining it. Within a few years, the unavoidable cost of sustaining our public schools has more than doubled. But the people have continually shown their willingness to meet this increase of cost. The amount received the past year from taxes, including the appropriation of fifty cents per child from the State-treasury and the small sum returned as 'voluntary contributions,' was upwards of $1,200,000, and exceeded the amount from the corresponding sources in any previous year by more than $125,000."

PRIMARY INSTRUCTION.

The board regards as "among the most important of the provisions of the present school-law that requiring that all children between the ages of 8 and 14 shall receive each year not less than three months' schooling. The necessity for some law of this kind is very evident. While the immense majority of our citizens need no compulsion in this matter, there are some whose children will grow up neglected and ignorant unless the law compels them to be sent to school. It is for this class only that the 'compulsory-attendance-law' is necessary. There are indications that this class, already too numerous, is increasing. According to the returns herewith given, the number of children

who attended no school during the year now reported was greater by 1,565 than in the previous year. Unless sufficient preventive measures are taken, a still larger number will hereafter be of this description.

"In connection with the enumeration taken in January, 1873, an attempt was made to ascertain how many of the children then enumerated had attended no school in the year 1872. Returns were received from about four-fifths of the towns, containing about three-fourths of the population. The incompleteness of these returns and the inaccuracy of a part of them seriously diminish their value. But with all their imperfections they show beyond question that several thousand, between the ages of 8 and 14 years, received no schooling in 1872. The majority of these are found in a relatively small number of large manufacturing-towns. The agricultural towns contain comparatively few of them. A small deduction must be made on account of those educated at home and those mentally or physically unfit to attend school. But, after all reasonable deductions of this kind, the number growing up in absolute ignorance is still so large as to threaten serious evil.

"A large proportion of these uneducated children are of alien parentage and know only a foreign tongue.* Living in compact manufacturing-villages and associating mostly with those of their own race, they remain ignorant of the English language. The first necessity, therefore, when they are sent to school, is that they be taught our language, for a knowledge of this is an essential preparation for pursuing any branch of study. The more intelligent of them already feel this necessity, and desire their less-educated countrymen around them to view this subject as they do and to seek the advantages offered in our free public schools.

"But not all the uneducated children in the State are of this race. Some whose parents came from other countries than the Province of Quebec, and some whose ancestors have lived here for several generations, need the compulsion of law to preserve them from the evils of ignorance. Our laws recognize no distinctions of class or nationality. Wherever there are children permitted to grow up in what our fathers, more than two centuries ago, stigmatized as the 'barbarism of ignorance,' there the law comes with its mandate."

COMPULSORY EDUCATION.

In accordance with the authority conferred upon the board by the sixth section of the new school-law,† they appointed Mr. Giles Potter as agent to supervise the enforcement of the compulsory-attendance-law. The high qualifications of this gentleman for that position will be conceded by all who are acquainted with his intimate relations to recent school-legislation and his long experience as a teacher. He entered upon his new duties immediately after his appointment in November last, and has since devoted to them a large portion of his time.

The agent thus appointed states that in New Haven there is a systematic effort made, and with a good degree of success, to enforce all the laws concerning the schooling of children.

The board of education of the city-school-district, in its report for the year ended September 1, 1872, says:

"Nearly two years have passed since the New Haven board attempted to give efficiency to the then existing laws against truancy and vagrancy by the establishment of a truant-school and by making more commodious the ungraded school in Fair street for children who are irregular in their attendance. * * A more definite statement of what has been accomplished * * * on these subjects includes the following particulars:

"(1) Truancy proper, or the absence of children from school without the sanction of their parents or teachers, has been considerably reduced, and in our best schools is not of frequent occurrence.

"(2) Irregularity of attendance from families which allow every excuse to be a reason and every pretext to be an excuse is largely diminished.

"(3) All disturbances around the different school-houses by vagrant boys have ceased.

"(4) It is rapidly coming to be regarded by children as a juvenile crime to be seen loitering about the streets during school-hours."

In Hartford, too, the truant-law is faithfully enforced by two officers detailed for that purpose. The board of school-visitors says in its last report:

"The truant-law is doing a vast amount of good in our large central schools, and in

* The reference here is mainly to a large influx of Canadian French, who have been pouring for some years past into the manufacturing-districts of New England.

† Established in 1869, revised in 1872, forbidding the employment of children under 14 years of age in any business whatever, unless such child shall have attended some public or private day-school at least three months in each year of such employment. The secretary of the board of education says of this: "The law is generally approved, and I learn of no opposition to it. Since its enactment no article, editorial or contributed, in any Connecticut paper, has expressed disapproval of it, so far as my knowledge extends. The wisdom and necessity of the law are admitted. It is certainly increasing the attendance in many places. The trustees of the State-reform-school give their opinion that it has already lessened commitments to that institution."

several instances officers have been sent into rural districts with most beneficial effects. The children are by no means always at fault for their absence from school. Parents often keep them from school without excuse or reason; and not until a truant-officer makes his appearance in their homes do they feel that their children must go to school."

In New London the police, under direction of the school-visitors, take charge of all boys at play or loitering in the streets in school-hours, and in that city the laws relating to attendance at school are well enforced.

Other places where the requirements of the law are systematically obeyed or enforced might be named, but these are held sufficient to show that no part of the law need be considered a dead letter.

The agent further says: "There are no statistics to show the number of children between the ages of 8 and 14 years in the State who have not attended school three months the past year. The number of children between 4 and 16 years of age who have attended no school is about 13,500. We have no means of determining how many of these are between the ages of 8 and 14 years." But while there are undoubtedly many such, he thinks the number is occasionally overestimated, he having heard complaints of non-attendance in places where personal inquiries showed that the law was well obeyed. He says, however, on the point, with good reason:

"Everything which furnishes a reasonable excuse to parents for not sending their children to public schools should be removed. There are school-houses in the State to which no humane school-officer can invite, much less compel, parents to send their children. Some school-houses, though very good otherwise, are crowded, though not a third of the children in the district are in school. In some cases persons are employed as teachers who are not fit to have the care of children. If the State intends to furnish education for all and to compel all to receive it, it must see that good houses and good teachers are furnished. No compulsory law can be enforced where these conditions are not complied with. When the school is in all respects as it should be, attraction will, in many cases, make compulsion unnecessary.

"The provisions of the one hundred and fourth section of the school-law, for paying to the several towns out of the State-treasury $1.50 for each child enumerated, may fitly be referred to in this connection. By giving to the towns this bounty the State acquires an additional claim upon them: that they expel illiteracy from their borders. They now receive from the school-fund and State-appropriation $2.50 for every enumerated child. This is a liberal contribution toward the entire expense of educating the whole youthful population. A town which receives this money is bound, in honor to the State and in justice to the children within its limits, to see that all of them, or at least as many as possible, receive every year the minimum three months of schooling."

ABSENTEEISM IN NEW HAVEN.

The superintendent of the New Haven city-schools says that, notwithstanding the efficient efforts made to increase attendance, there are in his district 1,597 persons of school-age habitually absent from their place in school. Of those, too, whose names are enrolled on the school-lists, some are present only a few days or weeks of the entire year; so that, if the difference between the average number belonging and the whole number enrolled be found, it will appear that about 15 per cent. of the latter are merely nominal attendants, coming and going, changing from one school to another, seldom remaining long enough anywhere to gain much good—more frequently proving an evil in every room they enter.

CHILDREN FORCED TO GROW UP IN IGNORANCE.

A more efficient enforcement of the law to prevent truancy and vagrancy has revealed, he says, surprising cases of ignorance for want of school-instruction. Boys have been found on the street 14 and 15 years of age who did not know the alphabet and had never been at school a day. The recent prosecution of Italian "masters" for holding boys in service, literally as slaves, suggests one of the causes which keep children from school and in the "barbarism of ignorance." "But it is not," he goes on to say, "the Italian task-master alone who holds his little victims and compels them to perform menial service under the shadow of the school-house without permitting them to enter. Parents are found, too, so debased as to keep their children from school and compel them to beg food for the family or bring home intoxicating drinks, that they may live in indolence or indulge depraved propensities. Others, for the small pittance a child can earn, are willing to sacrifice the future welfare of their offspring to secure this." From these and other causes he estimates that forty-one children out of every hundred are daily outside of the rooms of the public schools throughout the year.

In Southington the same thing is complained of, but not to the same extent, about 8 per cent. of all the children not attending any school, while at least a quarter of the ones attendant have come for so short a time, or so irregularly, as to receive very little benefit.

NON-ATTENDANCE DUE TO POOR SCHOOL-BUILDINGS.

To offset this, however, it is granted that in several of the districts the irregularity and brevity of attendance, or the absolute non-attendance, are attributable to a lamentable want of sufficient and comfortable school-accommodations, which ought most surely to be remedied. Whether this has anything to do with the non-attendance in New Haven does not appear. But in all places it must needs be understood that if school-rooms are either unhealthily overcrowded and illy ventilated or in such poor repair as to be open to all winds, even parents who are desirous to educate their children may shrink from exposing them to such unfavorable circumstances.

DRAWING IN SCHOOLS.

The new school-law permits the school-visitors of any town to require teachers to be qualified for giving instruction in drawing. The value of this accomplishment in its relation to the various manufacturing-interests of the State is obvious, and the board encourages teachers to make every needful effort to fit themselves for the new duty thus liable to be imposed.

MUSICAL EDUCATION.

The members of the board think, too, that the practicability of teaching even very young children to read music and sing by note has been amply demonstrated by experience in the schools. It has been found, they say, hardly more difficult to teach them this kind of reading than the reading of the English language, while the pleasure universally attendant upon the ability to sing, the beneficial effect on voice and lungs, and the agreeable entertainment musical practice introduces into the monotony of school-life all conspire to recommend this cheering exercise to those who have in charge the training of the young. Against such as decry music, calling it "unpractical," they argue that a practicable education is one which fits men and women for the duties which are to occupy their lives. But these duties, it is urged, include more than the gaining of a livelihood or the acquisition of pecuniary means. "Education, in its higher and truer meaning, pertains to *the whole* of a human being. Not the intellect only, but the finer sensibilities of the soul—the susceptibility to beauty in form, color, or sound—are worthy of careful culture. This part of education can only begin in the public schools, for it may be continued to the end of life. But if it be neglected at the beginning of the education of a child, it may never receive his attention, any disused faculty seeming to vanish with advancing years." "Let the children," they say, "then, learn to sing. They need gain no less knowledge of arithmetic, geography, or history, while from this accomplishment they may receive daily enjoyment, not only during their brief school-life, but ever afterward."

IMPROVEMENT IN SCHOOL-BUILDINGS.

Incidentally in this connection pleasing reference is made to the evidence of improving esthetic taste shown in the construction of better-looking school-houses and in the furnishing and surrounding them with things agreeable to see. And then is said, what is worthy of note throughout the country, that "a pleasant, cheerful school-room, whose walls are adorned with maps and pictures, whose surroundings are shade-trees and flowers, and whose inmates add to their knowledge of necessary studies some acquaintance with the ornamental, has a constantly educating influence."

UNION-DISTRICTS.

Within the past year, several towns have adopted the union-district-system. While the characteristic caution and conservatism of the people have prevented the rapid introduction of that system, it is gradually gaining favor. Only one town that has given it a trial has abandoned it. One has both renounced it and returned to it within a few months. The erroneous idea that it cannot be advantageously introduced except in compactly-settled towns is slowly disappearing. Two towns, of quite limited and scattered population, have recently adopted it. They can thus dispense with several of their discouragingly small schools and concentrate their resources on a smaller number of schools, each of which can be longer continued and higher in quality, without increased expense to the town. The union-system will thus be seen to be well adapted to the needs of sparsely-settled towns. High schools may thus grow up where otherwise such advance might seem impossible.

SECONDARY INSTRUCTION.

The recommendation in a previous report that every town containing a certain number of inhabitants should be required to establish and maintain a high school was not embodied in the new school-law. The law on that subject was left, as heretofore, in the form of a permission rather than a command. It has simply the force of a recommendation. But the year covered by the report under review has witnessed new activity in the establishing of high schools. The Morgan school, at Clinton, with a munificent endowment, was opened for the admission of pupils in April, 1872. Its

highest department is designed to be a high school of a very superior order, free to all the more advanced pupils of that town and receiving pupils from other towns on payment of tuition. This school is conducted under an arrangement entered into between the school-board of that town and the trustees of the Morgan school.

By a similar arrangement the "Institute," in Guilford, an endowed institution, established about eighteen years ago, has become a free high school for that town. These are practical examples of a suggestion contained in the last report. Three other towns, Norfolk, Old Lyme, and West Hartford, have established high-schools within the past few months, and in the fall of 1872 New Haven added to its previously-erected schools a remarkably fine building for the purposes of a high school.

Of the towns just mentioned, except New Haven, only one, Guilford, contains a population exceeding 2,000. Of the other four, West Hartford alone can be considered a relatively wealthy town. The board are hence justified in thinking that, if towns of small population and moderate wealth can maintain high schools, those more prominent in either of these particulars may reasonably be expected to establish such schools. And it is hoped that the worthy example of these comparatively small towns will soon be extensively followed.

Returns from 25 private schools and academies in various portions of the State have been received. Seventy-five teachers conduct the exercises in these schools, an average of three to each. These have under their instruction 709 male pupils and 603 female, making a total of 1,312, an average of about 17 to each teacher. In 17 of the 25 there is instruction in the classics, 335 pupils taking this portion of the course. In 13 of them the modern languages are also taught, 144 pupils taking these. In 12, drawing is taught; in 16, music, either vocal or instrumental, and in a few cases both. A chemic laboratory is possessed by 5, philosophic apparatus by 9, and in some instances a cabinet, the precise extent of which, however, is in no instance specified. In 15 there are libraries of from 25 to 2,000 volumes, 2 reaching the latter number and 2 others reporting 1,000 each. Several of these schools are new enterprises, two are old endowed academies, and one is reported closed in July, 1873.

PUBLIC HIGH-SCHOOL REPORTS.

Ten public high schools also furnish reports kindred with the above, evincing on the whole an instruction nearly the same in kind and appliances for illustration, save in the line of libraries, at least not much inferior. For instance, five out of the ten have chemic laboratories, though one of these is designated "a small one," and another "enough for most elementary experiments." Six, to the question "Has the institution a philosophical cabinet and apparatus?" answer, "Yes;" one with the qualification "somewhat," and another with a statement of the value of that possessed, $100. As far as can be ascertained from returns, which, in some cases, mix scholars of a lower grade with those of the high school proper and give the teachers also for the whole, 63 teachers have here under tuition 2,402 pupils. Of these, 286 are reported to be engaged in the study of the classics and 119 in that of one or more of the modern languages. These are not, however, all that are so engaged, as two schools report these studies to be a portion of their course, but do not specify the number of students pursuing them. In eight of the schools music is taught; in as many, drawing, in at least its rudiments. Six have libraries ranging from 50 volumes for reference to 1,000 for circulation.

Taking the sum of teachers and pupils for these academies and high-schools, we have 138 teachers to 3,714 pupils, at least 907 being students of the classics and 382 of some modern language besides their own. Out of the whole number of pupils, 236 are said to be preparing for either the academic or scientific departments of the colleges.

PREPARATORY INSTITUTIONS.

In addition to the schools already mentioned, six institutions, engaged in the preparation of students for colleges or scientific schools, report an aggregate attendance of 630 pupils, of whom 342 pursue classic and 288 scientific studies.

Hartford public high school, with 14 instructors, and 267 pupils in classic and an equal number in scientific studies, has 74 in the senior class, 94 in the junior, 163 in the middle, or third, 200 in the lowest, or fourth, grade, and three pursuing an advanced scientific course. The library numbers 1,700 volumes. The chemic laboratory is said to be one of the best in the State. There is a philosophic cabinet worth $3,500, an astronomic observatory, and a gymnasium.

The Connecticut Literary Institution, at Suffield, with 6 instructors and 77 pupils, has 56 in scientific and 21 in classic studies, of whom 9 are in the senior, 33 in the junior, and 35 in the middle or lowest class. There are 1,000 volumes in the library; there is a chemic laboratory, a small cabinet of natural history, and a philosophic cabinet and apparatus.

Woodstock Academy, with 7 instructors, has 19 pupils in classic studies, 5 in the senior, 3 each in the junior and middle, and 8 in the lower grade. There are also 47 in subordinate classes. This academy was re-organized and endowed in 1868, and is now

in successful operation, with new and splendid buildings, a library with 500 volumes, a chemic laboratory, and a philosophic cabinet and apparatus. There are three courses of study—classic, scientific, and a young ladies' or English course.

The Hopkins Grammar School, New Haven, founded in 1660, and thenceforth especially devoted to preparation for a college-course, now also training special classes for the Sheffield Scientific School; 9 instructors and 202 pupils in 1873.

New Haven Collegiate and Commercial Institute, "designed to secure for boys, at as early an age as possible, a thorough elementary English education, and on this, as a basis, to give an accurate and complete preparation for the academic and scientific departments of Yale College, the United States Naval and Military Academies, or any business pursuits." Officers and teachers in 1873, 10; pupils, 178.

Stamford Military Institute, one main purpose of which is "to furnish thorough instruction in Latin, Greek, and mathematics to students preparing for college." Instructors in 1873, 5; pupils, 41.

SHEFFIELD SCIENTIFIC SCHOOL.

At this increasingly popular institution, 26 persons graduated in 1872 and the aggregate number of students for 1872–'73 was 201. The 27 State-scholarships having been entirely full for several years and the pressure for admission upon such foundation still continuing, the visitors say that the time has evidently come for enforcing rigidly the requirements of the law, which are that, when there are more applications for the State-bounty than vacancies to be filled, the board shall give the preference to such young men as are fitting themselves for agricultural, mechanical, or manufacturing occupations, who are or shall become orphans in the naval or military service of the United States; next to them, such as are most in need of pecuniary assistance; and, furthermore, they shall provide that the appointments shall be distributed, as far as practicable, among the several counties in proportion to their population. The board justly holds that the benefit which the scientific school has conferred upon the State in turning out young men, who, on leaving the institution, are prepared to become leaders in important callings and educators of the people to a higher grade of culture, cannot well be overestimated.

An effort is on foot, and with fair prospects of success, to raise a professors' fund of $60,000 for the fuller support of the professors in this school; and among these professors an important change has occurred, General F. A. Walker, of the United States Census Bureau, succeeding Professor Gilman, who has become president of the University of California.

COLLEGES.

As respects facilities for full collegiate education, Connecticut maintains a high position.

YALE COLLEGE.

Yale, now substantially a university, with its faculties of arts, sciences, theology, medicine, and law, still holds upon its noble course of usefulness, with more numerous students, larger provisions for instruction, and a much-increased endowment. The number of its post-graduate-students—80 in all for the past year—is indicative of a tendency to more elevated scholarship, while the establishment of a fellowship in the past year and the appointment to it of the valedictorian of the graduating class are steps of decided progress. The grand new building of the scientific school, completed in the fall of 1873, is an excellent addition to its means of education in the department of natural science. A great increase of the specimens in the museums of the college, and of the volumes in its various libraries, adds also much to its capacity for illustration of the different subjects studied. The new Woolsey endowment-fund, from which it has received the first installment of $100,000, will enable it to increase the number of its tutors, and thus greatly aid the younger pupils in its schools.*

WESLEYAN UNIVERSITY.

The Wesleyan University, at Middletown, though somewhat embarrassed by financial difficulties, is so borne forward by the generous contributions of its friends as to continue and even add to its educational advantages, and thus maintain the influence it has acquired, not only over the youth of the great church it is connected with, but also over others that seek instruction in its halls. Two new professorships, one of modern languages and one of analytic chemistry, have been added during the year past and two new professors fill the chairs in these. Almost alone among the eastern colleges, it has allowed women to study in its classes, in spite of opposition from some of its young men, and reports that the women have kept well along with their competitors. The record of its alumni, compiled mainly by Orange Judd, esq., and published in 1873, shows 1,028 names of graduates, among them many of distinguished note.

*The statement of the financial condition of Yale made by the treasurer for the year ended May 31, 1873, showed the total funds of the institution at that time, in its various departments, to be $1,312,244.55, of which $1,225,062.35 were productive. The receipts from all sources for the year had been $107,427.20; the expenditures for the same time, $122,320.18; balance against the income-account, $14,892.98.

TRINITY COLLEGE.

Trinity College, Hartford, has made a great start in advance, by selling to the city its existing site, for a sum that will enable it to erect upon a greatly better one such buildings as will set it high in rank among colleges, for the comfortable housing of its students and for affording them recitation-rooms, laboratories, and museums in which it will be a delight to work. Around these buildings, too, is to be laid out, under able supervision, what promises to be, perhaps, the finest college-park in all the country, enabling it to approximate to its English sisters in the attractiveness and elegance of its surroundings, a thing of which American colleges have been too neglectful hitherto. As with the other institutions above named, a number of scholarships adds to the ability of Trinity to aid students of deficient means and give at least to such a free tuition, with great diminution of the other expenses of its course.

Statistical summary of universities and colleges.

Names of university and colleges.	Corps of instruction.	Endowed professorships.	Number of students.		Corporate property, &c.						Number of volumes in library.
			Preparatory.	Collegiate.	Amount of property of corporation.	Value of grounds, buildings, and apparatus.	Amount of endowment.	Amount of productive funds.	Income from productive funds.	Receipts for last year from all other sources.

SUPERIOR INSTRUCTION FOR WOMEN.

Three institutions for superior instruction of women make returns for 1873 as follows: (1) Hartford Female Seminary, Hartford, founded in 1825, by Miss Catharine E. Beecher; 7 male and 8 female instructors; total number of students, 130, "all girls." French and German, drawing, painting, and music are included in the course. (2) Young Ladies' High School, New London; 3 female instructors; students, 74; graduates since organization, 97; course, 4 years. French and music in the course. (3) Young Ladies' Institute, Windsor; 1 male and 5 female instructors, 60 students, 4 years in course; French, music, drawing, and painting included in it.

In all these, beyond a full corps of instructors, the appliances for illustration of philosophic, chemic, and astronomic studies, as well as the libraries, seem to be less complete than could be wished. The explanation of this is given in a note from one of the principals: "Our institution, like many another of its kind, lacks that which alone can make it a good school, and at the same time in the least degree remunerative, namely, endowments. * * * We are sorry to send so meager a report. If it was our fault, we should also feel ashamed."

THE NORMAL SCHOOL.

The board believes that the State Normal School, at New Britain, has never been more valuable and promising than at the present time. The grade of scholarship is becoming higher from year to year and the work done is more strictly "normal," *i. e.*, the professional training of teachers. Teaching, being truly a profession, requires a special training in order to eminent success as really as any other profession. And this training it is the object of the normal school to bestow. Greater prominence has been given to drawing than ever before in this institution or any other in the State, except the Sheffield Scientific School, and with the happiest results. New desks and furniture, too, have added much to the comfort and attractiveness of the school.

Under a new arrangement, already in force, the year will hereafter be divided into two terms of twenty weeks each. At the beginning of each term a new class will be formed and at the close of every term a class will be graduated. The number of graduates in July, 1872, was 26; in January, 1873, 11. This two-term-method has been tried with good result in several of the most successful normal schools in other States. The pupils who enter such schools have usually sufficient reason for wishing to economize both time and money. If there are two periods in the year when they can graduate, a larger number will be likely to seek admittance and to complete the course.

TRAINING-SCHOOLS.

As an evidence of the efficiency of training-schools, it is said that the superintendent of the New Haven City school-district has during the past twelve months been called to furnish 36 teachers to fill positions made vacant by resignation or created by the opening of new school-rooms, and has been able to fill them almost wholly from the training-schools under his charge. Of the whole number, 16 were taken directly from the schools and 6 had formerly been members of them, making a total of 22 substitutes furnished through this means, under circumstances which would otherwise have made a supply of suitable teachers utterly impracticable. The value of these schools in enabling a superintendent to supply with well-trained teachers schools that may be vacated during the school-year is sufficiently manifested by this case. The cherishing of this agency for preparing teachers and keeping them in steady readiness for work is hence reasonably urged.

Statistical summary of professional schools.

* From report of the treasurer for the year ended May 31, 1873.

AMERICAN ASYLUM FOR THE DEAF AND DUMB.

This institution, the oldest of the kind in the country, located at Hartford, has been in successful operation for fifty-seven years. The entire number of pupils under instruction during the past year has been 280. The number present May 1, 1873, was 220. Forty-three pupils who were dismissed in June had remained in the school upon an average five and three-fourths years. Four pupils graduated in regular course from the high class, and three of them, young men, have gone to Washington, to pursue their studies at the National Deaf-Mute College.

Mr. A. Graham Bell's method of teaching deaf mutes to speak by means of "visible speech" has been tried during the past year.

Considerable attention has been given to lip-reading, but this has been subordinated to what at present seemed more important, the correction of defects in semi-mutes and obtaining a basis of words in the congenital ones. Most of the latter have, in a week or two of special attention, proved that they can read from the teacher's lips most of the words learned.

Experience has strengthened the opinion that the mind of the pupil and a habit of attention should be somewhat developed before attempting "visible speech."

The practical question "Can articulation be made a means of ready communication for the average pupil in our institutions?" must wait during years of trial for its solution, but the experience of the past year, so far as it goes, tends toward the belief that it cannot.

HOME SCHOOL FOR DEAF MUTES AT LEDYARD.

As this institution now receives patronage from the State, the principal gives an account of the school and of the peculiar methods of visible speech there adopted, as follows:

"I use objects, pictures, and natural signs to communicate the first ideas to my pupils. These ideas are associated with words as rapidly as possible, and as fast as words may be understood, either written or spoken, all other means of communication are dropped and words alone are employed.

"When the pupil has mastered a few words, reading-lessons in sentences are introduced. In fact, I treat a sentence much as I do a single word: make it significant of the idea to be expressed. In this way my pupils learn the English language idiomatically, and are enabled to avoid many of the unfortunate muteisms which mar the compositions of some deaf and dumb persons who were educated by signs.

"I try from the first to make my pupils understand common things, and that involves a great deal of labor which I have as yet found no way to avoid. All the lessons must be prepared by the teacher, and they must be concerning events just occurring or such as have occurred so recently that the recollection of them has not passed from the mind of the pupil. In this manner the pupil learns to use the words which he writes in expressing original ideas much sooner and more naturally that if confined principally to general reading-exercises. Opportunities must be seized. Whenever the mute pupil attempts to express any idea by signs, then is the teacher's opportunity to teach a new sentence and perhaps some new words. It will be seen at once that it requires much more industry and application on the part of the teacher to be successful in teaching the English language than would be required to instruct pupils in the sign-language. But the results, I think, fully repay the extra labor."

THE INDUSTRIAL SCHOOL FOR GIRLS.

The report of the superintendent here shows that the institution, now thoroughly equipped for its work, has a full and well-organized corps of officers; that 123 inmates have been under its care, the school being generally more than full; that the average of committals has been three and three-eighths a month; and that the girls have enjoyed the best domestic, industrial, mental, and religious influences, not simply occasionally, but without cessation throughout the year. The results have continued to be of the most satisfactory character. There have been no cases of serious sickness or death and scarcely any of illness, and this, too, in the case of children who came to the school with numerous inherited and other tendencies to disease. There has been good progress made by the girls in the day-school, there being no truancy or failure of attendance allowed, and none but approved teachers employed. Some of the girls have become proficient in the domestic department, as is attested by the reports of those who have been placed at service in families. The moral influences of the school have produced their legitimate fruit. True, that girls born and bred in the midst of ignorance and vice, and accustomed from their earliest childhood to lie and profane the name of God, and utterly to disregard the restraints of decency, are not in a day nor a year taught to read and write, to understand the proprieties of life, or to perform their duties to God and to society; but as the best social and religious influences continually pervade all departments of the school, as they are wielded by those who delight in their use and make it their life-work to exert them in every form which ingenuity and love and a sense of responsibility to God and their employers will suggest, the most marvelous and encouraging transformations do often take place in the character and conduct of the girls.

In many cases the forward and obstinate become quiet and docile. Those who have been previously intractable and unmanageable have been subdued and become grateful, kind, and obedient. The grossly wicked and immoral have been taught to observe the proprieties of life, and to feel and acknowledge their accountability to God and to society. In not a few cases have girls who had already entered on a vicious life and been regarded as destined to a life-long course of sin and shame been led to feel that there were even for them possibilities of purity and womanly loveliness and usefulness.

When such hopes have been implanted a new world has opened to them, and high and noble purposes have been formed and kept.

THE CONNECTICUT TRAINING-SCHOOL FOR NURSES.

The report of this interesting institution, referring to the fact that "experience has demonstrated the necessity of special education for the important service required in the sick-room," dwells on the success which skillful training enabled Florence Nightingale to reach in the Crimean war, and some among the lady nurses in our civil war, and goes on to say, "Our most experienced physicians complain bitterly of the *ignorance* of nurses and the mismanagement of patients by unskilled attendants. The recovery of an invalid often depends more on good nursing than on the skill of the physician, and the efforts of the best doctors can be neutralized by blundering upon the part of these. Every nurse

should be competent to recognize and report to the doctor the variations of the pulse, the temperature of the body, the action of medicines, and the significance of ordinary symptoms, and to understand the dressing of wounds, the ventilation and disinfecting of rooms, the quieting of patients, and the preparation of food for the sick.

The training-school now organized in New Haven to teach women these things is, therefore, commended to the liberality of the people. The members of the medical profession in New Haven are said to be a unit in its favor. The enlarged State Hospital in the city supplies a field for the development of nursing skill. Managed by eminent physicians, placed on an unsectarian basis, and designed for the whole State, it is hoped that the school may secure a general sympathy.

EDUCATION IN PRISONS.

In view of the fact that ignorance is a fruitful source of crime, every effort is made to educate as well as to reform the juvenile offenders in the Industrial School at Middletown and the Reform School at Meriden. It is held that, while solitary confinement may be a merciful arrangement, as also a needful punishment in certain cases, still, as a rule, in any ordinary jail, idleness will not prove especially reformatory, but that prisoners should have access to books and light enough to admit of reading these. In the State Reform School the boys are, therefore, well instructed, wisely trained to industry, and formed into evening-classes when their work is done. Some of the classes are said to show great ambition to excel and to have made rapid progess. There are eleven school-sessions per week, of about two and a half hours each. The trustees say that they have always recognized in the conduct of the school, and mean to insist on it still more strenuously, the principle that boys committed there must have the primary rudiments of education before they are sent out either to their friends or to places. Labor enters largely as an element of success into the conduct of the school and has lately been more than usually successful in results. The idea is expressed that the enforcement of the truant-law is already being felt in a smaller number of commitments, and the hope is entertained that, if thoroughly carried out, it will in time work a revolution in the morals of the juvenile population.

TEACHERS' INSTITUTES.

The whole series of regular institutes held in the year past are said to have proved more than usually successful. The interest shown by the large audiences gathering during the day, as well as in the evening, was very gratifying. The importance and usefulness of these meetings were generally appreciated. Many local institutes, also, occupying a day or part of a day, were held in different sections of the State. It is proposed to multiply these meetings for the benefit of the teachers and friends of education in individual towns. Reading, language-exercises and the mastery of the mother tongue, drawing, and map-drawing will be prominent subjects of discussion and illustration at these town-gatherings.

TEACHERS' MEETINGS.

Besides the frequent meeting of the Teachers' Institutes, noted elsewhere, at Plymouth a school-visitor has succeeded in interesting the teachers under his superintendence in a series of teachers' meetings, which are held once in two weeks. At these gatherings mutual improvement is sought through the medium of essays, discussions, and interchange of thoughts and plans. The success attending this arrangement is said to be most gratifying.

NEW SCHOOLS ÆSTABLISHED DURING 1873.

In addition to the high schools noticed previously, one has been opened at Putnam, and new school-houses have been built at Groton, Portland, West Norwalk, Thompsonville, New Haven, and New London.

THE BULKLEY SCHOOL.

The last, called the Bulkley school, in honor of its founder, the late Leonard H. Bulkley, at New London, deserves special mention for the good management which has marked its progress. The fund donated for the school by Mr. B. ($21,000) came into the hands of trustees appointed by him in 1852. It was at once so invested as to yield considerable returns, and these, added to the principal for twenty years, have enabled the trustees to erect a beautiful stone building, costing $38,000, and leave $50,000 as a permanent investment for the support and improvement of the school.

This school is to be free to all boys over twelve who have a home in New London and can pass the requisite examination for admission.

A noble monument of its founder, this: a source of blessing to multitudes for untold years and an interesting instance of the progress that may be made in educational facilities through judicious husbanding of funds.

THE SCHOOL-LAW.

The report says: "The revised school-law of 1872 gives general satisfaction. It is, doubtless, susceptible of some improvements, but no serious complaint has been urged against any part of it, and we recommend that it remain for the present unchanged."

THE STATE BOARD OF EDUCATION.

The board in Connecticut is said to be fortunately constituted, representing various pursuits and professions, the college, the supreme court, the legal profession, and the practical teacher and business-man. Several of its members have had long experience both in the teaching and supervision of schools. That gentlemen of their high standing, burdened with their professional or business-cares, consent to give so much time and thought to this cause deserves a grateful recognition from the friends of education.

EFFECT OF EDUCATION.

The statistics of the United States Patent-Office show that the inventive genius of Connecticut is unrivaled. This pre-eminence is justly thought to be clearly due to the foresight of the fathers of the State in organizing public schools, which the text-books of the times, even those published in New York and Philadelphia, pronounced the best in this country. Education hence became universal, and the results show the pecuniary value of intelligence.

SHOULD AMERICAN YOUTH BE EDUCATED ABROAD?

The secretary thus remarks in considering the above topic:

"American and European schools have their distinctive excellences, and can each learn much from the other. Of late the schools of Prussia have been overpraised. Though justly lauded by Horace Mann, Professor Stowe, and others, thirty years ago, they do not retain the same pre-eminence. Relatively there has been greater progress in some other lands.

"The Prussian system, though of acknowledged excellence, is in some measure stereotyped. A just pride in the laurels won now tends toward satisfaction with past achievements. Such complacency does not foster that spirit of progress and improvement so conspicuous in Austria and America.

"For our youth, American schools are better than European. To send our boys or girls away to foreign boarding-schools is a great mistake or, rather, one of the fashionable follies which is just now having its day.

"In the German schools the course of study is so unlike ours, the subjects and method so peculiar, and the processes so *slow*, as to weary if not disgust the American boy. To him the school-rules seems odd, if not arbitrary. Many American boys I found there ill at ease, if not discontented, grumbling, and homesick, because, they said, these strange methods are not so well fitted to serve the practical ends of life and meet the conditions of success in America.

"In philologic studies and researches, in the refinements of art, in music, and in manners, European schools excel. But this linguistic and esthetic culture, admirable as it is, poorly compensates for the loss of a more practical training and for the neglect of our own vernacular and literature, too common with our boys educated abroad."

WOMEN AS SCHOOL-VISITORS AND TEACHERS.

In Connecticut, as well as in Massachusetts and several other States, the secretary states that women are beginning to serve as school-visitors. So far, the experiment is reported to work well: "In some towns it is not easy to find professional men, whether clergymen, lawyers, or physicians, who will spare the time required for the thorough supervision of schools. In such towns there are usually well-educated women, experienced as teachers, in practical sympathy with the work of the school-room and with leisure and heart for the duties of the office. The great majority of teachers are females. During the last summer the number of male teachers was only 198 while the females numbered 2,240, being more than eleven times the number of males.

LIST OF SCHOOL-OFFICIALS IN CONNECTICUT.

MEMBERS OF THE STATE BOARD OF EDUCATION, 1873–'74.

Ex-officio.

Name.	Post-office.
His Excellency Charles R. Ingersoll	New Haven.
His Honor George G. Sill	Hartford.

By appointment of the general assembly.

Name.	Term—	Post-office.
Thomas A. Thacher	Expires 1874	New Haven.
Elisha Carpenter	Expires 1875	Hartford.
William H. Potter	Expires 1876	Mystic River.
George M. Woodruff	Expires 1877	Litchfield.

CITY AND TOWN SUPERINTENDENTS.

City or town.	Name and title.	Post-office.
Bridgeport	Rev. Sylvester Clark, acting visitor	Bridgeport.
Danbury	Dr. E. F. Hendrick, acting visitor	Danbury.
Derby	Rev. C. J. Hill, acting visitor	Ansonia.
Enfield	Dr. E. F. Parsons, acting visitor	Thompsonville.
Greenwich	Myron L. Mason, acting visitor	Greenwich.
Groton	Samuel S. Lamb, acting visitor	Mystic.
Hartford	Dr. E. K. Hunt, acting visitor	Hartford.
Killingly	Anthony Ames, acting visitor	West Killingly.
Meriden	Dr. C. H. S. Davis, acting visitor	Meriden.
Middletown City	Henry E. Sawyer, superintendent	Middletown.
Do	George W. Atkins, acting visitor	Do.
New Britain	Charles Northend, acting visitor	New Britain.
New Haven	Ariel Parish, superintendent	New Haven.
New London	Ralph Wheeler, acting visitor	New London.
Norwalk	J. W. Wilson, acting visitor	Norwalk.
Norwich City	N. H. Whittemore, superintendent	Norwich.
Do	Rev. A. F. Spaulding, acting visitor	Do.
Do	John W. Crary, acting visitor	Do.
Stamford	John Day Ferguson, acting visitor	Stamford.
Stonington	B. F. Williams, acting visitor	Mystic Bridge.
Vernon	Gelen W. Wert, acting visitor	Rockville.
Waterbury City	M. S. Crosby, superintendent	Waterbury.
Do	Rev. C. F. Elliott, acting visitor	Do.
Windham	Huber Clark, acting visitor	Willimantic.

DELAWARE.

[This information has been collected and prepared by Colonel I. Edwards Clarke, of the United States Bureau of Education.]

THE SCHOOL-FUND.

The auditor's report in 1872 gives the following statistics for 1872:

In New Castle County there were raised by contribution	$131,779 16
Received from State fund	10,048 84
Number of districts	95
Number of schools in operation	93
Number of months in operation	966
Number of scholars	7,310
In Kent County there were raised by contribution	$21,840 21
Received from State-school-fund	8,737 44
Number of districts	118
Number of schools in operation	102
Number of months in operation	907
Number of scholars	5,235
In Sussex County there were raised by contribution	$9,665 26
Received from State-school-fund	10,327 20
Number of districts	168
Number of schools in operation	151
Number of months in operation	690
Number of scholars	6,245

ACTION ON PROPOSED REVISION OF SCHOOL-LAW.

There has been no change in the school-law of the State. An attempt was made during the session of the legislature to pass a law amending the present school-law, by providing for a thorough supervision of the schools, for annual reports of the condition of the schools to be made to the governor or legislature, and for giving to the colored population their *pro-rata* proportion of interest in the school-fund.

This bill was introduced in the house of representatives, March 19, 1873, by Hon. John Hickman, chairman of the house-committee on education. It passed the house, but failed to pass the senate.

EXISTING SCHOOL-LAW.

Abstracts of the present school-laws were given in the reports of the United States Commissioner of Education for 1871 and 1872. By these laws all questions relating to the schools are left entirely in the hands of the inhabitants of the school-districts, whose votes decide whether there shall be a school or not, and whose only connection with the State-authorities comes from the provision that a certain minimum amount of school-tax must be raised by each district in order to entitle it to its *pro-rata* share of the school-fund.

SPECIAL SCHOOL-LAW FOR WILMINGTON.

While for many years there has been no important change in the school-laws applying to the State, there has been a notable exception in the case of the city of Wilmington. In that city all matters relating to the public free schools are placed, by a law passed three years since, in charge of a board of education, which is elected by the citizens. Under the direction of this board and the supervision of an able and efficient city-superintendent of schools the system of public schools at Wilmington is rapidly developing.

LEGISLATIVE VISIT TO SCHOOLS AT WILMINGTON.

At the invitation of the Wilmington school-board the legislature of the State during its last session paid a formal visit of two days to that city, as the guests of the school-

board and the city-council. They examined the schools with great care and manifested much interest in the workings of the city-school-system.

INCREASING INTEREST IN PUBLIC SCHOOLS.

An increased interest in education is shown in many parts of the State, which it is hoped will result in the ultimate adoption of some improved system, which shall benefit the rural school-districts. Stimulated by the successful results of the new school-system adopted by the city of Wilmington, the larger towns are manifesting more interest in their public schools. Such reports, however, as are received from the country districts show little change. When it is remembered that the school-law of Delaware, substantially as it now exists, was adopted in 1829 and that it is wholly wanting in those provisions for the general supervision of schools or for any report of their condition from time to time, which are considered as all-important in all recent State common-school-systems, this stationary condition of things in the country districts is no longer surprising.

The ratio of representation in the legislature, being based upon the census of 1830 and being equally divided among the three counties of the State, prevents that immediate action upon general State-legislation in regard to schools which the rapidly-increasing population of the city of Wilmington might be expected to exert.

As showing the line of movement in regard to the general educational interests of the State, the following abstract from the proposed law, introduced during the last session, to which reference has already been made, is inserted:

ABSTRACT OF PROPOSED SCHOOL-LAW.

The bill was entitled "An act to amend the several acts relating to free schools in this State." The bill consists of seventeen sections. It provides for the election of county and State-boards of school-commissioners—the present law providing for the election by the taxable inhabitants of each school-district of three district-school-commissioners—for the appointment by the governor of a county-superintendent for each county, and for an annual report on the condition of the schools to be made to the governor and legislature. It further provides for careful supervision of every school, orders the district-commissioners to raise a certain specified annual tax, and makes them personally responsible for the amount; provides for the examination and certification of teachers by the county-superintendents; and authorizes the establishment of colored-schools, by the colored taxables of any district, in the same manner the white-schools are now organized, and which are to be numbered in the State-system of schools.

COUNTY-BOARDS.

The bill provides for the annual election by the commissioners of each school-district of one of their number to be a member of the county-board of commissioners.

The county-commissioners meet twice a year, on the first Tuesdays of May and November, at the county-seats of each county, at 1 p. m., and organize by electing from their members a president, secretary and treasurer, who shall serve for one year or until their successors shall be elected in like manner.

DUTIES OF COUNTY-BOARDS.

The county-boards shall hear and determine all controversies between different school-districts, between the county-superintendent and district-commissioners, and appeals by teachers from county-superintendent, subject to final appeal to State-board; they shall have full power to form new school-districts and to change the limits of the old ones, to determine on and provide text-books at cost; they shall receive, consider, and act upon the reports of the county-superintendent, required by law to be made, and shall consider all matters relating to education in the county and recommend such charges in the State-law as they think desirable.

STATE-BOARD.

The State-board, composed of the several county-boards and the county-superintendents, shall meet annually on the first Tuesday in October in the capitol at Dover, at 2 p. m., and organize by electing one of the county-superintendents president; shall also elect a vice-president, secretary, and treasurer.

DUTIES OF STATE-BOARD.

The State-board to hear appeals and determine controversies between superintendents and county-boards, superintendents and trustees or commissioners, and between commissioners and teachers; also to receive and consider reports of county-superintendents. It shall designate some person to perform the duty, or, failing to do so, shall through its president make full report to the governor of the conditions of the schools in the State, with such suggestions as seem advisable. A majority of mem-

bers of State and county-boards, respectively, shall constitute a quorum to do business, but a less number may adjourn from time to time till a quorum is obtained. Permanent records shall be kept by secretaries or treasurers of boards, and all who receive or are entitled to receive school-funds shall give bonds in double the amount likely to come into their hands.

COUNTY-SUPERINTENDENTS.

The governor shall appoint annually some fit person to be county superintendent of free schools in each county, who may be removed on request of two-thirds of the members of the county board.

DUTIES OF COUNTY-SUPERINTENDENTS.

He shall visit every school in his county at least once in the year; shall take notes in regard to the school-buildings, property, and surroundings; the qualification and efficiency of the teachers; conduct and standing of scholars; method of instruction and discipline of the schools; and report fully in writing to each meeting of the county-board the condition of the schools, with such suggestions as he deems best, these reports to be sent to the State-board for use in making the report to the governor. In all controversies his opinion shall be first taken, but appeal may be taken from his decision to county and finally to State-board. His whole time shall be given to promoting the cause of education in his county, and he shall engage in no other business. He shall, *ex officio*, be a member of the county-board of his county and shall attend all its meetings.

SALARY OF COUNTY-SUPERINTENDENTS.

County-superintendents shall receive a salary of $1,200, to be paid quarterly by the State-treasurer in amounts drawn by themselves and approved by president of the county-board of their respective counties. No president shall so approve unless the superintendent has made the reports required and discharged his duties faithfully.

TEACHERS.

A county-superintendent shall examine all persons who shall apply to him for that purpose, who propose to teach in his county, examinations to be public and oral or by writing, or partly by each method, to be held at such times and places as he may appoint, having due regard to necessities of schools and convenience of teachers.

CERTIFICATES OF TEACHERS.

Applicants who satisfy the requirements as to character and qualifications shall receive a certificate, good for one year, but to be effective must be countersigned by treasurer of county-board, to whom a fee of $3 must be paid. Applicants refused a certificate, or dissatisfied with the grade given, can appeal to the county-board. Superintendent shall keep an accurate list of all certificates granted by him, with date and name of person to whom granted.

The fees for certificates may be appropriated by the State-board to defraying the contingent expenses of State and county-boards, the surplus to be appropriated to any laudable object for the promotion of general education in the State at discretion of the State-board.

DISTRICT-TAXATION.

SEC. 12. It shall be the duty of the school-commissioners of every school-district in the State to raise by taxation, yearly, in the manner now provided by law, without regard to any vote thereon, at least $75 for school-purposes; and any school-commissioner failing to do so shall be personally liable to such school-district for that amount, which may be collected in an action at law in the name of the district for that purpose; and it shall also be the duty of the auditor of accounts to see that this provision is faithfully complied with.

TEACHERS' REPORTS.

SEC. 13. Every school-teacher in this State shall keep a complete list of every scholar in his district and his daily attendance, and of the days taught therein, and of the branches taught by him, and make report thereof to the county-superintendent as often as may be required, and the superintendent may prescribe and furnish forms for such reports, to be paid for out of such funds as the respective county-boards may direct.

COLORED-SCHOOLS.

SEC. 14. Whenever the taxable colored people of any neighborhood in any county of this State shall desire to organize a colored-school, and shall satisfy the school-commissioners of the school-district in which the same is to be located that they have a suitable house eligibly situated therein; that within a circuit of five miles thereof there are at least thirty-five colored children over six years of age needing instruction;

and that the colored taxables within the limits aforesaid have voted, in the manner now prescribed by law, to raise by taxation at least $75, such school, with the limits aforesaid, shall be recognized and established as a colored-school, and all such schools shall be under the direction of the school-officers as in other cases and subject to all general laws not inconsistent herewith; and shall be numbered in the several counties respectively as Colored School No. 1, and so on, consecutively, according to the priority of the date of their organization. In the city of Wilmington, however, the limits of such colored-schools may be fixed and regulated by the board of education, or whatever officers have, for the time being, control of the schools of that city: *Provided, however*, That no such school having less than thirty-five children, as aforesaid, shall be entitled to its proportionate share of the school-fund, nor then until it has otherwise complied with the requirements of the law as herein provided.

DIVISION OF SCHOOL-FUND.

SEC. 15. When the tax authorized to be raised as provided for in the next preceding section shall have been assessed and collected, or secured to the satisfaction of the school-commissioners or other officers having control of the district in which any such school is situated, it shall be entitled to its proportionate share of the school-fund: *Provided*, That notice thereof be given to the trustee of the school-fund at least ten days before the time fixed by law for making the yearly appropriations; and it shall be the duty of the clerk of every such district to give such notice. All taxes voted, as in the last preceding section, shall be levied and collected from the colored taxables as other school-taxes are collected by law, and shall be kept separate and expended for the benefit of the colored children within the limits in which they were collected: *Provided*, That the whole or any part of the sum of $75 herein mentioned may be raised by donations or contributions, as a substitute for taxation, and with like effect; but the same or a less sum may also be raised in addition to such donations and contributions, if said taxables so determine by a vote as aforesaid.

CITY OF WILMINGTON.

SEC. 16. The provisions of this, except sections fourteen and fifteen, shall not apply to the city of Wilmington; but the board of education, or the officers having control for the time being, may by resolution adopt the same and place the schools of that city within its provisions.

SEC. 17. All acts and parts of acts hereby supplied or inconsistent herewith are hereby repealed.

WILMINGTON.

Wilmington, New Castle County, the largest city of the State; population, census of 1870, 30,841; present population, 39,230.

PUBLIC SCHOOLS IN CHARGE OF BOARD OF PUBLIC EDUCATION.

The public schools are placed by law in charge of a board of public education, elected by the citizens; three members chosen from each of the ten wards of the city; time of service, three years; one-third of the members shall be elected each year, a plan which, while it keeps the board in close dependence on the citizens, avoids summary changes and secures the permanence essential to the success of any system.

It is made the duty of the city-authorities to collect such tax as the board of public education may annually assess for the support of the schools. An election of officers takes place annually at the organization of the board in April. The officers are a president, secretary and treasurer, and a superintendent.

ORGANIZATION OF THE NEW BOARD.

At the organization, April, 1873, William S. Hilles, esq., was elected president, Joseph L. Kilgore, secretary and treasurer, and D. W. Harlan, the efficient superintendent of schools for the past two years, was re-elected to that position.

The following statistics and statements relating to the condition of the schools are mostly taken from the second annual report of Superintendent Harlan:

Summary of statistics for the school-year ended July 31, 1873.

SCHOOL-HOUSES.

Number of school-houses	15
Increase for the year	1
Number of school-rooms used	82
Increase	5

Number of rooms used in grammar-schools	18
Increase	2
Number of rooms used in primary schools	64
Increase	3
Number of sittings in all the schools	4,502
Increase	305
Number of sittings in grammar-schools	862
Increase	0
Number of sittings in primary schools	3,640
Increase	300

TEACHERS.

Whole number of teachers, including teachers in the evening-schools, some of whom are also employed in the day-schools	97
Male teachers in the evening normal school	2
Increase	0
Male teacher in grammar-schools	1
Increase	0
Female teachers in grammar-schools at the close of the year	17
Increase	2
Male teacher in primary schools	0
Female teachers in primary schools at the close of the year	64
Increase	3
Male teacher in the evening-schools	0
Female teachers in the evening-schools	13
Increase	1
Special teachers of music, drawing, &c	0

PUPILS.

Whole number enrolled during the year	5,920
Average number belonging to the schools	3,650
Average daily attendance	3,355
Average daily absence	295
Per cent. of attendance on the average number belonging	92
Number perfect in attendance the whole year	96
Number perfect in attendance during the four school-months ended December 20	258
Number perfect in attendance during the three school-months ended March 14	413
Number perfect in attendance during the four school-months ended June 28	339
Average number of pupils belonging to grammar-schools	659
Average daily attendance	625
Average daily absence	34
Per cent. of attendance in grammar-schools	948
Average number of pupils belonging to primary schools	2,991
Average daily attendance	2,730
Average daily absence	261
Per cent. of attendance	912
Average number of pupils to a teacher in grammar-schools	38
Average number of pupils to a teacher in primary schools	47

TUITION AND COST OF BOOKS.

Average tuition per pupil in all the schools, estimated on the average number belonging	$8 92
Average tuition per pupil in grammar-schools	14 70
Average tuition per pupil in primary schools	7 66
Average cost of books and stationery per pupil in all the schools, estimated on the average number belonging	1 15
Average cost of books and stationery per pupil in grammar-schools	2 23
Average cost of books and stationery per pupil in primary schools	93

SCHOOLS.

The report gives a statement of each of the school-buildings and of the number and salaries of the teachers. There are fourteen school-buildings of brick and one of wood. There are two grammar-schools, with desks for 862 pupils, and thirteen primary schools, with desks for 3,640 pupils.

TEACHERS' SALARIES.

There are eighteen teachers of the grammar-schools. The male principal of school No. 1 receives a salary of $1,200. The lady in charge of the girls' department receives $800. The lady principal of school No. 4 receives $1,000. Three assistant grammar-school-teachers receive $550 each, three receive $500, five receive $460, and four $425. Of the primary-school-teachers ten principals receive $460, nine teachers receive $380, forty-five receive $360.

EVENING-SCHOOLS.

In addition to the above schools, evening-schools are held which are taught by thirteen lady teachers and attended by 339 scholars. Salaries of teachers not given.

PROPORTION OF MALE AND FEMALE TEACHERS.

Including the teachers of the evening-schools there are employed in the public schools of Wilmington ninety-five female teachers and one male teacher.

PRIZES.

Silver medals are given by the board of education for perfect attendance during the whole year. Ninety-six of these medals were awarded during the year closed July 31, 1873.

Two gold medals, one for boys, one for girls, are given by John H. Adams, esq., for excellence in English grammar. H. B. Seidell, esq., gives annually three prizes in books for best scholarship to the boys of grammar-school No. 1. Messrs. Howard M. Jenkins, Anthony Higgins, and Wm. S. Hilles gave similar prizes this year to school No. 4. Colonel B. R. Heisler gave two prizes for excellence in elocution.

Lists of the recipients of these various prizes, and also of all the pupils perfect in attendance during each term, are given in the report.

The following table, which shows the number of pupils of each age in the several schools, is of interest as giving the practical limits of school-age:

Table of ages.

School.	AGE AT LAST BIRTH-DAY.											
	6.	7.	8.	9.	10.	11.	12.	13.	14.	15.	16.	17.

EXAMINATION, PROMOTION, AND CLASSIFICATION.

Three examinations for promotion were held during the year: the first, the week previous to the Christmas holidays; the second, the first week in April; and the third, the two weeks previous to the close of the schools, June 27.

In the sixth primary grade, and in all the grades of the grammar-schools, the answers in these examinations were given in writing. Owing to the large number of applicants at the primary schools, no absolute standard of scholarship was fixed for promo-

tion; but, of the pupils in the lower grades passing the best examinations, enough were promoted each time to fill the vacancies in the grammar-schools. Such, however, was the ambition of both teachers and pupils to make high averages in examination, that few were promoted whose averages were below 70 per cent. Promotions were made mainly on the examinations. In some cases, however, pupils were promoted who stood low in examination, but had been so regular in attendance and correct in recitations that it was obvious that it would be better for them to go up. The desire in classing pupil was to put each where he would learn most.

Besides these three general promotions, special promotions were made within the schools whenever, in the judgment of the principals, pupils were prepared to do the work of the next higher class. This custom, of long standing here, works good continually. Merited promotion is worth more, to stir pupils to activity, than all other rewards. Some do not look favorably on these special promotions, because they deprive teachers of their best pupils before examination. Against this desire to keep back bright pupils for the credit they may do the teacher at examination is the good of the pupil and the incentive to study that comes from the belief that a promotion will be received as soon as the pupil has made it evident that it will be better for him to be in a higher class.

It would be desirable to have the number of pupils equal in all classes of the same grade; but, in Nos. 5, 9, 11, 12, and 14, to keep up large classes it is necessary either to class the pupils so that the best scholars in the class are discouraged by feeling that they are learning nothing new and the poorest by feeling that the lessons are too difficult for them or for each teacher to take more classes than in the large schools. The latter plan is much the better for the pupils, and has been adopted, although it increases the work of the teachers and disturbs the order of the schools. Another difficulty in classification has existed in the highest grade in the grammar-schools. At the end of each school-year, many members of the two classes of highest grade leave school altogether. If the best scholars in these classes wish to continue in the school another year, they know that they must be classed with scholars who are promoted into their class, not because it is better for them to be in a higher class, but to fill vacancies that cannot be filled in any other way. Instead of filling these classes with those who are not able, doing the work thoroughly, to go forward as fast as the members of the old classes, it would certainly be better to let these classes remain smaller than other classes. It is sometimes better to have two small classes recite in periods of twenty minutes each, than one large class, composed of pupils of different attainments, in one period of forty minutes. In fixing the time for promotions, the number of pupils to constitute a class, the length of time for a recitation, &c., it is very well to try to make all things adapt themselves to the regularity of a symmetrical system; but the irregularity of life out of school and the differences of intellect make it necessary that the system be a pliable one, and that it bend to fit these irregularities and differences, where they cannot be removed.

ARITHMETIC.

A great improvement is noted in the teaching of this study in the advanced classes, as, however, "the greatest difficulty is experienced in teaching the youngest children." Eight pages of the report are devoted to the abstract of Grube's system of communicating a correct idea of numbers to beginners, made by Louis Solden, assistant superintendent of the public schools of St. Louis.

DRAWING.

The importance of industrial drawing to the youth of a city having such manufacturing interests as ours can scarcely be overestimated. That there is talent for drawing among our young people, the blackboards of every school in the city prove.

Horace Mann's words apply to us exactly: "With the inventive genius of our people, the art of drawing would be eminently useful. They would turn it to better account than any other people in the world. We now perform far the greater part of our labor by machinery. Whatever will advance the mechanic and manufacturing arts, therefore, is especially important here; and whatever is important for men to know, as men, should be learned by children in the schools." Hon. Birdsey G. Northrop, secretary of the board of education of Connecticut, says: "Drawing ought to be taught in every school of this country, as it is in Switzerland, Germany, and other European countries. Aside from its important influence in cultivating the perceptive powers, the memory, the taste, and the imagination, it is the most essential preparation for the skilled artisan. No study pays better. None can so greatly improve our mechanical industries or multiply our resources."

Drawing has been taught to some extent in all our schools, but, until within the last year, in few cases according to any system or with reference to anything beyond copying pictures. About the middle of the year, Bartholomew's drawing-cards and books were introduced into nearly all our schools. The publishers of these books presented to the schools a copy of their Teacher's Guide for each teacher using their books

or cards. Previously, instruction in drawing had usually been given to one pupil at a time.

These guides gave the teachers an insight into a method of using the blackboard and directing the pupils in such a way as to instruct a whole division at the same time. The work was taken up and prosecuted under this new plan with commendable interest; but not with the success desirable. All felt the need of a leader in the work and of being taught themselves by a master of the art.

I would suggest in this connection the importance of having a special teacher of drawing employed to instruct the teachers in this branch, and also to give instruction to the advanced classes in the grammar-schools. In this way drawing is being successfully taught in many cities and towns. Walter Smith, State-director of art-education in Massachusetts, in his last report to the State-board of education, says:

"In my conference with school-committees I have recommended that, to introduce drawing into the common schools, the regular teachers should be instructed by a special teacher of drawing and that they then be required to instruct their scholars, and have done this both because of its economy and efficiency.

"On principle, I object to special teachers being employed in the public schools for the purpose of elementary teaching, for the regular teachers are thereby set aside and their inefficiency proclaimed. Whatever it is reasonable to expect little children to learn, it cannot be unreasonable to suppose that adult teachers can also learn; and inasmuch as this question has passed out of the region of theory into the realms of experience, and it has been found that every willing teacher can both learn and successfully teach elementary drawing, any school-committee which will provide for the instruction of its teachers may now introduce the teaching of drawing into its schools with the greatest efficiency. My advice has been followed in many cities with good results, and I hope before the year 1873 is past every city and town in the Commonwealth will have thus provided sound instruction in the schools."

NORMAL SCHOOL.

There were thirty-eight sessions of this school during the year. From September 7 till December 7 it was held from 10 to 12 o'clock a. m. on Saturdays, and from December 7 till the end of the year the sessions were from 7 to 9 o'clock on Friday evenings. The whole number of teachers who were members was sixty-five and the average attendance thirty-six.

The object had in view, in making out the course of study and in assigning the lessons each week, was to review the subjects in which teachers are required to be examined at the close of the year.

At the annual examination of teachers, held in July, 1872, twenty-eight made a general average in the elementary branches of 80 per cent. or more of correct answers. Of these nine studied algebra and general history in this school, during the year, and several of the others, I think, pursued these studies elsewhere.

During the next year these can finish the studies required in order to receive the certificate of the committee on teachers exempting them from examination. The following course of study has been adopted for the coming year:

COURSE OF STUDY.

First term, commencing September 5 and continuing twenty-one weeks.

Time.	Class A.	Class B, first division.	Class B, second division.
7 to 8 p. m	Geometry	Grammar	Grammar.
8 to 9 p. m	Natural philosophy	Arithmetic	Arithmetic.

Second term, commencing February 7 and continuing twenty-one weeks.

Time.	Class A.	Class B, first division.	Class B, second division.
7 to 8 p. m	Geometry	Physical geography	Grammar.
8 to 9 p. m	Natural philosophy	Grammar	History of the United States.

As two years are allowed by the rule of the board for the study of algebra, geometry, general history, and natural philosophy, those who enter the A class this year can study algebra and general history next year.

Teachers, of all persons, have need to be constant students. Few persons will follow out a course of study alone, but where several with similar interests can unite in a

study the social element introduced renders agreeable what undertaken alone would be irksome and soon abandoned. From this source comes one of the good results of the normal school. Another good result is that those who have a professional spirit and are enterprising have an opportunity in this school to show their fellow-teachers their fitness for leadership in educational work.

Your appreciation of the efforts of the teachers to educate themselves more liberally, shown in the fair advance of salaries lately made, has been very encouraging, and will lighten the labor of preparation for these Friday-evening-recitations.

THE TEACHERS' INSTITUTE.

Each of these monthly meetings of the teachers was attended, so far as I know, by all of our teachers, except a few who were absent from one or two meetings on account of sickness.

At the organization of the institute Miss Elizabeth D. Fraser was elected president for the year and Miss Sallie Hare secretary. A committee was appointed at each meeting to prepare business for the next meeting. Through the efficient management of the officers and the hearty co-operation of the members, a larger amount of important work was done in the course of the year.

RÉSUMÉ.

All connected with our schools have reason to congratulate themselves that during the year just passed these schools have made commendable progress. The attendance of pupils has been good, and their interest in study continually increasing. More teachers than heretofore have succeeded in governing without resort to severe punishments, and there is a growing conviction that even very bad children ought to be governed by something higher and better than the rod. There has been much painstaking on the part of the teachers to have the pupils enjoy their school-life. Gratifying progress has taken place in object and other kinds of illustrative teaching. Strenuous efforts have been made to solve the very important problem, how to keep the attention of all the members of a class on the point before the class. The device of requiring children to copy reading, geography, and other lessons on their slates, to keep them quiet, has not been so much abused as heretofore. A true professional zeal has been shown by the study of works on teaching and by attendance at and participation in the exercises of the Friday-evening normal school and the monthly teachers' institute.

You who are members of the board of education have, by the time and attention you have given in order to obtain good sites and plans for school-houses, by the encouragement and support you have given the teachers in the discharge of their duties, by the care you have exercised in promoting teachers to advance them according to their merit, and in selecting and providing text-books to get the best at the lowest market-prices, by the silver medals that you have promised to pupils perfect in attendance and the gold medals and large prizes of books, (the private gifts of members as rewards for scholarship,) by your faithfulness in watching over the other interests of the schools, and by your wisdom in legislating for them, done a noble work for the advancement of this great practical scheme of moral and intellectual improvement.

In conclusion, I desire to return my sincere thanks to the press of this city for the promptness with which they have published whatever seemed likely to advance the interests of our schools and for their frequent and able advocacy of measures tending to promote the cause of education in our midst; to the teachers for the many expressions of kindness which I have received from them and for the cordial manner in which they have worked with me for the good of the schools; and to the members of the board for the consideration they have given my suggestions and for the encouragement and support I have ever had from them.

DAVID W. HARLAN,
Superintendent.

Wilmington is known as one school-district, eleven and a half districts having been consolidated. There are no district-schools; all are graded. The old districts are entitled to their *pro-rata* share of the State-fund, which by inadvertence was not applied for during the past year. Forty-two weeks comprise the scholastic year. There are no libraries connected with the schools.

VISIT OF LEGISLATURE.

The visit of the State-legislature to the city-schools has been alluded to. The legislature, governor, and secretary of state were invited by formal resolution of the school-board of Wilmington to visit the schools. The invitation was accepted, and for two days they were the guests of the city, entertained by board of education and the city council. They visited schools Nos. 1, 3, 4, 8, and 15, and expressed great interest in investigating the practical workings of the school-system and gratification at the results shown.

REMOVAL OF GIRLS' GRAMMAR-SCHOOL.

On the 1st of September, 1873, the girls' school, formerly held in school-house No. 4, was removed to the second story of school-house No. 1, in which building is the grammar-school for boys. This brings the scholars of highest grade in the same building and affords additional facilities in the use of apparatus required equally by both schools.

STUDY OF LANGUAGES INTRODUCED.

On the 1st of September, 1873, the studies of Latin and German were added to the courses of study taught in the high-school-departments of the grammar-schools.

EDUCATION OF COLORED CHILDREN.

The board of education, which had previously contributed $1,000 annually towards meeting the cost of the Howard colored-school, under the charge of the Delaware Association for the Moral Improvement and Education of the Colored People, decided to take it wholly under their control, and took charge of it October 1, 1873.

ADDITIONAL SCHOOL-HOUSE.

The board is building a new primary-school-house, with seating capacity for 420 scholars, on the corner of Third and Hinman streets.

LETTER OF PRESIDENT HILLES.

As Colonel Grimshaw, the retiring president of the board, omitted making the usual annual report on the condition of the public schools, the following extracts from the reply of President Hilles to a letter of inquiry are inserted:

THE VISIT OF THE LEGISLATURE.

"I think the visit of the legislature to our city-schools last winter was an interesting and important event, as being a public recognition of their importance and tending to concentrate public thought and interest on the subject." * * * *

THE HOWARD SCHOOL.

"The Howard school-establishment, some years since, by the combined efforts of the Freedmen's Bureau, the city-council of Wilmington, and a number of private citizens, organized for the education of the negroes and appropriated by the deed of trust by which it is held for the use of a 'school 'from which no one shall ever be excluded by reason of race or color,' has recently been adopted and taken in charge by the board of public education. It is in successful operation and doing good work for the colored people.

"More schools are needed for their use and will, it is hoped, be hereafter established, as it is possible to accomplish this."

EDUCATION OF COLORED PEOPLE IN THE STATE.

"I can give you no information in reference to the prospect throughout the State for the participation of the negroes in the benefits of the school-fund. I presume it will be a work of time—much time it may be."

VALUE OF SUPERVISION OF SCHOOLS.

"Having been for several years interested in the working of the Association for the Moral and Intellectual Improvement of the Colored People, which maintains a superintendence over the colored schools throughout the State, I have been much impressed with the benefits which are conferred by this in aiding the local committees in the selection of teachers, in the purchase of uniform text-books, and, generally, in the requirement of regular reports to the central office. I think it is not too much to assume that, in consequence of this supervision, the colored schools in some parts of the State are in better condition and more efficient in their work than the white schools. It is not a *centralization of power*, the objections to which are well known to me, but a *voluntary submission* to or *acceptance* of aid from the central office, in return for which the teachers and trustees are expected to make periodic and complete reports of their doings.

"This requirement alone, without regard to the advantage of help in examination and selection of teachers, amply repays the local authorities for the nominal subjection."

SUPERVISION OF PUBLIC SCHOOLS FOR WHITES SUGGESTED.

"I would strongly recommend a similar agency to the white friends of education in this State and elsewhere. The *voluntary* or *individual* element incorporated into it is an advantage to the system, and the two can easily be harmonized. In further illustration of this, I respectfully recommend to your attention two reports issued in Edin-

burgh, Scotland, on the operations of the Dick bequest. A sum of money was devised many years ago by a Mr. Dick to trustees, in perpetuity, for the improvement of the parochial schools of three counties in Scotland, Banff, Aberdeen, and Moray. The net increase of the fund is annually divided by the trustees between the parish-schoolmasters, upon elements or numbers obtained from two sources: first, the numerical results of examinations held annually at Edinburgh in the higher branches of study; secondly, the actual condition of the schools under the teachers' charge. The result is an addition to the teachers' salaries of sums varying in amount in such a way as to correspond with these two elements, and thus to encourage the energetic and painstaking teachers in a most effectual way." * * * * * * *

"A great point is attained when the practical philanthropy and Christian sentiment of the community are embarked in the efforts to aid the general education, by personal aid given to the authorized system in use. If I am not mistaken the two high schools of Cincinnati owe their origin to the benevolence of private individuals ingrafted on the public system of schools.

"Respectfully,

"W. S. HILLES,
"*President Board of Public Education.*"

PUBLIC LIBRARY.

The public schools have no libraries, and there is no free public library in the city. There is, however, a reference and circulating library corresponding to the mercantile library association of other cities, access to which can be had by annual subscription. This is known as the Wilmington Institute. It owns a fine building at the corner of Eighth and Market streets, which contains, in addition to its reading-room and library, a large public hall and several stores. The sixteenth annual report shows an annual income of $8,456.70, derived from membership-dues, rents of public hall and stores, and other sources, with an expenditure during the year, for books, salaries, interest, taxes, &c., of $8,165.60. Balance of cash on hand, $770.17.

The library has been increased during the year by the purchase of a complete set of the "Tauchnitz Edition," 1,176 volumes, and by several hundred miscellaneous works. The library now numbers between 12,000 and 13,000 volumes. The reading-room is supplied with 58 newspapers and periodicals. The membership the past year numbered 585. It is felt that the membership has not kept pace with the growth of the city, and efforts are making to increase the number of members by the issue of shares of stock at a nominal cost of $10, on which the holder shall make a semi-annual payment of $2, entitling him to the use of the library and reading-room. The library is open every day from 8 a. m. to 10 p. m.

PRIVATE SCHOOLS.

Exact data as to the whole number of pupils taught in private schools are wanting. The students attending during the year the five institutions from which returns have been received number 600.

The Delaware State Normal University, incorporated in 1867, Mr. John C. Harkness, A. M., president, reports total number of students in attendance at 224. Students' annual expense, $170 to $200.

The Wesleyan Female College, in charge of Rev. John Wilson, reports 8 professors and instructors; 137 pupils; 75 in preparatory department, 56 in the regular collegiate classes; of these are 20 freshmen, 14 sophomores, 10 juniors, 12 seniors; 6 pupils in a special or partial course. Degrees of mistress of English literature and baccalaurea artium are conferred. Cost of board and lodging per year, $180. Tuition, $50 in preparatory course, $60 in regular course. Music, modern languages, and drawing are taught. There is a library of 3,600 volumes, and a small philosophic cabinet, a chemic laboratory, and a natural-history-museum.

Taylor and Jackson's Academy, principal, Milton Jackson, reports 125 pupils. This is a school for both boys and girls. Cost of board and lodging per year, $195. Tuition, $65. Modern languages, $21.50 per year.

Rugby Academy, Dr. Samuel W. Murphy, A. M., principal, a select school for boys, reports 74 pupils. Board and lodging, $5 per week. Tuition: English branches, $60; classic, $75; modern languages, $30 per year.

The Misses Robertsons' Family Boarding and Day School for Girls reports 40 students. Annual expenses for board and teacher, $400. Modern languages, $30 per year.

Fuller statistics of these schools will be found in the statistical table at end of this volume.

DOVER.

Dover, Kent County, the capital of the State. Population, census of 1870, 1,903; estimated, in 1873, at 2,100.

GRADED SCHOOL.

The town is divided into six school-districts. Four of these, in the upper part of the town, have consolidated their schools into one graded school, with four departments.

SCHOOL-STATISTICS.

Whole number of scholars in the public schools, 260; average attendance, 200; number of weeks in scholastic year, 44. There are 6 teachers, 2 male and 4 female.

SALARIES OF TEACHERS.

Salary of male principal of graded school, $800; salaries of lady teachers: 1 at $400; 2 at $300; 1, $200.

SCHOOL-DISTRICTS.

The district-schools are each, as elsewhere in the State, except at Wilmington, under the charge of three commissioners chosen by the district, only that in this respect the four consolidated districts count but as one and have only three commissioners. An attempt was made during the past year to consolidate all the districts of the town, but was defeated. More than three-fourths of the public-school-children are already included in the consolidated districts.

SCHOOL-HOUSES.

There are three school-houses, two of brick and one of wood, belonging to the town. One of the district-schools is held in a room rented for the purpose.

Much interest is felt in the school, as shown by the frequent visits of the commissioners and by the parents of the children, and no difficulty is found in obtaining all the money needed for its support.

GRADED-SCHOOL-HOUSE.

The graded school occupies a fine two-story brick building, built in 1867, with a large play-yard surrounding it on all sides. The lot runs from street to street. A wooden building, facing the other street, affords accommodation for two departments of the graded school.

This school is under the efficient management of Mr. Frederick A. Williams, who, with three assistants, has organized an admirable school.

PRIZES.

Prizes offered by the commissioners of the graded school were awarded, for the first time, at the public exhibition in April, 1873, for proficiency in studies, excellence of behavior, and punctual attendance. Seven prizes of books were given, 3 to girls and 4 to boys.

SCHOOL-FUNDS.

The amount of school-contribution the past year, in the consolidated district, was $1,400; in one of the other districts $200, and in the other nothing.

Amount received from State-school-fund, $80 per each of the six districts.

PRIVATE SCHOOLS.

There are five private schools, with about 130 scholars enrolled. Three are for very young children, one a select school, and one a Catholic school with an attendance of about 50 scholars.

WILMINGTON CONFERENCE ACADEMY.

The fine building of the Wilmington Conference Academy is nearly completed. It is a substantial four-story building, of brick, 80 by 90 feet; 64 feet in height. It stands in the center of a lot of 6¾ acres in extent, just north of the town. The school is already in operation. The new building is to be ready for occupation in September, 1874.

This school is chartered by the State and is controlled by a board of 34 trustees: 17 clergymen, 17 laymen. A majority must be members of the Methodist-Episcopal Church. The board may control the school themselves or may lease it to a principal. They have the right to confirm or reject text-books, teachers, &c. The school is designed as a thorough preparatory school for young men and boys. The admission of young ladies is contemplated when the new building shall be completed.

At present the academy occupies a rented building. It is in charge of Rev. James M. Williams, A. M., who, with an assistant, teaches the 26 pupils now in attendance.

SMYRNA.

Smyrna, Kent County. Population, census of 1870, 2,100; estimated 1873, 2,500.

SCHOOL-STATISTICS.

There are four school-districts, which are consolidated into two, with a graded school in each. There are two school-houses: one of brick, one of wood. Whole number of scholars in public schools, 450; boys, 250; girls, 200. Average attendance, 375; number of weeks in scholastic year, 44.

TEACHERS.

There are two male principals of the graded schools. Salaries, $700 per annum. Four female teachers: 1, salary of $400; 2, $300; 1, $250.

By an act of the last legislature each of the consolidated districts was authorized to raise, by taxation, a sum not exceeding $1,600. The share of State-fund to each district is $80. The country schools are not allowed to raise more than $300. Each district is compelled to levy a tax of $75; many districts raise nothing more. The country schools in the neighborhood are, many of them, closed from three to six months in the year, and but little interest is manifested in them. The consolidated schools in the town are held from forty-two to forty-four weeks in the year, and considerable interest is shown by commissioners and citizens, though many children of school-age in the town are reported as not attending any school.

PRIVATE SCHOOL.

The Smyrna Seminary, chartered in 1870, a flourishing classical school, is in charge of William H. Dashiell, A. B., with four lady assistants. Number of pupils, 80; 40 girls and 40 boys. Scholastic year, 40 weeks.

FREDERICA.

Frederica, Kent County. Population, census of 1870, 588; estimated 1873, 673.

SCHOOL-FUNDS.

Amount of school-contribution in consolidated districts	$200
Amount raised by taxation	400
Amount received from State-school-fund	327
Total amount available for school-purposes	927

GRADED SCHOOL.

The town is divided into five school-districts, which have been consolidated into one, in which is a graded school, which is held in the large wooden building built by the town in 1868, the upper story used for a town-hall and the lower divided into four rooms for use of the town-schools.

SCHOOL-STATISTICS.

Whole number of scholars, 125—males, 58; females, 67. Average attendance, 75. Number of weeks in scholastic year, 36. There are 3 teachers—2 male and 1 female. Salary of principal of graded school, $375 per year; of male assistant, $300; of lady teacher, $225.

PRIVATE SCHOOL.

A select school is usually held for twelve weeks each year for those who are not satisfied with the length of the school-year, scholars paying for tuition. Seventeen scholars attended the last session.

COUNTRY DISTRICTS.

Schools are held in the surrounding districts from six to nine months, supported principally from the amount received from the State-fund and the smallest tax possible to enable the district to draw its quota of the State-fund. There is a colored school for about twelve weeks in the winter, near Frederica, supported by payment of tuition by the pupils.

MILFORD.

Milford, partly in Kent and Sussex Counties; population, census of 1870, 3,093.

The town is divided into ten school-districts, consolidated into two districts, with two graded schools. There are two school-houses, one of brick, one of wood. Whole number of scholars, 259—male, 127; female, 132. Average attendance, 210. Number of weeks in scholastic year, 42.

There are 7 teachers—2 male and 5 female. Salaries of male teachers, $50 per month; average salaries of lady teachers, $23 per month. Amount of school-assess-

ment in each district, $160. Amount received from State-school-fund in each district, $66.

Educational interests are reported as advancing, public schools improving, and taxpayers willingly increasing the amount needed for support of schools.

PRIVATE SCHOOLS.

The Academic and Collegiate Institute, William R. Lord, principal, reports 47 male and 50 female pupils.

GEORGETOWN.

Georgetown, Sussex County. Population, census of 1870, 710; estimated 1873, 850.

SCHOOL-FUNDS.

Amount of school-contribution in each district	$275
Amount received from State-school-fund in each district	250

SCHOOL-STATISTICS.

There are four school-districts consolidated into two for school-purposes, with one graded school. There is one two-story brick school-house. Whole number of scholars, 110; average attendance, 75; number of weeks in scholastic year, 36. There are 2 teachers—1 male and 1 female—with salaries of $300 per annum.

PRIVATE SCHOOLS.

There are three private schools, with a total attendance of 60 pupils.

The Georgetown Academy, a high school for both sexes, occupies a large, fine brick building. Rev. William Edwards, principal; number of scholars, 25.

MILTON.

Milton, Sussex County. Population, census of 1870, 824; estimated, 1873, 1,100.

SCHOOL-FUNDS.

Total for support of schools	$825 50
Amount of contribution in each of the five districts	98 00
Amount received from State-school-fund in each district	69 10

SCHOOL-STATISTICS.

The town is divided into five school-districts. Two are consolidated into one, with a graded school. There are four school-houses of wood. Whole number of scholars, 200, (males 90, and females 110;) average attendance, 175; number of weeks in scholastic year, 24 to 28. There are 5 teachers—2 male, with salary of $35 per month, and 3 female, with average salary of $22 per month.

PRIVATE SCHOOLS.

There are two private schools, with some 40 scholars.

COUNTRY SCHOOLS.

The country district-schools in the vicinity of Milton are in session only so long as the *pro-rata* portion of the State-fund, together with the proceeds of the smallest tax that enables them to draw their share of the fund, permits. "They are generally very poor schools."

LEWES.

Lewes, Sussex County. Population, census of 1870, 1,090; 1873, estimated, about 1,400.

SCHOOL-FUNDS.

Amount of school-tax in each district	$30 00
Amount of State-school-fund received in each district	69 50

SCHOOL-STATISTICS.

The town is divided into four school-districts, not consolidated. There is one school-house of wood belonging to the district; if other rooms are needed, they are rented. There are no graded schools. Two district-schools are kept. Whole number of scholars, 95. Schools are kept 40 weeks, if additional tax warrants. There are 2 teachers—1 male, 1 female; salary of each, $30 per month.

PRIVATE SCHOOLS.

There are 3 private schools, with about 90 scholars.

Reports received from this place state that "not one-half of the children of the town attend any school; that, from the utter want of uniformity in the text-books used and from want of grading the scholars, the condition of the schools is much below any proper standard." An earnest friend of free public schools writes as follows: "There is no reason why such a state of things should exist, only that the people cannot see what is to their advantage in giving their children an education. One graded school with four classes, run at an expense for tuition of about $2,200 to $2,500 a year, will school all the children. Taxation alone, with consolidation, will bring about the school-system required in this State. Other States have good school-systems, and so can ours, if the people can be led to appreciate education.

"There is no school-system so expensive as a private school or so injurious to the community at large; only a few can afford to carry out an education for their children, and, therefore, many who would be men of use to society go neglected."

EDUCATIONAL INSTITUTIONS.

The statistics of Delaware College at Newark will be found in the table of college-statistics at the end of this volume.

There are quite a number of chartered academies and of private, select, and classic schools in the State, besides those that have been noticed in the reports of the various towns. The lists of such of these academies and private schools as have been obtained will be found in the statistical tables of institutions of secondary instruction.

In the absence of any authorized State report it has been sought to make as full a report as possible, both of the public schools and the private institutions of the State; but what has been done has been under great disadvantages, and is of necessity fragmentary and incomplete. Enough, however, has been obtained to afford opportunity for comparison between different places and to show decided and encouraging progress in many parts of the State.*

EDUCATION OF COLORED CHILDREN IN DELAWARE.

The following statement, made by the efficient actuary of the benevolent society, which still furnishes the only formal instrumentality for the education of the colored children of the State, outside of the city of Wilmington, shows the condition and progress of their schools during the past year:

"OFFICE OF THE DELAWARE ASSOCIATION FOR THE MORAL
"IMPROVEMENT AND EDUCATION OF THE COLORED PEOPLE,
"607 *Market Street, Wilmington, Delaware, December* 17, 1873.

"DEAR SIR: * * * During the school-year, from September, 1872, to September, 1873, we had 21 schools under our care throughout the State, including two taught in the Howard school-building in Wilmington. The total number of pupils on our rolls was about 1,800.

"The number of pupils enrolled for the month of January was 1,022, with an average attendance of 866. Of the number enrolled, 825 were reading and spelling, 686 writing, 423 studying arithmetic, 291 geography, 70 grammar, 72 history, and only 197 in alphabet and primer.

"This association expended in the prosecution of its work about $4,000. About $1,600 of this amount was expended in the Howard school alone, of which, however, the board of public education of the city has refunded us $1,000.

"The balance of the funds expended (about $3,000) has been collected by subscription from private individuals, and almost entirely from residents in and near Wilmington. The colored people themselves have raised and expended about $5,000, in payment of teachers, board, and salaries, and in repairing school-houses, &c. At the opening of our work this autumn (1873) the Howard school-building in Wilmington was leased to the board of public education, by the managers of this association, for one year, at a nominal rent, with the agreement that the house shall be for the use of a school from which none shall be excluded on account of race or color.

"The school, therefore, is now in charge of the officers of the public schools of the city, and will probably be reported to your Bureau with other schools under their direction. Nine pupils from this school have gone out as teachers to schools in this State and Maryland, fully competent for their duties. We have also employed one of the pupils from our school at Summit Bridge to teach a school under our charge in the lower part of the State.

*Persons in charge of academies and private schools will secure the insertion of the statistics of their several institutions in the annual reports of the United States Commissioner of Education by forwarding their addresses to the Bureau of Education, so that the schedules of inquiry can be sent to them at the proper time.

"We have at the present time 15 schools in active operation at different points throughout the State. Ten others are ready to open the 1st of January, 1874, making 25, in all, under our management. Four new schools have been organized within the current year and are in a favorable condition. We are gratified to say that there seems to be a greater interest manifested in the education of the colored people of the State than at any time before, and the colored people themselves are more unitedly working for their object.

"Respectfully submitted.

"ABBE C. PECKHAM,
"*Actuary Delaware Association.*

"General JOHN EATON,
" *United States Commissioner of Education, Bureau of Education,*
Department of the Interior, Washington, D. C.

FLORIDA.

[From report of Hon. Jonathan C. Gibbs, State-superintendent of public instruction, for the year ended September 30, 1873.]

FINANCIAL STATEMENT.

Receipts.

Income from taxation for school-purposes	$75,000 00
Interest on permanent school-fund	14,873 23
Revenue from Peabody fund	8,000 00
Revenue from seminary-fund	5,587 39
Proceeds of sales of lands	2,759 02
Proceeds from donations	10,000 00
Total receipts	116,219 64

Expenditures.

For sites and buildings, (300)	$10,000 00
For libraries and apparatus, (75)	----------
For salaries of superintendents*	5,000 00
For salaries of teachers	72,389 00
For fuel	1,000 00
For rent of buildings for school-purposes	3,000 00
For repairs of school-buildings	10,000 00
For stationery and school-books	10,000 00
Total	111,389 00

School-fund.

Amount of available school-fund	$101,820 00
Amount of permanent school-fund	281,785 56

Teachers and teachers' salaries.

Number of teachers in public schools, male	150
Number of teachers in public schools, female	350
Total	500
Average salary of teachers per month, males	$35
Average salary of teachers per month, females	35

SCHOOL-POPULATION.

The number of children of school-age (4–21) is given at	74,828
The number of children under 6 years of age	2,500
The number of children over 16 years of age	4,000
The number of children enrolled in public schools, of whom 8,728 are males and 10,882 females	19,610

EDUCATIONAL PROGRESS.

The State-superintendent, in his report for the year ended September 30, 1873, says that, although there is not, among the more intelligent classes in the State, as strong and personal an interest in the subject as is desirable, there is, in the minds of many, a marked increase of favor toward the school-system. The boards of public instruction in the different counties are working harmoniously; many good men have put heart and soul into the educational work, and in a number of instances money, lands, and school-buildings have been given to the county-boards and a commendable spirit of liberality has been manifested. A single county gave, in private contributions, $1,283, this being made up of small sums from a large number of persons.

*Many of these give their service without charge, and thus reduce this item of expense.

WORKING OF THE SCHOOL-LAW.

The school-law has worked well and is commending itself to the confidence of the people. The amendments suggested are: first, that the county-boards of instruction be limited to three members, in order to increase efficiency and diminish expense; secondly, that the census be taken by the superintendents once in five years; and, thirdly, that the county-clerks be required by law to report quarterly all the fines belonging to the school-fund to the comptroller, that the moneys in the hands of the sheriffs may be paid to the State-treasurer, as the law directs.

Earnest application has been made by Roman Catholics to the department of public instruction for a division of the school-money, on the ground of religious objections to the education of their children in the common schools. Such requests have been invariably refused by the superintendent, as the law forbids any such arrangement.

Great difficulty exists from want of uniformity in text-books. Many are too poor to provide the required books and others are prevented from obtaining them by distance from stores where they are sold and from other causes.

REPORTS OF COUNTY-SUPERINTENDENTS.

Madison County reports a higher standard of schools, an increase in their number and attendance, and more competent teachers than ever before; five frame school-houses, the first seen in the county, are being built and furnished, while hitherto the schools have been kept in unsuitable log outbuildings. Men who bitterly opposed the school-system a few years ago, regarding it as a political hobby, to be used for party-purposes, now see the necessity of educating the masses and willingly co-operate in school-work.

In Manatee County a new plan for securing regular attendance has been adopted. Every neighborhood which can start a school of at least ten scholars may do so, making such bargain as they can with the teacher, who, however, is to make regular monthly reports to the superintendent. The school is then adopted as a public school, so far as to secure to it $1 per month for each pupil shown to have attended regularly, not to exceed $25 per month to each school. It is hoped by this plan to secure a greater interest on the part of parents in sending their children regularly to school, the amount they have to pay being thereby lessened. It will also secure greater efforts on the part of the teacher in the discharge of his duties and enable thinly-populated neighborhoods to have the benefit of the free-school-fund.

There is about to be erected at Manatee a handsome school-building for the education of the colored people, the funds having been contributed by benevolent people at the North, through the efforts of certain ladies, agents of the American Missionary Society.

In Levy, and other counties, school-interests are retarded by the low financial condition of the treasury, many of the teachers being necessarily poor; the schools are small, owing to the sparseness of the population, and often those who can send their children to school do not send them regularly. A majority of the county-reports, however, indicate a steadily increasing interest on the part of parents in the education of their children.

SCHOOL-LANDS.

One source of income to the schools in this State is the sale of what are called school-lands. These consist, as in several of the newer States, of the sixteenth section in every township, granted under a general law for the support of schools in that township. The grant inures to the benefit of the schools immediately on the completion of the township-survey. The quantity of land thus brought into the market varies, of course, with the progress of surveying-operations. But if the number of townships now surveyed be estimated at 1,000, which probably comes near the truth, and if the sections are given an average area of one square mile, there would be 640,000 acres of school-lands. The full amount is said to be 704,692.21 acres; and, as the aggregate sales to January 1, 1872, had reached 108,677.34 acres, there remained at that time 596,014.87 acres still unsold, a fair inheritance for township-schools, if well disposed of.

SEMINARY-LANDS.

These are lands granted by the General Government for the support of two seminaries, one in East and one in West Florida. The amount is 85,714.08 acres. Under existing laws, the control of both the school- and seminary-lands is vested in the State board of education, and the proceeds of sale are devoted exclusively to educational purposes.

FUNDS RAISED BY TAXATION, ETC.

The amount raised by taxation in the several counties is given by the superintendent as $75,000, the same as in 1872. Adding to this private contributions of $10,000, donations from the Peabody fund of $8,000, from the seminary-fund and the sales of school-lands, $8,346.41, and from the interest on permanent school-fund, $14,873.23, and

we have in the neighborhood of $1.55 for each of the 74,828 of the children in the State of school-age, or $5.92 for each of the 19,610 enrolled in schools.

The aid from the Peabody fund is here, as elsewhere, of great value, because so distributed as to sustain for ten months in the year schools at important points, where they become models to surrounding neighborhoods of what good schools ought to be.

PEABODY FUND SCHOOLS.

In the absence of the clear reports given by northern town-authorities as to the schools under their control, the following information is gleaned from the statements of the agent of this admirably-managed fund for 1873.

From Jacksonville, under date of February 10, 1873, the chairman of the board of education reports: "The second term [of the school-year of 1872–'73] has opened very favorably. We have in the high school 250 scholars. As your rules require, the average attendance is large, exceeding 85 per cent. The colored-school is also doing well, the number of pupils being 360. For success we are dependent in a large measure on the aid received from the Peabody fund."

From St. Augustine the report is that, though the schools in the county have much to contend against, from the poverty and sparseness of the population, those in the city are doing very well, the Peabody school having never been in a better condition.

From Gainesville there is the report of "two large and good schools, one for white children, the other for colored," aided by the Peabody fund.

The schools of Key West received $1,000, while the city contributed $6,000.

In Pensacola the schools were reported in operation from April 2 to September 1, with about 250 scholars, and on this showing application was made for aid.

Madison reports that the aid received from the fund has enabled the people to continue the schools much longer each year than could have been done without this help.

MISSION-SCHOOLS.

There probably are several schools of this character sustained by societies devoted to the elevation of the colored race. One such, encouraged if not supported by the American Missionary Association, is spoken of with high commendation. This is the Stanton Institute, at Jacksonville, which has been in operation for four years, under the management of teachers from Massachusetts, who are said to have brought order out of chaos, and to have demonstrated the ability of colored children to acquire readily all the branches ordinarily taught in public schools. The record of this school for seven months of 1873 shows an average attendance of 363 pupils, all said to be reading well, spelling better than many white adults, drawing and coloring maps in creditable style, and evincing a fair knowledge of geography—political and physical—of physiology, and other useful themes.

The colored Baptists, with probably some missionary aid, are reported by the superintendent to have expended $2,000 for a school-building for their children near Live Oak.

The colored Methodists are also engaged in erecting, near the same place, buildings for schools and a future university, (Brown's University,) which will cost about $12,000.

SECONDARY TRAINING.

The principal schools for secondary instruction in this State are, probably, the West Florida Seminary at Tallahassee, the East Florida Seminary and Union Academy at Gainesville, and the high school at Jacksonville.

The West Florida Seminary, one of the institutions for establishing which the "seminary-lands" were given, has been in operation since 1857. It has 93 pupils—43 boys and 50 girls—and 4 teachers—2 male and 2 female. The study of Latin and Greek is pursued by about one-fourth of the boys. Tuition is free, the school having been placed, more than a year ago, under the charge of the county-board of education, as the high school of Tallahassee.

The East Florida Seminary, at Gainesville, and the Union Academy, at the same place, are both spoken of in the Peabody report as of elevated character and as forming for that county the chief dependence for competent teachers in the schools.

The high school, at Jacksonville, containing over 250 scholars, it has been the aim to make of as high a grade as possible, with a view to the removal of any remaining prejudice against public schools, and success in that endeavor is claimed for it. Its course, as published in the report of the State-superintendent, is remarkably extensive, as much so, in fact, as that of many colleges.

The St. Joseph's School for Young Ladies, at the same place, returns 8 teachers and 90 pupils, of whom a portion study French.

The Peabody Institute at St. Augustine still holds on its way and doubtless does good work, but the returns from it in 1873 are not such as to form a foundation for clear conception of its status as a school.

Besides these schools and two Roman-Catholic ones, from which no present report is in hand, there are, under the care of the Protestant-Episcopal Church, with the bishop as visitor, St. Mary's Priory, Fernandina, a diocesan school for girls, in which a high grade of instruction is said to be imparted, and Rutledge Institute, Tallahassee, in which, with English, classic training is united.

FLORIDA STATE AGRICULTURAL COLLEGE.

Measures have been taken toward the organization of this institution, which was established by act of the Florida legislature approved February 17, 1872, on the basis of the congressional land-grant for the benefit of agriculture and the mechanic arts. The general course of study marked out for the college is similar to that pursued in other colleges of this class throughout the country. It has been decided to locate the institution in Alachua County, in accordance with an offer from Hon. D. L. Yulee and other citizens, made conditional upon such location, guaranteeing to the college a donation of $50,000 in cash and 20,000 acres of land, and free transportation on the Florida Railroad for all the requisite building-materials for the college.

LIST OF SCHOOL-OFFICIALS IN FLORIDA.

GEORGIA.

[From report of Hon. Gustavus J. Orr, State-school-commissioner, for 1873.]

SCHOOL-POPULATION AND ATTENDANCE, 1873.

Children of school-age, (6–18,) males, 174,333; females, 169,302	343,635
Number enrolled on school-lists of public schools	76,157
Average attendance	32,240
Number of pupils in private schools	23,597

The superintendent states that the above figures are only approximations to the truth, as thirty counties which reported arrangements made for carrying on schools have failed to make the required school-reports.

SCHOOLS AND SCHOOL-TERM.

Number of schools reported	1,735
Average duration of school, in days	66

TEACHERS AND TEACHERS' PAY.

The number and average salary of teachers cannot be given, as the teachers are contracted with by the several county-boards, from whom returns on these points have not been received.

SCHOOL-FINANCES.

Receipts.

From taxation	$108,992 99
From other sources*	151,440 00
Total receipts	260,432 99

Expenditures.

Total expenditure: items not given	223,667 55

Through the action of the State-school-commissioner, seconded by the board of education and the better portion of the legislature, the public schools of Georgia are again in operation. During the year 1872 they were suspended, an unlawful diversion of the school-fund to other than school-purposes having left the board of education without resources for that year and with a debt of $300,000 from the preceding year. An effort was made to remedy this state of things by the passage of an act (January 19, 1872) conferring the power of local taxation for their support. But the power thus given was impaired by provisions which made any immediate result impossible. It required the grand juries, at the first term of the several courts after the passage of the law, to appoint a board of education for each district. These boards, at the next term of the courts after their appointment, were to recommend to the grand juries a tax for school-purposes, which these juries were empowered to either ratify or reject. In this way the possibility of the imposition of a tax on any district was removed to the latter portion of the year and the likelihood of the collection of it in the year made very doubtful. A subsequent act, meant to be amendatory of this one, approved August 23, 1872, failed to amend the matter. Under such circumstances there was no remedy but to close the schools and carefully husband the regular school-income for a year. This would at least provide for carrying on the schools another year, if the debt that had been incurred in 1871 could be disposed of. To the payment of that debt the commissioner directed his first efforts, and succeeded in getting an act passed to authorize the levy of a special tax for the discharge of it. The receipts from this source have been, up to October, 1873, $174,000, with a prospect of enough besides to make almost or quite $200,000, which is two-thirds of the whole debt. Of this sum, $109,000 was apportioned in December, 1872, and $74,000 in September, 1873, leaving the remainder to be assigned as it should be received.

Besides the $174,000 thus handed over toward the payment of the debt, $250,000 was apportioned in July of 1873 for the support of schools,† making a total payment of

* The sources of the above are given in the body of the report.
† This was for a school-population of 367,614.

$424,000 for school-purposes within a year. The amount due to teachers and school-officers who did service under the public-school-law in the year 1871 has thus been to a considerable extent provided for and the schools of the State set once again upon their feet. Such a result does great credit to the commissioner, who has been the chief agent in securing it, and gives promise of efficient and successful management of school-interests for whatever period he may continue at his post.

NO FURTHER DEBT.

Not only has it been the policy of the commissioner to incur no addition to the debt he found existing and to have as ample provision made as possible for the payment of this rather discreditable one, but he declares, as respects the future: "I have determined, as long as I remain in office, to contract no debt. My fixed-purpose, from which I will not depart, shall be to use the school-revenue of one year for the support of schools the next, thus paying as we go."

For the liquidation of the remnant of the debt of 1871, left undischarged by the proceeds of the special tax, it is proposed that State-bonds shall be issued bearing 7 per cent. interest, and that these shall be assigned *pro rata* to the several indebted counties, to be sold by the county-boards of education at a rate not less than a fixed minimum. The avails from such sale are to be used primarily for the payment of accounts due teachers and school-officers, any remainder over and above these to be turned to the support of schools within the counties. The assignment of these bonds to the county-boards is to be conditioned upon the county-authorities assuming the portion of school-debt existing within their respective bounds. It is hoped that in the present improved aspects of business and agriculture the people of the State, and especially the farming classes, may be induced to invest their augmenting means in these State-securities, which will be made by law untaxable, and that thus, without the seeking of an uncertain foreign market for the bonds, the funds for the discharge of the whole debt may be secured.

PROVISION FOR THE FUTURE.

Supposing the existing debt to be disposed of, the commissioner says there will be a State-school-fund sufficient for immediately prospective needs. The annual revenue, summed up, will be, from sources now provided—such as dividends on railroad-stocks owned by the school-board, poll-tax, tax on shows and exhibitions, and interest on State-bonds given for school-purposes—about $280,000. The present school-age being from 6 to 18, instead of from 6 to 21, as formerly, the school-population to be provided for—last reported as 366,388—it is supposed will not exceed 370,000 for some time to come. With this number the school-income above given would only allow about seventy-five cents *per capita* for the children of school age. But as it is estimated that the services of at least a third of the children of this age may be required for the support of the families with which they are connected, while another third may be kept at home by distance, sickness, or disinclination to attend, an average attendance of only about 123,400 has to be provided for. At this rate there will be about $2.25 from the State-fund for every child attending. And while it is granted that this would, of itself, be wholly insufficient to meet the annual charges of tuition, it is supposed that as an aid to local effort it may fully suffice. The State exhibiting by this allowance a paternal interest in the education of its children, the commissioner conceives that emulation between different communities, individual concern for the proper training of the young, and a natural tendency to watch carefully the expenditure of the supplemental means raised in each neighborhood for the education of the children there, may be relied on for bringing about a fair general system of instruction before long. Leaving, then, mainly to the several county-boards the care of providing needful local means as well as the details of local administration, he proposes to follow the now general example of using the State-fund just to stimulate and aid the counties, maintaining only a general supervision and certain general laws for all alike.

PROSPECTS.

In a written communication, additional to his report, the commissioner says:

"Our school-law provides that the board of education of each county shall report to the State-school-commissioner that arrangements have been made for continuing schools in operation, free to all, for three months of the year throughout the entire county, in order to entitle the county to receive her *pro rata* of the school-fund. We have one hundred and thirty-six counties in the State. Of this number, eighty-six have made the report required. Reports are still coming in, (October 10, 1873,) and I am induced to believe that we shall have three-months free schools in every county in the State.

"The State-fund will not be sufficient to pay the entire expense of all these schools. It is necessary to supplement it, and this is done by subscription, as the county-authorities have no right of local taxation. The authority of the general assembly to delegate the power of taxation for school-purposes to the county-officers has hitherto been doubted. My policy has been to rely mainly upon local levies, and I have endeavored

in vain to obtain the necessary legislation for this end. I never doubted the right of the general assembly to bestow the power, and, fortunately, the question has been recently decided by our superior court in favor of this right.

"The people are daily becoming more favorably disposed toward the public-school-system, and I hope to be able, at the next session of our general assembly, to obtain additional legislation, confirming the power of local taxation.

"When I entered office, a thick gloom was resting upon everything in my field of labor; now, the outlook is cheering."

The statistics of schools for the principal towns in the State are as follows:

ATLANTA.

Atlanta reports, to a population of 20,879, the number of children of school-age (6–18) 9,438, of whom 3,594 are enrolled in public schools and 95 in private ones, with an average attendance of 2,731 in the former and 75 in the latter. There are 10 public and 4 private schools, with 57 teachers in the former and 4 in the latter. The schools are of all grades, from primary to high, and a normal class, composed of the whole body of teachers, meets every Saturday during the school-year, with a view to the attainment of higher perfection in the art of teaching. The salaries of teachers range from $450 per annum to 1,800, the latter being the maximum for the high school. Income, including $6,531.30 from the State and $2,000 from the Peabody fund, $57,206.48. Expenditures for current school-expenses, $50,056.04; for sites and buildings, libraries, and apparatus, $75,100. Latin is taught, and, in the boys' high school, Greek also; in the girl's high school, French; drawing and vocal music in all the schools. In the high school, 30 students are preparing for the academic course in college and 15 for the scientific course.

AUGUSTA.

Augusta, with a population of 19,896, has 4,757 children of school-age, almost equally divided between white and black. The number enrolled is 1,545, with an average attendance of 1,138. There are 19 primary schools, of which 11 are for the colored population and 8 for the white; with 8 intermediate, 4 for the colored youth, 4 for the white; no grammar, high, or evening-schools, but, as in Atlanta, normal classes composed of all the teachers in the schools. Income from taxation, $21,000; from Peabody fund, $2,000. Expenditures about the same. The system of public schools is still new here, having only been inaugurated in January, 1873, and each step of progress has to be taken slowly in a population wedded to old ways. Private schools for both males and females are said to be numerous and of high character, but no statistics of them are given.

COLUMBUS.

Columbus (population 8,648) has 2,610 children of school-age, of whom 1,080 are enrolled in the public and 369 in the private schools, making a total of 1,449, with an average attendance of 1,128. The schools are 3 primary, 3 grammar, 1 female-high school, 1 evening-school, and 1 city-normal school, which last is presided over by the city-superintendent, and embraces the 16 teachers of the public schools, with 4 besides, the average attendance being 12. The private schools are 12, with an average attendance of 262 and 1 teacher for each school. The teachers in the public schools receive from $300 to $600 per annum; the city-superintendent, $1,925. In the income, $600 from the Peabody fund supplements $3,098.60 received from the State, $7,105.37 from local taxation, and $1,803.92 received for use of books—total, $12,607.89. The expenditures—for salary of superintendent, $1,925; salaries of teachers, $6,653.70; fuel and lights, $326; rents, $400; repairs, $1,427.26; stationery and school-books, $1,003.92; and miscellaneous, $872.01—balance the income. Latin is taught; 591 pupils take lessons in drawing; 230 in vocal music and 22 in instrumental music in the schools.

MACON.

Macon (population, 19,000; children of school-age, 6,560) reports 882 enrolled in schools of all grades, with an average attendance of 715, under 22 teachers, all of whom form a normal school by themselves; while 5 private teachers have under them 145 enrolled pupils and a current attendance of 130. The teachers in the public schools receive from $50 to $150 per month; the city-superintendent at the rate of $2,000 per year. An allowance of $1,500 from the Peabody fund comes in to aid $6,393 from the State and $11,500 from local taxation, making the school-income $19,393, of which $18,424.60 goes for the salaries of teachers and the remainder for that of the superintendent, for fuel and lights, repairs, stationery, and miscellaneous items.

SAVANNAH.

Savannah (population 23,235) makes return of 7,031 children of school-age, with 2,740 enrolled in public schools and 2,109 in average attendance; a total of 50 teachers employed in schools from primary up to high, but without evening-schools or normal classes. The salaries of teachers range from $450 per annum, for female teachers in

primary schools, to $2,000, the maximum for male principals of the high schools. That of city-superintendent is $2,800 per annum. The income here, including a balance on hand from last year of $2,919.31, is: from the State, $9,281.62; from county-funds, $20,000; from city-taxes, $27,500; from other sources, $3,360.44—total, $63,067.37. Expenditures: for sites and buildings, $9,957.47; salary of superintendent, $2,500; salaries of teachers, $42,396.55; fuel and lights, $515; rents, $300; repairs, $877.64; stationery, $498.46; miscellaneous, $5,010.88—total, $62,050. Latin and Greek are taught; 54 pupils study German and 120 French. No returns from private schools.

SECONDARY INSTRUCTION.

This has in Georgia, as in other southern States, been largely given in past days at private schools, held sometimes in the towns, sometimes in the planters' homes, two, three, or more families usually uniting in the support of such a school. Since the war, this system is, from the impoverishment of the people, less general, while academies and other high schools, where education can be cheapened by gathering numbers in one place, grow gradually in favor. Nine such reported to the Bureau in 1873 an aggregate of 16 male and 9 female teachers, with 652 pupils. Of these 14 are engaged in scientific studies, 7 in commercial, 24 unite modern European languages with English, and 294 study also Latin or Greek, or both. In three of these schools drawing is taught and in one music also.

Besides these, 99 high schools* appear in the report of the State-superintendent, presented to the governor January 13, 1874. The instructors in these amount to 162; the pupils, male and female, to 5,229. By far the greater part of these unite a classic with an English course; a majority embrace "sciences" in their curriculum, without specifying these; and a few have the modern languages and music.

UNIVERSITY OF GEORGIA.†

The University of Georgia, at Athens, is the recognized State-institution for affording superior instruction. But besides this, as everywhere throughout the States, other colleges and universities have sprung up at different points, some for the accommodation of particular localities, some with a view to the incorporation of denominational religious training with the college-course; while following these have come the agricultural colleges, on the base of a congressional land-grant. These are included in the tables of institutions for professional instruction, alike from certain peculiarities and from the special intent of the education given in them. But one of these, the North Georgia Agricultural College, at Dahlonega, from its connection with the University of Georgia, is reported with it. The statistics given below from returns made in the fall of 1873 embody the substance of present information with respect to these institutions.

In an address, delivered August 5, 1872, before the literary societies of the University of Georgia, Emory Spear, esq., gave the following items of historic information respecting the debt truly due to it from the State:

"In the year 1784, one year after the successful assertion of American freedom, the revolutionary statesmen and soldiers of Georgia set apart 40,000 acres of land as a permanent endowment to this university, and they declared that these lands should never be appropriated to any other purpose whatever. In 1785 the college was chartered; and the language of the great and wise men who framed it should be printed in indelible characters on the portals of this institution:

"'As it is the distinguished happiness of free governments that civil order should be the result of choice, and not of necessity, and the common wishes of the people become the law of the land, their prosperity, and even existence, often depend on suitably forming the minds and morals of their citizens. It should be, therefore, among the first objects of those who wish well to the national prosperity to encourage and support the principles of religion and morality, and early to place the youth under the forming hand of society, that by instruction they may be molded to the love of virtue and good order.'

"Such were the views of the founders of this institution. If they are to be realized, ours is the task; for while its founders acted most liberally toward the university, later legislatures have seemed to think it a legitimate subject to exercise the statesmanlike qualities of driving hard bargains. In 1798 the constitution of the State made it the imperative duty of the legislature to provide for the permanent endowment of the university and for the permanent security of its funds. These duties have never been performed, and the university to-day only receives from the State the interest on certain

* Four of the same, as above mentioned, occurring in a list of 103.

† This university holds 50 free scholarships for its old classes, the State College at Dahlonega, connected with it, 217 general scholarships, with 20 the right of presentation to which rests with the State Agricultural Society, 5 with the city-government of Athens, and 2 with private families; 170 students at Dahlonega raise the whole number connected with the university to 487. Its honored president, Dr. A. A. Lipscomb, still holds his chancellorship, notwithstanding summer-rumors to the contrary.

funds loaned to the State by the college. The legislature made several small appropriations, but they always secured themselves by taking mortgages on the college-lands. The legislature of 1815 concluded to sell all these lands. This they did. The sales aggregated $150,000. The legislature, with an eye to the main chance, took $50,000 of this sum to re-imburse themselves for their advances to the college. The remaining $100,000 was invested in bank-stocks. In 1821 the legislature took the bank-stock and bound themselves to pay the interest to the university. This has been faithfully performed. For the temporary suspension in the year 1867 of this fund the State cannot be blamed. It is not responsible for the conduct of General Pope, who is thought by some not to be responsible for his own.

"It will be readily perceived from the above account that the university is in no sense the debtor of the State. The 40,000 acres of land given to it in 1784 were vested absolutely in the college, and this was before the organization of the present State-government. For all subsequent appropriations the State has been amply repaid. The lands themselves sold at a great sacrifice. Had they remained in possession of the university, the chances are that she to-day would have rejoiced in the possession of a million dollars' endowment. Governor Wilson Lumpkin tells us, in a letter dated October 31, 1859: 'The State has been fully re-imbursed for all its appropriations out of the proceeds arising from the sale of 35,000 acres of the university-lands, and still stands indebted to the university-fund the value of 5,000 acres of the best Georgia lands to make up the deficit in the 40,000 acres donated to the university in 1784, 5,000 acres of land given to the university not being in the limits of this State, but lying and being in the State of South Carolina.'"

Respecting general education in the State, the same gentleman said on the same occasion:

"What has Georgia done for the cause of education? The State has attempted great things in this cause. It has accomplished very little. It is the old story, the perpetual parturition of the mountain and never-failing delivery of the mouse. Systems of public instruction have encumbered our statute-books. They have been abandoned and are forgotten. Appropriations have been made for educational purposes, and county-officials have not thought enough of the cause to apply to the treasury for the county-funds. In 1849 a law existed giving $20,000, to be divided among the several counties of the State, to establish schools for poor children. Thirty-two counties failed to make any return of their poor children, thereby voluntarily relinquishing their claims on the State. It is true the appropriation was ridiculously small; but when men fail to ask for money which may be had for the asking, you may be sure they do not care for the objects to be attained by its use.

"But the apathy of the people of Georgia with regard to public instruction has been illustrated with still more clearness. The Department of Education, a Bureau lately created by the General Government, has published a map showing the comparative degrees of illiteracy in the States of the American Union. The illiterate sections are represented by dark lines, and with shame, as a Georgian, am I compelled to say that on the map the good State of Georgia has a very somber appearance. In 1850 there were 213,993 native white adults in the State of Georgia; of these, 42,948 were unable to read and write. That is about 20 per cent., or one-fifth of the whole number. In 1860 the population had increased and the illiterates were reduced to about 18 per cent. This is confined to the native white adults, and yet we with justice may hope that the time will soon come when every child in Georgia, from the granitic slopes of the Blue Ridge to the magnolia-forests of the Southwest, will enjoy the priceless boon of free education.

PROPOSED UNIFICATION OF THE UNIVERSITY AND COLLEGES.

Under an act approved February 15, 1873, a commission was appointed by the governor to take into consideration a proposal for unifying the University of Georgia and the colleges of the State under one comprehensive plan, putting an end to conflicts now existing and harmonizing the educational interests. This commission met January 21, 1874, and its chairman, Rev. J. O. A. Clarke, D. D., the proposer of the scheme, read an elaborate paper in favor of the general idea of so uniting the various institutions that there should be one great State-university, to which the denominational colleges of the State should be attached as parts of the general plan. After an interesting discussion of the subject, continued into an evening-session, two resolutions were proposed, the first complimenting Dr. Clarke upon his paper and appointing a committee to present it to the governor, and through him to the general assembly, the second memorializing the general assembly to appoint or authorize the governor to appoint a commission to perfect a plan for the proposed arrangement, and, if this should not be found practicable, then to perfect a plan by which the university and colleges might be brought into a more cordial co-operation. The first of these resolutions was passed unanimously, the second with but one dissenting vote.

The general plan is to have the common school for the base, the university for the apex, grading up to this through the academies and high schools and colleges, eliminating from these last studies that should be peculiar to the university and from the university such as should be peculiar to the colleges; all then to participate in recognition by the State and to receive aid from it when needed, as parts of one great system. Whatever may be the issue of the proposition, the progress of negotiations towards accomplishment of it must be watched with interest.

COLLEGES FOR WOMEN.

Reports have been received from fourteen institutions for the higher instruction of women, a majority of which confer baccalaureate degrees; three merely award diplomas of graduation, and three others do not report definitely upon this point. The returns show an aggregate of 97 teachers, 40 of whom are gentlemen, and 57 ladies, and 1,556 pupils, of whom 499 are in preparatory departments, 55 in special or partial courses, and 6 were pursuing post-graduate-studies. Of those engaged in the regular collegiate course, 316 were in the freshman, 333 in the sophomore, 235 in the junior, and 174 in the senior-classes. In all these schools music is taught, and, in all but two, drawing and painting. French is taught in all; French and German in 5; and in 1 Italian is added. Twelve have chemic laboratories, 10 philosophic apparatus or cabinet, and 1 an astronomic observatory, with a good 6-inch acromatic refracting telescope, imported; 4 have at least the nuclei of an art-gallery, and the same number some means of physical culture. Eleven report the possession of libraries, the largest of which numbers 5,000 volumes, the smallest, 200.

GEORGIA INSTITUTE FOR EDUCATION OF THE DEAF AND DUMB.

Harmony in all departments, general success among the pupils, and general good health are among the things mentioned with thankfulness in the report for July 1, 1873. The appropriation for the support-fund has proved sufficient; one of $1,000 for repairs and furniture has been expended greatly to the improvement of the appearance and comfort of the institution and another of $1,500 has enabled the board of commissioners to introduce water into every part, providing for cooking, washing, bathing, and extinguishment of fires. During the year 63 pupils were admitted: 6 completed the course of study and 57 remained at the close of the term. The deportment of the pupils is said to have beeen wholly good, the literary studies have progressed satisfactorily, and the shoe-shop, the only mechanic department, has, besides furnishing the pupils in it with a good trade and supplying the establishment with all the boots and shoes required, proved fully self-sustaining.

The question of the admission of colored mutes has been of late presented with such frequency that, to avoid the embarrassments connected with it, the trustees propose an appropriation for the establishment of an institution especially for this class. They think that the number of colored mutes applying would not exceed 25 to 30 for some time to come, and recommend that provision be made by a legislative grant of $4,000 for the purchase of a building to receive that many and of $2,000 to begin with for their support.

OBITUARY.

In the death of the Rev. N. E. Cobleigh, D.D., LL. D., on the 1st of February, 1874, the educational interests, not of Georgia only, but of the whole South, have sustained a serious loss. Dr. C. was a native of New Hampshire, but had drifted southward under the influence of providential circumstances, and identified himself with the interests of the region where he found a home. Graduating with honor at the Wesleyan University, Middletown, Connecticut, in 1843, he entered the Methodist ministry the next year, and labored in it with growing reputation for ten years. He was then chosen professor in McKendree College, Lebanon, Illinois; subsequently was called to a professorship in Lawrence University, Wisconsin, and from there recalled to McKendree by election to the presidency. A successful presidency of five years still further enhancing his reputation, he was placed in an even greater post of usefulness as editor of Zion's Herald, the chief organ of the Methodist communion for New England. The sedentary labors of this position proved, however, too exhausting, and with broken health he had to seek in 1867 the milder climate of the South. Recuperating rapidly in the pure airs of Eastern Tennessee, he soon resumed his work as educator in the presidency of an institution of his church at Athens, Georgia; in 1872 was made editor of the Methodist Advocate at Atlanta, and there labored till his death, which was the result of exposure at the dedication of a country church near Athens, Tennessee. An active educator, with fine native powers and a wide range of acquirements, Dr. Cobleigh had thrown himself ardently into the movement for establishing a new university, under Methodist influences, at Knoxville, Tennessee, and had the happiness of seeing the preliminary steps toward its establishment accomplished in the autumn of 1873. Being dead, he will yet speak in the instructions there to be delivered, and its halls will rise in part as a noble monument to his memory.

Whitfield	Rev. W. C. Richardson	Dalton.
Wilcox	Stephen Bowen	Abbeville.
Wilkes	Rev. F. T. Simpson	Washington.
Wilkinson	Franklin Chambers	Irwinton.
Worth	J. M. C. Holamon	Isabella.

CITY-SUPERINTENDENTS.

City.	Name.	Post-office.
Atlanta	B. Mallon	Atlanta.
Athens	W. L. Brown	Athens.
Augusta	A. H. McLaws	Augusta.
Columbus	Geo. M. Dews	Columbus.
Macon	B. M. Zeitler	Macon.
Savannah	W. H. Baker	Savannah.

* Superintendent of schools for city and county.
† Former commissioner, still in office, no successor having been chosen and qualified.
‡ Has been elected, but has not, as yet, been commissioned.

The State-board of education is composed of the governor, attorney-general, comptroller-general, secretary of state, and State-school-commissioner.

ILLINOIS.

[From report of Hon. Newton Bateman, State-superintendent of public instruction.]

FINANCIAL STATEMENT, 1873.

Receipts.

From taxation	$6,675,097 35
Interest on permanent fund	487,731 20
From other sources	2,096,613 25
Total	9,259,441 80

Expenditures.

For sites and buildings	$952,075 23
For libraries and apparatus	59,695 99
For salaries of superintendents	102,546 28
For salaries of teachers	4,473,518 72
For fuel and light	641,818 31
For rent	32,530 54
For repairs	454,846 66
Miscellaneous	2,542,410 07
Total	9,259,441 80
Amount of available school-fund	6,382,000 00

The item of receipts from other sources includes balance from previous year and money borrowed for building-purposes, &c.

In the salaries of superintendents are included only State- and county-superintendents. City-superintendents are not reported separately.

Miscellaneous expenditure includes compensation of township-treasurers, interest on district-bonds, principal on district-bonds paid, and balance on hand September 30, 1873.

SCHOOL-STATISTICS.

Population under 21 years of age	1,399,191
Number of children under 6 years of age	489,363
Number enrolled in school	655,568
Average daily attendance	27.61
Whole number of schools	11,620
Average duration of school in days	151.4
Number of pupils in private schools	45,464

TEACHERS.

Number of male teachers in public schools	8,765
Number of female teachers in public schools	12,013
Whole number of teachers*	20,794
Average monthly pay of male teachers	$52 92
Average monthly pay of female teachers	$40 51

The reports from three counties were not received, and the figures of last year were used. Hence, the returns are not strictly correct; but the variation from the correct result is supposed to be so inconsiderable that they may be taken as a fair and just exhibit of the schools of the State for the year past.

ILLITERACY.

In addition to the statistics heretofore required by law, trustees and directors are to ascertain and report the number of children between the ages of 12 and 21 years who are unable to read and write, together with the causes of such illiteracy. The males and females of this class are to be reported separately and the causes of the neglect to educate them must be searched out and noted as fully as possible. The results of these inquiries will be valuable and suggestive. Some progress has already been made, as will be seen from the following statistics.

*Ten teachers reported whose sex is not given.

Report of number between the ages of 12 and 21 unable to read and write and causes therefor:

Causes.	Number.
Indigence	447
Feeble health	300
Unsoundness of mind	278
Inaccessibility of schools	453
Neglect of parents or guardians	4,175
Truancy	171
Colored persons without school-advantages	308
Mutes	25
Blindness, total or partial	82
Impediment of speech	2
Deafness	5
Intemperance of parents	1
Unknown	506
Total	6,753

Males	3,409
Females	3,307
Sex not specified	37
Total	6,753

The actual number of illiterates is doubtless greater than that reported. This is the first report under the new law; future ones will no doubt be more full and accurate.

SCHOOL-REVENUE AND EXPENDITURE.

"The State of Illinois, eighteen years ago, as trustee for the whole people, embarked in a gigantic enterprise, no less than the elementary education of all the youth within its borders. Under its authority, as the supreme head of the corporation, towns and school-districts have purchased lands and built and equipped school-houses to the aggregate value of twenty millions of dollars. On the pay-rolls of these cities, towns, and districts, there are now about twenty-four thousand teachers, school-officers, and other employés, to whom is paid annually over four millions of dollars. The other necessary incidental and current expenses required to maintain and keep in operation all the parts of the vast enterprise amount to over three millions per annum more. To meet this annual outlay of more than seven millions of dollars, the State itself, as such, contributes one million of dollars annually, and the several cities, towns, and districts the remaining six and more millions. All this money, or very nearly all, is raised by a direct ad-valorem tax upon the property and possessions of the people: one-seventh by the State itself, in its sovereign capacity, and the other six-sevenths by the local civil corporations, in virtue of powers conferred by the State."

RIGHTS OF TAX-PAYERS.

"Hence, every school-tax-payer in the State is a stockholder, in a financial sense, in that immense enterprise known as the free-school-system, and has a right, as such, to look for reasonable returns on his investment, and, in default, to institute such inquiries and endeavor to effect such changes and to apply such remedies as may seem expedient and necessary. And when it is considered that the dividends in this case are payable, not in dollars and cents, but in what is of infinitely more value, in the mental and moral improvement of the children of the tax-payer and stockholder and in the general improvement and elevation of society, the right and duty of seeking to discover and remove any causes of failure, or of partial failure, become still more apparent."

EDUCATIONAL RIGHTS OF COLORED CHILDREN.

The State-superintendent has always believed that the article of the State-constitution which provides for a "system of free schools, whereby all the children of this State may receive a good common-school-education," establishes the principle that all the school-going children in Illinois shall be entitled to the benefits of the free schools, without exception or discrimination; and the schools of the State, with occasional exceptions, have been conducted in accordance therewith.

Recognizing the spirit and intent of the law, and in practical furtherance of its paramount requirements, the twenty-seventh general assembly enacted that "every board of school-directors shall establish and keep in operation a sufficient number of

free schools for the proper accommodation of all children in the district over the age of 6 and under 21 years, *and shall secure to all such children the right and opportunity to an equal education in such free schools.*"

Directors throughout the State were peremptorily enjoined to comply with the provisions of this law; and the superintendent says that comparatively few instances have come to his notice of a set purpose to disregard the rights of any class of youth.

Several instances have been reported where school-directors, assuming that the clause providing that they shall "have power to assign pupils to the several schools" refers especially to colored pupils, have construed it as conferring upon them authority to take such pupils out of their proper grades and classes in the same school and place them in separate rooms and under separate teachers in the same building, and have done so, thereby depriving them of the manifest advantages of the graded system of schools. In a few cases, where the number of colored pupils was very small—from one to eight or ten—the practical effect of this interpretation has been to exclude such pupils from school altogether, and that result may even have been contemplated and desired. The exclusion in these cases was by no order or direct act of the school-board, but resulted from the refusal of the parents of the children to accept the inferior provisions tendered them.

In a few instances colored children have been openly refused admittance to the public schools, and no provision whatever made, or attempted to be made, for their education. They have simply been ignored or disregarded, just as before the changes in the constitution and laws.

The superintendent recommends that more adequate penalties and surer and speedier modes of redress be provided in cases where boards of school-directors or boards of education neglect or refuse to furnish to all children legally entitled thereto the opportunity for an equal education in the free schools under the control of such boards.

SCHOOL-DISCIPLINE.

A late amendment to the school-law empowers directors to suspend or expel pupils for "incorrigibly bad conduct," and declares that no action shall be against them for such expulsion or suspension. The phrase "incorrigibly bad" is not limited to violent outbursts of passion, or acts of open insubordination, or flagrant violations of the rules of morality. It applies to omissions of duty and to the settled and contumacious neglect or disregard of any proper regulation or requirement, quite as much as to more flagrant acts of disobedience and perversity. Hence, a scholar may lawfully be suspended or expelled for willful and obstinate refusal to comply with any reasonable rule or regulation in regard to absence or tardiness. The right and duty of directors to enforce such regulations as will secure regularity and punctuality of attendance have been affirmed by several of the circuit-courts and by the supreme courts of many States. The principle is inherently sound, being essential to the accomplishment of the purpose for which public schools exist.

SHORT SCHOOL-TERMS FOR YOUNG CHILDREN.

Directors are authorized to provide that children under 12 years of age shall not be confined in school more than four hours daily. In exercising the discretion granted, directors may extend the privilege to all under the prescribed age or only to those whose physical or mental condition requires the benefit of the shorter session.

THE WORD-METHOD.

The true method of learning to read is thus described:

Children should be "accustomed from their first school-hour to deal with objects and things—tangible and visible or readily comprehensible; then with words, as words, with which to name and describe those things and objects; and lastly with letters, as merely the material out of which words were made." Thus, they will "know their a b c's perfectly—their names, shapes, sounds, and combinations—without ever having studied them, as such, at all."

"The word-method, with a strictly phonic treatment of the letters," makes such results possible. This is "the short, pleasant, blessed road to 'reading without tears.'" "Its universal adoption would chase the clouds from school-room-skies and it would release for other studies at least one-half the time now needlessly spent in learning to spell and read."

THE CONSTITUTION AND LAWS INTERROGATED.

In the case before us, what is the end to the attainment of which proper means are to be employed? The constitution declares, explicitly, what the object or end of the school-system shall be: "A *good common-school-education* for all the children of the State." A "*good*" common-school-education implies a wise and appropriate selection of studies and sound and thorough instruction therein. The legislature in prescribing the studies assumed and believed them to be appropriate for the schools of the people,

adapted to the wants and necessities of common life, calculated to promote the material interests, and some of the higher interests, of the youth of the State and of the commonwealth, designed to aid, encourage, and elevate the pupils individually, to promote their success and prosperity in business, and render them better and more intelligent citizens.

Again, the fundamental law declares that the system of free schools to be provided shall be "*thorough* and *efficient*." That is "*efficient*" which actually produces or helps to produce *effects*. Efficient instruction in any department of learning is such instruction as results in a competent understanding of that branch of learning, such understanding being the object aimed at in teaching.

The work of the schools is also required to be *thorough*. That is a strong term. A subject is thoroughly taught when it is entirely and completely taught—when it is presented in all its essential conditions and relations—when the light is made to penetrate it through and through. The word is used in the constitution to express in the strongest manner possible the *kind* of schools and of instruction that the general assembly must establish and provide.

But how is it possible to teach the twelve branches prescribed by law in the common district-schools during the brief average period of pupilage therein? It is not possible. Of necessity, there must be limitations. The requirements of the constitution and laws must be taken in a qualified sense, not as to the character of the teaching, but as to its extent—as to the ground to be occupied in the case of each study. The work undertaken must be "thoroughly and efficiently" accomplished, but too much must not be undertaken; that is the practical point.

Teachers, especially in ungraded schools, should eliminate and revise nearly every branch of the common-school-course, "not assuming that whatever is in the book must be learned and recited, and that one paragraph, page, or chapter is about as important as another; but, thoughtfully surveying the whole field, the circumstances of their schools, the amount of work to be done and the time within which it must be accomplished, let them mark out and determine what portions of the book are essential and what may be dispensed with, so far as their particular schools are concerned, and strictly adhere to the line of study so marked out."

WHAT CONSTITUTES A GOOD TEXT-BOOK.

It is not necessary that a text-book should contain everything belonging to the subject of which it treats. Just here has been the mistake of authors and makers of elementary school-books. There are innumerable things appertaining to arithmetic, reading, grammar, natural philosophy, hygiene, &c.—things, too, of much intrinsic interest and value—which, nevertheless, are out of place in a book of rudimentary principles. And yet most school-books are burdened with these extraneous matters.

The essential outlines and principles of a subject are all that there is place or time for in the ordinary grades of public schools. In respect to the natural sciences, the law itself establishes this point, though really too obvious to need confirmation: that the "elements" of the sciences are to be taught in the common schools. And how much more than this is practicable in the case of arithmetic, grammar, geography, or history? What the schools attempt they should thoroughly accomplish; less than the rudiments cannot be undertaken, and these may be thoroughly mastered by every child in the allotted season of pupilage. If much more is attempted, it will not be accomplished, and even the less will be put at hazard.

Whatever other peculiarities it may have, a good elementary text-book should have two characteristics: brevity and precision. In some subjects, where the whole superstructure stands upon a few comprehensive principles, the book should contain all those principles, with matter enough for illustration and practice; and it need not contain anything more. And since, in all the stages of elementary instruction, the memory must of necessity be constantly employed, it is evident that rules and principles should be expressed in the most precise and comprehensive terms.

INSTRUCTION IN THE NATURAL SCIENCES.

The branches added to the common-school-course by the introduction of natural science are four in number: botany, physiology, (including hygiene,) zoölogy, and natural philosophy. In respect to the frequency of lessons, either of two methods may be adopted: there may be one or two exercises per week, each of from forty-five to sixty minutes' duration, or one brief exercise daily. The latter plan is considered preferable.

It is remarked with emphasis that the time for the study of the elements of natural science may be secured by a thorough revision of the old seven-branch-course of common-school-studies. Not more than one or two of them *can* be dispensed with, and not one of them *need* be, in order to make room for the new studies. How, then, is the necessary time to be gained for the elements of natural science? *By eliminating or discarding all useless or superfluous matter from the text-books, and thereby saving wasted time. This, with improved methods of teaching, will effectually solve the problem.*

COUNTY-SUPERVISION.

In this matter Illinois has taken a long step backward. By the provisions of the new law, county-supervision is virtually abolished. The office will nominally remain, with a few comparatively unimportant financial and other routine business-duties; but county-supervision and inspection of schools—those *educational* services which give to the office its chief importance and value and which have been so beneficial in the past—will practically cease, and, in this respect, the free-school-system will be shorn of one of its best instrumentalities and remanded to the condition it was in under the old "school-commissioners," who, strictly speaking, had no *educational* work to perform, and performed none.

The compensation is to be derived from three sources: (1) commissions on sales of school-lands and other lands, (2) commissions on moneys distributed and loaned, and (3) a per-diem of $4 for other services rendered. The number of days' service is to be fixed by the county-boards. In a few counties superintendents will be required to devote their whole time to the work, as now, and in some others from one hundred and fifty to two hundred days will be designated; but in a large majority of counties fifty days or less will be the rule, while instances will not be wanting where no per-diem-services whatever will be authorized, so that the average in the whole State will not exceed fifty days. The compensation will be substantially as follows: $4 a day, for fifty days, $200; commissions, about $200—total, $400 per annum. The question whether or not a competent county-superintendent of schools can be procured for a salary of $400 per annum need not be asked. Every capable and accomplished superintendent will be compelled to abandon the work and engage in other pursuits, as several have already done in anticipation of the probable future, and none can or will be found to supply their places.

It is hence strongly recommended that this provision of the law be repealed and that county-superintendents be paid a fixed and definite annual salary, the amount to be designated and prescribed in the school-law. It is also recommended that the counties be divided into five or more classes, according to population, and the superintendents' salaries be fixed according to the class, provided that the lowest salary allowed shall not be less than $1,000 nor the highest more than $3,000.

QUALIFICATIONS OF COUNTY-SUPERINTENDENTS.

Sooner or later, and the sooner the better, there must and will be some effectual means provided to secure *competent* and *qualified* county-school-inspectors. Around the fact that in some counties the office has been held by persons notoriously unfit for the position and incapable of performing its duties, cluster nearly all of those objections to the office which have in them a color of reason and force. While it is true that the remedy is in the hands of the people, who are free to elect whom they will, it is nevertheless the fact that unsuitable persons continue to be chosen with scarcely diminished frequency. It is believed that this great evil *can* be reached and that it *ought* to be, as speedily as possible Years of trial demonstrate that the vital matter of school-supervision is not safe under the policy of unrestricted choice; that year after year the welfare of the schools is sacrificed to partisanship, sectarianism, local dissensions, or indifference. It is a solecism in the school-system that, while no teacher can be employed or paid in any school-district in the State, under any circumstances, without due examination and licensure, no conditions or qualifications of any kind are required of the man who conducts the examination, and issues, or refuses to issue, the license. This is neither reasonable nor safe. The wise purpose of the law in requiring proof of the fitness and competency of teachers is obviously liable to be negatived and nullified in any county at any time.

"We have reached," says Mr. Bateman, "something like a crisis in the history of our free-school-system, and especially in this important arm of it. Every friend of education sees and feels it. We must advance or recede. County-supervision is especially assailed as unnecessary, useless. This opposition must come either from an unintelligent view of the nature and necessity of such supervision or from the poor quality of the service rendered in some of the counties. The first is beyond reach, the second is not."

It is therefore recommended that certain appropriate qualifications be prescribed and enforced as a condition of eligibility to the office. Such a law would be in the interest of the whole people of the State. Its aim would be to call the very best available man to the head of the common-school-work in every county and test his capability beforehand.

EXAMINATION OF TEACHERS.

The provision of the new law requiring examinations of teachers to be conducted jointly by the county-superintendent of schools and two other persons appointed by the county-board is believed to be wrong in principle and bad in its effect and tendencies. The examination and licensing of teachers is the most important duty that any school-

officer has to perform; it requires more ability, discrimination, discernment, good sense, and sound judgment than any other, and it should therefore be the very last to be put at hazard or intrusted to inexperienced or incompetent hands. That duty has hitherto been committed wholly to the county-superintendent of schools, to be performed either by himself in person or by examiners of his own appointment, or over whose appointment and action he has a supervisory control, and it is firmly believed that there it should remain. The superintendent should be held to a strict accountability for the manner in which he acquits himself of the trust, and for the character, scholarship, and competency of those whom he licenses to teach; and, to enable him to meet such accountability, he should have exclusive jurisdiction and ample powers. No certificate should be valid without his official signature, no examination lawful unless conducted by him or by examiners designated and approved by him; and in like manner the renewal and revocation of certificates and the re-instatement of teachers whose certificates have been revoked for cause should vest solely in him. So it has been heretofore, and no other provision of the law has, upon the whole, worked more satisfactorily. For any neglect of duty or any exercise of unwarrantable authority or any abuse of powers conferred, he may be summarily removed by the county-board; till then he should have exclusive control of the examination and certificating of teachers.

TEACHERS' INSTITUTES.

It is recommended that a system of institutes of instruction be put in operation, under State-control, in such form as may be considered wise and expedient, the object of which shall be to improve the qualifications of teachers and those about to teach and to enlighten the people in regard to education; that in furtherance of these ends it be provided that instruction shall be given in such institutes to the teachers in the art and methods of teaching, special attention being given to the branches of study usually taught in the elementary free schools, and more particularly to the rudiments of natural science recently added to the common-school-course of studies; and that addresses shall be delivered to the people on matters of education, science, the relation of the common schools to the arts, industries, prosperity of the Commonwealth, and any other subjects the discussion of which will tend to increase the intelligence of the people and attach them more closely and wisely to our grand system of public education; and that to meet the expenses of such institutes, $10,000 per annum be appropriated for two years from the State-treasury.

ABSENTEEISM.

The statistics of 1872 record the fact that, in a total enumeration of 882,693 between 6 and 21 years of age, only 696,833 are reported as having attended any school, public or private, during any part of the year, leaving 185,860, or 21 per cent. of the whole enumeration, in no school. After making allowance for those over 16 who have completed their common-school-education, for invalid children, and for probable shortage in the reports of private schools and all other reasonable deductions, it may be estimated that not less than 100,000 children of lawful school-age, or over 11 per cent. of the whole number, belonged to the class of absentees and truants during the last school-year. A compulsory law is hence beginning to be called for.

ELECTION OF WOMEN TO SCHOOL-OFFICES.

A law passed by the twenty-eighth general assembly declares "that any woman, married or single, of the age of twenty-one years and upward, and possessing the qualifications prescribed for men, shall be eligible to any office under the general or special-school-laws of this State."

This act took effect July 1, 1873. The terms of the act are comprehensive and exhaustive, leaving no room for doubt or question, and no ambiguities to be explained or construed. All the rights, powers, duties, obligations, and liabilities appertaining to *men* as particular school-officers appertain, all and singular, equally and in the same sense, and to the same extent precisely, both in form and substance, in manner and matter, to *women* who may be elected or appointed to the same offices.

Under the provisions of this law ten ladies were elected to office as county-superintendents in November, 1873.

CHICAGO.

SCHOOL-STATISTICS.

Population of the city, 367,396; children of school-age, (6–21,) 88,219; enrolled in schools, 44,091; number of public schools, 30, including 13 primary, 21 grammar, 1 high, and 1 normal school. All the pupils learn vocal music; the greater part, drawing also. Three thousand nine hundred and seventy-four are taught German and 56 French. Latin and Greek form a part of the course in the high school.

The private and parochial schools number 69 and include a total of 128 male and 204 female teachers, with 14,496 pupils.

ILLITERACY.

The last census-returns show that there are in the city of Chicago 7,350 persons above ten years of age who cannot read—nearly $2\frac{4}{10}$ per cent. of the entire population. Those who cannot write are reported at 10,548, which, without doubt, includes the number who cannot read. More than 35 persons out of each 1,000 in the city above 10 years of age are thus ranked as illiterate. Of the whole number, only 782 (less than three-tenths of 1 per cent. of the entire population) are reported between the ages of 10 and 21 years. Of the fourteen cities having over 100,000 population each, Chicago reports the smallest percentage, except two cities, of persons between 10 and 21 years who cannot write. That this city stands above the cities of nearly equal population, in this respect is due to the fact that she has derived her population largely from other States and countries where good school-systems have prospered for many years.

ATTENDANCE.

The total enrollment in the public schools has increased from 34,740, during the year 1868–'69, to 44,091, (nearly 17 per cent. of the entire population,) during the year 1872–'73. The decrease in the average attendance and in punctuality is attributed to "the unsettled condition of many families, deprived of their homes by the fire; the great demand for labor of all kinds and the necessities laid upon many; the severity of the winter of 1872–'73, and the unusual sickness consequent."

HALF-DAY-SCHOOLS.

This arrangement, designed to accommodate pupils who can attend school only half a day, has been made in the lowest divisions, containing pupils who, under the rules of the board, are dismissed either forenoon or afternoon at recess. Instead of this dismissal, each division is kept for the full time of one-half day and dismissed for the other half day. In the majority of cases the half-day-system has not at all interfered with the progress of pupils.

KINDERGARTEN-SCHOOLS.

There are in the city at least a dozen schools called Kindergärten, all with more or less rightful pretensions to the name. There is also at least one genuine Kindergärten in full operation, conducted by two German ladies from Hamburg, where they taught in Kindergärten and studied for the purpose of teaching in Kindergärten.

SCHOOL-DISCIPLINE.

In preceding years two methods of discipline have been employed: corporal punishment and suspension. The number of cases of both averaged daily $16\frac{3}{4}$. The past year, when there has been but the one method—suspension—shows a very large decrease in cases of discipline, the suspensions averaging $3\frac{1}{10}$ daily. For the last term of the year there was but one suspension for each 17,000 pupils—a much better showing than for the five years preceding this. The advancement of pupils has been more rapid than under the old method. The promotions are nearly 34 per cent. in advance of those of the previous year.

CLASSIFICATION OF SCHOOL-OFFENSES.

During the past year the attention of the superintendent has been called more closely to the character of offenses against good order in the school-room which lead to suspension, and the result is as follows: $8\frac{1}{2}$ per cent. are the result of continued thoughtlessness without willful intent; about 55 per cent. are the result of a settled purpose to disobey and to set up the pupil's will against the will of the teacher; about $36\frac{1}{2}$ per cent. are the result of unrestrained passion, malicious spirit, or corrupt sentiment. About 35 per cent. of those suspended, the majority of whom come under the last head, do not seek restoration to school. Of the 65 per cent. restored, 60 per cent. seem to be improved by the process of suspension and remain ordinarily obedient. The remaining 5 per cent. are soon, of necessity, suspended again.

RECOMMENDATION FOR AN UNGRADED SCHOOL.

Pupils, however incorrigible, are entitled to an education, and should not be turned upon the streets so long as there is hope of making them better. It is therefore recommended that there be established in the center of the city an ungraded school to which such pupils may be transferred, and that at the close of each term those who give evidence of permanent reform may be returned to their own schools for future study.

GERMAN.

The board of education is averse to making the study of German compulsory. It is taught in 13 schools, and the number of pupils has increased from 2,359 last year to 3,724. Of these pupils 1,525 are of German parentage and 2,199 are the children of

Americans. This increase in an optional study is considered quite remarkable and evidence of an extraordinary interest. The committee on German reports that the progress during the year has been entirely satisfactory.

DRAWING.

The time formerly devoted to instruction in writing is now divided between writing and drawing. The general testimony is that progress in the former is quite as satisfactory as before, the practice of the latter having a decided tendency to remove rigidity of muscle and awkwardness of movement, as well as to secure quicker and more accurate observation.

ATTENDANCE OF TEACHERS.

Of the 560 teachers employed, only 59 have been constant and punctual in attendance during the entire school-year. In three grammar-schools the tardiness of teachers was equal to, and in seven grammar and nine primary schools it exceeded, the tardiness of pupils. The number of days lost by absence is more than 2 per cent. of the number of days employed.

SALARIES OF LADY TEACHERS.

The superintendent calls attention to the fact that 20 per cent. of the decrease in the cost of the schools during the past year results from a reduction in the salaries of lady teachers who had served faithfully for three or more years, and remarks: "The vacancies annually occurring exceed the number of teachers supplied from our own schools. Teachers must be called in from without. As all our own supply is necessarily inexperienced, it is quite desirable that the teachers from abroad be experienced, and such cannot be obtained unless our salaries at least equal the salaries given such teachers elsewhere. If the salaries of lady teachers can be restored to the point reached before the fire, we can certainly find opportunities for retrenchment in other directions, if necessary."

GRADE-INSTITUTES.

These have been held nearly every Saturday forenoon during term-time, one day for the ninth- and tenth-grade-teachers, another for seventh- and eighth-grade-teachers, and so on. Attendance on these meetings is entirely voluntary, but the teachers have very generally attended, and no plan has heretofore awakened one-half the interest manifested during the past year. The influence of the meetings has been shown most decidedly in the schools.

CITY NORMAL SCHOOL.

Under the new arrangement a class of 15 young ladies was graduated in December, 1872, and another class of 20 in June, 1873. The latter class is the first one that has passed through the higher course of study.

The close relation between this school and the school-system is shown in the fact that, out of 323 graduates, 162 are now teaching in the city; and to this number will be added at the opening of the year the 20 recent graduates, making 182 out of 323 now engaged in teaching. It has 100 volumes in its library, including 20 on pedagogics.

ALTON.

Alton, with a total population of 12,000, and about 2,500 children of school-age, reports 1,211 enrolled in 19 schools, under 20 teachers, and an average attendance of 707.

AURORA.

Aurora, with the same population, 4,049 children of school-age; 3,211 enrolled in 35 schools, public and private, under 50 teachers, and an average attendance of 2,126.

BELLEVILLE.

Belleville, with the same, 4,549 children of school-age; 2,407 enrolled in 37 schools, public and private, under 49 teachers, and an average attendance of 89 per cent.

GALESBURG.

Galesburg, also with the same population, 3,572 children of school-age; 2,299 enrolled in 12 schools, public and private, under 30 teachers, and an average attendance of 1,441.

BLOOMINGTON.

Of larger towns, Bloomington, with 22,346 population, reports children of school-age 4,981; enrolled in 49 public schools, under 56 teachers, 3,247; average attendance, 2,830.

PEORIA.

Peoria, population 22,849; children of school-age, 7,787*; enrolled in public schools, 3,495, (besides 1,350 in other schools;) average attendance, 2,400.

QUINCY.

Quincy, population 24,000; children of school-age, 11,800; enrolled in public schools, 3,500; average attendance, 1,950.

SPRINGFIELD.

Springfield, population 20,000; children of school-age, 5,041; enrolled in public schools, 2,641; average attendance, 1,849.

At Alton and Aurora, Latin, Greek, and German are taught in the high schools, the latter adding drawing, and vocal music; at Belleville, drawing and German; at Galesburg, Latin, drawing, and German; at Bloomington, all the studies named; at Peoria, all; at Quincy, Latin, Greek, German, and drawing; at Springfield, these three languages, apparently without drawing or vocal music.

SECONDARY INSTRUCTION.

In proportion to the population of the State, the number of private academies and kindred institutions for secondary training appears to be less in Illinois than in many of the older States. The high schools and preparatory departments of the colleges or universities do much of the work which elsewhere is yet lodged in private hands. Still 21 schools of academic rank report for 1873 an aggregate of 143 teachers, (43 male, 100 female,) and 2,926 pupils, (986 males, 1,940 females,) of whom 221 are students of the classic and 314 of the modern languages. Music, vocal or instrumental—and in most cases both—is taught in 19 of these; drawing in 16; painting in oils in 2. Laboratories for illustration of instruction in chemistry are possessed by 9; philosophic apparatus by 12; libraries of from 25 to 3,000 volumes by 15.

Besides these acadmies, 20 preparatory schools of colleges show an aggregate of 98 instructors, with 2,700 pupils, (1,743 males, 957 females,) of whom 554 are specifically said to be preparing for the academic course in college and 649 for the scientific course.

It may be observed that the proportion of teachers to pupils is greater in the private academies than in the preparatory departments of the colleges, the former being 143 to 2,926 and the latter 98 to 2,700.

To both the above means of secondary instruction must be added the public high schools before alluded to. Of these 88 appeared in the last report of the State-superintendent. These, from the wide circle which they reach and the increasing elevation of their system of instruction, are destined to exert a growing influence.

And yet of these high schools the superintendent says: "The whole policy of free public high schools is questioned in some quarters, the very competency of a Commonwealth to go beyond the rudiments in its free-school-work being sharply challenged by not a few. There are signs of a combined and somewhat formidable attempt to push the States back from their advanced positions and compel them to stop with the elements, leaving the rest of the field to be occupied and developed by other instrumentalities and forces.

"The advantages of the free public high school, however, are great and obvious. It brings the means of higher instruction to the very doors of the people. It saves the expense and the moral and social risks incident to boarding-schools and other institutions remote from the salutary restraints of home. It plants in the midst of every township adopting the plan a school, the influence of which, if it be well conducted, must favorably affect the tone of society and nearly every interest of the community. Even the value of real estate and other property will be raised by it, for it will invite those who seek homes where they can educate their children without being parted from them; families of means, intelligence, and refinement, whose coming is a bless-

* The large increase in the number of children in Peoria is said to require a correspondent increase of accommodations, and it is recommended that to meet this need there should be established in different parts of the city small primary schools, leaving the grammar-grades in three or four buildings suitably located to accommodate those desiring to attend them. The superintendent of the high school says, "Our district schools give a fair knowledge of reading, spelling, penmanship, geography, English grammar, United States history, arithmetic, and some other things. In addition to these, the high school affords the opportunity to pursue the following studies: Latin, 3½ years; Greek, 3 years; German, 2 years; English language and literature, 2 years; algebra and geometry, 1 year each; trigonometry, 1 term; astronomy, physiology, botany, natural philosophy, chemistry, mental philosophy, and rhetoric, 2 terms each, together with some other studies which are optional." An evening-school was maintained during the winter of 1872–'73 with encouraging success and reopened November 10, 1873. The pupils were from 12 to 40 years of age, the eldest often the most earnest in the endeavor to repair the loss of educational privileges in early life. The attendance, which had been about 80 in January, 1873, and had fallen to 54 in March, was, at the reopening, in November, 103, and in December, 111.

ing to any neighborhood. It will powerfully tend to equalize the educational facilities of the State, which are now overwhelmingly in favor of cities and villages."

To the question "Is the high school a proper and legitimate part of a general free-school-system?" the superintendent says emphatically: "*Yes.* I believe that the question for American statesmen is, not how *little*, but how *much*, can the State properly do for the education of its children; that the one thing most precious in the sight of God and of all good men is the welfare and growth of the immortal mind; and that, to secure this, legislatures should go to the verge of their constitutional powers, courts to the limit of liberality of construction, and executives to the extreme of official prerogative. I believe that an American State may and should supplement the district-school with the high school, and the high school with the university, all at the public cost, exhibiting to the world the noblest fruitage of the century: a model free-school-system. And when at the head of the long line of educational forces there stands, as sooner or later there surely will stand, a great National University, fitly symbolizing the culture, refinement, and dignity of the Great Republic, then will our system of public education be indeed complete."

PREPARATORY INSTITUTIONS.

Two schools especially designed to prepare youths for the higher training of the universities report 41 pupils in classic and 18 in scientific studies. St. Francis Solanus College, at Quincy, with 10 professors and instructors, has 29 pupils in the classic and 19 in the commercial department. The institution has a cabinet of natural history and a philosophic cabinet and apparatus. The library numbers about 2,100 volumes. The Winnetka Institute, at Winnetka, with 4 instructors, has 12 pupils in classic and 18 in scientific studies, and 10 in subordinate classes. The institute has grounds and buildings worth $30,000, is unsectarian in its management and influence, and is one of the feeders of the University of Chicago.

* Partially.

The greater portion of these colleges and universities admit women. Some have a special "ladies' course," running parallel with the regular academic course, and admitting of the two sexes uniting in recitations where the subjects studied are the same.

Abingdon reports itself entirely out of debt, through the kind donations of its friends.

Besides its collegiate department, it has a school of the Bible for the preparation of young men for the ministry.

Augustana has also a school of theology for the same end.

The University of Chicago, besides a preparatory department within itself, has another sixteen miles away, on the lake-shore, and another—formerly the Wayland University, now Wayland Institute—at Beaver Dam, Wisconsin. These schools are opened to both sexes.

Eureka claims to have sent out from her halls 4,000 young men, more or less, prepared for the great duties of life, of whom hundreds have become teachers in the common schools and academies. It has a Bible-department—in which many have been trained for the Christian ministry—a normal, a commercial, and a musical department.

Illinois College, Jacksonville, includes in it the Whipple Academy, of which three of the college-professors are principals and others instructors. The Jacksonville Business-College is also connected with it.

At Lincoln the young ladies and gentlemen students attend in the same chapel every morning and, as far as possible, recite in the same classes. A theologic department has been created here.

Lombard adds to its catalogue a good feature: a list of those on whom it has conferred honorary degrees, with the years in which they were bestowed. It presents a classic, a scientific, and a literary course, each of four years.

McKendree has the same, with a normal, a law, and a commercial department.

At Monmouth there are also, besides a collegiate and a scientific course, a normal, a musical, an art, and an honor-course. This last is "additional to the ordinary or degree-course," and includes six departments, in any one or more of which a student may graduate with honors, first or second, according to the attainments made. For the securing of a second honor, one must master, besides the ordinary course, about half as much more matter, while for a first honor the ordinary course must be about double.

The Northwestern College embraces, in addition to its preparatory and collegiate, a ladies' course, a normal, a commercial, and an art-department.

The Northwestern University includes, with its preparatory and collegiate departments, the Garrett Biblical Institute, the Chicago Medical College, and the Evanston College for Young Ladies, which has, however, its own board of lady trustees and a lady principal.

Shurtleff has a theologic department connected with it, with four professors and a course of three years.

St. Ignatius has a commercial as well as a classical course.

St. Joseph's is mainly an ecclesiastic college.

Wheaton, besides its classic course, has a ladies' collegiate course, one of Bible-study, and one of art and music.

Westfield, a preparatory, a classic, a scientific, a normal, an instrumental-music, and an art-course.

COLLEGES FOR WOMEN.

Seven institutions for the higher education of women report a total of 105 professors and instructors, (18 males and 87 females,) with 1,024 students in their preparatory schools and 594 in their collegiate classes. One of these has 800 volumes in its library; another, 1,000; a third, 1,500; three others, 2,000 each; and one, 2,500. Four years is the ordinary collegiate course in these. In all, drawing and music and German and French are taught. All have chemic laboratories and all but one philosophic apparatus or cabinet. One other, the Women's College, at Evanston, reports 300 preparatory students, but gives no note of college-classes yet.

BUSINESS-COLLEGES.

Fourteen of these institutions in this State—at Bloomington, Bourbonnais, Chicago, Eureka, Galesburg, Joliet, Monmouth, Naperville, Peoria, Quincy, Rockford, Rock Island, and Springfield—report an aggregate of 64 teachers and 2,221 pupils.

NORMAL SCHOOLS.

The Cook County normal school, principal, D. S. Wentworth, is reported in 1873 to have five teachers in its normal department, with 146 pupils; course, three years. Established in 1867 by the county of Cook, for the purpose of preparing teachers of both sexes. It has had since that time, in all, 381 pupils in attendance, of whom 119 have graduated. Tuition to residents of Cook County is free, on the condition of signing a pledge to teach in the county. Volumes in library, 223, of which 30 are pedagogic.

The Peoria County normal school, course two years, reports, for 1873, 4 resident instructors, with 69 pupils in the first year of its course and 8 in the second year. Whole number during the school-year of 1872–73, 114. Volumes in library, 278. Graduates are entitled to a certificate of the highest grade from the county-superintendent.

The normal department of Eureka College returns 6 instructors, with 40 pupils in the one year of its course and a library of 2,000 volumes, embracing 30 on pedagogics. Carthage College has also such a department, which contained last year 46 students.

The Northwestern College, at Naperville, has 42 students in a three-years normal course, under the same supervision as students in the other courses and reciting in the same classes when pursuing the same studies.

The Northwestern German-English Normal School, at Galena, a private institution under the control of the Northwestern German-Methodist Conference, has 5 instructors, with 114 pupils in a normal course of three years and 50 volumes in its library. It has graduated 21 students since its organization, in 1868.

The Evangelical-Lutheran Teachers' Seminary, at Addison, returns 4 instructors, 86 students, and 188 graduates since its organization, in 1864. In the last year there were 21 graduates, who all engaged in teaching. Vocal and instrumental music are taught, a philosophic cabinet and apparatus are possessed, and 300 works on pedagogics are in its library.

The Normal University of the State of Illinois, with an annual appropriation of $29,000 from the legislature and four years in its full course, is the main dependence of the school-system of the State for its supply of teachers, valuable as is the aid of the others above named. It reports 13 instructors and 419 normal pupils in the fall-term of 1873. At the close of the last scholastic year 21 graduated, of whom 18 engaged in teaching. It has graduated altogether 221 pupils, 104 of these males, 117 females. Its library contains 1,000 volumes, of which 30 are on pedagogics. Drawing and vocal music are taught, and a good chemic laboratory, philosophic cabinet and apparatus, and museum of natural history add to its means of illustration in the scientific studies that now form a regular portion of the course in the public schools.

A new normal school for the southern portion of the State has been established at Carbondale, and Dr. Robert Allyn, of McKendree College, appointed principal.

In Knox College a normal class is organized each year for the benefit of students who desire a special preparation for the work of teaching. The exercises of this class continue for three months.

* Apparatus. † Besides 156 preparatory.

‡ The new and noble building for the use of the Industrial University—214 feet in total length and 124 in total depth—was dedicated with appropriate ceremonies on Wednesday, December 10, 1873. It contains 60 rooms devoted to public uses, and has cost, with furniture and heating-apparatus, $148,000.

ILLINOIS INSTITUTION FOR THE EDUCATION OF THE DEAF AND DUMB.

The crowded condition of this institution forms a prominent subject of remark in the last report received from it, 324 pupils being on its lists and 294 in attendance during the term, this number requiring the use of every available space for beds, the resort to a first and second table at each meal, and a series of constant shifts to avoid continual interference of one exercise and study with another. The immediate erection of additional buildings is hence urged, that the present one may be made a dwelling-house alone; while still further additions, it is held, must be made ere long, as the returns to the secretary of state indicate 632 deaf mutes within the Commonwealth, the real number being probably greater still.

Since the opening of the institution, in 1845, there have been 893 pupils admitted to its privileges, of whom 59 were found to be children of parents more or less nearly blood-related. For four years past a class has been under instruction in articulation, with a teacher said to be possessed of high capacity, energy, and tact. The result of the experiment is reported to be a conviction that under favorable circumstances a small class, with a more than usually able teacher, may make more progress with this method of instruction than with the sign-method. But, as it is very difficult to secure all these conditions, it is held that the sign-method should not be abandoned. The new method of *visible speech* has to some extent been introduced, one of the teachers having been specially instructed in it.

ILLINOIS INSTITUTION FOR EDUCATION OF THE BLIND.

The new building for this purpose, erected in place of one burned in April, 1869, was reported in the early autumn of 1873 to be sufficiently far advanced to be opened October 1, and it is supposed that it was so opened. The school meanwhile has been continued in a building which escaped the burning, but of course under disadvantages from overcrowding.

PRINCIPALS' ASSOCIATION.

The November meeting of the Chicago Principals' Association was held at Normal Hall on Saturday morning, November 1, 1873, President Pickard in the chair.

The question as to whether it is the province of the district-school to give a commercial education was discussed with some warmth, Mr. Belfield opening on the affirmative and Messrs. Lewis, Cutter, Haywood, Baker, Broomell, Merriman, Westcott, and Hanford participating. Mr. Belfield said: "The complaint is sometimes made, and I

think with full justice, that our schools are not doing their full duty in fitting boys for business-pursuits. After having completed our first grade, or even before that is done, pupils are sent to a commercial college to learn penmanship and business-arithmetic. This should not be. Our pupils should receive that training which would enable them to compete successfully with the graduates of the business-college." Mr. Lewis thought that the general expression of business-men is that business-colleges fail to accomplish the end for which they were established. He gave it as his experience, and Messrs. Cutter and Haywood coincided with him, that business-men would sooner take a boy from the district-schools and intrust their business to him than employ a graduate of a commercial college. As to the graduates of the high school, by the discipline they gained, they were better fitted for handling a set of books than those whose only education was a little training in penmanship and the general principles of book-keeping. Mr. Hanford said that we should give children a knowledge of underlying principles and, if we can do so, add such specialties as will be of practical benefit to them in life. He held that our graded course, if faithfully followed, would provide all of a business-education that it was in the province of a common-school-course to impart. Mr. Belfield said: "I shall use the argument of the gentleman to strengthen my own position. If, as has been said, the business-colleges do not accomplish that which they profess, this is an additional reason for our doing it. We can do it, without lengthening the time devoted to our course of study, by substituting this work for some of the less important, I may say useless, things which now encumber us." The committee on German, in its last annual report, say, "The use of the German principally in this country, and especially in the West, is for practical purposes. The children study the language to further their material condition more than to look into the treasures of German literature, otherwise hidden from their sight." The system of public instruction is yet in its infancy. The time will come when the different mechanic arts will be taught at the public expense, not necessarily in connection with the studies now pursued, but in special schools.

CHICAGO PUBLIC LIBRARY.

Established by act of the general assembly of the State, passed March 7, 1872, this library has not yet been opened to the general public, except to visitors who desire to see the progress made in the accumulation of books, in the quarters occupied temporarily in the "tank" over the city-hall. Its permanent location is to be the old post-office-building, an exchange having been made with the United States of a lot on the Chicago River for the old post-office-lot.

The reading-room of the library was opened to the people on the 1st day of January, 1873. The first report of the board of directors, dated June 4, 1873, gives the total number of visitors since the date of opening as 50,038, reaching a daily average of 331; weekly, 2,319; monthly, 10,007. The whole number of issues of periodicals to readers had been 33,986; the number of daily issues, 225; weekly, 1,575; monthly, 6,797. This municipal liberality is supplying to thousands an opportunity for that mental improvement hitherto denied them, and affords opportunity and means of employing idle time profitably.

The number of books already accumulated is 6,852, of which about 4,000 were received since January 1. There are also 3,222 valuable pamphlets. Of the books, only a portion have been purchased, the remainder being gifts from the people of England, Germany, France, Ireland, and Scotland, and from the citizens of Chicago, who contributed 2,500 volumes. From England have been received, from the national collection, commenced after the great fire, some 3,530 volumes. There is still to be received a special contribution of some 1,000 or 1,200 volumes, the gift of Mr. Thomas Hughes, M. P., and a few friends. The English patent-office-reports, which have been presented by the English patent-office-commissioners, number some 2,800 volumes, the binding of which in London this board has ordered through its agent, Mr. John Robson, at a cost of about $8,000. It is stated also that several more cases are on their way to Chicago, and it is probable that the entire English gift will, when all the books are received, amount to at least 7,000 volumes. These, with the number of books in the German collection, as well as those received from other sources, will make a grand total of some 10,752 volumes; and this, too, it may be said, without as yet making any considerable draft upon our income, except for the few named.

The board of directors, in estimating the commercial value of the books already on the shelves, for the purpose of insuring against fire, has directed a policy of fire-insurance to be taken out for $10,000. The probable value is $15,000 or $20,000.

But the principal value of many of the works will scarcely bear any pecuniary estimate. Some are editions or works of which no duplicates exist to be purchased. Thus, the English government sends 212 volumes, large octavo size, of their memorials and chronicles, and calendars of state-papers, of correspondence and public transactions with all the civilized countries of the globe, from the earliest periods of their history. These, published by the master of the English rolls, under authority of a special act of Parliament, passed in the year 1800, have occupied hundreds of transcribers and trans-

lators in all languages, at a cost of time and money which precludes the utter possibility of such a thing being ever undertaken as a private enterprise.

The complete sets of the English patent-office-reports, with some 77,000 specifications and 2,800 volumes, besides the annual additions of 140 volumes each year, can scarcely ever go into a private owner's or publisher's hands, and there are but three or four complete sets in the public libraries of this country. The University of Oxford, that most ancient seat of English learning, has made up and sent to Chicago a collection of books which—aside from the literary merit of the works sent—are, in style of bindings and typographic appearance and workmanship, of a value which, for the same number of books, could scarcely be replaced in case of loss.

ILLINOIS MUSEUM OF NATURAL HISTORY.

This institution was founded by the State Natural-History Society in 1858 and by this transferred to the State-board of education in 1871. It is supported entirely by legislative appropriation and is made an active center of exchange and distribution, especially for the public schools of the State.

It is now placed in the State normal-university-building, and contains about forty thousand specimens, nearly all named, catalogued, and thoroughly organized for the use of students.

It is designed to furnish, in time, to every school in the State which will use and properly care for it a small collection so selected as to illustrate in the best possible manner the branches required to be taught.

Mineralogy, geology, conchology, botany, and ornithology are represented by full and valuable cabinets, and measures have been taken to enlarge the already respectable collections in entomology and general zoölogy. The chemic laboratory connected with the normal university will soon be refitted and supplied with abundant apparatus, and will be opened to all who wish to make a special study of chemistry and the allied branches.

Designated sets of specimens are supplied to schools and public institutions.

The museum is for the free use of the people of Illinois, and all needed facility and assistance, in the way of books, specimens, and instruction, are afforded those who wish to avail themselves of it.

LIST OF SCHOOL-OFFICIALS IN ILLINOIS.

Hon. NEWTON BATEMAN, *State-superintendent of public instruction, Springfield.*

COUNTY-SUPERINTENDENTS.

County.	Name.	Post-office.
Adams	* John H. Black	Quincy.

Woodford	* William H. Gardner	Panola.

* Re-elected.

INDIANA.

[From biennial report of Hon. Milton B. Hopkins, State-superintendent, for the school-year ended August 31, 1872, and from his special report to the governor of the State for 1873.]

The last legislature, by an amendment to the nineteenth section of the school-law, approved as late as the 8th of March, required that the enumeration of the children of the State for common-school-purposes should be made in that same month and April following, instead of July and August, as heretofore. This required great expedition, and consequently notice of the change with the proper blanks was immediately sent to the trustees throughout the State, who have discharged the duty with energy and promptitude, the results of which are indicated by the figures below.

I. ENUMERATION.

Number of white males between 6 and 21 years of age	*342,082	
Number of white females between 6 and 21 years of age	307,067	
Total number of white children		631,149
Number of colored males between 6 and 21 years of age	4,589	
Number of colored females between 6 and 21 years of age	4,594	
Total number of colored children		9,183
Whole number		640,549
Whole number enumerated in the preceding July and August		631,549
Increase in our scholastic population within six months		8,783

II. ADDITIONS TO THE SCHOOL-FUNDS.

Common-school-fund.

Amount of common-school-fund in June, 1872	$2,239,502 22
Amount sinking-fund distributed	56,140 09
Amount since added from other sources	2,453 20
Amount in June, 1873	2,341,267 12

These figures show that the increase of the common-school-fund from the 1st day of June, 1872, to the same date, 1873, is $10,764.90. More than one-half of this amount, however, is from the sinking-fund, which is now exhausted, and consequently no additions in the future can be made from this heretofore fruitful source.

Congressional township-fund.

Amount of fund June, 1872	$2,269,867 61
Amount since added from sale of lands	19,316 15
Amount in June, 1873	2,289,183 76
Add the value of 12,925 acres of unsold lands	83,697 18
Total congressional fund	2,372,880 94

This fund, with the exception of the $83,697.18, the estimated value of the unsold congressional school-lands, is productive of interest. In a very few instances these lands are cultivated, and the rents and profits are applied to the education of the children of the proper township.

The school-funds have become very much simplified. They are now all embraced under two heads: common-school-funds and congressional township-funds.

The former embrace the various funds mentioned in the constitution of the State and set apart by it for educational purposes, such as the surplus-revenue-fund, saline-fund, bank-tax-fund, sinking-fund, and the fund derived from the sale of county-seminaries, the last dollar of which has found its way into the fund and is at the present time pro-

* These figures are taken from the official report published in the public prints.

ductive of interest. This fund embraces, also, fines, forfeitures, escheats, &c., which continue to augment it from year to year. A part of this fund is held in trust by the different counties in the State; the rest is held by the State herself, which debt she has acknowledged by the issuance of certain non-negotiable bonds, bearing 6 per cent. interest.

The congressional township-fund includes the proceeds of the sales of the sixteenth sections, as well as the present value of such of those lands as remain unsold. Both of these funds may be summarized as follows:

Non-negotiable bonds	$3,904,783 21
Common-school-fund	2,341,267 12
Congressional township-fund	2,372,880 94
Total	8,618,931 27

III. COMMON-SCHOOL-REVENUE.

The principal sources of the common-school-revenue are taxes upon the property and polls of the State, interest upon the common-school-fund, liquor-licenses, and unclaimed fees. The following table exhibits the revenue derived from each of these sources for the year ended November 15, 1873:

Apportioned by the superintendent of public instruction, collected by tax	$1,190,626 65	
Interest on common-school-fund	189,455 47	
Liquor-licenses	40,212 50	
Unclaimed fees	7,193 72	
State's interest on bonds paid	231,064 50	
Other sources	27,382 86	
Total revenue collected for apportionment		1,685,935 70
Amount apportioned		1,646,913 83
Apportioned by county-auditors:		
Interest on congressional fund, collected and apportioned by the coun-ties	$98,988 12	
Amount derived from local taxation	539,667 80	
Total		629,655 92
Grand total of school-revenue for tuition for the year ended November 15, 1873		2,276,569 75

THE REVENUE OF 1873 COMPARED WITH THAT OF 1872.

Increase by State-tax	$120,324 90	
Increase by interest on fund	28,615 37	
Increase by unclaimed fees	6,693 34	
Increase by local taxation	118,689 15	
Increase by interest on bonds	7,323 54	
Total increase		281,641 36
Decrease by abolishing fees for liquor-licenses	$68,067 50	
Decrease in congressional revenue, (only one distribution)	47,992 09	
Total decrease		116,059 59
Net increase		165,581 77

The increase derived from taxation is due to an increase in the wealth of the people and the number of taxable polls.

The increase in the amount of interest is caused, probably, by an increase in the productive school-fund itself, in accordance with the act of March 11, 1873, and partly by a change in the rate of interest from 7 to 8 per cent.

The increase in the amount derived from unclaimed witness-fees is the result of the energy of the attorney-general and county-superintendents, in accordance with the legislation of last winter.

The interest on the congressional fund is the amount appropriated in June, and does not include the distribution made in January of 1874, and is therefore only about half the usual amount reported from this source.

The same is true of the amount derived from local taxation.

IV. MISCELLANEOUS.

Average length of school-term, in days	105
Average length of school-term, in months	5¼
Number enrolled in primary schools	451,259
Number enrolled in high schools	13,895
Average daily attendance of white children	295,931
Average daily attendance of colored children	2,920
Number of districts in which schools were taught	8,918
Number of districts in which colored-schools were taught	90
Number of white male and female teachers employed	11,965
Number of colored male and female teachers employed	91
Number of school-houses in the State	9,202
Number of school-houses built within the year	465
Cost of same	$872,900 73
Whole number of persons licensed by the county-superintendents	9,575

Quite a number of changes were made in our school-law by the legislature at its last session, the wisdom of which can be certainly determined only by a practical test. This test has thus far been but imperfectly made. Among the changes, the most important is the abolition of the office of county-examiner, and the creation, in its stead, of that of county-superintendent. The law devolved the selection of this office upon the township-trustees, who, from their relation to the public schools, were supposed to be particularly fitted for making such selections. These appointments were made by the trustees in every county in the State on the first Monday in June, 1873, the day designated by the law. Persons were generally appointed by the trustees with exclusive reference to their qualifications, and in all such cases the results have been eminently satisfactory, and the law itself has been rendered popular. In a few instances, however, fealty to political party, rather than to common schools, was made the one essential qualification for the office. In such counties the law has failed in a great measure to respond to public expectation. The fault in this case is not in the law itself, but in the administration of the law.

COUNTY-BOARDS OF EDUCATION.

This board is composed of all the township- and school-trustees of the county, together with the county-superintendent, and is another new feature of the school-system. It takes its origin in certain general wants and needs of schools and school-property of which they have charge. It is the special province of this board to secure the best possible text-books for its schools, to relieve the parents of the burden of frequent changes, and to secure uniformity in text-books in the same school.

Under the law creating it, this board was not called into existence until as late as September last. It has, therefore, but fairly entered upon its work. Most of its decisions are merely advisory. "In a multitude of counselors there is safety."

TOWNSHIP-INSTITUTES.

Experience has abundantly shown that it was impossible to secure the attendance of all the teachers at the county-institutes, inasmuch as the law made such attendance voluntary, and that, as a general rule, those teachers who needed the advantages of these institutes most were the ones who failed to attend. For the purpose, therefore, of reaching all the teachers and making the benefits of institutes universal, the legislature at its last session enacted a law requiring the township-trustee to cause to be held in the township "township-institutes or model schools for the improvement of teachers" at "least one Saturday in each month during which the public schools may be in progress." The law requires the attendance of all the teachers in the township, and for non-attendance imposes a penalty.

Thus far, these institutes have been almost universally attended, and they have awakened rivalry among teachers, which must result in great good to the schools of the State.

CHANGE IN RATE OF INTEREST.

County-auditors are now collecting interest at the rate of 8 per cent. upon all expired loans and new loans, and have no difficulty in finding borrowers at the increased rate.

STATE-INSTITUTES.

Under the auspices of the State-board of education, the State-teachers' institutes were held during the past summer—one at Muncie, one at Franklin, and one at Vincennes. These institutes were largely attended by teachers from various parts of the State, and the instruction, which was given by experienced educators of our State and from abroad, was invaluable.

COUNTY-INSTITUTES.

These have been more generally held than in any former year and more generally attended by the teachers. They are now a fixed fact. They have given fresh impetus to the cause of popular education in every county in the State. Perhaps not less than 95 per cent. of the teachers receive all their professional training in these temporary normal schools. Trustees, in the employment of teachers, discriminate in favor of those who attend these institutes and against those who neglect or refuse to attend them. The money used in their support greatly increases the teaching power of the State, and is therefore wisely expended.

SCHOOL-HOUSES.

The reports now on file show that the people have expended during the year past $872,900.73 in the erection of school-houses, which is more than has been expended for the same purpose in any preceding year. The average cost of these is something over $18,000, which indicates very clearly the general character of these buildings. Not a child in Indiana, so far as is known, has been deprived of school-privileges for the want of a school-house in which to attend school.

GENERAL VIEW.

Almost every department of the school-system indicates progress during the past year. The permanent school-fund has been augmented; more than the usual amount of money has been raised by taxation. The school-houses erected have been more substantial and more in accordance with true architectural taste. The schools have been better attended, graded, and organized. The teachers have been better qualified for their profession and better paid for their services.

In respect to the average duration of the school-term, the year past suffers in comparison with the year immediately preceding; for while, as compared with the other years, it shows a decided gain, in this instance there is a loss of eleven days. This is much to be regretted, and shows the necessity at once of a law fixing the minimum length of a school-term.

In view of the fact that common schools are the only hope of the poor to obtain an education at all and in view of the additional fact that nineteen-twentieths of the population obtain from common schools all the education they do obtain, and that most of the public men receive from them the first elements of thought and their rudimental conception of men and things, the superintendent congratulates the governor, and, through him, the entire people of the State, upon the generally prosperous condition of the public-school-system.

AMENDMENTS TO THE SCHOOL-LAW.

The following are the principal amendments made to the school-law during the session of the legislature in 1873:

RELATING TO SCHOOL-FUND.

The rate of the special school-tax is increased to 50 cents on each $100 and $1 poll, just double the previous rate.

The rate of interest on all school-funds is fixed at 8 per cent.

An act was passed consolidating portions of several funds and various claims that were scattered and becoming less every year, to the amount of $170,000. The State assumed the ownership of these assets and gave to the school-fund a non-negotiable bond, drawing 6 per cent. interest.

RELATING TO TEACHERS.

Teachers are no longer to be elected by district-meetings. Their selection and appointment are henceforth to be entirely in the hands of the trustees.

The school-year is changed, so that it begins on the 1st day of July.

CONSOLIDATING SCHOOL-DISTRICTS.

Authority is given to two or more districts or municipal corporations to unite in building joint graded schools.

SALARIES AND APPROPRIATIONS.

The State-superintendent's salary is increased from $1,300 to $2,000 per annum.

The yearly appropriation of $10,000 to the State Normal School is increased to $15,000 and $2,000 additional for contingent expenses.

The State University receives an additional annual appropriation of $15,000, making the total annual income $30,500. Twenty thousand dollars were also appropriated for the new university-building.

AUTHORIZING CITY- AND TOWN-SUPERINTENDENTS.

Trustees of incorporated cities and towns are authorized to employ superintendents and pay them from the special fund. Heretofore this has been done without law.

AUTHORIZING CITY-BONDS.

Cities are authorized to issue bonds for building-purposes, to the extent of $50,000, instead of $30,000, as formerly.

SCHOOL-CENSUS.

Trustees are required to take the enumeration of children between the 1st of March and the 1st of May, and report to the county-superintendent on the 1st of May. Statistical reports are to be made September 1.

A penalty of $15 is inflicted if the county-superintendent fails to make his report of enumeration to the State-superintendent by May 15 and a penalty of $10 for not making the statistical report by September 15.

SPECIAL TAXES.

Trustees are authorized to levy a special tax to the extent of 25 cents on the $100, in order to pay off old debts.

PAY OF STATE-BOARD.

The law regulating the pay of members of the State-board of education has been changed so as to allow each $5 per day and 5 cents per mile for the distance necessarily traveled.

LEGAL VOTERS AT SCHOOL-MEETINGS.

All tax-payers, except married women and minors, are allowed to vote at school-meetings. Trustees are to be elected for one, two, and three years, so that hereafter one shall be elected annually.

COUNTY-SUPERINTENDENCY-LAW.

This law, though not all that was desired, has been hailed with delight by the friends of education throughout the State. It provides for a visitation, by the superintendent, of all the schools in the county at least once in the year; for county-organization, which will secure system and unity of work; and for township-organization, which will secure efficiency and uniformity in carrying out details.

COUNTY-BOARD.

The county-superintendent, with the trustees of the townships and the trustees of the towns and cities of the county, are to constitute a county-board of education, of which the county-superintendent shall be the president.

MEAGER SALARY OF SUPERINTENDENT.

The most serious defect in the law is that the pay of the superintendent is fixed so low ($4 per day) that in many counties good men cannot be secured, and, as a result, the work will not be as well done as is desirable. This is greatly to be regretted, since the success of the law and its popularity will depend upon the manner in which it is executed.

TEACHERS' INSTITUTES.

The law provides that "at least one Saturday in each month during which the public schools may be in progress shall be devoted to township-institutes or model schools for the improvement of the teachers, and two Saturdays may be appropriated, at the discretion of the township-trustee of any township." "The township-trustee shall specify, in a written contract with each teacher, that such teacher shall attend the full session of each institute contemplated herein or forfeit one day's wages for every day's absence therefrom, unless such absence shall be occasioned by sickness." This provision of the law will, it is believed, result in inestimable good.

In this law there is nothing to prevent trustees of small incorporated towns, not able to command the entire time of a superintendent, adding to the salary of a competent county-superintendent and securing a portion of his time. By this means a first-class man may be employed in almost every county and be paid a fair salary for his services.

INCREASE OF SCHOOL-REVENUE.

Under the old law, property for taxable purposes was seldom appraised at more than one-third or one-half its real value. According to these appraisements the total taxable property of the State is fixed at $662,000,000, while the census of 1870, in which people estimate their own property without any tax-duplicate staring them in the face, makes the

taxable property of the State worth nearly $2,000,000,000. The State-board of equalization, which has the best facilities for arriving at the facts in the case, estimates that the present basis of taxation, $662,000,000, is but little more than one-third the true value of the property of the State.

CHANGE IN PROPERTY-VALUATION.

The new law changes the basis and fixes the cash-value, or the amount the property would sell for at voluntary sale, as the standard. At the lowest estimate the valuation will be doubled.

The present yearly income from this source is $1,070,301.69, and the new law means that this amount shall be doubled, though whether so great an improvement will be effected is doubted by the superintendent.

APPOINTMENT OF TEACHERS.

One of the most important changes in the school-law is the one which does away with the district-meetings to elect teachers and leaves the selection and appointment entirely in the hands of the trustees. This will undoubtedly meet with much opposition, as people are very jealous of their rights, but it will be likely to result in much good. "The old law has given rise to more trouble in school-matters than almost all other things combined." Where two teachers apply for the same school, the defeated one and his friends not unfrequently use their influence against the successful teacher and the school; and hundreds of country schools have, in this way, been rendered almost useless. With the appointing power in the hands of the trustees, such trouble is avoided. This law has worked well in cities and towns. There seems no reason why it should not work equally well in the country.

IMPORTANCE OF GOOD TEACHERS.

The State-superintendent says: "School-teaching is now, by common consent, admitted into the ranks of the learned, honorable, and useful professions.

"The thermometer does not more accurately indicate the temperature of the surrounding atmosphere than do the moral and educational qualifications of the teachers indicate the civilization of the people in whose midst they live and labor. As are the teachers, so is the nation. Our law is correct, in theory at least, when it requires proof of moral character, and also sufficient knowledge to teach and to govern the school, as conditions of admission into the profession.

"Good teachers give us good schools and good schools make an intelligent, happy, and prosperous people. It is, therefore, the part of sound wisdom for the State to make liberal provision for the preparation of teachers possessing a high order of didactic skill."

STATE-CERTIFICATES.

The State-board of education has decided to grant two grades of certificates and has fixed the standard of qualification of each as follows: for the second grade, satisfactory evidence of good, moral character; superior professional ability; a comprehensive knowledge of the theory and practice of teaching; thirty months of practical experience in the school-room, ten of which shall have been in the State; a thorough knowledge of the branches taught in the common schools, of the Constitutions of the United States and of the State of Indiana, of the elements of natural philosophy, and of the art of composition.

A first-grade-certificate requires, in addition to the above, a knowledge of elementary algebra, the first three books in geometry, elements of botany, outlines of general history, elements of rhetoric, and elements of zoölogy.

INCREASE IN LENGTH OF SCHOOL-TERM.

The average length of the schools throughout the State has been increased nearly one month. This has been brought about by the levy of special tuition-tax. In many counties the trustees have levied sufficient tax to keep the schools open six months, and in Porter County the tax was sufficient to maintain schools nine months. The average length of schools for the year ended August 31, 1872, was 116 days. The improvement in this respect is highly gratifying and encouraging.

NEGLECT OF PRIMARY CLASSES IN UNGRADED SCHOOLS.

Complaint is made that in many cases the primary classes in ungraded schools are cheated out of half the time that properly belongs to them. In these instances each

class is allowed, indeed, to recite four times a day; but it is alleged that while the primary class is given only ten minutes, the advanced class, with no more pupils in it, is allowed *thirty*. The injustice of this is apparent when it is considered that the little ones cannot study as older pupils can and learn most through recitation. While the importance of a thorough grounding of these in the first elements is such as to justify a making of distinctions in their favor, much rather than against them, the foundations of education once well laid, the completion of the structure is comparatively easy.

SCHOOLS FOR COLORED CHILDREN.

The State-superintendent says: "I find a universal disposition among trustees and the people to make provision for the education of the colored children. Wherever congregated in sufficient numbers, without a single exception, so far as known to me, trustees have organized schools for them, provided houses, employed teachers—either white or colored—and made their school-terms equal in duration to those of the other schools. In many instances, by common consent, these children have been admitted into the white-schools, and in others, where they were refused, the trustees have expended to the best advantage their portion of the school-revenue in their education.

"I have visited many of these schools during the year. The children are well behaved and anxious to learn."

It is evidence of the interest taken in this class of children that, during 1873, there has been erected for them at the State-capital a school-building, costing $22,000, the cost of lot, furniture, and heating-apparatus bringing this up to $30,000. There are now eleven schools for colored children at Indianapolis, ten of them taught by colored teachers.

MORAL RESULTS OF THE SCHOOLS.

In connection with this subject the superintendent remarks: "The leading object in the organization of any school-system should be the moral culture of the children. That system of education that aims at the development of the intellectual faculties to the neglect of the moral is exceedingly defective. We should not allow ourselves to be deceived by the supposition that in cultivating the intellect we are necessarily developing the moral sentiments and feelings. Innumerable instances of moral degradation are found to-day in the ranks of the most highly educated. * * * Did not the advocates of our free-school-system promise the people that if they would take upon their shoulders the additional burden of taxation for its support the same would be lightened by the diminution of crime? Is there any perceptible decrease of crime in Indiana? Is there a reasonable probability that there will be? We should know what education *is not* doing for us as well as what it is doing. * * * It is hence becoming a grave question among those who take comprehensive views of the subject of education, whether intellectual culture without moral is not rather an injury than a benefit. That is the true system of education which adjusts itself in its course of training to the entire complex nature of the child. No government can safely ignore this grave subject, especially if it rely for security on the virtue, intelligence, and fidelity of its people. It is, therefore, a matter of the deepest concern that the legislature look well to the moral training of our youth. The law-makers of Indiana have not been heretofore unmindful of this great interest. Two statutes found in the school-law are monuments to the wisdom and patriotism of the general assembly: "The *Bible shall not be excluded* from the public schools of the State." "The common schools of the State shall be taught in the English language and the trustee shall provide to have taught in them orthography * * * and *good behavior*." The science of good behavior is a part of our common-school-curriculum, and the Bible is the text-book. These two sections clothe the teachers with all needed authority to bring their schools under proper *moral* and *religious influences*. Christianity should be made the basis of popular education.

ILLITERACY IN INDIANA.

The census of 1870 gives the number of illiterates over 10 years of age in Indiana as 127,124, or 7½ per cent. of the entire population. Of these, 100,341 were adults, and 39,509 (10 per cent. of the voting population) voters at all the elections, yet unable to read one section of the State- or national constitutions or the names of the candidates printed on their tickets.

ILLITERACY AND PAUPERISM.

As an illustration of the general rule that increased pauperism is a consequence of illiteracy, the superintendent presents the following statement: "The statistics re-

ceived from nine establishments (State and county) for the support of paupers show the total number of adults to be 1,375; minors, 987—total, 2,362. Of these, 959 were unable to read and write and 34 only had received a superior education. The total expense for the year was $216,575.56. These statistics show that of the 2,362 paupers in these nine establishments 1½ per cent. were well educated, while more than 40 per cent. were illiterate. I take it as a fair inference from the foregoing that 40 per cent. of the pauperism of Indiana is attributable to a want of intellectual and moral culture, and, consequently, 40 per cent. of the expenditure of the State on account of her paupers is chargeable to the same cause. It costs the State more to maintain a pauper than to educate a child. Should she not, therefore, in the name of economy, *demand* universal education?"

ILLITERACY A CRIME.

"If the State in her early history afforded meager privileges for free education, the reason is found in her early poverty. At no time, however, in her history have educational opportunities been so limited as to deprive the children of at least a knowledge of the elements of the English language. Illiteracy has at no time been a necessity. If any man or woman, reared in Indiana, is destitute of ability to read and write, it is almost invariably the result of slighted opportunities, and demands a defense—demands a *defense*, for illiteracy is incipient crime. To live from birth to majority in the midst of free schools and remain profoundly ignorantis a crime against the illiterate himself, against society, and demands of the State a remedy."

The remedy suggested is a

COMPULSORY LAW.

In urging the adoption of such a law the superintendent remarks: "Two features have characterized our system from its very inception: that the schools are *open to all* and *free to all*. The founders of it reasoned that public sentiment, parental pride, and the innate fondness of children for knowledge, combined, would send *all* into the schools. For fifty years we have acted upon this theory. What are the results? The census-table answers by facts and figures.

"To reach our 27,000 minor illiterates, together with a large number of truants and vagrants, and bring them within the elevating and refining influence of our schools, we have remaining one means, and only one: a compulsory law.

"The right to compel attendance is an obvious consequence of the school-system itself. If the State has the right to make, by compulsory taxation, the present liberal provisions for the education of all, she has the right to compel the attendance of all.

"I doubt not that a judicious law, compelling attendance upon the schools, would meet with favor in Indiana. It rises above all partisan considerations. Such a law would be the best friend of the orphan and the neglected. It would open to thousands a door of hope that is now probably closed forever. The public is ready for this measure. It can be enforced. It will break up old and bad habits and form new and better ones. Its adoption will mark a new and better era in educational matters and erase from the census-reports the figures that tell the disgraceful story of our illiteracy."

ADJUSTMENT OF COURSES OF STUDY.

The State-board of education has determined to readjust and modify, to whatever extent may appear to be necessary, the course of study in the public schools, so as to make it one continuous system from the lowest primary grade up to the State University. From the primary grades to the high schools the system does not seem, in their opinion, to need much adjustment. But between the high school and the university, the relationship between them needs some modification to bring the two into perfect accord and harmony. One noticeable feature of the new system is to be found in a provision which makes a certificate from certain designated high schools, showing that the bearer has satisfactorily passed through their course, a sufficient evidence to enter the university without further examination.

SECONDARY INSTRUCTION.

Nine private high schools, academies, and seminaries report an aggregate of 1,671 students in secondary studies—779 boys and 892 girls. Of these 95 are pursuing the classic course and 81 modern languages; 119 are preparing for college and 40 graduated from these various schools at their last commencement. Of these schools, 6 have fine libraries, the number of volumes ranging from 500 to 1,500; 3 have a chemic laboratory and philosophic apparatus, and in 4 music and drawing are taught.

In addition to the foregoing, 13 institutions for superior instruction have in their preparatory departments an aggregate of 1,689 pupils who are pursuing secondary studies, of whom 315 are young ladies.

NORMAL SCHOOL.

The State Normal School has not only maintained its own high character as a professional school, but likewise that of the class of institutions which it represents. "A written pledge on the part of the applicant for admission, filed with the principal, that said applicant will, so far as may be practicable, teach in the common schools of Indiana a period equal to twice the time spent as a pupil in the normal school," is the condition of admission. In the number of pupils, each year gains upon its predecessor. Its growth has been constant. Each year enrolls from 25 to 40 per cent. more students than the corresponding term of the preceding year. During the past year about three hundred students were in attendance. Twenty of this number graduated, and each of these is faithfully carrying out the conditions of admission. The universal verdict in reference to their teaching is that *their work is thorough.*

The influence of the school is not limited to its graduates. There are many under-graduates whose idea of school-work and methods of instruction have been greatly improved by an attendance at the institution. This school must ever be regarded as the heart of our common-school-system. Chauncy Rose, esq., a distinguished and wealthy citizen of Terre Haute, generously donated to the institution the sum of $4,000 for the purchase of a library of reference. More than one-half of that sum has been expended in accordance with his wishes, and the institution is now in possession of a very valuable library.

STATE UNIVERSITY.

The Indiana State University, located at Bloomington, was a seminary in 1824, a college in 1828, and was organized as a university in 1839. The State appropriates to it $23,000 annually. In all the six departments—preparatory, collegiate, engineering, military, medical, and legal—the number of professors and instructors is 26. Of the 174 classic or collegiate students, 31 are ladies, the collegiate course—classic and scientific—being open to them on the same terms as to young men. In every department tuition is free to all, only a small contingent fee of $3 being required in the law-school and college for each term.

A large new building for the university, corresponding with the one previously existing, has been erected during 1873, measuring 130 feet in length by 50 feet in breadth, and 3 stories high. On the first floor of this, in a room 100 feet by 50, will be displayed the extensive Owen cabinet of natural history and science, branching out into still another room for its exhibition of specimens. The remainder of the floor will be occupied by the laboratory and apparatus for illustration of the physical sciences. The second floor will be occupied by the libraries and two recitation-rooms. The third will contain the law-lecture-rooms, 60 feet by 50, and two halls for literary societies.

The alumni of this university now number 864, besides 6,000 who have received a partial training in it.

As has been stated under another head, the university will hereafter, it is understood, admit to its freshman-class approved graduates of the high schools of the State, without the examination to which other candidates for admission are subjected. Whether this implies a lowering of the standard of admission to the university or an elevation of that for graduation in the high schools does not yet fully appear; but it is taken for granted that the latter is the case, and that hereafter Latin, through Cæsar and Virgil, and Greek, through the grammar and reader, will be required for full graduation in the high schools.

Out of 110 applicants for admission to the university in 1873, only 50 were admitted. A part of the remainder entered the Bloomington high school, which is partly under the control of the university, to finish their preparation, and a part went to another college, where they were admitted. The advanced ground taken by the State University in regard to the standard of admission to the freshman-class is considered a matter for congratulation. If a general advance in this respect could be made by all western colleges, it would be some honor to hold a diploma from them. In the past there has been a strife among these institutions as to which should secure the largest attendance, and scholarship has been a matter of secondary consideration. It is hoped that all Indiana colleges will advance their standard so far that it will not be necessary for ambitious young men to leave the State in order to secure a *first-class* education.

*Includes 12 in scientific course.

PRIVATE AND DENOMINATIONAL INSTITUTIONS.

The following are private and denominational institutions, organized for local convenience or with a view to the retention of special religious influences throughout the college-course:

(1) Wabash College, at Crawfordsville; Presbyterian; 22 graduated at last commencement.

(2) Concordia College, at Fort Wayne; Lutheran; supported by free contributions of the clergy and congregations of the synod of Missouri, Ohio, and other States.

(3) Franklin College, at Franklin; Baptist. Of 4 students in the senior-class, 3 are ladies.

(4) Indiana Asbury University, Greencastle; Methodist-Episcopal. Of 385 students in the classic department, 38 are ladies. At the last commencement 30 graduated.

(5) Hanover College, at Hanover; Presbyterian. University-charter obtained in 1832; tuition, free. Graduates at the last commencement, 10.

(6) Hartsville University, at Hartsville; United Brethren in Christ. Of 89 students in classic department, 24 are ladies. Graduates at last commencement, 6.

(7) Northwestern Christian University; Christian. Of 61 students, 10 are ladies.

(8) Union Christian College, Merom; Christian. Graduates at last commencement, 3.

(9) Moore's Hill College, Moore's Hill; Methodist Episcopal. Graduates at last commencement, 7.

(10) University of Notre Dame, near South Bend; Roman Catholic. At last commencement, 15 graduated in the classic and 22 in the commercial department.

(11) Earlham College, Richmond; Friends. Of 59 students in classic department, 21 are ladies. Graduates at the last commencement, 14.

(12) St. Meinrad's College, St. Meinrad; Roman Catholic.

(13) Howard College, Kokomo. The sexes are educated together here.

(14) Fort Wayne College; Methodist-Episcopal; reorganized 1873. Gentlemen and ladies both admitted to the regular boarding-hall-room in separate buildings, but take meals in the same dining-room and, as far as possible, recite together.

COLLEGES FOR WOMEN.

Four institutions report an aggregate attendance of 371 pupils, of whom 28 are in preparatory departments, with 43 teachers, of whom 4 are gentlemen and 39 ladies. The pupils are divided in two of these colleges, as follows: in the freshman-year, 33; sophomore, 32; junior, 31; senior, 13; 2 are pursuing a special or partial and 7 a post-graduate-course. French, German, and music—both vocal and instrumental—are taught in all these colleges, and painting and drawing in all but one. Two report the

possession of chemic laboratories and natural-history-museums, 3 philosophic cabinets, and one each an art-gallery and a gymnasium. All have libraries, the largest numbering 3,000 volumes, the smallest, 550.

BUSINESS-COLLEGES.

Indiana has six of these—at Evansville, Indianapolis, Logansport, Notre Dame, and Terre Haute—reporting, in all, 25 teachers and 1,096 pupils.

Statistical summary of professional schools.

* These are also included in the regular college-course.
† Law-school is suspended for one year.
‡ Books and apparatus.
§ Only the president and professor of chemistry yet appointed. The institution will open for the reception of students March 1, 1874, but not with a full corps of professors. No students have been received in 1873. The gift of Mr. John Purdue, securing the naming of the institution after him, was $150,000 in cash. Citizens of Tippecanoe County have given $50,000 cash and citizens of Chauncey 100 acres of land, valued at $50,000, to secure its location at Chauncey. The State of Indiana in 1873 made an appropriation of $60,000, half of which was paid in June, 1873; the remainder to be paid in June, 1874.

INDIANA STATE TEACHERS' ASSOCIATION.

The nineteenth annual meeting of this association convened in the city of Logansport on Tuesday, December 31, 1872, and remained in session until the 3d of January.

Mr. W. A. Bell, the president-elect, in his inaugural address, touched upon the "woman-question," including the co-education of the sexes, woman as the teacher by nature, and the salaries of lady teachers. He brought forward the testimony of numerous presidents of colleges and professors in universities to establish the truth of certain propositions, the principal of which were that "women should be admitted to all colleges and universities on the same terms as men." "Co-education is the natural plan." "The effect upon character and manners is mutually elevating and refining;" "it promotes studiousness and good order."

The subject of "The study of German in the public schools" was discussed at considerable length.

Prof. H. B. Boisen, of the State University, read a paper on the Kindergarten, in theory and practice, in which he gave an account of the origin of the Kindergarten-system, its progress, the obstacles in its way, and its ultimate prosperity and success. "In the Kindergarten, morality is taught without moralisms, religion without theology, and science without text-books. Those American institutions into which text-books have been introduced do not deserve the name of Kindergarten."

"How to cultivate a taste for English literature" was the subject of a paper read by J. A. Zeller, principal of the Evansville high school. He held that teachers should be more fully cultivated in literature and should make a constant effort to enable the children to lay hold of ideas through words, the vocabulary to be increased only as the ideas increase.

A lengthy and highly-interesting address was given by John H. French, State-superintendent of the schools of Vermont. He confined his remarks chiefly to the subject of natural history in the common schools, showing how this branch of study can be made not only interesting but very profitable, even in the lower grades of the schools. In some of the eastern cities natural history is taught one year before the pupil commences English grammar. Every teacher in the common school has the means at hand by which he may give lessons to the pupil that will make him wiser and better. In teaching this subject, short oral lessons should be given two or three times each week. They should be reproduced by the pupil at some future time, and criticised by the pupils and teacher.

J. McNeil, superintendent of the Richmond schools, read a paper on the defects of the graded system of schools. The writer regarded the graded-school-system as having done more than given system to the work. It has given enthusiasm and a general interest in public education, but the highest object of this education has not yet been reached. The graded-school-system, in its unmodified form, makes no distinction as to mental ability, and is defective in that it expects equal results from very different capacities.

President W. A. Jones, of the State Normal School, read apaper on "Moral training in the public schools." He assumed, in the first place, that training involves both instruction and practice. A prevalent opinion among the people is, that the province of the public school is to teach scientific and literary subjects; but that, if moral instruction is taken into account at all, it is to be given in the most general manner; whereas, principles of social morality must be stated and practice of these be required.

T. C. Philips, editor of the Kokomo Tribune, in a paper on "The relation of journalism to education," claimed that the present intelligence of the people is very largely due to the newspaper; that while journalism was in its infancy ignorance everywhere prevailed, schools were poorly supported, and original thinkers were few. Since the newspaper contains that knowledge which is adapted to the practical wants of men, he would have in every school a "news-chair," with its regular professor. He would introduce daily or weekly papers into every school in the village or city and have a judicious selection from them read.

"The art of questioning" was the subject of a very practical paper by Mrs. Lois G. Hufford. Among many suggestions were the following: Do not word questions so as to convey information. Do not end questions with the word "what?" The teacher should never answer his own question. As a rule, do not give questions that can be answered by yes and no. Require the answers in complete sentences.

An address was delivered by Hon. William T. Harris, superintendent of the St. Louis schools, on "The function of education in its relation to the government, to society, and to the individual." He prefaced his discussion of the different parts of the subject by glancing at the heterogeneous elements which enter into the composition of the population of this country, and drawing the conclusion that a composite population conduces more to liberty and toleration than a homogeneous one. In such a community men learn that toleration and license are two different things. It is the province of the school to give the pupils a clear insight into the problems of life, to show them that true freedom is to be obtained only in subordination of self. The teacher has achieved success when he has learned to govern his pupils through their own convictions.

In order to secure uniformity in the reports of schools, on motion of W. H. Wiley, the rule known as the national rule was adopted by the association.

A large portion of the closing session was occupied with a discussion on the subject of compulsory education. J. M. Bloss, superintendent of the New Albany schools, strongly favored the adoption by the State of some law by which compulsory attendance at school may be secured. He believed that the vote of the people, which would be necessary to secure such an act, would of itself create a public sentiment that would be sufficient to enforce all the regulations of the system. D. D. Luke, superintendent of the Goshen schools, argued on the negative of the question. The time allotted for this exercise having expired, the discussion was not finished.

C. W. Ainsworth, assistant superintendent of the Boys' Reform-School, in a paper on "What shall be done with the bad boys?" sketched the management of the reform-school and gave some of the means of discipline that are brought to bear upon those who are admitted into the institution. A curtain is dropped between them and the world of crime in which they have been living. Religious teaching, music, cheerful amusements, &c., are employed with good effect. The object is to educate the head, the heart, and the hand, so that when they leave the institution they may be fully prepared to take their places in the world as intelligent, conscientious, and industrious members of society.

J. Cooper, superintendent of the Winchester schools, in a paper on "Discipline: what it is and how to secure it," defined school-discipline as such an adjustment of school-work that the proper ends of the school may be attained. The disciplinary agencies to be employed in the government of the school should receive the most earnest and careful study of the teacher. Among them may be noticed: (1) the literary qualification of the teacher, (2) self-control on the part of the teacher, (3) confidence in one's self, (4) work, and (5) the co-operation of parents.

The report of the committee on resolutions, which was unanimously adopted, contained the following: "This association bears testimony to the value of the National Bureau of Education as a means of collecting and disseminating valuable educational information, and we specially indorse the labors of General Eaton, the United States Commissioner of Education, as wisely planned and ably and efficiently carried out, and we hope the teachers of this State will, through the members of Congress of their respective districts, obtain the reports of this Department and make them a subject of special investigation."

The examiners' and superindents' section of the association discussed at considerable length the subject of "The powers, duties, and qualifications of county-superintendents." Papers were read on "The advantages, disadvantages, and feasibility of district and graded-schools" and on the "Best method of influencing public opinion in favor of education."

In the collegiate and high-school-section, a number of the members participated in a debate on the subject of "A common course of study for our colleges;" and the meeting listened to papers from Dr. Nutt, on the "Lecture-system of the German universities;" and from Prof. Geo. P. Brown, on "High-school-work in Indiana."

IOWA.

[From the biennial report of Hon. A. Abernathy, State-superintendent of public instruction, for 1872 and 1873.]

SUMMARY OF STATISTICS.

	1872.	1873.
SCHOOL-FUND.		
Amount of the permanent school-fund, November 1, 1873		$3,294,742 83
Amount of interest on the same for 1873		275,789 42
Number of acres of school-land yet unpatented		374,263 00
Amount of indebtedness to the school-districts in outstanding bonds		1,147,673 38
RECEIPTS AND EXPENDITURES.		
Amount received from district-tax, semi-annual apportionment, and other sources	$4,305,859 23	4,519,689 39
Total expenditures for school-purposes	4,065,667 77	4,229,455 54
Increase in two years		624,844 07
SCHOOL-POPULATION.		
Number of male persons of school-age, 5 to 21 years	244,890	252,485
Number of females, 5 to 21 years of age	230,609	238,859
Increase in two years		29,862
ENROLLMENT AND ATTENDANCE.		
Number of pupils enrolled in public schools	340,789	347,572
Increase in two years		5,332
Percentage of enrollment on total enumeration		.71
Total average attendance	214,905	204,204
Decrease in two years		7,522
Percentage of attendance upon whole number registered		.58
Percentage of attendance upon enumeration		.42
PRIVATE SCHOOLS.		
Number of private schools	78	121
Number of teachers employed in private schools	246	364
Number of pupils attending private schools	6,163	12,132
TEACHERS AND THEIR PAY.		
Number of male teachers employed	5,901	6,091
Number of female teachers employed	9,320	10,193
Whole number of teachers employed	15,221	16,284
Increase in two years		2,187
Average compensation of male teachers per month	$36 00	$36 28
Average compensation of female teachers per month	28 06	27 68
SCHOOL-PROPERTY.		
Number of frame school-houses	7,122	7,782
Number of brick school-houses	626	635
Number of stone school-houses	257	259
Number of log school-houses	248	180
Whole number of school-houses	8,253	8,856
Increase in two years		1,246
Value of school-houses	$7,425,926 19	$8,164,324 66
Increase of value in two years		1,391,308 50
Value of school-apparatus	113,009 75	122,337 60
Increase in two years		17,963 17
Number of volumes in district-libraries	11,633	12,944
Increase in two years		1,462
SCHOOL-DISTRICTS.		
Whole number of school-districts	1,717	2,538
Increase in two years		932
SCHOOLS.		
Number of ungraded schools	8,156	8,397
Increase in two years		556
Number of graded schools	403	419
Increase in two years		130
Whole number of schools	8,559	8,816
Increase in two years		689
Average number of months schools have been taught	6.5	6.5

SUMMARY OF STATISTICS—Continued.

	1872.	1873.
EXAMINATION OF TEACHERS.		
Number of applicants examined	15,119	17,287
Number receiving professional certificates	410	594
Total number of certificates granted	13,496	15,264
Number of teachers who have had no previous experience	2,779	3,543
Number who have taught less than one year	2,721	3,275
Number who have attended a normal school	1,111	1,710
Number employed who hold State-certificates	.....	87
VISITATION OF SCHOOLS.		
Number of schools visited by county-superintendents	7,655	7,665
Number of visits made during the year	10,572	11,969
Number of educational meetings held	365	466

EDUCATIONAL PROGRESS.

The foregoing statistics and comparisons exhibit concisely the present condition of the public schools of the State. They indicate a uniform and healthy growth in almost every department during the last two years, the only special exception to this being the marked increase in the number of independent districts, the cause here being found in the fact that the school-law of 1872 authorized the formation of independent districts from the subdistricts of a district-township, upon vote of the electors, whenever the people of any district may elect. This is substantially a return to the old district-system.

For the purpose of exhibiting the rapid and uniform growth of our school-system for a more extended period, the following table has been prepared, embracing some of the more important items of school-statistics for the last ten years, from 1863 to 1873:

Years.	Number of schools.	Number of youth between the ages of 5 and 21 years.	Number of youth enrolled.	Total average attendance.	Average number of months school has been taught.	Average compensation of teachers per month.		Am't paid teachers.	Amount paid for school-houses, grounds, libraries, and apparatus.	Amount paid for fuel and other contingencies.	Total amount expended for school-purposes.
						Males.	Females.				
					Mo. Dys.						
1863...	6,237	281,733	199,750	111,185	4 2	$22 00	$15 68	$570,115	$160,253	$31,169	$761,537
1864...	6,623	294,912	210,569	117,378	5 5	25 12	17 60	686,673	199,589	46,123	932,385
1865...	5,732	324,338	217,593	119,593	5 5	31 64	22 80	856,726	297,453	74,714	1,228,893
1866...	5,900	348,498	241,827	136,174	5 4	33 60	23 76	1,006,623	572,593	158,739	1,737,955

INCREASE OF POPULATION AND PROPERTY.

During the period embraced in this table, the total population of the State has increased from 702,162 to 1,249,418, and the total assessed valuation of property, personal and real, from $167,113,639 to $364,336,580, the per cent. of increase in population being 78, in the valuation of property 118.

The number of persons between the ages of 5 and 21 years has advanced from 281,733 to 491,344, an increase of 74 per cent.; the total enrollment has increased in the same ratio, while the total average attendance has increased 83 per cent.

INCREASE OF SCHOOLS.

The number of schools has increased during the same period from 6,237 to 8,816, an increase of 41 per cent. The increase in the number of schools, however, is less than in other items; the real gain is much greater than would appear from these figures, each room or department of our 419 graded schools, over which a single teacher presides, being counted as one school. These schools, which are rapidly increasing in number,

require the services of from two to twenty-five teachers each. While in 1863 the number of schools would nearly express the number of teachers required, now the 8,816 schools reported require the continued services of more than ten thousand teachers; and yet even the increase in the number of schools or of the teachers required does not fully indicate the growth of the schools, since the increase in these items is not in the same ratio as in the number of youth and the attendance. In the year 1863 the average attendance per school was 32; in 1873, 40.

The average number of months during which the schools have been taught has gradually risen from four months and two days to six months and ten days.

TEACHERS AND TEACHERS' SALARIES.

By referring to the general summary, it will be seen that the reported number of teachers employed in 1873 is 16,284, but as the 8,816 ungraded schools require the services of but one teacher each and as the graded schools require less than 1,400 teachers, the reports show some six thousand more teachers employed than would be actually required if all continued to teach during the whole school-term of the year. Teachers, however, are often employed in two or more districts during the same year, and are thus counted twice in the general summary. Deducting the number of these, there will still probably remain three or four thousand teachers in excess of the number of schools. Owing to the general nature of the industries of the State, a large number of male teachers are necessarily employed otherwise in the summer-season, either in agricultural labor or in other occupations, which are pursued chiefly during that season of the year. In this manner, the ungraded school is frequently taught by male and female teachers alternately during the same year. Because of the increased attendance, and usually of more advanced pupils and the rigors of our winters, teachers of ungraded schools command a higher salary during the winter-term. As stricter discipline is required, and as, in rural districts, teachers are liable to greater exposure to the inclemency of the weather, males are employed to a greater extent during this season than females. These facts account in part for the very considerable difference between the salaries of male and female teachers, the salaries paid to females being nearly equal to those paid to males for similar services during the same season of the year. The average compensation of male teachers per month has advanced during the last decade by an almost uniform law from $22 to $36.28 and of female teachers from $15.68 to $27.68.

INCREASED EXPENDITURE FOR TEACHERS' WAGES.

The most remarkable advance, however, is found in the school-expenditures, the annual amounts paid teachers rising from $570,115 to $2,248,677, an increase of 294 per cent.

INCREASED EXPENDITURES FOR SCHOOL-HOUSES.

The expenditures for new school-houses and sites, and for libraries and apparatus, have increased from $160,253 to $1,184,082, and those for rent and repairs of school-houses, for fuel, for compensation of district-secretaries and treasurers, and for other incidentals, from $31,169 to $796,696, the aggregate annual expenditures rising from $761,537 in 1863 to $4,229,455 in 1873, or 455 per cent.

INCREASED EXPENDITURE A MEASURE OF EDUCATIONAL PROGRESS.

The significance of these facts is unmistakable. Such munificent expenditures can only be accounted for by the liberality and public spirit of a people who manifest their love of popular education and their faith in the public schools by the annual dedication to their support of more than 1 per cent. of their entire taxable property; this, too, uninterruptedly through a series of years commencing in the midst of a war which taxed their energies and resources to the extreme, and continuing through years of general depression in business; years of moderate yield of produce, of discouragingly low prices, and even amid the privations of pioneer-life.

COST OF SCHOOLS.

The total expense of supporting the public schools, exclusive of school-house-building, is $2.50 to each man, woman, and child in the State; $8.82 to each pupil enrolled in the schools; $12.83 to each head of a family; about $11 to each adult male, and eight and forty-one one-hundredths mills on the dollar of the taxable property of the State. If the cost of building school-houses be added, the expense is considerably increased, as will be seen from the foregoing summary.

INACCURACY OF STATISTICS.

An examination of the column "Number of youth between the ages of 5 and 21 years," in the foregoing table, will reveal either a considerable degree of inaccuracy in the general result or a somewhat surprising degree of irregularity in the

amount and percentage of increase from year to year. If secretaries were required to report the name and age of each child, instead of the number of children, it is believed that inaccuracy and deception would be much less likely to occur. It is not the intention, however, to convey the impression that these statistics are less reliable in Iowa than elsewhere, or that, such as they are, they are of no value to the legislature or the people. On the contrary, it is believed that they possess the very highest importance and are indispensable in enabling the legislature to frame laws to meet the ever-increasing demand of public education.

RECENT CHANGES IN SCHOOL-LAWS.

The school-laws of Iowa have remained without radical change since 1858, when the district-township replaced the old independent-district-system. In 1862, and again in 1873, the law itself was remodeled, but the main features of the system remained unchanged; otherwise only occasional modifications and additions have been made. During the two sessions of the fourteenth general assembly a large number of minor changes were made and a few of more general importance.

The law requiring teachers to pass examination in physiology before receiving certificates to teach in the public schools of the State, took effect September 1, 1873, and it is too soon to judge of its general result. Among teachers the change has been received with favor, being regarded as a timely and wise provision, although a limited number only were prepared to teach the subject, a very large proportion being wholly unacquainted with it. It was, therefore, found necessary to give special attention to this branch in the teachers' and normal institutes held during the year.

The most radical change made by the new school-law was the one previously mentioned, authorizing the formation of independent districts from the subdistricts of a district-township upon vote of the electors. The objects sought by the passage of this law were (1) to obviate the objectional features peculiar to the district-township-system, the principal one of which is the representation of territory rather than population, and (2) to give back to the people of each subdistrict the entire management of their own school-interests. These advantages are secured somewhat at the expense of other benefits arising from larger and more uniform districts. In fact, there are very marked advantages and disadvantages inhering in, or necessarily resulting from, each system.

In the year and a half during which the law has been in force, the people of about one district-township in fourteen have elected to form independent districts from the subdistricts of the township. Of the 1,700 district-townships, containing 8,000 subdistricts, which were organized when this law took effect, 119 district-townships, containing 901 subdistricts, were reported September 15, 1873, as having completed the new organization. In 53 of the 99 counties, independent districts have been organized under the law. In Keokuk County the subdistricts of seven townships have become independent, forming fifty-nine independent districts, this being the largest number in any one county. If the new plan proves more desirable or more satisfactory to the people generally than the old, and the best attainable system, it will doubtless soon prevail throughout the State. At least one or the other, or else some substitute for both, will be likely eventually to replace the present complex system, and doubtless ought to do so, for the sake of simplicity and harmony. It would seem to be according to the dictates of good judgment to stop and re-examine the subject carefully in the light of such experience as we now have; and this appears the more advisable since there has been, and still exists, the greatest diversity of opinion among our people as to the advantages and disadvantages of the two systems.

SECONDARY INSTRUCTION.

Five high schools and academies in the State report an aggregate of 30 teachers—7 male and 23 female—and 814 pupils—286 male and 528 females—of whom 480 are in English studies, 74 pursue classic, and 93 the modern languages; 51 are preparing for college, and 16 graduates of the previous year entered college. In all of these schools except one the two sexes are educated together, the exception being the Academy of the Immaculate Conception, which is exclusively for ladies, having an attendance of 235 students.

In addition to such schools, eleven of the fourteen colleges for superior instruction have preparatory departments connected with them in which an aggregate of 1,385 students—850 young men and 535 young women—are pursuing secondary studies. In one, the Norwegian Luther College, at Decorah, it is mentioned that 35 of the 124 students engaged in preparatory studies are preparing for the profession of teaching.

NORMAL SCHOOLS.

Although there exist in the State various institutions devoted more or less to the preparatory training of teachers for the schools, all of which are said to be exerting a good local influence, the superintendent laments the continued want of normal schools of a high character, established and sustained by legislative aid. At the last session

of the general assembly, it was hoped that this deficiency would be supplied. A committee on normal schools was added to the standing committee of each house, and these committees, uniting on a plan, presented a bill to provide for establishing State normal schools, not to exceed four in number. This bill, with some modifications, passed the senate, was sent down to the house, and was there ordered to a third reading, but on the vote for a final passage received only 47 votes in its favor to 45 against it, lacking 4 votes of the constitutional majority required to make it a law.

BUSINESS-COLLEGES.

Of these there are seven in Iowa—at Burlington, Clinton, Davenport, Dubuque, Independence, Keokuk, and Mt. Pleasant—with 24 teachers and 1,425 pupils.

IOWA STATE UNIVERSITY.

The State University, located at Iowa City, was organized in 1860, as a means of securing for the youth of Iowa the best education at the lowest cost. Tuition is free, and young men and women are received upon equal terms. The students in the academic department are divided as follows: in the freshman-class, 51—34 gentlemen and 17 ladies; in the sophomore-class, 53—39 gentlemen and 14 ladies; in the junior, 22—19 gentlemen and 3 ladies; in the senior, 20—17 gentlemen and 3 ladies. Total number of students in regular course, 146. Besides these, 82 students were pursuing selected studies in the same classes as the others.

PRIVATE AND DENOMINATIONAL INSTITUTIONS.

The private and denominational institutions are: (1) Burlington University, Burlington; Baptist. (2) Norwegian Luther College, Decorah; Lutheran. Its receipts, $14,500 last year, were in great part from congregations of that faith upon which, in fact, the college relies entirely for support, tuition being free and the only expenses of students $70 a college-year (10 months) for board. (3) Upper Iowa University, Fayette; Methodist. (4) Iowa College, at Grinnell; Congregational. (5) Humboldt College, Humboldt; undenominational; was first opened for the reception of students in September of 1872. This college stands where ten years ago was only a wild prairie, and, there being no academies or grammar- or Latin-schools in the vicinity, the institution has to do the work of such schools in a great measure. (6) Simpson Centenary College, Indianola; Methodist; an outgrowth, as its name indicates, of the Methodist centennial celebration. (7) Iowa Wesleyan University, Mt. Pleasant; Methodist-Episcopal; students, 71 gentlemen and 56 ladies. (8) German College, Mt. Pleasant; Methodist-Episcopal; organized in 1873, and intimately connected with the Iowa Wesleyan University. (9) Cornell College, Mount Vernon; Methodist; students, 45 gentlemen and 30 ladies. (10) Penn College, Oskaloosa; Friends; students, 10 gentlemen and 10 ladies. (11) Central University, Pella; Baptist. (12) Whittier College, Salem; Friends; established in 1873, and already has, as students, 82 gentlemen and 81 ladies. (13) Tabor College, at Tabor; Congregational; 15 students in the regular collegiate classes and 15 in the ladies' course.

COLLEGE FOR WOMEN.

The only institution reporting for the higher education of women exclusively is Mt. Pleasant Female Seminary, which has 55 students in collegiate classes, of whom 8 are in the freshman, 20 in the sophomore, 12 in the junior, and 15 in the senior year. Music—both vocal and instrumental—drawing, painting, French, and German are taught. The institution has a philosophic cabinet and 15 volumes in ,the library.

TEACHERS' INSTITUTES.

During the year 1872 institutes were held in eighty-five counties, with a total attendance of 8,595 teachers, or an average of about one hundred to each institute. In 1873, eighty-four institutes were held in as many counties, with a somewhat larger aggregate attendance.

The value of these institutes can hardly be overstated. Year by year they are becoming more valuable, as their legitimate work is better understood and as the number of teachers qualified to give thorough and practical instruction in them increases. The best educational talent of the State is now everywhere brought into requisition in these institutes, including the presidents and professors of the State University, State Agricultural College, denominational universities, colleges, and academies; the superintendents, principals, and superior teachers of our graded and high schools; clergymen, judges, lawyers, physicians, editors, and cultured men and women in all ranks and vocations. The governor of the State, also, amid the many cares of his office, has found time occasionally to visit institutes, to delight, instruct, and inspire the immense audiences of teachers and citizens which everywhere assemble to hear him. They have become a powerful agency in educating teachers, who have no better means of obtaining normal instruction and in educating public sentiment; and thousands of teachers every year go out from these discussions and instructions with clearer views of their respective duties, with a determination to do better service in the future, and with a higher inspiration for their calling.

The great drawback to our teachers' institutes at present, however, is the limited time which the law requires and which the meager appropriation for securing competent instructors seems to necessitate. Conductors are often perplexed to determine what to introduce and what to omit in the five or six days to which they are limited.

NORMAL INSTITUTES.

In a few counties assistance has been given by boards of supervisors in defraying the expenses of institutes for a period of two or four weeks. In others, the teachers themselves, under the direction of the county-superintendent, have voluntarily gathered themselves into normal institutes, remaining in session four, six, and eight weeks, under the instruction of superior teachers, paid by their own contributions. Such an institute has never been known to prove a failure. About fifteen have been held in as many different counties during the present year, with the best of results. In a number of counties where such schools were inaugurated last year, the teachers have re-assembled this year for a greater length of time and with a largely-increased attendance. If such institutes could be held annually in all the more populous counties and in districts composed of from two to four counties in the more sparsely-settled portions, to remain four, eight, or twelve weeks, under efficient and earnest instructors, teachers would attend them by thousands and would be able in a few years to familiarize themselves with all the details of their profession and go over nearly the whole ground contemplated in a complete normal course, extending through a series of years, and that, too, at an almost nominal expense to the State. No other known agency could so directly, immediately, and powerfully reach the great body of teachers of the common schools of the State and of the thousands of young persons preparing for this work.

OBITUARY.

Mention is made by the superintendent of the loss sustained by the State in the death of Hon. Oran Faville, which occurred on the 31st day of October, 1872.

Mr. Faville was born October 13, 1817, at Manheim, New York, and graduated at the Wesleyan University at Middletown, Connecticut, after which he was engaged in teaching at various seminaries and colleges in New York, Vermont, Illinois, and Ohio. In 1853 he was for a time president of the Wesleyan Female College, at Lebanon, but ill-health compelling him to resign this position he removed to Iowa and commenced frontier-life as a farmer. In October, 1857, Mr. Faville was elected lieutenant-governor, and, *ex officio*, president of the State-board of education, then newly organized. In March, 1864, he was elected by the legislature superintendent of public instruction, in which office he continued until 1867, when failing health compelled him to resign the office which he had filled with great fidelity and distinguished ability. It is believed that to him very largely is the State of Iowa indebted for its present system of education, and its public schools may justly be regarded as a noble and fitting monument to his memory. By his death the cause lost a wise counselor and an able advocate.

Mr. J. J. E. Norman, superintendent of Dubuque County, and Mr. Thomas F. Healy, superintendent of Allamakee County, have also died during the last school-year; the former from an accident in the streets of Dubuque, December 12, 1872; the latter from lung-fever, contracted while visiting the schools, and terminating fatally May 31, 1873. Both are spoken of as men of marked ability and great faithfulness in the discharge of their official duties.

LIST OF SCHOOL-OFFICIALS IN IOWA.

Hon. ALONZO ABERNETHY, *State-superintendent of public instruction, Des Moines.*

COUNTY-SUPERINTENDENTS

County.	Name.	Post-office.
Adair	Miss Mary Childs	Arbor Hill.
Adams	W. W. Roberts	Mount Etna.
Allamakee	J. W. Hinchon	Lansing.
Appanoose	G. W. Taylor	Dennis.
Audubon	H. G. Smith	Exira.
Benton	S. T. Shortess	Vinton.
Black Hawk	A. F. Townsend	Waterloo.
Boone	T. P. Cain	Boonsboro'.
Bremer	H. H. Burrington	Waverly.
Buchanan	A. Rowe	Jessup.
Buena Vista	J. Davis	Newell.
Butler	J. W. Stewart	Shell Rock.
Calhoun	Mrs. C. E. O'Donaghue	Twin Lakes.
Carroll	N. F. Steigerwalt	Carroll.
Cass	E. D. Hawes	Atlantic.
Cedar	C. W. Rollins	Tipton.
Cerro Gordo	Mrs. J. B. Dakin	Mason City.
Cherokee	W. F. Harriman	Cherokee.
Chickasaw	J. F. Grawe	Bradford.
Clarke	A. P. Jenks	Osceola.
Clay	J. E. Chase	Annieville.
Clayton	J. F. Thompson	Elkader.
Clinton	Miss Lucy Curtis	Wheatland.

Wapello	Clay Wood	Ashland.
Warren	H. A. Huff	Indianola.
Washington	Miss Clara Harris	Washington.
Wayne	William Datts	Corydon.
Webster	Frank Farrell	Fort Dodge.
Winnebago	W. W. Olmsted	Forest City.
Winneshiek	G. N. Holway	Decorah.
Woodbury	A. R. Wright	Sioux City.
Worth	G. W. Whitcomb	Plymouth.
Wright	Thomas Garth	Clarion.

KANSAS.

[From report of Hon. H. D. McCarty, State-superintendent of public instruction.]

SCHOOL-FUND.

Amount of available school-fund	$1,003,681 99
Amount of permanent school-fund	3,017,589 16

Receipts.

From taxation	931,958 69
Interest on permanent school-fund	44,519 50
Revenue from other funds	519,344 69
Proceeds of sales of lands	150,791 67
Income from other sources	216,488 75
Total receipts for school-purposes	1,863,101 30

Expenditures.

For sites and buildings	515,071 18
For libraries and apparatus	33,873 00
For salaries of superintendents	68,500 00
For salaries of teachers	716,056 08
For rent and repairs	51,504 06
For miscellaneous purposes	79,812 50
Total expenditures for school-purposes	1,464,816 82

SCHOOL-POPULATION.

Number of males in the State from 5 to 21 years of age	95,156
Number of females in the State from 5 to 21 years of age	89,801
Total number of persons of school-age	184,957

ENROLLMENT AND ATTENDANCE.

Number of persons enrolled in public schools	121,690
Average attendance	71,062

TEACHERS.

Number of male teachers in public schools	2,206
Number of female teachers	2,469
Total number of teachers	4,675
Average salary of male teachers per month	$38 43
Average salary of female teachers per month	30 64

SCHOOLS.

Number of schools in operation	4,004
Average duration of school in days	106.8

PROGRESS.

During the year just closed much improvement has been made in school-affairs. Numbers of costly and even stately school-edifices have been erected and supplied with all modern conveniences and with the best quality of furniture and apparatus. While the State is growing rapidly in wealth and population, its educational developments are far outstripping its growth in material wealth.

SCHOOL-ABSENTEEISM.

Still, notwithstanding this general educational progress, it is a lamentable fact that many children in the State are growing up without an education, and this, too, in many cases where the schools and school-facilities are the pride of the people and the boast

of the State. Out of the 165,982 youth of school-age in the State, 59,319, or upwards of one-third, have never been enrolled in school, while of the 106,662 enrolled, only 61,538, or a little more than one-half, are found in average attendance. Many children are kept out of school upon the most frivolous whims and trivial pretexts of the parents, while many others within easy distance of the school-house spend their time with evil associates in idleness, profligacy, and crime."

COMPULSORY EDUCATION.

Statistics are given from the report for 1872 of the United States Commissioner of Education, proving that a large percentage of crime is committed by persons who have been deprived of education, and the conclusion arrived at is: "We must educate every child or be compelled to reap the bitter fruits of vice and crime which now produce a frightful harvest of misery and wretchedness. Educate every child to the full measure of its capabilities, and you will in a measure close the doors of your penitentaries, prisons, and alms-houses, restore to the community tranquillity and safety, and give to society the industrious artisan, good citizen, honest law-giver, upright judge, and enlightened statesman." Extracts are given from the report of Hon. Victor M. Rice, showing the beneficent results of compulsory education in other countries; also extracts from the views of Hon. B. G. Northrop, who states that his former objections to the system of obligatory attendance were fully removed by observations recently made in Europe. The views of Mr. Northrop are substantially adopted, when, in reply to some of the common objections made to compulsory attendance, he says:

(1) "'Such a law would create a new crime.' I reply, it ought to. To bring up a child in ignorance is a crime, and should be treated as such. As the most prolific source of criminality, it should be under the ban of legal condemnation and the restraint of legal punishment. * * * (2) 'It interferes with the liberty of parents.' I reply again, it ought to, when they are incapacitated by vice or other causes for the performance of essential duties as parents. * * * (3) 'It arrogates new power by the Government.' So do all quarantine and hygienic regulations and laws for the abatement of nuisances in time of pestilence. Now, ignorance is as noxious as the most offensive nuisance and more destructive than bodily contagions. Self-protection is a fundamental law of society. (4) 'It is un-American and unadapted to our free institutions.' To put the question in the most offensive form, it may be asked, 'Would you have a policeman drag your children to school?' I answer, yes, if it will prevent his dragging them to jail a few years hence. But this law in our land would invoke no dragging and no police-espionage or inquisitorial searches."

UNIFORMITY OF TEXT-BOOKS.

The want of uniformity in text-books has been a serious drawback to the efficiency of the schools. The endless variety and diversity of school-books brought to Kansas with the children from nearly every State in the Union find their way into the schools as so many disorganizers, bidding defiance to anything like classification or system. It is believed that so long as this evil continues will the schools remain comparatively valueless, and the securing of a uniform series of text-books and holding to these for some years at least will prove a means of greatly more efficient education.

TEACHERS' EXAMINATIONS.

The present law relating to examinations makes an unjust discrimination against many of the best and most successful teachers. Graduates of the State University and agricultural college, as well as those of other institutions, are required to submit to an examination as often as once a year before they can teach a school in one of the rural districts, while a diploma from one of the State normal schools serves the holder as a perpetual legal certificate of qualification to teach in any of the schools of the State without further examination. In order to do away with this discrimination, as well as to insure the recognition of teaching as an honorable profession, the superintendent advises the establishment of a State-board of education, for the purpose of examining teachers and conferring upon them diplomas and certificates authorizing them to teach. State-diplomas, valid during the life-time of the holder, should be conferred upon professional teachers of liberal culture, who have taught for two years in the State, upon their passing the required examination, other teachers, upon passing the requisite examination, to receive certificates of two grades, that of the highest being valid for five years and that of the other for three, such diplomas and certificates to supersede the necessity for all other examinations.

INFLUENCE OF TEACHERS.

"Every teacher should make it a sacred and binding duty to visit all the families in the district having children to be educated, seek the co-operation of the parents, and secure, if possible, the regular attendance of the children at school. Absenteeism, truancy, and tardiness, the bane of all schools, may in a measure be broken up through this

system of visitation. There is not enough of school-missionary-work done. It is no less the duty of teachers to *preach* school than to *teach* school. The teacher's influence should not only be felt and acknowledged in the school-room, but should pervade the whole district. He should not be a mere pedagogue, but an earnest and true teacher, in the highest sense of the word. Then child, parent, and citizen will hear his instructions and admit his power."

CITY-SCHOOLS.

The only city from which special returns have been received is Topeka, which reports the number of white children between 5 and 21 years of age, males, 1,007; females, 1,021—total, 2,028. Number of colored children of the same years, males, 91; females, 117—total, 208—total of white and colored, 2,236. Number of primary schools, 6; intermediate, 1; high, 1. Whole number of scholars registered during the year, 1,519 in the primary schools, 80 in the intermediate, 40 in the high—total registry, 1,639. The average daily attendance in the first class was 812; in the intermediate, 44; in the high, 23. The average number of scholars enrolled was, for each teacher, 71; the average number belonging, 45; the average daily attendance, 39, the total number of teachers being 23. The amount paid to teachers was $12,064.49; the comparative cost per scholar on the number enrolled, $7.36; on the average number belonging, $11.54; on the daily attendance, $13.72. Classes in German were formed in all the higher and some of the lower grades of schools in the beginning of the year, and at first a good degree of interest in the new study was manifested, both by parents and pupils; but, after the excitement of novelty wore off, this was not well sustained. For the rest, the only general evil complained of is tardiness; the only special one, a tendency to drop away from the studies of the high school before the course has been gone through.

GRADED SCHOOLS.

The system of graded schools has been adopted in nine of the principal towns and cities of the State. The superiority of this system is discussed at length by the superintendent, and its advantages summed up as follows:

(1) It secures more ample grounds, better buildings, furniture, libraries, apparatus, &c.; (2) more suitable and better-qualified teachers; (3) better classification; (4) better study and more rapid progress; (5) better education of the pupils; (6) high-school-advantages; (7) cheaper education; and (8) more thorough supervision.

In illustration of the superior economy of graded schools, it is stated that in the city of Leavenworth, in the year 1858–'59, under the unclassified schools, it cost $5,207.55 to educate 423 pupils, or at the rate of $12.29 per pupil; while, in 1862–'63, when the schools were graded, the cost was only $4.54 per pupil.

HIGH SCHOOLS.

The high-school-departments exist in connection with the graded schools in five towns and cities of the State. That at Independence numbers 78 pupils, 30 males and 48 females; that at Atchison only 5—3 males and 2 females; at Lyndon, 84 pupils, 40 males and 44 females; and at Topeka 47 pupils are engaged in high-school-studies. At Paola the high-school-department numbers 67—32 males and 35 females. In this town a fine high-school-building has just been completed, costing about $50,000. Its size is 82 by 82 feet; three stories in height above the basement, with curved ornamental roof of slate and tin, surmounted by cast-iron cresting. In each story above the basement are four school-rooms, twelve in all. Three sides of each room are lined with blackboards. The building is warmed by hot air from four furnaces, situated in the basement, and is well ventilated by means of foul-air-registers connecting with the ventilating shafts that communicate with the smoke-stacks.

STATE NORMAL SCHOOL AT EMPORIA.

The object of this institution, as expressed by its organic act, is "the instruction of persons, both male and female, in the art of teaching and in all the various branches that pertain to a good common-school-education; in the mechanic arts and in the arts of husbandry and agricultural chemistry; in the fundamental laws of the United States, and in what regards the rights and duties of citizens."

The school, while it has accomplished and is still accomplishing much good work, is at present contending with two serious evils: the low grade of scholarship with which pupils enter and the shortness of their stay at school. In the language of the board of visitors, "the normal school is doing too much district-school-work." The board recommends that "there should be no preparatory work, so called, done in the normal school proper, but that the entire attention of the faculty be devoted to purely normal work. High-salaried professors occupied with mere children in knowledge form a fraud upon the State."

The prime aim of the institution is, as its name imports, to prepare teachers for school-

work, and in the normal department—for it is only that at present—students take a pledge that it is their purpose to prepare themselves to teach in the public schools of Kansas.

The number of students enrolled during the year was 190, of whom 72 were males and 118 females. There were only 2 graduates. Many of the graduates of former years are doing noble work in the educational field in the State, and it is to be regretted that there are not many more such.

The legislature at its last session appropriated $50,000, to which sum the city of Emporia added $10,000, for the erection of a new building, which is now almost completed. The basement is of dressed stone; the main walls of brick, with cut-stone coins, with door- and window-embellishments of the same material, affording a pleasant contrast, and giving the building an imposing appearance. The dimensions are 76 by 125 feet.

STATE NORMAL SCHOOL AT LEAVENWORTH.

This school is under the management of a board of twelve directors, nine of whom are nominated by the Leavenworth board of education, the remaining three being chosen from the State-at-large. The school is in a prosperous condition. The enrollment in the normal classes, during the year now closing, was 65 pupils, of whom 5 were in the senior, 3 in the middle, 23 in the practicing, and 34 in the preparatory class.

QUINDARO STATE NORMAL SCHOOL.

This school, established by the legislature for the training of colored teachers, opened September 11, 1872. The number of students has gradually increased from 6 to upwards of 50. Want of home-culture and means renders this work peculiarly difficult. Students need a higher preparatory training. The students enrolled thus far have all been residents of Quindaro township. Applicants from other points for admission could not be received, as there were no boarding-accommodations in the place. Arrangements are being made to establish a boarding-house near the school-building, where pupils can be accommodated at a cost of $2.50 per week.

UNIVERSITY OF KANSAS.

This institution crowns and completes the educational system of the State. The department of science, literature, and the arts supplements the public schools in giving the higher education and culture necessary for the protection and preservation of free institutions, its course embracing a classic, a scientific, and an engineer-school of training. In it every child in Kansas is offered a full and free education.

It has ten professors and two subordinate instructors.

The total number of students enrolled during the collegiate year 1872–'73 was 272, 73 of whom belonged to the collegiate department, an increase in that department of 11 over the previous year, while the total enrollment shows an increase of only 19 over the previous year. The graduating class numbered 4, of whom 1 was a lady.

The colleges under denominational influences reporting are: (1) Baker University, at Baldwin City; Methodist Episcopal; founded in 1857; its graduates, since organization, numbering 6—4 gentlemen and 2 ladies. (2) College of the Sisters of Bethany, Topeka, not included in the following table; Protestant-Episcopal; formerly the Episcopal Female Seminary; chartered in 1870 with college-powers, and known by its present collegiate name since 1872; an institution with 9 professors and teachers (3 males and 6 females) and 75 students, of whom 11 are in the collegiate course, 16 in a partial course, and 48 in the preparatory. This college, having primary, preparatory, and collegiate departments, is designed especially to train young ladies for any position they may be called to fill. (3) St. Benedict's College, Atchison; Roman Catholic; chartered in June, 1868. Of its 95 male pupils in the preparatory department, 65 are specifically said to be preparing for college-classes. (4) St. Mary's College; Roman Catholic. This college, it is stated, "has only been established about four years, has had to struggle against a great many difficulties, and cannot be said, as yet, to have any under-graduates." (5) Washburn College, Topeka; Congregational; incorporated in February, 1865. It owns 160 acres of land a mile and a half from the State-house, on 40 acres of which a college-building is now being erected, at a cost of about $60,000, and is expected to be completed in April, 1874. (6) Highland University, at Highland, chartered in 1858, has, besides the regular collegiate, a scientific and a ladies' course, the latter comprising the mental, moral, physical, biblical, rhetoric, and historic studies of the regular course, with a part of the regular mathematic course, and Latin and Greek through the sophomore-year. The degree conferred upon graduates of this course is M. A., (maid of arts.)

The returns from these institutions, which here follow, are for the autumn of 1873:

* Ten acres with building at one point and forty acres with main building and a small observatory at another, near Lawrence.

† Seventy-two sections of land and $10,300 in bonds.

KANSAS ACADEMY OF SCIENCE.

A leading object of this society is the prosecution of the State-survey to its final completion. Two preliminary reports have been made in the right direction and a large amount of work has been accomplished by different members of the society. Most of the leading scientific men of the State are in active co-operation or in hearty sympathy with the organization.

AGRICULTURAL COLLEGE.

This institution is located near Manhattan, on a farm containing 415 acres, nearly all under fence and cultivation, the land affording all the varieties of Kansas soil. The college offers four courses of study, viz: of agriculture, mechanic arts, military science, and literature. The faculty consists of seven gentlemen-professors—including the preident—and three ladies. The number of students in attendance during the year 1871–'72 was 200, of whom 113 were gentlemen and 87 ladies. The graduates for that year were three—two gentlemen and a lady.

Arrangements for the industrial education of the lady students are not yet fully completed, the lack of suitable buildings preventing the immediate establishment of a kitchen, laboratory, a dairy, photographic gallery, and engraving-room. The literary course, however, provides instruction in book-keeping and commercial law, the sewing-room furnishes practice upon the more popular sewing-machines and the printing-room in type-setting.

BUSINESS-COLLEGES.

Two of these, situated at Topeka and Leavenworth, report 3 teachers and 376 pupils.

Statistical summary of a professional school.

REFORM-SCHOOL.

A strong public sentiment has grown up in many sections of the State favoring the establishment of a reform-school for juvenile offenders. The larger towns and cities of the State are infested with a dangerous class of street-boys, already familiar with all forms of iniquity. It often occurs that these youths, mere children in age, are arrested by officers of the law and sentenced to prison, where they are confined with old and hardened criminals, under whose ready tuition they soon become adepts in crime, and only too anxiously await their release in order to practice their nefarious acquirements. The fact is recognized that it would be much better and more economic for the State to institute measures for the prevention of crime, by the reformation of juvenile offenders and the industrial education of these children of poverty and neglect, than to apprehend and bring to justice hardened criminals after years of plunder and villainy. It is not held enough to loosen the hands of these young offenders from vice by reformation; the aim is to do more: to fasten them to the implements of industry and honest toil and teach them, amid reformatory influences, how to secure in lawful ways an entirely lawful livelihood.

STATE-LIBRARY.

From the report of the State-librarian for the year ended December 12, 1872, it appears that there were at that date 8,473 volumes in the library, there having been an increase of 1,116 during the year; of these, 500 were by purchase, 80 by donation, and the remainder were received in exchange for State-documents, laws, and supreme-court-reports, all the States but one and all but three or four of the Territories reciprocating. There is an annual appropriation of $200 for the purchase of new books Twenty-eight newspapers and periodicals are received, files of which are preserved.

KANSAS INSTITUTION FOR INSTRUCTION OF THE BLIND.

The fifth report of this asylum, published in January, 1873, states that the number of pupils for the year has been 26, and that all are steadily advancing. A year of prevalent sickness has given occasion for special instruction with respect to bathing, diet, ventilation, exercise, and other methods of preserving health, while training in letters, numbers, music, industrial occupations, good manners, and right morals has gone continuously on. The leading object of the school is to give the blind youth of the State such a measure and kind of education as may fit them to sustain themselves, if needful, and to be useful, intelligent, moral, and pleasing members of the circles and communities into which they may be thrown. Hence a fair measure of general culture is imparted, with a practical knowledge of mechanical employments, music and morals coming in to supplement and crown the whole.

STATE TEACHERS' ASSOCIATION.

The first address at this was from the State-superintendent, Hon. H. D. McCarty, upon "The changes required in the school-law." His suggestions, essentially the same as those recommended in his report, were discussed by the association and generally approved. Prof. J. W. Horner considered the question "How can the State secure trained teachers?" To supply the State with a full quota upon the present plan he asserted would require an annual expenditure of $75,000. In addition to those now in operation, he therefore advocated the establishment of a subordinate grade of normal schools, with shorter courses of study, adapted to the present wants of a majority of the teachers, to be jointly supported by the State and the counties. This would assimilate the State-method of training teachers to the system now pursued in the State of Illinois, which has produced the most encouraging results. Such schools, he asserted, could be carried on at a cost of $1,000 annually, as, being managed by the county-superintendent, one teacher, assisted by the graduating class, would be sufficient. Prof. Horner's plan was heartily indorsed by the association.

Addresses were delivered on "The relation of the denominational college to the public schools," "The orderly development of the mind," and "Culture and civilization."

It was resolved to transfer the editorial and financial management of the Kansas Educational Journal to individual control, said journal remaining the organ of the association.

The officers of the association elected for the ensuing year were: president, J. W. Horner, of Chetopa; vice-presidents, the county-superintendents of the State; recording secretary, S. B. Lemon, of Independence; corresponding secretary, S. M. Gaston, of Lawrence; treasurer, Mrs. H. A. Monroe, of Atchison; executive committee, William Wheeler of Ottawa, G. W. Hoss of Emporia, R. H. Jackson of Atchison, Miss Collins of Iowa, and Prof. Frank H. Snow of Lawrence.

LIST OF SCHOOL-OFFICIALS IN KANSAS.

Hon. H. D. McCARTY, *State-superintendent of public instruction, Topeka.*

COUNTY-SUPERINTENDENTS.

County.	Name.	Post-office.
Allen	Grasson De Witt	Iola.
Anderson	Amos Rice	Garnett.
Atchison	J. E. Remsburg	Atchison.
Barton	J. A. McClellan	Great Bend.
Billings	David W. Mills	Almena.
Bourbon	Joseph H. Lawhead	Osaga.
Brown	R. C. Chase	Hiawatha.
Butler	S. L. Roberds	El Dorado.
Chase	J. G. Winne	Safford.
Cherokee	Jos. A. Murray	Columbus.
Clay	J. T. Dodson	Wakefield.
Cloud	Samuel Doran	Concordia.
Coffey	George N. McConnell	Burlington.
Cowley	T. A. Wilkinson	Winfield.
Crawford	S. T. McClure	Girard.
Davis	Isaac Jacobus	Junction City.
Dickinson	D. R. Emery	Abilene.
Doniphan	Delos D. Rose	Troy.
Douglas	S. M. Gaston	Lawrence.
Ellis	John Gores	Hays City.
Ellsworth	William Meichner	Ellsworth.
Franklin	Philetus Fales	Ottawa.
Greenwood	George H. Martz	Eureka.
Harvey	F. S. Fatz	Newton.
Howard	H. H. Wells	Peru.
Jackson	R. M. Cook	Holton.
Jefferson	J. R. Earnest	Oskaloosa.
Jewell	T. J. Patterson	Jewell City.
Johnson	B. F. McFarland	Olathe.
Labette	Mary Higby	Oswego.
Leavenworth	J. P. Bauserman	Leavenworth.
Lincoln	J. C. Wright	Cedron.
Linn	G. W. Botkin	Mound City.
Lyon	Charles Caveness	Emporia.
Marion	Mrs. C. J. Sharon	Marion Center.
Marshall	Alviniza Jeffers	Irving.
McPherson	Philip Wickersham	Roxbury.
Miami	I. J. Banister	Paola.
Mitchell	John D. Mitchell	Cawker City.
Morris	J. E. Minney	Council Grove.
Montgomery	N. Bass	Independence.
Nemaha	J. D. Sammons	Seneca.
Neosho	S. Winfield	Osage Mission.
Osage	L. J. Sawyer	Burlingame.
Osborne	J. T. Saxton	Corinth.
Ottawa	A. B. Crosby	Lindsey.
Pawnee	H. Booth	Larned.
Pottawatamie	Charles T. Shipp	Louisville.
Phillips	A. Hitchcock	Phillipsburg.
Reno	Taylor Flick	Hutchinson.
Republic	A. D. Marble	Belleville.
Rice	Robert D. Stephenson	Brookdale.
Riley	J. F. Billings	Manhattan.
Rooks	J. M. Park	Stockton.
Russell	H. C. Hibbard	Bunker Hill
Saline	William Bishop	Salina.
Sedgwick	Albert Emerson	Wichita.
Shawnee	D. J. Evans	Topeka.
Sumner	Thomas H. Mason	Belle Plain.
Smith	Edmund Hall	Cedarville.
Wabaunsee	W. S. McCormick	Wilmington.
Washington	G. J. Main	Washington.
Wilson	William B. Shirley	Fredonia.
Woodson	J. L. Gilbert	Bramlette.
Wyandotte	W. W. Dickinson	Wyandotte.

KENTUCKY.

[From report of Hon. H. A. M. Henderson, State-superintendent of public instruction, for the scholastic year ended June 30, 1873.]

The following is the estimate for the year ended June 30, 1873:

SCHOOL-FUND.

A statement of moneys which may be expected to be paid into the treasury during the year ended June 30, 1873, subject to the order of the superintendent of public instruction, viz:

Amount of revenue, 1872, as per valuation of 1871, at 20 cents		$852,645 41
Amounts of delinquents relisted with sheriffs		75,000 00
		927,645 41
Less sheriffs' commissions, &c	$105,000 00	
Paid previous to 1st July, 1872	62 36	
		105,062 36
Total		822,583 05
From interest on State-school-bonds		79,620 00
From Bank of Ashland		1,000 00
From Bank of Kentucky		6,000 00
From Commercial Bank of Kentucky		7,500 00
From Farmers' Bank of Kentucky		8,500 00
From Farmers' and Drovers' Bank		900 00
From tax on billiards		2,000 00
From tax on dogs		1,500 00
From Bank of Shelbyville		950 00
From sheriffs' old balances		20,000 00
Total		950,553 05
Balance in Treasury 1st July, 1872, not transferred	$177,168 00	
Deficit 1st July, 1872	150,295 23	
		26,872 77
Total		977,425 82
Deduct estimated amount of unpaid school-drafts for the year 1872, 1st July, 1872	$15,000 00	
Deduct estimated amount of $822,583.05 to cover balance uncollected 1st July, 1873	50,000 00	
		65,000 00
Total amount of estimated receipts 1st July, 1873		912,425 82

The interest on county-school-bonds is not included in the above estimates.

EDUCATIONAL PROGRESS.

The school-year 1872–'73 was a year of substantial progress in every department of the common-school-system. With but rare exceptions, the reports of the commissioners and correspondence of the superintendent's office bear evidence of a great educational revival, pervading almost every section of the State. Through the agency of the Teachers' Institute, the addresses of the superintendent and of those representative men whom he succeeded in enlisting as advocates of a system of common schools, public attention appears to have been thoroughly arrested. Probably never before did the subject in Kentucky have such vigorous presentation before the people as during the past summer. In addition to a widely-diffused canvass, engaged in by the superintendent, speaking at the great centers of influence and population, such men as Hon. James B. McCreary, Hon. Thomas F. Hargis, Hon. W. C. P. Breckenridge, and General Frank Walford lent their powerful advocacy to the cause by encouraging the teachers and stimulating the timid and skeptical to a more courageous and confident development. Teachers' institutes were held in almost every county, with large attendance. The increased interest in the common schools is further indicated by the pressing demand for the professional training of instructors. From every quarter there has been a cry for the building of more convenient school-houses, provided with better seats and apparatus than the old ones, and many such have been erected.

DIMINISHED PRO-RATA DISTRIBUTION.

During the school-year ended June 31, 1873, the *pro-rata* to each pupil child was $2.20, while, for the school-year ending June 30, 1874, it will be but $1.60. The reasons given for this diminution are: first, there has been an increase of 10,763 in the number of pupil-children reported, consequently the *pro-rata* to each pupil-child must be correspondingly diminished; secondly, the annual revenue from the tax of 20 cents on the $100 has fallen short of 1871–'72 by $45,307.91; thirdly, while there was in that year relisted with the sheriffs the sum of $75,000, due from delinquents the current year, there has been only $30,000 from that source, making a difference of $45,000; fourthly, the auditor in 1871–'72 made an overestimate of $150,000, which must be deducted from the revenue of 1872–'73 to liquidate matured school-claims, as provided for by the law; and, fifthly, the dividends from bank-stocks have been $1,550 less than the preceding year.

SUSPENSION OF PAYMENT.

By the revenue-laws, sheriffs are not required to pay the taxes into the treasury until the month of April, and, by adding 5 per cent., they may even be retained until the latter part of June, while the law requires payments of teachers to be made upon the 10th of January, of April, and of July. Money being worth 10 per cent., (and on short loans a still higher rate of interest,) payment is often delayed; and, if a speculation is on hand which promises a handsome return, it is recovered only by annoying and tedious processes of law. The apportionment of the superintendent is made upon a statement furnished him by the auditor of moneys which may be expected to be paid into the treasury during the year. A sad result of the present system, which, while requiring half a million of dollars to be paid out on January 10, gives the officers intrusted with its collection until April or June to pay it into the treasury, is the suspension of payments to needy teachers, who, in some cases, have been obliged to sell their claims at a serious discount, in order to obtain present relief. Rather than have any such suspension again occur, the superintendent recommends that the commissioners of the sinking-fund should be authorized by the assembly to borrow the money for a few months, until the taxes can be collected.

THE FUTURE.

The superintendent says the probabilities are that there will be no further falling-off of the receipts, and that in the year 1873–'74 no deductions will have to be made from the current revenue of the year in consequence of an overestimate the previous year. This alone, assuming the revenue to remain the same, will enable the superintendent to advance the *per-capita* to $2. The falling off for 1873 will excite so much discussion that the general assembly will have its attention thoroughly directed to the finances, and it is hoped will develop some plan by which the actual valuation of property can be arrived at. The discouragement, therefore, he thinks, is temporary.

Kentucky is just beginning to develop its vast mineral resources, and its decline in landed wealth will soon be more than compensated for by the riches of the mines and forests. Railroads are piercing the hitherto inaccessible fastnesses of its mountains and bringing their hidden stores of wealth into the market. Many who have long lived on barren hills, gathering a scanty subsistence from an unfriendly soil, will soon have the means of plenty ready at their doors. For a half century these honest and hardy mountaineers have roamed their native hills, overgrown with the grandest timber, and with inexhaustible mines of wealth beneath their feet, but with no agencies at command to transport the growths of their forests and the crystallizations of their mines to the market. A new day is dawning on them. The sons of these men will become rich; population will flow into these sparsely-settled districts; and they will vie with the fertile agricultural counties in all the elements of a solid prosperity, and in their turn re-enforce the treasury of common schools with funds that shall make every wilderness of the State rejoice.

It is suggested that if more money is needed the patrons in each school-district should supply it by subscriptions, and thus tide the bark of education over the shoals, by lifting the gate of a generous private enterprise.*

IMPROVEMENT IN PROFESSIONAL QUALIFICATIONS OF TEACHERS.

Under the efficient agency of the teachers' institutes, the qualifications of instructors, as a class, have been substantially improved, and more carefulness in the granting of certificates has been exercised by commissioners and examiners. It is much more difficult now than formerly to obtain a certificate to teach in Kentucky. The number of applicants offering and the higher standard established for qualifications constitute two facts contributing to the result. An increased demand for competent teachers

* Since the preparation of this abstract, the announcement has been made that, in consequence of the financial troubles in the fall, many of the public schools have had to be closed from lack of funds for their support. It is to be hoped that this will be only temporary.

and a willingness to pay them more remunerative wages are operating to turn the attention of many young ladies and gentlemen to this honorable occupation. The teacher who does not see fit, by industrious study, to quicken his pace, is left behind in the race and is dropped from the roll of aspirants for employment in the schools. Districts that two years ago were willing to employ the poorest teachers, at the cheapest rate, are now anxious to engage the services of the best, at an outlay to some extent commensurate with the talents employed.

GRADED SCHOOLS.

Several of the larger towns have either established, or are agitating the question of establishing, graded schools, and in some others there has been a reconstruction of existing systems, which will prove of material benefit.

SOME CHANGES IN THE SCHOOL-LAW.

District-taxation.—This takes the place of the "rate-feature" of the old law. The levying of a rate hereafter will be illegal. The will of the people is clearly to be ascertained at the polls as to whether or not they favor a district-tax in aid of the common school therein. The vote must be taken at the annual election for trustees, on the first Saturday in July. The tax cannot exceed 25 cents in any one year on each $100 worth of taxable property. It can only be used for the following purposes: (1) the purchasing of a site for a district-school-house; (2) the building, repairing, or furnishing of the district-school-house; and (3) the better payment of the salary of the teacher or for the extension of the free school for a longer term than five months.

Tax for graded schools.—Cities desiring to establish a system of graded schools can, by a vote of the majority, tax their citizens, not exceeding 30 cents in any one year on the $100 worth of taxable property.

Board of education.—Formerly, the board consisted of the attorney-general, secretary of state, and superintendent of public instruction. To these have been added two professional educators, who, together with the superintendent, constitute a standing committee to prepare rules, by-laws, and regulations for the government of the common schools, and also to recommend a proper course of study and suitable series of text-books to be adopted at discretion by the county-board of examiners.

State Teachers' Association.—The superintendent may print the proceedings of this in his annual reports. No provision existed heretofore to publish its minutes.

Commissioners.—No change has been made in the qualifications for the office of commissioner, except that "he shall be competent to examine the teachers who shall apply to teach the schools in the county." Formerly, a teacher of a common school was ineligible, but this disability has been removed.

Teachers' institutes.—Every teacher must attend or forfeit his certificate, unless satisfactory excuse is rendered the commissioner. The commissioner recommends that the law should be so amended that the institutes may be held at the time of year he may deem best in order to secure the largest attendance of teachers. The law prescribes the months of July and August. The teacher attending, if his school is in session, is allowed the time he is engaged, provided the term be not longer than six days. If the institute is held during any other months of the year, he loses the time from his school-term.

Library.—None of the school-revenues derived from general taxation shall ever hereafter be used to purchase books, maps, or charts for the library.

School-houses.—The new law, although not up to the views presented by the superintendent, is a vast improvement upon the old one. The proceeds of the tax authorized by article two can be applied to purchasing a site for a school-house, or the building, repairing, or furnishing of one. Before, except in counties where there were special acts, a school-house had to be built by private subscriptions, and but few could be found who regarded it sufficiently their business to canvass the district for the necessary funds. Before, the trustee had no power to condemn land for a site. This power, in the revised laws, is clearly conferred and the mode of exercising it is plainly set forth. There are now three ways by which a school-house may be built: (1) by a district-tax, not to exceed 25 cents on the $100 worth of taxable property in any one year; (2) by a vote of the citizens of a district approving a commissioner's condemnation of an old school-house, and the trustee therein levying a capitation-tax of $2 upon each male in the district over 21 years of age; or (3) by the labor of the citizens of a district.

The superintendent is required to furnish, upon application, elevations, plans, and specifications of model school-houses, of which he has a number on hand.

The advanced legislation of the year having thus provided a way by which local necessity and pride can erect a house commensurate with its wants and ambition, the hope is expressed that ere long every village will be adorned with a temple of learning, and every neighborhood point the passing stranger, without a blush of shame, to the place where the business of education is carried on.

FURTHER CHANGES IN THE SCHOOL-LAW.

As before stated, there has been embarrassment respecting the payment of teachers under the old law, that law requiring a portion of the payment to be made in January, while the officers intrusted with the collection of the money had until April or June to pay it into the treasury. A circular of the superintendent, dated December 10, 1873, states that a bill was at that time pending before the State-senate which proposes to relieve the school-system from the embarrassments incident to this lack of harmony between the revenue-laws and the time prescribed for the payment of the teachers.

Another circular of the superintendent, dated December 17, 1873, and addressed to the commissioners of common schools, inclosing a copy of a recent act of the State-legislature, gives the substance of said act as follows:

"A school-district containing 50 and more census-children can have for the current school-year a school taught for four months, and a district containing less than 50 pupils, a school for two and a half months, if a majority of the trustees agree thereto. The same money will be paid for a four-months school as would have been paid for a five-months school, and for a two-and-one-half-months school that would have been paid for a three-months school. The trustees and the teacher are the parties to determine what would be equitable to all parties. Schools taught half out by January 10 will receive 40 per cent. of the amount due the district and the other payments will remain as provided in the new laws, viz: February 15, May 15, and July 1."

The new school-laws are now operative in every respect except as modified by the special act accompanying the circular, and commissioners will pay the money directly to teachers.

IMPORTANCE OF VENTILATION.

The average school-rooms are said to be sadly deficient in facilities for supplying the pupils with the proper diet of sweet, unadulterated air. "Many a teacher," says the superintendent, "goes with birch or ferule among stupid pupils in the vain conceit that he is establishing discipline, when, if he would let in the air of heaven, the demon of drowsiness would take swift wing, and he would do for his scholars what leagues of switches cannot do. Sunlight, also a great hygienic agency, not only affords the eye its full supply of natural aliment, but is energetic in dissipating the fever-breeding air that loads the atmosphere of a shaded room. More sunshine is needed. Every school-room should have one or more windows on each of its four sides and every class-room should be open to the outside air, so that it may be easily sunned and ventilated. The degree and direction of light should be regulated by means of blinds, which should be green, the color most agreeable to the eyes. At recesses and before and after school, the blinds should be opened to admit direct sunlight, the purifying effect of which is indispensable to keep the school-room healthy."

EDUCATION OF THE COLORED PEOPLE.

The superintendent reiterates the views expressed in previous reports to the effect that education should be comprehensive enough to embrace all the children of the Commonwealth. He says that if the foundation upon which a free government rests be the intelligence and virtue of the people—which is the only proposition that can be argued to a successful conclusion—then, since the negro has become an elector, it is the dictate of duty and of self-interest to consider how he may be trained for intelligent citizenship. Opposed, like most southerners, to mixing the races in the schools, he thinks that the present school-fund, clearly voted and dedicated for the education of the whites, should not be invaded, but that a new and entirely independent fund and system should be created for the colored people. The subject is involved in difficulties, but these only add to the urgency of the need for its consideration by legislative wisdom. Meanwhile the education of the colored race progresses, about 1,000 colored children in Louisville alone having the benefit of four good schools, with a large high school, which will be noticed in its place.*

*The report of the committee on colored public schools in Louisville, November 27, 1873, is as follows:

"The eastern, western, and Portland schools were opened in September with 10 teachers, the total enrollment for the month being 795, with an average daily attendance of 591. On the 8th of October, 1873, the beautiful central school was opened, and at the close of the month the total enrollment for all the schools was 1,347, with an average daily attendance of 1,163, 14 teachers being employed. For the month of November the total enrollment was 1,595, with an average daily attendance of 1,154, and 19 teachers."

LATER ON EDUCATION OF THE COLORED PEOPLE.

As this report goes to the press news comes from Kentucky that a bill for the education of the colored population of the State has become a law. This provides for taxing the colored citizens 20 cents on the $100 for a fund which is also to receive a *pro-rata* share of interest in whatever the Commonwealth may collect from the United States Government on account of its war-claims. The fund thus formed is, according to the bill, to be appropriated to the furtherance of education for the colored race in schools distinct from those for whites. The superintendent of public instruction is put in charge. The school-commissioners are charged with all the duties to the colored children that they now perform for whites. Each school for the former is to have a colored trustee, and teachers are to have the same qualifications as are required for white schools, "subject to such variations as the commissioner of common schools for the county may think proper to suit the demand of any particular district."

COMPULSORY ATTENDANCE.

The county-commissioners, in numbers surprising to the superintendent, advocate the passage of a law compelling parents and guardians to send their children to school. It would seem logical that, if the State claims the right to tax the childless man to furnish a fund to educate other people's children, it holds in its hands the corresponding right to compel those people to utilize the fund in the improvement of those who, ignorant as well as learned, are the born heirs to all the franchises of citizenship. The State does not establish and maintain a system of public schools merely to confer a benefit upon an individual or a class, but engages in the work of popular education for her own protection, as a fundamental civil duty, and cannot afford to be indifferent as to whether or not her citizens avail themselves of the civic advantages afforded by her munificent patronage of common schools.

ABSTRACT OF COUNTY-REPORTS.

In Ballard County, a teachers' institute for a term of six days in June, well attended, and reputed a success. In Bath, the same. In Boyd, a greatly increased interest in education, and several new school-houses built. In Breathitt, most of the school-houses repaired and several new ones built. In Callaway, the institute "a splendid success," a new frame school-house built, and a $5,000 normal institute erected, but much embarrassment experienced from frequent changes of the lines of school-districts. In Campbell, a gradual improvement in the class of teachers, and a teachers' institute in August, largely attended. In Casey, a teachers' institute for three days, and attended by 43 teachers, against 25 last year. Poor school-houses much complained of. In Clarke, a great awakening to educational interests evinced in seeking better teachers and a disposition to improve the school-houses. In Clinton, school-houses progressing finely, some of them completed and furnished with desks and blackboards. In Edmonson the school-attendance small, owing largely to the want of better school-houses, most of these being poor log-structures unfit for school-purposes. In Estill, 25 teachers attendant on a teachers' institute, held for five days; 24 absent. A better class of teachers than heretofore and a good prospect for a still better set next year. In Garrard, again, a better grade of teachers, but a deficiency in good school-houses; some utterly unfit for winter-use, though others are ornaments to the neighborhoods in which they lie. In Grant, a large per cent. of the schools log-houses, poorly furnished. In Graves, several new school-houses built, but the school-sessions held mostly in the winter, when the severity of the weather often induces a small attendance. In Grayson the average number of children at school better than formerly, and the past year a success in comparison with previous ones. In Green, considerable interest manifested; schools taught in all the districts, but generally very poor school-houses. In Hardin, the schools are taught, and the quality of teaching improved, but the supply of good teachers not equal to the demand. In Harrison, nearly all the schools continued as private or subscription-schools from three to five months after the session of the free schools had been completed; some new school-houses built, others in process of erection, and several old ones repaired. In Henderson, the average attendance small, "sending to school being the last thing with most people in this county." In Hopkins, a better grade of teachers and a decided improvement in the schools. In Jackson, difficulties arise from the sparsely-settled condition of the country and the indigence of the people. In Jefferson, the schools so growing in public favor that all the private schools have been absorbed by them. In Kenton, 34 out of 36 districts have had schools taught with general satisfaction to their patrons; a teachers' institute, well attended, held for three days in July. In Knox, the schools advancing, the teachers improved, and a growing interest manifested. In Laurel, the same, with comfortable school-houses. In Lawrence, schools gradually improving, better teachers, with advanced compensation, and school-houses a hundred per cent. better than two years ago. In Lee, schools taught in all the districts by a fair class of teachers and with fair progress of pupils; and, besides a teachers' institute held for six days with good attendance, a normal course for teachers after the close of the common schools; a teachers' association with 28 members formed, to discuss and study the best methods of teaching. In Lincoln, the schools better than in preceding years, the teachers better qualified, and the interest of trustees greater. In Madison, "the most successful institute ever held in the county," but teachers too often inferior and school-houses poor. In Marshall, a two-days institute, in which all seemed greatly interested. In Marion, all the districts taught, half the school-houses finished, and a prospect of having log-structures in most of the districts by November. In McCracken, a five-months school taught in every district except three. In Mercer, a growing and healthy interest in common schools. In Metcalfe some energy manifested in building more and better schools. In Monroe, 53 schools taught during the school-year, all except three with sessions of at least five months, and some little improvement in the school-houses. In Montgomery, a better class of teachers than in any previous year, and a teachers' institute of three days in August; only five districts without a

school. In Morgan, schools taught in every district and the teachers generally making efforts to qualify themselves for their high calling. In Nicholas, a normal school opened at Carlisle September 2, 1873, under Professor Vance. In Ohio, the schools of the county generally better than in the previous year, and a decided improvement in the teachers. In Oldham, about two-fifths of the school-houses good, but the remaining three-fifths very deficient. In Owsley, most of the districts have very comfortable school-houses, several others are in progress of erection, and arrangements are consummated for a high school at Booneville. In Perry, a school is taught in each district, and the school-houses, with few exceptions, are being either rebuilt or repaired. In Pike, all the schools are taught, eighty in number; fifty new school-houses completed and over twenty more to be completed for the fall term. In Pulaski, an improved condition of school-houses; nineteen new ones built and substantial repairs put on about fifty more; an institute of five days, exciting lively interest. In Robertson, there is a want of good school-houses, but the people are taking greater interest in the cause of education, a better class are offering their services as teachers, and there is an emulation among them as to who shall have the best-conducted school. In Rowan, improvement. In Shelby, schools taught in all the districts and, in most instances, by well-qualified teachers. In Taylor, the schools improving yearly and the class of teachers now superior to any previously had. In Todd, schools taught in all the districts except two and the school-system growing in favor with the people. In Trigg, the teachers too generally temporary and not promptly paid. In Union, a rich county, out of 3,845 children of school-age, only an average of 1,103 attending school. In Warren, schools taught in all the districts except one, where there is no school-house and few children; schools generally in poor condition. In Wayne, most of the houses in use of very poor character and many rather dilapidated. In Wolfe, increased interest in common schools and prospects decidedly encouraging.

SECONDARY INSTRUCTION.

Information under this head is less complete than that from the lower grade of public schools. Seventeen high schools and academies report an aggregate of 79 instructors and 1,626 pupils, of whom about one-fourth pursue studies in the classics and a considerable number in modern languages. Seven more, in three of which the modern languages are taught, but not the classic, report 79 instructors and 995 pupils, 125 of whom take the modern languages. Ten out of these twenty-four schools give instruction in drawing and music and nine others give it in music without drawing.

LOUISVILLE COLORED HIGH SCHOOL.

It is worthy of note that a high-school-building for colored pupils—the first ever erected in the State for that class—was dedicated at Louisville, October 9, 1873, city-officials and leading citizens being present and participating. The building cost $25,000 and will comfortably accommodate 600 pupils. This new school at the close of 1873 had already crowded into it 900 pupils, with 12 teachers; was thoroughly graded, and governed by the same laws which govern the schools for white children in the city. Its principal is O. M. Waring. It is anticipated that 1874 will witness the erection of one or more other school-buildings for colored youth in Louisville, the city seeming to be alive to the fact that this portion of its population must be educated.

NORMAL SCHOOLS.

It is not doubted that the State will finally establish normal schools in order that districts may be supplied with competent teachers. It is believed that the teachers' institutes have already done something, and will do much more, to improve the teachers in their calling and to awaken aspiration for quickened self-effort, but there are required one or more distinctly professional schools in which tuition by expert professors will be free and in which board will be reduced to a minimum.

The normal schools at present in operation, as far as appears, are: one opened at Carlisle, September 2, 1873, which reports 6 instructors and 75 pupils, 3 years in its course, and 500 volumes in its library; the East Kentucky Normal School, at Catlettsburg, said to be in a flourishing condition, with 5 instructors and 50 students in a course of 3 to 5 years; and one at Lexington, under the auspices of the American Missionary Association, with 280 pupils, the value of school-property being $8,000. Besides a training-school at Louisville, with 6 instructors and 35 pupils, a training-department exists at Frankfort in connection with the public schools of that city, from which, at the close of the last session, seven young ladies graduated, three of whom were employed in the schools. In addition to these facilities for normal training, three institutions for higher instruction in the State report normal departments connected with them.

SUPERIOR INSTRUCTION.

Of the institutions in the State for higher education, the State University at Lexington stands naturally first. Formed by the consolidation of several institutions, this

embraces in its plan seven distinct and yet connected colleges, each of which is again divided into several schools or departments of study, the general interests presided over by a regent and a board of thirty curators, while the immediate government of the students in each college is committed to its own special faculty. A student may, if he should choose, be connected with only one out of the various schools and may receive from the professor in that school a certificate of graduation on his residing for at least one scholastic year at the university and prosecuting to completion the studies of the school. But he can only receive the degree of bachelor of arts on the completion of the courses of at least ten schools, including languages, and that of bachelor of science on the completion of those of at least seven, not including languages. On his graduating in all the schools of the law-college, he receives the degree of bachelor of laws, and on similar conditions receives, from the commercial college, the college of the Bible, or the college of medicine, a diploma corresponding with the course taken. A comparatively limited or largely extended culture is thus put within the reach of any one desirous of a special or general education.

For the reception of the degree of master of arts he must have been admitted, at least one year previously, to the degree of bachelor of arts in this university, and must have passed a satisfactory examination in at least three out of five enumerated languages or in two of these and in a course of historic study prescribed by the faculty.

The other institutions for superior instruction in the State are indicated in the table, with such particulars as may serve to exhibit their condition.

Berea College, the first upon the list, is one of a number established, and to a large extent sustained, in Southern States by the American Missionary Association. Especially designed for the elevation of the colored race, it is open to all others, and, in its higher departments, (for it has seven, reaching from primary through collegiate,) the numbers of white and colored pupils are nearly equal, while of the whole 247 students it reports nearly two-thirds are colored. Of 19 who took part in the last commencement-exercises 5 were colored; 13 were males and 6 females; while the attendant company seated beneath the old oaks of the *campus*, to the number of 1,200, was about two-thirds white and one-third colored, the colored people of the Blue-Grass region mingling with white men from the mountains and the wealthy aristocracy of Richmond and Lexington, no apparent antagonism being awakened by an arrangement so new at the South. There is a normal department, as well as a ladies' course, in this college, and the institution rejoices in the erection of a new ladies' hall, costing over $50,000.

At *Georgetown College*, students preparing for teaching receive instruction free, on condition that after they leave college they shall spend as many years in instructing others as they have themselves been instructed without charge.

The *Kentucky Military Institute* is inserted as having substantially collegiate rank.

COLLEGES FOR WOMEN.

Eleven colleges, exclusively for the education of women, report an aggregate attendance of 1,013 pupils, 742 of whom are in collegiate and 271 in preparatory studies. In six of these institutions the classification of students is reported as follows: In the freshman-grade, 130; sophomore, 85; junior, 55; and senior, 32. Fifteen are pursuing special and 5 post-graduate-courses. There are 75 professors and instructors, of whom 27 are gentlemen. In all these colleges music and drawing are taught and, in all but

one, painting also. French forms a part of the course in all, while in all but three French and German are both taught and in one Spanish and Italian are added to the other two. Five have chemic laboratories; four, philosophic cabinets; two, natural-history-museums; and one has an astronomic observatory. One, only, has a gymnasium; another reports, "none except fields, forests, and fences around." Three of these institutions only report libraries belonging to them, ranging, in extent, from 500 to 3,000 volumes; one, the Georgetown Female Seminary, uses the library, as well as all other apparatus belonging to the Georgetown College, with which it is connected.

In all these the music taught is both instrumental and vocal. Degrees are conferred by the greater portion of them, such as A. B.—or its equivalent—mistress of polite literature, mistress of English literature, or maid of arts.

PROFESSIONAL INSTRUCTION.

The theologic schools reporting for 1873–'74 are: (1) The Bible College of the University of Kentucky, belonging to the denomination calling themselves Christians or Disciples. (2) The Danville Theological Seminary, (Presbyterian,) which, for reasons not given, had been for some time suspended, was re-opened in the fall of 1873, its endowment being ample and its income large. (3) The St. Joseph's Seminary, at Bardstown, (Roman-Catholic,) which gives five years as its length of course, probably combining academic with theologic instruction. (4) The theologic school of Bethel College, the students in which appear to be so combined with the college-classes as to make one body with them. (5) The Western Baptist Theological Institute, which is a branch of the Georgetown College, rooms its students in the college-building and has its studies so arranged as to proceed *pari passu* with the collegiate course.

The students in the law-school of the University of Kentucky, the only one reported in the State, have free access to all the privileges of instruction in the other schools.

The Louisville Medical College and the medical department of the University of Louisville report, respectively, 350 and 2,129 graduates, the former having been established in 1869, the latter in 1837. The Transylvania Medical College, with a resident faculty of eight professors, commences its course in January, 1874, as the medical department of the University of Kentucky, and the matriculates in it will have the privilege of enjoying, without further charge, the benefits of instruction in the classic, scientific, and technic courses of study pursued in the associated colleges of the University.

The Agricultural and Mechanical College of Kentucky forms a part of the university, and has connected with it schools of English language and literature, of mental and moral philosophy, of chemistry, of natural philosophy, of natural history, of civil history, of modern languages, of civil engineering and mining, and of military tactics. A meteorologic observatory has been established during the past year, under the auspices of the Signal-Service of the United States War Department, and in this opportunities are afforded for instructions in meteorology and telegraphy.

Each legislative district in the State is entitled to send to the Agricultural College, free of charge for tuition, three properly-prepared students. These must be at least 16 years of age, of good character and industrious habits, and must, upon examination, show a fair acquaintance with grammar, geography, the outlines of history, arithmetic, and algebra. Once admitted to the College of Agriculture, they may also attend the lectures and instructions given in the classic department of the university.

The State-scholarships here are 300; the graduates since organization, 4.

The commercial college of the university, with eight professors, two years in its full course, and an income of $3,417, numbers 148 students.

BUSINESS-COLLEGES.

There are two business-colleges in the State, at Louisville and Lexington, with 9 instructors and 240 students.

KENTUCKY PUBLIC LIBRARY.

Measures have been taken to establish a free library and museum at Louisville, Kentucky. A large building for the purpose has been purchased at a cost of $200,000. It is 168 feet front by 200 feet deep and is four stories high. The library and museum are to be forever open to every citizen of the United States gratuitously.

For the purpose of raising funds toward this enterprise, a series of grand gift-concerts was inaugurated. The lottery to be held proposes to distribute, in all, some 12,000 cash-gifts, aggregating $1,500,000 in money. Hon. Thomas E. Bramlette, ex-governor of Kentucky, is advertised as the chief manager of the enterprise.

SCHOOL FOR THE BLIND.

This school, established by the legislature for the blind children of the State, affords board and tuition to every child between the ages of 7 and 17 who is so deficient in sight as to be unable to be taught in schools for seeing children, the only condition being that such children be healthy in body and not feeble in mind. The only expense is the cost of getting to the school, which is in Louisville. In the case of children who are utterly destitute, the State provides clothing.

In addition to those branches taught in schools for the seeing, instruction is given in trades that the blind can profitably follow. The history of the school gives many instances of blind persons who have maintained themselves honorably and well in the practice of callings in which they became proficient through the instruction they received at this school. Blind persons who are over the age of 17 can be admitted for the purpose of learning a trade, if they can furnish suitable evidence as to their character.

The legislature last winter unintentionally did harm by denominating this institution an asylum—the only school for the blind in the United States that is now so styled. The effort has been made by its board and superintendent from the beginning to impress the public that this institution is a school, and not an asylum.

INSTITUTION FOR FEEBLE-MINDED CHILDREN.

Since the last report of this institution 36 have been admitted, 17 dismissed, and 8 have died. Of the number dismissed all save one had been greatly improved, and able, under the control of friends to give direction to their labor, to support themselves. The present number of inmates is 95, three-fourths of whom will become, by the training to which they are subjected, self-supporting or self-helpful. Many of them will be

able to read well and write a legible hand, and have a just conception of their obligations to God and man.

The State makes provision to meet the expenses of all the indigent, feeble-minded children received. Those having means are required to clothe their children and pay in money according to their ability, but in no case more than $150.

Quite a number of applications for admission have been rejected for want of room, and it is believed that the number would have been greatly increased but for a prevalent idea that the institution had been converted into an asylum for the insane and chronic epileptic. This institution was not organized for the custodial care of the helpless and unimprovable idiot, but for those children classed as feeble-minded: such as cannot be taught to read in the common schools of the State. That this class can be and has been greatly improved by the efforts of those having charge of them is no longer a matter of controversy by those who have at all investigated the subject.

INSTITUTION FOR DEAF MUTES.

Provision has been made by the State for the board and instruction of all its deaf mutes. No charge for board and tuition is made and no certificate of indigency is necessary. Every deaf mute in Kentucky will be received who is of proper age—10 to 30 years—of good character, and in good health.

To preserve health and promote habits of industry, the pupils are employed in manual labor as far as employment can be found, the boys in gardening and other kinds of work, and the girls in sewing and housekeeping, in which they often made great improvement.

The payment of $25 a year by pupils from Kentucky covers all contingent expenses, and this amount is required only of those able to pay it; others are furnished board, tuition, books, and even clothing, free of charge.

EDUCATIONAL ASSOCIATION.

[From the Kentucky Home and School Journal.]

State Teachers' Association.—This organization met in Winchester, on Monday, August 11, continuing in session four days. The first address was delivered by Dr. Henderson, the State-superintendent, upon the work of the year, which he announced had been such as to contribute to the substantial progress of the system of public schools, and that, out of 5,465 districts reported, schools have been taught in all but 99. Prof. W. S. Giltner addressed the association in favor of the co-education of the sexes. This subject was afterward discussed *pro* and *con* by several members, a majority of whom apparently approved the position of the speaker. Others, however, opposed it, chiefly upon the ground that the course of training suitable for young men could not be appropriate for young women. Prof. Chase did not want his daughter educated with young men; he wanted her to be a helpmeet rather than a rival to man, and said, "We need to put in a powerful protest against the agitation for the political rights of women." Prof. Giltner, who had tested the plan of co-education in his own school, and found it satisfactory, said it was a mistake to suppose that the idea of co-education originated with the blue-stockings of the North; on the contrary, the most gifted men of the age are in favor of it. Various other topics of educational interest were considered, as "Should music be taught in common schools?" "The importance of natural science as a means of development and school-discipline." At the close of the session the committee on resolutions reported in favor of making each county teachers' institute co-operative with the State-association; that the legislature be asked to take measures to secure a more efficient local superintendency, and to provide by appropriation for defraying the actual cost of instruction in the annual county-institutes; also to so adjust the revenue-laws that there shall be no delay in the payment of salaries of teachers. Superintendent Henderson, after being complimented very highly upon the zeal and ability with which he has guided the fortunes of the common-school-system, was re-elected president of the association.

Teachers' institutes.—It appears that teachers' institutes were held in thirty counties of the State, resulting largely in the enlightenment of the people as well as in the improvement of the teachers. By attendance upon the daily exercises and the night-lectures, communities were aroused to a sense of the importance of having a system of public instruction on an enlarged basis. As no appropriation is made by the State for institute-work, the teaching was all done by volunteers, one of whom declined similar work in Pennsylvania, where liberal payment was offered for it, preferring to work at home without compensation.

The State-superintendent reports this branch of the school-work as now thoroughly organized. A few counties are yet behindhand; but they cannot help catching the contagion of good example from their neighbors, and another year will probably suffice to bring them to a recognition of the utility of institutes and an ambition to share in the good results attending their efficient conduct.

Louisville Educational Association.—The Louisville Educational Association held seven

monthly meetings last year. The work of the year was thorough and satisfactory. The purely professional subjects were illustrated by practical exercises or exemplified in essays and prelictions, and, in addition to this work, addresses were given on the following subjects: physiology; mental science; corals; carbonic acid and ventilation; the dangers, duties, and responsibilities of the teacher; moral culture; what teachers should read; the minor morals; the law of gravity; compulsory education; and neologisms. The general average attendance was only about 60, but these were the 60 teachers in the public schools of Louisville who most loved their profession and who ranked highest in intelligence and zeal.

OBITUARY.

Rev. Silas Totten, D. D., LL. D., formerly professor of mathematics and natural philosophy in Trinity College, afterward president of the same, then president of William and Mary College, Virginia, and for many years president of a young ladies' college in Lexington, Kentucky, died at the last place, July, 1873, aged seventy-two.

Balance school-fund on hand		85,517 70

PRIMARY INSTRUCTION.

There are in the State six school-divisions:

In the first division, 98 schools have been in operation, in which 4,234 pupils have been enrolled. This is a slight gain over the number reported the preceding year, and would be encouraging under any circumstances, but is particularly so when the unfavorable influences that have tended to paralyze every public enterprise in this State during the past year are taken into account.

In the second division, the superintendent's report exhibits 92 public schools, (a gain of 9 over the number reported last year,) in which 121 teachers have been employed in teaching 6,712 pupils, a gain of 512. The whole number of months that schools have been taught is 644½, a gain of 93½ over last year, which furnishes satisfactory evidence of the permanency of the establishment of the public-school-system in this division.

In the third division there is satisfactory evidence that an amount of labor has been performed by the school-boards that will, when reported in detail, exhibit a material increase, both in the aggregate and the improved character of the work, over that reported the previous year.

* Total teachers' wages, $469,553.43; only $326,393.02 paid. $143,160.41 due teachers when report was made.

In the fourth division, the returns are unsatisfactory, and, with the exception of the reports of the parishes of De Soto, Natchitoches, Red River, Rapides, Caddo, and Point Coupée, there is no positive information. There are difficulties to overcome in this division that can only be surmounted by hard and constant labor.

In the fifth division, the meagerness of statistical information relative to the public schools is a source of much annoyance. The several parish- and town-school-boards in this division have, however, regularly drawn the apportionments of the current school-fund, and in general statements from parties residing in the several parishes there is evidence that schools were in operation and largely attended by the children.

The sixth division comprises the city of New Orleans. Here, as in the State at large, there is said to be embarrassment in the proper administration of the schools, from the continued deficiency in the revenue necessary to their support, which has been during the past year more trying to all concerned than ever before. Still, so faithfully are the teachers reported to have performed the duties incumbent on them and so well have the schools been sustained by the community—at least in a very increased attendance of pupils—that the year has apparently been one of usual prosperity. In view of the adverse circumstances of the year, the result of the work done has been satisfactory, and better than could have been reasonably anticipated.

It is not possible, however, the superintendent says, that these financial embarrassments should continue and the effect upon the welfare of the schools not be disastrous. The most faithful teachers cannot meet their responsibilities with the spirit and ardor that characterize those, engaged in any department, who receive their salaries regularly and promptly.

SCHOOL-HOUSES.

Great embarrassment and difficulty are experienced in New Orleans from the want of a sufficient number of suitable school-houses and the need of improved school-furniture and apparatus. More than thirty thousand dollars are annually expended for the rent of very poor buildings, intended for dwelling-houses and in no way suitable for schools.

The amount needed for the construction of all the buildings required is very moderate compared with the interests involved, especially when it is remembered that there has been hardly anything expended in this way in the city for many years.

TEXT-BOOKS.

The resources of the mass of the people having been greatly diminished since the war, there is great difficulty in obtaining the needful means of study, and it would be a relief to many whose children are attending the schools if they could be furnished gratuitously with the necessary books and stationery, as was formerly the case.

NORMAL SCHOOLS.

The superintendent of the sixth district reiterates a recommendation made in his previous report as to the necessity of establishing normal and training-schools, there being no comparison between the work of trained professional instructors and those who perform the part of amateurs. Existing normal schools will be found under the head of secondary instruction.

LYCEUM OR PUBLIC-SCHOOL-LIBRARY.

It is said that the usefulness of this institution is impaired by the want of means to carry it on in a proper manner and by the restrictions of the rules, which prevent it from being in the fullest sense a public library. It needs aid from the State. The city is its main support by its annual appropriation for the salary of the librarian and assistant librarian. But there is no source of revenue to meet the loss of books and keep up the necessary supply of current literature. A law allowing one-twentieth of a mill per dollar on the valuation of the taxable property of the city would produce an annual income sufficient to make the library a credit to the city and State, while the city would probably be willing, if this endowment were secured, to construct an appropriate library-building.

BENEFICIARY CADETS.

Though a number of candidates have been examined for admission to the State University as beneficiary cadets, (graduates of the high school who desire to pursue their studies through the university-course on a State-foundation,) not enough have passed to supply the number apportioned to the parish of Orleans. The requirement, latterly, of $100 per annum in currency from each beneficiary cadet, on account of the depreciation in value of State-warrants, probably interferes with the object proposed in the beneficiary clause of the law and will be likely to interfere with it as long as such requirement shall exist. It is free tuition that makes full schools. The youths that labor eagerly to reach a beneficiary place are apt to be slack in their exertions to obtain one in which a considerable payment must be made. But in the present financial embarrassment of both the State and university, the exaction of the hundred dol-

lars from each previously free student is probably unavoidable, as that amount is only representative of the depreciation in the value of the warrant from the State on which the university receives each student.*

THE STATE-WORK.

The school-population of Louisiana aggregates 280,384; 90,166 of this number reside in the parish of Orleans, and how to educate them is the problem to be solved. The State, having faith in the system of popular education, wisely made provision in her constitution for an educational bureau, and said that the chief officer of this bureau must be elected by the people for a term of years, thereby protecting its interests from the contingency of unfriendly legislation.

To induce appreciation of the magnitude of the work to be performed, inquiry is made:

First. What will it cost the State to educate one child six months?

Secondly. What will it cost to educate 280,384 children, the whole number in the State?

In answering these inquiries, it is taken for granted that the school-house is in each case owned by the parish: hence, that the school-board are not under the necessity of paying rent. It is also assumed that the school-directors have sufficient public spirit to devote labor and time for the benefit of the youth growing up around them and to give their services gratuitously. This assumed, the revenue to be counted on is the first thing to be considered. Respecting this, the following statement is made:

REVENUE.

"The taxable property of the State is estimated at $251,000,000. The assessment of the two-mill-tax on this valuation gives the schools of the State a gross revenue of $500,000. This is not enough to educate one-half of the children in the parish of Orleans. If the entire school-revenue from all sources in the State, the two-mill-tax, the interest on the sales of the school-lands, the license of the Louisiana State-lottery, the seminary-fund, the poll-tax, and the city-school-tax were given to the school-board of New Orleans, they still would not have means sufficient to maintain the schools needed for her own children."

The question may then be asked: How have the schools in the State been supported the last three years? The answer given is: "With the money provided and by using the credit of the State. The teachers employed, having confidence in the people and realizing their needs and demands, accepted the conditions, believing that the legislature, to whom was committed the privilege of providing for the support of the schools, would not neglect the interests committed to its care."

The painful issue, however, is that "teachers are unpaid, the rent-money for buildings used as school-houses has not been provided, and bills for school-books, apparatus, and fuel remain unsettled."

"It is not expected," the superintendent says, "that the legislature will provide at this time a revenue sufficient to give every child in the State educational facilities; yet a revenue sufficient to maintain the schools organized and to establish new ones must be provided, and, therefore, it is recommended that a tax of 5 mills on the taxable property of the State be levied, which will give a gross revenue of $1,255,000. It is further recommended that this and the free-school-fund arising from the interest on the sale of school-lands, the poll-tax, and all other revenues raised for educational purposes be paid into the State-treasury and denominated the public-school-fund, to be apportioned to the several cities, towns, and parishes of the State, as directed by act eight of 1871, and to be expended as provided for in the school-law. Such a legislative enactment as this will at once lift the public schools of the State out of embarrassment and establish them on an enduring basis."

SECONDARY INSTRUCTION.

The high schools of New Orleans, of which there are three in all, are reported to be in a flourishing condition, and show a larger attendance than at any time since the revolution in the administration of the schools in 1870. They are more and more appreciated by the community and contribute largely to the high reputation of the public-school-system. The graduation-exercises in them have in some cases been unusually brilliant. In one of the two girls' high schools, the graduating class of 1871 numbered 46 members; in the same school this class for 1872 consisted of 48 members—the largest number ever graduated at one time since the schools were first established.

In the boys' central high school, also, the largest class for some time, as well as one of the most meritorious, was graduated in 1872.

The importance of this grade of schools justifies the superintendent in alluding to them at some length with reference to their future improvement. He thinks there is

* The official register of the university for 1872–'73 states that "no appropriation having been made by the legislature, the beneficiary cadets were granted an indefinite leave of absence March 8, 1873."

no doubt that they may be rendered yet more useful and made to meet in a higher degree the wishes of the citizens. It is hence suggested that the course of study in these schools should be made eminently practical, that education being best which affords the best preparation for the duties of life in the sphere in which that life is cast. It is further suggested that an optional course should, as soon as practicable, be arranged in the high schools after a certain advancement in the general course shall have been attained, and that a new prominence should be given, in connection with the boys' high school, to agricultural, manufacturing, and mining sciences; also, that the department of languages in the high schools should comprehend, in addition to the ancient classics and the French language, the German and Spanish tongues. The superintendent goes on to recommend that a proper system of physical training be ingrafted upon the entire school-system, commencing in the primary schools and terminating in the central boys' high school, with the preliminary physical training practiced in military schools and gymnasiums of this country and Europe antecedent to "tactics."

SCHOOLS IN NEW ORLEANS.

A special report, received from the boys' central high school, describes it as the crowning institution of the State's public-school-system, being chiefly fed by the promotions from the intermediate classes of the common schools, though receiving a large number of pupils from the private academies. The matriculation exacts a full knowledge of geography, English grammar, arithmetic, history of the United States, and orthography. The examination is a written one, the answers of the pupils being liberally marked, in consideration of the trying character to youth of a public examination. The high-school-course of studies embraces a period of four years. Promotions are made annually, immediately following the commencement-exercises in December, when those members of the senior-class who have satisfactorily concluded the prescribed course are awarded deplomas. The present senior-class is composed of 11 members, all of whom are expected to graduate. The number of graduates sent forth since the commencement in April, 1867, is 70; number of pupils at present under instruction, (November, 1873,) 225; number of professors, 6.

The St. Joseph's School for Boys, (Catholic,) at New Orleans, organized in 1861, has 450 pupils, with 7 instructors. St. Aloysius Academy, New Orleans, (Catholic,) also for boys, was organized in 1869, and has, with 5 instructors, 140 pupils, all in English studies and modern languages. St. Vincent's Academy, at Fairfield, under the auspices of the Daughters of the Sacred Heart, was organized in 1868, and has 5 instructors, but at present, owing to the late epidemic, only 12 students.

NORMAL SCHOOLS.

Besides the high schools and numerous academies, out of which come many teachers for the public schools, there appear to be in the State two normal schools, with three normal departments belonging to other schools.

The only one of these brought fully forward in the State-report is the Union Normal School, at the corner of Camp and Race streets, New Orleans, in which are three instructors, other teachers being employed as the interests of the school require their services. The institution was founded in 1869, under the auspices of the Methodist-Episcopal Church, and its design is to prepare for teaching both young men and women, without distinction as to color, race, or previous condition.

The building in which this school is held is said to be a comfortable, two-story wooden structure, capable of accommodating 150 students, with dormitory-room for 20. The method of instruction has at least one element of thoroughness, in that every class passes a written examination at the close of each month on the studies of the month and at the close of each term on the studies of the term. There were, at the date of the last report, 100 students in attendance, with fair prospects of increase; and it is proposed by the denomination with which it is connected to make it, with the Thompson Biblical Institute, (a school for the training of colored ministers, held in the same building,) the foundation of a future New Orleans University. A class of 11 is believed to have graduated from this school in 1873.

Straight University, New Orleans, an institution in which also distinctions of race and color are ignored, has, too, a normal department connected with it, with 4 instructors and 14 pupils, 2 of whom graduated in 1873.

The agent of the Peabody fund for Louisiana reports also to the National Normal a Peabody normal seminary in New Orleans, with 5 teachers and 120 pupils, of whom 100 are said, in the report of the trustees of the fund, to be graduates of high schools. This is open to pupils from all parts of the State.

Then, at Meriden and Jackson, normal departments connected with other schools appear in the list of schools aided from the Peabody fund. The numbers in these are not given; but, from the amount of aid extended, there are supposed to be about 20 in each place.

BUSINESS-COLLEGES.

Two such institutions are reported in this State, both in New Orleans, with 15 teachers and 600 pupils.

SUPERIOR INSTRUCTION.

This, as supplementary of the education in the common schools, is meant to be afforded by the University of Louisiana, still in its temporary quarters at Bâton Rouge. To it have been sent, as State beneficiary cadets, selected graduates of the high schools from the different portions of the State; and from it these have received, in common with the other students, an education, classic, scientific, or commercial, as each might choose. The financial troubles of the State and university have lately seriously interfered with this arrangement, the State-warrants, upon which these students were received, and from which their educational expenses were to be defrayed, having greatly depreciated in their value. So great had this depreciation come to be in 1872, that the university was driven to give notice of its inability to continue the training of these students, unless at least $100 should be paid by each one on his own account or an appropriation to make up deficiencies should be granted by the legislature. The greater portion of the beneficiaries not being able to make good the depreciation in the value of their warrants from the State and the legislature not meeting the case by an appropriation, the State-cadets, as mentioned on a previous page, received in March, 1873, an indefinite leave of absence. The effect of this seemingly necessary action has been to leave the university with an exceedingly small number of college-students, and of course to imperil to some extent the prospect of its receiving aid in future from the legislature. It retains still, however, its corps of 7 professors and as many assistant professors, with an increasing library, a considerable museum, and other educational facilities of fair extent. Battling manfully with its difficulties, it now bids for an increase of its student-lists by offering to receive free of tuition-fees for four years any prepared pupil, on the payment of $100 for the general purposes of the university—a plan which will save to each patron, if carried out, $220 in four years, the fees having been heretofore $80 for each year. In its efforts to fight its way through existing troubles to firm standing upon solid ground, this once flourishing university deserves the sympathy of the friends of education.

Other institutions for superior training in the State are: Centenary College, Jackson; St. Charles College, Grand Côteau; St. Mary's Jefferson College, St. James; and in New Orleans, the college of the Immaculate Conception, Straight University, and the recently established University of New Orleans. From the college of the Immaculate Conception no returns for 1873 have been received. The most important items in relation to the others may be found below.

Straight University, chartered 1869, with classic, agricultural, normal, theologic, law, and medical departments, is open to both sexes and all races, and seems to give fair promise of extensive usefulness. Its law-classes for 1873-'74 number 11; medical, 4; theologic, 8; collegiate, 9; normal and preparatory, 41; primary, 70—total, 143. The more complete organization of these various departments is said to be giving excellent results, stimulating emulation and securing method and regularity in study, with hope of promotion and eventual graduation.

The University of New Orleans, established in 1873, is at present apparently only an expansion of the Union Normal School and Thompson Biblical Institute, both favorably noticed in the report of the State-superintendent for 1872. Mainly intended for the colored people, though not restricted to them, it reports 4 instructors and 100 pupils in its normal department, and 3 resident professors, with 23 pupils in the theologic, the classic department, if organized, not yet making a return.

Leland University, New Orleans, is a new institution just organized under Baptist influences.

Franklin College, Opelousas, much decayed, had recently some prospect of resuscitation; but the funds appropriated for that purpose by the legislature were purloined, and at the last accounts had not been recovered.

COLLEGE FOR WOMEN.

Only one institution of the above class in this State, the Silliman Female Collegiate Institute, has reported its statistics for the year 1873. The degree conferred by it is M. E. L., (mistress of English literature.) With 6 professors and instructors—1 gentleman and 5 ladies—there are 66 students; 41 in the collegiate and 25 in the preparatory department. In the freshman-year were 10 students; sophomore, 12; junior, 13, and in the senior, 4; 2 were pursuing a special or partial course. Music, both vocal and instrumental, drawing, painting, and French are taught; practical telegraphy is a specialty in the course. The institution has a chemic laboratory, a philosophic cabinet, and a library numbering 250 volumes.

LOUISIANA INSTITUTION FOR THE DEAF AND DUMB.

The peculiar complications of political affairs in Louisiana affect even such an institution as the above-named. When the new board came into power, in March, 1873, the books of the establishment were withheld from them by the old one, the funds

were not accounted for, and a tedious litigation was necessary to secure to the incomers their prerogatives. Amid such difficulties they have labored on, and report a generally favorable condition of things in the school, with unusually good health on the part of the pupils.

The income for the year has been $14,202.13, the expenditures $14,183 35, leaving, on the 1st of January, 1874, a cash-balance of $18.75. An indebtedness previously outstanding, of $6,485.38, is provided for by an appropriation in State-warrants of $10,000.

The board laments the fact that the State University, deprived of its buildings by fire during the war, has still to occupy a portion of the edifice intended for the deaf and dumb and blind, as the former class are thus cramped in their accommodations and the last have had to be removed from it, in consequence.

The number of pupils in attendance during the year has been 54, of whom 34 have been males and 20 females. The studies appear to have been in the elementary branches of English, with such training in language as could be given.

Printing-office-work has been attended to, and the annual report, the by-laws of the institution, and a bi-weekly newspaper, with considerable other matter, have been worked off by the inmates, saving the State a considerable outlay and earning $107 cash-proceeds, besides $239 uncollected.

The establishment of a shoe-shop and cabinet-shop is recommended as a further means of saving and instruction.

STATE EDUCATIONAL CONVENTION.

The first State educational convention which has occurred in Louisiana since the war commenced on the 23d of May, 1872, and continued three days. It was well attended, accomplished much good, and, considering that it was necessarily the precedent and initiative of similar assemblies in the future, was altogether successful.

Ex-Governor Hahn presided, and among those who attended were many prominent in the school-work of the State as well as in other departments. Able addresses were delivered by the State-superintendent of public education and by a number of gentlemen distinguished in the field of letters, interesting discussions on various educational subjects claimed the attention of appreciative audiences, and letters from eminent personages in various parts of the Union, evincing a hearty and sympathetic interest in the objects of the convention, were received and read. A very pleasing incident of the occasion was the presence of many who had previously held aloof from any association with those actively engaged in the cause of public education in the State, especially on public occasions of interest to the same cause. The effect of this gathering was to strengthen those interested in its success and in the cause with which it was associated, and of which it is a useful agency, in the conviction that obstacles growing out of political animosities and prejudices were disappearing, and that soon the labors of all concerned could be concentrated, without constraint and the consciousness of any popular hostility, upon the duties and subjects appertaining to the work of public instruction alone.

THE LATEST INFORMATION.

The annual message of Governor Kellogg to the legislature, read January 5, 1874, contained this additional information as to the schools of Louisiana:

"THE PUBLIC-SCHOOL-SYSTEM.

"There are 250,000 children in the State of an age suitable for education. It is estimated, at the present cost of the public schools—$3 per head a month in the city and $2 per month in the country—that it would require an annual revenue of $1,500,000 to confer upon all these children the advantages of the public-school-system. The school-revenues from all sources last year were $700,000. The income which might be derived from the school-lands is lost for want of supervision. Several funds which should be devoted to the support of the public schools have been improperly diverted. I urge that immediate measures be taken to restore to the school-fund the free-school-bonds alienated by act No. 81 of 1872. Steps should also be taken to recover, if possible, the McDonough fund, which was left as a sacred trust to promote the education of the children of the State.* The report of the State-superintendent of education, which is herewith transmitted, gives full particulars of the workings of our public-school-system.

"THE AGRICULTURAL-COLLEGE-GRANT.

"By act of Congress approved July 22, 1862, the General Government gave to the State of Louisiana 210,000 acres of land-scrip, provided the State accepted it and ap-

* This fund, originally $3,000,000, left in 1850 to the cities of New Orleans and Baltimore for the establishment and maintenance in them of free-schools, which should include both sexes and exclude no color, was so wasted by litigation that at the final division of it between the cities only $1,500,000 remained to be divided. The portion of it which fell to New Orleans was said, in a report to the city-council, January 23, 1872, to have diminished to the poor fragment of $23,000 in real estate and $1,674.44 in cash.

plied the proceeds arising therefrom to the establishment of a college to be devoted to the interests of agriculture and the mechanic arts. The State, by act No. 62, (Acts of 1869,) accepted the donation and created a commission to receive the scrip from the United States and dispose of it according to the provisions of the donating act. The scrip was sold and the proceeds invested in State-bonds; as the interest accrued it was collected and vested in other State-bonds, and this course pursued until the beginning of the present year, when the aggregate amount reached $327,000. To this may be added one year's interest on this amount, which is now due but uncollected. The commission holds these bonds subject to the order of the general assembly. This matter must be acted upon during the present session of the legislature, for, should the State fail to apply the fund as directed by Congress prior to July 1, 1874, it will lapse to the United States.

It is suggested that this grant might be utilized with great advantage in connection with the existing Louisiana State University at Bâton Rouge. That institution is now heavily in debt, and very insufficiently provided with accommodation since the destruction of the university-buildings at Alexandria.

CHRISTIAN ROSELIUS.

This great lawyer, the admitted master of civil law in the United States, who for so many years held the front rank in his profession at the bar of New Orleans, was for twenty-three years professor of civil law in the University of Louisiana.

His repute as a teacher was not less than his fame as an advocate. Possessing a remarkable vigor of constitution, his death, which occurred September 5, 1873, after an illness of two days' duration, was wholly unexpected and produced a profound impression. At a meeting of the bar convened the day after his death a committee was appointed to prepare and report resolutions to an adjourned meeting of the bar to be held November 3, when the members of the bar absent upon their usual summer-vacation should have returned; and the distinguished lawyer, J. Ad. Rozier, his contemporary, was requested to deliver a memorial address, from which is taken the following abstract, giving in brief the history of his professional and political career. Although confessedly a great lawyer, he is best known and loved as a teacher.

ADDRESS OF J. AD. ROZIER, ESQ.

"Christian Roselius was engaged in New Orleans during forty-five consecutive years, immediately preceding his death, (on the 5th of September, 1873,) in the uninterrupted and active pursuit of the profession of the law, for the half of that long period simultaneously performing the duties of a professor of law in the University of Louisiana. Bereft of all adventitious circumstances, of humble parentage, he rose from poverty and obscurity to an eminent position.

"So conspicuous a career deserves noted comment. It will serve a double purpose, as a tribute of respect to the memory of the distinguished departed, mingled with grief and interest, and will offer a bright example, by which the young especially will derive solace and profit.

"*His early life.*—He was born on the 10th day of August, 1803, in Brunswick, a State of Germany, at the distance of a few miles from the free city of Bremen, as well as I can understand, in the town of Thedinghausen. He received a good school-education, but knew only one language, the German, his maternal tongue. At the age of sixteen he left his native land as a passenger on board of the Dutch brig Jupiter, which sailed from the port of Bremen and arrived in that of New Orleans on the 11th of July, 1820. He was apprenticed for two and a half years as a printer to William Duhuy, publisher of the Louisiana Advertiser, and was afterward employed as a journeyman printer in the office of the Louisiana Courier. * * One of his fellow-printers, still a survivor, specially adds: 'But the stripling printer was always up bright and early at his task of printing. Industry and good conduct were his characteristics. He successfully imitated the early lives of Franklin and Judge François Xavier Martin.'

"Young Roselius and Alexander Dimitry, (the latter the well-known scholar,) after exchanging views as to the calling in life they should adopt, on the 16th day of December, 1826, entered as law-students the office of Auguste Davesac, who was a prominent practitioner in the criminal-court, and spoken of by his contemporaries as a gentleman of taste, wit, and of some eloquence. He did not rank high as a civilian, but these young students had, at the same time, the benefit of the instructions of Workman, (a name familiar to the bar as a thorough jurist with literary attainments,) who had an adjoining office.

"One of the first books placed in their hands was Cooper's Justinian, containing an English translation. Dimitry had an advantage over his fellow-studen: the could read the original text. To equalize this the latter taught the former Latin.

"In one year (the facility of the pupil for the acquisition of the languages was so great) he could read Roman law-authors in the original.

"On the 23d day of June, 1828, he was examined in open court by the supreme court, then composed of Judges Matthews, Martin, and Porter, and was on that day licensed. Just previous, on the 25th of March, 1828, was adopted that act the repeal of which is termed by Judge Matthews as sweeping in its effects—tremendously sweeping; and by Etienne Mazureau as 'le grand coup de balai.'

"In fact, in the absence of any legislative enactment, it left to the French, Roman, and Spanish laws that authority which the force of reason alone could command. This in no manner abated the study of the systems of jurisprudence of foreign countries; but, inasmuch as our civil code is mainly copied from the Code Napoléon, modified by some portions of Spanish jurisprudence and some local provisions, the French civil laws became an object of close study, to which the deceased devoted all the attention and perseverance he was capable of. He studied extensively the French commentators, (keeping up with all the new works,) and constantly cited them.

"It is to be regretted that the deceased, with his wide range of experience and profound erudition, did not favor us with an elementary work on our civil code.

"His love of the civil law was a passion: the subject of his daily meditation and the favorite topics of his conversations. It is unanimously conceded by the bar and bench, that in the department of the civil law he was the front figure. He would have graced a seat on the United States Supreme Court bench; would have materially aided, with the large resources he could have made to bear, in inspiring a taste to the profession in the United States for the study of foreign systems of law, and would have exalted the standard of legal culture.

"Fully appreciating the importance of the French language, he soon acquired it, and in his early career at the bar frequently addressed juries in French. He seldom wrote it, for he was cognizant, owing to its niceties, that there are few in this country, although having received a liberal education, who can write it in strict conformity with the numerous rules of grammar, and a less number with elegance. In 1869 he visited his native country, where he found only two of his schoolmates survivors.

"His contemporaries say that from the beginning of his professional career he attended to his practice with a vigor and energy seldom ever witnessed; he reached the front rank about 1836; from that time he never ceased to have the most lucrative practice, and received very large fees. Punctuality and probity characterized him.

"Many gratuitous professional services has he rendered to the widow, the orphan, and to charitable institutions. Members of the bar in his intimacy have an idea of their great extent.

"Wisely attentive to the means of preservation of health, he rose about daybreak, and when the weather permitted could be seen taking his exercise on a hard-trotting horse. In his habits he was very domestic; never belonged to a social club, for he avoided any temptation to excess in eating and drinking. Besides, he was economic of his time, careful not to deprive his family of that time which should be allotted to it. In his latter life, running far back, he never darkened the door of a drinking-saloon; never ate between meals; cultivated moderation in all things.

"As an instance of the attention he paid to minor matters, after being attorney-general, and in the midst of professional engagements, in order to improve a defective calligraphy, he found time to take a course of lessons at Dolbear's writing-school and succeeded in writing a legible hand.

"As professor, during twenty-three years he taught the civil law in the University of Louisiana. As a lecturer, most excellent; could compare favorably with the best professors. In this calling he delighted; very lucid, cogent, and animated; by his emphatic style commanded the attention of his hearers. His punctuality in the delivery of his course was exemplary; the students could not depend on the inclemency of the weather or the overflow of the streets in anticipating a relaxation to their labors. In his conversations some little vanity could be detected when referring to his lectures, for there were concentrated his strength, ability, and pleasure. He prepared some written lectures on the civil code for his own use—they are not very extended—the definitions and classifications of the various subjects are strikingly clear and methodic, intending it, as a compendium, to show the actual state of Civil-Law-jurisprudence in Louisiana. The introductory lecture to this course, published in a law-magazine in Montreal, is worthy of his fame.

"In his law-office were also to be found law-students under his charge. He deserves the public gratitude as an instructor of youth, for the impressions left on them follow them in the legislative halls, in courts, and the busy walks of life. His pupils are numerous, found on the bench and at the bar, two of them occupying seats on the supreme-court bench of this State. It was his delight to meet them all, and the feeling was warmly reciprocated. He practiced before judges that he had instructed and whose tastes he had formed. His name stands inseparably connected with the law-school.

"As attorney-general. He was appointed to this office in February, 1841, and served for the term of two years. At the time of his appointment by Gov. A. B. Rowan, he was a member of the house of representatives.

"*Political life.*—He was a member of the State-convention of 1845, where were to be found so many able men and lawyers who stood in the front rank of their profession. He took part in the debates. In the succeeding convention of 1852 he also had a seat. In 1861 he was a member of what is termed the secession convention, having been elected from his senatorial district by an overwhelming majority. During the canvass he made a vehement speech against secession. He voted against the ordinance of secession, and refused to sign it. He served in 1841 as a member of the house of representatives, only for a month, being appointed attorney-general. His heart was not in a political life, but in the profession he adorned.

"During the military occupation of the city General Shepley tendered him the office of chief justice, but he declined. Governor Wells sent him a commission for the same office. After ascertaining from General Hurlbut that the courts of the State would be held subject to military interference, he did not fancy such an embarrassing or nondescript position. In 1864 he was elected to the State-convention, took his seat for a day, and resigned it by reason of an oath that was exacted from its members.

"The names of Roselius and Martin will not be soon forgotten, the latter as the type of the Louisiana bench, the former as the Louisiana civilian, both honored sons of their adopted State. From the position of journeymen-printers one rose to the chief magistracy of the State, the other to the attorney-generalship. By laborious and persevering application they improved the gifts of nature, and received the rewards which they richly deserved in enjoying the public confidence, and having their names linked with the jurisprudence of Louisiana, in their respective spheres. They have acted their parts well and have done some service to the State. We remain to honor them and to profit by their example."

H. C. Miller, esq., in his remarks thus referred to his qualities as a teacher: "The deceased bore another and interesting relation. For years he had devoted himself with unfailing assiduity to the legal education of the young candidates for the bar. Whether in sunshine or in storm, or fresh or weary with professional labor, Christian Roselius was ever at the post of the self-imposed duty of imparting his knowledge to those under his charge. To his classes he was endeared. In their impressions of him there was no alloy resulting from the contact and the asperities of professional controversy. They knew him only as the faithful teacher, actuated by unselfish zeal, an affectionate solicitude for their welfare, and a lofty appreciation of the obligations of his profession. It was fit that those young men should have the opportunity of uniting their tribute with that of the older members of the bar."

The following, referring to his connection with the university as law-professor, is extracted from the preamble and resolutions passed at the meeting of the bar:

"Whereas the deceased merits the tribute of commendation for that love for his profession and self-sacrificing zeal which, in spite of the exactions of a large and heavy practice, impelled him to assume the onerous duties of professor of civil law in the University of Louisiana, the duties of which he discharged for years with unremitting diligence and assiduity, endearing himself to those with whose legal education he was charged, and fully requiting that debt which, it is said, every lawyer owes to his profession."

Hon. H. N. Ogden seconded the adoption of the resolutions and paid an eloquent tribute to the memory of the deceased as a teacher: "It was as a teacher of the science of law that I consider Mr. Roselius peculiarly entitled to the gratitude of all Louisianians. He was in every respect a great teacher. His knowledge was consummate. His love for the science kept his knowledge fresh and progressive up to the very last moment of his eventful life. How much the State of Louisiana owes him as a teacher can never be estimated. It was with him a genuine labor of love. Freely he had received; freely he gave. The influence of his life must be felt in this State so long as the constitutions of the civil law are preserved and respected among us."

LIST OF SCHOOL-OFFICIALS IN LOUISIANA.

Hon. WILLIAM G. BROWN, *State-superintendent of public education and president of State-board of education, New Orleans.*

DIVISION-SUPERINTENDENTS AND MEMBERS OF STATE-BOARD OF EDUCATION.

Name and division.	Post-office.
E. S. Hewitt, first division	Amite City.
E. S. Stoddard, second division	Carrollton.
Emerson Bentley, third division	Franklin.
C. S. Able, fourth division	Shreveport.
R. C. Wyly, fifth division	
J. B. Carter, sixth division	New Orleans.

MAINE.

[From report of Hon. Warren Johnson, State-superintendent of common schools, for the year ended April 1, 1872.*]

SCHOOL-FUNDS.

The sources of these are: (1) interest on permanent fund derived from sale of public lands, (2) a tax of one-quarter of 1per cent.—semi-annually—on the moneys deposited in savings-banks, (3) a tax of 1 mill per dollar on the appraised value of all property within the State, (4) a tax of 80 cents for each inhabitant, (5) proceeds from local funds, and (6) voluntary town- or district-tax. From these sources and from current legislative appropriations, there have come for 1872 the following receipts:

From interest of permanent school-fund		$18,778
From savings-banks-tax, payable July 1, 1872		57,335
From school-mill-tax, payable January 1, 1873		224,530
From municipal tax for current school-expenses		717,719
From local funds		14,408
From district or legislative appropriations—		
For erection of new school-houses	$131,799	
For prolongation of schools	13,164	
For school-supervision	24,139	
For teachers' institutes	4,000	
For normal schools	31,000	
For printing annual report	3,500	
Salary of superintendent, $1,800; clerk, $1,200	3,000	
Other expenses of office	800	
		211,402
Total receipts		1,244,172

The aggregate of expenditures for the same period is given only in approximate estimates, the full returns not having come in at the time the report was made. These expenditures appear to be as follows:

For erection of new school-houses	$131,179
For prolongation of schools	13,164
For supervision	24,139
For fuel, insurance, &c	76,841
For wages and board of teachers	682,864
For teachers' institutes	4,000
For normal schools	31,000
For office-work and incidentals	7,300
Total estimated expenditure	970,487

If these estimates should prove to be correct, there would seem to be a probable balance of $273,685 available for the school-year of 1872–'73.

All such expenditures, however, as may be observed, belong only to the public-school-system of the State, and do not fully represent the amount disbursed for education. Besides these, there is included in the estimates of the superintendent one item of $63,420 for private tuition, with $6,000 for the College of Agriculture and Mechanic Arts, $20,000 for a new normal school at Castine, with other considerable sums for high schools at Frenchville and Fort Kent, for the Maine Central Institute, for a seminary at Oak Grove, for various academies, and for the schools of the Madawaska territory—these last all outflows from the generous bounty of the legislature for the encouragement of educational interests within the State. A more recent report from the agricultural college gives $22,000 more as donated by the legislature in 1873 for the supply of needful buildings and improvements. Adding together all the items, the superintendent says: "It is reasonable to assert that the education of our youth costs annu-

*For returns for 1872–'73, see statistical tables I and II. The law in Maine requires school-officers to make up their returns to April 1 of each year, and transmit these to the State-superintendent by May 1. The returns here given represent mainly the school-year ended April 1, 1872, but are extended by observations of the superintendent to December 1, when his report is presented to the governor and councilors.

ally, in round numbers, $1,400,000." Deducting all extraneous expenses from those which properly belong to public schools, he makes the total for each inhabitant in 1872 $1.77; for each census-scholar, $4.87; for each registered scholar, $9.10; for average attendance, $11.99. "In round numbers, the annual tuition of the pupil at the public school amounts to $12. Now, the length of summer- and winter-schools together is nearly twenty weeks. The weekly tuition is, therefore, 60 cents, about the usual price of tuition in private schools. But, based on the number registered in public schools, this price would be only 44 cents, one-third less than private tuition. Based on the census-number of youth who have a right to avail themselves of the benefits of the public schools, the rate is only 23 cents, less than half the cost of private tuition." It is, hence, not the fault of the State, but of parents and guardians of children in the State, if the elements of a good education are not secured from the public schools at an expense far less than from any other source.

PERMANENT SCHOOL-FUND.

The portion of this fund realized from the sales of the public lands now amounts to only $317,902, yielding an annual interest of $18,778, or $0.083 per census-scholar. This is apportioned, on the 1st of July in each year, by the State-treasurer, the quota of each town being payable to it on its showing that the State- and county-taxes have been paid by its citizens. The lands from which the capital of this fund has been derived being now largely disposed of, no further considerable addition to it can be looked for from the sale of these. The fountain of supply being thus exhausted, the superintendent looks around for some new feeder of a fund which is so important to the school-system of the State. He can find none in general or special taxation or in gifts of individuals to a State-school-fund, and therefore turns to the General Government, hoping that out of its great land-domain some further appropriation may be made to individual States in aid of the system of free schools.

APPORTIONMENT OF SCHOOL-FUNDS.

Fault is found, and with apparent justice, with the mode in which the school-moneys are now apportioned by the State. The State-treasurer is required to distribute these to the several towns according to the whole number of youth in each between the ages of 4 and 21. The rate for 1873 would be about $1.60 for each youth. The town of Madawaska, with 514 such youths, would receive, under this rule, $822.40 in all. The town of Farmington, with 1,040, would get $1,664. Madawaska, educating about 101 scholars of her 514, would thus have $8.20 for each scholar, while Farmington, educating about 615 of her 1,040, would have only $2.71 for each. The town which does the larger duty in the way of education of its children receives thus, by law, the minimum of compensation, while that which does, perhaps, the least of all receives the maximum. A remedy for such unintentional discrimination in favor of the worse against the better sort of towns is, therefore, sought, and the superintendent finds it in an arrangement by which actual attendance on the schools for at least two consecutive weeks, by each scholar, shall be made the basis of apportionment. The moneys designed for educational purposes would then be placed where educational efforts are made; not going, as now, according to the number out of school as well as in, but rather according to the number who, by presence in the schools, show their desire for educational advantages. An amendment of the law to this effect is hence suggested.

SCHOOL-STATISTICS.

Whole population of the State, according to census of 1870	626,915
Whole number of scholars between 4 and 21	226,751
Number of these registered in summer-schools	118,222
Average attendance in summer-schools	92,750
Number registered in winter-schools	126,311
Average attendance in winter-schools	102,443
Per cent. of average attendance to whole number	.49
Per cent. of average attendance to scholars registered	.80
Per cent. of average attendance to registry in summer-schools	.78
Per cent. of average attendance to registry in winter-schools	.81
Average length of summer-schools, 5½ days per week	9w. 2d.
Average length of winter-schools, 5½ days per week	10w.
Average length of schools for the year, 5½ days per week	19w. 2d.
Number of school-districts	3,861
Number of parts of districts	310
Number of graded schools	462
Number of school-houses	3,868
Number of school-houses in good condition	2,279
Number of school-houses built last year	121
Cost of these	$131,799
Estimated value of all school-property	$2,644,264

The number of school-houses is somewhat less than last year; the cost of those erected, greater. Out of the whole number of school-houses in the State the superintendent says "more than one-third are reported 'poor;' and when we consider," he goes on, "that the standard of 'good' condition is an extremely low one, often embracing simply a building with a tight roof, exterior walls shingled or clapboarded, furniture poor, light and ventilation worse, ugly walls, patched plastering, no blackboards, no outline-maps, charts, globes, or books of reference, we shall conclude that the 'good' school-houses are less in number than the 'poor' ones. Observation corroborates this." He states, however, that in this respect the people are doing better than heretofore, and that many are doing the best they can. The district-system, in his judgment, stands in the way of better school-houses, as many of the districts have so few inhabitants, and these often so very limited in means that it is difficult to raise the necessary funds for the erection of really creditable buildings. Against this district-system he accordingly directs his pen, urging an abandonment of it for the town-plan, under which the town divides its money so as to afford equal facilities to all building, repairing, and owning the school-houses, and so controlling the services of the teachers as to afford nearly continuous employment to the better class. He gives some striking instances of the benefits that have resulted in specified towns from the abandonment of the one system for the other and trusts that such action may early become general.

TEACHERS AND TEACHERS' PAY.

Number of male teachers employed in summer in the State	145
Number of male teachers employed in winter	1,870
Number of female teachers employed in summer	3,959
Number of female teachers employed in winter	2,213
Number of teachers that are graduates of normal schools	270
Average wages of male teachers per month, excluding board	$33 17
Average wages of female teachers per week, excluding board	3 60
Average cost of teachers' board per week	2 32

To this matter of teachers' wages the superintendent devotes much attention in his report, showing how poorly these useful servants of the public are remunerated for labors which, in other spheres of occupation, would command high rates. He shows that, in many instances, even house-servants and factory-hands receive more per week than the trained teacher, while the employment of such, being more continuous, is more gainful at even the same rates. The female teachers especially command his notice, and he makes a really sad showing of their case. Referring to the fact in the tables that the weekly wages of female teachers, exclusive of board, amount to only $3.60, he says: "Now, if a female teacher instruct both summer and winter, the twenty weeks of the school-year, she will receive, at this rate, the magnificent sum of $72. That is, if a young woman comes into Maine to teach for a living, she will get each year $72 and her board for twenty weeks, and for the remaining thirty-two weeks must pay $74.24, the average teachers' board being $2.32 per week. She will thus, at the end of the year, be in debt $2.24, without paying one cent for culture, clothing, or comfort. In brief, the female teacher in Maine cannot earn her living by teaching." He gives, subsequently, a table of the monthly rates of teachers' wages in the different States, and shows by this that, while in the matter of the pay of male teachers Maine has one companion—Minnesota standing within a few cents of her low rate—in that of the pay of females she is at the lowest point in all the list, the scale falling from Nevada, where the pay is $107 per month, down through Louisiana, $76; California, $62; New Hampshire, $20.71, to Maine, $14.40. With such a rate of compensation, it can be no matter of surprise that sometimes there are complaints of poor teachers and poor schools. The wonder rather is that so much good service is received where the payment is so inadequate.

TOWN- AND CITY SUPERVISION OF SCHOOLS.

The total amount paid in the State for supervision of town-schools is reported to be $24,139, which sum is paid for the supervision of 4,101 schools, or, allowing two terms annually, for 8,202 school-terms, or 82,020 weeks of school. This gives $3 for supervision to each term. Some towns, however, pay more than others, Bangor, with 34 school-houses, paying $1,360, and Lewiston, with 30 school-houses, $2,000; while Auburn, with 28, pays $500. The rate of compensation for such work is thus, in many cases, considerably below the $3 above mentioned, $2.23 being set as the ordinary rate per term, that secured per day by visitation of two schools daily being the same. But, as the traveling-expenses of the supervisor have to come out of this, it is shown that the current rate for a day's service in such important work is only 73 cents. How difficult to secure the best and highest supervision at such rates must be at once apparent. A better pay, with a view to a more effective work, is therefore strongly urged.

Another suggestion is, that when a school-inspector has attained skill in his work he should be retained in office, that such skill may be utilized to the utmost; whereas now too often an annual election rotates experience out and inexperience in.

COUNTY- OR DISTRICT-SUPERVISION.

A return to something like the old system of county-supervision is argued for as almost indispensable to efficient working of the free-school-system. It is held that the general sanction of such a system in a large portion of the States gives an educational suffrage in favor of it which ought to have considerable weight, while its proved efficacy in stimulating teachers to their duty and aiding them in the right performance of their work unite with abuses that have grown up from the want of it to urge to its re-establishment. The need of some such agency being assumed, the question of the means for making it most thoroughly efficient is discussed, and the conclusion reached that to secure such supervision as is needed at least the former number of men should be employed and at a rate of compensation fully one-half higher than before. If the expense of such an arrangement should be made an objection to it, the superintendent would put into the fund for paying supervisors what is now appropriated for supporting teachers' institutes, and make it the duty of the supervisors to hold at least one institute of five days in each county, without extra cost to the State.

SCHOOLS OF PORTLAND.

The estimated school-expenses of this city for the school-year of 1872–'73 were, for salaries, $54,175; for ordinary expenses, exclusive of salaries, $17,000; for extraordinary, $2,500—total, $73,675.

The whole number of children of school-age (4–21) was 9,646. Of this number, about 70 per cent. were enrolled in some school; while of the number between 5 and 18 years, 93 per cent. were attending school. The average attendance was 3,904. Out of 1,719 pupils in private schools, the average attendance was 1,352.

The public schools embrace one high school, (for girls and boys,) grammar, intermediate, and primary schools. The course of study for each grade and the text-books to be used are prescribed by the superintending school-committee. Drawing was introduced two years ago, and, though it has been pursued under disadvantages, the beneficial influence of this training of hand and eye and taste has been apparent.

BATH.

In this town the system has been adopted of purchasing for the schools the text-books to be used and then loaning them to the pupils. By this means a uniformity of text-books is secured without imposing any burden of expense on parents of narrow incomes. The thing has worked so well that it has been adopted in other places and is recommended for general adoption in the State.

SECONDARY INSTRUCTION.

From 24 private academies and high schools in the State an aggregate is reported of 2,279 pupils—1,184 boys and 1,095 girls—with 70 teachers, 31 of whom are gentlemen and 39 ladies; 588 of the students are pursuing English branches, 259 classic, and 113 modern languages; 72 had graduated the previous year from these schools, of whom 28 were known to have entered college, and 123 are specifically reported as preparing for college at present. Only two of these schools are exclusively for the education of either sex—one for boys and one for girls—the remainder being for the joint education of both sexes; 8 are under denominational influences and the remaining 15 "non-sectarian."

An important addition to these institutions for secondary instruction in the State is to be made by the opening of an extensive classic and scientific school for boys and girls at Hallowell, in January, 1874, under the auspices of the Congregational conference. The old Hallowell Academy is to be used for recitations by the new school, while for the boarding of the pupils two buildings have been erected, one for the boys, to accommodate 40 inmates, the other for the girls, of considerably greater size. The latter is 160 feet in length, with two wings of 40 feet in breadth, and contains 76 rooms, arranged in suits of two chambers and one parlor for four pupils, accommodating thus about 100. As soon as possible, a still larger edifice is to be erected, in the confidence that it will be required. This school is meant to be to Maine what the Phillips Academies at Exeter and Andover have been to New Hampshire and Massachusetts: an institution for affording thorough training for either the ordinary walks of business or the advanced classes of good colleges. It will serve, at the same time, as a high school for Hallowell. The buildings are on an elevation which commands an extensive view up and down the Kennebec, the grounds including eleven acres.

STATE HIGH SCHOOLS.

In accordance with a recommendation from the State-superintendent, the legislature, in the winter of 1872–'73, passed an act for the encouragement of free high schools, engaging that where any town or city should make suitable provision for

such schools, the appropriation made for this purpose should be supplemented, after ten-weeks existence of the schools, by an equal appropriation from the State, provided that the amount of this should not exceed $500 annually. Under this act, free high schools have sprung up in every portion of the State, not less than 200 being said to be existent in the autumn of 1873. The advantages of an education superior to to that in the ordinary schools, and approximating that in the better class of old academies, have thus been brought within the reach of almost all. The academies have, in many instances, been absorbed by these high schools, and the apprehension is expressed by some of these remaining that, if the new law be sustained, the old academies and high schools of the State must needs go down. In that case there will have to be a careful looking after the character of the instruction given in the new schools, lest, in the rapid broadening of the stream, there come a correspondent shallowing.

PREPARATORY INSTITUTIONS.

Four institutions devoted especially to the preparation of students for college report an aggregate of 203 in classic and 74 in scientific studies, of whom 59 were in the senior, 74 in the junior, 56 in the third, and 88 in the fourth, or lowest, class. The Auburn high school, with 3 teachers, has 37 pupils in its classic and 23 in its scientific classes; there is a chemic laboratory, a small philosophic cabinet and apparatus, and a library numbering 50 volumes. The Nichols Latin School, at Lewiston, with 4 instructors, has 51 students in classic studies and 10 in subordinate classes; the Franklin Family School, at Topsham, with 4 instructors, has 14 students in classic and 5 in scientific studies; the library numbers 1,800 volumes; the Classical Institute, at Waterville, with 5 instructors, has 101 pupils in classic and 46 in scientific studies; there is a library of 50 volumes.

NORMAL SCHOOLS.

Maine has two normal schools, one at Farmington, the other at Castine, each with a carefully-selected principal, supported by corps of earnest assistants. These schools are said to be doing a valuable service to the public-school-system, by improving the quality of the teaching force. Proof of this and of the public appreciation of it is given in the fact that the graduates of these schools are eagerly sought for as teachers in the larger towns and cities, as well as in many of the rural districts. Many of these graduates find employment, too, in other States after serving out their stipulated term in the one from which they have received their education, it being found, in every direction, that skilled teachers, even at much higher rates, pay better for their employment in the education of the young than the cheap, unskilled ones, that have been too often heretofore employed.

With the Farmington school 772 pupils have been connected since its organization in 1864, of whom 156 have completed the course and received diplomas. Of the 175 connected with the school in 1872, many had taught before entering it, and came in to perfect themselves in their profession.

In the school at Castine 278 have been borne upon the rolls within the same year, the number of different pupils being 180. A large proportion of these continued to exercise themselves as teachers during some portion of the year. A model school, taught in connection with this normal school, has given opportunity for practical training of the pupils.

In addition to these two regular normal schools, there are said, by the superintendent, to be normal departments in the Maine Central Seminary, and at the Oak Grove Seminary, Vassalboro', both under the supervision of the State. In the former a special report for 1873 shows 12 students in the first year of the normal course and 13 in the second year. In the latter, where 46 students in all are reported, the number in the normal course does not appear.

In connection with the normal institute at South Paris and the Litchfield Academy, Litchfield, teachers are said to be trained for work in schools; but how many are thus trained is not reported, nor is the character of the training for school-work indicated; and the absence of definite returns here, as at Vassalboro', renders it somewhat doubtful whether these institutions can properly be reckoned among normal schools.

COLLEGE FOR WOMEN.

The only institution exclusively for the higher education of young ladies which has favored the office with its statistics for the year 1873 is the Wesleyan Seminary and Female College, at Redfield. The degrees conferred here are those of artium baccalaurea and artium magistra. With twelve professors and instructors, 6 of whom were gentlemen, there was an attendance in the collegiate department of 694 students. Music, (both vocal and instrumental,) drawing, painting, French, and German are taught; there is a chemic laboratory, a philosophic cabinet, a small natural-history-museum, a gymnasium, and a library numbering 1,600 volumes.

SUPERIOR INSTRUCTION.

This for Maine is afforded by Bowdoin College, Brunswick; Bates College, Lewiston; Colby University, Waterville, and the Maine State College of Agriculture and Mechanic Arts, at Orono.

Bowdoin has reorganized its faculty during the year past, established two new professorships, (of physiology and natural history,) enlarged its scientific curriculum, and made provision for post-graduate-instruction and for the appointment to fellowships of such students as graduate with honor in any one of the series of post-graduate-studies.

Bates has enlarged its body of instructors, added to its courses theologic instruction, and admits women.*

Colby, exchanging a much-respected, aged president for one in the prime of life and usefulness, takes, under his lead, a new start forward, with some fresh material in its faculty, with a college for women besides that for men, and with a fine new building for its cabinet and laboratory, erected at a cost of $27,000. An introductory course in the Waterville Classical Institute affords both to young women and young men a thorough preparation, under the supervision of the University, for the full classic and scientific course within its halls.

The Maine State College, for instruction in agriculture and the mechanic arts, offers, besides its training in these lines, courses in English literature, mental and moral science, mathematics and physics, chemistry, French and German, civil engineering, natural history, book-keeping, and commercial forms. Its students receive also such a drill in military tactics as to make it substantially a military academy for the State.

The statistics of these several institutions are thus given for the latter part of 1873:

Statistical summary of universities and colleges.

Names of university and colleges.	Corps of instruction.	Endowed professorships.	Number of students.		Corporate property, &c.						Number of volumes in library.
			Preparatory.	Collegiate.	Amount of property of corporation.	Value of grounds, buildings, and apparatus.	Amount of endowment.	Amount of productive funds	Income from productive funds.	Receipts for last year from all other sources

PROFESSIONAL INSTRUCTION.

The institutions for professional training, apart from Maine College, are the Medical School of Maine, at Bowdoin College; the Bangor Theological Seminary, at Bangor, and the theologic school connected with Bates College, at Lewiston. The first, with two years in its lecture-course and at least one additional year with a regular physician, numbers 11 professors and lecturers and 57 students, with 4,000 volumes in its library. The second, a congregational seminary, has 5 professors and 1 other instructor, with 37 students, and 15,000 volumes in library. The third, Free Baptist, reports 4 resident professors and 1 non-resident, 18 students, and a library of 2,000 volumes.

* The Rutland (Vermont) Herald announces the gift of $1,000 to Bates College by Judge Redington, for the endowment of a scholarship for a female student through all the successive classes perpetually. This is, perhaps, the first endowment of a scholarship specifically for the benefit of a woman-student in any college not designed for women only. Judge Redington has also bestowed $5,000 on the Redington professorship of mental and moral philosophy in the same college.

There appears also in this State one business-college, with 79 students.

EDUCATIONAL ASSOCIATIONS AND TEACHERS' INSTITUTES.

The Maine Educational Association held its sixth annual meeting October 22–24, 1872, at Bangor. The city generously furnished a place of meeting, while the city superintendent and teachers of the place did all that was possible for the comfortable entertainment of their visitors. The subjects discussed were eminently practical in character, such as "The town- *versus* the district-system," "Teaching illustrated by language," "Educational needs of Maine," "Free text-books for free schools," "Systematic elevation of teaching," "Free high schools," "Industrial education," "A complete system of public schools," "Teaching and its compensation," and "The principles which should inspire the teacher." The papers presented on these subjects are said to have been all valuable and the discussions to have exhibited a fair comprehension of the vital questions pressing for solution.

Renewed request is made for legislative appropriation, to foster an institution so likely to prove beneficial to the cause of education in the State.

Efforts were made by the superintendent to form, besides this, county educational associations, composed of the school-officers and teachers of the several counties in the State. Such associations were formed in a few counties with a view to the improvement of the members in the science of teaching and in the most approved methods of the same, as well as to the promotion of professional unity and the diffusion of educational information among the people.

Eighteen teachers' institutes were held during the year; but, though excellent instructors were employed and great satisfaction with their labors was expressed, the results appear to have been less encouraging than in some preceding years. This is attributed (1) to the disheartening influence exerted upon teachers by the low rate at which their services are held and (2) to the want of that active county-superintendency which on previous occasions had prepared the way for full and successful meetings.

MARYLAND.

[From reports of State-board of education, Hon. M. A. Newell, president, for the years ended September 30, 1872–'73.]

SCHOOL-POPULATION, 1872–'73.

Number of children of school-age, (6–21)—	
Males	138,813
Females	137,307
	276,120

The number under 6 and over 16 is not reported.

SCHOOL-ATTENDANCE.*

Number of pupils enrolled in public schools	130,324
Average attendance	59,001

STATISTICS OF SCHOOLS.

Number of public schools in the State	1,742
Average duration of school in days	283

The number of private schools and of pupils in these is not known.

TEACHERS AND TEACHERS' PAY.

Number of teachers in public schools—	
Males	1,079
Females	1,476
Total	2,555
Average salary of teachers per month, for males and females both	$39 86

FINANCIAL STATEMENT.†

Receipts.

From taxation	$1,093,721 42
From interest on permanent fund	59,146 32
From other sources	245,740 17
Total	1,398,607 91

Expenditures.

For sites and buildings	$197,387 10
For salaries of superintendents	31,440 00
For salaries of teachers	889,476 47
For rent of buildings	22,751 31
For stationery and school-books	69,526 29
For miscellaneous purposes, as fuel, lights, repairs, &c	143,485 54
Total	1,354,066 01

STATISTICS OF BALTIMORE PUBLIC SCHOOLS.

Included in these returns are those from the city-schools of Baltimore for 1873, which, separately stated, are as follows:

Total population of the city, 302,839; number of children enrolled in schools, 28,329; number of scholars enrolled in schools, 28,329, of whom 14,406 are in primary, 8,756 in grammar, 1,115 in high, and 1,666 in evening-schools. The number in average attendance is 22,181, of whom 12,164 are in primary, 7,271 in grammar, 1,007 in high, and 1,177 in evening-schools. The number of teachers is 624—males, 81; females, 543—

* The statistics of school-attendance are for the year ended June 30, 1873.
† The financial statement is for the year ended September 30, 1873.

of whom 337 are in primary, 211 in grammar, 32 in high, and 36 in evening-schools. There are 123 schools, of which 70 are primary, 39 grammar, 3 high, and 11 evening. The amount of funds received for school-purposes was $492,111.11, of which $130,851.97 were received from the State-fund, $321,826.01 from taxation, and $39,433.13 from other sources. Latin is taught to 288 pupils, Greek to 31, German to 121, French to 46, drawing to 5,763, and vocal music in all the schools, and also in the Baltimore City College.

PRIMARY EDUCATION IN THE STATE.

In the last annual report of the board of education it was said at the conclusion of the statistical summary: "We have shortened the average school-year by about ten days; we have diminished the teachers' salaries by about $24,000; we have spent $31,000 less in building, repairing, and furnishing school-houses, and in return we find 2,286 fewer children on the rolls and 2,040 fewer in average daily attendance." They now say: "It is very gratifying to see that this year the shades of the picture are reversed. We have lengthened the school-year, as compared with the last, by sixteen days; we have increased the teachers' salaries by $14,000; we have spent $70,000 more than last year in building and furnishing school-houses, and in return we find that the enrollment of pupils is increased by 12,198 names and the average daily attendance by 3,727. The total expenditure for schools exceeds the expenditure of last year by $97,083.08, but there has been a decrease in the items of 'books and stationery,' 'supervision and office-expenses,' and 'miscellaneous expenses,' amounting to more than $22,000. With the exception of the appropriation for colored-schools, of which the counties received $40,714.52, this increased expenditure has been provided for by county-taxation, voluntarily imposed, for the proceeds of the State-school-tax and free-school-fund were less than in the previous year by nearly $11,000.

"It is true that the greater part of the increase in the number of pupils is due to the opening of schools for colored children; still there is evidence of progress in the other schools, which show an increased enrollment of 1,009 pupils. A mere comparison of numbers, however, will fail to indicate the actual advancement which has been made. The popular feeling in favor of public schools is more nearly unanimous and more intense now than at any other time. Although a greater number of school-houses have been built than in any former year, the demand for more and better houses is still on the increase. There is more inquiry for experienced and well-qualified teachers and a greater willingness to pay them adequate salaries. Several new high schools have been established, some academies on the old foundation have been transformed into public high schools, and many large graded schools have assumed such proportions that we may expect them before long to furnish the foundation for additional high schools. Every effort on the part of school-boards to furnish better accommodations and better teachers has been responded to by the people and has resulted in an increase of pupils and in a higher appreciation of the school-system. We can point to instances where an old school-house was torn down and one twice as large built in its stead, and yet the new house was too small to accommodate the unexpected increase of pupils. It ought to be added that, in the cases referred to, the new school-houses were complemented by new teachers, at higher salaries. If the policy of providing good houses, good furniture, and highly-qualified teachers prevailed all over the State, the increased attendance would surprise even the best friends of public education.

"It must be borne in mind that the gratifying summary which we have given is taken from the public-school-system as a whole, and the inferences drawn from it cannot fairly be applied to all parts of the State indiscriminately. While we recognize with gratitude the efforts that have been made in many counties to make the schools worthy in every respect of the patronage of the people, we must acknowledge that there are other counties on which no eulogium can be pronounced, and which, so far from swelling the general tide of prosperity, have contributed only to lower the average level.

"The average daily attendance does not show an increase proportionate to the increase in the number of different pupils. This is accounted for partly by the prevalence of sickness to an unusual extent, partly by the necessities of labor; but it is to be feared that there is a large residuum of absenteeism which must be attributed to other causes: indifference in the parents, lifelessness in the schools, and want of energy in the visiting officers. In reference to this last cause, it may be observed that the district-trustees are required by law to visit the schools frequently; but this duty is very seldom performed. The examiner is required by law to visit every school in his county twice a year, and, if there are not more than fifty schools in the county, three times. The aggregate number of official visits paid by the examiners to the schools under their charge is about one thousand short of the number required by the law. What effect one thousand additional visits might have produced upon the attendance we can only conjecture; but it is certain that, without constant, searching, conscientious, and judicious superintendence, the schools cannot flourish. Believing that the teacher has it in his power to diminish to a certain extent the irregularity of which we complain, we repeat the recommendation made in a former report, that a

certain portion of his salary should depend upon the average daily attendance. Unless some energetic measures are put in operation we are afraid that the irregularity will increase and the teachers will become reconciled to it as one of the evils that 'can't be cured and must be endured.'

"Colored-schools are reported as having been established in all the counties as follows: Allegany, 2 schools, 132 pupils; Anne Arundel, 12 schools, 700 pupils; Baltimore County, 11 schools, 498 pupils; Calvert, 10 schools, 533 pupils; Caroline, 9 schools, 300 pupils; Carroll, 5 schools, 230 pupils; Cecil, 7 schools, 279 pupils; Charles, 15 schools, 925 pupils; Dorchester, 19 schools, 1,184 pupils; Frederick, 14 schools, 751 pupils; Harford, 14 schools, 582 pupils; Howard, 6 schools, 238 pupils; Kent, 6 schools, 435 pupils; Montgomery, 8 schools, 468 pupils; Prince George's, 9 schools, 409 pupils; Queen Anne's, 12 schools, 664 pupils; St. Mary's, 12 schools, 512 pupils; Somerset, 7 schools, 467 pupils; Talbot, 8 schools, 617 pupils; Washington, 9 schools, 455 pupils; Wicomico, 8 schools, 423 pupils; Worcester, 7 schools, 394 pupils—total, 210 schools, 11,189 pupils—to which should be added Baltimore City, 15 schools with 2,982 pupils, making an aggregate of 225 schools and 14,171 pupils.

"Two difficulties, which it will take time to remove completely, have retarded the operations of these schools: the want of good teachers and the want of suitable buildings. As these obstacles disappear, the number of children attending school will gradually increase. It is not unreasonable to expect an attendance of nearly 20,000 next year, and for this number a large appropriation will be necessary.

"In making such a grant it would be well to provide that it shall be distributed to such counties only as have properly expended the amounts previously received. This suggestion is made in consequence of several counties having spent much less than their quotas during the year, the unexpended balance amounting to nearly one-fourth of the whole amount received. In some cases the balance has been reserved for building school-houses, (it would have been better if houses had actually been built with it;) in others no explanation has been offered. It should be mentioned, in this connection, that many counties have spent more than the amount received from the State-treasury, and that, as a general thing, where the white-schools are best managed, there the greatest liberality is shown to the colored-schools. The lack of uniformity that is observable in all the school-work of the State is very conspicuous in these colored-schools. The enrollment of colored pupils in this their first year as part of the State-system is 8.6 per cent. of the colored population. But this proportion is very unequally distributed. In Dorchester it is nearly 16 per cent. of the population; in the adjoining county of Somerset it is not 7 per cent.; in Harford it is 12 per cent., and in Cecil, on the opposite side of the Susquehanna, it is 7 per cent.; in Frederick it is 10 per cent., and in the adjoining county, Montgomery, it does not quite reach 7 per cent. In most instances the annual reports of the colored-schools have been rendered in the same form and have embraced the same particulars as the reports of the white schools. In a few counties, however, the reports have been partial and fragmentary; the number belonging to each school and the daily attendance not being given, these items have been estimated. The limits of possible error in these estimates are very narrow and the general accuracy of the results is not seriously impaired.

CHANGES IN THE SCHOOL-LAW.

Every successive legislature seems animated by a laudable ambition to improve the school-law. The general assembly of 1872, following the usual practice, repealed the act of 1870, (which had repealed the act of 1868, which, in its turn, had repealed the act of 1865,) but, being animated by a spirit of judicious conservatism, re-enacted it almost word for word. The following are the only alterations or additions:

(1) The name of the board of "State-school-commissioners" is changed to "State-board of education" and that of "district-school-commissioners" to "district-school-trustees," (chapter 1, sections 1 and 3;) but the duties and powers are unaltered.

(2) Authority is given to county-school-commissioners "to take affidavits and administer oaths in all matters pertaining to public schools, but without fee or reward."

(3) The words "if possible" are added to the clause (v, 1) by which school-district-trustees are required to keep the schools open ten months in the year.

(4) There is added to section 3 of chapter vii: "In districts where there is a considerable German population, the board of county-school-commissioners are authorized to cause the German language to be taught, if they shall think proper to do so."

(5) The number of pupils in average attendance, necessary to authorize the employment of an assistant teacher, is changed from 45 to 50, (vii, 4.)

(6) The section limiting a teacher's certificate to three years is changed, so as to read thus: "Nor shall such certificate continue in force for more than six months, unless the person receiving the same shall satisfy the examiner of his fitness for governing a school and his ability to impart instruction in the various branches taught in the public schools; but, when the examiner shall have satisfied himself upon these

points, he shall be empowered to issue a certificate, which shall continue in force for three years," (xi, 2.)

EDUCATION OF COLORED CHILDREN.

(7) Chapter xviii, entitled "Colored population," is repealed, and the following chapter substituted:

SEC. I. It shall be the duty of the board of county-school-commissioners to establish one or more public schools in each election-district for all colored youth between 6 and 20 years of age, to which admission shall be free, and which shall be kept open as long as the other public schools of the particular county; provided the average attendance be not less than fifteen scholars.

SEC. II. These scholars shall be under the direction of the board of district-school-trustees of the respective school-districts within the limits of which they are established; they shall be subject to the same laws and furnished instruction in the same branches as the schools for the white children.

SEC. III. The comptroller shall apportion the sum appropriated for the support of the colored-schools of the several counties and the city of Baltimore in proportion to their respective colored population between the ages of 5 and 20 years, said apportionment to be made at the time he apportions the levy for the white-schools.

SEC. IV. The total amount of taxes paid for school-purposes by the colored people of any county or in the city of Baltimore, together with any donations that may be made for the purpose, shall also be devoted to the maintenance of the schools for colored people.

ENFORCEMENT OF THE LAW.

The board says, in its report of 1871–'72: "It would not be difficult to suggest some very desirable amendments; but probably no amendment would be so efficacious as a vigorous enforcement of the law as it stands. The State-board of education is authorized to enforce the provisions of the school-law; but the State-board has not power commensurate with its legal authority. All that it can attempt is to call the attention of the public and of those concerned to important particulars in which the law has been ignored or violated, in the hope that the proper remedies will be employed."

SCHOOL-STATISTICS.

The school-statistics of the State are said to be still imperfect. The number of children who are attending school in any given term is known, and, where the registers are carefully kept, (as they are in most of the schools,) it can generally be told how many days each enrolled scholar was present during the year.

ABSENTEEISM.

But at present there is no certain way of ascertaining how many children do not go to school at all. Outside of the city of Baltimore, it is thought that the number cannot be large, excluding colored children. "The white population of the counties," says the report for 1871–'72, "is 377,703 and the number of enrolled scholars is 77,943, or a little over 20 per cent. The number of enrolled scholars, compared with the entire population, is, in Massachusetts, 18.7 per cent.; in New Jersey, 18.6 per cent.; and in Connecticut, 20.5 per cent. It is evident, then, that the number of white children in the counties whose names do not appear on the school-register must be comparatively small. In the city of Baltimore, however, we can arrive at no definite conclusion on the subject. The population is 267,354 and the enrolled scholars 37,031, or about 14 per cent. We know that there is a very large number of children attending private and denominational schools; but how large it is and how large is the residuum that never gets within the walls of the school-house, who begin their education in the gutter and graduate in the penitentiary, we have no means even of guessing."

IMPORTANCE OF SCHOOL-CENSUS FOR BALTIMORE.

"We would earnestly urge upon the city-authorities the importance of taking a school-census, which shall enable us to ascertain the exact facts of the case and to form a correct estimate of the magnitude of the problem that lies before us. Even if it should turn out to be as serious a business as we fear it is, we are not prepared to advocate a 'compulsory law,' though the current of opinion among philosophic educators seems to set in that direction just now. We have not yet done what we could to make schools attractive, interesting, and useful; and until that is done we believe that it is not prudent to use force. We would rather draw than drive; we would rather allure than compel. We do not deny the abstract right of a State to force a certain amount of intellectual food upon an unwilling stomach; but we hold that the first duty is to pro-

vide good food and to create a healthy, natural appetite, which will render force unnecessary. Nevertheless, it is probable that, at least in Baltimore and in some of the other cities and larger towns, some additional legislation is needed to provide the elements of education for 'idle, truant, and neglected children.'"

SECONDARY INSTRUCTION.

In the report for 1871–'72, the board remarks that "Though the school-law, amid all its changes since 1865, has always contained a chapter authorizing and encouraging the organization of high schools, there is as yet no high school in connection with the public-school-system in Allegany, Anne Arundel, Baltimore, Calvert, Caroline, Carroll, Cecil, Charles, Frederick, Harford, Howard, Kent, Montgomery, Prince George's, Queen Anne, St. Mary's, and Washington Counties. In Dorchester, Talbot, and Worcester, high schools have been in operation for several years; and it is worthy of notice, in passing, that these three counties report an increased number of scholars in the public schools. In Somerset and Wicomico, arrangements were made, about the close of the year, to change the old academies into new public high schools, which arrangements were subsequently carried into effect. There is a probability that Baltimore County will have a high school before the date of the next annual report. Howard has taken a step backwards, and, by appropriating the academic fund to common-school-purposes, has declared, in substance, that a high school is either a superfluity or an unattainable luxury."

On this subject the State-board remarks:

"The whole subject of high schools, in connection with State-donations to schools and colleges, deserves the immediate and serious attention of the legislature. We are earnest advocates of liberal appropriations for higher and intermediate education; but duty compels us to say that the liberality of the State has been and is in many instances sadly abused; and an investigation will show that, if the purpose be to secure the smallest return for the largest expenditure of money, the present system of academic donations is a decided success."

SUPERIOR INSTRUCTION.

The following account of St. John's and Washington Colleges appears in the board eport for 1873:

"St. John's College,* Annapolis, reports 140 students in attendance during the year ended July 31, 1873. This is an increase of 20 over last year and an increase of 2 over the number reported in 1871. Of the whole number, 68 were in the college proper and 72 in the preparatory department. The number of students entitled to free tuitions is 150; the number availing themselves of this privilege, 98. The number of students entitled to and receiving board and tuition, free of expense, is 50, of whom 1 is in the junior class, 4 are in the sophomore, 14 in the freshman, and 31 in the preparatory. In the fall of 1876 these 50 young men, who have received board and education for four years at the expense of the State, are expected to take their places for two years among our teachers, according to the terms of their contract. The experiment will be watched with interest, and in any event it will lead to valuable results.

"Washington College, in Kent County, was attended during the past year by 23 students, of whom 9 received board, tuition, and books free of charge." The late report of the board of visitors says: 'There were five graduates at the last commencement, all of whom were of good standing. During the recent vacation the college-buildings have been thoroughly repaired and are now in complete condition for the reception of students.' The faculty of the college has also been thoroughly reorganized and a third professor added. The professors are men of experience and ability, and the visitors think there are substantial indications of renewed prosperity in the future. Under the united efforts of the visitors and faculty, the visitors of the college confidently hope that their next report will give proof of substantial progress.

"*The college of the future.*—The munificent bequest of the late Johns Hopkins has placed in the hands of trustees, selected by himself, a property estimated at not less than three millions of dollars, for the purpose of founding a university which is to bear his name. Not Maryland alone, but the whole civilized world, will watch with eager interest every step in the march of events until the magnificent intentions of the testator shall be carried into effect. With ample means at their command, it will not be difficult for the trustees to raise an architectural pile that shall be a lasting memorial of its founder and a fitting temple for the votaries of learning to worship in. With a yearly income exceeding the revenues of the wealthiest of American colleges of the present day, which makes it entirely independent of patronage for its support, it is easy to believe that it will attract to its halls as professors a fair proportion of the experience, the learning, the science, and the philosophy of the country. Untrammeled by tradition, unfettered by superstition, unhampered by conditions, with all the wisdom of the past for guidance and with all the errors of the past for warning, may we not hope that the Johns Hopkins University will be conceived in such a spirit and be commenced on such a plan as will warrant the expectation that it may one day become the National University of the United States?"

*This college receives from the legislature something of the same fostering care as is bestowed in several Southern and Western States on the State-universities. In 1872 it had from this source, for the improvement of its library and apparatus, $5,000, besides a regular grant of $3,000 per annum and a special grant of $12,000 a year for six years from 1871. It has also from the legislature $10,000 a year "to furnish board, fuel, lights, and washing for two free students in its collegiate course for each senatorial district in the State." These students number 50, and are under bond to teach school in the State for not less than two years after leaving college. The receipts from legislative appropriations have thus been, for the year, $25,000.

†Appropriation by legislature.

‡The peculiarity of this institution is the partial co-education of the sexes, the two meeting at chapel-services and at meals and having the same teachers, though not reciting in the same classes. The results of this system are held by the college-authorities to be "eminently satisfactory."

COLLEGES FOR WOMEN.

Five seminaries and colleges exclusively for young ladies report an aggregate attendance of 494 pupils, of whom 114 are in preparatory and 380 in collegiate studies, and 49 teachers—11 gentlemen and 38 ladies. In four of these colleges the pupils in the different classes are divided as follows: in the freshman-year, 62; sophomore, 86; junior, 53; senior, 33; 3 others were pursuing post-graduate-studies. Music—both vocal and instrumental—drawing, painting, and French are taught in all these institutions, and in all but one, German is added. All report the possession of chemic laboratories and philosophic cabinets, one a natural-history-museum and a gymnasium, and two the beginnings of an art-gallery. All have libraries, the largest numbering 3,750, the smallest 50 volumes.

THE STATE AGRICULTURAL COLLEGE.

The Agricultural College reports 130 students, a decrease of 8 as compared with last year. At the close of the year, the president, Rev. Samuel Register, D. D., resigned, and his place was filled by the appointment of General Samuel Jones, of the University of California. Tuition in the college is now free to all young men in the State who are qualified to pursue its course of study. Instruction in Latin and Greek is given to all students who desire it, but the course is so arranged that those who have had no elementary training in classics have abundant occupation in the study of modern languages, mathematics, physics, natural history, and mental and moral science. It is a fundamental principle of the college that the study of science is not inferior to the study of classics, either as regards mental discipline or future usefulness; consequently no student suffers any loss of standing or respectability through not taking a full classic course. An appropriation of $3,000 by the legislature is required for the purchase of chemic and philosophic apparatus; there is a very urgent need for it, and the investment will pay a high rate of interest in educational advantages.

STATE NORMAL SCHOOL.

The whole number of students enrolled during the year ended May 31, 1873, was 146. This is 16 less than the number reported for the preceding year; but the difference is more than made up by the fact that the students who entered remained a longer time, so that in fact the average attendance of the year was the largest on record, 114 students having been present at the final examination. The students were distributed as follows: from Allegany County, 2; Anne Arundel, 7; Baltimore County, 18; Baltimore City, 59; Calvert, 2; Caroline, 3; Carroll, 2; Dorchester, 6; Frederick, 3; Harford, 6; Howard, 3; Montgomery, 3; Prince George's, 6; Queen Anne, 7; St. Mary's, 2; Somerset, 6; Talbot, 3; Washington, 4; Worcester, 3; District of Columbia, 1. The number of graduates for the year was 13, of whom 12 are now teaching. The whole number of students enrolled since the organization of the school in 1865 is 675. Of these 325 were teaching in the public schools of the State when last heard from. The whole number of graduates is 153, of whom 81 are of the highest grade, (teachers of grammar-schools.) Of these 81, 74 are now teaching, 2 are engaged in other employments, 4 (ladies) are married, and 1 is dead. Wherever they have been employed they have given satisfaction to their employers. The school is willing to rest its reputation on the work done by its graduates.

"We renew the request, so often made before, that the legislature would make an appropriation to build or purchase a house suitable to the wants of the school. If the public-school-system is to continue, the normal school must continue to be an essential part of it; and a permanent building is essential to the continuance of the school. The house now rented may and probably will pass from our control in July next. We rely on the wisdom of the legislature to provide that this large, flourishing, and popular school shall not be dissolved for want of accommodations."

NORMAL SCHOOL'S RESULTS.

It is sometimes asked "Do the graduates of the State Normal School actually engage in teaching?" "A few plain figures," says the principal, "will answer the question. A considerable number of students (averaging about one-fourth of the whole number) enter the school without adequate preparation and without any just conception of the severe mental labor they will be called on to perform. Such usually leave within six months. And yet of the whole number of 593 students who had entered before September, 1872, more than three hundred became teachers. Between January, 1866, and June, 1872, the State Normal School commissioned 69 graduates of the highest grade. Of these, 63 were actually employed as teachers in 1872; 1 (gentleman) having paid tuition-fees, and not being under obligations to teach, engaged in business; 3 (ladies) had married and 2 (ladies) were waiting for and ready to accept employ-

ment as teachers." It is doubtful whether the members of any profession can show a greater amount of persistency than these figures indicate.

EDUCATION OF WOMEN.

On this subject the board says: "We desire to direct attention to the fact that the State Normal School is rapidly becoming a college for women exclusively. The number of young men in attendance has always been small, never more than 17 per cent. of the whole number of students. In 1872, there were 28 young men; in 1873, there were 13; in 1874, there are only 8. The appropriation of $10,000 a year for the free boarding of such students in St. John's College as will pledge themselves to become teachers seems to indicate the intention of the legislature that St. John's College should become the Normal School for men. Under these circumstances we respectfully ask that the State Normal School should be open to women exclusively. In making this recommendation we wish it to be distinctly understood that, so far as the principle of co-education of the sexes is concerned, our experiment has been a complete success. If the two sexes were equal or nearly equal in numbers, no change would be asked for. But it is evident that a school consisting of 140 students of one sex and only 8 of the other must work awkwardly for both parties. If we believe that woman needs education as much as man, that she is as capable of receiving it and will make as good use of it, it will be hard to explain the reason why the State has done so much for the education of men and so little for the education of women. The public schools and the State Normal School are open alike to both, but there the equality ends. We spend $40,000 a year in colleges and academies from which women are excluded and only $5,000 for the education of young women exclusively; and part even of this small sum is expended uselessly for education no higher and better than that which may be obtained at the district-school.

"If this question of higher education could be considered in the light of our present necessities, apart from and unincumbered with local associations and personal interests, it would be easily perceived that Maryland cannot afford to maintain more than two State-colleges—one for men and one for women—and that by a judicious expenditure of the money now appropriated, without calling on the State for any additional help, two colleges of high standing could be maintained."

NORMAL SCHOOL FOR COLORED PUPILS.

The Howard Normal School continues its useful labors for the education of colored teachers. It had 231 pupils during the year 1871–'72, of whom 69 were in the normal department, 87 in the grammar-school, and 75 in the primary. It is unfortunate that, owing to the great demand for teachers, comparatively few remain to complete their studies. Yet even those who left school prematurely for the purpose of teaching are generally giving satisfaction. There have been 47 of those thus partly trained employed within the State as teachers. The report for 1873 contains the following statistics of the school for the past year.

"The normal school for the education of colored teachers is now in the eighth year of its existence. The number of different pupils in all departments (normal, grammar, and primary) is 234 and the average attendance is 186. The number in the normal department is 74. There is a well-selected library of over 1,000 volumes, but no philosophic or chemic apparatus, a want which ought to be supplied as soon as possible. All the pupils pay for their tuition, but the receipts from this source and from the State-treasury are not sufficient to meet the necessary expenses. We commend this excellent and indispensable institution to the generous liberality of the State. There are at this time 72 of the students employed as teachers in various counties, and, as far as we have heard, they are doing good service. We suggest that the certificate or diploma of this school should be made a legal qualification for teaching in colored-schools.

MARYLAND INSTITUTE.

Of this, the State-board of education says: "The schools of the Maryland Institute form a very important part of the educational agencies of the State. Nearly three hundred young men, most of whom are busily employed during the day in the active duties of life, assemble in these schools in the evening for the study of chemistry, book-keeping, music, and drawing. The drawing-classes are the largest, the most important, and the most interesting. They are twelve in number and are arranged as follows:

"(1) The elementary class, 182 pupils, engaged in drawing from flat studies; (2) the first preparatory, 40 pupils, drawing from flat studies of a more difficult character than the preceding; (3) the second preparatory, 67 pupils, engaged in pencil-drawings from the round; (4) third preparatory, 31 pupils, advanced studies from the same; (5) geometric class, 41 pupils, applied geometric drawing; (6) fourth preparatory, 29

pupils, details of mechanic and architectural drawing; (7) perspective and architectural, 12 pupils, pencil-drawings from the flat and round; (8) artistic class, 3 pupils same as the above in design; (9) mechanic class, 4 pupils, drawings of machinery and mechanic engineering; (10) architectural class, 12 pupils, architectural drawings and designs; (11) general drawing-class, 9 pupils, including all the above studies; and (12) graduating class, 11 pupils, including the fine arts, architectural and mechanic engineering.

"The usual appropriation to this school from the State-treasury is $3,000, which hardly enables the directors, with all the aid they can get from other sources, to meet the annual expenses. There is a pressing demand at the present time, also, for better accommodations, the rooms now occupied being inconvenient and uncomfortable, and we hope that the joint liberality of the city and the State will place this admirable institution in a position to extend to the students the aid and comfort which they deserve."

PRINCIPLES THAT SHOULD REGULATE STATE-DONATIONS.

"We renew our annual protest against the way in which the academic donations are distributed and the purpose for which they are used; and we again invite the attention of the legislature to this subject. We state briefly, without argument, the following principles, which, we think, will bear examination:

"First. No public money should be given to any college or academy which is controlled, nominally or actually, by any religious denomination.

"Secondly. No public money should be given to any college or academy that is conducted simply as a private and personal business-enterprise.

"Thirdly. No public money should be given to any school, college, or academy unless the State has a representation on the board of management in proportion to the money expended by the State.

"Fourthly. Public money granted for one purpose should not be applied to another.

"The rigid application of these principles would prevent many abuses of which we now complain."

UNITED STATES NAVAL ACADEMY, ANNAPOLIS.

Although national in its connection and character, this great naval school is noticed here because of its location in the State of Maryland. Originally little more than a school of practice and comparatively slender mental training on board ship, it was, in 1850, reorganized under the title of "The Naval Academy," as a training-school for midshipmen in all the theoretic and practical branches of instruction that could fit them for their profession. The course of study was materially enlarged and the institution placed under the charge of the Bureau of Ordnance and Hydrography. The next year a four-years course of instruction was adopted. In March, 1867, it was placed under the care of the Secretary of the Navy; but its administration continued to be mainly conducted under the supervision of the Bureau of Navigation, which had been formed and put in charge of it in July, 1862. Since March, 1869, the supervision of the Secretary over it has been without this intervention. March 3, 1873, a law was passed extending the course of study to six years, the rule applying to all classes admitted after the passage of the act, but not to those which had previously entered.

In these years the cadet-midshipmen are subjected to a thorough and exhaustive drill, not only in mathematics and the natural sciences, but in the English, French, and Spanish languages, in history, international law, seamanship, ship-building, gunnery, and steam-enginery, drawing (both mechanical and free-hand) being carried through all, especially in its applications to ship-construction, machinery, and map-making. Three times each week, weather permitting, exercises in practical seamanship on board ship or in boats, help to vary the course of the lecture and recitation-room, while, from the middle of June till the middle of September, a cruise along the coast in a United States sailing-ship or steamer gives opportunity for putting into practice all the nautical knowledge that has been acquired. The number of cadet-midshipmen for the session of 1873–'74 is 241.

Since 1864, classes of naval constructors, or civil and steam-engineers, called cadet-engineers, have been permitted to be educated at the Academy, the number of such being limited to 50, and the course for them being two years at the school and now also two years on board ship.

MARYLAND INSTITUTION FOR EDUCATION OF THE DEAF AND DUMB.

The commencement of the year 1873 was marked here by the removal of the pupils from the unsightly old buildings previously occupied into an elegant and spacious new one, which is a credit to the State. The health and spirit of the inmates of the institution have been most favorably affected by the change. Ninety-nine pupils have been in attendance during the year, of whom 62 were males and 37 females. Of this number 44 were from Baltimore, 52 from other portions of Maryland, and 3 from other

States. The standing of the school is said to be intellectually decidedly above what it has been, the first class, instead of being increased by the addition of new material, continuing, with three exceptions, the same as the preceding year. This has enabled the teachers to take up a new and more advanced course of study, and thus raise the standard of scholarship throughout the school.

A class in articulation, or lip-reading, has been under the instruction of a skillful and trained hand for more than two years, and zealous labor has secured very gratifying results. But whether this method would be expedient or useful with deaf and dumb pupils generally is held to be yet undetermined.

In the industrial department less than half the boys are receiving mechanic instruction in the only trade that has thus far been introduced, that of shoe-making. But the success in this has been so great as to encourage the introduction of yet other trades. The shoe-shop has not only nearly paid its way, but has turned out good work and good workmen. Three of the boys who commenced work in it acquired such skill as to find employment afterward at good wages, and one of them at high rates of pay.

The library contains now about 2,000 volumes and, with its well-filled reading-room, forms a great attraction for the pupils in their leisure-hours.

MARYLAND INSTITUTION FOR THE INSTRUCTION OF THE BLIND.

At the date of the report for 1871 there were 48 pupils in this institution. The discharges and admissions for 1872 having been equal, this still represented the number present at the time of the last report. Of these 32 are from Baltimore, the remaining 16 from other counties of the State.

Through a liberal bequest of $50,000 from Mr. Alex. Lorman, the directors have been enabled to enlarge and improve their building, to purchase additional ground for its uses, and to erect a stable. The teachers and pupils having been mutually faithful, commendable progress in study has been made. Sewing, broom-making, and pianotuning have been taught in connection with the other studies; but the need of further industrial training in the school and of some industrial association for giving employment to the adult blind after their leaving school is spoken of.

A department for blind colored children and deaf mutes, provided for by the last legislature, was opened at 92 South Broadway, Baltimore, on the 2d of October, 1872, with a matron and 2 teachers. Subsequently a broom-shop was added, with another teacher for it. Six pupils have been admitted here and several others were at the date of the report awaiting admission.

Statistical summary of schools for professional instruction.

One business-college appears also in this State, with 389 students.

SPECIAL INSTRUCTION.

The McDonough Institute was opened on the 22d of November, when 41 pupils were admitted. The object of the institute is, in the words of the founder, to give "instruction in the Christian religion, a plain English education, music, and the art of husbandry or farming to poor boys of good character, of respectable associations in life, residents of the city of Baltimore." For this purpose John McDonough left his entire property, valued then at several millions of dollars, to the cities of Baltimore and New Orleans. The war, lawsuits, and various casualties seriously diminished the value of the property; still the amount realized by the city of Baltimore is in excess of $725,000. With this a farm of 833 acres of good land was purchased near the city, and a house fitted up temporarily for the accommodation of 50 pupils. It is reckoned that after the permanent buildings are erected the trustees will have an annual income sufficient for the maintenance and education of 250 boys. The manual-labor-school, the nature and purpose of which have been stated in a previous report, is still continuing its good work; but no report has been received of the number of boys in attendance.

MUSICAL ACADEMIES.

From Appletons' Journal we clip the following concerning musical academies in general and the Peabody in particular:

"Several ambitious attempts have been made to found musical conservatories and all the tricks of puffery have been lavishly used to cheat the public into an undiscriminating confidence. But all of these have failed, and still American aspirants for musical greatness have been carried abroad in steady streams of travel by the comparative ease with which the higher needs of study are answered in Europe. The European conservatory is a complete musical university, and some of the best ones, as the Conservatoire de Paris and the institution at Leipsic, are armed with even more perfect facilities for the cultivation of music than are the Universities of Oxford and Berlin even for studies in philosophy and literature. Not only are all the branches of the musical art and the principles of the science taught by the most accomplished professors, not only is instruction given on the different leading instruments which constitute the orchestra, but that mode of teaching most efficacious of all is carefully used which corresponds to the clinic lecture in the medical school, the moot-court in the law-school, the lessons in copying and practice which the student in sculpture and painting gets in the picture-gallery or the *atelier* of his master. In other words, to either of the great institutions mentioned above there is attached a fine orchestra, the special function of which is to educate the ear and sensibility of the musical student through the agency of continual habit. All the different stages in the unfolding of musical taste and talent are illustrated by the daily interpretation of symphony, quartets, quintets, &c., and thus theoretic knowledge goes hand in hand with most subtle and sensitive feeling in its practice. This crowning agency in a musical curriculum is absent in America from all our so-called *conservatoires*, except from the Peabody Institute in Baltimore, with which all our readers are familiar, at least by name, as having been endowed by the great philanthropist whose name it bears. This institute may, then, be called the only school in the United States which embodies the leading features of a great musical school. It is the pioneer of a full and comprehensive system of teaching. It is all the more remarkable, as music by no means covers all the ground aimed at under Mr. Peabody's endowment, for the nucleus of a great free library is also organized and liberal provision made for lectures in literature and science. The musical department of the Peabody Institute professes to include the different branches of vocal and instrumental study, including the leading orchestral instruments as well as the piano, and the school of composition as well as that of mere execution. Attached to the institution is a fine orchestra of forty pieces, under the leadership of Mr. Asger Hamerik, a favorite pupil of the great French composer Berlioz, and also of Franz Liszt. The orchestra, in addition to its special connection with the school, performs the same office for Baltimore which is filled in New York by the Philharmonic Society and the Theodore Thomas organization. Mr. Hamerik, the conductor, is also the chief of the staff of instruction in the institute, and the two duties supplement each other admirably. As the symphony-concerts, with their attendant rehearsals, are provided for by the endowment-fund, the directors of the institute are enabled to reduce the rates of admission to a merely nominal price, which permits the poor man who loves music to attend as well as the man of wealth. In the symphony-series there is a regular students'-course, in which the principles of handling an orchestra are specifically illustrated and an attempt made to familiarize the audience with the laws underlying each of the great works produced, as well as each composer's peculiar mode of treatment. The latter aim is further carried out by the rule adopted of confining each one of the concerts to some one of the great schools in music, now the German, now the Italian, and now the French. The student is thus en-

abled to devote his whole thought to one branch at a time and to make a careful analysis of the modes and tendencies embodied in each school without danger of confusion. To sum up the peculiarities of these symphony-concerts in a few words, it is aimed, even when they are ostensibly given for the general public, to make them subject to the great purpose of the institute: systematic and thorough instruction. The plan on which the musical department of the Peabody Institute is organized is a grand one, and, though not yet completely unfolded in all its possibilities, promises to lead the way to the solution of one of the great art-problems of the country, viz: 'How shall we develop the growing esthetic tastes of our people under purely home-auspices?' There is reason to believe that the example set by the Baltimore institution will soon be followed in other parts of the country."

THE MEETING OF THE MARYLAND STATE TEACHERS' ASSOCIATION.

The State Teachers' Association held a meeting at Hagerstown, which commenced August 27, 1873. At a preliminary meeting of the board of education the president was instructed to prepare a circular requesting the county-boards of school-commissioners to enforce the law which requires teachers to hold certificates before taking charge of schools and instructing the treasurers not to pay any salary where the law is not complied with, and also requiring teachers to enter into a written contract with the district-trustees before assuming control of schools. It was also resolved that the power of appointing assistant teachers is vested in the county-school-commissioners, and not in the district-trustees.

At half past 10 o'clock Prof. James M. Garnett, the president of the teachers' association, called the meeting to order, and the eighth annual session was opened with prayer. Rev. John McCron, D. D., the principal of the Hagerstown Female Seminary, then addressed the association, welcoming the members to Hagerstown.

Prof. Garnett returned the thanks of the association for the warm welcome which they had received.

The report of the committee on defense being called for, Prof. M. A. Newell, on the part of the chairman, stated that no occasion had arisen since the last meeting of the association for any action on the part of the committee.

Mr. John R. Roche, of Baltimore, then delivered an address upon the subject of mathematics.

No further business of importance was transacted in the morning.

In the afternoon the association re-assembled at 2 o'clock.

Prof. John A. Remley, of Hagerstown, then delivered an interesting address on "Irregular attendance: the causes and remedies." He said that out of the 200,000 children in the State between the ages of 5 and 20 years, there were only enrolled 60,000, and out of these there was only an average attendance of 40,000. He claimed that Washington County was the banner-county of the State in regard to attendance, there being an average attendance of 33 per cent. of the children enrolled in the county-schools. In regard to the remedy he contended that the State should compel the attendance of the children upon the schools, and as an example of such a measure he referred to the prosperity and material progress of Prussia, where a rigid compulsory system is enforced. He urged that the association should use its influence to obtain the passage of a law upon the subject and offered the following resolution:

"*Resolved*, That the State Teachers' Association of Maryland, in council assembled, direct the appointment of a committee of to wait upon the legislature and ask the enactment of a law compelling regular attendance in the public schools."

Prof. H. A. Lucy, of Howard County, then read a paper on "compulsory education," in which he opposed the passage of any law to compel attendance upon schools, and advocated a system of encouragement, by furnishing high schools in each county, and holding forth special inducements to bring about a larger attendance. Rev. A. G. Warley, of Queen Anne County, seconded the resolution offered by Prof. Remley, and also advocated very earnestly and enthusiastically the passage of it.

Prof. M. A. Newell opposed the adoption of the resolution. He claimed that when teachers came before the legislature and asked for a compulsory law they acknowledged their own incompetency.

Prof. J. H. Schoemaker spoke of his experience in this matter in Pennsylvania. He claimed that it was wrong to quote the results obtained from the European system of education as arguments in favor of establishing similar systems here. He argued that the results of the late Franco-Prussian war were more owing to the want of religious training in France and its enforcement in Prussia than to anything else, and also that compulsory education was contrary to our system of government. Men in this country are unwilling to be educated or made righteous by compulsion: the principle of blind obedience to the powers that be is not recognized here; and until it is it will be useless to pass a compulsory law upon the subject.

Prof. Remley replied to some of the arguments which had been adduced by those who had opposed the adoption of his resolution.

Mr. J. M. Newson, of Carroll County, also expressed himself as opposed to its passage.

The question of the adoption of the resolution was then put to vote and negatived.

The exercises of the evening were commenced with music by the Hagerstown band. Prof. J. M. Garnett delivered the annual address, his theme being the "Past and present of education in Maryland." The address was an interesting review of the history of education in the State from the earliest days to the present time and of the defects in the present State-system.

Upon motion of Dr. Bryan, of Dorchester County, the thanks of the association were returned to Prof. Garnett for his address, and he was requested to furnish a copy of it for publication by the association, to be distributed to the various boards of county-school-commissioners and among the members of the next legislature.

Thursday, August 28, Prof. William R. Creery, of Baltimore, delivered an address on the "History of the public schools of Maryland."

Upon motion of Prof. Remley, the thanks of the association were returned to Prof. Creery, and he was requested to furnish a copy for publication.

Prof. Garnett called Prof. Leakin to the chair, and offered an amendment to article 7 of the constitution, striking out the proviso "that none but public-school-teachers shall be allowed to vote or hold office in the association," and also one substituting for article 6 of the constitution the following: "All public- and private-school-teachers, including professors in colleges and seminaries, school-commissioners, and superintendents, are hereby declared members of this association upon signing the constitution, either in person or by proxy, and paying to the treasurer fifty cents, and shall continue their membership by the annual payment of this amount." The amendments were laid over for action to-morrow. He also offered a resolution that the executive committee be authorized to make arrangements with the editor of the Virginia Educational Journal for the publication of such papers presented to this association as the executive committee may select.

Rev. Dr. Heaton offered an amendment to instruct the executive committee to inquire into the feasibility of establishing a similar journal in Maryland.

Dr. Bryan advocated the including of the Pennsylvania Journal in the original resolution, as many of the teachers now take it.

Prof. Creery advocated the establishment of a Maryland journal.

Dr. Nelson expressed himself also in favor of Dr. Heaton's amendment, but he wanted the matter referred to a special committee, the executive committee having enough of other matters to attend to.

Prof. Garnett then, with the permission of the association, withdrew his original resolution and offered as a substitute a resolution "that a special committee of five be appointed to take into consideration the practicability of establishing an educational journal for the State, and report at the next meeting."

Prof. William Elliott expressed himself as also in favor of a Maryland journal. The motion was further discussed by Dr. Bryan, Dr. Heaton, and Prof. Newell.

Prof. Garnett's resolution was then unanimously adopted.

Prof. Garnett also offered a resolution "that the teachers of private schools in this State are hereby especially invited to connect themselves with this association, and the secretary is directed to communicate to them this invitation." Adopted.

The question arising as to the place for the next meeting, Prof. Hollingshead suggested Baltimore, and Mr. John E. McCann, Cumberland. Decided by vote in favor of Baltimore.

At the afternoon-session, Prof. Newell, as chairman of the committee on text-books, made a verbal report. He said the committee wished to direct the attention of the association to two particulars: the selection of text-books and the use of text-books. As to the first, he claimed they should not be selected either by the teachers or by those who pay for them, the parents or school-commissioners, but by experts appointed for that purpose, if possible, who should have nothing to do with the contracts. In regard to the kind of books to be selected, they should not necessarily be the cheapest, nor of that kind on the title-pages of which you find the names of the most distinguished authors, nor of that kind which are most vehemently urged upon us by the book-agents, but of that kind which examination and trial will prove to be well adapted to the ends we have in view. They should be short books and those which will stimulate personal observation and thought on the part of both scholars and teachers. As to the use of the books after the proper kind had been obtained, the committee was of the opinion that it was not necessary for the teachers to teach the books from beginning to end, but that it is necessary to teach a subject from beginning to end.

The report of the committee on modern languages was made by Prof. C. F. Raddatz, of the Baltimore City College. He confined it exclusively to the subject of "The study of the German language," how it had been pursued in the college and the results obtained.

Prof. J. P. Wickersham, the State-superintendent of public schools in Pennsylvania was then introduced to the association and addressed it briefly. He said that he had

come to-day to shake hands with the teachers of Maryland on behalf of the teachers of Pennsylvania. He gave an account of the recent rapid increase in the prosperity of the school-system of Pennsylvania in all respects and also spoke of what they intended to do in that State in the future to remedy the defects that still exist.

THE JOHNS HOPKINS INSTITUTIONS.

Among the many noble benefactions for educational and benevolent purposes bestowed in the past year, those of the late Johns Hopkins, of Baltimore, stand grandly prominent. The donor of these, formerly a prosperous merchant in the city and more recently a noted bank- and railroad-manager, having accumulated a great fortune, which there was no immediate family to claim, determined to bestow the larger portion of it on the foundation of a university, a hospital, and an orphans'-home, which should bear his name and be his monument.

THE JOHNS HOPKINS UNIVERSITY.

Accordingly, some years before his death, he secured from the legislature of Maryland a charter for the first of three institutions, the Johns Hopkins University, with liberal provisions, the government to be vested in a board of twelve trustees selected by himself and empowered to fill all vacancies occurring in their number. To this first object of his cherished plans he dedicated his beautiful country-seat of Clifton, in the neighborhood of Baltimore, containing 330 acres, with park, conservatory, gardens, and extensive buildings, bestowing on it, in addition, an endowment-fund of more than $3,000,000, invested in the most profitable form of Baltimore and Ohio Railroad stock. Upon this Clifton property he desired that the buildings for the university should be erected, the park and gardens to be preserved as far as possible, affording it, perhaps, the finest college-domain in America. To the privileges of the university thus founded, colored as well as white youths are to have equally free admission. A liberal provision is to be made for a chair of botany; the other branches of a generous education are to have their proper place; and it is made a matter of special request that the influences of religion may be impressed on the whole management, but without sectarian peculiarity of any kind.

This provided for, his attention was next turned to the maturing of wise plans for the Johns Hopkins Hospital.

THE JOHNS HOPKINS HOSPITAL.

These plans appeared March 10, 1873, in a letter to the trustees whom he had selected to administer the charity. Substantially, they were as follows: on a lot of thirteen acres, in the city, bounded by Wolfe, Monument, Broadway, and Jefferson streets, the needful buildings for a hospital were to be erected, one part to be devoted to the reception and care of sick, poor white persons, another to that of sick, poor colored persons, and still another to that of a limited number of patients able to make compensation for the care and attention they require, the moneys received from these pay-patients to go to the enlargement of the relief afforded to the other classes. The plan adopted for the main building was to be one that would admit of symmetrical additions till accommodations for 400 patients should be reached, while in construction and arrangement it must compare favorably with any other institution of like character in America or Europe. For the service of the hospital, physicians and surgeons of the highest character and greatest skill were to be secured, and a training-school for female nurses was to be established in connection with it, that women competent to care for the sick in the hospital and be of service to the community at large might be constantly in course of preparation. The grounds surrounding the hospital, it was directed, should be inclosed with iron railings and be so laid out and planted with trees and flowers as to afford solace to the sick and be an ornament to the section of the city in which the institution was located.

THE JOHNS HOPKINS ORPHANS' HOME.

On other ground, and entirely separate from the hospital, the same trustees were charged with the duty of erecting suitable buildings for the reception, maintenance, and education of from three to four hundred orphan-children of the colored race, including among these, at their discretion, those who have lost one parent only, or even such as, though not orphans, may be in circumstances requiring the aid of the instituted charity.

In addition to the gift of thirteen acres for a site, Mr. Hopkins dedicated to the hospital and home an amount of real estate and bank-stock estimated by him to be worth $2,000,000 at the moment, with a productive income of at least $120,000. This income he directed the trustees to apply, first, to the erection and completion of the buildings and, afterward, to the maintenance of the two institutions, in the proportion of $100,000 for the hospital to $20,000 for the home. In the management of both he wished to have the same rule hold as in the university, respecting the prevalence of a religious influence devoid of sectarian disturbance or control.

Having made these provisions deliberately and wisely and taken means to have them fully executed, the good man watched for a few months the progress of his plans, and then, December 23, 1873, passed quietly to the heavenly reward of such beneficence.

The hospital is to form ultimately a part of the medical school of the Johns Hopkins University, and will, at the death of a surviving sister, come into possession of about $200,000, in addition to the $2,000,000 given it. Nor did his judicious liberality stop here, for after providing generously for his relations, friends, and servants, he left, at his decease, to the Baltimore Manual-Labor School for Indigent Boys, the sum of $20,000; to the Maryland Institute for the Promotion of the Mechanic Arts, for the use of its school of design, $10,000; to the Home of the Friendless, $10,000, and to the Baltimore Orphan Asylum, $10,000; all which, with his gifts to the university and hospital, including the value of the grounds bestowed, may be held to make his contributions for these noble objects nearly or quite $6,000,000, *Monumentum ære perennius.*

OBITUARY.

Prof. Thomas D. Baird, LL. D., principal, and also professor of moral and mental philosophy in Baltimore City College, died July 9, 1873.

He was born in 1819, at Newark, Ohio; was educated at Jefferson College, in Washington County, Pennsylvania, at that time the largest institution of the kind west of the Alleghanies, receiving successively the degrees of A. B. and A. M. He came from the college to Baltimore in 1839, and was elected, though only in his twenty-first year, a professor in the chartered high school, of which the late Rev. Dr. R. J. Breckenridge and William McDonald, with Rev. Dr. Bacchus, still living, were among the trustees. In 1847 he was elected professor of mathematics in Marshall College, Mercersburg, Pennsylvania. Resigning this in 1850, he conducted a private school in Baltimore three years, when he removed to the West, accepting a professorship in Westminster College, Missouri. Remaining there three years, he returned to Baltimore and was elected principal of the Baltimore College, a position which he filled up to the time of his decease. He had received the honorary degree of Ph. D. from Concordia College, Missouri, and that of LL. D. from Centre College, Kentucky.

Professor Baird was a close student and laborious worker. He was, for a number of years, a member and secretary of the Maryland Historical Society; he was also an active member of the Children's Aid Society and of the Prisoners' Aid Society; also of the Evangelical Alliance, of the Maryland State Bible Society, and of the city and State Teachers' Associations.

LIST OF SCHOOL-OFFICIALS IN MARYLAND.

STATE-BOARD OF EDUCATION, (*formerly State-school-commissioners.*)

Hon. M. A. NEWELL, *Baltimore, president;* P. A. Witmer, George M. Lloyd, General F. Beaven; Samuel Kepler, *secretary.*

COUNTY-EXAMINERS.*

County.	Name.	Post-office.
Allegany	George G. McKay	Cumberland.

Wicomico	George W. M. Cooper	Salisbury.
Worcester	Mr. Upshur	Snow Hill.

* Respecting these the president of the State-board writes, under date of January 19, 1874, "I send you a list of examiners corrected according to my latest information. The new organization of the various county-boards having taken place only last week, I am without *official* information with regard to several counties. This must be my apology for omittting the Christian name in two cases." He justly holds that the fact of most of the examiners going on into another term of office is a good sign. The examiners are required by law to give their whole time to their public-school-duties.

MASSACHUSETTS.

[From the thirty-sixth and thirty-seventh annual reports of the board of education, Hon. Joseph White, secretary.]

SUMMARY OF STATISTICS.

FINANCIAL STATEMENT.	1871–'72.	1872–'73.
Total amount of school-fund	.....	$2,127,653 47
Amount of local school-funds, the income of which can be applied only for schools and academies	$1,361,173 61	1,627,388 86
Receipts.		
From taxation, for wages and board of teachers, fuel, and care of fires	3,594,686 38	3,889,053 80
From interest on permanent State-school-fund	87,356 39	180,000 00
Income of local funds appropriated for schools and academies	87,651 93	93,360 39
Income from dog-tax, surplus-revenue-fund, &c., appropriated at the option of the town	38,962 51	30,106 20
Donations to prolong public schools or to purchase apparatus	14,745 37	13,535 01
Raised by taxes for the education of each child 5 to 15 years of age, exclusive of taxes for school-edifices and superintendence	128 63	.....
Amount paid to maintain public schools	5,476,927 65	4,206,055 40
Expenditures.		
Expended for the erection of school-houses	1,328,268 22	1,010,521 33
Expended for repairs	402,528 40	405,588 43
Expended for libraries and apparatus	.....	8,504 78
Expended for salaries of superintendents*	47,751 00	57,736 00
Expended for stationery and school-books	.....	75,000 00
Total expense of supervision, including school-committees and reports	109,734 30	121,005 72
Amount expended for evening-schools	46,624 68	.....
For schools in State charitable and reformatory institutions	2,746 84	.....
Tuition paid in academies and private schools	423,186 50	731,568 20
Expenditure for each person in the State 5 to 15 years of age	19 39	.....
Expenditure for each man, woman, and child in the State	3 76	.....
SCHOOL-POPULATION AND ATTENDANCE.		
Number of persons in the State 5 to 15 years of age	282,485	287,090
Increase for the year	4,236	.....
Number of pupils of all ages enrolled	276,602	283,872
Increase for the year	2,941	.....
Average attendance	205,252	202,882
Increase for the year	3,502	.....
Ratio of average attendance to school-population	.73	70.67
Number of children under 5 years of age attending public schools	2,825	.....
Increase for the year	111	.....
Number of persons over 15 years of age attending public schools	23,211	.....
Increase for the year	1,238	.....
Average attendance of pupils in evening-schools	5,000	.....
ACADEMIES AND PRIVATE SCHOOLS.		
Number of incorporated academies returned	58	.....
Average number of scholars	4,265	.....
Increase for the year	1,320	.....
Amount paid for tuition in incorporated academies	$175,185 73	.....
Increase for the year	$60,049 58	.....
Number of academies and private schools returned	463	.....
Increase for the year	35	.....
Estimated average attendance	13,687	22,001
Increase for the year	1,243	.....
TEACHERS.		
Number of male teachers in the public schools	1,024	1,028
Number of female teachers in the public schools	7,419	7,421
Total number of teachers in the public schools	8,443	8,449
Number of teachers in evening schools	360	.....
Average wages of male teachers	$85 09	$93 65
Average wages of female teachers	$32 39	$34 14
SCHOOLS.		
Number of public schools	5,193	5,305
Number of high schools in towns required by law to maintain them	132	.....
Number of high schools in towns not required by law to maintain them	44	.....
Total number of high schools	176	.....
SCHOOLS IN STATE-INSTITUTIONS.		
Number of schools in State charitable and reformatory institutions	18	.....
Number of teachers in State charitable and reformatory institutions	25	.....

Average attendance	735	.....
Number of pupils 5 to 15 years of age	475	.....
Number of pupils over 15 years of age	348	.....

* Included in total expense of supervision.

EDUCATIONAL PROGRESS.

The total amount of taxes for public schools, in 1871–'72 including wages, fuel, care of fires and school-rooms, repairing and erecting school-houses, superintending schools, printing school-reports, providing apparatus and instruction of children in reformatory institutions and almshouses, was $5,476,927.65; being for each person in the State between 5 and 15 years of age $19.39; for each man, woman, and child in the State, $3.76. The aggregate amount of money from all sources expended during the year for popular education, in private schools and academies, as well as in public schools, but not including the cost of books or the expense of professional and scientific schools and colleges, was $6,350,000, or $22.85 for each person between 5 and 15 years of age and $4.36 for each person of the entire population.

In comparing the above items with those of a like summary for the year 1864–'65, it appears that in the period of six years there has been an increase of 444 schools; of 35,210 persons between 5 and 15; of scholars of all ages in the public schools, 50,197; of teachers employed, 1,076; of the average length of public schools, eleven days; of the wages of male teachers, $30.32 and of female teachers, $10.57; and of the average expenditures for the education of each person between 5 and 15, exclusive of cost of school-edifices, $5.63. But the most striking evidence of progress is found in the increase within the period above named in the amount raised by taxes for the support of schools, exclusive of the cost of erecting and repairing school-houses, namely, $1,812,061.96, which is an increase of 100 per cent. The increase in the amount raised last year over that of the preceding year was greater than the increase of any previous year, with a single exception.

POWERS AND DUTIES OF THE BOARD.

The doings of the board of education during the past year have not been different, in any important particular, from those of previous years. Being invested by the statutes with but limited authority, it has no specific powers to undertake measures for the improvement of the public schools or for the regulation of their management or methods of instruction. It is, however, intrusted with the care and control of the State normal schools. The officers of the board are in like manner limited in the range of the powers conferred on them by law. At the time of the establishment of the board the school-system of the State was excessively decentralized: its management was mainly in the hands of the school-districts and the opposition to the exercise of any central authority in educational matters was quite general and decided. Hence, in establishing the form of a system of State-supervision, it was clothed with almost no attributes of authority. Its functions were strictly limited to the collection and dissemination of information respecting educational matters and the recommendation of measures for the advancement of the interests of the schools. The system still remains substantially the same in respect to the scope of its duties.

IMPROVEMENTS SUGGESTED BY THE BOARD.

While the members of the board, from their knowledge of the workings of the system of public schools, entertain a conviction that, in its essential features, it is sound and efficient, they are equally decided in their opinion that the time has come for undertaking the introduction of several important improvements in its provisions, in order to meet the wants of an advancing civilization and maintain the rank hitherto held by Massachusetts as a leading educating State.

EQUALIZATION OF SCHOOL-BURDENS.

The most important of the improvements referred to is that of supplementing the revenues derived from local taxation for the support of schools by a general State-tax. The principle that underlies the American system of popular education—that it is the duty of the State to provide for the education of all the children of the State by taxing every man in proportion to his property—is nowhere more generally accepted than among the citizens of the Commonwealth; and yet the State has never voted a dollar from the general State-revenues for the direct maintenance of her common schools, the towns being required to attend to this. While the effect of this policy has been satisfactory in the past and has doubtless tended greatly to develop the local interest in schools, it is not so well adapted to the present circumstances of the people as it was when agriculture was almost the sole occupation of the people and the taxable property quite equally distributed. This condition of things has entirely changed since the development of manufacturing-interests and the consequent rapid accumulations of wealth in cities and towns. Two-fifths, if not half, of the property of the State is now embraced in the limited territory which lies within five miles of the State-house. The consequence is that, while in certain portions of the State a tax sufficient to maintain good schools during the period required by law is a serious burden, in other portions

it is comparatively light. Hence a change is demanded in the mode of providing for the support of schools such as will restore, to some extent at least, the ancient equality of educational burdens.

The proposed plan does not contemplate any increase in the aggregate of the taxes for schools; it does not propose to shift the responsibility from the municipalities to the State, but simply to appropriate a small share of the means of the whole State for the benefit of the whole State, the specific recommendation being that provision be made for raising a half-mill State-school-tax, to be distributed to the cities and towns, a part in proportion to the number of children of school-age and a part in proportion to the school-attendance, a fraction being reserved for the education of teachers and for other general educational purposes.

HOW TO SECURE PROFESSIONAL TRAINING FOR TEACHERS.

Another important improvement needed to perfect the system of schools is that of providing for giving the mass of teachers a better preparation for their work through the instrumentality of a course of professional training. No matter how much money may be raised and expended for schools, unless care is taken to provide competent and professionally-skilled teachers, the outlay will not yield its legitimate benefits. The teachers of the State, as a body, deserve great credit for what they accomplish, considering the inadequate means of special preparation provided for them, but it ought to be adopted as a rule that all teachers should have some degree of normal training before receiving a certificate of qualification. It is, however, impracticable at present to educate teachers enough in normal schools of the existing type, and, then, the comparatively few graduates of such schools gravitate to the cities and large towns, leaving the rural population comparatively destitute of direct benefit from them. It is therefore proposed to provide another class of training-schools as supplementary to those now in operation, schools where a short and comparatively cheap course of strictly professional instruction may be imparted. A plan has also been suggested looking to the introduction of normal training into high schools and academies.

The importance of the subject requires that it should receive early and serious attention and that some course be speedily adopted by which all the schools in the State may be supplied with professionally-trained teachers.

ATTENDANCE.

Another improvement, regarded by the board as of vital importance, is that which has for its object the securing of a more complete attendance at school of the children of school-age, for it is of no avail to build and equip commodious school-houses and employ accomplished teachers if the children, through inability or perverseness on their own part or on the part of their parents or guardians, are prevented from attending the schools. Two ways are suggested by which the desired improvement may be promoted: the one is a more stringent system of compulsion, with the necessary agencies for its efficient administration, the other the employment of an additional force of moral agencies. This latter, it is thought, could be effected largely by the fourth improvement suggested by the board, namely, the establishment of

COUNTY-SUPERVISION.

In nearly all the States of the Union there has been provided a class of educational officers, occupying an intermediate position between the town-committees on the one hand and the State-system of supervision on the other, such supervisors or superintendents being, in most of these States, county-officers. With the existing evidence of the utility and importance of this agency of progress and improvement coming from a score of States, it would be presumptuous to assume that Massachusetts can maintain her former prestige in educational matters without the adoption of this or some analogous instrumentality for increased efficiency in the management of her schools.

CITY-SUPERINTENDENTS.

At the date of the secretary's last report 46 cities and towns were employing superintendents of schools; others have since followed their example, while still others are discussing the question.

The progress of public opinion in this direction is seen in the fact that the number of towns employing superintendents has increased from three or four in 1861 to more than 50 at the present time. It is also mentioned that striking evidences of progress in educational matters already appear in these towns as the fruit of labor thus bestowed. Springing up as if by magic, are seen improved school-houses, with improved methods of heating and ventilation and better furnishing for the health and comfort of teachers and pupils; a more systematic grading of the schools; more carefully devised and arranged courses of study; teachers selected with greater care and better judgment, and

vastly improved methods of teaching; in a word, proofs that the true end of the schools is clearly comprehended and that all appliances, arrangements, and efforts are made to minister to that.

FEMALE TEACHERS.

Of the persons employed as teachers in the past year one-eighth were males and seven-eighths females, the decrease of males for the year being 25, while the increase of females was 233. For upwards of 30 years this process of diminution in the number of male teachers and increase in the number of female teachers has been going on. During past years the board of education and the secretaries have frequently referred with approbation to the substitution of female for male teachers in the schools; but the opinion is now expressed by the board that the time must come, if it has not actually arrived, when the best interests of education may require some limitation to this movement. The want of success, whether in respect to male or female teachers, taken in the mass, is due not so much to the want of natural aptitude as to want of special preparation and adequate experience. The great obstacle to the acquirement of the needed experience on the part of females is in the shortness of the period of their service, and this again is the reason why they do not make a more thorough preparation for the work.

PHYSICAL CULTURE.

The superintendent of the Boston schools, twelve years ago, made an earnest appeal to the board in behalf of physical education, urging the introduction into all grades of the schools of a thorough system of physical training as a part of school-culture. Since that time he reports that some progress has been made in this important branch of education. A vigorous and effective system of military drill provided for the boys in the high schools has been of incalculable advantage. A gain in the score of health has been made by excluding from the primary schools children between 4 and 5 years of age. Another gain has been made in limiting the afternoon-sessions of the schools to two hours. School-accommodations have been improved. The average size of the school-rooms has been increased, while the average number of pupils to a room has decreased. The teachers take more pains than formerly to ventilate their rooms without exposing their pupils to cold draughts of air. By these and other means the average physical condition of the school-children has been improved. Still, in the opinion of the city-superintendent, there is great room for further improvement. The aim should be not merely to avoid injuring the health of pupils while carrying on their instruction in the schools, but to increase their physical strength and beauty; and, in his opinion, that system of education is a failure which sends out into the world, to fight the battles of life, its finished graduates with narrow shoulders, flat chests, crooked spines, pale faces, weak muscles, and low vital energy. He says: "Our boys receive less physical injury from their schooling than our girls. Nature helps the boy more. He manages to get some wholesome play. But the poor girl is easily crushed under the terrible weight of school-lessons. Her strong love of approbation, given her for a wise purpose, is easily made to work her physical ruin by the machinery of examinations." He says further: "I do not hesitate to tell any mother in Boston that in the present state of things the headship of a class in school is not a very safe or desirable place for a girl to occupy;" and urges two items of immediate reform: first, that the rules restricting home-lessons be rigidly enforced and that our high-school-girls shall no longer be seen carrying home daily for study large bundles of class-books.

SPECIAL INDUSTRIAL TRAINING.

During the session of 1872 the legislature passed an act providing that the city-council of any city or town may establish and maintain one or more industrial schools and raise and appropriate the money necessary to render them efficient, such schools to be under the superintendence of the "board of school-committee" of the city or town, which shall employ the teachers and prescribe the arts, trades, and occupations to be taught; the expenses, however, of such school, in no case to exceed the appropriation specifically made therefor. This act was passed in response to a recommendation of the board of education, made in 1871, in the hope of devising a feasible plan for giving, in the common schools of the cities and larger towns, additional instruction especially adapted to young persons who are acquiring practical skill in mechanic or technic arts or are preparing for such pursuits. But the introduction of these branches into existing public schools was considered impracticable, since, besides the fact that we must go beyond the range of the present common-school-studies in selecting the desired technic branches, except drawing, and find them in the high-school-course, a great majority of children leave school before the completion of their grammar-school-studies, a mastery of which is a necessary preparation for efficient technic training;

and even were it otherwise the lower course is already overcrowded, and there is too much ground for the common complaint of the scanty attainments now made in these fundamental branches. If, therefore, technic instruction is to be given at all in schools of a public nature, it must be by the establishment of a class of schools authorized in the foregoing act; and at such a time as the present, when the demand for skilled labor in every department of mechanic industry is every day becoming more urgent, when, owing to the introduction of machinery and to false ideas respecting the relations of capital to labor, the system of apprenticeship is passing into disuse, its passage is a matter of congratulation, and it is hoped that the large cities and towns of the State will embrace the opportunity thus afforded to establish these schools in sufficient numbers, and with the necessary instructors and appliances, to fully solve the problem of their adaptation to advance the interests of the varied industries of the people.

In respect to a higher industrial training, a good beginning has been made in the school for industrial science at Worcester, the Institute of Technology in Boston, and the Agricultural College in the Connecticut Valley, all recently founded and in successful operation. For the lower grade of industrial instruction, a partial—and, so far as it goes, a good—provision has been made in the formation of evening-classes for teaching industrial drawing in nearly all the cities and towns having 10,000 inhabitants.

What is now wanted seems to be an enlargement of the scope of these evening-schools, so as to embrace, in addition to free-hand and mechanic drawing, the branches of knowledge connected with the several leading industries and the establishment of them in all the towns where these industries have their seat, certainly in all having 5,000 inhabitants.

The extension of the annual sessions to a period of not less than four months and the opening of similar schools during the winter-months in towns which form the centers of agricultural portions of the Commonwealth, with courses of study and lectures adapted to the needs of such as intend to till the soil, are also recommended.

SUGGESTIONS FOR PREPARATORY TECHNIC SCHOOLS.

Moreover, to meet the wants of those who desire a more complete education, it is thought that there should be established, in the great manufacturing-centers, a middle class of schools, receiving their pupils from the higher classes of the common schools on examination and carrying them through courses of not less than two years, adapted to their future specialties and fitting them for an intelligent and skillful pursuit of their chosen calling or for admission to the highest grade of technic schools. Nor need the system rest here. Schools of the highest grade, whenever called for, may also be added to those already existing, such schools to have a permanent existence, secured by proper endowments. From the fifty or more academies in the State, many of which have outlived the wants which called them into being and are struggling for a precarious existence, selections might be made at convenient points, and the institutions, endowed with a new life, be made to perform good service in the new field.

INDUSTRIAL EDUCATION OF GIRLS.

A report of the committee on industrial schools, made to the board of education, recommends that sewing, which is now taught in three classes of the girls' grammar-schools, be carried forward gradually into all the classes, by a gradual and progressive change, which need not interfere with the intellectual culture and training. They propose, also, that, as instruction in sewing is thus enlarged in the number of classes to which it is imparted, it shall be enlarged in the character and practical value of the instruction given, and that certainly in the first and second, and perhaps in the third, instruction shall be given in cutting, shaping, fitting, and thoroughly making girls' and ladies' garments, the requisite materials for this instruction to be furnished by the city, under the supervision of the committee on accounts.

INDUSTRIAL DRAWING.

During the last few years the subject of art-education has been more than once brought before the legislature; and, in view of its high importance in connection with the improvement in the public schools and in relation to the promotion of the industrial interests of the State, attention is again invited to the subject. The provision of 1870, making drawing an obligatory branch in the public schools and requiring all cities and towns having a certain amount of population to give free instruction in industrial and mechanic drawing to men and women, as well as to children, was the first step in the right direction, but it was not understood to be all the legislation that would be needed for the development of such a system of art-education as the interests of the community require. In the cities and larger towns a good beginning has been made in providing for instruction in elementary drawing in the public schools, but to

give full effect to this part of the plan throughout the State it will probably be necessary to make special provisions in temporary drawing-classes, or otherwise, for the preparation of the great mass of the teachers for the work required of them. Soon after the organization of drawing-classes was commenced under the requirements of the act of 1870, it became apparent that the chief difficulty to be encountered in this movement was that of providing competent teachers. To remedy this difficulty a proposition was laid before the committee on education of the legislature of last year for an appropriation of the sum of $10,000 for the establishment of a State normal art-school, where art-masters might receive the requisite training. Although the arguments in favor of that measure apparently satisfied the committee of its expediency, it was deemed best to postpone action upon it until its objects and bearings were more generally understood. The board now respectfully urge upon the attention of the legislature the importance of making immediate provision for the establishment of the proposed school for the thorough training of art-teachers.

As stated in the last report of the secretary of the board, classes in industrial drawing had been formed, up to that date, in all but two or three of the cities and towns required by law to make provision for them, and pupils eagerly flocked to them in large numbers from mechanic and manufacturing establishments of every description. During the last year the progress in this branch has been equally encouraging. Perhaps no other educational improvement undertaken in the State ever met with more general and hearty favor than has been accorded to this. Whatever difference of opinion may exist as to the desirableness or practicability of esthetic culture as a branch of common-school-education, there is now a tolerably general agreement among well-informed persons as to the commercial value of instruction in the various departments of industrial art, especially in a community largely engaged in mechanic and manufacturing pursuits.

STATE NORMAL ART-SCHOOL, BOSTON.

The special purpose of this school, just above referred to, is to train teachers of drawing and of the arts of design. It is the first institution of the kind established in this country. The legislature in June, 1873, appropriated $7,500 for its expenses, and placed it under the direction of the board of education. Prof. Walter Smith, State-director of art-education, was appointed director of the school, and it was opened November 6. There have been admitted 107 pupils, of whom 39 are males and 68 females. Twenty-four students are already employed as teachers of drawing in public day-schools or free evening-classes. Tuition is free to those engaged as drawing-teachers in the State or who declare their intention to become such.

INDUSTRIAL DRAWING EXHIBITION.

As a means of ascertaining what had been done in the different free industrial drawing-classes of the cities and towns where they had been established and of creating a deeper and more intelligent interest in art-education, an exhibition of the works produced by the students was held in Boston on May 16, 17, and 18, 1872, in conjunction with that of the pupils of the Boston public schools, when the works of classes in eleven cities were exhibited. The occasion attracted a large number of visitors and evidently imparted a new impulse to the movement in favor of art-culture. A correspondent of a distant paper wrote at the time:

"There are 20,000 drawings on exhibition from the public schools of Boston, and in the lower hall all the larger cities and towns and the Boston evening-schools have specimens. The technologic school is represented by a large number of designs for carpets and prints, which are very creditable. The mechanic drawings and the copies from casts are finely executed. The manner in which the creative spirit has become infused into the evening-school-instructions, also, is seen in the much larger number of original designs this year in comparison with former years. A full set of drawings for an elaborate country residence, so complete that a builder could take them and put up the house from them, is the work of a boy of 15 at the Haverhill school. And there is a boy of the same age who mill-men say should command a salary of $1,500 a year as designer, if the quality of his work is compared with others. The value of this movement, therefore, to the industrial interests of Massachusetts is at once apparent, while any and every form in which art embodies itself must be ultimately benefited by a release from the dead mechanic aims and methods of the old school. Boston's experiment ought not to want interest for educators all over the country."

A pamphlet containing photographic specimens of many of the drawings was published and sent abroad by the directors of the exhibition and was sufficient of itself to demonstrate the great measure of success attained in this department of the public-school-instruction. The delicacy of the lines, the perfection of the shading, and the beauty of many of the designs from even quite young children were remarkable at the slightest glance and called forth everywhere expressions of admiration.

RAPID PROGRESS OF DRAWING-CLASSES.

The committee on drawing in the Boston schools reports that the past year has been one of satisfactory progress in the department under its charge. The general supervisor has given normal instruction to the teachers in perspective and in model-drawing and designs, in which lessons, as well as in those given in the high and grammar-schools, several new subjects have been introduced, such as drawing from solid models and the practice of original designs, by which the pupils are brought to combine elementary, geometric, and plant-forms into patterns approaching in character to those used for wall-papers, calicoes, and similar articles of manufacture, which exercises compel the pupil to think, to remember, to call upon his inventive faculties, teaching him the value of symmetry and harmony as resulting from repetition, balance of parts, and continuity. In a late letter addressed to the committee by the general supervisor, he thus expresses his general satisfaction at the actual progress of the schools in his department: "Whatever progress may be annually made in the future under the present scheme, which has been but a short time in operation, there will never be a time when it will be greater than it has been during the past year. From the monotonous drawing of one subject from flat copies in drawing-books, the pupils have advanced to the study of five subjects in every class, and some of the classes include in that number the exercise of original design. The variety of the subjects prevents the study of drawing from becoming monotonous, and, in the character of the exercises—such as memory, dictation, drawing, and design—every faculty of the mind is brought into gentle but wholesome operation. Every teacher in the public schools to whom I have spoken on the subject informs me that drawing is now infinitely more interesting to the pupils than it used to be, and that is quite sufficient to account for the fact that it is much better done."

BOSTON.

In Boston the number of pupils in attendance upon the public schools—38,688—shows a slight increase over the total of the previous year. These pupils are in charge of 1,001 teachers—147 male and 854 female. These aggregates include 2,072 pupils and 95 teachers who belong to the evening-schools, leaving 36,234 pupils and 906 teachers connected with the day-schools alone. Instruction is given in 103 school-houses, containing about 870 different rooms, the average number of pupils to a teacher being between 38 and 39. The whole amount paid in salaries to teachers was $863,658.51, or an average of about $863 per teacher. The average cost per year for each pupil in the day-schools was: for tuition, $23.83; for all items, including school-houses and lots, care of buildings, school-apparatus, &c., $33.57.

The whole number of pupils of all ages belonging to the public and private schools is considerably in excess of the number of persons in the city between 5 and 15 years of age, while the number between these ages belonging to the public and private schools is 92 per cent. of the whole number in the city; and of the 7 per cent. not attending school, six-sevenths are pretty well accounted for, making 99 per cent. in school or accounted for, while 1 per cent. remains unaccounted for. This shows that the number of children who are growing up in the city without acquiring at least the rudiments of an education is very small.

Working of truant-law.—The truant-law which has been in operation for twenty years has proved a powerful auxiliary in the warfare against ignorance. Indirectly the truant-officers have performed a valuable service, which perhaps was not anticipated when the law was enacted. They have, to a very great extent, been the means of making those classes of persons who do not appreciate the value of education at least feel the disgrace of voluntary ignorance. Let the sentiment once become universal among all classes of society that voluntary illiteracy is not only disgraceful but criminal, and there will be comparatively little need of the application of compulsory means to secure school-attendance.

Special and evening-schools.—During the last year (1873) there have been in operation 17 special schools, namely: two evening-drawing-schools, one evening high school, ten elementary evening-schools, two schools for licensed minors, one for deaf mutes, and one Kindergarten-school. The whole number of teachers employed in these schools was 101 and their salaries amounted to $26,526.34.

Evening-drawing-schools.—The free-hand evening-drawing-school, with 4 instructors, had a maximum attendance of 95; minimum, 23; average attendance, 65—males, 51; females, 14. The school in mechanic drawing, with six instructors, had an attendance of about 200, all males. It was divided into four departments, one for ship-draughting, one for geometric drawing, one in architecture, and one in machine-drawing. The greater part of these students were engaged in some branch of industrial labor requiring skill in drawing for its most successful pursuit.

The evening high school has, from its commencement, constantly increased in numbers and efficiency; the average attendance for the last year was 225 against 150 for

the preceding year. The whole number connected with the school varied from 375 to 524.

In the elementary evening-schools the average nightly attendance was 920, against 887 for the preceding year.

Schools for licensed minors: newsboys and bootblacks.—In the two schools for licensed minors the average attendance during the last half year, (1873) 51, is less than half as large as it was during the corresponding six months of the previous year, a result of the fact that more of the newsboys than formerly attend the grammar- and primary schools. The schools for licensed minors were designed especially for newsboys and bootblacks, the former attending for a session of two hours in the morning, the latter for the same length of time in the afternoon, such attendance being indispensable to their obtaining licenses to pursue their avocations. The carrying out of this rule is in the hands of the truant-officer in co-operation with the police. These two schools in Boston have already wrought a radical change in the appearance and manners of the boys who are employed in selling papers and blacking boots, increasing their self-respect and stimulating their efforts for improvement. Those boys who do not attend with a fair degree of regularity are reported to the committee on licenses of the city-council, and their licenses are canceled, while boys applying for licenses are not allowed them unless they promise to attend school. The average number belonging to these schools during the last half of the year 1872 was 79; average attendance, 66.

CAMBRIDGE.

The report of the school-committee for 1874 says: "From the high school to the primary schools there has been a steady advance in the way of bringing in thought and casting out mere routine. More attention is given to the culture of the scholar's mind through his senses. There is less confinement to the study of books and to recitations from memory. The teacher is more true to the name." Books on natural science are in all the schools and drawing is taught in all. Even in the high school it is a required study in all the classes except the first.

Leigh's phonic system.—Dr. Leigh's phonic system of reading has been taught in the training-school since its establishment and with the best results. The class in this school numbers twenty members. The practice-school is large.

Industrial training in the common schools.—It is thought that industrial education must gradually be ingrafted upon the school-system of Massachusetts, that the tyrannic and exclusive power of various trade-unions, the restrictions enforced as to the number of apprentices, and the difficulties interposed in the way of learning some of the most common mechanic arts may not improbably impose upon school-boards the duty of providing some measure of industrial training.

CHARLESTOWN.

Here the opinion is steadily gaining ground that drawing is of intrinsic practical value, and should be, as it is by law, a part of the regular school-instruction. It has been found that while pupils may vary in their aptitude for this, as for other studies, drawing can be learned by all as readily as arithmetic, grammar, or geography.

FALL RIVER.

Here the policy has been successfully pursued of engaging the graduates of the high school as teachers, in preference to those from abroad, other things being equal. Six young ladies who have taken the four-years course at the school will graduate from the normal class at the close of the present term, (1874.)

Factory-children.—Since the establishment, in 1868, of the factory-school, in which the factory-children between 10 and 15 years of age are taught, the growth of the city has been rapid and the distance of the school from many of the mills is now so great as to make it necessary for many of the mill-children to attend the regular schools near their homes.

GREENFIELD.

An evening-school was opened early in the winter for three evenings in each week, and was well attended by young men and women and boys. The average attendance through the winter was about forty pupils, a majority of them being young lads of foreign parentage, who work through the day and have little or no opportunity for attending day-schools. Instruction was given in reading, spelling, arithmetic, book-keeping, and drawing. The experiment of an evening-school has been successful.

LAWRENCE.

The two evening-schools have been kept three evenings in the week. In no previous year has the attendance been more regular and the progress made more gratifying. The importance of these schools is not likely to be exaggerated in the public mind.

Drawing has been taught in all the schools of the city for a little more than two years. The teachers have been successful in their efforts to prepare themselves to teach this new branch of study. The drawing-class for teachers, now pursuing its second term, is attended by most of the teachers in employment in the city.

Two classes in mechanic drawing were formed—one an advanced class of about 18; the other one of beginners, with an average attendance of 25. The interest manifested and progress made were good.

LOWELL.

The school-committee's report for 1872 says: "The time seems near at hand when the high school will require a department devoted more especially to the technicalities of industrial education. The general dying-out of the old-fashioned apprentice-system makes this want an increasing one. The Institute of Technology at Boston, the similar school at Worcester, the Rensselaer Institute at Troy, and some lesser seminaries have given technic education an impetus in which it is not to be supposed that Lowell, with her immense industrial interests, will be slow to join."

The evening-schools here have never been so prosperous as during the year 1873; the number of scholars was never before so large, and the zest with which this means of education has been taken advantage of has seldom been equaled.

The attendance upon school for the last year has been as good as could reasonably be expected. The teachers have exercised more than usual watchfulness and the law relating to the employment of children in the mills has been more strictly enforced than ever before. The number of cases investigated by the truant-commissioner was 567, of whom 103 were found to be truants, 70 doubtful, 394 satisfactorily excused, 40 arrested, 29 carried before court for sentence, and 11 put on probation and returned to school.

LYNN.

The number of pupils enrolled in the industrial drawing-school was 50, about one-half of whom retired, finding the study and practice of the art too arduous and requiring more time than they could afford. Of the class formed in 1871, the number who continued till the close of the term was less than one-third of that registered. Twenty pupils furnished drawings for the exhibition of industrial specimens of drawing at the Horticultural Hall in Boston, and, of these, four received honorable testimonials of their skill and proficiency.

NEWBURYPORT.

A great evil in this community, and one which greatly hinders the work in the schools, is truancy. It is a noticeable fact that nearly three-fourths of all criminals in the police-courts are juvenile offenders, who for the most part are truants. In 1864, a truant-school was established, under enactments by the legislature in 1862, which was of the greatest efficiency in breaking up this hurtful and disorderly habit. After the school was put in successful operation and both parents and children found that the law would be enforced, not a truant could be seen upon the wharves or the streets. But the cost of the school was large, and for this reason it was discontinued. It is a matter suggested for the consideration of the city, whether the same result could not be secured at less expense.

In the school for industrial drawing, enough has been accomplished to show that much more could be done, and to make it evident to those who have in charge the educational agencies of the State that great and permanent good is to result from them.

NEWTON.

A training-school was established last year, (1873,) which it is hoped will furnish all the teachers needed for the primary and the lower grades of the grammar-schools. The course of instruction occupies one year. Most of the students are graduates of the high school.

For the free evening-schools of industrial drawing, busts, models, and copies have been obtained at considerable expense from England and faithful and competent instructors employed.

The time given to drawing is 80 minutes per week; in the primary schools the pupils draw on slates, in the high and grammar schools in books. The teaching has been mainly by the regular teachers, and many who at first doubted their ability have met with flattering success. Thus far, no pupils have been found who are utterly unable to learn.

NORTHAMPTON.

The mechanic and industrial drawing-schools were attended in 1872 by 171 and in 1873 by 104 students, among the best and leading citizens of the town. These classes

are considered one of the most valuable parts of the free common-school-system. A liberal culture in scientific and artistic studies, on the part of artisans and mechanics, is encouraged by this instruction, and it also leads to a more successful management of great manufacturing interests.

Drawing has been carefully pursued during the past year (1873) in most of the schools here. The directions and text-books of the art-master for the State were in the hands of each teacher and were of essential service.

PITTSFIELD.

In Pittsfield, attendance at school by the present law is rendered compulsory for three months in each year for every child between the ages of 8 and 14 years, six weeks of which time shall be consecutive, with penalties for disobedience, except in certain special cases, while, at the same time, the towns are required to maintain their schools at least six months in the year. It is suggested that the statutes be so changed as to render attendance compulsory for the same period in which the maintenance of the schools is compulsory for the tax-payers.

Two evening-schools were kept open during the winter of 1873, with an attendance of 358 pupils—237 males and 121 females—the oldest members attending being 49 and 45 years.

SALEM.

Half-time-school.—The half-time-school at Naumkeag, established mainly for factory-children, has had an attendance during the year of 275 pupils, of whom 116 were not connected with the mill, but were picked up from the high-ways and by-ways, the rule being not to admit scholars here who belong to any regular school or who can be induced to attend the school to which he or she ought to belong. The afternoon-sessions were fuller than the forenoon, for the reason that they were attended by a number of errand-boys engaged in stores and markets in the forenoon. Since the establishment of this school, the nationality of its pupils has been gradually changing, until now 90 per cent. are French Canadians, and the teacher has recently been obliged to acquire a knowledge of the language spoken by a majority of her pupils, and now the exercises are carried on in both French and English.

SPRINGFIELD.

The half-time-school at Indian Orchard numbered (1872) about 30 pupils, who were in school three hours each afternoon for five days in the week, many of them making rapid progress. If the population of the village was sufficient to furnish another school of equal size for a forenoon-session it would leave, it is thought, nothing more to be desired for such a school.

The school for mechanic or industrial drawing, established in a small way two years ago, numbered for the year 1873 170 persons, mostly men, and embraced 26 different trades or occupations, more than half, however, being carpenters or machinists. The ages of the students ranged from 15 to 53 years, though more than half were between 20 and 40 years of age.

Eighty-five young men and women were in attendance upon the evening-school, some just learning to read, others considerably advanced in their studies.

TAUNTON.

A free evening-school of industrial drawing was maintained for four months during the year 1873, the enrollment of pupils being 275; average number belonging, 154; average attendance, 101. The free industrial drawing-school has now become a permanent institution of the city.

A teachers' drawing-class was organized and kept in operation during the year, in which elementary instruction was given twice a week in a course of lessons embracing free-hand, outline, geometric, memory, and perspective-drawing.

WESTFIELD.

The crowning evil here, and one which places an effectual bar to anything like satisfactory progress in the schools, is truancy and absenteeism. The former pertains, for the most part, to those schools which are located near the village; the latter, though by far too common in the graded, is most damaging in the small mixed schools. Careful observation inclines to the belief that absenteeism in the vast majority of instances results from carelessness and indifference on the part of the parents rather than from the pupil's aversion to attend to his school-duties. As a remedy for truancy it is recommended by the school-committee that the town, in accordance with statute-law relating to it, adopt by-laws for controlling and punishing it.

Previous to two years ago, vocal music had been in the schools only as an exercise, at the discretion of the teachers; at that time a teacher was employed to give scientific instruction in the study in all schools so located as to be accessible, and the result has been in a high degree satisfactory.

WORCESTER.

The whole number of pupils enrolled in the schools of Worcester was considerably larger than that of the previous year, while the average attendance was less, owing partly to the opening two Roman-Catholic schools, by which about 500 children were withdrawn from the public schools, and partly to the withdrawal of children from school to work, as soon as they have attended during the period required by law. Of the whole number registered in all the schools, except the evening-schools, less than 74 per cent. is the average number belonging for the year, and of this number less than 90 per cent. are in the schools daily, such absence involving a pecuniary loss of not less than $10,000. The disparity between the whole number registered and the average number belonging shows that the law requiring the attendance of all children of school-age during three months in the year is pretty thoroughly obeyed, about 2,000 children being withdrawn from school at the end of that time. It is believed that were the time of compulsory attendance extended to the whole school-year, the enforcement of the law would be as complete as it is now and less difficult.

Worcester evening-drawing-schools.—A public examination of these schools was held in March, 1871, at which the work of the school was exhibited and its aims set forth. Nearly every sheet was the work of plain men and women, come from their daily occupations to acquire some skill in a useful art of which they had felt the need, in view of which, and of the general correctness of the work, the success of the classes was all that could have been expected. The necessity, however, was apparent for a larger variety of models, both mechanic and artistic, and an appropriation of $2,000 being made by the city for the purpose, a collection adapted to the wants of the school was purchased in Europe, embracing among the life-size and heroic figures the Venus de Milo, Germanicus, a Discobolus, Dancing Faun, and busts of Apollo, Venus, Homer, &c. Provision has been made for fitting a room to receive this collection, which it is hoped may become in time an extensive art-gallery. Specimens were contributed for the use of the class of practical mechanics by manufacturers of machinery in the city and others, embracing numerous patterns of the various parts of machines and models of other articles, both useful and ornamental, and there is assurance that all which may be needed will be forthcoming as the wants arise.

Five classes were in operation during the winter of 1872; an advanced class in free-hand drawing from casts, beginners in free-hand from the black-board, advanced mechanic from models and flat copy, beginners mechanic from the black board, and a carpenters'-class.

Worcester free public library.—The public library of Worcester now contains 30,798 books, many of which are rare and valuable. During the year, 3,757 were added; the number given out was 73,264; number of new applications made for books, 2,412; and the number of books lost, 151. More than 8,000 persons asking information of the librarian were satisfactorily served.

The reading-rooms are well stocked with newspapers and periodicals, the number taken being 178. The expenses of this department were $10,723.65 and the income $1,954.74.

The recent opening of the reading-room on Sunday has elicited considerable comment, and the success of the enterprise is not yet fully established, since it remains to be seen whether or not a sufficient number of persons have a desire to avail themselves of such a privilege for the sole purpose of mental and moral advancement.

HIGH SCHOOLS.

The instrumentalities afforded for secondary education embrace the public high schools, which are a part of the public-school-system of the State, academies—both incorporated and unincorporated—and both State and city normal schools.

These are maintained according to law in 132 cities and towns having 500 families and also in 44 others, which, not possessing that amount of population, are not required to sustain them. In all, 191 are reported as existing. As an evidence of the progress made during the past 35 years, it is mentioned that two high-school-buildings recently erected have cost as much as the entire valuation of the 3,000 school-houses in the State 35 years ago, viz, the girls' high school in Boston, costing over $300,000, and the Worcester high school, costing about $200,000. The latter is a building of great elegance; the former, although plainer, is substantial and comfortable in a high degree. It has also been proposed to erect a building for the Latin and English high school for boys in Boston, which, including every expense, shall cost more than a million of dollars and be a model of its kind.

The average number of pupils in attendance upon the high schools in Boston during the past year was 139 in excess of the number belonging during the preceding year. The total number graduating at the close of the year from the four public high schools of this city was 327, of whom 145 were boys and 182 girls.

BOSTON LATIN HIGH SCHOOL.

The Latin school, with an enrollment of 207 pupils, had an average attendance during the year of 195 pupils, and at its close awarded diplomas to 18 graduates, 15 of whom entered Harvard University.

BOSTON ENGLISH HIGH SCHOOL.

In the English high school it is stated that a much larger proportion of boys remain of late years to complete the three-years course at the school than formerly, and the percentage of graduation this year is three-fold what it was ten years ago.

The girls' high and normal school from this time takes a new name and a new *rôle*. Instituted originally as a normal school and afterward converted into a girls' high and normal school, it now becomes, by the elimination from its curriculum of whatever is peculiar to a normal or training-school, a girls' high school in name and purpose. Henceforth it is to be an institution for the higher general education and culture of young ladies, without special regard to the particular pursuits in which they may engage.

The Roxbury high school,* open to both boys and girls, maintains its high rank as a vigorous, thorough, and successful school. The total attendance during the year was 234. The average number of pupils belonging during the last half of the year 1872 was 194—boys, 91; girls, 103. At the close of the year graduating-diplomas were awarded to a class of 42—14 boys and 28 girls.

The Dorchester high school was established in 1852 on the plan of the ordinary Massachusetts high school, which character it still retains, in this respect being essentially different from the other high schools of the city. The public Latin school is intended solely for young men who intend to enter college; the English high school, for those who desire a general advanced culture as a preparation for active business; and the girls' high school, for the education of young ladies in the higher branches. The Dorchester high school receives pupils of all these three classes, fitting young men for college and supplementing the education of both sexes in the advanced studies.

It is reported to be a thoroughly-equipped school, with accommodations of the highest order and a broad and liberal course of study. At the close of the school-year a class of 43 graduated—14 boys and 29 girls.

Standing as they do at the head of the public-school-system of the State, the influence exerted by the high schools of Massachusetts upon all of a lower grade cannot be overestimated. The general opinion given in the reports of school-committees upon this point is expressed by the following extract from that of Worcester: "The high school, attractive, attainable, invites to broader fields of study, arouses the ambition and stimulates the dormant energies of boys and girls at every stage below itself, and, if they never reach its doors, they at least press further towards them." The school-committee of another town yet without a high school reports that the simple hope of having one has exerted a beneficial influence upon all the lower grades of schools, stimulating dull and negligent pupils to industry.

ACADEMIES.

The 58 incorporated academies report 4,265 as an average number of pupils taught within the year, being an increase over the past of 1,320 pupils. The total amount paid in these institutions for tuition during the year was $175,185.73, an increase over the previous year of $60,049.58.

Among the schools of the academic class, open to both boys and girls, are the Dean Academy, Franklin, with 8 instructors and 254 pupils; Monson Academy, Monson, 6 instructors and 146 pupils; the Hitchcock Free High School, at Brimfield, endowed in 1855, by S. A. Hitchcock, esq., teachers 4, pupils 127—62 boys and 65 girls; the South Berkshire Institute, New Marlboro', offering a thorough academic education to boys and girls, with 6 teachers and 65 pupils; the Lawrence Academy, Falmouth, with 3 instructors and 33 pupils; and Leicester Academy, at Leicester, incorporated in 1784, teachers 5, pupils in attendance 94—57 boys and 37 girls.

The English and Classical School for Boys, at 161 Fremont street, Boston, established in 1860, on the plan of some of the best European seminaries, and Edwards' Place

* This high school is practically relieved of the work of fitting young men for college by the Roxbury Latin School, an excellent institution, free to its pupils, but not under the control of the school-committee.

School, at Stockbridge, prepare a limited number of boys for college. Wesleyan Academy, at Wilbraham, opens its winter-course (1873) with 387 students, over one-half of whom are pursuing classic studies. There is also the Highland Military Academy, at Worcester, the name of which sufficiently indicates its specialty, and Adams Academy at Quincy, founded and endowed by President John Adams in 1822.

Abbot Academy, at Andover, is exclusively for the education of young women; attendance during the year, 136 pupils; while the Phillips Academy at the same place, with 9 instructors, 155 pupils in its classic department, and 97 in its English, stands, by general consent, among the highest institutions for secondary education in New England. It has, in 1873, graduated 61 students and sent more than 40 of them to the colleges,* Williston Seminary, at East Hampton, coming little, if at all, behind, with 8 teachers, 108 classic students, 100 scientific, and 29 English. The number of unincorporated academies in the State, including the private schools, is 463; total number of pupils not given.

Distinct returns from 34 schools in various localities, besides the ones specifically indicated, enable us to ascertain to some extent the general composition of such institutions, as well as the character of the instruction given in them. The number of teachers in these is 195; of pupils, 3,745, an average of about 1 teacher to 20 scholars. In all these schools, save 10, the two sexes are taught. In all but 7, the ancient languages form a portion of the course, and in all but 10, the modern, there being in the former 1,210 pupils and in the latter 1,681. In one, the boys' high school of Boston, all the 570 pupils are said to be engaged in studying French. In another, the girls' high school of the same place, all the 640 pupils are reported as students of both the classic and modern languages. Music, mainly vocal, is taught is 26 of these schools; drawing in 22. In 15 there is a chemic laboratory; in 24 some astronomic or philosophic apparatus; and in 23 there are libraries of from 25 to 3,000 volumes.

PREPARATORY SCHOOLS.

The schools from which information has been received devoting themselves especially to the work of preparation for college number 17 and report an aggregate of 1,585 pupils in classic studies, 832 in scientific, and 420 in English and preparatory classes. In 14 of these schools the pupils engaged in classic and scientific studies are divided as follows: in advanced classes, 430; in senior, 353; junior or second-grade, 506; middle, or third, 657; lowest, or fourth, 254. In the remaining 3 schools the pupils were not thus classified, but had, in classic studies, 221 pupils. All except 2 of these schools have libraries, ranging in extent from 12 volumes to 6,000; 9 have chemic laboratories, 6 have cabinets of natural history, 11 philosophic cabinets, 6 gymnasia, and 1 has an astronomic observatory.

NORMAL SCHOOLS.

The four normal schools, supported at the expense of the State for the professional training of teachers, are, as reported by the board of education, in a sound and prosperous condition, doing the work for which they were designed with efficiency and success. The demand for teachers who have enjoyed the advantages of the instruction they afford is constantly increasing and is much greater than the supply. The number of pupils in attendance during the last year was larger than that of any previous year, the whole number admitted being 329, of whom 186 graduated. The classes in the advanced course of study are fully organized, and, although not large, enough has been done to vindicate the wisdom of the plan. The graduates have found eligible places at fair wages and have been successful in their chosen work.

In the Framingham school the number of pupils under instruction during the year was 165, of whom 40 graduated, 20 leaving without finishing the course. Within two years the graduates of the school have contributed a sum of money for the purchase of casts to adorn the main hall, and during the year the grounds have been much improved and needed repairs made on the school-building. The growth of the school is retarded by the limited accommodations of the boarding-building.

The Salem school is reported as in a highly satisfactory condition. The number of different pupils under instruction during the year was 226; graduates, 54; 37 pupils received State-aid, and 26 received aid from the income of the Bowditch fund. During the year 14 volumes were added to the general library, 11 by purchase and 3 by gift, and to the text-book library 392.

The Bridgewater school reports an attendance larger than that of preceding years. The enlargement of the school-building, completed about a year ago, has greatly increased the facilities for instruction, and the school-building has been further improved by the introduction of a complete steam-heating and ventilating apparatus. The num-

* A new principal, the Rev. C. F. B. Bancroft, well known as a succesful educator, has succeeded here the retiring one, F. W. Tilton, A. M., who enters on the headmastership of the Rogers High School, Newport, Rhode Island.

ber of pupils admitted during the year was 82, of whom 64 were ladies and 18 gentlemen. The whole number in attendance during the year was 197—ladies, 157; gentlemen, 40—number of graduates, 57. State-aid was afforded to 40—28 ladies and 12 gentlemen. Thoroughness is aimed at alike in the subjects studied and in the methods pursued.

In the Westfield normal school the attendance was 162, of whom 141 were ladies. Of these, 41 graduated, 34 of whom were ladies. State-aid was received by 115 pupils—102 ladies and 13 gentlemen. The advanced course of instruction was taken by 14 pupils who had previously graduated, thereby enabling them to respond to the increasing demand which is made for teachers in high schools and training-schools. Valuable additions have been made to the cabinet during the year by the generous and thoughtful gifts of friends. Hon. H. L. Dawes has presented a large and rare collection of minerals, a gift which is most gratefully appreciated by the school. A boarding-house for the school, for which the legislature appropriated $75,000, has been erected, which will furnish the pupils better accommodation at largely reduced rates.

In addition to these provisions made by the State for the professional training of teachers, several towns and cities sustain either normal schools or training-classes for teachers in connection with the public high school or with the graded schools of the town. The normal school of Boston, for many years a department of the girls' high and normal school, has recently been made by the city-board of education a distinct normal school. Established by the city twenty years ago, in consequence of a demand for provision for the higher education of girls who did not intend to become teachers, it became both a high and normal school, and though it never entirely lost its normal characteristics, those of a high school have predominated.

It is believed by the board of education that far better results would have been attained by two separate organizations, since institutions become more efficient in proportion as their functions are limited and distinctly defined; and in accordance with such views it was determined to have a separate high school for girls and a separate normal school for the training of female teachers. The new school is open to all who can present a certificate of graduation in the usual high-school-studies. At its commencement, in September, 1872, over 50 pupils were received.

The normal-school-building at Worcester, now probably completed, is a noble edifice, worthy of the Commonwealth and of the object for which it stands. With this and the normal school in Boston in operation, the Commonwealth may boast of six schools of the first class.

HARVARD UNIVERSITY.

Changes.—President Eliot, in an address delivered at the last commencement of the university, indicated certain changes which have taken place within the past year in the college-regulations and in the requisites for admission. By a recent vote of the corporation, passed at the instance of the academic council, a body comprising all the professors of the university, the rule which prevails at some of the southern and western universities was adopted, that a member of one department can attend any of the instructions given in the others. Thus, a law-student can study history or political economy with the college-classes; a medical student can pursue chemistry or zoölogy; a scientific student can study German in Holden Chapel or human anatomy at the medical college. The professional schools of the college are, moreover, now characterized by a discipline as thorough and a spirit as liberal as those of the college itself, and the term of residence in several of these professional schools has been lengthened. Important changes have been made in the requisites for admission to college. A portion of the Latin now demanded for admission has been abandoned in favor of Roman history, and in three successive years three additions to the present requisites will be made: in 1874, English; in 1875, the elements of French or German; in 1876, the rudiments of one or two natural sciences besides. These changes have been made after much deliberation and careful consultation with the heads of preparatory schools and academies. In 1874 and thereafter the examination for admission to college will be divisible into two parts, so that the candidate, if he please, can pass a part in one year and the rest in another, returning to school in the interval. In the scientific school English, French or German, Latin, and the rudiments of some natural science are to be added, in 1874, to the present requisitions for admission, the scientific professions demanding as thoroughly-educated men as the learned professions.

Local examinations of girls.—One other step has been taken during the past year by the college which, as President Eliot remarks, "has some significance, but rather because of its direction than of its length." Last summer the Woman's Educational Association of Boston asked the corporation, through a committee, if the university would hold examinations for young women at Boston on the general plan of the local examinations which have for several years been successfully conducted by the universities of Oxford, Cambridge, London, and Edinburgh. After consulting the overseers, the corporation said that

they would. A committee of the faculty thereupon examined and compared the courses of study in a number of schools and academies for girls, discussed the length and breadth of the attainments which it would be reasonable for the present to expect, and arranged a scheme of examinations in two grades, to be held for the first time in 1874. The Woman's Educational Association published the detailed programme of these examinations, with a circular of its own, giving information about fees, lodging, beneficiary aid, and other like matters. People naturally ask What good can examinations by the university do when the university does not teach girls? They can do precisely the same service for girls' schools that college-admission-examinations have done for preparatory schools for boys: they can set a standard and prescribe a programme of study for several years of life between 12 and 18. There is now no standard for girls' schools; no means of publicly comparing one school with another; no goal for pupils or teachers. These deficiencies the proposed examination for women may in part supply. The examinations will be held in any town or city where an association of women may be organized to take charge of the candidates and do the local part of the business, and may also promise a reasonable number of candidates.

Legacies.—In the spring of 1872 the corporation received a legacy of $100,000 from the late James Arnold, of New Bedford. Two-thirds of the income of this fund is to be accumulated until the fund amounts to at least $150,000, and the Bussey estate passes completely into the hands of the president and fellows. It will then be the duty of the university to establish with this fund a professorship of tree-culture and to maintain an arboretum upon a specified portion of the Bussey estate, which will be laid out as an open park, with suitable walks and roadways.

A legacy of $150,000, left many years ago to Harvard, has recently become available by the death of the widow of the donor. The interest of this bequest is to be applied to the support of graduates in foreign travel and study, and will support three men abroad, while the gift of Hon. George Bancroft for the same purpose supports one, so that Harvard can now give to four of her graduates the benefit of this means of improvement.

Subscriptions to Memorial Hall.—During the year 1873 there was added to the Memorial Hall Fund $23,760.05, making the sum total $127,950.85. Expended during the year for construction, $82,722.30; at present on hand towards the erection of the building, $119,958.65; subscriptions yet unpaid, with interest, amount to $24,707.82. The building will probably be completed so as to be ready for use at the commencement of 1875.

Loss by Boston fire.—The university lost heavily by the Boston fire of 1872, its property in the burned district, including the land, being valued at $562,000, making an actual loss of $200,000. The annual rental of the buildings destroyed was $38,000, funds relied upon for the current expenses of the institution. An appeal of the president and fellows to the friends of the university secured the subscription of a considerable portion of the amount, and it is hoped that the whole may yet be made up.

BOSTON UNIVERSITY.

Incorporated in 1869, the charter and general statutes of this new institution provide for the building-up of a group of collegiate and post-collegiate schools, in which all forms of professional and general education may be accessible to both sexes. A preparatory academy, two colleges, and four post-collegiate professional schools are already established, embracing schools of theology, law, medicine, and oratory, and colleges of liberal arts and music. The preparatory academy and school of theology are old schools incorporated into the new organization. The college of liberal arts was opened in September, 1873, with a class of 20, of whom 4 were ladies. The school of oratory, with a two-years course for persons already liberally educated, claims to be the first of its class in the country for the express training of professors of elocution and oratory. It is based on the fact that the call for instructors in this line in the colleges, professional schools, and high schools of our States is steadily increasing, that the positions offered are desirable and the compensation tempting, while yet, from lack of facilities for preparation, the supply is very small. The school opened October 21, 1873, when 12 students entered for a full course and over 100 for shorter special courses. Ladies are admitted here, as to the other schools, on the same terms as gentlemen. The college of music offers a three-years course for graduates of musical conservatories and began the year with a class of 25.

The whole number of professors, lecturers, and other instructors in this university is 87, while one or two additional departments are already in process of organization.

AMHERST COLLEGE.

At a meeting of the trustees, December 1, 1873, the board is reported to have referred to a committee, of which President Stearns is chairman, the selection of a professor of rhetoric to succeed Prof. L. C. Seelye, resigned, and to have committed to the faculty the determination of candidates for the degree of A. M., requiring that those

seeking this degree in course should have been graduated for at least three years, and have spent two of these in professional studies or some other form of liberal culture. They also ordered the printing of a revised edition of the college-laws. The report of the treasurer for the year showed that, though the term-bills had reached $28,000 and the receipts from general funds $19,480, there was still an excess of expenditures over receipts of $6,000; and this though the total of college-funds is said to be now $666,000. The cheapening of a liberal education to the students is thus obviously expensive to the colleges themselves.

Besides liberal aid to meritorious students intending to study for the ministry, the college is enabled, by the generosity of friends, to offer prizes of from $10 to $100 for excellence in various studies. To these a new one has been added during the year by Mr. S. H. Washburn, of New York. He proposes to give $100 a year to the class that shall most faithfully avail itself of the advantages of the department of physical education. This department possesses an extensive gymnasium for its use, and at an appointed hour each class is required to present itself here and engage in exercise under the direction of the professor, who is an educated physician and is expected to make himself familiar with the physical condition of each student and adapt his instructions to individual needs.

WILLIAMS COLLEGE.

The course here has been somewhat modified, modern languages taking a portion of the time once given to the Greek and Latin, which become optional in the junior-year, while scientific studies, illustrated by appropriate apparatus, occupy an honored place with increased facilities for study. And besides the aid afforded indigent students by endowed scholarships, the trustees and alumni have built and furnished a new boarding-hall, the use of which, with its equipments, will be free to all that need this help, while any income arising from the rent of rooms to those able to pay for them will go to lessen the charges to the others for their board.

An improving library and a much-enlarged museum, with extensive additions to the botanic collection, are reported.

Physical culture receives here, as at Amherst, a fair share of attention, the general principles of hygiene, with special reference to student-life, being explained by the president to the freshmen, while those of the more advanced classes receive instruction in physiology and anatomy for better understanding of the laws of health, out-door-sports and exercises being also encouraged.

TUFTS COLLEGE, COLLEGE HILL.

Besides the regular college-course of four years, there is here a philosophic course of two years and engineering and theologic courses of three years each. But though these are open to all who desire them, even without a college-training, the full collegiate course is earnestly recommended to all who are prepared to enter on it, especially to the students of theology, the call in all professions, and emphatically in the cleric, being for men of liberal culture, prepared to handle clearly and instructively the various great questions of the day. To worthy young men who desire to enter the ministry, aid is rendered by a system of loans, to be repaid after graduation; besides which there are in the gift of the college 27 scholarships—15 of $60 and 12 of $100 each, diminishing by that amount the expense of education for each year. As in most of the colleges, there are, too, prizes for excellence in certain lines of study, ranging in value from $10 to $20.

COLLEGE OF THE HOLY CROSS, WORCESTER.

The object of this institution is to prepare youth either for a professional or commercial life. Its course of studies embraces in its whole extent a period of seven years, of which three are given to the preparatory and junior-classes and the remainder to the senior. The last of these years is devoted exclusively to the study of rational philosophy and natural sciences. The study of the French language is a part of the college-course. Other modern languages may be taught, if required, but, like music and drawing, form the basis of a separate charge. In the course of rational philosophy the text-books are Latin, and that language is commonly used in the daily lectures and disputations.

WELLESLEY COLLEGE.

Henry F. Durant, esq., this year completes a college for girls, located at Needham, Massachusetts, to be known as Wellesley College. The building is 600 feet in length, 150 feet wide, and five stories high in the main building. The course of study and regulations of this institution are not yet developed. It is, however, stated that the pupils are to be taught cooking and all the light kinds of house-work, and are themselves to do house-work, in the manner of the Mt. Holyoke Seminary. The generous founder of the college is said to have devoted $1,000,000 to this effort to improve the education of young girls. This and the Smith College for the higher education of the sex, already located at Northampton, with Prof. Seelye, from Amherst, at its head, and

Prof. Clarke, the late principal of Williston Seminary, in its chair of languages, will form a large addition to the opportunities of women for reaching the highest culture practicable. As one means of securing, with this culture, the retention of the special characteristics of the sex, it has been proposed—with what success has yet to be developed—that the young ladies, in the progress of their education, should not be shut up in a semi-conventual seclusion, but be distributed among the families of the professors, introduced to the church-work of the congregations in their neighborhood, and allowed to share, in a free social intercourse with families, the society of the other sex.

* This department only recently opened and not yet fully organized.

† Includes funds of the university, college, library, observatory, and Bussey Institution, not those of the divinity-, law-schools, &c., which will be found under their proper heads. Besides all these, there are various trust-funds for special purposes, bringing the whole aggregate of property in the various departments up to $2,765,110.61.

COLLEGES FOR WOMEN.

Eight colleges, seminaries, and institutes for young ladies report statistics for the year 1873, in which there is an aggregate attendance of 1,188 students, only 75 of whom are reported in preparatory departments, with 131 professors and instructors, 41 of whom are gentlemen. Four of these institutions give the number of pupils in the different college-years as follows: freshman, 264; sophomore, 191; junior, 145; senior, 153. In special or partial courses there were 68, and in post-graduate-studies, 5. The return from one of the four in which no report is made of collegiate classification, the Lassell Seminary, at Auburndale, states that, while strictly speaking that institution has no collegiate department, its course of study is as comprehensive as that of the best of female-colleges. Music, generally both vocal and instrumental, is taught in all these colleges; drawing in all but one, and painting in all but two; French and German in all but one, in which the place of German is filled by Italian and Spanish; in another Italian is added to the French and German. Five of these institutions have chemic laboratories, 6 philosophic cabinets, 4 natural-history-museums; one has an astronomic observatory, and one without the observatory has a telescope; 4 have at least the beginning of an art-gallery, and 5 have each a gymnasium. All but 5 have libraries, the largest, that of Mt. Holyoke, numbering 8,782 volumes; the smallest, 1,500.

MASSACHUSETTS AGRICULTURAL COLLEGE, AMHERST.

The course of instruction here occupies four years and is so arranged as to combine the largest practicable literary and scientific culture with the theory and art of agriculture and horticulture. Civil engineering, veterinary medicine, chemistry, and military tactics are prominent in the regular curriculum. It is intended that every graduate shall be rendered familiar with the principles and methods of agriculture, with special reference to those branches of farming best adapted to Massachusetts. The graduates are taught to write and speak English correctly and to translate German and French with facility. The scientific course is made as thorough as possible and every science is taught with constant reference to its application to agriculture. Each topic is discussed in the lecture-room and again in the plant-house or the field, where every student is obliged to labor. In the military department the forms and customs of the Regular Army are adhered to. It is not supposed possible to give a complete knowledge of the art of war, but it is intended that every graduate shall be able to organize, clothe, equip, drill, and command a regiment in conformity with the uniform system of standing armies.

The appreciation of the college by the people is indicated by the steady increase in

the number of its students since the opening. Beginning in 1867, with but 56 students, the following year the number had increased to 85; in 1869, to 119; in 1870, to 147; in 1871, to 166; and in 1872, to 171. The college-faculty consists of the president, who is one of the professors at Amherst College, with eight resident professors and a few non-resident lecturers.

WORCESTER COUNTY FREE INSTITUTE OF INDUSTRIAL SCIENCE.

This technic school, located in the center of a thriving and extensive manufacturing-district, and thus possessing opportunities for observing various forms of practical industry, is now fully organized and has graduated two classes. The ease with which most of these young men have at once secured honorable and lucrative employment, confirms the trustees in their confidence in the soundness of the general principles upon which the school is organized and carried on. In scope and purpose, essentially like the technic schools of Europe, it yet gives special prominence to the practical element, being designed to meet the wants of those who do not desire, or cannot obtain, a so-called liberal education, and to afford them a system of training for the duties of active life broader and better than the popular method of learning a trade and more simple and practical than the ordinary college-training. Established by the joint munificence of John Boynton, esq., Hon. Ichabod Washburn, and Hon. Stephen Salisbury, no expense is incurred for tuition to students residing in Worcester County and to others the rate is very low. Three years are required to complete the course of instruction in all departments, except that of mechanics, in which a half year longer is necessary, the first term being spent in the apprentice-class, the members of which are required to work in the shop eight hours daily. By this means is acquired an ease in the use of tools and in the management of machines, which is of especial value. With this, too, are united the discipline and culture of free-hand drawing, bringing the judgment and the taste under constant and careful training.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY.

This important institution provides for students a series of scientific and literary studies and exercises so selected and arranged as to offer a liberal and practical education for active pursuits, as well as a thorough training for scientific professions. Ten regular courses, each extending through four years, have been established, as follows: (1) A course in civil and topographic engineering, (2) one in mechanic engineering, (3) one in geology and mining-engineering, (4) one in building and architecture, (5) one in chemistry, (6) one in metallurgy, (7) one in natural history, (8) one in physics, (9) one in science and literature, and (10) one in philosophy. These courses are identical during the first year; but for the three remaining years the studies in each course are selected and arranged with reference to the end in view. For proficiency in any of these courses the degree of Sc. B. (bachelor of science) is conferred, while for advanced courses beyond these, for which arrangements have been made, the degree of doctor of science may be bestowed. The catalogue for 1873–'74 shows a total of 303 students, of whom 182 are candidates for a degree and 2 are resident graduates.

A society of arts connected with the institution numbers 350 members, and holds bimonthly meetings, at which are presented communications on applied science, with machines and apparatus illustrating important inventions in the mechanic and useful arts. Students of the institution may be present at these meetings by permission of the secretary.

PUBLIC LIBRARIES.

According to returns in 1860, there were 45 free public libraries, containing 201,706 volumes, with annual additions of not less than 22,000 volumes and delivering annually over 500,000 volumes. In 1866, there were returned 50 public libraries, with 345,588 volumes, annual additions of 19,995 volumes, and with an annual delivery of 886,172 volumes. According to returns of 1872, there were 82 free public libraries in 82 cities and towns, containing 564,479 volumes, with an addition in 1871 of 50,130 volumes, and delivering during the year 1,345,179 volumes.

Of social libraries, there were, in 108 cities and towns, 213, containing 777,569 volumes. Total number of volumes in libraries returned, 1,342,048, exclusive of private and Sunday-school-libraries.

STATE PRIMARY SCHOOL AND ALMSHOUSE.

In February, 1872, the character of this institution was changed by the abolition by the legislature of the almshouse-department of it, that having been regarded as an obstacle to the success of the primary school. The children now feel that they are not in a poorhouse, and that the name of pauper will not follow them when they go out. The institution is now devoted entirely to the education and reformation of the young. A majority of the children are admitted to it from the courts, most of them having

lived upon the streets of cities in idleness or been at work in the mills like human machines. Coming from such scenes many seem thoroughly conversant with evil, and yet are ignorant of the commonest employments of the household or of the farm. Hence an important part of their education here is the instruction of the boys in farm- and of the girls in house-work. Most of them are sent out eventually into families, to remain for a term of years, though some, not desired by families, in consequence of bodily infirmities, remain a long time at the school. It is therefore intended to fit up work-rooms in which such unfortunates may be taught suitable useful trades or employments. During the year 1872, 168 children went out into families—125 boys and 43 girls—and 79 of those in places returned. The number of children in the primary school was, at the latest report, 355—273 boys and 82 girls.

CLARKE INSTITUTION FOR DEAF MUTES, NORTHAMPTON.

This institution, founded by the late John Clarke, esq., of Northampton, was organized in 1867 and is in a prosperous condition. Number of teachers, 6; number of pupils, 44. The annual income from the fund was, for 1872, $15,428.87. Received from the State, $9,180.65. When the debt for buildings and repairs is liquidated, which it will be in a few years, the cost to the State of instructing its deaf mutes at this institution will be greatly lessened.

This institution is especially adapted for the education of semi-deaf and semi-mute pupils, but others may be admitted. It assumes all care of the children's living and training. Its charges are $350 per year; for tuition alone, $80. Its domestic *régime* is as nearly as possible that of a well-regulated private family. Boys and girls have their separate dormitory-buildings and play-grounds, but come together in the school- and dining-room. The younger pupils are taught to use the needle, the older girls to make and mend clothing, and the older boys find some employment on farm or garden, with rudimentary exercises in the use of carpenters' tools. Of the system of training now used, the report says, the "use of 'visible speech' so far has been exceedingly encouraging and promises well for the future. Greater and better results have been obtained with new pupils than were possible by the German method. On the part of advanced pupils, too, some defects in articulation have been corrected which imitation had failed to correct. We are unable to see any good reason why Mr. Bell's system should not be a success. It need not interfere essentially with mental culture. Its very symbols are a lesson in physiology and the application of those symbols necessitates intellectual activity. Here is mental culture at the outset. It is also highly auxiliary to lip-reading. Further than this, it disturbs no one's partiality for any particular medium of mental instruction. Those who prefer signs can use signs." "Mr. Bell has but ten elementary symbols, all based on nature, and by their combinations all sounds in all languages can be represented. Each combination denotes the position and use of the vocal organs requisite to produce a given effect. If the requisition be fully met a wrong sound cannot be produced.

"What is wanted in the case of deaf mutes is something to start their vocal machinery and guide its action. That is precisely what Mr. Bell's symbols do. Just as the blind by the palpable alphabet take in printed languages, so the deaf by visible speech take in oral language. There is a difference in mode, none in principle. In each case a sense possessed takes the place of a sense not possessed. It is worthy of note that the symbols were contrived for philologic purposes and that their application to the deaf was an afterthought."

During 1872 the principal, Miss Harriet B. Rogers, made a visit to Europe on a tour of inspection of various deaf-mute-institutions, visiting 22, "one each in Italy, Switzerland, Holland, and Belgium, the others in Austria, Germany, and England. Of the 22 visited, 15 employ the German and 7 the French system. No one of the 15 now uses the manual alphabet; 7 of these use but few signs." She objects to having a large number of mutes dwelling together and suggests the boarding of them in families and attending the institution as day-pupils.

BOSTON SCHOOL FOR DEAF MUTES.

The whole number of pupils in 1872 was 38; average attendance during the last six months, 31. The city receives from the State for the instruction of resident pupils $100 each and for non-residents $150. In this school the pupils are not taught the sign-language nor the manual alphabet. The system of instruction employed is what is known as the German method, the pupils being taught to speak and to read from the lips. Not only semi-deaf and semi-mute pupils, but also congenital mutes, are very generally found capable of deriving benefit from this system.

In the American Asylum at Hartford, there are 68 pupils who are aided by the State of Massachusetts, 19 of whom were admitted during the year 1872.

The whole number of deaf-mute children in Massachusetts who ought to be at school is probably more than 225, while the number actually in school in the Clarke Institution, the Hartford Asylum, and the Boston day-school is only about 160.

SCHOOL FOR NURSES.

Among other followings of Pastor Fliedner's practical training-schools at Kaiserwerth is a school opened in Boston November 1, 1873, for giving a systematic training to women who wish to become nurses. With a small and manageable number for a beginning, an influential body of ladies and gentlemen has made arrangements with the trustees of the Massachusetts General Hospital for exercise of the pupils in their wards. Lodging and boarding at a house near the hospital, these pupils are to receive instruction there in the theoretic part of their profession and in the preparation of diet for the sick, and for a year will practice in the wards under the direction of the hospital-physicians. During that year they will receive $10 a month for clothing and personal expenses. At the expiration of the year they will become full nurses and receive as such a salary sufficient for their support, but must remain another year for further practice and instruction. This full term of two years completed, they will, if approved, receive diplomas certifying their knowledge of nursing, their physical ability, and good character.

KINDERGARTEN-SCHOOLS.

The Kindergarten-school in Cambridge, formerly under the charge of Miss Elizabeth Peabody, is now in charge of Mrs. Horace Mann, assisted by a young lady teacher. A visitor to this school, in a published account, says: "About a dozen children of from 5 to 7 years of age were present. The management of the school was the exact reverse of that on which our teachers mainly pride themselves—the maintenance of order—there being as much freedom as in the nursery. Their little fingers were deftly weaving bright-colored strips of paper in a warp of white, producing agreeable and even beautiful patterns, while their feet and tongues were kept in motion, and the results of their play-labor, partially or wholly finished, were held up by each with glee for the admiration of all. Mrs. Mann stated, however, that at certain times they were required to keep still for a few moments, while some moral lesson suited to their comprehension was impressed upon them. A genuine garden belongs to the school, in which the little ones plant seeds, tend flowers, and exercise their limbs."

A Kindergarten-school was opened in Boston on the 26th of September, 1870, under the charge of Mrs. Charlotte B. Thomas, a graduate of Mrs. Kriege's training-school. The number belonging has varied from 15 to 24. The experiment, it is stated, has been, thus far, interesting and useful. The only practical objection to its introduction in populous communities, in the opinion of the superintendent, seems to be its cost. He believes that, were the numbers of these schools sufficient for all children from 4 to 6 or 7 years of age, all the work in the primary schools, now occupying three years, could be accomplished in two, by children who have received the Kindergarten-course.

DR. LEIGH'S PHONIC METHOD.

The superintendent of the Boston schools states that "The method of teaching the first steps of reading by the use of Dr. Leigh's pronouncing-type has been steadily gaining in favor. A year ago it was used in 11 districts and about 30 schools: it is now found in 23 districts and upwards of 60 schools. It has had a thorough and protracted trial, and the result has been in a high degree satisfactory." He, therefore, gives the system a cordial indorsement and hopes the board will, without delay, make its use obligatory in all the districts.

The testimony of the school-committee of Cambridge is that "Experience has shown that the scholars who learn to read by the phonetic method pass without the slightest difficulty into the ordinary mode, nay, that they only show themselves the more prompt in the discrimination of silent letters and different sounds of the same letter from their having a standard of comparison."

The school-committee for the town of Brookline reports that "Six years of careful experiment in several schools have shown the best results from the use of the phonetic method of Dr. Leigh. Pupils learn the sounds belonging to phonic type very readily; and, as those sounds are unchanging, the labor is much less than in gaining the mastery of a less number of letters, most of which are liable to arbitrary variations. Within six months, ordinary pupils, under this system, get nearly through the second reader, a point which pupils by the old method were always eighteen months and often two years in reaching. It is a moderate statement that every pupil instructed under this new method saves a year or more of time in preparing for the grammar-school."

MASSACHUSETTS TEACHERS' ASSOCIATION.

At the twenty-eighth annual meeting of this association, at Worcester, beginning on Thursday, December 26, 1872, Rev. Charles Hammond, of Monson, delivered the introductory address, giving a brief account of the origin of the organization, with a reference to some of the more prominent educational laborers of that time, to whose efforts the association owes its existence. "At the time this association was formed," he said, "the American Institute of Instruction had been in existence fifteen years, yet some of

its most efficient members heartily co-operated in the formation of the new organization, not that it might supersede the old, but that, by working in a different sphere, it might give a new impulse to the cause of education, the leading design of one being to promote the cause of education by the diffusion of a knowledge of themes, that of the other to improve teachers by the friendly discussion of methods.

A paper was read by A. H. Davis, of Worcester, upon "English literature in schools," in which he contended that at least two hours a week should be given to this study; that it should be put on a par with other studies, from the primary school upwards. "Young children," said the speaker, "can be taught to recognize excellencies of style, and there is no good reason why a child should not know a metaphor when he sees it, as well as a meeting-house; a felicitous expression, as well as a smiling face."

Papers were read, and afterward quite generally discussed, on various subjects bearing upon school-interests, as, "The limits of a school-education," by Mr. Thomas Emerson; "Latin as a branch of popular education," by Mr. F. A. Hills, of Chelsea; and "What should be included in the study of English grammar?" by Mr. J. G. Scott, of Westfield. Dr. P. A. Chadbourne, president of Williams College, lectured in the evening on "The world and the school-room," in which he claimed that our education is deficient in the power of developing manhood and womanhood. A paper was read by Professor A. B. Miller, of Maplewood Institute, upon "The proper length of the school-day," in the course of which he laid down the proposition that, "When the pupils have breathed three times over all the air furnished by the school-authorities, they should be allowed to go home."

From the report of the treasurer it appeared that the receipts of the association for the year amounted to $3,643.73 and its expenditures to $3,748.87.

Albert G. Boyden, of Bridgewater, was elected president, the list of vice-presidents, councilors, and secretaries including 31 members, 3 of whom were ladies.

TEACHERS' INSTITUTES.

During the year eight were held, each session lasting five days, except in the case of that held at Chester, which was held during the week of the presidential election and only lasted three days and a half. The average number attending each institute was 126, the total attendance reported being 1,010. In most respects these institutes were quite satisfactory and compare favorably with any previously held. Nearly two hundred teaching-exercises and lectures, of an hour each, were given during the day and thirty-nine evening-lectures, seven of the last being followed by readings—an average of twenty-five day-exercises and five evening-lectures at each. A very large proportion of those in attendance were practical teachers, many having taught for long periods. Others were expecting soon to teach, and frequently members of the school-committees from adjacent towns were present as active participants in the exercises. Many teachers, being allowed by the school-committees to close their schools for only two days, are unable to attend throughout the session, and thus fail to reap the full benefit of the institutes. It is suggested that, if institutes are of sufficient value to be maintained by the State, school-committees should not only permit but require the teachers to attend them during the entire session.

MASSACHUSETTS ASSOCIATION OF CLASSICAL AND HIGH-SCHOOL-TEACHERS.

The sixth annual meeting of this association was held in Boston, on Friday, April 11, and Saturday, April 12, 1873, when papers were read and discussed by the members present, on the following subjects: "Single or double sessions in high schools;" "The best means of cultivating facility and propriety in the use of English;" "Are our high-school-courses of study suited to the needs of girls?" "Is it expedient to enlarge the range of requirements for admission to college?" "Optional studies in high schools;" "Should German be substituted for Greek as a requirement for admission to college?" Upon the subject "Natural history—what to do and how to do it," remarks were made by Prof. Agassiz and others.

The discussions upon all of these subjects were of great interest, and it is a matter of regret that a want of space forbids a fuller report of them.

A paper by Mrs. A. C. Martin, in reference to the education of girls, elicited remarks of special interest. The sentiment expressed by her that girls need, most of all, such training as shall lead to breadth of mind—that shall teach them not to magnify petty details, but measure the value of things and see them in their true relations—was heartily indorsed by Mrs. A. G. Woolson, who especially emphasized the statement that what girls need most is thorough discipline of mind. Woman's work to-day is much more varied than that to which she has hitherto been confined, and no one can say for what special tasks she should be fitted. Let her, however, be made an observant, thoughtful, reasonable being, and she will fill any sphere with credit.

Mr. Charles F. Rice, of the Springfield high school, believed that a high school which is suited to boys is suited to girls also, and that, if in any respect it fails to meet the needs of girls, this failure is due to an inherent defect in the course, which applies to both sexes alike and is of equal injury to both.

In reference to the question "Should German be substituted for Greek as a requirement for admission to college?" Mr. W. C. Collar, of Boston, urged that, if any single modern language were to be substituted for Greek, the claims of the German would be indisputable. For the scientific, professional, and literary classes, and, indeed, for large numbers in all the various spheres of life, German, in this country, is absolutely indispensable. President Eliot, of Harvard, assented to most of the positions taken by Mr. Collar and advocated the study of German as essential to a complete education in at least five important professions. He considered it inexpedient to require the study of Greek of all pupils as a requisite for entering college and thought there should be an option between Greek and German or French, an opinion which gains ground at Harvard.

WOMAN'S EDUCATIONAL ASSOCIATION.

In January, 1872, an association of gifted and benevolent ladies was formed in Boston, known as the Woman's Educational Association, the object of which is declared to be "to promote the better education of women." In furtherance of this object there are four standing committees, on the industrial, the intellectual, the esthetic, and the moral and physical education of women. In furtherance of the objects of the association, numerous meetings were held during the winter, at which were present, participating in the discussions, presidents of universities, learned professors, venerable men who had passed their lives in educating the young, those who were engaged in alleviating the misery of the dangerous classes, members of the school-committee, and teachers of schools both public and private. Among the various lines of action that were proposed and discussed, one contemplated the establishing a higher institution for girls than any now existing, by which they might go through a course of study in some degree equivalent to that of Harvard College. Another contemplated a system of university-examinations for women similar to those of England, and a proposal for a like arrangement made by the association to the faculty of Harvard College was favorably received by the president and faculty and an arrangement established to secure such examinations. A subscription was also raised for the purpose of assisting such lady students at the State normal schools as desired to pursue the advanced course lately instituted for the pupils, but could not without such assistance, for want of means. The subscription for this purpose amounted to $1,840, of which $475 was expended in assisting six pupils for one-half year, such aid being offered in the way of a loan, rather than as a direct gift in money, a feature calculated to foster a spirit of independence and self-reliance no less needful in the educated woman than in the educated man.

The practical wisdom of this association in choosing existing institutions as agencies for the accomplishment of these benevolent designs is commended by the secretary of the board, and the belief is expressed that a luxuriant harvest will spring from seed thus sown.

OBITUARIES.

The report of education in this State would be incomplete without brief notice of at least three gentlemen, prominent as educators, who have died during the year: Prof. Henry James Clark, Prof. Louis J. R. Agassiz, and Prof. William Russell, whose services in their respective lines have been unrivaled in New England.

PROF. HENRY JAMES CLARK, PH. D.

This esteemed scientist, a graduate of the University of the City of New York and of the Lawrence Scientific School at Cambridge, died at Amherst, Massachusetts, June 1, 1873. A friend and pupil of Profs. Agassiz and Gray, he early made himself a name as a student of the natural sciences, particularly by a work on the jelly-fishes of our coast; and at the suggestion of these great instructors was chosen a professor in the Massachusetts Agricultural College at Amherst. He was only fairly settling down here to what promised to be useful and interesting work, when he was summoned to retire from earthly labors and enter the presence of the great Father of us all.

PROF. LOUIS J. R. AGASSIZ, M. D., PH. D., LL. D.

Since the death of Humboldt, no brighter light has vanished from the scientific firmament than when this noble naturalist went to his rest, December 14, 1873. Born, May 28, 1807, of Huguenot ancestry, but in the parsonage of the fair Swiss parish of Mottier, by the lakes of Neuchatel and Morat, he was favored with the best of early training. His paternal ancestors for six successive generations had been clergymen, and it was hoped by his father that he might, himself, become one; but his inclinations were towards the medical profession, which his mother's father had pursued. With a view to preparation for it he went at 11 years of age to the gymnasium of Bienne, and afterward to the college of Lausanne, spending six years in academic studies. Two further years in the medical school at Zürich (1824–'26) prepared him for the higher advantages of the University of Heidelberg, where, from 1826 to 1827, he studied anatomy under Tiedemann, zoölogy under Leukart, and botany under Bischoff. The facilities for scientific study

presented in the then newly reorganized University of Munich next attracted him, and in the autumn of 1827 he went there, devoting himself to embryology with Döllinger, to botany with Martius, to zoölogy with Oken, to mineralogy with Fuchs, and to philosophy with Schelling. Five years in all were spent in this thorough training for professional engagement, during which time he took the degree of Ph. D. at Erlangen and of M. D. at Munich, both after full examination and with great *éclat*.

But he was not to be a doctor, save in the prime sense of a teacher of his race. The noble work of interpreting the divine wisdom in creation was opening before him, and more and more his heart took hold of this as his true task. He had been a student of nature from his childhood; had caught and classified, while yet at school, the insects that flitted around his native lakes; had noted the plants which grew upon the hills and the fishes which sported in the streams; and in the intervals of college-study had made large collections and sketches in this line. Researches in the same direction were pursued during the university-vacations, and the first rich fruit of them appeared, while he was yet at Munich, in two important works: one, a description of a large collection of new fishes brought home from Brazil by an Austrian and Bavarian scientific expedition; the other, A Natural History of the Fresh-water Fishes of Europe, planned and begun at this time and carried on with the aid of a great German publisher for several years. The evidences of philosophic arrangement, clear knowledge, and descriptive power exhibited in the first of these and in the preliminary sketches for the second gained him at once a name among the scientists of Europe and secured him the high admiration of such men as Humboldt and Cuvier. His native country heard with pride of the rising reputation of her gifted son, and in 1832 an effort was made to secure for her own service his expanding powers by the offer of a natural-history-professorship at Neuchatel. He accepted it immediately, and that acceptance decided his whole subsequent career. The scientific researches which had been the recreation and delight of leisure-hours became, by virtue of it, his duty and life-work, and with the power of a great soul he threw himself into the prosecution of them. In connection with lectures to his classes, his history of fresh-water fishes was carried forward; another, on fossil fishes, of great compass, was begun in 1833, and published in five successive volumes, with 400 plates, 1834-'44; an Introduction to the Echinoderms appeared in 1834, followed by monographs descriptive of the different radiate forms; and in 1836 began a series of extended observations* of the glaciers, which, carried on till 1845, resulted in his once greatly controverted and now generally accepted theory of wide-spread glacial action in the reduction of the earth to its existent form. This theory, propounded in 1837, was further elaborated and defended in his Studies on the Glaciers, published in 1840, and in his Glacial System, published in 1847, while meantime appeared his *Nomenclator Zoologicus* and *Bibliotheca Zoologiæ et Geologiæ*, important aids to the study of the natural sciences he loved. The large research and genial enthusiasm shining forth in all these works brought honors showering on him from all quarters and set him, by general consent, among the first of the naturalists of Europe, if not upon the highest throne of all.

But minds of his wide grasp want more than single worlds to conquer, and, having made the geology and natural history of the old continent pretty thoroughly his own, by explorations reaching into every important field, he came, in 1846, to the United States, partly upon an invitation to lecture here upon his favorite themes and partly under a commission from the Prussian government to study, for the benefit of science, new forms of natural phenomena in a new world. He met enthusiastic welcome, and had opened to him such facilities for the prosecution of his aims, especially in connection with the operations of the Government-Coast-Survey, as determined him to continue in a country which had greeted him so cordially and spend his life in the furtherance of science on our shores. Among the issues of this determination have been his settlement as professor in the Lawrence Scientific School at Cambridge, his careful explorations of the geologic and zoölogic phenomena of our sea-coasts and lakes, and his great collection of specimens in both these lines, making a museum of comparative zoölogy remarkable and even wonderful in view of its brief age. How much besides these his coming has done for us, in important publications on the natural history of the United States, in popularizing by lectures his favorite pursuits, in stimulating an enthusiastic prosecution of them by great numbers, in drawing forth splendid contributions for this purpose, in teaching our young men to unite great patience of research with eager zeal for fresh discoveries, and especially in bringing them to study with deep reverence the great open book of nature, thus looking "through nature up to nature's God," would take more space to tell than can be given here. We can only suggest the work he has accomplished, cast our slight wreath of honor on his grave, and thank God that he was brought to labor for our country and show us how to carry on what he has so well begun.

He leaves two noble monuments of his work among us: one the Museum of Comparative Zoölogy at Harvard College, built up by his exertions at an expense of over

* The closeness of these observations may be judged from his own statement that he spent 72 consecutive nights on the bare ice, at an elevation of 8,000 feet, without any other covering than the canopy of heaven.

$200,000, and forming, not only from its immense collections, but from the scientifically-excellent arrangement of them, the rival, if not the peer, of the greatest kindred museums of the Old World; the other his recently-established Anderson School of Natural History, on Penikese Island, a unique enterprise for training teachers of the science by the study of marine zoölogy from specimens collected in aquaria upon the coast and gathered by daily dredging from the deep waters of the seas around.

His publications since his coming to this country have been largely in our scientific journals and in the transactions of our various learned societies; besides which have been Physical Characteristics of Lake Superior, Lectures on Comparative Embryology, Principles of Zoölogy, (prepared in conjunction with Dr. A. A. Gould,) Methods of Study in Natural History, Geological Sketches, The Structure of Animal Life, two works illustrative of the ichthyology of Brazil and the region of the Amazon, (from visits in 1865–'66 and 1871–'72,) and, especially, Contributions to the Natural History of the United States, a great undertaking, meant to be completed in ten quarto volumes, of which only four had been published ere he died.

On such a head great honors gather thickly. Among those bestowed on him were the Copley medal, from the Royal Society of London; the Wollaston medal, from the London Geological Society; the medal of merit, from the King of Prussia; the Monthyon and Cuvier prizes, from the French Academy of Sciences, with the offer of a chair in the academy itself; and besides his well-earned Ph. D. from Erlangen and M. D. from Munich, the honorary LL.D. from the universities of Dublin, Edinburgh, and Harvard.

PROF. WILLIAM RUSSELL.

As a teacher of elocution, an educational journalist, and a promoter of the system of normal-school-training, Prof. Russell deserves special mention. Born in Glasgow, Scotland, April 28, 1798, his early training was in the schools and university of that place. He was the youngest student in the university at his entrance, and yet, at the first annual competitive exhibition, carried off from hundreds of his elders the highest prize for happy rendering of Latin. Many subsequent prizes were carried off, and it is in further illustration of his ready scholarship that his sisters tell of his reading to them the Greek comedies of Aristophanes with as easy fluency as if they had been English, giving a running translation of them as he went.

On the completion of his college-course he sailed for Georgia, to seek amidst its balmy airs a climate better suited to him than the frosty fogginess of Scotland. For some years he was tutor in the family of a distinguished Georgian, and then, with invigorated lungs, returned to Scotland. The reputation he had gained in Georgia, however, soon led to his recall, and he was induced to go back to Savannah and take charge of the Chatham Academy there. How long he continued in Savannah is not known. His removal thence was induced by a happy marriage with a lady of Connecticut, under whose influence he was led to transfer his labors to New Haven, where for some years he taught the new Township Academy, and then the Hopkins Grammar-School, preparing students for Yale College. Continued difficulty with sensitively-tender lungs at length compelled him to give up this sedentary life and remove to Massachusetts, where he became a teacher of elocution at Cambridge, at Andover, in Chauncy Hall School, Boston, and in the Public Latin School, the passage from place to place giving him exercise and air. While thus engaged, he became the editor of the American Journal of Education, the first regular publication on that subject either in America or England. The journal met with warm encouragement from English educators as well as from those of the United States and gave a great impulse to the cause of education.

In 1849 he was induced by friends to establish a normal school at Reed's Ferry, in New Hampshire, his plans for which embraced a happy combination of social and intellectual advantages. The days were given to the intellectual training proper to the character of the institution, while the evenings combined with this the pleasant associations of a family, one evening being given to a simple social gathering, when the parlors were thrown open, and the pupils, teachers, and generally some friends from without, mingled in easy friendly conversation, with sometimes a brief reading and sometimes the piano or a song; another evening was devoted to a review of current newspaper-literature; a third to elocutionary exercises, which his skill in that line made intensely interesting; a fourth to more formal lectures from educators brought in from abroad.

Eventually the school was removed to the beautiful town o fLancaster, in Massachusetts, which Mr. Russell was induced to think would be a better location than Reed's Ferry. In this he was disappointed, for, although admirably planned and managed, the interest in such an institution at that early day was too slender to insure to it success. It failed, and with it failed his fortunes. He had to go back to his old work of teaching elocution, finding ready occupation in this line in the various schools and colleges. He located his simple cottage on the shaded margin of the Nashua, and there, with the murmur of the stream beside him and the answering murmur of the

leaves above, spent many a pleasant summer-evening after the labors of the day were done. His pen was still occasionally engaged in contributing to different periodicals, and amid such occupations steadily continued to the close, he went quietly down the vale of life, till at last the shadows of a deeper evening closed around him, and he passed out into the light of the better world he had been looking for.

Genial, warm-hearted, amiable, and sincere, acquainted with the best English literature, familiar with the poetry of his native Scotland, well posted in the current reading of the day, and as much at home in the Latin and the Greek as in the English, Mr. Russell was an admirable teacher, a useful writer, and an exceedingly agreeable and pleasant man; and were it not that he has trained many to his art, his death would leave a blank in elocutionary teaching which it would be hard to fill.

Increase over last year	76
Number of districts reporting no school	50
Number of school-houses, (stone, 79; brick, 595; frame, 4,153; log, 591)	5,418
Increase over last year	118
Number of seats in school-houses	382,107
Value of school-houses and lots	$7,470,339
Increase over last year	$714,344

SCHOOL-FUNDS.

The primary-school-fund is derived from two sources: from the sales of primary-school-lands—the sixteenth section in each township—and one-half of the amount of cash-sales of swamp-land, the former paying interest at 7 and the latter at 5 per cent. The primary-school-lands are sold at the uniform price of $4 per acre, while many of them are worth from $10 to $30 per acre. The exhibit of this fund for the past year makes it less by several thousand dollars than heretofore. About 400,000 acres of the primary-school-lands are yet unsold. When sold the fund will be increased by about $1,500,000, and, if the lands are properly graded and sold according to value, by double that amount.*

No estimate can be made of the future increase from the swamp-lands; but, if the future sales for cash should be in the same proportion as in the past year, the present fund from that source will probably be doubled.

The university-fund amounts altogether to $542,794.49. "This has, like the primary-school-fund, shrunk in the Land-Office $22,288.82."

The amount of the normal-school-fund in the hands of the State September 30, 1872, was $48,314.70. There was due from purchasers $20,969.84, making a total of $69,284.54.

Of the agricultural-college-fund there was in the hands of the State September 30, 1872, the sum of $73,783.46; due from purchasers, $81,184.75; total, $154,968.21.

PROGRESS OF SCHOOLS.

In reporting the general condition of the public schools, the superintendent takes occasion to review the progress of the last eight years, the term of his official service. During that period the amount invested in school-buildings and school-property has nearly quadrupled. The increase of children has been an average of 15,532 annually.† The increase of property may be estimated by the increase of the two-mill-tax, which has nearly doubled. The number of graded schools has more than doubled. The number of children attending school has increased by nearly 100,000.‡ The number of teachers has increased nearly 3,000 and the amount paid for teachers' wages has been increased by over $1,000,000.

SCHOOL-CENSUS.

The census-returns for the past year are not considered accurate. Of some of the items the superintendent remarks, "They must be taken only as approximately true." The report of attendance is not complete, from the fact that 263 districts, with 16,630 children, fail to report under this head. The average attendance has increased 6 per cent. in four years. The number of new districts reported during the year is 136, but, owing to the consolidation of districts, the actual increase is but 76.

GRADED SCHOOLS.

Graded schools are sustained in 300 districts. These districts, less than one-tenth of the whole number in the State, have 38 per cent. of the children, own 64 per cent. of the whole value of school-houses, and pay 47 per cent. of the aggregate wages to teachers. The average length of sessions of the graded schools was nearly two months above the average of the State. The attendance of these schools is reported at 110,096, out of 155,740 of school-age; but 18 teachers or directors failed to report. The attendance in their districts would probably increase the number to about 114,000. There are now but seven unorganized counties in the State. These will soon require organization and will then report schools.

*An examination lately made in the General Land-Office in Washington has revealed the fact that a deficiency exists in the amount of land intended to be devoted to school-purposes in Michigan. The fractional sections are short by some 50,000 acres of what they were supposed to contain. The making up of this deficiency will add about $200,000 to the State primary-school-fund, such lands selling for $4 per acre. Steps are already taken to have the additional amount of lands secured.

†In Detroit the schools, at the opening of the session of 1873, have been so crowded that the city-superintendent has been obliged to open half-day-schools, one division being taught in the morning and another in the afternoon.

‡Some months ago the Michigan Teacher suggested, as a means of promoting regular attendance in the graded schools, that a fine picture be purchased and hung up in the room having the best record with reference to this. The experiment has been tried in Traverse City, with the result of bringing up the average attendance to 99 per cent.

Referring to the errors in school-reports and the discrepancies in the tables of receipts and expenditures, the superintendent says: "We are obliged to confess that the statistics abound with errors, although the result is sufficiently near the truth for the practical purpose for which their publication is designed."

THE TOWNSHIP-SYSTEM.

The union- or graded-schools are exerting a very general influence over the educational interests of the State. These schools were formed by uniting several districts into one, thus permitting a thorough grading and the introduction of the principle of division of labor. The expectations of those who urged the formation of these schools have been fully met. No one would think of returning to the old district-system. These schools are now confined to the cities and villages, but it is believed that the system, in a somewhat modified form, may be introduced with great benefit in the more thickly settled farming-districts by forming the schools of a township into one, under the direction of one board of officers. It would be found necessary to have ward-schools for primary and intermediate pupils, as in the cities and villages. A regular course of study could then be laid down, and most of the pupils, it is believed, could be induced to complete it. Most of the youth in the country attend school for two or three months in the winter only, and, as there is no regular course of study, even that time is spent to comparatively little purpose. If they found themselves every year advancing in a given course, they would realize that they were accomplishing something, and would be encouraged to complete it. If each township had a central school for the more advanced pupils, where the branches of the grammar-department could be taught and certificates given for a completed course, numbers would be induced to prosecute many studies now entirely omitted.

COUNTY-SUPERVISION.

The office of county-superintendent was created in 1867. The results of six years' trial have not been entirely satisfactory. Among the causes that have operated to prevent a realization of the good that was hoped for are the violent opposition to the system of county-supervision; carelessness in the selection of men for the office of superintendent; the reduction of salaries to the minimum that the law allows, so that competent men could not be procured; and, in the larger counties, imposing upon the superintendent an amount of work that made it impossible for him to do any part of it thoroughly. Nevertheless, the system has been sufficiently tested to prove its value and efficiency.

IMPROVEMENT CAUSED BY GOOD SUPERVISION.

In every county in the State the schools are in a better condition than they would have been under the old system, and in those counties where the superintendent has been properly sustained the change is very manifest. A significant fact in this connection is that the visits of school-directors have doubled in number since the first year of county-superintendence. Equally so is the great improvement visible in the school-houses and grounds.

Counties having 10 or more school-districts have county-superintendents. Upon the enactment of the law in 1867, 46 counties were entitled to the office. Since that time the number has increased to 56, leaving now 14 organized counties with less than 10 districts, and consequently without superintendents.

The State-superintendent urges upon the people to select the best man in the county for superintendent, to sustain him fully, and, in the larger counties, to provide an assistant, so that the work may be performed with the greatest degree of efficiency. If the people will do their part, "there is no doubt the system may be made to accomplish much more than it has yet done."

NEED OF COMPETENT TEACHERS.

The university and normal school, together with the different colleges, supply the higher grade of schools with thoroughly competent teachers, but it is difficult to find a sufficient number of properly trained instructors for the districts. These schools make little advancement, for the reason that entirely incompetent teachers are often employed. Many districts are no longer satisfied with this state of things and demand good teachers. Where and how shall they be trained for their work? This is, at present, the educational problem of Michigan. Many of the union-schools have training-classes during a part of the autumn. From these classes hundreds go to their work, not thoroughly qualified, but able to give better instruction and to manage their schools better than they otherwise could have done. This kind of work will continue to be done by these schools, and much good will result from it. The frequent change in the principals and teachers of the graded schools is regretted, not only as an injury to the schools, but as preventing the exercise of that influence over the teachers in their vicinity which might be productive of the highest good.

TEACHERS' TRAINING-CLASSES IN COLLEGES RECOMMENDED.

It is suggested that, if normal departments could be established in the various colleges, under the supervision of the State-board of education and the State-superintendent, it would be equivalent to establishing so many normal schools and large numbers of teachers could be thoroughly trained for all grades of schools.

TEACHERS' WAGES AND QUALIFICATIONS.

Teachers' wages have increased in the last ten years about 70 per cent., although the past year shows a decrease, viz: 81 cents per month for males and 49 cents for females. The ratio of increase in the pay of females for those ten years has been greater than in that of males. The qualifications of female teachers have been also raised and the higher grades of work have ceased to be a monopoly of male teachers. The yearly increase of male teachers is in no proportion to that of females. The denial of certificates to many cheap, because incompetent, teachers and the disuse of the "boarding-around abomination" are regarded as among the bestresults of county-superintendency.

FREE SCHOOLS POPULAR.

No act pertaining to the public schools has been received with greater favor than that by which they were made free to all pupils within the limits of the district. The collecting of rate-bills was a great annoyance to school-officers as well as to those who paid them. The facts that the rate-bills were to be assessed after the public money was expended operated disastrously upon many schools. Those who found it difficult to meet the bills removed their children from school if they could find the slightest excuse. The free schools are a great relief to the poor and highly prized by them. The effect upon the general attendance is marked.

COMPULSORY EDUCATION.

It is believed that the compulsory law has much to do with the largely increased attendance in the public schools. Its moral effect was very soon manifest. Many children, finding they would be compelled to attend school, did not wait for that, but went voluntarily. The final results can only be determined by the faithfulness with which the law is executed. Parents, generally, are willing to assist in the enforcement of the law, but boys particularly are disposed to truancy, and it is difficult to keep them in school. The question is asked, "Cannot the compulsory law be supplemented with a law for incorrigible truancy?" The truant-law of Massachusetts is quoted, and something similar recommended for Michigan. It is asked: "If there are youth who will not willingly attend schools which will fit them to become useful citizens, shall they not be *made* to do so?" and the remark is made that "the government that will not tax itself to secure the intelligence and virtue of its *youth* will be compelled to impose a triple tax to restrain its *men* from vice or punish them for their crimes."

SECONDARY INSTRUCTION.

The new importance attaching to the high schools of Michigan, from their adoption as feeders of the university, thus forming a link of close connection between it and the lower schools, gives interest to the following discussion of their status on the part of the superintendent of instruction:

OPPOSITION TO PUBLIC HIGH SCHOOLS.

"No little excitement has arisen in some places from the discussion of the question of the legality of public high schools. The claim has been made that this department formed no part of the school-system recognized by law and that all taxes imposed to raise money to sustain these schools were illegal. It is claimed to be unjust to sustain such a school. The law contemplates that such schools should be self-supporting by charge of tuition. The law merely provides that every child shall be educated up to a certain point, but it makes no provision by taxation for giving instruction beyond the ordinary English branches, and the school-boards exceed their powers in providing for high schools at public expense.

"It is also contended that these boards have no right to employ superintendents and pay them from the public money; that they had not only created the office, but had transferred the power conferred upon them by the people to the person appointed to the illegal office; and that, although the legislature has the power to confer the right of voting a local tax to support a primary school, yet they cannot give authority to vote such tax for high schools. These two sections, it is said, require the legislature to provide for and establish a system of primary schools defined as free of charge for tuition and all conducted in the English language. Usage has never required higher qualifications for teachers in primary schools than those specified in instructions to county-superintendents, viz, orthography, reading, writing, grammar, geography, and arithme-

tic. Instruction in these branches must be in the English language exclusively. The legislature has imposed all other education on the university-fund. The income from one cannot be diverted to perform the work of the other without a breach of faith to the United States, pledged before the State became the custodian of the fund."

The superintendent gives this full statement of the views held by not a few citizens of the State and the ground of the opinion expressed, that the attention of the legislature might be called to the subject and that it might have a definite idea of the ground of the objections made to the high schools as now established and maintained. "If these statements," it is remarked, "were mere rumors or complaints made by thoughtless men, who were dissatisfied with the tax they had to pay, they would not be worthy of the least notice; but since they come from men of character and standing, who have a reputation as lawyers and who profess to have given the subject careful consideration, it is deemed best to call the attention of the legislature to the subject. If the legislature has no power to authorize the establishing and maintaining of high-school-departments in the graded schools, it is time that the fact should be known, that the power may be given."

HIGH SCHOOLS AND ACADEMIES.

There are only 6 high schools and academies from which returns have been received; these report an aggregate of 30 instructors—9 gentlemen and 21 ladies—and 855 pupils—358 boys and 497 girls—in attendance; 195 of the pupils are preparing for college and 48 for the scientific course in college. These schools all report libraries except one, the number of volumes ranging from 1,000 to 3,227; 4 are under denominational control, namely, two Catholic, 1 Episcopalian, and 1 Methodist, the remaining two being public high schools.

The high school at Ann Arbor is one of the main feeders of the university, and has, with 8 instructors—4 of either sex—305 pupils—181 young men and 124 young women; 49 of these are in the classic course, and 75 study Latin, and 42 are in the scientific course; 165 are preparing for college and 42 for the scientific course in college; 34 have entered college from the school since the close of the last academic year, in addition to the 15 others who completed the course but did not enter college. Since the commencement of the school 352 students have graduated, 140 of whom have entered college.

SUPERIOR INSTRUCTION.

The University of Michigan, as a part of the public educational system of the State, aims to complete the work which is begun in the public schools by furnishing facilities for liberal education in literature, science, and the arts, and for extended professional study of medicine and law. Its pupils in 1871–'72 numbered 1,224; in 1872–'73, 1,163. The graduates of the Michigan high schools are received into the university without examination, when, on the report of a committee of inspection, the faculty approve the work of any school and the candidates for admission present evidence of having pursued with success the studies preparatory to the freshman-class. The number admitted thus from the high schools in the first year of the experiment (1871–'72) was 50, and these are said, in the president's report, to have stood at least as well as any others the first tests of study, and in some things to have gone beyond their fellows, while the effect of their admission has been stimulant and healthful in a high degree upon the schools from which they came. The report for 1872–'73 is essentially the same.*

CO-EDUCATION OF THE SEXES.

The president of the university says, in his report for 1873: "The history of our work during the past year has only deepened the impression made during the two preceding years of the entire practicability of co-operative collegiate and professional education of the two sexes in the same schools. If any have cherished a fear that the admission of women would tend to reduce the standard of work in the university, their attention may be directed to the fact that during the last three years we have been

* The language of President Angell here is: "We have now finished our second year's trial of receiving, without examination, the graduates of high schools who have been inspected and approved by the faculty, and I think there is no difference of opinion in the faculty concerning its salutary effect. We have suffered no embarrassment from this course in respect to the quality of the preparation of our freshmen. The superintendents and teachers of the approved schools evidently feel the responsibility of being made virtually examiners for admission to the university, and thus becoming thoroughly identified with us. The visits of our committees keep us constantly in intimate relations with the schools and, according to the testimony of the superintendents, furnish a valuable help and stimulus. The faculty, after examination, voted to receive for the coming year from the following schools: Detroit, Flint, Pontiac, Jackson, Adrian, Cold Water, Grand Rapids, Ypsilanti, and Ann Arbor. Other schools in the State will probably next year be organized on a sufficiently broad basis to be placed on the same footing. We are certainly approximating towards a more substantial unity in our public system of education than any other State in the Union."

steadily increasing the requirements for admission* and broadening the range of studies. And certainly the women experienced no such difficulty in acquiring the studies assigned in the regular curriculum as to call for any modification of the course on their account. Their record is as creditable in all branches as that of the other sex. Nor do I see any evidence that their success in their intellectual pursuits is purchased at the expense of health. On the contrary, I doubt whether the same number of young women in any other pursuit in life have been in better health during the year." In the college-year of 1873–'74, 87 women students entered the university, 51 taking the academic, 4 the law, and 32 the medical course, the restriction on their entrance in this last department having been removed and a course of study provided for them separate from that for males, but in all respects equal to it.

A large new building for the university, costing $125,000 and uniting the two built in 1841 and 1848, has been completed and occupied during the year 1873. With this addition to its means of operation, with libraries now numbering over 30,000 volumes, with a museum embracing upwards of 100,000 specimens, and with a faculty of large extent and proved ability, its influence upon the educational interests of the State, and especially upon the public schools—with which it is now intimately linked—can hardly fail to be a steadily improving one.

At the formal opening of the new hall, November 5, 1873, Regent Willard said: "That which gives special significance to the expenditures for its completion is the fact that the erection of this building signalizes the first complete union between the university and the State. This is the first building on the university-grounds built from funds furnished by the people of Michigan. In providing the other buildings and conducting the university onward in its course of usefulness, the State has hitherto acted merely the part of an agent or trustee. The Government of the United States has made the endowment and the State has been its steward in the management of the means supplied."

D. Bethune Duffield, esq., on the same occasion, said: "This university, in all its departments and schools, is as much a part of our school-system as the humblest red school-house in the State. Without the university and the inspiration it imparts, the schools would ere long become languid, and without the schools it would not be long before the halls of the university would be solitary."

The main address of the occasion was by President White, of Cornell University. It was devoted to a consideration of the proposition that provision for the establishment and maintenance of institutions for superior instruction must be made by State and national governments. It is said to have been a most scholarly and able speech.

Respecting the other institutions for superior instruction in Michigan, statistical details will be found in the appended table.

Adrian has added two new professors to its faculty and reports its clear assets—additional to grounds, buildings, and apparatus—$160,000. A musical department here is said to be proving a success.

Albion, besides forming a Greek and Latin scientific course, additional to its previous Greek-scientific and Latin-scientific separate courses, has, through the generous efforts of Mr. David Preston, of Detroit, added $110,000 to its endowment.

Hillsdale, with two new professors in the college, as well as a new lecturer in the theologic department, has also increased its endowment by $35,000 and counts over 600 pupils in its different schools. This college has been so unfortunate as to lose by fire its principal building since the beginning of the year 1874.

Hope has perfected arrangements for opening a seminary for young ladies in connection with the college.

Kalamazoo has put a new professor in the chair of chemistry and received an addition of $2,500 to its funds.

Olivet, offering equal advantages to students of either sex, has considerably increased its library and has some prospect of discharging its indebtedness and adding $100,000 of endowment to its funds.

SUPERIOR INSTRUCTION OF WOMEN.

Two institutions only for the superior education of young ladies, the Young Ladies' Seminary and Collegiate Institute at Monroe and Michigan Female Seminary at Kalamazoo, have reported their statistics for the last year. The aggregate attendance was 171, of whom 22 were in preparatory studies, with 16 professors and instructors, all but one of them ladies. In the freshman-year there were 50 pupils; in the sophomore, 41; in the junior, 20; and in the senior, 17. Nine were in special or partial courses and 12 in post-graduate-studies. Vocal and instrumental music, drawing and painting, French and German, are taught in both seminaries, while in that at Monroe

* For example, there have been instituted the following additional requirements for admission to the classic course in 1874: in English, the chapters in Hart's Rhetoric, on punctuation and the use of capitals, proof-reading, and the study of the English language; in Latin, the last six books of the Æneid; in Greek, as introductory to the fair study of the language, the first three books of Smith's History of Greece, not including the chapters on literature and art.

Italian is added. This reports a chemic laboratory, a philosophic cabinet, and a natural-history-museum. The seminary at Kalamazoo has a small natural-history-museum; both have gymnasiums and libraries of 1,200 and 500 volumes, respectively.

STATE NORMAL SCHOOL.

The year 1871-'72 is said to have been one of steady advancement in all departments of this institution. It has been the earnest purpose of the faculty to make the professional work the leading characteristic of the school. Special instruction was given in the application of the principles of psychology to the science of teaching, and there having been a deficiency of attention to the ancient languages that has proved a hinderance to graduates securing high positions in preparatory schools, the course of study in this line has been extended so that those who complete it will be qualified to take charge of the larger union- and high schools and prepare students for college.

The demand for teachers from the normal school, both graduates and under-graduates, has been far greater than could possibly be supplied. More than 150 of the pupils in attendance the last year, including the graduates, have been teaching the present year. Most gratifying reports have been received of the work done by them. It is believed that this institution was never exerting a wider or more healthful influence over the schools of the State than at the present time. There is a large increase of pupils, the number enrolled up to December, 1872, exceeding the entire enrollment of the preceding year. Pupils are not received for less than an entire term, and the board is required by law to reject every candidate who, in its opinion, "will not make an apt and good teacher."

The number of pupils in the normal school for the year ended June 30, 1872, was 296, of whom 120 were males and 176 females. Of this number, 84 were free pupils under appointments from members of the legislature. The graduates in 1872 were 47, of whom 12 had pursued a classic course of four years, 10 a course of modern languages for the same time, 12 a full English course of three years, and 13 a common-school English course of two years.

Additions to the laboratory are greatly needed and the library is represented as entirely inadequate to the wants of the school. Books of reference for teachers and pupils are greatly needed, for many subjects are taught in such a way as to require their use. An expenditure of $500 in each of these departments would greatly increase their interest and usefulness.

THE AGRICULTURAL COLLEGE, LANSING.

A correspondent of the Detroit Weekly Post writes thus of a visit paid this institution: "Passing through the gateway leading to the college-grounds, the gates being opened and closed by the action of the carriage-wheels, we went on through a well-conditioned lawn, over a good road, winding among trees that had been reserved from the native forest, and drove to the building especially devoted to teaching chemistry, where I found Prof. Kedzie, with his class before him, engaged in a recitation which was only interrupted long enough to glance at my letter of introduction and then continued in my hearing. Enough remained to show that the class had to give the closest attention. This exercise over, we were invited to dinner with the students. The dinner was plain, but of good food well cooked, and the large room, furnished with the short tables now in general use at hotels, was well filled with young men and a few ladies, and everything seemed to be conducted with order and decorum. The students are required to board in this hall, unless special permission is given to board elsewhere. The board is furnished them at cost and, the last session, was $3 per

week. At the opening of each term each student pays $20 as an advance on board, which is allowed for in the settlement of accounts at the end of the term. In addition to this advanced payment of $20, a student, on entering college, is required to pay a matriculation-fee of $5 and every term $3.25 for incidentals, with $1 for room-rent—in all, $29.25 at the commencement of the first term. Students from other States pay $10 additional per term, $20 for the year.

"Students receive remuneration for the labor they perform, the amount paid depending on their ability and fidelity. The highest wages paid have been 11½ cents an hour; the lowest, not more than 2 or 3 cents. Labor is not required on Saturday, but is usually furnished if applied for, and is estimated at a higher rate, the maximum being 12½ cents per hour. * * * The general appearance and bearing of the young men attracted my attention, and their show of health and gentlemanly conduct impressed me favorably. I learned that they were mostly the sons of farmers; that their ages would average 20 years; and that the privilege of working on Saturday was so eagerly seized as to secure them last year $2,000 for work done on that day.

"I asked, 'What has become of your graduates?' and was answered that 2 died in the army before entering into business; that 31 were farmers; 5 teachers in colleges having charge of farms, one of these being professor of entomology in the Agricultural College; that another is professor of agricultural chemistry in Michigan University; 2 students in animal physiology; 1 a student of veterinary science; 1 a student in chemistry; 1 a manufacturer; 3 engineers and surveyors; 5 engaged in law; 4 merchants' agents; 1 a clergyman, but president of a farmer's club with large attendance; and 4 teachers in colleges. One student, not a graduate, was made professor of agriculture in the Kansas Agricultural College."

The land still held by this institution, 171,074 acres, with the endowment already in hand, $207,500, must make it eventually one of the wealthiest of its class and bring within its reach most noble opportunities for influence. During the year past it has received from the State $37,348 and has expended for new buildings $13,000; for improvement of grounds, buildings, library, and apparatus, $2,602. It now numbers 6 resident professors, with 4 other instructors; has 115 students in its regular course, with 25 in a partial course and 3 post graduates still prosecuting studies; reports an income of $11,038.61 from productive funds and $15,500 from other sources; and counts 2,800 volumes in its library.

BUSINESS-COLLEGES.

Seven of these institutions—at Detroit, East Saginaw, Hillsdale, Jackson, Kalamazoo, and Lansing—report a total of 25 teachers and 1,248 students. One other, at Grand Rapids, makes no return for 1873.

MICHIGAN INSTITUTION FOR DEAF AND DUMB AND BLIND.

The trustees report, in their last biennial, the uniform good health of officers, teachers, and pupils. Out of 171 deaf and dumb pupils and 48 blind, making a total of 219, only one had been lost by sickness, and that a case of probable inherited disease.

The school is said to have maintained its well-established reputation for thoroughness in all its departments, both deaf and dumb and blind having made remarkable and most satisfactory progress in the various studies pursued. One of the examining committee represents the annual examination as creditable in a high degree to the teachers and the pupils, nearly if not quite equaling similar examinations in the public schools. Training in mechanic occupations, such as type-setting, printing, shoemaking, and cabinet-making, has gone along with the drill in other studies, and has produced a considerable saving to the institution from the products of the labor of so many hands; has had the most beneficial influence on the spirit of the pupils, and has fitted many of them to be helpers to their parents instead of being a burden and a care. The cabinet-shop has not only cleared its expenses, but $1,274 more. The shoe-shop has come within $333.71 of meeting every expense. The sewing of about 50 deaf and dumb girls for three hours each day has secured several hundred dollars for the increase of the library. And these healthful industries have quickened the minds and animated the spirits of the ones engaged, exercising their faculties in practical directions and giving them the encouragement of feeling that they were taking steps towards self-support.

The school-course has been extended one year, and further extension of it is proposed and probable.

PROPOSED CHANGES IN SCHOOL-LAW.

A constitutional convention held in Lansing, 1873, recommended the following changes in the provisions of the constitution respecting education: (1) That the superintendent of public instruction shall be a member of the boards of all State educational institutions, including the reform-school. (2) That the supervision and control of the university shall be vested in the board of regents, thus removing it from exposure to the legislative interference which has sometimes proved embarrassing. (3) That the legislature shall provide for the establishment and maintenance of a library in each township and of at least one in each city. (4) That women shall be eligible to the office of county-superintendent and other school-offices.

TEACHERS' INSTITUTES.

Seventeen institutes have been held during the year. The average attendance was 75. A greatly increased interest was manifested on the part of the teachers and the results of the meetings were in the highest degree satisfactory.

LIBRARIES.

The number of volumes reported in district-libraries is 108,281; in town-libraries 49,744—total, 158,025. The amount expended during the year for books, by districts, is $11,287.86; by towns, $4,244.83. The amount voted from the two-mill-tax for this purpose is $2,069.63; from fines, $20,323.77, or $6,860.71 more than was used as the law requires.

The number of volumes in the libraries is scarcely more than in 1864. The withdrawal of the annual appropriation to the library-fund proved a death-blow to the township- and district-libraries. If this could have been continued, although it was a small allowance for so important a purpose, there would now be thousands of libraries of well-selected books, which would be of the greatest service to many of the youth now destitute of suitable reading-matter, and it would not be many years before their influence would be seen and felt. A taste for good reading cannot be acquired without books. Create the library and the taste will very soon be formed. Good school-libraries are considered an important part of the common-school-system—almost an essential one.

LIST OF SCHOOL-OFFICIALS IN MICHIGAN.

Hon. D. B. BRIGGS, *State-superintendent of public instruction, Lansing.*

COUNTY-SUPERINTENDENTS.

County.	Name.	Post-office.
Allegan	Edgar S. Linsley	Allegan.

Increase for the year		903
Number of summer-schools in 1871	2,164	
1872	2,358	
Increase for the year		194
Aggregate length of summer-schools, in months, in 1871	6,931	
1872	7,824	
Increase for the year		893

* The returns for 1873 may be found in statistical tables I and II.

THE PUBLIC-SCHOOL-SYSTEM.

There has been no radical change in the work of the schools within the past year. The present system, as yet imperfectly developed, owing mainly to the youth of the State, is gradually unfolding itself, and, as more tangible results follow, errors are corrected, improvements made, and a better confidence established.

The Minnesota system of common schools is designed to exhibit the American ideal of what public education should be: the education of every child in the State. The purpose is to give the greatest possible facilities for instruction; to improve the methods; to elevate the profession of teaching; in a word, to make the common schools—the schools of the people—so thoroughly attractive and useful as to secure the support of all who are entitled to their benefits.

The hearty support and co-operation of nearly all the citizens of the State with the school-work during the past year and the apparent purpose not to be outdone by sister-States in the meritorious effort to make the school-buildings equal to the necessity for them encourage the belief that the school-system accords with public sentiment and is an expression of the public will.

As one result of the interest manifested throughout the country in the improvement and perfecting of the public schools, the teachers employed possess better educational and other qualifications, and with these improved talents demand higher compensation. Teaching is becoming more permanent, requiring natural ability, study, and preparation. Thought is beginning to take the place of mere mechanic routine in teaching. Work is being performed by those who love it; pupils are instructed, not simply questioned; lessons are relieved of their asperities and are better adapted to the age and capacities of the learners; labor is lightened; mental powers are strengthened, and there is less unnecessary strain upon the delicate organization of children.

Another result of the public interest in schools is marked in the new buildings erected for school-purposes. In the older counties the log school-houses and frame shanties are fast disappearing and substantial and commodious structures are taking their places. Many of these are furnished after the approved modes, with outline-maps, globes, and all the modern improvements in the way of school-room-conveniences.

The demand for a higher school-standard is also evidenced in the feat that, of 2,745

teachers who were examined, 345 failed to obtain license to teach for lack of the necessary scholarship.* The county-superintendents are becoming more rigid in their examinations, both with regard to a knowledge of the branches taught and the methods of imparting instruction.

OBLIGATORY EDUCATION.

Of this, the superintendent says: "However men may differ in opinion as to the best plan of preventing absenteeism or reclaiming truants, all are impressed with the necessity of some measure to cure this almost universal evil. Laws compelling attendance at school of children between certain ages have been adopted in Michigan, New Hampshire, Texas, and California and laws regulating the school-attendance of children of certain ages who are employed in manufactories have been enacted in Massachusetts and Connecticut. It is believed that these laws work well—are sustained and give satisfaction. In many of the European states compulsory educational laws are adopted and enforced. The fact that compulsion works well under a monarchic government is indeed no evidence that it is adapted to a government where all power is derived from the consent of the governed. But if the principle we so often hear reiterated be a true one, that the safety and preservation of a republican form of government lie in the virtue and intelligence of the people, and if it be also true that the power of the government can come into the home of the citizen and take thence the father, son, husband, and brother in order to preserve that government when in danger or peril, the same power can come into the family-circle and force the citizen to educate his children, in order that they may become qualified to exercise the rights and privileges conferred upon them by the state and that they may be better able to preserve and defend the state when assailed by either foreign or domestic foes."

There was a compulsory law passed by the State of Michigan in 1871. State-Superintendent Hosford says of its workings: 'I do not remember that any law bearing upon the school-interests of the State was ever received with such universal favor as this one. The press, without distinction of party, very generally commend it and very few of the people were heard to speak against it.'

"Believing, as I do, in the necessity, in a Government established upon a basis like our own, of universal education, I do not hesitate to say that the Legislature ought to incorporate the principle of compulsory attendance into our school-system in this and every State in the Union. There are unanswerable arguments in favor of the proposition. Those who own the property of the State are taxed for the support of common schools for the benefit of all children alike. The poor as well as the rich enjoy the advantages of the schools supported by the tax-fund. The question arises, Shall the intemperate, the indolent, the thriftless, who do not contribute to the general welfare of the State and yet receive its protection and enjoy its privileges, being in a minority, be allowed to transmit their ignorance through their children, prevent the successful operation of the law, and thus defeat the will of the majority upon a question so interwoven with our higher interests and our very existence as a free State? The priceless boon of a free school is of incalculably more importance to the non-tax-payers than to any other class; for the property-holders will, as a class, educate their children under any financial system. Now, if the State, for high, social, moral, and political reasons, can justly coerce the property-holders and employers into the support of universal free education; if it can regulate the labor-department in our manufacturing-establishments by a stringent law, can it not—yea, ought it not—for every reason, to insist that the children, in whose interest the factory-law was passed and for whom such ample provision is made, shall avail themselves of the proffered opportunities of instruction?"

PRIVATE SCHOOLS.

Blanks were sent to all the county-superintendents upon which to return the statistics of the private schools of the various grades. It is thus shown that there were 4,285 pupils, in the schools reported, who did not attend any public school during the year. Add this number to the 120,352, the number of persons reported as having been enrolled in the public schools within the past year, and we have 124,637. By a calculation based upon the census-returns, showing the population of Minnesota between the ages of 5 and 20 years, 74¼ per cent. of this class were between 5 and 15 years of age. This is the age when the largest proportion of the schoolable population cease to attend the common schools. Assuming this to be true, we find 74¼ per cent. of 180,020, the entire schoolable population, to be 134,115. From this number deduct 124,637, the aggregate number enrolled in both the public and private schools of the State during the past year, and we have but 9,478, or less than 6 per cent. of the children of the State under 15 years of age who were not enrolled in some school within the year.

This is certainly a fair showing and may challenge any State to exhibit a better one.

---

* The tabular statement differs from the superintendent's report, giving 3,179 as the total number examined and the number rejected as 368.

HIGH SCHOOLS.

The various reports from the superintendents of city graded schools seem to show that the grade of the high schools is constantly advancing. The course of study seems to be thorough, embracing higher mathematics and the languages, and is intended to prepare pupils for admission to the State University. Considerable attention is given to normal instruction, written examinations are a regular exercise, and, in some of the schools, a part of each day is devoted to practical composition.

The Red Wing Collegiate Institute seems to be a private high school, for both boarders and day-pupils. The building is large, convenient, and well furnished with educational and physical appliances; and moral training is not forgotten.

The reports of the county-superintendents indicate a marked progress in nearly every respect in the class of schools here indicated.

Eleven private institutions for secondary training, additional to those referred to by the superintendent, report an aggregate attendance of 1,302 pupils—642 young ladies and 660 young gentlemen. Of these, 304 are engaged in classic studies, while 568 are pursuing modern languages; 76 are specifically stated as preparing for college and 45 for a scientific course. In 6 of these schools drawing is taught; in 8, music; 6 have libraries ranging in extent from 208 to 875 volumes; 2 schools are for the exclusive education of young ladies, while the remainder are for both sexes; 4 are sustained by the Catholic Church, 3 by the Episcopal, and 4 are unsectarian.

THE UNIVERSITY OF MINNESOTA.

During the period covered by the report of the president, the library of the university has been increased by the addition of many valuable works, mostly presented.

Tuition is still free in all departments, the only university-charge upon students being a small one of $6 per year, to cover incidental expenses.

Boarding and lodging are obtained with some difficulty. Some thirty young men have been sheltered in the building, mostly in the basement-rooms. Sixteen others have been lodged in the handsome structure erected by the honorable president of the board of regents at his own expense. To a boarding-club, composed of the young men so lodged, has been given the use of some basement-rooms and furniture. The cost of board in this club at no time exceeded $2 per week. But for these arrangements it would have been almost impossible for some of the most promising students to attend.

No provision has been made for the maintenance of young ladies. It is thought probable that, until such time as suitable homes can be provided at reasonable cost for lady students in the neighborhood, the proportionate number attending will continue to decrease. The president expresses the hope that private or associated benevolence will at no distant day find a noble field in providing comfortable homes for students of both the sexes desiring to receive the free instruction of the university.

The examinations have been unusually rigorous, and of the 122 candidates for admission 20 failed to pass and 27 were admitted with conditions.

An act was passed by the legislature of 1872, entitled "An act to provide for a geological and natural-history survey of the State, and to intrust the same to the University of Minnesota." It is much to be regretted that the demands upon the treasury obliged the legislature to restrict the annual appropriation for these surveys to the sum of $1,000. The board of regents will at once proceed to so expend this sum as to assure the legislators that the larger appropriations hereafter to be made will be wisely used. The possible benefits of these surveys to the State no one can foretell, the incidental advantages certain to accrue to the university are obvious. The collections of natural history contemplated by the law will form a valuable means of illustrating the instruction in natural sciences; men of science and others interested in the physical character of the State will be attracted to the institution, and the mere fact that the operations are carried on at the university will prove a sharp stimulus to scientific investigation. In conclusion, the president says of the university: "Having but few things, it wants almost everything—that is, if the State wants a university indeed. Every genuine university is a growth. It is for the good people of Minnesota to say, through their representatives, whether the University of Minnesota, whose corporate existence was coeval with that of the Commonwealth, shall, under hard conditions, have a tedious, stinted, unshapely development, or whether, enriched and stimulated by generous cultivation, it shall rapidly but healthfully attain to noble and full proportions."

In the report of the board of regents it is stated that an agricultural farm is connected with the university and that the chair of chemistry has been temporarily combined with that of agriculture. The department of geology and mineralogy was to be opened in January, 1873, and the survey is already far advanced. The college of the mechanic arts was also to open in January, and so the university to begin the year with all the classes of a regular American college. New departments are contemplated when the buildings shall have been enlarged and multiplied.

Five hundred models from the Patent-Office in Washington have been added to the museum and a collection of marine specimens has been purchased.

CARLETON COLLEGE.

This college is already ranking itself among the first educational forces of the State. Its faculty is steadily increasing with its endowment. Its course of study shows that it aims at the eastern standard; and, that it may realize its object, it has given three full years to its preparatory course, thereby placing its requisites for admission fully up to those of the older institutions of the country and also introducing additional studies. A fourth year is added to its English course, giving greater prominence to book-keeping and the modern languages, as well as to the sciences.

A new stone building has been finished within the past year and is now occupied. The first and second stories are devoted to the purposes of a chapel, library and cabinet, lecture and recitation-rooms, and the third to dormitories. The boarding-department has been brought into closer relations to the college-authorities. The effect of these and other improvements is seen in the greatly-increased attendance of pupils.

Though aiming to be thoroughly Christian in its character, the college is under no ecclesiastic control and is not sectarian in its methods or influences. Its privileges are offered to all alike, irrespective of race, nationality, or denominational preferences. All departments are open to students of either sex. Ladies reside with their teachers in the ladies' hall, but both sexes meet in all general exercises, are instructed in the same classes, enjoy the same privileges, and may take the same degrees.

ST. JOHN'S COLLEGE.

This college, conducted by the Benedictine Fathers, is delightfully located, the buildings and grounds ample and commodious, and the number of its students increasing. The use of tobacco is forbidden in the institution, and a student wishing to abide by this habit is not tolerated.

SUPERIOR INSTRUCTION OF WOMEN.

St. Mary's Hall, at Faribault, is the only college or school exclusively for the higher education of women reporting from this State. It has, with 11 professors and instructors—2 gentlemen and 9 ladies—an attendance of 104 pupils. Music—both vocal and instrumental—drawing, painting, French, and German are taught. The institution has a natural-history-museum and gymnasium and, in common with the Shattuck School for Boys, a philosophic cabinet and a chemic laboratory.

SCHOOLS OF THEOLOGY.

The two institutions devoted to theological training in the State from which returns have been received may be found in the table appended to this head. Besides these, there is the Bishop Seabury Divinity School at Faribault, under the presidency of the Right Rev. H. B. Whipple, D. D., and with four additional professors in its faculty, this, with the Shattuck Grammar-School for Boys and St. Mary's Hall for Girls, both also at Faribault, forming a group of educational institutions for training young persons of the Protestant-Episcopal communion from the first elements of learning up to the entrance on professional and active life. The last two, of course, are not professional schools; but their connection with the other in an associated group leads to the mention of them here.

BUSINESS-COLLEGE.

One institution of this kind, at St. Paul, reports 6 instructors and 246 students.

NORMAL SCHOOLS.

The State normal-school-board presents a favorable report of the three normal schools of Minnesota. The enterprise has steadily grown and there have never been so many normal students under instruction as at present.

In the model or preparatory department of the Winona school are 62 children of the State Soldiers' Orphans' Home, who have received, not only instruction, but books, stationery, and other apparatus, free of charge to the home. The board regards "no State-charity more worthy than this."

The Mankato school, in charge of Miss Julia A. Sears, is reported to be "doing excellent service" and "in the highest degree satisfactory to all concerned." The board says: "At the time of Professor Gage's resignation, the question arose whether it were better to commit the school to the charge of a *man*—a total stranger—or Miss Sears, who had been connected with it from the first as first assistant. The latter course was decided upon and has been abundantly justified by results."

Of the St. Cloud school the board says: "We have not the shadow of a doubt that, if the new building were complete and fully equipped from basement to turret, it would be crowded with students to its utmost capacity within the first term. The teaching of this school has been thorough from the first, and no normal-school-graduates are more worthy of confidence than those of St. Cloud."

The board asks for a settled appropriation of $35,000 a year, for the support of the three normal schools, and says in conclusion: "We have now nearly 300 normal graduates in the field, besides more than twice that number who have gone into active service, as teachers, short of graduation. The idea is now fully recognized that teaching, with proper qualifications, is a profession as much as law, medicine, or theology; and this profession, in conscious dignity and power, is now able, as formerly it was not, to command the respect of all classes of people; and the effect of this is, and must be, to give discipline, depth, breadth, poise, and dignity to our children, such as neither we nor our fathers were ever able to acquire at school. Whatever looks to the elevation of our school-system and the true dignity of our rising humanity must challenge our respect and awaken the deepest sympathies of our nature, for the *mind* of the State, more than its muscle or 'thousands of silver and gold,' must determine its standing in the sisterhood of States."

Prof. Phelps, the principal of the first State normal school, combats the idea that "academical teaching" has no place in a normal school. He claims that nineteen-twentieths of those who enter the normal school must go back to first principles. "Not only are they ignorant of the very beginnings of the common-school-studies, but they have no power of expressing what they do know. And as the art of imparting one's knowledge fluently, clearly, and forcibly is one of the prime elements, not only in a good education, but in a teacher's qualifications, it is perfectly evident that this art must be learned by patient, persistent, toilsome practice at the normal schools, where teachers are prepared. How can this be done if the branches to be taught are not themselves taught in the teachers' seminary? Hence, what the unthinking are pleased to call 'academical work' must be done at the normal school."

Further on he says: "The establishment and hearty support of normal schools means reformation in education. It means revolution in schools where revolution is necessary. And if thorough *teaching* be not now universal, it is because thorough *teachers* are not universal. Hence, revolution and reformation in schools must begin with the revo-

lution and reformation of the teachers, and this is precisely the business of the normal schools.

"The way to make the purely professional schools of our modern theorists possible is to raise up a supply of teachers who will so conduct our other public schools of every grade that they shall take the burden of this so-called 'academical instruction' from the normal schools, and thus enable them to test these theories. * * * The varied and toilsome experience of practical men in this field has led them to the discovery that thorough and scientific academical teaching, so called, is one of the very best means of effective professional teaching, and that it is only through the latter that some of the best results of the former can be realized. This will ever be the case when the academical work is done with a definite and paramount professional object in view, especially in the field of elementary instruction."

MINNESOTA INSTITUTION FOR THE DEAF AND DUMB AND BLIND.

The eleventh annual report of this institution speaks of the schools within it as working well and satisfactorily. The south wing of the main building, only inclosed two years ago, has been completed, furnished, and occupied during the year 1873, enlarging greatly the accommodations of the institution and contributing to the comfort of the various inmates. An additional building, 24 by 40 feet and two stories high, designed for a cabinet-shop below and a shoe-shop and store-room, has also been completed, improving much the facilities for instruction in mechanic arts. A fine farm of 97 acres, with about 67 acres of cultivated and ornamented grounds surrounding a comfortable family-mansion, has been secured for the special accommodation of the blind pupils, and is to have a large brick building 40 by 60 feet, with basement, two full stories, and Mansard-roof added during the incoming year to the building already existent on the farm, making with it a continuous whole.

The total number of pupils in all departments during 1873 has been 106, of whom 86 were deaf and dumb and 20 blind, an increase of 20 of the former and 4 of the latter over the number in 1872. The department for the blind sent out its first three graduates in 1873, provision for this class having been made three years later than that for the deaf and dumb. One deaf mute also graduated.

Mechanic instruction has been considerably attended to and the cooper-shop has turned out over 4,000 barrels, yielding a profit to the institution. More attention will be paid to this line of instruction in the future.

DIRECTORS' INSTITUTES.

The superintendent renews his recommendation of last year, that a convention of school-district-officers be held for the purpose of consultation and instruction in reference to the duties required of them by law. He states that, "out of the twelve thousand school-officers in the State, there is not one-fourth of them who can make an accurate report of the doings of a district during a school-year." Hence, "the place to begin making needed improvements in our common schools is to educate the school-officers in regard to their duties."

STATE TEACHERS' ASSOCIATION.

The annual meeting of this body convened at Minneapolis on the 28th of August and continued three days.

A course of study for the common schools of the State was recommended, and the State-superintendent of public instruction was requested to issue the same in circular-form for the use of teachers and school-officers. A committee was appointed to prepare and recommend a course of study for high schools.

The following resolutions, among others, were unanimously adopted:

"*Resolved*, That we see, in the marked success which has attended the teaching of music in our graded schools the past year, a demonstration that it is not only desirable, but also practicable, to introduce its study at once into all the graded schools of the State.

"*Resolved*, That the employment of a teacher of music for the district-schools of each town, as suggested by the president of the association, meets with our entire approval, and we hope to see it secured at no distant day."

TEACHERS' INSTITUTES.

Teachers' institutes have been held during the past school-year as follows: in the months of April and May, in the counties of Chisago, Rice, Martin, Sherburne, Meeker, Brown, and Carver; and in September and October, in Douglas, Stearns, Hennepin, Scott, Sibley, Dakota, Goodhue, Wabashaw, Winona, Mower, Freeborn, Faribault, and Dodge—twenty in all. There was an aggregate attendance of over nine hundred teachers, who manifested a commendable interest in the important matter of fitting themselves for their school-room-work.

"It is a question which it would be well for the legislature to consider, whether it should not be made, by law, a condition-precedent to a teacher's receiving a certificate

licensing him to teach, that he should have attended the session of the State teachers' institute whenever held in his county. It seems no more than just that, after the State has made provision for bringing the institute to the very doors of teachers, as it were, that the teachers should be required to avail themselves of its benefits, unless they can render to the county-superintendent a valid excuse for such absence; and, whenever teachers fail to do this, license should be withheld from them. In some States there is a provision of law requiring all the common schools in the county to be suspended during the time of the institute and also that the wages of the teachers should continue while they are in attendance. This is nothing more than justice. If there was such a provision of law in Minnesota, teachers could have no excuse for absenting themselves from the institutes. Should the legislature so amend the law providing for these institutes as to continue the wages of teachers while in attendance upon the session held in the county, it would merely extend the principle upon which normal schools are built and sustained.

"No money that has been expended by the State for improving the qualifications of teachers and increasing the efficiency of the common schools has made a better return than the sum annually appropriated for supporting teachers' institutes. These gatherings of teachers have been the means of stimulating the great majority of those who have attended them to a determination to attain to a higher standard of qualification in their calling, a desire for accomplishing greater good, and of gaining a good reputation in their profession. The result has been better schools, better methods of teaching, better school-discipline, and better wages."

The superintendent suggests that in the older counties training-schools, to continue in session for four or five weeks, might advantageously be substituted for teachers' institutes. These should be organized and conducted on the same general plan as a normal school, and rather as a supplement to the latter, to satisfy the desire for normal methods and instruction and to furnish the great body of teachers who are pecuniarily unable to take a regular course in a normal school. There is work enough for all and the great need of the State is more and better-qualified teachers.

To the end, therefore, that the institute-work may be made the most efficient, it is recommended that the annual appropriation of $2,000, for the purpose of holding teachers' institutes, be increased to $3,000, one-third of which shall be spent annually in conducting institutes of one week in length in the newer counties, and the other $2,000 in holding normal training-schools, of at least four weeks' duration, in such central and convenient places as the State-superintendent may think advisable.

LIST OF SCHOOL-OFFICIALS IN MINNESOTA.

Hon. H. B. WILSON, *State-superintendent of instruction, St. Paul.*

COUNTY-SUPERINTENDENTS.

County.	Name.	Post-office.
Anoka	Rev. J. B. Tuttle	Anoka.
Becker	F. B. Chapin	Detroit City.

MISSISSIPPI.

[From report of Hon. H. R. Pease, State-superintendent of public instruction, for the scholastic year ended December 31, 1872.]

SCHOOL-FUND.

Amount of common-school-fund, including Chickasaw and sixteenth-section-funds	$1,950,00 00

Receipts.

Amount of revenue accruing from various sources	545,916 32
Amount of revenue by special county-tax, reported	543,768 76
Amount of common-school income-fund, including capitation- and privilege-taxes and attorneys' fees	152,623 45

Expenditures.

Amount expended for teachers' salaries	584,536 67
Amount expended for salaries and mileage of school-directors	70,000 00
Estimated cost of county-school-officers	145,000 00
Amount expended for school-houses and contingent expenses	176,917 76
Total expenditures	1,136,987 95

SCHOOL-POPULATION.

Number of youth of legal school-age	317,264

ATTENDANCE.

Estimated number of pupils enrolled in public schools	148,780
Average attendance	125,000
Number of students in normal schools	150

TEACHERS AND OTHER SCHOOL-OFFICERS.

Estimated number of teachers of public schools	4,800
Average monthly salaries of teachers	$51.32
Number of superintendents	72
Number of school-directors	432

SCHOOL-PROPERTY.

Estimated number of school-houses, including buildings rented	4,650
Number of school-houses built during the year	426
Estimated value of school-property	$1,000,000

SCHOOL-DISTRICTS AND SCHOOLS.

Number of civil school-districts	76
Estimated number of public schools	4,650
Estimated number of graded schools	125
Estimated number of high schools	80
Number of normal schools	2
Number of universities	2
Average length of school-terms	5 mo. 15 days.

PRIVATE SCHOOLS.

Estimated number of private schools	400
Estimated attendance upon private schools	7,050

EDUCATIONAL PROGRESS.

The superintendent reports that the results of the educational work of the past year are of the most encouraging character; that the free public schools are rapidly gaining favor among all classes of the people; and that the cause of education throughout the

*For returns of 1873 see statistical tables I and II.

State is steadily advancing. Irrational prejudices are gradually giving way to reason and an enlightened conservatism. The masses of the people, including a large proportion of the wealthy and intelligent classes, are beginning to demand a conformation to the great fundamental changes in our State- and national policy, particularly with reference to popular education. The preceding statistical statement, prepared from the annual reports of county-superintendents and such information from other sources as could be obtained, presents a general view of the present condition of public education in the State and exhibits some of the facts which measure the progress and success of the system of common-school-instruction since its inauguration.

Considering the short period of time that the system of public instruction has been in operation, the many difficulties and embarrassments necessarily attending its inauguration, the magnitude of the educational scheme—comprehending the providing of ways and means for the instruction of nearly half a million of children, scattered over a large area of territory—the system of public education as a new and untried experiment in the State, the legislation adopted for its organization and maintenance necessarily crude and imperfect—viewing these considerations in all their bearings, the foregoing statement presents an exhibit of results which must be highly gratifying to the friends of popular education.

PEABODY FUND.

The aid extended by this fund to schools in the various towns of the State was as follows: Jackson, with an attendance of 600 pupils, received $1,500; Crystal Springs, with an attendance of 187, received $450; Kosciusko, with an attendance of 300, received $450; Hazlehurst, with 347 pupils, received various donations, amount not specified; Summit received $1,000; Yazoo City, $750; Harperville, $300, and Hillsboro', $300. For the ensuing year arrangements have been made for colored-schools at Hazlehurst, Crystal Springs, and Wesson, allowing $200 to each. The county-superintendent, in his letter asking assistance in their behalf, remarks: "We have three colored-schools in this county, kept in operation five months by the free-school-system and five by private subscription, having an enrollment of from 140 to 150 each and a daily average attendance of over 100. One of these is at Hazlehurst, where there is a large school-house built by the colored people themselves without the aid of the county- or State-board of education."

Rev. B. Sears, general agent of the Peabody fund, in his report for 1872, says: "Considering the great disadvantages under which public instruction has been introduced and thus far carried on in this State, we must regard the results as highly encouraging. There has been a rapid increase of public schools, accompanied with corresponding indications of increasing popular favor."

CHANGES IN SUPERVISION RECOMMENDED.

The experience of another year confirms the superintendent in the conviction that certain modifications in the details of the system of school-supervision are necessary. There is too much complication in the internal machinery, and the supervising agencies are unable to give proper direction on account of the indirectness of their control. Efforts to avoid too much centralization in the supervising power have resulted in the opposite extreme. The adoption of the department- or bureau-system of supervision would give that directness, simplicity, and economy of management which is adopted in the business world, and which, had it been adopted at the outset, it is asserted would have saved to the State a half million of dollars per annum, to say nothing of the increased efficiency it would have given to the educational forces employed.

NEED OF QUALIFIED TEACHERS.

The pressing need in the educational work is properly-qualified teachers; and, indeed, in the elementary schools the demand for teachers is greater than can be supplied, even with the poor material at command. While not more than one-third of the school-population of the State are receiving any school-instruction whatever, it is believed that of this number at least one half are under the tuition of teachers wholly unprepared in professional skill and training to apply the principles of the science and art of teaching and in many instances lamentably deficient in scholarship and ability to manage a school.

TRAINING-SCHOOLS FOR TEACHERS RECOMMENDED.

In view of these facts it is suggested that the State should stretch forth her strong arm and assist in educating and improving her teachers. Being bound by the terms of her fundamental law to extend to every child within her borders the means of acquiring the rudiments of an education, she should educate her teachers as a measure of economy and sound public policy, applying the well established rule that skilled labor is more valuable than unskilled. The establishment, therefore, by the State of one or more permanent normal schools and the appropriation of $2,500 for institute-work are recommended; also the modification of the present law relating to teachers' institutes, so as to establish county- instead of congressional-district-institutes.

ABSENTEEISM.

The evil of voluntary absenteeism is absolutely alarming. While the State has expended near a million of dollars per annum for the education of its youth, out of about four hundred thousand educable children over two hundred thousand have received no tuition whatever, from sheer neglect, indifference, and prejudice.

COMPULSORY LAWS SUGGESTED.

A compulsory law is not only just and feasible and required by the highest considerations of public policy, but it is made the duty of the legislature, by the terms of the constitution, to see that every child is provided with suitable facilities for elementary instruction. There is a general sentiment favorable to such a law, especially among the wealthy classes. They say, "If we must be taxed to educate other people's children we want the children to receive the benefit of the funds we contribute." And, indeed, the evidences are that a majority of the population are favorably disposed to such a measure. Still there is a large class who are wholly indifferent to the advantages of education, and it is for this class of the population that citizens are taxed to build jails and defray the expenses of courts of justice, and from them designing and wicked men recruit their Ku-klux Klans. There are still others who willfully refuse to send their children to school under the belief that "a little learning is a dangerous thing." "What we want," say they, "is meat and bread. Book larnin' is of no account no how." If such a law be inexpedient in other localities, it is a necessity in this State. A law compelling all parents and guardians to furnish their children between the ages of 7 and 14 years with four months' tuition annually, either privately or in the public schools, it is believed could readily be executed.

GENERAL TAXATION FOR SCHOOL-PURPOSES.

The present system of raising school-revenue by local taxation is not only impracticable, wrong in principle, but is a violation of the spirit and letter of the constitution of the State. Experience proves that it fails to meet the wants and necessities of the counties and municipal districts, which it is intended to serve.

PRESENT SYSTEM OF SCHOOL-TAXATION UNEQUAL.

In many counties the maximum per centum allowed by law would not raise revenue sufficient to educate one-fourth of their scholastic population, and in the majority of such cases the educational needs of the people are the greatest. In other counties an excessive levy of taxes has been made, while in others the boards of supervisors have failed to levy a sufficient tax to meet the current expenses, and, as a consequence, those counties are already involved in debt to a large amount. It is, therefore, recommended that the present system of county and municipal taxation for school-purposes be abolished, except the assessment for school-house- and contingent expenses, and that the teachers' fund be levied per centum on the general State-tax. The superintendent is persuaded, from a careful investigation, that a general tax for the teachers' fund is essential to the successful administration of the school-system.

OBJECTIONS URGED AGAINST STATE-SCHOOL-TAX.

The opponents of a State-tax urge against it various objections: that it is unjust to tax the people of one county or section to educate the children of another; that in the present condition of the State, as regards the ratio of the distribution of wealth to the population, the burden would fall upon the few, and upon a class who have no children to educate; that it would impose upon the wealthy planters in the alluvial districts, and the merchants and bankers at the different commercial centers, an expense from which they would receive no benefit. In other words, it would compel the rich to support the poor. Again, it is objected that a general tax compels the white men of the State to educate the children of the negro. But as the negro forms a majority of the entire population of the State and in an eminent degree a majority of the producing classes, as such classes of every population—the laborer, tenant, and consumer—indirectly bear the burdens of taxation, it follows that an assessment upon the property of the State would be principally paid by the negro, and, therefore, the ground of complaint, if any exist, against a general tax is with the colored people and not the whites. But the colored people are more than willing; they are anxious to have the opportunity of earning with their strong hands the revenue necessary to educate all the children of the State. Those who entertain these prejudices against a general system of taxation for the education of the masses are comparatively few in numbers and comprise only a class of fossil theorists, living in the past, willfully refusing to recognize the living issues of the present or receive instruction from the lessons taught by the "logic of events."

CHANGES IN THE SCHOOL-LAW NECESSARY.

The constitution of the State contemplates a system of public education uniform and economic in its operations: equal, knowing no distinction of class or condition;

unsectarian, extending its benefits and privilges to all religious sects, with partiality towards none; unpartisan in its administration, conforming always to the will of the majority, not only making instruction in morals and the elements of knowledge universal, but fostering instruction in the higher branches of learning. In the opinion of the superintendent, the present system fails to meet the requirements of the fundamental law, and certain changes are recommended by him to the consideration of the legislature, changes which he deems essential to the administration of a system of public instruction adapted to the wants of the people.

Five fundamental conditions are mentioned as essential, viz: (1) the adoption of a sound financial policy, (2) a well-regulated system of general and local supervision, (3) uniformity, (4) competent teachers, and (5) instruction in the elements of knowledge made obligatory.

These the present school-policy, while containing in its general outlines some very excellent features, most signally fails to comprehend, and is especially defective in its adaptation to the present social, political, and financial condition of the people.

FINANCIAL POLICY.

Alluding to the mismanagement for forty years of the school-lands bequeathed to the State for educational purposes by the General Government, to the unlawful diversion of the school-funds to other than school-purposes, and the irretrievable loss of millions of this sacred endowment to the people's schools on account of improper legislation and supervision, the superintendent remarks that had a proper financial policy been pursued the school-land-fund alone would now afford revenue sufficient to support a system of free schools with ample facilities for the instruction of all the youth of the State.

The educational provisions of the new constitution were intended to remedy the evils of the former policy by establishing a State-board of education for the management of the school-funds under the direction of the legislature and requiring a consolidation of the different classes of the school-funds into one common fund, to be invested in United States bonds and the income to be inviolably appropriated to the support of the free public schools. By the terms of the constitution the common-school-fund is made to consist of the proceeds of all lands belonging to the State heretofore granted by the General Government (excepting certain swamp-lands situated on Pearl River) and the proceeds of all lands vested in the State by escheat or purchase or forfeiture for taxes; all fines for the breach of the penal statutes; licenses for the sale of intoxicating liquors, under the general laws of the State; the funds arising from the consolidation of the congressional township-funds, and the lands belonging thereto. Nothing has been done as yet towards consolidating the different classes of funds or making the investment as contemplated in the organic law. The State is indebted to the school-fund to the amount of half a million of dollars, funds arising from the sales of lands forfeited for taxes, fines, and licenses, for which the school-fund has as yet not received one dollar of revenue. Again, the sixteenth-section-fund, amounting to not less than one and a half millions of dollars, affords, under the present management, little or no revenue for the support of the school-system. In view of these facts, the superintendent suggests that the State should assume the entire debt, and pay to the school fund interest at the rate of 10 per cent., to meet the difference between the interest on United States bonds and the present depreciated paper of the State, until the whole debt is paid and invested as required by the constitution.

ABSTRACTS OF COUNTY-REPORTS.

In Adams County, the cause of public instruction is gaining ground daily. In Amite, much of the former prejudice against the public-school-system has been overcome and intelligent citizens desire to see the colored people educated. In Attala, a teachers' institute was organized and held three meetings. Prior to this no teacher of the county had ever attended such a meeting. Eighteen schools established for the colored people, and more might have been but for the difficulty of obtaining teachers. Twenty-six private schools, maintained a part of the time, were suspended during the sessions of the public schools, which enrolled their pupils. Benton County reports two or three private schools poorly attended and great improvement in the public schools. In Bolivar, seven new schools established in localities that had been entirely destitute; in all, two schools with twenty-three teachers, and averaging sessions of six months each. Calhoun County reports the interest in public schools decidedly on the increase. In Carroll, sixty-nine schools established; no opposition to free education, but many objections to the defects of the present system. In Chickasaw, where trouble had been experienced from a determination to break up the colored-schools, seven houses having been burned, the spirit of lawlessness seems to have yielded. Choctaw reports the last session one of marked advancement; no opposition to free schools; the colored-schools fairly maintained and two successful teachers' institutes held. Claiborne reports harmony and success in public-school-affairs; prejudice against teachers of colored-schools fast passing away. In Colfax, public schools have met with severe

opposition from those who should have been the first to aid. In Covington, schools have been improved; instruction of a higher order; discipline better. In Franklin, the success has not been satisfactory, prejudice existing against the school-system and funds being insufficiently supplied. Grenada reports no opposition to the schools and very little complaint about paying taxes to support them, the colored people's interest in the cause almost amounting to enthusiasm. Greene reports no funds on hand for school-purposes; consequently no public schools organized, but seven private schools in operation, five white and two colored. In Hinds, attendance upon public schools much larger than the previous year. In Holmes, school-system steadily increasing in public favor and land-owners liberal in donating sites for schools, colored as well as white; the teachers, however, not well paid. In Jackson, the great barrier to success is want of funds; but opposition is disappearing, and men of education and worth are offering to serve on school-boards who formerly refused. In Jasper, for want of funds, competent teachers could not be secured. In Jefferson, fourteen new schools organized, two white and twelve colored. In Jones, where more than ordinary obstacles exist, streams impassable for children on foot preventing attendance, the people generally are zealously in favor of free schools. Kemper reports increase of three colored-schools; prejudice and opposition of the people to free schools almost entirely passed away. In Lauderdale, the school-system better appreciated than at any time since its inauguration, some who were violent enemies being now its warmest supporters. A high school established large enough to accommodate two hundred pupils, under the influence of which the common schools have been greatly improved. No outrages committed; but school-houses that were burned in 1871 rebuilt; prejudices against colored-schools fast disappearing. In Lawrence, number of children attending public schools considerably larger than last year; schools growing in popularity; but school-houses poor and no modern furniture. In Lee, prejudice has existed against the school-system, but the feeling is now better. No private schools in the county. In Leflore, schools have not prospered, mainly for want of teachers; twenty-four schools were established, but only nine teachers could be found; but one permanent school in the county. A growing interest in public schools among the colored people. Lincoln reports a good class of teachers, the people, as a general thing, sustaining the free-school-system. In Lowndes, a marked change in sentiment towards public schools; not an instance of violence to teacher or school-building; but difficulty in obtaining competent teachers in the lower grades, particularly in the colored schools. Madison reports increased educational interest; schools never before in as prosperous a condition. Marion, for the first time, has the schools properly and thoroughly organized; but great difficulty in procuring teachers for the colored-schools, though prejudices of the whites are gradually giving way. In Marshall, the school-system working admirably, public sentiment being decidedly favorable. In Montgomery, the board of supervisors refused to levy the school-tax called for by the board of directors, thus embarrassing school-operations; but a majority of the citizens are in favor of free schools; their number is increasing. Noxubee reports but two obstacles in the way of complete success: the want of money and the want of efficient teachers. In Newton, the lack of competent, energetic teachers is the most serious obstacle. Oktibbeha reports peace and tranquillity in school-affairs; no insults or violence to school-officers or property. Panola reports a gain in attendance of 1,414 white and 1,659 colored pupils. In Perry, "public sentiment very much averse to the school-system under the present law, on account of its expensiveness." In Rankin, public schools have advanced in numbers and efficiency, with an increased number of colored-schools and competent teachers. Scott reports no disposition on the part of white people to interfere with colored-schools, but difficulty in procuring teachers for them. In Simpson, out of 2,138 educable youth, 1,294 received instruction; few private schools, and these were converted into public ones by petition. In Smith, the people are becoming better satisfied with the public-school-system. In Sunflower, where there were but four colored- and three white-schools, the pressing demand for labor in the cotton-fields broke them up early. No opposition to public schools worthy of notice. In Tallahatchee, attendance at school was good until the cotton began to open, when schools became thin and were mostly discontinued; the great drawback is want of school-funds; the county flooded with warrants worth from 40 to 70 cents on the dollar, with which teachers are paid, reducing their salaries greatly. In Tippah, the enrollment 2,250 and average attendance 1,345; total scholastic population, 3,624. No difference made in the pay of teachers on account of sex or color; private schools suspended during the session of the public ones. Tishemingo reports an increase of fourteen white- and two colored-schools; schools in better condition than last year; teachers improved, having attended the high schools during vacations. In Tunica, public-school-system is pronounced a success, citizens, irrespective of race or color, giving it all possible aid. In Warren, progress of the schools not satisfactory, for while the scholastic population has increased 1,664, attendance has decreased 1,076, less than one-fourth the educable children being enrolled in public schools and the average attendance little over one-sixth, the people, however, beginning to awaken to the value of the free-school-system and to exert themselves to secure its success; outside

the city of Vicksburg no private schools in operation coincident with the public schools. In that city 780 enrolled in public and 425 in private schools, while 2,554 were without instruction. In Yalabusha, schools in the busy season discontinued, children being kept at home to work. Yazoo has begun to build up a permanent school-fund and has an average attendance in the schools of 763 white pupils and 857 colored.

HIGH SCHOOLS.

Among the eighty high schools reported as existing in the State special mention is made of the Peabody High and Grammar School at Summit, numbering 335 pupils, 62 of whom are in the higher studies; the high school at Kosciusko, with 170 pupils; and two in Yazoo City, aided also by the Peabody fund; Franklin Academy, at Columbus, with 285 pupils. The Columbus Union Academy, for colored pupils, has prepared many of the best teachers for the colored-schools. A high-school-building has just been completed in Lauderdale County, which will accommodate 200 pupils. The high schools at Meridian, known as the Meridian Female College, the Methodist College, the Male Academy, and the Darling Academy, employing eleven thorough professional teachers, a local report states, have recently made application, through their principals, that their institutions be, in accordance with law, declared public schools.

High-school-studies are also pursued in all the institutions for superior instruction in the State. The preparatory department of Mississippi College numbers 60 pupils. The trustees of the State University intend to organize, at the earliest possible period, a university high school, on the most approved plan. A building of adequate dimensions is to be erected and furnished in every respect for the work of preparatory education. Meantime the preparatory department exists as a substitute for the high school and embraces 50 pupils with four instructors. Mississippi College has 52 and Pass Christian College 20 students in their preparatory departments.

CENTRAL FEMALE INSTITUTE.

The number of pupils in attendance is at least 20 per cent. in excess of that of the last academic year. The course of study embraces literary, musical, and ornamental departments. In the higher classes of the literary department the English, French, Latin, Greek, and German languages are taught.

UNIVERSITY OF MISSISSIPPI, OXFORD.

The plan of this university includes three general departments, viz: preparatory, scientific, and literary and professional. A college of agriculture and the mechanic arts is also soon to be connected with the institution, the legislature having appropriated to this purpose two-fifths of the congressional land-grant to the State for the benefit of agriculture and the mechanic arts. Although the department has not yet been fully organized, preliminary steps have been taken by the appointment, to the chair of agricultural chemistry and the special geology and agriculture of the State, of Dr. Eugene W. Hilgard, who has delivered to the students during the current year a course of lectures on these subjects.

The State appropriates annually the sum of $11,700 to the support of the university, and all students residing in Mississippi are admitted into the department of science, literature, and the arts free of charge for tuition and two classes of students are admitted to all the departments free, viz: such as are preparing for the gospel-ministry and all of good moral character who are unable to pay. County-scholarships in this university were established, in 1871, by the legislature, which provided that one student from every representative-district in the State shall be selected by competitive examination and sent to the university, $100 being allowed him from the common-school-fund of the county to aid in paying his expenses at the institution. There are 17 in the faculty; 178 in collegiate department; 24 students graduated and received degrees at the last commencement; 5,000 volumes in the library.

MISSISSIPPI COLLEGE, CLINTON.

The total number of students enrolled during the year was 159, of which 98 belonged to the collegiate department. Although the enrollment shows an increase over previous years, such increase is by no means the measure of its prosperity. The character of the students, though it compared last year not unfavorably with that of students in similar institutions, exhibits a marked improvement. The number of students pursuing studies with a view to the ministry has increased since the last year from 35 to 48. A mortgage of $10,000 was paid off by voluntary contributions of friends and the sum of $30,000 raised as a new endowment, the latest returns from the college indicating a total endowment of $40,000.

PASS CHRISTIAN COLLEGE.

Pass Christian College, at Pass Christian, reports, with 14 in the faculty, the number of students in freshman-class, 30; sophomore, 15; junior, 10; and senior, 5; while the total number of undergraduate-students in classic or academic department is given as 5.

MADISON COLLEGE

Madison College, at Sharon, which had 50 students during a part of the year, 24 ladies and 26 gentlemen, is now temporarily suspended.

ALCORN UNIVERSITY.

This institution, now in its second year, has an endowment from the agricultural-college-scrip-fund of $134,900; it has 275 acres of land and college-buildings complete, with dormitories, all valued at $100,000. The amount of productive funds is $123,150, 8-per-cent. State-bonds amounting to $9,852 cash, and $50,000 annual appropriation in State-warrants worth 80 per cent. Tuition is free to residents of the State; to non-residents it is $15 a year; the library numbers 5,000 volumes; there are 5 instructors and 179 students, all as yet in the preparatory department. It is, substantially, an agricultural college of the State.

COLLEGES FOR WOMEN.

Six colleges for young ladies report a total attendance of 769 pupils, of whom 302 are in preparatory departments. Of the 494 in collegiate studies, 157 were in the freshman, 165 in the sophomore, 100 in the junior, and 47 in the senior-year; 23 were in partial or special courses; and 2 were pursuing post-graduate-studies. Music, both vocal and instrumental, is taught in all these colleges; also drawing and painting; French in all but one and German in two. Four have chemic laboratories and philosophic cabinets; two have the beginnings of natural-history-museums, and some provision for physical culture; and one reports an art-gallery. All but two have libraries, the largest numbering 2,000 volumes, the smallest 50.

STATE NORMAL SCHOOL AT HOLLY SPRINGS.

This school has labored under many embarrassments during the year on account of the want of proper conveniences, its pressing need being the want of room.

The number of pupils in attendance during the year 1872 was 75. Of these the greater number have been in school the whole year, but there are some who have been obliged to teach a part of the time in order to support themselves. The energy which they have shown is commendable, for in nearly every instance they provided themselves with books and continued their studies, coming back to the school stronger for the effort made.

The school has a full supply of necessary text-books and maps; a reference-library has been begun, and quite a number of volumes secured.

STATE NORMAL SCHOOL AT TOUGALOO.

The board of normal trustees, in accordance with the requirements of law, made arrangements, in March, 1872, with the trustees of the Tougaloo University, whereby the normal department of that institution became a State normal school, the State obtaining the free use of the normal department with its buildings and appurtenances. The great and pressing need of the school is room and better appliances for the various exercises and recitations. An appropriation from the legislature of $40,000 or $60,000 would place the school on a permanent, self-supporting basis, and it is thought that the outlay of an equal amount in no other direction would bring greater and more immediate returns in securing order and a more settled condition of society in the State. In the near future not less than $500,000 will be expended on a State-peniten-

tiary, and cannot the State afford at least one-tenth of this amount for the equipping of a State normal school? thus striking a direct blow at ignorance, the cause of crimes which fill jails and prisons.

During the year instruction has been given in the normal classes to 112 students; at the time of report those classes numbered 70, about 140 being in attendance upon the primary and intermediate grades. During the year (mostly from June to December) 25 of the students were engaged in teaching in the public schools, mainly with marked success; and, notwithstanding that during the fall-term several of these continued teaching, the attendance at the normal increased beyond any former occasion, and numbers, for want of room and accommodations, were refused admission.

The regular course of instruction occupies four years. The methods are those used in the best normal schools at the East, with such changes only as are adapted to the different circumstances.

TOUGALOO UNIVERSITY.

Although this institution bears the name of a university, it does not yet seem to have a collegiate rank, its university-education being reserved for future years. Only common-school, normal, and industrial classes have as yet been organized. Other departments for university-education and professional training will be put in operation as necessity demands.

The institution was chartered by the legislature of 1871, though it had been in successful operation for two years previous under the management of the American Missionary Association. There are three fine buildings, including a boarding-hall each for the ladies and gentlemen of the institution.

A marked feature of the university is an agricultural department, in which opportunity is afforded those who desire it of paying a part or the whole of their expenses by manual labor, without materially interfering with their studies. The industrial department is of equal value to females in the way of defraying expenses and in giving practical knowledge and experience in household-duties.

MISSISSIPPI INSTITUTION FOR THE DEAF AND DUMB, (*near* JACKSON.)

The report of the trustees for the first full fiscal year since the re-establishment of this school speaks favorably of the new building purchased for its use, but says that more mutes are applying for admission than can well be accommodated in it. They therefore propose an early addition to it, at a cost of some $6,000, as well as the putting up of workshops for mechanic training of the pupils, at a further cost of perhaps $1,000. Another important proposal is that, as the school is sustained by State-appropriations, derived from a taxation of the citizens of the whole State, it should be thrown open, as the other public schools are, without discrimination between rich and poor, to every mute child of at least every white citizen.

The general arrangements for the training of the pupils appear to be admirable, happily mingling a perfect order with a genial family-freedom. The order is such, that the pupils, in going to and from the school-room and the dining-room, move in regular ranks; the freedom such that, once out of school-hours, we seem to be reading of the

easy tasks and pleasant recreations of a well-ordered private household. Study and care of rooms engage the morning-hours; then half an hour of recreation before dinner and as much after it; then work from 3 to 5 o'clock; the girls, in sewing and other domestic duties under the matron; the boys, in some kind of out-door occupation, such as gardening, sawing wood, pumping water, cleaning up yards, clipping hedges, repairing fences, and so on; another hour of recreation, supper, two study-hours, and bedtime is reached, the little ones being allowed to retire earlier if they desire to. It sounds like school and family combined.

MISSISSIPPI ASYLUM FOR THE BLIND.

The report for the year ended December 31, 1872, speaks of 22 having been in the school for the spring-term and 23 for the autumnal one, 10 more being looked for by January 1, 1873. This being a very small proportion of the 113 blind persons in the State of proper age to receive instruction, the superintendent recommends that agents be occasionally sent out to bring to the institution such persons as require its benefits. He also recommends the omission of the word *asylum* from its title, both as a means of securing a better class of pupils and of preventing applications, now quite frequent, from persons too old for training. Maps, books, globes, illustrative models, apparatus, and musical instruments are asked for, the present supply of such being of the most meager kind. Repair of buildings and fences is desired, too, the former being unpainted and leaking badly and the latter having been patched and propped till they are unsightly in the extreme. As in the Institution for the Deaf and Dumb, the plea is made that, as the establishment must largely be sustained out of legislative funds derived from taxes, it should be thrown open, as the public schools are, without money and without price, to all that need its training. The general system, in this training, appears to be much the same as elsewhere, the ordinary English branches being imparted through oral instruction and books in raised type, a preference being given in these last to the new Ruggles method of having letters in ordinary type for the teacher's eye, within corresponding ones in raised points, for the pupils' hands. For mechanic instruction there is a small work-shop, in which the boys are taught broom- and mattress-making and cane-seating.

* For the returns of 1873, see statistical tables I and II.

SCHOOL-FUNDS.

The State-fund apportioned in March, 1872, amounted to $355,682. Of this sum $255,475 were transferred from the State-revenue, being 25 per cent. of that revenue, as required by law. The remainder, $100,206, constitutes the interest on the permanent investment for school-purposes. When the school-fund shall have been invested in bonds of the State, as provided for in a recent amendment to the constitution, the revenue to the schools from this source will be largely increased.

The superintendent thinks that, "according to the present plan of apportionment, the public-school-fund of the State is not doing the work which was designed for it." Produced by interest on over a million and a half of permanent investment, this fund has been annually distributed upon the enumeration of the school-population. It has thus extended but a limited assistance to any, while it was especially designed to help the weak. The constitution provides that in the distribution of it there shall be taken into consideration the amount of any county- or city-funds appropriated for school-purposes, and such distribution be made as will equalize throughout the State the amount appropriated. "Justice seems to require that the school-statute should be made to conform to the constitution."

There is said to be urgent necessity for legislation to give better protection to the school-funds, the county- and township-school-endowment having been reduced from what should have been $14,000,000 to an actual present valuation of less than $5,000,000. This results from a large portion of the county-school-funds being loaned on personal security and then lost by meeting the statute of limitation. Besides this loss of funds already gathered, there has been a corresponding loss from failure to obtain what was intended to support the schools. The moneys arising from fines, forfeitures, &c., are required by the constitution to be turned into the State-school-fund. These amount to about $100,000 yearly, and, if properly husbanded and invested, would have increased the permanent school-fund by a million of dollars in ten years. But thus far, through imperfect collection or through misconstruction of the law respecting commissions, not one cent of these moneys has ever found its way to the State-treasury or been invested as prescribed. By such means $50,000 of the school-fund have disappeared in a single year. The State-school-fund of last year came back from the accounts of township-clerks more than $50,000 less than when it started from the State-treasury. Reports are received from about one-third only of the township-clerks of the State, and these are procured with the greatest difficulty by county-superintendents. A correspondence upon the subject shows that the records of school-funds, in a large number of counties, are in a very obscure and confused condition. One county, and that one of the best, states that it will take three months at least to produce a clear statement of the condition of their school-funds.

As a remedy for these irregularities, it is recommended that there be a special school-officer in each county, whose business it shall be to write up and keep a constant record and account of all school-funds; also that the county treasurer be made the sole custodian of the school-funds of the county. The present system gives an average of twenty treasurers in a county, each receiving his commission. The collection of funds is thus attended with great expense, and it is thought that the commission of 2 per cent. should be abolished.

The act relating to the recovery of school-lands and funds by the board of education, approved March 22, 1870, has spent its force. The board appointed an attorney in each congressional district, who examined the records. The work resulted in an approximate showing of the condition of the county- and township-school-endowments, but beyond this it has not been possible to go. The fees allowed by the law are not sufficient to warrant vigorous suits; therefore few suits have been brought to recover lands fraudulently conveyed or funds squandered or lost. It is strongly urged that there be "such a change in the law as shall permit the board of education, through the attorney-general, to compel, by *mandamus*, county-court- and other officers holding school-funds to restore these interests to their proper custodians."

CONDITION OF EDUCATION IN THE STATE.

"Notwithstanding the adverse influences arising from political excitements, from the failure of staple crops, from low prices and heavy taxes, and the unusual burdens which the agricultural classes have been called upon to bear, the year 1872 has witnessed a perceptible advance in the cause of general intelligence, and in whatever promotes intelligence, throughout the State. A desire to read and gain information has been quickened as if by some magic inspiration; periodicals and newspapers have been more eagerly sought for and more widely distributed than ever before, and the miscellaneous book-trade has received so powerful an impetus as to astonish the most hopeful." This growth of mind and the means of its improvement are considered due in great measure to the increase of railroad-facilities and the better state of feeling consequent upon the removal of political disfranchisement. The schools have shared in the general progress. They have increased in number, power, and efficiency, and

find a largely increased circle of friends and supporters. The general character of the school-statistics is encouraging. The rapid increase in the number of school-population is gratifying, as an indication of a proportionate increase in the population of the State. This, together with an increased percentage of attendance over that of last year, forcibly suggests the immediate necessity of providing more ample school-accommodations. The number of public-school-sittings in the State is about 422,560. If these were all filled, there would be 244,997 of the school-population necessarily left out of the public schools. The private educational accommodations of the State, including colleges, give a capacity for not more than 40,000; so that, were all the school-houses of the State filled to their utmost capacity, upwards of 200,000 persons of school-age must be left to other chances than schools for their education. Reckoning the period of actual school-going as embraced between the ages of 5 and 16, at least 100,000 under 16 years could not find admittance to any school. The need of fuller school-accommodations is thus obvious.

The colored-schools of the State are gradually gaining strength. There is some lingering prejudice against them and great indifference to their establishment, but, on the whole, the cause advances. When the local school-officers fail to provide for the colored children within the limits of their supervision, (where these children number more than fifteen,) it is the duty of the State-superintendent to step in and use the powers of these local officers. In response to calls growing out of such neglect, between fifty and sixty colored-schools have been established, without resorting to the expedient of a tax, as authorized by law. Many of the former owners of slaves have co-operated with the superintendent in making provision for the education of the colored people. The greatest difficulty attending all attempts of this nature lies in the fact that about half of the children are so widely scattered as to make it impossible to collect them in sufficient number to warrant the expense of a school. The colored people are forcing the question of mixed schools in cases where there are but two or three colored children in a subdistrict. The official opinion given is that the law contemplates separate schools, and whether colored children shall, in some cases, be admitted to white-schools is a question which confronts prejudice and appeals to benevolence more than to law.

It is remarked that "no one interest can so effectually either help or hurt the progress of Missouri as the free-school-system;" that the success of the system must proceed, to a large extent, from the constantly improving quality of the schools; and that the best educational conditions prevail in districts where directors are elected, without any reference to party politics and with a view to the securing of the best school-training possible.

RECOMMENDATIONS CONCERNING INTERNAL MANAGEMENT.

False economy in the management of schools is strongly deprecated. It is suggested that, where a graded school is crowded and the financial ability of the district cramped, it will be better to resort to some other expedient than that of employing cheap and poor teachers or shortening the term of school. The report of the Boston schools is quoted to show the advantages of the half-day-system, (one-half the pupils attending in the morning and the other half in the afternoon,) and its adoption, especially in the primary grades, in cases where the funds are not sufficient to sustain schools in the usual manner for the full term, is strongly recommended.

As the improvement of schools depends largely upon a careful definition of the respective duties of school-officers and teachers, the former must insist upon certain conservative rules with which teachers may not interfere.

Township-boards and directors should require of every teacher a record of his work for the benefit of his successor; otherwise each teacher will waste time in repeating and "doing over" a large portion of the work of his predecessor.

The necessity for change and improvement is strongly urged upon school-officers, who "are apt to be quite too apprehensive and jealous of innovation." "In some instances they stoutly oppose globes, outline-maps, improved seats, and even blackboards." As a result of this, attention is called to "some schools that are lagging far within the limit of progress measured fifty years ago." Improved means of education are demanded as the indispensable condition of growth and progress; among others, that the study of natural science should be introduced into the schools as soon as possible. The action of the legislature of Illinois in providing that "no teacher shall be authorized to teach a common school who is not qualified to teach the elements of the natural sciences" is commended.

SCHOOL-LAW.

The opinion is expressed that any attempt to change, at the present time, any of the essential features of the common-school-system must either prove fruitless or disastrous. A resolution to this effect was passed by the State Teachers' Association. It was demonstrated last winter that it is impracticable at present to combine and give a resultant in law of the opinions of the people better than is now secured in the

present imperfect school-statute. The diversity of circumstances among the people constitutes, in great measure, the cause of diverse and conflicting views. For example, where the country is yet comparatively wild and sparsely settled the township-board is deemed a needless and expensive part of the school-machinery. Where the population is more dense and the system has been worked with more vigor, the township-board is regarded with jealous tenacity. The passage of a law authorizing the organization of counties into municipal townships fixes, for the present, the difference of opinion upon the school-township organization. The proper change to make now, if any were made, would be to abolish all subdistrict-boards, and secure thereby, as rapidly as possible, the absorption of small and feeble schools by larger and stronger ones.

It is questioned whether any legislation can do very much to benefit the school-system. "Do the difficulties encountered root in the law that shapes the system or in the people, whose duty it is to sustain and operate the system? Will abuses cease by a mere change in the statute? Has a law, of itself, any power? And will it exert any influence towards the advancement of a general public interest unless it is borne up by the enlightened and united sentiment of the people?" If it is claimed that it is the business of education to purge away the notion that all the ills of society are to be cured by the panacea of legislation, the reply is, "All that legislation can do is to remove the common obstacles of a great system, prescribe methods for the distribution of common good, and then simply regulate and preserve general order. The substance of a system must come from the thought, purposes, and faithfulness of the people. They make the school-system. The law cannot make it. The present great need of the educational system of the State is *popular interest*. Out of this will spring every needed reform."

TAXATION FOR SCHOOLS.

Great opposition is manifested by many citizens of the State to the system of local taxation for the support of schools. At several of the county-conventions held during the last summer for the nomination of representatives, the present school-law was declared oppressive and it was resolved that the representatives of these counties be instructed to use their influence to have the amount of taxation reduced. Concerning this it is said that, "if local taxation is depended upon chiefly for the support of the schools, the maximum limit of taxation cannot be reduced without virtually closing the schools in many parts of the State." Tables from the report of the Commissioner of Education are quoted to show that the rate of taxation in the State is not excessive. According to these, Missouri ranks twenty-seventh in the scale of the amount paid for education. The amount applied to the schools in 1871 was $1,749,049. Of this amount $1,001,750 was raised by local tax. Estimating the taxable valuation at $570,000,000, this would require a levy of only 1.7 mills on the dollar. The next-door neighbors to Missouri raise a tax of from 7 to 11 mills on the dollar for public education and pay $6.45 *per capita* of school-population, while Misssouri pays only $2.75. In view of these facts it cannot be doubted that a reduction of the maximum limit of school-tax would be equivalent to the abolition of the public-school-system.

Many persons who are not opposed to taxation for schools yet claim that the present mode of levying taxes is not equitable. This is conceded, but it is claimed that the object of complaint should be, not the school-law, but the abuses in its administration. Facts are cited in illustration. In some localities there is a definite understanding between many tax-payers and the collector that the part of their tax-bill denominated "school-tax" will not be pressed to payment. The community must have a school, and, to support it, the honest tax-payer bears the delinquencies of his neighbors and pays his just proportion of tax several times over. In some counties of the State, many land-holders are settled on homesteads exempt from taxation. Under the scheme of local taxation their children must be educated by a few property-holders who retain their possessions in the usual fee-simple. To support a four-months school under such circumstances often requires a levy of more than 1 per cent. tax—in some instances as high as 4 per cent.—on the property liable to taxation. The number of townships that find it necessary to levy a tax up to the maximum limit of 1 per cent. is very large, while the number that carry their tax above this limit is not, by any means, small. Yet in some localities in the State, where schools are the very best, they are generously supported by a tax not exceeding 4 or 5 mills. St. Louis meets the entire expense of her system of schools by a tax of 4 mills on the dollar. In some subdistricts the habit, until quite recently, has been to levy no local tax, but to charge a regular tuition-fee for all pupils attending school. The man of wealth sent six children to the school, because he could afford to pay; the poor man who had six children to send found that he could afford to send but two. This made schooling cheap for large property-holders, but did not make education universal and free.

As a remedy for these abuses and as a means of equalizing the burden of sustaining public education, it is recommended that the whole, or nearly the whole, expense of carrying on the schools be met by a general tax upon the whole property of the State,

instead of by the unequal imposition of local tax. A levy of four mills on the dollar of taxable wealth, added to the sum total from permanent funds, will be sufficient to maintain schools nine months of the year in every district in the State, while, with the present heavy weight of tax, the average yearly term is but four and a half months—just what it was sixteen years ago. It is believed that this plan has the advantages of thoroughness and economy and that its results would be generally satisfactory.*

RELATIVE COST OF EDUCATION AND CRIME.

The fact is noted that, while from every quarter comes the demand for a reduction of the school-tax, as if that were alone the cause of the heavy weight of taxation now laid upon the people of the State, no complaint is ever heard from tax-payers about the costs of criminal cases paid by the State and raised by tax levied on the people.

In 1872, the amount of the State-revenue applied to the support of schools was $243,197.33, while there was expended for the prosecution of criminals and the transportation of convicts to the penitentiary the sum of $174,078.38. The amount paid by the State for bringing to justice the criminals that were actually convicted was $416 *per capita*. The expenditure of the State (not including local funds or taxes) for the education of her school-population was 53 cents *per capita*. In several counties in which the school-system is comparatively weak, these parallels are still more striking. In one county where complaints were made concerning the expensiveness of the public schools, inquiry proved that, while the State paid the last year for schools in that county $3,952.92, the criminal costs during the same year amounted to $9,130.68. In view of these facts, the question is asked whether whatever amount is subtracted from the appropriation for schools will not have to be added to the amount already expended for the prosecution and transportation of criminals.

A few counties in which the schools receive careful attention and a liberal expenditure present facts worthy of notice as contrasted with those already given. Cooper County, which pays for teachers' wages $3 *per capita* of her whole school-population, received from the State last year $3,961 for the support of schools and but $1,089.97 for the prosecution of criminals, although she contains a population more than six times as numerous as the county already mentioned, which pays three times as much for criminal costs. It is generally conceded that large cities are the homes of crime; and yet St. Louis County receives from the State but $27,652 for the prosecution of her criminals, and $72,399 for education—about 8 cents *per capita* of her population for crime and nearly 25 cents *per capita* for education. Intelligent communities have found that education is the cheapest defense of cities as well as of nations.

SUPERINTENDENCE.

In the debates of a year ago, which left scarcely any feature of the school-system without discussion, the utility of the office of State-superintendent of public schools was frequently questioned. This, it is believed, arose from the vague idea entertained by many of the duties of the office, and a brief outline is given of the work of the State-superintendent. It is remarked that "the utility of State-supervision in education is affirmed by the practice of almost every State in the Union. It springs from the labor-saving principle that underlies every successful system of activity connected with our modern civilization. The same reason for substituting one responsibility in a county for a common work suggests the desirableness and necessity of establishing one bureau in the State to do what every county wants, instead of operating one hundred and fourteen bureaus for the same work." The most effectual labor of the superintendent, in the present condition of educational progress, is believed to be accomplished by direct contact with the people at teachers' institutes and popular conventions and in general public addresses. At present, not more than one-half the counties of the State can be visited during the year. But with a sufficient force it would not be difficult to bring every school-district into constant sympathy with the best educational improvements of the times.

The county-superintendency has its supporters and its opposers. In those counties where the deepest interest is taken in the efficiency of the schools and where, as a consequence of this interest, a competent person has been selected to fill the office, the people are reluctant to dispense with this officer. In counties where the general school-interest has never risen above low-water-mark, and a poor officer has been selected, the people consider the office as a useless superfluity and clamor for its abandonment.

MORAL EDUCATION.

The charge has been made that the public schools are deficient in moral instruction. This is admitted insofar as that there is a lack of a definite system of teaching and

* At a more recent date, the superintendent has recommended to the several school-boards a means of improving the educational facilities of the State, which will not have the form of tax. It is, to provide for the schools and people series of popular lectures, which, besides their direct educational effect, may have an indirect one in enabling them, out of the proceeds of the lectures, to establish and maintain good town- or circulating libraries.

training in morals in them, while certain causes are stated that work injury, either directly or indirectly, to the moral habits of the pupils.

The remedies suggested for these defects are as follows: (1) Make the personal character of the teacher of more importance. It is as necessary that teachers should be *true men* and *true women* as that they should be acquainted with the branches to be taught. (2) Banish from the school all rules except such as are manifestly founded in necessity and common sense, the list of school-crimes being augmented in exact proportion to the list of rules. (3) Make morals a distinct science and a definite study to be pursued in the schools. Morality need not be confounded with theology. Morals can be taught without teaching the theologic opinions of any sect, and there is an imperative necessity for teaching some simple form of scientific ethics. If this were done a better race of men would grow up to purify every department of public life.

EDUCATION AND LABOR.

It is believed by many that common schools are the enemies of farming. With the view of discovering what is, in this State, the effect of common-school-education upon farm-laborers, letters of inquiry were addressed to leading farmers throughout the State. Their uniform testimony is that the transition from slave to free labor was attended with inconvenience and loss; but they are unanimous that free labor is quite as remunerative to the employer and that *intelligence is one of the necessary conditions of its success.*

The defects of country schools in this connection are dwelt upon. Much time is spent in what is positively useless. A portion of the time thus spent would furnish an elementary knowledge of botany, natural history, or entomology, which would lead a country boy to place a new value upon his surroundings and prepare him to conduct a farm upon principles of intelligence and progress.

EDUCATIONAL CONVENTIONS.

One of the greatest needs of education in Missouri is free, thorough, dispassionate discussion of all questions bearing upon the subject. In this direction the teachers' institute has, for years past, done an efficient work. But its range has been too narrow. It was apt to be circumscribed, both in respect to the disputants and the topics for discussion. The people and the tax-payers did not feel that degree of freedom to participate in the exercises which a more popular instrumentality is designed to inspire. The popular convention, made up of teachers and all classes of citizens, has been adopted with marked results. Free discussion has been invited, and the effect has been largely beneficial to the cause of education in the State.

ST. LOUIS.

[From report of Hon. W. T. Harris, superintendent of St. Louis public schools.]

A table is given showing the progress of the schools during the past fifteen years. In that time the total enrollment has increased from 9,769 to 30,294, the average attendance from 5,361 to 20,479, number of teachers from 123 to 534, average amount of teachers' salaries from $550.75 to $763.88, and the total expenditure per scholar from $14.60 to $20.82. During the past eight years the number of school-houses has increased from 21 to 58 and the number of sittings from 8,976 to 25,750. As only 67 per cent. of the pupils enrolled are found attending, on an average, at any one time, the present number of seats would accommodate an annual enrollment of nearly 34,000 pupils. By the opening of the fall-term of 1873 four new school-buildings will be in readiness, with 48 rooms and 2,800 sittings. In the early history of these schools the bulk of their support was drawn from tuition-fees; at present six-sevenths of the revenue is derived from State- and municipal taxation. The expenditure amounts to one-sixth of the entire annual taxation of the city.

The reports of the district-schools for the past year show an increasing attendance of pupils under 7 years of age. It is hoped, by next year, to found a number of small primary schools, more or less on the Kindergarten-plan, for the benefit of this class of children. The average number of pupils in the lowest three years of the course is about 72 per cent. of the entire number enrolled. The fact that a very large percentage of children receive no education above these grades suggests the importance of making the instruction in those years the most efficient possible. There has been a great decrease in the percentage of tardiness. Two-thirds of the pupils were not tardy at all and the remainder were tardy, on an average, only three times during the year. The number "not absent during enrollment" was 2,046. The result of the introduction of natural science into the district-school-course has more than justified the wisdom of the experiment. The improvement is manifest both in teachers and pupils. The use of text-books by the teacher is forbidden in all cases where the pupil is expected to recite without it. This insures thoroughness of preparation in all the lessons.

German.—There is a constant increase, from year to year, in the number of pupils studying German. The most noteworthy change during the year has been the tendency of

pupils in the higher grades to commence this study. By an act of the board German is made one of the alternative studies required for admission to the high school. The statistics of the German-English department exhibit a considerable increase over the previous year. In some of the schools the proportion of German-English pupils constitutes upwards of 80 per cent. of the entire school. At present, Anglo-American children are allowed to take up German at the same time with the German-American children, instead of, as formerly, in the fourth year. This plan is to have a fair trial, but brilliant results are not anticipated.

Discipline.—Mention is made of improved methods of discipline. An accurate record of cases of corporal punishment shows only twelve and a half cases per day for 20,000 pupils. The system of suspension has proved far more successful.

Classification and promotion.—A change in the present plan of classification and promotion is recommended. It is believed that examinations should be held and consequent promotions made every few weeks. Thus pupils who fail to pass would not be set back more than is necessary. When there is only a yearly examination, a pupil who fails to pass is degraded a year, when he needed, perhaps, only a quarter's review, and is thereby completely demoralized. It is a moral failure quite as much as an intellectual one.

Schools for colored children.—Good buildings are provided for the schools for colored children, but there seems to be little, if any, increase of pupils. The entire registration was only eight more than last year. The colored population seems to be rather decreasing than otherwise.

Evening-schools.—These have attained a remarkable degree of success during the past two years, having, within that period, nearly doubled their attendance. They are so organized as to furnish one room in each for the purpose of instructing foreigners in the use of English. Punctual attendance and industry at these schools secure free membership in the public-school-library for the rest of the year.

The public-school-library is extending its sphere of usefulness through the liberal policy of the board. No branch of the school-system exerts a more beneficial influence. The library has been opened on Sundays with good results.

St. Louis high school.—The present actual number of pupils in the high school amounts to about 2½ per cent. of the number in all the schools. Statistics indicate that, as a rule, about one pupil in four that enter the district-schools reaches the high school. There are four classes, the work of each occupying a year. It is believed that the policy recommended for the district-schools, of more frequent examinations and promotions, is equally necessary for the high school, so that pupils failing to pass need not be put back a year, when, perhaps, they need but a few weeks. Some plan by which the course of study in the higher grades can be made more elastic is believed to be greatly needed. The change in the rule for admission, allowing German to be substituted for geography, on condition that the former be taken up in the high school in conjunction with Latin, has proved unwise on the whole. It has improved the German in the district-schools, but injured it in the high school. A modification of this rule is deemed desirable. It is found that when the time is divided between Latin and German but little progress is made in either. Generally, the school has been, during the past year, in an unusually flourishing condition. Four branch high schools relieve the pressure from too great numbers.

HIGH SCHOOLS, ACADEMIES, AND SEMINARIES.

The 19 institutions of the above class which report their statistics for the past year show an aggregate attendance of 1,812 pupils—866 boys and 946 girls—the total number of teachers—46 gentlemen and 77 ladies—being 123. One hundred and forty-two of the pupils were engaged in classic studies and 157 in modern languages. Eleven of these schools teach drawing and 14 music; 7 only report libraries belonging to the school, the largest of which numbers 1,500 volumes, the smallest 2, which, however, were the standard dictionaries.

How far the high schools of the State are graded up to the requirements of the preparatory training for the university does not appear in the otherwise excellent report of the superintendent. The existence of a State-university implies that such will be the case, if it is not at present, as the university is the cap-stone of the edifice which has its foundation in the common school.

UNIVERSITY OF THE STATE OF MISSOURI.

In the report of the chairman of the executive committee it is remarked that the year ended June 26, 1873, has been one of unexampled progress. No other period in its history has been signalized by so many and such marked improvements. The following summary of the year's progress is given:

The faculty has been increased by the accession of able and experienced men as professors; the number of students has largely increased, and nearly every county in the State is represented; the new scientific building, one of the most complete of the kind

in the country, has been furnished at a cost of about fifty thousand dollars; the library, in all its departments, has been greatly increased; the apparatus has received large and valuable additions, and important instruments for field-practice and engineering have been purchased; the law-department and the medical college have been established under most favorable circumstances; the laboratory of analytic and applied chemistry has been completed and equipped; notwithstanding the increase in numbers, there has been a most noticeable improvement in the manners and bearing of the students; and by the payment of the indebtedness of the State to the funds of the university the institution is, in a great measure, for the first time in many years, relieved of debt. The university has, within the year, been made practically a free institution, a small incidental fee being now the only charge. The county-system of appointment has been abolished.

The university now comprises the following departments: (1) the college proper, with four courses: those of arts, science, letters, and philosophy; (2) the normal college, opened September, 1868; (3) the agricultural and mechanic college, September, 1870; (4) the school of mines and metallurgy, November, 1871; (5) the college of law, October, 1872; (6) the medical college, February, 1873; and (7) the department of analytic and applied chemistry, May, 1873.

The progress of the school of mines at Rolla is especially a subject of congratulation and pride. It is but in the second year of its existence, but the number of students has been more than double that of the previous year. Its instructors have been increased and its means of instruction enlarged in every direction.

The number of students in the agricultural department has increased, in three years, from 26 to 138. The prejudices against a collegiate education for farmers are rapidly disappearing before the manifest beneficial influences of this department. Ladies have been invited to the horticultural course, and 19 joined the first class formed during the present year.

Ladies are received into the normal, the preparatory, or into any other of the university-classes for which they may be found qualified. Several ladies are now in advanced classes in university-courses. A great and pressing need of the university is a building especially designed for the women's college.

To make a complete university of liberal and practical education there are still needed a college of mechanic arts, a college of the fine arts, a department of engineering, and some provision for architecture and construction. The bill pending before the legislature providing for the erection of a mechanics' hall is designed to furnish a building for the first-named department. It is due the mechanics of the State that they should be recognized in the university-system and that instruction should be furnished them in the mechanic arts.

The university is crippled and hampered for the want of means. A strong appeal is made to the State for aid. The number of students in the classic department is 417 and there are 92 in the school of mines. The faculty numbers 31.

THE WASHINGTON UNIVERSITY OF ST. LOUIS

Is established by charter and is supported partly by endowment and partly by tuition fees. It is entirely unsectarian, and this feature of its organization is secured by its charter. Ten years ago the number of pupils was 200; there are now 700 in actual attendance, 34 of whom are in the collegiate department. It has five departments: Academic, collegiate, polytechnic, the Mary Institute, and the St. Louis law-school. The various faculties comprise 60 professors and tutors and the annual expenditure is over $85,000. The tuition-fees are considerably below the actual cost of education. There are a large number of free scholarships, 15 of which are filled from the public schools of St. Louis. The university has a common interest with the public schools in the support of the evening polytechnic schools and in the public-school-library. The institution is free from debt, with an invested endowment of about $250,000.

OTHER INSTITUTIONS FOR SUPERIOR INSTRUCTION.

These, quite too numerous for special mention otherwise, find each a place in the appended table, and fuller notes of them may be found in Table VIII, at the close of the Report.

COLLEGES FOR WOMEN.

Nine institutions for the superior instruction of women report an aggregate of 1,136 pupils—807 in collegiate and 329 in preparatory studies—with 97 professors and instructors, 11 of whom are gentlemen. Five of these colleges specify the number of pupils in the different college-years, giving an aggregate of 115 in freshman, 156 in sophomore, 88 in junior, and 48 in senior-classes; 28 were in special or partial courses and 20 in post-graduate-studies. In all but one of these institutions music, both vocal and instrumental, and drawing are taught, and in all but three painting also. French and German are taught in seven; two have chemic laboratories; three have philosophic

cabinets and natural-history-museums; two report art-galleries, and one a gymnasium. Five have libraries, the largest numbering 2,000 volumes, the smallest 400.

STATE NORMAL SCHOOLS.

The board of regents is endeavoring to adjust the systems of the two norma schoo's already established to the special condition and wants of the State. The higher mathematics and dead languages, except within a certain practical limit, are to give way to a more generous attention to natural science, drawing, and the perfecting of teachers in the best methods of conducting the common branches.

As a means of reaching the large number of teachers who have neither time nor means for a normal-school-course, a "sprinkling of the State with normal institutes" is suggested. Two of these institutes, of six weeks' duration each, have been established in connection with the normal school at Warrensburg.

An increase of appropriation is asked for sufficient to double, within the next year, the force of instruction in the normal schools. Unless this is granted only a limited number of pupils can be received. About $15,000 per annum is needed for each school. This appropriation is small compared with those of other States for similar schools.

The North Missouri Normal School, situated at Kirksville, two hundred miles north from St. Louis, is accessible to a large territory rapidly growing in population. The new building, for which the State appropriated $50,000, is one of the largest and most commodious structures of the kind in the country. About 200 teachers sent out from this institution are engaged in teaching in the State. The term of 1872–'73 opened with a larger attendance than any previous year. Annual appropriation, $5,000.

The South Missouri Normal School, at Warrensburg, has, during the past year, passed through an experience of entire reconstruction. The number of pupils has increased from about 22 at the commencement of the year to 140. Any increase in this number will not be possible until the new building is ready for occupation. In arranging the course of study, the wants of the schools as they now exist have been kept especially in view. The course has three divisions: elementary, scientific, and professional. A training-school will be established as soon as a class is ready for the work. The State-superintendent advises that the normal-school-diplomas be received as first-grade-certificates, entitling the holder to teach in any school in the State. An effort will be made to have a law passed which will make these diplomas equivalent to State-certificates. Annual appropriation for the school, $5,000.

THE NORMAL SCHOOL OF ST. LOUIS

Is intended exclusively for the education of teachers for the St. Louis public schools, but is open to persons from any section. The time required for completing the

course is two years. Many of the applicants being found not to possess sufficient maturity of mind to enable them to profit by the course of study, the age of admission has been increased from 16 to 17 years. The requirements for admission have been made more difficult by the addition of algebra to the examination-list. This has considerably decreased the number enrolled; but the number in the high school has correspondingly increased. Pupils from the high school, whose record there is satisfactory, are received into the normal school without examination. It was found necessary to materially change the course of study, in order to adapt it to pupils entering from the high school. The course now differs from the one generally pursued in normal schools, but is believed to be best adapted to the circumstances of the St. Louis schools. The whole number of graduates has been 318, of whom 196—or one in three of the whole number employed—are teaching in the public schools of St. Louis.

LINCOLN INSTITUTE.

This is for the instruction of colored teachers, the building being a contribution from the colored soldiers of the State after the conclusion of the war. The result of the first scholastic year of this institution in its new building, with an enlarged corps of teachers and well-classified departments, is encouraging. The whole number of pupils during the year was 216, of whom 20 were in the normal department. Twenty-two of the pupils in attendance during last session have since been teaching public schools in the State. Some of these will return to the institute to complete their studies. The debt of $10,000 before reported is still unpaid. Repairs and improvements are greatly needed, but lack of means forbids them. The hope is expressed that the State, in its disposal of any means dedicated to educational purposes, will remember the urgent wants of this institution, the only one in the State devoted to the higher education and normal instruction of colored persons. The State-superintendent in his report remarks that "the least the State of Missouri can do for this institution is to see that its debts are canceled." The expenditure for the institute during the past year was $8,811.44.

BUSINESS-COLLEGES.

Six of these—at Kansas City, St. Joseph, and St. Louis—report a total of 1,828 students, under the care of 47 teachers.

MISSOURI INSTITUTION FOR THE DEAF AND DUMB.

This institution makes its ninth biennial report. Since the organization of the asylum, in 1851, there have been admitted 421 pupils. During the two years included in the report, 211 pupils have been under instruction. Of these, 9 have been discharged by expiration of term, 8 have removed to other States, 4 have become teachers in the asylum, 2 have died, and 42 have failed to return; leaving, at the time of the report, December 31, 1872, 146 pupils—males, 72; females, 74. The progress of the pupils has been very gratifying and the institution has never been in a more flourishing condition. An appropriation of $25,000 is asked for to repair the building and increase its capacity so as to accommodate 200 pupils. Even then, not more than one-half of the deaf and dumb in the State capable of receiving instruction will be provided for. There are no facilities for giving instruction in the trades usually taught in such institutions, and the only employment of the male pupils is gardening and preparing fuel. The females are instructed in needle-work and various domestic duties. A beginning has been made in teaching articulation, but to secure the advantages arising from this branch a professorship should be established, where the instructor shall be solely employed in teaching it.

MISSOURI INSTITUTION FOR THE EDUCATION OF THE BLIND.

Owing to delay on the part of contractors, the buildings of this institution could not be used during a considerable portion of the year, and the session of 1871–'72 continued only four months. Sixty-six were present during the session. New pupils were not received, and those who lived in distant parts of the State were advised not to return for the short term, but to wait until the fall. Applications for admission have not been so numerous as was expected, owing probably to the fact that parents and guardians of blind children do not consider them capable of acquiring an education or are ignorant of the existence of such an institution. It is suggested that county-superintendents and school-directors make special inquiry for blind children in their respective districts and report the number in their annual returns. The present law, fixing the age of admission at 5 years, is considered objectionable. All the pupils are taught, besides branches taught in other schools, some kind of handicraft—the girls knitting, crocheting, bead-work, sewing, and the use of sewing-machines; the boys broom-making, mattress-making, braiding mats, and willow-work. The present school-session opens very favorably, with an increased number of pupils.

GIRLS' INDUSTRIAL HOME AND SCHOOL OF ST. LOUIS.

This institution, for the care of neglected children and orphans, makes its eighteenth annual report. Number of inmates at close of last report, 64; admitted since, 74; dismissed, 63; present number, 75. The progress of the school is very satisfactory and it is believed that it will compare favorably with any of the public schools.

EDUCATIONAL ASSOCIATIONS.

The State Teachers' Association met at Kirksville, pursuant to arrangement, December 26 and continued in session two days. About 300 teachers from different parts of the State were in attendance and important business is said to have been transacted, but the reports of it have not reached the Bureau.

ST. LOUIS CONVENTION.

A convention of the teachers and superintendents of the first, second, and third congressional districts was held by arrangement of the St. Louis Teachers' Association, December 26–28, at which an address of much interest was delivered by Mayor Brown, on universal education, and such important topics were discussed as public-school-libraries, natural science in district-schools, the functions and management of reform-schools, Kindergärten, a library of educational classics, and grading and classification for county-schools.

Superintendent Monteith delivered an address on the condition of the public schools, in which he said that the public-school-system was gloriously growing, aided by the advance of general intelligence and the spread of liberal and enlightened views. Still, there were hinderances threatening it, which he deprecated, especially a disposition to throw aside all local taxation for the support of schools, which taxation he held to be essential to the schools and not oppressive to the people. The average cost of public-school-instruction in the State was not, he said, above $2.65 *per capita* of the whole school-population, whereas, in Kansas, it was $6.43; in Illinois, $7.97; in California, $11.89; in Nevada, $19.17; and in Massachusetts, $20.65. The whole amount appropriated to schools laid a tax of only about 2.1 mills on the dollar, whereas Massachusetts raised 3.1 and Kansas 7, so that education in Missouri was as cheap as it possibly could be, and complaints of heavy taxation were unfounded.

OTHER CONVENTIONS.

Conventions similar to the above were held in the fourth, sixth, and twelfth districts, and one at Richwoods, all of which discussed subjects of much interest, while 84 teachers' institutes are believed to have been held during the year.

LIST OF SCHOOL-OFFICIALS IN MISSOURI.

Hon. JOHN MONTEITH, *State-superintendent of public instruction, Jefferson City.*

COUNTY-SUPERINTENDENTS.

County.	Name.	Post-office.
Adair	Robert Mercer	Kirksville.
Andrew	William D. Hoar	Savannah.
Atchison	George F. Bixby	Phelps City.
Audrain	H. M. Hamill	Mexico.
Barry	J. H. McDonald	Cassville.
Barton	A. D. Pittinger	Nashville.
Bates	James D. Harper	Butler.
Benton	Washington Allen	Warsaw.
Bollinger	John W. Revelle	Marble Hill.
Boone	Harvey Halen	Centralia.
Buchanan	John T. Riley	St. Joseph.
Butler	Isaac B. Tuble	Poplar Bluffs.
Caldwell	H. B. Meffert	Breckenridge.
Callaway	James I. Nichols	Fulton.
Camden	David N. Simons	Linn Creek.
Cape Girardeau	Samuel M. Green	Cape Girardeau.
Carroll	Wiley Roy	Carrollton.
Carter	George R. Highsmith	Van Buren.
Cass	G. S. Spring	Harrisonville.
Cedar	Frank H. Smith	Stockton.
Chariton	Alfred Mann	Keytesville.
Christian	J. J. Martin	Ozark.
Clarke	Dr. M. B. Scott	El Dorado.
Clay	George Hughes	Liberty.
Clinton	Vincent P. Kelley	Graysonville.
Cole	Thomas Ward	Jefferson City.
Cooper	O. F. Arnold	Bunceton.
Crawford	Elias R. Fort	Scotia.
Dade	W. C. West	Greenfield.
Dallas	Dr. A. G. Hollenbeck	Buffalo.
Daviess	W. W. Stout	Gallatin.
De Kalb	J. L. McKee	Maryville.
Dent	Spencer H. Ware	Salem.
Douglas	James L. Davis	Arno.
Dunklin	Homer Spiva	Clarkton.
Franklin	Julius Kahrmann	Franklin.
Gasconade	Henry Read	Canaan.
Gentry	Lemuel C. Taylor	Albany.
Greene	O. S Reed	Springfield.
Grundy	R. C. Norton	Trenton.
Harrison	Nelson Church	Mt Moriah.
Henry	James E. Flagg	Clinton.
Hickory	David B. Biddle	Quincy.
Holt	E. S. Eyerly	Oregon.

SCHOOL-DISTRICTS AND SCHOOL-PROPERTY.		
Number of organized counties	35	48
Number of school-districts	1,028	1,410
Average number of children in each district	40	36¼
Number of brick school-houses	36	41
Number of stone school-houses	11	24
Number of frame school-houses	373	473
Number of log, sod, &c	139	149
Whole number of school-houses	559	687
Value of school-houses	$374,270 88	$739,969 60
Value of school-sites	44,318 70	76,702 00
Value of books and apparatus	2,347 08	2,491 99
Total value of school-property in the State	420,936 67	819,163 59

SCHOOL-FUND.

The present school-fund is estimated at $1,096,304.30. This, however, includes a large amount known as the 5-per-cent. fund, that as yet has yielded no income. There

*Statistics for 1873 in tables I and II, at end of volume.

is also an investment of over $60,000 in personal loans, on which no interest has been paid during the past year. On the moneys loaned on bond and mortgage, the accrued interest, still unpaid, amounts to $16,535.80. Of the whole estimated permanent fund there is under the control of the State-treasurer only $231,192.32. Without the 2-mill-tax, the counties would have less than one-half of the present apportionment. This subject demands the immediate attention of the legislature. Measures should be at once adopted to put the school-fund into such shape that there shall be no uncertainty respecting the annual payments of interest. State-securities are considered the least objectionable and yield the largest revenue.

MODE OF DISTRIBUTION UNSATISFACTORY.

The division of the State-school-fund as prescribed by law is in many instances very unsatisfactory. How to secure equality in the distribution is the most difficult problem of the school-system. The following method is recommended: let the State-fund be distributed to the several counties, as at present, taking the enumeration of scholars as the basis; then let the county-superintendent divide the one-fourth (which the law requires to be distributed equally) among the several districts, counting each organized district sustaining a school as one and allowing each district containing more than forty pupils to count one district for each forty and each fraction of forty over twenty. While this method would not give exact equality, it would yet be so nearly equitable that no complaint could be made.

The tenor of the present law makes it necessary that a school-district shall not only report the enumeration of children within its limits, but shall also have sustained a school previous to the annual meeting in April, in order to have, for the ensuing year, any share in the school-funds. Thus many newly-formed districts find it very difficult to sustain a school for the first year.

CHANGE IN THE METHOD OF DISTRIBUTION RECOMMENDED.

It is recommended that the law be so amended as to allow such districts as have voted to have a school to receive their proportion of the school-money, the money, however, not to be drawn until the school has been in operation the requisite length of time. The ambiguity of the present law causes a diversity of methods in the different counties. Uniformity is imperatively needed and can only be secured by plain legal enactments.

SCHOOL-LANDS.

One-eighteenth part of the total area of the State of Nebraska, or 2,702,044 acres, is school-land. This if sold at the minimim price ($7 per acre) would give a permanent fund of $18,914,308. Previous to 1869 there had been sold 21,944 acres of school-lands, at an average price of $10.53 per acre. During 1869 and 1870 there were sold 64,905 acres, at an average price of $8.48 per acre. During 1871–'72 the amount sold was 25,223.07 acres, at an average price of $7.632 per acre. A large amount of school-lands sold reverts to the State from failure on the part of purchasers to comply with the conditions of sale; and as no provision has been made in the law for a report of the amount that reverts it is impossible to give the exact amount derived from this source.

INDEMNITY-SCHOOL-LANDS.

During the past year a great effort has been made to secure to the State the lands known as indemnity-school-lands. Letters were addressed to the Commissioner of the General Land-Office at Washington and to Representatives in Congress, making inquiries in regard to these lands, and a commissioner was appointed to select lands for the State as provided by law. The total number of acres selected, including the selections made previously, was 47,155.73. It is requested that steps be immediately taken to have the selections approved, as this is of the utmost importance to the educational interests of the State. Many of the selections previously made have been lost and lands of less value have been selected. If the present selections are not soon confirmed the same process must be gone over, and still poorer lands will have to be taken.

NORMAL-SCHOOL-LANDS.

Of the normal-school-lands 3,200 acres have been sold, at an average price of $7.288 per acre. The present law relating to the sale of these lands is very defective. It gives the purchaser a deed to the land immediately after the first payment of interest, the State taking a mortgage on the land as security, and there is no provision declaring the land forfeited when interest is not paid, so that the State is obliged to foreclose the mortgage before the land can revert to it. The interests of this land cannot be too carefully guarded. When the land is all sold the income accruing will very nearly pay the running expenses of the normal school.

AGRICULTURAL-SCHOOL-LANDS.

The condition of the agricultural and university-lands is not certainly known at present. No special provision has been made for their sale or lease.

NEED OF A GOOD PUBLIC-LAND-SYSTEM.

Attention is called to the lack of system in the public-land-business of the State, and it is recommended that there be at once established a land-department with a sufficient cleric force, and all the landed business be under the control of that department.

SCHOOL-LAW.

Nebraska has the basis of a very good common-school-law. The existent one has indeed defects that must be remedied, but its general features are well suited to the wants of a new State. The number of officers required to carry out the provisions of the present law acts as a stimulus to the people and interests many in the cause of education who otherwise would pay little attention to it. The law, however, needs harmonizing and energizing. On many vital points it is entirely silent; it imposes duties, but makes no provision for discharging them properly. The provisions of the law were undoubtedly intended to include schools of all grades and sizes; but either it is not sufficiently comprehensive or local prejudices and ambitions have so considered it, and special laws have been enacted for Omaha and Nebraska City. This establishment of independent districts is regretted, as involving the school-system in intricacies, giving occasion for interminable disputes, awakening sectional jealousies, and fostering a spirit of exclusiveness without in the end gaining anything. A system that shall harmonize thoroughly from the district-school to the university is considered above all things desirable. Amendments on several points are recommended in connection with the various subjects of the report.

THE DISTRICT-SYSTEM.

The objectionable features of this system are admitted; but it is remarked that, "in a sparsely-settled State, it would be nearly impossible to adopt the township-plan." By the provisions of the present law county-superintendents have authority to form new districts, change boundary-lines, unite districts or dissolve them. This places great power in the hands of one man, but it is doubtful whether any better plan can be devised at present. It is recommended that a definite compensation be granted district-officers for the time actually employed in their regular duties and that they be required to perform them faithfully. There being no penalty for neglect of duty, the law has only been executed by common consent, and is, to the people, advisory rather than compulsory. Legislation is advised in the matter of allowing districts to issue bonds. The present law allows a district to assume an indebtedness to the amount of $5,000, but does not provide for bonding the indebtedness. Some districts have issued bonds, but doubts as to the legality of that proceeding have injured their sale.

SCHOOL-HOUSES.

The superintendent remarks: "This is the era of school-house-building. The people in many parts of our State, with an enthusiasm almost amounting to frenzy, are bending all their energies towards erecting school-houses, many of which would do honor to any city in our country.* There is at present an intensity of feeling on this subject that has seldom, if ever, been witnessed in any other State. The general feeling is that their children must have comfortable and pleasant school-houses, even if the parents suffer for a time for some of the comforts of home." During the past year over a hundred new school-buildings have been erected. One county alone has erected twenty-eight. Regret is expressed, however, that greater care has not been taken in the construction and general arrangement of the school-houses. Various suggestions upon this subject are made. The points specially urged are dry and elevated locations, extensive play-grounds, arrangements for thorough ventilation of school-rooms, comfortable seats, and a liberal supply of apparatus. It is hoped that the legislature will make an appropriation by which proper plans for school-houses may be placed before the people. Much difficulty has been experienced in some districts in obtaining school-house-sites. Legislation upon this point is recommended.

REPORTS.

At present it is nearly impossible to get anything like full and correct district-reports, owing mainly to a want of proper record-books. The law requires reports, but makes no provision for books for keeping the district-records. Districts will not incur the expense of providing such books, and, unless they are provided, perfect reports can never be obtained. It is recommended that the State-superintendent be authorized to prescribe the forms to be used throughout the State and then require the county-superintendents to supply the districts. This would soon give system and order, instead of the present confusion.

* The city of Omaha is said to have one of the finest high-school-buildings in the country, erected and furnished at a cost of $250,000. The high-school-building at Lincoln cost $40,000 and the new building of the State-university $150,000.

STATE-SUPERINTENDENT.

The business of the State-superintendent's office has nearly doubled within the past two years. "The apportionment of December, 1870, was made to about 32,000 children. The next apportionment will be made to more than 60,000. This is an index to the increase in all respects." With no provision for a regular clerk, the whole business of the office falls upon the superintendent, and he is obliged, in consequence, to neglect other duties defined by the law, such as visiting schools, holding teachers' institutes, &c. It is requested that the legislature make an allowance sufficient to engage the services of a competent clerk for at least one half of the year.

TEACHERS.

The people are beginning to demand a thorough preparation on the part of teachers, and the standard of qualification has been greatly elevated. A change in the method of granting certificates is recommended. Three grades are given at present, but the lines of distinction between them are not sufficiently clear. In the plan suggested the third-grade-certificates remain as at present, with the proviso that no person shall be granted more than three certificates of that grade. The standard for second-grade-certificates is raised, the county-superintendent to have the power to grant this certificate for one or two years, as the candidate's proficiency may indicate. The first-grade-certificates should be given only to persons of superior qualifications, experience, and ability. Provision should be made for the granting of State-certificates by a commission composed of the State-superintendent, chancellor of the university, principal of the State Normal School, and a committee of three appointed by the State Teachers' Association. The plan of allowing the State-superintendent to grant certificates at will is liable to great abuse. He should have power, however, to annul, at any time, any certificate, when he has sufficient evidence of the incompetence or immorality of the person holding it. At present he has no power to do so directly.

TEACHERS' INSTITUTES.

The law makes it the duty of the State-superintendent to appoint teachers' institutes in various parts of the State and to cause all schools in the district in which the institute is held to be closed during its session. But no means are provided to enforce this requirement, and the institutes thus far appointed have been but partially successful. The class of teachers that needs them most cannot be reached. The superintendent advises that "a law be framed requiring the attendance of all teachers at the institutes in their respective districts, allowing time to go on as if they were engaged in teaching, and considering the certificates of those not attending as null and void, unless afterward indorsed by the county-superintendent. To provide a fund to defray the expenses of the institute, require the payment of fifty cents by each candidate for examination, and let the State appropriate $1,500 for a like purpose. Without some such provision it will be impossible to secure proper attendance and the assistance of competent instructors."

In accordance with the instructions given at the meeting of the State Teachers' Association in August, 1871, arrangements were made for holding a State Teachers' Institute in the following July. This institute was an experiment. No provision being made by the State to defray the expenses, a tuition-fee of $4 was charged each member. The attendance was very encouraging and the result of the institute highly gratifying.

COURSE OF STUDY FOR THE COMMON SCHOOLS.

In accordance with a resolution passed at the State Teachers' Association in August, 1871, a course of study was arranged by the State-superintendent and laid before the teachers at the last State Teachers' Association. A resolution was adopted requesting the publication of the course, and its distribution among the teachers and school-officers of the State. The course is based upon the supposition that each district will have at least six months' school during each year. School-boards have entire control of the matter. This course is only recommendatory and not at all binding on any district; but it is earnestly urged upon all school-officers and teachers to give it a careful examination and, if approved, urge its adoption. It is confidently believed that, if the school-work were systematized, the results would be far more satisfactory than at present.

INDIAN SCHOOLS.

The superintendent of Indian affairs in Nebraska reported, for 1871, number of schools, 12; teachers, 23; pupils registered, 827; average attendance, about one-half of the total enrollment. One of the schools is a manual-labor boarding-school, where 64 pupils receive instruction in different trades. In addition to these there is one evening-school and six Sabbath-schools. The Indian-superintendent says: "The influence of these schools is good and the parents in all the tribes are not only favorable to, but take a deep interest in, them. The Indians of Nebraska are becoming civilized, and, if

they could be let alone by politicians, hostile Indians, and low whites, there is nothing to prevent the rising generation becoming reputable citizens of the State. There is no report of these schools for 1872. One important one has been added in 1873.

THE NEBRASKA TEACHER.

In accordance with the resolution passed at the State Teachers' Association in 1871 a teachers'-journal, called the Nebraska Teacher, was started. Resolutions indorsing it were adopted at the recent session of the association and a corps of editors appointed to take charge of it. Already this journal has quite an extended circulation in the State. It should be in the hands of every school-officer as well as teacher. Provision should be made by the legislature to furnish a copy to each school-district.

OMAHA.

Organization.—In accordance with the special law passed at the last session of the legislature, the board of regents, to whose charge had been committed the erection of the high-school-building, and the board of directors, who had previously controlled the common schools, were both discontinued, and the new board of education entered upon the duties of its office in April, 1872. A city-superintendent of public instruction was elected, who commenced his duties in August.

The schools have been reorganized. There are four departments, including the high school. The maximum course of instruction covers a period of 14 years, the minimum of 12 years. The course of instruction for the schools below the high school was prepared about two years ago by the State-superintendent and adopted by the board of directors. It has never, however, been closely followed and made practical. The intention now is to "insist that the teachers shall regard it as law in their work." A graded course of object-lessons is arranged for the eight years. A philosophic apparatus, to cost $500, has been ordered. Calisthenics, abandoned for a time, have been restored. The corps of teachers has been improved, with a view to the highest possible efficiency, and, among others, a teacher of high qualifications, just returned from Europe, has been engaged.

Drawing.—The subject of drawing, heretofore generally neglected, is being made an important department in the schools. Bartholomew's drawing-cards are being used in the first three grades and the series of drawing-books in the higher grades.

High-school-building.—The magnificent building for this school, before referred to, was completed in the fall of 1872, at a cost of over $200,000. It has a *campus* of ten acres, stands on an eminence commanding a view of the whole city, of the city of Council Bluffs, and of many miles of the river-valley of the Missouri. It consists of a main building, with north and south wings, is four stories high above the basement, and contains fifteen school-rooms and four recitation-rooms. Fourteen of these rooms are capable of seating each from 48 to 60 pupils and the other will accommodate 75. The latter is at present used as the high-school proper, the institution having been organized only a year before the opening of the building and containing in 1872 but 60 pupils.

At least two private schools of high grade are also maintained in Omaha: one, the Brownell Hall Academy for Young Ladies, with seven teachers; the other, the Omaha Collegiate Institute for Boys, with a principal and several assistants. The number of pupils in these is not ascertained. Their aim is to afford a fair school-training, either for college or for the business of life, in connection with the religious influences of the Protestant-Episcopal communion.

STATE NORMAL SCHOOL.

The normal school comprises three departments: the model and practicing school, the academic department, and the normal department. The latter has three courses of study, viz: the elementary English, advanced English, and classic. The first comprises the studies of the first academic year and a year of professional study. The second comprises the first two years of the academic course and the professional year. The third embraces the first three years of the academic course and the professional year. No student can enter the normal department who cannot pass a satisfactory examination in the studies of the preparatory year and no student can graduate who has not taken the studies of the professional year. Diplomas of three grades are given. Only those who take the classic course will be entitled to the degree of N. G.—normal graduate. The present course of study is not final, but will be modified in some particulars. It is considered especially desirable that the model school should be so organized as to comprise three departments of at least nine grades, each grade occupying one year. This, in connection with the academic department, will constitute a graded school, whose course of study comprises thirteen years. It will be possible thus to have a model graded school. The normal school has already done much to elevate the standard of common-school-teaching in the State; but it is impossible for one school to furnish teachers for all the districts; every effort is therefore made to induce students to remain and take the full normal course, thus fitting themselves for teachers of the

graded schools in the cities and large villages. In this way it is believed the influence of the institution will be most quickly and powerfully felt. The new building, now in process of erection, is greatly needed, but it cannot be completed and properly furnished without a further appropriation by the legislature. There is also great need of a larger corps of teachers and more extensive apparatus.

NEBRASKA CITY.

The number of pupils in all the schools is 752, including a colored-school (ungraded) of 23. The schools are well filled and the attendance regular. There are eight grades, each occupying a year in the primary and grammar-schools. The high-school-course occupies three years. A regular course of oral instruction has been prescribed for each of the grades below the high-school. All the schools are making satisfactory progress. During the year many valuable improvements have been made in the school-houses.

There is also a superior grammar-school connected with Nebraska College.

LINCOLN.

The school-buildings furnish accommodations for 450 children. The average daily attendance is 370. The whole course of study embraces a period of ten years, of which two years are spent in the primary schools, three in the secondary, two in the grammar, and three in the high-school. A high-school-building is in process of erection. The cost, inclusive of furniture, will be $50,000.

STATE UNIVERSITY.

The incredulity with which the university has, to a certain extent, been regarded is gradually disappearing from the minds of the people, and the large proportion of students from distant parts of the State gives assurance that the university-work is becoming better known and its advantages more highly prized with every succeeding year.

At the commencement of the academic year two new professors were added to the faculty. This has greatly strengthened the institution and permitted the opening of new departments of study. The board of regents, at its annual meeting in June, decided to open, at the beginning of the fall term, the agricultural department of the university. This department proposes two courses of instruction: first, a four-years course, similar in most respects to the scientific course of the university, but giving pecial attention to scientific agriculture and farm-economy; secondly, a course of one year in practical agriculture. The agricultural farm comprises 480 acres. An appropriation of $2,500 was made by the board of regents for beginning operations on it in the spring.

The collections for the cabinet and museum progress rapidly. The liberal donations to the former will make it one of the most complete and extensive in the country.

The number of students in the preparatory department of the university for 1873–'74 is 77, with 1 instructor. In the classic department are 47 undergraduates, with 6 professors. Females, as well as males, compose the classes, and in the preparatory school there are 23 of these to 54 of the other sex.

NEBRASKA COLLEGE, DIVINITY AND GRAMMAR SCHOOLS, NEBRASKA CITY.

This institution is conducted under the auspices of the Episcopal Church, and the Episcopal bishop of Nebraska is president of the board of trustees. A thorough course of instruction is given in classics, mathematics, science, and business. A school of divinity has been organized during the past year. The bishop, the dean of the divinity-school, and the cleric professors of the college-faculty instruct the theologic students in the course prescribed by the house of bishops. The faculty numbers 4 resident and 3 non-resident professors, with 4 other instructors; the students in the preparatory department, 62, all males, of whom 15 are preparing for the academic course and 20 for the scientific. The full course is meant to embrace ten years. New buildings, to cost not less than $10,000, are to be erected during the coming year, the funds for them being already in hand.

DOANE COLLEGE, CRETE.

This institution, under the auspices of the Congregational churches of the State, was formed in 1872. Its name is in honor of Thomas Doane, esq., of Charlestown, Massachusetts, who has bestowed on it $12,000, on condition that $10,000 more be raised from its friends within the State and the same amount elsewhere. Its faculty in 1873–'74 consists of 2 instructors—1 male and 1 female—its students, of 14 males and 15 females in the preparatory department and 5 males in the freshman-class. Its permanent buildings are to be erected on a high plateau overlooking the village of Crete, the Big Blue River Valley, and a wide reach of prairie-land beyond.

* Instruction in this department is given by the bishop and faculty of the college. Two young Indians are among those who are receiving a training with a view to the ministry.

NEBRASKA INSTITUTE FOR THE DEAF AND DUMB.

This institution was opened at Omaha, in 1869, with 12 pupils. The next year the number increased to 23. In 1871 the legislature made an appropriation for a new building and the citizens of Omaha gave ten acres of land. The building was ready for occupation in January, 1872. The cost was $15,000. Most of the difficulties attending the organization of a new institution have been surmounted, and both the educational and financial interests of the institute are in a perfectly satisfactory condition. One-half of the grounds has been worked by the boys of the institute. The number of pupils during the year was 29—males, 15; females, 14. The ages of admission are from 10 to 25. Owing to the diversity of acquirements among the pupils, the number of classes is greater than in most schools of the kind. The methods of instruction are not indicated. The legislature is petitioned for an appropriation of $32,000 for the next two years.

STATE TEACHERS' ASSOCIATION.

The eighth annual session of this body was held in the court-house at Tecumseh, and began December 23, 1873. The president, Hon. J. M. McKenzie, State-superintendent, delivered the opening address, enlarging on the importance of teachers' institutes for the improvement of comparatively untrained teachers and on the kindred importance of a law for compulsory education to bring into the schools such as would never otherwise attend. In the former he saw the only present hope for the elevation of many school-teachers who cannot secure training in a normal school; in the latter, the only effective means of bringing prejudiced or ignorant or selfish parents to afford their children the advantages of education.

The institution of a judicious and elevated course of instruction for the high schools

of the State was also insisted on. The law establishing the State-university makes a certificate from a county-superintendent that a youth has graduated honorably from a high school of the State a sufficient warrant for his admission to the university without further examination. But unless a uniform and elevated course should prevail in the high schools it was held that such a provision must eventually degrade the standard of admission to the college-classes, so that no special scholarship would be required to enable one to enter. Hence the necessity for such a guarding of the high-school-course as to secure a set of thoroughly-trained pupils for the State's highest school and make the grand idea of free education from the common school to the university something more than a mere bubble in the sunlight or a great edifice without a base.

His final picture of what a thorough system of school-training would make the State is too pleasing and too instructive to be omitted. He says, in a sort of prophetic vision here: "I see in the future a vast body of people living in Nebraska, and my idea of their social life would have them intelligent in a high degree, industrious, and enterprising. Then, dotting the whole landscape we would have neat, commodious dwellings, surrounded with all the adornments that nature, aided by art, could bestow. At convenient distances would appear school-houses of the most improved style of architecture, combining beauty, taste, comfort, and convenience. The people, keenly alive to the influence that the school-house and its surroundings exert on the impressible natures of children, would have the outhouses so located and constructed as to preserve all the inherent modesty implanted in a child, to shield it from the snares of vice. The play-grounds would be inclosed with a neat fence and arranged with every convenience for healthful sports. Everything would be elevating and refining, the yard tastefully ornamented with trees and flowering shrubs and covered with a carpet of green.

"They would have a beautiful house for the teacher in close proximity to the school-yard. He should no longer be a homeless wanderer, dependent on the grudged shelter now so often a necessity to him. He should be a workman needing not to be ashamed, and the children should continue under his instruction until qualified to ascend to a school of higher grade.

"All the methods of instruction should be in accordance with reason and nature and the school-room should be a delightful place.

"As the children advance in their studies and primary schools no longer afford them opportunities for further education, they would have located near the center of every township, if possible, a high school, manned by a corps of well-qualified teachers, furnished with appliances for illustrating the various studies pursued. The course of study would be so arranged as to commence just where the common school ended and reach sufficiently high to give all who desire it a thorough preparation for the university."

To effect all this, it was granted, was beyond the work of any single man; but if teachers would all work towards so desirable a consummation, if each would plan for it and all carry out their plans, if a spirit of professional pride, of desire to place the teacher's profession at least upon a footing with the law or medicine, should be awakened in the two thousand teachers of the State, the thing might eventually be effected.

"The best method of managing teachers' institutes" and "The place and value of object-teaching in Nebraska common schools" occupied the morning of the succeeding day, while in the afternoon a paper was read by Prof. Thompson, of the Agricultural College, on agricultural education.

On the first of these three topics it was held that the institute should aim mainly to acquaint the teacher with the philosophy of his profession, to discuss the best methods of imparting instruction, and to establish principles by which the value of methods may be tested; that the impartation of school-instruction is not properly a part of it, but rather the cultivation of an *esprit de corps*, of a social, a sympathetic, a professional connection with each other, that all may work upon a plan, and that the best possible one.

On the second topic, "object-teaching," the tone of the essayist, Dr. Williams, of Lowell, was rather depreciative, the disposition being rather to exalt objective or illustrative teaching as the more effective method, indeed, "the most effective of all means of instruction," to be used in every school and to contribute to the interest of every study.

The essay of Prof. Thompson on agricultural education was an exposition and a vindication of the system of the agricultural colleges, and was followed by a brief speech from Governor Furnas, in commendation of the one belonging to the State.

A paper on "The best method of moral instruction," by Professor J. H. Kellom, concluded the exercises as far as the report has been thus far printed.

LIST OF SCHOOL-OFFICIALS IN NEBRASKA.

Hon. J. M. McKENZIE, *State-superintendent of public instruction, Lincoln.*

COUNTY-SUPERINTENDENTS.

County.	Name.	Post-office.
Adams	A. H. Bowen	Juniata.
Antelope	B. C. Palmer	Oakdale.

NEVADA.

[From the biennial report of Hon. A. N. Fisher, State-superintendent of public instruction, for the years 1871 and 1872.]

	Dec. 31, 1870.	Dec. 31, 1872.
SCHOOL-FUNDS, PERMANENT AND DISTRIBUTIVE.		
Amount in State-(irreducible) school-fund	$58,000 00	$104,000 00
Increase		46,000 00
Amount disbursed from general (distributive) school-fund during the school-years of 1869–'70 and 1871–'72, respectively	17,124 41	22,613 74
Increase		5,489 33
FINANCIAL STATEMENT.		
Total school-expenditure in all the counties of the State	73,836 64	98,468 82
Increase		24,632 18
Surplus of school-moneys reported in county-treasuries at close of school-year	17,527 22	12,492 86

	1871.	1872.
POPULATION AND ATTENDANCE.		
Number of boys between 6 and 18 years of age	2,152	2,529
Increase since 1870		461
Number of girls between 6 and 18 years of age	2,257	2,421
Increase since 1870		537
Whole number of children between 6 and 18 years of age	4,409	4,950
Increase since 1870		998
Whole number of children under 6 years of age	2,909	3,310
Increase since 1870		1,089
Whole number of persons between 18 and 21 years of age	219	185
Increase since 1870		67
Total number of persons under 21 years of age	6,291	8,445
Increase since 1870		2,154
Whole number of children between 4 and 6 years of age	676	861
Increase since 1870		326
Whole number of such attending public schools	126	135
Increase since 1870		9
Whole number of boys enrolled in public schools	1,676	1,821
Increase since 1870		245
Whole number of girls enrolled in public schools	1,430	1,551
Increase since 1870		244
Total number of pupils enrolled in public schools	3,106	3,372
Increase since 1870		389
Average number belonging		2,372
Increase since 1870		
Average daily attendance		2,080
Increase since 1870		
Number of children reported as attending private schools	354	439
Increase since 1870		90
Number of children between 16 and 18 years not attending any school	1,225	1,410
Increase since 1870		560
TEACHERS AND TEACHERS' PAY.		
Number of male teachers in public schools	24	29
Increase over 1870		11
Number of female teachers in public schools	50	47
Increase over 1870		12
Whole number of teachers in public schools	74	76
Increase over 1870		23
Number of teachers in public and private schools		88
Increase over 1870		25
Highest monthly pay of male teachers, (in coin)		$175 00
Increase over 1870		9 00
Highest monthly pay of female teachers, (in coin)		150 00
Increase over 1870		
Lowest monthly pay of male teachers, (in coin)		75 00
Increase over 1870		5 00
Lowest monthly pay of female teachers, (in coin)		40 00
Increase over 1870		
Average monthly pay of male teachers, (in coin)	$106 92	116 53
Increase over 1870		
Average monthly pay of female teachers, (in coin)	83 64	88 73
Increase over 1870		

	1871.	1872.
LENGTH OF SCHOOL-TERM.		
Number of schools maintained 9 months and over	26	31
Number of schools maintained more than 6 and less than 9 months	15	17
Number of schools maintained less than 6 months	8	12
Average number of months schools were maintained	7 mos. 11 d.	8 mos. 10 d.
SCHOOL-DISTRICTS AND SCHOOLS.		
Number of school-districts in the State	54	58
Number of districts reporting according to law	38	38
Number of districts which have voted a district-tax	3	5
Number of districts using the entire State-series of text-books	24	37
Number of free public schools maintained without rate-bills	32	49
Number of primary schools	8	9
Number of intermediate schools	6	6
Number of grammar-schools	8	8
Number of high schools	1	1
Number of unclassified schools	45	52
Whole number of schools	68	76
SCHOOL-HOUSES.		
Number of new school-houses erected	5	6
Whole number of school-houses	43	50
Number of school-houses rented	11	15
Number of school-houses unfit for use	4	8
Valuation of school-houses and furniture	$56,330	$69,413
Valuation of school-apparatus	755	1,067
Valuation of school-libraries	1,160	1,207

THE PERMANENT FUND.

As the result of unusual activity in the sale of public lands, this fund has rapidly grown.

By the loss of special deposits, it suffered in the treasury-defalcation of 1870 to the extent of over $43,000, and, in addition, it has been diminished since that date by the sum of $12,050, for expenses allowed, as per controller's report. An increase in the fund under these circumstances is a matter of congratulation.

The fund cannot, however, be regarded as having attained satisfactory proportions. It will yield, for the fiscal year 1873, about $10,000 for distribution. This will pay $2 towards defraying the tuition-expenses of each child of school-age in the State, or $100 to each public school of 50 children. The present endowment is, therefore, only sufficient to employ a teacher for the average public school for one month in the year. Nine months' tuition must be paid for by direct taxation.

If the permanent fund to-day amounted to $1,000,000 it could be considered hardly more than a generous endowment for the public schools. Amounting to barely one-tenth this sum, its condition appeals for legislative protection against the merciless spoliation it has been compelled to suffer. It has been made to serve the present convenience of the State. By supporting the land-office during selection and sale of the public building-grant, the children's fund helped to build the State-capitol. Unless the existing land-law is changed, the children's fund will, in like manner, assist in the endowment of the State-university. This is little to the credit of the State and less to its profit. Every interest involved demands that the State-school-fund be rendered in reality, as it is in name, an irreducible fund.

COUNTY-SCHOOL-FINANCES.

The superintendent says: "It will be noticed that the present report contains but a meager statement of transactions in the school-fund of the several counties. By collation of statistics received from treasurers and superintendents, I am able to give a table of total expenditures and of balances, but a detailed exhibit is impossible. The failure to procure complete and reliable financial returns is due to unfortunate legislation had at the last session. The statute authorizing county-superintendents to draw warrants on the county-school-fund, was repealed, and they were thereby deprived of information with which they are required to furnish this department. The legislation referred to was, doubtless, well intended, but it seriously interferes with the working of the school-law, and should be rescinded. For several reasons the former provisions should be restored."

DEFECTS OF THE PRESENT EDUCATIONAL SYSTEM.

The superintendent, after alluding to the unusual activity in educational matters lately evinced in several counties, resulting in the erection of new school-houses, the

purchase of new furniture, and the employment of better qualified teachers, says: "It cannot be claimed, however, that the grand intent of our educational scheme is yet fully realized. There must be radical improvement in several respects before the system can be said to be in successful operation. There are defects in its working which seriously impair its efficiency. Not one-half our schools approximate excellence in either the extent or quality of instruction furnished. And this, notwithstanding the fact that we are in advance of most States in the average duration of our schools, the average compensation of teachers, and the average expenditures per pupil.

"We are at present advantaged above all other States in the item of ability to provide for our schools. We have a maximum of taxable territory with a minimum of school-population. Our leading industry is of a character calculated, more perhaps than any other pursuit, to afford a diminished ratio of juvenile to adult inhabitants, while it yields a generous revenue for the support of public institutions. In consequence we are able, with perhaps less of effort than is required in other States, to expend a larger sum upon the education of each child. The $19.17 expended *per capita* in furnishing common-school-privileges to the children of the State in 1870 was, probably, a no more creditable outlay than was the $7.97 paid in Illinois or the $6.86 paid in New York, or even the $2.75 paid in Missouri. The total expenditure in the State first named was nearly $7,000,000, while in our own it was less than $75,000.

"We are not at liberty to boast, except it is clear that our large *per-capita* expenditure procures for us better results than are elsewhere realized. I see no good reason why it ought not. While there are less than 5,000 children of school-age in the State and our distributive fund, as in the present year, amounts to nearly $100,000, it is difficult to find an excuse for manifest deficiencies in the extent and character of facilities furnished. There ought to be afforded in this State more tuition, and that of a better quality, than is enjoyed elsewhere on this continent. If certain changes in the plan of apportionment are adopted, I am satisfied that we shall immediately achieve distinction in the respect first named. I am not so hopeful of rapid improvement in the second and more important item. If legislation were competent to insure that the employing parties shall be neither careless nor ignorant, neither venal nor prejudiced, there would be prospect of reform. There is no lack of qualified applicants, and, as a rule, where there are faithful trustees there is an excellent school. The weakness of the system lies in the fact that its local officers are not under compulsion to act wisely or honorably. Its burden is that they sometimes conspire to act foolishly and wickedly. If the law could make certain that examiners and trustees shall be intelligent, honest, capable, and efficient, there would be promise of better results from our liberal expenditure.

"No more important subject can be broached by legislative wisdom than is presented by the urgent demand that qualified teachers be furnished every district in the State."

CHANGES IN THE SCHOOL-LAW.

During the session of the legislature in February and March, 1873, several suggestions made by the superintendent in his report were adopted as amendments to the school-law. The most important amendments are as follows:

The portion of the law relating to trustees is so amended as to provide that the boards shall be so constituted that there may always be at least one experienced member. The powers of trustees are enlarged in respect to the amount of expenditure possible without a vote of the district. The recommendation of the superintendent of Storey County, proposing to make the proceedings of trustees public, was also adopted. They are now required to keep a record which shall at all times be open to the inspection of tax-payers in the district and to publish in some newspaper full minutes of the proceedings of each session.

The county-superintendent is authorized to appoint two competent persons, who, with himself, shall constitute a board of examination, of which he shall be the chairman.

A life-certificate of any State or a diploma of a California State normal school shall entitle the holder to a county-certificate, without examination, provided that such State-certificate or diploma shall be presented within five years from the date of issuance.

COMPULSORY LAW.

By the provisions of an act passed in February, 1873, it is made obligatory upon parents and guardians to send every child between the ages of 8 and 14 years to a public school for a period of at least sixteen weeks in each school-year, at least eight weeks of which shall be consecutive, unless the child is being otherwise instructed or is excused from attendance by the board of trustees for some satisfactory reason.

The penalty for non-compliance with the provisions of this act is a fine of not less than $50 nor more than $100 for the first offense, nor less than $100 nor more than $200 for each subsequent offense.

The children of indigent parents thus compelled to attend school shall be furnished with books by the school-trustees.

ABSENTEEISM.

The superintendent, in urging the passage of the compulsory law, makes the following statements:

"The statistics show that, on an average during the past school-year, not quite one-half the children of school-age in the State were in attendance at the public schools. If due allowance be made for those attending private school, for those who are unable to attend any school, and for those under 18 who have acquired a common-school education, there will remain, probably, about 25 per cent. of the entire school-population who ought to be in school but are not. The number reported as not enrolled in schools, public or private, is 23 per cent. of the school-population. When all reasonable deductions have been made, it will probably be found true that the proportion of those willfully refusing this first privilege and duty of citizenship is sufficiently large to demand legislative interference in the interest of a better attendance."

DURATION OF SCHOOLS.

It appears that in only two counties of the State was a full school-year (ten months) of tuition given; that three counties gave eight months and less than ten; six counties six months and less than eight; and two counties less than six. Of the seventy-six schools in the State, less than half were sustained nine months. These facts show a radical deficiency in the operation of the school-system. "It is time," says the superintendent, "that some means of preventing this inequality in the amount of tuition furnished residents in different districts be sought and applied. The nature of the difficulty suggests the remedy. Short terms are invariably found to be occasioned by want of funds. They occur only in sparsely-settled districts and are the necessary result of the *pro rata* plan of the distribution of public moneys." The "unjust discrimination of the present plan" may be readily corrected, either by a consolidation of districts or by adoption of the plan of distribution recommended in the last report. This proposes that a portion of the school-fund of each county be apportioned according to the number of districts in the county and the remainder *pro rata*, according to the number of census-children, as at present.

NEGRO CHILDREN.

In explanation of the omission of all statistics concerning these the superintendent says: "I am happy to say that, practically, the children of all citizens are now free to attend our public schools. The statute still discriminates against the children of colored citizens, but by decision of the supreme court, rendered in January last, the section excluding negroes was declared unconstitutional. I believe that this ruling has been cheerfully complied with throughout the State and that the privilege it secures is eagerly enjoyed by the hitherto proscribed race."

NORMAL INSTRUCTION.

Attention is called to the desirability of some provision for the normal instruction of those who design to become teachers. With the present sparse population the establishment of a State normal school is deemed impracticable. But under the provisions of the California statute, this State can, by an appropriation of $100 per pupil, secure admission for its pupils to the State normal school at San José. It is believed that an appropriation of six or eight hundred dollars biennially will meet the requirements of the case and result in an improved condition of public instruction.

STATE UNIVERSITY.

In March, 1873, an act was passed by the legislature locating the State University and providing for its control and maintenance.

The university is to be located at the town of Elko, provided that the citizens of the town give to the university twenty acres of land with a building furnished and ready for occupancy, costing not less than $10,000 and adapted to the accommodation of not less than one hundred pupils.

Tuition is to be free and no one is to be excluded on account of sex, race, or color.

Immediate selection and sale of the seventy-two sections of land granted the State by act of Congress for the establishment and maintenance of a university are ordered. The moneys arising from the sale of these lands shall constitute a fund to be known as the "irreducible university-fund." The money derived from certain specified sources shall constitute a contingent fund.

The preparatory department is to be opened within three months after the reception of a deed of the land from the citizens of Elko.

LIST OF SCHOOL-OFFICIALS IN NEVADA.

Hon. A. N. FISHER, *State-superintendent of public instruction, Carson City.*

COUNTY-SUPERINTENDENTS.

County.	Name.	Post-office.
Churchill	E. P. Hull	
Douglas	Rev. G. B. Hinkle	Genoa.
Elko	T. B. Henley	Elko.
Esmeralda	W. H. H. Buckley	Aurora.
Humboldt	C. Chenowith	Winnemucca.
Lander	J. R. Williamson	Austin.
Lincoln	Louis Suttan	Pioche.
Lyon	M. B. Augustine	Silver City.
Nye	J. V. Hathaway	Belmont.
Ormsby	L. S. Greenlaw	Carson.
Storey	J. N. Flint	Virginia.
Washoe	Orvis Ring	Reno.
White Pine	H. S. Herrick, M. D	Hamilton.

NEW HAMPSHIRE.

[From the annual report of Hon. John W. Simonds, State-superintendent of public instruction, for 1873.]

FUNDS.

Amount of school-revenue raised by taxation, as required by law	$367,552 23
Amount raised by town or district beyond what the law requires	66,598 69
Amount received from local funds, railroad-tax, and literary fund	57,518 41
Amount contributed by individuals	10,868 27

EXPENDITURES.

Total amount expended for support of public schools	507,446 49
Average appropriation for each registered scholar	7 38

SCHOOL-POPULATION.

Number of children of school-age in the State	76,167

ATTENDANCE.

Number of pupils enrolled in school—boys, 36,529; girls, 33,345	69,874
Decrease during the year	2,888
Average attendance	46,759
Decrease of average attendance during the year	2,534
Per cent. of average attendance to the whole number	68
Number of children reported 4–14 years of age not attending any school	3,680
Decrease of the same	922

PRIVATE SCHOOLS.

Number of resident scholars reported attending private schools	2,613

TEACHERS.

Number of teachers engaged in teaching in the State	3,823
Number of male teachers	527
Number of female teachers	3,296
Average wages per month of male teachers, including board	$40 78
Increase during the year	$3 22
Average wages per month of female teachers, including board	$23 84
Decrease during the year	$0 49
Number of teachers in the State teaching for the first time	632
Increase	15
Number reported having attended teachers' institutes	1,762

SCHOOL-PROPERTY.

Estimated value of school-houses with lots and appurtenances	$1,917,625 00
Value of school-apparatus	27,345 00
Number of school-houses unfit for their purpose	402
Decrease during the year	29
Number built and repaired during the year	222
Cost of the same, including land, fences, &c	$111,604 00

SCHOOL-DISTRICTS AND SCHOOLS.

Number of school-districts	2,183
Number of schools	2,496
Increase during the year	44
Number of graded schools	392
Increase	67
Number of schools averaging twelve scholars, or less, for the year	938

EDUCATIONAL PROGRESS.

Encouraging reports were received by the superintendent from 131 towns, comprising three-fourths of the school-population in the State, containing unmistakable evidences of improvement and progress in school-work and of a healthful and vigor-

ous interest in behalf of the public schools. An increased interest on the part of parents is evident from the number of visits made to the schools and from the number of new school-houses built and of old ones repaired. There has also been an increase of attendance and a decrease of tardiness. Several graded schools have been organized, and in others the system of classification has been improved, while in a few cases districts have been united and the town-system adopted. Exceptions to the general good progress of educational work are found in the sparsely-settled portions of the State. Ninety towns thus located failed to make any report to the superintendent, while six of those reporting complain of a general indifference as to school-affairs.

A circular for information was sent by the superintendent to school-committees and city- and town-superintendents, and to a number of experienced teachers, for the purpose of ascertaining in a full and accurate manner the real condition of the public schools of the State, inviting comments upon the facts given and suggestions as to the best measures for improving the schools, particularly those in the rural districts. Replies to this circular of inquiry, received from 85 towns in all sections of the State and from 13 teachers, embrace the following facts:

SCHOOL-APPARATUS.

Scarcely 2 per cent. of the public schools in the State are supplied with an appropriate dictionary of the language; not 1 per cent. have globes; about 1½ per cent. possess outline- or wall-maps, and 80 schools in every one hundred are not furnished with a sufficient amount of blackboard-surface. Another obstacle complained of, in the way of the prosperity of the schools, is a lack of uniformity in text-books, particularly in the rural districts. Some progress has been made in securing a uniformity of books in the towns.

COUNTRY SCHOOLS.

Many small, isolated neighborhoods requiring school-advantages are a result of the physical conformation of the State, while, owing to the tendency of settlers to leave the farm and congregate in villages and cities, the schools in such localities are too small to be properly classified. The superintendent of South Hampton reports one school in which the whole number of pupils attending throughout the year was but five. Another reports the least number of pupils in a school three, a union of districts being forbidden by a lake and mountains between. From another county the word comes, "Schools very small; several from four to eight scholars. School-houses are generally badly located, packed away in some corner or out-of-the-way place, upon some hill; old, having poor seats." From Exeter, the principal of an academy writes: "So far as my knowledge extends, the condition of schools in our sparsely-settled districts is generally bad. I believe in consolidation; have good school-houses and good teachers." Another teacher writes, from Lebanon: "The condition of our public schools in the rural districts is deplorable. The schools are too small to be properly classified. The teachers are compelled to work without suitable apparatus and without the sympathy and co-operation of parents." On the other hand, the superintendent of Bath County writes: "The rural or back districts are very far ahead of the villages in exhibitions of real interest in the success of their schools, are freer in their contributions of wood and board in order to lengthen them, and, in fact, seem much more alive to offer inducements to their children to improve."

DISTRICT- VS. TOWN-SYSTEM.

The general opinion of the school-officers of the State, expressed in their replies to the superintendent's circular of inquiry as to the best means of improving the country schools, is represented by the following:

"The only effectual way to improve these schools is to abolish the district- and adopt the town-system, as allowed and recommended by the act of the legislature, June session, 1870." "By the town-system a more systematic and efficient organization of the schools can be effected. * * * The power often exercised, to the disadvantage of schools in small districts, by men either ignorant or unprogressive, or for selfish purposes, would be rendered impotent for evil under this system. The poorer and more sparsely-settled districts, whose schools are shortened to the minimum length by the district-system, would be especially benefited by having secured to them an equal amount of schooling with the most favored section. It not unfrequently happens, under the district-system, that in the division of school-money the wealthy districts draw more money than can be judiciously expended for the support of their schools, and it is held by them without benefit to any one, while it ought to and should be used in those districts which sorely need it. Under the town-system this inequality and injustice would be obviated and every dollar appropriated for schools would be spent for its legitimate purpose."

The opinion of the superintendent upon this subject, after an official association of two years with the public schools, is that "a complete abolition of the school-districts would contribute most effectively to improve and advance the interests of education in the rural neighborhoods."

PRUDENTIAL COMMITTEES.

Over 80 per cent. of the communications returned to the superintendent's office by town-school-committees concur in the opinion that the present system, which commits the employing of teachers to one party and their examination to another, is a great barrier to the success of educational efforts. One says: "The office of prudential committee should be abolished. They have too many friends and relatives." In some localities, it is stated, the custom prevails of selecting prudential committees by routine. Each man must have his turn, whether interested by having children in school or not. He generally employs his daughter or some other relative, so as to keep the money in the family.

CO-OPERATION OF PARENTS.

Replies to inquiry 14, as to the value of parents' visits to schools, are in the following vein:

"The value of parents' visits to schools cannot be overestimated. It is their duty and their privilege to visit them. I have witnessed the good results of such visits." Another: "Parents should visit the schools and witness the conduct of their children. Such visitation could not but result in good. Educated parents are culpably remiss in this respect in withholding priceless favors from their offspring." Another: "I have always felt severely many of the disadvantages of our system, and especially the lack of interest on the part of parents in their children, in entirely leaving them to the mercy of the teacher. Many schools are never visited except by the committee, and not often enough by them." Another writes: "Their value is priceless. By frequent visits parents manifest an interest in the education of their children, and the children feel the influence and are stimulated to greater exertions. These visits are also encouraging to the teacher. The schools are much better and all parties are benefited."

Among the means of improving the schools suggested at the teachers' institutes held in the State during the year past, that of the co-operation of parents was strongly urged. "Parents," it was remarked, "should come into the school-room every week. It will encourage the children to try to evince good progress. Well-trained children like to appear well before their parents. There is often a failure in schools for want of a familiarity between parents and teachers. When there is no longer less care for the school-children than for the farm-animals, we shall see more effort to visit them."

WOMEN AS SCHOOL-OFFICERS.

The growing interest of women in the public schools and the importance to these of their influence and supervision are recognized in the passage of the following act by the New Hampshire State-legislature of 1872:

"SECTION 1. Any female citizen of any school-district, of adult age, who has resided therein for six months at least, may hold and discharge the duties of prudential committee of such district, whenever chosen thereto by the legal voters of such district or appointed by the mayor and aldermen of any city or the selectmen of any town.

"SEC. 2. Any female citizen of any city or town, of adult age, who has resided therein for six months at least, may hold and discharge the duties of a member of the school-committee of such city or town, whenever chosen thereto by the legal voters of such city or town or appointed by the mayor and aldermen of such city or the selectmen of such town."

MUSIC.

Vocal music and elementary drawing, though not yet required studies in the schools of New Hampshire, have been introduced into many of them, with the best possible results. The Manchester board of education reports the influence of its study in that city as manifest in better reading and speaking, in purity, sweetness, and clearness of tone, and in fullness and distinctness of enunciation.

The replies received by the superintendent to inquiry 9, in his circular, "Do you commend the study and practice of vocal music in common schools?" are represented by the following extract from one of them: "If innocent pleasure, if increasing usefulness, if good health, if correct morals, if capacity of intellect, are to be considered among the advantages of our education, then music, and especially vocal music, as a branch of practical importance, should not be neglected in our public schools. */ * Every one who has an ear with which to hear and a voice with which to speak can learn to sing. Some may be mechanical singers, but are there not, also, mechanical readers? Among other important objects served by the practice of music in schools, the advantage of it to the health is urged. The proper position, the vocalization of breath, the sustained tones, the required promptness in vocal music as it is practiced in the schools, are all favorable to a proper development of the physical system. There would be less of biliousness, less of sluggish circulation, less impediment in secretions, and far less consumption in the world, if there were more singing."

DRAWING.

The superintendent of schools at Nashua states that, while drawing is a prescribed study in the grammar- and high schools of that city, it is not on the programme of studies for the lower grades, an arrangement which, he thinks, "seems to reverse the natural order. The work should commence in the primary school, and it should, in connection with writing, occupy a prominent position in that course of study. One of the first impulses of the child, at home or at school, is to draw something. I have been surprised at the large number and fit proportions of the objects which many of our youngest children readily draw on slate or blackboard. * * * * It is an exploded idea that only a few gifted ones can learn to draw. Taking scholars of the same average ability, it has been invariably found that more can be taught to draw well than read satisfactorily or spell correctly."

Upon this subject the opinion of Mr. Walter Smith, State-director of art in Massachusetts, is quoted by the Milford school-committee, to the effect that "There are but four classes of human beings whom it is not found practicable to interest in drawing: they are the blind, the idiotic, the lunatic, and the paralytic. Of the rest of mankind and womankind exactly 100 per cent. can be taught to draw." As to the utility of this acquirement, the same gentleman says: "I venture to say that in every workshop or factory where no knowledge of drawing is possessed by the workmen, there is a waste of material, a waste of time, and an inferior article produced in the end, evils which are a loss to the employer through sacrificing of his materials and inferiority of work, a loss to the workman through his time having to be wasted in experiments, and a loss to the public of tasteful objects to be obtained at a moderate cost."

COMPULSORY ATTENDANCE.

The law for compelling attendance at school, passed by the State-legislature, July, 1871, provides that every parent, guardian, master, or other person having the custody, control, or charge of any child between the ages of 8 and 14 years, residing within two miles of school, shall cause such child to attend school twelve weeks at least during each year, unless excused by the school-committee of the town on the ground of mental or physical incapacity or upon that of having received private instruction for the required length of time. The penalty incurred by guardians of children for violation of this law is $10 for the first offense and for all subsequent ones $20. It is made the duty of school-committees, boards of education, and superintending school-committees, respectively, to sue for all penalties thus incurred, upon written notice, served on them by a tax-payer, stating by whom, when, and how any such penalty has been incurred.

The fact that, notwithstanding this law, there are nearly four thousand children in the State who do not attend any school is accounted for in the school-committee's report of the town of Boscawen upon the ground that, "as no person is obliged to enforce the compulsory law and no one *wishes* to do so, it remains in some cases a dead letter." In the cities, the superintendent states, there has been a commendable effort made to enforce the law, especially in Manchester and several of the larger manufacturing-villages. The matter is receiving attention, and it is thought the results of the law will be perceived in a larger attendance upon school than existed the preceding year.

EVENING-SCHOOLS.

These schools, particularly in the larger cities, are becoming more important and beneficial each year, and are now as much a part of the educational system of the land as are the day-schools. In many cities such is the favor with which they are regarded that there is no school for which an appropriation can be more readily secured.

EDUCATIONAL JOURNAL.

The expediency of publishing a monthly journal devoted to the interests of the teachers of the State was discussed quite generally at the institutes and invariably received the approval of teachers and others present who were interested in the cause of education. It was urged that such a journal would supply much of the need felt by teachers in the many sparsely-settled districts for intercommunication, and the labor of filling its columns is largely guaranteed by the friends of education in the State. At the Strafford County Institute a resolution was unanimously passed requesting the State Teachers' Association to publish a teachers' journal, for which were pledged hearty co-operation and support.

A large proportion of the replies received by the superintendent to inquiry 3, in his circular for information, "Do you advise the publication of a monthly State-school-journal? Can it be sustained?" are represented by the following: "By all means; it is what is greatly needed and would greatly aid teachers and present many things which parents ought to consider. Sustained? Yes; why not? Every committee-man and teacher would want it, of course, and every family with children in the State ought to have it."

RECOMMENDATIONS OF THE SUPERINTENDENT.

Certain changes in the school-laws, which seem to him to be of vital importance to the prosperity of the schools, are recommended by the superintendent to the consideration of the general court:

(1) The expediency of legislating so that the State may aid schools in purchasing a certain amount of illustrative apparatus.

(2) Facilitating the attendance of teachers of the public schools at the teachers' institute for their county.

(3) Uniting the powers and duties of the town-school-committee and prudential committee in one board of officers chosen for a term of years.

(4) The utility of making provision for a clerk for the superintendent.

(5) Lastly, that the force of the legislation should tend to the adoption of the town- or municipal system for the management of all the public schools.

EDUCATIONAL ADVANCE FOR 1873.

At the meeting of the State Teachers' Association at Claremont, in October, Hon. J. W. Simonds read a paper, from which we make this extract:

"The annual statistical report indicates a steady advancement in nearly all the elements that constitute a progressive school-system. The reported increase of school-property in the past year is $47,625; increased value of apparatus, $11,912; decrease of school-houses unfit for their purpose, 29; increase of school-revenue, $38,918; increase of appropriation for each scholar, 95 cents; decrease of the number of school-districts, 101; increase in the number of schools, 44; increase of graded schools, 67; increase of the aggregate length of summer-schools, 3,220 weeks; of winter-schools, 237 weeks. The average length of the sessions of the public schools throughout the State was 21.2 weeks, an increase of 1.5. The male teachers employed in the State were 527; the females, 3,295. Average increase of wages for all the teachers in the State, $2.73. Of these teachers, 632 taught for the first time; 1,135 taught the same school for two or more terms; and 1,762 are reported to have attended teachers' institutes."

HIGH SCHOOLS, ACADEMIES, SEMINARIES, AND INSTITUTES.

The instrumentalities for secondary instruction in the State are 27 high schools, 17 academies, 5 seminaries for ladies, and 4 institutes. The statistics of 37 of these schools show an aggregate attendance of 3,685 pupils—1,770 boys and 1,915 girls—with 96 teachers, of whom 41 are gentlemen and 55 ladies; 817 of the pupils were engaged in classic studies; 365 studied modern languages, and 457 were preparing for college. Music is taught in 20 of these schools and drawing in 15; 17 report libraries, although some of them number only a half dozen or more books of reference, the largest reporting numbers 4,000 volumes, the smallest 3.

For the preparation of young men for college, the most noted school is, perhaps, Phillips Academy, at Exeter. In this school provisions are made for the aid of indigent pupils in a charity-foundation, to which about 20 pupils annually are admitted, and 3 scholarships, called, respectively, the Bancroft, Hale, and Gordon scholarships, and Sibley book-fund. Attendance during the year 1872–'73, 252 pupils.*

PREPARATORY SCHOOLS.

Three schools engaged in preparing students for college, report an aggregate of 391 pupils in classic and 116 in scientific studies. In two of the schools, the Kimball Union and Phillips (Exeter) Academies, the pupils were divided in the various grades, as follows: in advanced classes, 38; in senior, 83; in junior, 86; in middle, or third, 98; in lowest, or fourth, classes, 39. St. Paul's School, at Concord, has 155 in classic studies; the scholarship-funds belonging to it amount to $14,000; there is a library of 1,500 volumes, a cabinet of natural history, a philosophic cabinet and apparatus, and a gymnasium. Kimball Union Academy, at Meriden, has 80 pupils in classic and 108 in scientific studies, a library of 3,000 volumes, a chemic laboratory, a cabinet of natural history, a philosophic cabinet and apparatus, and a gymnasium. Phillips (Exeter) has 156 students in classic studies, 38 of whom are in an advanced class, 53 in the senior, 46 in the junior, and 24 in the third.

* It is but justice to a veteran educator, to give here a brief notice of the Rev. Gideon L. Soule, LL.D., who retired in July, 1873, from the principalship of this academy. In the year 1813, he entered, at 17 years of age, as a student of the academy from Maine, and prepared in it for college. Graduating in 1818, at Bowdoin, he returned to the academy as an instructor under Dr. Benjamin Abbot. He continued such, with one brief interruption, Dr. Abbot leaning more and more upon his aid, till 1838, when, by the unanimous suffrages of the trustees and friends of the institution, he succeeded Dr. Abbot as principal, on his retirement, and served for 35 more years with growing reputation, making among his pupils hundreds of grateful and loving friends. The number graduated from the academy while under his charge was upwards of 2,000, the greater part of whom passed into college, and thence spreading as educated men through every portion of the country the molding influences received from him. Retiring in a green old age, he left the academy in a most flourishing condition, its buidings renovated, its endowment unimpaired, and its prospects encouraging in a high degree.

STATE NORMAL SCHOOL.

During the year 1872–'73, 212 ladies and 71 gentlemen belonged to the school. A class of 28 received certificates of graduation at the close of the fall-term and a still larger class are preparing for examination at the close of the spring-term in May. Sixty per cent. of the students have taught in the public schools of the State.

The new normal-school-building, now completed, is a fine three-story brick structure 80 by 50 feet and cost $17,650. The school possesses sufficient apparatus to illustrate the instruction comprised in the courses of study and the library contains several valuable works of reference. There are two courses of study: the first, requiring one year for its completion, includes all the branches required by law to be taught in the common schools; the second includes such higher English branches as require for its completion two school-years. The certificates of graduation from the first course have the effect of licenses to teach in the common schools of the State for three years from their date and those from the second course for five years.

DARTMOUTH COLLEGE.

This time-honored institution is now in the one hundred and fifth year of its age, with steadily-increasing influence and usefulness. Embracing an academic, a scientific, an agricultural, an engineering, and a medical department, it affords its students almost the advantages of a university. Discreetly yielding to the present call for varied, and especially for practically useful, culture, yet holding steadily in its academic department to the main features of the established curriculum of college-study, it affords a good example of an institution that keeps pace with an advancing age, still carrying with it what the past has proved valuable.

Its lately-published triennial catalogue shows a list of 5,317 alumni, of whom two-thirds graduated from the academic department, 1,200 from the medical, 200 from the scientific, and 8 from the agricultural.

About $100,000 have been received from legacies and donations during the past year. The library has been increased by 1,100 volumes; the museum, by large collections of entomologic, geologic, and other specimens, as well as by a number of valuable casts; and that of the agricultural department by some rich gatherings from European fields. Two new halls, one for the Alpha-Delta-Phi Society and the other for the agricultural department, also add to the accommodations and appearance of the college. Two new scholarships, of $1,000 each, have been endowed during the past year.

At the annual reunion of the alumni in the winter, President Smith reported the number of freshmen for the class of 1873–'74 to be 82 and the whole number of students in the various departments 420.

Statistical summary of Dartmouth College.

Name of college.	Corps of instruction.	Endowed professorships.	Number of students.		Corporate property, &c.						Number of volumes in library.
			Preparatory.	Collegiate.	Amount of property of corporation.	Value of grounds, buildings, and apparatus.	Amount of endowment.	Amount of productive funds.	Income from productive funds.	Receipts for last year from all other sources.	
Dartmouth College	23	4	.....	262	$600, 000	$160, 000	$440, 000	$400, 000	$28, 000	$22, 153	22, 300

THE CHANDLER SCIENTIFIC SCHOOL.

The Chandler Scientific School, connected with the college, and the Agricultural College, not far away, afford admirable advantages to those who purpose to devote themselves to engineering, the mechanic arts, the natural sciences, or agriculture.

The course of study in the Chandler School, if not a complete professional course, bears essentially the same relation to professional life as the academic course in college, though in another line. Like the Worcester Free Institute of Science, the Sheffield School at New Haven, the Stevens Institute at Hoboken, and others, it aims to combine, to some extent, a scientific and literary training. Thoroughness in its teaching is continually striven for, and how great success has been attained in this is attested by the readiness with which graduates of the Chandler School obtain positions. The class which entered in 1873 is said to be the largest yet recorded and the prospects of the institution eminently encouraging.

The Thayer School of Civil Engineering is meant to be essentially, though not for-

mally, for post-graduate-instruction, with a course of study of the highest order, passing beyond what is possible in institutions for general culture and preparing the student for the most responsible positions in the engineering line. This course extends through two years, each divided into two terms, a large portion of each term being devoted to out-door-practice, with a view to practical familiarity with work, as well as principles.

The Agricultural College has a course which, as at present arranged, embraces three years, with three classes: junior, middle, and senior. During the first or junior-year all students pursue the same studies. At the beginning of the second year they are required to select either the special course of agriculture or the course of mechanic arts, and are not allowed to change from one course to another without special permission from the president.

The new Culver Hall, for the use of the Agricultural College, now completed, furnished, and in constant use, affords greatly-increased facilities for the studies of this department. This building is 100 feet in length, 60 in breadth, and four stories high, containing laboratories, recitation- and lecture-rooms, and rooms for the various cabinets and museums.

Statistical summary of schools for professional instruction.

Names of schools for professional instruction.	Corps of instruction.	Number of students.	Corporate property, &c.					Number of volumes in library.
			Amount of property of corporation.	Value of grounds, buildings, and apparatus.	Amount of productive funds.	Income from productive funds.	Receipts for last year from all other sources.	
SCHOOL OF MEDICINE.								
Dartmouth College, medical department*	11	52	.....	$25,000	$0	$0	$3,500	1,400
SCHOOLS OF SCIENCE.

* This school received from the State in 1873 $5,000 towards the renovation of the building which it occupies. This is now said to be completed, conformably to the wishes of the faculty, combining all conveniences for practice and instruction.

† Endowment, $120,000; of which the above $100,000 is productive.

‡ Apparatus.

BUSINESS-COLLEGE.

One business-college only is reported as existing in this State; it is at Manchester and had 376 students on its rolls in 1873.

COLLEGES FOR WOMEN.

From five institutions claiming to be engaged in the superior education of young ladies come partial returns for 1873, which may serve to show what is being done in this line in New Hampshire. (1) The Adams Female Academy reports 3 teachers and 12 pupils in a preparatory department, without indicating whether there are any in collegiate classes. "Art-studies, belles-lettres, and general literature" are said to be especially attended to. Music—vocal and instrumental—drawing, painting, French and Italian, are taught; there is a small chemic laboratory, an art-gallery, and a gymnasium, while a library of 700 volumes, increased by 50 during the year past, affords reading for the pupils. (2) The New Hampshire Conference Seminary and Female College, at Tilton, with 8 instructors and 44 young ladies in college-classes. Two courses of study are here provided for young ladies, a classic course of four years and a belles-lettres-course of three, the former running up to Cicero in Latin, Racine in French, and William Tell in German; the latter the same, with the exception of the Latin. There is also a musical department, the schedule of studies in which is quite complete, and a normal class for such as desire to become teachers. (3) The New Hampton Literary Institution—with 9 teachers and in the female college-classes 108 pupils—its

classic course extending through Virgil and into Cicero in Latin, and through the Anabasis and into the Iliad in Greek. (4) The Robinson Female Seminary, at Exeter, with a property valued at $300,000, of which $100,000 is in grounds and buildings and $200,000 in productive funds; 9 female instructors, besides a president; a three-years collegiate course, with music, drawing, painting, French and German, and other languages, "if required," but no note of any students. (5) Tilden Seminary, West Lebanon, with grounds and buildings valued at $40,000; 13 instructors; whole number of pupils, 116, but no designation of those in college-classes. Music, drawing, paint ng, French, and German taught, and a "fine gymnasium" possessed, with limited chemic laboratory, philosophic cabinet, natural-history-museum, and art-gallery. A specially interesting feature of the catalogue here is a named list of 111 graduates of the first degree, 187 of the second, and 25 that have received a diploma for an elective course. In all these lists the marriage-name, as well as maiden-name, is given, as far as ascertained—the number of the married reaching 143.

The Kimball Union Academy and Littleton Graded School appear, from the schedule of studies in their catalogues, to rank with the above, the latter going up into Virgil, the Anabasis, and Iliad; the former into the same, with a considerable course in French and a fair one in German. In both these, as well as in the New Hampshire and New Hampton Seminaries, there are classes for young men as well as for young women.

TEACHERS' INSTITUTES.

Institutes were held, as required by law, in every county in the State, and in Coos County two were held. Nearly 900 teachers, comprising over one-third of the number in the State, received instruction at these institutes, while 100 school-officers and 4,800 citizens were in attendance, a large increase over previous years. Practical and experienced teachers, fresh from school-work, were employed as instructors, to each one being assigned that department for which he appeared peculiarly qualified.

Teachers' institutes are no longer an experiment in New Hampshire. Experienced educators acknowledge them to be among the most efficient means devised for improving the greatest number of teachers in the shortest time. In numerous instances, on visiting the public schools, the superintendent has witnessed the practical application of improvements suggested at the institutes. It is believed that one of the most valuable results attending this work is the powerful influence diffused among parents and citizens in the community where the session is held, in awakening and strengthening correct ideas of the public-school-system.

STATE TEACHERS' ASSOCIATION.

The annual session was held at Plymouth, on Thursday and Friday, October 24 and 25, 1873. Preliminary remarks by the president of the association. Prof. Quimby, of Dartmouth College, explained the object of the organization to be "in no sense to perform the work of a teachers' institute, which places the common teacher subordinate to the professor and simply in the attitude of a learner. In this association none are simply learners, but all are teachers, as well. We meet to see and confer with each other, to become acquainted and learn from each other's experiences. All teachers and citizens, as they are affected by the educational interests of the day are invited to take part in the discussions. Let teachers relate their new elements of success and especially their failures." Among other subjects considered, which bear closely upon the interests of the public schools, was the necessity of shortening the daily sessions, especially of the primary and intermediate schools. The discussion was opened by Prof. Pearl and was participated in by Prof. Quimby and others. The marking-system was discussed by several members, a majority being in favor of it, while two objected to the plan decidedly, as a means of encouraging the strong over the weak. State-Superintendent Simonds gave his report on the subject of the abolition of school-districts and other reforms. He advised the discussion of the school-district subject, so that people at large might understand it better, and gave a history of the system from its inception to 1870, when the legislature made the abolition of districts optional with the towns.

The great discussion of the session, on the co-education of the sexes, was opened by Mrs. H. M. Miller, of Concord, who assumed her position by earnest request, although generally declining to come before the public otherwise than as interested in subjects pertaining to reading. She believed that, with co-education, manliness would prevail among men and womanliness among women, and that such education tends to fit each for better fulfillment of mutual relations in life. This view was coincided in by five participants in the discussion, only one, Prof. Orcutt, of West Lebanon, taking the opposite side. The professor insisted that as woman was to fill a particular sphere in life she should have a special training.

OBITUARY.

Silas H. Pearl, late principal of the New Hampshire State Normal School, was born at Albany, Vermont, July 27, 1833. His boyhood was passed on the paternal farm.

His early educational advantages were limited to the district-schools of his native town, yet he early acquired a taste for study and formed the purpose of securing a liberal education, a purpose in which he persevered, notwithstanding many inducements to a contrary course held out to him by friends, preferring to work his own way through college rather than to be assisted in business. He fitted for college at Craftsbury (Vermont) Academy, partly under the tuition of Hon. Judge Ross, now on the supreme bench in Vermont; entered the university at Burlington in 1855, and graduated in 1859.

His first school, of some 50 pupils, convened in a small and dilapidated schoolhouse, was successfully taught in Albany when he was 18 years of age. He continued to teach in public schools in the winter during his academic and college-course with good success. The fall after graduating he taught the academy at Craftsbury, where he had fitted for college. The three following years he had charge of a school at Danville, Canada East, from which position he was called to the principalship of the academy at Johnson, Vermont, in 1864. He found this school in a low condition, and at the end of seven years left it in a highly prosperous condition to accept the position of principal of the New Hampshire State Normal School at Plymouth. Here his work was equally difficult and laborious. The normal school was an experiment; the legislature had simply given it license to live, if it could; the people were skeptic as to its utility; some neighboring academies, jealous of its rivalry, became its open enemies, and still other adverse influences from within and without tended to increase the difficulty of the enterprise. But, under Prof. Pearl's wise and energetic leadership, the school proved a great success, and gained many personal friends and much public favor, as seen in the fact that the State has contributed $18,000 in appropriations to finish and furnish its elegant building. At the end of two years, and chiefly through the efficiency of this lamented principal, the State Normal School has become one of the best of its kind in the nation.

As a student, Mr. Pearl is described by Judge Ross, his academic teacher, as diligent, thorough, and honest with himself. As an instance of his manly independence and self-reliance as a scholar, Judge Ross relates that he once encountered a difficult example in miscellaneous algebra, in the solution of which he refused his assistance. At the close of the term he carried it with him to his home, and continued to work upon it at intervals all summer while engaged upon the farm, and finally overcame the difficulty. "This was the character of the boy as a student," says Judge Ross, "and years after, when, as a member of the board of education, I again met him, I found the man and teacher but the larger growth of the boy and student. He was characterized by the same thoroughness and the same conscientious performance of every duty."

Prof. Pearl possessed in an eminent degree the indispensable quality which may be termed authority, or the power to control and govern his school without apparent effort. His aptness to teach was evident to all who ever attended his class-recitations or public examinations. Thoroughness characterized all his work, whether organizing, managing, or instructing his school, and he had a wonderful faculty for imparting his own self-reliance and energy to his pupils; no teacher ever possessed more earnestness and enthusiasm in his work. This gave him power to infuse his own spirit into the minds of his pupils, to rouse them to activity, and to secure from them the best results of their efforts. His unbending Christian integrity and gentle, unassuming, Christian life were ever imparting a silent but salutary influence.—(Prepared for the State Teachers' Association, by Hiram Orcutt, A. M., principal of Tilden Academy, West Lebanon.)

BOARD OF EDUCATION.

Hon. DANIEL G. BEEDE, *State-superintendent of public instruction and secretary of board, Concord.*

His excellency Ezekiel A. Straw, governor; Samuel F. Dow, John J. Morrill, William P. Newell, Bolivar Lovell, and Nathan R. Perkins, council.

NEW JERSEY.

[From reports of Hon. Ellis A. Apgar, State-superintendent of public instruction, for the scholastic years ended August 31, 1872 and 1873.]

TABLE OF STATISTICS—FINANCIAL STATEMENT.

	1872.	1873.
REVENUE.		
Two-mill tax	$1,168,803 08	$1,207,331 00
Increase		38,527 92
State-appropriation	100,000 00	100,000 00
Township-school-tax	44,467 91	51,313 33
Increase		6,845 42
Interest of surplus revenue	31,654 92	35,363 30
Increase		3,708 38
District- and city-tax for teachers' salaries	331,673 81	442,345 48
Increase		110,671 67
District- and city-tax for building school-houses	586,470 58	660,715 32
Increase		74,244 74
Total amount for maintaining the schools	1,676,599 72	1,836,353 11
Increase		159,753 39
Total amount, including that raised for building	2,263,070 30	2,497,068 43
Increase		233,998 13
Amount per child for maintaining the schools	6 00	6 40
Increase		40
Value of school-property	4,966,788 00	5,554,828 00
Increase		588,040 00
TOWNSHIP-SCHOOL-TAX.		
Number of townships that raised school-tax		40
Number of townships that raised no school-tax		177
DISTRICT-SCHOOL-TAX.		
Number of districts that raised school-tax	491	507
Increase		16
Number of districts that raised no school-tax	887	860
Decrease		27
Number of districts that raised tax to pay teachers' salaries	162	175
Increase		13
Number of districts that raised tax to build school-houses	419	447
Increase		28
COST OF EDUCATION.		
Average cost per pupil calculated on total school-census	$5 88	$6 40
Increase		52
Average cost per pupil calculated on average attendance	16 29	20 90
Increase		4 61
SCHOOL-ATTENDANCE.		
Total school-census between 5 and 18 years of age	279,149	286,444
Increase		7,295
Total enrollment in the public schools	178,826	179,443
Increase		617
Number attending public schools 10 months	14,926	16,009
Increase		1,073
Number attending between 8 and 10 months	25,389	26,780
Increase		1,391
Number attending between 6 and 8 months	31,561	31,087
Decrease		474

Average time the schools have been kept open	9 months 10 days.	9 months 13 days.
Increase		33 days.

GROWTH OF THE SCHOOL-SYSTEM.

The following table shows the remarkable growth of the public system within the past five years:

Year.	State-appropriation.	Township-school-tax.	Interest on surplus revenue.	District-tax for teachers' salaries.	District-tax for building and repairing school-houses.	Total amount of district-tax.	Total amount raised for all purposes.	Value of school-property.
1869	$100,000 00	$423,868 86	$27,539 46	$419,628 69	$486,896 90	$906,525 59	$1,457,933 91	$2,980,996 00
1870	100,000 00	462,955 24	28,722 88	513,308 06	476,606 83	989,914 89	1,581,593 01	3,677,442 00
1871	1,197,481 72	49,779 17	30,993 50	417,686 09	597,400 20	1,015,086 29	2,293,340 68	4,246,998 00
1872	1,268,803 08	44,467 91	31,654 92	331,673 81	586,470 58	918,144 39	2,263,070 30	4,966,788 00
1873	1,307,331 00	51,313 33	35,363 30	442,345 48	660,715 32	1,103,060 80	2,497,068 43	5,554,828 00

SCHOOL-FUNDS.

The schools of New Jersey are supported by funds derived from the following sources: (1) The two-mill State-school-tax; (2) the interest derived from the school-fund, amounting to $35,000 annually; (3) an additional appropriation of $65,000, derived from the revenue of the State; (4) the interest of the surplus revenue; (5) township-school-taxes; and (6) district- and city-school-taxes.

The school-fund was first created by an act of the legislature, February 9, 1816. By this act the State-treasurer was directed to invest $15,000 in the public 6-per-cent. stocks of the United States, to be a perpetual fund for the benefit of the public schools of the State. This fund has been increased from time to time by subsequent legislation. At present it amounts to $792,190.77. The amount of the income from this fund that can be appropriated to schools is determined by act of the legislature. As the fund, and the interest arising therefrom, increases, the legislature, from time to time, increases the amount of the annual appropriation. The sum now annually appropriated is $35,000. All the interest received in excess of this appropriation is added to the principal.

The amount of the surplus revenue apportioned to New Jersey by act of Congress in 1836 was $764,670.44. This money was apportioned to the several counties of the State in the ratio of the State-taxes paid by them at that time; but, as it is subject to recall at any time by the National Government, it is only loaned to the counties. Notwithstanding the guarded provisions of the act relating to this fund, the principal appears to have been used in eight counties to pay county-expenses. In these counties the schools no longer receive any benefit from the fund.

It will be observed that the State-appropriation amounts to about three-fourths of all the money needed to maintain the schools. This money is derived from the tax of two mills on a dollar, levied by the State. This tax is uniform in all the counties and is apportioned for the use of the schools on the basis of the school-census. A State-appropriation derived from a uniform State-tax is undoubtedly the most equitable and just means for supporting the public schools. This method of raising school-money does not meet with a tithe of the opposition that the old plan of resorting to township-taxation always encountered.

If in any township the funds received from the apportionments are not sufficient to maintain free schools nine months during the year, the school-law requires that the supplemental amount needed shall be raised by township-tax. In accordance with this provision, 40 townships out of the 217 in the State raised additional funds by township-tax, and, in 507 districts out of a total of 1,367, district-school-taxes were assessed. In 175 districts, taxes were assessed to pay teachers' salaries and in 477 they were imposed to build and repair school-houses.

The only custodians of school-moneys are the State-treasurer, the county- and township-collectors and the city-treasurers. The township-collectors are responsible for the safe-keeping of all the school-funds of the State and also for their proper disbursement.

FREE SCHOOLS.

"The free-school-law of New Jersey went into operation September 1, 1871. During the past two years, therefore, all the children of the State have had an opportunity of attending school free of charge. The results under the workings of this law are most gratifying. There has been a liberal increase in the salaries paid to teachers, and the time the schools have been kept open has been considerably increased. There is a stability given to the school-system by this act which it never before had. When the schools depended upon the township-tax for their support, the question whether they should be continued or closed depended every year upon the vote given at the town-meeting. Consequently there was an annual recurrence of anxiety felt by the friends of the schools, lest sufficient funds should not be voted for their support. Now the tax is assessed and collected by State-authority, and every district has an assurance that it will receive an apportionment sufficient to maintain a free school a reasonable length of time during the year.

"The law gives general satisfaction. It is popular in all parts of the State. The unanimity with which the bill passed the legislature was most gratifying to its friends, but more gratifying has been the hearty indorsement given it by the people."

SCHOOL-LAW.

Of the present law, the superintendent says: "Our school-law, in all its main features, is well adapted to our wants. Our system of school-taxation is equitable and just and furnishes the means necessary to maintain the schools on a liberal basis. Our plan of supervision secures an accurate apportionment of the school-funds, a full knowledge of its mode of expenditure, a careful inspection of the schools, a rigid examination of the teachers, a ready adjustment of all school-difficulties, and complete and

reliable statistical and written reports of the full workings of the schools, at the close of the year. No change affecting any of the main features of the system should, in my opinion, be made."

DISTRICT-SCHOOL-CENSUS.

Six new districts have been formed and seventeen old ones abolished during the year 1873, making the whole number 1,367, eleven less than last year. The districts abolished were considered too small to maintain schools. They were, therefore, divided and the parts were joined to other surrounding districts. A number of others in which the school-census ranges below 70 will be abolished during the coming year. It requires a census of 70 or 75 children to give a fair average attendance, and the desire is to have as few districts as possible with less than this number.

LENGTH OF ANNUAL SCHOOL-TERM.

The school-law requires that every district shall maintain a school for at least nine months in the year. Failure to comply with this condition involves a forfeiture of all school-money coming from the State. The length of time prescribed is greater than that in any other State. Notwithstanding this fact, very few of the districts have failed to comply with the requirement. In this particular the exhibit made for the year 1872–'73 is more favorable than ever before presented. The average length of time the schools have been kept in session is nine months and thirteen days. This is more than a month longer than the average school-term in any of the New England, Middle, or Western States. From nearly all the districts that failed to maintain schools the required length of time, good and sufficient reasons for the failure have been received, and the money apportioned to them has not been withheld. In many of them school-houses have been undergoing repairs or new ones have been in the course of erection.

ATTENDANCE.

The exhibit of the percentage of attendance does not materially differ from that given in last year's report. The evils of irregular attendance then referred to still exist. The superintendent says: "We are making reasonable and satisfactory progress in all matters pertaining to the schools, excepting this one. In the matter of attendance we seem to be making no advancement whatever." This seems now the greatest obstacle to the success of the school-system. The total attendance is satisfactory. Seventy-five per cent. of the children of school-age are reported as having attended either a public or private school some portion of the year, leaving 25 per cent. who have attended no school. This 25 per cent. includes many children between the ages of 5 and 7, who are kept at home because they are considered too young to attend school, and many between 15 and 18, whose school-days have ended, but who have probably received a fair public-school-education. This being considered, the total attendance is as great as can reasonably be expected. The evil complained of is not absenteeism, but irregularity of attendance. The attendance for the whole school-term has been only 9 per cent. of the number enrolled, and 40 per cent., or more than one-third of the enrollment, were in attendance less than four months. In considering the magnitude of this evil it must be remembered that it does not all fall upon those who absent themselves; a portion of it is sustained by those who are regular in their attendance, by classes becoming disorganized and consequently losing ground. Those members of a class who attend regularly have to be kept back while irregular attendants make up for lost time. It is urged upon parents, educators, and school-officers to put forth every effort to make the attendance on the public schools more regular and constant. In Jersey City there has been a gratifying improvement in this particular, 87 per cent. of the average number belonging having been in regular attendance, against 83.7 per cent. during the preceding year. This result, it is believed, has been attained by a plan which has been pursued during the past three years of rewarding that class which has had the most perfect attendance throughout the week, by dismissal on Friday afternoon, with special praise and honor, one hour before the regular time. In some cases, also, those classes that have achieved 95 per cent. or more are dismissed soon after the triumphant class.

CORPORAL PUNISHMENT.

A law forbidding corporal punishment in schools was enacted in 1867. At first, a large portion of the teachers of the State regretted the passage of it; but it is the opinion of the State-superintendent that a majority of them would now oppose a proposition to repeal the law; and he thinks that three-fourths entirely dispense with the use of the rod. The effect of the law is held to have been good. It has led teachers to make the experiment of governing without corporal punishment, and many have been successful. He states that, "as a rule, those schools in which the rod is not used are better governed than those in which the use of it is continued."

SALARY OF STATE-SUPERINTENDENT.

The report of the State-board of education to the legislature contains the following: "The provisions of the law making the public schools entirely free have added to the labors of the State-superintendent of public instruction; and, as his services, apart from these additional labors, have been but moderately remunerated, the board of education respectfully asks the legislature to consider the propriety of increasing his salary."

COUNTY-SUPERINTENDENTS.

The State-superintendent says of this office: "The amount of work required is sufficient to employ one man's entire time and attention in each county in the State. But the salaries they receive are not such as to enable them all to do this, the average salary at present being only $794.17. The remuneration should be such as would induce educated, experienced, and thoroughly competent persons to accept these positions and to devote their whole time and energies to the work. An increase of 50 per cent. on the present salaries would no more than fairly compensate these officers for their labors." Most of the county-superintendents, in their reports, refer to the matter of salary, conceding the necessity of the superintendent's whole time being given to the schools and regretting their inability to do this, the small salary making it necessary for them to devote a portion of their time to some other employment. The results are unfortunate. One superintendent writes: "In endeavoring to supplement my salary by the occasional performance of acts appertaining to a separate profession, I have risked a loss of influence in the schools, and my conviction is a settled one that the entire time and energy of the superintendent should be devoted to the school-work. How he is to be justly requited for such unremitting labor does not yet appear." Similar sentiments are expressed by a majority of the county-superintendents. The good results to the schools of a supervision which would be constant and thorough, because sufficiently remunerated, cannot be overestimated.

Notwithstanding these difficulties and hinderances, the visitation of schools seems to have been faithfully performed. The number of such visitations during the year averages two and one-half for each school in the State, and a majority of the county-superintendents have visited their schools oftener than the law requires.

INCREASE OF FEMALE TEACHERS.

During the past year there have been 907 male and 2,234 female teachers employed in the public schools, being a decrease of 48 males and an increase of 104 females. For several years there has been this uniform decrease in the number of male teachers employed and a corresponding increase in the number of females. With the exception of California, no State pays her female teachers so liberally as New Jersey, and only in the States of California, Massachusetts, and Connecticut do the male teachers receive as much as in this State.

EXAMINATIONS AND CERTIFICATES OF TEACHERS.

Examinations of teachers are held quarterly by the county-boards of examiners. The questions used at these examinations are uniform throughout the State and are furnished by the State-department. The certificates issued are of three grades. The first is granted to candidates not less than 18 years old with not less than two years experience in teaching, and is good for three years in all parts of the State, the second to persons not less than 17 years old with an experience in teaching of not less than one year. No experience in teaching is required for a third-grade-certificate, but candidates must be not less than 16 years old. The second-grade-certificate is good for two years and the third-grade for one year only in the county in which they are issued. The increase in the number of first-grade-certificates granted during the year is very gratifying. The number of rejections goes to show that the examinations are conducted with considerable thoroughness. It is intended to make the examinations more and more rigid every year, and thus continually to raise the standard of teachers' qualifications.

Special attention is called to the great importance of having thoroughly qualified teachers for the primary schools. Trustees too often have the idea that persons of limited attainments and no experience are good enough for such schools; and teachers themselves sometimes complain because they are required to pass an examination in grammar and geography before they can secure a license to teach a school where these studies are not taught. The reasoning upon which this idea is based is false and the legitimate results most pernicious. At no period in a child's educational course does so much depend upon the teacher as during the first five years of his school-life. For this reason the requirements of primary-school-teachers should be considerably above the branches they are required to teach. The work must not be intrusted to ignorant and inexperienced teachers. The strongest terms are used in urging the importance of this subject upon school-trustees and school-officers generally.

SCHOOLS SHOULD BE VISITED BY PARENTS AND SCHOOL-OFFICERS.

The neglect of the schools by trustees and the almost total indifference manifested by parents are made the occasion of remark by many of the county-superintendents. The results are alike evil to teachers and scholars; the former, feeling that they are unappreciated and that they receive neither thanks nor sympathy, lose heart and courage for their work; and the children are not roused to energy and ambition, as they surely would be if a constant interest were manifested in their progress and their schools were frequently visited by persons whose good opinion they would value. The superintendent of a county where the general intelligence is above the average says: "Very few of our trustees make a point of visiting the schools and the visits of patrons at large are fewer still. Often I have to hear from teachers, 'You are the only person that ever visits me or manifests the least interest in what I am doing.'" Many superintendents express a wonder that under such discouraging circumstances teachers continue earnest and faithful. It is hoped that this evil may be remedied and that all who are interested in paying for the common schools will manifest an interest in their progress.

UNIFORMITY OF TEXT-BOOKS.

One great obstacle to satisfactory progress that confronts the teacher of an ungraded school is the multiplicity of classes. In nine-tenths of the districts of the State the schools are ungraded or the grades mixed. The number of classes is necessarily large and the time the teacher can devote to each is correspondingly short. In many of these schools the number of classes is greatly increased by the diversity of text-books used, and a great decrease would be effected if uniformity could be secured. The question "How can uniformity be secured?" becomes then an important one. In most of the counties the superintendents have endeavored to secure either township- or county-uniformity by calling the trustees of the townships or counties together and agreeing upon the books that shall be used. The result has not been successful. An approach to uniformity has been made, but in no county has it been fully secured. The difficulty is that, after uniformity is decided upon, there is no authority to compel parents to buy the books selected; and, even if it were given, it is doubtful if it could be exercised to the necessary extent. The opinion is expressed that uniformity can never be secured until the law provides that the same parties that decide what books are to be used shall also be the purchasers. To secure county-uniformity, there must be a county-board to select and to purchase books for the whole county. For township- or district-uniformity the same must be true. Provided district-uniformity can be secured, county- and township-uniformity are not considered of so much importance. It is suggested that if every district were to raise by tax an amount sufficient to purchase all the books needed to commence with, the children could be required to pay a small annual sum for their use, and with this fund the supply could be constantly kept up. There is no reason why the purchase of books should not be met by a common tax, as well as that incurred for erecting school-houses, hiring teachers, or purchasing fuel. The custom is common in the cities, and there is no reason why it cannot be introduced in the rural districts with equal facility and advantage.

SCHOOL-HOUSES.

During the past year 88 new school-houses have been built and 96 have been remodeled, refurnished, or enlarged. The total amount expended for the improvement of school-property was $586,470.58. The total amount ordered to be raised and expended for this purpose next year is $660,715.32.

The remarkable number of school-houses built and repaired during the past five years, the large sums of money expended for these purposes, and the consequent increase in the value of school-property are shown in the following tabular statement:

Year.	No. of districts without school-houses.	New houses built.	Old houses repaired.	Total amount expended for the improvement of school-property.	Total value of the school-property of the State.
1869	.....	62	95	$486,896 90	$2,980,996 00
1870	.....	58	60	476,606 83	3,677,442 00
1871	62	82	84	597,400 20	4,246,998 00
1872	52	85	99	586,470 58	4,966,788 00
1873	37	83	96	660,715 32	5,554,828 00
Total	.....	370	434	2,808,089 83	.....

The total number of school-buildings in the State at the present time is 1,480. It thus appears that one-fourth of the entire number have been built within the past five years and that more than one-half of them have either been built anew or remodeled and improved within this short space of time. There is a large decrease in the number of poor and medium school-houses and a corresponding increase in the number of good ones. A few years ago the greatest want in the State respecting educational matters was a just appreciation of the importance of furnishing suitable school-accommodations. The school-houses, as a rule, were poor, and the people seemed to be satisfied with them. That state of apathy has passed. In every county new buildings are being erected and old ones repaired, and the utmost willingness is shown by the people to vote the necessary means for these improvements.

The legislature of 1872 changed the law where it required a two-thirds vote to order a district-tax for making improvements in school-buildings, so that now only a majority-vote is necessary. This change has already been productive of great good. In very many of the districts where new houses have been erected during the past two years the old ones would still be standing had this change not been made.

The most cheering feature of this record is the superior character of the houses that have been built. During no preceding period have there been so many inquiries respecting competent architects, suitable designs, methods of heating and ventilation, furniture, apparatus, &c., as during the past two years.

In each of the annual reports for the past three years the attention of school-officers and others has been directed to the fact that school-houses exist in the State with no outhouses attached. Three years ago the number in this condition was 152, and in addition to this there were 423 in which the outhouses were not kept in proper order. It is some satisfaction to know that the number of schools with no outhouses has decreased to 87 and the number with indifferent ones to 269; but the wonder is that a single case of the kind should exist. The State-superintendent is determined to correct this evil, if possible, by the enforcement of the penalty provided in the law for such cases, and will, therefore, direct the county-superintendents to withhold the State-money from all districts not provided with suitable outhouses, until such as are needed are built.

DISTRICT-SCHOOL-LIBRARIES.

The law providing for the purchase of school-libraries or school-apparatus has been in operation over two years. Under its provisions every district that raises $20 by subscription is entitled to an equal amount from the State, and for every year thereafter, by raising $10, a like sum of $10 is paid by the State. This money can be expended either in the purchase of library-books or school-apparatus. Thus far 236 districts in all have established libraries and during the past year 49 districts made additions to the libraries established last year.

THE TOWNSHIP-SCHOOL-SYSTEM.

The school-law, which authorized county-superintendency, has been in operation six years. By the provisions of this law the number of school-officers in the State was materially lessened and the whole system was strengthened and made more efficient. A still further reduction in the number of school-officers can be made by adopting the township system. This change, it is believed, would strengthen still more the general school-system and add greatly to its efficiency.

The number of school-districts then would be reduced from 1,367, the present number, to 254, the number of townships and cities in the State. The number of school-officers would be reduced from 4,200 to about 1,600. There are now, on an average, seven boards, or twenty-one school-officers, for each township. With one-fourth the number to look after the interests of the schools there will be more system, a greater degree of harmony, a deeper interest, and more effective work in the school-organization than is now possible.

DEFECTS OF DISTRICT-SYSTEM.

The principal defects of the present system are: too frequent elections; the difficulty of selecting any basis upon which the school-moneys can be apportioned, so that each district shall receive the precise amount of money it needs; the needless expense incurred, in many cases, in maintaining a full school for the benefit of a few children; the endless disputes and troubles about district-boundaries, and the impossibility of grading or classifying the schools of small districts.

One of the greatest hinderances to the proper administration of the school-system lies in the cumbersomeness and inefficiency of the school-machinery in the counties. The county-superintendent has too many officers through whom he must act and upon whom he must rely for information. There need be no doubt that an improvement in the efficiency of supervision and in the ease with which school-statistics can be gathered will follow the adoption of the township-system.

This change in the school-law is strongly urged because it is believed that it will make the entire school-organization far more efficient than at present.

CITIES.

The educational interests in all the cities are in a very satisfactory condition. The total number of school-buildings in the cities is 99 and the number of departments is 748.

CITY-SCHOOL-HOUSES.

Without an exception the school-houses in the cities are in good condition and many of them are models of excellence and beauty. Forty-one of the 99 buildings are valued at more than $20,000 each and twenty-five are worth from $50,000 to $80,000 each. In Jersey City the average value of the school-houses is $53,000, which is considerably higher than the average value in any other city. In Newark the average value is $32,700.

LENGTH OF SCHOOL-YEAR.

The average length of time the schools were kept open in the cities is ten months and two days, or twelve days longer than the average term in the State at large. The average attendance for ten months was 18 per cent. of the enrollment, or twice as great as that for the State. The average attendance for the year was 55 per cent. of the enrollment.

TEACHERS' SALARIES.

The average salary of male teachers in the cities is $118.50 per month and that of female teachers $42.14 per month. The highest salary paid to male teachers in the State is in Jersey City, being $193 per month, and the highest paid to female teachers is in Newark, being an average of $60 per month.

EVENING-SCHOOLS.

Night-schools, for a longer or shorter period during the year, have been maintained in Bridgeton, Elizabeth, Jersey City, Millville, Newark, Paterson, Perth Amboy, Salem, and Trenton. These schools furnish educational facilities to adults and to all who, for any reason, are unable to attend the day-schools. They have been found productive of great good.

GRADED SCHOOLS.

In Camden the grading of some of the schools has been much improved, and active measures have been taken by the board of education for increased school-accommodations. A fine building, which will contain eight rooms, intended for the use of colored children, is rapidly approaching completion.

In Newark two large school-houses, each of which will seat about 800 pupils, have been completed during the year. The course of study in the Newark high school has been advanced, in order to meet the advanced requirements of the best colleges.

In Perth Amboy the increase in attendance of children over 6 years of age has been so great as to render it necessary to remodel a portion of the school-building and to appoint an additional assistant teacher in the primary department.

STATE NORMAL SCHOOL.

While the standard of scholarship in the normal school at Trenton has been raised fully 30 per cent., the attendance during the three quarters ended with June 28, 1872, has somewhat increased. Every county in the State has had its representative, while 13 other States sent scholars who either paid tuition or pledged themselves to teach in the State upon graduation. The attendance was 228—194 ladies and 34 gentlemen—of whom 33 ladies and 5 gentlemen graduated, nearly all of whom at date of the report had secured positions at good salaries. The addition of another year to the course of study has had a very beneficial effect, most of the pupils, who would otherwise have graduated, having availed themselves of its benefits.

It is believed by the trustees that many gentlemen are deterred from pursuing this course of study by the constantly increasing expense attending it, which now amounts to a sum varying from $250 to $300 annually. They are, therefore, giving their attention to devising means for the erection of a boarding-house for the gentlemen students, similar to that now working satisfactorily for the ladies, and at which the total annual expense, including room-rent, board, washing, and books, is only $150.

HIGH SCHOOLS AND ACADEMIES.

Reports received from 18 schools for secondary instruction show that in all but one of these classic studies are pursued, 7 also embracing the study of modern languages. As reported, 710 pupils are engaged in the English course, 196 in the classic, 120 study the modern languages, while 81 are pursuing both classic and modern-language-courses. The total number of pupils under instruction is 1,295—688 boys and 607 girls. These are taught by 104 instructors, of whom 44 are gentlemen and 60 ladies. Two of these schools are exclusively for the education of girls and four are for boys. In one of the latter class, however, an English and classic school for boys, girls seem to

have been admitted. The remainder are for the education of children irrespective of sex. One of these, the Farnum Preparatory School, an auxiliary to the State normal, is aided by the State, a condition of its endowment, received from Paul Farnum, esq., being that the State should appropriate $12,000 annually. Mr. Farnum gave $20,000 and the school-property, about $30,000, for the purpose of "improving the general education of the State."

It may have been noticed that "in the Newark high-school the course of study has been advanced to meet the advanced requirements of the best colleges." A more general advance of this kind is probable. The two are parts of one great whole, the high school the link between the common school and the university.

PREPARATORY SCHOOLS.

Two institutions devoted especially to the work of preparing students for the colleges, the Peddie Institute, at Hightstown, and Stephens High School, at Hoboken, report an aggregate of 20 in classic and 40 in scientific studies. Peddie Institute is supplied with a chemic laboratory, worth from $3,000 to $4,000; a cabinet of natural history; and a philosophic cabinet and apparatus, worth about $600. Of the 50 students in the Stephens High School, only two are preparing for college, most of the others intending to enter scientific schools, such as that established in the neighborhood, the Stevens Institute at Hoboken.

COLLEGE OF NEW JERSEY.

The whole course of study in this institution requires four years. All the studies of the first two years are required studies, being obligatory upon every member of the class. During the last two years of the course, students have an opportunity of selecting, to a certain extent, the studies which they will pursue. These elective studies, chosen at the beginning of the college-year and for the entire year, will, when chosen, be equally obligatory with the required studies.

Should a student fail to pass the examination in any of his studies, his name is not entered on the class-roll at the beginning of the next term, until he shall have been examined in that study. On the second day of the next term such delinquent students are required to meet in the chapel, prepared for an immediate examination in the studies which they have omitted. Members of the sophomore-class found deficient in any study at the biennial examination are conditioned and re-examined in that study before being allowed to proceed to the elective courses of the junior year. A graduate of the college offers a prize of $100 to the student of the sophomore-class who may stand highest at the biennial examination to be held at the close of the year 1872–'73.

A limited number of students is educated by means of endowed scholarships. The college also possesses a fund for the purpose of aiding indigent candidates for the ministry of the Presbyterian Church, from which they receive about $30 a year each.

The college has received from Mr. John C. Green the sum of $100,000 for the endowment of a school of science.* This will supply a want that has long been felt. An elegant building is in process of erection and $25,000 has been set apart for the purchase of scientific collections and apparatus. The instructors in the academic department will give instruction in the scientific school and the professors of the latter will aid in the academic department. The sum of $5,000 has been subscribed towards a chair of civil engineering. This school is believed to have been opened at the beginning of the academic year, September 10, 1873.

RUTGERS COLLEGE.

The departments of the college are classic and scientific. In the classic department, all the studies up to the close of the sophomore year are obligatory and are intended to be of such a character as will be equally desirable whatever subsequent profession or career is chosen.

SUPERIOR INSTRUCTION.

During the junior- and senior-years, elective studies are permitted. Students desiring to pursue special studies may do so, provided they are properly prepared to go on with the regular classes.

The scientific department, known as the Rutgers Scientific School, constitutes the State College of Agriculture and the Mechanic Arts. There are two distinct courses of study: (1) a course in civil engineering and mechanics and (2) a course in chemistry and agriculture. During the first and second years, the studies of the two courses are the same and are designed as a suitable introduction to the higher branches of either course. These two years form a course complete in itself, and students leaving at this period of the course receive a certificate of their attainments. There is also a special course in chemistry and agriculture, occupying two years and designed for those who

* This is in addition to his gift of $120,000 for the library.

desire to devote themselves entirely to these branches. According to the requirements of the law, the students in this department are regularly drilled in military tactics.

One of the pressing wants of the college is being supplied by the erection of a new building from the funds derived from a legacy to the institution. Among the present wants are: (1) a sum not less than $35,000 for the erection of a dormitory; (2) a large present addition to the library, considered absolutely essential to the progress of the institution; and (3) a permanent fund, the income of which can be used to make yearly additions to the library and to keep in order what has been accumulated. The funds for the general purposes of the college require a large increase. The good of the institution requires a greater outlay for instruction. The growth of the college and the demand for greater facilities for education are creating wants which appeal imperatively to the friends of the institution.

In the appended table the condition of the two above-named institutions, as well as of the two others in the State, is briefly presented.

Statistical summary of colleges.

Names of colleges.	Corps of instruction.	Endowed professorships.	Number of students.		Corporate property, &c.						Number of volumes in library.
			Preparatory.	Collegiate.	Amount of property of corporation.	Value of grounds, buildings, and apparatus.	Amount of endowment.	Amount of productive funds.	Income from productive funds.	Receipts for last year from all other sources.	
Burlington College	9	0	54	.....	.....	$50,000	.....	.....	.....	$10,000	3,000
College of New Jersey	18	7	38	397	.....	550,000	$750,000	$850,000	$54,000	25,500	30,000
Rutgers College	13	....	.....	124	.....	.....	.....	.....	.....	.....	5,500
Seton Hall College	16	....	80	70	.....	.....	.....	.....	.....	.....	8,000

COLLEGES FOR WOMEN.

Four institutions for the superior instruction of young ladies report an aggregate attendance of 566 pupils, with 54 professors and teachers, 19 of whom are gentlemen. Music—vocal and instrumental—drawing, painting, French, and German are taught in all these colleges, and in one Italian and Spanish are added. All have chemic laboratories and philosophic cabinets, three natural-history-museums, and all some provision for physical culture, and libraries, two numbering 2,000 volumes each and the other two 1,000 each.

PROFESSIONAL AND SCIENTIFIC TRAINING.

Of the theologic schools referred to in the following table, the Drew Seminary, at Madison, is Methodist-Episcopal, and all the bishops of that denomination are, *ex officio*, members of its board of supervision, while any annual conference of the church may appoint two of its members as official visitors. The regular course of study, arranged with reference to the attainments of college-graduates, requires three years for its completion. But to meet the wants of those whose age or other circumstances may make a previous college-course impossible, an introductory course of four years in the classes of science has been arranged, two years of which must be completed before coming to the institution. The remaining two may be attended to within its halls. In the regular course, the theologic training proper appears to belong to the last two years, the first year being mainly occupied with the study of mental and moral philosophy and Butler's Analogy.

The Princeton Theological Seminary (Presbyterian) shows a list of students almost all of whom are graduates of colleges. The course of instruction seems to be very thorough and complete, embracing all the ordinary topics of theology, with a recently added department of Christian ethics and apologetics. Rhetoric and elocutionary training have special care bestowed on them; and among the optional studies beyond Hebrew (which is in the regular course) are Chaldee, Syriac, Arabic, and the elements of Janseric, all important to a student of the scriptures in the original.

The German School, near Newark, is also Presbyterian, and is established to provide German-speaking instructors for the vast belt of German population which has settled itself along the great railroad-lines stretching westward from New York and Philadelphia, even to the Mississippi States.

The Theological Seminary of the Reformed Church in America, formerly the Reformed Dutch Church, is the chief training-school for the ministry of that very respectable and very conservative denomination. It is substantially a theologic department of

Rutgers College, New Brunswick, as the Princeton Seminary is of the College of New Jersey.

The Scientific School of Rutgers College is, by act of the legislature, constituted the State College for Agriculture and the Mechanic Arts, embracing, as has been previously stated, a course in civil engineering and mechanics and one in chemistry and agriculture. Comparatively unnoticed until lately, this institution has come considerably into the foreground of observation through the able defense of the agricultural-college-system, put forth by Prof. Atherton, at the meeting of the National Educational Association in Elmira, August, 1873, and through various publications from him on the same theme since that time. Besides its well-arranged course in chemistry and agriculture, under the direction of an ample faculty, there is sustained by the trustees an extensive model farm, designed to illustrate the principles of agriculture and test by experiment the value of different systems. Forty free scholarships secure the education of as many State-students without charge for tuition.

The John C. Green School of Science is closely linked with the College of New Jersey as one of its departments, the instructors in the academic department giving instruction in the scientific school and the professors in the scientific school assisting in the academic department.

The Stevens Institute of Technology, another school for special scientific training, stands on a wholly independent basis, aiming to prepare men for engineering, chemic, and physical-science-occupation, and, from its ample endowment new and excellent buildings and rapidly-increasing library and museums, presents great advantages. A department of belles-lettres and one of languages accompany the scientific course and give opportunities for quite liberal education.

An institution not in the following table may perhaps not inappropriately be mentioned here, the New Brunswick Conservatory of Music, which aims to elevate into a science one of the most delightful of the arts and to have the study of it pursued, under highly-qualified instructors, to a point considerably beyond what is reached in ordinary schools.

Statistical summary of schools for professional instruction.

* With 35 preparatory students additional. † This is given as the amount of endowment.

BUSINESS-COLLEGES.

Two of these schools of training for commercial life exist in the State, one at Trenton, the other at Newark. No returns from the latter for 1873. The former reports five teachers and 254 pupils.

OBITUARY.

The only New Jersey educator of whose death in 1873 intelligence has been received was Rev. William A. Dod, D. D., of Princeton, who passed away January 2, in his fifty-fifth year. He was a son of the well-known Princeton professor of mathematics of that name, received his education at the college, under his father's supervision; graduated there in 1838; was a tutor in his *alma mater* from 1840 to 1841, and professor of architecture and the fine-arts from 1855 to 1859. His later years were spent in the quiet duties of rector of the Protestant-Episcopal church in his native place, his fine taste and scholarship giving great attractiveness to his ministrations.

LIST OF SCHOOL-OFFICIALS IN NEW JERSEY.

Hon. ELLIS A. APGAR, *State-superintendent of public instruction, Trenton.*

STATE-BOARD OF EDUCATION.

Name.	Post-office.
OFFICERS.	
President, Governor Joel Parker	Freehold.
Vice-president, William A. Whitehead, esq	Newark.
State-superintendent, and *ex-officio* secretary, Hon. Ellis A. Apgar	Trenton.
EXECUTIVE COMMITTEE.	
Rev. John McLean, D.D. LL.D	Princeton.
Charles E. Elmer, esq	Bridgeton.
William A. Whitehead, esq	Newark.
Hon. Henry C. Kelsey	Trenton.

COUNTY-SUPERINTENDENTS.

County.	Name.	Post-office.
Atlantic	George B. Wight	Mays Landing.
Bergen	E. E. Vreeland	Hackensack.
Burlington	Walter A. Barrows	Mt. Holly.

Sussex	E. A. Stiles	Deckertown.
Union	N. W. Pease	Elizabeth.
Warren	Ephraim Dietrich	Columbia.

NEW YORK.

[From the report of Hon. Abram B. Weaver, State-superintendent of instruction, for 1872, transmitted to the legislature February 28, 1873.]

PERMANENT SCHOOL-FUND.

Bonds for lands sold	$217,003 65
Bonds for loans	175,379 30
Loans of 1840	49,326 00
Bank-stock	50,000 00
State-stocks	1,165,057 24
Comptroller's bonds	36,000 00
Money in the treasury	1,277,547 36
Oswego City bonds	34,200 00
Total amount of fund September 30, 1872	3,004,513 55
Increase from last year	25,937 03

This fund was established in 1805, and amounted at that time to $26,774.10. By judicious investments it has been gradually increased to the present amount.

FINANCIAL STATEMENT.

The school-moneys for the fiscal year ended September 30, 1872, are derived from the following sources:

From the common-school-fund	$170,000 00
From the United States deposit-fund	165,000 00
From the State-school-tax	2,448,784 31
Total	2,783,784 31

The apportionment has been made, as required by law, as follows:

For salaries of school-commissioners	91,200 00
For supervision in cities	18,500 00
For libraries	55,000 00
For contingent fund, (including $84.99 for separate neighborhoods)	1,797 57
For Indian schools	3,172 00
For district-quotas	871,371 58
For pupil- and average-attendance-quotas	1,742,743 16
Total	2,783,784 31

The following table is a summary of the financial reports relating to common schools for the year ended September 30, 1872:

Receipts.	Cities.	Rural districts.	Totals.
Amount on hand October 1, 1871	$818,869 09	$264,749 05	$1,083,618 14
Apportionment of public moneys	1,016,887 98	1,641,978 12	2,658,866 10
Proceeds of gospel- and school-lands	44 86	36,452 62	36,497 48
Raised by tax	4,340,065 60	2,940,862 78	7,280,928 38
Estimated value of teachers' board		235,660 87	235,660 87
From all other sources	90,722 21	169,744 62	260,466 83
Total receipts	6,266,589 74	5,289,448 06	11,556,037 80
Corresponding totals for 1871	5,481,467 18	5,190,099 19	10,671,566 37
Increase	785,122 56	99,348 87	884,471 43

Expenditures.	Cities.	Rural districts.	Totals.
For teachers' wages	$3,316,926 27	$3,640,529 49	$6,957,455 76
For libraries	10,862 13	15,197 37	26,059 50
For school-apparatus	167,966 08	57,715 36	225,681 44
For colored-schools	59,835 04	6,690 13	66,525 17
For school-houses, sites, &c	1,110,144 14	878,779 04	1,988,923 18
For all other incidental expenses	721,950 12	429,850 70	1,151,800 82
Forfeited, in hands of supervisors		142 13	142 13
Total expenditure	5,387,683 78	5,028,904 22	10,416,588 00
Corresponding totals for 1871	4,662,598 09	4,945,305 72	9,607,903 81
Increase	725,085 69	83,598 50	808,684 19
Balance on hand October 1, 1872	878,905 96	260,543 84	1,139,449 80

Since 1850, when the total expenditure for the maintenance of public schools was $1,607,684.85, the expenditure has increased at the average rate of nearly half a million per annum, until, in 1872, it reaches the sum of $10,416,588. The total expenditure for the period from 1850 to 1872, inclusive, has been $116,562,930.57.

The following table shows the entire amount expended during the year for the maintenance of public educational institutions, not including appropriations made to orphan-asylums and other public charities in which instruction is given:

Wages of common-school-teachers	$6,957,455 76
District-libraries	26,059 50
School-apparatus	225,681 44
Colored-schools	66,525 17
Buildings, sites, furniture, repairs, &c	1,988,923 18
Other expenses incident to the support of common schools	1,151,800 82
State-appropriation for support of academies	41,746 50
State-appropriation for teachers' classes in academies	15,080 00
For teachers' institutes	16,190 28
For normal schools	174,339 23
For Cornell University	44,000 00
For Elmira Female College	3,500 00
For Indian schools	7,690 94
For salaries of school-commissioners	90,187 32
For department of public instruction	19,620 08
For regents of the university	6,242 26
For printing reports and school-registers	13,958 72
Total	10,849,001 20
Corresponding total for 1871	9,880,185 06
Increase	968,816 14

SCHOLASTIC POPULATION.

The whole number of children between the ages of 5 and 21 years, as reported, was:

	Cities.	Rural districts.	State.
In 1871	645,128	857,556	1,502,684
In 1872	662,778	859,175	1,521,953

WHOLE NUMBER IN ATTENDANCE.

In 1871	411,133	616,977	1,028,110
In 1872	409,272	614,858	1,024,130

AVERAGE DAILY ATTENDANCE.

In 1871	195,230	298,418	493,648
In 1872	199,853	294,997	494,850

AGGREGATE ATTENDANCE.

The aggregate number of days of attendance was as follows:

	Cities.	Rural districts.	State.
In 1871	39,096,552	53,511,055	92,607,607
In 1872	38,479,418	50,234,513	88,713,931

The average time each pupil in the rural districts attended school was sixteen and nine-tenths weeks; in the cities, nineteen and three-tenths weeks.

LENGTH OF SCHOOL-TERM.

Average length of term in cities	$41\frac{3}{10}$ weeks.
Average length of term in rural districts	32 weeks, 4 days.
Average length of term in the State	35 weeks.

CLASSIFICATION OF PUPILS.

The number of pupils instructed in all schools during the year was as follows:

	1871.	1872.
In the common schools	1,028,110	1,024,130
In the normal schools	5,807	6,377
In the academies	30,370	31,421
In the colleges	3,194	4,012
In the private schools	135,433	131,761
Total	1,202,914	1,197,701

The total number thus reported as having attended school during 1872 is about 79 per cent. of all persons in the State between the ages of 5 and 21 years and much larger than the entire population between the ages of 6 and 17 years.

NUMBER OF TEACHERS.

The whole number of teachers employed in the common schools was:

	Males.	Females.	Total.
In 1871	6,481	21,773	28,254
In 1872	6,670	21,987	28,657

The number reported as employed at the same time for the legal term of twenty-eight weeks or more was as follows:

	Males.	Females.	Total.
In 1871	4,752	13,119	17,871
In 1872	4,800	13,256	18,056

TEACHERS' LICENSES.

Teachers in the common schools were licensed as follows:

	By normal schools.	By superintendents of public instruction.	By local officers.	Total.
Cities	270	448	4,480	5,198
Rural districts	273	647	22,539	23,459
Total for 1872	543	1,095	27,019	28,657
Total for 1871	533	1,054	26,667	28,254

TEACHERS' SALARIES.

The whole amount expended for teachers' wages was:

	Cities.	Rural districts.	Total.
In 1871	$3,066,787 94	$3,586,305 11	$6,653,093 05
In 1872	3,316,926 27	3,640,529 49	6,957,455 76
Increase over 1871	250,138 33	54,224 38	304,362 71

	Cities.	Rural districts.	State.
The average annual salary for each teacher was—			
In 1871	$645 37	$273 38	$372 86
In 1872	691 03	274 63	385 33
The average weekly wages was—			
In 1871	15 44	8 33	10 58
In 1872	16 73	8 37	11 04

The whole amount paid for teachers' wages was $2,130,984.12 more than in 1867, which is an advance, in five years, of more than 44 per cent. upon the gross amount and of more than 22 per cent. upon the average annual salaries of the increased number of teachers.

SCHOOL-DISTRICTS.

The reported number of school-districts in the State, exclusive of cities, which have no such divisions, was—

In 1871	11,350
In 1872	11,367
Increase	17

This increase is chiefly owing to the formation of new districts in sparsely-settled sections of the State, as required by the increasing population. On the other hand, owing to the consolidation of small districts and the organization of graded schools in cities and villages, there has been, in the aggregate, a diminution of thirty during the last ten years.

SCHOOL-HOUSES.

The number of school-houses and their classification according to the materials of which they are constructed are as follows:

	Log.	Frame.	Brick.	Stone.	Total.
Cities		51	329	10	390
Rural districts	121	9,890	869	473	11,353
Total, 1872	121	9,941	1,198	483	11,743
Total, 1871	127	9,914	1,182	505	11,728

Their number and classification, as reported for the years 1862 and 1872, are as follows:

	Log.	Frame.	Brick.	Stone.	Total.
1862	228	10,004	964	554	11,750
1872	121	9,941	1,198	483	11,743
Increase			234		
Decrease	107	63		71	7

The increase in the number of brick school-houses does not represent the full number of new buildings that have been erected during the period mentioned, for many have been constructed in place of old ones of similar materials. The improvements which have been made in providing suitable houses and sites are better indicated by their reported value as compared with preceding years and the sums expended each year for these and kindred purposes, as stated in the following tables:

VALUE OF SCHOOL-PROPERTY.

The value of school-houses and sites was first reported in 1865. The reported value in that year and in 1872 was as follows:

	Cities.	Rural districts.	Total.
In 1865	$5,041,061	$4,904,862	$9,945,923
In 1872	15,165,314	9,350,936	24,516,250
Increase tince 1865	10,124,253	4,446,074	14,570,327

The average value of school-houses and sites is, in the cities, $38,885.50; in the rural districts, $823.65. The average value of school-houses and sites in the rural districts has risen from $433.02 in 1865 to $823.65 in 1872.

EXPENDITURE FOR SCHOOL-BUILDINGS.

The sums spent for school-houses, outhouses, sites, fences, furniture, and repairs, as reported for the years 1863 and 1872, were as follows:

	Cities.	Rural districts.	Total.
In 1863	$242,547 53	$186,961 40	$429,508 93
In 1872	1,110,144 14	878,779 04	1,988,923 18
Total expenditure for the period from 1863 to 1872	8,081,804 30	6,670,579 11	14,752,383 41

More than ten millions of dollars have been expended for these purposes during the last five years, and the large increase in the reported value of school-houses and sites would indicate that the amount had been chiefly used in permanent improvements.

STATISTICS OF NORMAL SCHOOLS.

Number of such schools, exclusive of New York City	8
Whole number of pupils	2,666
Average number in attendance	1,395
Average age of male pupils, years	19.2
Average age of female pupils, years	19.1
Number of graduates—males, 46; females, 226	272
Total receipts	$195,164 90
Increase over 1871	59,375 42
Total expenditure	174,487 62
Increase over 1871	46,774 73

STATISTICS OF SCHOOLS FOR INDIANS.

Number of districts	27
Number of children between 5 and 21 years of age	1,774
Whole number registered during the year	1,192
Average daily attendance	706
Number of teachers—males, 8; females, 29	37
Number of white teachers	20
Number of Indian teachers	17
Average number of weeks school was taught	32.8

GENERAL VIEW.

The superintendent says: "The returns for the school-year ended September 30, 1872, are as favorable in nearly all respects as those of any preceding year. This indicates a fair measure of prosperity, according to the usual standards, but should not be accepted as conclusive evidence of such great success that efforts for a better condition may prudently cease.

"Although statistics may be truthful in reference to the facts reported and for some purposes very serviceable, they cannot reveal the whole life of our school-system, nor without careful study will they disclose its defects. The figures given, if inconsiderately accepted, might encourage the inference that there is no occasion for further improvement. But those in charge of public instruction should ever keep before their minds the question whether we are doing the proper work in the best way.

"Changes for the better may be made" and suggestions upon several points will be submitted to the legislature.

FREE-SCHOOL-FUND.

It is suggested that the law in regard to the free-school-fund be so amended as to give to the superintendent of public instruction a supervision of this fund similar to that exercised by the comptroller over the general fund.

Under the existing law, all payments from the free-school-fund are made upon the warrant of the superintendent and all receipts for moneys coming into the fund are required to be countersigned by him. His control does not extend further. He has no means of ascertaining whether the money for which he receipts is actually placed in the bank to the credit of the fund. The frequent mistakes which have occurred show the necessity for an amendment of the law.

APPORTIONMENT OF SCHOOL-MONEYS.

The pupil- and average-attendance-quotas, amounting the past year to $1,742,743.16, are distributed to the several school-districts which have maintained schools the required term of twenty-eight weeks, one-half according to the number of children of

school-age and one-half according to the average daily attendance. Concerning this it is remarked: "It was undoubtedly the original design in establishing this basis for the distribution of a portion of the public moneys to encourage attendance at school; but the practical operation of the law tends to defeat that purpose by rewarding the highest average daily attendance, which is more easily secured for a short term than for a long one. Thus a district maintaining school beyond the required legal term not only receives no public money on account of such additional time, but incurs the risk of reducing the average daily attendance already attained and, consequently, its share in the next annual appropriation. It would be more equitable and encourage attendance for longer terms to divide this portion of the fund according to the whole number of days of attendance at school."

ATTENDANCE.

The largely increased attendance upon the public schools which has hitherto marked the years following the adoption of the free-school-law has been substantially maintained during the last year. Though the total number of pupils reported as having been in attendance during some portion of the year is somewhat less, the average attendance is more than for any preceding year. The average number of pupils in attendance for the whole State, each day of the entire term in 1872, was 1,202 more than that of the equal term in 1871, 10,145 more than in 1870, 26,429 more than in 1869, 48,982 more than in 1868, and 74,893 more than for the shorter term in 1867.

SUPERVISION.

The present system of supervision by commissioners having been in operation since 1856, there has been ample time to test its merits and reveal its defects. While recognizing the existence of imperfections, the superintendent is not convinced that any other method would subserve the purpose as well or with less cost to the State. He would, however, favor any modifications that are really calculated to render it more effective.

Two methods have been suggested. The first proposes to increase the number of officers and reduce the size of their districts; also that officers shall serve gratuitously, but their expenses shall be paid. The objections to this are that with so large a number of officers it would be impossible to conduct many of the operations of the department with requisite directness and precision and that the expense would really be greater: the sum allowed to the 114 commissioners under the present system would be quite inadequate to meet the expenses of the 2,000 officers whom it is proposed to substitute for them.

The second plan provides for the appointment of commissioners by some authority which shall be held responsible for the choice of competent and faithful officers, instead of choosing them by popular elections.

The superintendent remarks: "In whatever mode the school-commissioner may be selected, he should be required by law to give his undivided attention to the duties of that office."

DISTRICT-LIBRARIES.

The condition of the district-library-system and the ruinous tendency of its present management have been fully stated in former reports. The reported number of volumes has constantly decreased from 1,604,210 in 1853 to 874,193 in 1872, notwithstanding the annual appropriation of $55,000 for their support. The decrease for the last year was 54,123. If the system is to be redeemed and made useful the legislature must interfere.

In accordance with previous recommendations and for the purpose of carrying them into effect, amendments to the code of public instruction have been prepared, providing for the repeal of those provisions which permit the use of library-moneys for any other purpose than for the purchase of books and making it the duty of trustees to raise by taxation, in each district respectively, a sum equal to that apportioned to it for library-purposes and to apply the same exclusively to the purchase of books.

Amendments in form embodying these provisions will be submitted to the legislature at its present session.

SCHOOLS FOR INDIANS.

The reports made by the several local superintendents indicate a steady increase in the aggregate and in the average daily attendance at the Indian schools and that most of them are progressing satisfactorily in other respects.

The superintendent of Indian schools for the Allegany and Cattaraugus reservation reports a largely increased interest among the Indian people in regard to the schools. As a result the attendance is larger and more regular. This change is attributed largely to the influence of the evening-lectures during the institutes held for the benefit of teachers, at the Indian council-house, in the two preceding summers, addressed directly to the parents, with a view of enlightening them upon their relations

to the schools and their duty to their children in the matter of education. These institutes have exerted a marked improvement upon the character of teaching in the schools. In the asylum-school the object-system has been used with most satisfactory results. The apparently stolid indifference of the Indian to intellectual matters can only be overcome by appealing to the intellect or mind through the senses. This renders the object-method peculiarly fitted for these schools. A more general introduction of modern contrivances for the aid of the teacher is recommended; also a continuation of institute-instruction. It is also recommended that the plan of having the Indians keep their school-houses in repair, so far as practicable, without State-aid be continued. In the majority of the districts they are able to assist in the expense of maintaining the schools, and will do so rather than dispense with them. Too much assistance is a curse rather than a blessing.

In the Oneida and Madison Indian reservation school was maintained for a period of thirty-three weeks. The whole number of children between the ages of 5 and 21 is 47; whole number registered in school, 39. The daily attendance is not what it should be, but a portion of the pupils are quite regular and make satisfactory progress. The school-houses and apparatus are in good condition.

The Indians of the Onondaga reservation have had the advantages of a school about twenty-five years, but during much of that time only a small portion of the tribe have sent their children to school. About half the population are pagans, who have generally opposed schools and keep up the customs and festivities of the ancient Onondagas. Besides the State-school there is a parochial school under church care, and many children have been withdrawn from the State-school to attend this. The existence of these two schools near each other, each scantily furnished with scholars, the patrons of each more or less hostile to the opposing school, has a depressing effect upon education among the pagan portion of the tribe.

In the St. Régis Indian reservation the condition of the schools and the progress of the pupils are not encouraging. The children are irregular in attendance and cease to attend school at all when 14 or 15 years of age. The parents appear to have but little control over their children or regard for their welfare.

The superintendent of the Indian school in the Shinecock reservation reports 43 children between the ages of 5 and 21. Whole number registered, 35; average daily attendance, 19. The school has been taught thirty-two weeks during the year. The members of the tribe seem fully to appreciate the importance of educating their children and eagerly avail themselves of the privileges afforded them.

In the Tonawanda reservation schools have been taught nearly the usual length of time during the past year. Last fall the Indians were urged to repair the old school-houses for the winter-term. This was considered in their councils, and some of the old chiefs recommended the stopping of the schools and a return to their old pagan rule and worship. It is now thought by that portion of the Indians interested in schools that so long as the office of chief is kept up no considerable improvement can be made, and some of them are making an effort to do away with that office. The buildings were repaired from the Quaker fund.

In the Tuscarora reservation the whole number of children of school-age is 172; number registered in school, 118; average daily attendance, 44. Taking into consideration the fact that the Indian children seldom go to school before they are 6 or 7 years old and usually leave by the time they are 14 or 15, the attendance is creditable. The children improve as fast as can be expected of those who have not only their lessons to learn, but a language also, for most of them on entering school cannot speak a word of English. The Indians willingly furnish fuel and make repairs on the buildings, but seem to think that nothing more ought to be required of them.

The State-superintendent says: "There seems to be no question but that, under the operation of the fourteenth amendment to the Constitution of the United States, the Indians are entitled to all the privileges and immunities of citizens. The education and training which the Indian children now receive at the expense of the State are intended to fit them to properly perform the duties of citizenship. In order, however, to produce the contemplated result, the Indians must be taught to help themselves by being required to bear some measure of responsibility." It is respectfully suggested that all State-aid hereafter granted to the Indians for the purposes of education, for building and repairing roads and bridges, and for other improvements, should be coupled with such a requirement.

NEW YORK CITY.

[From annual report of Hon. Henry Kiddle, city-superintendent, for the year ended September 30, 1873.]

Attendance in schools.—"The average attendance of pupils for the year ended September 30, when returns were made from all the schools under the control of the board of education, was 107,639 and the whole number of pupils who received instruction during any portion of the year is reported as 235,618. The average attendance and

number of pupils taught in each class of schools during this and the preceding year are exhibited in the following table:

Schools.	1873.		1872.	
	Average attendance.	Whole number taught.	Average attendance.	Whole number taught.
Male-grammar-schools	17,051	32,483	16,930	31,271
Female-grammar-schools	15,411	28,941	14,923	28,062
Primary departments	39,865	90,297	38,363	88,997
Primary schools	15,652	38,142	16,260	39,176
Colored-schools	803	1,965	797	1,832
Normal schools	1,395	2,434	1,446	2,145
Corporate schools	8,302	21,806	8,257	23,418
Evening-schools	9,160	19,550	9,350	20,979
Total	107,639	235,618	106,326	235,880

"It will be perceived from this that the average attendance in all the schools for the year was 1,313 in excess of that reported in 1872, while the number taught was 262 less. The accommodations, except in the primary departments, have been increased in a much greater proportion than the number of pupils to be accommodated. The reasons for this are the increase of school-population in some parts of the city and the diminution in others, the withdrawing of the pupils from the public schools by the establishment of parochial schools, and the establishment of schools and the erection of buildings in localities where they are needed without the discontinuance of schools where they are not needed. In this way the cost of the system is year by year increasing in a greater rate than the number of pupils educated. This table shows the number of pupils that can be accommodated in each class of schools, as compared with the average number on register:

Schools.	Number that can be accommodated.	Average registered number.	Excess of accommodation.	Excess of accommodation in 1872.
Male-grammar-schools	22,532	18,594	3,938	3,553
Female-grammar-schools	20,441	17,078	3,363	3,106
Primary departments	45,634	45,594	40	1,500
Primary schools	23,848	17,898	5,950	2,893
Colored-schools	1,657	1,090	567	595
Total	114,112	100,254	13,858	11,641

"The largest percentage of public-school-attendance, as compared with the population, is in the Tenth ward, where it is 15 per cent., while the smallest is in the Eighteenth ward, where it is only a little over 6 per cent., the average for the whole city being about 9¼ per cent.

"*Overcrowding in the schools.*—Probably the most serious evil connected with the school-system is the overcrowding of the schools. To this fact the attention of the board has been frequently called, and measures have been adopted from time to time to abate the evil; it, however, still exists to an alarming extent and calls for the earnest consideration of the board.

"Some more definite rule is required to regulate this matter effectually. Mr. Kiddle suggests that the board fix the capacity of every building, every main room, and every class-room in the city, and prohibit the placing, at any time, of more children in any room than the number thus established by law, and that every principal be required to refuse admission to all pupils when the number assigned for his or her department or school has been reached. If this were carefully and accurately accomplished, keeping in view not merely the number of seats that could be placed in a room, but allowing a sufficient number of cubic feet of air for each child, the accommodations would be greatly reduced.

"*The examinations.*—During the year the schools have all been minutely examined at least once and many of them twice. Of 1,858 classes thus examined the instruction in 905 was found to have been excellent; in 781, good; in 158, fair; in 13, indifferent; and in 1, bad. The general result of the examinations, based upon a careful compila-

tion of the returns of nearly 2,000 classes, shows a slight improvement in reading and spelling, but in other respects an inferiority to the results reported in 1872. This table will exemplify this fact:

Year.	Discipline.	Reading.	Spelling.	Writing.	Arithmetic.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
1870	89½	81½	76	83	76½
1871	89	79½	79¾	83½	79½
1872	92	81½	82½	84½	81½
1873	90½	82	83	82	79

"*Difficulties of discipline.*—There has been a considerable falling-off in respect to discipline in the male-grammar-schools. While last year the number of classes reported as deficient in this respect was only 3 per cent. of the whole examined, this year it is 9 per cent. Still, as a general thing, excellent order is maintained in the schools, though evidently only by means of a great expenditure of time and labor on the part of both principals and class-teachers. The whole number of pupils reported as suspended from the schools for various kinds of misconduct during the past year is 79; from male-grammar-schools, 47; and from primary departments and schools, 32. The latter includes one girl, suspended from one of the primary departments. The following are the reported causes of these suspensions: 22 for disobedience, 40 for disorderly conduct 8 for truancy, 3 for stealing, 4 for indecent conduct, and 2 for striking their teacher. Thirteen of these suspended pupils have been re-admitted on certificates granted by the undersigned." On this point the superintendent says:

"In my last annual report I stated that the by-law in regard to suspensions had not been found adequate to prevent the frequent occurrence of the most heinous offenses in the schools on the part of vicious boys, such as insulting and outrageous language to teachers, violent and injurious assaults upon their fellow-pupils, the wanton destruction of school-property, and gross disobedience and constant disregard of the rules of the school. The careful and thorough investigation of this matter by a committee of the board having resulted not simply in fully proving the accuracy of this statement, but in showing that the evil is of far greater magnitude than was represented in the report, there is no need of any further statement of facts by me. The state of the case must be apparent to all; there is a large class of boys whom our schools do not and cannot restrain, and whom, therefore, they cannot benefit, but must send adrift, to find their way inevitably to the reformatories and prisons, after having committed those injuries to the community which our school-system was designed to prevent."

*Corporal punishment.**—"In my last annual report I recommended that, as 'moral suasion' had failed to restrain a large class of the pupils, the right to inflict corporal punishment should be restored to the principals. In the opinion upon which this recommendation was based I have been greatly strengthened by the conclusion at which the investigating committee, before referred to, arrived, and which prompted them to report unanimously in favor of such restoration, as well as by the fact that, after a full discussion in open board, so large a number of its members were also in favor of the restoration. As, however, the report of the committee has not been adopted, the question What shall be done with persistently disobedient and disorderly pupils? is still an open one.

"*Course of instruction.*—No changes having been made in the course of instruction during the year or in any of the regulations pertaining to it, it would be well to adopt the plan briefly sketched in my last annual report, that is, prescribing a perfectly uniform course for all schools up to a certain grade of attainment, from which a divergence should occur, so that different schools might teach as specialties different departments of study, each adapted to some special pursuit. Every year parents are compelled to withdraw their sons from the higher grades of our grammar-schools and send them, at great expense, to schools in which, by careful instruction in a few important branches, they may be prepared for business. This would not be the case if certain of the schools were made in their higher grades 'commercial schools,' in which the pupils would be insured the best possible training and instruction in everything required for business-pursuits, and the same is true in regard to other occupations. At the present time a preparation for the colleges is all that is attended to, while hundreds never design to enter either of those institutions.

* The question of the restoration of corporal punishment, dropped some time ago, has grown out of the want of efficient discipline, of which the superintendent here complains. The committee on teachers of the board of education presented in the autumn a report giving sixteen reasons in favor of re-investing principals with the right to punish with the rod refractory and ungovernable boys. Twenty-five principals examined by the committee were unanimous in the opinion that this right was indispensable to the proper government and general progress of the schools, and 1,200 of the teachers in the city-schools, including 100 principals and vice-principals, united in a petition to the board of education for the restoration of corporal punishment as necessary to restore the schools to the condition of healthful discipline and efficiency which existed before the abolition of such punishment.

"The improvement made in German instruction during the year has not been satisfactory. The cause of this is the failure to comply entirely with the provisions of the by-laws in relation to this matter. The old system of employing special teachers to attend two or three hours each week and give a few scattered lessons to the first and second classes of the school has been continued and still exists, in at least sixteen of the grammar-schools, notwithstanding the fact that, when the new system was established, it was especially provided that "the services of all special teachers of German not employed under this by-law (the new system) shall be dispensed with." Had this been carried out, the German instruction in schools would have presented at this time a very different degree of progress than it now exhibits. Moreover, there are but few schools in which the prescribed system of teaching German is fully carried out in other respects. The course of instruction has not been carefully followed; promotions have been made without regard to the proficiency made in this branch; and, in some cases, too little time has been given to it to enable the teacher to accomplish the desired object. There are at present only twenty schools in which the attempt has been made to introduce this branch as a part of the regular course of study; in all the others there is either no instruction in German at all or none that is of any real value.

"The teaching of the French language is confined to the two higher grades of the grammar-school and the time devoted to it varies from one to three hours a week. In some of the female-grammar-schools the pupils are required to pursue both the German and French languages, and, of course, no satisfactory progress is made in either. The examinations have not resulted in showing that any considerable proficiency has been made in French, and I believe that it would be better to make the study of one foreign language obligatory in all the schools, regulate carefully the amount of time that should be given to it, and leave the study of others for the New York College or the Normal College exclusively. Many good reasons may be assigned for selecting the German language in preference to all others for instruction in our common schools; and, in order to make that instruction thoroughly effective and beneficial, and to avoid the requirement of excessive study from the pupils, the study of French in our schools, perhaps with very few exceptions, should be wholly abandoned."

"Much disparity exists both in the system pursued and the progress made in musical instruction in the grammar- and primary schools. The teaching of musical notation having been for some years merely optional, it had become the fixed practice in most of the schools, previous to the issuing of the Teachers' Manual by the board, to confine the musical exercises to rote-singing. The positive requirement in the Manual of a certain amount of attainment in musical reading has had the effect to stimulate the special teachers as well as the principals to efforts to accomplish what has been prescribed; and the result has been to effect a very considerable reform in this department of instruction.

"There are at present employed in the several schools 2,860 teachers, of whom 374 are males and 2,486 females. The whole number of days lost by the absence of teachers during the past year is 16,653; last year it was 18,300. There has thus been an improvement in this respect of 1,647 days.

"*The evening-schools.*—The examinations held in the evening-schools show that, of 247 classes examined, the instruction in 110 was excellent, in 109 good, in 24 fair, in 1 indifferent, and in 3 bad. At the examination of 1871–'72 in these schools, of 213 classes examined, 68 were found to be excellent, 120 good, 21 fair, and 4 indifferent. The whole number of pupils enrolled during any part of the term was 12,153 males and 5,574 females; the average attendance for the term was 4,970 males and 3,436 females, while the largest average attendance for any single week was 7,846 males and 3,947 females. This is exclusive of the evening high school and the colored-schools. The average attendance in the latter was 130; the whole number enrolled, 421; and the largest weekly average, 197.

"The schools now in session were opened in October last, and have thus far been well attended. As much more care was taken this year than last in the appointment of the teachers, it is reasonable to expect that the examinations which will be held early in the ensuing year will be attended by better results than those of the previous year."

CORPORATE SCHOOLS OF NEW YORK CITY.

The whole number of these schools, contained in orphan-asylums, houses of industry, houses of refuge, &c., and subject to the supervision of the city-board of education, is stated by the superintendent to be 46. The number of teachers employed in them is 183, of whom only 45 have been licensed by city- or State-authority, and it is suggested that, as the wages of these teachers are paid out of the common-school-fund and the law requires such payment to be made only to qualified teachers, they should all come under the general rule for the examination and licensure of teachers. The pupils on register in this class of schools were found to be 10,240, with an attendance of 8,257 at the time of the superintendent's visit. He examined in his visitation 170 classes and found that in most of them the instruction appeared to be efficient.

The schools under the care of the Children's Aid Society are mainly composed of

children whose parents are unable to send them to the public schools for want of means to clothe them; 3,952 pupils are on the rolls here.

Those under the care of the American Female Guardian Society are of the same character, but are attended exclusively by girls. The whole number of pupils on register in these schools at the time of the examination was 1,881 and the average for the previous week 1,443.

Besides the city-schools proper, the Children's Aid Society reports, in the fall of 1873, that it has had in the 21 day- and 15 evening-schools under its charge 9,584 children who were taught and partly fed and clothed; 3,701 of these were sent to good homes, mainly in the West. Total number under charge of the society during the year, 24,788. There have been 5,115 orphans in the lodging-houses and 1,366 were provided with homes.

The following are industrial schools of this society which are open to all children who cannot attend the public schools:

Cottage Place School, 204 Bleecker street; East River School, 206 East Fortieth street; Hudson River School, 350 West Twenty-seventh street; Avenue B School, 607 East Fourteenth street; German School, 272 Second street; Italian School, 44 Franklin street; Lord School, 207 Greenwich street; Park School, Sixty-eighth street, near Broadway; Fifty-second Street School, Fifty-second street near Eleventh avenue; Fifty-third Street School, 340 West Fifty-third street; Water Street School, corner Dover and Water streets; Avenue C School, corner Fourth street and Avenue C; Phelps School, 355 East Thirty-fifth street; Newsboys' School, 49 Park place; Girls' School, 120 West Sixteenth street; Fourth Ward School, 52 Market street; Fifth Ward School, 141 Hudson street; Eleventh Ward School, 709 East Eleventh street; Thirteenth Ward School, 327 Rivington street; Fourteenth Ward School, 93 Crosby street; Sixteenth Ward School, 211 West Eighteenth street.

These and other industrial schools receive aid from the city-school-fund in proportion to the number of children whom they educate.

COOPER UNION, NEW YORK.

This noble foundation has had, during the year ended May 31, 1873, in its free art-school for women, 198 pupils, of whom 100 received certificates and 13 were advanced to the Academy of Design. In the free school for women for wood-engraving were 42 pupils, of whom 27 received certificates and 34 continued to the close of the term. In the free school of telegraphy were 32 pupils, 2 of whom were dismissed, 9 obtained situations, and 21 remained at the conclusion of the term. The free night-school of science admitted during the term 1,134 pupils, gave certificates to 278, and had remaining at the close 547. The free school of art (for males) had in it a total of 1,591, certificated 289, and had a remainder of 732 when the term ended. Besides all these, 516 have availed themselves of the privilege of free consultation with the professors of industrial chemistry and mechanics, there has been a large attendance on the Saturday-night-lectures on scientific subjects, while during 1872 no less than 397,728 readers partook of the advantages of the library and reading-room. A total of 1,910 is given, of various trades and occupations, as having been the pupils in the different schools.

BUFFALO.

[From report of J. N. Larned, esq., city-superintendent.]

School-system.—The chief faults in the organization of the municipal school-system are: (1) That it exposes the schools to political influences more directly and with less protection than any other municipal system of public education that exists in the United States within the knowledge of the superintendent. (2) That it brings too small a number of persons into official contact with the schools, and so does not enlist for them, in an intelligent and responsible way, enough of a representative interest. This difficulty stands in the way of measures of educational advancement and is also believed to be largely the cause of the deficient popular acquaintance with, and popular interest in, the public schools. The superintendent says: "I know of no other important city in the country in which the government of the schools is not separated from the general organization of municipal government and committed to a board of education; and I am convinced that the exception which our city exhibits is not in its favor and that experience is against our present system. The schools are very much harmed by the frequency of change which occurs in the direction of them."

The present plan of districting the schools requires the maintenance in each district of a school fully organized and equipped for the entire graded course, from the primary to the highest grammar-class, thus making it necessary to maintain as many grammar-schools as there are primary schools, notwithstanding that only 17 per cent. of all the pupils in the schools are found in the grammar-grades, while there are 48 per cent. in the primary grades. It is recommended that there be either a consolidation and reconstruction of school-districts as they now exist or else that district-divisions be entirely abolished. The latter course is considered preferable. Fewer teachers would be needed and the work of supervision could be better performed by eight or nine male prin-

cipals than it is now performed by twenty-three. The superintendent has taken some steps in the direction of these views during the year, and the results have fully demonstrated the advantages to be derived from a reorganization of the schools.

School-accommodations.—Two new school-buildings have been opened during the year, and a further increase of school-accommodations is imperatively demanded. The reconstruction of many of the buildings now occupied is absolutely necessary. There is scarcely a school-house of six years' standing in which the work of the teachers is not seriously impaired by the inconveniences of the rooms; and the defective method of heating and entire absence of proper means of ventilation make many of them utterly unfit for use.

Compulsory education.—The school-statistics give evidence of great irregularity in the attendance at the schools, and also of an enormous, fluctuating mass of children, who attend school at brief intervals only, for a term or for a few weeks. Making allowance for those who attend parochial and private schools and for those who are employed in industrial occupations, there still remain from 15,000 to 20,000 children, whose absence from school cannot be satisfactorily accounted for. Under existing school-regulations, there is no adequate restraint placed even upon the truancy of pupils who are nominally in school. The law should interfere in this matter. Juvenile vagrancy should be totally prohibited and suppressed. Education should be compulsory and it should be made the duty of the police of the city to take into custody and commit to school all children found in the streets during school-hours whose absence cannot be satisfactorily accounted for by circumstances of exemption, which the law should strictly define.

Study of German.—A graded system for the study of German has been adopted during the year, with marked success. Monthly and term-examinations are now held in the German classes, as in other classes, and the work of teaching in this department is thus tested, as it has not been heretofore. German is an elective study in all the schools.

Music.—During the past year a systematic course of instruction has been adopted, under the supervision of two visiting teachers, assisted by the teachers in the schools. The charts prepared for the Boston public schools have been introduced in some of the schools, and the result proves their excellence. At the close of the term an examination in music was held for the first time. Great and unexpected progress was shown in most of the schools.

Drawing.—The teaching of drawing in the schools is working out the results anticipated from it as rapidly as can be expected. Every term develops more interest in it among the pupils and a heartier reconciliation to the requirement of it on the part of parents. No pupils are allowed to be excused from the drawing-exercises except such as are suffering from defective eyesight or some form of disease.

Graded course of instruction.—A revision of the course of instruction prescribed for the graded schools went into effect on the 1st of September last. The course is still far from perfect, and many experiments of revision, with much experience under each, will be required to produce even a nearly perfect graded system of teaching. Much improvement has, however, been effected in several important particulars by the changes which this last revision introduced. The greatest weakness of the schools is in the primaries, owing, chiefly, to the low standard of qualifications required of primary teachers. It is mainly on behalf of these schools that the request is made for "some established, regular system of education and preparatory training, defined and instituted by law, to control the admission of candidates into the public educational service."

Evening-schools.—Ten evening-schools were maintained for two terms, nineteen weeks in all, during the year. Two of these schools contained large classes of Germans, taking lessons in the English language and pursuing no other study. To make the evening-school-system complete, there should be established an evening high school or evening industrial school The improvement which the industries of the city would derive from such an institution cannot be overestimated.

The colored-school.—An amendment to the city-charter, adopted last April, opened all the public schools to children of color; but very few, comparatively, have taken advantage of this justly-conceded right. The colored-school is so well conducted and rendered so satisfactory and attractive to them that the majority of colored pupils prefer to remain in it. In December the colored-school registered 49 pupils, against 30 colored pupils in all the other schools of the city.

The central school.—The central school, which crowns the public-school-organization of the city, has maintained throughout the year its high reputation as an academic institution. Two courses of study are sustained, the English and scientific and the classic. The questions used in the examination of applicants for admission are supplied by the regents of the university. Of the 171 who passed last year 35 attained fully to the standard exacted by the regents, which is called passing "full regents." The previous year only 13 "full regents" were passed. The increased number shows improved work performed in the graded schools. The average daily attendance in this school is 95 per cent.

SYRACUSE.

[From report of Edward Smith, esq., city-superintendent.]

Attendance.—About 70 per cent. of the school-population between the ages of 6 and 16 are in attendance at the public schools. Those attending private schools on the same basis number about 10 per cent., leaving only 20 per cent. of youth between the ages of 6 and 16 not in attendance on any school.

During the past year a gain has been made of 26 per cent. in diminishing the absences and 33 per cent. in diminishing the tardinesses. But notwithstanding this improvement, there were lost by absence 40,877 whole days and 28,653 half days. Taking into consideration the fact that the total enrollment is only 8,014 and the average number belonging 5,931, these numbers are very large. More stringent rules are needed to more effectually check the habit of absence and tardiness. "If any part of a pupil's education is more important than another, it is the education to prompt and punctual attention to his duties and engagements, and this should be a part of education in the public schools."

Drawing.—Drawing has been taught in the public schools for a long term of years, but, owing to a lack of system and a want of proper education on the part of teachers, it was not, for a long time, attended with any very satisfactory results. During the past year a change has been made in the method of teaching; the teachers have received regular instruction; and the examination at the close of the term—the first examination ever held in drawing in the city—was very creditable to pupils and teachers.

Music.—The introduction of music as a regular branch of study was accomplished about a year ago, and it may now be considered as permanently established. The progress during this period has been far greater than could have been expected. Experience proves that, "as music is perfected and used in the daily routine of school-duties, just in that proportion are the deportment and general appearance of the schools improved; and, where it is relied upon as an instrumentality for these results, it has never failed."

The evening-school.—The evening-school was continued for fifteen weeks. The registered number was 220, with an average attendance of 70. The application, recitations, and discipline were all better than last year. The irregularity of attendance greatly interferes with the successful working of the school; nevertheless it is doing a vast amount of good for a large class of pupils.

ROCHESTER.

[From report of S. A. Ellis, esq., city-superintendent.]

School-houses.—The character of the school-buildings has not kept pace with the general improvement of the city. A rigid economy has always been observed in the construction of these buildings, and to such an extent as to preclude the possibility of securing good ventilation, light, and air, the best means of heating school-rooms, and a respectable style of architecture. Several of the school-buildings are in a very dilapidated and unhealthy condition and demand immediate attention. The success of the schools is greatly hindered by the want of sufficient and suitable accommodations; but the funds at the disposal of the board are too small to keep up with the increasing demand for more room. In one district over 100 scholars are occupying an unfurnished store.

Condition of schools.—The schools were never in better condition than now. In almost every respect the past year has been the best in their history. Strenuous efforts have been made to reduce the amount of absence and tardiness and the statistics of attendance are more satisfactory than for any previous year.

Corporal punishment.—Corporal punishment is permitted, but there is a growing public opinion against it and among teachers an increasing unwillingness to resort to it. It is thought best that it should die a natural death. It is not believed possible, as yet, without substituting a worse expedient in its place, to do away with it entirely and secure the necessary obedience and order. Suspension has proved ineffectual.

German.—The study of German has been introduced into three schools during the year. No little misgiving was felt as to the success of this experiment, but the results of the examination, at the close of the year, were in the highest degree gratifying and satisfactory. The continuance of the German classes is recommended.

Evening-schools.—For several years the board of education has refused to organize evening-schools on account of the disorder which prevailed in them in former years and by reason of which they were abolished. Last winter two schools were organized and remained in successful operation three months. The pupils were orderly and quiet, earnest and studious, and the progress made was very satisfactory. There were nearly six hundred in attendance upon the two schools. This experiment may be regarded as a success in all respects.

AUBURN.

[From report of B. B. Snow, esq., city-superintendent.]

Attendance.—The average attendance for the year is 1,705, some two hundred more than last year, and the most marked improvement which the statistics show is in regularity and punctuality in attendance. The number of days' absence for the year is 40,770, against 46,194 for the year previous. The number of cases of tardiness for the year is 8,072; the year previous, 13,016. The time lost by tardiness—nearly four hundred school-days last year—has been lessened about one-half. The importance of punctuality, as a feature of school-discipline, cannot be overestimated. "There may be a necessity for an occasional absence, but for tardiness there can be no excuse. It is the unpardonable sin."

There are in the schools confirmed truants, whom no discipline on the part of teachers or parents succeeds in reforming. A truant-school would be the means of saving many of these from the penitentiary and the prison. It has become a question whether it is not the moral duty of the board to establish such a school.

The evening-school.—The school opened with an attendance of 63, which was increased to 89, the highest number, the following week, from which date the number gradually decreased to 27. The total number registered was 146; number of sessions, 27. In consideration of the small attendance and the slight interest manifested, the committee recommends the discontinuance of the school. The superintendent admits that there has been great cause for discouragement, but, nevertheless, believes that more good has resulted from the school than may at first appear. The improvement of those who continued throughout the session was very marked.

REPORT OF REGENTS OF THE UNIVERSITY OF THE STATE OF NEW YORK.

The institutions subject to the visitation of the regents, and which are required to make annual reports in relation to their property and system of instruction and discipline, are (1) literary colleges, (2) medical colleges, and (3) academies.

That portion which relates to academies may be found under the head of secondary instruction in the present abstract, that which relates to literary colleges under the head of superior instruction, and that which relates to medical colleges under the head of professional instruction.

SECONDARY INSTRUCTION.

The institutions for secondary instruction, from which information has been received by the Bureau of Education, are 250 high schools, academies, seminaries, and institutes, of which 31 are exclusively for boys, 39 for girls, and 180 for both boys and girls, a majority of the latter being public free high schools and academies.

The 31 schools for boys, with 195 instructors—172 gentlemen and 23 ladies—report an attendance of 3,010 pupils, of whom 680 were in classic studies, 385 were preparing for college, including one for Annapolis. Drawing is studied in 23 and music in 21 of these schools. Eighteen have libraries, the smallest of which numbers 100 volumes, the largest 3,000.

The 39 girls' schools report 253 instructors—8 gentlemen and 165 ladies—and 3,748 pupils, of whom 249 are engaged in classic studies and 1,384 in the modern languages. Twenty-one only are specifically reported as preparing for college. In all but 6 of these schools drawing is taught and in all but 7 music; 23 have libraries, ranging in extent from 100 volumes to 6,000.

The schools for the joint education of both sexes, numbering 180, with 1,133 instructors—380 gentlemen and 753 ladies—have an aggregate attendance of 39,632 pupils—19,356 boys and 20,276 girls—of whom 3,867 are engaged in classic studies and 4,795 in the modern languages; 1,125 are preparing for college and 349 for the scientific course. Drawing is taught in 129 and music in 139 of these schools. A large proportion of them possess libraries, the number of volumes ranging from two to 5,000.

The grand total attendance of pupils in these three classes of institutions for secondary instruction is 46,360—22,366 boys and 24,024 girls—4,796 studying the classic and 6,797 the modern languages, of whom 1,531 are preparing for college and 349 for the scientific course.

PREPARATORY SCHOOLS.

Engaged especially in the work of preparing for the university, the college, or scientific school are 14 academies, seminaries, and institutes, reporting an aggregate of 1,338 pupils in classic and 814 in scientific studies; 930 are in advanced classes, 147 are in the senior, 257 in the junior, 395 in the middle, and 235 in the fourth class. In six of these schools are libraries, ranging in size from 6 volumes to 3,000. Six have chemic laboratories, 3 have cabinets of natural history, 9 have philosophic cabinets and apparatus, and 5 have gymnasia.

REGENTS' REPORT.

Respecting the class of institutions making the above returns, the regents say:

"The whole number of academies and academic departments of union-schools subject to the visitation of the regents and in operation at the date of the report is 218. These report a total of 31,421 scholars during the year, of whom 6,123 (males, 2,729; females, 3,394) are claimed to have pursued classic or higher English studies, or both, for four months or more of said year. The number of pupils instructed, free of charge, in the theory and practice of teaching is 1,594. During the year 2,455 pupils have passed the preliminary academic examination; the whole number who have passed during the last six years is 20,940. There are employed in all the academies 1,183 teachers, of whom 462 are male and 721 female. The academy, lots, and buildings are valued at $3,912,081, the libraries at $162,564, the apparatus at $130,490, other property at $686,897; total value of academic property, $4,892,032. The total annual revenue is $1,048,639; total expenditure, $1,059,394; amount of debts of academies, $389,838. Amount of apportionment from the literature-fund in January, 1873, $40,000; rate of apportionment, $6.91. Amount raised by academies during the year for the purchase of books and apparatus, $3,000; amount apportioned by the regents for the same purpose, $3,000. Number of volumes in academy-libraries, 147,490.

"The reduction from year to year in the number of scholars claimed as classic is mainly due to the operation of preliminary academic examinations instituted by the regents. Of the whole number (6,123) claimed as classic scholars during the last year, 340 were rejected by the regents.

"The whole attendance on the academies, as shown by the reports, has varied but little from that of the preceding year. The number of academic scholars on whom the distribution of the literature-fund is made shows a continued diminution, being 876 less than the number of 1870. This reduced number is believed to be principally due to the more critical examination of the answers to the questions now made in the office of the regents. While it cannot be regarded as creditable to the elementary schools, it is believed that the examinations are exerting an influence in stimulating instruction in preliminary studies, which will soon appear in the increased number of scholars who pass them. This is being realized in the academies and union-schools in cities and large villages, whose scholars are comparatively permanent and many of whom pursue a systematic course of study. In the academies proper scholars are less permanent and frequently leave before they have an opportunity of perfecting themselves in the preliminary studies. Many pursue higher studies before elementary ones are completed and do not consent to subject themselves to the examination. A remedy for this condition of things lies in improving the instruction in the common schools. When those in the rural districts carry their scholars through the subjects of study which are appropriated to them and in which those under the age of 12 years should be perfected, the academies will be able to limit their work to instruction in the higher studies.

"Instruction in the theory and practice of common-school-teaching is given, free of charge, in ninety academies appointed for the purpose by the regents. The number of scholars in any academy for whom such instruction is provided is limited by statute to 20 each year and the sum allowed by the State for such instruction is fixed at $10 for each full-term-scholar, no allowance being made for those who attend during a period less than thirteen weeks.

"The regents renew the expression of their high estimate of the academies in the system of education of the State and earnestly recommend more liberal appropriations for their support. The sum distributed to academies has remained as it was fixed in 1838. Since that time the number of academies has doubled and the scholars in them have increased threefold. The fixed capital invested in lots, buildings, libraries, and apparatus has increased from $830,187 to $3,674,275. A large portion of this has been raised by voluntary private contributions. This State has always encouraged such contributions. A continuance of this liberal and enlightened policy demands a large increase of the fund annually distributed among the academies."

FREE ACADEMY, ROCHESTER.

A high standard of scholarship has been uniformly maintained in this institution. It has been, and is to-day, a place for hard intellectual work. For three or four years past an effort has been made to elevate the standard for the entrance-examination and last year the per cent. required was nearly equal to that fixed by the regents of the university. Out of 176 candidates, 79 passed as "full regents." It is believed that a higher standard of admission will tend to increase the number of graduates. Many, finding themselves unequal to the work, drop out in the second or third year. With more thorough preparation the work would be easier and pupils would remain to complete the course. Three university-scholarships have been given to the academy, but comparatively little interest in the matter has been manifested by the pupils. For several years only two of the three have been taken. A new building is being erected for the academy, to cost $75,000.

HIGH SCHOOL, AUBURN.

The standard for admission is equivalent to that required by the regents of the university for academic scholars. The classic course covers the whole range of studies necessary to a preparatory course for college. A preparatory department was established last year. The large increase of pupils makes an addition to the high-school-building necessary.

SPECIAL APPROPRIATION FOR ACADEMIES.

The annual appropriation-act for 1872 authorizes the raising, "for the benefit of the academies and academical departments of union-schools, the sum of $125,000, or so much thereof as may be derived from a tax of one-sixteenth of one mill upon each dollar of the taxable property of the State." Conceding the full value and importance that may be justly claimed for academic instruction, it is respectfully submitted that the taxation authorized by the above passage is liable to serious objections.

These institutions have been aided by the State, by dividing among them the income of the literature-fund since 1813 and part of the income of the United States deposit-fund since 1838, which sums have, for several years past, amounted to $61,000; and the allowance, rated *per capita*, has increased from $2.68, in 1862, to $10.08 in 1872, for each academic scholar at the 190 academies which participated in the apportionment last year; while the public-school-moneys annually distributed by the State for all purposes amount to but $2.84 *per capita* for all who attend the public schools and but $1.94 for each child of school-age. The balance needed for the full support of the schools is raised by local taxation.

Of the 190 academies participating in the distribution, 81 are, by original organization or subsequent adoption, public schools, supported mainly by local taxation. The 109 others are private academies, outside of the public-school-system, and charge tuition.

It has never heretofore been the policy of the State to maintain or in any degree to assist these academies by a general tax. Now it is proposed to levy, in addition to the general and local taxes now raised for public schools, a third tax, amounting to $125,000, for academic instruction, thereby swelling the amount for each academic pupil to $30.74, as against $2.84 for each common-school-pupil; and the proposed increase is exacted from tax-payers all over the State, who, except in the few districts where the academies are located, cannot use them without sending their children from home, nor then without paying tuition after having paid three distinct school-taxes. It is contended that there is neither reason nor justice in providing for academic instruction more liberally than for common-school-education, nor in making such a discrimination in favor of higher education against those who cannot avail themselves of its advantages.

There are, moreover, special objections to giving any moneys raised by tax to those academies which are not public, but which belong to stockholders or companies or religious denominations, who manage them for profit and will receive for themselves this appropriation, if made, as they do the tuition which they charge. It is well known that a number of these institutions are of strict sectarian character, and for that reason alone are not entitled to support by general taxation.

A general tax for academic instruction, if proper in any case, which is questionable, should be applied only to such instruction in public academies. The circumstance that teachers' classes are maintained in some of the academies is no argument in favor of the appropriation in question, for it is not made in consideration of such classes, but is to be divided according to the number of academic pupils. The appropriation of $18,000, which they now receive for teachers' classes, is not all used.

Now that the State has developed a public-school-system ample for the educational wants of the people, that embraces eight normal schools to train teachers for the common schools and that authorizes the establishment of academies in districts where they are needed and the people are willing to support them, there can be no justification for additional taxation for the purpose of giving to private schools more than they now receive and vastly more in proportion than the common schools receive.

THE NEW NORMAL COLLEGE, NEW YORK CITY.

The difficulties under which the normal college of the city has been struggling from want of proper and sufficient accommodations for its work were removed on Wednesday, October 29, by the dedication to its uses of an elegant new building. This structure, fitted with every convenience, occupies the whole block situated between Lexington avenue and Fourth avenue and Sixty-eighth and Sixty-ninth streets, is 400 feet in length by 200 in depth, and will accommodate from 1,500 to 1,600 pupils. A means of supply for the 160 to 180 vacancies occurring annually in the corps of city-teachers, as well as a means of furnishing teachers for new schools, is thus provided, and New York takes her place by the side of Boston, the two having now the noblest normal-school-buildings on the continent, one costing $300,000, the other $350,000. The dedi-

cation-services were held in the handsome new chapel of the college. Addresses were delivered by the president of the board of education, the mayor of the city, the superintendent of city-schools, the lady president of the alumnæ, the president of the college, and Hon. William E. Curtis all agreeing that this admirable structure heralded higher education for women, and thus better teachers, better schools, and a better world.

STATE NORMAL SCHOOL AT ALBANY.

This is the oldest of the State normal schools. Although seven others have lately been established, there has been a steady increase from year to year in the number of its students and of its graduates.

During the year ended September 30, 1872, the aggregate attendance was 515 and the average daily attendance 275; average age of pupils, 19 years. Within the two terms ended July 2, 1872, 222 normal students were admitted. The average time they had previously spent in teaching was a little more than one and a half terms. The number of graduates during the year was 82, and, with scarcely an exception, they have entered on the work of teaching. The whole number of graduates since the school was opened in 1844 is 1,918, of whom 722 are gentlemen and 1,196 ladies.

The model and primary departments, maintained for the practice of normal students, are supported by the tuition of pupils attending them. The number of pupils is limited, but because of the acknowledged excellence of these schools patrons are willing to pay liberally for tuition. The income from these departments during the year was $5,014.25; cost of their maintenance, $4,000; leaving a balance of $1,014.25 applicable to the general purposes of the school.

STATE NORMAL SCHOOL AT OSWEGO.

During the nine years this school has been in operation 483 students have graduated, and many more, who had not fully completed the regular courses of study, are engaged in teaching. The number of graduates last year was 66. Of these 36 completed the elementary English course, 22 the advanced English course, and 8 the classic course. The whole attendance of normal students was 429; average daily attendance, 212; average age of pupils, 21 years.

The school is furnished with a library and apparatus valued at $9,000, and considerable additions have been made to the collections in natural history by means of a system of exchanges recently adopted. A primary and a junior-department of the public schools are maintained in the normal-school-building for the convenient practice of normal students.

The recommendations contained in last year's report, in regard to a Kindergarten-department and enlarged accommodations for the school are repeated.

STATE NORMAL SCHOOL AT BROCKPORT.

The whole attendance of normal students for the year was 329; average attendance, 214; average age of pupils, a little over 19 years. The number of graduates was 18, making 65 since the establishment of the school. Besides these nearly 700 of the undergraduates have engaged as teachers in the schools of the State.

Additions have been made to the library and apparatus, at a cost of $882.48, making the total value nearly $11,000. The improvements made to the buildings and grounds during the last two years are valued at over $10,000.

In the academic department the income from tuition was $3,237.59 and the amount paid for instruction $1,045, leaving a balance of over $2,000 for the general expenses of the school.

The training-department consists of a primary, an intermediate, and an academic department, which represent all the various grades of instruction required in district, union, and high schools.

STATE NORMAL SCHOOL AT FREDONIA.

The number of normal students in this school has annually increased. The number enrolled last year was 305; average attendance, 176; average age of pupils, a little less than 19 years. During the year 10 completed the prescribed courses of study and received their diplomas, making 86 graduates since the opening of the school. The receipts for tuition in the academic and practicing-departments were $857.50.

More practicing-rooms are needed; also cases for the library- and apparatus-rooms. An appropriation for these purposes is requested.

STATE NORMAL SCHOOL AT CORTLAND.

The number of normal students connected with the school the last year was 370; number of graduates, 34; average age of students, 19.

The educational work accomplished by the school during the three and a half years of its existence sums up as follows: a total enrollment of 605 normal students, of whom 74 have graduated, many of them now occupying prominent places in teaching; two

more classes near their graduation, and over 300 undergraduates who have done a vast amount of teaching in the common schools of the State.

The reference-library is large and many valuable contributions have been made to the department of natural history.

STATE NORMAL SCHOOL AT POTSDAM.

Three hundred and sixty-three normal students were registered during the last year. The average of their ages was over 19 years. The number of graduates was 15. The receipts for tuition in the academic department amounted to $2,139.60.

A temporary training-class, for the special benefit of persons intending to teach the present season, was organized at the commencement of the fall-term and maintained for a period of 10 weeks, with an attendance of 55 teachers. The plan was also adopted in five other of the State normal schools, and the results have already justified the experiment and give encouragement that it may be made a means of much practical benefit.

STATE NORMAL SCHOOL AT BUFFALO.

The second annual report of this school gives the number of normal pupils for the year as 185; average attendance, 149; average age of pupils, over 18.

A special class, to continue during five or six weeks, will be held at the commencement of the spring-term, for the benefit of those who design to teach in the summer-schools. The board has authorized the forming of a preparatory class, which should embrace promising pupils who would be 16 (the age of admission) before the beginning of the next school-year, and those students from abroad who have properly-indorsed recommendations, but who might fall somewhat below the required standard at the preliminary examination. The board hopes, and has planned, to make this one of the State normal schools a normal college, with a course of study extending three or four years beyond the normal course and a grade of scholarship at least equal to that for which academic degrees are usually granted. Circumstances have not favored this plan, as was expected, but it is still considered feasible, and the hope of accomplishing it is by no means abandoned.

STATE NORMAL SCHOOL AT GENESEO.

This school has been in operation but little more than a year, but is reported in a very prosperous condition. The attendance of normal students, which was 71 at the opening, amounted to 191 during the year ended September 30, 1872, with an average attendance of 97. The average age of pupils was 19. Ten were sufficiently advanced to graduate the first year, and all of them, besides others who attended for a special term, are now engaged in teaching in schools of the State. The library of text-books and the chemic and philosophic apparatus are adequate to the wants of the school. During the year additions were made at a cost of $598.96, and the total value is now about $6,000.

TEACHERS' INSTITUTES.

Fifty-four county-institutes were held during the year in as many different counties of the State, besides one for Indian-school-teachers on the Allegany and Cattaraugus reservation. The aggregate attendance of teachers was 8,683, of whom 2,840 were males and 5,838 females. The average attendance for each county was 161. The attendance, though less than in 1871, was 71.4 per cent. of the whole number of teachers employed for the full legal term in the counties in which institutes were held.

The average length of time that those in attendance had taught was 5.3 terms, or a little more than 2½ years. Assuming this to be a fair measure of the experience of the entire number of teachers in the public schools of the rural districts of the State, more than 5,000 of the 13,256 employed for the full legal term and more than 9,000 of the 23,459 employed during some portion of the year were teachers of no previous experience. Though there has been an increase in salaries, a demand for better qualifications, and a tendency to greater regularity of service, yet these frequent changes continue to occur, causing large accessions of those who have had no special training for their work.

Institutes held for the short term of two weeks are not expected to supply such thorough instruction and discipline as it is the design of the normal schools to impart, but they render important service in giving general information relating to improved methods of management and teaching, and convey to the great mass of teachers needed advice and encouragement.

The aggregate cost of maintaining these institutes was $15,724.48, or $1.81 for each teacher in attendance.

TEACHERS' CLASSES IN ACADEMIES.

The number of academies in which teachers' classes were maintained during the year 1871–'72 was 90; number of pupils, 1,589, of whom 590 were males and 999 females.

Academies for the instruction of these classes are annually designated by the board of regents, in accordance with the statute, which also provides that the sum of $10 shall be paid for each pupil, not exceeding 20 to each academy, instructed "under a course prescribed by the regents of the university, during at least one-third of the academic year, in the science of common-school-teaching." One hundred and seventeen academies for this purpose appear in the list for 1872–'73.

STATE-CERTIFICATES.

Under existing provisions of law the superintendent is authorized, upon the recommendation of school-commissioners or other satisfactory evidence, to issue State-certificates, which license the holders thereof to teach in any common school in the State. It is desirable that authority to grant licenses of this character should exist under proper restrictions, but the superintendent expresses the opinion that the law should be so amended as to render the exercise of the power safer and more just to the profession at large.

There are many successful teachers who are entitled to a permanent footing in their profession, as an inducement to continue therein and as a recognition of their abilities. The present plan of granting State-certificates only upon recommendation, besides being liable to abuse, operates unfairly, even when conscientiously administered. The way to promotion should be open to all teachers alike; the standard of qualification should be accessible to all and the advantage and distinction of receiving a State-certificate should depend upon success in teaching.

The legislature will be asked to change the law on this subject, so that State-certificates may be granted only upon the examination of applicants.

THE STATE NORMAL SCHOOLS.

The State has eight normal and training-schools in full and successful operation. The first one was established, as an experiment, in 1844. For nineteen years it was the only institution of the kind in the State, and was surrounded by a multitude of academies professing to do similar work in training teachers for the common schools. A trial of the two plans through that period and a comparison of results led to the conclusion that normal and training-schools, organized and conducted with special reference to the object in view, were the proper institutions to educate teachers for the public schools. Accordingly, provision was made for a second normal school at Oswego, in 1863, and in 1866 a law was passed authorizing certain officers of the State to act as a commission to locate six others.

"When the new normal schools were opened to the public, a feeling of hostility was manifested on the part of many persons interested in the private academies, which developed itself in the legislature of 1872 by an unsuccessful attempt to defeat the usual appropriations. There was no real provocation for this assault except the success of the normal schools, whose excellence and popularity were such as to diminish the attendance at the academies. This controversy results from the bad policy of the State, that not only tolerates, but partially supports, two conflicting systems of education. One of them is the free-school-system; the other consists of private academies and seminaries, owned and managed by individuals, corporations, or religious denominations. These, while kept outside of the free-school-system, ask pecuniary aid from the State, to enable them to compete with the public schools. If all schools which the State to any extent supports were associated in one homogeneous system and the appropriations of the State were confined to that system, as heretofore recommended by this department and as repeatedly urged by the State Teachers' Association, there would be no ground for conflict.

"Instead of considering pretexts for abandoning the normal schools, their condition should be studied for the purpose of improving them. It may be that the course of instruction ordinarily pursued could be made simpler and shorter without diminishing their usefulness and the expense to the students and to the State be thereby reduced. As an experiment of this kind, special training-classes have been established in several of the schools during the last year, for the accommodation of those who cannot attend or who do not need the full regular course. Perhaps other changes in their organization or management might be made to advantage."

The ordinary annual expense of maintaining all the normal schools is about $150,000, payable out of the free-school-fund. Much less than one-third of this aggregate amount is raised by a general tax and more than two-thirds of it by local taxation, voted voluntarily by the inhabitants in the several school-districts. "Whether it is advisable to expend the sum mentioned to educate competent teachers or to expend the whole great amount to pay poor teachers is not debatable with those who believe that the improvement of the common schools is the first duty to the tax-payers who support them and who use no others." The eight State normal schools are commended to liberal and unfaltering support.

SUPERIOR INSTRUCTION.

Of institutions subject to the visitation of the regents of the university, and required to make to them each year a report of their condition and system of instruction, the regents say:

"The number of literary colleges reporting, as stated in the eighty-fifth annual report, is 22. Of these, Genesee College is not in operation; and from the Rensselaer Polytechnic Institute and two departments of the University of the City of New York, the school of civil engineering and architecture and the school of analytic and practical chemistry, no reports have been received.

"The reports from the remaining institutions—19 colleges and universities entire and three departments of the University of the City of New York—sum up as follows: number of *emeritus* and honorary professors, 4; presidents and professors, 246; tutors or teachers, 102; students, (not including medical,) 3,013; value of college-buildings and grounds, $3,942,309.28; value of other college-property, $9,297,908.62; yearly revenue, $989,177.01; yearly expenditure, $936,136.96; amount of debts, $435,103.02.

"The reports of the colleges indicate their continued prosperity and show an increase in the number of students, as compared with any former year. During the last five years the whole number of students in the literary and medical colleges has increased from 3,276 to 4,375.

"It is remarked that the apprehensions entertained some years since by friends of the then existing colleges, in view of the proposed establishment and liberal endowment of Cornell University, have not thus far been realized. Although the latter institution has, within less than a decade, attained a growth and achieved a degree of success unprecedented in the history of literary institutions, it has seemed to derive its patronage mainly from new sources, without encroaching upon the fields occupied by other colleges. Young men engaged in the mechanic and other manual arts and many who aspire to professional pursuits, but who are unable or unwilling to enter upon the ordinary college-course, have been stimulated to enter upon regular or optional courses in the Cornell University, and the result has been, not the diversion of students from other institutions, but a very large increase in the aggregate number of college-students within the State.

"Some of the friends of classic learning were also fearful that the influence of a thriving university, whose aim was so eminently practical, would be seriously adverse to true liberal culture. The regents take great pleasure, in this connection, in recording the well-attested fact that the experience of Cornell University has demonstrated the utility of classic studies as a preparation and as the best preparation, for the pursuit of the natural sciences."

SPECIALTIES RESPECTING COLLEGES.

The Brooklyn Collegiate Instititute, mentioned secondly in the following table, is rather a preparatory institution than a full college, its classic studies embracing only the studies required for admission to the freshman-class in our most advanced colleges, though in mathematics, natural sciences, modern languages, &c., its course is quite extended.

The College of the City of New York is a development from the old New York City Academy and crowns the school-system of the commercial metropolis, affording, to those who wish to go beyond the schools, an opportunity for free collegiate education. Thirteen professors and numerous tutors attend here upon the 592 students of the introductory department and the 333 of the collegiate.

Columbia College, still in the upper portion of New York, has opened its lecture-rooms to ladies, and, having tasted in these the advantages of college-culture, the ladies have lately been petitioning for admission to all the privileges of the institution. They find a vantage-ground in the fact that the college-charter, on examination, shows it to be not exclusively for males.

Cornell has a course in literature as well as in arts, for completing which the degree of bachelor of literature awaits the candidate. It has also made arrangements for giving special instruction in journalism to those who wish to make this a profession. Instruction in this will embrace the art of printing, journalism proper, phonography, and telegraphy. The Sage College for Women, designed to accommodate about 100 pupils, is in progress, and will be completed in the spring of 1874. Gifts amounting to $155,000 in cash have been received during the year.

Hamilton has received in the year ended November 1, 1873, about $88,000 in legacies and gifts: a part for general purposes, another part for renovating a college-building, and a third for the department of natural history.

Hobart has had $800.72 in the same time, towards library, endowment, and repairs.

Ingham reports a "splendid" art-gallery, with music, drawing, painting, French, and German in its course.

Manhattan, New York City, has received from the Rev. John Breen an addition of 3,000 volumes to its library.

St. Bonaventure, Allegany, has had in progress a new building, to be completed in the winter of 1873–'74 and to accommodate 150 students.

The St. Lawrence University, Canton, presents two female names in its list of instructors, one professor of French, the other tutor in German. It has had from Mr. John Craig, of Rochester, a gift of $25,000 towards its endowment.

St. Stephen's, Armandale, has had about $10,000 bestowed on it in gifts and legacies during the year past, besides about $13,000 for the support of students.

The University of Rochester reports $137,772.98 received from Hiram Sibley, William Kelly, R. A. Wright, James B. Hoyt, Charles Pratt, John B. Trevor, and James B. Colegate, for a library-building and endowment-funds.

Union reports $10,000 from James Brown, esq., New York, and the same amount from Hon. R. M. Blatchford, LL.D., for increase of its library. Subsequently to this report $100,000 more is said to have been received from an anonymous donor for the uses of the university, together with $60,000 from its alumni, making $180,000 in all. It has also incorporated with it, under a new university-charter from the legislature, the Albany medical and law-schools and the Dudley Observatory, at Albany.

Syracuse University, inaugurated September 18, 1873; its college of the fine arts designed to include ultimately instruction in the formative arts of architecture, sculpture, painting, &c., and in the sounding arts of music, poetry, and oratory. For the present, courses of instruction in architecture and painting only have been instituted.

* $150,000 per annum is appropriated by the county. † Partially.

COLLEGES FOR WOMEN.

Thirteen institutions for the higher education of young ladies report an aggregate attendance of 2,132 pupils, of whom 445 are reported in preparatory departments, the remainder in collegiate and academic studies. In the four reporting a collegiate classification there were in the freshman-year 38; sophomore, 32; junior, 32; and senior, 19; 24 were pursuing partial courses and 4 post-graduate-studies. There were 190 professors and instructors, 43 gentlemen and 147 ladies. Music, drawing, painting, and French form a part of the course in all these institutions, and in all but two German

is also taught; in one Spanish is added to these, in another Italian, and in the Packer Collegiate Institute, at Brooklyn, all four languages are pursued. Seven of these colleges have chemic laboratories, 8 philosophic cabinets, 3 natural-history-museums and art-galleries, and 2 astronomic observatories and gymnasia. Nine have libraries, ranging in extent from 100 to 10,000 volumes.

The Rutgers Female College, New York, was not included in the above, its returns having come late to hand. It reports 3 teachers and 29 pupils in its preparatory department, (20 of the last preparing for the academic course,) and in the academic or college-department 12 professors and instructors, 27 undergraduate students, and 2,100 volumes in its library. Receipts in the last year from all sources, $20,000.

The college at Elmira, Ingham University, and Wells College are, as well as Rutgers and Vassar, colleges for women, with extensive courses. The Normal College of the City of New York, elsewhere referred to, must, with its new building and enlarged advantages, take high rank among these institutions.

UNITED STATES MILITARY ACADEMY AT WEST POINT.

The number of scientific and professional schools in this large State forbids specific mention of the greater part, except such as appear in the following table. But one school located in the State, though not belonging to it, merits such mention from its national character, its important object, and its thorough scientific course. This is the United States Military Academy at West Point. Each congressional district and Territory in the United States (the latter including the District of Columbia) is entitled to have one cadet at this Academy, while ten are usually appointed at large by the President. The age for admission is between 17 and 22, and the candidates must be in good health and well versed in arithmetic, reading and writing, and orthography, and have a knowledge of at least the elements of English grammar, descriptive geography, and the history of the United States. The cadets, once admitted, live in camp during the months of July and August, engaged only in military duties and exercises and receiving practical military instruction. The academic duties begin on the 1st of September and continue till about the last of June, embracing school- and field-instruction in all the subjects belonging to military science and art, including several modern languages, the course extending through four years. Examinations of the several classes are held in January and June, and at the former such students as are found proficient in studies and correct in conduct are given the standing in their classes to which their merit-marks entitle them. After each examination students found deficient in conduct or studies are discharged, unless special reasons plead for the retention of them. Admitted in 1873, 118; resigned in the same year, 5; discharged, 34.

AGRICULTURAL AND MECHANICAL DEPARTMENT OF CORNELL UNIVERSITY.

The agricultural and mechanical department of Cornell University deserves mention as being substantially the agricultural college of the State. There are in it 512 free scholarships, of which 100 have been filled by the school-authorities of the State and 40 have been given by university-authorities to students of special merit. The manual-labor-system has been adopted; but is limited to those students that apply for work, the hours for which range from 2 to 5. Among the improvements for the year 1872–'73 are large additions (of British cereals, foreign and domestic farm-implements, vegetable products of the United States, and engravings of improved stock) to the museum, a new barn for the experimental farm, and a new shop for wood-working in the mechanic-arts-department, both from Mr. E. Cornell, and additional machinery in the machine-shop, from Hon. H. Sibley. Mr. Sibley has, during the year, increased by $50,000 his previous gift of $40,000 to the college of mechanic arts, making the whole sum $90,000.

An additional instructor in free-hand drawing has been appointed during the year, and Prof. Roberts, of the Agricultural College of Iowa, has been called to the professorship of agriculture, in place of Prof. McCaudlin.

Statistical summary of schools for professional instruction.

BUSINESS-COLLEGES.

New York has 16 of these institutions—at Albany, Brooklyn, Buffalo, New York City, Rochester, Syracuse, Troy, and Utica. Of these, 14 report 64 teachers and 2,797 pupils. Two furnish no report for 1873.

NEW YORK INSTITUTION FOR THE INSTRUCTION OF THE DEAF AND DUMB.

This institution, established by act of the legislature in 1817, has enjoyed a corporate existence of nearly fifty-six years and is the oldest institution of a benevolent character in the State and the largest school for the deaf and dumb in the world. The number of pupils remaining in the institution on the 30th of September, 1872, was 509, of whom 294 were males and 215 females. Of these 329 were beneficiaries of the State of New York; 131 of the counties of this State; 33 of the State of New Jersey; 14 were supported by parents or guardians, 1 by a scholarship known as the Frizzell fund, and for 1 no provision has as yet been made. The number of teachers is 29, of whom 11 are ladies and 18 gentlemen. Of the lady teachers 7 can hear and speak, 3 can speak but cannot hear, and 1 is a congenital deaf mute. Of the gentlemen, 6 can hear and speak, 6 can speak but cannot hear, and 6 are deaf and dumb from birth.

The year that has just closed has been one of continued prosperity. The health of the inmates has been good, only two deaths having occurred, one by an accident and the other as the result of a constitutional disease. The expenditures have not exceeded the receipts and the various objects sought by the institution have been thoroughly accomplished.

The education of the pupils has the threefold purpose of developing their physical, intellectual, and moral nature. Improvements have been made in the processes of teaching, the effect of which has been to bring the pupil to a practical use of language at an earlier period of his course. Surprising progress was made by a class that had been but two months under instruction. The improvement in method consists in leading the pupil to attach words directly to objects and actions without the intervention of signs, so that he shall be made to think in words from the first. It is the purpose of the principal to carry this idea as far as possible, and he is not without hope that he may be able to devise a course of instruction whereby the sign-language may be entirely excluded from the school-room. The attention of the principal having been repeatedly called to the system of "visible speech" introduced by Prof. Bell, he has devoted much time to an examination of the method, but is not so convinced of its superiority as to recommend its adoption.

In addition to a knowledge of language, which is the direct and paramount object of instruction, all the pupils pursue a course of instruction in geography, history, (sacred and profane,) and arithmetic. In the high class are studied algebra and geometry, natural philosophy, astronomy and chemistry, mental and moral philosophy, grammar, rhetoric, and logic. Latin, as a foundation of etymology, a means of comparing grammatic forms and a device for improving style by the processes of translation, is also taught to a selected few.

Great attention is paid to forming a good moral character in the pupils and establishing in their minds principles of rectitude. The general laws affecting crime are explained and an elementary idea is given them of the rights of property. They are also taught those fundamental points of religion in which all denominations of Christians agree, but do not receive a bias towards any particular form of worship or belief.

The pupils also receive a mechanic education, whereby they may support themselves when they leave the institution. The arts of design have also been lately introduced for both boys and girls, under the tuition of a graduate of the institution, who spends three hours a day with successive classes and two hours with a special class of both boys and girls, selected from the most gifted.

The principal earnestly recommends to the legislature to remove from the institution all restrictions of a pecuniary character and exercise towards this unfortunate class the same generosity that is shown by some of the Western and most of the Southern States.

The institution has, during the past year, sustained a great loss in the death of Dr. Harvey P. Peet, who was connected with it for a period of more than forty-two years, and who, during the greater portion of that time, was its principal.

INSTITUTION FOR THE IMPROVED INSTRUCTION OF DEAF MUTES.

This institution was primarily designed for the instruction, according to the articulative method, of semi-mutes and semi-deaf; but a large number of congenital mutes have been received, many of whom have attained great proficiency in speech and lip-reading.

"The two systems of signs and articulation are conflicting and cannot with advantage be combined in the same institution. Separate and distinct educational establishments must be provided for articulating pupils and those capable of being taught speech."

This consideration and the need of work-shops and facilities for teaching trades are the cause of an appeal to the legislature for more ample accommodations. Several boys were removed during the year, insufficiently educated, because no trades were taught and they must acquire some means of support.

Complaint is made of the short period that many pupils remain in the institution, very few reaching the legal limit. The State is liberal in her provisions for the care and education of her mutes: between the ages of 6 and 12 years they are chargeable

to their respective counties and for eight years after attaining the age of 12 they are supported as State-pupils. That deaf mutes fail to acquire a suitable education is the fault only of themselves or their guardians.

NEW YORK INSTITUTION FOR THE BLIND.

The number of pupils at the beginning of the year 1872 was 156. Thirty-nine were subsequently admitted and 29, whose terms had expired, were discharged, leaving 166 pupils in attendance at the close of the year. Of these, 140 are New York State-pupils.

The general course of instruction remains the same as previously reported. The difficult experiment of instructing female pupils in the operation of the sewing-machine was here first undertaken, and has been attended with marked success. The example has since been followed by a number of institutions in other parts of the United States. Considerable attention has also been devoted to the training of male pupils in the art of tuning pianos, and with much success.

The ingenious system of point-writing and printing devised by the principal, Prof. William B. Wait, and which he has styled the "New York system," was unanimously adopted by the convention of superintendents held at Indianapolis in 1871. It has since been introduced into all the institutions for the blind in this country and also into some of the European institutions.

THOMAS ASYLUM FOR ORPHAN AND DESTITUTE INDIAN CHILDREN.

The number of children reported in this institution at the close of the year ended September 30, 1871, was 89. Six were then discharged, leaving, to commence the current year, 83, of whom 71 remained through the year. There were received during the year 27, making the total number 110, of whom 64 were boys and 46 girls. Of these, 14 have been discharged, leaving the number at the close of the year, September 30, 1872, 96, of whom 53 are boys and 43 girls. The average for the whole year is 91.7.

The receipts for the year amounted to $9,992.35 and the expenses to $10,731.55.

TRAINING-SCHOOL FOR NURSES,* NEW YORK CITY.

A company of ladies in New York have instituted what they style a Nurses' Home, in connection with the Bellevue Hospital. The house secured for it is a large one near the hospital, is neatly furnished, and has as its present lady superintendent Miss H. Bowden, who for some time had charge of the nursing staff of University College Hospital in London. The persons admitted must be over 21 and must present a certificate from a clergyman and physician of their being of good character and sound health. Such will be received for one month on probation, during which time they will be lodged and boarded at the expense of the school, but will receive no further compensation for their services if they should either leave before the expiration of the month or be found unsuitable for fuller training. Those fulfilling the conditions of the probationers' month will be accepted as pupil-nurses and must sign a written agreement to remain at the school one year and after that be subject to the orders of the school-committee for another year. For their year of tutelage they will receive board, lodging, and $10 a month for personal expenses. At the expiration of the year they will be promoted to such positions as they may be found capable of filling, with a proportionate increase of salary. When the full term of two years is ended with approval, they will be permitted to choose their own field of labor, either in hospitals, private families, or among the needy poor.

Their training will include the dressing of blisters, burns, sores, and wounds; the application of fomentations, poultices, and leeches; the administration of enemas; the management of trusses; the needful attendances on helpless patients; and all other things which go to promote the comfort and improvement of the sick and suffering. Seventeen pupils were in the Home at the close of November, 1873, about 100 others having failed to meet the trying conditions of the probationary month.

The commissioners in charge of Bellevue Hospital have been so greatly pleased with the marked improvement in the six wards committed to the charge of the training-school as to urge the including of yet more wards in the work. This cannot be done at present, but, as the school increases and the pupils come forward in their training, the likelihood is that more and more of the nursing in the hospital will be confided to them, and the most ample opportunities for bedside-experience and instruction be afforded. A class of nurses greatly superior to the mass of those employed in families at present will thus be gradually prepared, and the possibilities of comfort and improvement for the sick be, in proportion to the number of such nurses, strengthened.

EDUCATIONAL ASSOCIATIONS.

The State-Association of School-Commissioners and City-Superintendents met in Rochester on the 21st day of May last and continued in session three days. Many leading educators, besides school-officers, from different parts of the State were present. In respect to the character and scope of the subjects presented, the well-considered and

* From information furnished by Miss Julia F. Gould.

practical suggestions brought out in the discussions, and the earnest and thoughtful interest in the exercises manifested by all in attendance, this meeting was probably unsurpassed by any of its kind ever held in the State.

The State Teachers' Association held its twenty-seventh anniversary at Saratoga Springs during the three days commencing July 23, 1872. The arrangements made by the local committee for the meeting and for the entertainment of members have rarely been equaled, and the attendance of many from this and other States who have become eminent in various departments of educational labor gave character and interest to the proceedings.

OBITUARIES.

The following notable persons connected with the educational work have died during the year:

PROF. JOHN TORREY.

The death of Prof. John Torrey, of Columbia College, which occurred March 10, 1873, at the ripe age of 75 years, removed one who for nearly half a century has occupied a high place in the scientific world.

He became known at first by a catalogue (published in 1819) of the plants growing about New York. In 1824 he was appointed professor of chemistry, geology, and mineralogy at West Point; in 1827 was called to the chair of chemistry and botany in the New York College of Physicians and Surgeons, which he occupied until 1855, and in 1864 was appointed chief assayer in the United States assay-office. In several valuable works he communicated much interesting information on the flora of North America, the principal of these being the Flora of the Northern and Middle States, 1824; Cyperaceæ of North America, 1836; Flora of the State of New York, 1843–'44. As a man of science he commanded universal respect. At home and abroad he was regarded as an accomplished botanist, and made many valuable contributions to this, his favorite science. Above all, he was a sincere Christian, and illustrated in his life the real harmony between science and religion.

JAMES CUSHING, JR.

The death of James Cushing, jr., one of the recently-appointed members of the board of education of New York City, will prove no common loss to the cause in which he was engaged. He had entered earnestly upon the duties connected with his important office. No one was more keenly alive to the need of a more perfect system of public instruction or felt more deeply that the highest interests of the city and the country were bound up in the fate of the common schools. All his labors, therefore, since his entrance upon his office had been given to improve and elevate the condition of public instruction. He led the minority in the board who demanded a thorough reform in the educational department. His high character and vigorous intellect gave force to his arguments, and had he lived he must have produced a signal change in the views of many of his associates.

Mr. Cushing was only 41 years of age, yet he had been for a long time connected with the public schools; was school-commissioner in 1858 and 1859; and had also been a ward-trustee. He was an active member of the church of the Divine Paternity, (Dr. Chapin's,) and was engaged in mercantile pursuits. Although solicited to accept other public offices, it is stated that he would consent only to be school-commissioner. He died in the service of that cause to which he had given a lasting devotion. The teachers of the schools are indebted to him for several important services. He aided in preventing the reduction of their salaries or the abridgment of their privileges; he defended their interests and was sensible of their value. Had he been able he would have begun that thorough reform in the method of instruction which must at last be carried out to render the teachers and public schools of New York the firm support of equality and freedom. He felt that it was because the people were so often uneducated that they were led into measures fatal to their own welfare. He was anxious that all should be educated alike. It is, therefore, with no common regret for his loss that those who have faith in popular instruction offer their tribute of respect to the high character and generous aims of James Cushing, jr.

REV. T. T. TITUS.

Rev. T. T. Titus, A.M., professor of theology in Hartwick Seminary, died on Saturday, February 15, 1873.

He was born in Loudoun County, Virginia, on the 4th day of March, 1829. At a very early age he displayed a remarkable desire for education, though of poor parentage, and his unbending will found a way to gratify his desire. When only 16 years of age he was converted, joined the church, and entered the institution at Gettysburg, Pennsylvania, with the view of preparing for the gospel-ministry. He literally worked his way through the college and seminary, and, though receiving some aid as a beneficiary of the synod, paid a considerable part of his expenses by teaching while pursuing his studies, during the latter part of his course being tutor in the theologic seminary. His first pastoral charge was at Lower Merion, Pennsylvania; after five

years he accepted a call to Milton, Pennsylvania; two years after he removed to Ohio, where he labored four years; after which he removed to Hagerstown, Maryland. Here he labored till June, 1871, when he was elected principal of Hartwick Seminary, in New York. After one year's labor in this office he resigned it, and was elected professor of theology in the seminary, which position he occupied at the time of his death.

As a minister Mr. Titus was held in high esteem. He was possessed of talent of no common order. As a writer he was favorably known. His contributions to the Lutheran Observer have been widely read. He has given to the church two important evidences of his usefulness in the "explanatory question books" for Sunday-schools, the second volume of which issued from the press not long before his death.

In the crowning work of his life, that of an instructor, Mr. Titus showed peculiar fitness.

REV. HENDRICK METCALF.

Hendrick Metcalf was born at Newport, New Hampshire, November 23, 1805, so that he was not quite sixty-seven years of age at the time of his death, on the eve of All-Saint's, 1872. By birth he was allied to a race of the intellectual giants of the Old Granite State, not the least of whom, among his kinsmen, is the honorable and venerable Theron Metcalf, of Boston, one of the retired judges, by reason of his advanced age, of the supreme court of Massachusetts. Dr. Metcalf had a thorough classic education, graduating with honor at Dartmouth College in the class of 1829 and immediately devoting himself to the business of education, teaching Latin and Greek, at first in Buffalo and then in Rochester. On December 12, 1831, he was admitted to the order of deacons and on August 15, 1832, he was ordained a priest, by Bishop B. T. Onderdonk, in the Protestant-Episcopal Church. From that time forth he became most emphatically a missionary, at first officiating in Wayne and Monroe Counties, where he is still remembered as "the good man;" then for eight years the rector of St. Mark's Church, Le Roy; then sent to other places, mainly to compose differences, disagreements, and dissensions; and then, at last, called back to his old profession of teaching as professor of the Greek and Latin languages and literature in Hobart College in 1850. How well and how faithfully he discharged the duties of this office the recorded testimony of the trustees and faculty bears witness. In all that time he was occupied in the great interests of the college and the church and identified with them in some responsible office, always thought of, consulted, and especially relied upon for the wisdom of his counsel, the honesty, sincerity, and self-sacrificing independency of his advice and action.

He was not a man of that broad and careless view of principles in church or state who could look upon all opinions with equal favor. Far from it. He held very decided and clearly-defined opinions upon all important questions and possessed the utmost fearlessness in declaring them on all proper occasions. And still he was as far as possible from opinionativeness or uncharitableness towards other persons and their opinions. He knew too well the effect of education and partisanship upon common minds to feel any surprise at meeting erroneous opinions upon all subjects wherever he went; and he was content not to be wiser than the Master, but to let truth and error—the tares and the wheat—grow together till the end of the world. And he entertained no suspicion that he had received any commission to sift or separate them. He was content to do his own duty in that state of life in which it had pleased God to call him.

OTHER EDUCATORS.

Many other laborers in the cause of education have fallen during the past year whose names should be recorded here, but of whose life and labors there is not space for even so brief a notice as the foregoing. Among these are Harvey Prindle Peet, LL. D., who was for forty years principal of the New York Institution for the Instruction of the Deaf and Dumb; died at the institution January 1, 1873, in the seventy-ninth year of his age. He was the author of a Course of Instruction for the Deaf and Dumb, which passed through numerous editions, and in the line of teaching, to which he was devoted, stood among the first of the educators of this country, if not of any country in the world. Rev. Joshua Leavitt, who has been more generally known as a clergyman, journalist, and reformer than as a teacher, although after his graduation at Yale, and before entering the ministry, he was for five years a successful teacher, and during his life was author of some of the best reading-books for schools ever published, died in New York City, January 16, 1873, in the seventy-ninth year of his age. On the same day died, at Ithaca, Prof. William Charles Cleveland, C. E., of Cornell University, an accomplished scientist, who had been connected with the university since its organization. Miss Caroline Chesebro, who was more widely known as an author and magazine-writer than as a teacher, although she had been for eight years previous to her death one of the most efficient and beloved teachers of the Packer Collegiate Institute, Brooklyn, died at Piermont, February 16, 1873, at the age of about 45 years. Mrs. Ophelia M. Livingston, who was for many years at the head of a large seminary for young ladies in Savannah, Georgia, died in Brooklyn, March 3, 1873, at the age of 65 years. Mr. Samuel C. Barnes, who died in Brooklyn, February 18, 1873, at the age

of 60 years, had been for more than thirty years, and until the last four or five years, a teacher in the public schools of that city and an efficient actor in all measures for their improvement. Samuel Adams Lyons Law Post, who commenced teaching at the early age of 14, and after his graduation at Yale College resumed the profession and continued in its successful practice fifteen years, or nearly all the remainder of his life, died at Ellenville, New York, aged 44 years. William W. Clark, A. M., professor of physical sciences in the State normal school at Albany, from 1845 to 1849, and afterward enaged in the geologic survey of the State, died at Rochester, August 10, 1873, aged 49. Rev. Samuel Roosevelt Johnson, D. D., for many years professor of systematic theology in the General Seminary of the Protestant-Episcopal Church, located in New York, died August 13, 1873, at Amenia, New Jersey, at the age of 78.

LIST OF SCHOOL-OFFICIALS IN NEW YORK.

Hon. ABRAM W. WEAVER, *State-superintendent of public instruction, Albany.*

SCHOOL-COMMISSIONERS.

County.	Name and district.	Post-office.
Albany	John F. Shafer, first	Cedar Hill.
	Zebediah A. Dyer, second	East Berne.
	Thomas Helme, third	McKownville.
	John O. Cole, (city-superintendent)	Albany.
	Murray Hubbard, (president board of education)	Cohoes.
Allegany	Frank S. Smith, first	Angelica.
	Walter D. Renwick, second	Friendship.
Broome	Hiram Barnum, first	Osborne Hollow.
	George Jackson, second	Binghamton.
	G. L. Farnham, (secretary board of education)	Binghamton.
Cattaraugus	Newton C. McKoon, first	Ellicottville.
	Henry M. Seymour, second	Salamanca.
Cayuga	Hulbert Daratt, first	Cato.
	Charles H Greenfield, second	Niles.
	Lauren M. Townsend, third	Moravia.
	B. B. Snow, (secretary board of education)	Auburn.
Chautauqua	Henry Q. Ames, first	Sherman.
	Lucius M. Robertson, second	Frewsburg.
Chemung	Jonas Sayre Van Duzer	Horseheads.
	E. B. Yeoumans, (secretary board of education)	Elmira.
Chenango	Matthew B. Ludington, first	North Norwich.
	David G. Barber, second	Oxford.
Clinton	William B. Dodge, first	Schuyler Falls.
	Robert S. McCullough, second	Chazy.
Columbia	John Strever, first	Clermont.
	Hiram Winslow, second	Green River.
	Cyrus Macey, (city-superintendent)	Hudson.
Cortland	George W. Miller, first	Marathon.
	Rufus T. Peck, second	Solon.
Delaware	George D. Ostrom, first	Franklin.
	Amasa J. Shaver, second	Meredith.
Dutchess	Derrick Brown, first	Poughkeepsie.
	Edgar A. Briggs, second, (box 883)	Poughkeepsie.
	R. Brittain, (clerk board of education)	Poughkeepsie.
Erie	Charles A. Young, first	Tonawanda.
	George Abbott, second	Hamburg.
	Russel J. Vaughan, third	Springville.
	J. A. Larned, (city-superintendent)	Buffalo.
Essex	William H. McLenathan, first	Jay.
	Thomas G. Shaw, second	Olmsteadville.
Franklin	Sidney P. Bates, first	Malone.
	William Gillis, second	Fort Covington.
Fulton	John M. Dougall	Johnstown.
Genesee	Richard L. Selden	Le Roy.
Greene	Samuel S. Mulford, first	Tannersville.
	Robert Halstead, second	Greenville.
Hamilton	Isaac H. Brownell	Northville P.-O.
Herkimer	John D. Champion, first	Little Falls.
	William W. Bass, second	Jordanville.
Jefferson	Willard C. Porter, first	Adams Center.
	Henry Purcell, second	Watertown.
	George H. Strough, third	Lafargeville.
	D. G. Griffin, (city-superintendent)	Watertown.
Kings	C. Warren Hamilton, first	New Lots.
	Thomas W. Field, (city-superintendent)	Brooklyn.
Lewis	William D. Lewis, first	Constableville.
	Charles A. Chickering, second	Copenhagen.
Livingston	John W. Byam, first	Livonia Station.
	Robert W. Green, second	Dansville.
Madison	Joseph E. Morgan, first	Earlville.
	Paul S. Maine, second	Perryville.

List of school-officials in New York—Continued.

County.	Name and district.	Post-office.
Monroe	Edwin A. McMath, first, (158 Powers' Block)	Rochester.
	George W. Sime, second	Brockport.
	S. A. Ellis, (city-superintendent)	Rochester.
Montgomery	George F. Cox	Amsterdam.
New York	Henry Kiddle, (city-superintendent)	New York.
	T. F. Harrison, assistant city-superintendent	New York.
	N. A. Calkens, assistant city-superintendent	New York.
	J. H. Fanning, assistant city-superintendent	New York.
	John Jasper, jr., assistant city-superintendent	New York.
	Arthur McMullin, assistant city-superintendent	New York.
	William Jones, assistant city-superintendent	New York.
Niagara	William Gritman, first	Lockport.
	Esek Aldrich, second	Johnson's Creek.
	James Ferguson, (city-superintendent)	Lockport.
Oneida	John R. Pugh, first	Utica.
	Charles T. Burnley, second	Clinton.
	Henry S. Ninde, third	Rome.
	Horace O. Farley, fourth	Prospect.
	A. McMillan, (city-superintendent)	Utica.
Onondaga	J. Warren Lawrence, first	Plank Road.
	James W. Hooper, second	Geddes.
	Parker S. Carr, third	Fayetteville.
	E. Smith, (city-superintendent)	Syracuse.
Ontario	Hyland C. Kirk, first	Phelps.
Orange	Robert B. Simmons, second	Allen's Hill.
	George K. Smith, first	Monroe.
	Asa Morehouse, second	New Hampton.
	R. V. K. Montfort, (city-superintendent)	Newburg.
Orleans	William W. Phipps	Albion.
Oswego	Isaac W. Marsh, first	Bowen's Corners.
	William B. Howard, second	Fulton.
	John W. Ladd, third	Mexico.
	V. C. Douglass, (city-superintendent)	Oswego.
Otsego	Nahum T. Brown, first	East Worcester.
	Warren L. Baker, second	Portlandville.
Putnam	John H. Spencer	Farmer's Mill.
Queens	Eugene M. Lincoln, first	Glen Cove.
	Garret J. Garretson, second	Newtown.
	Alanson Palmer, (city-superintendent)	Long Island City.
Rensselaer	Amos H. Allen, first	Petersburg.
	George W. Hidley, second	Wynantskill.
	David Beattie, (city-superintendent)	Troy.
Richmond	James Brownlee	Port Richmond.
Rockland	Spencer Wood	Clarkstown.
St. Lawrence	Daniel S. Giffin, first	Heuvelton.
	A. Barton Hepburn, second	Colton.
	Barney Whitney, third	Lawrencevill.
	R. B. Lowry, (city-superintendent)	Ogdensburg.
Saratoga	Neil Gilmour, first	Ballston Spa.
	Oscar F. Stiles, second	Saratoga Springs.
Schenectady	David Elder	Van Vechten.
	S. B. Howe, (city-superintendent)	Schenectady.
Schoharie	John S. Mayhan, first	Gilboa.
	John Van Schaick, second	Cobbleskill.
Schuyler	Charles T. Andrews	Watkins.
Seneca	Henry V. L. Jones	Ovid.
Steuben	Zenas L. Parker, first	Bath.
	Reuben H. Williams, second	Woodhull.
	William P. Todd, third	Canisteo.
Suffolk	Horace H. Benjamin, first	Riverhead.
	S. Orlando Lee, second	Huntington.
Sullivan	Charles Barnum, first	Monticello.
	Isaac Jelliff, second	Liberty.
Tioga	Lemuel D. Vose	Owego.
Tompkins	Orville S. Ensign, first	Ithaca.
	Robert G. H. Speed, second*	Caroline.
Ulster	Cornelius Van Santvoord, first	Kingston.
	Ralph Le Fevre, second	New Paltz.
	Harrison R. Winter, third	Phœnicia.
Warren	Daniel B. Ketchum	Glen's Falls.
Washington	Ezra H. Snyder, first	Argyle.
	Edward C. Whittemore, second	Adamsville.
Wayne	Joseph H. L. Roe, first	Wolcott.
	Felix J. Griffen, second	Marion.
Westchester	Joseph H. Palmer, first	Yonkers.
	Casper G. Brower, second	Tarrytown.
	Joseph Barrett, third	Katonah.
Wyoming	Edwin S. Smith, first	Dale.
	Edson J. Quigley, second	Gainesville.
Yates	Bradford S. Wixom	Italy Hollow.

*For term commenced January 1, 1872.

NORTH CAROLINA.

[From report of Hon. Alexander McIver, State-superintendent of public instruction, for the year ended June 30, 1873.]

FINANCIAL STATEMENT.

Condition of the educational fund.

Balance of fund October 1, 1872	$61,270 56
Receipts for fiscal year ended September 30, 1873	41,705 01¼
Total	102,975 57¼
Disbursements for fiscal year ended September 30, 1873	83,007 18
Balance October 1, 1873	19,968 39¼
Amount of permanent fund October 1, 1873	3,821 54¼
Amount of distributive fund October 1, 1873	16,146 85
Total	19,968 39¼

Receipts.

From the State-treasurer	$63,301 32	
Capitation-tax, 1872	137,103 32	
Property-tax, 1872	75,295 89	
Balance on hand September 30, 1872	133,130 14	
		408,830 67

Disbursements.

To teachers of schools for white children	112,175 36	
To teachers of schools for colored children	45,954 19	
For building and repairing school-houses	25,100 00	
To examiners	1,520 00	
To county-treasurers	6,925 52	
		191,675 07
Balance remaining in the hands of county-treasurers June 30, 1873		217,155 60

SCHOLASTIC POPULATION.

The school-age is from 6 to 21 years.

Number of white children of school-age—males, 120,455; females, 113,296	233,751
Number of colored children of school-age—males, 59,260; females, 55,592	114,852
Total scholastic population	348,603

ATTENDANCE.

Number of white children enrolled in school—males, 56,316; females, 49,993	106,309
Number of colored children enrolled in school—males, 20,578; females, 19,850	40,428
Grand total of enrollment	146,737
Estimated daily average, white children	70,872
Estimated daily average, colored children	26,958
Total daily average	97,830

SCHOOLS.

Estimated number of public schools for white children	2,565
Estimated number of public schools for colored children	746
Average length of school-term, weeks	10

TEACHERS.

The estimated number of teachers examined and approved during the past year is:	
White teachers	2,160
Colored teachers	530
Total	2,690

Some of the above statements can be taken only as approximations. Only sixty-eight counties have reported the number of schools and only sixty-three have made returns of the number attending school. The estimates made for the remaining counties are based upon the supposition that the number of schools and the enrollment are in the same proportion as in the counties reporting.

Forms were given for reporting the average attendance; but this was so rarely done that no reliable estimate can be made. In the few instances in which the average attendance has been reported, it appears to be about two-thirds of the registered number.

SCHOOL-FUNDS.

The law appropriates annually 75 per cent. of the entire State- and county-capitation-taxes, a property-tax of 8⅓ cents on the hundred dollars' worth of all property and credits in the State, all taxes on auctioneers and licenses to retail spirituous liquors, and the income arising from the permanent school-fund for the support and maintenance of free public schools. The amount which will be realized from all these sources will make an average of about 70 cents for each child in the State between the ages of 6 and 21 years, and will, therefore, be insufficient to maintain a public school in each district, according to the requirements of the constitution of the State. The question of levying an additional school-tax must be submitted to the electors of each county. If voted against in any county, the only school-fund in such county will be that which the law has absolutely appropriated, as mentioned above.

The school-money is to be apportioned to the children of each race separately.

This apportionment cannot be made, and the schools cannot properly begin under the present law until the districts are laid off and the census is taken.

RULES ADOPTED BY THE STATE-BOARD OF EDUCATION.

The State-board of education, on the 16th of April, 1873, unanimously adopted the following rules and regulations in relation to free public schools:

Form of school-districts.—The school-districts shall be laid off as nearly square in form as the situation of the several localities will permit. Natural boundaries, as streams, swamps, &c., shall be adopted as the boundaries of school-districts. The convenience of each neighborhood must be consulted.

Area of school-districts.—Each school-district shall contain an area equal to from four to seven miles square and the school-house shall be as near the center of the school-population as practicable.

It is considered better that the districts should be made as large as possible, so that a few good public schools may be established and maintained. If the districts are small, the schools will be so numerous that none of them can be supported properly.

District-trustees.—Three trustees are to be elected for each district, the white electors to elect trustees for the school for white children and the colored electors to elect trustees for the school for colored children.

Teachers' wages.—Teachers' wages are fixed at the rate of not more than 75 cents a month for each pupil of a third-grade-school, nor more than $1 a month for each pupil of a second-grade-school, nor more than $1.25 a month for each pupil of a first-grade-school, counting the number of pupils, in every case, by their average attendance.

The object of limiting the compensation of the teacher according to the average attendance of pupils was to remedy an evil which had became common and which was calculated to damage the system. In many instances schools were taught at a season of the year when very few, often not more than four or five, children could attend. The teacher would continue with empty benches till his time was out and then receive all the money due the district, without any benefit whatever to the great majority of the children for whom it was intended. The rule was intended to remedy this evil and to bring the public school into sympathy with the wishes of the people of the district.

DEFECTS OF THE SCHOOL-SYSTEM AND AMENDMENTS PROPOSED.

Sufficient provision is not made for the execution of the law. However excellent a law may be in theory, if it is not executed it is worthless in practice. The failures in the execution of the law are:

(1) The poll-taxes, which constitute the principal school-fund, are not properly col-

lected. If every man who is liable to pay such taxes should pay them the school-funds would be very considerably increased and a very serious cause of complaint against the school-system would be removed.

(2) The school-money is not promptly paid over to the county-treasurers. Many of the sheriffs retain it for several months after it is collected and in a few instances it has been retained more than a year. The people have a right to demand that the school-money shall be paid to the county-treasurers at the time fixed by law.

(3) There are no county-superintendents of public schools. The county-commissioners are charged with "a general supervision and control of the schools in their respective counties," but their duties are confined to their office: there is no going out into the districts, no visitation of schools. If the law should provide for the appointment in each county of a county-superintendent of public schools, charged with the duty of establishing schools and executing the school-law in the county, it would give vitality to the system and establish and build up the schools.

(4) The school-committees are charged with many and important duties, but receive no compensation for performing them, nor is any penalty imposed by law for their non-performance.

(5) The school-districts should be laid off not less than four miles square, and the people of each district should have the right, by a majority-vote, to tax themselves to support a free public school in the district for such a portion of each year as they may desire. Just at this point the public-school-system of the State has always been a failure. That essential element of the American school-system, the right of local taxation, has never been incorporated into the school-law.

This was the defect of the system of 1840–'41. It provided an annual school-fund of about $1 for each child between the ages of 6 and 21 years, but gave no right to supplement this fund by local taxation. One dollar a year for each child of school-age was too much to be wasted and too little to do much good. It did just enough to be in the way of good private schools, but not enough to meet the wants of the people. The consequence was that, after the system had been in operation about twenty years, the census of 1860 placed North Carolina among the most illiterate of the States of the Union.

The school-law of 1868–'69, gave the right of local taxation to the townships. But there are from four to twelve school-districts in each township. One district might vote for a sufficient tax to maintain a school ten months in the year and the other districts would vote against it. By the State-constitution the tax could be collected only by a vote of the people, and under the law of 1868–'69 the townships generally voted against it.

The act of 1872 offered the apportionment of the school-fund as a premium to such school-districts as would, by voluntary contributions, supplement it, so that a public school might be maintained. But no right of local taxation was given to the districts.

If provision should be made for properly collecting the taxes levied by the law of 1873, the annual school-fund provided by law would be larger than at any former period in the history of the State. But the number of children to be educated is also much larger than formerly. And the present law, like all its predecessors, gives no right of local taxation. It authorizes the county-commissioners to levy an additional school-tax in the county by a majority of the votes given at an election to be held for the purpose. The counties have voted against the additional school-tax so generally that there is little expectation that an additional school-fund will be thus provided.

There may be in every county in the State from one to twenty school-districts in which the people would be willing to tax themselves to maintain a free public school eight or ten months every year. They should have the right to do so by a majority-vote of the people of the district. If the people are allowed this right, public schools will be established all over the State. One well-regulated public free school in a county would produce others. The true value and economy of the public-school-system would be seen, felt, and believed, as they never have been and never can be under a system which authorizes no local tax.

(6) It is suggested that there should be no limitation of the prices which may be paid to teachers out of the public-school-funds. The price of teaching, like that of other labor, should be left to the law of supply and demand. Each district should be at liberty to pay its teachers such price as his services may be worth.

(7) Many districts are without school-houses, and, as there cannot be a school without a house, it is believed that districts should have the privilege of using their apportionment of the school-money in building a suitable school-house.

If the districts were properly laid off, the school-houses properly located and built, and the people of each district had the right to tax themselves and elect the officers to manage the school, it is believed that most of the districts in the State would maintain a free public school from four to ten months every year.

GRADED SCHOOLS.

A bill was introduced at the last session of the general assembly to authorize the residents of every town or city of more than two thousand inhabitants, by the

vote of a majority, to levy a tax upon the corporation sufficient to supplement the school-fund provided by law, so that a graded school may be maintained ten months every year. If this bill should become a law, it will enable many towns and cities in the State to realize and to exhibit the true value and economy of public education.

TEACHERS' CERTIFICATES.

Examiners are cautioned against yielding to the idea that, if competent teachers cannot be found, certificates must be given to those who are not competent. This is fatal to the success of the public schools. The law makes it a duty to give "certificates to all applicants of sufficient moral and mental qualifications," and to no others. If the standard is made high, applicants will come up to it sooner or later.

It is advised that a teacher's certificate shall hereafter indicate with certainty: (1) that the holder is of good moral character; (2) that he is familiar with all the branches of study named in his certificate; and (3) that he knows how to teach and how to govern a school and how to make and keep a school-register.

Every applicant for a third-grade-certificate should pass a satisfactory examination on the sounds of the marked letters and in spelling, reading, writing, and arithmetic.

Applicants for second-grade-certificates should, in addition to the above, be examined in English grammar, political and physical geography, map-drawing, English composition, and history.

First-grade-certificates should require, in addition to the branches named for the lower grades, a knowledge of drawing, book-keeping, the rudiments of natural philosophy, chemistry, botany, and astronomy.

It is believed that, if examiners will adopt the standard which the law requires and give certificates only to competent teachers, their action in this respect will meet the approval of the public and secure confidence in the public schools.

COMPULSORY EDUCATION.

The superintendent, after quoting from various distinguished authorities upon this subject, says: "The voluntary system is certainly preferable so far as it can be made to answer the purpose. But as the law intervenes to protect the life of the child, it may also protect the child's right to be educated. If the State is justifiable in providing, at public expense, for the education of children for its own protection, it is also justifiable in protecting the rights of children to be educated for its own protection."

PEABODY EDUCATIONAL FUND.

North Carolina has received aid, during the year, from the Peabody fund, as follows: Wilmington, $1,000; Washington, $600; Hayesville and Catawba Vale, $450 each; Warrenton, $400; twelve other schools, $300 each; two, $200 each; and $250 for the support of four teachers' institutes—amounting, in all, to $7,150. The additional amount of $4,500, promised to fourteen schools, has not yet been given, the schools having not yet reported in compliance with the rules for distribution. Since July 1, 1873, amounts varying from $300 to $600 have been promised to thirteen schools, upon condition that all the rules for distribution be complied with. Three of the schools assisted by the fund were for the education of colored children.

JOURNAL OF EDUCATION.

In accordance with the resolution passed by the State Educational Association, arrangements were made for the publication of an educational monthly of forty-eight pages, to be called The North Carolina Journal of Education. It was intended to publish the first number of the journal about the 1st of November; but the expense of publication was to be met mainly by the subscriptions, and the names of a sufficient number of subscribers had not been received to justify the undertaking. If the general assembly will authorize the State-superintendent to supply the proposed journal to the several townships, the difficulty in the way of its publication will be overcome; and as the journal will publish the school-laws, the expense of publishing them in circulars for the use of school-officers will be entirely avoided.

EDUCATIONAL CONDITION OF THE STATE.

"The condition both of the public schools and of education generally in the State," according to the report of the agent of the Peabody Fund for 1873, "is far from being satisfactory. There is an alarming indifference on the subject among the common people and a want of union and hearty co-operation among public men. The school-law, though it may be the best that the friends of education could obtain at the time it was passed, is by no means what it should be. Nowhere has it been more clearly demonstrated that half-measures in establishing and supporting public schools cannot be attended with great success. The good and the bad features of the amended school-law will appear from the following statements, taken from a circular of the State-superintendent addressed to the county-commissioners February 27, 1873:

"'Public schools are to be maintained four months every year in every school-district in each county of the State in which the qualified voters shall vote to levy the additional school-tax necessary for that purpose. It is the duty of the county-commissioners of every county in which there is not already a sufficient school-fund on hand to submit the question to the qualified voters of the county, whether or not the additional school-tax shall be levied. In every county in which a majority of the votes given shall be for school-taxes, it will be the duty of the county-commissioners to levy a sufficient tax to maintain a public school at least four months in every school-district in the county for each race and pay half the cost of building, repairing, and furnishing school-houses and the whole cost of purchasing school-house-sites.'

"If the county-commissioners and school-committees in the several counties could be induced to consider the alarming illiteracy of the rising generation and the vast importance of public education to the material interests and safety of North Carolina, they would exert an influence in their several counties which would permanently establish public schools."

The agent of the Peabody fund further remarks:

"It is to be feared that in many, if not in most, of the districts there will be no schools at all, on account of the aversion of the people to paying school-taxes. One of two things will be necessary: either systematic and energetic efforts must be made to enlighten the people, so that they shall demand a good school-law, as in Tennessee, or the legislature must, in advance of the people, establish a system which shall command respect and win its way to favor, as in Virginia. Two public meetings recently held in Raleigh in regard to the general interests of education indicate that a more auspicious time may be approaching.

DIFFICULTIES.

In Wilmington, by the recent action of the county-board of education and of the board of aldermen, the free schools have been made city free schools, and a school-committee of five and a superintendent appointed. There is an increasing average attendance, amounting now to about 1,000. The city-authorities, being requested and desiring to levy a tax to meet the deficiencies of the State- and county-tax for schools, were prevented from so doing by a law of the State making such levy of taxes illegal. The same is true in regard to Raleigh, which applied to the general assembly at its last session for authority to raise money for free schools by popular vote, and the application failed because that body considered such authority unsafe.

LEGISLATIVE ACTION INVOKED BY CITIZENS OF RALEIGH.

In the senate of North Carolina, December 13, 1873, the bill to authorize cities and towns of more than 2,000 inhabitants to establish and maintain free public schools came up as the special order at 12 o'clock. The bill provides that the mayor and council of each city or the commissioners of each city or town of more than 2,000 inhabitants may, at any time of their own motion, and shall at the written request of any twenty voters in the city or town, submit the question to the electors within the corporate limits of the city or town whether or not free public schools shall be established and maintained within the city or town by a tax upon the property, credits, and polls within the corporate limits thereof. It provides, further, the manner of holding the elections and the levying of the tax, &c.

The following letter was read during the debate:

"RALEIGH, *December* 11, 1873.

"SIR: At a meeting of the citizens of Raleigh to consider the subject of public schools in the city, Hon. William H. Battle presiding and General John C. Gorman acting as secretary, the Rev. Joseph M. Atkinson, Rev. A. W. Mangum, and Hon. Wesley Whitaker, together with the undersigned, were appointed a committee to make application to the general assembly for such legislation as will enable the city of Raleigh to inaugurate and support by taxation an efficient system of public graded schools, equal, if possible, to the best in the land.

"The meeting very fairly represented the intelligence and the tax-paying power of our citizens. After a full discussion and with inconsiderable opposition, the following conclusions were reached:

"(1) That it is vain to expect schools of high character to be sustained out of the meager school-fund, and it is not probable that this fund will be soon greatly increased.

"(2) That efforts to supplement this fund by voluntary contributions will be spasmodic, uncertain, and unreliable.

"(3) That the only mode of insuring success is to raise a definite and liberal sum annually by taxation on all the taxable subjects of the city.

"(4) That such action will make the capital a shining example, which will be copied by other cities and towns of the State, will lead to influx of population desiring to receive educational advantages, will thus increase the wealth of the city so far as to overbalance the burdens of the requisite taxation, will dispel ignorance and diminish crime,

will promote the intelligence, virtue, and usefulness, not alone of the rising generation, but of the people generally.

"The committee are painfully conscious of the bad state of education in our midst. Probably three-fourths of the children are growing up in mental darkness. Many are learning nothing but how to do evil. The strict discipline of graded schools is needed to supplement the efforts of parents to secure habits of obedience and right course of intellectual and moral training.

"The committee therefore venture to express the hope that the general assembly will see fit to enact into a law the bill authorizing cities and towns of more than 2,000 inhabitants to establish and maintain free public schools, or, at least, will grant such authority to the city of Raleigh.

"With great respect, yours truly,

"KEMP P. BATTLE,
"*Chairman of Committee.*

"Hon. JOHN W. CUNNINGHAM,
"*Chairman of Committee on Education.*"

What action was taken on the above does not appear at the time this report goes to press, but the movement is important.

SECONDARY INSTRUCTION.

Information has been received from twenty-one high-schools and academies, having an attendance of 1,348 pupils—boys 912, girls 436—with 51 instructors. Of the pupils, 425 were pursuing classic studies and 104 the modern languages. In seven of these schools music and drawing are taught. Fifteen are sustained by religious denominations, while seven are unsectarian. Only one—the New Berne Academy—offers free tuition. Eight are for the exclusive instruction of boys and one is for girls, while the remaining twelve are for the education of both sexes.

The number of public high schools in the State, and the character and condition of the instruction given in them, does not appear in the report of the superintendent of schools or in the returns made to the Bureau of Education.

NORMAL SCHOOLS.

The Ellendale Teachers' Institute at Ellendale Springs and the Williston Academy and Normal School at Wilmington are the only schools reported for the professional training of teachers. The first is aided by the Peabody fund, the last is supported by the American Missionary Association. During the past year 98 pupils—45 gentlemen and 53 ladies—received instruction in these two schools.

SUPERIOR INSTRUCTION.

The institutions for superior instruction at present in operation are five colleges proper, four of which are for the exclusive education of young men, while one is open to both sexes; and eleven institutions for the superior instruction of young ladies, designated variously as seminaries, colleges, schools, and academies. Four of the five colleges mentioned are sustained by as many religious denominations, viz, Presbyterian, Lutheran, Methodist-Episcopal, and Baptist, while the Rutherford Male and Female College claims to be "unsectarian in its influence."

Davidson College, at Davidson College village, had 28 graduates last commencement; North Carolina College, at Mt. Pleasant, 5 graduates; Trinity College, Trinity, 14 graduates; Wake Forest College, 7 graduates; and Rutherford Male and Female College, at Excelsior, with 125 students in classic studies—42 ladies and 83 gentlemen—5 graduates during the year. These aggregate 406 students in collegiate and 372 in preparatory departments, with 28 instructors and 59 graduates at the last commencements.

The State University, organized in 1795 and suspended in 1871, is still suspended, though reporting grounds and buildings valued at $150,000 and libraries containing 21,700 volumes.

A specialty of Rutherford is that, though possessing no endowment, the college instructs all indigent orphans and all ministers' children, of whatever religious denomination, free of charge for instruction, the number of free pupils during the past year being 50, the previous year 53, and since the first commencement of the college 578.

Rush University, an institution for the education of young colored men for the ministry, is to be established at Fayetteville, under the auspices of the African Methodist Church, as soon as the needful arrangements can be made.

Eleven seminaries and colleges for young ladies report a total of 101 professors and instructors, 1,109 pupils, nearly equally divided between the collegiate and preparatory departments of study. In all these institutions modern languages take the place of the classic. Music and painting are taught in all except one. Nine are sustained by religious denominations, while two are reported unsectarian.

Statistical summary of university and colleges:

Names of university and colleges.	Corps of instruction.	Endowed professorships.	Number of students.		Corporate property, &c.						Number of volumes in library.
			Preparatory.	Collegiate.	Amount of property of corporation.	Value of grounds, buildings, and apparatus.	Amount of endowment.	Amount of productive funds.	Income from productive funds.	Receipts for last year from all other sources.	
Davidson College	7	....	.....	114	$235,000	$150,000	$90,000	$85,000	$7,000	$7,000	7,000

COLLEGES FOR WOMEN.

Eleven colleges, seminaries, and institutes report an aggregate attendance of 1,047 students, of whom 229 were in preparatory departments. In five only is the collegiate classification given, and it is as follows: in the freshman-year, 142; sophomore, 103; junior, 45; and senior, 33; 61 were in partial or special courses and 4 in post-graduate-studies. There were 101 professors and instructors, of whom 28 were gentlemen and 73 ladies. Music—vocal and instrumental—drawing, painting, and French are taught in all these institutions; in all but two, German; also two add Italian to this, and one French. Seven have chemic laboratories; six philosophic cabinets; four natural-history-museums; two have an astronomic observatory; and one, without the observatory, has a telescope; three have art-galleries; eight have libraries, the largest of which numbers 3,500 volumes, the smallest 300.

STATE EDUCATIONAL CONVENTION.

In April, 1873, the State-board of education adopted resolutions calling upon the friends of education in North Carolina to meet in convention in the city of Raleigh, on the 9th day of July, 1873, for the purpose of considering and recommending such measures as might be deemed advisable for the promotion of education in the State.

In answer to this call a convention was held in the hall of the house of representatives and continued in session three days. It was composed of representative men of both of the great political parties, of all the leading religious denominations, and of the principal institutions of learning in the State. Hon. W. H. Battle was elected president of the convention.

On taking the chair he addressed the convention, chiefly upon the subject of the condition of the University of North Carolina and the necessity of its re-establishment. This, he believed, would contribute, in no small degree, to the advancement and elevation of common schools in the State. "The constitution places the university under the control of the State and in inseparable connection with the public-school-system. It is true that one of the proposed amendments to the constitution will, if adopted, change this provision, but the change need not interfere with the connection between the university and the common schools. The university is the head of the common-school-system, and if the head is made sound, the whole body will thereby be made sound. All institutions of learning, whether public or private, whether established for the benefit of the white or colored people, will feel the influence of the university and be made to accomplish the full measure of usefulness for which they are designed." The following resolutions in regard to public schools were reported by a committee, of which Hon. A. S. Merrimon was chairman:

"*Resolved*, That the dignity and the importance of the educational interests of a people cannot be overestimated and they may never be neglected but at the hazard of consequences which no friend of humanity can contemplate without fearful apprehension.

"*Resolved*, That the general educational interests of this State are deplorable and alarming in a high degree, and are such as to require the noblest and most self-sacrificing efforts of every true son of North Carolina to relieve her from such serious embarrassment.

"*Resolved*, That the chairman of the convention appoint a committee of seven members, charged with the following duties, viz: to prepare and circulate through the State an address to the people showing that the small amount raised by taxation for educational purposes can be most beneficially used by the establishment of a common school in each school-district; to correspond with members of the general assembly upon this subject and to memorialize that body to pass such laws as may be necessary to effect the purposes of this resolution; and to memorialize Congress on the subject of national aid for the promotion of popular education.

"The committee also recommends that the convention urge upon the clergy, all the public speakers and the press to be zealous and constant in making efforts to arouse people to a sense of the importance of education, and especially of common schools."

These resolutions were unanimously adopted.

Rev. Neill McKay, D. D., reported a resolution from the committee on the university, to the effect that "the revival of the university at the earliest practical moment is essential to education in North Carolina."

T. M. Argo, esq., offered the following additional resolution:

"*Resolved*, That, in the opinion of this convention, the early revival of the university, and its establishment in a position of dignity and usefulness, is impossible unless upon a basis entirely removed from the field of religious and political controversy."

Governor Caldwell moved to amend the resolution by striking out the words "removed from the field of religious and political controversy" and substituting in lieu thereof the words "impartial in denominational and political representation." The amendment was accepted by Mr. Argo, and the resolution, as amended, was adopted.

Rev. Dr. Wingate, from the committee on normal schools, reported a recommendation that the convention memorialize the general assembly, at its next session, to establish one or more normal schools at such town or city in the State as will subscribe the largest sum to aid in the establishment and maintenance of such schools.

J. H. Mills, esq., submitted the following from the committee on compulsory education: "It is our opinion that the law should secure to children the privilege of learning to read and write and of growing up to become wise, virtuous, and useful citizens; and that it should restrain the cupidity of selfish parents and masters, who would deprive their children of these advantages."

The following resolution was adopted by a majority of the convention: "That the compulsory ignorance in which some of the children of this State are kept is heartily deplored by this convention and that means for their enfranchisement should be speedily devised."

John W. Norwood, esq., introduced the following preamble and resolution, which were unanimously adopted:

"Whereas agriculture lies at the foundation of all industrial pursuits and is essential to life and civilization: Therefore,

"*Resolved*, That a practical elementary treatise on agriculture should be prepared and introduced into the common schools of this State."

Rev. Dr. Craven, of the committee on permanent organization, reported a resolution that the convention "now proceed to form a State Educational Association; and that any resident of the State may become a member by causing his name to be enrolled and paying a fee of $1.

The report was adopted by a unanimous vote.

Forty-four names of members of the convention were enrolled as members of the State Educational Association and a constitution was adopted for the association. Hon. W. H. Battle was unanimously elected president of the association. The other officers were elected and the association was permanently organized.

The executive committee of the State Educational Association was instructed to confer with the superintendent of public instruction, and, if it finds it practicable, make arrangements for the publication of a State Journal of Education.

The State Educational Association then adjourned.

EDUCATIONAL CONVENTION OF BAPTISTS.

An educational convention was held by the Baptists of North Carolina, in Raleigh, February 12, 1873. Rev. Needham B. Cobb addressed those present on "The condition of education in the State and what can be done by the Baptists to improve it." The means proposed were: first, to create a public sentiment among the people in favor of general education by a thorough canvass of every church; secondly, establish and sustain Sunday-schools in every church and in every destitute neighborhood, for adults as well as for children, and impress every illiterate with the idea that it is his Christian duty to learn to read in order that he may study God's word for himself; thirdly, encourage common schools; fourthly, endow academies.

Among other facts it was mentioned by the speaker that the cost of maintaining the dogs of the State during the year 1872 was nearly six times greater than the sum expended that year upon public education.

LIST OF SCHOOL-OFFICIALS IN NORTH CAROLINA.

OHIO.

[From report of Hon. Thomas W. Harvey, State-commissioner of common schools, for the year ended August 31, 1872.*]

IRREDUCIBLE SCHOOL-FUND.

This statement shows the amount of interest on the several funds constituting the irreducible school-fund for the year ended December 30, 1871, due and payable to counties on and after January 1, 1872, and paid during the fiscal year ended November 15, 1872.

Sixteenth-section-school-fund	$175,835 26
Twenty-ninth-section ministerial fund	6,319 79
Virginia military-school-fund	11,680 48
United States military-school-fund	7,216 33
Western-reserve school-fund	15,455 22
Total	216,696 71

The amount paid to the Ohio University was $157.24 and to the Ohio Agricultural and Mechanical College, $2,000, making the aggregate amount of interest on the irreducible school-funds disbursed by the auditor of the State, $219,053.95.

FINANCIAL STATEMENT.

Balance on hand September 1, 1871	$2,393,376 86
Received from State-school-tax	1,494,588 02
Decrease from last year	19,472 32
Interest on irreducible funds and rents of school-lands	248,194 41
Increase over last year	6,792 47
Received from local taxes	4,933,759 08
Decrease from last year	14,040 71
Received from sale of bonds	508,852 55
Increase over last year	94,780 04
Received from fines, licenses, &c	234,944 07
Decrease from last year	13,713 55
Receipts for 1872, exclusive of balance on hand September 1, 1871	7,420,338 13
Increase over last year	54,345 93
Total school-resources for 1872, including balance on hand September 1, 1871	9,813,714 99
Increase over last year	203,668 49
Amount paid teachers	4,219,563 04
Increase over last year	111,767 74
Paid for managing and superintending schools	129,615 07
Increase over last year	26,635 02
Paid for sites and buildings	1,428,964 91
Decrease from last year	88,056 18
Paid for interest on and redemption of bonds	566,498 48
Increase over last year	142,803 63
Paid for fuel and contingent expenses	1,039,215 18
Decrease from last year	64,022 94
Total of expenditures in 1872	7,383,856 63
Increase over last year	129,127 27
Total of expenditures in 1872, exclusive of amounts paid for interest on and redemption of bonds	6,817,358 20
Balance on hand September 1, 1872	2,429,858 36

Concerning expenditures the superintendent says: "I am satisfied that the amount reported as paid for managing and superintending schools, though larger than that reported in 1871, is too small. Such a proportion of the salaries of teachers who devote a portion of their time to supervision as corresponds to that time should be separated from their salaries and classed as expenditure for supervision.

"The decrease of $64,022.94 in the amount paid for fuel and other contingent expenses probably results from the fact that last year an amount quite as large, which should have been classed with the amount paid for interest on and redemption of bonds, was erroneously charged to this item."

* The statistical returns for 1873 will be found in tables I and II, at the close of the report.

SCHOOL-POPULATION AND ATTENDANCE.

White scholastic population—males, 533,703; females, 513,268	1,046,971
Increase from last year	15,206
Colored scholastic population—males, 13,348; females, 12,955	26,303
Increase from last year	20
Total scholastic population	1,073,274
Increase from last year	15,226
Scholastic population between the ages of 16 and 21	218,667
Scholastic population between the ages of 5 and 16	854,607
Number of males enrolled in public schools	370,719
Number of females enrolled in public schools	338,081
Number of pupils re-enrolled	14,452
Total enrollment, deducting number re-enrolled	694,348
Decrease from last year	23,322
Number of pupils enrolled between the ages of 16 and 21	85,309
Number of pupils enrolled between the ages of 5 and 16	609,039
Per cent. of enrollment on enumeration	65
Per cent. of enrollment on enumeration between 5 and 16	72
Average daily attendance of males	210,818
Average daily attendance of females	197,720
Total daily average attendance	408,538
Per cent. of average attendance on enrollment	58
Per cent. of average attendance on enumeration	38

CLASS-SCHOOLS AND PRIVATE SCHOOLS.

Class-schools comprise schools where instruction is given in the German language exclusively and schools composed exclusively of colored children. A school which ranks below an academy or high school, and receives no support whatever from public-school-funds, is called a private school. The following are statistics of such schools in the State:

Number of pupils enrolled in German schools	4,899
Decrease from last year	581
Number of pupils enrolled in colored-schools	6,455
Increase over last year	633
Whole number of pupils in class-schools	11,354
Number of pupils enrolled in private schools	8,386
Increase over last year	2,441
Whole number of pupils in private and class-schools	19,740
Number of teachers in German schools	67
Decrease from last year	24
Number of teachers in colored-schools	163
Increase over last year	18

TEACHERS AND TEACHERS' PAY.

Number of male teachers	9,718
Increase over last year	155
Number of female teachers	12,343
Decrease from last year	201
Whole number of teachers employed	22,061
Decrease from last year	46
Number of teachers necessary to supply the schools	14,788
Changes of teachers during the year	7,273
Number of permanent teachers—males, 3,070; females, 4,015	7,085
Decrease from last year	495

The following are the average monthly wages of teachers in the different schools:

Male teachers in township primary schools	$39
Female teachers in township primary schools	26
Male teachers in township high schools	64
Female teachers in township high schools	43
Male teachers in separate district primary schools	58
Female teachers in separate district primary schools	36
Male teachers in separate district high schools	81
Female teachers in separate district high schools	56

TEACHERS' CERTIFICATES.

Number granted for 24 months: to gentlemen, 367; to ladies, 178	545
Number granted for 18 months: to gentlemen, 1,468; to ladies, 1,025	2,493
Number granted for 12 months: to gentlemen, 4,386; to ladies, 4,027	8,413
Number granted for 6 months: to gentlemen, 4,182; to ladies, 5,098	9,280
Whole number granted: to gentlemen, 10,403; to ladies, 10,328	20,731
Increase over last year	902
Number who failed in examination: gentlemen, 2,103; ladies, 2,526	4,629
Number of colored persons who applied for certificates: gentlemen, 117; ladies, 117	234
Increase over last year	41

SCHOOL-TERM.

Number of weeks' school required by law	24
Average number of weeks primary schools were in session in townships	26.37
Average number of weeks high schools were in session in townships	26.55
Average number of weeks primary schools were in session in separate districts	34.18
Average number of weeks high schools were in session in separate districts	34.39
Average number of weeks common schools were in session in the State	30.37

SCHOOL-DISTRICTS AND SCHOOL-HOUSES.

Number of school-districts, township and separate	1,893
Number of subdistricts in townships	10,695
Number of school-houses erected during the year	566
Cost of school-houses erected during the year	$893,422
Whole number of school-houses in the State	11,665
Total value of school-houses in the State, including grounds	$17,168,196
Increase over value of last year	$2,179,584
Number of common-school-rooms in the State	14,201
Increase over last year	15

NET COST OF EDUCATION FOR THE YEAR.

In townships, total cost, less amounts paid on permanent property in 1872	$2,913,825 00
In separate districts, total cost, less amounts paid on permanent property in 1872	2,479,396 00
In the State, total cost, less amounts paid on permanent property in 1872	5,393,221 00
In townships, average cost per pupil on year's expenditures, net, in 1872	$10 62
In separate districts, average cost per pupil on year's expenditures, net, in 1872	18 48
In townships, average cost per pupil on year's expenditures, net, in 1872, including 6 per cent. on estimated value of permanent improvements	12 11
In separate districts, average cost per pupil on year's expenditures, net, in 1872, including 6 per cent. on estimated value of permanent improvements	23 11
In the State, average cost per pupil on year's expenditures, net, in 1872, including 6 per cent. on estimated value of permanent improvements	15 72

AVERAGE RATE OF LOCAL TAX FOR COMMON SCHOOLS.

Average number of mills on each dollar, local levy, in townships, for schools in 1872	3.04
Increase over last year	.02
Average number of mills on each dollar, local levy, in separate districts, for schools, in 1872	6.37
Increase over last year	.18

THE TOWNSHIP-SYSTEM.

The system inaugurated by the act of March 14, 1853, is a compromise between the independent subdistrict-system in force previous to the passage of that act and a sys-

tem in which each township becomes a school-district, all subdistrict-boundaries being abandoned.

The recommendation made in the last annual report, that "the number of local directors in each subdistrict be reduced from three to one and that the management and control of all the schools in each township be transferred to the township-board," is repeated.

SCHOOL-TERM.

In every district, whether township or separate, schools are required to be kept in session at least twenty-four weeks each year.* The funds raised by State and local taxation are not sufficient, in some districts, to enable school-authorities to obey this requirement; but it is gratifying to know that, while many boards of education are embarrassed in their efforts to continue the schools the required number of weeks, objections to the length of the scholastic year are rarely made. In almost every instance an increase of the amount to be raised by local levy is recommended. A steady improvement in this particular is evidenced by the fact that, while last year the number of subdistricts reported as maintaining schools less than the time required by law was 884, there are reported for this year only 497.

ATTENDANCE.

The prevalence of small-pox and other contagious diseases in most of the cities and towns, as well as in many country districts, during the winter of 1871–'72 occasioned a marked decrease in the average daily attendance in those localities and a consequent decrease in the general result.

The legal school-age is from 5 to 21 years, but comparatively few children attend school before the age of 6 years and a very large proportion leave the public school at the age of 15 to engage in some employment.

ENROLLMENT-STATISTICS NOT TRUE INDEX OF ACTUAL ATTENDANCE.

The per cent. of enrollment on the whole enumeration of youth between 5 and 21 years does not, therefore, present a just idea of the educational condition of the youth of the State. The per cent. of enrollment of youth between 5 and 16 years, the usual school-age, on the enumeration of such youth in the State, is 72.28; therefore only about three-tenths of this class of youth were not in attendance upon any school during the past year. This showing indicates a near approach to universal common-school education.

TRUANCY AND ABSENTEEISM.

The superintendent remarks, in this connection: "The influence of our public schools is not so far-reaching as could be desired, not from any radical defect in the system, but from the inadequacy of the means and agencies provided for its administration. Truancy and absenteeism are evils for the cure or prevention of which no laws have been enacted. Attendance at school is entirely optional. Children unable to read or write may be employed on the farm or in mine, workshop, or factory. The State does not interpose to protect them against the avarice of parents or the rapacity of employers. There is, however, a growing sentiment in favor of stringent laws against truancy and the employment of illiterate youth in industries of any kind, when such employment is a virtual denial of school-privileges. The people desire to see the results of compulsory laws, although it is questionable whether they are ready to sanction their enactment."

SUPERVISION.

In most of the 549 special districts in the State—especially in those containing more than three hundred youth of school-age—supervision is employed and acknowledged to be as essential an element to success in educational effort as in business-enterprises. In most of the large cities the superintendent is assisted by supervising principals, who have charge of several schools, or by principals of ward- or district-schools, each devoting all or a portion of his time to supervision and the training of inexperienced teachers. Earnest and intelligent supervision has contributed as much as any other agency to the efficiency and consequent enviable reputation of these schools.

The 1,344 township-districts in the State are each, with a few exceptions, divided into subdistricts. Theoretically, the schools in these districts are managed and controlled by township-boards of education; practically, they are managed or mismanaged, so far as the details of the work of education are concerned, by local directors, to whom the "local interests and affairs" of subdistricts are intrusted. The duty of visiting schools is rarely performed by these directors, and when performed—because it is a requirement of the law—the visit is usually made a mere matter of form. The conduct of the schools is left entirely to the teachers, most of them young and inexperienced.

Township-boards of education may, if they think best, appoint one of their own num-

* This provision still exists in the new law, passed since the above was written.

ber to perform the duties of supervision and management of the schools; but apathy, indifference, or a desire to economize in school-expenses has rendered this provision of the law a practical nullity. Very few acting managers have been appointed since the passage of the act creating the office. Some of them have labored diligently to improve the condition of the schools in their townships, and in most instances their efforts have been eminently successful; but the school-system, as a whole, has not been vitalized by their labors. Their influence has been felt in single townships only, and these few in number and scattered here and there over the State. "A more efficient system of supervision, expressly adapted to the peculiar wants and needs of the country schools and to the administration of educational affairs in rural districts, should be inaugurated."

In the reports of auditors, examiners, and other school-officials, the plan of county-supervision is recommended with remarkable unanimity as the most economic and as best calculated to benefit the country schools. At a meeting of the teachers' institute in Paulding County, the teachers of that county passed a resolution declaring that the interests of the schools of the county demand the supervision of a county-superintendent.

The State-superintendent joins with others in recommending the adoption of the plan of county-supervision and urges the matter upon the attention of the general assembly.

CHANGES OF TEACHERS.

The number of teachers necessary to supply the schools of the State is 14,788; the number of different teachers actually employed during the year was 22,061; showing that 7,273 changes of teachers were made within the year—128 fewer than in the preceding year.

"Permanent teachers" are those who are employed in the same district during the entire school-year. They do not, necessarily, equal in number those who make teaching a business during the time the public schools are in session. It is difficult, if not impossible, to ascertain the number belonging to this class or the number of teachers employed in more than one district within the year. The number of permanent teachers reported for the year is 7,085, a decrease from last year of 495. An increase of 4,082 in the number of permanent teachers was reported in 1870 and an increase of 409 in 1871. The superintendent is not aware of the existence of causes which should occasion the decrease reported this year.

SALARIES OF TEACHERS.

In the township-schools there has been an increase of salaries, amounting to $5 per month for ladies and from $2 to $7 per month for gentlemen. In the separate district-schools there has been a reduction of salaries; in the primary schools, $14 per month for gentlemen and $5 per month for ladies; and in the high schools, $12 per month for gentlemen and $2 per month for ladies.

Many of the school-officers, in their reports, recommend an increase of salaries for teachers. The idea is gaining ground that to secure competent instructors there must be a fair remuneration. Until the pay for teaching is raised, talent and energy will naturally be carried into more remunerative professions. One official says: "When the pay is raised and teachers employed by the year, with a sufficient year's pay, the number of teachers will be decreased and their qualifications raised in a corresponding ratio." The auditor of Hardin County, where teachers' wages have nearly doubled within two years, writes: "The result is that many of our most talented young men and women, who have hitherto followed other vocations, have entered the teachers' ranks."

EXAMINATIONS OF TEACHERS.

There are 264 county-examiners in the State, of whom 147 are teachers, 50 attorneys, 21 ministers, 14 farmers, 8 physicians, and 20 are engaged in other employments. They are appointed by the probate-judges of their respective counties and hold their office for two years. The compensation they receive is small, in comparison with the responsibilities they are required to assume; but it is believed that the duties of no other class of school-officials are discharged more faithfully or more intelligently.

A determination is manifested, in many counties, to raise the standard of qualifications heretofore required of teachers. A comparison of the lists of questions used as examination-tests in 1869 with those used the past year shows that, so far as these tests are concerned, examinations are not more thorough now than they were three years ago. It is not necessary, perhaps not desirable, that examinations be made more difficult, in theory at least, than they have been during the last few years. The standard can be raised by requiring of applicants a greater familiarity with methods of instruction, a larger percentage of accurately-expressed answers, knowledge of principles as well as facility in the application of rules, and evidence of ability to rouse the energy and interest of their pupils. To these requirements may be added an acquaintance with some of the best practical works on mental and moral science and intelli-

gence in matters of general interest, without which a teacher will do routine-work only.

Examiners, especially in country districts, have reason to know that the mistaken notion that intelligence, good scholarship, and professional training are not essential in the teachers of young children is too prevalent. The clerk of a board of examiners writes: "We are often urged—sometimes by members of school-boards—to violate the law and grant certificates to those who are known not to be qualified in some of the branches specified in the statute, because they are desired to teach primary schools or summer-schools, in which there will be no advanced pupils." Other examiners encounter the same difficulty in the discharge of their duty. Earnest, active teachers always support progressive measures on the part of examiners. At a teachers' institute, largely attended by some of the most earnest teachers in the State, it was "Resolved that we * * * ask and demand that the examiners license no incompetent persons out of fear or favor."

TEACHERS' CERTIFICATES.

The tables in the State-commissioner's report relating to applications for teachers' certificates show an increase of 590 in the total number of such applications and an increase of 889 in the number of those that failed to pass the required examination.

STATE-BOARD OF EXAMINERS.

A new school-law, passed May 1, 1873, makes it the duty of the State-commissioner to appoint a State-board of examiners, to consist of three competent persons, resident in the State, which board is authorized to issue life-certificates, of high qualifications, to such teachers as may be found, upon examination, to possess the requisite scholarship. The applicants for such certificates must exhibit satisfactory evidence of good moral character and of eminent professional experience and ability.

LIFE-CERTIFICATES.

These life-certificates must be countersigned by the commissioner of common schools, and, when thus perfected, will supersede the necessity for any other examination of the persons holding them and be valid in any school-district in the State, unless revoked by the State-board of examiners for good cause.

TEACHERS' INSTITUTES.

Reports from sixty-nine teachers' institutes have been received. It is probable that others were held within the year. If so, their officers failed to report. The sum of $6,262.86 was expended in sustaining these institutes, of which $10,585.02 was taken from the institute-fund, $4,415.51 was contributed by members, $825 appropriated by county-commissioners, and $437.33 obtained from sources not specified. The institutes were attended by 6,838 teachers, nearly one-third of the whole number in the State, and 337 instructors and lecturers were employed.

Ten counties appropriated an aggregate of $885 to sustain institutes in their respective counties. This small sum was all the State expended during the year for the professional training of teachers. One-third of the amount paid by teachers in examination-fees could have been legally used for this purpose, and teachers join with the State-commissioner in recommending that the law authorizing this appropriation from the county-treasury be so amended as to make the action of county-commissioners a legal requirement.

WORK OF TEACHERS' INSTITUTES SHOULD BE SYSTEMATIZED.

It is remarked that "the usefulness of teachers' institutes would be greatly increased if the exercises were carefully classified and systematized. Generally speaking, those who conduct them act independently of each other and without any definite, matured plan. Quite frequently the instruction given is not such as inexperienced non-professional teachers need. To secure the best results, the organization and conduct of both county- and district-institutes should be intrusted to a board of managers composed of men who have had long and successful experience as teachers and lecturers." The work could then be defined and classified and institutes made more popular and efficient than they are now.

The suggestion made in the last annual report, that the schools of each county be closed during the week a county-institute is held and the teachers required or permitted to attend it without loss of wages, is repeated.

SCHOOLS FOR COLORED CHILDREN INADEQUATE.

Adequate provision is not made for the education of the colored youth of the State. In many districts, where the number of such youth, by enumeration, is less than twenty, the operation of the school-law practically deprives them of educational privileges and advantages.

Mention is made in some of the county-reports of neglect and unfair dealing on

the part of boards of education in respect of the colored population. One auditor states that in his county there is but one board of education that provides the same number of weeks' school for the colored youth as for the white. Two districts in this county provide, respectively, twenty-six and twenty-eight weeks of schooling for white youth and only twelve weeks for colored.

WHAT SHALL BE TAUGHT IN OUR PUBLIC SCHOOLS?

"The authors of our public-school-system undoubtedly thought that our schools ought to furnish such an education as would enable the youth of the country to act intelligently as citizens, to fill places of trust and responsibility, and to transact the ordinary business of life readily and accurately. From the fact that they made adequate provision for the establishment and maintenance of schools of a higher grade than the common or primary school, it is inferred that they fully appreciated the value and importance of liberal culture and that they considered the encouragement and support of all practicable schemes for the dissemination of knowledge among the people a proper function of government.

"A practical knowledge of the so-called common branches can be obtained by the average pupil before he ought to be removed from school and its restraining influences. Hence, in our best schools some provision is made for instruction in other branches. Oral lessons in botany, chemistry, physics, &c., are now given in the lower departments of most of our graded schools. Being continued through successive years, they afford opportunity for teaching many things of great practical value to the farmer, mechanic, and business-man, of which pupils unable to complete a high-school-course of study might otherwise remain ignorant. Instruction of this kind ought to be given in every school in the State. The unwisely conservative, who cling with such tenacity to the 'good old ways,' should remember that progress pays no respect whatever to myths and traditions. While thought is reforming abuses in government, sweeping away antiquated systems that have outlived their usefulness, and science is revolutionizing the industries of the world, it is not probable that the school-room, with its traditional methods of instruction and management, will be let alone."

MORAL INSTRUCTION.

"No person who has not obtained a 'certificate of good moral character' from a board of examiners can be legally employed as a teacher in the common schools of Ohio The standards of moral excellence differ widely in different counties, and it is to be feared that some examiners do not pay due attention to this salutary provision of the law. Public opinion, however, is strongly in favor of excluding from the ranks of qualified teachers all who cannot furnish satisfactory evidence that they lead blameless lives and whose example is not such as youth should follow. The 'silent example' is not, however, all that is requisite. Our youth must receive direct, positive instruction in moral science. They must be taught to respect the rights and feelings of others, to obey parents and those in authority, to be kind, truthful, frank, unselfish, chaste, courteous, respectful. They may be instructed in that morality which concerns the family, society, and the State. They may be taught to love the true and the genuine, to hate all shams and humbugs, to have faith in whatever is right, to be honest in business-transactions, to respect those principles of honor upon which all good citizenship rests, and to cherish and practice those virtues which are the beauty and glory of character. Such instruction as this is not sectarian, and every true patriot and philanthropist will rejoice when it shall be required to be given in every school in the land."

DRAWING.

The neglect of this branch is spoken of as the "great defect in our educational system;" and the necessity for art-culture in those schools where our mechanics and artisans receive their education, if we would successfully compete with other countries in the manufacture of products requiring taste and skill, is urged in the strongest terms. The superintendent quotes from the Report of the Secretary of the Massachusetts State Board of Education upon this subject, and then remarks: "Among our teachers and educational men generally there is a growing conviction that the example set by Massachusetts should be followed by Ohio. Free-hand drawing, as a required or optional branch of study, should be taught in our common schools and mechanical drawing in the higher departments of our graded schools. The school-authorities of our cities and large towns should also be required to establish evening-schools, in which instruction in this branch shall be given to apprentices and journeymen unable to attend day-schools."

With regard to the objection urged by some that the study of drawing cannot be introduced successfully in the public schools, because teachers as a class are ignorant of the art, it is said: "This objection has really no force whatever, for no more talent is required to teach free-hand drawing than is needed in teaching penmanship or the other common branches." The successful experience of Massachusetts in this respect

is referred to, and it is also said that the experience of the superintendents of those schools in Ohio in which drawing is taught will confirm the truth of this statement.

The report of the superintendent of the city of Akron contains the following: "Not the least difficulty in attempting the introduction of drawing was the want of any one properly qualified to direct the work; and the entire absence of instruction and experience on the part of the teachers very naturally led them to shrink from the undertaking. But feeling the importance of culture in this direction, it was determined to make the attempt with such facilities as were at our command. I have no hesitation in saying that the results are more than an equivalent for the outlay."

SCHOOL-HOUSES.

The expenditure for building-purposes has been decreasing for several years. The amount expended in 1870 was $1,391,597; in 1871, $1,025,077; and in 1872, $893,422, or $498,175 less than the amount expended in 1870. Of the 566 school-houses erected during the year, 519 were in townships, an increase of 17 from last year, and 47 in separate districts, a decrease of 29 from last year. In 1871, a decrease of 81 was reported in the number of school-houses erected in townships and an increase of 14 in separate districts.

Great pains have been taken to obtain reliable returns of the estimated value of school-houses and grounds in the State, and it is believed that the estimates reported this year are much closer approximations to the true value of that kind of property than those reported heretofore.

CINCINNATI.

[From report of Hon. John Hancock, superintendent of city-schools.]

Attendance.—Statistics of the city-schools show that 75 per cent. of all the pupils on entering school are under 12 years of age and less than 9 per cent. are above 14. A table giving the per cent. of withdrawals of pupils from all the schools at the different ages, estimated on the whole number enrolled at those ages, shows that the best years for permanency in school are from 7 to 9, inclusive. The prevalence of small-pox during the winter of 1871–'72 reduced the attendance nearly 25 per cent.

Teachers.—The superintendent remarks: "I am fully persuaded that schools in general are suffering more from defective scholarship on the part of teachers than from almost any other cause." It is considered desirable that the board of examiners should in its examinations lay greater stress on methods of instruction and their philosophy. It is impossible to attach too much importance to this department of pedagogics.

The question is presented for the consideration of the board of examiners whether they should not, after a specified time, say one year, require candidates to pass an examination in the elements of music and drawing, in addition to the branches now on its list. If the regular teachers are to be relied on for instruction in these branches, they should be tested as to their capacity for doing the work.

It is recommended that all new appointments of teachers be temporary, say for three months, their permanent appointment depending on their success during this period.

The German department.—The ratio of the pupils studying German to the whole number in attendance in the schools is constantly growing. This is not only an evidence of an increasing interest in the subject, but also of confidence in the method of teaching it.

A more systematic plan for the upper grades is considered of great importance, as is also a higher standard of attainment. Pupils should at the end of their course be able to speak and write the language with correctness and to read the best classics with ease and pleasure. Under the present lack of a settled plan for the high schools, but few, if any, become able to do this. That pupils pursuing the study in the intermediate schools have been compelled to drop it for the first year on entering the high school has worked badly. And the other fact, that on taking up the study in the C grade of the latter schools, pupils of every stage of advancement have been thrown together in the same class, is a still greater drawback to successful and thorough work.

It is recommended that no one hereafter be allowed to begin the study of German in the high schools, but that all pupils intending to make this language a part of their education, and who have not studied it in the district schools, shall take it up on entering the intermediate schools. It is also recommended that such pupils should not only be examined in German for transfer from grade to grade, as is now the case in the district and intermediate schools, but also for transfer from the intermediate to the high schools. Such an arrangement would be the highest inducement for faithful work in this study. Not only this, but the six years—as a minimum—of systematic study would give results that have not, as yet, been even approximated, and which cannot be attained except by a plan exacting and sharply defined in its outlines.

As recommended in the last report, a German-English normal department has been established in connection with the Cincinnati normal school, and at the close of the first course thirteen graduates received their diplomas.

Drawing.—Last year, under the new rule of the board for teachers' meetings, it was

arranged to have one of the schools dismissed each afternoon at recess, for the purpose of having the teachers of the schools take a lesson in drawing. At these lessons the teachers divided their time equally in drawing on paper and in drawing on the blackboard, the latter exercise being especially necessary to fit them to teach the subject. In this way about nine lessons were given in each school during the year. The teachers generally seemed to take hold of the exercises with much spirit, and undoubtedly derived great profit from them. Quite a number of teachers also took lessons on Saturdays.

The Cincinnati day-schools are now behind none in their drawing. One point absolutely essential to the success of this department is, that its teachers should receive the hearty co-operation of all the regular teachers. Without the aid of the latter, neither it nor any other special branch can succeed. It is not surprising that the general public should not at once correctly estimate the value of these branches, but that professional educators should fail to do so is matter of special wonder. The Cincinnati board of education has been the leader in this movement for instruction in art and has manifested at no time since it entered into it any inclination to abandon it.

Music.—The examination this year was considerably more difficult than that of the previous year, and the pupils were required to be more prompt in their answers and in their singing of exercises at sight. Altogether, it evidenced commendable progress and showed the wisdom of the board in appointing a superintendent of the department, thereby unifying and harmonizing the work of the teachers. An effort is being made to correct the fault that has hitherto characterized the singing of our schools, particularly in the lower grades: the overstraining of the voice by too loud singing. Voice-culture ought to occupy a greater share of attention in our musical instruction than it has heretofore done.

Geography.—The course of instruction in this branch has for the last few years been undergoing a gradual change. Formerly the course was largely confined to local geography, especially in the district-schools. At present local geography occupies but a subordinate place, and the syllabus for instruction in it has been abandoned in all the grades in which geography is taught, except the lowest. Descriptive and physical geography have been made to take the place of local geography. No branch has seemed so sterile of valuable results as local geography, while, on the other hand, the study of descriptive and physical geography vitalizes the thinking powers to a greater extent, perhaps, than any other branch taught in the public schools.

Night-schools.—Although the enrollment of pupils in these schools last year was considerably larger than that of any previous year, the per cent. of attendance was smaller. A part of this falling off may, perhaps, be attributed to the prevalence of small-pox during the winter-months. This irregularity of attendance is the great drawback to the success of night-schools. Any scheme that would in part remedy this defect would insure a more favorable result in the working of these schools than it has been possible hitherto to attain. The larger part of the irregularity is among the younger pupils, whose powers of endurance seem scarcely sufficient to carry them through the labors of the day and two hours' mental application at night. The older the pupils the more regular their attendance and the greater their diligence and interest, and it is questioned whether the minimum age for admission might not be raised a year or two with advantage to the *morale* of the schools.

An efficient means of lessening the irregularity of attendance will be always to have instruction full of vitality. No droning book-methods will answer. Pupils cannot be held in the schools if such are adopted. For this reason only teachers of the first rank must be employed. An attempt was made during the winter to limit the number of pupils to each teacher in the night-schools to twenty. As the teachers of the night-schools must come from the corps of day-school-teachers, five nights a week is considered too much, and it is recommended that hereafter there be no school on Wednesday night.

The committee joins with the superintendent in recommending that the branches taught in the night high school shall be elective by the scholars; they also recommend that to secure the best teachers for this school some addition be made to the salary heretofore paid. The superintendent recommends a supply of drawing-stands, patterns, models, &c., so that drawing may be taught in this school under the best possible conditions.

Cincinnati University.—It is a matter of regret that this institution is not ready for pupils and that it is uncertain when the directors will be able to set it in operation. Laboring, as they have been, under almost insuperable obstacles in putting into permanent productive shape the magnificent bequest for the establishment of the university, still it is to be hoped that these preliminary arrangements are nearly complete and that some, at least, of the departments may soon be opened.

Public library.—The circulation of books has nearly doubled and the use of the reading-rooms has more than trebled during the year. The donations of books have more than doubled and many of them have been received from Europe. The addi-

tions to the library during the year include 1,208 volumes in French and 1,674 in German. Before the expiration of another year the main library-building will be completed. This will be the largest and, save one, the only *fire-proof* structure for library-purposes in the country.

CLEVELAND.

[From report of Hon. Andrew J. Rickoff, city-superintendent.]

Study of German in the public schools.—The rapidity with which the German department has grown, the general gratification which has been manifested on account of its introduction, the unabated support which it has received in the board of education, the uninterrupted harmony which has existed between the English and German corps of teachers, are all justly held to be evidences of the wisdom of its establishment in the Cleveland schools. In answer to the question sometimes asked, whether the study of the German does not retard the progress of the pupil in his English studies, the superintendent says that, while doubtless there are exceptions to the rule, the careful observation of twenty years establishes the fact that children who study the German language for the first four years of the school-going age half the school-hours of each day, and for the remaining period three-quarters of an hour per day, reach the seventh class in the school-curriculum at an average age less by one year than those who study the English language alone.

The lessons of the primary German classes are from 45 minutes to 2 hours in length daily. The grammar-classes have one lesson of 45 minutes daily. There are 91 classes, 35 consisting of both German-speaking and English-speaking pupils, 30 consisting only of German- and 26 only of English-speaking pupils. The German teachers have held meetings for improvement once a fortnight.

Special superintendence of primary instruction.—At the beginning of the last school-year, two ladies who have made a special study of primary instruction, who were familiar with its processes and comprehended its purposes, were appointed supervisors of the two lower primary grades. The movement has proved even more prolific of good results than was anticipated. It has given a unity of design and secured a uniformity of results in the work of the primary grades which was not before supposed to be possible, and, in all that belongs to educat on proper, discipline, and culture, it has more than doubled the efficiency of the schools.

Adaptation of women to the work of supervision.—When women were placed at the head of the grammar-schools and again when the special superintendents of primary instruction were first appointed, grave apprehensions were entertained by some as to their securing, in the performance of their duties, the deference and respect from their subordinates which would be accorded to men in these positions. All such apprehensions have proved entirely groundless. The harmony which has prevailed since these changes have been made has been without precedent in the schools, certainly for many years.

Corporal punishment.—Corporal punishment is allowed by the rules of the school, which also provide that "all cases of such punishment shall be reported to the superintendent, according to the form and requirements of blanks, to be furnished by him for the purpose."

The fact that a report of the infliction of corporal punishment of every kind is required, that this report is placed on file, and that it is subject to review and comparison from month to month, and the consequent demonstration of the fact that the "maximum of punishment indicates the minimum ability on the part of the teacher to govern and control her pupils," has gone far towards suppressing it. The number of cases has been gradually but steadily reduced, until, at the present time, they are not more than a tenth of what they formerly were, though the attendance upon the schools has been almost doubled. The change is regarded as more satisfactory than if it had been the result of prohibitory action on the part of the board of education.

The statistics given in the report of the schools of Cleveland for the autumn of 1873 are as follows: children of school-age, (6–21,) 36,601; enrolled in schools, (public, 15,515; private and parochial, 7,686,) 23,201. Schools, primary and grammar, 23; high, 3; evening, 3—total, 29, besides 4 private and 15 church-schools, making a grand total of 48. Teachers in public schools, (male, 13; female, 221,) 234. Besides these, 4 males are employed as special teachers, 1 for music, 1 for drawing, 1 for penmanship, and 1 for gymnastics, while 2 act as assistant superintendents, making the whole number of males employed 19. The two ladies employed as special superintendents of primary instruction may also be added to the female force, making the number of women 223 and the whole number of regular and special instructors 242. The salaries of teachers are from $400, the minimum per annum for female teachers in the primary schools, to $3,000, the maximum for male principals in the high schools. The school-income, including a balance on hand from the last school-year of $95,949.43 and a library-fund of $8,315.51, is $349,383.33. The expenditures, including $9,658.95 for sites and buildings and $4,863.36 for libraries and apparatus, have been for the past school-year, $234,030.10. Latin and Greek, as well as German, are taught in the schools. Thirty of the pupils are known to be preparing for college, and almost all are instructed in drawing and vocal music.

COLUMBUS.

[From report of Hon. Robert W. Stevenson, city-superintendent.]

The enrollment and attendance of pupils during the past year has been larger than ever before. Few parents have complained of injustice or other wrong; no case of cruel or excessive punishment has been reported; no expulsions and but few suspensions have been found necessary. School-officers and teachers have worked faithfully and with zeal. No opportunity was offered the teachers for the better preparation of themselves for school-work which they did not cheerfully and eagerly embrace. When required to spend an hour or two hours, after a hard day's work, at a teachers' meeting, they did it willingly and with an evident desire to learn. The number of teachers whose day's work ended with the close of the daily sessions of the school was few.

Drawing has been taught in all the lower grades of the schools, with varying success. The teachers have little knowledge of the subject, and, having no special teacher, the results were good, bad, and indifferent, in accordance with the interest and effort of the teachers to prepare themselves for giving instruction.

The results of teaching botany and physics in the grammar-school-grades demonstrated fully the wisdom of the board in giving them a place in the course of instruction. About one hour a week was set apart for teaching the elements of these sciences.

In the German-English schools there were registered 1,717 pupils, all but about 100 of whom were children of German parentage. The only distinguishing feature of these schools from the other schools of the city is the study of the German language. During the first few months of the children's attendance at school all instruction is given in German, the language used in the homes from which they come. The teacher, in her conversation with the children, adheres closely to the German until the study of English is begun, which is when too great confusion will not arise from the introduction of another language. The elements of both the German and the English are taught phonetically and the transition from one to the other is easily made. From this point both languages are carried along together, the teacher sometimes giving instruction in all branches of study in German and sometimes in the English language. In the primary grades as good results are not secured as in the purely English schools, but the pupils who remain in school long enough to complete the grammar-school-course are, at the end of the course, equal in scholarship to the pupils in the English schools, having a fair knowledge of German in addition.

DAYTON.

[From report of Hon. Warren Higley, city-superintendent.]

Course of study.—In the district-schools the course of study is divided into eight grades, occupying the same number of years. Reading, in the lowest grade, is taught by the phonic method. In the sixth year the elements of botany are taught and in the seventh the elements of natural philosophy. These lessons have proved both interesting and profitable. The district-school-course prepares for the entrance-examination to the high school. There are four distinct courses of instruction for the high school: the Latin-English; the German, French, and English; the college-preparatory course; (each of four years;) and the English course of three years. The first course prepares for entrance to any of the colleges of the State where Greek is not required as one of the conditions. The college-preparatory course will fit pupils for entrance to most of the eastern colleges or to those in the West requiring Greek.

A feature of the district-schools is the semi-quarterly written examinations. These are the only records by which the standing of the pupil is determined. Class-records are dispensed with.

German-English instruction.—One-third of the school-attendance belongs to the German department. The pupils are chiefly of German parentage and are taught alternately a half day in English and a half day in German. This German instruction continues through the first seven years of the district-schools, and it is found that the pupils thus taught in the two languages enter the last year of the course with an average age no greater than that of the English pupils. This is accounted for on the ground that the continued study of two languages necessarily creates an activity of mind that gives greater strength to the mental faculties, and hence increased ability for acquiring knowledge.

Music.—Music is taught as a science, from the lowest to the highest grade. This department is in charge of a professor, who instructs the teachers in his method. Every teacher gives the daily lesson and is responsible for the progress of her pupils in this as in any other study.

Normal school.—The city normal school has been in operation three years. The course of instruction and practice extends through one year. Pupils entering this school agree to teach in the public schools of Dayton for two years after their graduation, provided their services are required. There have been forty graduates, of whom thirty-two are engaged in the schools.

Women as principals.—The experiment of employing women as principals, inaugurated in Dayton at the beginning of last year, has more than justified the wisdom of the board in making so sudden and sweeping a change. Instead of the insubordination and disorder predicted by many, there has been an increase of order. All details of school-management have been attended to with that scrupulous care which prevents irregularity and inefficiency in the workings of a large school. The subordinate teachers at once yielded the respect due to the position and evinced their confidence in the new system by the ready assent given to all requirements of the lady principals. Notwithstanding the fact that the principals taught the subjects of the highest grade for the first time and attended also to the general order of the building, the teaching has been as thorough as in former years.

Hamilton city-schools.—The enrollment for the past year was 1,616; average number belonging, 1,178; average attendance, 1,114; per cent. of attendance on number enrolled, 69; per cent. of attendance on average number belonging, 94.5.

The school-accommodations have hitherto been entirely inadequate. A building is now in process of erection which will afford seating capacity for nearly 600 pupils. The cost of this building is estimated at $60,000.

There are four school-departments: the primary, with three grades; intermediate, two grades; grammar, two grades; and high school, four grades.

Music, drawing, and object-lessons.—Music is taught under the direction of a special teacher. Bartholomew's system of drawing was introduced about three years ago, but the result was a failure, owing to the fact that the work of instruction was left entirely to the regular teachers, very few of whom had any knowledge of this branch. Object-lessons and language-lessons occupy a prominent place in the course of study, but the instruction has not been altogether satisfactory.

German-English instruction.—A German-English department, in connection with the public schools, has been in operation since 1854. Fully one-third of the pupils enrolled receive German instruction. A higher per cent. of attendance is obtained in these schools than in those purely English, thus showing the estimation in which school-advantages are held by the Germans. The discipline in these schools is far from being satisfactory and the English instruction (given by German teachers) is a partial failure. It is recommended that English teachers be employed for the English branches, and it is considered probable that this method of instruction will be adopted at an early day.

The course of studies in the high school extends over a period of four years. It has lately been reorganized—made less restrictive and more elective—and the school has thereby been rendered more popular without lowering its standard.

Teachers' pay.—The highest annual salary paid any teacher is $950; the lowest, $450. It is in contemplation to raise the salaries of teachers in the lower grades, their work being considered as important, fully as difficult, and requiring the same amount of teaching power and experience to perform it successfully as the work of the higher grades.

TOLEDO.

[From report of Hon. D. F. De Wolf, city-superintendent.]

Growth of the school-system.—This will be seen from a comparison of the present school-statistics with those of 1864. At that time there were only 24 schools and 33 teachers, with 2,217 pupils enrolled during the year, out of an enumeration of 5,392, the term-enrollment in the four classes of the high school being 61. In January, 1866, the German schools then existing were adopted into the public-school-system, and since that time others have been added to meet the wants of this class. With these additions, the growth of the city, and a constant effort to induce all children to attend the schools—clothing in very many cases being provided, through private benevolence, for those who could not otherwise attend—the number of schools has reached 80, the number of teachers 100, and the number of pupils 6,572, or 62 per cent. of the mean between the 10,236 and the 10,860 youth enumerated in 1871 and 1872. The term-enrollment of the three classes of the high school is 181.

Evening-schools.—These are maintained by the board of education three nights each week during the winter, for those only who cannot attend a day-school. The number of pupils enrolled was 315; average weekly enrollment, 247; average nightly attendance, 180.

Catholic church-schools.—In the Catholic church-schools about 1,200 pupils are enrolled.

Employment of children in manufactories.—The growth of such manufactories as employ juvenile help is already affecting the per cent. of youth attending the schools. In one of these were found nearly 100 youth between 11 and 16 years of age and in each of several others a large number.

ZANESVILLE.

[From report of Hon. Alva T. Wiles, city-superintendent.]

City-schools.—The per cent. of average attendance on the total enrollment has been 71; the per cent. of average attendance on the average enrollment, 93; the per cent. of punctuality, 99.71; per cent. of enrollment on enumeration, 6–16, 80.

The schools are arranged in four departments. The first three years of the course constitute the primary department, the second three the secondary, the seventh and eighth the senior-department. The high-school-department comprises three distinct courses of study: an English course of four years, a classic course of three years, and a commercial course of two years. Pupils are allowed to take Latin in connection with the English course.

Corporal punishment.—There has been a decrease of 22 per cent. in the cases of corporal punishment during the year. It is recommended that the superintendent be authorized in certain cases to substitute temporary suspension for corporal punishment, which is described as a "relic of barbarism and badge of inefficiency."

Science-lessons.—The course of lessons in natural science, adopted a year ago as part of the course of instruction, has proved a source of great interest and has been of no small value.

Drawing.—The only exercises in drawing are those given in connection with the lessons in natural science in the secondary and senior grades. Drawing as a branch of systematic instruction is commended to the attention of the board.

THE NEW SCHOOL-LAW.

The following are some of the more important features of the school-act passed by the Ohio legislature at its last session:

The State is divided into five classes of districts: (1) city-districts, to consist of cities of 10,000 inhabitants and over; (2) city-districts, to consist of cities of less than 10,000 inhabitants; (3) village-districts, composed of incorporated villages; (4) township-districts, of organized townships; and (5) special districts, being existing districts not included in the four classes above named.

All school-districts are constituted "bodies politic and corporate," with sole and exclusive control of educational matters, including the full title and ownership of all real estate and all other property now used or hereafter to be acquired therefor. This is considered one of the most important features of the law, in that, while it invests boards with every needed power for independent action, it will also definitely fix responsibility for any failure in administration.

City-districts are placed entirely in the hands of boards of education, independent of city-councils.

Each board is required to establish a sufficient number of schools to provide for the free education of the youth of school-age within the district and may provide schools of higher grades than primary, and shall continue the same for not less than twenty-four nor more than forty-four weeks in each year. Special provision is made for children at "children's homes" established at county-infirmaries. Provision is also made for evening-schools in cities and villages.

Boards of education are to determine courses of study and text-books, provided no book shall be changed within three years after adoption without the consent of three-fourths of the members of the board.

Upon the request of seventy-five freeholders, residents of the district, representing not less than forty pupils, the German language may be taught, provided that all branches shall be taught in the English language in such schools.

Full control of schools, including the appointment, direction, and dismissal of superintendents, teachers, &c., is conferred upon boards of education, provided that in townships the local directors shall have the appointment and control of teachers in their local schools.

No member of a board of education shall receive compensation for his services, except as clerk of the board.

All youth between 6 and 21 years, being children, wards, or apprentices of actual residents, are entitled to full rights of the schools; and no pupil can be suspended from school-privileges longer than may be necessary to bring the case before the board or local directors, nor expelled, except by a two-thirds vote, and then for the current term only.

The State-commissioner is to appoint a State-board of examiners, authorized to issue life-certificates to such teachers as may pass the required examination. These certificates shall supersede all necessity for other examinations or certificates.

County-boards of examiners are to be appointed by the probate judge and to grant certificates good for six, twelve, eighteen, and twenty-four months within the county.

The State-commissioner shall be chosen by the people once in three years, the first election to take place in 1874.

Teachers' institutes are provided for in counties and funds appropriated for their support. These shall continue not less than four days. Teachers may dismiss their schools for the purpose of attending institutes.

There is to be an annual levy of one mill on the dollar of valuation on the grand duplicate for school-purposes.

This law is considered to be, on the whole, a great improvement on the disjointed and confused legislation which it supplants

PAROCHIAL SCHOOLS.

These are sustained by the churches, and most of them by the Roman-Catholic Church. A few are supported by the German Lutherans and occasionally one by other denominations. The number of these schools in Ohio is 446, with an enrollment of 40,881. The average attendance is estimated at about half the enrollment.

WOODWARD HIGH SCHOOL, CINCINNATI.

It appears that 20 per cent. of the pupils have been withdrawn during the year, a large part of them from inability to do the work of their grade. It has become an important question how to retain these pupils for a longer period. The plan proposed is to make three daily recitations the standard requirement for advancement from grade to grade. One-half the time in school is thus reserved for the preparation of lessons.

The additional requirements for admission, recently adopted by some of the eastern colleges, and especially Harvard, will prevent classes from being thoroughly prepared to enter at the end of three years. It is, therefore, recommended that the classic course be extended to four years.

HUGHES HIGH SCHOOL, CINCINNATI.

The enrollment of this year has been the largest in the history of the school, 425, an increase of 69 over last year. The graduating class numbered 37. The principal of this school joins with the principal of the Woodward High School in recommending the reduction of the number of studies required to three per day, and for substantially the same reasons.

CENTRAL HIGH SCHOOL, CLEVELAND.

This school reports 216 pupils and 8 teachers. The permanency of school-membership for the past three years shows a gratifying improvement in that respect. Thirty-five pupils graduated at the close of the year, of whom 10 were graduates of the four-years course and 25 of the three-years course.

WEST HIGH SCHOOL, CLEVELAND.

Various circumstances have hindered the efficiency of this school, but it has nevertheless done a good work and exerted a strong local influence. There is now a larger number of candidates preparing for admission to this school than ever before, and hopes are entertained that it will soon equal the Central High School in every respect.

PREPARATORY SCHOOLS.

Chickering Institute, at Cincinnati, said to be the largest boys' school of similar grade in the West, and the preparatory department of Oberlin College have an aggregate of 758 pupils preparing for college, of whom 560 are in the classic course and 198 in the scientific. In advanced classes there are 397; in senior, 78; in junior, 110; in middle, 149; and in fourth grade, 34. Chickering Institute, with 274 pupils, has a library numbering 500 volumes, an excellent chemic laboratory and cabinet of natural history, a philosophic apparatus, and a gymnasium. The preparatory department of Oberlin has 484 pupils in classic studies; it possesses a cabinet of natural history, a philosophic cabinet and apparatus, and a gymnasium. The library belonging to the college is used by the school.

OHIO CENTRAL NORMAL SCHOOL.

The regular course of the normal department occupies two years. There is a shorter or "school-district-course," which may be completed in ten weeks, and is designed, with the one-year academic course, to accommodate teachers who wish to review their studies and methods of teaching during the fall-term preparatory to entering upon their winter-schools.

The academic department comprises three courses: an English course of one year, a Latin and English course of two years, and a classic course of two years.

A Kindergarten is organized in Columbus, where, by special arrangement, those who belong to the normal department, and who possess the requisite qualifications, may learn the art of instructing in Kindergärten at one-half the usual rates, the time ranging from six months to a year, two lessons per week, one in theory, given at the normal school, the other in practice, in the Kindergarten.

There is connected with the institution a model school, including all the departments from the primary to the high school.

Diplomas will be awarded those who complete the entire course, academic and normal. Certificates will be granted to others according to time of attendance and proficiency.

CINCINNATI NORMAL SCHOOL.

The proportion of the pupils entering the normal school that are graduates of the city high school is constantly increasing. This year 27 per cent. of the admissions had completed the high-school-course; last year but 12 per cent. were graduates of these schools.

During the year there has been established in the normal school a department for the training of German teachers. These will, for the future, have the same advantages enjoyed by the English teachers, and this justifies the hope of great improvement in the present high standing of the German-English schools. A class of sixteen was admitted. Thirteen graduated at the close of the year and were immediately appointed to positions. The course of study has consisted of German grammar, translation, composition and literature, methods of teaching, English grammar, and composition. Drawing, penmanship, and music are taught the same as in the English department.

The normal school now occupies rooms in one of the district-school-buildings. The principal urges the necessity of better and increased accommodations. During four years the number belonging has increased from 25 to 70; the number of instructors, from 2 to 7; the number of classes, from 1 to 5; and the number of practice-rooms, from 2 to 8. It is found necessary to conduct two or three recitations in one room at the same time. The impossibility of doing thorough work in this way is strongly set forth.

NATIONAL NORMAL SCHOOL, LEBANON.

Over 1,600 pupils from thirty different States have in some years studied in this school. For 1873 it reports 1,506 as the number attendant during the last school year, of whom 457 were in the preparatory, 90 in the scientific, and 15 in the classic year. The number of resident instructors is 17; the number of graduates for the year, 44; since organization, 259. Its library consists of 3,250 volumes, of which 100 are on pedagogics. Thirty-five educational journals and magazines are taken. Drawing is taught from real objects; the natural sciences are assiduously cultivated; music, vocal and instrumental, is attended to; and there is a good working laboratory and philosophic cabinet and apparatus.

NORMAL INSTRUCTION.

The report of the State-superintendent says on this head: "Nearly one-third of our teachers leave the profession each year to engage in other employments. Of the many thousands required to supply our schools, a few hundreds only intend to become professional teachers. The expediency of establishing special training-schools of high grade, with complete exhaustive courses of study for the large non-professional class, may be questioned. The tax-paying population demand less expensive agencies than these, and it is the duty of statesmen to ascertain, if possible, what they are and whether they cannot be successfully employed."

Most of the non-professional teachers are undergraduates of high schools, academies, seminaries, and colleges, and have enjoyed no other educational advantages than those furnished by the country district-school. The question to be considered, then, is, What agencies are best calculated to fit and prepare the largest number of these teachers, in the best manner possible, all circumstances considered, for their work?

Private enterprise and State-munificence have done much towards providing facilities for obtaining a certain amount of special training. So-called "normal schools" have been established by individuals and corporations in almost every State. The objection to these is that "instruction in methods is made subordinate to the acquisition of scholastic attainments."

"City normal schools," it is said, "should not be cast in the same mold. The special wants of no two communities are alike." But whatever the character or limits of the instruction, it "should be purely professional." These schools answer the end of their establishment in supplying the demand for competent teachers in all grades of the city public schools.

"The case is far different with State normal schools. Comparatively few of the non-professional class of teachers will voluntarily avail themselves of their advantages. But they are needed as training-institutions for those ambitious and persevering enough to aim at the highest excellence in the profession of their choice and because they are indispensable to the existence of other agencies by which the non-professional class may be trained more or less thoroughly for their temporary calling. The graduates from this institution will be employed as teachers in the better class of town, village, and country schools. Many of them will organize and teach normal classes and repeat to others the lessons they have learned at their *alma mater*. Large numbers of non-professional teachers will be their pupils, will become imbued with their spirit, and use in school-work such methods as they recommend. In this way, both directly and indirectly, the normal school will exert a wide and healthy influence. It will be a purely professional school, not an academy or college with a normal department at-

tached, and in due time will become the acknowledged head of our school-system, controlling, stimulating, and directing all educational effort." Two courses of study are recommended for these schools, an elementary and an advanced course, the latter to be so complete that those who finish it shall be "thoroughly prepared to perform all the duties required of a first-class teacher or superintendent."

"But the State is not restricted to the employment of a single agency in providing professional instruction for its teachers. Boards of institute-managers should be appointed, whose duty it shall be to organize and provide for the conduct of normal institutes in different sections of the State, continuing them in session from six to ten weeks each year. County-institutes may be made more efficient than they now are by increasing the length of their sessions and intrusting their management to experienced educators. These agencies, when thoroughly organized, will place the means for professional instruction within the reach of every teacher in the land. It is admitted that their work will be limited, and, perhaps, somewhat superficial. They are, however, comparatively inexpensive, and, in the judgment of many thoughtful friends of the public-school-system, will do more immediate good to the non-professional class of teachers, all circumstances considered, than more expensive agencies."

Statistical summary of universities and colleges.

* Partially. †Unclassified. ‡One is but partially endowed. § All the endowment is general. ‖ After long litigation the supreme court has decided on the case of Oberlin College, affirming its title to lands in West Virginia, given by Gerritt Smith years ago, and now worth from $25,000 to $30,000.

ANTIOCH COLLEGE.

Ladies and gentlemen are admitted on equal terms. Those who do not wish to pursue the regular college-course are allowed to select any studies from its curriculum

which they are prepared to undertake to advantage. Degrees are conferred only on those who complete the prescribed course, but students pursuing selected studies for a period of not less than two years may receive certificates of proficiency. A preparatory school, connected with the college, is under the general supervision of the faculty. The charter of the college forbids the teaching of sectarian dogmas, but it is administered in the spirit and in consonance with the methods of liberal Christianity.

CINCINNATI WESLEYAN COLLEGE.

This institution, the first chartered college for women in the United States, includes eight departments: preparatory, academic, collegiate, (with three courses: first-classic, second-classic, and scientific,) the department of modern languages, college of music, academy of design, college of accounts and business, and Sunday-school normal institute. It is in contemplation to establish a woman's medical college as another department.

DENISON UNIVERSITY.

The courses of study are: collegiate, occupying four years; scientific, occupying three; and preparatory, occupying two. There is also an English-preparatory course, the object of which is to furnish instruction in the common English branches to those who are unprepared, through want of these, to enter the classic, preparatory, or the scientific course. Students who have the ministry in view, if without means of supporting themselves, are admitted as beneficiaries of the Ohio Baptist Education Society, furnished with free tuition and from $80 to $150 per annum.

HEIDELBERG COLLEGE.

Founded in 1850 by direction of the synod of Ohio of the Reformed Church, the curriculum has been revised and enlarged, so that it embraces all the subjects usually taught in the oldest and best established colleges, and the teaching force has been increased so as to afford the means for obtaining a truly liberal education. Special facilities are afforded for the study of German. A scientific course is provided. A preparatory department and a theologic department are connected with the college.

HIRAM COLLEGE.

Open to both sexes. The courses of study are preparatory, classic, scientific, ladies' higher English, (designed for those who have neither the time nor means for a collegiate course,) and commercial. A normal class is organized each fall-term, and the presiden delivers a course of lectures on school-management, methods of teaching, &c. A bib lical course, intended to be supplemental to the classic course, is open to all students. The charge for tuition is remitted in the case of young men preparing for the ministry.

KENYON COLLEGE
