REPORT.

DEPARTMENT OF THE INTERIOR, BUREAU OF EDUCATION,
Washington, D. C., June 30, 1883.

SIR: I have the honor to submit my thirteenth annual report.

So large a number of systems and institutions of education have been able to bring their reports up to the end of June, 1883, that this report is closed at that date. It will aid this Office greatly if this date should prove convenient for all those who are coworkers with it in the preparation of data included in these annual reports. So far little space has been given to the work of the Office itself. The reports have been devoted to the briefest summary of the vast amount of educational data in hand, but anything like a full representation of the work of the Office any year would fill a volume larger than this. It would contain the latest discussions of a variety of topics touching education the world over, based on the latest statistics, in which these would appear incidentally only. This part of the work of the Office comes and goes with the daily mail. Not infrequently single communications require months of research, and the results find their way into educational literature and thought and action, but are not known to have had any connection with this Office. One division, having three clerks, reports fifty-six days devoted to work of this character.

The communications sent out numbered 30,745 and those received 67,875. At the cost of great labor an entire rearrangement of the document division has been effected, which adds much to its efficiency. The documents distributed numbered 323,592 and were usually mailed in separate packages. Many of these were sent in response to individual requests. One document was asked for by as many as ten thousand persons, requiring the writing of as many addresses. This distribution of documents has favorably affected many educational methods and appliances. The teachers' institutes have been much more freely supplied than before. Circulars and bulletins were sent to 406 institutes held in twenty-three different States. Seventy-eight of these teachers' gatherings in a single State were furnished these publications. So far there is no means of ascertaining the number of teachers thus supplied with valuable information.

The following circulars of information have been printed and distributed since the enumeration in the previous report:

No. 1, 1882. The inception, organization, and management of training schools for nurses. 28 pp.

No. 2, 1882. Proceedings of the Department of Superintendence of the National Educational Association at its meeting at Washington, March 21–23, 1882. 112 pp.

No. 3, 1882. The University of Bonn. 67 pp.

No. 4, 1882. Industrial art in schools, by Charles G. Leland, of Philadelphia. 37 pp.

No. 5, 1882. Maternal schools in France. 14 pp.

No. 6, 1882. Technical instruction in France. 63 pp.

No. 1, 1883. Legal provisions respecting the examination and licensing of teachers. 46 pp.

No. 2, 1883. Coeducation of the sexes in the public schools of the United States. 30 pp.

No. 3, 1883. Proceedings of the Department of Superintendence of the National Educational Association at its meeting at Washington, February 20–22, 1883. 81 pp.

The following bulletins have also been issued:

Instruction in morals and civil government. 4 pp.

National Pedagogic Congress of Spain. 4 pp.

Natural science in secondary schools. 9 pp.

High schools for girls in Sweden. 6 pp.
Planting trees in school grounds. 8 pp.
Comparative statistics of elementary, secondary, and superior education in sixty principal countries. Sheet.

In addition to these publications a special report of three hundred and nineteen pages on "Industrial Education in the United States"[1] was prepared and printed in compliance with a resolution of the Senate.

The number of copies of each circular or bulletin issued has been increased to supply the correspondents of the Office, and several of those most in demand have been reprinted.

AMERICAN OFFICIAL CORRESPONDENTS OF THE OFFICE WHO FURNISH STATISTICS.

The following summary gives the number of correspondents of the Office at the head of systems and institutions of education in our country who furnish the official information contained in these reports:

Statement of educational systems and institutions in correspondence with the Bureau of Education in the years named.

	1872.	1873.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.

It will be seen from the above table how steady has been the increase of the number of persons voluntarily furnishing the statistics for this annual report. Very many others not at the head of any system or institution of education have furnished valuable data for the use of the Office. This annual report is the result of information systematically but gratuitously supplied by more than ten thousand correspondents. In the preparation of the statistical tables in the appendix of this volume, blanks carefully prepared, generally after conference with representatives of those to whom

[1] See p. clii.

they are to be addressed, are sent out. These blanks are filled as far as found to be expedient by the head of each system or institution addressed. When received in the Office they are sent to the statistical division; there the data furnished are drawn off upon large sheets to correspond in headings and form with those thus filled by the respective educational officers, and this form of copy is used by the printer.

It is gratifying to know that this voluntary system of statistics is constantly improving in completeness and exactness. The only return this Office is able to make for all this great labor among its friends is to supply them with its publications. It is clear that all of those who have thus contributed to the report should in equity be furnished a copy of the document. Moreover, it should be noted that an additional number is needed to supply requests from writers, teachers, professors, school officers, the press, public libraries, and other worthy sources of aid. There should be printed of the report not less than 20,000 extra copies for distribution by the Office.

This system of voluntary statistical information, instituted and carried forward by these colaborers so widely scattered, is believed to be the most complete of the kind in existence, and shows that the objects and methods as well as the publications of the Office are very acceptable to the educators of the country. The usefulness of the Office is of course chiefly determined by the benefit to be derived by the people from its publications. These should, therefore, contain information not only about whatever of good or ill occurs in the experience of our own people, but also about what is happening or observed abroad, and particularly as to the results of all scientific and careful investigations respecting matters concerning the nurture, education, and training of the young for the best performance of their duties as the citizens of the future. So far as the limited funds at the disposal of the Office have allowed, I have sought to secure the results of these labors, domestic and foreign; but those requiring the expenditure of any considerable amount of money have been practically beyond my power for lack of means. The salaried assistants in the Office are not able to do all the work required by the Office in its various relations to the public and the funds now appropriated and available for outside help amount only to $2,200.

THE LIBRARY.

The provisions of the statute establishing this Office and expressing its general duties have always been present to my mind when considering and choosing methods for accomplishing the results desired. The collection of "statistics and facts showing the condition and progress of education in the several States and Territories" is one of the duties mentioned in this law, and the due performance of it makes the collection and care of a library containing the educational reports, pamphlets, catalogues, school journals, and other pedagogic publications of the whole country one of the first necessities of such an office. The statute also provides that the Bureau is to diffuse "information respecting the organization and management of schools, school systems, and methods of teaching" of such character as may promote "the establishment and maintenance of efficient school systems," as well as "the cause of education" in general. These provisions of the law, brief and without much detail as they are, cannot be carried out without collecting printed matter, foreign and domestic, respecting the theory as well as the practice and results of pedagogics. Nor, since the school in modern society has been modified or amplified in numerous ways to produce numerous results never demanded of it in earlier times, has it been possible to comprehend or to exhibit the nature, functions, and problems of modern education without some collateral knowledge and study of other social and educational forces. Thus, applying the approved and universal rules of modern scientific research to the fulfilment of this official duty, it was necessary to include enough material in the scheme of the Office library to enable those using it to study, historically and comparatively, the development and the environment of education as a whole.

The practical beginning of the collection conformed to the necessities of the Office work; the "statistics and facts showing the condition and progress of education in

the several States and Territories," annually collected and compiled, constitute the greater part of the yearly reports of this Office transmitted to Congress like other executive documents. To prepare these reports it became necessary to establish a regular exchange of documents with all State and local educational centres that published them. The yearly publications of this kind in the Union number several thousand, most of them published in small editions only; if not obtained soon after publication, copies disappear into public or private libraries and the edition becomes exhausted. The library, since 1870, has gathered these documents, reports, bulletins, catalogues, circulars, announcements, programs, &c., and has preserved them carefully. In addition copies of earlier editions or series have been sedulously sought and obtained, never at great expense of money, but often by much expenditure of time and management. In this way the collection of State reports, city reports, college catalogues and publications, academy catalogues, and programs and circulars of professional and special schools now in the possession of this library is far superior, in quantity, quality, and interest, to any other general collection in the world, and in most cases more complete than the series belonging to the offices and institutions in correspondence with the Bureau. Unlike most libraries, this part of the library of the Bureau is arranged, shelved, and indexed geographically as well as topically, so that any document in its possession can always be found in the same relative place and consulted without loss of time whenever required. This system, originating like the library itself from the necessities of the work to be done, has been more than a dozen years in successful use and has proved entirely capable of successive enlargement and subdivision without causing loss, confusion, or delay. Indeed, since the annual reports of this Office from 1870 to the present time arrange the facts and statistics contained in them in accordance with the same geographical and topical system, these reports, in addition to their public use, may be considered as *classified subject indexes of the annual accessions to the library.*

Another part of the collection, which began also in necessity, has now assumed an important and valuable position, viz, the periodical literature of American education. The value of such publications, as preserving the very "age and body of the time" in which they appear and recording countless facts, opinions, names, and dates that would otherwise be lost beyond recall, is conceded in all other branches of study and must, of necessity, be allowed in this subject also. By exchange, subscription, purchase, and gift, the library now possesses and is daily adding to a collection really unique in the world; by no means complete, for there are important lacunæ that may never be filled, but, despite these, more full, various, and valuable than that in the possession of any corporation or individual. These journals also have been indexed by author or title and subject, and this part of the index, if printed (though covering a field almost entirely distinct from that occupied by the great Index to Periodical Literature[1] recently reissued by its veteran originator, Dr. William F. Poole, and his industrious younger colleague, William I. Fletcher, esq.), would fill a larger book than that magnum opus of the librarians.

The periodicals received are also consulted regularly for facts, allusions, and ideas to be used in the annual reports or other publications of the Office. Nor is the daily press overlooked: such newspapers as reach the Office are carefully examined, and articles, facts, and opinions of present or possible value are preserved in scrapbooks with indexes.

---

[1] An Index to Periodical Literature, by William Frederick Poole, LL. D., librarian of the Chicago Public Library; third edition, brought down to January, 1882, with the assistance as associate editor of William I. Fletcher, assistant librarian of the Watkinson Library, Hartford, Conn., and the coöperation of the American Library Association and the Library Association of the United Kingdom. Boston, James R. Osgood & Co., 1882. 4°. 28 + 1442 = 1470 pp.

It would be improper in a report of this kind to omit mention of a work so long expected, so ably done, and so eminently useful as this volume is. The germ of the present work was a pamphlet indexing the periodicals contained in the library of a literary society of which Dr. Poole was a member when a student at Yale College. Additions to the successive editions of this work have decupled the pamphlet of 149 pages into the volume now referred to.

The duty for doing which this Office was established has obliged it to gather, gradually, foreign reports, catalogues, and educational treatises. The progress of society has made an interchange of ideas, usages, and customs between nations as inevitable as the exchange of material products. Therefore it has been the practice of this Office neither to resist nor to overstimulate this interchange, but to afford to the people of this country an opportunity to make a wise choice of foreign ideas, and to recommend to inquirers from other countries only such ideas and usages as might be suitable to the other parts of their social structure. By exchange, purchase, and gift the library thus possesses a large collection of foreign educational works, nearly every civilized country and its colonies being represented. Magazines and journals in the principal foreign languages are also procured, in order that there may be no delay in obtaining and disseminating useful ideas and facts from these distant sources of information. The translator attached to this Office is charged with the custody and management of the books and periodicals in foreign languages. This portion of the library will be completely catalogued, both by authors and subjects, as soon as the condition of the Office will allow; parts of this catalogue have already been completed.

One very interesting portion of this foreign collection is that relating to the colonial possessions of the British monarchy. These dependencies, the present hope and future home of many millions of English-speaking people, are following in school matters the example of the United States rather than that of the mother country. By this channel the most vital and useful features of American life are becoming and will hereafter constitute the heritage of new nations and peoples yet unborn.

I have thus described some of the peculiarities of this library and some of the circumstances attending its origin and manner of growth. The unostentatious but unceasing and intelligent labors of Mr. Samuel R. Warren (one of the editors of the Special Report on Libraries in the United States) and of Mr. Henderson Presnell (now assigned to the custody and management of the collection) should not go unmentioned. To their work and care the Office is indebted for much of the convenience and completeness of the collection and the library itself for its useful classification and rapidly advancing catalogue.

Bearing in mind the practical manner in which this library originated and has increased, the flexible scheme on which it is now enlarging may be stated as comprehending the following subjects:

A. Antique culture, religious, philosophical, artistic, or industrial, so far as it was influential in forming or modifying the mother countries of our population: e. g., the genesis and progress of religions, and particularly those deriving their primal impulses from the Hebrews; the genesis and development of art in Egypt, Chaldo-Assyria, Greece, Rome, and modern countries; prehistoric life and industry, particularly with reference to the development of useful ideas, implements, and processes among various peoples, and the investigation of savage and semi-civilized life, beliefs, and customs; Greek, mediæval, and modern philosophy, &c.

B. Educational theories, methods, and results in those European countries from which the population of this country is derived: England, Ireland, Scotland, Wales, France, Germany, Sweden, Norway, Denmark, Spain, and other lands.

C. The formation and combination of social forces during the colonial period of American life; histories, biographies, college publications, town records, and all available sources of information.

D. The history and development of social and educational forces in the American Union — for the earlier years, material similar to that last mentioned, and, for the later years, in addition, reports of State and city school officers, school journals, catalognes, text books, &c.

E. Contemporary educational thought and practice in foreign countries, particularly the study of new or intrusive phenomena, such as Chinese life and thought, Mormon development and tendencies, the growth and influence of pessimism in society, the cause and increase of suicide and mental disease; and other phenomena bearing upon the training of the young.

The library is organized and shelved in accordance with the classification that governs the material in my annual reports. It is hoped to have a complete catalogue and index of all accessions. The State is taken as a unit, under which the topics are arranged alphabetically and chronologically. For the purpose of illustration, under

the State of Michigan the following topics appear alphabetically arranged, or, in other words, the topical is here subordinate to the geographical method of arrangement:

Michigan: Education.
History.
School reports.
School laws.
Miscellaneous.

Want of room, however, prevents the carrying out of the plan in many of its details. In the index catalogue, now in preparation, the same plan is substantially carried out whenever practicable, but not to the exclusion of the topical method, for the catalogue is distinctively educational, and to render that feature prominent it has been found necessary to subordinate, in some instances, the geographical to the topical method.

The files of catalogues, circulars, reports, and prospectuses of colleges and universities, schools of science, law, medicine, and theology, schools for the superior education of women, normal schools, preparatory and secondary schools, &c., are arranged topically, so as to correspond to the plan of the statistical tables of the Commissioner's report. These files embrace the following topics, in alphabetical order:

Academies and seminaries.
Art museums.
Botanical gardens.
Business colleges.
City school systems.
Colleges for women.
Colleges and universities.
College entrance examinations.
Homes for infants.
Industrial schools.
Kindergärten.
Law schools.
Libraries.
Medical schools.
Natural history museums.
Normal schools.
Orphan asylums.
Preparatory schools.
Prison schools.
Reformatory schools.
Schools of art.
Schools of music.
Schools of science.
Schools for the blind.
Schools for deaf-mutes.
Schools for the feeble-minded.
State school systems.
Theological schools.
Zoölogical gardens.

The index catalogue recognizes this arrangement, and each topic will be found indexed under its initial letter in the alphabetical arrangement. In further illustration of the scheme, the entries under the letter E are given.

Education:
Bibliography of.
History of.
Methods and systems.
Science of.
Miscellaneous.

Works on infant, primary, elementary, secondary, high school, classical, college, and university education may be found under Infant, Primary, Elementary, &c.; on education in foreign countries, under the name of the country.

Educational societies. *See* Society, educational.
Elective studies.
Electricity.
Elementary education. *See, also,* Infant education.
Elocution.

Evening schools.
Evolution. *See, also,* Man, Physiology.
Exhibitions:
Educational.
Industrial.
Expositions, industrial. *See* Exhibitions, industrial.
Examinations.

Thus it will be seen that the object and uses of the library have determined the form of its organization and the character of its catalogue and index, and it may be suggestive to those undertaking to organize educational libraries elsewhere.

It should be observed that no one of the great general libraries in the country prior to the establishment of this Office had begun to make any considerable collection of educational information, nor could such a collection have been brought together by ordinary methods of growth. It is largely the result of a well established system of exchanges and of contributions, due to the hearty coöperation of the officers and friends of education at home and abroad. Its value has never been approximately represented by the appropriations for its support, which have not exceeded $1,000 a year for books and never more than $700 a year for completing sets, journals, magazines, &c. The card catalogue of subjects and card catalogue of authors and titles above mentioned, as soon as published, will become specially helpful to all educators of the country whenever searching educational literature. The publication of this catalogue is already earnestly sought, and it is hoped that it can be ere long undertaken. The collection now numbers 15,000 volumes and 37,000 pamphlets.

The question has been raised whether this collection of educational literature could not be merged into some general collection, but it should be noted that in many investigations it is necessary to gather large numbers of books around the investigator and to keep them in hand for a considerable length of time. No one familiar with the requirements of thorough research can fail to understand the difficulty of going from one point to another to obtain separate books. Of this the Office has had ample and unprofitable experience. It is clear that the time of a clerk competent to make researches is too valuable to be wasted in running about or waiting or writing notes for books.

It hardly need be said that a question relating to ventilation, to architecture, to the organization of State or city systems, or one relating to methods of instruction, or an inquiry as to education and insanity, or education and crime, or education and labor will demand in its treatment not merely what comes in the form of current literature, but will create a demand for the readiest access to all sources of the desired information.

From the foregoing it is apparent (1) that the Office has never contemplated gathering a general library, (2) that its library has grown with its growth and is inseparable from its daily duties, and (3) that if the present collection should be withdrawn from its own rooms and control the efficiency of the Office would be indescribably impaired and the value of the collection wellnigh sacrificed. In a large general library administration it could hardly fail to be remanded to some out of the way corner, where it would be lost to the daily use for which it is intended and which is, indeed, the only reason of its existence. It is confidently believed that placing the volumes of this collection in any other than the present close relation to the administration of the Office would defeat the economical purpose of any such measure. Imperfect as the library of this Office is, I have no hesitation in saying that it has become indispensable to the rapid and economical transaction of the official business of the Bureau.

Statistical summary of institutions, instructors, and students, as collected by the United States Bureau of Education, from 1873 to 1882.

	1873.			1874.

New York	5–21	Wyoming	7–21
Virginia	5–21	Texas	8–14
South Carolina	6–16		

a Inclusive.

The following diagram shows that there are sixteen different school ages in the States and Territories; the longest, extending from four years of age to twenty-one, covers a period of seventeen years, and the shortest, from eight years of age to fourteen, a period of six years only.

Diagram showing the different school ages in the States and Territories during 1882.

In all studies of the school statistics of the United States this diversity of ages should be kept in mind.

a For white teachers; for colored teachers the average salary is reported as $21.88.
b The average salary of male teachers in graded schools is $100.97; in ungraded schools, $54.52; for female teachers the salaries are, respectively, $67.39 and $50.02.
c Number employed in winter.
d Number employed in summer.
e In 1881.
f For white schools in 1881; the average monthly salary of colored teachers for 1881 was $22.
g In 1880.
h For white schools in the counties; the average for teachers in graded schools for whites in the cities is $71.25; in public high schools, $88.97.
i Estimated.
j For white teachers; for colored teachers the average salary is $19.93.
k Includes evening school reports.

TABLE I.—PART 1.—*Summary* (B) *of the number of teachers employed, &c.*—Continued.

a Includes $15,500 spent for normal schools.
b Includes expenditure for repairs.
c Items not fully reported.
d Includes balance on hand from last school year.
e In 1881.
f In 1880.
g Includes $1,690 expended for colored schools outside of Wilmington.
h For white schools only.
i Salaries of county superintendents only.
j Exclusive of the value of normal school property.
k Total amount expended from tuition revenue.
l Includes salaries of secretaries and treasurers, interest on bonds, &c.
m Includes salaries of superintendents.
n Buildings, repairs, rents, &c.
o In 1878.
p Includes miscellaneous expenditure.
q Total of reported items.
r Includes total expenditure for high and normal schools of $58,000.
s Several counties failed to report this item.
t Includes interest on bonds.
u Includes evening school reports.
v $50,255 of this are for sheriffs' commissions and delinquent lists.
w Exclusive of cost of normal schools.

	1882	35	2	128,483,681	1,089,015

The reports of the Office give gratifying evidence of the progress towards completeness in the educational statistics of the country.

Table I presents statistics of the five items of school population, enrolment, average daily attendance, income and expenditure of public schools from all the States and Territories, and a more or less accurate statement of the number of teachers, one Territory alone failing to report. In some instances, as noted in the table, the figures have been taken from the United States Census of 1880, and are therefore two years behind the date of the report, and in a few cases estimates only were attainable. On the whole, the figures make a reliable exhibit of the condition of public schools for the year.

The totals under the several headings of the table show increase over the same for

1881, which increase, as will be seen by a detailed comparison of the figures in this and the preceding report, is well distributed throughout the country.

School population, enrolment, and average attendance.—The total increase in the items reported in Table I, Part 1, is as follows:

School population: States, 359,958; Territories, 4,358; total, 364,316.

Enrolment in public schools:[1] States, 152,107; Territories, 1,386; total increase, 153,493.

Average daily attendance:[2] States, 446,504; Territories, 7,471; total increase, 453,975.

If the enrolment in private schools, viz, 567,874, be added to that of public schools, 10,013,826, we have a total of 10,581,700 youth under instruction in the schools, that is, 65 per cent. of the legal school population and 21 per cent. of the entire population as given in the United States Census of 1880.

Legal school age.—The legal school population, it should be observed, in most States is a larger number than would be obtained by the enumeration of the youth in the years of the usual period of school attendance. The legal school ages remain the same as in 1881, with the following exceptions: In Kentucky the legal school age for blacks, formerly 6 to 16, has been made the same as for whites, viz, 6 to 20. In Florida the legal school age 6 to 21 has been given in preference to 4 to 21, as in the previous report. In this State the interest of the school fund and the proceeds of the 1 mill tax are distributed among the several counties upon the basis of the population 4 to 21 years of age, but the apportionment to the different schools is made upon the basis of the average attendance of pupils between 6 and 21 years of age. So long as the present diversity as to age in the enumeration prevails, it is difficult to arrive at conclusions entirely satisfactory as to the relative effectiveness of the State school systems. In the inquiries sent out by this Office it is sought to ascertain the approximate number of persons between 6 and 16 years of age included in the school censuses. Only 5 States and 1 Territory are able to respond to this inquiry, but in 4 other States the census of the school age corresponds very nearly to the enumeration desired. It is believed that school officers throughout the country recognize the desirability of a census that shall be uniform with respect to the ages included, but they have not at command the means of obtaining such a census.

Duration of school term.—Two States only and 4 Territories do not report the average duration of schools. The term shows decrease below that reported in 1881 in the following: Alabama, Connecticut, Indiana, Iowa, Kansas, Maine, Michigan, Mississippi, Missouri, New Hampshire, New York, Rhode Island, and Utah Territory.

The length of the term varies greatly, ranging from 199 days in Maryland to 62½ days in North Carolina. The differences in this respect are more clearly seen by a comparison of the different geographical sections. The term is more than 5 months in three of the six New England States, in five of the six Middle Atlantic States, in three of the nine Northern Central States, in one of the two Pacific Slope States, and in the District of Columbia and Idaho Territory; and it is above 3 months in all the States of the sections named. On the other hand, the school term is less than 3 months in all the South Atlantic States, in two of the four Gulf States, in one of the six Southern Central States, and does not equal 4 months in any State of the two last named sections. These differences deserve the serious attention of those who can affect legislation in respect either to the duration of the school term or the funds necessary for the maintenance of the schools for the time allowed, since it cannot be doubted that the differences in the opportunities for early instruction indicated in the varying

[1] For all the States enrolment is reported by the local school officials. Enrolment for the Territories is obtained from the returns for 1881–'82 and in two instances from the Census of 1880.

[2] Delaware, Michigan, and Missouri did not report average daily attendance. For Michigan and Missouri the census figures were used. Average daily attendance for seven Territories was taken from reports of territorial superintendents and for three others from the Census of 1880.

duration of the school period will ultimately be the cause of great diversity in the average intelligence, enterprise, and worthy ambition of the citizens. It is true that those who have meagre school opportunities may make greater progress than those to whom every provision is freely extended, but examples of this kind seldom occur outside of communities so filled with intelligence and enthusiasm that the most obscure individuals cannot escape the inspiring influence.

Number and salaries of teachers.—The number of teachers reported is, for the States, 290,028; for 9 Territories, 3,266; total, 293,294, being an increase of 4,135 over the number reported in 1881. The sex of teachers is not reported from Georgia, Maine, Mississippi, and Idaho Territory; so far as the figures are given, the number of male teachers is 106,676, and of female teachers, 166,705. Both numbers show increase over the same for 1881, but the proportion of female teachers is greater than at the last report. Even in the frontier States, the proportion of women engaged in teaching is rapidly increasing.

There is an upward movement in teachers' salaries, 18 States showing increase in the average salaries for both sexes; 4, viz, Massachusetts, Oregon, Pennsylvania, and South Carolina, increase in salaries for men, but not for women; and West Virginia, increase in salaries for women only. Salaries have also increased in Utah since the last report received, namely 1878.

Finances.—Several of the States include balances from the last school year in the statement of annual income. Where this occurs, attention has been called to the fact in the summary, and an examination of Table I of the appendix will show in most instances the amount so included.

As the figures stand, the summary for 1882 shows an income of $94,327,188 and an expenditure of $91,158,039, against $88,142,088 income for 1881 and $85,111,442 expenditure for the same year.

Five States and 1 Territory for 1882, against 7 States and 2 Territories for 1881, fail in making report of the value of school property. The total for 1882 for the country is $216,562,197, against $186,143,452, the difference between the figures being $30,418,745. Maryland, Massachusetts, and Idaho, non-reporting States and Territory for 1881, would make up for 1882 $24,993,235 of this excess. Making allowance for this sum, there is reported a net increase of $5,425,510 in the value of school property in the country.

In the permanent State school funds there is also a reported increase of over $5,000,000. Many of the States show very fair increase in their permanent funds, but $3,500,000 of the amount of increase is made up in Kansas, where the State superintendent reports $13,500,000 as the estimated amount of the fund when all shall be available, against $10,000,000, his estimate for 1881.

A table of the per capita expenditure for the year, based on school population, enrolment, &c., has been made up, as in previous years. For 1882 as for 1881, estimates have been made in this Office, where it was practicable, for the non-reporting States. As the table stands, Massachusetts among the States heads the list and Alabama is at the foot, i. e., Massachusetts spends annually for each child of legal school age over fifteen times as much as Alabama.

The sources of the public school funds can be ascertained by reference to the abstracts of the several State reports and to Table I of the appendix. From the latter it will be seen that local taxes are the main support of the public schools in a majority of the States, a condition that seems essential to a progressive, efficient system of free schools. The figures show increase in the amount realized from local taxes, as compared with 1881, in Connecticut, Georgia, Illinois, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Nebraska, Nevada, New York, Oregon, Rhode Island, Tennessee, Vermont, West Virginia, and Wisconsin.

The favorable view of the public schools of our country presented in the statistics is confirmed by the verbal statements of superintendents and other officials and accords with the impression I have received from personal observation in various parts of the country.

Progress is not limited to the increase of scholars, teachers, funds, &c., but appears in the organization of the school systems, in the greater efficiency of the work carried on in the schools, and, what is still more important, in a deeper and more intelligent interest on the part of the people. Everywhere there is evidence of a clearer understanding of the purposes of the schools, of their relation to our civil rights and liberties, and a readier disposition to adopt measures for their support and improvement.

Work of superintendents.—The superintendents are a body of earnest and determined men, having a clear understanding of the wants of the schools and of the temper of the public whose good will and coöperation they must secure. Upon superintendents devolves almost entirely the labor of stimulating, watching, and directing legislation in school matters, interpreting the school laws, and keeping teachers and parents advised as to their requirements. To these officers more than to any other agency must be attributed the two most promising general movements now going on with a view to the greater efficiency of the schools, namely, the increase of local taxation in the Southern States and the effort to abolish small, independent, irresponsible districts in the older Northern States.

Hon. H. Clay Armstrong, State superintendent, Alabama, calls attention to the fact that in 20 counties of the State the public fund was supplemented by patrons to the amount of $66,990, and in 46 other counties by an amount equal, probably, to $175,000. He appeals to the general assembly to increase the annual appropriation to $230,000, and recommends a special school tax for the purchase of sites, building, and pay of teachers, not to exceed 4 mills on the dollar. Hon. D. H. Pope, State superintendent, Arkansas, reports the opposition to the school tax as declining in his State and that in the towns the public funds have been largely increased by voluntary subscriptions. Private subscriptions to the school fund are not officially reported from other States, but they have occurred to some extent; meanwhile the advocates of the school tax meet with more and more favor.

Hon. J. W. Dickinson, secretary of the Massachusetts board of education, has had the satisfaction of seeing his efforts to overcome the district system crowned with success. The law abolishing the district system and making the township the unit for the control of educational affairs went into effect January 1, 1883. Other superintendents are indefatigable in their efforts to bring about a like result. While nothing new on this point is elicited in the report of the year, there is an important accumulation of evidence. Hon. N. A. Luce, State superintendent, Maine, says that there are 36 towns in the State so cut up that they average less than 20 scholars to each district and 79 towns containing 693 districts so small that in summer terms the average attendance upon each school is less than 10 scholars. Hon. J. W. Patterson, State superintendent, New Hampshire, reports for the year ending June, 1883, 786 schools averaging 12 scholars or less and 313 schools averaging 6 scholars or less. Hon. C. D. Hine, secretary of the Connecticut board of education, reports for the year ending August 31, 1883, the number of districts in which the average attendance was between 8 and 18, 548; number in which it was less than 8, 165; number in which it was 5 or less, 94. Hon. M. A. Newell, secretary of the Maryland board of education, instances one county containing 21 schools, the average attendance for each being between 1 and 8 scholars.

Hon. G. S. W. Crawford, State superintendent, Tennessee, observes, in this connection:

> The school fund should be distributed in such a way as to secure to every child in a given district the same number of school days as is enjoyed by the children living in the other districts of the same county. By the present system great injustice is done. Two school districts in the same county lying side by side are taxed exactly alike; but in one district there are twice as many children as in the other, and the one with the greater number has twice as many school days as the other.

County supervision.—Intimately connected with the abolition of small districts is the establishment of county supervision or supervision of groups of towns uniting voluntarily in legal organizations for this purpose. In some of the States the county

schools are virtually without supervision, while in a number of States in which county superintendents are employed the remuneration is so small that it is impossible to secure the entire service of competent men.

Efficient county superintendence or its equivalent offers the readiest solution of the most perplexing problems relating to the rural schools. The scope of its action and the need for its service are thus summed up by Hon. R. D. Shannon, State superintendent, Missouri, whose views are confirmed by the statements of many other superintendents who have conferred with me upon the subject.

Mr. Shannon says:

The greatest of all needs is an efficient, responsible, paid county superintendency. Our system will never be successful without it.

* * * * * * *

We say that no public moneys shall be distributed to a district that has failed to maintain a public free school, and yet we have provided no means by which the fact shall be ascertained by the officer who makes the distribution.

We say that the net proceeds of all fines, forfeitures, &c., shall be placed in the public school funds of the several counties, and yet the evidence is conclusive that immense sums which should be placed thus annually are not reported. In my reports I have frequently estimated the annual loss from this source as not less than $50,000. In the confirmation of the correctness of this estimate I invite attention to two facts shown in this report: First, although the year for which the report is made was not characterized by unusual disorder or criminal proceedings in courts — it was a notably quiet and peaceful year — the amount of fines realized and placed in the county funds, as heretofore stated, exceeded the annual average over $40,000. Second, the great city of St. Louis reports collections in round numbers of $2,000, while Bates County reports $6,000. No one will believe that any such disproportion existed between the fines imposed in the two localities.

If I should say that we lose $100,000 a year from this source for the lack of supervision, the statement would not only express a well founded belief but would accord with the settled conviction of every citizen who is at all familiar with public affairs.

How is it possible for any system to succeed without executive agency or supervision? We deem it necessary to have our schools in cities or towns under supervision, but the schools of our counties are left without control or superintendency. Success, under such circumstances, the prevention of loss, both in time and money, and of extravagance, is impossible. Never did such an anomalous state of facts exist in any other department of the State government.

No State in the Union ever expressed more liberal and enlightened sentiments and purposes toward public education than are found in the constitution and statutes of Missouri, and no State ever so signally failed to provide effective means for executing its will. There is only one possible solution of the problem, and that is rational, easy, and economical. A failure to solve it — a failure to apply the remedy for the many admitted and glaring evils arising from our loose methods under the law — is wasteful, extravagant, and expensive. The solution is the establishment of executive agency, or direction, in each county. No business under government or in social or private life was ever successfully conducted without a manager or superintendent; it could not possibly, in the very nature of the case, fully succeed. Yet our school system is absolutely without any superintending control or management. It rests alone with the legislature to say how long this state of affairs shall continue.

Improvement of the teaching force.— The means of improving the teaching force of the rural schools engages the serious attention of all who are interested in the education of our children. Efforts are being made in a number of States to raise the standard of teachers' examinations, and in several States it is proposed to do away with the third-grade certificate, for which the requirements are very low. Unfortunately the examining bodies have little voice in appointing teachers, so that the qualifications of teachers are after all determined by local influences. Often every other consideration is sacrificed to the desire for cheapness; again, kinship or political relations decide the choice of a teacher. So long as this loose system of appointment is tolerated it will be difficult to maintain high standards for the service.

The increase of salaries previously noted is a favorable circumstance; not only are better teachers thereby attracted to the schools, but the interest of the districts in securing good teachers is proportionately increased.

The effect of the revised school law of Michigan, which, as noted in my last report, became operative July 1, 1881, has been followed with much interest. The law provides for the examination of teachers by county boards under regulations calculated to raise the standard of qualification and make it more nearly uniform throughout the State. The law has naturally had the effect of diminishing the number of ignorant, untrained applicants for positions and attracting an opposite class, with the inevitable result of increasing wages. The State superintendent, Hon. Varnum B. Cochran, says in this connection: "The wages of men have risen during the year an average of $4.61 per month and of women $4.83 per month in the rural districts, where, of course, the effects of the law are soonest and chiefly felt."

The decline of salaries in Michigan for the past few years has been the occasion of regret, as the established reputation of the school system of that State gives peculiar weight to its example. It is to be hoped that the advance here noted will be permanent.

The suggestion of a minimum salary fixed by State law meets with approval in many States. Hon. C. W. von Coelln, State superintendent, Iowa, calls attention to the fact that the salaries of teachers of ungraded schools in his State do not average above $150 per annum, whereas a common laborer receives $200 with board and is not expected to dress well and has no examination or institute fees. Mr. von Coelln adds significantly, "the salaries of teachers are the only salaries of public employés" wholly within the control of the people.

Inquiries instituted in several States during the years 1882 and 1883 have elicited important information with reference to the increasing number of trained teachers employed in the schools and their increasing tenure of office:

In California 584 districts were reported as employing the same teacher more than one year and 568 teachers were graduates of normal schools.

In Connecticut, of 3,120 teachers employed, 470 were beginners.

In New York, of 31,233 teachers employed in 1882, there were 1,183 graduates of normal schools.

In West Virginia, out of 3,045 teachers employed, 1,115 had taught the same school two or more terms previously; 640 reported the present year their first in the work; 711 reported having attended one of the State normal schools.

In Illinois 1,465 teachers were reported as having been trained in the normal university, of whom 151 were graduates.

In Kansas, out of 8,150 teachers, 214 were normal graduates, 79 held State certificates, and 3,953 had attended normal institutes.

In Maine, out of 7,599 teachers, 6,402 had had previous experience; 601 were graduates from normal schools.

In Massachusetts 30 per cent. of the teachers have received professional training in normal schools.

In New Jersey the following was reported for the year ending August 31, 1882: Number of teachers who have been in the same school 1 year or less, 1,063; 1–5 years, 1,302; 5–10 years, 635; 10–15 years, 253; 15–20 years, 96; 20–25 years, 35; over 25 years, 22. Average time for teachers throughout the State, 3 years and 9 months; average time for teachers in cities, 6 years and 6 months.

In New Hampshire for the year ending June, 1883, the number of teachers reported as having no previous experience was 569; number reported as teaching in the same school two successive terms, 1,421; number who had been trained in normal schools, 318.

Courses of study for rural schools.— The excellent effects of graded courses of study in the rural schools are admitted wherever they have been introduced, but there is an unaccountable indifference to the subject in many localities.

Without this important aid it seems impossible to maintain systematic progress in the schools and equally impossible to form any clear idea of the attainments made by the scholars. With such courses universally employed, it would be comparatively easy to find out the number of scholars pursuing the obligatory branches and the number in higher and optional branches. This analysis would be of material help in the endeavor to form union or graded county schools and in deciding upon the means of bringing the common free schools into line with higher institutions, especially with

the public high schools, schools endowed with the land grant of 1862, and State universities.

Building and apparatus.— The improvement of school-houses is noticeable throughout the country, provision being made in a number of States for the periodical inspection of the buildings.

The last thirty years have somewhat extended our knowledge about the requirements for school buildings of different kinds. This knowledge is of two kinds, of which one, as to the best *method* of construction under prescribed conditions of site, size, and material, should be possessed by the architect employed; the other, as to the best form and aspect of school rooms, the best modes of heating, lighting, and ventilating, &c., should be studied and known by the school authorities, as well as by the architect; in this way the public may have some hope of obtaining for its money edifices that express, by the most direct and logical style of structure known to the building art, the results of the widest knowledge attainable as to the requirements for teaching, for hygiene, for safety against accidents, &c. As science and experiment have been accumulating both kinds of knowledge, both should be used and manifested in public school architecture. It is a vain waste of money at this day to turn out merely a Gothic or a Greek building from the architect's studio, for we are neither Goths nor Greeks; it is equally wasteful to plan good school rooms and class rooms, easy stairways, and theoretically perfect heat flues and air ducts, if we ruin them by bad construction or the use of bad material. The literature of building abounds in many excellent books; so many, indeed, that to merely name the best would fill pages of this report. Yet I must find space to mention two: the article published by the New Hampshire State board of health on "Suburban school-houses," written by Mr. W. R. Briggs, of Bridgeport, Conn., republished as a separate pamphlet, and the excellent Handbuch der Schulhygiene of Dr. Adolf Baginsky, of which a second edition is just announced by a Stuttgart publisher.

In order that certain questions connected with the ventilation and air supply of school buildings might be definitively settled for the whole country, I have requested R. L. Packard, esq., translator of this Office, who is an excellent practical chemist, to institute the necessary investigations and experiments, so arranging them as to secure the coöperation of school authorities and experts throughout the country. His results and conclusions will be published as soon as they can be properly completed. Among other matters, I may mention that Mr. Packard is experimenting on the best and simplest form of a durable instrument by which teachers can speedily ascertain the quantity of carbonic acid gas in the air of their school rooms, this gas serving approximately as an indication of the quantity of other dissolved impurities.

Circular of Information No. 4, 1880, republished by this Office more than once to supply the great demand for it, has spread Mr. T. M. Clark's wise suggestions respecting right methods of placing, arranging, constructing, lighting, and heating school buildings over every part of the country; this pamphlet does not give rigid plans for buildings, from which deviation becomes difficult, but discusses the difficulties and necessities of common school-house construction in a perfectly clear, systematic way, illustrating the points to be emphasized by drawings and illustrations. It forms the first part of a plan long since matured by this Office for the information of the educational public respecting the general subject of school architecture.

The rural schools generally are not well supplied with apparatus, reference books, and illustrative material. Improvement in this respect is greatly needed.

COMPULSORY SCHOOL LAWS.

The following compilation shows the status of each State and Territory with reference to compulsion:

STATES.

California, March 28, 1874, enacted that every parent, guardian, or other person having control or charge of any child or children 8 to 14 years of age must send such

to a public school for at least two-thirds of the time during which a public school should be taught in the city, county, or school district of such child's residence, unless the child or children should be shown to be physically or mentally disabled, taught otherwise the common school primary branches of study, or out of reach of school; penalty, not to exceed $20 for a first proven offence, or $20 to $50 for subsequent ones, with costs of suit.

Connecticut, in 1882, passed a kindred law, requiring that, except in cases where the physical or mental condition of a child made attendance at school inexpedient or impracticable, parents or other persons having control of any child 8 to 14 years of age should cause such child to attend a public day school or to receive elsewhere regular and thorough instruction in reading, writing, English grammar, geography, and arithmetic during at least 12 weeks, or 60 full school days, in any consecutive 12 months, 6 weeks at least of which attendance or instruction must be consecutive. Each week of failure to comply with this requirement is made a distinct offence, punishable with a fine not to exceed $5. No child under 14 years of age that has resided in the United States 9 months may be employed to labor, unless such child can be shown by official evidence to have complied with the above requirements, and any person that employs a child contrary to these provisions is to be fined not more than $60.

Illinois, in 1883, required that every person having the control and charge of any child or children 8 to 14 years of age should send such child or children to a public or private day school for a period of not less than 12 weeks in each school year, unless such child or children be excused by the school officers of the city, town, or school district in which the child or children reside. Such excuse may be given by said officers for any good cause shown, namely, a mental or bodily condition that would prevent attendance at school or application to study for the time required by this act, a proven acquaintance with the ordinary branches of learning usually taught in public schools, or a distance of 2 miles from the public school which the child or children would have to attend under the provisions of the act; penalty for the violation of this statute, $5 to $20.

Kansas, since 1874, has had essentially the same provisions on this subject as Illinois enacted in 1883, except (1) that the attendance required of 12 weeks in each year must include 6 weeks of consecutive attendance and (2) that the penalty for violation of the law is made progressive, being not less than $5 nor more than $10 for a first offence and not less than $10 nor more than $20 for a second or any subsequent offence.

Maine, in 1875, enacted that every parent, guardian, or other person in the State, having control of a child or children 9 to 15 years of age, should be required to send such child or children to a public school at least 12 weeks in each year, unless such child or children be excused by the school officers of the town for the reasons recited in the preceding laws of California and Illinois, except in cases where a public school is not taught for 3 months in the year within a mile and a half, by the shortest travelled road, of the residence of a delinquent or is not taught within the school district in which the child resides; penalty for a parent, guardian, or other person in control failing to send a child or children to school according to this law, a fine of not more than $5 and costs of prosecution; penalty for a child neglecting or refusing to attend school as required, unless excused by the proper school officers, not to exceed $5 for each offence.

Massachusetts, since 1873, has required every person having control of a child 8 to 14 years of age to cause such child to attend, at least 20 weeks each year, some public day school in the city or town in which he resides, which time is to be divided, as far as the arrangements of school terms will allow, into 2 terms, each of 10 consecutive weeks, unless excused by the school committee because of poverty, bad physical or mental condition of the child, or instruction elsewhere or previously for

a like period in approved schools; penalty for violation of the rule, a fine not to exceed $20 in each case of neglect.

To secure still further for all children in the State some fair amount of education, the laws of Massachusetts, since 1876, have forbidden the employment of children under 10 years of age in any manufacturing, mechanical, or mercantile establishment; and also the employment, except during the vacations of the public schools, of any child under 14 years of age, unless he has, for at least 20 weeks in the year preceding such employment, attended some public or private day school under teachers approved by the school committee of the place where such school is kept, which time may be divided, as before noted, into 2 terms of 10 consecutive weeks each. Since 1878 no child under 14 who cannot read or write may be employed as above during the sessions of the public schools, even if he has attended school the year before; penalty for violation of either of these statutes, $20 to $50, to go to the use of the public schools.

Michigan enacted in 1871, repealed in 1881, and reënacted in 1883 a law that every parent, guardian, or other person in the State having control and charge of any child or children between the ages of 8 and 14 should be required to send such child or children to a public school for a period of at least 4 months in each school year, at least 6 weeks of which sending must be consecutive, unless such child or children should be excused, for the reasons given in several preceding cases, by the board of the school district in which the parents or guardians reside.

Still further to secure the education of all children as far as may be possible, there are appended to this reënacted law the following requirements: (1) That no child under the age of 14 years shall be employed by any person, company, or corporation to labor in any business, unless such child shall have attended some public or private day school, where instruction was given by a teacher qualified to instruct in such branches as are usually taught in primary schools, at least 4 months of the 12 months preceding the time in which such child shall be employed; (2) that every parent, guardian, or other person having charge or control of any child 8 to 14 years of age that has been temporarily discharged from any business or employment shall send such child to some public or private day school for the period for which the child shall have been discharged, unless the child be excused from such attendance for the reasons referred to in section first; penalty for violation of either of these provisions, $5 to $10 fine for a first offence and not less than $10 for each subsequent one.

Nevada, in 1873, passed a law with essentially the same requirements as the preceding as to the age of children to be sent to school (8 to 14) and as to the reasons for excuse in special cases by the district school board; but the time for attendance at school was made "at least 16 weeks in each school year, at least 8 weeks of which shall be consecutive." Special provision was also made for informing the school board of each district, through the principal of each school, as to absentees from school, that they might, in cases of failure to comply with the provisions of the first section of the law, either obtain from the parents or guardians of non-attending children the fine of $50 to $100 imposed for a first offence, with $100 to $200 for each subsequent offence, or, failing to obtain it, institute proceedings to secure it.

New Hampshire, July 14, 1871, enacted a compulsory statute requiring "every parent, guardian, master, or other person having the custody, control, or charge of any child between the ages of 8 and 14 years, residing in any school district in which a public school is annually taught for the period of 12 weeks or more, within 2 miles by the nearest travelled road from his residence," to "cause such child to attend such public school for 12 weeks in every year," * * * 6 weeks at least of this attendance to be consecutive, unless such child should be excused from such attendance by the proper school authorities for such reasons as have been indicated in preceding cases. Notice of this requirement was directed to be given annually by the school officers by posting it in three of the most public places in each school district or by publish-

ing it for at least three weeks successively in some newspaper printed in their town in the month of August; penalty for violation of the act by parents, guardians, &c., $10 for a first offence, $20 for every subsequent offence.

Under amendments of 1881, in sections 11 and 12 of chapter 91 in general laws of 1878, no child under 16 years of age may be employed in any manufacturing establishment, unless he has attended school at least 12 weeks in the year preceding, and none under said age may be so employed (except in vacations of the school in the district in which he resides), unless he can write legibly and read fluently in readers of the grade usually classed as third readers. Nor may any child under 14 be so employed unless he has attended school in the district in which he dwelt at least 6 months in the preceding school year, or during the whole time school was kept in that year; penalty for employment except under the conditions prescribed, $20 for each offence.

New Jersey passed, March 27, 1874, and amended, April 9, 1875, a law requiring parents and guardians having charge of children 8 to 14 years of age to cause them to attend some school at least 12 weeks in each year, 6 of these weeks to be consecutive, or to be instructed at home at least 12 weeks each year in the branches of education commonly taught in the public schools, unless the physical or mental condition of such children renders such attendance (or instruction) inexpedient or impracticable; penalty for failure to comply with the provisions of this act, $2 for a first offence; afterwards, $3 a week for not more than 12 weeks in any year during which, after written notice, there has been failure to comply with the provisions of the act. The district clerk of each school district and some person in each city selected by the city board of education are to report to the collector of the township or the treasurer of the city where the offence has occurred the names of all persons that fail to comply with the law, and the officer to whom such report is made is to proceed to collect the penalties in any court of competent jurisdiction, such penalties to be added to the public school money of the school district in which the offence occurred; provided that this law shall not be operative in school districts in which there are not sufficient accommodations to seat the children compelled to attend school under the provisions of the act.

New York passed in May, 1874, and amended in 1876 "An act to secure to children the benefits of elementary education," which requires all parents and those that have the care of children to instruct them or cause them to be instructed in spelling, reading, writing, English grammar, geography, and arithmetic. Every parent, guardian, or other person having the control or charge of any child 8 to 14 years of age has to cause such child to attend some public or private day school at least 14 weeks each year, or to be instructed regularly at home for the same period in the above named branches, unless the physical or mental condition of the child should be such as to make this attendance or instruction inexpedient or impracticable.

Amendments in chapter 372 of laws of 1876 put restrictions on the employment of children under the age of 14 not instructed as aforesaid, made it the duty of the regular school trustees or of officers employed for the purpose to examine all manufacturing establishments within their jurisdiction, to see whether these restrictions were complied with; and if they should find them violated they were to report the violations to the chief fiscal officer of the city or supervisor of the town where the violator lived, with a view to the collection of the proper penalty, which was made $1 for a first offence and $5 for every week, not to exceed 13, in any year during which, after written notice from the proper officer, there should be a continued violation of the law. If poverty should prevent the purchase by any parent or guardian of the necessary text books for a child whom he was willing to send to school as required, the school officers were to provide the text books, to be paid for by the treasurer of their city or supervisor of the town. If a child whose parent or guardian is willing to send him to school cannot be induced to attend for the 14 weeks required, the school trustee or other officer appointed for these cases may, on the written statement of parent or

guardian to that effect, deal with such child as a habitual truant and relieve the parent of the penalty incurred.

Ohio, in 1877, established a kindred compulsory requirement as to sending to school children 8 to 14 years of age, making the time for such sending 12 weeks in each school year, 6 of which should be consecutive, unless the school officers of the district or subdistrict in which the parent or guardian resides should excuse such child from attendance for the reasons indicated in the laws of several preceding States or because the time and labor of the child are essentially necessary for the support of an indigent parent, brother, or sister.

Provision is also made against the employment of children under 14 years of age during the school hours of their place of residence, unless such children shall have had at least the 12 weeks' schooling above required and have delivered to their employers a certificate to that effect from the school officers of their place of residence or from the teacher of a school they have attended. Boards of education are required to look after this matter of employment of untaught children each February and September. Where poverty of parent or guardian prevents the purchase of necessary text books for the school study required, the proper school officers are authorized to furnish these. Penalty for parent, guardian, or other person failing to comply with the provisions of this chapter, not less than $2 nor more than $5 for a first offence, nor less than $5 nor more than $10 for each subsequent offence. And if the clerk of a board of education fails to prosecute every offence required to be thus punished he is made liable to a fine of not less than $10 nor more than $20 for each case of such neglect. Two weeks' attendance at a half time or night school is made, by the same statute, equivalent to an attendance of one week at a full day school.

Pennsylvania, to secure some instruction for its children, has since 1849 forbidden that any children from 13 to 16 years of age be employed in or about any factories, unless such children have attended school at least 3 consecutive months within the year of such employment; penalty for owners of factories and employers of children violating the provisions of this statute, as well as for parents consenting to or conniving at such violation, $50 for every offence.

Rhode Island, in 1854, passed a law to forbid the employment in factories of any minor under 15 years of age, unless such minor shall have attended school for a term of at least 3 months in the year next preceding such employment; nor was any such minor to be employed more than 9 months in any calendar year — evidently to afford an opportunity for 3 months' schooling; penalty for owner, employer, or agent of such factories employing children contrary to the statute or for parents or guardians permitting or consenting to such employment, $20 for each offence.

Vermont passed, November 21, 1867, and amended, November 23, 1870, a compulsory school law requiring every child of good health and sound mind to attend school under the public school system at least 3 months each year, "unless such child has been otherwise furnished with the means of education for a like period or has already acquired the branches of study taught in the public schools." A child neglecting to comply with this requirement is made liable to arrest and delivery to the school teacher of his district, notice of which is to be given in writing to the parent, guardian, or master of the child, who is to be required in said notice to send the child to school regularly. If such parent, guardian, or master does not, for 6 days after receiving such notice, cause the child to attend school regularly, having no good reason therefor, he is made liable to a fine of $10 to $20, said fine to go for the benefit of schools in the town.

It is also forbidden that a child 10 to 14 years of age who has resided in the State a year shall be employed in a mill or factory, unless such child has attended a public school 3 months during the preceding year; penalty for employment, without evidence of such attendance, $10 to $20, to go one-half to the complainant and one-half to the town.

Wisconsin, March 19, 1873, passed an act for placing in truant schools for 2 years

children 8 to 17 years of age that were habitually truant, and for enforcing daily attendance on such schools.

In 1879 a further law was passed, to take effect September 1 of that year, "to secure to children the benefit of an elementary education." This required parents and others having charge or control of any child or children 7 to 15 years of age to send such child or children to a public or private school for at least 12 weeks in each school year, unless excused by the school authorities of the school district, village, or city in which the parent or guardian should reside for such reasons as have been recited in the case of other States. The school district board or board of education, as the case might be, was required to look after such children 7 to 15 years of age in September and February of each year, and where any of that age were found not to be in attendance on any school a record of each case was to be filed with the clerk of the board, this record to be open for inspection to any elector or taxpayer of the district. To take away from neglectful parents all excuse for not sending children to school the school officers were authorized to furnish free text books, as in New York and Ohio, to parents not able to procure such otherwise. If, in view of these provisions, parents or guardians should still fail to comply with the provisions of the act, they were to be fined from $5 to $10 for the first offence and from $10 to $20 for each subsequent offence.

TERRITORIES.

Arizona, which in 1875 (February 9) passed a compulsory law requiring children 8 to 14 to be sent to school for 16 weeks of each school year, 8 of the 16 to be consecutive, and which imposed a fine of $50 to $100 for a first violation of the law, with $100 to $200 for subsequent violations, has dropped this act from its amended school laws of 1883.

Dakota, in its latest school law, of March 8, 1883, requires parents, guardians, or others having charge of a child or children 10 to 14 years of age to send such to a public school at least 12 weeks in each school year, at least 6 of these weeks to be consecutive, unless excused by the school board for the reasons given in preceding laws. School officers are directed to ascertain whether any children are deprived of school privileges while an accessible school is taught, and are to notify parents, guardians, &c., and direct that such children be sent to school. If, after such notice, there is failure or neglect to send, complaint is to be made before a justice and the offender to be fined $3 to $10. If school officers fail to make complaint in such cases, other persons may do so.

For the *District of Columbia* it was ordered in 1864, June 23, that every person in the District having under control any child between the ages of 8 and 14 years should send annually, during the continuance of such control, such child to some public school in that part of the District in which he should at that time reside. Such sending to school was to continue at least 12 weeks, 6 of them consecutive. For every neglect of such duty the party offending was to forfeit, for school use in that part of the District, not to exceed $20, unless it should be made to appear to the justice that the party so offending either could not send the child to school, had been sending it to some other than a public school, or showed such physical or mental inferiority in the child as made school attendance inexpedient.

Governor Sheldon, of *New Mexico*, in his report to the Secretary of the Interior for 1881, says: "Education is compulsory for 5 months of the year."

Washington Territory requires in its school law of 1877 that in any city, town, or village containing more than 400 inhabitants every parent, guardian, or other person residing therein, having control of any child or children between the ages of 6 and 16, shall send such child or children to public school for at least 6 months in each school year, at least 6 weeks of which shall be consecutive, unless the mental or bodily condition of the child or children prevent this, or unless they are engaged in labor necessary for their own support or that of others dependent on them, or are taught the ordinary school branches in a private school, or have already acquired these; no penalty.

Wyoming, in 1873, made it the duty of parents, guardians, or other persons having control of children 6 to 21 years of age to send such children to some school at least 3 months in each year, unless excused on a physician's certificate of sickness or by the district board because attendance would work great hardship; penalty for disobedience, not to exceed $25 for each offence.

COMPULSORY INSTRUCTION ABROAD.

Germany.—Compulsory elementary instruction is universal in Germany, in some parts of which laws on the subject were passed as long ago as the seventeenth century.

In other European countries, the idea of obligatory instruction was not expressed in the form of laws until the present century and in some of them such laws are still wanting.

Denmark passed a law making elementary instruction obligatory in 1739, which proved inadequate in certain respects, and a new law was enacted in 1814.

Switzerland made primary instruction obligatory in 1832 and 1833.

A law to the same effect was passed in *Greece* in 1834.

Sweden.—The Swedish law dates from 1842, and *Norway* followed in 1869.

Austria-Hungary.—The first obligatory law was also passed in the year 1869 in Austria-Hungary, making instruction compulsory for children between 6 and 12 years of age. The time was extended 2 years by the law of 1882.

In *England*, acts of Parliament in 1870, 1876, and 1880 authorized the local school boards to compel parents to send their children of school age (6 to 13 years) to school.

Scotland followed with a law to the same effect in 1872.

In *Italy*, where education has received especial attention in recent years, the compulsory law was enacted in 1877.

In *Japan* education was made obligatory by the law of 1879 and 1880.

France.—On June 16, 1881, the French Assembly passed a law making primary instruction absolutely free throughout the Republic, and this was followed by the law of March 28, 1882, making it obligatory.

Roumelia.—Primary instruction is also compulsory in Roumelia and in the *United States of Colombia.*

Belgium.—A bill is to be introduced into the Belgian legislature in 1883 making elementary instruction obligatory throughout the kingdom.

BRIEF SUMMARY OF THE EDUCATIONAL CONDITION OF THE UNION.

NEW ENGLAND STATES—MAINE.

Although there was again a decline in the number of youth of school age and also a considerable diminution in the enrolment in public schools, there was, if the figures given are correct, an increase of 11,688 in average daily attendance, while the aggregate daily attendance advanced so much as to encourage the State superintendent to believe that on the whole there was a healthier condition of school affairs. Of the teachers employed, a much larger proportion had had some previous experience. Through shortening the sessions of teachers' institutes a great increase of attendance on them was secured, resulting in better school work. The chief hinderance to progress, the old district system, still held its ground however, only two towns having abandoned it in 1882 for the town system. While it continues, thoroughly good schools outside of cities seem impossible.

NEW HAMPSHIRE.

An improvement over the previous year is noted in 1882. There were 1,114 more pupils enrolled, 53 more in average daily attendance, and 713 more in private schools. Five more school-houses are reported and 7 more were built than in the previous year, while those unfit for the purpose for which they were used decreased by 32. There

were 21 more fitted out with maps and globes, and the estimated value of school property was $227,828 greater than in 1880–'81. An increase in teachers of 9, with 33 more who were graduates from normal schools, is a favorable sign. The average monthly pay of men was higher by $3.82, that of women by 59 cents. The income and expenditure also increased — the former by $7,039, the latter by $1,680. Decreases, however, were noted in the number of public schools, in graded and high schools, in the length of school term, in the number of men teaching, and in the persons teaching successive terms. The State superintendent says that many of the schools are extremely good, others the reverse; some cities and towns were inclined to erect and furnish school buildings, others hesitated, but a general upward tendency is noted in school matters.

VERMONT.

There is less advance to be noted here than in some of the other States, but great efforts have to be made to build up the district ungraded schools, which six-sevenths of the pupils of the State attend. Indeed, the work of the last two years has been largely in the direction of dissipating illiteracy by means of improving the common schools. The statistics so far do not show very favorable results, although the school term was lengthened about 2½ days. The teachers who had attended a Vermont normal school numbered 17 more, although there were 43 fewer teachers, the average monthly pay of both men and women being greater and receipts and expenditures increasing. The public school enrolment, however, fell off 646; the number of schools, 34; average daily attendance, 1,928; and per cent. of attendance on enrolment, 1.9. The attendance in private schools was smaller.

MASSACHUSETTS.

In almost all important items there were decided gains. With an increase of 8,697 in children of school age, there were 5,182 more pupils enrolled in public schools, 3,411 more in average membership, and 2,631 more in average attendance; and, as the pupils in evening schools, in State charitable and reform schools, in academies, and other private schools amounted to 4,931 more than in 1880–'81, it is evident that the increase of children did not equal the increased number brought under some kind of instruction. The regularity of attendance in evening schools greatly improved. As the means for instruction in day and evening schools, in funds for paying teachers, and in the number of teachers employed were fairly up to the additional demand for them, and the proportion of teachers trained in normal schools was considerably higher, the record for the year is an encouraging one; especially as the few surviving remnants of the old district school system were abolished.

RHODE ISLAND.

A moderate but encouraging advance nearly all along the line appears from a comparison of the statistics of 1880–'81 with those of 1881–'82. The fact, however, that manufactories successfully compete with the schools in securing the attendance of children largely accounts for the absence of 13,826 children of school age (1,087 more than in 1880–'81) from the public schools. With 2,755 additional children, the public school enrolment increased 668; there was a larger increase still in the average belonging, and 529 more pupils than in the previous year were in average daily attendance in State common schools. When we add to these 107 more in evening schools and a considerable number in private and church schools, it will be seen that the record of the State was fairly good, especially as it raised $25,160 more for its free schools, spent $41,899 more for them, increased by about $1.50 the average monthly pay of school teachers, and added 5 to the number of school buildings, 3 to the number of graded schools, and $110,249 to the valuation of school property.

CONNECTICUT.

Gain at most points characterizes the year: gain in enrolment out of an increased school population, gain in the average attendance on free schools and in attendance

on schools of all kinds, gain in the annual amount received for supporting public schools, gain in the number and pay of teachers, and gain, too, on the whole, in the gradation of the public schools. A reduction of 24 in the number of school districts affords a negative indication of the same tendency, as the district system, with its small schools and ill paid teachers, is at present the chief obstacle to effective school work. The percentage of gain in enrolment and attendance, however, was a little less than in the previous year and public schools were not quite so numerous nor maintained quite so long. The State compulsory school law was considerably improved, and, as there is an excellent and experienced agent to enforce it and a growing public sentiment behind it, it is likely to tell on the general school attendance.

MIDDLE ATLANTIC STATES — NEW YORK.

The statistics show an increase for the year of over 19,000 in the youth of school age and in the number enrolled in public schools, the latter more than keeping pace with the former, while the average daily attendance was over 10,000 greater than in 1881. There were also over 7,000 more pupils attending private or church schools, over 3,000 more in academies, 208 more in normal schools, and 245 more in colleges: the whole number under instruction being 30,581 more than during the previous year. The amounts received and expended for public schools were each nearly half a million more, although the average school term throughout the State was 2 days less. Twenty more public school-houses were reported, but the estimated value of school property was less by $759,339. The number of men employed as teachers decreased by 546, while that of women increased by 953. There were 320 more teachers licensed by local officers and 88 more through normal schools; 171 more were employed consecutively 28 weeks or over, and the average monthly pay throughout the State increased by $1.04.

NEW JERSEY.

The report from this State shows that with 343,897 youth of school age there were 209,526 enrolled in public schools, of whom 113,532 were in average attendance, besides 44,560 in private and church schools, the increase in youth of school age being over 8,000, that of enrolment in the public schools nearly 6,000, and that of average daily attendance 3,480. Fewer public school buildings were reported and the valuation of school property decreased, but a larger number of sittings for pupils was provided. Less money was expended on public schools, but the average term throughout the State was 2 days greater. An improvement in the teaching force is indicated by an increase of 42 in the number of teachers holding State certificates, of 80 in those holding from cities, and of 33 in those having first grade county certificates.

PENNSYLVANIA.

As the State takes no census of the children of school age, the number of such children is not known; but the public schools increased their enrolment by 13,596 and (outside of Philadelphia) there were 7,914 more in private and academic schools. For the whole State there was an addition of 348 to the number of free schools, of 555 to the number of graded schools, of 477 to the teachers in free schools, of $268,540 to the expenditure for them, of 6.82 days to the school term, and of $1,736,239 to the estimated value of school property. In the State, exclusive of Philadelphia, there were 264 more free schools that taught their pupils drawing, 792 more that taught them vocal music, 488 more that had uniform text books, 119 more school-houses for free schools, 108 more rated as first class, and of the 21,829 teachers 595 more that had had the benefit of normal school instruction. The private schools of higher grade were 6 fewer than before, those of lower grade more numerous by 65, and the teachers in them all 109 more numerous. The distinction between schools for white and colored pupils was abolished by law, and Philadelphia took a great step forward in securing a city superintendent.

DELAWARE.

In the absence of a full report for 1882, no comparisons can be made between the school statistics of that and of the previous year. The schools for colored pupils under the care of the Delaware Association for the Education of the Colored People, with the aid of a State appropriation, did better than ever before, nearly every locality that could support a school having had one.

MARYLAND.

Maryland reports a year of successful work, with advance in every important particular. With 330,500 youth of school age, according to the United States Census of 1880, there was, in 1882, an increase of 1,036 children enrolled in public schools and of 3,450 in average daily attendance. There were 19 more public schools taught and $47,327 more were expended on them. The report calls attention to the inadequacy of teachers' pay in some of the schools and to the very small enrolment in some of the others.

VIRGINIA.

With over half a million youth of school age (according to the census of 1880), Virginia, in 1882, reported an enrolment in public schools of 257,362, with 144,904 in average daily attendance, an increase for the year of 18,316 in the number enrolled and of 10,417 in average daily attendance. The enrolment included over 172,000 white youth and over 85,000 colored, the total school population comprising nearly 74,000 more white than colored. Of the whole increased enrolment, 9,947 were white children and 8,369 colored, the increase in average attendance being nearly equally divided between the two races. There were 205 more public schools taught (123 more for white pupils and 82 more for colored), the average term throughout the State being nearly a day longer. Almost $57,000 more were expended for public schools. The average monthly pay of teachers increased slightly and 205 more were employed. Although a large proportion of this increase was among colored teachers, there were still 438 colored schools taught by white teachers. The superintendent calls attention to this fact, and says that these schools should be taught by competent colored teachers and that many more schools for colored children should be opened.

SOUTH ATLANTIC STATES—NORTH CAROLINA.

Education in 1881–'82 was in a transitional state, an improved school law having provided county superintendency. There is promise of a much better state of school affairs, but the new machinery is not yet working freely. Partly from this cause, the figures as to school attendance are largely on the losing side: with nearly 5,000 fewer children of school age, the number in public schools was 7,645 less and the average attendance reported 10,274 less. School-houses were said to be more numerous by 146, but free schools fewer by 354. The number of teachers trained in normal institutes and teachers' pay increased; the decrease reported in receipts for schools was apparently due to incomplete reports and school property was represented as much more valuable. The average time of schools was 15.9 days longer. Great progress was made during the year among the graded schools.

SOUTH CAROLINA.

No census of school children has been taken since 1880. The records show that during the year 1882 12,516 more children were enrolled in the State schools; that average attendance, now first reported as the basis for distribution of school funds, was fairly proportionate to the enrolment; that schools were more numerous by 126; that the duration of them averaged 6.66 days more; that teachers increased in number apparently enough to meet the increase of pupils, and that average pay, on the whole, was about the same as in 1880–'81. School expenditures, as incompletely reported, hardly reached a fair ratio of increase with the enrolment, and school-houses were 158 fewer, although 105 new ones were built within the year.

GEORGIA.

Georgia reports an increase of 35,757 in youth of school age, of 12,235 enrolled in public schools, and of 14,272 in average daily attendance, a decrease of 1,647 in the number of elementary and academic private schools taught and an increase of 2,242 in collegiate institutions, 296 more public schools, taught by 223 more teachers, and $85,642 more expended for public schools. The large additions to the average attendance and to the funds for the support of public schools were especially encouraging, and the decrease in elementary private schools, together with the other facts mentioned, indicates that the public schools were taking their place.

FLORIDA.

The biennial report from this State shows a rapid advance in public school interests during the years 1881 and 1882. The statistics for 1882 also show advancement in most particulars, although the reports are not sufficiently complete to warrant comparisons. More money was spent for teachers' pay in 1882 in almost every county, and this fact, the superintendent says, is worthy of note as indicating an increasing demand for the public school and an encouraging growth in educational work.

GULF STATES — ALABAMA.

With about 401,000 youth of school age, Alabama reports 177,428 enrolled in public schools and 114,527 in average attendance, an increase for the year of about 13,000 in school population and of 1,139 in public school enrolment, the average attendance being 789 less. There were 52 more public schools taught, but the average term of schools throughout the State was shorter by more than 2 days; fewer teachers were employed, at less pay; $7,000 less were expended for public schools; and public school property was valued at $21,519 less. The State superintendent appeals to the legislature for assistance, showing that with present means only a little over 44 per cent. of the children were enrolled in school and only about 28 per cent. were in average daily attendance.

MISSISSIPPI.

There is little information from this State for the year 1882, the last biennial State report having covered the years 1880 and 1881. From a written return for 1882, it appears that with an increase of 24,168 in school population there was a loss of 17,671 in average monthly enrolment, of 23,749 in average daily attendence, and of 805 in the number of teachers employed, receipts for schools also falling off nearly a quarter of a million dollars.

LOUISIANA.

Although there is no official report from the State superintendent for 1882, it abundantly appears from other sources that public school interests were far from satisfactory in this State. The poor pay of teachers, the insufficient provision for comfort in rural school-houses, the virtual abolition of taxation for schools and the utter inadequacy of school funds resulting therefrom, together with the want of a definite school law corresponding with the new constitution, combined to make efficient educational work almost impossible.

TEXAS.

It was stated in the report for 1881 that in a fire at the State capitol the school returns of that year had been consumed and that efforts made to duplicate them had proved only partially successful. Hence, comparison of the statistics of 1880–'81 and 1881–'82 cannot be made, but the absolute record for the latter year appears encouraging: 295,344 school youth, 142,960 brought under instruction in 5,236 schools, with an average term of about 100 days, under at least 5,037 teachers; and, as efforts were being made to improve the State school system and to give it both a body of professionally trained teachers and county supervision, it may be hoped that the record will be better in the future.

SOUTHERN CENTRAL STATES—ARKANSAS.

In Arkansas an encouraging condition of public school affairs is reported. Prejudice against the system is disappearing and the people are coming to look on the public schools as the only means through which the great part of the school population can obtain an education. The statistics, though imperfect, afford abundant proofs of progress. With but 16,776 more youth of school age than the previous year, there was an increase of 18,952 in public school enrolment, although only about half the school districts reported on this point. The superintendent thinks the real increase in attendance was about 40,000, or more than twice as great as the increase of youth to be educated. Over $115,000 more were expended for public schools. Fewer school-houses were built, but these were better adapted to their purpose and supplied with improved furniture and apparatus.

Under the head of General Condition in the abstract, mention was inadvertently omitted of the fact that Arkansas received from the Peabody fund, in 1882, $5,075, $1,700 being divided among the schools of Pine Bluff, Russellville, and Lonoke; $1,700 given for teachers' institutes, $1,475 for Nashville scholarships, and $200 to an educational journal.

KANSAS.

Very gratifying progress in school work is apparent in this State in 1881–'82. Increases are noted in children of school age, in enrolment, in average daily attendance, in school districts organized and reporting, in districts with three months' school or more, in the average length of school term, and in the number of school rooms, although there were 116 fewer school-houses reported. The women teaching received $1.46 more monthly pay on an average and 33 more teachers in private and church schools were reported. The receipts and expenditures for public schools increased, the former by $228,458 and the latter by $197,839. An increase of $32,109 in the amount of available school fund was also reported. Although the value of school property fell off $88,018 and fewer men taught (at an average of $7.46 less a month), the record as a whole speaks well for the State.

MISSOURI.

The schools of Missouri seem to be in a very prosperous condition, although the statistics are far from complete, as many counties failed to report fully. There were 18,239 more pupils in attendance at the public schools, which were more numerous by 137, the buildings used for school purposes by 328, and additional sittings by 11,573. Teachers numbered 1,306 more; receipts increased $257.016 and expenditures $601,046. An apparent decrease in attendance of colored youth at school is explained by the fact that 32 counties do not report. Eighteen fewer schools for colored youth are mentioned. School property diminished in value $1,089,319.

KENTUCKY.

In Kentucky, where the years 1879–'80 and 1880–'81 afford the most recent basis of comparison available, there was a decrease of 6,918 white youth in free schools and of 8,992 in the daily average attendance of whites. The statistics for colored youth are not given, so that no comparison can be made of the two years under consideration. An advance is noted in every other direction, except in the decrease of men teaching. There were 98 more school districts (67 of them for whites), 53 more districts having schools for whites and 21 more for colored; 29 more school-houses for white youth, valued with their sites at $166,697; and an increase of 104 private schools of all grades. The female teachers numbered 369 more than in the previous year. The receipts for school purposes are not given for 1880–'81, but the expenditures increased $381,124.

TENNESSEE.

From 1875 to 1880 this State, under excellent leadership, showed steady progress in

school work; but since that time, judged from its own roperts, there has been a considerable decline. With a growing number to be taught, there have been fewer brought into the State schools; the average attendance, when last shown, in 1881, had greatly diminished, as well as schools and school-houses. In funds for the State schools there was a decline, but these have increased again.

WEST VIRGINIA.

This State reports 216,598 youth of school age (over 208,000 of them being white children); 155,544 enrolled in public schools, of whom 151,098 were white and 4,446 colored children; and 96,652 in average daily attendance. The percentage of enrolment and of average attendance based on the whole number of school age increased. The figures also show an increase in the number of schools taught, in the amount of money expended for them, in the value of public school property, and in the amount of the public school fund, which materially increased during 1881 and 1882, the apportionment among the counties being the largest ever made in the State. The average school term throughout the State was one day longer than the previous year. Superintendent Butcher says the general approval and generous aid given educational work by members of all professions and callings has been very gratifying. Newspapers and physicians are especially mentioned, the latter for instruction given to teachers in school hygiene and other subjects.

NORTHERN CENTRAL STATES—OHIO.

Although Ohio has not an ideal school system, the good work of many excellent school officers tells well in its results. For 1881–'82 the figures of the State report show gains with few exceptions in all the items: $634,455 larger receipts for public schools, an increase of 17,984 school children, 6,343 more enrolled in the State schools and 15,091 more in average daily attendance; while, to accommodate these growing numbers there were 27 more school-houses (including 96 built during the year), 453 more school rooms, and 165 more teachers, at an average pay of $2 a month more for men and $1 more for women. The cost of additional school-houses ($1,123,688) shows that they must have been generally good, while all the State school grounds and buildings were rated $1,506,876 higher than the year before. The only offset to all this advance is a doubtful decrease of 595 in colored pupils and of 20 in their teachers.

INDIANA.

The statistics of 1882 show a falling off of more than 5,000 in the number of youth of school age and in the number enrolled in public schools, with a comparatively small decrease of 788 in average daily attendance, fewer districts in which public schools were taught, and a smaller enrolment in private schools. There was, however, on the other hand, an increase of $13,261 in the income and of $254,039 in the expenditure for public schools, of $73,806 in the amount of the common school fund, of 60 in the number of public school-houses, and of $286,725 in the value of public school property. The superintendent reports, as good evidence of progress, more attention given to the mental, moral, and physical education of the children, as well as to methods of instruction, greater efforts made to train pupils to think for themselves, and more attention given to the formation of character and the inculcation of good habits.

ILLINOIS.

This State reported an increase of 35,345 in youth of school age, of 18,034 in enrolment in public graded schools, of 15,936 in all public schools, and of 26,627 in average daily attendance. There was also an increase of 29 in high schools, and of 38 in the number of school buildings erected during the year. There was a decrease of 2,098 in attendance on ungraded schools, of 22 in public school-houses, and of 270 in

teachers employed. The valuation of all public school property increased by $1,220,666, receipts by $358,281, and expenditures by $709,261; the last increase named was partly due to an increase in the pay of teachers, which averaged $2.69 a month for men and $2.27 for women.

MICHIGAN.

Michigan reports an increase of more than 20,000 in youth of school age and of 13,761 in the number enrolled in public schools, the per cent. of school age enrolled being about the same as during the previous year; 789 more pupils attended private or church schools. There were 153 more public school-houses and 27,331 more sittings, the value of school property being $463,792 greater; $371,693 more were expended for public schools, which were taught in 242 more districts. Fewer men and more women were employed as teachers, the average monthly pay of men being increased $4.58; that of women, $1.66.

WISCONSIN.

With 495,233 youth of school age, Wisconsin reports 303,452 enrolled in public schools, besides 20,967 in private or church schools, an increase for the year of 3,875 in school population and of 3,330 in public school enrolment, with a decrease of over 5,000 attending private or church schools. There were also over 4,000 in normal, collegiate, and theological schools. Exclusive of these, counting public and private school pupils, a little over 65 per cent. of the school population were under instruction during some part of the year. There was an increase in the number of high and graded schools, as well as in the whole number of schools taught and of teachers employed, the latter including fewer men and more women. A larger number of public school-houses were reported, the value of public school property increasing by $47,305; the average pay of teachers also increased somewhat, although the whole expenditure for public schools was less than the amount reported for 1881.

MINNESOTA.

With 289,028 youth of school age, this State enrolled 196,643 in public schools, an increase for the year of over 13,000; the average daily attendance in winter was over 12,000 more and in summer it was 2,577 more. There were $435,070 more expended on public schools, the available school fund increasing by $464,238; 159 more school-houses were reported in use and the value of school property was $244,808 higher.

IOWA.

The progress made in this State cannot be accurately stated, as the biennial report covering the years 1882 and 1883 has not yet appeared. From other official sources, however, a few facts are learned. More money was received and expended for school purposes; the permanent fund was increased by over $185,000 and the estimated value of school property by $443,649. The ratio of attendance to enrolment was better, but the enrolment itself fell off 24,566 and the percentage of enrolment on school population was 5.3 less; average attendance was 400 less and the average school term was 6 days shorter. There were more teachers in the public schools, 502 fewer men and 807 more women, the average monthly pay of men being $2.70 more and that of women 21 cents more.

NEBRASKA.

The progress in educational affairs is quite marked in this State: the enrolment was greater by 14,770 pupils, the average attendance by 523; 130 more public school districts are reported, 221 more with 6 months' school and 17 more having graded schools; and 108 more public school-houses, increasing the valuation of school property $180,415. There were 4 fewer men employed as instructors, but 543 more women, who, however, received $3.16 less per month on an average than in the year

1880–'81. Institutes were attended by 395 more teachers, while 9 more counties held such institutes. The compensation of county superintendents was slowly increasing, yet much was left to be desired, as the poor pay secured only an inferior class of work. Income for public schools increased $211,430 and expenditures $201,234. The length of term in which schools are held is said to have increased 2 days since 1879–'80. The question of school furniture receives more attention than formerly.

COLORADO.

This State shows an increase of 8,403 in the school population, of 4,731 in public school enrolment, and of 3,839 in average daily attendance. The proportion of enrolment to school population increased nearly 1 per cent., while that of average attendance to enrolment increased 2 per cent. An increase also appears in other particulars. Fifty-six more school-houses were reported, affording 6,984 more sittings; school property was valued at $258,278 more; 99 more teachers were employed; and $69,814 more were expended for the public schools, which were taught an average of 100 days. The State superintendent reports a steady improvement in the quality of the schools as well as an increase in their number.

STATES ON THE PACIFIC SLOPE—NEVADA.

A comparison with the previous year shows that, while the enrolment and daily attendance of pupils decreased both in public and private schools, while there were 6 fewer districts voting a district tax, and while the school property diminished $21,260, yet in every other way there was a decided advance over 1880–'81. There were more districts, more public schools, graded and ungraded, and more without rate bills, an increased school term, more teachers, both sexes receiving better pay, higher receipts and expenditures, and a larger State school fund.

CALIFORNIA.[1]

Although an advance is noted in nearly every direction in the educational affairs of this State, yet Superintendent Campbell says that the progress made is not entirely satisfactory to those who furnish the means for carrying on the work of education. An increase in the number of primary and grammar schools was noticeable. The well ventilated and the well furnished school buildings outnumbered by 114 and 126 those of the previous year. There were 103 more buildings supplied with apparatus. Nearly 5,000 additional pupils were enrolled in the public schools, while the average daily attendance increased 1,636 during the year under consideration. The school property reached a valuation of $240,844 more than in 1880–'81. Among teachers a marked difference was noted; 116 more held life diplomas, 145 more educational diplomas, and 299 more first grade county certificates. There were also 10 more graduates from normal schools employed as instructors. The income for public schools advanced $110,568 during the year. The items of decrease were of minor importance.

OREGON.[2]

Oregon makes a very good showing. With 3,600 more school children, 3,245 more were gathered into the State free schools and 2,151 more held in average attendance, while in other than State schools there were 2,571 more enrolled than the preceding year. The number reported as not in any school was thus 327 less than in 1880–'81. School districts organized were 56 additional; the number reporting their statistics, 38 more; school terms were lengthened from an average of 86 days to an average of 90 days; school property increased in value $26,829. Receipts for schools increased $15,000 and expenditure for them $28,630; the permanent school fund, $222,522. In addition to a normal department at the university two already well established institutions were adopted as normal schools.

[1]The Office is specially indebted to Mrs. Sarah B. Cooper for aid in obtaining full information of the various phases of educational progress in the State.

[2]For the full information obtained of the educational progress of Oregon, the Office is specially indebted to Rev. Geo. H. Atkinson, D. D., of Portland.

THE TERRITORIES — ALASKA.

Educational work in this vast Territory is still entirely dependent on private benevolence. Letters from Rev. Sheldon Jackson, D. D., and Mr. Ivan Petroff show the following facts:

In the southeastern section of the Territory, known as as the Alexander Archipelago, there were 7 good English schools, 3 of which had boarding and industrial departments. Six of the 7 were maintained at the expense of the board of home missions of the Presbyterian Church. Six of them were among the Thlinkets and one among the Hydah speaking people. Over 500 pupils were reported in these schools, 200 of them belonging to the school at Sitka.

In the southwestern section the only schools were one sustained by the Russo-Greek Church, at Belkovsky, and 3 by commercial companies, one of the latter at St. Paul, with 69 in average attendance, and the other at St. George, with 22. No other educational facilities are afforded the people of Southwestern Alaska, although among them in the principal trading centres are several thousand people of mixed blood, who, under Russian rule, had made considerable advance in civilization. About 500 of this class out of 8,000 or 9,000, it is estimated, are able to read and write their own language, and perhaps a fourth of this number the Russian language also.

There is perhaps no portion of United States territory that stands in greater need of national aid for school work than this. Certainly the efforts already made by churches and by private benevolence have been and are being amply rewarded.[1]

ARIZONA.

The statistics from this Territory are too meagre to afford a basis for satisfactory comparison of the school work of 1882 and previous years. A territorial school census

[1] As this report is going through the press, the House of Representatives, on the 14th of May, 1884, passed the Senate bill providing a civil government for Alaska, which was signed by the President on the 17th.

This act creates a governor at a salary of $3,000, a judge at $3,000, a district attorney at $2,500, a marshal at $2,500, a clerk at $2,500, four commissioners at $1,000 each and fees, and four deputy marshals at $750 each and fees.

These officers are appointed by the President, with the exception of the deputy marshals, who are appointed by the marshal.

The seat of government is established at Sitka. The four commissioners and four deputy marshals are to reside respectively at Sitka, Wrangell, Juneau, and Unalashka.

The laws of Oregon, so far as applicable, are extended over the district. A term of the district court is to be held each year at Sitka, commencing on the first Monday of May, and one at Wrangell, beginning on the first Monday in November. No provision is made for a territorial legislature or a delegate in Congress. The general land laws of the United States are not extended over the country. The squatter rights of Indians and others are recognized. Mission stations are continued in the occupancy of the 640 acres now claimed by them. The owners of mining claims can perfect their titles in the usual way.

The governor is required to inquire into the operations of the Alaska Commercial Company and annually report to Congress the result of such inquiries and any and all violations by said company of the agreement existing between the United States and said company.

The Secretary of the Interior is directed to select two of the officers, who, together with the governor, shall constitute a commission to examine into and report upon the condition of the Indians residing in said Territory; what lands, if any, should be reserved for their use; what provision shall be made for their education; what rights by occupation of settlers should be recognized, and all other facts that may be necessary to enable Congress to determine what limitations or conditions should be imposed when the land laws of the United States shall be extended to said district.

The importation, manufacture, and sale of intoxicating liquors in said district, except for medicinal, mechanical, and scientific purposes, are prohibited.

The Secretary of the Interior is directed to make needful and proper provision for the education of the children of school age in the Territory of Alaska, without reference to race, until such time as permanent provision shall be made for the same, and the sum of $25,000 is appropriated for this purpose.

Thus, after seventeen years of delay, a government has been secured for Alaska. In respect to this successful result this Bureau has endeavored to do its whole duty by obtaining trustworthy information in regard to the condition of the inhabitants and their educational needs, and by furnishing it to the

shows 10,283 youth of school age; but the number attending schools, either public or private, is not given. More public school teachers were employed than during 1880–'81 and $53,640 more were expended on the schools. A uniform series of text books was adopted, which had facilitated the work of teachers and the progress of their pupils. The superintendent says the schools are in need of that general supervision which the insufficiency of legislative appropriation prevents him from giving, although required by law, and that they also need more local supervision than the probate judge, who acts as county superintendent, can find time to give.

DAKOTA.

Dakota reports a school population of 38,815, with 25,451, or about 65 per cent., enrolled in 41 graded and 981 ungraded public schools, 16 counties having failed to report in respect to all these items. No comparison can be made between 1881 and 1882, in respect to these points, in the absence of any report for the former year. The insufficiency of reports from this Territory is ascribed partly to the neglect of local supervisors and partly to a municipal system quite independent of territorial authority, which is rapidly removing the more populous places from the superintendent's control.

DISTRICT OF COLUMBIA.

As the statistics of District schools have not been furnished for 1882, no comparison of the educational condition of the District between this year and 1881, can be made, except in regard to the funds received and expended for public schools. Each of these figures in 1882 amounted to $579,312, against $555,644 received and $527,312 expended in 1881, an increase for the year of $52,000 applied to public school purposes.

The city of Washington, with a white school population of 27,142, enrolled 17,306 in public schools, of whom 13,168 were in average daily attendance, besides 5,000 in private schools. The public schools were taught 186 days, in 54 buildings, containing

Government officers and to the people. In this effort Prof. W. H. Dall, of the United States Coast Survey, and Rev. G. H. Atkinson, D. D., of Oregon, were especially helpful.

The report of this Office for 1870 had a notice of education in Alaska, and year after year these notices were continued as data warranted.

In 1876 the Commissioner of Education, as representative of the Department of the Interior, expended a portion of the funds at his control to secure a representation of native life in Alaska for the Centennial Exposition at Philadelphia.

In February, 1882, a special report from this Office on education in Alaska, recommending an appropriation of $50,000 for schools, was made to the Secretary of the Interior, and by him forwarded to Congress through the President.

In 1877 Rev. Sheldon Jackson, D. D., superintendent of Presbyterian missions for the Rocky Mountain Territories, having had his attention called to Alaska, visited the southeastern portion, and established the first American school in that section on the 10th of August, 1877, with Mrs. A. R. McFarland, as teacher. Later, he established schools at Sitka, Haines (Chilkats), Boyd (Hoonyahs), and Jackson (Hydahs). Returning to the States, Dr. Jackson commenced an agitation to arouse the dormant public sentiment of the country in behalf of a government and schools for Alaska. He held public meetings in many of the leading cities and many of the prominent towns from the Pacific to the Atlantic, delivering from 1878 to 1884 about nine hundred addresses on Alaska. He went before committees of the Forty-Sixth, Forty-Seventh, and Forty-Eighth Congresses, and with unflagging zeal sought to enlist the interest of congressmen. He secured the hearty coöperation of the missionary societies of the Baptist, Methodist, Congregational, Episcopal, Moravian, and Presbyterian churches.

In 1880 he published a book on Alaska, and on March 23, 1882, delivered an address before the Department of Superintendence of the National Educational Association, which was printed by this Bureau in Circular of Information No. 2, 1882. Of this circular three editions have been called for, making an aggregate of 60,000 copies. During the summer of 1883, he visited the twenty-second annual meeting of the National Educational Association of the United States, the second National Educational Assembly, and the State teachers' associations of Vermont, New Hampshire, Massachusetts, and Connecticut, each of which passed strong resolutions asking Congress to provide a school system for Alaska.

Through these meetings the teachers became interested, and thousands of petitions from teachers, scattered from Maine to Texas and from Florida to Oregon, were sent to congressmen, asking for schools for Alaska. So persistent and continuous was the pressure invoked by Dr. Jackson from so many, varied, and widely separated forces, that when the bill was reached Congress passed it with great unanimity.

244 rooms and 14,552 sittings for study, an increase of 115 in the number of seats provided, of 809 in pupils enrolled, and of 530 in average attendance.

IDAHO.

There were 9,650 youth of school age reported in 1882, but the number under instruction was not given. Two hundred teachers were employed in public schools, 25 more than in 1881; men received $60 a month and women $50; $46,855 were expended for public schools, about $2,000 more than the year before.

The superintendent complains of embarrassments resulting from defects in the school system and lack of funds. Being an ex officio superintendent, with only a part of his time for school work and no salary as superintendent, his supervision of school interests is necessarily imperfect, and the same is true of county superintendents. Attention is also called to the absence of any provision for teachers' institutes, to the small pay of teachers and lack of care in selecting them, and to the short school terms, covering but 3 months in many districts.

INDIAN TERRITORY.

Among the 262,366 Indians reported in the United States, exclusive of Alaska, there are, it is believed, over 44,000 within the school age, of whom upwards of 35,000 belong to tribal Indians and over 9,000 to the Five Nations in the Indian Territory. There were enrolled in schools of all kinds 14,394 Indian youth, or less than 33 per cent. of the whole number, a loss for the year of 544 in the Five Nations and a gain of 646 among the tribal Indians. With this slightly increased attendance among the tribal Indians there was considerable advance in the number of teachers and missionaries employed and in the whole expenditure for Indian schools. All the statistics received, as also the concurrent reports, indicate a steady advance in Indian education.

MONTANA.

With 10,484 youth of school age, Montana reported 6,054 enrolled in public schools in 1882 and 3,558 in average attendance, an increase for the year of over 1,000 in school population, of nearly that number enrolled in public schools, and of 758 in average attendance. There were 25 more schools taught; the average term increased by 15 days; more teachers were employed at an increased salary, and $9,577 more were raised for school purposes, the last being due to the increased value of property, as the rate of taxation was one-tenth of a mill less than during the previous year.

NEW MEXICO.

Education in New Mexico is far from flourishing. As there is no territorial superintendent and, in fact, no system of public free schools, no statistics are reported.

UTAH.

There were here over 43,000 youth of school age and over 27,000, or nearly 63 per cent., enrolled in public schools, with 17,594 in average attendance, the latter being over 1,000 less than in 1881. Public schools were taught an average of 139 days, one less than the previous year, and $13,726 less were expended on them, although 14 more teachers were employed. Non-Mormon private schools reported decided gains.

WASHINGTON TERRITORY.[1]

The superintendent of instruction reports a prosperous condition of the schools. School districts and school-houses increased in proportion to the increase in population, school buildings were better than they had ever before been, and there was an increasing demand for better teachers.

WYOMING.

This Territory sends no report for 1882. Except as to the city of Cheyenne, the latest information respecting the schools is from the report for 1881 of the governor, Dr. J. W. Hoyt. Cheyenne had 500 pupils enrolled during 1882 in a graded course of study, comprising 8 years up to the high school, which offered 4 years more.

[1]The Office is specially indebted to Rev. George H. Atkinson, D. D., for the full information obtained of the progress of education in Washington Territory.

COMPARATIVE STATISTICS OF EDUCATION IN THE SOUTH.

Table showing comparative school population and enrolment of the white and colored races in the public schools of the recent slave States, with total expenditure for the same in 1882.

States.	White.			Colored.			Total expenditure for both races. *a*
	School population.	Enrolment.	Percentage of the school population enrolled.	School population.	Enrolment.	Percentage of the school population enrolled.	
Alabama	224,464	107,949	48	176,538	69,479	39	$403,602

a In Delaware, in addition to the school tax collected from colored citizens, which has heretofore been the only State appropriation for the support of colored schools, the legislature now appropriates annually $2,400 from the State treasury for educating the colored children of the State; in Maryland, there is a biennial appropriation; in the District of Columbia, one-third of the school funds is set apart for colored public schools; in South Carolina, the school moneys are distributed in proportion to the average attendance, without regard to race; and in the other States mentioned above, the school moneys are divided in proportion to the school population, without regard to race.

b As far as reported; several counties failed to make race distinctions.

c In 1881.

d In 1880.

e United States Census of 1880.

f Estimated.

g Four counties failing to report.

h Number of colored children in Kentucky between the ages of 6 and 20 according to the United States Census of 1880; in 1882 the school age for colored children was changed by law from 6–16 to 6–20.

i According to return for 1880; since then the legal school age for colored children has been lengthened by four years.

j For 1881; in 1882 the per capita of the white child of legal school age and the colored child of legal school age was made the same, thus giving to the colored children equal advantages with the white children in the common school fund of the State.

k Thirty-two counties failing to report.

l Fifteen counties failing to report.

Table showing the number of schools for the colored race and enrolment in them by institutions, without reference to States.

Class of institutions.	Schools.	Enrolment.
Public schools	*a*15,932	*a*802,982
Normal schools	56	8,509
Institutions for secondary instruction	43	6,632
Universities and colleges	18	2,298
Schools of theology	24	665
Schools of law	4	53
Schools of medicine	3	125
Schools for the deaf and dumb and the blind	6	116
Total	16,086	821,380

a There should be added 391 schools, having an enrolment of 31,125, in reporting free States, making total number of colored public schools 16,323 and total enrolment in them 834,107. This makes the total number of schools, as far as reported, 16,477, and total number of the colored race under instruction in them 852,505. The colored public schools in these States in which no separate reports are made, however, are not included.

From the table of comparative statistics of education in the South it appears that the white school population of 16 States and the District of Columbia is 4,046,956 and enrolment in public schools 2,249,263, the increase over the same as reported in 1881 being, respectively, 92,356 and 14,386. The colored school population is 1,944,572; enrolment, 802,982; the increase, respectively, 15,385 and 610.

For Delaware, Kentucky, Louisiana, Mississippi, and the District of Columbia the figures for enrolment are the same as in 1881; Alabama, Florida, Georgia, Missouri, South Carolina, Virginia, and West Virginia report increased enrolment for both races; Arkansas and North Carolina, increase for the whites only; Maryland, for the colored only; while in Texas and Tennessee the enrolment for both races is less than that reported in 1881. In the latter State marked progress appears again in 1883. If we turn to the report for 1876–'77, the first year in which the table under consideration was attempted, we shall see clearer evidence of the remarkable work that has been accomplished in the Southern States: as compared with the numbers reported in 1876–'77, white school population shows increase of 13 per cent.; enrolment, of 23 per cent. Colored school population shows increase of 28 per cent.; enrolment, increase of 40 per cent. During the same time the expenditure for public schools in these States and the District of Columbia has been steadily increasing. For the successive years since 1878, the first year for which a separate statement of the amount was given, the expenditure has been as follows: 1878, $11,760,251; 1879, $12,181,602; 1880, $12,475,044; 1881, $13,359,784; 1882, $14,820,972.

The increase in enrolment and funds corresponds to a radical change in the sentiment of the people. A free impartial system of education is recognized as indispensable to the future prosperity of the States, and there is a very general disposition to establish schools and to make like provision for both races. Louisiana appears now to be the only one of the States under consideration in which the prospect is in the main discouraging.

By reference to the table it will be seen that both races now share alike in the school fund, excepting in Delaware, Maryland, and the District of Columbia, in which special provision is made for the colored race, and in South Carolina, where the basis of apportionment is the same for each race but the amounts realized depend upon the extent to which the people avail themselves of the provision by absolute attendance upon the schools. Since the date of my last report, Kentucky has abolished all discrimination between the races in respect to the distribution of the school funds, the act to that effect bearing date April, 1882. In view of this action in Kentucky, it is to be hoped that the disposition manifested in some other States to adopt similar invidious distinctions will yield to better counsels.

While the disposition to deal impartially with both races in respect to school provision is so general in the Southern States, it will be noticed that the proportion of the colored school population enrolled in the schools is very much less than that of the white school population. The reasons are apparent to every one personally familiar with the situation of affairs in this section. There are few school buildings for the use of the colored people, the supply of teachers is extremely limited, while the poverty of the people, their irregular habits, and capricious moods interfere with their school attendance, especially in the country districts. These are, however, all minor difficulties, the most serious obstacle to the practical fulfilment of the school laws in the Southern States being the want of funds.

It is unnecessary to repeat here the proofs of the statement that the Southern States cannot of themselves bear the whole burden of the instruction and development of the freedmen: the fact is admitted; the responsibility of the nation in the matter is admitted; there appears to be an overwhelming sentiment in the country in favor of appropriations from the National Treasury to meet the emergency, and a determined effort will be made to secure from Congress at its next session the measure of relief desired. The preparation of teachers for the colored schools is at present the most important end to be accomplished. The special provision for this

training is set forth in the table of normal schools, which gives a total of 56 schools, having 8,509 students and 307 instructors, as against 47 schools, with 7,621 students and 258 instructors, in 1881. The schools for secondary instruction, colleges, universities, and schools of theology also contribute to this work of preparing teachers. It will be seen that all classes of schools for the colored people above the elementary grade depend largely for their support upon the various religious denominations, whose zeal and liberality in the cause of the elevation of the freedmen continue without abatement.

Schools of law number 4, with 16 instructors and 53 students, as against 3 schools, with 12 instructors and 45 students, in 1881. One additional school of medicine is reported, with a total for the 3 schools of 23 instructors and 125 students, as against 18 and 116, respectively, in 1881. The total number of schools of all classes reported is 16,086, against 17,375 in 1881. The enrolment is greater than that reported in 1881, viz, 821,380, as against 818,365.

Since my last report two notable benefactions have been made to promote education in the Southern States:

In March, 1882, John F. Slater, of Norwich, Conn., gave $1,000,000 to several gentlemen in trust for the education of the freedmen of the South. Dr. A. G. Haygood was appointed general agent for the distribution of the fund, and entered at once upon a careful investigation of the field. Although his first report has not yet been published, he has already given some indication of the action he will recommend. The need of provision for the industrial training of the freedmen is especially emphasized by Dr. Haygood.

In June, 1882, Mr. Paul Tulane, of Princeton, N. J., executed a trust deed conveying to certain persons incorporated under the name of "The Administrators of the Tulane Education Fund" certain real estate in the city of New Orleans, La., for the promotion and encouragement of intellectual, moral, and industrial education among the white persons in the city of New Orleans, and for the advancement of letters, the arts, and sciences therein. In 1883 this gift was increased by a further donation in cash, stocks, and bonds. The total value of the benefaction is placed at $701,926.

PEABODY FUND.

The disbursements from the Peabody fund amount for 1882 to $80,334, a larger sum than has been reported in any single year since 1877. In addition to the substantial aid afforded by the money an immense impetus has been given to the cause of education by the efforts of the general agent, Hon. J. L. M. Curry, LL. D. Legislation has been stimulated by his eloquent appeals, while his counsel has determined many practical details of school organization and his vigilant supervision has been felt throughout the States participating in the benefit of the fund. A striking evidence of the estimation in which the service of the board of trustees and the personal influence of the general agent are held is furnished by a memorial of May 3, 1883, addressed to the trustees of the Peabody fund by certain citizens of Louisville, Ky. The memorialists pray that Kentucky may henceforth be included in the operations of the board and that the general agent shall be authorized to address the Kentucky legislature on the subject of education, "laying before them the results of his reflection and experience on this great subject."

The prosperity of the Normal College, Nashville, Tenn., seems to be permanently assured. Dr. Curry reports that—

> The Normal College seems to be acquiring, by its excellence of instruction and management, a stronger hold upon the people of Tennessee. * * * The State board of education, at their meeting in June, assured the Peabody trustees of their hearty coöperation in efforts to promote the success of the college and to elevate the standard of education, and they memorialized the legislature to appropriate $10,000 to the Normal College and $2,500 to the Colored Normal Institute.

The State board petitions the trustees of the Peabody fund to grant scholarships to Tennessee on the same footing as they are granted to other States, which request Dr. Curry advises the board to grant whenever and so long as Tennessee shall give annually to the college $10,000 free from all incumbrances. The amount of the Peabody fund devoted to Nashville scholarships for the year ending October 1, 1882, was $18,525, in addition to which sum $9,000 were appropriated to the college.

The course pursued by the trustees and the agent of the Peabody fund in concentrating the money upon the training of teachers has accomplished more than any other single agent in creating throughout the South a just appreciation of the paramount importance of this part of public school work.

a Based on average enrolment. *b* Based on enrolment.

School population and accommodation.— Table II presents the school statistics of 263 cities having a population, according to the Census of 1880, of 10,918,638. Diminishing this population by that of the 24 cities in the table for which school population is not reported, we have for 239 cities a total population of 9,474,730, the corresponding school population being 2,859,287, or 31 per cent. of the total.

A glance at the column of school ages will show that the reported school population must be larger than the number of youth of the ages included in the usual period of school attendance. This latter number, which for convenience we may designate as actual school population, would bear a ratio to total population varying in different sections; for instance, in Massachusetts, where the legal school age corresponds with the ordinary period of attendance, and consequently legal and actual school population differ but slightly, if at all, the school population of the cities tabulated ranges from 16 to 20 per cent. of the total population. In some of the frontier States the proportion of school population would be even smaller, but on the whole the ratio that obtains in Massachusetts would be too low for the country at large. The ratio which the children between 3 and 13 years of age in England are found to bear to the whole population (viz, 23 per cent.) may be employed as affording an ample estimate of the actual school population in our country. Using 23 per cent. as a basis of reckoning we may arrive at a more correct idea of the school provision in our cities than can otherwise be formed.

The school population and school accommodation of 196 cities that report both items are, respectively, 2,473,317 and 1,114,560, or an accommodation for 45 per cent. of the legal school population and for 13 per cent. of the entire population of these cities. The deficiency of accommodation when represented as equal to 55 per cent. of the legal school population seems enormous, but if actual school population be reckoned at 23 per cent. of the entire population the deficiency of accommodation is then seen to be equal to 10 per cent. of the entire population, that is, 811,940 places. This number is still, however, larger than the true deficiency, as will be seen when provision in private schools is taken into account.

For 187 cities reporting the items previously considered, together with estimated enrolment in private schools, we have a population of 7,928,869; school population, 2,411,414; sittings in public schools, 1,087,210; estimated enrolment in private schools, 371,922, or a total school accommodation of 1,459,132. Reckoning the actual school population at 23 per cent. of the total population, as heretofore explained, 364,507 places would be required to meet the deficiency.

For the supply of this deficiency there still remains the provision in institutions for special classes, viz, orphans, deaf-mutes, &c., besides which, allowance must be made for children permanently incapacitated by reason of mental or physical infirmity. Upon the most favorable interpretation of the figures, the deficiency of accommodation in a number of cities occasions, and properly, great solicitude. The table indicates very plainly where the deficiency is excessive. In the southern cities the evil is attributable to the recent date of free schools; in northern cities, to the rapid increase of population. It is evident that in the great commercial and industrial centres appropriations must be allowed and provision made for anticipating this increase in the school accommodation.

School enrolment.—As pointed out in former reports, the statistics of enrolment in the schools will lead to false conclusions unless the difference in the legal school age in the cities be kept in mind. The following computations show for a certain number of cities the percentage enrolment is, first, of school population; second, of total population; also, the difference expressed in percentage between the percentage of enrolment on total population and 23 per cent. of the total population. It will be evident from an examination of these figures that enrolment bears a much larger ratio to 23 per cent. of the population than it does to the legal school population, or, in other words, the record of enrolment appears much more satisfactory when compared with

the estimated number of youth in the ages of actual school attendance than when compared with all those enumerated in the legal school population.

The following table will serve to indicate the importance that attaches in England to exact statements of the condition of school accommodation and enrolment. The school boards of the larger cities of England go further than our own city boards in anticipating the growth of population; at the same time the enrolment is kept well up to accommodation and in many cities exceeds it. It is assumed by the educational department of England that six-sevenths of the population are of the class whose children ought to be found in the public elementary schools. Making allowance for

unavoidable causes of irregular attendance, it is calculated that school places should be provided for one-sixth of the population. The table here given is based on that estimate.

City or town.	One-sixth of population.	Efficient schools, 1883.		Percentage of accommodation on one-sixth of population.	Percentage of roll on one-sixth of population.
		Accommodation.	Roll.		
Bolton	17,569	27,411	22,306	156.0	126.9

School attendance.—School attendance is a matter demanding even more serious consideration than accommodation and enrolment. There are certain uncontrollable causes of irregular attendance, as epidemics and extremely bad weather; but in general it may be said that if the provision made for the instruction of youth is not made use of it argues culpable indifference on the part of parents or poor schools and defective administration, all of which conditions are opposed to the public welfare. The following shows for a certain number of cities selected from the table the enrolment, average attendance, and percentage of average attendance on enrolment:

City.	Enrolment.	Average attendance.	Percentage.
San Francisco, Cal	40,752	30,827	73
Washington and Georgetown, D. C	17,306	13,168	76
Atlanta, Ga	4,752	4,465	93
Chicago, Ill	73,015	48,615	66

Cincinnati, Ohio	37,969	28,657	75
Philadelphia, Pa	102,185	91,894	89
Charleston, S. C	5,904	3,789	64
Memphis, Tenn	3,948	2,671	67
Galveston, Tex	2,150	1,447	67

The foregoing figures would seem to indicate very unequal results in the several cities from the endeavor to maintain regularity of school attendance. In a measure this difference may be attributable to the different social classes represented in the schools. Wherever the lawless classes or those who are driven by necessity or avarice to profit by the labor of children are in great numbers it becomes difficult to secure a high average of attendance. The remedies for this evil are obligatory laws, attractive schools, instruction adapted to the practical demands of the community, and perpetual vigilance in the use of these corrective agencies. The following statements are from the reports of cities in which unusual attention has been given to the subject of attendance.

In Boston the schools are taught forty weeks in the year and the law compels attendance twenty weeks. Any child who has complied with the law in this particular may obtain a certificate, which protects the child and his employer during the period of allowed absence from school. With reference to the operation of this system the superintendent, Hon. E. P. Seaver, says:

In some of the schools the work is much broken in upon by the constant departure and return of this class of pupils. * * * I would therefore recommend that the committee on truant officers consider the propriety of making it the duty of the principal of each grammar school to keep a record of the names, ages, and residences of all holders of the certificates of twenty weeks' attendance, together with the dates of issue and expiration. It would be well, also, to record the names of their employers, so far as these could be ascertained. * * * When such records have been kept a year or two information may be gathered from them, in the light of which another important question may be considered, and that is whether the needs of children who must work a part of the time while getting an education would not be better served by a system of so-called half time schools, or half time classes, than by the present system. Would it not be better if these children could go to school half the time throughout the year instead of going all the time through only half the year? The practical aspects of this question I am not now prepared to consider; but I am convinced of its importance, and suggest it now, trusting that I may receive the benefit of all the practical wisdom which can be brought to bear upon it. From the principals of the grammar schools especially this aid is expected.

In view of the showing of the census with reference to the number of children in Baltimore who do not attend school and are in danger of growing up in ignorance and vice, the superintendent, Hon. H. A. Wise, says:

I think it is advisable to try the experiment of establishing a number of half day schools in the city for the benefit of this class of children.

Some discussion having arisen with reference to school attendance in Cincinnati, the superintendent of schools, Hon. J. B. Peaslee, made a careful analysis of the statistics bearing upon the subject with the following results, as given in his own language:

By careful estimates, based upon the school statistics for the past year, there were in Cincinnati 8,809 children between the ages of six and fourteen years who were not enrolled in school. (Fourteen years is the average age at which pupils complete our course of study below the high schools, and is practically the limit of school age in most of our cities.) Of these children under fourteen years not enrolled, many are from well-to-do families, where the parents do not believe in sending their little ones to school before they are seven or eight, and, in some cases, even nine or ten years of age, preferring to give them instruction at home. Again, a large part of this number left the intermediate schools (6th, 7th, and 8th years), some of them after having completed the entire grammar school course; another large part left the district schools (first five years) at the completion of the course, or after an attendance of from three to nearly five years; and some, of course, after an attendance for a less time. Again a large percentage left church and private schools after a corresponding attendance. It is evident, therefore, that there are comparatively few children (the first class referred to above excepted) between the ages of six and fourteen years who never attended school, and many of these belong to the physically or mentally unfortunate. In my opinion the actual number of children over ten years of age, born and brought up in our northern cities, who never attended school at all and who are physically and mentally able to do so, is but a small percentage of the youth of school age; certainly not many of this class can be found in Cincinnati. The number who cannot read and write is still less.

Upon the question of truancy, Hon. Joseph O'Connor, deputy superintendent of public schools, San Francisco, gives the following opinion, quoting the section of the rules of the board respecting truancy:

"Habitual truancy shall constitute good cause for suspension or expulsion of the pupil from school." For many years I believed this a most inadequate punishment, for the reason that it sentenced the pupil to undergo the idleness he enjoyed. I considered that the unreasonableness of the act and the want of governing power in the parent made it incumbent upon the teacher to work upon the pupil's fears, and hence that corporal punishment was the proper corrective. I am slowly changing my mind on this subject. My experience tells me that the free enjoyment of a bath in the surf, a stroll among the hills, or a ramble along the sea wall is often sufficient to overcome the fear of a whipping; that the tendency to truancy is often inherited; that the parents frequently detain their children at home for the most frivolous reasons, thus disposing them to consider truancy a trivial offence; and that parents often not only give expression to this sentiment in the presence of their children, but, also in their presence, misinform the teacher as to the cause of the absence. I believe the parents are to blame for at least 80 per cent. of the truancy. Why, then, should boys who are allowed by their parents to persist in the vice be permitted to continue in schools where they are likely to exert a bad influence upon their weak classmates?

Upon the same subject, Hon. J. M. B. Sill, superintendent of schools, Detroit, Mich., says:

We have at last, through the efforts of many friends of good order, and especially through the judicious persistence of the Hon. John Devlin, of this city, a law which puts it into the power of this board to place some restraint upon the juvenile disorderly persons who infest certain localities of Detroit, and to do something towards correcting the evil of truancy and youthful incorrigibility. * * * This law empowers boards of education in cities like Detroit to establish ungraded schools for the instruction and, if possible, the reformation of the class of children under consideration. It also empowers the board to compel the attendance of such children upon instruction, under penalty of confinement in one of the State reform schools.

As soon as the finances of the board will justify moderate expenditures for this purpose there should be no further delay in the establishment of a central ungraded school, such as this law contemplates and authorizes.

For the present, a single room, * * * equipped with suitable school furniture and apparatus, made as comfortable and attractive as possible, and presided over by a firm, but humane and intelligent teacher, will meet wants and conditions.

I hope the board will see its way clear to the establishment of such a school and to the opening of the same early in the next school year.

The board of education of New York City has made the enforcement of the compulsory law one of the duties of the city superintendent, who has at his disposal in carrying it out the service of twelve assistants, known as agents of truancy. With reference to the operation of this department, Hon. John Jasper, the superintendent, says, in his report for 1882:

That the efficiency of the department grows with time and experience is shown in the great success attending the work done in this direction during the year. The whole number of non-attendants placed in school was 882, an increase of 480 over the year 1881 and an increase of 558 over 1880.

It seems proper to state that 356 of the 882 were children of Italian birth or parentage, and that the attendance in five primary departments and schools and six corporate schools increased 1,156 during the year, this increase consisting of the 356 above mentioned and of nearly 800 other Italian children, whose parents, aroused by the action of the department, voluntarily complied with the law.

* * * * * * *

Truancy is another evil which the efforts of the agents abate. During the year 2,495 cases of truancy called for and received attention at the hands of the officers of this department. In the cases of 1,617 a reformation may be said to have been effected, as action by the agents was found necessary only once. In the remaining 878, the truant disposition was too strong to be thus easily overcome, for 229 were reported twice, 77 three times, 22 four times, 13 five times, 1 six times, and 3 ten times during the year. The number 345 that might be called more or less incorrigible is thus seen to be about 18 per cent. of the total number, a large decrease when compared with the returns of the previous year.

The facts and opinions here presented are sufficient to show that the school officers of our cities are fully alive to the importance of maintaining a high average of school

attendance, and that they will accomplish everything possible in this direction with the means at their disposal.

Location of cities.—Table II indicates very plainly a difference in the distribution of the population of the various sections of the country that should be kept in mind in discussing the conditions affecting education. Of the 263 cities enumerated, 222 are in the New England, Middle, and Northern Central States. The ratio of the population of these 222 cities to the entire population of their respective sections is as follows: For the New England States, 44 per cent.; for the Middle States, 37 per cent.; and for the Northern Central States, 17 per cent. In other words, a large proportion of the youth of the New England and Middle States come within the operation of the city school systems, which is the case only with a small proportion in the remaining sections. Not only is it true that a very large proportion of the youth of the New England and Middle States is found in the city schools, but, on account of the compactness of the population and the facility of communication in those sections, the influence of the city schools is readily extended to the rural districts.

Tendencies.—As centres of wealth and population, cities, it must be allowed, possess great advantages for the work of public education. At the same time the magnitude of the undertaking, whether considered in reference to the number of youth collected together or the money and material employed, calls for the most thorough organization, and organization implies what is often termed machinery. Machinery—schemes, regulations, tests, tabulated representations, &c.—has, it is well known, an undue influence over minds of a certain order. To them routine is progress, and they believe in nothing that cannot be formally reported. Education becomes mechanical and fruitless when such men have authority to order its conduct or to pass final judgment upon its results.

It is important to know as exactly as possible the conditions of attendance, punctuality, and classification in our schools; it is important to have periodical investigations and reports upon the condition of school buildings, the use of funds, the progress of classes, the results of particular methods, &c.; but a large part, and that the best part, of the teacher's work must be taken on trust. The great end of a year's school effort is accomplished when the average intelligence, aspiration, and moral character of the scholars have been advanced, results that cannot be exactly measured and tabulated.

"The work of a teacher," says Professor Laurie, "is intellectual and moral, or it is a fraud on society. You cannot measure moral forces by a foot rule." The tendency to apply the foot-rule measure, once so strong among us, is giving way to the exercise of a higher and nobler judgment. Methods of instruction, the spirit that pervades the work, the means of adjusting the schools to the ends and uses of common life, and of drawing to them the interest of the best minds of the community, engage more and more the attention of school officers.

In a work so vast and so complicated as a system of city schools, progress involves constant change. Methods of organization, instruction, and discipline will be adopted at one time that from their very success assume exaggerated importance and come eventually to be more regarded than the ends to which they were originally subsidiary; a reaction takes place and the method is discarded; subsequent experience discloses the fact that the evil was wrought through the abuse of that which was inherently good, and there is a counter-reaction.

Measures are approved in one city and condemned at the same time in another, because in the one place judgment is determined by their moderate and in the other by the effects of their excessive application. The interchange of information between the school authorities of the different cities is desirable, as thereby the experience acquired in one city may be utilized in another. For this reason I endeavor to embody in my annual reports the statements of superintendents and other school officers with reference to what may chance to be prominent subjects of interest. Some difficulty arises in the comparison of such statements from the different terms employed in dif-

ferent cities for the same grade of schools. It would be an advantage, in many ways, if the grading were expressed uniformly by numbers or letters and each grade corresponded to one school year.

The following extracts are from reports for the current year:

From the report of the school committee of Boston for 1882 it appears that the average number of pupils belonging to the primary schools was 24,428; to grammar schools, 26,695. Out of a total of 51,331 children in the schools June, 1882, there were in the primary grades 24,239; of this number 23,453 were between the ages of 5 and 10, inclusive. Three years are included in the primary schools and 6 years in the grammar schools of this city. The number of primary scholars in the schools of Baltimore, 1882, was 15,521 out of a total of 35,649. In this city also primary schools cover 3 years. The total enrolment in the public schools of Chicago, June, 1882, was 68,614, of which number 55,488 were in the primary departments, the course in which occupies 4 years. In Cincinnati the schools are classified into district, 5 years; intermediate, 3 years; and high, 4 years. Out of an average enrolment in all the schools of 27,809, the district schools numbered 22,201. Allowing for differences in classification the figures show plainly enough that, so far as the number of children affected is concerned, the primary and lower grammar grades represent the most important part of the school work.

The efforts made within a few years to change the methods of instruction and discipline in the primary schools have been closely followed in my annual reports. The present aspect of this department in the cities generally may be well summed up in the statement of Hon. Samuel T. Dutton, superintendent of schools, New Haven, Conn., in his report for 1883:

The reformation begun some years since in methods of primary teaching has taken strong hold during the past year, and the prospects were never better for the wholesome, healthful treatment of little children during their first year in school. The school sessions have been materially shortened during the summer months, and by the introduction of physical drill and other forms of activity life in the school room is made less fatiguing and more attractive. Number tables are being supplied as fast as teachers are prepared to make a good use of them. A considerable sum has also been expended for supplementary reading matter. The benefits of this provision are too obvious to need explanation.

The following new departure is noted in the report of the Boston school committee for 1882:

For the first time within the knowledge of this committee, a uniform and systematic examination of the first classes of the primary schools was successfully carried out last June. The method adopted was in the main the same as that under which the graduating classes of the grammar schools are examined. The papers were prepared by the board of supervisors and approved by the committee on examinations. The examinations were conducted at the same time in each study and with the same questions. The results of these examinations were recorded in blanks furnished for the purpose, inspected by the supervisors, who added their own recommendations, and submitted to the committee on examinations; and the promotions to the grammar schools were made in accordance with the decision of that committee.

It should be observed that this experiment occurs at a time when there is in many quarters a decided protest against the prevailing system of annual examinations, as will be seen by the following statements, the first of which is from the report of Hon. Joseph O'Connor, deputy superintendent of common schools, San Francisco, Cal.:

In a large school department attempting to give a practical elementary education to more than 40,000 children, the system of written examinations in vogue is, in many respects, positively injurious and is totally inadequate as a test of the labors of the teachers and of the progress and standing of the pupils. The course of study provides that certain books must be studied to certain pages and paragraphs, mentioning lessons, articles, and, in many instances, the very words to be omitted. It is understood that the deputy superintendent shall prepare questions for the examinations, taking care not to go outside of the "course" in a single word. The children are promoted upon percentages obtained in their written answers to these questions, and the average director rates the degree of success or failure of the teacher by the proportion of her pupils so promoted. The natural result is that the great majority of

the teachers (and I do not consider them to blame) spend nearly all their time in drilling and preparing the pupils for the annual examinations.

Under this plan the crammed pupils will appear to best advantage and the cramming teachers are likely to have the highest reputation. The entire department will follow the idiocrasy of the question maker. There will be no correct measure of intellectual advancement in the student or of pedagogic skill in the teacher.

When I add that from the time the pupils enter the sixth grade (often sooner) until they leave the senior class of the high school—a period of at least nine years—they are subjected not only annually and semiannually, but monthly and often weekly, to the temptation of copying, and otherwise improperly obtaining credit to which they are not honestly entitled, I think there cannot be much argument in favor of the moral aspect of the written examinations plan. * * * Any person possessing even a slight appreciation of the wear and tear of mental strain must see that the labor of conducting the usual annual written examinations is something fearful. The teachers must not have charge of their own classes. The pupils sit scarcely a foot apart; each one eagerly hoping to obtain the required percentage. The teacher, by a cat-like vigilance, is required to enforce honesty upon fifty or sixty persons whose undeveloped judgment often recognizes the advantage in the opposite course. Then commences the work of poring over quire upon quire of nervously, hurriedly written answers which, when deciphered, reflect lines of thought just as different from those of the examiner as the reasoning and motives of the child are from those of the adult. If there be a doubt as to the intended meaning, the child is not present, as in oral examinations, to explain. When the papers are marked and returned to the class examined the objections of pupils, parents, and teachers to the crediting come thick and fast. These troubles settled, the credits must be entered upon the proper records, the percentages calculated, and certificates made out and issued. When one considers what it must be to hold fourteen examinations, with attendant difficulties as described, between the 9th and 25th of the month—a period embracing thirteen school days—he must certainly be amazed at the power of endurance possessed by the average San Francisco teacher. I am happy to state that with the assistance of the inspector and of the late deputy, Mr. D. C. Stone, who was engaged with us during sixteen days of our busiest time, we were enabled at the close of our last school year to reduce the number of written examinations to seven (including French and German, which were given in the cosmopolitan schools only), and these were scattered over a period extending from April 11 to May 31. The rules also allowed the promotion by the principals, upon evident fitness, of not "more than 50 per cent. of the pupils of any class."

I have made the foregoing digression to show:

(1) The necessity for a better system of examination; (2) some of what has already been accomplished by the appointment of one inspector.

On the basis of Mr. Leggett's oral examinations in 1873, one inspector working steadily can examine 107 grammar classes in half the school year. Primary classes can be examined more quickly. Mr. Leggett was a rapid and able examiner. He was and is an indefatigable worker. Hence I think from 120 to 125 classes, one-third of the number grammar and two-thirds primary, would be as many as any person could thoroughly examine twice a year. * * *

Some of the advantages, then, of a proper system of inspection and oral examination would be:

(1) A large direct money saving.

(2) A very much larger indirect saving by preventing loss of valuable time.

(3) An improvement of the moral tone of our children by doing away with their greatest stimulus to falsehood and cheating.

(4) The improvement of the methods and teaching power of the instructors, under the suggestion and advice of the inspectors.

(5) The deliverance of both teachers and pupils from the periodical overexcitement consequent upon written examinations.

From report of Hon. Sylvester Brown, superintendent of public schools, Quincy, Mass.:

It was formerly the custom to promote pupils from grade to grade, provided they attained an average of a stated percentage of correct answers on an examination or a series of examinations. More recently those pupils have been promoted whom their teachers named as being qualified for advancement. Experience has shown that there will be a percentage of good and studious pupils whose names the honest teacher will be forced to omit from the list of those qualified to go on to the next higher grade with their classmates. The aim of the common school should be to do the greatest good to the greatest number, and teachers should never overlook the fact that the schools are exclusively for the children. The question to be answered in making promotions is not "Has this child as good and clear a mind as his classmates?" but "Will this child be less fitted for the duties of life if he goes on with the pupils of his class and works with them the succeeding year?"

After giving a good deal of thought to this subject, I have come to the conclusion that promotions should include the whole class, with very rare exceptions, after the first two years of the child's school life, until he reaches the first class in the grammar school. If children are left in the same grade for two or more years they become discouraged, and the benefit derived from this repetition of studies is not at all commensurate with the time that is lost. It must be understood, however, by parents and children that no one is entitled to promotion unless his teacher can conscientiously recommend him as a pupil who has worked according to the best of his ability.

From report of Hon. Samuel T. Dutton, superintendent of public schools, New Haven, Conn.:

In order to relieve the pressure upon both teachers and pupils, a simpler marking system has been devised which, if used intelligently, takes only one-fourth the time of the old method and does not demand that the teacher shall sit while teaching with pencil in hand to record the percentage value of recitations.

The annual examination as a basis of promotion in primary and grammar schools has been dispensed with, and, while occasional tests, both written and oral, are applied, principals and teachers are urged to use them as a *means* rather than an *end* of teaching.

Grammar grades.—The examinations here referred to affect the grammar schools chiefly, the department of the public schools which just now stands most in need of attention.

The age of pupils is a matter to be carefully considered in the arrangement and conduct of studies for this grade. The consideration is forcibly presented in the following observation by Hon. J. L. Brewster, superintendent of schools, Lawrence, Mass.:

I cannot contemplate without deep solicitude the operation of the factory law in diminishing the numbers in our grammar schools, because many of the common branches of study, which all agree are necessary to intelligent citizenship in all the walks of life, cannot be taught in schools of lower grades, where, of necessity, the time is spent upon work of a much more fundamental character—largely abstract—training the perceptive faculties and the like, without which no common school education can be of much value. The criticism is often made that pupils do not make the progress in the city schools that they do (or rather did forty years ago) in the country schools, where the terms of school are much shorter. The fact is that the pupils in those schools were much older, possessed of more mature minds, inhabiting the bodies of young men and young women, not those of small boys and girls. One of the hindrances of the city schools is that, influenced as we are by the shortness of the school life of a majority of the pupils, we have drifted and are still drifting too far in the direction of crowding in *quantity*, forgetting *quality*, in attempting to do for children between nine and twelve years of age what ought not to be attempted for the average child until three years later, between twelve and fifteen. It is true that some few can do the work as now attempted, with profit, but not so the average; and it is the average child who must be the standard in any scheme of public education. Physical and mental maturity—the product of time—is necessary to the successful prosecution of most of the work in the grammar school course. An additional compulsory year, extending the limit to fifteen years, would do much to aid our grammar schools, or rather to aid the children to prepare for usefulness in life.

Memoriter and cramming processes are sure to be resorted to whenever the chief aim in a course of instruction is to carry the pupils through a given quantity of work, irrespective of their ability to comprehend it. Temporary results may thus be obtained, which are the more hurtful the more they are showy and imposing. A case in point is furnished in the report of the superintendent of Quincy schools, Sylvester Brown:

In the study of arithmetic we rarely see results attained at all commensurate with the time and energy expended. This is because teachers, committeemen, and superintendents, who were educated at a time when arithmetic was the almost universal hobby, cannot rid themselves of the idea that pupils must get as much knowledge of the subject now as pupils formerly did who were several years older. So it is not often that a lesson is given or an examination made that does not contain some features in advance of the immature minds of the pupils. Perhaps I cannot make plain to you my meaning better than by the following illustration: While inspecting a B grammar room I saw this problem placed upon the board, which the pupils were expected to perform: "A grocer's quart measure was too small by half a gill. How much did he thus dishonestly make in selling four barrels of cider, averaging 34 galls.,

2 qts., 1 pt., each, if the cider was worth 24 cents a gallon?" This is not an isolated case; it is only one of the many problems which teachers continually give and examiners require that are wholly above the heads of children and can only be solved by an adult with a pretty clear head for reasoning. Such problems are not only useless, but are positively pernicious, by putting obstacles in their way that it is impossible for them to overcome, thus causing them to become discouraged. I confess to having seriously misjudged children as to their powers of logical reasoning, and shall hereafter in my examinations confine myself to those topics in arithmetic in their simple form which children should know and are able to comprehend.

Another cause of partial failure in the teaching of this subject is the tendency of teachers to crowd too many problems, embracing a large number of principles, into one lesson. An examination should include problems containing all principles the pupils have been taught; but one principle is usually sufficient for the daily lesson. Teachers should bear in mind that it is a good quality rather than a large amount of work that is to be desired, and that it is better to have one principle thoroughly understood by all members of the class than many principles imperfectly comprehended. Our successful teachers of arithmetic insist that a diagram shall be drawn by every pupil to illustrate each problem before a solution of it is attempted. When all teachers insist upon this in each case, according to the instructions they have received, they will find it a great help to their classes in gaining arithmetical knowledge.

Much has been said in a general way against the forcing process here illustrated, but it is not likely to be prevented until the observation and statements of particular instances have brought about a clear understanding of the nature of the evil.

Grading.—Grading is a feature of our city schools that excites more or less criticism, yet it is by no means peculiar to public elementary schools. On the contrary, the absence of grading (i. e., distinct classification based upon standards of scholarships) is noticeable where funds are meagre and there is a general want of the requisites for an efficient educational work. Grading is an evil only when it is treated as an end in itself, a tendency which has not been sufficiently controlled in the past. The subject has been very thoroughly discussed in recent conferences of teachers and supervising officers, with results that promise a better regulation of grading in the future.

The plan of dividing each grade into two classes pursuing the same studies but reciting alternately has been tried with good results. This arrangement gives every child a chance to work by himself and in school, insures greater diligence on the part of the child in school hours, and decreases the hours of mental effort by requiring less time to be spent in protracted recitations, whereby the number of hours of home study is virtually diminished.

With reference to the principle of classification to be observed in this arrangement, Hon. A. P. Marble, superintendent of public schools, Worcester, Mass., makes the following recommendations:

(1) In the first place do not put the boys in one class and the girls in another.

(2) It will be harmful to sort out the nervous, brilliant reciters of lessons for one class and the slow and dull for the other. The nervous, high strung, ambitious boys and girls are not the ones to be pushed forward in advance. It is better in many cases for them to go along moderately, and to fill up the spare time by broadening the range of what they learn, than to push them forward or allow them to rush forward too rapidly in the school curriculum. This broadening may be done by directing their reading and turning their attention to what goes on around them, in the shops, on the street, and in the business which they may happen to know about. Instead of adding to the set and formal lessons of this class of pupils, they may be allowed to set down in writing what they know of any subject or any process of manufacture. They thus get ease of expression and a definiteness of thought which less practice does not give the other pupils. The interest of this class of pupils in the lessons which it takes only a small part of their time to master may be kept up by incidental attention to correlative subjects. It is not always best to hurry a bright and active pupil into the next grade. So much by way of suggestion as to these smart pupils.

(3) Again, in each of the rooms, there is a class tolerably well graded; they are never exactly graded; if they are subdivided, the classes will not long remain exactly graded. It is not necessary and not desirable that they should be kept exactly graded. Now, by dividing the room into two classes, the matter stands about where it did before—no more difficulty, no less. If it happens that the two classes keep on, neck

and neck, no matter. If it turns out that one class gets along faster than the other, no harm in that. But the bright division, if there be one, should not absorb the teacher's time; and pupils are not to be put from one to the other as a reward of merit or a punishment. In either case, the two divisions will go on together to the next room just the same as if there were but one class.

The experiment has been found to work well. It should be observed that this practice of double divisions in the same grade has always been maintained in certain cities.

From the usual organization of the systems of city schools the duty of instructing and disciplining the scholars of the grammar grade falls largely upon women. There are serious objections to the exclusion of men from a due share of this work, much of which seems to require the strength, force, and endurance characteristic of the sterner sex. In a number of cities measures are proposed for bringing the grammar schools more directly or more largely under the influence of male teachers.

With examinations subordinated to instruction, grading made properly flexible, and the teaching force judiciously constituted, the grammar schools will be in condition to realize the hopes of those who have labored so earnestly for their improvement in recent years. Already the good results of changes that have been introduced within a few years are apparent. The quantity of arithmetic and technical grammar required has been considerably diminished, while better methods of teaching computation and language have effected a freer exercise of the reasoning powers and a more correct use of language on the part of pupils. Drawing has been very generally introduced in the grammar grades, and much attention has been given to the development of taste and sensibility. Among the exercises that particularly conduce to this end must be mentioned those of authors' day and arbor day. Although these exercises are not confined to the grammar schools it is here that their influence is most positive and beneficial.

The feature of the work in our city schools just referred to is noticed particularly by the foreigners who from time to time visit this country to study our institutions. The following statement is from a report submitted to the minister of public instruction, France, by Mademoiselle Marie Loizillon.[1] Referring particularly to impressions derived from her inspection of the schools of Cincinnati, she says:

It appears that instruction is considered almost everywhere as a means towards an end; that is, education pure and simple is the goal to be attained. On all sides the aim of teaching is to elevate the mind and to improve the moral tone. Therefore reading and literature enter largely into the course of study. Pupils of all grades participate in such work according to their ability; in the higher classes they familiarize themselves with the most celebrated authors, quoting readily from their best known works and often reciting the master pieces of English and American poets. Many times the pupils write whole poems or essays on the blackboard. They are never at a loss. Should poetry from Longfellow, Bryant, or Shakespeare be called for at any time it would be given, so great and so highly cultivated is the taste of the American child for literature.

Superintendent Peaslee lately inaugurated in the schools so-called anniversary days of great men, such as prominent citizens, statesmen, poets, artists, &c. These "days" take place quite often and are veritable tournaments. The pupils prepare themselves carefully beforehand, and, in their readings or recitations on the subject taken from the life of the celebrity selected, without making any pretensions, they ofttimes show considerable talent. These fête days are almost like family festivals, and the authorities present add much to the success of the day by their well timed marks of approbation and encouragement.

[1] In the fall of 1882 Mlle. M. Loizillon, inspectrice générale des écoles maternelles, and Mlle. M. Couturier, Paris, directrice de l'Ecole professionnelle du Havre, visited this country to study education.

The fact that the two ladies, commissioned by the French minister of public instruction, came by themselves was interesting to American educators in itself. The eminent ability and character of the ladies and the great work they had already accomplished in education gave a special value to any opinions they might form. They expressed themselves in many ways appreciative and grateful for the courtesies extended them by our teachers and school officers. After their return a very cordial note of thanks was communicated to this Office by a representative of the French ministry, expressing in earnest terms appreciation of the courtesies and opportunities extended to these ladies in their visits among our schools.

Evening schools.—The extent of the provision made in evening schools for scholars who have not the chance to profit by the day schools will be seen by reference to Table II, appendix. It is with great satisfaction that I am enabled to record the final triumph of the Evening High School, Boston. After uncertainty and protracted discussion, the school was reopened January 3, 1882, under satisfactory conditions.

Finances.—From the financial summary, Table II, it appears that the total receipts for education in 1882 were $30,181,675, four cities not reporting; total expenditure, four cities not reporting, $27,894,427. The receipts do not represent the whole amount raised in the cities for the support of public education, as many cities contribute much more to the State school tax of their respective States than they receive from that source.

School system of Washington, D. C.—I am indebted to Hon. J. O. Wilson, superintendent of schools, Washington, D. C., for the following outline of the organization and conduct of the schools under his supervision. It is a brief but precise exposition of one of the most carefully planned and efficient systems maintained in our country:

The public school system includes the elementary schools, the high school, and the normal school. The courses of study are arranged as follows: The course for the elementary schools is divided into eight grades, and, beginning with the lowest and proceeding to the highest, they are designated by the terms first grade, second grade, and so on to the eighth grade. A year is required for doing the work of each grade, from the first to the seventh inclusive, and two years are allowed for the work of the eighth grade. Some of the stronger and more capable pupils do the work of the eighth grade in one year. As one-half or more of the pupils who enter the eighth grade leave the schools on completing its course, it is thought best to make the treatment of the studies as thorough and broad as possible, and two years are allowed for this purpose. Arithmetic is thoroughly completed, so that it need not be reviewed by those who pass on to the high school; the elements of algebra are studied; geography and the history and Constitution of the United States are reviewed and studied with a higher and more scientific treatment; English grammar, including abundant practice in writing, business and social forms, reproductions, transpositions, compositions, and essays, receives much attention. A few of the standard works of the best English authors are critically read and studied.

Promotions from grade to grade are ordinarily made only at the beginning of the school year. They are made at other times whenever the best interests of a pupil justify or require it. The exceptions to the rule have not been numerous or troublesome. Under a system of yearly promotions, while the course of study for each pupil is the same in length it need not be so in breadth, and there are very obvious and weighty reasons for not making the several periods of tuition in a graded course of study (each requiring a change of teacher) so short that the teacher has time to learn but little about the pupils individually.

Written examinations are held in the fifth, sixth, seventh, and eighth grades, usually designated grammar schools, as follows: In the fifth and sixth grades monthly and in the seventh and eighth grades bimonthly, commencing with October and ending with May.

In most schools the examinations are divided and distributed over the period of study included, so that only one study is taken up at each examination. This part of the school work, unattractive alike to teachers and pupils, is thus distributed through the year as equably as possible. Each teacher prepares his or her own questions, supervises the work, examines the papers, and marks and records the results. There is no attempt to make these examinations uniform in all the schools. By means of a recitation card, devised for the purpose, a note is made of the daily recitations. From these two sources combined a yearly record of the scholarship of each pupil is made. An annual written examination covering all the work of the year is held just before the close of the schools in June. In this examination the questions are prepared by the school officers, and no teacher has charge of the work in his or her own school.

Promotion from grade to grade below the high school is not based upon any specified percentage attained by the pupils. It is left to the best judgment of the teacher who has instructed them in the grade from which they are to be promoted, and who has, as aids to a correct decision, the record made through the year, the record of the annual examination, and a personal knowledge of the pupils.

At the close of the year each teacher makes out, on a prescribed form, a list of the pupils who have satisfactorily completed the work of the grade, certifies the same over his or her signature, and the promotions are made accordingly. This plan of making promotions gives general satisfaction. Mistakes are made but seldom, and then are easily corrected.

During the past few years there has been no change in the list of studies pursued in the elementary grades, but the methods of teaching these studies have been constantly changing for the better. They are much more objective now than formerly. Moulding, map drawing, pictures, and specimens of productions and manufactures are all brought into use in teaching geography, and in fact they are considered indispensable to effective teaching. The simple elementary facts of natural science are taught with the aid of visible illustration: botany is taught from plants, zoölogy from animals, mineralogy from minerals. Physiology and hygiene cannot be illustrated so readily, but a fair degree of success has attended the efforts in this direction. More than one hundred pieces of apparatus, simple and inexpensive, have been devised and made by teachers and pupils for experiments in physics. Drawing is a regular study in all the grades, and no study is more popular with teachers and pupils. It gives a training of hand and eye that is of great general value to all and of special practical value to many who engage in occupations requiring knowledge and skill in this subject.

TABLE III.—NORMAL SCHOOLS.

The following is a comparative summary of normal schools, instructors, and pupils reported to the Bureau for the years 1873 to 1882, inclusive:

	1873.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.
Number of institutions	113	124	137	151	152	156	207	220	225	233
Number of instructors	887	966	1,031	1,065	1,189	1,227	1,422	1,466	1,573	1,700

a Exclusive of appropriations for permanent objects.

b From county.

c Includes $120 from rent of land.

d Includes $120 from county.

e Received annually from the State, being one-third of the income in this State from the congressional grant of land to agricultural colleges.

f Appropriated by the legislature of 1882 for site and buildings.

g $1,400 from the city and $320 from the State.

h Part returned to State treasury according to law.

i Per month.

j From State, county, and city.

k From Springfield; also twenty sections of land from the Territory.

l Appropriation in common with other departments of the university; see Table IX.

Table III presents a summary of the provision for training teachers in public normal schools, private normal schools, and departments of other schools, colleges, and universities. The total number of public institutions reported is 119, with 1,045 instructors and 28,711 students, viz, 21,296 normal students and 7,415 other students. These schools comprise 97 supported by State, 1 by county, and 21 by city appropriation. The private normal schools number 114, with 655 instructors and 22,421 students; of these 15,043 are reported as normal and 7,049 as other students, the classification of 329 not being specified. The number of graduates from public normal schools in the last year was 2,568, and the number who have engaged in teaching, 1,836; the corresponding numbers for the private normal schools are 1,034 and 708.

The appropriations for normal schools, exclusive of the sums for buildings, sites, &c., are a trifle in excess of the same for 1881, including appropriations for building; the amount reported in 1882 is about $60,000 in excess of that reported in 1881. The six States making the largest appropriations are New York, $138,256; Virginia, $112,049 (including $100,000 appropriated by the legislature for site and buildings for the Virginia Normal and Collegiate Institute, for colored students, at Petersburg); Massachusetts, $85,899 (exclusive of appropriations for the Boston Normal School); Pennsylvania, $79,054; California, $62,000; and Illinois, $61,264.

The increase of normal schools in the Southern and Western States is a noteworthy feature of progress.

Delaware, Georgia, South Carolina, Louisiana, and Nevada make no public provision for normal schools and Ohio has no State normal schools. Oregon appears for the first time in the table of States reporting public normal schools, the legislature of 1882 having passed an act providing for the establishment of two State normal schools.

Since December, 1882, the Peabody Normal Seminary, New Orleans, La., has been continued as a private institution, the educational authorities having failed to make provision for either of the normal schools in New Orleans.

In the discussion of the general subject of the training of teachers three important questions arise: (1) What method of training will best fit young people for the work of primary instruction so largely intrusted to them? (2) Shall the professional training in normal schools be distinct from the academic or shall both be carried on together? (3) What means shall be employed to inculcate a true educational philosophy?

These are matters to be determined by experiment, for which reason I have given much space in previous reports to detailed statements of the courses of study and methods of procedure characteristic of the leading normal schools, and to the results of their work as displayed in the progress of elementary schools under the conduct of their graduates. In the endeavor to draw practical suggestions from the example of these institutions we are further assisted by noting, from time to time, the impression that they make upon the minds of experienced and impartial observers from abroad, who have no other object in view in their examinations than to accumulate information for the ultimate advantage of their own institutions.

A report of unusual interest, in this respect, is that made by Dr. McLellan, inspector of high schools in Ontario, who, in the fall of 1881, was deputed to examine into our normal schools and certain other features of our system of public education, for the purpose of comparing the same with corresponding departments in the province. The whole of his report is well worth the attention of all interested in these subjects; space will only permit me to make a few extracts embodying his observations upon certain of our normal schools.

With reference to the city normal school, Boston, Mass., which Dr. McLellan styles "a really professional school," he observes:

The limits of the powers of children, the physical condition of effective mental action, and the conditions of growth and health, the necessity for rest, air, sleep, and the means of securing these, the means of guarding children against draughts of cold

air, against excessive heat, &c., all these and many other details are considered and discussed for a special purpose, giving to the student a special knowledge acquired for application to a particular calling. It is justly assumed that physical education is of paramount importance — that the corpus sanum is a necessary condition of the mens sana.

Dr. McLellan dwells particularly upon the observation and practice exercises accomplished in the training school connected with the Boston Normal School, which were described quite fully in my report for 1880.

With reference to the State Normal School, Albany, N. Y., after stating the admission requirements, he says:

It may thus be seen that the literary attainments required for graduation are quite extensive, perhaps too extensive if thoroughness be taken into account. The students, however, receive a thorough drill in all the subjects of the public school course, while they are instructed in the branches as carefully as time permits. It is justly assumed that the minimum course for the public school pupil should not determine the maximum course for the public school teacher.

The appliances for teaching science are very good and methods of instruction are excellent.

(1) *Professional training.*—The professional training, it will be noticed, is not distinct from the academic (or "general"); they are carried on simultaneously. Dr. Alden is of opinion that, under present circumstances in that State, the two courses must go on together. Teachers (candidates for the teaching profession) must acquire correct habits of thinking, must learn how to think and how to acquire knowledge with the best results in discipline. If the modes of instruction in academic work have not been such as to secure this in the student he will inevitably follow wrong methods of instruction when he himself becomes a teacher. The force of habit will prove too strong for him, and he will teach as he has been taught, not as he has been told how to teach. Under the vicious influence of bad teaching in the public school, strengthened by bad teaching in the high school, the student becomes, as it were, saturated with wrong methods. These will be followed in spite of a theoretical lecturing in a brief normal school course on different and better methods.

(2) In the teaching of all the professors the ultimate calling of the students is kept in view. They teach subjects not merely to impart literary and scientific facts and principles, but so as to give them the highest educational value and leave upon the mind the impress of the best educational methods. In their own methods they reveal and illustrate the true methods which, in all essentials, the students are afterwards to observe in the work of the school room. Students become habituated to the true path by being constantly kept in the true path under the guidance of those who are familiar with it; they learn to think correctly by being constantly taught to think correctly; they learn how to acquire knowledge in the best way by being constantly trained in the best methods of acquisition; they learn the value of subjects as instruments of discipline, as well as the best methods of making them efficient instruments, because they are perpetually under the influence of methods designed to secure discipline and the development of power. Each professor, too, keeps in view any modifications of his method which might be necessary in dealing with children. In a word, each professor is expected to be himself a true teacher, by precept it is true, but especially by example. And thus philosophical instruction, not so much formal as material, is given at every recitation in every branch.

(3) A course of instruction in mental philosophy and its application in education is given by Dr. Alden. There is no attempt at metaphysics, nor time wasted in fruitless discussions of unsettled problems of philosophy. But a simple course is followed—a course having special and practical reference to the teacher's work. Dr. Alden pursues—and trains his students to pursue—the inductive method in the study of philosophy, approaching the study of mind as we do the study of nature, observing particular facts in order to arrive at the general laws which regulate the mental activities. Having treated of the human mind in the usual threefold division of intellect, emotions, will, he proceeds to show the bearings of the knowledge thus acquired on the work of education.

With reference to professional training in the State Normal School, Worcester, Mass., Dr. McLellan says:

(1) Though the professional and the general training are carried on together here, Principal Russell is of opinion that the proper function of a normal school is to give professional training exclusively, or at all events chiefly. If the schools with which it rests to give the required scholarship are really efficient—capable of giving a thorough general training—it would seem that there ought to be no difficulty in confining nor-

mal schools to professional work. Efficiency on the part of such schools for general training is, however, essential. Sound knowledge must be given, and in a sound way; that is, the methods of instruction followed must be thoroughly rational. This means skilled and trained teachers in these schools. If this condition fail, a short course in a normal school will not correct the defects of general education. The normal school course would have to be extended so that the general work imperfectly accomplished by these schools might be completed. In fact, if the work is badly done in these academic institutions, the work of the normal schools is made more difficult than would be the entire education of the student. For not only would they have to give the necessary scholarship, they would also have to eradicate the bad habits of a previous training.

In any case, the normal school course ought to cover sufficient time to enable the professors to supplement the previous training, to give a connected view of the various branches as departments of science, and to secure facility and power in specially important subjects, as science, drawing, and elocution.

(2) Here, as in the Albany Normal School, the faculty, in all their teaching, keep constantly in view the fact that they are teaching those who intend to become teachers. Every professor endeavors to be, not by occasional teaching merely, but especially by the example set in his own daily teaching, a teacher of didactics. Hence the students are trained in the direction of philosophic methods of education, inasmuch as they are constantly subject to the influence of right methods of instruction and education.

(3) A course of instruction is given by Professor Brown on psychology, with special reference to applications in education.

In addition to this course in psychology, lessons are given by Principal Russell in the history of education and educational methods and in the practical and definite application of the principles of education. From what I saw of these courses and the practical, commonsense way in which they were given, I have not the slightest doubt that they are of great value in the training of the teacher. The Socratic method followed by the professors clearly revealed the intelligence of the students and the undoubted worth, in a professional point of view, of the educational psychology and history, which the skill of the instructors made constantly interesting and profitable.

There is a special teacher of methods, a lady who appears to be thoroughly qualified for her task. This teacher of methods gives well digested lessons and practical illustrations of the best methods of teaching reading, writing, arithmetic—in fact every branch which the student will afterwards be called upon to teach.

In the general summary of his observations, Dr. McLellan, having enumerated the conditions which to his mind make it seem desirable to separate the academic and professional courses, says:

Under these conditions I have no doubt that the plan of separating the academic from the professional course can be made entirely successful. The Boston Normal School affords a satisfactory example of this. Some of the best teaching I had the pleasure of witnessing during my visit, I might say some of the best I ever saw, was done by graduates of this school. They had been subject to a long course of training in the city public schools; this had been followed by a full course of four years in the high schools, and this again by one year's sound professional training under earnest and capable teachers. The results were eminently good. Nature, indeed, had contributed something to these results, for nascitur, non fit, which is so often applied to the true poet, may, at least in a measure, be affirmed of the true teacher. Here was natural aptitude trained to high perfection. The teacher had learned to play on the "harp by playing on the harp," but evidently every touch of her finger had been directed by one who was skilled on the instrument.

In the lowest primary grade I saw lessons given in reading, number, color. form, measure (the metric system), and all were given with the educative power of the true teacher. The fundamental maxims of education, from the concrete to the abstract, from the known to the unknown, from the idea to the word, from the thought to the expression, &c., which are often glibly repeated and as often mere dead vocables without a living influence, had entered thoroughly into the teacher's conception of her work and spontaneously governed every act and element in her teaching. She did not "communicate" knowledge; she helped her pupils to acquire knowledge. She never did for the pupils what they could do for themselves: the development of their self activity was her studied aim. She seemed to know exactly just what the pupils could do for themselves and what they could not do, and with admirable tact led the little ones to recognize in the unknown that was before them the familiar features of the known. She knew that self exercise on the part of her pupils was the necessary condition of the acquisition of knowledge and the development of power, and there-

fore both the senses and the intellect were kept in constant activity; the children saw with their eyes, they heard with their ears, they wrought with their hands; and therefore they "understood with their hearts."

* * * * * * *

The Americans [observes Dr. McLellan] are a progressive people; their inventive genius has become proverbial, but they have never been able to discover a royal road to learning, nor to invent a means of annihilating time as a necessary condition in producing culture. They have not in any State, I believe, devised a means of giving all the teachers of the public schools a fair measure of professional training, so that many teachers are to be found with little scholarship and little skill in teaching. But the teachers whom they do educate and train professionally, in general, do credit to their training and are worthy of their calling. And this is due to the fact above referred to: they consider that a long course of literary and professional training is indispensable to the turning out of really efficient teachers. I cannot now enlarge upon this point, but I have no doubt of its importance. I observed everywhere evidences of the good effects of a long course of training under able and enthusiastic teachers.

The following extracts are from the report of Mademoiselle Marie Loizillon to the French minister of public instruction, previously alluded to in these pages:

The normals are splendidly housed, either in separate special establishments, as at St. Louis, or in edifices containing schools of different grades, as in Boston, New York, and Philadelphia. The furnishings are very complete, many times even very luxurious. Fine libraries, rich collections, &c., aid greatly in both theoretical and practical instruction.

* * * * * * * *

All the more noticeable characteristics of the public schools — such as order, discipline, fine bearing, activity, ambition, and enthusiasm — are found in the highest degree in the normals. The regular onward march towards progress in the instruction in pedagogy is particularly interesting.

The practice or model schools deserve special attention. The pupil teachers work under the watchful eye of instructresses who make notes of their general bearing, of the language used, the clearness of the explanations, the tone employed, the voice, manner of asking questions, use of blackboard, discipline, &c.

* * * * * * *

Notwithstanding this flourishing condition of things matters do not remain dormant. Each year suggestions are made by the principals of the different schools in regard to points of improvement, and such improvements are generally carried out.

* * * * * * *

In order not to multiply details, it is sufficient to say that the end and aim of the boards of education and principals is to study the needs of these schools, to correct abuses, to increase the powers of the teaching force, and to thus assure increasing prosperity to the public schools.

Dr. McLellan's observations, it will be seen, were confined to the States bordering upon the provinces. Those familiar with the whole country are aware that equally favorable impressions might be formed from an examination of the normal schools in the interior, the far West, and even the Southern States, in which, although the school systems are of recent growth, the training of teachers has received much attention.

The position of Washington, upon the border line of the South, naturally causes southern school officers to look to that city for example and suggestion in their endeavors to develop the public schools of their own cities. Like the Boston Normal School, the Washington Normal School is strictly professional. Superintendent J. O. Wilson furnishes the following account of the system of training pursued:

The normal school takes a limited number (at present twenty-five) of graduates from the high school and gives them a one year's course of professional training, the study of the theory and the practice of the art of teaching. The candidates admitted are selected by competitive examination, which secures to the school a high standard of academic scholarship as a starting point for each class. The normal school has practice schools of the first and second grade, under the exclusive control of the principal of the school. The teachers of the practice schools rank as assistants in the normal school. Schools of the higher grades are also made use of for observation and practice. The fundamental principles of education can be studied best in connection with their application in teaching young children. Hence the greater part of the practice is in the lower grade schools especially assigned for this purpose.

While certain of our normal schools are thus ably fulfilling the purposes for which they are established, it must be admitted that others fail of any special results as

training schools. Some are embarrassed by the low and unequal attainments of their scholars; others, by the lack of efficient training teachers. Some are dragging along with the courses of study and practice that were adopted twenty years ago and some are hindered by the influence of selfish or narrow minded politicians, manifesting itself through legislation. To guard against such conditions it is necessary that the schools should be conducted in accordance with well defined requirements as to standards of admission and graduation and courses of study and practice. They must maintain the character of efficient and progressive institutions, or they will not justify the expense incurred in their behalf. This character, however, cannot be maintained under the depressing effects of meagre funds and adverse legislation.

Teachers' institutes. — Few graduates of normal schools teach in the small district schools, as they readily command more lucrative and permanent positions elsewhere. Under existing circumstances, teachers' institutes and summer normals are indispensable as a means of imparting to the great body of rural teachers some knowledge of approved methods of instruction and of school organization. Each year affords new evidence of the importance of these agencies, and the superintendents and other officers who are responsible for their conduct use every endeavor to increase their efficiency and extend their influence. The expense of these institutes and summer normals is comparatively small, and it is desirable that action should be taken in every State to place them upon a sure financial basis. It would be well if attendance upon these training classes should be made one of the requisites for obtaining a teacher's license in the case of candidates who have had no other preparation for the work of teaching. Particular accounts of the institutes held during the year will be found under the heading Training of Teachers in the abstracts.

The instruction of common school teachers was made a part of the work of the regents of the University of New York as early as 1834, when the legislature passed an act authorizing the regents to distribute to such academies as they might select a portion of the surplus income of the literature fund, estimated at $3,000 per annum, to be expended in educating teachers of common schools in such manner and under such regulations as the regents should prescribe. Up to 1881 the fitness of candidates for membership in teachers' classes had been determined by an examination, usually informal, made by the principal of the school. At this time the standard for admission to the classes was made a regents' preliminary certificate, where it now remains. The necessity for more careful and personal supervision of the teachers' classes had long been felt. The classes under instruction during the fall and winter terms of 1881–'82 were accordingly visited by special inspectors employed by the regents. The results of these visitations plainly indicated the value of such personal inspection and examination of the classes. By legislative enactment of June, 1882, the regents were authorized to make permanent provision for the due supervision and inspection of these classes, in accordance with which enactment the appointment of the present inspector was made, and he entered upon his duties in July, 1882. By the provisions of the same act these classes were placed under the official visitation of the school commissioners in their respective districts, who are to assist in the organization and management of the classes and in their final examination, and to make to the regents of the university a report in regard to the instruction of the classes and the qualifications of their members. Each scholar instructed in a teachers' class who holds a regents' preliminary certificate and who passes the final examination of the class thereby becomes entitled to the regents' testimonial, which, when indorsed by any school commissioner, becomes a valid license to teach in the schools of his district for one year from the date of the indorsement, and the testimonial may receive subsequent indorsements at the discretion of the commissioner.

Some difficulty has been experienced in maintaining the standard for admission to the classes, i. e., the regents' preliminary certificate, on account of the fact that many school commissioners persist in licensing the cheapest teachers they can procure or in

using the license as a means of favoring relatives, political supporters, &c.; nevertheless the regents' action is a step in the right direction, and if persisted in, as it undoubtedly will be, may assist materially in putting an end to the abuse of the license power.

The following interesting particulars with reference to the teaching force of the State are derived from the returns of commissioners to the regents' inquiries. The commissioners' reports from 26 schools show that the total number of licensed teachers in their districts is 2,653, of whom 1,833 had attended academies and 861 had been members of teachers' classes. In reports from 32 schools, the total number of licensed teachers is 3,435, of whom 2,318 had attended academies. From this the fact appears that in the commissioner district from which these reports are received, 60 per cent. of all licensed teachers have been instructed in the academies or high schools and 32 per cent. have received the benefit of instruction in teachers' classes. The commissioners have shown a very earnest coöperation in the efforts made to benefit the common schools through the instruction given in these classes, and freely express their appreciation of the work attempted by the regents in advancing the standard of admission and instruction.

While the importance of all agencies for the training of teachers is recognized, it must be admitted that no training is so fruitful in results as that which is accomplished in the normal schools, with a class of students who have made a satisfactory record in a well ordered course of instruction in the elementary and high schools. The multiplication of public normal schools, with a due provision for the appointment of their graduates in the public schools, is the surest and in the long run will prove the most economical means of raising the standard of education throughout the country.

Pedagogics in universities and colleges.—Chairs of pedagogics or didactics have been established in the Universities of Michigan, Missouri, Iowa, and Nebraska, and an effort is being made to establish the same in the Mississippi State University and in the Agricultural and Mechanical College of that State. Johns Hopkins University maintained, during 1882, special Saturday classes for the benefit of teachers of Baltimore. The public lectures given under the auspices of the university have also been largely attended by teachers. They included a course in psychology by G. Stanley Hall, PH. D., university lecturer on pedagogics, Harvard University. It is probable that Dr. Hall will accept a permanent appointment as lecturer upon psychology in Johns Hopkins. The following announcement appears in the prospectus of the Lawrence Scientific School, Harvard University:

> The school offers facilities to teachers, and to persons preparing to be teachers, who desire to qualify themselves in the modern methods of teaching science by observation and experiment. A one year's course of study, adapted to this purpose, may be selected from the elements of natural history, chemistry, and physics, including any of the following subjects: Physical geography and elementary geology, general chemistry and qualitative analysis, mineralogy, physics, botany, comparative anatomy and physiology, zoölogy.
>
> This course is flexible and comprehensive; the instruction is mainly given in the laboratories and museums of the university, and is of the most practical character, every student being taught to make experiments and study specimens.

Dr. Barnard, president of Columbia College, again, in his report for 1882, urges upon the trustees the importance of establishing a department "to train young men to education as a profession."

Provision in other countries for training teachers.—The provision made in other countries, especially English speaking countries, for training teachers should not escape our attention.

The public school system of Ontario includes an effective plan for testing the literary and scientific attainments of all candidates for the teacher's profession.

In Great Britain the training of teachers is a subject that engages the interest of many important bodies. In addition to the inspected training colleges reported in

the foreign summary, the Office has information of provision for training or examining teachers as follows: In 1880 Cambridge University inaugurated examinations in pedagogy for teachers of secondary schools. The university has also founded a chair of pedagogy. The University of London has instituted a teacher's diploma, the first examination for which was held in March, 1883. Practical teaching is an integral part of the examination, which is open only to graduates.

The College of Preceptors, London, maintains a training class for teachers and an examination of teachers for the college diploma. In 1883 150 candidates entered for this examination.

The Skinner Street College, Bishopsgate, London, was established for the especial purpose of training women for the position of teachers in secondary schools. Candidates for admission must be at least seventeen years of age and must pass an entrance examination. The students are divided into two classes: the first includes those who enter for one year; the second, those who enter for two years. The courses are pursued with a view to the examinations in pedagogy of Cambridge University, London University, University of St. Andrews, and the College of Preceptors, in all of which examinations the students of this college have gained great distinction. The council of the college has also instituted a diploma, which is only obtained by a severe examination, to which no student under twenty years of age is admitted. The college fee is 25*l.* per annum. Forty scholars entered for the session of 1882. That the college meets a recognized want is shown by the demand for its graduates to fill responsible positions in secondary schools.

The University of St. Andrews includes pedagogy in the subjects of examination for the degree of L. L. A. (literate in arts). Edinburgh and St. Andrews Universities have both founded chairs of pedagogy.

The best method of preparing teachers to give instruction in elementary science is a subject of earnest consideration by leading teachers and scientific men in England. On account of the system of examinations and grants administered by the science and art department elementary teachers find themselves directly interested in the matter. A union of teachers of science and arts was effected in June, 1883, whose objects are, first, the advancement of the profession; second, the redress of grievances. The presidency of the association for one year was accepted by Professor Huxley.

TABLE IV.—COMMERCIAL AND BUSINESS COLLEGES.

The following is a comparative exhibit of colleges for business training, 1873–1882:

	1873.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.

k Not reported of 3,778 whether they are in day or evening school.
l 1,061 attend both day and evening school.

It must be confessed that, up to the present time, one among us who seeks a complete business education must, as a rule, go outside of the courses of study established by the public schools or the endowed institutions for secondary and superior instruction. This want has been met up to the present mainly by certain able and cultured teachers who have seen the great public demand and come forward and out of their own means and energies furnished the required instruction. Instead of disparagement from those engaged in other departments of education, they should have sympathy and support in all these meritorious efforts. An increasing consciousness of the imperative necessity for this training and of its value to the young is manifested among school authorities. Arithmetics have an increasing amount of business forms and text books on book-keeping are frequently studied.

It is not amiss to notice here two objections raised against these efforts with considerable force. One is that the character of the instruction by the teacher or text book is so unlike anything in practical affairs that it is worse than useless. The pupil that has thus been taught banking or exchange or business forms, it is affirmed, when he takes his place in a mercantile house, has to free himself from what he has thus acquired and learn the methods in practical use.

The other objection, which pertains more exclusively to business education, is that urged by a class of business men who despise learning. They are ignorant; they treat all questions in a selfish or narrow or ignorant light. They would not have a boy instructed; in their language, "the school would spoil him," teachers are fools; and they do all in their power to keep mercantile affairs in the hands of those like themselves and to make the pursuit distasteful and offensive to the youth of noble aspirations.

These objections will not stand investigation, however available they may be for the purpose of the opponents of a sound and thorough preparation for business and of those who would keep this instruction out of the hands of teachers and out of schools. The more this instruction is made fit the more its rightness and expediency will be seen, the greater the number of youths who will resort to it, and the faster will it elevate and ennoble the vocation.

On the continent of Europe various forms of special instruction have been carried further than with us. Schools for business may be found aided by the public funds. Their appliances are sometimes elaborate and expensive. The course of study at the commercial school of Antwerp is worthy of note. It embraces two years, and the students are eighteen or twenty years old. They are thoroughly trained in the mercantile offices connected with the school. The program embraces transactions of a general business house, commercial arithmetic, invoices, accounts of sales, accounts current, commercial calculations and valuations, exchange operations, public funds, book-keeping, bills of lading, foreign and international commercial law, general history of commerce and industry, commercial and maritime legislation compared, customs legislation, the tariff schemes of different nations, ship building and fitting out, commercial and industrial geography, political economy and statistics, and correspondence in foreign languages, the pupil receiving instruction in French, Dutch, German, Spanish, Italian, and English, and being required to examine and draw inferences from newspapers published in nearly all the business centres of the world.

The education of business men is especially demanded in this country. All the powers and attainments and manhood of the American merchant are laid under contribution in every direction. The tide of affairs rushes around him; everything is at high pressure; his walk, his manner, are infected by it. Who shall say that he of all men does not need a high and far-reaching purpose, all possible preparation, a clear calculation of the perils along his course, sure and ready command of himself and his forces, power to go and stop at will, habits of rest as well as labor, time for a happy home and a place for recreation — that his youth may be renewed and prolonged — and wisdom, that he may administer on his own estate?

TABLE V.—KINDERGÄRTEN.

The following is a comparative summary of Kindergärten, instructors, and pupils reported to the Bureau from 1873 to 1882, inclusive:

a Includes some pupils receiving primary instruction.

The statistics of Kindergärten show a noticeable growth the past year. The increase is due both to the establishment of Kindergärten in States which did not report any for the previous year and to the multiplication of them in large cities. Kindergärten existing in Nevada and New Hampshire in 1881 have disappeared and others have been established in Kentucky, Mississippi, Nebraska, and Oregon, States which were not credited with any in my last report. A Kindergarten has also been established in New Mexico. The principal growth has been in the very largest of our cities, in which the Kindergarten methods are most demanded. More than one-half of these enterprises have started in the cities of Boston, New York, Philadelphia, Washington, Chicago, and San Francisco. They are supported by the wealthy for the sake of their own children and by the philanthropic for the benefit of the poor by whom they are surrounded.

The charity work of the Kindergarten is one of its most pleasing and attractive features. Its beneficent influences and instructions are carried into the poorest and most forbidding sections of our large cities, and seeds are sown in fresh soil that show immediate growth and promise future harvests. Associations are organized for extending and supporting this work. Among them are the Public Kindergarten Society, the Jackson Street Kindergarten Association, and the New Silver Street Kindergarten Society, in San Francisco; the Free Kindergarten Association and the Fröbel Kinder-

garten Association, in Chicago; the Kindergarten Association in Cincinnati, and the Sub-Primary School Society in Philadelphia. Their purposes may be illustrated by words used in the report of the Chicago Fröbel Kindergarten Association, as follows:

This charity is designed by the association for the benefit of little children too young to be admitted to the public schools, who in winter are often locked *into* their comfortless homes while their mothers are out at work and in summer are locked *out of* them, exposed to all the corrupting influences of the streets and alleys.

The Chicago Free Kindergarten Association has for its object the maintenance of a class for training teachers and the promotion of free Kindergärten in the city. The society sprang up as a remote consequence of the terms on which a lady, Miss Matilda H. Ross, accepted the invitation to become the principal of a new Kindergarten department in the Cook County Normal School, namely, that she might associate with her duties at the normal school the organizing of free Kindergärten for neglected children in Chicago. Her work became widely known through efforts to have its headquarters removed into the city, and an association for the establishment of a free training school and of free Kindergärten resulted. The first Kindergarten was organized July 5, 1881. Nine others have been opened by the association, and the number is increasing. The average daily attendance of children is about 600.

The Cincinnati Kindergarten Association has three Kindergärten in successful operation and nearly 200 children in attendance. The first one was opened in March, 1880.

In Boston there are 24 free Kindergärten, supported by Mrs. Q. A. Shaw, and superintended by Miss L. B. Pingree. The condition of these charities in 1882 was given by Miss Pingree as follows:

There are at present 31 free Kindergärten for poor children in and near Boston, carried on by the private charity of one lady. Four of these Kindergärten began their work in 1877; during 1878 and 1879, 14 others were started, and in 1880 the remaining 13. Twenty-three of these Kindergärten receive 50 children, each under the charge of two trained teachers, a principal and an assistant; and 8 receive 25 children, with one teacher in charge. Nineteen of these occupy school rooms or halls the use and care of which are kindly given by the city or town where they are placed; the remainder are in houses where day nursery work is also carried on, or in suitable rooms hired for the purpose. * * * No Kindergartner is engaged until she receives a diploma from a competent trainer, and great care is taken to engage only those who seem to have special fitness and ability for the public work among poor children.

In Philadelphia the Sub-Primary School Society has undertaken a movement on behalf of neglected children under school age and for the prevention of crime and pauperism. With these objects in view 17 free Kindergärten have been established, in which care is taken of about 500 children. Other schools are to be provided as soon as funds will permit. The society has coöperated with the charity organizations of several of the wards. An offer of one-third of the teacher's salary and an outfit for the Kindergarten made to any ward association which would establish a free Kindergarten has been accepted in numerous instances. In San Francisco the three Kindergarten societies already mentioned have carried forward their charitable work with energy and success. Seventeen free Kindergärten have been established and 11 report an attendance of 624 children. These little ones come from mothers of all nationalities and religions, from homes of the most varied character, and from surroundings of poverty, woe, and crime; and all that can be is done to promote their moral, physical, and intellectual growth. In the report of the Jackson Street Free Kindergarten Association, Mrs. Sarah B. Cooper says:

The work of a teacher in these free Kindergärten is a distinctive work; it does not end with school hours. The children are so young and the home life is often so wretched as to require the best energies of the faithful teacher when the work of the school room is over. There is much visitation to be done to look up absent children; and, where sickness invades, the teacher is often called upon to supply medical aid and other necessary help; and where death comes there is sometimes no one but the Kindergarten helpers to see the little one decently buried.

The influence of these free Kindergärten upon both children and parents is everywhere acknowledged to be excellent. The report of the women's corps of visitors of the twenty-ninth ward in Philadelphia says:

There is a noticeable improvement in the children in a short time. At first they are somewhat uneasy, and perhaps a little afraid, at their novel surroundings; but, finding themselves so kindly cared for and their welfare so evidently sought, they soon brighten into natural and happy children, showing by their intelligent readiness to adapt themselves to their new conditions how hopeful is work for the children. A visible effort is made by the mothers to send them as tidy as their circumstances permit.

The following quotations from a published letter by Miss L. B. Pingree, superintendent of the Boston free Kindergärten, are of interest in this connection:

When these Kindergärten began their work it was interesting to see the mixture of curiosity and indifference among the parents whose children were found in the streets and asked to come to them. It was difficult to secure regular attendance, even in the most crowded localities, but gradually an interest and some appreciation of what was being done for their children began to be manifested among them; but this we feel was greatly due to the faithful visiting in the homes by the Kindergartner, where after a little time she gains the confidence of the mothers and is able to make useful suggestions about cleanliness, proper food, clothing, &c., but more than all to learn something of the children's lives there, their temper and dispositions, for, even in their ignorance about any right ways of guidance or control, these people are often intelligent about the general characteristics of their children and able to give an earnest Kindergartner much help. Then the interest manifested in the children and families does much to encourage the parents to do something for the children themselves and to make them feel more responsible for them. The impression made upon the mothers by the patience and gentleness of the teachers is a deep one.

The little ones often come to us so degraded and almost depraved from constant association with vice of every kind, lawless and defiant, using profane language with the ease of full grown men, untruthful, sullen, and unhappy; but gradually, in the most hopeless cases, habits of honesty, truthfulness, and obedience have been formed, impure language hushed, and some degree of gentleness and kindness toward others has been gained; and oh! how often wan, sad faces and lives made happy and glad!

A truant officer in one place told me, without knowing I was interested in the work, that the Kindergarten had made a great change in that neighborhood; there was less swearing and rudeness among the older children; he often heard the little ones reprove the older for using bad words and for unkind treatment.

KINDERGÄRTEN AND THE PUBLIC SCHOOLS.

The school board of Milwaukee appointed a special committee in January, 1882, to visit St. Louis for the purpose of examining the Kindergärten of that city which are connected with the public school system. The committee performed their mission and made an elaborate report, in which the difficulties attending the maintenance and operation of these schools were fully explained and discussed. Yet the committee felt thoroughly satisfied of the practicability of establishing a Kindergarten system in Milwaukee. They advised cautious movements, the exercise of great care in the selection of Kindergartners, and the exclusive control of the Kindergärten by the school board. The important question seemed to be whether one teacher could conduct two separate classes a day. If this could be done the expense would not be such as to prevent the successful establishment of the system. The board came to the conclusion that the experiment was worth making, and that, if prudently conducted, it would probably solve the problem of infant instruction for the city. Rules were adopted for the regulation and government of the system which exhibit the principal features of the plan adopted. They are as follows:

(1) It shall be the duty of the director of Kindergärten to give all the instruction in the training school for Kindergartners and to supervise the public school Kindergärten of the city, and she shall be director of the Kindergarten in connection with the training school.

(2) The director of Kindergärten shall be responsible for the training school for Kindergartners and the Kindergarten in connection therewith in the same manner and to the same extent as principals are for their schools, and all reports relating to said training school and Kindergarten shall be made to the superintendent and secretary in accordance with the rules of the board.

(3) The course of study in the training school for Kindergartners shall embrace thorough instruction in the philosophy and practice of Fröbel's system, including the gifts, occupations, plays, and songs, and actual training as assistant in the central and local Kindergärten, the leading principles of bodily hygiene, the elements of mental and moral science in their relations to child education, and the general history of educational methods.

(4) The training school for Kindergartners shall be open to such persons as are able to pass an examination as to education and personal qualifications for Kindergarten work, to be held by the committee on Kindergärten, the superintendent of public schools, and the director of Kindergärten. On entering the training school, the applicant shall be put on one month's probation, and if at the end of that time she gives assurance of becoming a successful Kindergartner she shall be made a regular member of the class.

(5) No person shall be certified as director until she has passed a satisfactory examination in the studies prescribed for the training school for Kindergartners and has by actual service proved herself proficient in the management of classes in the various gifts, occupations, and exercises of the Kindergarten. Certificates shall be good while the holders remain in the service of the board. Paid assistants who have attained sufficient experience to act in that capacity shall be selected from the pupils in the training school, and certificates shall be issued to them which shall be good for the school year during which they are granted.

(6) All persons admitted to the training school for Kindergartners shall, during their attendance upon the same, be required to act as assistants in the local Kindergärten for one session each day, without compensation, unless when detailed to act as paid assistants.

(7) The daily session of a Kindergarten shall be 3 hours. No pupil over 7 years of age shall be received, and no pupil shall be permitted to attend a Kindergarten and a class of a higher grade at the same time.

(8) Each Kindergarten shall be entitled to a director and 1 paid assistant for 60 pupils and an additional paid assistant for each 30 pupils over 60. No Kindergarten shall be opened unless an enrolment of 60 pupils can be secured.

(9) Directors having charge of two Kindergarten classes in one day shall begin with the same salary and shall receive advancements on the same terms and conditions as teachers holding the A certificate [the highest grade], and assistants shall receive $20 per month for a full day's service. Directors and assistants employed for one class per day shall receive one-half of this compensation.

(10) The Kindergarten shall constitute the lowest grade in the course of instruction of the public schools and shall be treated as a department of the primary or district school in which it is located. Except as to such matters pertaining to the program, the details of work, and the duties of local directors as are under the immediate supervision of the director of Kindergärten, the Kindergarten shall be subject to the control of the principal of the school in which it is placed.

(11) No Kindergarten shall be organized or conducted in any school unless upon the recommendation of the committee on Kindergärten and the order of the board.

(12) The Kindergärten shall be under the same general supervision by the superintendent of schools as are the other schools, and they shall be governed by the regulations of the schools established by the board, except as these are modified by the foregoing rules.

A FRENCH VIEW OF AMERICAN KINDERGARTEN WORK.

The following paragraphs, translated from the report of Mlle. Loizillon on primary instruction in the United States, are of special interest to American readers:

The establishment of the Kindergarten in the United States of America was a thoroughly feminine work, which does not date back more than a dozen or fifteen years. * * *

It is to be feared that on account of the reception of children from the wealthier classes — who many times have been favored and spoiled at home — certain concessions will be made in the Kindergarten which may be opposed to the principles of the system, and, by introducing disturbing conditions, may have an unfortunate influence on the pupil teachers. * * *

At Boston and St. Louis the most interesting Kindergärten for study are to be found, not only on account of their number and origin, but on account of their organization and the unity of their direction. * * *

These establishments are noteworthy because of the buildings, furnishings, &c., but the retiring rooms for the children are not arranged according to the best hygienic ideas. * * *

The result of the exercises in drawing on slates, in constructing solid figures, in combining colors, in the weaving of papers is very remarkable. The children acquire

great dexterity, combined with quick powers of observation, but the work should not be carried too far, as in one school where children of four years of age sew, cut out dolls' clothes, and even mend garments. Little folks of that age are too delicate to wear the thimble, hold the needle, and give the strict attention required in such work. * * *

The teachers only have three hours' class work each day, but the amount accomplished in this short space requires such tension of mind, so much vigilance, that the nerve force would not suffice for a longer period. One source of fatigue is caused by the different nationalities present at the Kindergarten [Mrs. Shaw's apparently]. The English tongue has to be taught to the pupils. * * *

The disposal of the different objects made at the close of each year awakens ambitious instincts at the beginning of the new term, as each child wishes to help in redecorating the school room. Then curiosity and enthusiasm are both excited. Even the colored children show as much amour propre in this matter as the whites. * * *

The experiments made in St. Louis and Boston have given rise to many more or less successful attempts to establish similar schools elsewhere. * * *

Notwithstanding the hopes that this interesting movement has awakened, it is impossible not to feel that the establishments due to private sources are quite insufficient. What are 232 Kindergärten (with 8,871 pupils) to a population of more than 50,000,000 persons? Public generosity is inexhaustible in the United States of America, especially in the interests of education; yet, even if the number of Kindergärten be doubled in a dozen years, the situation will remain the same: there will be too few Kindergärten for the public need. There is one point in the education of children in the United States which may be called a fault of the organization. As the school only admits pupils at the ages of 5 or 6 years it happens many times where the families are out at work that the children are left without any one to care for them, so that they run on the streets and acquire bad habits at an age when the powers of reasoning cannot be brought to bear. Even the Kindergarten does not suffice to prevent grave errors, as the little folks are only there three hours a day. This problem will only be solved when the state takes charge of the education of children from infancy upward. All efforts made by private parties will only have a limited value. General measures are better. * * *

The project of connecting the Kindergarten with the public school has been mooted (in Boston it was attempted, but found too onerous a duty), but insurmountable financial difficulties seem to stand in the way. Notwithstanding the wealth, generosity, and devotion of the American people the State governments cannot impose the necessary taxes to form a budget for Kindergarten instruction in addition to what is required for the actual organization. * * * Nothing is impossible, however, in a country where suggestions so soon become facts.

But if the work of protecting little folks is to remain isolated from the rest of the school system it will suffice at least to glorify the American women who were the means of founding the schools.

SECONDARY (INCLUDING PREPARATORY) INSTRUCTION.

TABLE VI.—INSTITUTIONS FOR SECONDARY INSTRUCTION.

The following is a comparative summary of the number of institutions for secondary instruction (exclusive of high schools, preparatory schools, and departments of normal schools and of institutions for superior instruction) making returns from 1873 to 1882, inclusive:

a In 159 cities. *b* Strictly normal students are not included.

Application of the term secondary instruction.—The expression secondary instruction, as I have frequently had occasion to observe, is not employed in my annual report to designate institutions of exact and uniform grade. It has, however, proved a convenient term of classification, serving as a means of bringing together and in some degree systematizing a mass of information that could not well be referred to any other head. The data thus collated afford a very fair conception of the endeavor made in our country to continue education beyond the elementary stage.

Schools and enrolment.—Secondary instruction is the specific work of three classes of institutions: public high schools, represented in the statistical summary of pupils receiving secondary instruction by city high schools, that enroll, so far as reported, 39,581 pupils; institutions for secondary instruction, Table VI, numbering 1,482, with an enrolment of 138,384; preparatory schools, Table VII, numbering 154, enrolment, 15,681; or a total enrolment of 193,646. To this must be added the students in academic courses of normal schools, 14,464; in the preparatory departments of institutions for the superior instruction of women, 8,284; preparatory departments of universities and colleges, 31,838; and preparatory departments of schools of science, 3,381; making a total of 251,613 pupils receiving secondary instruction.

Distribution of schools and scholars.—The distribution of the various classes of institutions engaged in the work is worthy of notice. More than two-thirds of the pupils in preparatory schools are reported in the New England and Middle States, while about the same proportion of those in the preparatory departments of superior institutions are in the Southern and Western States. The ratio to the entire population of the pupils receiving secondary instruction is, for the whole country, 1 in every 199; for the New England States, 1 in 130; for the Middle States, 1 in 196; and for the Northern Central States, 1 in 238.

Courses and standards.—The varied character of the schools represented in Table VI will be seen by examination of the extended table in the appendix, which sets forth very plainly the determining conditions, viz, denominational affiliations, extent of patronage and resources, as funds, apparatus, and teaching force. These schools are responsible for the instruction of more than half the entire number of scholars in the secondary grade, and their labor is about equally divided between girls and boys, the former numbering 65,559 and the latter 69,362. Three-fifths of the students are in the English course and less than one-twelfth (viz, 10,753 out of a total of 138,384) are preparing for college.

The schools represented in Table VII are more uniform in character than the preceding. While less than one-third of their students are professedly preparing for college, it is understood that the courses and standards for all scholars are chiefly determined by the requirements of the college entrance examinations. The comparatively small number of scholars preparing for college in the schools reported in Tables VI and VII and the small number annually reported as proceeding from them to college warrant the inference that both classes of schools are in the main finishing schools for their pupils. As such it is important that they should have at command all the agencies by which students are stimulated to the highest exertion, and that they should give to the communities in which they are placed reliable guarantees of their capacity to impart sound knowledge. The purpose of preparing students for matriculation in superior institutions has proved a great stimulus to the schools undertaking that work. The effect has not been confined to the students who contemplated entering college, but all the students have experienced the advantage of working in a systematic manner toward a high and definite result.

The endeavor of certain eastern colleges to arrange for uniform courses has resulted in a substantial agreement as to the requirements in all ordinary subjects.[1] The degree of uniformity secured is sufficient to facilitate the work of secondary schools that must prepare pupils for several of these colleges at the same time.

[1] The institutions represented in the agreement are Harvard, Yale, Brown University, Dartmouth, Williams, Trinity, Amherst, Wesleyan University, Tufts, and Boston University.

The standard at which many candidates pass the entrance examination and their subsequent record in the college course indicate the need of a better adjustment between the courses of secondary instruction and the college courses. This is even more apparent in the case of scholars who enter the higher schools of science.

The desire on the part of the graduates of secondary institutions to secure some authoritative indorsement of their work is evidenced by the fact that numbers who have no intention of entering upon a college course annually pass the college entrance examinations. The opinion is quite general that standards differing somewhat from those represented in these entrance examinations, and applied by some independent representative body, would be a better means of testing the attainments of graduates from secondary schools. The idea is illustrated in the regents' examinations in New York, which have proved of great service in maintaining high standards in the secondary schools of that State. In 1882 the board adopted resolutions amending the conditions on which charters would be granted to academies and on which academical departments of union schools would be received under visitation, to the end that the standard of the academies might be raised. The terms hereafter to be required for coming under the visitation of the regents and enjoying the advantages of sharing in the distribution of the literature fund are shown in the following resolution:

That the ordinance of the regents in regard to the incorporation of academies be amended so as to require as a condition precedent to such incorporation the possession of property amounting to at least $5,000 over and above all incumbrances and that the debts shall not exceed the one-third part of said property; and that, besides the buildings (which, as required by law, must be of the value of at least $2,000), said property shall include a library of suitable books worth at least $500, and apparatus and collections suitable for instruction in physics, chemistry, and natural history, worth at least $500; and that reasonable assurances exist of a sufficient income for the suitable support of said academy and of the attendance thereat of at least twenty-five scholars who are qualified to pursue the proper studies of an academy.

A second resolution extends the same requirements to union schools which seek to participate in the benefits of the fund.

The whole number of academies and academical departments now carried on the regents' lists is 279. In 1881–'82 reports were received from 257 of these, having an enrolment of 34,171 scholars. The total amount distributed to these from the literature fund was $40,000.

In the preliminary examinations which determine what scholars are to be counted in the distribution of the fund, certificates are issued when the candidates pass satisfactorily in arithmetic, English grammar, geography, and spelling. In 1881–'82 the number of these certificates issued was 4,202. The advanced examination for the academic diploma is recognized throughout the State as a valuable standard of scholarship. In the university convocation held July, 1882, these examinations were the subject of earnest discussion, and many suggestions were made that promise to result in practical measures for increasing their scope and force.

Effects of recent movements.—The movement for the higher education of women has had a favorable effect upon secondary instruction. During the past few years a number of excellent schools have been established for the pupose of fitting girls for the colleges open to them, schools previously existing have shown the beneficial effects of the higher standards and more definite aims in woman's education, while coeducation schools have been relieved somewhat from the embarrassing necessity of arranging special courses for girls without lowering their general standard.

I have also to note increasing provision for those courses and methods of training by which students are properly prepared for the higher schools of science. Progress in this respect is hindered by two conditions: the cost of laboratories and apparatus and the difficulty of finding competent teachers. Only schools well endowed or in receipt of public appropriations are able to incur the necessary expense.

High schools.—The tabular representation of public high schools is less complete than is desired, being confined to city high schools,[1] representing 29 States and 1 Territory. The reported enrolment in these, viz, 39,581 pupils, is equal to 1 in every 286 of our urban population as given in the census of 1880. Neither this average estimate nor the larger ratio of attendance which is shown by the records of particular cities[2] warrants the notion that the high schools render any considerable portion of our youth either visionary or averse to industry. The cause of such tendencies must be sought in our social and industrial habits rather than in our schools. The requirements for admission to the high schools are such as to insure a class of pupils well prepared for the work of this grade, a very important consideration; since, if on the one hand it be urged that these schools are a public expense, on the other it would be found that they are engaged in the training and culture of minds whose development is likely to prove a public advantage.

In the Northwestern States the policy of making high school courses preliminary to the courses in the State universities is proving doubly advantageous. It promises on the one hand to relieve the higher institutions of the burden of preparatory work and on the other it greatly improves the quality of instruction in the high schools.

In 1881 the legislature of Minnesota enacted a law for the encouragement of higher education, in accordance with which appropriations are made to high schools conducted according to specified regulations and passing final inspection in the visitation of the State high school board and in the report of the examiner. The conditions of admission to the list of schools entitled to aid are as follows:

There must be a well organized graded school, having not less than three distinct departments below the high school, and including not less than eight years of elementary and grammar school instruction.

The school must be provided with suitable rooms, furniture, and apparatus for good work.

The school shall hold sessions of not less than eight months each year. Each department shall be supplied with a teacher whose qualifications have been certified to upon examination by an authorized examiner of the district, county, or State.

The high school department shall consist of at least twenty pupils, who shall be entered upon examination as provided for in the regulations. Not less than five of this department shall pursue the entire university preparatory course, and shall be known as the university preparatory class.

Others of the high school may omit Latin, in the discretion of the principal.

The high school shall be open, free of tuition, to all non-resident pupils upon passing the examination required.

High schools not receiving aid under this statute, yet desiring to avail themselves of the advantages of the State examinations as in lieu of the entrance examinations to the university, as provided by the board of regents, shall, upon application, be accepted and be entitled to the same privileges as those receiving aid.

The course of study shall include as its minimum the following course, to be known as the university preparatory course:

First year. Higher arithmetic, elementary algebra, English grammar (including analysis), geography, and United States history reviewed, Latin grammar and reader.

Second year. Natural philosophy, physical geography, elementary astronomy, general history, plane geometry, physiology, Cæsar (first three books in 1882–'83), Cicero (first oration against Catiline).

Third year. Elementary chemistry, geometrical drawing, botany, ancient history, algebra to quadratic equations, solid geometry, Cicero (last three orations against Catiline in 1882–'83, with an examination for both years in Cicero), Virgil (first four books in 1882–'83).

In Indiana the certificate of the superintendent of schools setting forth that a pupil has completed a prescribed course of study in a commissioned high school en-

[1] See statistical summary of pupils receiving secondary instruction, p. cxiv; for more extended information, see Table I of the appendix, and the abstracts of State reports under the head of Secondary Instruction.

[2] Boston reports 1,802 in high schools, or 1 in every 201 of the population; Baltimore, 1,570, or 1 in every 211; Cincinnati, 1,342, or 1 in every 190; Chicago, 1,377, or 1 in every 365; San Francisco, 1,206, or 1 in every 190.

titles the holder to admission to the State university or to Purdue University. The following is the minimum course:

Reading, writing, orthography, geography, English grammar, word analysis, United States history, physiology, arithmetic, elementary and higher algebra, geometry (first four books), Latin grammar, Latin reader, Latin prose composition, Cæsar (two books), and Virgil (two books).

It has sometimes been represented that the high schools are too largely devoted to the work of preparing students for college, and must therefore be regarded as serving a particular class rather than the general public. The objection is not well taken, as the superior education of a few is in itself a means of public good. But while the high schools have achieved an enviable reputation for their success in preparing candidates for college, an examination of their courses of study and of the subsequent careers of their graduates will show that this is by no means their chief merit. The high schools offer the only provision accessible to the majority of our teachers for that extended culture whose advantages are nowhere more needed or more directly exercised for the public advantage than in the places which these teachers fill. Great care has also been taken to include in the courses of the high school those branches of study that prepare men for the intelligent conduct of the public duties which may devolve upon any citizen of a republic. Political economy, civil government, mental science, and ethics are features in the curricula of many high schools. Science occupies a prominent place in most of the courses, and the appliances for teaching the same are in general very good. The need of a specific business course in the high schools is recognized in a number of cities, and in a few instances provision has been made for the same.

In this connection the following statements from current reports are interesting:

[Extract from the report of Hon. A. J. Moulder, superintendent of public schools, San Francisco, Cal., 1883.]

At a very early date it became apparent that the usefulness of the boys' high school could be greatly increased by the addition of a commercial or business course to the three courses already established. It was believed that such an addition would tend to popularize the institution and remove many of the objections heretofore urged against it. The superintendent therefore introduced such a measure, and it was unanimously adopted by the board of education, to take effect on the reopening of the school in July. The new course is intended to prepare young men not simply to become book-keepers, but to fit them for practical business in almost any vocation. It embraces all the branches usually taught in a first class business college, besides instruction in the ordinary English studies and in the natural sciences. The full course is of equal dignity with the other three courses in the school and extends through a period of three years. In it will be taught business penmanship, business arithmetic, book-keeping, business forms, commercial law, geography, with special reference to its use in commerce and trade.

The youth who graduates in this course ought not only to be a fair English scholar, with some knowledge of the sciences, but he should be competent to enter at once into any business enterprise. His abilities and his attainments will undoubtedly render his services of immediate and practical value to any employer seeking a skilled assistant in his business.

I have already received such assurances from parents and teachers as to satisfy me that the new course will meet a long felt want and that over one hundred students will enter it at the beginning of the next school term. Should there be a sufficient demand for it, I am in favor of establishing a similar course for the benefit of the pupils in the girls' high school.

[Extract from the report of Hon. Norman Bridge, president of the Chicago board of education.]

The number of pupils attending the high schools during the year was 1,436, or 1.98 per cent. of the whole number of pupils (72,509) attending all the schools. Of these 1,436 pupils, 403 were boys and 1,033 were girls.

The following table shows the number of pupils of each sex in the several years of the high school course:

High schools.	First year of the course.		Second year of the course.		Third year of the course.		Fourth year of the course.	
	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.
North division	48	66	25	68	10	31	4	33
South division	74	145	34	108	8	41	17	24
West division	99	240	61	162	12	69	10	47
Total	221	451	120	338	30	141	31	104

Thus it happens that, while the boys are in the minority at beginning, most of them drop out before the end of the course. This is greatly to be regretted: there ought to be a larger number of boys, exclusive of those attending other institutions of learning, in a city of over half a million people who can and will pursue to completion the high school course of study.

Many of the boys who leave the high schools before the end of the course do so because obliged to go to work; others, because the bustle and promises of business are more alluring than school and they prefer to go to work. Can the course not be made more inviting to them without lessening, but with increasing, its usefulness for them? Most undoubtedly the addition of a course in manual training and business methods would accomplish this end. The experience of the schools of manual training is that constant care must be exercised lest the pupils neglect their literary studies for the drawing and the shop, the tools and the things. The addition of some short course of this kind — even tentatively and in a small way — to our high school curriculum, for such boys as elect to take it, would at once, if we may judge by the experience of others, increase the charm and usefulness of these schools for a very considerable number of pupils, many of whom now receive little or no instruction after leaving the grammar school.

I know it is said that there is no room in our high school course for industrial studies, and that therefore the suggestion is impracticable. But such a position is absurd, since the manual training schools are nothing but high schools with the practical part added and some or all the studies of the dead languages cut off. It cannot be impossible — it ought not to be difficult — to ingraft a department of manual training upon our high school course; nor need the trial step be costly. It is my belief that the time has come for an innovation in this direction, and that the board ought to take up the consideration of the subject with this end in view.

The Washington High School affords an example of an institution of this grade conducted with special reference to the mental discipline and culture of the scholars, the demands for business training being partially met by the plan of study in the grade preceding. The work of the high school is thus outlined by Superintendent Wilson:

The high school course or courses of study cover a period of three years. The standard for admission and average age of pupils are about one year in advance of those usually required, and the full course one year less.

The following statement, preliminary to the courses of study, briefly explains the plan of organization:

The studies of the high school embrace mathematics, physics, chemistry, natural science, business training, English, German, French, Latin, Greek, history, political science, and drawing. For convenience of classification three leading courses of study are outlined, but no one of these is in every part compulsory. Subject to the requirements of the hour plan of recitations, a pupil, acting with the approval of his parents or guardian, may determine his own course of study. As an aid in the pursuit of the different studies, whenever practicable, a syllabus is prepared and furnished to the pupil, containing an analysis of topics and giving references, both general and special, to works in the school library which the pupil is expected to consult.

The studies are made as fully elective as any plan of recitations in such a school will allow; each teacher has a special department of work; physics, chemistry, and botany each has its laboratory fitted up and furnished appropriately.

The opposition to high schools is renewed from time to time in different quarters, but generally results in establishing them more securely in the confidence of the people. Such promises to be the outcome of a recent experience of this kind in Detroit, Mich., concerning which the president of the Detroit board of education, Hon. E. C. Warner, reports as follows:

In view of a report of a committee of the old board of estimates made to that body and of a resolution adverse to the support of the high school from "money raised by taxation for the maintenance of free common schools" adopted by the common council of the city, a special committee was appointed to consider and report upon the following propositions:

(A) Whether, in view of the established character of the high school as an existing institution, there are sufficient grounds for its discontinuance.

(B) If not, whether a certain fee or charge ought to be made to those seeking its privileges, with suitable provisions against excluding any not reasonably able to comply with the requirement.

(C) Whether foreign languages ought to be eliminated from the regular course of study, and, if not, whether a tuition fee ought to be charged for instruction in them.

The committee appointed to consider these propositions was composed of able and intelligent members of the board, who brought to the deliberations of the committee extensive research, mature judgment, and a conscientious desire to determine the question fairly and justly, with due regard to the rights and opinions of individuals upon the one hand who believed that the high school should be eliminated from our public school system, and to opinions of those on the other who believe in maintaining the present policy of free liberal education in advanced or high school grades.

The question received deliberate and careful consideration, and the worthy chairman, Inspector Griffin, submitted an able and exhaustive report, which was concurred in by the entire committee, wherein the State legislation was reviewed, arguments pro and con weighed, statistics cited, and logic brought to bear, and wherein the committee unanimously reported that, "in the best judgment of the committee, impressed with the grave responsibility which rests upon them, and enlightened by every source of information reasonably accessible, and carefully weighing all suggestions in opposition to their present conclusion, conceding to all who may differ from them sincerity in their convictions, the high school ought to be maintained with substantially its present course of study.

Hon. Robert Graham, State superintendent of schools, Wisconsin, gives the following comprehensive view of the operation of the high schools in his State, established by the law of 1875:

By this measure a new and important class of schools have been brought into existence; a class of schools with a clearly defined course of study, prescribed by, or having the approval of, the State superintendent, and in charge of teachers qualified by holding diplomas or some form of State certificate or by special examination in the branches included in the course of study. More than that, these schools have afforded a field for observation, a scope for experience, which ought to prove of great value in considering and determining the features to be insisted upon in such schools, and their real value and function in our system of schools. This observation and experience leads to inquiry in two directions: First, the relation of these and similar schools to higher education; second, their relation to the elementary or common district schools.

No words can so clearly and emphatically answer these inquiries as the statistics relating to these schools.

(1) They meet a demand that is felt in nearly every community and are highly appreciated wherever established under fair conditions for success. This is indicated by the fact that in 98 free high schools reporting the present year there was an enrolment of 6,528 pupils, an average of 66 pupils to each school, who attended an average of 116.6 days, or nearly 6 months of 20 days each; and by the further fact that $10,337 was collected as tuition fees from such as were not entitled to attend them without charge — an average of more than $100 for each school. Eighty-seven of these schools had an average daily attendance of more than 25, while but 11 had an average daily attendance of less than that number.

(2) These schools, notwithstanding the efforts and inducements to secure their organization and management in organic relation to collegiate and university courses of study, and directly tributary to higher institutions of learning, are largely attended by such as seek for a better equipment for immediate and active business than the common schools afford, and not in any great numbers by those seeking fit preparation for collegiate courses of study. Of the 6,528 enrolled in these schools last year, but 367 — a little more than 5 per cent. — completed either course of study. During the seven years the schools have been in progress, but 2,418 have completed a course of study. Furthermore, while both English and classical courses of study are provided,

and while German is an optional study in the English course, the number of pupils instructed in English branches only during the last year was 5,546, while the number instructed in other than English branches, which, of course, includes such as chose German among the elective studies of the English course, was but 982, about one-seventh of the number enrolled.

* * * * * * *

If the statistics were attainable, there is no doubt but that another very important way in which these schools exert a useful and wide reaching influence would be found in the opportunity they afford young people to prepare themselves in scholarship for the position of teachers in the elementary schools. From the reports that incidentally reach the office of the State superintendent, it is presumable that between 5 and 25 persons are found in each of these schools every year who are intending to teach and are there to fit themselves for so doing. If the medium number of the extremes mentioned is assumed to be the average number which each school thus yearly sends out as teachers in the common schools, then we have a measure for estimating their value and influence expressed by more than 1,500 such teachers.

It will readily be seen that the possibilities of these schools as helpful factors in improving the common schools are very great and far exceed any result hitherto realized. It gives me pleasure to be able to state that the attention and interest of some of the principals of these schools have been awakened, and inquiry has been started whether, in addition to scholastic equipment, they may not do something directly in training these embryo teachers in the schools under their charge in the theory and art of teaching. Some tentative experiments are already being made in the direction indicated.

Finances.— It is impossible to present a statement of the funds available for secondary instruction in our country, since the appropriations to public institutions of this grade are reported in totals with other funds.

The funds invested in the schools in Table VI, including value of grounds, buildings, apparatus, and productive funds, are reported as $34,412,034; in those of Table VII, $7,606,795. The income of the former schools for the year, including interest on productive funds and tuition fees, was $3,331,743, or $24 per capita of reported enrolment; that of the schools in Table VII, $742,916, or $47 per capita of reported enrolment. These funds, as the tables show, are very unequally distributed throughout the country, and are not reported in all cases.

SECONDARY INSTRUCTION IN GREAT BRITAIN.

In 1865 the British schools inquiry commission instituted a special examination into the condition of secondary schools, which gave an impetus to measures for the extension and improvement of the means of secondary instruction. A brief notice of what is now going on in Great Britain will not be out of place here, more especially as the conditions affecting secondary schools in that country are very similar to those existing among ourselves.

Nearly all the universities maintain examinations for secondary schools and scholars. The examinations under the auspices of the two older universities are naturally most generally known and most extensively employed.

The report of the Oxford local examinations show that for the year 1882 the number of girls examined was 777; number of boys, 1,360; numbers passed: girls, 473; boys, 810; total examined, 2,137; passed, 1,283. Thus far, 1,889 candidates have presented themselves for examination in 1883.

The total number of candidates who presented themselves for the Cambridge local examinations in 1882 was 7,640, viz: 4,574 boys and 3,066 girls. The tenth annual report of the Oxford and Cambridge schools examination board for the year ending October 31, 1883, gives a total of 60 boys' schools and 27 girls' schools examined during the year.

The College of Preceptors is doing a great and important work in the examination of secondary schools.

In 1883 it examined 14,000 candidates, coming from some 2,000 schools; in 1879 the number of pupils examined was 7,000, representing about 700 schools, so that the work of the society was more than doubled in four years.

The schools of the Girls' Public Day School Company enrolled about 5,400 pupils in 1883. The success of these schools has led to the formation of a Boys' Public Day School Company for the promotion of intermediate schools for boys.

It is admitted that private endowments and denominational zeal are not sufficient to accomplish all that is required in this department. "No educational system," says Mr. Mundella, "is complete which does not provide what we call the ladder. It is no use relying on an elementary system which does not bridge over the gulf between the public school and the university." In accordance with these views various plans have been adopted for establishing a connection between the elementary schools and the higher institutions of learning. The school boards of the principal cities of England have scholarships at their disposal that enable successful competitors from the elementary schools to enter one or other of the great public schools, and in a number of cities "higher board schools," corresponding to high schools in this country, have been established.

Sheffield, Manchester, Leeds, and Bradford have taken the lead in this work.

In his attempt to reform education in Scotland Lord Young saw the importance of giving distinct recognition to three grades of institutions, elementary, secondary or higher class schools, and universities. The act in which his views were embodied specified the schools which should be regarded as higher class schools and the means of testing their efficiency in the branches required, viz: Latin, Greek, modern languages, mathematics, and natural science, with a view, as the act expressly stated, "to promote the higher education of the country."

Eleven such schools were originally designated, which number has increased to eighteen, situated in the larger towns. To these must be added a number of elementary schools with flourishing secondary departments. These schools are not, however, in number or resources adequate to the end in view, namely, "supplying the whole of Scotland with secondary education," a work which it is acknowledged cannot be accomplished.

"The Scotch feeling," says Professor Laurie," is entirely different from the English on this point. The Scotch people do not wish to see their secondary schools and universities independent of the state, and they believe, with the Germans, that it is the duty of the state to render them as complete as they can be made." Great hopes are entertained that the commission created by the educational endowments act passed in 1882 will be able to do much for secondary education by bringing to its service many endowments now running to waste.

In all these movements in Great Britain the importance of science instruction and the means of adjusting the secondary schools to the requirements of industrial and business life are made prominent. It is gratifying to observe that in this respect Englishmen acknowledge that we have made greater advance than themselves.

OVERWORK IN SECONDARY SCHOOLS IN GERMANY.

The following is a brief statement of official action in several German States respecting overwork in Gymnasien and Realschulen:

After the opinion became general in Germany that numerous pressing reforms in the hygienic treatment of pupils and the arrangements of school buildings were necessary, the educational authorities began to investigate the matter out of deference to the warnings of physicians and the pressure of public opinion. As a consequence, many improvements have been made in school arrangements and in the management of scholars. These changes are made in obedience to ministerial decrees, the most recent of which deal with the scope and methods of teaching, the number of hours of study and the amount of home study, and are designed to put a check upon the overwork and haste in study about which there has been so much complaint recently. They refer especially to overwork as it exists in the higher institutions: Gymnasien, Realschulen, and other secondary schools. This official action is of the more consequence because school directors and members of school boards participated in the deliberations which preceded the preparation of the decrees. The decrees referred to were issued by the governments of Prussia, Saxony, Würtemberg, Baden, Hesse, and Alsace-Lorraine.

The *Prussian* publication is a circular of March 31, 1882. It is in reference to a revision of the system of instruction, and makes some explanations thereof, in which

attention is called to certain dangers arising from overwork to which school children are liable. This circular leaves the total number of weekly school hours unchanged, but introduces some changes of arrangement calculated to lighten the labor of the scholars.

The *Saxon* decrees are dated March 4 and March 10, 1882. They refer to the earnest discussions in the Landtag on overwork in schools, and state that the government is fully in accord with those members of the Landtag who believe that there is a necessity for regulations which shall reach the question of overwork, and then give particular directions affecting the scope and method of instruction, but without touching the subjects of home work, the number of school hours, and other matters. It is interesting to observe that the Saxon government is of the opinion that the object and scope of instruction in the classical languages are exceeded in the Gymnasien; that devoting special attention to philological sciences is detrimental to the unity and harmony of gymnasial instruction, and that in many cases instruction in ancient languages is turned into teaching philology as a profession instead of giving a general intellectual training. Besides being the cause of overwork, therefore, the system of instruction in ancient languages, which takes up most of the time in Gymnasien, is faulty in other respects. Indeed, the Saxon decree goes further and declares that the requirements in other departments, in natural history, mathematics, and history, are too high, and that anticipation is often carried to such an extent that little is left for the university. The expressions of this decree with reference to essays on given subjects which the students translate into a foreign language on dictation and write down without preparation are also very important. These essays (extemporalia) hold a very important position at present in gymnasial instruction, so that in many of these institutions conclusions as to the progress, ability, and industry of students are drawn solely or almost solely from their success in preparing the papers in question. There would be some ground for this if the subjects were invariably so arranged as to present no special difficulties to students of moderate talents and somewhat slow minds. But this is not always the case. According to the decree under consideration the essays in question are often mere collections of questions in syntax, which produce in the student a feeling of anxiety and vexation instead of an agreeable consciousness of knowledge. This is the kind of evil to which the Saxon ministry objects and the removal of which is of the greatest necessity, because nothing is more likely to produce nervous excitement and the intellectual languor following it than the frequent writing of difficult compositions which the students know will have an effect on their rank. This state of things did not exist thirty years ago.

The decree of the *Württemberg* government on the subject of overwork appeared in 1883. No medical men took part in the deliberations which preceded its publication, and yet the necessity of limiting the requirements in certain branches and of changes in several particulars in the methods of instruction was as clearly recognized as in the Prussian decrees. It seems hardly necessary to enter into details concerning it at present, but it should be said that a commission composed exclusively of teachers acceded to the recommendations.

The *Baden* ministry published an outline of a decree on March 18, 1883 (finally issued January 17, 1884), which had been prepared by the board of health in concert with a number of teachers. It takes up the question of the number of school hours a week, home study, the method of instruction, gymnastics, and certain necessary hygienic arrangements of school buildings. In Baden the different classes of the Gymnasium have had 30, 31, 32, and 34 hours of study a week without counting elective studies and gymnastics. They have now been changed to 28 and 32 hours for the two groups of classes below and above the secunda. This change will be especially beneficial to students of the tertia class, whose time of life renders them peculiarly susceptible to injury to health from overwork. Before 1869 the total number of hours of study was 269 a week for a Baden Gymnasium of 9 classes, after 1869 it was 286, and it is now 268. Each study hour is to be limited to 50 minutes. The amount of home

study is also definitely fixed and the method of instruction has been modified in some points. That these changes were necessary is shown by the fact that in the lowest class of a Gymnasium 1,300 Latin words have to be learned the first quarter of the year, and nearly as many the second, which makes a daily average of about twenty words. It is impossible to expect that young students can remember all these words, because some of them are not met with in any author read by the students until they reach the upper classes, and are also special expressions of ancient life, which a nine-year old boy knows nothing about and of whose German equivalents even he is ignorant. This is pure parrotry and is certainly without value. Learning by rote—committing to memory—is good enough in its way, but not when applied to things which are not understood by the learner. The intellectual effort required to memorize in this way leads to bad mental effects on account of the excessive brain effort the young students are compelled to make.

The *Hessian* government issued decrees about home study as early as 1877 and again in 1881. Nevertheless complaints were still made about the overwork of young scholars. In order to determine how just these complaints were, a commission, consisting of 8 school directors, 4 physicians, and 7 members of the chamber of deputies, who were also fathers of students in secondary institutions, was appointed to investigate the matter and report. In December, 1882, this commission published from the stenographic records a complete report of its proceedings. The ministry adopted a large part of the recommendations and embodied them in two decrees of February 23, 1883. One of these is devoted to regulating the quantity of home study, and establishes a maximum which amounts to an hour a day for the lowest classes, and gives particular directions to prevent exceeding the limit. The other makes such changes in the system of teaching as will lessen the amount of study bestowed on Latin and Greek. It is worthy of note that these decrees absolutely prohibit all tests of the student's progress which require much reviewing, because the work demanded of him in this way is regarded as injurious to his bodily and intellectual health, and they expressly command that the day and hour for these test exercises shall not be announced to the students more than twenty-four hours before they take place. These decrees will also have the effect of lessening the amount of memorizing.

The decree of the Stadtholder of *Alsace-Lorraine* on the subject of schools is based on the well known report of the commission appointed in April, 1882. This commission was composed of 9 physicians and 2 members of the superior school board. The report recommended a maximum number of hours a week of home study, a certain amount of physical exercise, precautions to be taken to protect the eyesight, and some improvements in the arrangements of the school rooms. A restriction of the hours of labor and of home study was desirable, because it was found that the children were suffering from overwork. The following is a summary of the conclusions of the report of the medical commission:

(1) Scholars should not be occupied with school duties more than the following number of hours a week:

Ages of scholars.	Class.	Hours at desk.	Singing.	Gymnastics.	Work at home.	Total.
7, 8	IX, VIII	18	1	2–2½	3	24–24½
9	VII	20	1	2–2½	5, 6	28–29½
10, 11	VI, V	24	2	2–3	8	36–37
12, 13, 14	IV, III	26	2	2	12	42
15, 16, 17, 18	II, I	30	2	2	12, 18	46–52

(2) Between every two hours of instruction there should be an intermission of ten minutes. If more than two hours of work follow each other, there should be an intermission of fifteen minutes between the second and third and of twenty minutes between the fourth and fifth.

(3) There should be a half holiday in the middle and at the end of the week.

(4) No work should be done between the forenoon and afternoon hours of the same day and no work should be done on Sunday.

(5) The autumn vacation should begin on the first of August and last until the

middle of September. No school work should be done during the Whitsuntide and Christmas holidays.

(6) The practice of giving hot weather half holidays is advisable and should be maintained.

(7) The greatest number of scholars which should be permitted in one room should be determined according to Pettenkofer's rule. [Pettenkofer's calculation of the amount of ventilation needed for each individual was based on the assumption that the proportion of carbonic acid gas, including that due to respiration, should not exceed .7 in 1,000 parts of room air. Starting from this basis he estimated that 60 cubic metres, or 2,119 cubic feet, of fresh air are needed for the use of a male adult every hour.]

(8) Restriction of competitive exercises and avoidance of partial accentuation in ex tempore exercises, and of all excessive efforts in preparing for examinations are recommended.

(9) Studies which make severe demands on the reflection and memory should be confined to the forenoon.

(10) Besides the obligatory instruction in gymnastics, swimming exercises, open air sports, excursions, and skating are strongly recommended. Eight hours a week should be devoted to bodily exercise.

(11) New buildings for secondary schools where the class rooms are less than five meters wide should be lighted by a single row of windows on the left of the scholars. Where the rooms are wider the windows may be placed on both sides and in exceptional cases light may be admitted behind the scholars.

(12) When light is admitted on one side only, care must be taken to select the east, west, or north side for that purpose.

(13) In school buildings already existing those rooms which are lighted from the south entirely should not be used as class rooms.

(14) Where rooms do not have a sufficient amount of light more must be provided by bevelling the edges of the window apertures and making new windows in the upper part of the walls between the windows.

(15) Badly lighted rooms, especially those in the corners of quadrangular courtyards, should not be used as class rooms.

(16) Every school room should be provided with window shades and means for supplying sufficient artificial light.

(17) The desks should be placed so that light can fall directly on each. Therefore where the spaces between the windows are wide the floor shaded by these spaces must be kept free from desks.

(18) Surfaces which reflect light strongly, such as white walls and the like, should not be permitted in the neighborhood of school buildings.

(19) All wrongly built seats should be removed from the schools forthwith and replaced by others made on rational principles.

(20) The school books, maps, and atlases should be examined with reference to the size of the type, form of letters, and their spacing. All books, &c., not answering the requirements should be gradually excluded from the schools.

(21) The plan of studies should be arranged so that a regular alternation may take place in the occupations of the scholars as far as possible, and particular care should be taken to avoid studies requiring reading during several successive hours.

(22) Near-sighted scholars should be placed in the best lighted seats and be excused from all work which taxes the eyes. Drawing fine lines in maps or geometrical figures should be avoided.

(23) Standard regulations with regard to the construction, regulation, and endowment of secondary schools should be published.

(24) Proposals for altering a school building of the secondary grade or building a new one should be examined by a medical expert or medical officer to see if they conform with the regulations.

Signed by Von Hofmann, president, and Drs. Boeckel, Hoppe-Seyler, Jolly, Kestner, Kussmaul, Laqueur, Neubauer, Ruhlmann, and Wasserfuhr.

TABLE VIII.—SUPERIOR INSTRUCTION OF WOMEN.

Statistics in detail of schools for the superior instruction of women will be found in Table VIII of the appendix. The following is a comparative summary of institutions, instructors, and pupils from 1873 to 1882, inclusive:

	1873.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.

Statistics in detail of schools for the superior instruction of women will be found in Table VIII of the appendix. The summary here presented shows a total of 227 institutions, with 2,721 instructors and 28,726 students, as against 226 institutions, with 2,211 instructors and 26,041 students, in 1881. Five colleges for women in New York State, which on account of their relation to the University of New York are included in Table IX, report 812 students;[1] coeducation colleges and schools of science, Tables IX and X, show an enrolment of 10,869 women students, making altogether a total enrolment of 40,407 women in institutions for superior instruction. Of this number 16,106 are reported in the preparatory departments and 18,047 in collegiate, special, and post graduate courses, the classification of the remainder not being specified.

The item of property valuation is very fully reported for schools of Table VIII, amounting in the whole to $10,017,041. The amount of productive funds reported is $1,116,211; income from the same, $53,063. Tuition fees, it will be seen, are the chief source of support for schools of this class. The total number of these institutions authorized by law to confer collegiate degrees is 142, of which 111 are in the Southern and Southern Central States. The total number of degrees conferred in 1882 was 904, of which 684 are reported from the two sections just named.

Every year shows a slight increase in the number of women brought under instruction in schools that maintain high standards and an increase in the enrolment of women in collegiate courses. No unusual progress in this direction has been apparent since my last report. The advocates of equal provision for both sexes in the East have labored with undiminished ardor to bring about that arrangement. The West has given new evidence of the liberal policy that has led in the past to identical provision

[1] The colleges are Wells, Elmira Female, Rutgers Female, and Vassar, and Ingham University.

for both sexes in the leading colleges, and in the South the demand is arising for more satisfactory guarantees from so called superior schools for girls of their fitness as regards resources, equipments, and standards. The need of a well endowed college for girls at some central location in the South is urged upon the attention of those who are known to be ready to devote money and influence to the public good. The preference of the South is for separate institutions for the two sexes. A young southern girl recently completed with distinction the full A. M. course of Vanderbilt University, obtaining her degree when just passing out of her teens.

No change has taken place since my last report in the attitude of any of the older eastern colleges with reference to the admission of women, but the sentiment in favor of equal and identical provision for both sexes has undoubtedly become deeper and more extended. This is due in part to the statements of the presidents of coeducation colleges as to the excellent results of the policy, but more to the effect produced by the subsequent careers of women graduates. Wherever they have been called on to exercise their attainments, whether in the domestic circle, in society, or in business, the value of their training has been demonstrated.

Movements for improving the living conditions of our communities, for the relief of the poor, for the control of the lawless, for the care and instruction of neglected children, owe much to the efforts of women who have brought to the discussion of these practical problems the force and method of trained minds. One of the best outcomes of the higher education of women has been the formation of societies of women for the promotion of that interest. At the first public meeting of the Association for Promoting the Higher Education of Women in New York, the following resolutions were presented by Dr. William H. Draper:

Whereas the progress made by women in the prosecution of the studies usually taught in the higher institutions of learning in this country and abroad has conclusively shown that women are not incapacitated by any supposed physical or mental inferiority from taking their part on an equal footing with men;

And whereas there are many women who, without the aid of systematic training, are unable to develop their natural capacity for literature, science, and art, to some of whom the advantage of a collegiate education is of vital importance and who cannot rest satisfied with any instruction short of the best;

And whereas the opening of colleges to women cannot fail to improve the general system of school education from the primary to the final grade, giving it a thorough, practical, and definite standard by which to regulate the ordinary instruction of girls:

Resolved, That it is the undoubted right of women to have as complete and unfettered an opportunity for developing and training their mental faculties as men now have; that this meeting therefore cordially approves the objects of the Association for Promoting the Higher Education of Women in New York, and considers that it would be most desirable that the higher institutions of learning should open their lectures and examinations to properly qualified women on the same terms as to men; that this meeting expresses its obligations to President Barnard, of Columbia College, for pointing out, in his recent annual reports, how an ancient and nobly endowed institution like Columbia College can increase its field of usefulness by adapting itself to these requirements.

The position of Columbia College with reference to the admission of women was thoroughly discussed and the following petition was approved:

We, the undersigned, residents of New York City and its neighborhood, beg leave to present our respectful petition: That, in view of the present state of public opinion both here and in other countries touching the justice and expediency of admitting women to the same educational advantages as men, a state of opinion especially evidenced by the recent action of the English universities of Cambridge and London, and in view of the influential position of Columbia College as among the oldest and most richly endowed educational institutions in the United States and preëminently representing the intellectual interests of the city of New York, you will be pleased to consider how best to extend, with as little delay as possible, to such properly qualified women as may desire it the many and great benefits of education in Columbia College by admitting them to lectures and examinations.

The last report of the Massachusetts Society for the University Education of Women contains the following announcement:

In union there is strength, and we are glad to number among signs of progress and guarantees of permanence the formation in Boston, January 14, 1882, of an associa-

tion of collegiate alumni. They organized with 66 women, graduates of Oberlin, Vassar, Smith, Wellesley Colleges, and Cornell, Michigan, Wisconsin, and Boston Universities. The power of this association, with its branches, to advance the cause of the higher education of women can scarcely be overestimated. They have issued so far two circulars of information, one relating to opportunities for post graduate work and the other an earnest appeal for the physical education of women. Their object and their methods call for a hearty Godspeed from every man and woman who realizes that the possibilities of a people are measured by the position and condition of its women.

The Women's Education Association, Boston, has accomplished a great work in extending provision for the special training of women and in assisting struggling students through their graduate and post-graduate courses. The need of such assistance is universally recognized and has been generally accomplished for men by means of scholarship funds. The amount of such funds at the disposal of women is extremely limited. An increased liberality in this direction is one of the most urgent needs of the time.

HIGHER EDUCATION OF WOMEN ABROAD.

In consideration of the interest manifested in the United States with reference to provision in foreign countries for the education of women, I deem it advisable to present a summary of information drawn from the files of this Office, designating with some degree of fulness the superior institutions engaged in the work, the standards they maintain, and, so far as possible, the number of students who avail themselves of the privileges offered.

UNIVERSITY EXAMINATIONS OPEN TO WOMEN IN GREAT BRITAIN.

I. Cambridge: Examinations for individual scholars.

A. Local examinations for girls and boys. Junior examinations for young people not more than 15 years of age. Senior examinations for young people not above 18 years of age.

B. Higher local examinations for men and women above 18 years of age.

II. Oxford:

A. Senior local examinations.

B. Oxford University examinations of women over 18.

III. University of Durham local examinations — corresponding to those of Cambridge and Oxford.

IV. Edinburgh University: Local examinations.

V. Aberdeen University: Higher certificate for women.

VI. The University of St. Andrews has founded the degree of literate in arts for women, which is about equivalent to the master of arts.

VII. University of Glasgow: Superior examinations for women.

VIII. Dublin University: Examinations for women.

IX. College of Preceptors: Admits women to examination for diplomas of associateship, licentiateship, fellowship, and certificates of special proficiency.

The following schemes at Cambridge and Oxford will give an idea of the range of studies and the standard that these examinations present to women:

1. Cambridge examination of senior students, in two parts.

Part first includes reading, writing, English grammar and analysis, and arithmetic.

Part second is divided into nine sections, and every student must satisfy examiners in three at least of sections marked A, B, C, D, E, F, G, or in two of them and in one of sections marked H, I.

A. Religious knowledge.

B. (*a*) English history; (*b*) physical, political, and commercial geography; (*c*) Shakespeare, a tragedy or comedy; (*d*) the outlines of political economy. The candidate must choose at least two subjects from B.

C. Latin and Greek; either language is enough for a pass.

D. French and German; either suffices for a pass.

E. Geometry, Euclid, I, II, III, IV, VI, and XI to proposition 21, inclusive, and algebra. These suffice for a pass; but questions are also given (*a*) in plane trigonom-

etry and analytical geometry of two dimensions, and in (*b*) the elements of statics, hydrostatics, and astronomy.

F. Natural philosophy: (*a*) Facts and general principles of chemistry; (*b*) chemical analysis, practical experiments; (*c*) statics, dynamics, and hydrostatics experimentally treated; (*d*) heat, laws and elementary principles; (*e*) electricity and magnetism. Every student must satisfy examiners in *a* and in one of the three, *c*, *d*, *e*.

G. (*a*) Zoölogy and elements of animal physiology; (*b*) botany and elements of vegetable physiology; (*c*) physical geography, with geology.

H. (*a*) Drawing from flat, (*b*) from models, (*c*) in perspective, and (*d*) imitative coloring.

I. Music, elements of harmony, and musical composition.

2. Cambridge University higher local examinations for men and women.

This examination is open to all who are above 18 years of age or who have obtained a first, second, or third class in the senior local examinations.

Honor certificates: (*a*) Candidates who satisfy examiners in group A and in elementary arithmetic and in two of groups R, B, C, D, E, F, obtaining a first or second class in two of these seven groups, will receive honor certificates; (*b*) candidates who have obtained a first, second, or third class in senior local examinations, and who obtain a first or second class in two of groups R, A, B, C, D, E, F, receive honor certificates.

Ordinary certificates: Candidates who satisfy examiners in group A and in elementary arithmetic and in two of groups R, B, C, D, E, F, receive certificates to that effect.

Subjects of examination:

Group R: The specified scripture subjects and one of the three subjects, Butler, Hooker, Paley, are necessary for a pass. For a first or second class, one other of the three is also required. Scriptural subjects (1882): Old Testament — historical parts of Jeremiah, Ezra, Nehemiah, Psalms XLI, LXXII. New Testament — Luke, Galatians, Ephesians, St. James. Credit is given for knowledge of the original Greek. Butler: Analogy, introduction and Part II. Hooker: Ecclesiastical Polity, Book V, 50–68. Paley: Horæ Paulinæ, Chapters I, VI–XVI.

A. (1) English History; (2) English language and literature; (3) early English; (4) essays on English literature.

B. (1) Latin, (2) Greek, (3) French, (4) German, (5) Italian.

C. (1) Arithmetic, (2) Euclid, I, II, III, IV, VI, and XI to proposition 21, inclusive; (3) elementary algebra; (4) elements of plane trigonometry; (5) elements of conic sections; (6) elements of statics; (7) elements of astronomy; (8) elements of dynamics; (9) elements of differential and integral calculus.

D. (1) Political economy; (2) logic; (3) constitutional history of England.

E. (1) Elements of chemistry, physics, and biology; (2) theoretical and practical chemistry; (3) physics; (4) botany; (5) zoölogy; (6) physiology; (7) geology and physical geography.

F. Theory of music.

3. Oxford University local examinations for women over 18.

The first examination includes the following subjects: (1) English composition; (2) two of the following languages, the choice being left to the candidate: Latin, Greek, French or Italian, German; (3) arithmetic; (4) (*a*) Euclid, the first two books, or (*b*) algebra through equations of the first degree. In marking account is taken of orthography, punctuation, and correctness of expression.

The second examination is in two parts, pass examination and honors examination. The following is the outline of subjects:

Pass examination.—This examination consists of six sections: (*a*) Two languages; (*b*) ancient history, Greek and Roman; (*c*) modern history; (*d*) mathematics; (*e*) physics, chemistry, with, optionally, elementary biology and geology; (*f*) logic and

political economy. The candidate may take section *a* and one of the other sections at the first trial and defer the remaining subjects till the next year if she prefer.

Examination for honors.—This examination consists of eight sections, and the candidate can only take one, or, at the most, two sections in a single year: (1) English; (2) Latin and Greek; (3) German, French, Italian, and Spanish; (4) mathematics, pure and applied; (5) ancient history, with Latin and Greek texts; (6) modern history, with the original texts; (7) philosophy; (8) physical sciences.

Rudiments of faith and of religion.—A separate diploma is awarded the candidate who satisfies the examiners in the last named subject. It may be presented at the same time as the subject of the second examination or later, at the option of the candidate.

The following universities admit women to the same examinations as men and confer upon them the same degrees and honors: London University, Victoria University, and Royal University, Ireland.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF WOMEN OR TO WHICH WOMEN ARE ADMITTED.

England and Ireland.

London:

(A) University College admits women to nearly all courses.
(B) Bedford College, for women.
(C) Queen's College, for women.
(D) Crystal Palace School of Arts, Science, and Engineering, ladies' division.
(E) Birkbeck Literary and Scientific Institution.
(F) College of Medicine for Women.
(G) Holloway College for Women, founded 1881, completed 1883.
(H) Department of King's College for the higher education of women.

Outside of the metropolis:

Cambridge: Girton College, Newnham Hall.
Oxford: Somerville Hall, Lady Margaret Hall.
Bristol: Bristol University College.
Birmingham: Mason Science College.
Manchester: Woman's College, annexed to Owen's College.
Leeds: Yorkshire College.

Ireland:

Dublin: Queen's College; Alexandra College.

The Oxford Association for Promoting the Higher Education of Women reports that in 1882 the number of women attending the lectures of the association (which are delivered by Oxford professors and tutors) showed considerable increase. In December, 1881, 8 women went in for the first examinations and 4 passed. In June, 1882, out of 15 candidates for the same examination 10 were successful; while for the second (honors) examination there were 5 candidates, of whom 3 gained first classes in their relative subjects, one a second, and the fifth a third.

From the twenty-fifth annual report of the Cambridge local examinations syndicate it appears that examinations were held at 114 centres for girls. Number of girls entered, 3,066, viz, 1,793 juniors and 1,273 seniors. Number of junior girls examined, 1,140; percentage passed, 71.5; percentage failed, 28.5; number of senior girls examined, 1,238; passed, 56 per cent.; failed, 44 per cent. The twenty-sixth Cambridge University local examinations (i. e., December, 1883) obtained a larger entry than ever before. Out of a total of 8,287 candidates there were 3,277 girls against 3,066 in 1882.

From the ninth annual report of the Oxford and Cambridge schools examinations board for the year ending December 31, 1882, it appears that examinations had been held during the year under the authority of the board at 23 girls' schools.

At the first matriculation examination of the Royal University of Ireland, held December 6, 1881, the number of women presented was 31, of whom 25 passed. At the second matriculation examination, October, 1882, 48 of the candidates were women; of these 44 passed.

The roll of students in Girton College in 1882 numbered 68. The number of stu-

dents who have been in residence in the college since its commencement is 137. Of these, 62 have obtained honors according to the Cambridge University standard (22 in classics, 17 in mathematics, 1 in mathematics and moral science, 10 in natural science, 7 in moral science, 4 in history, 1 in theology) and 20 have passed examinations qualifying for the ordinary B. A. degree.

The College of Preceptors is the oldest board for the examination of middle class schools and pupils in England. Its operations are very extensive, the number of schools which from time to time make use of the examinations being 2,400. From the report of the examinations of this board for the half year ending Christmas, 1882, it appears that out of a total of 8,125 candidates examined 4,750 were girls; of the 84 candidates who presented themselves at the examination of teachers for the college diploma, 40 were women. The following statement is from the dean's report for the year ending Christmas, 1883:

Girls.	Entered.	Passed.	Failed.	Per cent. of passes.
Entered for first class	596	311	285	52
Entered for second class	1,648	805	843	49
Entered for third class	2,739	1,846	893	67

The examination of teachers for the college diplomas took place on the 1st of January and four following days, and was attended by 91 candidates, of whom 40 were men and 51 women. The subjects of examination included the theory and practice of education, scripture history, English language, English history, geography, Latin, Greek, French, German, arithmetic, algebra, Euclid, trigonometry, analytical geometry, natural philosophy, experimental physics, animal physiology, chemistry, drawing, and music.

The Continent.

The following information is derived from the inaugural addresses for 1882 and 1883 of M. L. Trasenster, rector of the university at Liége, and from other documents in the files of this Office:

In *Austria-Hungary* the entrance of women in the university courses, which was permitted for a while, has been forbidden. Now the education of women is limited to that obtained in the common and burgher schools, in normal courses, and in the weibliche Arbeitschule. In the last, instruction is given in female handiwork in general, in making clothes, machine sewing, straw work, and hat making.

Germany.—Women have never been admitted to the Prussian universities. At Leipzig a few women followed the courses between 1871 and 1880 and two or three passed the examinations; but the authorities of Saxony soon forbade their admission. In Munich scientific courses were inaugurated in connection with the Academy of Sciences in the year 1878. Many secondary schools for young girls are reported.

In *Belgium* the question of admitting women to the universities was first brought up in 1875, by a dispatch from M. Delcour, minister of the interior, to the different universities of that country, in which he asked for the opinion of the various faculties as to the admission of women. Liége and Ghent saw no special reasons for excluding them, but the latter felt inclined to await the result of the trial in other counties. In 1881 the University of Brussels admitted women, and 3 women followed the course in natural sciences. In 1882–'83 there were 7 in attendance: 5 in natural sciences, 1 in pharmacy, and 1 in philosophy. Five registered themselves for the examinations: 3 in sciences, 1 in pharmacy, and 1 in medicine. At Liége 6 women attended in 1882–'83: 4 in pharmacy, 1 each in medicine and natural sciences. On the 20th of October, 1883, there were 17 students (women) in the sciences; that is, in medicine, pharmacy, and natural sciences. One room is specially reserved to be used for study and recitation by the female pupils during the hours between recitations. One woman has already passed through a 2-year course and received the highest honors in pharmacy. Ghent had 1 woman in the course in natural sciences in 1882–'83. A law of the

15th of June, 1881, stipulated for the establishment of at least 50 secondary schools for girls and for normal courses as preparatory to the position of directress or regent. The examinations of those profiting by these courses and intending to be teachers were extremely successful. Women have pursued higher branches before the professors of the athenæums at Brussels and Liége. Language, literature, history, and mathematics seem to be the subjects of attraction. The courses in the normals cover morals, psychology, pedagogy, methods, the history of pedagogy, the mother tongue (with its literature and history), either French, Flemish, or German (according to locality), Belgian history, geography and cosmography, elementary mathematics, elements of natural sciences, hygiene, some knowledge of arboriculture, agriculture, and horticulture in the normals for males and domestic economy in the course for women, penmanship and book-keeping, elements of constitutional, administrative, and commercial law and of social economy, drawing, vocal music, gymnastics, elements of the German or English language (with the object of interesting pupils to still further pursue these branches after leaving the normals), industrial training for men and needlework and cutting and fitting for women.

In *France* a law of December 21, 1880, provided for the establishing of institutions for the secondary education of girls. The course of instruction is similar to that given above for Belgium. (See Report of the Commissioner of Education for 1881, p. cexlvi). A law of July 26, 1881, provided for a normal school to furnish female professors for the secondary grades. The Société pour l'enseignement professionnel des femmes reports as follows for 1883: There are 535 pupils distributed among 4 schools under charge of this society in Paris. In addition to the general courses the majority of these girls pursue either business courses, drawing and design, cutting and fitting, or the courses in which drawing is applied to some industrial occupation. Pupils are fitted to be teachers and have been very successful in their examinations for professorships in drawing in the lycées for girls and in the common schools. Sixteen were admitted to the exhibition of fine arts. Eight passed for the above professorships. The administration of the Academy of Fine Arts has created a diploma of superior grade for drawing (brevet supérieur de l'enseignement du dessin) and the necessary courses leading to such diploma have just been organized. In two schools free courses in English are given. Arithmetic and accounts, chemistry, hygiene, and botany are also taught in these professional schools. Women are admitted to the courses in the different faculties of the University of France, but it is only in Paris that they carry on the complete courses. The Faculty of Medicine in Paris numbered 50 lady students in 1882–'83. Since 1868, at which date women were first admitted, the medical faculty has conferred 22 diplomas of M. D. on women and 1 as health officer. The faculties of science and literature have given to women 49 diplomas of B. L., 33 of B. S., 2 as licentiate in literature, and 29 diplomas (brevets de capacité) for special secondary instruction. The question of the education of women is still being agitated in the assembly and in the newspapers, and many young girls come forward to the examinations who do not look forward to making any use as teachers of the knowledge acquired.

In *Italy* the higher education of women dates centuries ba . The University of Padua is proud of the names of Cornaro Piscopia and Novella d'Andréa. The University of Bologna had Clotilde Tambroni as professor of Greek literature up to 1817. A regulation of the 11th of October, 1875, authorized the admission of women into the universities, providing they had obtained the lyceum certificate exacted from men who graduate from those schools. As there are few establishments for girls leading to such an examination, the numbers entering the universities are limited. In 1882–'83, there was 1 lady student at the University of Turin, 1 at Pavia, 3 at Padua, 4 at Rome, and probably the same at Bologna. The following diplomas have been conferred upon women: Doctor of medicine at Turin, Pisa, and Bologna; doctor of laws at Turin and Bologna; doctor of philosophy and letters at Turin, Padua, and Bologna, and 3 doctorates of natural science at Rome. In Turin 3 girls are following the courses in the Lycée Cavour. These courses succeed to those of the gymnasia and include

rhetoric and 2 years in philosophy. Information obtained in the early part of 1883 is to the effect that institutions for the higher education of women are to be organized and put under charge of the ministry of public instruction. They are to be placed on a similar footing to the universities. The three institutions for girls at present existing in Turin have been found quite insufficient, so that the officials have already been obliged to open advanced schools for such graduates of the elementary grades as desire to continue their studies.

Switzerland outranks other continental countries in point of women students and the number of diplomas given. In 1882–'83 there were 52 women at the university in Geneva, 36 at Berne, and 24 at Zürich. Switzerland, Germany, Austria, Russia, Roumania, the United States of America (4 in medicine), and South America were represented in the 24, 17 of whom were medical students, the others pursuing a philosophical course. Formerly many Russians were present, but their government has interfered to prevent such attendance, as too much liberty of action and too great political exaltation were found among such women. The conditions of admission at Zürich are quite severe, as the student who desires to pursue the regular course must have attended a high grade of school and must have sufficient knowledge of mathematics, natural sciences, and three languages (German being one, Latin and French or Italian and English the others) to be able to take up the proper studies. Most of the women students in the universities either go as "hearers" or intend to obtain a baccalaureate. The doctors' diplomas given to women up to the present day are 41 for medicine at Berne, 25 at Zürich, and 1 at Geneva (where the medical faculty has been but lately established; for philosophy (PH. D.), 4 diplomas at Berne and 7 at Zürich; for law, 1 at Berne. Women frequently obtain the highest points at the examinations. At Geneva the two upper classes in the highest secondary school for young girls, corresponding to the philosophy classes in the French lycées, had 147 pupils in 1882.

Spain formerly admitted women to some of the universities, but this is now prohibited. By decree of May 17, 1882, the authorities added a fourth year to the course of the Central Normal School for Female Teachers, and several decrees were promulgated in 1882 in regard to the primary instruction of girls.

In *Portugal* the subject is being canvassed. The rector of the university at Coimbra has been charged by the government to present the basis of a university reform which will allow the admission of women. Two women, authorized by royal decree, have passed the examination for pharmacist, one in 1860 the other in 1872, but without having followed university courses.

The Netherlands report 14 higher burgher schools for girls in 1881–'82, with 1,089 pupils in attendance. The instruction in the secondary schools for girls covers religion, arithmetic, natural sciences, mathematics, chemistry, botany, zoölogy, science of government, geography, history, Dutch, French, English, German, book-keeping, needlework, drawing, æsthetics, and psychology.

The secretary of the senate of the University of Leyden writes to this Office that there are no enactments to prevent women from attending university lectures or taking degrees the same as male students in that university or in any other university in the Kingdom. The director of the University of Ghent writes that a young woman passed the first examination in natural science last July. During the present academic year the faculty of science has 5 young women students: 1 in natural science, first examination; 1 in natural science, second examination; 2 in pharmacy; and 1 applied for the degree of doctor of sciences. The secretary of the senate of the University of Groningen writes that this year the names of 16 women are upon the rolls of the university. Of the number, 6 were admitted to the faculty of letters, 9 to the faculty of mathematics and physics, and 1 to the faculty of medicine. In 1882–'83 there were 18 women studying at the University of Amsterdam, 11 at Groningen, 4 at Leyden, and 7 at Utrecht.

In 1878 women commenced to study in the "hoogescholen," and the first to enter Leyden were in 1882. Most of the students follow the courses in modern languages in order to get a "diploma of capacity" as teachers in secondary schools. At Amsterdam

15 out of 18 were classed as follows: 1 in psychology, 1 in French literature, 1 in English literature, 1 in Greek art, 5 in geography, 2 in the Gothic tongue, 2 in old Dutch, and 2 in botany. One woman student in medicine is mentioned at Utrecht, 1 at Amsterdam, 1 in mathematical sciences and physics at Amsterdam, and 6 in natural sciences at Groningen. This last university gave one woman a diploma in pharmacy in 1878 and a medical diploma to another in 1879.

Denmark reported 6 women entering the university at Copenhagen in 1883.

Norway.—The Norwegian University at Christiania has allowed women to attend its lectures for two years past, and it has now obtained the right from the Odelthings to place women students on the same footing with men as far as examinations and scholarships are concerned.

Sweden has between 60 and 70 girls' high schools, in which are taught religion, the Swedish, French, German, and English languages, geography, history, mathematics, the natural sciences, calligraphy, drawing, fancy work, singing, and gymnastics. Studies of an advanced nature have already been added to this curriculum in order to meet the needs of adult young women. Normal courses are also reported, and a woman has lately received the degree of doctor of philosophy at Upsala University. A royal decree of June 3, 1870, opened the career of medicine to women, and the Carolinian Institute in Stockholm has a special course in anatomy for them. Other courses are taken up at the University of Upsala. After passing the requisite examinations in medicine the women are allowed to practise. At Stockholm the Wallin School and the lycée for girls have a section leading to a kind of baccalaureate degree, the same studies being taken up as in the lyceums for boys. Fifty young women have passed this examination since 1870. Some continued their studies at the university, others became teachers.

Finland had one woman in the philosophical course of the university at Helsingfors in 1881–'82.

In *Russia* women are excluded from university courses, but at St. Petersburg, in addition to the school of medicine, there is a very prosperous institution where young girls take up higher courses in literature and the sciences. This establishment was organized in 1878, and at a later date (probably in 1881–'82) there were 938 pupils reported. The course covers four years, and in 1882 there were 163 pupils ready to receive diplomas: 99 in the literary department, 64 in that of sciences. In 1870 a special course for women was opened at the medical academy. This course was ostensibly for midwifery, but really gave an extended knowledge of medicine. A four-year course could be attended by those who had followed the regular lyceum course prior to coming up for examination. Later, another year was added to the course. During seven years 959 women came up for examinations and 718 were received. Political reasons caused the cessation of the course, but students were allowed to finish their studies, although no more were to be admitted.

In *Roumania* 4 women are studying at the university in Bucharest; they are scattered through the departments: 1 in philosophy, 1 in philology, and 2 in medicine.

Servia reports a school for the higher education of young girls, with 250 pupils. There is a pedagogical section attached to this school.

TABLE IX.—UNIVERSITIES AND COLLEGES.

The following is a statement of the aggregate number of this class of institutions, with instructors and students, as reported to this Bureau each year from 1873 to 1882:

	1873.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.

It is difficult to make such a presentation of the progress and condition of college education as the importance of the subject demands, because few of the institutions make any descriptive reports. Accounts of the tentative measures of the leading universities are in some cases published annually. Most colleges report only as they

are connected with some benevolent or educational society, or are a part of the State system of education, or have been through some unusual experience. An instance of the first kind is afforded by the institutions connected with the American College and Education Society. It aids and makes a report of one college in each of nearly all the Western States: Michigan, Wisconsin, Minnesota, Iowa, Missouri, Kansas, Nebraska, Colorado, Oregon, and Washington Territory.

The State systems of education usually include a university, and as it is a public institution a report to the legislature or to the chief executive is made of its condition and needs. The governor's messages frequently commend the State university to the people and urge them to give it a generous support. Hon. Edward A. O'Neal, governor of Alabama, said last year: "The university was founded by our fathers, the first great statesmen of Alabama, and it has been a source of blessing to the young men of the State since its organization." Governor Pitkin, of Colorado, says of the State University: "I believe the president and faculty give to the institution not only large abilities but great enthusiasm, and that the character of the educational work is such as to commend it to the confidence of the people of the State." Governors Jackson of West Virginia, Jarvis of North Carolina, and Nance of Nebraska report the universities of their respective States as increasing in usefulness and prosperity. Governor Hugh S. Thompson, of South Carolina, speaks of the State college in the following terms:

Results have proven the wisdom of the policy which guided the councils of the college in the past, the earnest purpose to send forth thorough scholars: men fitted by severest classical discipline to lead the senate, the pulpit, and the bar. Let this still be the policy of the college, but let it also aspire to do something more, to hold a foremost place in the march of scientific discovery, and to send forth young men equally as well fitted by thorough technical training to lead in the development of the resources of the State: its fields, mines, and quarries, its railroads and water power, its manufactures and commerce.

Examples of the kindly mention of colleges and universities by public officers might be indefinitely multiplied, but enough has been quoted to show the prevailing sentiment toward institutions providing for a liberal education.

Among the current events of note are the organization of the University of Texas and the destruction of the buildings of Iowa College by a cyclone.

The act for establishing a university in Texas was approved March, 1881, and a board of regents soon afterward appointed. Buildings are in process of erection, a faculty has been selected, and "the university will be opened on the 15th of September, 1883, for the reception and instruction of students." The intention and spirit of its regents are expressed by their president, Hon. Ashbel Smith, as follows:

The means to carry their will into effect lie idle in the treasury, and their use for this noble purpose will not add one cent to the public taxes. The people will take no educational starveling, no institution big in name but meagre in performance. They demand a university to be now organized in a manner and on a basis soon to be developed into an institution on the high level of the foremost institutions of knowledge in the entire world; a university whose instruction, absolutely free, shall offer to every child in the State, poor or rich, that knowledge which is power to the individual and, in the aggregate, power inherent and indefeasible to the magnificent imperial State of Texas.

Iowa College, Grinnell, Iowa, was swept into ruins by a tornado on the 17th of June, 1882. The pecuniary loss was estimated at $81,645. The efforts of the officers to put the institution into shape for resuming work in the fall were successful, the college finding many friends in the time of its necessity. Its needs are yet unsupplied in many particulars, notwithstanding the noble efforts of its students, officers, alumni, and friends.

Among the questions which have been under discussion during the year have been admission requirements, elective studies, athletic sports, graduate studies and degrees, and the selection of professors.

ADMISSION TO COLLEGE.

The movements modifying the conditions of admission to colleges and universities have consisted in more frequently receiving on probation graduates of high schools

and academies upon the strength of their diplomas, the holding of entrance examinations at different centres of population, and attempts of associated colleges to adopt uniform requirements of admission. An account of a movement of this kind is given by President Eliot, of Harvard College, as follows:

As the result of several debates and conferences within the past two years considerable changes have been made in the statements of the requisitions for admission to the following colleges: Harvard, Yale, Brown University, Dartmouth, Williams, Trinity, Amherst, Wesleyan University, Tufts, and Boston University. The object in view was to make the requisitions of these different institutions the same, on paper at least, for all common subjects; and this object has been measurably accomplished, so that the work of a school which is required to prepare boys in the same classes for several of these colleges has been much facilitated. The same quantities of the same authors in Greek, Latin, and English, the same topics in arithmetic, the same amounts of algebra and geometry, and the same descriptions of what is required as to reading Greek and Latin at sight will be found in the official statements of the requisitions for admission at all the abovementioned institutions, with some exceptions in the single case of Yale College. At several of the colleges, however, there is an older and perhaps easier set of admission requisitions which is maintained as an alternative. Some of these colleges, moreover, require candidates to offer subjects which are not demanded at the others; and no attempt has been made to bring all the colleges even approximately to the same standard in conducting examinations on the same paper requisitions. In spite, however, of all the diversities which remain, the degree of uniformity which has been secured by the negotiations of the past two years is a gain for the secondary schools, and, therefore, for the colleges as a whole.

The "Association of the Colleges of Ohio," an organization formed about twenty years ago to improve the standard of the colleges in the State, is at present composed of the following institutions: Ohio University, Athens; Western Reserve University, Cleveland; Kenyon College, Gambier; Denison University, Granville; Marietta College, Marietta; Ohio Western University, Delaware; St. Xavier's College, Cincinnati; Wittenberg College, Springfield; Otterbein University, Westerville; Oberlin College, Oberlin; Antioch College, Yellow Springs; Baldwin University, Berea; University of Wooster, Wooster; Hiram College, Hiram; Ohio State University, Columbus; Buchtel College, Akron; and the University of Cincinnati, Cincinnati.

STUDIES.

Electives.—Arguments for and against elective studies have been presented, as in former years. Those for electives are now being drawn from experience, while opponents of the system defend their position by reasoning and precedent. The apparently gratifying results of the system were stated at considerable length in my last annual report. The objections were presented strongly by Hon. M. E. Gates, in his inaugural at Rutgers College, June, 1882. The following sentences are taken from this address:

Experience has proved that in developing mental power certain studies have a far greater effect than do others. Herbert Spencer holds, in his treatise on education, that the knowledge which is of most practical value is uniformly pleasantest in the act of acquiring and gives the student most mental power in the gaining. The judgment of the ages and of the wisest men of this age is against his view, and analogy is not for it.

There is another equally serious objection to this system. It makes an appeal to that natural love of doing the easiest thing which is subversive of all self discipline, of that mastery of the inclinations which all sound methods of education foster. "No way has been found of making heroism easy, even for the scholar," says Emerson. "The most valuable result of all education is the ability to make yourself do the thing you have to do when it ought to be done, whether you like to do it or not." This is a sound maxim of Huxley's, and strikes at the central idea of electives. A system of education which substitutes for all the disciplinary work of the college course a seductive and discursive field of elective studies, where a youth at eighteen is told to wander, selecting at his own sweet will, with a view to "unfolding his own individualities to the full in all directions," I submit, is utterly subversive of all self discipline, and will not develop manly fibre, or give tone and symmetry to intellect or character.

One of the institutions which have recently introduced a partially elective system is Dartmouth College. A fixed number of recitations is required each week; a part of them may be chosen by the student after the second year. The required recitations

diminish in number in the senior year, that the student may take optional studies. Such an arrangement, with opportunity at the outset of choosing a particular course, gives a wide latitude of choice to the student.

Honor studies.—A system of honor studies, adopted by the University of Rochester, is described in the annual report of the regents of the University of the State of New York as follows:

In the University of Rochester a system has been for some time in operation by which young men of more than average ability, found in every class, may have the opportunity to pursue, under the care of a professor, studies in advance of their class. These are termed honor studies, and at the commencement those of the several classes who have successfully completed the work undertaken receive appropriate recognition. Only those who give undoubted evidence of being able to accomplish more than the regular work of the class are permitted to enter upon these honor studies. In this way, without interfering with the general curriculum for the class, which must be based on average ability, its best members are afforded an opportunity to pursue in a systematic way the higher studies for which they have a special aptitude. A successful experience of several years has proved, what is of great importance, that this system is perfectly practicable for a small college, with a small but scholarly faculty.

Original research.—Original research is becoming more recognized as a part of college work. The following extended notice is taken from the notes to a paper read by Prof. J. H. Wright, of Dartmouth College, before the National Educational Association:

Information as to original work done at Johns Hopkins by the students (mostly, however, post-graduate) is given in the University Circulars and is summarized in the Annual Register. Professor Gildersleeve's Greek seminary probably approaches the best German ideals more nearly than any other American institution of the kind in the range, method, and quality of work done in and through it. The Latin seminary under Professor Warren well maintains the high standard set by its director and by the university. Professor Sylvester's mathematical seminary is without doubt unsurpassed in the world.

At Harvard there is much activity in this direction. Mr. George Bendelari, lately an instructor, writes:

"In history, certain of the courses are in original work. The original work is of two kinds: First. The men select a subject for a thesis, and are then turned loose into the library among the original authorities, so that the results, although they may not be new, are certainly original so far as the work of the student is concerned. Second. The history of England, for example, is worked up without a text book, the men using only the original authorities, under the guidance of the instructor. The best work, of course, is done by men who are candidates for honors; but there are plenty of others in the courses. In mathematics and physics work of this sort is likewise done; part of it consists in finding known results by new methods, part in obtaining absolutely new results. Some of the work in physics appears in the Journal of Physics, the results of original experiments by undergraduate students. In natural history the same is true; the results appear in the bulletins of the Agassiz Museum and in those of the Boston Natural History Society. * * * I know that considerable work of this kind is done in classical philology. * * * In some of the German and French courses in modern languages these are required. I am inclined to think, however, that they are mainly in the nature of literary criticisms or of compilations. In Middle High German and Gothic, original work was done; for instance, on the grammar of particular authors and works. In my old French course theses were required, and if they were mainly compilations the fault lay chiefly with the scarcity of material in the library. The effort was constantly made to obtain original individual work from the student. In all these cases, so far as the undergraduates are concerned, I doubt whether the results are ever very startling. As a means of preparing men for work after they leave college, however, and of teaching them to think for themselves, not to trust blindly to books, and not to be too much frightened, I consider it the very best work done in college."

With regard to Yale College, Prof. T. D. Seymour writes: "Professors Packard and Peck assign special investigations to their graduate students, but do not find the undergraduates so ready as they would desire for such work. * * * Occasionally a student is ready to undertake an independent investigation. He is always (supposing his fitness for the work) encouraged and aided. In other departments the optional work of the last two years is largely independent. In metaphysics, for example, each student looks up the system of some philosopher, which he is to study and criticise in all its relations. His thesis on this subject takes the place of an examination. * * * Mr. Packard tries the seminary work occasionally."

Political science.—The study of political science has recently been attempted to an enlarged extent. The school established for this purpose in Columbia College has commanded a fair attendance, so as to "justify the belief that the power of the school for good is justly appreciated by the public." The School of Political Science established in 1881 at the University of Michigan has been attended by interested classes, and there seems to be no obstacle to its successful career. At Cornell University a course in history and political science was opened at the beginning of the last college year. A full professorship of American history has been established. The purpose of the course is stated by President A. D. White as follows:

The purpose of the new department of history and political science, I again remind you, is to send a considerable body of young men out into the world fitted to discuss political and social questions thoroughly and intelligently. All tendency to party views, as such, has been and will be carefully avoided. Though it is clear that men, whether educated or not, will continue to view political and social questions to a considerable extent from party standpoints, we may fairly hope that a beginning has been made here and elsewhere in fitting men to discuss the main questions involving our social and political well-being with a large knowledge of their historical development and of the best ascertained bases for healthful action.

ATHLETICS.

The subject of college sports has attracted much attention recently. It includes questions whose discussion cannot be outlined on a single page and which require a multitude of facts on which to base correct conclusions. It is my purpose to have these facts collected and prepared for the public. Doubtless all college authorities have opinions on the profitableness and on the dangers of boating, ball playing, and similar sports. The action of the Harvard authorities is stated as follows:

Since the beginning of the current year the standing committee of the faculty have made regulations which forbid college clubs to play or compete with professional clubs, and provide that, after the current year, no student shall belong to a boat crew unless he can swim and that no student shall engage in any athletic contest until he has been examined and pronounced fit by the director of the gymnasium. The committee have also denied to professional "trainers" access to the grounds and buildings of the university, except by special permission of the committee. The influence of the committee has been successfully used to reduce the number of match games of ball and to confine them to Saturdays. These various restrictive measures have, on the whole, commended themselves to the judgment of the whole body of students and graduates; for even the young men most active in athletic sports had perceived that the college competitions were running to excess, and that the ball games, boat races, and some of the sports technically called athletic were in danger of losing that amateur quality which should always characterize the bodily exercises and sports of young men who are in training for intellectual pursuits and for modes of life in which satisfaction and power of usefulness come, not from great muscular strength or special skill in any sport or exercise, but rather from a well proportioned bodily development and good general health. When games are made a business they lose a large part of their charm; and college sports cannot approach the professional standard of excellence without claiming the almost exclusive attention of the players and becoming too severe, monotonous, and exacting to be thoroughly enjoyable. The most devoted college athletes have repeatedly rebelled against what they thought too strict or too prolonged training. Moreover, a high standard of excellence tends to make the number of persons who actually take part in athletic sports very small, the considerable number of tolerably good players being driven from the field and reduced to the unprofitable position of mere lookers-on.

GRADUATE STUDIES AND DEGREES.

The custom of granting degrees without examination or the pursuit of a course of study is gradually being discontinued. The master's degree is earned in many institutions by the completion of a required amount of study. The regulations of the time and place of study are not alike in the different institutions. Some require merely the passing of an examination and set no limits as to the time and place of doing the work. For example, the Illinois Wesleyan University offers courses of study to non-resident students, upon the completion of which such degrees as bachelor of philosophy, doctor of philosophy, and master of arts are conferred. Exami-

nations are held semiannually by persons accessible to the student and acceptable to the university. The examination papers are furnished by the university. The University of Michigan offers its graduates a similar privilege, but the examination must not occur until more than two years after graduation. A second class of institutions are those that do not so much require time as the completion of a certain class or group of studies and attendance at the institution during study. The University of Virginia gives the master's degree to those who complete the courses of eight of its separate schools —Latin, Greek, French and German, pure mathematics, natural philosophy, general chemistry, moral philosophy, and historical science—and who have been subjected in the last year of their candidacy to a special examination in any two schools of their own selection in which they have graduated in a previous year. A third class of institutions fix the minimum limit to the time of study and require the accomplishment of a course of study prescribed by the faculty or by certain of its members. The earned degree of master of arts in Columbia College is given after a year's study and an approved examination upon one at least of five specified groups of studies. Lehigh University requires either one year's study at the university or two years' study elsewhere. The preparation of essays is frequently required in connection with the examinations.

PROFESSORS.

The selection and qualifications of college professors have called out some comments in recent reports. President Andrew D. White, of Cornell University, says:

In calling professors it is not always advisable to select the men whose reputation is already made and who have passed the active part of their lives. A certain number of such are indeed useful, but the main strength of the faculty must always reside in younger men who have their reputation to make and who can make it. With care, discretion, and fair treatment of our instructing body we shall at no distant day realize the most ardent hopes of our friends as regards our faculty; but it cannot be done in a single day or in a single year, nor can it be done by indiscretion of any sort; it demands thoughtful study of needs and of men, weighing of testimony, a wide look over the whole field concerned, and great judgment in making selections.

President D. C. Gilman, of Johns Hopkins University, says:

The disciplinary method of a college calls for men of high social, mental, moral, and religious character, for they are to be concerned in moulding the dispositions of young men and in forming their habits at a critical period of life, when the parent begins to relax his authority and the youth has not learned to govern himself. It requires as professors those who were born to be teachers, who delight to act upon youthful minds, to inspire them with lofty motives, to train them by the best methods, to emancipate them from the slavery of sloth, to set before them noble examples, to cherish their faith. The lessons to be inculcated during a college course include obedience to recognized authority, the performance of appointed tasks, punctuality in meeting all engagements, and attention to physical development. To acquire knowledge, to master the arts of clear reasoning and fit expression, to test the capacity for different kinds of intellectual exertion, to develop a desire to master difficulties, and to form intellectual friendships and associations are among the ends to be sought in college life.

TABLE X.—SCHOOLS OF SCIENCE.

The following statement shows the number of institutions and departments of this class, with instructors and students, as reported to this Office each year from 1873 to 1882, inclusive. These numbers include the National Military and Naval Academies:

	1873.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.
Number of institutions	70	72	74	75	74	76	81	83	85	86
Number of instructors	749	609	758	793	781	809	884	953	1,019	1,082
Number of students	8,950	7,244	7,157	7,614	8,559	13,153	10,919	11,584	12,709	15,957

c Value of apparatus.

Continued interest in industrial and scientific education is shown by largely increased attendance at schools of this class, by the extension of their facilities for instruction, and by opinions expressed in public and in private gatherings, in personal letters, and in printed documents. The progress of technical education in this country is looked upon with surprise by foreign educators and manufacturers. Our own people are alive to the necessity of cultivating the arts of peace and are inquiring for methods of education directly preparatory to the common industries. Men, eminent as leaders in technical education, are studying the schools of Europe and introducing valuable features from them into our American schools. Among those who have recently undertaken this work or are now engaged in the examination of foreign methods are Prof. J. M. Ordway, A. M., of the Massachusetts Institute of Technology; C. O. Thompson, PH. D., president of Rose Polytechnic Institute, and H. T. Fuller, A. M., president of the Worcester Free Institute. Such results are expected of our technical institutions as Hon. R. W. Thompson, formerly Secretary of the Navy, attributes to those in France. He recently said:

They have enabled her engineers to occupy positions in the front rank among the most distinguished in the world. These, by thorough explorations, have succeeded in mapping out with great particularity all her material and natural resources. By this means and by the scientific classification of her soils and her mineral and vegetable products, she has been enabled to understand the nature and extent of her own resources and to shape her policy and industries so as to develop them to the utmost. Her wonderful success in this is seen in the facts that wealth and the means of subsistence are more equally distributed in France than in any other European state, and that almost every foot of earth is made to contribute to the prosperity of a people to whom emigration is not necessary, as in neighboring nations, in order to better their material condition.

PREPARATION FOR INDUSTRIAL ARTS.

Two circulars of information were issued by this Office in 1882 in response to this popular feeling and demand. One prepared by Charles G. Leland, esq., of Philadelphia, discussed the subject of industrial art in schools from a practical standpoint. The experience of the author enabled him to speak clearly on the topics presented and to engage the attention of readers to an unusual extent. About 50,000 copies have been distributed to correspondents and applicants and have produced marked results. The circular has been reviewed and warmly commended by educators in foreign countries.[1]

The other circular relating to industrial education was the preliminary report of a commission appointed by Queen Victoria to inquire into the instruction of the industrial classes of certain foreign countries in technical and other branches, and the influence of the instruction on industrial pursuits. The first report of the commission was on manual and technical instruction in France, with a description of the system of elementary instruction in that country. A representative of the commission, Mr. William Mather, visited this country for the purpose of examining our methods of technical instruction and the institutions in which this department of education is prominent. He observed faithfully and obtained much correct and valuable knowledge of our technical and industrial schools for the use of the commission in preparing a final report. His report comes to hand as this is going through the press and it

[1] Karl Werner, government inspector of schools at Salzburg, presented a review of Mr. Leland's circular and an outline of industrial efforts in European schools in the Literarische Beilage der Montags Revue, Vienna, April 23, 1883. He introduces in the beginning of his article the following sentences:

While people were contented at an earlier period with giving in schools only such branches of knowledge as might form the basis of a more extended culture, the requirements of life demanded practical training for the people, and industrial education. The child should, in addition to reading, writing, and arithmetic, also learn those things which exercise a determining influence on life, and knowledge derived from natural science, geography, and history should give the future citizen broader views to qualify him the better to fulfil his mission.

But the teachers did not rest here. It was desired to introduce work itself to the school, and this is what is treated of in a pamphlet by Charles Godfrey Leland, director of an industrial school in Philadelphia, who seems to have practically solved a problem for which Europe is yet hardly prepared.

ably presents the conclusions and facts obtained during his tour of five months. I take from it some opinions and expressions that will be read with great interest:

The preëminence of the Americans in many branches of mechanical industry renders it necessary to give a general view of the character and scope of the education in the public schools as well as to discover what provision has been and is being made for technical and industrial training. The provision made for science teaching in the many universities and colleges not directly technical in their character, in the various States, has also required my attention for the reason that a large proportion of the graduates of these institutions pass at once into the industrial arts after leaving college.

In America, where all institutions are founded by the people for the people, there is not a school or college in which may not be found the sons and daughters of the working classes. Not unfrequently have I found young workingmen spending a year at college in scientific studies, who intend to resume their manual employment after leaving it. * * *

Disappearance of apprenticeship.—The old system of apprenticeship has almost ceased to exist in America. * * * The whole tendency is to engage boys as they do men, only for what they are worth. The evil of this will be severely felt in the future, if not mitigated by great changes in education, for the reason that many boys are obliged to leave school at 14 or 15, and if they are not allowed to enter the skilled trades they will be thrown upon casual employments or unskilled pursuits for temporary gain and a livelihood. Thus a mass of incompetent and unskilled laborers would grow up, incapable of going out West, and would become a drug upon the labor market in the East. It is undoubtedly a shortsighted policy on the part of employers to discourage the employment of boys without aiding those movements which, in the form of industrial schools, would enable a boy to qualify for service at 17 years old at a higher rate of wages than he could probably get at that age but for this training.

* * * * * * *

The existence and character of technical institutions.—There exists in America a certain number of high class institutions for technical and scientific training in mining, and civil and mechanical engineering. I am of opinion that in these branches, judging from my own observation, there is nothing better of the kind, though such institutions are more numerous at present, in Europe. The advantage of the training in the best of them is its *practicalness*. The students feel that careers are open to them if only they have acquired the art of applying their knowledge; hence their ambition is excited and every one of them appears to be working for a definite purpose. * * * The act of Congress in conservating forever a large portion of the territorial wealth of the nation for the purposes of industrial and scientific education is a sagacious scheme of statesmanship. There is provided in every State at least *one* centre from which all the knowledge necessary to instruct the youth of the State in scientific industry may radiate. That many of these colleges have drifted from the original intention of the authors of the act is only a temporary evil. The tide has set in the other direction now, and the marked success of those colleges, such as in New York State, Michigan, Illinois, Missouri, Massachusetts, &c., in the direction of technical instruction, is gradually leading to the conversion of all. * * *

It is probable that within a short time all these institutions will become the great technical schools of the country, while still retaining facilities for general literary education. * * *

To make the best use of a given quantity of material requires a sound knowledge of its properties and of its disposal in the arts and manufactures by scientific methods. In this direction the technical and science schools already instituted have accomplished much in providing foremen and managers, chemists, miners, and intelligent employers in the engineering and manufacturing industries. * * *

Graduates.—Many hundreds of young men have been furnished from these sources for the superintendence of railway works, mining operations, machine shops, and the textile industries, besides chemical works, glass manufactories, building operations, agriculture, &c. I have met in almost all the manufactories I have visited—from mining, iron and steel manufacturing, through all the mechanic arts up to watch making and sewing machine manufacturing—evidences of the influence of the technical schools.

The graduates of the various technical schools are in good repute among the iron-masters, and employment is readily offered to those who have studied chemical and metallurgical science.

Deficiencies in technical education.—It is remarkable that in the great centres of the mining and iron producing districts, where also a large amount of mechanical construction is carried on, as, for instance, in Pittsburgh, Pa., Chicago, Ill., Detroit, Mich., Cleveland, Ohio, and Philadelphia, Pa., so little has been done by the owners of large establishments or by the town or State authorities in the direction of technical schools or evening science schools. These industries represent a large pro-

portion of the working population in those large cities, and yet the owners of works have to rely upon the scientific knowledge obtained through many institutions remote from these districts. * * *

I have not met with any institutions for technical training having any bearing upon the textile industries. The knowledge of chemistry acquired at the various institutions which I have described is of course utilized more or less in dyeing, printing, and bleaching; but there are no schools in which the knowledge of the nature and qualities of fibres and of the various processes in working up the raw material—silk, cotton, or flax—are taught. In all the manufactures into which taste and design enter the Americans have to rely almost entirely upon European aid. * * *

Possible results of industrial training.—If industrial training, however, is adopted throughout the country, the capital and labor of the future will find profitable employment without protection in the vast regions now opened up by the railways in all directions. The true source of wealth, in the resources of nature, may be drawn upon to supply all the comforts and necessaries of life at greatly reduced prices, so that the purchasing power of wages will be increased. When America abandons the shadow for the substance, her national wealth and prosperity must be augmented, while her industries will develop upon the solid and sure foundation of freedom in trade as in political institutions. It is to meet her under such conditions in friendly rivalry and competition that we must prepare ourselves.

A report on industrial education in the United States[1] was called for in December, 1882, by the Senate. Its resolution was as follows:

Resolved, That the Secretary of the Interior is directed to furnish to the Senate the latest and fullest information in the possession of the Bureau of Education in relation to technical or industrial education in the schools and colleges endowed in whole or in part by the Government of the United States, and also in other schools in the country reporting instruction in industry for either men or women.

The resolution was immediately complied with, and a report made of the objects, condition, and work of institutions endowed by the national land grant of 1862, of similar schools not so endowed, and of enterprises for the industrial education of women. Many of the institutions interested had furnished accounts of their condition and work, and in some instances plates for the illustration of their facilities and methods of instruction, so that with the material in the Office it was possible to present a full survey of the field of industrial education. Some advances in this direction have occurred since, and they form the principal part of the subject matter of the subsequent pages.

EDUCATION IN AGRICULTURE.

Agricultural education has made perceptible advance during the time covered by my report. The industrial colleges of the South especially have been improving their courses of study in agriculture. Through the Northern States the number of students taking such courses is still small. Hon. George W. Atherton, A. M., president of the Pennsylvania State College, refers to the reason for this, in his report for 1882 to the board of trustees, as follows:

So far as the almost uniform experience of this country goes, the market demand for highly educated scientific men is not so great in agriculture as in many other employments. I say "market demand," and mean that alone. There is no field of labor in which education and knowledge can be more usefully and productively applied than in agriculture; and if young men starting in life had sufficient capital they would often prefer the life of the farm to any other occupation. But the present state of our industries is such that a young man whose only capital is a good education finds that he can use it with greater certainty of immediate returns in other pursuits rather than in farming.

As a result of the increased interest in scientific agriculture and the disinclination of students to devote themselves to it, the establishment and conduct of experimental stations have been attempted in connection with several institutions. Connecticut, New Jersey, Ohio, and Wisconsin are among the States which have provided for such stations. The one in Connecticut was established in 1877 and has been associated more or less intimately with the Sheffield Scientific School at New Haven. In 1882 the legislature au-

[1] Industrial Education in the United States. A special report prepared by the United States Bureau of Education. Washington, 1883. 319 pp.

thorized the purchase of a lot and the erection of buildings for the station. This was done during the summer, and the work of the station was transferred to the new quarters in September. Its investigations have hitherto been mostly in the field of chemistry. The station at Rutgers College, New Jersey, was established in 1880, and is distributing the results of its investigations and experiments among the farmers of the State. The stations in Ohio and Wisconsin are more recent in their origin. The work of the former is classified under the four heads of grain raising, stock farming and dairy husbandry, fruit and vegetable culture, and forestry. Preparation is made for analyzing fertilizers, examining the quality of seeds, identifying weeds and other plants, investigating the habits of insects, and making other inquiries of a similar nature. The Wisconsin Agricultural Experiment Station proposes to investigate questions of special interest to the farmers of the State in such a manner as to make the results of general value. "Its sole purpose is the discovery of new truths and laws which may be of benefit to agriculture."

The experiments in practical agriculture on the farms of agricultural colleges have been conducted with much profit and are being more frequently undertaken. Those mentioned in my last report as going on at the Houghton farm, Orange County, New York, have been continued, and instruction is being given in connection with them. Mr. Henry E. Alvord, the director, writes the following:

One feature of Houghton farm not shown by our pamphlets is that we keep three or four young men constantly with us as farm pupils, receiving practical instruction, on a scientific basis, to fit them for conducting farms of their own or managing the estates of others. We have had pupils from Massachusetts, Connecticut, New York, Virginia, North Carolina, Wisconsin, England, Island of Jersey, Germany, and Japan.

The courses of study in the State Agricultural and Mechanical College of Alabama have recently been remodelled, in order that they may include more branches immediately connected with the industries of the State. A special professor of agriculture has been added to the faculty and the State agricultural experiment station has been established at the college. The legislature has made appropriations for improving the farm and supplying apparatus and books. A short course in agriculture has been established for young men who cannot afford the time and expense necessary for the completion of the regular course of four years. An agricultural museum contains nearly 700 specimens, illustrating varieties of soils and products, and a museum of mechanic arts has been commenced.

The Missouri Agricultural and Mechanical College is being conducted with renewed vigor by Prof. J. W. Sanborn, B. S., who was recently called from the New Hampshire College of Agriculture and the Mechanic Arts. Professor Sanborn has added to the announcement for the coming year some general remarks of interest. Of the progress of agricultural investigation he gives the following outline:

In 1804 the King of Prussia put Von Thaer in charge of the estate of Mœgelin, of 1,200 acres, where the science and art of agriculture were taught. In 1806 Fellenberg founded a school of agriculture in Switzerland that trained 3,000 students, while France devoted the royal palace at Grignon to agriculture. It was not, however, until the three grand characters, Liebig, Boussingault, and Laws, came almost simultaneously into the field, about 1840, that agricultural investigation took on its present broad proportions. Liebig's masterly genius opened up a wide field for investigation, while the latter two gentlemen had both the genius and the talent for research. The former (Boussingault) has devoted a lifetime to farm research on his estate at Bechelbron, France, while the latter (Laws) has devoted his English estate to the cause of definite agricultural knowledge. Chemists, botanists, field hands, are in his constant employ in a work that began in 1840 and involves an annual outlay of $15,000, and $500,000 are devoted by him to its continuance. In 1852 the first public experiment station was founded at Leipzig, and this work, inaugurated by the Germans, has extended until the world boasts of nearly 150 stations, employing from 2 to 5 scientific men each constantly. To these workers must be added hundreds of investigators connected with agricultural colleges or carrying on private inquiry.

Professor Sanborn speaks of the functions of agricultural colleges as follows:

To familiarize the student with the science of farming is not the only function of an agricultural college. When properly managed, each operation of husbandry is

taught by field work from hot-house propagation through planting, budding, pruning, and the general management of horticultural products. Upon the farm proper, laying out and construction of drains, selection, management, and breeding of animals, grading of wool, rotations, tillage operations, and crop growth are taught by practice, and every attempt made to fix the habit of observation. Regular labor on the farm serves to retain a taste for farming, especially as it is used to illustrate some principle or law involved. The intellect being called in play, farm work is divested of its monotony and robbed of the repressive influence derived from it when viewed as mere physical labor.

The Storrs Agricultural School, at Mansfield, Conn., owes its existence to a gift of a farm of 170 acres, with commodious school and farm buildings, by Mr. Augustus Storrs, and of $6,000 by Mr. Charles Storrs, of which $5,000 were for fitting the institution for work and $1,000 for drainage. These gifts were accepted by the State and an institution was established for the instruction of boys in the State "in such branches of scientific knowledge as shall tend to increase their proficiency in the business of agriculture." The full course of study requires two years of three terms each, the terms being twelve weeks in length. Students receive instruction both in the class room and on the farm. In the class room they study those branches of natural science which have a directly useful bearing on New England farming, such as general and agricultural chemistry, natural philosophy, farm mechanics, surveying, botany, zoölogy, geology, animal physiology, mineralogy, and theoretical agriculture, stock-breeding, and composition. The general principles of these sciences are taken up first, and afterward their special applications to practical agriculture. Elementary English studies, simple carpentry, and agricultural practice are also taught. This last subject includes the improvement of the soil by tillage, drainage, manuring, and irrigation; the culture and handling of the various field, garden, and orchard crops of New England—grass, grain, roots, vegetables, and fruits—from planting to market; the use, care, and repair of farming tools, implements, and machines; the breeding, rearing, training, feeding, and use of live stock; the best methods of dairying; the business and management of the farm in all its details; keeping accounts, inventory, capital, labor, rotation of crops, and systems of farming adapted to various circumstances, and the history of foreign agricultural methods.

The Hampton (Va.) Normal and Agricultural Institute is the leading institution in which the industrial education of the colored race is undertaken. It adopts a course of instruction in mechanics less expensive and more productive than those of most northern and western institutions. It has extensive farms on which produce for the school and for the markets is raised by the help of student labor. During the last year 133 young men were employed in farming. The mechanical department of the institute affords instruction and practice to colored and Indian apprentices in carpentry, wheelwrighting, blacksmithing, tinning, painting and glazing, shoemaking, and harness-making; and to colored students in the operations of a knitting factory, in sawing and wood working in the Huntington Industrial Works, and in printing. The Huntington Industrial Works are employed in manufacturing lumber, mouldings, windows, door frames, and other building material. Two periodicals are issued from the printing office and much miscellaneous work is done. The young women of the institute find employment in sewing, tailoring, and making shirts. The amount earned at Hampton by the students in 1882-'83 was $35,288.93. Student labor is estimated to be 25 per cent. more expensive than common labor; but the value of training the hand, of industrious habits, and self reliance and the effect of labor on character are such as to justify the present system. Yet the mechanical department is considered the most difficult problem of Hampton Institute. The employment and paying of skilled foremen and mechanics, the purchase of material, the prevention of waste in its manufacture by apprentices, and the sale of products require persons of the highest business qualifications. A recent examining committee, consisting of Rev. M. E. Strieby, D. D., and J. M. Ward, of New York, Mr. George A. Walton and Mrs. E. N. L. Walton, of West Newton, Mass., and Henry W. Foote, of Boston, reported that in the very limited time at their disposal enough "was seen to show that manual labor, as

a means of mental and physical training, is an essential. * * The students make long days, but with the varied employments little fatigue is experienced and good health is the rule. Thus, in addition to the knowledge and discipline received in the school proper, every student leaves the institution with the ability to support himself by some useful employment."

PROGRESS OF INSTRUCTION IN PRACTICAL MECHANICS.

A course in shop practice was introduced into the Colorado Agricultural College in 1882. Students give to it two hours a week during the winter terms of their preparatory, freshman, and sophomore years and the same amount of time during the entire senior year. The kinds of work undertaken and the time assigned to each were as follows: Bench work in wood, 12 weeks; machine work in wood, 4 weeks; pattern making and foundry work, 12 weeks; vise work in iron, 10 weeks; iron forging, 14 weeks; steel forging, 4 weeks; and machine work in iron, 20 weeks. The mechanic shop consists of a main building 25 by 56 feet and two stories in height, with a one-story wing 20 by 62 feet for the forge shop and its accessories. The whole is fitted up with an engine, wood and iron working machinery, and the proper tools and benches for work by hand on iron and wood, including wood carving. It is intended that this department of practical mechanics shall give "a systematic and progressive education in the use of tools and materials, combined with as much theoretical knowledge as shall be deemed necessary to properly explain the principles involved."

A report in regard to the better development of the mechanical department of the Illinois Industrial University was made to the trustees in March, 1882, by the regent, Selim H. Peabody, PH. D., who is himself professor of mechanical engineering and physics. It contains a concise statement of the condition of that department and the lines along which its extension seems most desirable. He considers the province of the shop to be, like that of the laboratories, to give instruction, but finds it difficult to arrange the time of shop work so that the students may gain the maximum benefit from it without interfering with other studies and exercises. The class of beginners in the machine shop numbered 17 at the time of the report. The limited supply of tools and the distribution of room necessitated an illogical and inconvenient arrangement of work. The equipment consisted of 6 sets of bench tools in the pattern shops, 8 vises and accessories at the iron-workers' benches, 3 fires and anvils in the blacksmith shop, and 8 machine tools in the machine shop. Dr. Peabody recommended, in addition to these, a supply of elementary tools: 9 sets of carpenters' bench tools, for the pattern shop; 7 vises, with hammers, files, &c., for the machine shop; small lathes for wood turning; and small engine lathes, for the machine shop. The trustees approved of the recommendations and the department of mechanics is much aided by the provision for its wants.

Purdue University, Indiana, has been advancing its department of practical mechanics and perfecting its course in shop work. The important appliances added to the shop in 1880–'81 were 5 sets of carpenters' tools, 4 wood-turning lathes, and a scroll saw; in 1881–'82, 1 small machine lathe, 1 speed lathe, 3 iron-working vises with tools for them, 3 sets of carpenters' tools, and a circular sawing machine; in the summer of 1882, a large machine lathe, a set of standard gauges, and miscellaneous tools. Three classes of students are instructed: regular, agricultural, and special. The agricultural students take an abbreviated course, occupying one hour a day during the middle term of two years. Special students enter the shops with the view of taking some one or more selected branches. A number of young ladies have been among the special students, and "they have done the same work as the young men, and, though progressing much slower, have been nearly as successful." The special work of the department is separated into three distinct divisions: the "supplementary course of instruction," consisting of recitations and lectures; class work in the shops; and work in the shops outside of classes. The supplementary course of instruction occupies an hour daily for three terms and includes the presentation and discussion of working

drawings and a consideration of the uses and operations of tools and machines. All necessary directions are given and explanations made in regard to shop work. The shop exercises require two hours daily throughout the first two years of the college course, and the elementary principles of construction are involved in the operations performed. The students receive compensation for work done outside the regular class hours. The quality of this work has been good, and the remuneration for it has aided in the payment of the expenses necessarily incurred during a college course.

At Cornell University, the Sibley College of Mechanic Arts has received substantial additions to its equipment. A foundery recently provided is being used in training men in the practical duties of the master mechanic and mechanical engineer. A large collection of models to illustrate mechanical construction, prepared under the eye of Professor Reuleaux, director of the Imperial School of Arts and Manufactures at Berlin, enables the professors to illustrate every important form of machine connection and mechanical movement; and many combinations and contrivances which would be only imperfectly understood by the most complete drawings are shown clearly by these models. Specimens of American tools and machinery are being collected with a view to setting before students examples of excellent workmanship. The method of instruction adopted is a combination of the constructive and the Russian systems. The graduates of the college are sending in gratifying reports, and President White, commenting on their success, says: "We shall see more and more of such results; more and more the State and the nation will have cause to thank the benefactor who has provided so liberally for the application of science to the great mechanical industries of our country."

The Agricultural and Mechanical College of Texas is making commendable efforts to improve its department of mechanics, in which one-half of its students are required to be instructed. Six hours of shop practice a week are required, with three hours of mechanical drawing. Students are taught the use and care of tools and the kinds of work for which each is intended. They apply their knowledge in a regular course of exercises and in the construction of articles for practical use and the repair of buildings. The faculty have recommended that $4,500 for buildings and $2,800 for equipment be applied to the mechanical department out of a recent legislative appropriation.

MANUAL TRAINING SCHOOLS.

Manual training schools have been established in connection with the Massachusetts Institute of Technology at Boston and Washington University at St. Louis. The establishment of a school of this kind is being discussed earnestly in Baltimore by members of the city school board and others and is urged by leading daily papers. In Chicago an association has been incorporated for the purpose of providing a manual training school in that city. The object of the school is stated in the articles of incorporation to be—

instruction and practice in the use of tools, with such instruction as may be deemed necessary in mathematics, drawing, and the English branches of a high school course. The tool instruction as at present contemplated shall include carpentery, wood turning, pattern making, iron chipping and filing, forge work, brazing and soldering, the use of machine shop tools, and such other instruction of a similar character as it may be deemed advisable to add to the foregoing from time to time, it being the intention to divide the working hours of the students as nearly as possible equally between manual and mental exercises.

A fund of $100,000 has been secured, a suitable lot of land purchased, an architect engaged to complete plans for buildings, and a director chosen. The board of trustees, with Hon. E. W. Blatchford as its president, is such a body of men as will not allow any failure in the enterprise committed to their care.

The success of the School of Mechanic Arts of the Massachusetts Institute of Technology and of the Manual Training School of Washington University has been marked, and is becoming more evident as operations and results of the schools are

better known. Testimonies to their efficiency and value are given by those who have been in a position to observe their methods and work. Three quotations with regard to the St. Louis Manual Training School are given below, the first from Governor T. T. Crittenden, of Missouri; the second from Prof. C. M. Woodward, director of the school; and the third from Hon. William G. Eliot, D. D., chancellor of Washington University. Governor Crittenden says:

The old system of apprenticeship is about at an end, and it is necessary, if we propose to protect the interests of our industries and consult the welfare of our youth, to devise some means for their proper training. In our ordinary and more advanced schools the only vocations aimed at and in which positive interest is aroused are commerce, buying and selling, banking, reckoning accounts, keeping books, and the so-called "learned professions." The ordinary school boy gets the idea that it requires no education to be a mechanic; hence he aspires to what is called a higher profession, a higher avocation, and foolishly learns, from vicious sources, to despise both craft and craftsman. If this pernicious tendency can be corrected and the dignity of skilled labor and skilled workmen be maintained by the introduction of manual training into grammar schools of high grade, great good will be accomplished. I have no hesitancy in directing attention to this manual school as one of our educational ornaments, worthy of the patronage of our sons and the respect of our citizens.

Professor Woodward says:

The zeal and enthusiasm of the students have been developed to a most gratifying extent, extending into all the departments of work. The variety afforded by the daily program has had the moral and intellectual effect expected, and an unusual degree of sober earnestness has been shown. The wholesome moral effect of a course of training which interests and stimulates the ardor of the student is most marked. Parents observe the beneficial influence of *occupation*. The suggestions of the day fill the mind with healthy thoughts and appetites during the leisure hours. Success in drawing or shop work has often had the effect of arousing the ambition in mathematics and history, and vice versa.

The following is from Chancellor Eliot:

One other feature of our young institution (and thus far, as I believe, peculiar to it as a university) must be dwelt upon with emphasis, though very briefly. It is the manual training school, which now has a hundred student workmen busily engaged in acquiring the elements of a sound mental education at the same time with practical training in the use of tools, to fit them for intelligent application of skilled labor in whatever direction the growing industries of manufactories and workshops may require. Old-time educators doubtless smile at the idea of a university saddling itself with a workshop as altogether beneath its dignity, but we think it high time for the clear recognition of the equal dignity of skilled industries with the so-called professional pursuits. Let education go into the workshops and it will so dignify them. The educated mechanic is the peer of the statesman, and from the union of his head and hand work comes a large part of the civilizing agencies of the nineteenth century.

ELECTRICAL ENGINEERING.

A course in electrical engineering is to be offered by Cornell University at the beginning of the next college year and one was established last year at the Massachusetts Institute of Technology. This movement is in response to "a real demand for men educated to take part in the great interprises called into being by the development and application of electrical energy." The course in the Massachusetts Institute of Technology is an alternative course in physics, differing from the one previously existing chiefly in the continued study of electricity, instead of a pursuit of other branches of physics, and in the introduction, in place of chemical analysis, of a considerable amount of practice in mechanical engineering in the laboratory and the workshops. It is intended to impart a knowledge of the theory of elecricity sufficiently extensive to prepare for ordinary electrical work and advanced study. Instruction will be given in the various methods of electrical testing, and particularly with regard to land and submarine telegraphy, the telephone, electric lighting, the electrical transmission of power, and acoustics as involved in telephony. The study of electricity is being given special and increased attention in several other scientific institutions.

A NEW POLYTECHNIC INSTITUTE.

A technical school of a high order was opened at Terre Haute, Ind., in March. It received its generous endowment from Mr. Chauncey Rose, and was named in his honor the Rose Polytechnic Institute. The steps taken preparatory to opening the institute were stated by the secretary of the board of managers, Samuel S. Early, A. M., and I insert from his paper the paragraphs relating to the proceedings immediately prior to the organization of the school:

Finding themselves, by the receipt of the specific legacy, possessed of funds which yielded an income of about $25,000, the managers felt that the time had come when they might take the necessary measures for opening the institute. Their first important step was the election of Dr. Charles O. Thompson, of Worcester, Mass., to the presidency of the faculty. This occurred on the 20th of February, 1882, and the president of the board, with the secretary and General Charles Croft, visited Worcester for a personal conference with Dr. Thompson. Toward the end of March he accepted the appointment, and immediately began the work of selecting a faculty and preparing a detailed plan for the organization of the school. Professors of chemistry, of elementary and the higher mathematics, and of drawing and the superintendent of the machine shops were chosen and accepted. Those whose services were necessary reported for duty as soon as their prior engagements admitted, and by the end of the summer of 1882 great progress had been made in the work of preparation. It was found that a small class could be provided for by the beginning of March, 1883, and in August of 1882 circulars were published inviting applications for admission.

An opportunity for the purchase of the apparatus and library of the late Dr. John Bacon, of Harvard College, was availed of by the board, and a most admirable collection of instruments and of scientific books was added to the resources of the school. Power, machinery, and tools for the shop were purchased by Mr. Edward S. Cobb, the superintendent, under the sanction of a committee composed of Messrs. Peddle, Nippert, and Cox; cases for the mineralogical specimens were constructed after the plans of Prof. Charles A. Colton, of the department of chemistry, and the elegant collection was mounted, labelled, and stored under his skilled labors. Shelving for the library, designed by Prof. Clarence A. Waldo, the future librarian, was provided, and the early purchases of the board and the Bacon library were catalogued by the secretary and arranged by members of the faculty. Large additions to the library and apparatus were made by President Thompson, who had sailed for Europe, in July of 1882, for study of the methods and progress of technological instruction in the more advanced schools abroad. Tables, easels, models, in brief, all the required appliances for the department of drawing were procured upon the suggestions of Prof. William L. Ames, of that department, and by the time anticipated everything was in readiness for the opening. On the 6th of March candidates for admission were examined, and a class of twenty-five members selected from the most proficient.

The condition of the school is shown by the following clauses from a preliminary announcement by the president, Charles O. Thompson, PH. D.:

In accordance with the directions of the founder, the institute offers a good education based on the mathematics, physical sciences, living languages, and drawing, and familiarity with some form of applied science or of handicraft. The course of study is so planned that every student spends a fixed portion of his time in learning the elements of the business or profession that he designs to pursue after graduating; this part of his work is called practice.

Recitations, lectures, laboratory work, and drawing are of uniform kind and amount for all students; exercises in practice are widely different, depending upon the department selected by the student. The general course of study does not differ essentially from that pursued in other polytechnic schools. The practice is offered in the following departments: Mechanics, civil engineering, chemistry, physics, drawing, and design. The choice of a department is made by each student soon after entering, under the advice of the faculty. A department of mining engineering will be organized as soon as possible, and duly announced.

In the shop is an assemblage of rooms in which iron and wood working tools and machinery, arranged with reference to instruction by means of construction, are provided for the use of the students. The wood-room, boiler and engine rooms, are in order; the iron-room and forge shop will be in order before September 1, 1883, as all the requisite tools are now under contract; so that students in mechanics will enjoy the advantage of practising in a large, well lighted, manufacturing machine shop, which is equipped with the best modern tools and machinery.

INSTITUTIONS NEEDED FOR INDUSTRIAL EDUCATION.

The accomplishment of the industrial education of a nation can only result from a system of instruction begun in the elementary schools and carried up to the most advanced institutions. Prof. Robert H. Thurston, A. M., C. E., of Stevens Institute of Technology, Hoboken, N. J., has prepared an outline of the requirements of such a system, which shows how much remains to be accomplished in this country for technical education. He says:

Such a plan to be satisfactorily complete must comprehend —

(1) A common school system of general education which shall give all young children tuition in the three studies which are the foundation of all education, and which shall be administered under compulsory law, as now generally adopted by the best educated nations and states on both sides the Atlantic.

(2) A system of special adaptation of this primary instruction to the needs of children who are to become skilled artisans or who are to become unskilled laborers in departments which offer opportunities for their advancement when their intelligence and skill prove their fitness for such promotion to the position of skilled artisans. Such a system would lead to the adoption of reading, writing, and spelling books in which the terms peculiar to the trades, the methods of operation, and the technics of the industrial arts should be given prominence, to the exclusion, if necessary, of words, phrases, and reading matter of less essential importance to them.

(3) A system of trade schools, in which general and special instruction should be given to pupils preparing to enter the several leading industries, and in which the principles underlying each industry, as well as the actual and essential manipulations, should be illustrated and taught by practical exercises until the pupil is given a good knowledge of them and more skill in conducting them. This series should include schools of carpentry, stone cutting, blacksmithing, machine work, &c., weaving schools, schools of bleaching and dyeing, schools of agriculture, &c.

(4) At least one polytechnic school in every State in the Union, in which the sciences should be taught and their applications in the arts indicated and illustrated by laboratory work. In this school the aim should be to give a certain number of students a thoroughly scientific education and training, preparing them to make use of all new discoveries and inventions in science and art, and thus to keep themselves in the front rank.

TABLE XI.—SCHOOLS OF THEOLOGY.

The following is a comparative statement of the number of schools of theology (including theological departments) reporting to this Bureau each year from 1873 to 1882, inclusive, with the number of professors and number of students:

	1873.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.
Number of institutions	110	113	123	124	124	125	133	142	144	145
Number of instructors	573	579	615	580	564	577	600	633	624	712
Number of students	3,838	4,356	5,234	4,268	3,965	4,320	4,738	5,242	4,793	4,921

Statistical summary of schools of theology.

Denomination.	Number of schools.	Number of professors.	Number of students.
Roman Catholic	21	119	1,104
Baptist	21	98	839

REVIEW OF PROGRESS IN MEDICAL EDUCATION.

The course and progress of medical education since the date of my last report, like many other objects of human effort, are partly cheering and partly depressing. If, indeed, we look too long at the temporary hindrances in the way of many laudable endeavors we are apt to become discouraged; yet the point that we have reached already is the net result of many past advances and retrogressions, nor is there any worthy end to which we may not hope in time to attain by wisdom, perseverance, and courage. The history of medicine in this country when written will exhibit many illustrations of this truth; one of these, for the comfort of desponding medical educators, is here mentioned. In our day, when medical men endeavor so scrupulously to conform to the requirements of medical associations and to the dicta of professional "codes of ethics," the condition of affairs sixty-five years ago, as described by the venerable Dr. J. L. Atlee in a recent address, seems barbarous:

In my day, previous to the establishment of medical societies throughout the country and the organization of the American Medical Association and the general adoption of the code of ethics, I saw many disastrous effects from the want of brotherly consideration and kindness. The medical men of that day were often in difficulties; patients would be taken from one physician to another without ceremony; and so great was the jealousy existing between [physicians] that for more than twenty years after my graduation it was impossible to form a medical society in my native city and county [Philadelphia], because there were so many aspirants for the honors. Here let me speak of some of the difficulties I had to encounter in my early professional life. Instead of being taken in hand by the older physicians, every obstacle was thrown in my path: consultations were refused and the treatment of my patients unfavorably criticised. By the establishment of medical societies and the adoption of the code of ethics a wonderful change has been effected.[1]

The future of medical education will show an improvement as great as the past has shown in medical ethics and demeanor. The necessity and the advisability of educational reforms must be argued patiently and their personal advantage manifested without possibility of error; the more widely these efforts are made the more surely and speedily the incredulous and the indifferent will be convinced. Reform in med-

[1] The Medical Gazette, New York, June 5, 1883.

ical education can be attained only by compliance with the laws of human nature; in this as in every other subject of public interest the minority before prevailing must become the majority.

When analyzed from the standing point of historical development, all the current questions relating to medical education may be grouped under four general heads: (1) those relating to qualifications for the study of medicine; (2) those respecting the quantity and method of medical instruction; (3) those respecting the licensing of practitioners; and (4) those respecting the number, government, and support of medical schools.

CONDITION IN COLONIAL TIMES.

During the colonial period of our history medical education received only the scant attention that might be expected from a people of vigorous physique, occupied in clearing and settling an enormous territory and free from most of the diseases that afflict humanity of lower vitality and under less favorable conditions. The thinly settled coast between the Kennebec and the Savannah Rivers contained, in 1776, about 3,000,000 inhabitants, for whose medical service there were about 3,000 practitioners. Perhaps 500 of these were in possession of a medical or surgical degree. There were exactly 51 graduates from the two medical schools then existing in the country; the others were graduates or licentiates of Edinburgh, Aberdeen, London, Leyden, Paris, or Padua. Persons desiring before 1765 to study medicine were forced, in most cases, to content themselves with the instruction of a "preceptor;" few were able to incur the expense of a long absence in Europe. It is obvious that the standard of medical education as it is understood now was not high; yet the absence of medical schools, societies, dissections, and text books was replaced by an abundance of practical instruction: indentures usually ran for five or six years; students prepared the forms of medicine now common in apothecaries' shops and compounded their preceptors' prescriptions; they were obliged to bleed, cup, pull teeth, dress wounds, spread poultices, gather herbs, and perform a great part of the work now divided between the physician, the druggist, and the nurse; they visited invalids in company with their preceptors and often treated cases under their supervision. Yet more than this, they were often obliged to become fluent Latinists, because text books, lectures, and students' notes were chiefly in that language as late as 1750; thus it happened that young men often studied the classics at the same time that they studied medicine, or were pretty thoroughly trained to read and speak Latin before they began their professional studies. The early colonial physician often combined other functions with those of healing: sometimes he was a minister of the gospel, sometimes a farmer, a shopkeeper, or a mechanic; indeed, he may have combined all these duties. While the progress of events has endowed the American rural and village practitioners with somewhat better chances for medical training, it is still true that many of them are farmers or druggists. The less wealthy, less populous, and less educated parts of the nation still abound in medical men who have never entered the doors of a medical school or at the most have contented themselves with one course of lectures.

The early conditions of American life also fostered two other habits in the public mind, which have resulted in serious evils: private persons recommend favorite remedies or nostrums to their friends and "patent medicines" are bought and swallowed in reckless profusion. The mortality resulting from the first mentioned habit probably does not exceed some hundreds annually, but the fatal results of the other propensity number thousands every year. When the number of professed and responsible medical practitioners was small and their general qualifications were low, such practices were excusable and in many cases unavoidable, but at the present time this guerrilla mode of fighting disease with weapons of unknown range and missiles of secret composition should be discouraged by enlightened public sentiment.

ESTABLISHMENT AND GROWTH OF MEDICAL SCHOOLS.

The lack of proper facilities for medical education in early times at last encouraged the establishment of medical schools in the colonies: one was opened in Philadelphia

in 1765, now called the medical department of the University of Pennsylvania; another, in connection with King's (now Columbia) College in New York, in 1768. The revolutionary war suspended both these enterprises. There were four other schools begun before 1800. Of the six, only the University of Pennsylvania and the medical schools connected with Harvard (1782) and Dartmouth (1796) Colleges now exist. The establishment of schools has kept pace with the increase of population and the extension of the settled area of the Union; indeed, the increase of medical schools and medical men has been double that of the actual necessity. This is a great evil, but its causes run far back in our social development.

Our earliest schools tried to preserve a distinction between the bachelor and the doctor of medicine; circumstances induced them to abandon the effort, but the lowering of purpose was significant of the social confusion and lowered moral tone that followed the revolutionary war. The newer colleges followed the older in failing to require any educational qualifications in their matriculates, and all followed Dr. Cullen, of Edinburgh, in his innovation of lecturing in English instead of Latin. Neither social nor political ideas had so far advanced that either women or colored men sought to become physicians. Thus any white man who could pay the fees might attend medical colleges and, if he passed a rather easy examination, become a doctor of medicine. Yet the graduates were, as a rule, the best of the medical profession, the most enlightened, the most far-seeing, and a small proportion of them were graduates of literary institutions, so that the upper grades of the profession still had a tincture of letters. But the bulk of the profession at the beginning of this century and for many years afterwards did not possess any medical degrees.

The natural consequences of this irrational freedom after a time came to pass. Men of lively fancy, untrained reason, and natural boldness revolted against the frequent ignorance and numerous errors of physicians and became followers and advocates of special medical doctrines rather than students and practitioners of the medical art as a whole; thence arose the once widely known "botanic" school of practice, which has succeeded in impressing some of its ideas on the class of physicians who call themselves "eclectic;" from the same cause the novel doctrines of Hahnemann received their earliest converts in this country; and the vagaries of hydropathy, physiopathy, vitopathy, electropathy, and other "medical heresies" in later days derive much of their support from the same cause. Simultaneously with the early rebellions against the pretensions of the regular medical profession "the New York Reformed" Medical College was opened in 1826, "the Worthington Medical College" (1832), and "the Physio-Medical College" (1836) in Ohio, and other schools at Petersburg, Va., Macon, Ga., and other places.[1] Of course this revolt was seized by designing men as a good opportunity for the furtherance of their own purposes, and "diploma selling" in America began as early as 1833 under the auspices of a "Christian College," which was contained in the house and bounded by the person of a man named Bennett, who lived in New Albany, Ind., but sold his wares as far east as New York City.[2]

After a while some women wished to study medicine. The idea was intensely unpleasant to the profession, composed as it was entirely of men. If entrance to the medical schools had depended on some adequate previous training in letters the female aspirants for medical training might have been turned aside to make a preliminary attack on the schools and colleges of classical and literary character; but since sex had been the only qualification for admission conservators of the old order of things were put to great labor and plunged into vexatious and fruitless disquisitions about the natural unfitness of women for the healing art. This position, being false in fact and untenable in argument, failed, and the Woman's Medical College of Pennsylvania was opened at Philadelphia in 1850; a homœopathic school for women was also begun at Boston in 1848.

[1] See Transactions of the National Eclectic Medical Association, vol. V, pp. 44, 45.

[2] Minutes of New York County Medical Society, 1833.

Again, some colored people wished to study medicine, and colleges for their instruction in this subject began shortly after the late war. Even the dextrous John Buchanan, of diploma-selling fame, was attracted by the eagerness of some to practise medicine, and kindly organized his "Philadelphia University of Medicine and Surgery," wherein colored medical men were manufactured with great speed and in considerable numbers. Schools of a more reputable character and with intellectual and scholastic requirements quite up to the average of American medical schools have also been organized for them in Washington, D. C., Lincoln, Pa., and other places.

The old qualification for becoming a physician having been thus gradually rendered inoperative, the history of medical education for the last fifteen years shows a very rapid increase in the number of medical schools and students, so that the Union has now more physicians in proportion to its population than any other part of the globe. So great, indeed, has the number of physicians become and so alarming is the annual increase that a very intelligent medical journal of recent date remarks as follows:

The recurring commencements of medical schools have added their annual quota to the great army of medical men. Though a time worn and hackneyed topic, the Gazette cannot refrain from a repetition of some well known facts that these many graduates may have heard before, but which are perennially true and fresh, and will therefore bear repetition.

These hundreds of medical men are coming into a profession which is greatly overcrowded. What knowledge or what talents have they which will fit them for the struggle before them? for to the majority of them it must be a struggle and to many necessarily an unsuccessful one. They will have to contend with those who have been specially favored by education, or ability, or opportunity, as well as with those whose only claim for the patronage of their fellows is unlimited self assurance. They must practice among people who are becoming more and more intelligent as regards medical knowledge, and must contend against widespread skepticism as to the value of medicine and the necessity for their existence as physicians. What are the qualities, what the accomplishments, which will enable them to rise superior to the flotsam and jetsam of scoffing criticism and to establish their right to be the advisers of their fellows on such supremely important questions as the physician is called upon to solve?[1]

INADEQUATE REQUIREMENTS FOR PRACTISING MEDICINE, PAST AND PRESENT.

In plain English, the time has now come (the profession being so crowded and the increase of candidates for employment being so much greater in proportion than the increase of population) when the medical student pays to the medical college money for which he receives no calculable equivalent; he asks for bread and receives a stone. The really capable graduate is jostled, crowded, shouted down, and trampled upon by a horde of unwieldy behemoths, who not only intercept most of the work that he only is able to do satisfactorily, but who supplement their scant incomes by arts and devices that his nature and training forbid him to join in. Having overcrowded all other departments of medical employment, many of these physicians by the grace of a diploma have lately taken up the work of opening and conducting medical colleges, much to the wrath and confusion of the older schools who would dearly like to retain their monopoly of oversupplying the market with medical "spring chickens." The position assumed by these older schools is exquisitely illogical: they do not like to establish effectual entrance examinations (which might force some candidates to defer the study of anatomy and chemistry until they had mastered the simpler mysteries of reading and writing) because they do not want "to limit the number of doctors by artificial regulations." This phrase, quoted from a recent address by a widely known and much respected medical teacher and author, teaches us that "artificial regulations" mean all rules or usages that may or can hinder any young white man from paying money twice over for the privilege of hearing the same course of lectures during two courses of instruction. The "regulations" that forbid the faculty from receiving the money of a white *woman* or that of a *black* man, we learn by inference, are not "artificial."

[1] The Medical Gazette, New York, May 19, 1883.

This same medical professor and author says that "the law of supply and demand will properly control the professional expansion." Assuming that this is true, let the same rule be applied to the schools that supply the human integers of "the professional expansion:" the establishments that do not try "to limit the number of doctors" by long, complicated, and difficult courses of study obviously should become the most frequented and best attended, because the law of prompt and cheap supply is as much an axiom as the one quoted by the learned professor and author. When, however, "the law of supply and demand" is thus supplied, the professor expresses his disapproval of the result in the following words:

Many of the new colleges which have sprung up so abundantly over the country have really no right to exist. They are unprovided with the materials for teaching, and the fees are insufficient to procure them; they have no hospitals or dispensaries to which they can resort for clinical instruction; the faculties are without reputation or experience; the building in which the college has its habitat is some temporary structure little suited to the purpose. The lectures are mere recitals of text books, which the student could better read for himself. * * *

These medical schools get into such desperate pecuniary straits that they must employ every possible expedient to obtain students. One hears of personal solicitations, of promises, of sending out drummers to intercept students on the trains and at hotels, of practices in short which seem to touch at the lowest point of degradation. The "advantages" of these institutions, besides their proximity to the homes of students, are the low fees, or no fees at all, how highsoever the nominal price, and the certainty that a diploma may be obtained on a minimum of attendance on lectures. Such institutions are, indeed, little more than "diploma mills." These medical shops hurt our position before the public immensely. They unite with the reputable medical schools to form a national association of medical colleges. After a time they put on a severely virtuous air and are disposed to snub newer colleges organizing in their vicinity, stigmatizing them as unnecessary, crude, and inferior. Having thus acquired a quasi-position and assuming a tone of lofty pretension, they carry on a traffic in medical diplomas the profits of which enable them to maintain a baleful existence. The most beneficent reform which can now be undertaken is to close the doors of these institutions engaged in flooding the country with unqualified doctors.[1]

Denunciations like the foregoing are of little value, for they accomplish nothing; when analyzed dispassionately they are reduced to complaints that newer competitors are underselling "the old and well known stands." Of course the customers at the cheaper shops will get an article of inferior quality; that also is a "law" of trade. Even if the respected professor could have his wish and he could "close the doors of these institutions engaged in flooding the country with unqualified doctors," the evil, so injurious to the profession at large and to the guild of higher-priced medical colleges in particular, would not be corrected. If the cheaper schools are closed their clients "will enter some diploma shop and secure such training as its meagre resources afford," together with the coveted diploma. In this direction there is no hope of relief. Gazing on the prospect before him, the professor can well adopt Satan's melancholy words:

> In the lowest deep, a lower deep,
> Still threatening to devour me, opens wide.

Some medical schools and many medical educators have chosen a much better expedient: they have adopted a preliminary examination to test the would-be medical student's general intelligence and knowledge. I am sorry to say that in several cases this preliminary test is a "humbug," but in most of the colleges that have adopted the expedient it has been applied in good faith. Into these schools a person styling himself in writing "a Nachural Practishuner"[2] can no longer enter for the purpose of being crammed with medical lore. There is little doubt that, either by general consent or the passing of State laws, it will not be many years before an entrance examination will be required of all persons desiring a medical training.

Another antiquated and obsolescent practice in American medical education is also doomed to an early death; I mean the practice of requiring less than the usual exer-

[1] See the Maryland Medical Journal, vol. VIII, pp. 505–512.

[2] See the Boston Advertiser of July 1, 1882.

tion in order to obtain a diploma from the man who, without previous lecture courses, has dared to trifle with the lives and health of his fellow creatures during some "years of reputable practice," so called. Formerly it was quite common to offer a man of this kind a degree at the end of *one* course of lectures, while young men whose records and consciences were entirely clear of professional manslaughter were obliged to pay for *two* courses, exactly like each other in subject, length, and cost.

This practice of selling the same article twice is also falling into deserved disrepute, although still followed and defended by many flourishing medical schools and "demanded" by the large body of young men who always want to become physicians in the easiest way that is considered respectable. These clients crowd the amphitheatres of the schools alluded to, well knowing that, if public sentiment were once thoroughly informed as to their unwritten bargain with the schools they attend, such haste and imperfect preparation for their solemn responsibilities would not long be tolerated in a civilized community. Does this language seem harsh and ill-natured? Let me relieve its effect by quoting the following wise and witty remarks of Surgeon John S. Billings, U. S. A., at a recent medical college commencement:

Being unable, as I have just explained, to remember what was said to *me* by way of valedictory and never having been present at a similar ceremony from that day to this, I thought it would be prudent to consult the literature of the subject and find out what is usually said upon such occasions. For this purpose I have examined about a hundred valedictory addresses, and have obtained from them a vast amount of instruction and some little amusement. From them I gather that this is an epoch in your lives, that you are entering a remarkable age of the world's history (it is customary here to allude to steam and electricity), that you live in the most wonderful country under the sun, and that the eyes of the world are upon you. All are agreed upon these points, and also as to the importance and dignity of the science and art of medicine and the necessity of continued study on your part to keep pace with its advances. But the addresses are not equally harmonious on all points. Some of them assert that the condition of medical education in this country is not altogether satisfactory; that there are some medical colleges (not, of course, the college of the graduates, but some other medical college) which might be spared; that there are too many doctors now and more coming, and that some of these not only have not as clear ideas about the precession of the equinoxes or the authorship of the book of Job as a member of one of the learned professions should have, but that there are even graduates in medicine (of other schools of course) to whom the addition of vulgar fractions is a stumbling block and correct spelling a vexation of spirit. On the other hand, I find some who assert, first, that the above statements are unfounded; second, that it is not necessary to know how to spell correctly in order to cure the chills or set a broken leg; and, third, that the demand for higher medical education is essentially a pernicious, aristocratic movement, calculated to oppress the poor and prevent them from obtaining the sheepskins so desirable to cover their nakedness. As, however, I am sure that all of you are just now strongly in favor of higher medical education (without regard to what you may have thought about it a few weeks ago, or what you may think about it a few years hence, when you get a little steam hatching machine of your own), I feel that I shall most contribute to the harmony which this occasion demands by—entirely agreeing with you.[1]

NEED OF IMPROVED STANDARD IN MEDICAL INSTRUCTION.

The more thoughtful and less self seeking members of the medical profession unite with Dr. Billings in his desire for a higher and better medical training than has hitherto been common in America. The venerable American Medical Association has, almost since its foundation, tried to produce a better condition of sentiment on this subject in the profession, and learned committees of its members have reported at different times important recommendations. My first annual report, fourteen years ago, contained an article on medical education as it was and as its writer[2] thought it should be. Some of the recommendations in that paper have been almost literally carried out by the recent reforms instituted; others, which I believe to be as useful and indispensable to both public and professional wellbeing, are not accomplished yet, but soon may be. The special form that reformed medical education should assume was

[1] The Medical News, March 18, 1882.

[2] Charles Warren, M. D., of this Office.

pointed out in that article and it was recommended that the lecture courses be *graded* and extended through *three* years, preceded by an entrance examination and terminated by an examination conducted under the auspices of the State. When that article was published only two medical colleges in the country provided a graded course of lectures occupying three winter sessions, the Chicago Medical College and the Woman's Medical College of the New York Infirmary. Now, although the Chicago school has not yet made such a course compulsory, many others have done so under the leadership of the medical departments of Harvard University and the University of Pennsylvania.

Harvard for 1871–'72 announced an extended and graded course of instruction. The University of Pennsylvania, laboring beside a formidable and vigorous rival school, was obliged to proceed more slowly: a university hospital was opened in 1874; three professors of the medical faculty and three lecturers appointed by that faculty, together with five professors appointed by the trustees, became the teaching staff of the hospital. April 4, 1876, four of the hospital teaching corps became permanent members of the medical faculty in the university. In 1877–'78 a compulsory graded course of instruction comprised three lecture courses, each five months long. Early in 1878 a generous woman endowed the university chair of surgery with a gift of $50,000, and a like endowment of the other chairs in the medical faculty is progressing, so that in time the pay of the faculty will not depend on the size of the attending class or the number graduated. The entrance examination, still of a rudimentary character, was instituted in 1881. The lecture term was lengthened from five to six months in 1882, and a further prolonging to seven months is announced for the session of 1883–'84. Moreover a fourth year of more advanced study, recommended and advised, but not as yet required, has been arranged to begin at the same time. The graded scheme has thus been tried for six annual sessions, at which the attendance of students has varied from 378 to 363, with an average of 367.5 per session. The graduates from 1878 to 1883, six years, have been 670, an average of 111.66 annually. For the six years before the adoption of the graded course the annual attendance was 388.33 and the average number of graduates was 108.33. Thus, while the university has substantially preserved its attendance, the quality, character, and attainments of the students have improved immensely. The longer time, more thorough teaching, harder work, and greater expense have attracted a better class of men while frightening the superficial, the lazy, the badly prepared, and the "crammers." The advance in general intelligence and education is very manifest and the proportion of students possessing literary and scientific diplomas has doubled in six years.

Harvard, as I have said, adopted an excellent scheme of three lecture courses properly graded in 1871, and candidates for degrees were required to spend at least the last entire year under its instruction, besides passing the oral and written examinations in the studies of the two previous years. Of late, like the University of Pennsylvania, a graded course of four years has been provided and is strongly recommended by the faculty, though it is not yet obligatory. Men graduating in three years at Harvard receive the degree of M. D.; those who study the fourth year and pass the examination with credit receive the degree cum laude and, on proper application to the university authorities, may also receive the degree of M. A. I have not space here even to mention the numerous other schools of medicine that have obligatory or alternate graded courses of instruction.

The greatest security for the permanence of this improvement would be the endowment of the medical chairs with sums sufficiently large to afford, by investment, a decent income to the incumbents. I would not recommend paying an absolutely fixed sum per annum to university professors of any faculty, but would compensate them by a fixed minimum salary (which would prevent the professors' minds from being harassed and weakened by financial worry) and an additional amount, depending on the number of students who should study in that faculty. The very great

importance of endowing the medical chairs is well set forth by Dr. Oliver Wendell Holmes in the following remarks:

Medical science is only a special province of biology, the science which deals with the laws of life. It borrows much from the other divisions of this great realm of knowledge. It levies contributions from other realms, from physics, from chemistry; it accepts a useful hint from whatever source it may come. A medical school has to teach much that is incidental to medical practice, but only in this way can it send forth fully equipped practitioners. It begins with chemistry, anatomy, physiology, and thus prepares its students for study at the bedside and in the operating room. All this takes time and the coöperation of different experts, each of whom should be a master in his special department. There is a general tendency in this country to hurry through a student's medical education. Young men are impatient to be at work, and they will flock to a school which will give them a degree after a short period of study and a slight examination which they are almost certain they can pass successfully. In this way great multitudes of practitioners are sent forth not thoroughly fitted for their work, and the community has to suffer the consequences. * * *

A school which depends for its existence on the number of its students cannot be expected to commit suicide in order to satisfy an ideal demand for perfection. Any institution which is essentially dependent on the number of paying students it can draw must be tempted to sacrifice its higher aims to popularity. No high standard can be reached under such circumstances, and the only way to insure the independent action of a school which aims at teaching the whole country by example is to endow its professorships so that the very best and highest grade of instruction, and not that which is popular because it is easy and superficial, may always be given from its chairs, whether the classes be large or small. A small number of thoroughly accomplished medical graduates, their knowledge based on sound scientific acquirements and made practical by assiduous clinical observation and teaching, will be worth more to the country than twice or thrice the number of half taught, hastily taught practitioners. A series of such classes will, in the course of a single generation, elevate the whole professional standard, as they go forth, year after year, missionaries in the cause of health, soldiers, and, if need be, martyrs, in the unending battle with disease and its cause.[1]

I am obliged, for want of space, to pass without comment the interesting question whether a course of three years is long enough for the education of general practitioners. At present I am inclined to believe that it is, but that the fourth year should be kept up for the benefit of those students who desire to pursue some particular department further than usual and for those practitioners who find the general training already received by them insufficient for their entire qualification. In this connection it is pertinent to add that abroad the requirements for practising medicine are much higher even than those here advocated.

MEDICAL LICENSES AND THE CONTROL OF MEDICAL SCHOOLS.

Having reviewed some topics connected with the preliminary qualifications of persons desiring to study medicine and with the amount and method of the medical instruction demanded by the nature and conditions of our present life, I pass now to the consideration of the best way to license persons desiring to practise medicine. The old and common way of allowing any one who chose to announce himself as a physician or surgeon is fast passing away. The later habit of being satisfied if the candidate for public favor could show his "diploma" has been fatally injured by the labors of John Buchanan and other proprietors of medical "steam hatching machines." The device of throwing the responsibility of licensing upon voluntary associations of physicians called "medical societies" has succeeded only on the condition that homœopathists, hydropathists, eclectics, &c., are not numerous or noisy enough to make an effective resistance. The State of Illinois seems to have solved the problem of protecting the public without assailing the right of personal medical judgment by the establishment of its State board of health. This board contains representatives of at least three systems of medical doctrine and practice and two lay members; its method of procedure has been to ascertain not what system or doctrine a candidate believes or wishes to practise, but whether he has studied the human body in health and disease and has investigated the action and results of

[1] The Boston Medical and Surgical Journal, January 19, 1882.

medical interference with sufficient thoroughness to enable him to act understandingly when he uses a scalpel or administers a remedy. Under such a rule, it is obvious that men of inferior attainments will be forced to prosecute their studies till they have acquired a sufficient amount of knowledge to satisfy the requirements of the board, that medical colleges in the State and in surrounding Commonwealths will be stimulated to increased exertions in order to prepare their students for the ordeal, and that quacks, pretenders, and rascals will be gradually forced out of the State. Such have been the results; and if the board had done nothing else for public health in Illinois it would deserve the gratitude and hearty support of every good citizen; its severer labors about questions of public hygiene, prevention of epidemics, and similar subjects are additional reasons for public gratitude, but cannot here be discussed.[1]

Passing now to the questions respecting the regulation and control of medical colleges, I would remark that the experience of the last decade is enough to warn any sensible man of the dangers attending entire absence of public control over the conduct of these corporations. We have seen unscrupulous and infamous men unhappily in control of the charters of American medical schools, advertising and selling their wares in three continents, disgracing the profession of medicine, and soiling the reputation of the country which sheltered them. We have seen even the officers of justice conniving with these scoundrels to shield them from punishment for some of their guilty deeds. We have seen tardy justice at last overwhelm the most conspicuous of these offenders, the charters of his schools impeached and repealed, himself, a pretended suicide, fleeing from justice to a neighboring country and even then and there finding dupes stupid enough or rascals vain enough to buy his worthless wares. We have seen him captured and inadequately punished for his long career of knavery by a short imprisonment. We have seen the short pause of bewilderment and dismay that overtook the diploma selling industry at this blow succeeded by renewed activity in another State, the laws of which permitted them to hope that medical colleges might be chartered in sufficient numbers to supply the diploma market. We have seen the new crop of medical mushrooms sprouting up in the State of Massachusetts, while the law seems inadequate to deal with the offenders. The correction for this condition of affairs is quite evident, but it will be difficult to attain it at once.

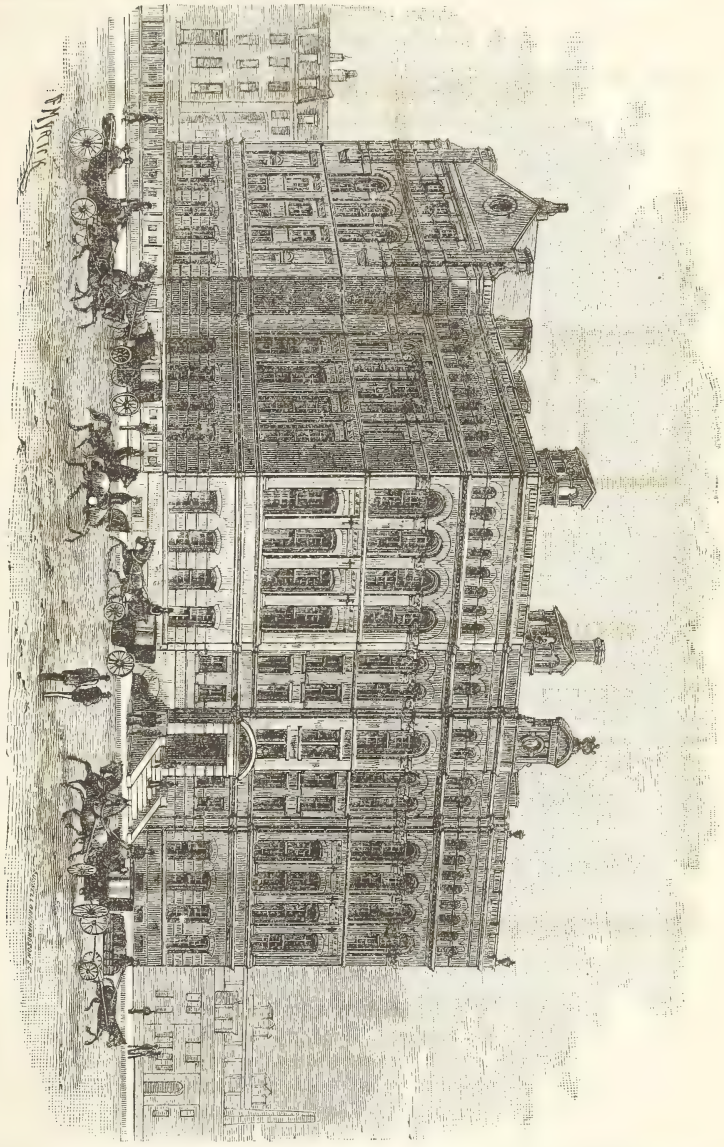
Every State and Territory, and Congress for the District of Columbia, should pass a law ordering every school teaching medicine or surgery in any fashion whatever to furnish unquestionable bonds or other like security for the speedy acquirement of a fund amounting to not less than $300,000; the laws should direct that this sum, as fast as any part of it is collected, shall be invested in United States bonds or productive real estate or interest bearing loans on real estate security; the laws should also prescribe that the corporations so endowed shall distribute the income derived from such investment equitably between at least ten professors; that these professors shall teach, didactically or clinically, at least one hundred hours apiece in each calendar year, the instruction by each professor to be progressive in subject and character; that no students shall be admitted to these courses of medical instruction before passing a satisfactory examination in the elements of language, mathematics, physics, and biology; that no candidates shall be finally examined for degrees by a State board till they have studied three years, during each of which they must have studied at least one-third of the course of instruction provided by the ten professors and the thousand hours of teaching above mentioned, and, in addition, performed such an amount of dissecting, laboratory work, and hospital attendance as the faculty shall deem necessary; two or more schools desiring to unite their forces under the provisions of the acts should be allowed to do so, retaining one of the charters and names already in existence if they choose, but surrendering the others; and all charters not thus fortified and regulated within two years after the passage of the acts should be declared null and void.

[1] The name of Dr. John H. Rauch, its wise, courageous, and efficient secretary, deserves special mention whenever the labors of the board in any direction are described.

Under a law like this, any ten gentlemen who possessed a sufficient quantity of the public confidence could begin a new medical school whenever and wherever it was thought best, the public would be protected from charlatans, and medical students would have some assurance that the money and time they spent would be of some value to them afterwards. The plan is perfectly practicable; and it is absurd to say that it is unjust to vested interests, &c. The higher courts of New York found, a few years ago, that admission to the bar in that State had become so easy and that the number of young men desiring to become lawyers was so much in excess of the legal business and legitimate increase of the legal profession that they must take measures to restrict the supply; and they did this by a prearranged order that only graduates of specified law schools should after a certain date be eligible for examination. The other law schools in the State promptly closed their doors, and the profession cheerfully upheld the courts in this wise but certainly unusual exercise of their authority in this matter. Medical men, unlike lawyers, are not, ipso facto, officers of a department of the State government; but they are, or should be, equally guarded by the State governments from the competition of incompetent men and from the injurious effects of overproduction by the medical schools.

MEDICAL SCHOOLS FOR THE COLORED RACE.

I trust that the foregoing observations will not lead any reader to believe that I am opposed to a wide diffusion of medical knowledge or to the imposition of any but educational restrictions on the production and licensing of medical men or women, white or black. On the contrary, I welcome every honest attempt to supply a thorough and systematic training to every person properly prepared to receive it and properly endowed to use it for the public good. Therefore I am glad to mention that the Shaw University, in North Carolina, felt justified in opening the Leonard Medical School for Colored Students in November, 1881, and that the State legislature has given the school an excellent site, whereon private gifts have enabled the university to erect both a dormitory and a building for teaching purposes. The school has adopted a graded scheme of instruction extending through four years and comprehending four lecture courses of five months each.

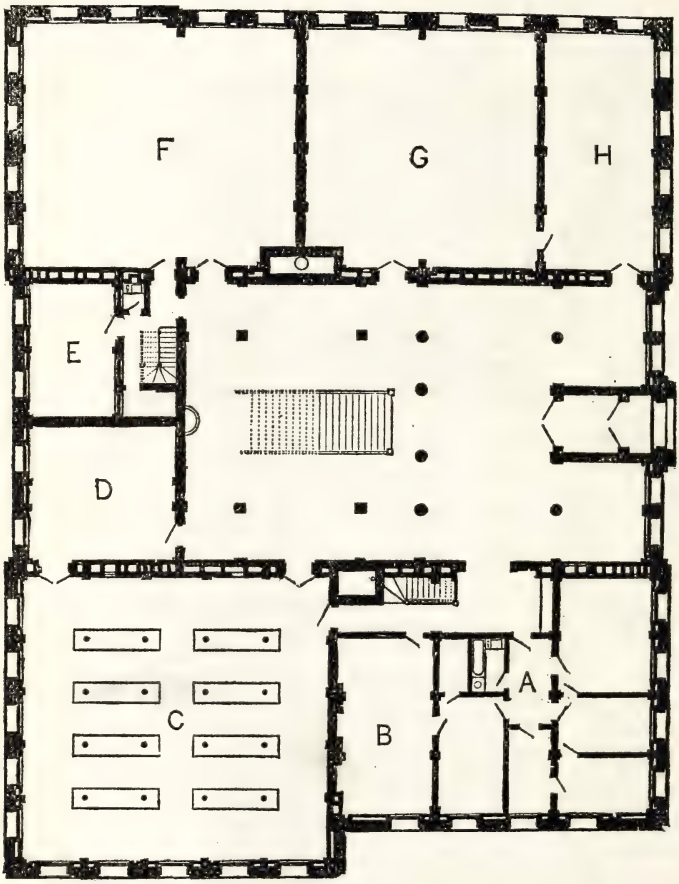


Howard University Medical School, in this city, continues to give instruction, without regard to race or sex, to such persons of good moral character as choose to matriculate.

The seventh annual commencement of the Meharry Medical College was held in the chapel of the Tennessee Central College on the evening of February 22, 1883. Addresses were delivered on "The circulatory system," by F. R. Robey; on "Variola," by C. K. Wright; and on "The duties of the physician," by Prof. E. L. Gregory.

Dr. Hubbard, dean of the faculty, presented the class to President Braden, who delivered diplomas to the following graduates: Lee Roy Fearn, Huntsville, Ala.; Zebulon Wallace McMorris, Newburg, S. C.; Isaiah Eugene Mullon, A. B., New Orleans, La.; Franklin Reese Robey, Mobile, Ala.; Cea Kenchen Wright, Atlanta, Ga.

Near the close of the war many of the colored people crowded into Nashville. Their friends helped them in their poverty, feeding the hungry and clothing the naked. Schools were also opened for their instruction in the churches and other buildings hastily prepared for this purpose. In one of these church schools originated the Central Tennessee College. The primary instruction given at first was confined to the primer and spelling book. This was all that was needed. The school grew in numbers. Other buildings were secured. A charter was obtained in 1866 with the present name, and in 1867 the Freedmen's Aid Society took the school under its fostering care, and has supported it till the present. As the pupils advanced in their studies and were expected to prepare to teach, the normal department was organized, because it became a necessity; then followed for similar reasons the theological, preparatory, and collegiate courses of study. All did not feel that their life work was



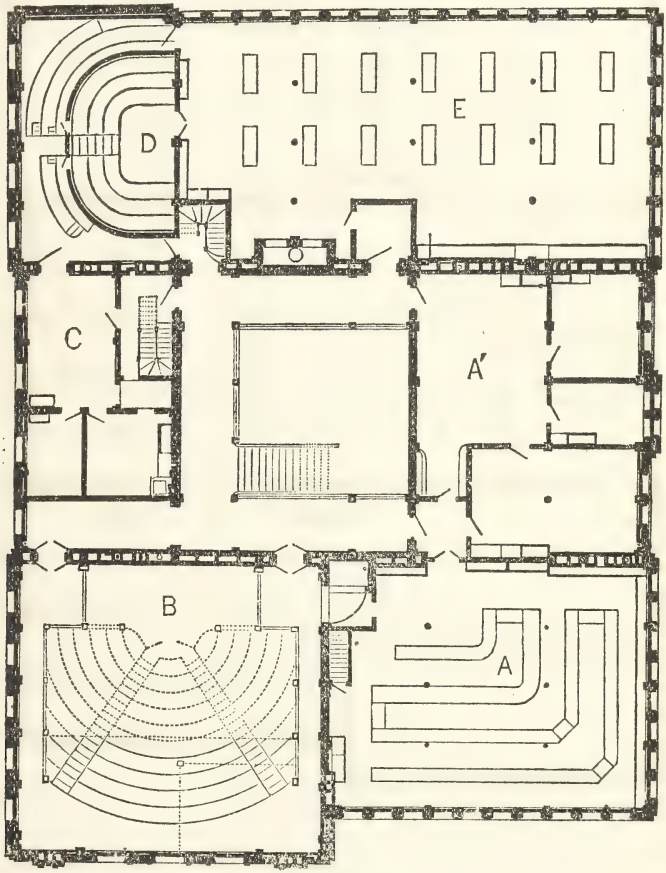
to be either teaching or preaching and some began to inquire whether it was not possible for them to have a medical training. As the difficulty of securing proper medical attention for the colored was very great and the mortality among them alarming, the necessity for educated physicians became apparent. In 1875, about ten years after the opening of the primary school, the medical department was or-

New building of the Medical School of Harvard University.

ganized, and in 1879, through the munificence of Rev. Samuel Meharry and his brothers, Rev. A. Meharry, D. D., and Hugh Meharry, esq., the beautiful and commodious four-story brick building now occupied by the Meharry Medical Department was erected. This school has conferred the degree of M. D. on 23 young men. Nearly all of them are engaged in the successful practice of their profession

They have been kindly received by the white physicians, whose uniform testimony is that these colored physicians, sent out by this school, give evidence of very thorough and intelligent preparation for their work, the practice of medicine. This is the only thoroughly organized medical school in the Mississippi Valley south of the Ohio River where colored persons can pursue this study; and, when it is remembered that in this same territory there are over four millions of colored people, there is great reason that this school should be rendered most efficient by liberal endowment and thorough equipment for its important work.

First floor.



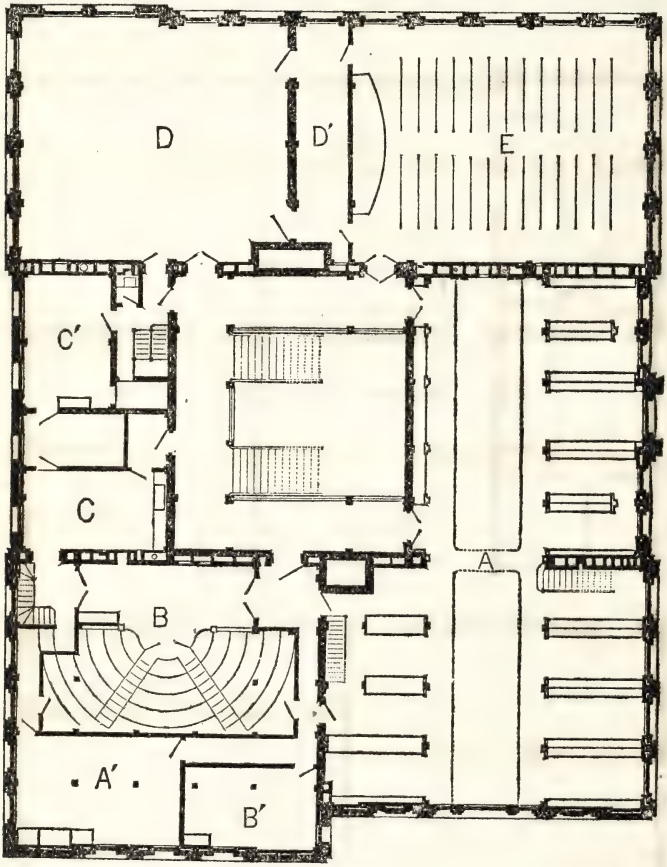
The building is constructed of brick, is 40 feet wide and 60 feet in length, and is four stories in height, including the basement. The ground floor will be used as a laboratory for practical work in chemistry; the second story, for office, museum, and dwelling apartments; the third contains a lecture room of sufficient size to accommodate one hundred students, recitation room, and cabinet of materia medica; the fourth story is fitted up for dormitories.

An additional building has been erected for practical demonstrations in anatomy.

The colored graduates from Howard, Lincoln University, and the Meharry school are doing good work in many parts of the Union and are well received by the medical profession in general.

IMPROVED MEDICAL SCHOOL BUILDINGS.

Collateral to the improved methods in medical education are the improved buildings in which it will hereafter be presented. The former senseless adhesion to some outward architectural form invented in other ages and adapted to purposes absolutely alien to modern materials and requirements is gradually but surely giving way to architecture wherein the purposes of the structure determine its arrangement and the necessities of its construction dictate its artistic form. The most recent, as it is the most perfect, of these medical buildings is that recently finished for the medical school of Harvard University, at the corner of Boylston and Exeter streets, in Boston.



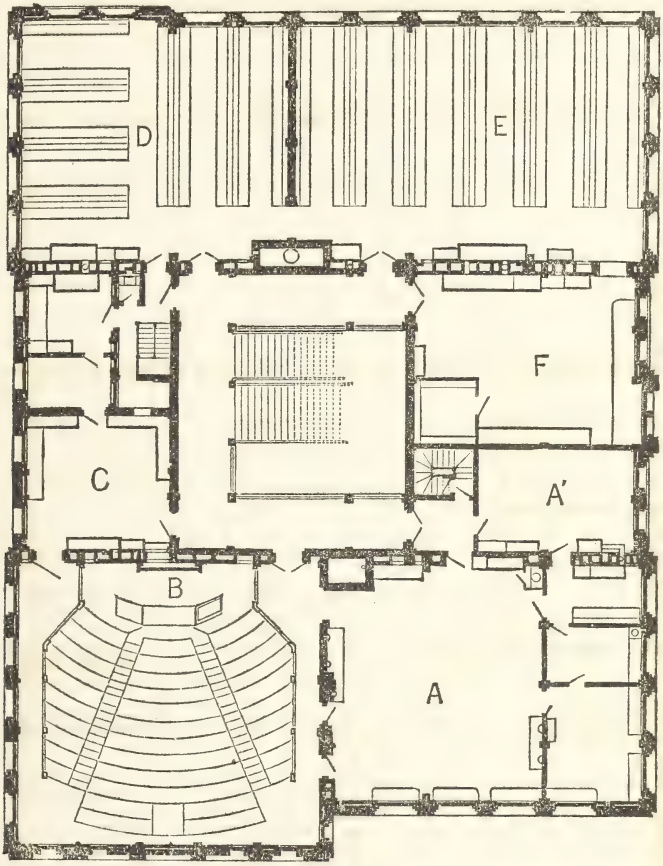
Second floor.

The building is for the most part 122 feet from east to west and 90 feet from north to south; its walls are brick, with cut stone caps and sills and terra cotta panels; warmth and ventilation are secured by steam radiators, which heat the air before it is distributed throughout the building, and by a series of flues which carry the vitiated air into a heated central shaft having a strong upward current.

The perspective view and floor plans, kindly supplied by Messrs. Houghton, Mifflin & Co., of Boston, will afford a good idea of the structure. It is four stories high above the basement; the principal entrance is on the north side from Boylston street,

and leads directly into a quadrangular hall, which, with the main stairway, extends to the fourth story. In the plan of the first floor, A represents the janitor's rooms; B, a coat room; C, the reading room; D, conversation room; E, the anteroom to F, a lecture room; G, the library; and H, the faculty room.

The second floor is entirely devoted to instruction in chemistry and physiology. A is the physiological laboratory, 40 by 30 feet, with instructors' rooms at the right; A′ is the room where mechanical repairs and contrivances for this laboratory are made; B is the lecture room, with 200 seats for these subjects, having, underneath the rising



Third floor.

seats, smaller rooms opening into A; the chemical anteroom is at C, with instructors' rooms adjoining; D is the laboratory for medical and E that for general chemistry; F is a laboratory for special analyses; over A′ and F are similar rooms in the half story, used as library and experiment rooms.

The third floor contains A, the Warren Anatomical Museum room, 40 by 80 feet; A′, the curator's office; B′, the ante room to B, the anatomical and surgical amphitheatre, with seats for 300 auditors; C and C′, offices of the professor and demonstrator of anatomy; D and E, other lecture rooms, between which D′ is a storage room for wall charts and other illustrations. Rooms marked A′ and B′ are under the higher part of the amphitheatrical seats in B, shown in B, fourth floor.

The fourth story, besides the upper part of the amphitheatre B, has A, the laboratory of pathological anatomy and histology; A′, the laboratory of experimental pathology; C, anteroom to D, the operative amphitheatre; and E, the room for practical anatomy; the small rooms between E and A are for use in special anatomical or pathological studies.

Fourth floor.

The stairways to the amphitheatres and laboratories are entirely separate from the main or central staircase, so that all crowding, confusion, and delay are avoided. The building will be supplied with a profusion of the best cases, instruments, materials, and facilities for use in the lectures, experiments, demonstrations, and practical work.

TABLE XIV.—UNITED STATES MILITARY AND NAVAL ACADEMIES.

In Table XIV of the appendix will be found the statistics of the examinations of candidates for admission to the United States Naval and Military Academies for the year 1882.

In connection with the summary of degrees conferred in 1882 by the very numerous institutions empowered to do so under the laws of the several States, I would refer to a correspondence between this Office and an accomplished young American lady, Miss Florence Kelley, who has been studying at the University of Zürich. It appears that several persons practising medicine in the United States assert that they are graduates in medicine or surgery from that university, and, in fact, that some of these are unsuccessful candidates for those degrees. I am also informed that the worthy "Pedell" of the university, Herr Henke, has in press and shortly to appear a complete and authentic list of rectors, professors, instructors, and graduates in all faculties of the university since its foundation in 1833 to and including 1883. Attention is also invited to my remarks under the head of Review of Progress in Medical Education, pp. clxv et seq.

Adding the totals of the preceding summary to those of the summaries of 1881, 1880, 1879, 1878, 1877, 1876, and of the Special Report on Public Libraries published by this Bureau in 1876 (see also the Report of the Commissioner of Education for 1875, p. cvii), we have the following aggregates for the libraries now reported:

Total number of public libraries reported, each having 300 volumes or upwards	4,119
Total number of volumes	13,040,034
Total yearly additions (1,851 libraries reporting)	529,304
Total yearly use of books (900 libraries reporting)	9,962,547
Total amount of permanent fund (1,775 libraries reporting)	$6,871,457
Total amount of yearly income (1,042 libraries reporting)	1,491,263
Total yearly expenditure for books, periodicals, and binding (986 libraries reporting)	645,233
Total yearly expenditures for salaries and incidental expenses (807 libraries reporting)	800,122

It should be noted, however, that the figures for these items are but approximately true for the libraries of the country, inasmuch as they do not include the very considerable increase of the 3,647 libraries embraced in the Special Report on Public Libraries or the increase of the 341 libraries embraced in the Reports of the Commissioner of Education for 1876, 1877, 1878, 1879, 1880, and 1881, from the dates thereof to the present time.

The foregoing statistical summaries show that this report contains statistics respecting 131 libraries not mentioned previously in my reports, and that the number so reported since and including the annual report for 1875 has been 4,119.

The reports of other countries can show no parallel to this voluntary and uniform method of collecting and communicating information respecting these establishments, so graphically called the universities of the people. If circumstances permit, I design to take up the subject of public libraries again in a special publication, reprinting such parts of the special report on public libraries (now quite out of print) as have permanent value; another publication projected is a fresh statistical tabulation respecting all the libraries of public or semipublic character in the United States; but these designs are as yet work for the future chiefly.

During the eighteen months covered by this statement several matters of much interest have agitated the library world. The proper selection of a plan for the Library of Congress is one of these. Respecting this I would only suggest that in the consideration and adoption of plans for library buildings anywhere the judgment of experts in the storage and management of books is as important for the best success as the judgment of experts in building, and that special care seems requisite in the case of the Library of Congress, because the building when erected will be expected by the public to embody the best appliances, arrangements, and ideas about library construction.[1]

Among the important gifts to libraries during the year, the transfer of the private library of Dr. Joseph Meredith Toner to the Library of Congress requires special mention. This valuable medical and surgical collection numbers about 27,000 books and 12,000 pamphlets, the results of Doctor Toner's personal collection and purchase during his whole professional life; it is the first free gift of a large library to the nation, and, as such, deserves that, like the Library of George III in the British Museum, it be kept together for the future and designated by the donor's name.

The Boston (Mass.) Public Library also, since the date of my last report, has received an important accession by gift of the library of J. Montgomery Sears, esq., which includes the famous book collection of Ferdinand Freiligrath, the German poet and politician; this valuable present numbered 6,000 volumes. This great city library, the friendly rival of our national collection in its number of volumes, has also been preparing to erect a new building on the land given by the State. For some time an effort was made to adapt the high and Latin school building to the purposes of the library, but this project did not meet with any cordial support among library experts

[1] The Library of Congress at the end of 1882 contained 480,076 volumes and 160,000 pamphlets.

or the public press; so that the site on Dartmouth and Boylston streets will doubtless be occupied in a few years with a library building in which the utmost care, skill, safety, handiness, and wise economy of space will be shown. Meanwhile a new branch library at the north end of the city has been opened.

Philadelphia, though possessing admirable libraries, particularly that of the Library Company, has been discussing the formation of a free public library. In these matters, and especially when the need of books can be supplied at small personal cost, it may be well to make haste slowly, lest the public lose what it already possesses without gaining any adequate substitute.

New York City, great and rich and busy as it is, seems to have little time to think about the culture of its people. Not the Astor Library with its 200,000 volumes, the Lenox Library with its priceless Americana and its bibliographical treasures, the valuable possessions of the Historical Society, the Young Men's Christian Association, the Mercantile Library, nor the united resources of the rest of the collections seem to satisfy the needs of the city. Probably a scheme of reading, prepared and encouraged by the school authorities, would be the proper beginning for the great collection that such a city as New York ought to have. The future public trained to need the library and the library itself would thus grow up together, and before many years the average tone and intelligence of New York in relation to books and reading would be modified greatly for the better.

Yet another noble gift to libraries is the collection of 12,000 volumes, once owned by the late Hon. George P. Marsh, LL. D., formerly our minister to Italy and one of the greatest and most modest scholars that this country has produced. The Hon. Frederick Billings has purchased and presented these volumes to the library of the University of Vermont, to which at one time Mr. Marsh, before his long service to his country had made him poor, designed giving his books. It is fortunate that the college has thus received the books without impoverishing the family of the collector.

Rochester, N. Y., has been offered by Mr. Mortimer F. Reynolds, one of its worthiest citizens, real estate now producing an income of $40,000 per annum, on condition that the city shall release all taxes thereon when it is conveyed to a free public library association. Doubtless this generous offer will result in another large library foundation.

The village of Fredonia, N. Y., has been given property by Judge Darwin R. Barker in order to endow a free public library. George M. Pullman, noted for his good works as well as for his sleeping cars, has given 5,000 volumes to the town of Pullman, Ill., as the nucleus of a free public library. Beaufort, S. C., has been given 800 choice books by the Hon. Edward L. Pierce, of Milton, Mass., and a book room to contain them by Mr. R. K. Darrah, of Boston; the charge for using this library is 3 cents a week. Mr. John Carlovitz, a teacher, of Milton, Fla., has collected a library of 2,500 volumes, which he designs to present, together with a natural history collection, to some institution of learning in the town, of permanent character and properly chartered. Meanwhile the library and museum are handsomely cased and deposited in the custody of the Masonic fraternity, in whose building a room for their safe keeping has been set apart. Surely the generosity and self denying labor of such men deserve commemoration among a people who have abolished all hereditary dignities and allow a man to leave his children only the property he has accumulated.

The Public Library of Chicago, having outgrown its present quarters, is now meditating the construction of a new building on a new site. In addition to Dr. Poole's many labors in this direction and on other subjects, this indefatigable worker has lately begun a labor designed to bring the public school and its teacher into more intimate relations with the public library and its custodian. He invites a single school or class, with its teacher, to visit the library on a Saturday morning designated in advance. Here they find Dr. Poole surrounded by all the books in the library that treat of the subject intended for the morning's conversation. By showing how interesting that subject is as a department of human thought and industry and how

much the contents of the library may help the student to a knowledge of the subject, he has succeeded in producing a profound and beneficial effect on the upper grades of the school system. This connection between library and school, both in Chicago and elsewhere, is the true solution of the whole matter, the school training the reader to use the book for his own information, and the library training him to use the book he reads for the benefit of himself and others.

	Total	97	475	124	1,622	779

In addition to the 23 training schools for nurses mentioned in the accompanying summary of Table XVII, I am informed that nurses' training schools are contemplated in connection with hospitals in Worcester, Mass.; Baltimore, Md.; Indianapolis, Ind.; Detroit, Mich.; Paterson, N. J.; Cincinnati, Ohio; Philadelphia, Pa.; Providence, R. I.; and Charleston, S. C.

Perhaps a little care should be exercised lest the support and enthusiasm which encourage the beginning of these schools should wane and the enterprises fall through from after lack of interest. Still, the need of trained nurses is so very great, even in private cases, that all qualified persons now living can find remunerative work, and a judicious increase in the number of schools for their instruction will meet with public support and approval.

In connection with this subject, it is timely to invite attention to the propriety of establishing "directories" for nurses, such as those in Boston, Philadelphia, Washington, and other cities, where families and physicians may apply for them and where unemployed nurses may leave their addresses and references.

Nor should the importance of nurses' homes be forgotten. The women engaged in this laborious, monotonous, and almost sacred duty must of necessity be chiefly drawn from the unmarried and unprotected portion of their sex. A home, where they can find peace, rest, cheerful company, and healthy regimen during the intervals between their engagements, and where pupils may lodge while under instruction, is of the greatest value to them and to the community they serve. I am happy to report that the Washington Nurses' School has at last been able to open a "home" of this kind at 1321 H street n. w. This school has graduated its second class of thoroughly trained nurses, and with the increased facilities now at its command will doubtless extend its work and usefulness.

a Including department for the blind.
b For salaries; $150 per capita for support.
c Includes some appropriations from counties.
d Value of apparatus.
e Congressional appropriation.

The condition of deaf-mute education is satisfactory and has not been affected by any unusual occurrences during the year. An institution has been established in New Jersey. Increased attention is being paid to giving facilities for education to colored deaf-mutes. Provision was made for them in North Carolina as early as 1867 and in Maryland in 1872. Departments for the colored pupils exist in the Tennessee and Mississippi institutions. Georgia and South Carolina are more recently assuming their burdens of this character.

The one hundredth anniversary of the birth of Rev. Thomas H. Gallaudet occurs in 1887, and it is proposed that the deaf-mutes of the country erect a statue to the man whose life and family have been closely identified with their education. Philadelphia and Washington (Kendall Green) have been suggested as suitable places.

A new feature of the Nebraska Institute is the attempt of its principal, Mr. J. A. Gillespie, to cultivate the power of hearing in cases where there is any to be developed, so that semi-deaf persons may distinguish sounds and even spoken language.

METHODS OF DEAF-MUTE INSTRUCTION.

The different methods of instruction in language are often mentioned and discussed, but are rarely defined so as to be intelligible to the common reader. Prof. Edward A. Fay, editor of the American Annals of the Deaf and Dumb, has stated the essentials of each method with unusual clearness, and the following definitions of the manual, oral, and combined methods are taken from one of his editorials:

By the *manual* method is meant the course of instruction which employs the sign language, the manual alphabet, and writing as the chief means in the education of the deaf, and has facility in the comprehension and use of written language as its principal object. The degree of relative importance given to these three means varies in different schools; but it is a difference only of degree, and the end aimed at is the same in all. If the pupils have some power of speech before coming to school or if they possess a considerable degree of hearing, their teachers usually try to improve their utterance by practice; but no special teachers are employed for this purpose and comparatively little attention is given to articulation.

By the *oral* method is meant that in which signs are used as little as possible; the manual alphabet is generally discarded altogether, and articulation and lip reading, together with writing, are made the chief means as well as the end of instruction. Here, too, there is a difference in different schools in the extent to which the use of signs is allowed in the early part of the course; but it is a difference only of degree, and the end aimed at is the same in all.

The *combined* method is not so easy to define, as the term is employed with reference to several distinct methods, such as (1) the free use of both signs and articulation with the same pupils and by the same teachers throughout the course of instruction; (2) the general instruction of all the pupils by means of the manual method with the special training of a part of them in articulation and lip reading as an accomplishment; (3) the instruction of some pupils by the manual method and others by the oral method in the same institution; (4)—though this is rather a combined *system*—the employment of the manual method and the oral method in separate schools under the same general management, pupils being sent to one establishment or the other, as seems best with regard to each individual case.

Elementary instruction.—Alexander Graham Bell, PH. D., has made an interesting and successful experiment in the instruction of a congenitally deaf boy five years of age. The plan adopted was to familiarize the child with written language by means of play. The child's school room was turned into a play room, and language lessons were given through the instrumentality of toys and games. Words were taught first. The names of playthings were put on them and a search instituted for their counterparts in a collection of names on cards. Afterward the child was required to ask for playthings and food by presenting cards, with the proper names on them. Words signifying action were added later. Sentence exercises were soon begun in the forms of impromptu conversations and regular sentences. The impromptu conversations were written on a blackboard, with the words which should be emphasized in speaking written large. After the writing, pantomime was used sparingly to explain it. The regular sentence exercises consisted of imperative sentences written on the

board, and their commands obeyed first by the pupil, afterward by the teacher, when the pupil pointed to a sentence. The child soon wished to write as well as point out the sentence, and instruction in writing was commenced. At first partially erased sentences were traced over. Then copies of sentences were made. The need of spelling was soon felt, and a glove with the letters located upon it was put on his left hand. He was soon taught to find particular letters and to point out in order those that formed individual words. Professor Bell soon could communicate with him by touching the places on his hands corresponding to those on the glove where letters were located. From this time onward the child was required to communicate by language, and progressed rapidly in its skilful use. He was afterward admitted to the primary department of the Columbia Institution and was distinguished for freedom and accuracy in the use of language. It is thought this trial will afford encouragement and aid to parents in giving home instruction. "If pupils could commence their school course," says Professor Bell, "with even an imperfect and rudimentary knowledge of English, the labor of the teacher would be enormously reduced and the progress of the pupil immensely accelerated."

Preparation for college.—It is important for the instructors of deaf-mutes to be well informed as to the nature of the preparation they should give pupils intending to pursue a higher course of studies, and such information is suggestive to many who are brought into other relations with such pupils. Prof. A. G. Draper, A. M., presented a paper on this subject at the tenth convention of American instructors of the deaf and dumb, held at Jacksonville, Ill., in August, 1882. He says that the first and foremost requisite is the ability to use and to understand the English language. This may be increased by substituting, as far as possible, the use of connected language in place of sign language. Proficiency in arithmetic is a second essential, because its principles underlie all mathematics and its study develops the power of attention and ideas of order, value, and proportion.

Lip reading should be familiarized before entering college, as afterward the required work does not allow leisure for the acquirement of elementary skill, though constant opportunities for intercourse exist. A trade should be learned, as a resource against misfortunes that may deprive one of other fields of labor. The use of tobacco should be prevented, as it is an obstacle in the path of mental and physical improvement. Bodily exercise should be taken, for by strengthening the muscles of the deaf-mutes "we shall store up the energy, courage, and temper without which their best gifts will be of little worth." Finally, moral instruction should be faithfully imparted, especially by personal efforts and example.

j For two years.

The subjects which appear to have recently elicited especial attention from educators of the blind are the industries most suitable to their pupils, the adoption of a single kind of printing, the regulation of the association of the sexes, the medical care to be bestowed, and the removal of prejudices against sending children from home to an institution commonly but erroneously called an asylum. They find the same need of the coöperation of parents, of prompt and regular attendance, and of an appropriate arrangement of studies which is felt by teachers in ordinary pub-

lic schools. The mind of a blind child is developed by the usual methods of education, but these must be employed by patient, skilful, and sympathetic teachers in order to produce immediate and permanent results.

The attendance upon schools for the blind is much smaller than it should be. The Michigan school had 73 pupils in 1882, and its superintendent, Mr. J. F. McElroy, estimates the number of blind persons in the State who are of proper age and condition to be educated at 350.

It is estimated that only 25 per cent. of the blind in Arkansas who are of suitable age to be admitted to the State school are or have been in it. The reasons given for this are the ignorance of the people as to the existence of the school, the supposition that the school is not free but expensive, the idea that the school is a sort of poor-house, the reluctance of parents to be separated from their unfortunate children, and the failure of the State to supply full accommodations and to enable the officers of the school to offer its privileges to all those who are deserving of them.

It seems to be always in order to urge those having the care of young blind children to treat them in such a way as to prepare them for school duties when they are of sufficient age to leave home. The age at which they should enter a school of the usual character depends much upon the circumstances of the family. A rule given by a good authority is that, if they can be under good influence at home, can have the care of mother or sister, can exercise freely in the open air, can be taught elementary studies, it is better for them to remain at home until they are twelve years old; but, if they cannot receive proper care and be taught to some considerable extent, they should enter at the age of nine or ten. Dr. S. G. Howe was emphatic in cautioning parents against too much indulgence of sightless children. His ideas are shown by the following quotation:

Do not prevent your blind child from developing as he grows up, in courage, generosity, self reliance, and manliness of character, by excessive self indulgence, by sparing him thought and anxiety and hard work, by giving him undeserved preference over others. Much may be done for his advantage by judicious firmness, by resolutely insisting that he shall learn to do everything for himself and for those about him which it is possible to do without actually looking at things.

Keep him out of doors and running about as much as possible. Bear in mind that he is exercising for health and strength, and that his object is to be in the open air and to keep warm by exercise, not by extra clothing. But the benefit accruing to your blind child from such continued exercise and work in the open air is not confined to his bodily growth and health; for the effort to do something useful, to bestir himself and to keep himself warm, is good exercise for his moral nature; for every habit of meeting and overcoming little difficulties increases courage and self reliance.

Hon. F. J. Campbell, LL. D., principal of the Royal Normal College and Academy of Music for the Blind, Upper Norwood, London, Eng., puts great emphasis on physical training. In his report for 1881 he says:

By careful examination it will be found that the blind men who are leading lives of usefulness are those who have not allowed their blindness to debar them from physical activity. Professor Fawcett in his able addresses on blindness has repeatedly borne testimony to this fundamental truth. The pupils of the Royal Normal College who have been most energetic in regard to their physical development have achieved the best results when they have gone forth to test their value in the open market. Owing to the lack of physical training, young blind persons come to us awkward and helpless, although they have been several years under mechanical training.

The disposition to give blind children suitable medical attention and opportunities for physical culture is manifest in many schools. The strength and vigor of blind youth are not up to the average. The same causes which operated to produce blindness have also resulted in other evils, sometimes scarcely less deplorable.

The object of physical culture is to increase the strength and fortify the health. The aim of the medical efforts is to remove pain and disease, and in some cases to restore sight. The trustees of the Iowa College for the Blind appointed two physicians, expert "ophthalmologists," to examine and operate upon the eyes of the members of the college. They reported that none had been made worse by their interference and that many successful operations had been performed. They found over 40 persons needing their special attention, half of them for increase of vision and half for

the purpose of personal comfort and for relief of pain. Nearly as many more could be benefited by medical treatment and the adjustment of glasses. The regular course of instruction pursued in the literary, musical, and industrial departments has not undergone any marked change. The studies in the literary departments are like those of elementary public schools and are graded as closely as circumstances will allow. The instruction in music is continued with profit to pupils and with pleasure to their friends. Occasionally it seems necessary to neutralize the effect of some unfair criticism of the blind in their work as tuners of instruments by stating their peculiar fitness for that occupation and the success they have obtained in it. The loss of sight seems to quicken the senses of feeling and hearing and to bestow faculties peculiarly serviceable to tuners, so that manufacturers and eminent musicians have frequently shown preference for blind tuners. The industrial departments include the trades mentioned on page 76 of the abstract, and new occupations are being sought by the heads of these departments. Broom making and caning still appear to give the best results. The profits from the former industry to the Kansas institution for the two years ending June 30, 1882, were $820.06, besides $815.25 paid the boys for labor. Silk culture has been tried at the Arkansas school. The superintendent, Mr. Otis Patten, reported results as follows:

Two things are proved by our experiment: First, that silk culture can be carried on by intelligent blind persons directed by the seeing where sight is indispensable; and, second, that they can do it without special instruction in the institution. An intelligent blind person can take the manuals prepared for the purpose, and with a seeing person to read for him can get a knowledge of the subject. I would not advise anybody to embark in the business who has not the proper food on his own grounds. Some of our girls who were in the class mentioned in the essay intend to pursue the business when they go home. We do not think it necessary to repeat the experiment in our institution, but will read to our girls enough to interest them in silk culture.

The introduction of Kindergarten methods or the addition of the Kindergarten itself is advocated earnestly by many of those in charge of the education of the blind. It is argued that a large part of these unfortunates are among surroundings of vice and destitution and should be removed from them at the earliest moment practicable, before corrupt tendencies and vicious propensities are hardened and crystallized into permanent habits. Mr. M. Anagnos, superintendent of the Perkins Institution and Massachusetts School for the Blind, would have a separate school for this purpose, with suitable grounds, ample endowment, and nothing to compromise its educational character. The pupils should be received when from five to nine years of age, "retained until the age of twelve, and taught and trained objectively according to the simple and rational methods developed in Fröbel's Kindergarten." The trustees of the institution favor such a school. They say in their annual report for 1882:

For such children the Kindergarten system, with the genial warmth of kindness radiating from its principles, with its methodically arranged gifts and games, its block building, weaving, sewing, and modelling, affords the best and most efficient means of training. It is calculated to awaken, strengthen, and regulate their faculties of imagination, volition, and action, which are weakened by their infirmity, depressed by the wretchedness of their surroundings, and benumbed by the frost of their privations. It promises to raise them up from a state of misery, sloth, and torpor, to that of comfort, activity, and diligence. It will create a new era in the history of the education of the blind by laying the foundations and increasing the possibilities of a higher standard of attainments than has hitherto been reached.

Mr. B. B. Huntoon, superintendent of the Kentucky institution, speaks of his experience with the Kindergarten as follows:

The Kindergarten department, under the charge of a skilled teacher from Mr. Hailmann's training school in Detroit, has answered every expectation formed of its great practical usefulness in a school for the blind. In training the senses, in stimulating thought, and in developing the mind, it seems to furnish the methods needed to make broad and strong the foundations of an education.

Some of the results of the education of the blind are shown in the following quotation from the report of Mr. William Chapin, superintendent of the Pennsylvania institution:

Of the 32 institutions for the blind in America sustained mainly by the States, 10 were originated by blind graduates: 4 from the Pennsylvania institution, 5 from

the Ohio, and 1 from the Massachusetts institution. This is a gratifying record of the talent, energy, and perseverance of these persons under trying difficulties.

Referring to statistics reported to a convention of American superintendents in 1878, of the graduates of these institutions 16 became superintendents of institutions for the blind and 5 of orphan asylums; instructors in literature, music, and handicraft, 502; clergymen, 34; piano tuners and repairers, 125; students and graduates of colleges, 36; agents and lecturers, 71; editors, lawyers, and physicians, 30; storekeepers and traders, 277. Classifying these and others, it appeared that the number engaged in literary or mental work was 710; in music and tuning pianos, 527; in handicraft, 1,111; total, 2,348.

These numbers would be considerably enlarged up to the present time.

Mrs. Asa D. Lord, matron of the New York State institution, reviewed the work of institutions for the blind in an excellent paper before the convention of instructors of the blind held in August, 1882, at Janesville, Wis. A few clauses from her remarks give a concise view of the situation:

The coming year, the first of the last half of the century [of instruction for the blind], will mark a new era in the progress of the education of the blind. We stand on high vantage ground. Our buildings in the main are ample, well furnished, and well adapted to their uses. We have improved and vastly increased appliances to facilitate our work, for which, I trust, we are truly grateful. Our pupils, as in the past, are the beautiful, the deformed, the strong, the weak, physically, morally, and intellectually.

It is our work to take these contrasting and widely diversified powers and develop from them men and women who shall be fitted to take honored and useful places in society, not only in the estimation of men, but in God's sight.

VISIT OF DR. WILLIAM MOON.

The intention of Dr. William Moon, of Brighton, Eng., to visit this country for the purpose of extending his work for the blind, was announced in my last annual report. An authoritative account of this visit has been published, from which the following paragraphs are taken:

In the month of April, 1882, at the request of Sir Charles Lowther, Dr. Moon, accompanied by his daughter, paid a visit to several cities of the United States to see what could be done by way of establishing home teaching and free lending libraries for their blind. The visit was most successful; throughout the whole of his tour Dr. Moon was warmly received by the various authorities of the institutions he visited, and at Philadelphia the Bible Society displayed the deepest interest in circulating copies of the Bible in his type, through the agency of home teaching and free libraries. Mr. Rhoades, the treasurer of the Bible Society, through a requisition signed by Mr. Chapin, principal of the School for the Blind, Mr. Hall, superintendent of the Workshop for the Blind, and Miss Lloyd, president of the Home for Blind Women, convened a public meeting which was held at the Bible Society House. At this meeting a home teaching society was formed and a committee appointed for arranging the details of the work. Teachers were shortly afterwards appointed, and Dr. Moon had the pleasure of seeing the work progressing before his return to England.

At Mr. Chapin's institution, as soon as the books arrived which had been presented by Sir Charles Lowther, they were distributed among the inmates, and as many as 114 were able to read them in the short space of 8 days. Thirty of these readers were adults accustomed to work and unable to read any of the books embossed in the United States. This, it may be remarked, was not owing to any defect in the embossing, for the books are beautifully printed, and sufficiently raised for the use of children, both at the American Printing House at Louisville and at Boston, but owing to the complex form of the letters, which is avoided in Dr. Moon's simplified alphabet. At the Workshop for the Blind and the Home for Blind Women, good progress was soon made when the books were presented to those institutions, and Mr. Hall, the admirable superintendent of the workshop, who is himself blind and who could never read the American embossed books, was among the early readers of Dr. Moon's type. Sir C. H. Lowther has kindly made a present of the entire Bible to this institution, and it was most gratifying to hear Mr. Hall's warm and grateful expressions in reference to the benefits the inmates would receive therefrom.

At Chicago Mr. W. H. Bradley and his son manifested great interest in the work of home teaching, and called a number of friends together and laid the matter before them. Twelve married gentlemen and their wives immediately gave their names as members of a committee and a sufficient amount was subscribed for a complete set of Dr. Moon's books to form a free library. A teacher was expected to be soon appointed, and the names and addresses to be obtained of the entire blind of the city. Before Dr. Moon left Chicago he had the gratification of knowing that several of the blind had

learned to read and were anticipating with much pleasure the use of the books of the new library.

At Boston and New York promises were received from friends that in the autumn of the year they would use their endeavors to carry out the same means for the blind of these cities.

The success of Dr. Moon's efforts is indicated by the following extract from a letter from Mr. J. P. Rhoades, of Philadelphia, through whom much has been done to advance the interests of the adult blind and the introduction of Dr. Moon's system of printing:

I am glad to say that the results of our efforts to reach the adult blind who cannot learn to read by the old system are highly encouraging. I have received numerous applications from the blind living in various parts of the United States, and have mailed to them the alphabet and elementary reading cards. Many of these have informed me that after a few weeks' study they have learned to read and are now using the books. We are reaching those who are isolated from all other efforts in their behalf, and who have no access to institutions designed for their benefit, and who never supposed it possible to learn to read.

a Instructors only.

The education of feeble-minded children is undertaken by public authorities not so much as a charity as a means of increasing the productiveness of a large class of defective citizens and decreasing the probability of the transmission of their defects to another generation. Many children of undeveloped intellect are in popular estimation included among those almost hopelessly idiotic. While the latter class may be improved by the careful training of their muscles and their habits of life and action, the most satisfactory results have been obtained with the more intelligent. Their training is painfully slow and must provide for the gradual increase of physical power, the stimulating of the senses, and the application of the mind to tasks judiciously assigned. Their education cannot come from instruction in the branches taught to stronger youth so much as from simpler exercises calling will power into play and withdrawing the attention from personal feelings and wishes. Still, the classification of feeble-minded youth for purposes of school work is very complete in several institutions. This is necessary in order to accomplish the most possible in this difficult work at the smallest expense. The English schools pay less attention to formal educational efforts than do ours, and some American instructors are inclined to imitate their example. Certainly the health of these youth is of primary importance, as it is frequently on an equality with their mental condition. Recreation and labor are the means for strengthening both body and mind. The recreations must be of the simplest kind, and the labor adapted to the abilities of the child. The demand for farms and agricultural employment is made by institutions having only small tracts of land. Massachusetts has provided a farm to which the school can send a portion of its inmates who are best fitted for farm work. The Ohio institution finds its large tract of land of great value to its pupils. There are some simple trades that may be followed by the feeble-minded, but their condition of mind and body diminishes their ability to do farm work less than it does their efficiency in shops.

The usefulness of institutions is increased when they are enabled to extend care to feeble-minded adults, for whom no provision exists outside the poor-house. It is public economy to remove such from a life whose probable tendency is toward an ultimately increased burdening of the community. It has been said that "the helpless condition and prospective fate of these children of misfortune, after they have received all the training, both mental and physical, that any school can give them, appeal strongly and constantly to the same spirit of public charity that founded the present asylums, for further protection."

a Of those committed during the year.
b This distinction not reported in all cases.
c These figures are for two years.
d Includes total income of one institution.

One of the questions naturally asked about the inmates of reform schools is as to their antecedents. Statistics bearing on this inquiry are collected by nearly all the schools. They show that the offender has almost always been idle; that he has very frequently been the child of parents born in foreign countries; that a large proportion of the boys have no father living; and that, contrary to the prevailing opinion, their parents are not usually intemperate. The statistics of different States vary greatly as to the social condition of parents, and an equal dissimilarity exists between city and country schools. After giving percentages of children coming from specified classes of surroundings, Mr. Israel C. Jones, superintendent of the House of Refuge on Randall's Island, near New York City, comments upon the statistics as follows:

It does not appear from the foregoing that intemperance is a prevailing vice with the parents, nor that the delinquency of the children is chargeable to their being orphans, for about 86 per cent. of the fathers and 94 per cent. of the mothers are found to be temperate people, and correspondingly few of the children have lost both parents. A noticeable feature that probably contributes to their delinquency is the thriftlessness of the parents, as indicated by the character of the homes and the lack of forethought in laying up any portion of their earnings against want. From 75 to 80 per cent. are known to live in crowded tenement houses, and about the same proportion are possessed of no property except their furniture, which is often scanty.

The reform school of the present is a decided improvement on those which were first established, some sixty years ago. The changes effected have been stated as follows in a pamphlet issued by the Colorado State Industrial School:

In the earlier history of these schools all inmates were classed together. For their safe keeping it was thought necessary to fasten them in cells at night; strong iron bars guarded the windows; heavy doors, constantly locked and bolted, closed the passages; and the premises were surrounded by high stone walls. Great improvements have marked the progress of reform schools. In the modern reformatory neither high walls, cells, bolts, nor bars are found. Nothing in the surroundings distinguishes them from first class public schools. Neat fences inclose the grounds, which are beautified by trees, shrubs, lawns, and flowers. Well kept roads and walks lead to the various places of interest, and thus the very grounds are used to teach important lessons.

A description of some of these institutions shows them to be inviting in appearance and attractive in surroundings. For example, the Ohio Reform School is a village of itself, excellently laid out and provided with conveniences.

The buildings consist of the main building; the Ohio, Hocking, Muskingum, Cuyahoga, Scioto, Huron, Miami, Erie, Maumee, and Union family buildings; shoe, brush, blacksmith, tailor, paint, carpenter, bake shops; carriage, meat, ware, engine, gas, ice, corn, and green houses; water tower, hospital, mending room, knitting room, chamber of reflection, laundry, two horse barns, a piggery, cow barn, and numerous outbuildings.

The family buildings are arranged in a segment of a circle around the main building, with the exception of a double building, called the Ohio, for the use of the very youngest boys, which is separated from the main and other buildings nearly half a mile, but is connected with the rest of the institution by a good board walk. These family buildings are named for the rivers in the State. The building for the youngest boys has three stories above the basement. On the first floor are two rooms for the elder brother and his family, two school rooms with folding doors between, which, when open, throw both into a sitting room for the boys in the evening. There is a wide hall separating the elder brother's rooms from the school rooms. On the second floor are rooms for the teachers and two dormitories. On the third floor are rooms for the employés and two smaller dormitories. The basement serves as a play house and a place where the boys prepare themselves for school or detail. This building accommodates about one hundred boys under twelve years of age. There is connected with it a kitchen, dining room, and workshop, so the boys have no communication with the large boys, only coming over to chapel on the Sabbath.

Of the other family buildings, four are 57 feet long by 36 wide and are three stories high above the basement. The remaining five are like the four, with the exception of being but two stories high above the basement. Each of these nine buildings makes a good, comfortable home for fifty boys.

The treatment of the inmates of reform schools has improved as much as the buildings in which they are accommodated and the methods of instruction. Home life more attractive than they have ever known awaits many of those committed. Kindness and patience awaken hope and confidence in many a dark and suspicious mind. The future welfare of the inmates is primarily regarded by most institutions, not only in the studies and labors required, but also in the attention given them. This is indicated in a circular issued recently by the board of managers of the Connecticut State Reform School. The methods and advantages of the institution are described in the following terms:

The institution is not a prison, but a school of detention and reform, where the inmates receive such instruction and training as are best adapted to form and perpetuate a virtuous character, to establish habits of industry, and to advance them in those branches of knowledge which are taught in the common schools of the State. They are here provided with a home in every way pleasant and comfortable; are furnished with steady employment that will aid them in earning an honest living after they leave the school. They have appropriate seasons for recreation and play, are well fed and clothed, and when sick have the best of care and medical attendance. They attend school regularly six days of the week, are taught by experienced and efficient teachers, and on Sunday enjoy the privileges of the Sabbath school and one regular chapel service, over which some minister of the gospel from one of the city churches presides. The Catholic boys of the school receive one hour of instruction each Sabbath from the Sisters of Mercy.

Mr. J. J. Barclay, president of the board of managers of the House of Refuge at Philadelphia, describes the life of inmates there as follows:

Great care is bestowed on the training, health, and comfort of the inmates. The discipline is parental and calculated to prepare them for the duties of life. When sick they are placed in an admirable infirmary and attended by experienced and skilful physicians and an excellent nurse. They are employed about seven hours a day in the workshops or household duties, are engaged three hours in the school rooms under excellent teachers, and strenuous efforts made to instruct them in the elements of a good education. They are allowed ample opportunity for exercise in the open air and in the recreations suitable for the young. They are provided with a well selected library, affording them the means of acquiring valuable information and mental enjoyment.

The daily routine of these schools is so planned as to avoid too rigorous exactions and to secure the full value of their time and strength to the inmates and less directly to the institutions. A division of the day between study, labor, and recreation is effected so as to give a suitable proportion to each. An example of this and of the attention paid to other minor details may be taken from the report of the Girls' Industrial Home, Delaware, Ohio. The matron says:

The work hours are from 8 to 11 A. M., the school hours from 1.30 to 4.30 P. M. In the work and school room, the schedules require promptness to the minute, as indicated by the central bell. The time for recreation is so arranged as to allow all a liberal amount of exercise. Special attention is given to the housekeeping and laundry departments, so as to have the girls, if possible, when discharged from the home second to none in this very important branch of woman's education; also, the work in the sewing room is carefully watched, so as to secure both neatness and promptness in the use of the needle. To secure harmony and equality in the kitchen instruction, as well as to secure an economical variety of food, we have provided a regular bill of fare, by which all are equally governed.

Mr. W. C. Sampson, superintendent of the Colorado State Industrial School, says that the course of industrial, mental, moral, and religious instruction in that institution "is arranged to correct the bad and vicious habits already partially formed; to induce the love of system, regularity, and cleanliness in heart and person; to create a thirst for knowledge and habits of industry as a means of earning a competence, comfort, and happiness; to elevate the low moral and religious standard to the Bible standard; and to thoroughly instil the love of country and good citizenship." The necessity of not only industrial instruction but also of comparatively uninstructive labor is understood. The constant use of the head and the hands is effective in crowding out and keeping out of a boy's mind the thought and desire of wrong doing and deprives him of time for accomplishing mischief. "An important auxiliary in the reformation of boys, at least," as is said by Mr. J. Hood Laverty, superintendent of the Philadelphia House of Refuge, "is regular, steady, concentrated work. Neither idle boys with dishonest tendencies nor girls with lewd inclinations can ever be reformed until they are taught to love and adapt themselves to steady, continuous work of some kind, and to understand that all honest labor is not only respectable but yields pecuniary advantage." Consequently, as much of the work of a reform school as possible is performed by the inmates, whether boys or girls; with the latter, house work is given most prominence. The future of girls who are qualified to enter families, and do so, is much more secure than that of girls passing from school life into shops and factories. The trustees of the State primary and reform schools of Massachusetts, in a recent report, say:

The house work, at first irksome to a girl who has been leading a lazy life of self indulgence, becomes interesting when carried on with companions. Recognizing the difficulty which seems to belong to all institution life, the contrast of its shelter and security as compared with the unexpected trials and insecurities of a life of honest self support, it is the constant study of the trustees to make the family system of the school a preparation for family life outside; to train the girls not only to submit to rules, but also to obey conscience when rules are withdrawn. They are taught the economies necessary to good housekeeping, they see the little vexations resulting from carelessness, and learn what is meant by "duty" and "individual responsibility" as they could not under the restraint found necessary for a more hardened class of offenders.

The now acknowledged principle that industrial education should be a part of every system of reformatory training is stated by Mr. Z. R. Brockway, superintendent of the New York State Reformatory, at Elmira, as follows:

No reformatory system is complete that does not train each subject for a specific industry for which he has natural adaptation, and actually induct him into it, maintaining supervisory control long enough to insure a good degree of permanence and success. In spite of all our efforts and because of the limits of the industrial organization here, we are obliged to send men, naturally qualified for something better, to menial or cheap employment, with which they will not and ought not to be content. There is a most intimate connection between the conduct of reformed criminals and the readiness with which they can suitably support themselves.

The shop work of the Connecticut State Reform School is reported by the superintendent, Mr. George E. Howe, as follows:

We now have three shops where cane seating is done, two being in the main building and one at the cottage building. The whole number of boys employed in these shops averages about one hundred and seventy-five in the winter season. In the summer time there is a less number, as the boys are taken from these shops for the farm, garden, and other out-of-door work.

In the manufacturing room, where overalls are made, we employ about ninety boys. Seventy-five boys, seated at as many sewing-machines, at active work, with a large class of the little fellows sewing on buttons, folding the goods, keeping the records of work, &c., makes a pleasant and interesting sight to behold. The boys in this department soon become experts at the machines, and a knowledge of this manufacturing prepares them to obtain ready employment after leaving the school. We have a tailor shop in which twelve boys are employed in the manufacture of the clothing worn by the boys. The mending is also done in this shop. Only two boys work in the shoe shop. We manufacture but few of the shoes worn, but all of the repairing is properly attended to in this shop.

The Toledo (Ohio) House of Refuge has introduced knitting as one of its industries, and the superintendent, Mr. A. A. McDonald, contrasts it with other employments very favorably. He says:

In the [knitting] industry each boy has his machine; he takes it apart, cleans it, puts it together, repairs it, and prides himself on keeping it in perfect order. It to him is a machine, and in viewing its parts his mind goes out to stronger and more complicated machinery; he discusses its beauty and power; he is improved and benefited. In operating a "knitter" every muscle of the body is brought into play, the mind is active in calculations and watchful in giving proper dimensions to articles manufactured. In every instance, without exception, each boy who goes into the knitting factory comes out of it in better health and stronger mentally and physically. In the latter industry [brush making] nineteen-twentieths of the boys never can reach beyond the hope of being able to sit in cramped positions and fill little perforated boards with bristles, in which "trade" no ingenuity is awakened, no lively interest manifested.

The usefulness of reform schools is enhanced by facilitating the employment when they are discharged of those who have been inmates. There is great danger that the correct habits which have been slowly forming will not have taken a sufficient hold upon them to keep them from falling into temptation. It is not easy either to prepare such youth for an occupation or to find a place in which they may exercise such skill as they possess. These difficulties have not been so great as to prevent the majority of those that have gone out from becoming useful men and women. Ninety-two per cent. of the boys paroled from the Newark (N. J.) City Home are "on the law and order side of life and are thrifty and industrious." More than 73 per cent. of the 20,000 children who have been under the care of the refuge at Randall's Island, near New York City, "have owed to it their permanent change from the condition of outcasts to that of useful citizens." Similar reports are made by other institutions, and there is abundance of proof that the usual result of reformatory education is to prepare inmates to meet successfully the duties of life in some honorable pursuit. The attention given to industrial training is still insufficient, and it is to be hoped that legislatures may see the wisdom of promoting it by such means as they are able to command.

THE CONTRACT SYSTEM.

A committee recently inquired into the truthfulness of charges that cruelty was shown to the inmates of the State Reformatory at Elmira, N. Y. They found the charges unwarranted; they added to their report some remarks on the administration of such institutions. They objected to the contract system of labor for the following reasons:

(1) The contract system introduces into the management of the prison the factor of private pecuniary interest. The State enters into a contract with private parties to furnish them with a specified number of laborers at a fixed price per day for each laborer. The contract is likely to be, and in fact is, one requiring, in order to its financial success, the employment of a large number of men, and at the ruder, heavier, less intelligent, and less desirable forms and kinds of mechanical labor. The prisoners have been employed in the manufacture of shoes of the coarser grade, brushes, stoves, and various other forms of hollow ware. These contracts must be strictly carried out. The pecuniary interest of the contractor must be a controlling consideration in connection with the discipline and treatment of the prisoners. No legal skill or adroitness can so frame the contract as to exclude from it the element of private interest and include in it a paramount regard for the well being and reformation of the prisoners; and, if a contract could be so framed, no sane business man would take it. No contractor, not even the very intelligent and estimable gentlemen who have contracts with the State for prison labor at Sing Sing and Elmira, some of whom appeared before us and testified concerning the operation of the contract system, would enter into a contract with the State for the labor of prisoners upon any other basis than that of their own financial advantage.

(2) Under the contract system the prisoners are brought under a divided control: the control of the State on the one hand and that of the contractors on the other hand; and these will not always agree. The control of the State is, in theory, paternal and reformatory; that of the contractors is, in theory and in fact, purely legal, and looks alone to their business success. Such a conflict of interest and purpose cannot be otherwise than prejudicial to the discipline of the prison and to the reformation of the prisoners. The interest of the contractor and the terms of his contract may require that certain prisoners shall be employed at a particular kind of work as long as practicable, while the interest of the prisoner and the proper conditions of his reformation and transformation into an industrious and worthy citizen may require that he should be put at a different kind of labor, or even that he should be discharged from his imprisonment altogether or upon his parole. The interest of the contractor requires that his agents and subordinates in the prison should be selected with reference to their fitness and skill in supervising and directing the particular kind of work to be done under the contract, while the interests of the prisoners and the reformatory ends sought by the State require that the men who are put in immediate supervision of the prisoners should possess other and higher than mere mechanical and business qualifications.

(3) A proper classification of the prisoners as to their moral and intellectual status and as to their fitness for particular kinds of labor cannot be made under the contract system. The contract calls for several hundred men to be employed, for instance, in the manufacture of hollow ware. Among the hundreds so employed there must be a large percentage of men whose love of honest remunerative labor will never be stimulated or strengthened by such employment. They will feel their work to be onerous and degrading, and will never voluntarily engage in it after their discharge. If put at employment suited to their capacity and peculiar adaptations and, so far as practicable, to their taste and preference, their self respect might be restored, their love of honest work encouraged, and their purposes of reformation confirmed. Instead of smarting continually under a sense of injustice and spurning all inducements to the amendment of their lives, as is now too often the case, they would be made to feel that the State cherishes a genuine, kindly interest in their welfare; and unless they can be made to feel that the State whose laws they have violated is benign and magnanimous, as well as great and powerful to punish, no genuine desire and purpose to lead a better life can be awakened in them. Mere power cannot subdue and reform the human will, and an exhibition of mere vindictiveness only begets the like spirit in its victims.

(4) In order to secure the best reformatory results in prison management, it is important that the State should maintain its proper immediate relations with the criminals therein confined. The prisoners should be led to see and feel that they are in direct contact with the sovereign power which they have disobeyed. This may humble, but cannot degrade them. They will respect the majesty of the law. They cannot despise, though they may defy it. But the contract system introduces an intermediary power, and that a purely self interested or mercenary one, between the pris-

oner and the State. The labor of the prisoner is let or sold by the State with a view to the largest pecuniary profit to the State. The prisoner thus finds himself in the situation of a hireling, not to say a slave, to serve mere mercenary ends: first, the pecuniary advantage of the State, and, second, the pecuniary interest of the contractor; and the reformatory design of the prison becomes necessarily a subordinate and scarcely appreciable factor in the management.

(5) The inevitable result of the contract system must be and is to prevent the introduction into prison management of those reformatory methods and influences which are required in order to carry out the design of this institution. Mere labor is not in itself and irrespective of other agencies reformatory in its nature. Nor is it rendered so by making it remunerative, especially if the remuneration is to some one other than the laborer. And yet the great State of New York, after proposing to itself the grand moral and benevolent purpose of reforming the younger class of its criminals and establishing a magnificent prison upon this reformatory basis, and after timidly experimenting for the short period of five years on the plan of employing the prisoners on its own account, suddenly and apparently from mere pecuniary considerations reverses its policy, abandons its great humanitarian purpose, and by the act of 1881, and against the earnest protest of the superintendent and managers, adopts the contract system as a part of its reformatory scheme and resolves to transform this great charity into a money making institution. It may be claimed that the State was wrong in founding this prison for reformatory purposes; but if, as we believe, the State was right in its original purpose, then, in our judgment, that purpose should be consistently carried out with all the energy and resources which the State is accustomed to bring to the execution of its will. The question of pecuniary profit or loss in the management of this prison should be in all cases treated as a matter of secondary consideration, and subservient to one controlling end of reforming the prisoners therein confined. And we are gratified to find that some of the best authorities on prison management in this country have given expression to similar views.

PROTECTION OF FOREIGN-BORN CHILDREN.

Connected with the general subject of juvenile protection and care is the prevention of the traffic in foreign children, and especially in children from Italy, by padroni, who gain a livelihood out of the earnings, beggary, and moral ruin of the children whose time and labor they control. Congress in 1874 passed an act making the importation or holding to involuntary service of persons kidnapped or inveigled in foreign countries, or guilty consent to such importation or retention, a felony punishable by fine and imprisonment. Almost at the same time the legislature of Pennsylvania passed a law whereby persons hiring, giving, or employing minors under eighteen years of age for public minstrelsy, begging, or other mendicant business, and persons sharing in any way in the profits of such business, are guilty of a misdemeanor punishable by fine and imprisonment.

The State of Maryland has passed an act similar in purpose to that of the State of Pennsylvania; it is an excellent example for all other States to follow, for, though driven out of Pennsylvania and Maryland, there is nothing to hinder these cruel and lazy child-owners from carrying on their business in other parts of the country, and particularly in those places where neither a federal judge nor an Italian consul is to be found. This traffic deprives Italy of the civil labor and military service which that government under its laws has a right to expect from many of these deported youth; it deprives the children themselves of their home, their native country, and all regular instruction in morals, behavior, and letters, exposing them in a foreign land to all the moral and physical dangers of a strange climate, of exhausting and unimproving toil, of bad and insufficient food, and of foul lodgings among immoral associates, while jealously preventing them from acquiring sufficiently the speech, the habits, or the self reliance that they could so easily obtain by a suitable life in this country; finally, it afflicts the cities and large towns of this nation with numerous ill-used children, who often become thieves, desperadoes, and paupers as they grow older: the only persons benefited by all this suffering, injustice, crime, and squalor being the ruthless men or women who import these children, live on their earnings, and keep them from all hope or desire of anything better.

EDUCATION IN FOREIGN COUNTRIES.

I.—EUROPE.

AUSTRIA-HUNGARY.—*a.* AUSTRIA, constitutional monarchy: Area, 115,903 square miles; population (December 31, 1880), 22,144,244. Capital, Vienna; population, 1,103,857. Minister of public instruction, S. Conrad von Eybesfeld.

The following information is taken from the Oesterreichische Statistik—Statistik der Unterrichts-Anstalten in den im Reichsrathe vertretenen Königreichen und Ländern für das Jahr 1881–'82; bearbeitet von der k.-k. Direction der administrativen Statistik.

Higher instruction.—The number of teachers of all kinds at the different universities of Austria in 1881–'82 was as follows: At Vienna, 319; Grätz, 122; Innsbrück, 89; Prague, 203; Lemberg, 60; Cracow, 96; and Czernowitz, 38—total, 927. Of this number 328 were regular or ordinary professors, 138 were extraordinary, and the rest were Docenten, assistants, special teachers, &c. Seventy of the 927 teachers belonged to the theological faculty, 134 to the law faculty, 342 to the medical, and 381 to the philosophical faculties. The students attending the universities numbered 10,594 in the winter and 9,766 in the summer semester. Of these, 11.8 per cent. attended the theological faculty, 52.5 per cent. attended the law faculty, 23.8 per cent. the medical, and 11.9 per cent. the philosophical faculty during the summer semester. As to religious belief, 76.3 per cent. of the students were Roman Catholics, 2.9 Greek Orientals, 3.7 per cent. Evangelicals, 16.6 per cent. Israelites, and 0.5 per cent. belonged to other faiths. These religions had somewhat different proportions in the population at large. Thus, in 1880, the Roman Catholics formed 91.35 per cent. of the total population, the Greek Orientals 2.23, the Evangelicals 1.81, the Jews 4.54, and other confessions 0.07 per cent. Classified as to native language, 48.9 per cent. of the students were Germans, 15.5 per cent. Czech-Slavonians, 15.7 Poles, 4.8 Ruthenians, 1.8 Slovenians, 2.8 per cent. Servians and Croatians, 3.2 per cent. Italians, 1.6 per cent. Roumanians, 4.5 per cent Magyars, and 1.2 per cent. belonged to other branches.

There were six higher institutions for technical instruction, with 337 teachers and an attendance of 2,699 students in 1881–'82. The attendance on these institutions has been decreasing in the last few years. The superior agricultural institute in Vienna had 16 professors and 23 teachers and Docenten and 511 students in 1881–'82. The two mining academies at Leoben and Pribram have shown increased activity in the last few years. They had 29 professors and 188 students in the academic year 1881–'82.

Secondary and special instruction.—There were six commercial academies, with a total attendance of 1,284 persons at the close of the collegiate year. Between the year 1877–'78, when the academies were increased to their present number, and the year 1881–'82 the number of students increased 18.8 per cent. The academies of art at

Vienna and Cracow had 36 professors and teachers and 430 students in the academic year 1881–'82. The 46 theological seminaries had 247 professors and teachers and 1,591 students during the same period. The Gymnasien numbered 129, the Realgymnasien 35, the Realschulen 80, institutions for training male teachers 42, for females 28, making a total of 314 secondary schools in the year 1882. These institutions had 5,599 teachers, of whom 3,192 were in the Gymnasien and Realgymnasien and 1,412 in the Realschulen. The students numbered 75,565, 50,291 of whom were in the Gymnasien and Realgymnasien and 15,251 in the Realschulen. There were 15,788 public elementary schools, with 51,171 teachers and 2,506,118 pupils during the scholastic year 1881–'82. During the same period there were 52 commercial schools, 345 industrial schools, 191 singing and music schools, 68 agricultural and forestry schools, 5 mining schools, 4 veterinary schools, 14 schools of midwifery, 3 naval schools, 282 work schools for women, and 342 other special institutions. These various institutions had, in all, 5,917 teachers and 82,674 students in the year 1881–'82.

b. HUNGARY, constitutional monarchy: Area, 125,039 square miles; population (December 31, 1880), 15,642,102 (including Croatia-Slavonia, with military frontier, Transylvania, and the town of Fiume). Capital, Budapest; population, 360,551. Minister of public instruction, Dr. August von Trefort.

Primary education.—According to Das ungarische Unterrichtswesen, 1882–'83, the number of children of school age in 1882 was 2,215,387, of which number 1,697,984, or 76.7 per cent., attended school. The review schools were not so well attended, the attendance reaching only 55 per cent. of their school population. Classified as to nationality, 44.87 per cent. of the children of school age were Magyars, 14.60 per cent. were Germans, 17.66 per cent. were Roumanians, 15.88 per cent. Slovakians, 2.56 per cent. Servians, 1.87 per cent. Croatians, and 3.06 per cent. Ruthenians. As regards school attendance, 49.56 per cent. of the pupils were Magyars and 15.49 Germans, showing a larger proportion of these two nationalities attending school than would be expected from their proportion to the school population. The other nationalities showed a smaller proportion in attendance than in school population. The total attendance was far from being that required by law, school attendance being obligatory from the beginning of the eighth to the end of the thirteenth year. The number of elementary schools was 16,000, made up of 22,661 class rooms, of which only about three-fifths were in the condition required by law. In the last twelve years a great number of fine school-houses (nearly 300 a year) have been built of stone or brick at the expense of the state, and these and many others compare favorably with the school buildings of any other country. But in many small villages, especially in Roumania, the school-houses are mere huts, totally unsuited to the purposes for which they are used. The regular teachers, male and female, numbered 22,396, and the assistants 3,054. The expenses for primary education in 1882–'83 reached 11,755,625 florins ($4,714,006).

Secondary instruction.—There were 150 Gymnasien and 28 Realschulen in the kingdom in 1882, with 37,876 students. Of these 71.34 per cent. were Magyars, 15.37 per cent. Germans, 6.4 per cent. Roumanians, 1.80 per cent. Servians, 0.44 per cent. Croatians, and 0.8 per cent. Ruthenians. The proportions of these nationalities to the population of the country were different from those just given, and were as follows: Magyars, 45.11 per cent.; Germans, 13.15 per cent.; Roumanians, 16.98 per cent.; Slovakians, 13.08 per cent.; Servians, 3.01 per cent.; Croatians, 1.97 per cent., and Ruthenians 2.50 per cent. The outlay for secondary education was 3,465,997 florins ($1,389,865). The average annual expense of a student of a Gymnasium supported by the state was 98.7 florins ($40), and 76.3 florins ($31) in a Gymnasium belonging to a religious denomination. The cost of primary education per child was 6 florins, 40 kreutzers (about $2.60).

Superior instruction.—Work on the buildings of the University of Budapest was continued in the year 1882–'83. There were 160 professors, of whom 63 were ordinary, 20 extraordinary, and the rest Docenten and special teachers. They delivered 590 lectures during the scholastic year 1882–'83. At the University of Klausenburg there

were 60 professors, 43 of whom were ordinary or regular, who delivered 250 lectures during the year. The appropriation for the University of Budapest was 520,804 florins ($208,842), and for the University of Klausenburg 189,275 florins ($75,899).

Special instruction.—The central drawing institute at Budapest had 108 students in 1882–'83. It has recently opened a practical course in painting. A superior normal school of drawing is annexed to this institute, which granted 17 certificates for teachers of drawing in Gymnasien, &c., in 1882–'83.

BELGIUM, constitutional monarchy: Area, 11,373 square miles; population (December 31, 1880), 5,520,009. Capital, Brussels; population, 388,781. Minister of public instruction, P. van Humbeeck.

The following information is taken from the Annuaire statistique de la Belgique for 1882.

Normal and primary instruction.—Up to December 31, 1881, the six normal schools for male teachers had 767 students and the eight normal sections had 785 students, making a total of 1,552. The six normal schools for young women had an attendance of 823 and the seven normal sections an attendance of 727; total, 1,550. The number of diplomas issued from the schools for male teachers was 325 and from the schools for female teachers 311; total for the year, 636.

There were 174 students in attendance at the normal schools and sections for secondary instruction during the scholastic year 1881–'82. Sixty-three of these were young women.

The number of primary schools in 1881 was—

Adopted	55	746	801	699	102
Total	188,539	151,579	340,118	303,938	36,180

For these schools there were 5,307 male and 2,990 female lay teachers, no male and 31 female teachers belonging to some religious order; total, 8,328. The number of protective schools for infants in 1881 was 701, with an attendance of 2,142 children (only three provinces recorded). The schools for adults numbered 2,445, of which 1,925 were for males and 512 for females, 8 being mixed schools. They were attended by 59,268 males and 17,650 females, 76,918 persons in all. Of these only 575 were paying students. There were 81 schools under the supervision of the department of justice (asylums, prisons, &c.), with a total of both sexes of 6,393 persons under instruction. Of conscripts for the army 19.33 per cent. could neither read nor write in 1881. In 1882 the proportion was 19.09 per cent.

On June 30, 1882, a bill was introduced into the Belgian chambers by the government making elementary education obligatory throughout the kingdom.

Secondary instruction.—Institutions for secondary instruction numbered 130, divided into royal athenæums, 22; secondary schools for young men, 65; the same for young women, 26; and 17 subsidized communal colleges and athenæums for young men. These secondary schools were attended by 22,947 students in 1881, 3,427 of whom were young women.

Superior and special instruction.—At the state universities, viz, Ghent and Liége, there were, in the scholastic year 1881–'82, 706 and 1,203 students, respectively, and at the independent universities of Brussels and Louvain 1,341 and 1,592 students, respectively. The Royal Academy of Fine Arts at Antwerp was attended by 1,792 students in 1881. Besides the Antwerp academy there were 80 other academies and drawing schools in the kingdom in 1881, with a total attendance of 10,488 persons. The royal conservatory of music at Brussels had 515 students in 1881; that at Liége had 1,105 and that at Ghent 584 students. Besides these royal conservatories there were 87 other conservatories and schools of music, attended by 8,405 students.

There were five agricultural, horticultural, and veterinary schools, with an attendance, in the year 1881–'82, of 225 students, and 33 industrial schools, with an attendance of 9,198 students. To these should be added the industrial and mining school at Mons and the superior commercial institute at Antwerp, with 84 and 119 students, respectively. The apprentice workshops numbered 52, with 1,029 pupils, of whom 7.48 per cent. were illiterate. The number of workmen turned out in 1881 was 541.

DENMARK, constitutional monarchy: Area, 14,553 square miles; population (February, 1880), 1,969,039. Capital, Copenhagen; population, 234, 850.

Very little information is obtainable respecting the schools of Denmark for 1881–'82. It is stated, however, that the educational system is especially well organized. Yet, notwithstanding this, there is a vast amount of ignorance among the people, as was shown by the examinations in reading, writing, and orthography of the recruits in 1881. Only about one-third could read correctly, one-third could read a little, while the other third read very badly. About one-fifth of the recruits were reported as able to write Danish — yet not in a very correct manner — as orthography seemed to be a great stumbling block. The university statistics, however, speak well for the higher education of the people. According to the Aarbog for Kjøbenhavns Universitet for 1881, there were 1,057 students in attendance in the autumn of 1880 and 867 in the early term of 1881. Among the number were a few graduates of previous years (1863–1880), who were continuing certain branches of study. Connected with the university are the polytechnic institute (107 and 69 students in the terms mentioned), school of pharmacy (61 and 52), the agricultural, botanical, and forestry departments (9 students each term), and a normal school with 11 pupils in 1880 and 9 in 1881. The courses in the university cover theology, jurisprudence, political science, medicine, philology, philosophy, mathematics, and natural sciences. At the entrance examinations in 1881, there were 223 students from the lower schools of Denmark who passed successfully. Of these 141 obtained first class certificates, 54 the second grade, 21 the third, while 7 were classed as "remarkably successful." Six students entered the university who had not taken the lower school courses, so that there were 229 seeking university instruction.

Copenhagen University is well endowed and has a fine library of nearly 300,000 volumes and 4,000 manuscripts. The surgical academy, two observatories, a botanical garden, and a museum furnish students with varied opportunities for getting an excellent education.

FINLAND, a dependency of Russia: Area, 144,222 square miles; population (December 1, 1881), 2,081,612. Capital, Helsingfors; population, 43,142.

A large majority of the people of Finland are Lutherans. In the year 1881 the numbers stood as follows: Lutherans, 2,040,535; Greek orthodox, 38,757; Roman Catholics, 2,320. The population of Finland is made up of Finns, 1,756,381 (in 1880); Swedes, 294,876; Russians, 4,195; Germans, 1,720, and 3,610 with no nationality given. The Finnish and Swedish tongues are both taught in the schools. Statistics of schools for 1881–'82 are presented in the Årsbok för Finland. The primary grades numbered 668, teachers 858, pupils 37,166, or an average of 43 to each teacher. Seven lower elementary schools are also reported, with 21 teachers and 266 pupils. There

were 4 seminaries for instructing teachers of the primary grades, with 43 teachers and 479 pupils. Schools for girls numbered 41, teachers 404, and pupils 3,169. The 19 Realschulen had 868 pupils, under charge of 135 teachers. Four preparatory departments, with 14 teachers and 201 pupils, lead up to the 23 lyceums. These had 3,713 students and 298 teachers. The Polytechnic Institute at Helsingfors reported courses in architecture, engineering, constructing machines, surveying, and chemistry. There were 26 teachers and 95 students at the first term of 1883. The university at Helsingfors has four departments, those of theology, law, medicine, and philosophy. The professors and lecturers numbered 67 in the early part of 1883, the students present 725 (including one woman, in the philosopical course); those on the rolls, 1,330. The receipts for the university were 980,700 marks; the expenditures, 839,300 marks.

FRANCE, republic: Area, 204,177 square miles; population (December 18, 1881), 37,672,048. Capital, Paris; population, 2,269,023. Minister of public instruction, Jules Ives Antoine Duveaux, August 7, 1882; Jules Ferry, February 21, 1883.

No statistics of education in France later than those given in the Report of the Commissioner of Education for 1881 have been received.

The law making primary instruction compulsory was finally passed March 28, 1882.

GERMANY, constitutional empire: Area, 208,692 square miles; population (December 1, 1880), 45,234,061, divided among the following 26 states, constituting the German Empire: Prussia, kingdom, 27,279,111; Bavaria, kingdom, 5,284,778; Saxony, kingdom, 2,972,805; Württemberg, kingdom, 1,971,118; Baden, grand duchy, 1,570,254; Hesse, grand duchy, 936,340; Mecklenburg-Schwerin, grand duchy, 577,055; Saxe-Weimar, grand duchy, 309,577; Mecklenburg-Strelitz, grand duchy, 100,269; Oldenburg, grand duchy, 337,478; Brunswick, duchy, 349,367; Saxe-Meiningen, duchy, 207,075; Saxe-Coburg, duchy, 194,716; Saxe-Altenburg, duchy, 155,036; Anhalt, duchy, 232,592; Schwarzburg-Sondershausen, principality, 71,107; Schwarzburg-Rudolstadt, principality, 80,296; Waldeck, principality, 56,522; Reuss-Greiz, principality, 50,782; Reuss-Schleiz, principality, 101,330; Schaumburg-Lippe, principality, 35,374; Lippe, principality, 120,246; Lübeck, free city, 63,571; Bremen, free city, 156,723; Hamburg, free city, 453,869; Alsace-Lorrine, imperial territory (Reichsland), annexed from France in 1871, 1,566,670. Capital of the empire, Berlin; population, 1,122,360.

Taking the various states in alphabetical order the following are the latest available educational statistics of the German empire:

Alsace-Lorraine.— After the annexation of this territory to Germany in 1871 great attention was paid to education by the imperial government. The University of Strassburg was opened on May 1, 1872. In 1882 this institution had 104 teachers (64 of whom were ordinary or regular professors) and 849 students. The library, which was destroyed in the bombardment of August 24 and 25, 1870, was replaced as soon as possible by a new one of about 400,000 volumes. Higher and lower schools were established on the German system, but open to pupils of all religious beliefs without distinction. When General von Manteuffel became governor on October 1, 1879, the management of the schools passed to a department of the ministry of the interior. Since then a series of regulations creating supervisory officers of education in the different districts, organizing local school boards, and reorganizing Kindergärten and elementary schools has been issued. In 1882 a superior school council was established as the supreme supervisory body respecting educational affairs, presided over by the secretary of state. This superior council busied itself in 1882 with the "overpressure" question, in which Alsace-Lorraine took an equal interest with other German States. According to Seyffarth's Chronik des Volksschulwesens, in 1881 there were 214,657 pupils in the public elementary schools, 6,137 in the free schools, 37,976 in infant schools, 2,607 in the review schools, 6,368 in the higher girls' schools, and 913 in the middle schools (higher elementary schools), making a total of 268,658. These pupils were instructed by 2,725 male and 2,853 female teachers. Of the female teachers 61 per cent. and of the male 1.7 per cent. belonged to some religious order. Thirty-two per cent. of all the teachers (male and female) were clerical. There were 6 teachers' seminaries for males and 3 for females, and 4 preparatory schools, with 872 students in 1880. There were 12 Gymnasien, 3 Realgymnasien, 1 Oberrealschule,

9 Realschulen, and 5 Realprogymnasien. In 1878 these institutions were attended by 6,213 students and had 324 teachers.

Anhalt.— The appropriations for the salaries of teachers increased 200 per cent. in ten years and amounted in 1883 to 665,376.64 marks ($158,360). In 1882 there were 100 teachers at the Gymnasien and Realschulen, 1 female and 15 male teachers at the seminary, 30 male and 17 female teachers at the four higher schools for girls, and 543 male and 91 female teachers at the elementary schools, a total of 797 persons. In 1881 the number of scholars in the primary schools was 37,147 (an increase of 8 per cent. in seven years). In 1882 two Realschulen of the first grade were opened. The higher schools for girls were raised in grade and the programs of the "middle" schools (burgher schools) were also enlarged.

Baden.— The central authority on school matters is the ministry of the interior, which also directly administers the two universities at Heidelberg and Freiburg and the Polytechnic Institute at Carlsruhe. All other educational institutions are under the supervision of a superior board or council of education, which deals immediately with the secondary schools, as the ministry does with the universities. There were in 1882 7 Gymnasien, 5 Realgymnasien, 6 complete and 3 incomplete Progymnasien, 30 higher burgher or city schools modelled after the Prussian system, 37 industrial schools, 8 higher schools for girls, 3 teachers' seminaries for men and 1 for women, 1 seminary for teachers of gymnastics, 2 institutions for the deaf and dumb, and 1 blind asylum. The primary schools numbered 1,592 and had 3,238 teachers and 245,650 scholars.

Bavaria.— Mr. Joseph W. Harper, United States consul at Munich, prepared a report on the school system of Bavaria in 1882, which was transmitted by the Department of State to the Bureau of Education. The following is a summary of it: School attendance is compulsory in Bavaria, and non-compliance with the law on the part of parents or guardians or of persons of school age themselves is punished by fine and imprisonment. Teachers of elementary schools pass through a 3-year course in a preparatory school after leaving the elementary schools, then attend a teachers' seminary for 2 years, and finally have a 4-year course of practical training and study, after which they are required to pass an examination. The minimum amount of pay for male teachers of elementary schools ranges from 857.20 marks ($204) a year in districts or communes of 10,000 inhabitants to 600 marks ($142.80) in communes of less than 2,500 persons. An assistant gets a minimum of 342.90 marks ($81.61), of which he must pay 205.80 marks ($48.98) for board and lodging. In addition to their salaries teachers receive a quinquennial advance of 90 marks ($21.42), beginning with the tenth year after leaving the seminary. Female teachers receive a minimum of 514.20 marks ($122.40) and have an increase of pay for long services, like the men. In the elementary schools both sexes receive instruction in common where there is only one teacher; where there are two or more the government decides whether the separation of the school shall be made by class or sex. Where there are more than three teachers the highest class is divided according to sex. In all the larger towns a complete separation of the sexes has been effected. Children of poor parents are educated at public expense. The school age is from 6 to 13 years, inclusive, for elementary schools, after which there is a further compulsory attendance of 3 years at the Sunday schools.

The preparatory schools for teachers had an attendance of 2,464 and the teachers seminaries 1,329 students in 1882. The agricultural review schools numbered 1,088 with 1,412 teachers and 14,633 scholars. There were 296 industrial review schools, with 22,269 students and 1,160 teachers; 4 superior industrial schools, with 309 students; 5 Realgymnasien, with 480, and 46 Realschulen, with 7,065 students. The technological institute had 741 students. The universities had an attendance of 3,664 students. There were 14 institutions for the deaf and dumb, with 63 teachers and 573 pupils. The Bavarian teachers' union numbered 10,084 members.

Bremen.— The city possesses a high school, which comprises a Gymnasium, Real-

gymnasium, and a common preparatory school for both; and 2 Realschulen, besides 1 each in Bremerhaven and Vegesack. The higher schools for girls are private institutions. The elementary schools are partly under church control, supported and superintended by the state, and are partly state institutions; of the latter 5 are public common schools, with 3,500 scholars, and 6 charity schools, with 4,000 scholars. There is a teachers' seminary for men; also, a private institution of the same character for women.

Brunswick.—Brunswick had in 1882 1 superior institute of technology, 5 Gymnasien, 1 Realgymnasium, 1 Realschule, 3 private schools of the grade of a burgher school (2 of which were Jewish), 1 school of agriculture, and 1 school of construction. There were two public superior schools for girls combined with seminaries for female teachers. The elementary schools were under the supervision of 44 superintendents and had a teaching force of about 700 persons in 1882. There were 3 seminaries for training teachers, 2 reform schools, several orphan asylums, 1 institution for the deaf and dumb, and 1 institution for the care of idiots.

Hamburg.—From the report of the board of education for the year 1882–'83 we take the following figures: In that year Hamburg had 61 public elementary schools, with 34,847 scholars and 540 male and 247 female teachers. Of the 34,847 children 33,819 were Lutherans, 352 Reformed, 148 Catholic, and 29 Jews. The teachers' seminary for men had 102 and the teachers' seminary for women 66 students; there were 2 preparatory schools for teachers, with 111 male and 94 female students: giving a total of 373 individuals studying the profession of teaching. The Wilhelm Gymnasium had 203 students, the Realschule 531, the higher burgher school 388, and the Johanneum school 633 students. Preparatory schools for these higher institutions had a total attendance of 534 scholars. The poorhouse school had an attendance of 95; the orphan asylum school, 462; the institute for the deaf and dumb, 65; and 47 other public schools had an attendance of 6,623 in all. The total public school attendance was 44,381 persons. There were 27 church, foundation, and association schools, with 7,780 children in attendance. There were 129 private schools of all kinds, with an attendance of 14,453. The total of all persons receiving instruction was 66,614.

Lübeck.—At the close of the year 1881–'82 Lübeck and its suburbs had 76 schools, with 11,478 children and 211 male and 163 female teachers. This number includes the Catharineum, the higher burgher school, the business school, the navigation school, the industrial art school, all the public elementary schools, church and charity schools, and private schools of all kinds.

Mecklenburg-Schwerin.—This duchy had 6 Gymnasien, 6 Realgymnasien, 1 Progymnasium, 1 Realschule, and 4 higher burgher schools in 1882–'83. In 1877 the number of public elementary schools was 1,389, together with 55 burgher and city schools. There was 1 institution for the blind, 1 for the deaf and dumb, and 1 for the feeble-minded. The business review schools numbered 45. The University of Rostock had 42 teachers and 236 students in the winter of 1882–'83.

Mecklenburg-Strelitz had 3 Gymnasien, 2 Realschulen, 2 higher schools for girls, 1 seminary, and 233 county and 12 city schools.

Prussia.—The number of elementary primary schools in Prussia in 1882 was 33,040. Sixty-nine per cent. of these schools had only 1 teacher each. As to religious belief 22,821 schools, having 2,723,911 children and 39,106 teachers, were evangelical; 9,452 schools, having 1,405,989 children and 17,429 teachers, were Roman Catholic; 250 schools, with 10,037 children and 310 teachers, were Hebrew; and 517 schools, with 199,792 children and 3,072 teachers, were schools where children of different beliefs received instruction in common. The total number of children in school was 4,339,729, and the number of instructors 59,917. For preparing teachers there were 103 seminaries for males and 8 for females in 1882–'83 and the attendance was 9,955. In 1870 the number of seminaries was 79 for males and 3 for females, with an attendance of 5,000. Prussia had 249 Gymnasien, 33 Progymnasien, 89 Realgymnasien, 12 upper Realschulen, 78 Realprogymnasien, 16 Realschulen, and 23 higher burgher schools. The Gymnasien

and Progymnasien enrolled 77,260 students in 1879, all the Realschulen about 50,000. Of the 127,260 over 90,000 were evangelical, about 22,500 were Catholic, and 13,000 Jews. There were in 1882 17 agricultural schools of an intermediate or secondary grade (below the agricultural institutes connected with the university), and 53 of a lower grade.

The statistics of the Prussian universities for the year 1882–'83 are as follows:

	Professors.	Total number of teachers.	Summer, 1882.			Winter, 1882–'83.	Summer, 1883.
			Students.	Other hearers.	Total hearers.	Students.	Students.
Berlin	68	241	3,900	1,095	4,995	4,678	4,062
Bonn	55	110	1,061	41	1,102	973	1,165
Breslau	55	123	1,532	150	1,682	1,495	1,559

Braunsberg *a*	7	9					

a Academies having faculties of Catholic theology and of philosophy only.

In 1881 there were 51 institutes for the deaf and dumb, with 301 teachers and 3,629 students.

Saxony.— In 1881 the number of schools in Saxony was 2,205, with 6,551 teachers (only 350 of whom were women) and 488,680 scholars—16.4 per cent. of the total population. The review schools numbered 1,832 and had an attendance of 71,114 persons. There were 12 Gymnasien, with 355 teachers and 5,098 students; 11 Realschulen of the first order, with 216 teachers and 2,779 students; 22 Realschulen of the second order, with 236 teachers and 3,023 students, and 19 seminaries, with 271 teachers and 2,596 students.

The University of Leipzig had 177 professors and teachers and 3,317 students. The Polytechnicum at Dresden had 51 professors and teachers and 371 students. There were 557 pensioned teachers, including 4 women. The mining academy, at Freiberg, had 19 teachers and 122 students, and the 2 mining schools had 8 teachers and 87 students. These institutions, together with the forestry school, are under the minister of finance. Under the minister of war are the cadet school at Dresden, with 21 teachers and 160 students (in 1881–'82); the subaltern school, at Marienberg, with 13 teachers and 400 students; the school for soldiers' sons, at Struppen, with 2 teachers and 80 scholars, and 5 garrison schools, with 6 teachers and 106 students. The minister of the interior has control of the art academy at Dresden, with 23 teachers and 123 students; the art industrial school, at Leipzig, with 13 teachers and 196 students; the art industrial school at Dresden, with 19 teachers and 212 students; the technological institute at Chemnitz, with 40 teachers and 447 students; and 44 industrial and review schools, with 309 teachers and 6,127 scholars. The conservatories of music at Leipzig and Dresden were attended by 985 students and had 101 teachers in 1881–'82. Besides these institutions there were 15 fitting schools for trade, with 94 teachers and 1,536 students, and schools for preparing boys for special vocations, such as seafaring, architecture, agriculture, &c.

Württemberg.— On January 1, 1882, there were 4,158 primary school teachers in Württemberg, of whom 2,890 were evangelical and 1,268 Catholic. In 17 cities there are

so-called elementary schools, which receive boys of six years of age and give them instruction until they enter the Gymnasien. These schools numbered 18 in 1881 and had 58 teachers and 2,482 scholars. There were 11 higher schools for girls, with 3,299 pupils, 106 male and 98 female teachers. The number of public secondary schools numbered 92, of which 4 were lower evangelical theological seminaries, 12 were Gymnasien, 8 lyceums, and 68 lower Latin schools. These institutions had 406 established principal teachers and 9,257 students. Of the latter, 6,716 were evangelical, 2,134 Catholics, and 396 Jews. There were 74 public Realschulen, including the burgher school at Stuttgart, with 268 teachers and 6,629 scholars. The seminary for teachers of higher schools for girls at Stuttgart had 41 students and 14 teachers, 12 of whom were men.

The art school at Stuttgart had 11 teachers and 69 students in 1881, and the conservatory of music had 610 students at the same time. The Polytechnikum in Stuttgart had 65 teachers and assistants in 1881 and 410 students. The school of architecture at Stuttgart had 41 teachers and assistants and 448 students. There were 153 industrial review schools, with an attendance of 9,600 scholars and 735 teachers, and 28 industrial schools for girls and women, with a total attendance of 3,182 persons. The agricultural institute at Hohenheim had 21 teachers and assistants in 1881 and 72 students. The veterinary school at Stuttgart had 13 teachers and assistants and 60 students. The farm schools at Ellwangen, Ochsenhausen, and Kirchberg had 12 students each. The school of viticulture at Weinsberg had 15 students, 5 agricultural winter schools had 89 students, and the various other evening and winter agricultural schools numbered 883 and had an attendance of 20,100 persons.

The University of Tübingen had 106 professors and assistants and 1,401 students in 1882.

The Knabenhort.—The Prussian minister of the interior, in a circular dated April 10, 1883, called the attention of the provincial authorities to an association called the Knabenhort which has existed in Munich since 1881. The object of this association is to place boys of school age who are sons of poor parents in charge of suitable persons during part of the time they are not in school, and give them some useful occupation, such as wood working, &c., or amuse them in a way to stimulate and develop their understanding and sensibilities. The boys in this way become accustomed to habits of obedience, order, industry, and cleanliness and are kept from the influences of bad company. Of the objects of the association, the first report says:

> The homes of many poor people are left deserted on work days until evening, and when their children come out of school there is no one to take care of them, so that they are exposed to the dangers which come from bad company or from being left to themselves. So also many poor widows heroically devote themselves to work for their own and their children's support. They are compelled for the most part to work far from home during the day, and they return at night filled with anxiety lest some bodily or moral harm has come to their children during their absence. The conviction is constantly spreading that indifference to these circumstances on the part of the public will tend to aggravate the social evils which spring from them, and it is from such considerations as these that the Knabenhort was established.

Notwithstanding its recent origin this association has received such support as to enable it to open two places for its purposes in Munich.

In his circular the minister points out that the Kindergärten and similar schools exercise a very salutary influence, but that their scope is limited to infants not yet old enough to attend the public elementary schools, while the danger of leaving pupils of the latter schools to themselves after school hours is equally to be avoided. Moreover, the expenses of such a society as the one at Munich are small, the subscription in that city being only one mark, and yet the Knabenhort has been able to take care of over a hundred boys in less than two years. The minister recommended the formation of similar societies whenever local circumstances made it desirable. The circular also states that the boys are admitted at 2 o'clock Wednesday and Saturday afternoons and at 4 on other work days. They only get bread to eat in the Munich Knabenhort, because the popular schools of that city have kitchens attached, where the poor children can get both bread and soup.

Similar institutions have since been started in Hanover, Fürth, and Bamberg, while Nuremberg also reports in favor of a Knabenhort. As far back as 1829 Darmstadt undertook to look after her boys out of school hours, and now between 400 and 500 boys are cared for. Erlangen, Baümenheim, Augsburg, and Dresden have had like establishments under way in past years. In some of these "refuges for boys" soup and meat are given at noon. At Hanover each boy is given a plot of ground to cultivate. At present 25 boys are learning, under charge of 2 instructors, to hoe, chop, plant, water flowers, keep paths clean, &c. The fruits or vegetables raised may be carried off for home consumption. In wet weather indoor industries are taught, and already a straw matting has been made for the shop floor. Whether all these institutions are called "Knabenhort"[1] is not stated, but the plan is said to be the same.

GREAT BRITAIN AND IRELAND, constitutional monarchy: Area, 120,832 square miles; population, 35,241,482. *a.* ENGLAND AND WALES. Population, 25,974,439. Capital, London; population, 4,766,661.

The following information regarding elementary education is compiled from the report of the committee of council on education for the year ending August 31, 1882, signed by Lord Carlingford and Mr. Mundella:

Day schools.—Number of day schools inspected, 18,289; number of certificated teachers, 35,444, with a large number of assistants and pupil teachers; accommodation for 4,538,320 scholars; enrolled, 4,189,612; average daily attendance, 3,015,151; present on the day of inspector's visit 3,542,742; qualified by attendance for examination, 2,943,114; presented for examination, 2,780,430, viz, 661,056 (being under 7 years of age) for collective and 2,119,374 (7 and above) for individual examination. Of these last, 1,378,175 passed the prescribed test without failure in any one of the three subjects, viz, reading, writing, and arithmetic.

These figures show improvement upon the returns quoted in 1881, as follows: While the increase of the population during the year is estimated at 1.35 per cent., the accommodation has increased by 148,687 school places (or 3.39 per cent.); the scholars on the registers, by 144,250 (3.57 per cent.); the average attendance, by 151,616 (5.29 per cent.); and the number of children individually examined, by 123,676 (or 6.2 per cent.).

Since 1870 the provision in schools visited by the inspectors has risen from 1,878,584, or 8.75 per cent. of the population, to 4,538,320, or 17.24 per cent. of the population. Of this total increase of 2,659,736 school seats, no fewer than 705,868 have been required to meet the growth of the population. The rest, or nearly 2,000,000 seats, may be taken as the measure of the deficiency which existed at the passing of the education act.

Night schools.— Number examined, 1,015; average attendance, 33,135.

Training colleges.—Number, 41; attendance, 3,121.

Income and expenditures.—The total income of day and night schools was 5,566,804*l.* The total cost of maintenance of day and night schools was 5,572,820*l.*, an increase of 235,841*l.* over the same for 1881.

School accommodation and attendance.—On the usual assumption that six-sevenths of the population are of the class whose children ought to attend public elementary schools, one-fifth of the whole population might be found in the registers of the schools, and seats should be provided for one-sixth of the population, which seats ought to be daily occupied. With the estimated population for 1882 (viz, 26,325,376), this would give 5,265,075 on the school registers and 4,387,562 in average daily attendance, whereas the returns show 4,189,612 children on the registers and 3,015,151 in attendance.

The actual provision of school places, while somewhat in excess of the number required, is not evenly distributed, so that in several counties there is marked deficiency of accommodation.

[1] A Berlin society is to be started early in 1884 for the express purpose of establishing similar places for girls: that is, Mädchenhort.

The average daily attendance, it will be seen, falls below the required number by above one and a quarter million. Improvement in this respect will, it is thought, be very rapid under the new code, which makes it, more than ever, the interest of all concerned in the efficiency of each inspected school to increase the average yearly attendance by diminishing daily irregularities.

Infants.—Of the day scholars on the school registers 416,126 were under 5 years of age and 898,483 were between 5 and 7. The provision which in many districts was specially needed, and has been supplied of late years, for the separate accommodation of infants, will, it is to be hoped, materially increase the number of this latter class of scholars. The methods of instruction for children over and under 7 years of age are very different, and cannot be efficiently carried on in the same room. Every school, therefore, except the very smallest, requires a separate department for infants, and the new code contains special provisions for securing that proper arrangements are made for the purpose. Of the 863,817 infants in average attendance during the last year, 565,224 were found in infant schools, 139,746 in infant classes of mixed schools under schoolmistresses, and as many as 158,847 in similar classes under the very unsuitable charge of male teachers.

Scholars over 7 years of age.—The following table shows the classification of children over 7 for each standard:

Standard.	Age at which standard should be passed.	Scholars of this age on registers of aided schools.	Scholars examined in the standard.	Number over 10 years old examined.
I	7	499,082	569,717	50,338
II	8	489,745	505,859	146,808
III	9	486,475	444,769	274,241
IV	10	456,822	346,539	338,927
V	11	415,406	184,093	183,915
VI	12	322,950	68,397	68,396

Whereas, out of 2,119,374 scholars examined individually, as many as 1,062,625, being over 10 years of age, ought to have been presented in standards IV–VI, only 591,238 were so presented, while 471,387 (or 44.36 per cent.) were presented in standards suited for children of 7, 8, and 9 years of age.

There has been, however, a gradual improvement in this respect, which is due partly to the more regular attendance and increased proficiency of the children between 5 and 10 years of age and partly to the greater attention paid by teachers to the progress of individual scholars, in consequence of a provision of the codes of late years which made the payment of certain grants depend upon the proportion of scholars examined in the three upper standards. That proportion has risen from 17.96 in 1872 to 28.26 per cent.

Class subjects and specific subjects.—For class subjects grants were made in respect of an average attendance of 1,878,987 scholars, of whom 1,514,446 were paid for passes in two subjects. The number examined in specific subjects was 185,157, of whom 137,671 passed successfully, 50,953 of them in two subjects and 1,287 in three subjects. In this class were comprised 59,812 girls examined in domestic economy.

Miscellaneous.—Military drill is systematically taught to the boys attending 1,157 day schools. Cookery is taught in 347 schools, or in 48 more than in 1881. Savings banks have been established in 1,376 and school libraries in 2,603 schools. Singing is taught in 26,681 departments of schools, the instruction being given by ear in 22,352.

With the view of encouraging the study of scientific subjects in training colleges, it has of late years been arranged that success in the examinations in science held by the Science and Art Department should be taken into account in determining the students' places in the class list of candidates for teachers' certificates. From the

record of the Christmas examinations it appears that 1,357 male students were examined in one or more subjects, the total number of passes being 1,915; the number of female students was 1,245; number of passes reported for them, 511.

Languages now enter into the course of study in all the training colleges for masters and in several of those for mistresses. At Christmas last 1,122 papers were worked by male students and 465 by female students. Of the papers presented 1,122 were in the French language, 463 in the Latin, and 2 in the Greek.

Salaries.—The average salary of a certificated master, which in 1870 was 95*l.* 12*s.* 9*d.*, is now 119*l.* 15*s.* 6*d.*; that of a schoolmistress was 57*l.* 16*s.* 5*d.* in 1870 and is now 72*l.* 0*s.* 11*d.* In addition to their other emoluments, 6,194 out of 14,255 masters and 5,393 out of 20,094 mistresses are provided with residences free of rent; these averages are calculated upon the whole of the certificated teachers, whether principal or assistants.

The number of female pupil teachers in 1869 was 7,273; they now number 19,433, an increase of 167 per cent. The male pupil teachers, who numbered 5,569 in 1869, have increased to 8,852, or by about 59 per cent.

Pensions.—The education department has received during the school year 140 applications on behalf of teachers in England and Wales satisfying the required conditions, and has awarded 5 pensions of 25*l.* and 5 of 20*l.*, together with 12 gratuities to the amount of 360*l.*

Education in London.—From the annual statement of the chairman of the board, Mr. Edward North Buxton, it appears that the number of places required in efficient elementary schools, December, 1882, was 641,428, while the number provided was 539,044. A practical proof of the deficiency here indicated, Mr. Buxton observes, is found in the number of children who are still refused admission in the growing districts. He recommends, as in previous years, the purchase of sites for school-houses in anticipation of the demand in rapidly growing districts. The report of the by-laws committee for the half year ending midsummer, 1883, gives as the total accommodation 557,984; average number on the roll, 530,697; average attendance, 431,467. As compared with 1871, these figures show that in all efficient schools the number of school places has increased by 295,725—that is, by 112.7 per cent.; that the number on the roll has increased by 308,179—that is, by 138.4 per cent.; and that the average attendance has increased by 257,166—that is, by 147.5 per cent. Attention is drawn to the fact that the percentage of average attendance as compared with the average number on the roll is higher in this report than in any previous report, not only for the whole metropolis, but also both in board and voluntary schools. This percentage for the whole metropolis is 81.3; for board schools, 82.0 per cent.; and for voluntary schools, 80.2 per cent. The committee, however, would point out that the board must not expect this proportion to be maintained in future, for the following reason: The board schools have been in the habit every week of clearing their rolls of children who have been absent for two weeks. A regulation of the education department, which the boards have been compelled to follow, lays it down that the roll of all public elementary schools should only, except in certain specified cases, be cleared of children who have been absent for six weeks. In future, therefore, the number on the roll as compared with the average attendance will, at all events in the board schools, appear to be greater than has hitherto been the case.

The whole number of schools under the board, viz, 324, shows the number of children in each standard in the week ending March 22, 1883, as follows:

Total number in and percentage of each standard, the enumeration being taken just before the Easter holidays, when the attendance is always low:

Below I.	I.	II.	III.	IV.	V.	VI.	Beyond VI.
74,858 25.1	65,230 21.8	50,842 17	43,056 14.4	32,721 11	20,415 6.8	9,402 3.2	2,222 .7

The report of the government examinations for the year ending March, 1883, shows for 110 schools the following results:

Percentage of passes in reading	91.9
Percentage of passes in writing	89.3
Percentage of passes in arithmetic	86.0

The income of 120 schools, for which the reports of the government inspectors were received for the same year, was 226,824*l.* 10*s.* 7*d.*, all of which was absorbed in the expenditure.

The gross average cost per child in average attendance in 110 schools reported upon for the entire year was 2*l.* 15*s.* 10½*d.*, and the net cost 1*l.* 11*s.* The fees charged in the schools average about 2*s.* 2*d.* per week. The gross amount collected from this source for the year ending September 29, 1882, was 100,000*l.* The expenditures of the board for the fiscal year 1881–'82 were 921,642*l.* 2*s.* 11*d.* The rates for 1881–'82 were 6.15*d.*; for 1882–'83, 5.93*d.*

For the year ending September 29, 1882, there were in the service of the board 837 head teachers, 2,821 assistant teachers, 1,078 pupil teachers, and 468 candidates. The average salary of head teachers was 202*l.* 2*s.* 9*d.*; that of assistants, 102*l.* 15*s.* 4*d.* A proposal of the school management committee recommending that the teachers be paid fixed salaries will undoubtedly be adopted by the board.

The number of blind children on the rolls 22d of March, 1883, was 105. They received special instruction in 33 classes, which included from 1 to 13 children each.

The number of deaf and dumb children on the rolls was 191 and their average attendance was 128. With reference to their instruction the superintendent observes:

The oral system, which teaches all deaf children speech by means of speech, to the entire exclusion of manual signs, is undoubtedly the best system, and efforts are now being made to carry it out to its fullest extent in all the classes. It has been considered desirable under the present arrangements to make the average as near as possible ten children in each class, and to keep the classes separate and distinct. The difficulty of obtaining qualified teachers in the oral system still continues, the few who are trained at the Ealing College being eagerly sought after as private governesses.

Twenty-three cookery centres were open during the half year; all girls in standards V and VI in schools where domestic economy is taken as a specific subject have been required to attend a course of twenty lessons in practical cookery; also, girls over twelve years of age, not in the upper standards, have to make twenty attendances at a cookery centre.

The superintendent of method in infants' schools points out the need of increased material and better accommodation for the training of young children.

The reports of the instructor in drill and the superintendent of the physical education of girls show progress in both these departments.

In 1882 the number of schools saving penny banks in connection with the post office was 30.

Industrial school cases.—Under this head Mr. Buxton observes:

Since 1870 7,566 children and during the past three years 2,231 children have been sent to industrial schools. The convictions for juvenile crime are now only half what they were in 1870. The obvious connection between these figures justifies me in placing them together. It is now difficult for a child in the company of thieves, or otherwise likely to adopt a life of crime, to escape the knowledge of one or other of our industrial school officers; and if, on investigation, his case is found to be a suitable one, he is removed from a position where he is in danger himself and likely to become dangerous to the community, and placed where there is a reasonable chance of his becoming a useful member of society. During the past three years 4,580 of such cases have been considered by the committee, 3,675 have been taken before the magistrates, and 2,231 have been sent to industrial schools. * * * The appointment of a royal commission to inquire into the whole subject of industrial schools is a satisfaction to all of us, as we may confidently hope that the weak points of the system will be exposed without the destruction of so valuable an aid in arresting the sources of crime. I also trust that one result will be to give more prominence to the educational and less to the penal side of these institutions.

b. SCOTLAND: Population, 3,735,573. Capital, Edinburgh; population, 236,002.

The following summary is compiled from the report of the committee of council of education in Scotland for the year 1882, signed by Lord Carlingford and Mr. Mundella.

Day schools.—Number of day schools inspected, 3,073; number of certificated teachers, 5,728, with a large number of assistants and pupil teachers; accommodation for 619,086; enrolled, 555,660; average daily attendance, 421,265; present on day of inspector's visit, 490,372; qualified by attendance for examination, 413,266; presented for examination, 374,957, viz, 54,207 (under 7) for collective and 320,750 (7 and over) for individual examination; of these last, 243,814 passed the prescribed test without failure in any one of the three subjects.

Since 1872 the provision in aided schools has risen from 281,668, or 8.3 per cent. of the population, to 619,086, or 16.4 per cent. of the population.

Of the total increase of 337,418 seats, some 63,260 have been required to meet the growth of the population during the last ten years. The rest, or upwards of 274,000 seats, may be taken as the measure of the deficiency in inspected schools at the passing of the education act.

Night schools.—Number examined, 221; average attendance, 11,904.

Training colleges.—Number, 7; attendance, 850.

Income and expenditure.—The total income of day and night schools was 878,506*l.*; total cost of maintenance of day and night schools, 873,918*l.*, an increase of 11,144*l.* over the same for 1881.

School accommodation and attendance.—It is stated that, when the outstanding building grants have been paid and several schools now in the course of erection without such aid are occupied, the school supply of the country will be virtually complete.

School attendance is still far below the required number, for, whereas there might be 755,072 scholars on the registers and 629,227 in average daily attendance, the returns show only 555,660 children on the registers and 421,265 in attendance.

This deficiency in school attendance has caused the department to make special inquiries as to the manner in which the school boards carry out their compulsory powers. They have also presented a bill in Parliament with a view of facilitating the exercise of those compulsory powers.

Infants.—Out of a total of 114,267 children from 4 to 7 years of age enrolled upon the school registers, there was an average attendance of 81,087; of these, only 25,987 were instructed in infant schools proper, 10,454 in the lower classes of mixed schools under schoolmistresses and as many as 44,646 in similar classes under male teachers, who, unless assisted, as they sometimes are, by competent female teachers, are obviously quite unsuited for such a charge.

Scholars above 7 years of age.—Whereas, out of 320,750 scholars examined, as many as 162,057, being over 10 years of age, ought to have been presented in standards IV–VI, only 114,699 (or 70.78 per cent.) were so presented, while the remaining 47,358 were presented in standards suited for children of 7, 8, and 9 years of age.

Specific subjects.—Of 58,210 scholars presented in subjects beyond the standard examination, 2,805 passed in three subjects, 24,190 in two subjects, and 23,088 in one. In this class were comprised 25,367 girls examined in domestic economy, of which number 20,078 passed.

Miscellaneous.—Military drill is systematically taught to the boys attending 258 schools; cookery is taught in 40 schools; savings banks have been established in 94 and school libraries in 136 schools. In 3,082 departments of schools in which singing is taught, the instruction is given by ear in 1,222, or 39.65 per cent.

Teaching power.—The number of students in training colleges who presented themselves at the examinations of the Science and Art Department was: men, 298; women, 217. For the former, 299 passes are reported; for the latter, 58. The extent to which the training colleges have contributed to the existing supply of certificated teachers

in Scotland is shown by the fact that, of 3,211 masters employed in schools reported on last year, 1,929, or 60.08 per cent., had been trained for two years; 323, or 10.06 per cent., for one year, and 98, or 3.05, for less than one year, while 861, or 26.81 per cent., were untrained. In like manner, of 2,517 schoolmistresses, 1,734, or 68.89 per cent., had been trained for two years; 122, or 4.85 per cent., for one year; 8, or .32 per cent., for less than one year, and 653, or 25.94 per cent., were untrained. Of the teachers, however, who, from whatever cause, have not attended a training college, a considerable proportion cannot, except in a technical sense of the word, be classed as untrained, having under the superintendence of some of the best teachers satisfactorily completed the pupil teachers' course and served as assistants in large schools before passing the examination for a certificate and undertaking independent charges.

The system introduced by the code of 1873 of combining attendance at university classes with the efficient course of practical professional training provided by the colleges under inspection, is now producing very satisfactory results. All the training colleges for masters are now availing themselves of this provision of the code.

Salaries and pensions.—The average salary of a certificated master, which was in 1870 110*l.* 16*s.* 7*d.*, is now 136*l.* 3*s.* 7*d.*; that of a schoolmistress was 55*l.* 14*s.* 2*d.* in 1870 and is now 67*l.* 10*s.* 10*d.* During the year the department has received 11 applications for pensions on behalf of teachers in Scotland. Since the practice of granting pensions was resumed in 1875, 117 Scotch applications have been dealt with, and the department has granted 5 pensions of 30*l.*, 19 of 25*l.*, and 26 of 20*l.*, and 18 gratuities to the amount of 650*l.*

IRELAND: Population, 5,174,836. Capital, Dublin; population, 249,602.

From the report of the commissioners of national education in Ireland it appears that the number of schools on the operation list on the 31st of December, 1882, was 7,705. During the year 72 schools were dropped or ceased to exist as independent schools and 129 were brought into operation, giving a net increase of 57 schools as compared with 1881.

The total number of pupils on the rolls between the 1st of January and the 31st of December who made at least one attendance was 1,083,298; the number of pupils on the rolls who made at least one attendance within the last fortnight of the results period was 678,970; the average daily attendance was 469,192, an increase of 15,625 as compared with that of 1881.

School accommodation, allowing 8 square feet for each pupil, was adequate for an attendance of 670,178.

Mixed schools.—The total number of mixed schools under Roman Catholic teachers exclusively was 2,750, attended by 358,342 Roman Catholic pupils and 22,458 Protestant pupils; the total number of mixed schools under Protestant teachers exclusively was 1,283, attended by 24,316 Roman Catholic and 128,812 Protestant pupils. The number of mixed schools under Roman Catholic and Protestant teachers conjointly was 86, attended by 10,331 Roman Catholic pupils and 10,069 Protestant pupils. Total mixed schools, 4,119; total attendance, Roman Catholic pupils, 392,989; Protestant pupils, 161,339.

Unmixed schools.— Of 3,501 schools showing an unmixed attendance, 2,907 were in charge of Roman Catholic teachers and attended by 462,481 Roman Catholic pupils and 594 were in charge of Protestant teachers and attended by 65,922 pupils.

Model schools.—The number of model schools reported is 26, having an average daily attendance of 8,692 pupils.

Workhouse schools.—The number of workhouse schools in connection with the board on the 31st of December, 1882, was 160, having an enrolment of 14,382 and an average daily attendance of 7,709.

Examinations.— The total number of distinct schools examined for results during the year was 7,648, including 64 evening schools. The number of pupils examined was 491,440, of whom 115,370 were infants. The number passed was 372,967, includ-

ing 104,752 infants. The number of pupils examined and passed in extra subjects was as follows: Music, examined, 53,474; passed, 40,099. Drawing, examined, 23,210; passed, 17,028. Other extra subjects, viz, mathematics, physical science, language, domestic economy, &c., examined, 27,782; passed, 17,950.

Comparative view.—The percentages of passes gained in reading, writing, and arithmetic in Ireland, as compared with England and Wales and with Scotland, are set forth in the following table:

	Ireland.	England and Wales.	Scotland.
Reading	92.9	89.2	92.3
Writing	94.7	81.9	89.3
Arithmetic	76.6	77.3	85.1

School farms and gardens.—The total number of school farms in connection with the board on the 31st December, 1882, was 73, of which 71 were examined during the year, and special results fees for agriculture were granted upon the answering of the pupils. The total number of pupils examined in agriculture in this class of schools was 965, of whom 709 passed in the agricultural program.

The commissioners had also 19 schools having school gardens attached, for the management of which and for the agricultural knowledge displayed by the pupils special agricultural fees were granted upon the reports of the district inspectors. The number of pupils examined in the school gardens last year was 257, of whom 118 passed.

The number of pupils examined in agriculture by the district inspectors in the ordinary national schools at the results examination was 44,493, of whom 21,135 passed. The total number of pupils examined in agriculture during the year 1882 (including the pupils of ordinary agricultural schools and school gardens referred to above) was accordingly 45,715, of whom 21,962 gained passes for their proficiency in that branch. These figures show that a larger number of pupils were brought under instruction in agriculture in 1882 than in 1881.

Teaching power.—There were in the service on 31st December, 1882, 7,497 principal teachers and 3,035 assistants, making in the whole 10,532 classed teachers, of whom 3,491 were trained. In addition to these there was a large number of paid monitors, temporary assistants, &c. The total number of teachers and students trained in 1882 was 161, viz, 70 males and 91 females.

The total number trained from the commencement of the proceedings of the commissioners up to 31st December, 1882, was 10,875.

The total income of the teaching staff from all sources for the year ending March, 1883, amounted to 746,586*l.* 4*s.* 9*d.*, viz, 600,293*l.* 15*s.* 7*d.* from the board, 11,906*l.* 7*s.* 1*d.* from the rates, and 134,386*l.* 2*s.* 1*d.* from payment by pupils (including portion of model school fees), subscriptions, and the estimated value of free residences, &c. Of the total sum 19.6 per cent. was locally provided and 80.4 per cent. was derived from the parliamentary fund.

Pensions.—The number of teachers connected with the pension fund in the year ending the 31st December, 1882, was 4,927, and the amount paid in pensions was 9,552*l.* 17*s.* 9*d.* and in gratuities 8,139*l.* 8*s.* 8*d.*

Income and expenditure.—The funds at the disposal of the commissioners for the year ending 31st of March, 1883, amounted to 829,938*l.* 2*s.* 5*d.* The expenditures by the commissioners for the same time were 803,109*l.* 8*s.* 3*d.*, leaving a balance on 31st of March, 1883, of 26,828*l.* 14*s.* 2*d.*

Progress of national education.—The per cent. for all Ireland of children 5 years old and upwards who could neither read nor write was, in 1881, 25.2, being a reduction in illiteracy of 8.2 as compared with the year 1871, the greatest reduction

attained in any consecutive decade. The commissioners submit that this improvement affords the most satisfactory evidence of the progress of national education within the last ten years. The percentage of illiteracy of those who were 15 and under 20 years of age—a section of the population for whose education the national system might, to a certain extent, be held responsible—was, in 1861, 27.3; in 1871, 17.5; and in 1881, 12.4.

Science and art department.—The following information is derived from the report of the Science and Art Department, whose operations embrace the United Kingdom:

The numbers of persons who, during the year 1882, have attended the schools and classes of science and art in connection with the department are as follows, viz: 68,581 attending science schools and classes in 1882, as against 61,177 in 1881, and 909,216 receiving instruction in art, showing a decrease upon the previous year of 481.

At the Normal School of Science and Royal School of Mines there were 39 regular and 173 occasional students; at the chemical department science schools, 78 students; at the metallurgical laboratory, 31 students; at the Royal College of Science for Ireland there were 24 associate or regular students and 61 occasional students.

The lectures delivered in the lecture theatre of the South Kensington Museum were attended by 5,207 persons; the evening lectures to workingmen at the Royal School of Mines were attended by 1,732 persons, being 260 more than last year; and 256 science teachers attended the special courses of lectures provided for their instruction in the new science schools at South Kensington.

The various courses of lectures delivered in connection with the department in Dublin were attended by about 766 persons. The total number of persons who, during the year 1882, attended the different institutions and exhibitions in connection with the department has been upwards of 5,015,217. This total, compared with that of the previous year, presents an increase of 203,959 persons.

The expenditure of the department during the financial year 1882–'83, exclusive of the vote for the geological survey, which was 18,536*l.* 17*s.* 4*d.*, amounted to 326,826*l.* 17*s.* 3*d.*

GREECE, constitutional monarchy: Area, 19,941 square miles; population, 1,679,775. Capital, Athens; population, 63,374. Minister of education, Lombardos.

No educational statistics are at hand for the year under consideration, but the following items, from the pen of Professor Pio, of Denmark, give an insight into the school life of Greece.

A great stumbling block to learning is said to be the use of modern Greek in conversation and ancient Greek in official and social correspondence. Even adults find that this creates a difficulty, and for children it is especially hard to overcome. Compulsory education for children between 5 and 12 years of age is a feature of the law since 1834. Yet even the fine of 50 francs for any infringement of the law has no material effect, and it practically remains a dead letter on the statute books. The people will not pay the fines, and the officials omit to enforce the penalty. Certain studies are required by law, but theory and practice seem to differ. The law specifies the following subjects for common schools: the catechism, elementary Greek, writing, arithmetic, weights and measures, linear drawing, singing, and, "when convenient," the elements of geography, history of the country, and the elementary training most needed in natural sciences. For boys there are these additional branches: gymnastics, practical agriculture, horticulture, arboriculture, beekeeping, and silk culture; for girls, practical instruction in handiwork. In reality no instruction is given in gymnastics, at least the writer of this article has seen nothing of the kind, either in the common or higher schools. In the district schools many of the abovementioned branches are taught; in the village schools the limit is reading and writing (not very correct chirography either) and the fundamental rules of arithmetic in addition, subtraction, multiplication, and division. After 1834 many of the schools were subdivided into schools for girls and schools for boys, yet many mixed schools existed. As the years went on the people revolted against the coeducation of the sexes, so that by law of 1852 a separation took place, and a philanthropic society took charge of educating girls. In Greece, the connecting link between the common (elementary), middle (Hellenic), and higher schools (gymnasia) is an established fact. In the Hellenic

schools, which are similar in grade to the lower Gymnasien of Germany, instruction is given in ancient Greek, biblical history, ancient Greek history, with short exercises in more modern history, in geography, arithmetic, and geometry. French is taught from the second school year, while pupils fitting for the gymnasium take up Latin from the third year. The course of study in the gymnasium includes reading from Greek authors, with grammatical instruction (12 hours a week), Latin (4 hours a week), French, history, algebra, geometry, trigonometry, and mathematical geography; also, natural history, physics, psychology, logic, and religious instruction. According to the school law of 1836, German, drawing, painting, and music are also to be taught, but they do not enter into the course. In theory the Hellenic (middle) schools require a good deal of their pupils, but, on account of the scarcity of scholars, this course of study is rarely carried out. In a gymnasium the pupils are expected to be very thorough, and the requirements are considerable, but the culture of the teaching force is defective. Tuition fees are the order of the day in the lower grades, but instruction is free in the middle and higher schools. In the matter of punishment a very humane course is pursued, the law forbidding corporal punishment. Unfortunately this phase of law does not seem to be appreciated by the school children, for they are reported as lacking greatly in discipline. According to official statements the illiteracy among the people, estimated on the basis of those supposed to attend the lower public schools, is as follows: In the district of Thebes, as in the Peloponnesus, the percentage of population regarded as illiterate is 90 to 95 per cent.; in other districts, 75 to 90 per cent.; and where more favorable reports are received—as in Attica—55 to 60 per cent. can neither read nor write. The contrast in the education of the sexes is quite noticeable. For instance, in Attica and Ithaca, where more than half of the men have some education, there are few districts in which more than 30 per cent. of the women are educated, while often only 1 to 2 per cent. have been instructed. As an offset to the statements of a lack of education mentioned above, reports indicate that private schools are flourishing. The philanthropic society associated in the work of providing a suitable education for girls has developed many private institutions. These are laying a foundation for a higher order of culture than is found elsewhere.

Favorable reports are received from the American school of classical studies at Athens, which was under the charge of Prof. William W. Goodwin, of Harvard College, during its first year.

ITALY, constitutional monarchy: Area, 114,296 square miles; population, 28,452,639. Capital, Rome; population (at end of 1880), 300,467. Minister of public instruction, G. Baccelli.

The latest available statistics published by the Italian government give some interesting information respecting public instruction in that country.

Cost of education.—From these statistics it appears that only about 12,500,000 lire[1] ($2,412,500) were expended for public instruction during the first year of the existence of the kingdom. From 1867 to 1870 the average annual expenditure was about 15,000,000. Since then the increase has been rapid, as is shown by the following figures:

Years.	Appropriations.	Years.	Appropriations.
	Lire.		*Lire.*
1871	16,300,000	1879	27,900,000
1872	17,400,000	1880	28,400,000
1873	19,200,000	1881	28,300,000
1874	19,700,000	1882	32,100,000
1875	20,500,000	1883	30,400,000
1876	20,700,000		
1877	21,500,000	Total	308,400,000
1878	26,000,000		

The amount at present expended for public instruction by the communes and government together is about 87,000,000 lire a year.

[1] The lira = 19.3 cents.

The Italian appropriations for education are small compared with those of some other states of Europe, as is shown by the following table:

Countries.	Years.	Francs.	Countries.	Years.	Francs.
France	1873	41,000,000	France	1882	114,000,000
England	1873	65,000,000	England	1882	110,000,000
Russia	1873	43,000,000	Russia	1882	72,000,000
Belgium	1873	10,000,000	Belgium	1882	20,000,000
Italy	1873	19,000,000	Italy	1882	32,000,000

Primary instruction.—Before the unification of Italy primary instruction was only organized in Piedmont (law of 1848). The first general organic law dates from November, 1859. This law makes instruction compulsory and gratuitous for all children from 6 to 12 years of age. It should be remarked, however, that its provisions were not carried into execution. It should also be noted that under the law the communes were to bear the expense of establishing new primary schools. For this reason the increase in the number of these schools was not very rapid, as is shown by the following table:

Years.	Schools.		Years.	Schools.	
	Public.	Private.		Public.	Private.
1861–'62	21,353	7,137	1872–'73	34,786	7,392
1862–'63	23,340	6,082	1873–'74	35,683	7,637
1863–'64	24,999	6,805	1874–'75	38,062	8,952
1865–'66	25,682	5,435	1875–'76	38,255	9,156
1867–'68	29,909	6,414	1877–'78	39,702	7,906
1869–'70	31,225	7,075	1878–'79	41,108	7,422
1870–'71	32,782	6,876	1879–'80	41,862	.....
1871–'72	33,556	8,157	1880–'81	42,510	.....

The number of scholars attending these schools was:

Years.	Public schools.		Private schools.		Total number of scholars.
	Boys.	Girls.	Boys.	Girls.	
1861–'62	527,729	357,423	51,821	71,701	1,008,674
1862–'63	574,421	408,915	52,168	73,720	1,109,224
1863–'64	597,202	440,627	57,366	79,548	1,174,743
1865–'66	630,230	468,491	56,068	59,081	1,213,870
1867–'68	806,349	543,717	63,128	71,338	1,484,532
1869–'70	825,249	602,940	64,959	80,211	1,573,359
1870–'71	843,734	614,850	64,888	81,506	1,604,978
1871–'72	881,371	664,419	79,116	98,041	1,722,947
1872–'73	913,073	708,846	80,247	95,630	1,797,796
1873–'74	931,911	725,877	77,246	106,946	1,841,980
1874–'75	949,939	743,861	88,756	113,198	1,895,754
1875–'76	967,317	755,352	87,152	121,796	1,931,617
1877–'78	1,006,418	824,331	73,509	98,451	2,002,709
1878–'79	1,048,801	853,479	63,469	92,228	2,057,977
1879–'80	1,035,715	864,100	.....	.....	1,899,815
1880–'81	1,048,781	879,925	.....	.....	1,928,706

The number of pupils nearly doubled from 1861 to 1876, but 28,000 should be deducted from the total for the annexed provinces, Rome and Venice, and the general increase of population of the kingdom should also be taken into account. During the same period (1861 to 1876) the number of primary school teachers increased from 21,050 to 37,623 in the public schools and from 7,123 to 9,462 in the private. On July 15, 1877, the law on primary instruction was passed. It went into effect in 1877–'78 and requires all communes of less than 5,000 persons to have at least one teacher to 1,000 inhabitants; communes of from 5,000 to 20,000 population, one teacher to 1,200 inhabitants; and all the more important communes, at least one teacher to 1,500 persons. In all other communes the law had to be applied gradually. At the end of the school year 1877–'78, 7,533 communes out of a total of 8,279 were complying with the law making instruction obligatory. In 1881 about 700 additional communes came under the new law. The progress which resulted from the application of this law was slower than had been expected and is shown by the following figures:

Years.	Public schools.	
	Number.	Increase.
1876	38,255	.....
1878	39,702	1,447
1879	41,108	1,406
1880	41,862	754
1881	42,510	648

The private schools decreased during the two years 1878 and 1879 from 9,156 to 7,422 and the total number of primary schools increased only from 47,411 to 48,530. The following table gives the number of scholars:

Years.	Schools.			
	Public.		Private.	
	Boys.	*Girls.*	*Boys.*	*Girls.*
1877–'78	1,006,418	824,331	73,509	98,451
1878–'79	1,048,801	853,479	63,469	92,228

These figures represent the enrolment, not the actual attendance. The number of children who gradually absented themselves from school, especially in summer time, amounted to a third of the enrolment.

The following figures showing the number of scholars in the primary schools to 10,000 inhabitants give some instructive information in this regard:

Before the law of 1877	1866–'67	543
	1875–'76	721
After the law of 1877	1877–'78	747
	1878–'79	768

It should be added that 7½ per cent. of the population cannot profit by the primary schools on account of the distance of the schools from their dwellings.

There were, in 1878–'79, 11,161 schools for adult males, 472 for females; 592 Sunday schools for males and 5,979 for females. These schools were attended by 460,818 males and 207,308 females. The census of 1881 shows that in 18 principal towns the number of persons from 12 to 18 years of age who could neither read nor write varied between

82.55 and 51.15 per cent. of the population. In 145 chief towns there were only 32 where the percentage of illiteracy was less than 30; in 13 the proportion was 80 per cent.; in 12, 70 per cent.; in 18, 60 per cent.; and the rest varied from 50 to 30 or less. There is considerable improvement in this respect in children between 6 and 12 years of age, for the proportion of them unable to read or write has declined to 72 per cent. in the pontifical states and to 20 per cent. in Lombardy. Ten and twenty years ago the percentage was as follows:

Age.	1861.	1871.
6 to 12	82	78½
12 to 19	72	63½
19 and above	73	68

The proportion of all persons over 5 years of age who could neither read nor write declined from 75 to 69 per cent. during the decade 1861 to 1871.

Classical and technical instruction in secondary schools.—Secondary classical instruction lasts eight years, the first five of which are passed in the gymnasia and the remaining three in the lycées or colleges. The number of these institutions in 1880–'81, with their enrolment, was as follows:

113 government gymnasia	12,876
157 communal gymnasia	7,822
57 endowed gymnasia	2,996
230 ecclesiastical gymnasia	11,141
144 private gymnasia	6,289
701 gymnasia	41,124

The number of teachers employed in these various institutions was 3,674.

The number of colleges or lycées in 1880–'81, with enrolment, was as follows:

83 government	5,989
34 communal	1,121
13 endowed	326
111 ecclesiastical	2,004
57 private	1,693
298	11,133

The number of teachers was 1,601.

The technical schools in 1880–'81, with enrolment, were as follows:

63 government schools	6,852
210 communal schools	11,508
4 provincial schools	461
24 endowed schools	854
82 private schools	2,445
383 schools	22,120

These schools had a total teaching force of 2,704 persons.

There were also 79 technical institutes, public and private, with 6,878 enrolled students and 1,169 teachers, and 26 naval schools (merchant marine), with 816 students and 183 teachers. There were therefore in 1880–'81 a total of 1,487 secondary institutions, with 9,331 teachers and 82,071 enrolled students.

Superior and special instruction.—The 17 royal universities of Italy are those at Bologna, Cagliari, Catania, Genoa, Macerata, Messina, Modena, Naples, Padua, Palermo, Parma, Pavia, Pisa, Rome, Sassari, Sienna, and Turin. The total enrolment during the scholastic year 1880–'81 was 10,592 students. The largest numbers were enrolled at the universities of Naples and Turin and were 2,851 and 1,651, respectively. Then came Padua with 973, Rome with 754, Bologna with 743, and Pavia with 714 students.

Pisa, Genoa, and Palermo had between 500 and 600 students each, and the rest a much smaller number. There are 4 independent universities in the kingdom, at Camerino, Ferrara, Perugia, and Urbino, which had a total of 265 students in 1880–'81. Besides these there were 21 superior institutes, academies, and special schools, with 1,948 enrolled students. This makes a total of 12,805 enrolled students in the higher institutions of learning in Italy in the year 1880–'81.

MALTA AND GOZO, British colony: Area, 111 square miles; population, 149,782. Director of education, S. Savona.

The following information is derived from the report of the director for 1882:

The department includes (1) the primary or elementary schools in Malta and Gozo; (2) the lyceum and the female secondary or intermediate school at Valletta and the Gozo secondary school; (3) the university.

The primary schools are entirely under the management of the director of education, assisted by an inspector, who examines each school twice a year and visits the same at least once in every quarter. In the administration of the lyceum, the director of education is assisted by the speical council of the faculty of arts and sciences, and in all important matters connected with the university the director of education is advised by the special councils of each of the four faculties, of which he is the president. The principal of the university is intrusted with the general supervision and the maintenance of discipline in the several schools of the university and lyceum. In the director of education, under the head of the government, is vested the supreme control of the education department, for which he is responsible to the governor. The government of Malta thus makes provision for the educational requirements of all classes of the people.

Gratuitous elementary schools are open to the children of the poor in all the towns and in almost every village in Malta and Gozo. The lyceum of Valletta and the secondary school of Rabato, Gozo, prepare the sons of the middle and higher classes for the superior professional studies pursued in the university, for the civil service, the army, government and other appointments, and for commerce. The university completes, in the arts faculty, the studies pursued in the lyceum; prepares students for the degree of M. A. and for entering upon their professional studies in the faculties of theology, law, or medicine; and, after an academical course of 4 years in any one of these faculties, confers upon successful students the degree of D. D., LL. D., or M. D.

Primary schools.— The rolls of the primary schools for the month of October, 1882, showed 9,891 pupils registered and 7,158 in average attendance. The unsatisfactory results accomplished in the primary schools led to the appointment of a special commissioner to inquire into the causes. These were reported to be, in the main, want of trained teachers, adoption of Italian as the medium of communication, and inefficient and badly paid assistants. With reference to the first of the causes specified Mr. Savona says:

The chief cause of the unsatisfactory condition of our primary schools, as pointed out by Sir P. Keenan, was the want of trained teachers, suitably remunerated for the important work intrusted to them; and, before that want is adequately supplied, it is vain to expect any real and permanent improvement in our elementary schools. Not only was the training of the teachers employed entirely neglected, but the rate of payment offered to them from the beginning was most inadequate to secure the services of persons possessing the literary qualifications required to teach, besides other branches, the two foreign languages (English and Italian), through which it was attempted to give instruction to the children of the poor. Eleven pounds a year, rising to a maximum of 38*l.*, was the salary offered in 1851 to the schoolmistresses, and 18*l.*, rising to 45*l.*, was assigned to the schoolmasters that were called upon to devote 6 hours a day to the education of the people. These minimum rates were in 1861 raised to 21*l.* and 38*l.*, and the maximum to 48*l.* and 65*l.*, respectively. At the time of my appointment, little more than two years ago, there were 8 schoolmistresses receiving 21*l.* a year and 11 with a salary of 25*l.*; whilst 7 schoolmasters re-received 38*l.* a year and 16 from 41*l.* to 45*l.* a year; this, too, at a time when policemen were paid at the rate of 30*l.* to 38*l.*, and clerks in the public service received 60*l.* a year on first appointment, with the prospect of rising to 250*l.* and even to 500*l.*

a year. As was natural, none but young men, who were unable, because not qualified, to obtain better situations, offered themselves to perform the duties of elementary teachers, and to these teachers, without any attempt being made to train them for the duties of their profession, was intrusted the arduous task of developing the mind and heart and of moulding the character of the rising generation, besides teaching them the English and Italian languages, arithmetic, writing, geography, the catechism, and the other subjects enumerated in the programs of the schools.

Arrangements have been made by which a certain number of promising pupil teachers may be sent to England annually to be prepared for their work in some one of the inspected training schools. The first company sent under this arrangement, viz, four in 1881, will not return to Malta before January, 1884, and the result of this excellent measure will not be felt for some years yet.

Salaries.—Teachers' salaries have also been materially increased since the 1st of December, 1881. The lowest salary now paid to principal teachers is for men 50*l.* a year, for women, 40*l.* a year; average salary: for men, 64*l.*; for women, 53*l.* The teaching staff numbers 77 principal teachers and 225 assistants. The director reports that the increase of salaries has had a most salutary effect on the schools.

NETHERLANDS, constitutional monarchy: Area, 12,648 square miles; population (December 31, 1882), 4,172,971. Capital, The Hague; population (December 31, 1882), 127,931.

The following figures are taken from the Verslag van den staat der hooge-, middelbare en lagere scholen in het Koningrijk der Nederlanden over 1881–'82.

Superior instruction.—The number of students at the three government universities in 1881–'82 was as follows:

	1880–'81.	1881–'82.
Leyden	514	520
Utrecht	385	434
Groningen	251	274
Total	1,150	1,228

In the figures for 1881–'82 students attending the universities gratuitously are not included. They numbered 179, of whom 101 were at Leyden, 44 at Utrecht, and 34 at Groningen.

The number of students at the communal university of Amsterdam was 637 in 1881–'82, against 632 in 1880–'81. The independent university at Amsterdam had 15 students in 1881–'82. There were 24 Gymnasien and 5 Progymnasien, with 334 teachers and 1,911 students.

To these Gymnasien should be added 13 private institutions intended to prepare young men for superior instruction. These institutions were attended by 613 students in 1881–'82. Besides these there were also 14 seminaries of various denominations, which have theological and literary courses combined. These institutions had an attendance of 1,323 students. The total outlay for the universities in 1881 was 1,339,870 florins ($538,628). For the Gymnasien, Progymnasien, &c., there were expended during the same time 332,361.52½ florins ($133,609). The total amount expended by the state and communes for the universities, Gymnasien and Progymnasien, Latin schools, and seminaries was 1,918,391 florins ($771,193.)

Secondary instruction.—There were 36 burgher schools and similar establishments in 1881, with 3,871 students against 4,034 the previous year. The teachers numbered 369. There were, besides, 46 drawing, industrial, and professional schools, with 252 teachers and 4,842 students, and 59 higher burgher schools, with 4,653 pupils. Twenty-one of these schools were open to girls and had an attendance of 150. The number of higher burgher schools attended by both sexes was increased by 2, while the number of female students diminished by 5, compared with the previous year. The increase in the number of male students over 1880 was 144. The teachers of the higher burgher schools numbered 668. Besides the mixed burgher schools above mentioned there were 14 schools of the same grade for girls exclusively, attended by 1,089 pupils in 1881 against 1,002 in 1880. The teachers numbered 165, of whom 106 were women. This grade of schools received 992,704 florins ($399,067) from the state, the total expendi-

ture being 1,965,118 florins ($789,977). The Royal School of Midwifery had 11 students during the year 1881–'82. The Royal Veterinary School had 53 students during the same year.

Primary instruction.—The primary schools showed an increase of 47 over the year 1880, and numbered 3,927. Of these, 2,799 were public schools, 86 were private subsidized schools, and 1,050 were private schools not subsidized. A comparison of the attendance in January, 1881, and January, 1882, results as follows:

	Boys.		Girls.		Total of both sexes.	
	1882.	1881.	1882.	1881.	1882.	1881.
Public schools	226,766	226,297	182,574	181,510	409,340	407,807
Private subsidized schools	1,638	2,004	2,399	2,985	4,037	4,989
Private non-subsidized schools	61,219	59,037	77,336	72,782	138,555	131,819
Total	289,623	287,338	262,309	257,277	551,932	544,615

The number of children of school age who did not receive instruction during the year 1881–'82 was 71,658, of whom 30,725 were boys. In 1880 the number of children receiving no instruction was 70,085. The school population in 1881–'82 was 528,827 children between the ages of 6 and 12 years. The previous year it was 517,259. Non-attendance at school was due in great measure to the want of suitable school accommodations in the large communes, and this defect will be soon remedied. It is expected also that a salutary effect will be felt from the general interdiction of infant labor, which was forbidden in only 115 communes in the year 1881. The number of pupils attending evening schools exclusively was 10,866, of whom 8,610 were boys. This does not include 7,601 pupils of the review schools. The number of teachers in the year 1881 was 15,123, of whom 3,747 were women. The previous year the number was 14,174. The normal courses were attended by 829 persons, 588 of whom were men. The state appropriation for primary instruction in 1881 was 4,665,228 florins ($1,875,422), an increase of 2,224,237 florins over the amount granted in 1880. The communes contributed 5,533,715 florins ($2,224,553). The total amount expended in 1881 for educational establishments, except military, prison, and protection schools for infants, was 14,168,734 florins, or $5,695,831.

These infant schools and asylums numbered 802 in 1881, with 87,728 infants in attendance and 2,710 teachers. These figures, however, do not include many private institutions of this character, about which the government has no information.

NORWAY, constitutional monarchy: Area, 122,869 square miles; population in 1879, 1,916,000. Capital, Christiania; population in 1875, 76,054. Minister of public instruction and worship, N. C. E. Hertzberg.

The latest information with reference to the schools of this country is to be found in the Report of the Commissioner of Education for 1881.

A catalogue of the famous Latin school of Norway, the Aars og Voss's latin- og realskole, presents the following statistics: This school is a private establishment situated at Christiania; in 1883 it entered on its twentieth year of existence. In 1882–'83 there were 47 male instructors and 3 women teachers connected with the school. Three divisions are reported: the common, with 5 classes; the Latin, with 6; and the real, with 5. The pupils in regular attendance numbered 578 in 1873–'74 and 782 in 1882–'83. Of the 782, 620 resided in Christiania, 50 came from other Norwegian towns, 107 from the rural districts, and 5 from other countries. There were, in the last year mentioned, 222 students in the Latin classes and 187 in the "real" classes. During the twenty years 2,777 pupils were reported, 2,022 in the last ten years. The studies for the common or lower division were religion, Norwegian and German, history, geography, natural sciences, arithmetic, writing, and drawing. In the Latin and "real" divisions the studies enumerated are religion, Norwegian, Ger-

man, Latin and Greek (or English and drawing), French, history, geography, natural sciences, mathematics, and writing.

PORTUGAL, constitutional monarchy: Area, 36,510 square miles; population, 4,160,315. Capital, Lisbon; population, 253,496. Minister of the interior, Barjona Freitas.

Hon. John M. Francis, minister resident and consul general of the United States to Portugal, addressed a communication to the Department of State on the progress of education in Portugal, under date of December 29, 1883, which was forwarded to the Bureau of Education by the kindness of the Hon. Secretary of State. Mr. Francis's account is as follows:

Portugal has made considerable and commendable progress in educational achievement during the past fifteen years.

A stimulus was given to this paramount interest of the state in 1869 by the testamentary appropriation of a large sum—150,000*l.*, I am informed—by the late Count Ferreira, of Oporto, for charitable and educational purposes in this kingdom. This included provision for the construction of 120 school-houses in needy districts. Then the government directed its efforts with more efficiency than ever before to the important duty of making additional provisions for the education of the children of the state.

Primary instruction, as now existing in Portugal, is based upon the decree of May 2, 1878, modified somewhat by subsequent legislation. The primary schools are intended for the instruction of both sexes and are divided into two classes, namely, primary and advanced primary. They are, for the most part, under district control and sustained by district contributions.

Attendance at the primary schools is obligatory, unless evidence is adduced that the children receive instruction at home or reside at a greater distance than two kilometres [about a mile and a quarter] from the public school. In case of non-attendance without the above valid excuses, parents or guardians are subject to fine.

The primary schools are intended for all children from 6 to 12 years of age. As a rule, every parish must have an elementary school; but in cases where the children of adjoining parishes do not exceed sixty in number, then one school may be organized for two or more parishes.

The parochial authorities are required to furnish house, books, and furniture for the school and residence for the teachers, and to pay the latter 100 milreis annually in rural districts, 120 in towns, and 150 in Lisbon and Oporto. In addition to this compensation the teacher is entitled to 5 cents monthly for each pupil under his instruction, 2 milreis for each pupil passing successfully the final examination in the elementary branches, and, further, for every six years of acceptable service, an advance of 25 per cent. on the salary. There is also a pension system of small allowances for "retired" teachers.

In the primary schools boys are taught reading, writing, arithmetic, elements of grammar, of the metrical system, rudiments of drawing, and "moral and Christian doctrine," the last excepted in the case of children not Catholics; the same tuition for girls, with the addition of needle work. Mixed schools are to be instructed by married teachers, a lady to teach needlework. Boys may be taught by teachers of either sex.

In each district there must be an advanced primary school, to be sustained by the municipality thereof, teachers of these schools to be paid at least 180, and in Lisbon and Oporto 200, milreis per annum, receiving also 2 milreis for every pupil passing into a higher school.

The "advanced primary" teaching for boys includes (1) reading and recitation in prose and verse; (2) writing and written exercises; (3) arithmetic and elementary geometry; (4) grammar; (5) legal system of weights and measures; (6) elements of cosmography, geography and Portuguese history; (7) sketching; (8) moral and sacred history; (9) elements of hygiene; (10) elements of agriculture; (11) gymnastics; (12) choral singing; (13) rights and duties of citizens.

For the female sex, same as above from 1 to 9 inclusive, with lessons on the duties of a mother; also, embroidery, making patterns, taking measures, and lace and flower work.

There must be a regular assistant for every 60 pupils. The municipalities are to appoint the teachers and pay them.

There shall be in Lisbon and Oporto two normal schools for qualifying teachers of either sex. Each school shall have 40 pupils of either sex, who shall be entitled to 7 milreis monthly for maintenance, the same to be paid by the district. There shall be in other districts normal schools of the second class to the number of ten. The State will appoint and pay inspectors and subinspectors.

In towns having more than one school, the municipality is authorized to establish "central schools," with three or four teachers for each one. The establishment of evening and Sunday schools for adults is enjoined upon the various municipalities as a duty. In every district there shall be a school committee to aid the municipality, and in every parish a parochial delegate.

There shall be conferences of teachers in each district annually.

The government will give annually prizes of 100 and 200 milreis to students; it will provide books by public competition every five years. It will aid the parochial assemblies in the creation of a school fund to assist the municipalities in the payment of teachers, in the establishment of evening and Sunday schools, in the establishment of Kindergärten for children, to enlarge educational institutions, to establish libraries, and to bestow prizes upon deserving teachers and worthy pupils, to secure pensions for poor scholars who may enter the normal schools, to provide proper instruments for instruction in the natural sciences, &c.

Secondary instruction is given in institutions of three classes according to the decree of June 14, 1880, namely, central lyceums, national lyceums, and secondary municipal schools. There is a central lyceum in Lisbon, in Oporto, and in Coimbra; in each of the capitals of other districts there is a national lyceum. All these are supported by the state. Other municipalities may, upon petition, open secondary municipal schools, they paying two-thirds and the state one-third of the cost of their support. The object of these lyceums is to prepare pupils for admission into schools of superior instruction.

The course in the central lyceum embraces (1) Portuguese language; (2) French language; (3) Latin; (4) geography, cosmography, universal and natural history; (5) architecture, geometry, algebra, book-keeping; (6) elements of physics, chemistry, and natural history; (7) elements of civil legislation, of Portuguese law, and political economy; (8) drawing; (9) national literature; (10) natural and moral philosophy and laws of nature; (11) algebra, geometry, and trigonometry; (12) physics and chemistry; (13) Latin; (14) Greek; (15) English; (16) German.

There are taught in the secondary schools (1) Portuguese; (2) French; (3) arithmetic and geometry; (4) drawing; and there may be one or two professional chairs.

No pupil under 10 years of age is to be admitted to the lyceums.

No school for private instruction by individuals can be opened without informing the supervisor of the district.

The teachers of central lyceums receive an annual salary of 600 milreis; of the national lyceums, 500; the rector of the central lyceums, 200; of national lyceums, 150; the teachers of secondary municipal schools, 200, with some additional fees for scholars and upon the successful examination of the latter.

Superior instruction.—The centres of superior education are Lisbon, Oporto, and Coimbra. The university at Coimbra has faculties of law, theology, medicine, and philosophy or natural sciences.

In Lisbon there are the polytechnic school, the army, navy, and medical and surgical schools, school for the superior course of literature, commercial and industrial school, general institute of agriculture, and an academy of fine arts.

There exist in every diocese of the kingdom institutions for ecclesiastical learning.

At Oporto there are a polytechnic academy, an agricultural college, and an academy of fine arts. Near Cintra there is also an agricultural college, with an experimental farm.

I have presented an analysis of the laws on the subject of education in Portugal. The system embraces a wide and extended field, with a great deal of machinery for its working, and, though it is imperfectly operated in many cases, the fact is conceded that decided educational advancement has been made in this kingdom since the enactment of these laws.

No reliable statistics of the attendance of children at the public primary schools can be obtained. I have seen a statement that in 1875–'76 (before the adoption of the existing law enforcing attendance) there were in the kingdom and adjacent islands 141,466 children attending school.

This, I am assured, was incorrect, and to my inquiries in regard to the number now in attendance I am told in the proper official department that no statistics can be furnished which would be other than vague estimates. It is a truth, however, that the want of school-houses is severely felt throughout the kingdom, that those existing are uncomfortably crowded, and that in the city of Lisbon the want is painfully felt. However, gradually, but too slowly it is feared, buildings are provided for this purpose, to meet the growing necessity.

The criticism I have heard pronounced upon the educational system of Portugal is that it expends its greatest forces upon higher education, and fails to provide as good schools as should be maintained for elementary instruction.

As to expenditures for education by the government (not including the larger local contributions for this purpose), it may be stated that under the head of "Public in-

struction" there were appropriated in the budget of 1883–'84 934,759 milreis for the following purposes:

Primary instruction (district schools and teachers)	190,177
Secondary instruction (certain specified advanced schools and teachers)	179,649
Special instruction (galleries of fine arts, opera house)	59,941
Superior instruction (universities at Coimbra, Oporto, and Lisbon)	257,999
Academies (Academy of Sciences, School of Fine Arts, Government Printing Establishment, &c., all of which are specified in the budget)	246,993

ROUMANIA, principality of Europe: Area, 48,307 square miles; population, 5,376,000. Capital, Bucharest; population, 221,805.

In 1882–'83 there were 2,459 primary rural schools for both sexes reported. The pupils numbered 83,076, 8,544 of whom were girls; teachers, 2,101 males and 358 females. In the cities were 146 boys' primaries, with 475 teachers and 23,832 pupils; also, 125 schools of like grade for girls, where 12,989 pupils were taught by 342 teachers of their own sex. Among the higher grades there were 7 lyceums, with 160 professors and 2,108 pupils, and 19 Gymnasien, with 180 professors and 2,077 pupils. Nine seminaries had 1,512 pupils, under the care of 99 professors; 8 primary normals, with 85 professors and 741 pupils; 5 commercial schools, with 56 professors and 772 students, while in 12 secondary and professional schools for girls there were 1,316 pupils, taught by 144 instructors. The special schools numbered 31; professors, 217; students of both sexes, 2,316. The 2 universities, at Bucharest and Jaffy, had a total of 693 students and 87 professors. At Bucharest there were 4 women studying, 1 in the philological department, 1 in the philosophical, and 2 in the medical department. In addition to these public schools there were 205 private schools, with 1,120 male and female teachers and 13,124 pupils.

RUSSIA, absolute monarchy: Area, 8,387,816 square miles; population, 100,372,553. RUSSIA IN EUROPE: Area, 2,088,419 square miles; population, 85,058,415. Capital, St. Petersburg; population, 667,926. Minister of public instruction, Delyanoff.

The state of education is such in Russia that but little information can be given in reference to the country as a whole. At St. Petersburg there were 105 primary day schools and 8 schools taught on Sunday at the commencement of the year 1883. The pupils numbered 4,866. A handiwork school for boys was also reported. Generally speaking, education is at a low ebb in Russia. The upper classes are said to be at fault, and they are upheld by the clergy in preventing the spread of popular education. Still there is a tendency towards progress in certain directions. For instance, a project is on foot to establish a number of superior primary schools for girls. Among the lower or middle classes in the cities are many young girls who earnestly desire an elementary education. A few parents send their daughters to the Gymnasien and Progymnasien, but the courses there are said to be too long and quite unsuited to these girls, who must necessarily labor for a livelihood. The plan at present is to have elementary grades especially adapted to the wants of this part of the population. In October, 1882, a beginning was made, and the first superior primary school was established in St. Petersburg. The course of study covers 4 classes, and pupils are admitted between 9 and 11 years of age. The program of studies is as follows: religion, the Russian tongue, arithmetic, geography, calligraphy, natural and national history, drawing, geometry, singing, and needlework. These primary grades are to be attached to the so-called Empress Maria institutions. In Russian Gymnasien and Realschulen socialistic doctrines prevail to such an extent that the Russian authorities have taken the matter in hand. A circular of the minister of education, Deljanoff, states that in 13 Gymnasien, 1 Progymnasium, and 16 Realschulen evidences of the influence of nihilistic ideas are noticeable. For this reason many new regulations have been made, so that directors and teachers may have better control of the pupils under their charge. Out of school, too, a certain watch is kept in regard to the movements of pupils. The police, parents, and teachers are expected to aid

the minister in his efforts to crush out revolutionary ideas. The only information obtainable for the year under consideration in regard to Russian universities is that reported on the foundation day of Dorpat University, which was celebrated on December 23, 1883. Statistics at that date were as follows: In the theological faculty there were 191 students; in the law department, 242; in the medical, 711; in the historico-philological, 180; in the physico-mathematical, 109; total, 1,433. In the preceding year 1,331 students were reported. The increase of 102 students in the year speaks well for the college. Most of the chairs are filled, a statement which does not hold good in many of the Russian universities, as quite a number of professors have been called to professorships in other countries.

SERVIA, principality: Area, 18,787 square miles; population (December 31, 1882), 1,810,606. Capital, Belgrade; population, 36,177. Minister of public instruction and worship, G. Pantelitch.

The minister of public instruction and worship is at the head of educational and church affairs in Servia. A director has immediate supervision of the school system. There is also a council of education composed of 12 ordinary and 20 "extraordinary" members; the first of whom are appointed by the minister for 2 years and the second for 1, they being also eligible to reappointment. This body is recruited from the teaching force of the country. The council formulates school regulations and laws and, as a consulting body, aids the minister in executing the laws pertaining to schools and in deciding all literary and scientific questions.

The library and national museum are considered a part of the educational system; a director has charge of each at a salary of 18,031 francs ($3,479). In 1883 the museum was placed under charge of the professor of archæology at the university.

The university has a rector and 27 professors. In the budget there is an item of 214,229.30 francs ($41,346) for the university. Of this amount 2,000 francs ($386) are for scientific excursions, 5,052 francs ($975) for a botanical garden, and 46,500 francs ($8,974) to buy books, &c. The university of Belgrade has faculties of philosophy, arts and trades, and law. It does not, however, grant doctors' degrees, but simply prepares young gentlemen for liberal careers. The number of students ranges from 150 to 200.

The theological seminary, with 4 courses, 14 professors, and 186 pupils, is in the budget for 48,290 francs ($9,320).

A school of pedagogy reports a director, 12 professors or instructors, 97 pupils, and 93,970 francs from the budget. About 15,000 francs ($2,895) are to be used for the instruction of young teachers who are insufficiently prepared, this instruction to take place during the vacations. At the close of 1881 a school of pedagogy was to be opened at Nich. This normal school was to be divided into two sections, one section to instruct pupil teachers for the Servians in Turkey.

The Belgrade Gymnasium has a director, 22 professors, and 455 pupils, and an income of 81,710 francs annually. The Gymnasium at Kraguyewatz has a director, 18 professors, and 225 pupils; annual fund, 59,770 francs. A similar school at Nich, which is still incomplete, reports a director, 5 professors, and 73 pupils; annual income, 16,208 francs from the state. Two Progymnasien in Belgrade, each under charge of a director, have 7 or 8 professors and over 150 pupils. The annual budget provides 30,790 and 27,750 francs, respectively. Eighteen Progymnasien, several of them still incomplete, with but two or three classes, receive 202,420 francs annually. A Progymnasium at Oujiza, having 7 professors, 73 pupils, and funds amounting to 16,909 francs, was to be changed into a Realschule. These Progymnasien have, by a recent law, courses of study very similar to the courses in the lower classes of the Realschulen. The special instruction commences with the upper divisions. The Realschule at Belgrade has 5 higher classes (the two lower classes have the same studies as the Gymnasien), 12 professors, and 47 pupils; funds, 35,540 francs ($6,859).

A school for the higher education of young girls has a pedagogical section. There is a directress in charge; then there are 7 instructresses and 10 professors from the middle schools of Belgrade. The pupils number 250; funds, 49,428 francs.

Primary education is given in 614 schools, with 705 men and 112 women teachers. Pupils: boys, 24,000; girls, 4,000. For teachers' salaries the budget provides 760,000 francs annually. All other expenses are paid by the commune; indeed, teachers are paid in part by the communal authorities, but under state direction.

SPAIN, constitutional monarchy: Area, 195,767 square miles; population (June 1883), 16,858,721. Capital, Madrid; population, 397,690.

Education in Spain is passing through a period of reform, the object of which is to reorganize the system of public instruction so that it may compare favorably with educational methods in other countries. The present government is eager to break loose from precedent and has already taken the first steps in that direction. Its first general measure was the publication of the royal decree and ministerial circular of March 3, 1881, which set forth the views of the government on public instruction and reinstated the professors who had been removed from their chairs in 1875. Before carrying its projected reforms of educational methods into execution the government sought to find out the opinions of teachers on the subject, which was done by means of the decree and circular of July 15, 1881. In order to enable the public to form a correct idea of the legislation and other measures taken in other countries in regard to public instruction, the royal decree of September 12, 1881, supplemented the preceding decree by creating a special library under departmental direction.

Then came the decree of March 4, 1882, reorganizing the system of inspection of educational institutions. The number of inspectors was increased, and they were required to visit all the institutions in their districts and report on them. Following this came measures of a more special character and particularly those affecting primary instruction, which has always been in a lamentable condition in Spain. The only innovation worthy of praise made in this branch of education during the last twenty-five years is the establishment of the Fröbel school at Madrid, by decree of March 31, 1876. Other attempts at reform, although supported by official decrees, have been unsuccessful.

A notable evil, which has always affected primary education, is the practice of allowing the small salaries of teachers to remain unpaid. The arrearages amounted to such a large sum in 1881 that the King himself took the initiative, and provision was made for paying salaries promptly when due. This was effected by the decree of June 15, 1882.

On May 6, 1882, an educational museum was established, embracing collections of models and drawings of Spanish and foreign primary schools, furniture, and apparatus, scientific apparatus and material, objects and charts for illustration, and a library. On August 13 of the same year a fourth year was added to the course of the central normal school for female teachers, and on May 17 provision was made for the care and training of very young children in "maternal" schools. The necessity of providing better educated teachers for primary instruction is recognized in Spain, and this necessity is greater there than in many other countries, because the proportion of children whose education ceases with the primary grade is larger.

Little change has as yet been made in secondary education. By a decree of July 8, 1881, an industrial school was established at Toledo and a veterinary school at Santiago.

Four new professorships were established in the universities during the period 1881–'82, and the salaries of the professors were raised.

In addition to the decrees mentioned above there were two, of March 17, 1882, and February 23, 1883, which, if carried out, will lead to great educational reforms. The substance of them is as follows: The public primary or infant schools are to be placed in charge of women, who are to be aided by assistants, according to the number of pupils. For more than 60 pupils at least one other teacher is to be employed, with title of professor; under 60 pupils the directress is allowed to designate one of her own sex to aid her.

These schools are to be free; the school age is from 3 to 7. In benevolent institutions, in charge of sisters of charity or of any religious body, children up to 4 years of age are to be cared for. Above that age they are to be placed in the public schools. Directresses who are obliged to have an assistant are to receive extra compensation: not less than 275 pesetas (peseta=19.3 cents) in schools where the salary is less than 1,650 pesetas, 325 pesetas where it amounts to that, and 375 when the pay is greater. To be a head teacher the proper qualifications must be shown as required by law and the proper certificates obtained. There are to be boards of directors of primary schools (Patronato general de las escuelas de parvulos), composed of a president and eight members, appointed by the minister of commerce and agriculture. Among the members are to be the directress of the central normal school, one other woman, and several professors already connected with the corps of primary school instructors. One of these professors is to be secretary of the board. The regulations of the board are to be considered by authorities, officials, and corporations as orders from the minister, while the board may act without referring to the minister. An annual report is to be published by the board. A special course for preparing primary school teachers, principals, or assistants is to be opened at the central normal school at the beginning of the next academic year. Professors for primary grades are to be appointed by the minister in accordance with any suggestion from the board of directors as a whole. According to the decree of February 23, 1883, local boards of primary instruction (juntas locales) are to publish each December an annual census of all children of the ages specified by the law of September 9, 1857, who are found within their districts. The provincial committees and the boards of directors are to receive copies. In April and October of each year teachers of primary grades are to send in to the president of the local board of their commune, or district, a complete list of the boys and girls in attendance at school during the preceding term. This list is to cover scholarship, conduct, and general bearing of pupils, &c. Inspectors of primary grades are to be advised of the fines imposed in executing the law of 1857, and justices of the peace are also to forward the decisions pronounced during the year according to the provisions of the penal code. The inspectors are to give the board of directors, in June and December, a list of the children of school age, attendance, or reasons for non-attendance, with suggestions as to negligence of local authorities. Inspectors not attending to their duties and offering no good excuse are to be dismissed. The board of directors is to report to the minister any negligence on the part of the authorities in warning parents of the penalties attached to non-attendance of children at school. Teachers of either sex who increase attendance in their schools from term to term, keep their lists up to the maximum, show good reports as to punctuality, scholarship, &c., are to be rewarded as follows: by receiving a sum of money in proportion to their salary and to the reports made; by honorable mention; with right to an earlier promotion; with greater increase of salary than would naturally follow; and by report of their names to the to the minister for some honorary distinction.

Special meetings are to be held annually by local boards to decide as to the compensation of teachers. The minister is to reward teachers according to the representations made by the general and provincial boards. Allowance is to be made in the general budget for such pecuniary rewards, and local and provincial committees or boards are requested to add whatever funds seem necessary and to distribute a few prizes to poor parents who have made sacrifices in order to send their children to school at the proper hour each day. Provincial and local boards and primary school inspectors who show great zeal in enforcing the attendance of pupils are to be especially and honorably mentioned by the government. All public functionaries of the state, province, or municipality, with a salary not exceeding 1,500 pesetas a year, must show to their immediate chief that their children over 6 years of age have received the education required by the law in either public or private schools. Laborers of low grade, living at such distances as to make attendance at school almost

impossible for the children, may be excused from this rule if their employers recommend it. Officials already in service are to show within three months after the publication of this decree that they have carried out the provisions of the law of 1857. Employés carrying out the above to the best of their ability are not to be dismissed for any apparent fault until they have been allowed a hearing. Heads of departments may recommend dismissal if they deem it advisable.

SWEDEN, constitutional monarchy: Area, 170,979 square miles; population, 4,579,115. Capital, Stockholm; population, 185,325. Minister of education and ecclesiastical affairs, Carl Gustaf Hammarskjöld.

The latest educational statistics from Sweden were given in the Report of the Commissioner of Education for 1881. The subject of industrial education is one of great interest in Sweden, as elsewhere, and the following items give the latest news in regard to this matter. At the ninth meeting of the Swedish Common School Teachers' Association, which took place at Upsala, in August, 1883, about 1,300 teachers were present. The subject of industrial training was earnestly discussed, and it was stated that handwork had already become a part of the course in 500 schools of Sweden. There is also a seminary at Nääs, where manual training is carried on to perfection. The object of such instruction is to produce orderly methods, skill in use of the hands, close attention to business and to inculcate habits of industry and produce a general interest in work for the work's sake. Certain methods are adhered to very closely. Work in wood is a specialty, and 100 models are used in the different steps leading up to the end of the course. In connection with the teachers' meeting, there was a display of articles made by different schools. The finest specimens came from Stockholm, in which city about 370 boys receive industrial training three times a week, 2½ hours each time. What Sweden is doing for the education of woman may easily be learned from the following:

Until the early part of this century the education of women had preserved an exclusively private character in Sweden. The rich families of the aristocracy intrusted the education of their daughters to governesses and the middle classes in easy circumstances had recourse to private schools established in the cities or the country. These schools were always in charge of women and were ordinarily combined with accommodations for boarding a greater or less number of pupils. A certain number of women received in this way a relatively good education, considering the demands of the times, but the great majority, even among the educated classes, were content with very elementary instruction. According to the ideas then in vogue it was a waste of time for women to devote themselves much to study; it was enough for them to know how to manage their domestic affairs properly and to appear well in society. In the private boarding schools the principal aim was to enable the scholars to carry on a conversation in foreign languages, especially French. Music, painting, and fancy work held a subordinate place. Religious instruction was generally given by a clergyman and embraced as a minimum the knowledge necessary for the confirmation of catechumens. The study of history, geography, and mathematics was of the most elementary kind and no attempt whatever was made to include natural sciences.

Between the years 1820 and 1830 the need of public establishments for young girls began to be felt. In 1826 a merchant of Gothenburg, M. Jonas Kjellberg, bequeathed to that city the sum of 50,000 crowns (about $13,500), in memory of his wife, for the establishment of an institution for the higher education of women. That institution was opened in 1835; it has received additional gifts at different times from the Kjellberg family, and is still in operation under the name of "The Kjellberg School." In 1831 there was opened at Stockholm, through the efforts of Bishop Wallin, a new school for the education of women, which was designed to enable young girls to acquire the same serious and substantial instruction boys received in the public schools. This establishment is still in existence, under the name of "The Wallin School." It is a strictly private institution. All the measures tending to elevate the instruction of women could not, however, attain their complete development without government aid in providing capable teachers. A vigorous impulse

in this direction was given by a number of professors and men of learning interested in the education of women, who organized at Stockholm in the winter of 1858–'59 a course of higher instruction for adult females. Many of the scholars were already teachers and others wished to prepare themselves for that vocation. From that moment the government took the movement in hand. The first normal schools for female teachers of primary schools were opened in 1860, and the normal school for female teachers of secondary schools was opened at Stockholm in 1861. Now there are 5 government normal schools for female teachers of primary schools and 7 for males. More than half the teachers of the primary schools are women, who, for the most part, have charge of the lower primary schools. The principal object of the superior normal school for female teachers is to train private teachers, that is, governesses, as well as mistresses of higher girls' schools. At present it graduates twenty or twenty-five such teachers annually.

The total number of girls' high schools in Sweden is now between 60 and 70. Only one belongs to the government, namely, the practice school attached to the Superior Normal School for Female Teachers. The object of this school is to serve as a model for other high schools and to give an opportunity to the scholars of the normal school of attending the school exercises and of taking part in them, so as to get practice in teaching. Nearly one-half of these girls' schools are municipal institutions to a greater or less extent. In localities where the district or community has not established such schools intelligent and educated or tolerably wealthy private individuals have joined together for that purpose. Generally they contribute a considerable sum at the outset to start the institution and guarantee additional amounts in case of need. The greater part of these schools receive aid from the district in which they are placed or from business concerns in the neighborhood, and some from the general council of the province. It is probable that they will gradually become purely community or district schools and will eventually be taken in charge by the municipalities. The other half of the girls' high schools are exclusively private and are established wherever they can be supported by the tuition fees. With the exception of the Kjellberg school at Gothenburg, all the institutions for the superior education of women receive tuition fees. In this respect they differ from all the other educational institutions of the country.

An idea of the scope of the education given in these girls' high schools in Sweden may be obtained from the following program of subjects taught in one of them, which is substantially a representative one. The figures of the table give the number of hours devoted weekly to each subject of study by each of the classes.

Subjects.	Classes.								Total.
	1	2	3	4	5	6	7	8	
Religion	2	2	3	3	3	3	2	2	20
Swedish language	4	4	4	3	3	3	3	3	27
French language	6	6	6	5	5	5	5	5	43
German language	.....	.....	.....	3	3	2	3	3	14
English language	.....	.....	.....	.....	.....	3	3	3	9
Geography	2	2	2	2	2	1	.....	.....	11
History	2	2	2	2	2	2	3	3	18
Mathematics	2	2	2	3	3	3	4	4	23
Natural sciences	.....	1	1	1	1	2	3	3	12
Calligraphy	2	2	1	1	1	.....	.....	.....	7
Drawing	2	2	2	1½	1½	2	2	2	15
Fancy work	3	3	3	2	2	2	.....	.....	15
Singing	1	1	1	1	1	1	1	1	8
Gymnastics	1½	1½	1½	1½	1½	1½	1½	1½	12
Total	27½	28½	28½	29	29	30½	30½	30½	234

These studies are all obligatory in the three lower classes; in the fourth, fifth, and sixth classes fancy work is optional; in the seventh and eighth classes one of the foreign languages may be dispensed with, as well as geometry and drawing; singing and gymnastics are electives in these two classes. French is the foreign language most in demand. In the western part of the country, however, and in some cities, the schools commence with German, and one of them gives English a prominent place. The fact that German occupies the leading place in secondary schools for boys may account for its comparative popularity in girls' schools, but in the majority of them French holds its sway and has increased in popularity in the last few years.

The age for admission to these high schools for girls is generally fixed at 9 years, as in the boys' schools. Most of the girls' schools have a preparatory department, which embraces three classes for children from 6 to 9 years. It appears from the program of studies that obligatory instruction is, strictly speaking, limited to the first six classes; consequently, obligatory studies are confined to a period ending with the fifteenth year of the pupil's age.

SWITZERLAND, federal republic: Area, 15,992 square miles; population, 2,846,102. Capital, Berne; population, 36,000.

Educational statistics of the different cantons for the year 1881 were not received in time for the Report of the Commissioner of Education for 1881. They are herewith presented.

The totals, according to the Statistik über das Unterrichtswesen in der Schweiz, show that in the whole of Switzerland there were, on March 31, 1882, 434,080 pupils in the 4,386 primary schools. Of these, 14,892 were natives of other countries. German was the mother tongue of 311,271; French, of 97,113; Italian, of 19,864; the Romance tongues, of 5,832. There were 2,021 feeble-minded children not attending school and 7,876 children free from school attendance. In the 4,386 schools there were 8,362 classes, 6,462 of them mixed. About half the schools employ one teacher only. The teaching force numbered 5,840 men and 2,525 women, an average of 1 teacher to 52 pupils. Among the male teachers there were 15 belonging to some religious order and 30 lay brothers; among the female teachers, 299 belonging to an order. The age of male teachers was between 15 and 80 years. Over 80 years of age there were 2 teachers; between 71 and 80 years, 40; between 61 and 70 years, 306. The 12 oldest women were between 61 and 70 years of age. There were 90 between 51 and 60 years. Between the ages of 15 and 20 were 250 men and 335 women teachers. Two men had taught 60 years, 32 from 51 to 60 years; 294 men and 8 women had taught between 41 and 50 years. There was 1 teacher to every 340 inhabitants. For teachers' salaries (males) 7,608,694 francs ($1,468,478) were expended; for women, 2,074,560 francs ($400,390). Added to this there were 686,775 francs' worth of produce for the men and 179,270 for the women, an average of 1,419 francs in value for each man and 901 for each woman. The canton of Berne paid out the largest amount for the support of teachers, viz, 2,375,214 francs; Zürich, 1,381,258; Vaud, 1,200,395 francs. The highest average salaries were paid in Zürich, 2,228 francs for men, 1,805 francs for women. There were 17 teachers who are graduates of universities, 63 from Gymnasien, 6,971 from normal schools, and 85 from primary schools.

The annual expenditure for the schools was 14,781,616 francs ($2,852,852); the value of school property, 137,534,597 francs ($26,544,177).

In the 413 secondary schools (283 of which were mixed) were 11,155 boys and 8,976 girls; men teaching, 1,216 (958 lay teachers, 14 belonging to some order, and 244 lay brothers); women, 232 (200 lay, 32 sisters). The teachers' salaries amount annually to 2,370,180 francs. The expenditures were 2,136,514 francs; the school property amounted to 9,077,720 francs. There were 102 middle schools, including Gymnasien, technical industrial schools, normal schools, and those for girls. The pupils in attendance numbered 9,492 boys and 2,093 girls.

The "high schools" (universities), located at Zürich, Berne, Basle, and Geneva, re-

ported 2,512 students. At Zürich are also a polytechnicum and a veterinary school; at Lucerne, a theological institute; at Freiburg, a law school; and at Lausanne and Neufchâtel, academies. There were 104 women pursuing higher studies in connection with these ten schools.

In the Kindergärten (which are obligatory only in the canton of Geneva) there were 10,864 boys and 11,242 girls; in private schools, 6,057 boys and 4,834 girls. The Fortbildungsschule (or review school) is only obligatory in two cantons, Thurgovia and Soleure.

A total of 516,925 children was reported on March 31, 1882, in some grade of school. The funds for school purposes vary in the different cantons; in certain cantons there is no school fund; in others the taxes leave a large amount above expenditures; in others still, private parties and communes raise from fourteen to fifteen million francs annually for school purposes.

Hon. M. J. Cramer, minister resident and consul general of the United States in Switzerland, forwarded a communication on the Swiss school system to the State Department in December, 1882, which, by the kindness of the honorable Secretary of State, has been transmitted to this Bureau. In this communication Mr. Cramer gives the following translation of Article 27 of the present federal constitution of Switzerland in regard to public instruction:

The several cantons will provide for sufficient primary instruction, which shall be under the exclusive supervision of the state. It is to be obligatory, and in the public schools gratis. The public schools shall be so conducted that they may be attended by the children of all confessions (denominations) without their liberty of faith and conscience being encroached upon. Against cantons which neglect to follow these provisions the confederation is to take the necessary steps.

Mr. Cramer also quotes the following resolution of the Federal Assembly in regard to the preceding article, adopted on June 14, 1882:

The federal council is instructed to cause the department of the interior to collect without delay such information concerning the public schools in the several cantons as is necessary for a thorough execution of Article 27 of the federal constitution, as well as for the adoption of laws in relation to it. In order to enable the department of the interior to carry out the provisions of this resolution, that department may appoint a secretary (of education) with a salary of 6,000 francs, whose duties shall be prescribed by the federal council.

This resolution gave dissatisfaction in many quarters, on account of the apparent abridgment of the rights of the individual cantons which it sanctioned. Accordingly a petition was drawn up against the resolution, as allowed by the Swiss constitution, and signed by 180,000 persons. When the vote was taken on November 26, 1882, the resolution was defeated by a vote of 316,852 against 171,970.

II.—Asia.

British India: Area, 1,383,504 square miles; population, 253,906,449.

The following information is from the reports of the director of public instruction for the Bombay presidency for 1881–'82 and 1882–'83: The total number of all schools and colleges aided and inspected by government was, for 1881–'82, 5,704, having on the rolls March 31, 1882, 358,891 pupils, 1.57 per cent. of the estimated population (22,928,851). For 1882–'83 the number of schools was 6,138, having on the rolls March 31, 1883, 389,986 pupils, or 1.68 per cent. of the estimated population (23,184,835).

The income of the department in 1881–'82 was, from provincial funds, 1,128,148 rupees (rupee = 38.3 cents); from local funds, 1,295,109 rupees; total, 2,423,257 rupees. The total expenditure on schools and institutions connected with government, including the expenditure from private funds on aided schools and the cost of schools belonging to native states and inspected by the education department, was 3,407,508 rupees. The corresponding figures for 1882–'83 are: income from provincial and local funds, 2,618,091 rupees; expenditures, 3,811,222 rupees.

Schools for girls.—The total number of schools for girls is now 326, with 19,197 pupils, but the director of public instruction has given these figures as exclusive of

28 schools of the high and middle class and of many girls, whose number should have been stated, attending boys' schools. In 1882–'83 schools for girls numbered 359, with 23,586 pupils.

In 1881–'82 the night schools numbered 134, with 3,919 pupils; in 1882–'83 the number was increased to 176 schools, with 4,826 pupils.

In 1882–'83 the number of pupils learning English was 26,732. The total number of Mussulmans at schools was 46,167. It is stated that the employment of special Mahometan deputy inspectors has produced good results.

Physical training receives much attention. Most of the high schools are furnished with gymnasiums, and in some cess schools[1] a beginning has been made in providing the means of physical training. In some villages small open places near the schoolhouses are hedged round for the gymnasium, and soft earth or sand thrown over the levelled ground.

University examinations.—The number of candidates sent up for matriculation examination in 1881–'82 was 1,374; number passed, 388, of whom 26 were Europeans. For the various degree examinations 643 candidates were sent up, of whom 221 passed, including 3 Europeans. The corresponding report for 1882–'83 gives the number sent up for matriculation as 1,600; passed, 572, including 30 Europeans. Number sent up for the various degree examinations, 683; passed, 308, including 6 Europeans.

From report on public instruction in British Burmah for the years 1881–'82 and 1882–'83:

The total number of children of school age (4–19) in British Burmah, according to the recent census, is 1,327,080. The total number of schools under inspection in 1881–'82 was 3,286, having 89,050 pupils, a number equal to 2.35 per cent. of the whole population. The primary schools numbered 3,238 and were attended by 87,750 pupils, of whom 6,677 were girls. The large majority of pupils at primary schools, namely, 81,334, were Burmese. In 59 of the schools English was taught; the rest were vernacular schools. In 1882–'83 the total number of schools under inspection was 3,863, having 107,037 pupils, a number equal to 2.8 per cent. of the population and to 10 per cent. of the children between 5 and 15 years of age.

Primary education was provided for in 3,857 schools, having an average attendance of 105,387 pupils. The average number of girls attending English schools was 1,050; the average number attending vernacular schools was not shown; but it is observed that of the total number of pupils on the rolls at the close of the year 8,196, or 7.8 per cent., were girls.

Secondary instruction is carried on in high and middle schools that numbered 39 in 1881–'82, having 1,074 pupils, viz, 981 boys and 93 girls. In 1882–'83 the number of secondary schools had increased to 43, attended by 1,074 boys and 115 girls. All these schools are classed as English except one.

Under the head of special and technical schools an account is given of the three normal schools for training teachers, which, in 1881–'82, numbered 99 students, and 145 in 1882–'83. In 1881–'82 an extension of this branch of education was undertaken by establishing a normal class for Burmese schoolmistresses in connection with the American Baptist mission school at Rangoon. Out of a total of 5 higher grade and 71 lower grade certificates granted to normal students during 1882–'83, 3 of the higher and 10 of the lower were awarded to candidates from the girls' class.

The government high school at Rangoon is the only institution with a college department. Seventeen undergraduates studied in this department in 1882–'83 and two passed the first arts examination of the Calcutta University.

In summing up the information with reference to the education of girls in 1882–'83, the chief commissioner says:

From the statements it is observed that the number of institutions devoted to the education of girls increased from 21 in 1881–'82 to 26 in the year under review. Of these 2 are classed as high, 8 as middle, and 16 as primary schools. There are besides

[1] Schools supported partly or wholly by local tax.

many schools which admit boys and girls. Of these the number is not stated in the report. The number of girls under instruction is shown as 8,394, as compared with 6,770 in the previous year. One hundred and forty-five girls passed various examinations as compared with 121 in 1881–'82.

The chief commissioner has been much struck by the great success which has attended the opening of separate classes for girls under female teachers at several of the municipal schools which he has visited in the course of his recent tours. At Henzada he found 70 girls attending a class which had very recently been opened. The number had become far too large to be properly managed by the single teacher in charge of the class. At Yandoon, also, he found a capital girls' department under a female teacher. It is evident that, if only good female teachers can be provided, the Burmese are ready and anxious to send their daughters to school. The training of schoolmistresses is accordingly a matter which the chief commissioner would specially commend to the attention of the director. An excellent example has been set by Miss Rathbun at the American Baptist mission school in Rangoon, one of whose pupils is mistress of the Henzada school.

The expenditure on education in 1881–'82 was 497,794 rupees and in 1882–'83 594,892 rupees.

CHINA proper: Area, 537,590 square miles; population, 350,000,000.

Education is considered of the utmost importance in China, as it leads to rank, wealth, and influence. Even many of the literati become teachers. Self supporting day schools are universal and primary instruction is found in the remotest village. The government appoints state examiners, but does not otherwise assist in educating the masses. There is an absence of statistical publications in regard to public instruction, yet M. Martin, director of the university at Pekin, estimates the proportion of illiterates for the whole empire above 10 years of age as 1 to 6, and for the countries of Northern China as 57 to the 1,000 or 1 to 18. The governmental examinations admit about 2,000,000 candidates each year, and 1 or 2 per cent. of these pass successfully. The public examinations take place in October, and persons of all ages throng from every part of the empire to the large cities to attend them. They many times bring their own tents and utensils, as each person must be in a separate establishment, without communication with the outside world, during the period of the examinations. Each person is to show by an essay that he comprehends the ancient authors, that he can express himself with poetical elegance, and write a fine hand. History and geography are not taken up. The laureates are admitted to the presence of the Emperor, which honor is felt in the family for generations, and the most distinguished receive employment under the administration. Others who are successful become licentiates (hsiu ts'ai). Each licentiate may open a school, and he is allowed to arrange the tuition fees. Those pupils who cannot pay him 6 tiaos (about half a dollar) a month are not considered worth teaching. There are many private schools. There are also public schools, for which the Emperor furnishes the buildings and pays the teachers' salaries. These imperial professors receive from 12 to 18 taëls (taël=about $1.35) a month and two meals a day. Inspectors have the care of such schools, each of which consists of one class, with only 15 pupils as the maximum. If a private individual wishes to open a school for adults his salary is to be limited to 20 taëls and only 6 pupils are to be allowed at a time. Preliminary instruction is very long in Chinese schools, from the lack of alphabet, declensions, conjugations, and grammar; in fact, with nothing but words or characters, which must be memorized in a certain order, with all the affixes and prefixes which throw light on the phrase or word. A stumbling block in education is that the language of the school is different from that of the people. When a young man knows about 12,000 characters and can compose literary or poetical essays he is ready to go up to the examination for licentiate. The university at Pekin, founded about 20 years ago, contains about 150 pupils who enter for the purpose of acquiring a knowledge of foreign branches, and who are paid for so doing. Professors from other countries teach French, English, German, Russian, geography, history, physics, chemistry, astronomy, &c.

COCHIN CHINA, French colony in Asia: Area, 21,630 square miles; population of French provinces proper, 1,563,130. Capital, Hué; population, 100,000.

Educational affairs are under the direction of a primary school inspector. As the people are mostly Anamites, primary teaching differs from that in the majority of the colonies. The primary schools number 443, with 473 instructors and 13,299 pupils (boys, 13,172; girls, 127). In these the Anamese tongue and the elements of French are taught. In the schools of first grade (so called) the children are taught to read and write in French, and also receive their first lessons in grammar, arithmetic, and geography. These schools number 7, with 47 professors (13 Europeans and 34 natives) and 1,062 pupils. They are located where the population is thickest. In the second grade schools the instruction is very similar to that of the French primary school; a 3-year course is given. Only two establishments—the Collége Chasseloup-Laubat at Saïgon and the college at Mytho—have adopted this method. The professors number 35; the pupils, 279. Eventually these two colleges will be considered as the first two years of secondary instruction. Private schools are found in many villages. The pupils are taught to read and write the Chinese or Cambodian characters. These schools are kept up by gifts from individuals or the pupils pay a modest sum towards the expenses. About 414 private schools are reported, with 417 professors giving instruction to 6,008 pupils (5,928 boys and 80 girls). The mission schools number 64; professors, 97; pupils, 3,384 (1,839 boys and 1,545 girls).

JAPAN, absolute monarchy: Area, 156,604 square miles; population (1883), 36,700,118. Capital, Tokio; population, 823,557. Minister of public instruction, Fukuoka.

According to a report on the Japanese school system, there were 5,615,007 children of school age in the monarchy in 1881, as a census of that date states. The school age, since the school law was revised in 1879–'80, is 6–14. Attendance is obligatory in the common schools, which in 1881 numbered 28,901, including private schools organized like the public ones. There are 3 grades in these common schools, a 3-year course in the first two and a 2-year course in the last. The studies are: first year, morals, reading, writing, arithmetic, singing, and gymnastics; second year, elements of geography, history, drawing, natural history, and sewing (for girls); third year, elements of chemistry, physiology, geometry, national economy, or, in the school for girls, domestic economy. In certain sections of the country the elements of an agricultural, industrial, or commercial education enter into the course, which in that case is somewhat modified; but in any case instruction must be given in reading, writing, and arithmetic.

The program of studies in the middle schools varies somewhat according to the needs of the youth of the quarter. There were 172 middle schools reported, with two divisions, one for elementary, the other for higher instruction, in each school. The studies at the school in Osaka serve as a model, viz: Lower course, moral teachings, Japanese and Chinese literature, English, arithmetic, algebra, geometry, geography, history, physiology, zoölogy, botany, physics, chemistry, national economy, book-keeping, calligraphy, drawing, singing, and gymnastics. This course lasts 4 years. The higher course, lasting 2 years, continues morals, literature of China and Japan, English, book-keeping, drawing, singing, and gymnastics, and adds trigonometry, mineralogy, Japanese code of laws, physics, and chemistry.

The normal schools, 74 in number, have a threefold course, covering 1, 2½, and 4 years. There are also model schools connected with these teachers' seminaries. The one year course embraces morals, reading, writing, arithmetic, geography, physics, pedagogy, school supervision and school practice, singing, and gymnastics. In the 2½-year grade the same studies are continued, and history, drawing, physiology, natural history, chemistry, geometry, and book-keeping are added. In the 4-year course are found the additional branches of algebra, national economy, Japanese legal lore, and psychology. This plan of study may be changed according to the wants of an industrial, commercial, or agricultural education.

The normals for women follow out the same courses, only that instead of national economy and law they take up domestic economy and needlework. In Tokio there are two model institutions for men and women desiring to become teachers. The one for males has two subdivisions, a 4-year course for those intending to teach in the common schools and another course (which is now undergoing some changes) for those who wish to be teachers of the middle grades. These courses take up the studies named above. The other, for women, which allows graduates to teach in any grade, has a 4-year course, covering morals, reading, narration, writing, arithmetic, geography, Japanese history, natural history, physics, chemistry, drawing, pedagogy, practice in teaching, needlework, etiquette, domestic economy, singing, and gymnastics. A six-class school for girls — a lower grade school — serves for a practice school; a five-class higher grade is also connected with it. A school for children from 3 to 6 years, similar to the Kindergarten, is also a part of this teachers' seminary. Seven of these infant schools are now in existence.

A certificate of graduation, showing how much of the course the normal pupil has undertaken, entitles the holder to a teacher's position in some of the grades according to the branches pursued. This certificate is good for 7 years, but may be extended 7 years or for life. Examinations are also held for persons of 18 years of age or more who desire to take the position of teacher but who have not followed the normal courses. A successful passing of such examination before the proper authorities entitles the candidate to a grade of certificate equivalent to the studies examined in. The teacher is then allowed to fill a position within the district for a longer or a shorter period, in any case not upwards of 5 years, although then a renewal is permitted if the position has been acceptably filled.

The university at Tokio and the polytechnic school represent the highest grade of instruction, in addition to some special schools. The four faculties embrace law, sciences, medicine, and literature. The legal studies include English, French, and Japanese law, but not the Roman law. The sciences include mathematics, physics, chemistry, biology, astronomy, geology, civil and mining engineering. The medical department graduates physicians, pharmacists, and apothecaries. The literary course has four sections: philosophy, politics, national economy, and Japanese and Chinese literature. Each course takes 4 years except the pharmaceutical, which requires 3 years, and the higher medical, which occupies 5 years. Two preparatory schools have special courses for the university. One, with a 3-year course, leads up to the legal, scientific, and literary departments; the other, four years in length, to the medical school. Astronomical and meteorological observatories, a botanic garden, a chemical and a natural history museum, and two hospitals are all connected with the university. The technical high school, or school for engineers, has a 6-year course, two of which are preparatory. The English language, geography, the elements of mathematicsl mechanics, and physics, chemistry, and geometrical and machine drawing are taught as preparation for the special courses in the construction of machines and ships, in telegraphy, architecture, practical chemistry, surveying, and mining. The instruction is both theoretical (two years) and practical (two years). Museums, laboratories, foundries, &c., aid greatly in rendering the students proficient.

Special schools are scattered among the cities and districts of Japan. According to the needs of the people around, there are either medical, pharmaceutical, legal, agricultural, or commercial institutions, or, perhaps, schools for students of natura, sciences, mathematics, literature, drawing, architecture, seamanship, &c. Far more schools are devoted to medicine than to any other branch. A 4-year course leads to the degree of M. D.; a 3-year course produces physicians of the second class. There are similar courses for those desiring to become druggists, but the studies are limited to 2 and 3 years. There are 2 special schools — one for languages and one for teachers of gymnastics — in Tokio. The first, in a 5-year course, gives instruction in French, German, Russian, Chinese, English, and the Corean tongues. The second pays more attention to physical development, yet it includes Japanese, Chinese, and

English literature, arithmetic, algebra, geometry, anatomy, physiology, physics, hygiene, and drawing. The course is of two years' duration. There are also army and navy institutes; schools of agriculture, forestry, and veterinary science; 3 commercial or trade schools; many private establishments; a school of technology (especially for chemical and mechanical branches); various institutions for the deaf, dumb, and blind; so-called "Japanese" schools, where the history, literature, poetry, and ancient art of Japan are taught; German schools; schools of etiquette and for woman's handiwork, needlework, &c.

The school system is benefited materially by the numerous libraries, pedagogical museums, and collections of apparatus which are found in the capital and in the provinces. Students are sent at government expense to foreign lands to study educational systems. Conferences are held in different districts, so that there may be an exchange of thought on school matters, and the minister of education gathers his aids around him from time to time for a like purpose. Japan is divided into 44 school districts, with the prefect at the head of the educational system in each, but each of these districts is subdivided and under supervision of an inspector, all of these officials being subject to the commands of the minister of education. There are also school boards having certain duties in the communal departments. Religious orders have nothing to do with schools in Japan. With the exception of the governmental schools, the different sections are supposed to furnish funds for their own immediate schools; still help is given if the district funds do not hold out. When new school buildings are to be erected, the government furnishes the ground, if possible; all school grounds are free from taxation.

The Japanese school system is not yet fully developed and some reforms are soon to be made, but the prospects are said to be excellent. The greatest trouble so far seems to be in the lack of money in a few districts and in the lack of cultivation among the teachers. This last, it is thought, will be done away with as the teacher realizes more fully what is expected of him.

III. — Africa.

Egypt, a dependency of Turkey: Area, 1,406,250 square miles; population, 16,952,000. Capital, Cairo; population, 368,108. Minister of public instruction, Khaïry Pacha.

For the latest educational statistics, see the Report of the Commissioner of Education for 1879.

Cape of Good Hope, British colony: Area, 239,305 square miles; population, 1,155,168. Capital, Cape Town. Superintendent general of education, Langham Dale.

Since 1860 the aided school system has been extending its operations in this colony. Theoretically it presents a very elaborate and complete gradation of schools, extending from the elementary schools to the university and adapted to all the classes and races that make up the population of the colony. Practically, the results accomplished have not proved satisfactory, and in 1882 Donald Ross, previously well known as one of Her Majesty's inspectors in Scotland, was appointed inspector general of colleges and schools, with instructions to investigate and report in full upon the educational affairs of the Cape. His preliminary report gave an interesting survey of the field and evinced a wonderful power in the observation, analysis, and classification of practical details. His death, which followed almost immediately upon the completion of this report, brought to an end one of the most promising investigations ever undertaken in the interests of education. For reasons that may be readily inferred from the condition of the colony, it is not easy to gather reliable school statistics. Mr. Ross concluded that one-sixth of the children of school age in the colony attend schools with beneficial results, while five-sixths are still outside the government system; of the latter number he estimated that about 6,500, mostly children of the superior class, were under private instruction.

Of the total population the Europeans number about 250,000. It is estimated that one-half the children of this portion of the community are under instruction. Mr. Ross dwelt particularly upon the want of competent teachers, which the superintendent general had also long recognized as a great obstacle to the progress of the schools. The most satisfactory feature in the system at present seems to be the supply of good buildings and apparatus, in which respect Mr. Ross was of the opinion that the colony surpassed what England had accomplished up to 1870.

The following statistics are from the report of the superintendent general for 1882: Number of aided schools, 960; annual enrolment, 75,314; daily attendance, 37,316; government expenditure, 88,822*l.* (this includes grants to university and colleges); local expenditure, 119,918*l.*

IV.—North America.

Dominion of Canada: Area, 3,470,392 square miles; population, 4,324,310. Capital, Ottawa; population, 27,412.

Each of the seven provinces forming the Dominion of Canada has power to regulate its own local affairs, including education, so far as may be done without interfering with the policy and action of the central administration under the governor general.

Public instruction in most of the provinces is under the control of a council of education and of one or more superintendents, according as the religious element is or is not recognized. Full information upon this point is embodied in my annual report for 1876.

a. British Columbia: Area, 341,305 square miles; population, 49,459. Capital, Victoria; population, 4,540. Superintendent of education, C. C. McKenzie.

The report for the year ending June 30, 1883, gives total enrolment in common schools during the year as 2,632; average attendance, 1,345. Enrolment in high school, 61; average daily attendance, 38. Number of teachers in all the public schools, 62. Cost of education for the year, $60,758.75. Average monthly salary of teachers on permanent staff in 1882–'83, $60.86. Highest salary paid, $110 per month; lowest, $45.

b. New Brunswick: Area, 27,174 square miles; population, 321,233. Capital, Fredericton. Chief superintendent of education, Theodore H. Rand.

From the report for the year ending October 31, 1882, it appears that the total number of different pupils in attendance on the schools within the year was 64,267; increase, 1,644. The proportion of the population of the province enrolled at the public schools in the summer term, according to the census of 1881, was 1 in 6.18. The average monthly percentage of pupils daily present during the term was 72.44. The proportion of the population at school during the winter term was 1 in 6.58 (census of 1881).

The number of teachers employed during the summer term was 1,453; during the winter term, 1,371. The average rate of teachers' salaries per annum from all sources, compiled from the returns of the winter term of 1882, was as follows: male teachers of the first class, $508; female teachers of the first class, $338.70; male teachers of the second class, $315.40; female teachers of the second class, $230.27; male teachers of the third class, $235.80; female teachers of the third class, $185.71.

There were in attendance at the normal school 168 student teachers, of whom 28 belonged to the French preparatory department.

c. Nova Scotia: Area, 20,907 square miles; population, 440,572. Capital, Halifax; population, 36,100. Superintendent of education, David Allison.

The following information is from the report of the superintendent for the year ending October 31, 1883:

Total number of schools in operation, winter term, 1,844; summer, 1,943; total number of registered pupils, winter term, 79,091; summer, 81,863; average daily

attendance, winter term, 4 2,508; summer, 43,165. Total number of teachers and licensed assistants employed, winter term, 1,911; summer term, 2,011. Total government expenditure for education, $186,087.62. The total number of pupils reported in institutions for secondary instruction, viz, county academies and special academies, was 1,130; average daily attendance, winter term, 616; summer term, 517.

In the normal school 125 students were enrolled, of whom 75 remained throughout the whole session. The number of diplomas awarded was 82. The number of teachers employed, 5. The total expense of the school was $5,132.83. The model school in connection with the normal enrolled in the winter term 711; in the summer term, 779; average daily attendance, winter term, 515; summer term, 452. Number of teachers, 12; expense of the school, $6,807.50.

The number of pupils enrolled in the public schools of Halifax, exclusive of the high school, for the term ending October 31, was 5,128; average daily attendance, 3,925; number of teachers employed, 98.

d. ONTARIO: Area, 101,733 square miles; population, 1,923,228. Capital, Toronto; population, 86,415. Minister of education, George W. Ross.

The following information is derived from the report of the education department for 1883 and the statistical report for 1882:

School population and attendance.—The number of children between 7 and 13 years of age reported as not attending any school for 110 days during the year is 87,444. The number between 7 and 13 not attending any school whatever was 8,086, or less than 2 per cent. of the whole school population. By the school act of 1881, now in force, the parent or guardian of every child between the ages of 7 and 13 is required to cause such child to attend a public school for 11 weeks in each of the two terms of the public school year, and the attendance must be during the whole time in each week, except in cases where half time is allowed.

The average attendance, viz, the aggregate daily attendance divided by the number of legal teaching days in the year, being 222 days for rural and 211 for urban schools, was 214,176. The percentage of average attendance, as compared with total number attending school, is, for rural districts, 43; cities, 58; towns, 53; province, 45. The percentage of pupils under 5 to the total number attending school is 0.28; for pupils between 5 and 16, 96.96; for those between 17 and 21, 2.66; and for those over 21, 0.10.

Nine per cent. of the pupils attended for less than 20 days during the year, 17 per cent. from 20 to 50 days, 25 per cent. 51 to 100 days, 22 per cent. 101 to 150 days, 23 per cent. 151 to 200 days, 4 per cent. 201 days to whole year.

Teaching force.—In the 5,203 schools reported, 6,857 teachers were employed, of whom 3,062 were male teachers and 3,795 female teachers. There were 733 more female than male teachers. Highest salary paid to a male teacher in a county was $900; the lowest, $120; in a city, the highest, $1,100; the lowest, $400; in a town, the highest, $1,000; the lowest, $240. The average salary of male teachers in counties was $385; of female teachers, $248; in cities, of male teachers, $742; of female teachers, $331; in towns, of male teachers, $576; of female teachers, $273. The number of teachers who had attended the normal schools at Toronto or Ottawa was 1,873, an increase of 74.

High schools.—Number of schools, 104; number of pupils, 12,473. The amount received by the high school board from legislative grant for the salaries of teachers was $84,304; increase, $1,016. The amount of municipal grants in support of high schools was $196,438; decrease, $4,375. The amount received for pupils' fees was $29,269; decrease, $1,621. Balances of the preceding year and other sources, $63,137; increase, $6,882. Total receipts, $373,150; increase, $1,900. Expended for salaries of masters and teachers, $253,863; decrease, $3,354; for building, rent, and repairs, $19,361; decrease, $4,341; for fuel, books, contingencies, $68,673; increase, $5,905; for maps, prize books, apparatus, and libraries, $1,821; decrease, $339; total expenditure for the year, $343,720; decrease, $2,129. The cost per pupil, based on total ex-

penditure, was, for collegiate institutes, $29.30; high schools, $26.61; collegiate institutes and high schools, $27.56. Thirty-seven high schools charge fees, 67 are free, and 51 are united with public schools.

Receipts and expenditure.— The total receipts for all public school purposes for the year 1882 amounted to $3,469,990, showing an increase of $210,751 over the total receipts of the year 1881. Total expenditure for all public school purposes, $3,020,974; increase, $182,702. The average cost per pupil, based on total expenditure, was $6.03 for rural districts, $8.81 for cities, $6.86 for towns, being for the whole province $6.42.

Normal schools.— The report of the normal schools for the school year 1882–'83 shows that 200 pupils were admitted to the Toronto normal school, of whom 84 were men and 116 women. Certificates were granted to 60 men and to 95 women. The teaching staff numbers 8 persons. The Ottawa normal school admitted 138 students, viz, 65 men and 73 women. Certificates were granted to 53 men and 60 women. The teaching staff numbers 7. Each of the schools has a model school attached. The expenditure for normal and model schools for 1882 was $44,904.36; for 1883, $45,340.40.

e. PRINCE EDWARD ISLAND: Area, 2,133 square miles; population, 108,891. Capital, Charlottetown; population, 8,807. Chief superintendent of education, I. Montgomery.

According to the report for 1882 the number of pupils enrolled in the public schools was 21,269; average daily attendance, 11,285; number of teachers, 468. Total expenditure for education, $130,446.96; rate for each pupil enrolled, $6.13; rate for each pupil in average daily attendance, $11.56.

The average salary for teachers ranged for male teachers from $228.64 for teachers of the third class to $465.16 for teachers of the first class; for female teachers, from $165.56 for the third class to $360 for the first class.

The Prince of Wales College and Normal School was attended by 93 students, viz, 33 non-professional and 60 in training for teachers.

f. QUEBEC: Area, 188,688 square miles; population, 1,359,027. Capital, Quebec; population, 62,446. Superintendent of public instruction, Gédéon Ouimet.

According to the report of the superintendent for the scholastic year 1881–'82 the number of schools (under control) was 4,457; number of pupils, 236,699; average attendance, 180,463.

The following table shows the classification of schools in the province, with the teaching force and enrolment:

	Schools.	Professors.	Pupils.
Universities	3	129	1,075
Schools of the second degree	231	1,349	36,022
Normal schools	3	20	323
Special schools	20	113	1,351
Primary schools	4,609	5,600	200,354
Total	4,866	7,211	239,125

GUATEMALA, republic: Area, 41,830 square miles; population (1883), 1,276,961. Capital, Santiago de Guatemala; population, 55,728.

The following information is taken from Anales estadísticos de la República de Guatemala for 1882, an official publication issued by the secretary of the bureau of statistics of Guatemala:

The law on public instruction in Guatemala declares that primary instruction shall be obligatory for all children between six and fourteen years of age. The law further provides that an annual return shall be made of all children of school age and

of their attendance at school. The following table shows the number of children of school age and their attendance at school for the year 1882 in each department of the country, together with the population of the department. The total number of primary schools was 811:

Departments.	Population in December, 1882.	Children of school age.			Proportion to the number of inhabitants.
		Boys.	Girls.	Total.	
Guatemala	129,564	8,793	7,621	16,414	1 to 8
Amatitlan	32,387	2,902	2,538	5,440	1 to 6
Escuintla	29,890	1,739	1,494	3,233	1 to 9

JAMAICA, British colony: Area, including Turk's Island, 4,362 square miles; population, 585,536. Capital, Spanish Town; population, 6,000. Inspector of schools, Thomas Capper.

The following information is derived from the annual report of the inspector of schools for the year ending September 30, 1882:

Number of schools inspected, 677; number receiving aid, 627; number of pupils registered, 53,366; average attendance, 29,894; amount of grants in aid, 18,225*l.*

With respect to school attendance the inspector says:

The regulation requiring all schools receiving government aid to be open for at least 180 days in the year has been very generally disregarded. The proportion of scholars on the books of schools under government inspection to the whole number of children in the island between the ages of 5 and 15 is almost exactly 30 per cent. But low as this percentage undoubtedly is, it must not be inferred from it, as some suppose, that 70 per cent. of the children in the island go without any education. The figures would be the same if every child in the island attended school regularly for three years, which, unfortunately, is far from being the case. To put it in another way, the children of Jamaica have on an average three years each in an elementary school, which, if they attended regularly and were well taught, would be quite sufficient to give them a better education than the great majority of them actually get. In the course of those three years, however, they only attend on an average five-ninths of the school days, broken up in most cases into detached portions, so as to produce the smallest possible good results.

As a means of improving the teaching force, regulations were published in August last under which certificates will be granted, on the results of an examination to be held annually, to teachers, and, after a probationary period of two years, to outgoing students of training colleges. To holders of these certificates an annual bonus will be paid of 5*l.*, 10*l.*, or 15*l.*, according to the class of their school at the annual inspection. Provision is also made for the payment of a sum of 15*l.* to such voluntary training colleges as apply for examination, for every resident student who passes. The standard to be attained is such that nearly all capable teachers in the island should be able to secure a certificate within two or three years.

MEXICO, federal republic: Area, 743,948 square miles; population (1882), 10,046,872. Capital, Mexico; population (1882), about 300,000.

There are no statistics of primary education covering the whole country of Mexico later than 1875. A French gentleman, M. A. Dupin de Saint André, has made a report to the French minister of public instruction on education in Mexico, from which the following details are taken:

The reorganization, or rather the organization, of primary instruction in Mexico was effected in 1867, since which time considerable progress has been made and numerous schools have been established. In 1875 instruction was made obligatory in 19 out of 29 states, viz, in Aguascalientes, Chiapas, Coahuila, Campeche, Guanajuato, Guerrero, Jalisco, Michoacan, Morelos, Nuevo-Leon, Oaxaca, Puebla, Sinaloa, Sonora,

San Luis Potosí, Tlaxcala, Vera Cruz, Distrito federal, and Baja California. In some of these states (Aguacalientes, Campeche, Michoacan, Jalisco, Morelos, Nuevo-Leon, Oaxaca, Sinaloa, Vera Cruz, San Luis Potosí, and Guerrero) parents and guardians who do not send their children to school are fined and may be sent to prison. In others (Puebla and Coahuila) the delinquents are brought before the police magistrates, while in Sonora, the federal district, and Lower California children who go regularly to school receive a reward, and all public employment is refused to the fathers who neglect to comply with the requirements of the law.

The program of primary instruction embraces reading, writing, Spanish grammar, arithmetic, weights and measures, morals, and politeness. In most of the schools instruction in geography, drawing, and natural history and in the rights and duties of citizenship are added to these obligatory subjects. Girls are taught sewing. In the City of Mexico the school programs are of wider scope and include geometry, algebra, general history, and French.

In 1875 (date of the latest statistics) there were 8,103 primary schools in Mexico, conducted by the government, the municipalities, or by corporations and individuals. They are subdivided as follows: government schools, 603; municipal, 5,240; maintained by corporations or private parties, 378; by the clergy, 117; private schools, 1,581; unclassified, 184. Instruction is gratuitous in all, except some of the private schools. The schools belonging to the clergy, as shown above, are not numerous. Clericalism is powerless in Mexico. This fact is all the more extraordinary because the country is Roman Catholic and the Indians are still the humble servants of the padres. But sangre azul Mexicans dislike the priests. They are anxious to rescue the country from their influence and hope to succeed in their project by increasing the number of governmental or communal schools.

Divided as to sex and age, the Mexican schools are classified as follows: Primary schools for boys, 5,567; for girls, 1,594; mixed schools, 548; adult male, 124; adult female, 21; unclassified, 249; total, 8,103. The number of pupils in the 8,103 schools was 349,000. This is not a large number in proportion to the 800,000 children of school age in the country. But, although the Mexican Republic is three times as large as France, the population is scattered, the schools are not nearly so numerous as they should be, and the illiterate Indians have no conception of the value of education. These causes sufficiently account for the ignorance of which so much complaint is made and for which there is no remedy except the establishment of schools in all the remotest villages. In 1875 the confederation, the states, the municipalities, and the corporations expended $1,633,436 for primary education, of which nearly $417,000 came from the confederation, the corporations giving $173,000. The rest came from State funds and municipalities.

The number of secondary and professional schools in 1875 was 54, with 9,337 pupils. This is exclusive of the ecclesiastical seminaries, which numbered 24, with 3,800 students. There were also 15 secondary schools for girls, with an attendance of 2,300 students.

YUCATAN, Mexican state: Area, 29,567 square miles; population, 302,319. Capital, Merida; population, 9,727.

From a report presented by the president of the council of public instruction of Yucatan to the governor of that state we obtain the following statistics: The number of primary schools in 1882–'83 was 227, an increase of 37 over the previous year. Of these, 170 were boys' and 57 were girls' schools. The total attendance was 8,216, and of this number 6,041 were boys and 2,174 were girls. The previous year the attendance was 9,600, composed of 7,500 boys and 2,100 girls, thus showing a decrease. The annual expenditure was 71,220 pesos ($63,671), of which sum 43,068 pesos were appropriated from the public treasury and 28,152 pesos were contributed by the various municipalities.

There are a normal school; a literary institute for girls, which had an attendance of 177 pupils in 1882; the Literary Institute of Yucatan, which gives both primary and sec-

ondary instruction and was attended by 174 students in 1882; a public museum; and a library of 1,340 volumes. The literary institute of Valladolid, which gives primary instruction, had an attendance of 57 pupils in 1882. The medical school at Merida had 50 students the same year, while the law school had 53 students.

V.—South America.

Argentine Republic: Area, 515,700 square miles; population, 2,830,000. Capital, Buenos Ayres; population, 295,000. Minister of justice, worship, and public instruction, Dr. Eduardo Wilde.

The following information is taken from an official report on the condition of education in the Argentine Republic in 1882 by Dr. Benjamin Zorrilla, president of the national commission on education. The commission was established in 1882 for the purpose of examining and reporting upon the condition of education in the republic during that year.

The first act of the commission was to take a school census of the city of Buenos Ayres, so as to determine the number of children of school age (5 to 14 years) in that city, the number attending the public and private schools, those receiving instruction at home, and those who receive no instruction whatever. The census showed that there were 44,170 children of school age whose parents are required by law to send them to school, and 19,543 children enrolled in the public schools in May, 1882, with an attendance of 16,958, which figures rose in October to 21,698 enrolled, with an attendance of 17,885.

There has been a gradual increase in school attendance in the last few years. To go back twenty-five years, there were 6,427 children at school in Buenos Ayres in 1856, according to information in the possession of the department of education. The census of 1869 showed that the total population of the province of Buenos Ayres, including the city, was 495,107, and that 28,373 children attended the public and private schools. In the city alone in 1882 there were 21,698 children enrolled at the public and 11,493 at the private schools, making a total of 33,191, or 4,818 more than attended school in the whole province in 1869. The population of the city in 1881 was 289,925, while in 1869 it was 177,790.

A comparison of the enrolment and attendance in the years 1880, 1881, and 1882 at the public schools shows a constant increase. Thus in 1880 the enrolment was 16,637 and attendance 13,422; in 1881 the corresponding figures were 18,023 and 14,714; and in 1882, 21,698 and 17,885, which shows an increase of 5,000 children in the enrolment during those three years. The number of schools in 1882, besides normal schools, was 168, divided into 5 graded, 94 elementary, 53 infant, 14 night, 1 Sunday school, and 1 Kindergarten. The total number of teachers was 437. The sum of $137,000 was paid for the rent of 150 buildings for school purposes, including that occupied by the national educational commission.

The number of private schools in Buenos Ayres was 118, of which 46 were for boys, 19 for girls, and 53 mixed. The attendance in September, 1882, was 6,777 boys and 4,716 girls, a total of 11,493. The number enrolled in the public schools at the same time was 21,698, so that the entire number of children enrolled in the schools was 33,191. There were, besides, 697 pupils of the public normal schools, 225 students at the national college in the first and second years (who still belonged to the school population), and 1,323 children who received instruction at home, making a total of 35,436 children receiving instruction out of the 46,000 of school age in the city. The number 46,000 represents the number of children of school age better than the census figure, 44,170, because many persons did not give the number of their own children or of others living in their houses who were of school age.

The law of September 25, 1871, organizing public instruction, had gone into effect in all the provinces of the republic by the end of 1882. Under this law school commissioners are appointed in each province, who are independent of the local governments and who administer the funds appropriated for school purposes. The law specifies the sources from which the appropriation shall be made.

In the province of Buenos Ayres 70 new school buildings were in course of construction in 1882. The total number at the close of that year was 324, with 276 male and 294 female teachers and 22,498 pupils (of whom 12,102 were boys and 10,396 girls). The average attendance was 16,742. The number of schools in 1881 was 248 and of pupils 18,451.

The province of Santa Fé made no returns for the year 1882, and therefore had no share in the national subvention for education.

The census of 1869 showed 7,188 pupils of both sexes in the public and private schools of the province of Entre Rios, out of 27,709 children of school age. Since then the school attendance has not increased, while the number of children of school age has kept pace with the increase of population. The number of children attending the public schools in 1882 was 3,777; the enrolment was 4,217 (2,399 of whom were boys and 1,818 girls). There were 64 schools, with 64 male and 57 female teachers. The average monthly pay of all the teachers was 44.64 pesos fuertes (about $45). The total school attendance did not exceed 7,000.

The province of Corrientes, like San Luis, Santa Fé, and others, has passed excellent laws on primary education, which have not been rigidly enforced, on account of the apathy and indifference of the public. In 1882 there were in that province 101 schools, with 151 teachers (88 male and 63 female) and an enrolment of 4,928 children (of whom 2,977 were boys and 1,951 girls). The attendance was 4,420. The total paid for salaries was 2,680 pesos fuertes a month. In 1869 the school attendance, public and private, was put down at 6,569. The returns for 1882 only give the public schools, but it is probable that there has been no increase in the attendance at private schools since the earlier date.

Cordova is the second province of the republic in population. It has no law upon primary instruction but the legislature votes a certain amount of money for that branch of education every year. Its university and the Colegio de Monserrat receive much attention from the legislature and the public, but primary education is neglected. In 1872 the city of Cordova had 2 public schools, with 42 pupils; in 1882 the number had increased to 20 schools, with 1,698 pupils. The province has a population nearly equal to that of the city of Buenos Ayres, so that it may be assumed that it contains 46,000 children of school age. In 1872 the province had 39 public schools, with 1,559 pupils. In 1882 there were 102 schools, with 6,611 pupils. More children, therefore, attend the private schools of the city of Buenos Ayres than are taught in all the schools of Cordova. In the 102 schools there were 147 teachers (76 male and 71 female), the number of pupils enrolled was 6,611 (3,976 boys and 2,635 girls), and the attendance was 5,692.

The legislature of the province of San Luis passed a new law on public primary education on March 14, 1883, some of the principal features of which are as follows: It makes primary instruction obligatory and gratuitous. An annual census is established to determine the number of children of school age and a fine is imposed upon the parents or guardians for non-enrolment and non-attendance of such children at school. A provincial educational commission is established, with a president, council, and other officers, and district inspectors are appointed under the commission. The duties and powers of the commission are to administer the school fund, appoint and discharge employés (discharges are to be made for sufficient reasons only), take the school census, draw up regulations and programs for the schools, visit and inspect the schools twice a year (and oftener if necessary), suggest improvements to the executive, prepare an annual report, appoint and remove teachers, build or buy school-houses, propose new taxes to increase the school fund, receive gifts or legacies, demand dispossession of land necessary for school purposes, draw up annually a general budget for all school districts and forward it to the executive, keep an account of the receipts and expenditures of the commission, recommend the establishment of public libraries, deposit the funds it receives in the national bank, collect the subsidies granted by the general and provincial governments for school

purposes, receive and distribute books and apparatus, &c., for educational purposes, and arrange for collecting taxes destined for the school fund. The members of the commission are responsible for the property administered by it. The commission has the right of representation in court. The president has control of the employés of the commission. His powers and duties are to preside over the commission, and he may vote in case of a tie. His signature, together with that of the secretary, legalizes the acts of the commission, and he communicates such acts to the proper functionaries. His duties are, further, to draw up and submit to the commission the regulations affecting the powers and duties of the employés thereof; to authorize payments and collect, distribute, and advise upon the various appropriations; to execute the dispositions made by the commission for distributing school furniture, books, &c.; to inspect the schools of the capital and to recommend improvements in instruction; to conduct an official journal containing decrees, &c., on primary instruction; to superintend school inspection; to prepare an annual report and a budget; and to become a party to any suit or action involving school funds or property. The duties of the inspectors are to inspect and report upon the competency of the teachers, prevent them from using other text books than those adopted by the commission, notice the attendance of the teachers and verify their returns of attendance of the pupils, keep the commission informed of the hygienic conditions of the schools and the condition of the buildings, furniture, &c., and attend to the fulfilment of the regulations of the commission and to the collection of taxes for the school fund in each district. The law then specifies the sources from which money is to be derived for the school fund. They include certain fines and penalties, a percentage of gifts and legacies and of property left by persons dying intestate, proceeds of the sale of public lands, taxes on wills, the income from certain rights and privileges, and the subsidies from the national and provincial legislatures. The receivers of these moneys, appointed by the executive authority, render an account thereof to the commission of education, and they act in concert with said commission on all matters affecting the disposition of such moneys.

The salaries of the officers of the central commission, of the inspectors, and other employés are to be determined annually by the budget for that year and be paid by the commission itself. The teachers are required to present their pay estimates to the district inspectors every four months, and the latter send the same to the commission. Every person who has established or desires to establish a private school must prove to the inspector of the district that the branches which are required as a minimum in the public schools are taught in his school. This is to permit the children in private schools to be exempt from attendance at the public schools. Private schools are required to give the statistics demanded by the inspectors and the commission and to be subject to supervision and inspection by the inspectors as far as the morality of the instruction and the hygienic conditions of the school are concerned.

The commission will establish two endowments for boys and girls in the normal schools of each school district. The beneficiaries of these endowments are bound to serve four years in the schools of the province. The number of subsidized schools in the province of San Luis at the end of 1882 was 78, with 116 teachers (55 male and 61 female) and 4,047 enrolled pupils, of whom 2,298 were boys and 1,749 were girls. The attendance was 3,653. The average monthly pay of the teachers was 27.87 pesos fuertes (about $28). The census of 1869 showed 2,216 children attending the public and private schools, so that the subsidized schools now have an attendance which is nearly double the total number of children who went to school fourteen years ago.

The province of Mendoza passed a law on public instruction on November 30, 1880, which is like those enacted by other provinces in the last few years. The school statistics for 1882 show 61 public subsidized schools, with 64 male and 55 female teachers and 4,458 enrolled pupils (2,665 boys and 1,793 girls). The attendance was 3,843. In 1869 the total attendance at public and private schools was 2,132. The province of San Juan enacted a law on primary education in 1873, and as considerable attention

is paid to the subject in that province many improvements have been introduced into the system which was adopted at that time. A proposed new law provides, among other things, that a school shall be established in every locality where there are 30 children of school age; that public schools shall be open to both sexes; that whenever the mean attendance at a school exceeds 30 pupils an assistant teacher shall be engaged; that private schools shall submit to inspection and supply the statistical information required by the general council within specified periods, under penalty of a fine. An additional fine will be imposed for refusing to supply the information desired or for giving false returns. Teachers will be required to obtain diplomas from a normal school or from the general council. In 1882 San Juan had 48 public subsidized schools, with 41 male and 77 female teachers and an enrolment of 5,031 children. In 1869 the census showed an attendance at all schools of 5,091 children.

The province of Rioja is in an isolated situation, its soil is barren, and its mineral resources have only recently begun to be developed. It could hardly be expected, therefore, to contribute much to educational purposes. Nevertheless its legislature passed a law in July, 1882, which is in conformity with the national school law. It appropriated 16,000 pesos fuertes, to be deposited in the national bank subject to the order of the school commission. The latter was created by the same law and was also intrusted with the money of the national subvention. In 1882 there were 69 public subsidized schools in the province, with 40 male and 45 female teachers and an enrolment of 4,120 pupils, of whom 2,295 were boys and 1,825 girls. The attendance was 3,796. The average monthly pay of the teachers was 14.92 pesos fuertes (about $15). In 1869 the attendance was 3,000.

The group of the four provinces San Luis, Mendoza, San Juan and Rioja presents a more satisfactory state of things, as far as public elementary instruction is concerned, than the littoral provinces, except Buenos Ayres.

The province of Catamarca was one of the first to respond to the national law by enacting one in conformity therewith, appointing commissions in the capital and the country districts and appropriating money for public instruction. But primary instruction made little progress under the original law, and a new law was passed in December, 1882, which reorganized the system of instruction and made additional appropriations to support the same. The number of public subsidized schools in the province in 1882 was 37, with 29 male and 21 female teachers and an enrolment of 2,443 children, of whom 1,601 were males and 842 females. The attendance was 2,077. The monthly pay of the teachers was 18.84 pesos fuertes. The public and private school attendance in 1869 was 2,622.

None of the requirements of the law of September 25, 1871, had been complied with in the province of Santiago up to the beginning of 1882. No school commission had been appointed and no funds had been raised for educational purposes. But this state of things will not last long, and a law has been proposed which is fully in accord with the circular of April 10, 1882, and makes appropriations for school purposes. In the early part of 1883 there were 34 public primary schools in the province, with 26 male and 16 female teachers. The enrolment was 1,117 boys and 566 girls. The attendance was 1,679. The average monthly pay of the teachers was 26.42 pesos fuertes.

The province of Tucuman had not adopted a general law on primary education before 1882. It regulated its schools in its own way, without reference to the national law on elementary education. The governor of the province, however, in his annual message to the provincial legislature, called attention to the importance of accepting the conditions of the law providing national aid for elementary instruction, and the province will, in all probability, shortly join in the general movement which has given an impulse to that branch of education in the last few years. In 1882 there were 64 public elementary schools, with 58 male and 62 female teachers and an enrolment of 3,186 boys and 2,912 girls. The attendance was 5,118. The average monthly pay of the teachers was 20.35 pesos fuertes. In 1869 there were 3,219 children attending the

public and private schools of the province. The legislature of the province voted 23,563 pesos fuertes for primary instruction in 1882, and the municipalities 34,440 pesos fuertes additional.

The constitution and school laws of the province of Salta provide for an annual school tax, which equalled the general estimate of the province in 1883. A periodical representing the interests of education is published under the auspices of the council. In 1882 there were 64 subsidized elementary public schools in the province, with 43 male and 56 female teachers and an enrolment of 2,335 boys and 2,123 girls. The attendance was 3,990. The average monthly pay of the teachers was 35.82 pesos fuertes. In 1869 there were 2,885 children in the public and private schools of the province.

In 1882 the province of Jujuy adopted the conditions of the national law on elementary education, made suitable appropriations to supplement the national aid, appointed a school commission, created a system of school inspection, and, in short, complied with all the requirements of that law. The number of subsidized public elementary schools in the province in 1882 was 28, with 19 male and 14 female teachers and an enrolment of 626 boys and 414 girls. The attendance was 1,035. The average monthly pay of the teachers was 18 pesos fuertes. There is no record of the school attendance of 1869.

The following table gives a summary of the foregoing information, together with some additional figures showing the condition of primary education in the colonies and the average monthly cost of each scholar in each province:

Provinces and colonies.	No. of schools.	Number of teachers.			Enrolment.		
		Male.	Female.	Total.	Boys.	Girls.	Total.
Buenos Ayres (city)	167	158	337	495	10,010	11,688	21,698

[a] The figures represent pesos fuertes. One peso fuerte = $1.013.

The population of the foregoing provinces and territories in 1882 was estimated to be as follows, according to the Almanach de Gotha:

Buenos Ayres (city)	295,000
Buenos Ayres (province)	612,000
Cordova (province)	320,000
Corrientes (province)	204,000
Entre Rios (province)	188,000
Santa Fé (province)	187,000
Tucuman (province)	178,000
Salta (province)	167,000
Santiago (province)	158,000
Catamarca	102,000
Mendoza	99,000
San Juan	91,000
La Rioja	87,000
San Luis	76,000
Jujuy	66,000
Territories	112,000
Total	2,942,000

Secondary education.—From a report presented to the national congress in 1883 by Dr. Eduardo Wilde, minister of justice, public worship, and instruction, the following statistics of secondary instruction are taken. In the report regrets are expressed that in consequence of insufficient appropriations the efficiency of the teaching force in the national colleges and normal schools has been seriously diminished, both as regards the number and permanence of the force and its energy and enthusiasm. Attention is also called to the insufficient number of school buildings and their bad condition.

In the 14 national colleges of the country there were 1,116 students in 1881 and 1,629 in 1882. In the 9 normal schools for boys there were 228 students in 1881 and 306 in 1882. There were 6 normal schools for girls in 1881, with 272 pupils, and in 1882 the number had increased to 8, with 335 pupils.

Complaint is made that many students of the secondary schools do not complete their elementary education before entering them. Some of the teachers of the girls' normal schools are foreigners. An idea of the character and scope of the instruction given in the colleges may be obtained from the program of the National College of Corrientes:

First year. The native language; reading; writing; grammar; geography; arithmetic (including decimals, powers and roots, &c.); sacred and ancient history; French.
Second year. Native language; arithmetic (including elementary algebra and logarithms); practical geometry and lineal drawing; geography and history (Argentine Republic and America); English and French.
Third year. Exercises in composition, &c.; algebra; book-keeping; French, English, Greek, and Roman history; geography; drawing.
Fourth year. Literature and rhetoric; geometry; trigonometry; Latin and Greek grammar; physics; history; general review of geography.
Fifth year. Literature and rhetoric; topography; physics; inorganic chemistry; natural history; mental philosophy; Latin and Greek; review of history.
Sixth year. Spherical trigonometry and cosmography; organic chemistry; natural history; physiology and hygiene; moral philosophy; Latin; general review of history; civic instruction; elements of political economy.

Some teachers complain of the inadequacy of scientific teaching and of the insufficiency of apparatus and material.

Superior education and special institutions.—The National Academy of Sciences was founded in 1870, under President Sarmiento, as a faculty of mathematical and physical sciences at the University of Cordova, but that institution manifested so much opposition to the plan that the faculty was reorganized under its present name. It was afterwards reunited with the university. It publishes reports and other works and its members give instruction in the university.

The university at Buenos Ayres had 40 professors and 761 students in 1882. Of the professors 15 were in the medical faculty, 8 in the faculty of law and social science, and 17 in the faculty of physics and mathematics. Of the students 365 were in the medical, 215 in the law, and 181 in the physical and mathematical faculties. There were 2,684 medical lectures, 485 on law, and 1,629 on physical and mathematical subjects during the year. The library contained 6,834 volumes.

The University of Cordova had 240 students in 1882. The mineralogical museum contained 9,000 specimens. There were, besides, a zoölogical museum, a cabinet of physical apparatus, a chemical laboratory, an anatomical museum, and histological, physiological, and pharmaceutical laboratories. The library contained about 8,000 volumes. Complaint was made of the want of books.

The engineering school at San Juan graduated 15 students in 1882.

Besides these purely educational institutions, the national observatory at Cordova carried on astronomical observations, including celestial photography, and the meteorological bureau continued its observations; both were under the directorship of the American astronomer, B. A. Gould. The report of this officer for 1882 contains the results of observations taken at eight stations in different parts of the country, from

Salta, latitude 24° 46′ south, to the mission of Ushuaiá, in Tierra del Fuego, latitude 54° 53′ south, and from Concordia, on the east, to Villa Argentina, at the foot of the Andes, on the west.

BRAZIL, constitutional empire: Area, 3,287,964 square miles; population, 9,930,478. Capital, Rio de Janeiro; population, 274,972.

No later information than that furnished by the Report of the Commissioner of Education for 1881 is at hand in regard to education in this country.

UNITED STATES OF COLOMBIA, federal republic: Area, 504,773 square miles; population (in 1870), 2,951,323. Capital, Bogota; population, 50,000.

The latest information in regard to the educational system of this country is to be found in the Report of the Commissioner of Education for 1881.

VENEZUELA, republic: Estimated area, 439,120 square miles; estimated population, 2,075,245. Capital, Carácas; population, 55,638. Minister of public instruction, Dr. A. Dominici.

The following account of the Venezuelan school system was prepared by Mr. Horatio N. Beach, United States consul at Puerto Cabello:

Until recent years there has not been in Venezuela anything that could properly be denominated a school system. Prior to 1879, the period of the incoming of the present president, there were no public schools. There existed in the larger towns a few private schools, having a very restricted attendance. President Guzman Blanco, since his last advent as chief magistrate, has inspired the establishment and maintenance of public schools.

The principal school is the university at Caracas, the capital of Venezuela, a spacious and well arranged edifice, with a large and able faculty, the institution giving a classical education. It receives government aid.

Aside from the university named there are no buildings erected for school purposes in the country. The school system will be best explained by saying that the country has seven states, each state divided into two legislative or judicial districts. Each district has a chief, who, together with the municipal officers, administers the city and village governments; he also administers the governent of the rural population and manages the schools. The expense of conducting the schools is shared between the national government and the district governments.

There being no public school-houses, the plan has been adopted of giving a teacher a stipulated price per quarter, the compensation to include instruction and a furnished school room. The "furniture" is often quite scant in the school rooms, there being nothing more than miscellaneous sized boxes and kegs that are utilized as seats. Nearly all the schools are conducted under this system. In some of the cities a partial exception is made, a portion of the scholars being provided with instruction rooms leased for the purpose. The teachers in these schools are paid a monthly sum for instruction alone. These leased school rooms are provided with blackboards, wooden benches with backs, and ordinary tables for writing.

The teachers who provide school rooms are paid from $40 to $80 per quarter. Those teaching in rooms provided by the authorities are paid from $15 to $40 per month.

The school hours are from 8 to 11 in the forenoon and 2 to 5 in the afternoon. In the cities the sexes are educated separately. There are no restrictions or distinctions on account of race or color. As before indicated, tuition is free to all scholars. There are no rate bills and no school tax.

The language generally taught is the Spanish and the books in use are intended to impart only a rudimentary education in reading, writing, spelling, grammar, and geography.

At present only about one-tenth of the adult population can read or write, which, however, is a much better percentage for education than a few years ago would have shown. Of course literature is very circumscribed. In the cities the public journals do not have more than one subscriber to each 300 population, and in the villages and more rural communities the proportion of subscribers and readers is much less. In the cities there are many highly educated people, who in the main received their education in the United States and Europe. But the cause of education is progressing slowly, like nearly everything else in the way of advancement, yet in the right direction.

VI.—OCEANICA.

HAWAII, constitutional monarchy: Area, 6,677 square miles; estimated population (in 1882), 66,895. Capital, Honolulu; population, 7,000. President of the board of education, Hon. C. R. Bishop.

From the biennial report of the president of the board of education for the two years ending March 31, 1882, it appears that there were in the kingdom 201 schools of

all classes, employing 314 teachers and having an enrolment of 8,046 pupils. Three-fourths of the children in the country were being educated in the public schools, while about one-fourth were cared for in the private schools. Considerably more than half of the children of the nation were under training in the English language, while the remainder were instructed in the Hawaiian language.

The tables show an excess of 1,010 boys over girls in attendance upon the schools. This is in part accounted for by the tendency to early marriage in the case of the girls, but the president observes that it is in a measure attributable to unknown causes. Progress is noted in almost every particular: enrolment and average daily attendance are greater than in any previous report, many new school-houses have been built, and school accommodations and equipment have been greatly improved and increased. A teachers' association has been formed that promises good results in awakening enthusiasm and extending the knowledge of the best methods of instruction and discipline. Progress is also shown in the growing interest of parents and the public generally.

During the year 1882 the inspector general of schools, by direction of the board, prepared a course of study for the government select schools. The course comprises twelve grades, each corresponding to one year, beginning with the entrance of the pupil to the primary and progressing with easy gradations each year until the pupil is prepared for college, for teaching, or for business. Promotions are based on annual and term examinations.

The amount of school tax paid over to the several school agents throughout the kingdom for 1881 was $46,872; the amount of school fund in the Hawaiian treasury March 31, 1882, bearing 12 per cent. interest per annum, was $44,629.38.

NEW SOUTH WALES, British colony: Area, 316,320 square miles; estimated population, 817,468. Capital, Sydney; population (1881), 220,627. Minister of public instruction, G. H. Reid.

The following information is from the report of the minister for 1882:

Means of education.—(*a*) Provided at the public expense: The Sydney Grammar School, 1; public schools, 1,229; provisional schools, 188; half time and third time schools, 81; evening schools, 36; certified denominational schools, 124; orphan schools, 2, and industrial schools 2. (*b*) Provided at private expense: School for the deaf and dumb and the blind, 1; ragged schools, 3; private schools, 491; total number of schools, 2,158.

Number of children from 4 to 15 years of age, December, 1882 (estimated), 222,426; net enrolment in the schools of the department, 167,989; number of children receiving instruction through other agencies, so far as can be ascertained, 38,890.

With reference to these figures the minister observes: That in any community 206,879 out of a population of 817,468 (i. e., one in every four persons) can be under instruction in ordinary schools or at home, seems well-nigh impossible, and such a phenomenon, it is believed, has never yet been observed in any country. This point cannot be definitely cleared up, however, until some more effective mode of obtaining complete educational statistics than that now existing has been devised and brought into operation.

While the record of enrolment is flattering to the colony, the minister expresses regret that such a limited proportion of the children attend school for a sufficient length of time for the instruction to be effective. Thus, in 1882 the number of pupils enrolled in the day schools was: For the whole year, 76,554, being 45.95 per cent.; for three quarters only, 23,542, being 14.13 per cent.; for two quarters only, 34,004, being 20.41 per cent.; for one quarter only, 32,504, being 19.51 per cent.

The average attendance for the year was 90,944; total number of teachers, 2,926; number of persons constituting the inspectorial staff, 26; the number of pupils enrolled in the training school for the year, 94, viz: 40 men and 54 women; total sum available for the operations of the department, 648,810*l.* 9*s.* 2*d.*; total expenditure for the year, 618,800*l.* 8*s.* 9*d.*

NEW ZEALAND, British colony: Area, 105,342 square miles; population, exclusive of aborigines, 532,000. Capital, Wellington; population in 1871, 7,908. Minister of education, Thomas Dick.

The following information is from the report of the minister for 1882:

Number of pupils on school rolls at the end of the school year, 87,179; average daily attendance, 66,145; number of teachers, exclusive of teachers of sewing, employed during the last quarter of 1882, 2,143; total number of students in the four training schools, December, 1882, 147; number of children attending the Maori village schools, 2,024.

The deaf and dumb institution was attended by 31 pupils; the articulation method is employed to the exclusion of all others. The course of instruction includes reading and writing in the first instance, followed by English composition, arithmetic, geography, history, drawing, elementary science, &c. The girls are also instructed in sewing, knitting, and other useful domestic accomplishments. The pupils, who are all resident boarders, under the watchful supervision of Mr. and Mrs. Van Asch and the assistants, occupy three separate dwellings, situated at convenient distances from one another. There is also a detached school-house. Besides the gardens attached to the residences, there are ample playgrounds and abundant facilities for recreation purposes. The locality is salubrious. The institution is subject to regular medical inspection, and it is visited, from time to time, by the minister of education and officers of the department.

The number of children on the rolls of the industrial schools December 31, 1882, was 1,040. The colony is well supplied with secondary schools, twenty of which made report to the government for the year.

Provision is also made for superior education in the University of New Zealand, University of Otago, the Canterbury College, and the University College at Auckland, which last was established by act of the general assembly in 1882.

VICTORIA, British colony: Area, 87,884 square miles; population, June, 1883 (estimated), 915,948. Capital, Melbourne; population (1882), 291,464. Minister of public instruction, James Service.

Enrolment in public day schools, minus estimated duplicate enrolments, 184,402; average attendance, 116,414; net enrolment in night schools, 2,988; average attendance, 1,865. Enrolments in 647 private schools, no allowance being made for duplicate enrolments, 41,479; attending industrial school, 371; reformatory, 146; number of pupils who obtained certificates of being educated up to standard, 9,646; total 1873 to 1882, inclusive, 58,226.

There are at present 51 state school exhibitioners attending the Melbourne University and the public grammar schools and colleges; number of head teachers and assistants employed, 2,555. Expenditure of the department for year ending June 30, 1883, including the cost of buildings, 614,276*l.* 8*s.*; excluding the cost of buildings, 532,051*l.* 6*s.* 3*d.*

The number of students attending Melbourne University in 1882 was 397; number of graduates, 80.

Schools of design have been established at twenty-five places in Victoria, in connection with a royal commission for promoting technological and industrial instruction. Each school receives 2*s.* 6*d.* from government for every pupil who attends at least eight times in one quarter, besides which, fees varying from 2*s.* to 10*s.* per quarter are paid by pupils. The number of pupils on the rolls December 31, 1882, was 2,172, of whom 1,698, or more than three-fourths, had attended eight or more times during the quarter ending with that day.

Among important educational agencies may be mentioned the Melbourne Public Library, which has cost 111,604*l.* and is still unfinished; the National Gallery, containing, at the end of 1882, 13,228 works of art; and the Industrial and Technological Museum, opened in 1870.

TECHNICAL INSTRUCTION IN EUROPE.

The invaluable Report of the Royal (English) Commissioners on Technical Instruction comes in while my report is in press, and it seems best to substitute the conclusions of the commissioners for other subjects. They are as follows:

PROGRESS OF MANUFACTURE ABROAD.

It will have been seen from the preceding pages of this report that we have attached considerable relative importance to that portion of our commission which directed us to inquire into the condition of industry in foreign countries; and it is our duty to state that, although the display of continental manufactures at the Paris International Exhibition in 1878 had led us to expect great progress, we were not prepared for so remarkable a development of their natural resources, nor for such perfection in their industrial establishments as we actually found in France, in Germany, in Belgium, and in Switzerland. Much machinery of all kinds is now produced abroad equal in finish and in efficiency to that of this country, and we found it in numerous instances applied to manufactures with as great skill and intelligence as with us.

In some branches of industry, more especially in those requiring an intimate acquaintance with organic chemistry, as, for instance, in the preparation of artificial colors from coal tar, Germany has unquestionably taken the lead.

The introduction by Solvay, of Brussels, of the ammonia process for the manufacture of soda and the German application of strontia in sugar refining constitute new departures in those arts. In the economical production of coke we are now only slowly following in the footsteps of our continental neighbors, while the experiments which have been carried on for nearly a quarter of a century in France for recovering the tar and ammonia in this process have only quite recently engaged our attention.

The ventilation of deep mines by means of exhausting fans was brought to perfection in Belgium earlier than with us, and although our methods of sinking shafts served for many years as models for other countries, improvements thereon were made abroad which we are now adopting with advantage.

The abundant water power in Switzerland and in other mountainous districts is utilized for motive purposes by means of turbines perfect in design and execution.

The construction of the dynamo-machine by Gramme gave the first impulse to the general use of electricity for lighting and to the various new applications of that force which appear likely to exercise so great an influence upon the industry of the world; and in all these applications at least as much activity is exhibited on the continent as with us.

In the construction of roofs and bridges, more especially in Germany, accurate mathematical knowledge has been usefully applied to the attainment of the necessary stability with the least consumption of materials.

Certain printed cottons of the highest class, produced at Mulhouse from Parisian designs, are not excelled, and rarely equalled, in this or in any other country, although the distance between our general productions in this department and those of Alsace is no longer so great as it was ten or twenty years ago. The soft, all-wool fabrics of Rheims and Roubaix are scarcely equalled as yet on the average by those of Bradford, especially as respects the dyeing.

Silk dyeing and finishing is still as much the specialty of Lyons as is the production of the beautiful silk fabrics on its hand looms, for which it has so long been pre-eminent.

The export from Verviers to Scotland of woollen yarns, carded and spun by machinery made in England, from South American wool formerly purchased in Liverpool and London, but for which Antwerp is now becoming the chief market, is an instance of an intelligent, careful, and persevering attention to details having established a special trade which the cheaper labor of the Belgian factories now assists in preserving.

The ribbon trade of Basle, that in velvets and silks of every kind at Crefeld and in mixed fabrics at Chemnitz, are examples of recently established or transformed industries which have rarely been excelled in boldness of enterprise and in success by anything of the same kind accomplished in our own country. And it may not be improper to mention here that in whatever degree the technical instruction of our continental rivals may have trained them for competition with ourselves in their own, in neutral, and to some extent in our home markets, much of their success is due to more painstaking, more pliancy, and greater thrift; and also to the general cultivation, the knowledge of modern languages, and of economic geography usually possessed by continental manufacturers.

NEW DEPARTURES AT HOME.

But great as has been the progress of foreign countries and keen as is their rivalry with us in many important branches, we have no hesitation in stating our conviction,

which we believe to be shared by continental manufacturers themselves, that, taking the state of the arts of construction and the staple manufactures as a whole, our people still maintain their position at the head of the industrial world. Not only has nearly every important machine and process employed in manufactures been either invented or perfected in this country in the past, but it is not too much to say that most of the prominent new industrial departures of modern times are due to the inventive power and practical skill of our countrymen. Among these are the great invention of Bessemer for the production of steel in enormous quantities, by which alone, or with its modification by Thomas and Gilchrist, enabling the commonest description of iron to be used for the purpose, steel is now obtained at one-tenth of the price of twenty years ago; the Weldon, Hargreaves, and Deacon processes, which have revolutionized the alkali trade; the manufacture of aniline colors by Perkin; the new processes in the production of silk fabrics by Lister; the numerous applications of water pressure to industrial purposes by Armstrong; the Nasmyth steam hammer; the compound steam engine as a source of great economy of fuel; and the practical application of electricity to land and submarine telegraphy by Cooke, Wheatstone, Thomson, and others.

Machinery made in this country is more extensively exported than at any former period. The best machines constructed abroad are, in the main, and with the exceptions which we have named, made, with slight, if any, modifications, after English models. A large proportion of the power looms exhibited and used in the continental weaving schools has been imported from this country. In the manufacture of iron and steel we stand preëminent, and we are practically the naval architects of the world. Our technical journals, such as those of the Institutes of Civil and Mechanical Engineers and of the Iron and Steel Institute, are industriously searched and their contents assimilated abroad.

In those textile manufactures in which other nations have hitherto excelled us, as in soft, all-wool goods, we are gaining ground. We saw at Bradford merinos manufactured and finished in this country which would bear comparison in texture and in color with the best of those of the French looms and dye houses, and in the delicate fabrics of Nottingham and Macclesfield (thanks, in great measure, to their local schools of art) we no longer rely on France for designs.

In art manufactures proper, notably in porcelain, earthenware, and glass, as also in decorative furniture, our productions are of conspicuous excellence. It is possible that this may be due in a certain degree to the employment, in some branches, of skilled workers trained in foreign countries, and we cannot do otherwise than acknowledge the preëminence, in the main, of our French neighbors in design as applied to decorative work or disregard the efforts which they are making to maintain that preëminence, and those made in Belgium and Italy to emulate them.

ORIGIN OF MODERN INDUSTRIAL SYSTEM.

The beginnings of the modern industrial system are due, in the main, as we have indicated, to Great Britain. Before factories founded on the inventions of Watt, of Arkwright, and Crompton had time to take root abroad, and while our own commerce and manufactures increased from year to year, the great wars of the early part of this century absorbed the energies and dissipated the capital of continental Europe.

For many years after the peace we retained almost exclusive possession of the improved machinery employed in the cotton, woollen, and linen manufactures. By various acts of the last century, which were not repealed till 1825, it was made penal to enlist English artisans for employment abroad; the export of spinning machinery to foreign countries was prohibited until the early years of Your Majesty's reign. Thus, when less than half a century ago continental countries began to construct railways and to erect modern mills and mechanical workshops, they found themselves face to face with a full grown industrial organization in this country, which was almost a sealed book to those who could not obtain access to our factories.

FOREIGN TECHNICAL SCHOOLS.

To meet this state of things abroad, foreign countries established technical schools like the École Centrale of Paris and the polytechnic schools of Germany and Switzerland and sent engineers and men of science to England to prepare themselves for becoming teachers of technology in those schools.

Technical high schools now exist in nearly every continental state and are the recognized channel for the instruction of those who are intended to become the technical directors of industrial establishments. Many of the technical chemists have, however, been and are being trained in the German universities. Your commissioners believe that the success which has attended the foundation of extensive manufacturing establishments, engineering shops, and other works on the continent could not have been achieved to its full extent in the face of many retarding influences, had it

not been for the system of high technical instruction in these schools, for the facilities for carrying on original scientific investigation, and for the general appreciation of the value of that instruction and of original research which is felt in those countries.

With the exception of the École Centrale of Paris, all these schools have been created and are maintained almost entirely at the expense of the several states, the fees of the students being so low as to constitute only a very small proportion of the total income. The buildings are palatial, the laboratories and museums are costly and extensive, and the staff of professors, who are well paid according to the continental standard, is so numerous as to admit of the utmost subdivision of the subjects taught. In Germany, as we have stated in a previous part of our report, the attendance at some of the polytechnic schools has lately fallen off, chiefly because the supply of technically trained persons is in excess of the present demand; certainly not because it is held that the training of the school can be dispensed with. The numerous young Germans and Swiss who are glad to find employment in our own manufactories have almost without exception been educated in one or other of the continental polytechnic schools.

Your commissioners cannot repeat too often that they have been impressed with the general intelligence and technical knowledge of the masters and managers of industrial establishments on the continent. They have found that these persons as a rule possess a sound knowledge of the sciences upon which their industry depends. They are familiar with every new scientific discovery of importance and appreciate its applicability to their special industry. They adopt not only the inventions and improvements made in their own country, but also those of the world at large, thanks to their knowledge of foreign languages and of the conditions of manufacture prevalent elsewhere.

The creation abroad of technical schools for boys intending to become foremen is of much more recent date than that of the polytechnic schools. To this statement the foundation during the First Empire of the three French Écoles des Arts et Métiers, at Châlons, Aix, and Angers, is only an apparent exception, because they simply vegetated until their reorganization within the last twenty-five or thirty years. Mining schools were, however, established in Prussia in the last century and in France about 1817. Among the examples of schools for foremen are those of Winterthur in Switzerland, Chemnitz in Saxony, and Komotau in the Austrian dominions, principally for engineers, and the École des Mines at St. Étienne, the latter more especially for mining and metallurgy. The theoretical instruction in these schools is similar in character but inferior in degree to that of the great polytechnic schools. On the other hand considerable attention is devoted in these schools to practical instruction in laboratories and workshops, which is not the case in the polytechnic schools. In Prussia, as will be seen from the ministerial report found in the appendix, a beginning has been made in the establishment of such secondary technical schools, but, in the words of the report, "its execution will be tedious and costly." In Bavaria the Industrie-Schulen, which are technical schools of a grade inferior to the polytechnic school, give both theoretical and practical instruction, the latter in some cases highly specialized, in preparation either for direct entrance on an industrial career or for further study in the polytechnic school. In France technical schools of a somewhat lower type are being established all over the country. The one at Rheims, previously described, is an excellent example of these schools. The boys from the Rheims school either enter the École des Arts et Métiers at Châlons or go into manufactories or into business, in each case with a fair knowledge of theory and manipulation, as mechanics or as chemists.

It is important to bear in mind that the French schools of the type of that at Rheims, though virtually advanced schools, now rank as superior elementary schools, to which the pupils are consequently entitled to claim admission without the payment of any fees.

Up to the present time, however, although a few foremen have received some theoretical instruction in schools of this kind, foreign foremen have not generally been technically instructed, but, as in England, are men who, by dint of steadiness, intelligence, and aptitude for command and organization, have raised themselves from the position of ordinary workmen.

The continental weaving schools may, on the whole, so far as their influence on trade is concerned, be ranked in the first and second categories; that is to say, they are attended by those who propose to become merchants, manufacturers, managers, or foremen. They are held in the highest estimation by some of the most intelligent and successful continental manufacturers; of this there can be no better proof than the erection, in substitution for the one already existing, of the splendid new weaving schools at Crefeld, probably the most flourishing centre of the general silk trade, at the joint expense of the state, the locality, and the commercial body. Weaving schools for workmen, like the evening and Sunday school of Chemnitz, which must not be confounded with the superior weaving school of that town, are poorly attended,

and can have had no sensible influence on the progress of textile manufactures. But there are in many places lectures on weaving and pattern designing largely attended by workmen.

The French and German schools for miners, and the one which has been quite recently founded in Westphalia for workers in iron and steel, differ from the preceding schools for foremen, inasmuch as they are reserved for the theoretical instruction of men who, having already worked practically at their trades, have distinguished themselves by superior intelligence and good conduct. Most of the German schools of this kind are founded or maintained by the manufacturers, and will, we feel confident, repay the trades which have had the foresight and public spirit to create them, by training young men to become foremen and leading hands, willing and able to carry out with intelligence the instructions of their superior officers.

SOCIETIES AS TEACHING BODIES.

For the technical education of workmen, outside of the workshop, the resources of continental countries have hitherto been and are still very much more limited than has been supposed in this country to be the case. In several of the more important industrial centres of the continent there exist societies such as the Sociétés industrielles of Mulhouse, Rheims, Amiens, &c.; the Société d'enseignement professionnel du Rhône, which has its headquarters at Lyons and the Niederösterreichischer Gewerbe-Verein of Austria, one of the chief objects of which is the development of technical education among workmen and other persons engaged in industry, by means of lectures and by the establishment of schools and museums of technology. These associations are supported mainly by the merchants and manufacturers of the district to which their operations are restricted. In many cases they are founded and supported or are greatly assisted by chambers of commerce. These bodies abroad being incorporated, and having in France considerable taxing powers over their members, are generally wealthier and more influential than those in our own country. In addition to these sources of income the associations receive help from the municipality and sometimes from the state. In Mulhouse, besides promoting education, the society sees to the material wellbeing of the workmen by erecting on a large scale laborers' dwellings (la cité ouvrière) and by organizing savings banks and other economic arrangements, undertaking in this respect on a smaller scale what is done in this country by self sustaining associations like building and coöperative societies of the workpeople themselves. The society in Lyons has established numerous evening classes for elementary and technical instruction, which are attended chiefly by workpeople; and the South Austrian Trade Society, which has its central office in Vienna, has organized several technical day and evening schools for operatives of every grade, which are now under state control and receive subventions from the government. But although these societies, under different names and with varied objects, are very numerous, their sphere of action is limited, and the facilities they offer for evening instruction in science and technology are inferior to those which are at the disposal of our own workmen. No organization like that of the Science and Art Department or of the City and Guilds Institute exists in any continental country, and the absence of such organizations has been lamented by many competent persons with whom we came in contact abroad.

EDUCATION OF ARTISANS ABROAD.

In two very important respects, however, the education of a certain proportion of persons employed in industry abroad is superior to that of English workmen: first, as regards the systematic instruction in drawing given to adult artisans, more especially in France, Belgium, and Italy; and, secondly, as to the general diffusion of elementary education in Switzerland and Germany. In some parts of these latter countries great attention is paid to drawing in the elementary schools. In France, too (where elementary education has hitherto by no means been so general as in the two former countries), in the case of those workmen who have had the benefit of regular elementary school training, more attention has been paid to elementary drawing than is the case in this country. There are also in all large towns in France, and to a more limited extent in other countries, numerous evening "conférences" and "cours" on almost every subject of interest in art, science, and literature which workmen have the opportunity of attending, as they are entirely gratuitous. Among these the most remarkable are the lectures given by eminent men at the Conservatoire des Arts et Métiers of Paris. Most of these are of the nature of lectures rather than of practical instruction. There are, however, in many places excellent and numerously attended evening and Sunday technical classes, more especially in Belgium and Austria, and there can be no doubt that the instruction thus given is already exerting a considerable influence on the capacity and intelligence of the workmen, and that this influence will be increasingly felt in the future.

In the evening schools of North Germany (Fortbildungsschulen) the studies of the ordinary elementary school are continued, the further instruction being confined mainly to book-keeping and rudimentary mathematics, with some notions of natural philosophy. In the evening schools of the same class in South Germany the instruction given is of a more technical character than in the North.

For instruction in drawing, as applied mainly to decorative work in France, and to both constructive and decorative work in Belgium, the opportunities are excellent. The crowded schools of drawing, modelling, carving, and painting, maintained at the expense of the municipalities of Paris, Lyons, Brussels, and other cities—absolutely gratuitous and open to all comers, well lighted, furnished with the best models, and under the care of teachers full of enthusiasm—stimulate those manufactures and crafts in which the fine arts play a prominent part to a degree which is without parallel in this country. Instruction in art applied to industry and decoration is now pursued with energy in South Germany and in several of the northern Italian towns, and the influence of this instruction on the employment of the people is becoming very conspicuous in those countries. The government schools of applied art in France, under the decree of 1881, of which the Limoges Decorative Arts School is the earliest example, and which, like the abovementioned schools, are gratuitous, should be mentioned in this connection. * * *

HOME INDUSTRIES.

Home and village industries have been in some cases initiated, in others improved and extended, in districts where, from the poverty of the population and the scarcity of capital, special aids were essential, notably in Baden, Bavaria, and the Tyrol. In the schools established and maintained for this purpose, wood carving and inlaying, clock making, filagree work, basket making, and other simple trades for which there were local material and aptitude, have been taught with considerable success. In some cases these industries have been so firmly and permanently established as to render unnecessary the further maintenance of the special schools. In the primary schools of the Black Forest, straw plaiting is taught to the girls. Discriminating regard is paid to the capabilities of each sex. In "women's work" schools on the Reutlingen model and in the professional schools for girls which have been established in France and the Netherlands, instruction is successfully given qualifying girls for many useful occupations, though these are scarcely of the kind usually understood under the term of manufactures.

REPORT ON THE UNITED STATES.

The report of Mr. William Mather to your commissioners on his six months' tour throughout the United States of America and Canada for the purpose of studying the schools and factories of that continent deserves the most careful perusal. It will be seen that Mr. Mather assigns greater influence on American manufactures to the general education of the American people derived from their common schools than to their technical schools, the importance of which latter, however, in the training of civil engineers has been experienced for some years, though it has only more recently become recognized by those who are engaged in mechanical engineering and in metallurgical and manufacturing establishments of various kinds. This recognition is, however, now becoming universal. A decided preference is being given in the United States for the positions of managers and heads of departments to persons who have received a scientific training in a technical school, and the plan is followed in these schools of combining instruction in "application" with instruction in pure science. Although the conditions of American industry differ in many respects from our own, there can be no doubt that we may derive great advantage from a careful study of what is being done in the way of technical instruction in the United States, as, together with the elementary education of Canada, it is so graphically described by Mr. Mather. We may add that the accuracy of his statements and conclusions is generally confirmed by the accounts of technical instruction in America which we have received from other competent judges.

NEED OF TECHNICAL INSTRUCTION.

Not many years have passed since the time when it would still have been a matter for argument whether, in order to maintain the high position which this country has attained in the industrial arts, it is incumbent upon us to take care that our managers, our foremen, and our workmen should, in the degrees compatible with their circumstances, combine theoretical instruction with their acknowledged practical skill. No argument of this kind is needed at the present day. In nearly all the great industrial centres, in the metropolis, in Glasgow, in Manchester, Liverpool, Oldham, Leeds,

Bradford, Huddersfield, Keighley, Sheffield, Nottingham, Birmingham, The Potteries, and elsewhere, more or less flourishing schools of science and art, of various grades, together with numerous art and science classes, exist, and their influence may be traced in the productions of the localities in which they are placed.

SPECIAL SCHOOLS ESTABLISHED BY MANUFACTURERS.

The schools established by Sir W. Armstrong at Elswick, by the London and North-western Railway Company at Crewe, and those of Messrs. Mather and Platt of Salford, in connection with their engineering works, testify to the importance attached by employers to the theoretical training of young mechanics. The efforts of Messrs. Denny, the eminent shipbuilders of Dumbarton, for encouraging the instruction of their apprentices and for rewarding their workmen for meritorious improvements in details applicable to their work, are proofs of this appreciation. The evidence of Mr. Richardson, of Oldham, and of Mr. Mather, of Salford, is emphatic as to their experience of its economical value.

Without more particularly referring to the valuable work in the past accomplished by the numerous mechanics' institutes spread over the country, many of them of long standing, we may point out that they are now largely remodelling their constitutions in order to bring up their teaching to the level of modern requirements as regards technical instruction. The example of the Manchester Mechanics' Institute may be studied in this connection.

Moreover, as evidencing the desire of the artisans themselves to obtain facilities for instruction both in science and art, we must not omit to mention the classes established and maintained by some of the leading coöperative societies. The Equitable Pioneers' Society of Rochdale has led the way in this, as in so many other social movements. It is much to be wished that the various trades' unions would also consider whether it is not incumbent on them to promote the technical education of their members.

The manufacturers of Nottingham speak with no uncertain voice of the important influence of the local school of art on the lace manufacture of that town. Without the Lambeth school, the art productions of Messrs. Doulton could scarcely have come into existence. The linen manufacturers of Belfast are becoming alive to the necessity of technical instruction if competition on equal terms with foreign nations in the more artistic productions is to be rendered possible. The new generation of engineers and manufacturers of Glasgow has been trained in the technical schools of that city. The City and Guilds of London Institute owes its existence to the conviction of the liverymen that technical instruction is a necessary condition of the welfare of our great industries.

TEACHING OF NATURAL SCIENCE.

Natural science is finding its way surely though slowly into the curriculum of our older English universities and of our secondary schools. It is becoming a prominent feature in the upper divisions of the elementary board schools in our large towns. There are scarcely any important metallurgical works in the kingdom without a chemical laboratory in which the raw materials and products are daily subjected to careful analysis by trained chemists. The attainments of the young men who have been trained in the Royal Naval College at Greenwich recommend them for remunerative employment by our great shipbuilding firms.

BEST MODES OF ADVANCING TECHNICAL INSTRUCTION.

In our relations with public bodies and individuals in this country during the progress of our inquiry, the greatest anxiety has been manifested to obtain our advice as to the mode in which technical instruction can be best advanced, and we have to acknowledge the readiness of the Education and Science and Art Departments to receive and act upon suggestions in matters of detail from individual members of the commission which it would have been pedantic to delay until the completion of our task. Among the suggestions which have thus been made was that of an exhibition of the school work of all nations, which His Royal Highness the Prince of Wales has consented to add to the health exhibition of 1884. This exhibition will be an appropriate illustration of the account of foreign schools contained in the previous parts of this report. Your commissioners, during their continental visits, received from the authorities of technical schools numerous assurances of their cordial support and coöperation in such a display.

Thus, there is no necessity to "preach to the converted," and we may confine ourselves to such considerations as bear upon the improvement and more general diffu-

sion of technical education at home in accordance with the conditions and needs of our industrial population.

In dealing with the question of technical instruction in this country we would, at the outset, state our opinion that it is not desirable that we should introduce the practice of foreign countries into England without considerable modification. As to the higher education, namely, that for those intended to become proprietors or managers of industrial works, we should not wish that every one of them should continue his theoretical studies till the age of twenty-two or twenty-three years in a polytechnic school, and so lose the advantage of practical instruction in our workshops (which are really the best technical schools in the world) during the years from eighteen or nineteen to twenty-one or twenty-two, when he is best able to profit by it.

We have, also, in the science classes under the Science and Art Department (to the intelligent and able administration of which it is our duty to bear testimony) a system of instruction for the great body of our foremen and workmen, susceptible certainly of improvement, but which in its main outlines it is not desirable to disturb.

Moreover, in considering by whom the cost of the further development of technical instruction should be borne, we must not forget that, if it be true that in foreign countries almost the entire cost of the highest general and technical instruction is borne by the state, on the other hand, the higher elementary and secondary instruction in science falls on the localities to a much greater extent than with us; while, as to the ordinary elementary schools, the cost in Germany and Switzerland is almost exclusively borne by the localities; and this was also the case in France and Belgium until the people of those countries became impatient of the lamentable absence of primary instruction on the part of vast numbers of the rural and in some instances of the town population, an evil which large state subventions alone could cure within any reasonable period of time. With the exception of France, there is no European country of the first rank that has an imperial budget for education comparable in amount with our own. In the United Kingdom at least one-half of the cost of elementary education is defrayed out of imperial funds, and the instruction of artisans in science and art is almost entirely borne by the state. Hence it will be necessary to look, in the main, to local resources for any large addition to the funds required for the further development of technical instruction in this country.

In determining what is the best preparation for the industrial career of those who may expect to occupy the highest positions, it is necessary to differentiate between capitalists, who will take the general as distinguished from the technical direction of large establishments, and those at the head of small undertakings, or the persons more especially charged with the technical details of either. For the education of the former, ample time is available and they have the choice between several of our modernized grammar schools, to be followed by attendance at the various colleges in which science teaching is made an essential feature, or the great public schools and universities, provided that, in these latter, science and modern languages should take a more prominent place. Either of these methods may furnish an appropriate education for those persons to whom such general cultivation as will prepare them to deal with questions of administration is of greater value than an intimate acquaintance with technical details. It is different in regard to the smaller manufacturers and to the practical managers of works. In their case, sound knowledge of scientific principles has to be combined with the practical training of the factory, and therefore the time which can be appropriated to the former, that is, to theoretical instruction, will generally be more limited.

How this combination is to be carried out will vary with the trade and with the circumstances of the individual. In those cases in which theoretical knowledge and scientific training are of preëminent importance, as in the case of the manufacturer of fine chemicals, or in that of the metallurgical chemist, or the electrical engineer, the higher technical education may with advantage be extended to the age of twenty-one or twenty-two. In the cases, however, of those who are to be, for example, managers of chemical works in which complex machinery is used, or managers of rolling mills, or mechanical engineers, where early and prolonged workshop experience is all-important, the theoretical training should be completed at not later than nineteen years of age, when the works must be entered and the scientific education carried further by private study or by such other means as do not interfere with the practical work of their callings. Many colleges of the class to which we have referred have already arranged their courses to meet these requirements, and some of them, as will appear from our reports of visits, have workshops for the purpose of familiarizing the students with the use of machine and hand tools.

It is to be regretted that nearly all of these very useful institutions suffer more or less from the want of adequate funds to enable them to provide for such a staff of professors as is necessary for the proper subdivision of the various subjects taught, and for the equipment of museums, apparatus, and laboratories of the various kinds essential to the practical instruction of the student. In this respect the provision in

this country compares most unfavorably with that in the universities and polytechnic schools of the continent, even in spite of recent munificent benefactions like those of the late Mr. Charles Beyer of Manchester, the late Sir Josiah Mason of Birmingham, of the Baxter family at Dundee, the late Mr. Harris of Preston, the liberal gifts of Mr. Crawford to the Queen's College at Cork, and others. In speaking of benefactions, we do not overlook the noble endowment of Sir Joseph Whitworth for the encouragement of engineering by affording to able and promising young men, especially of the class of artisans, the means of obtaining theoretical combined with practical training, the former in institutions of the kind we have referred to.

SECONDARY SCHOOLS AS A PREPARATION FOR TECHNICAL SCHOOLS.

The best preparation for technical study is a good modern secondary school of the types of the Manchester Grammar School, the Bedford Modern School, and the Allan Glen's Institution at Glasgow. Unfortunately, our middle classes are at a great disadvantage, compared with those of the continent, for want of a sufficient number of such schools. The transfer of the functions of the endowed schools commissioners to the charity commissioners has not had the effect of increasing the rate of progress in the reorganization of our secondary schools. We consider it to be essential that steps should be taken to insure that this work shall be carried on with greater vigor in the future than it has been hitherto. We learn that there are still endowments available for education, amounting to upwards of 200,000*l.* per annum, which have not been dealt with by the commissioners. In the schemes for the new schools the subjects of science and modern languages should form a very prominent part; and it would be desirable in some of these schools, especially in large towns (where classical schools are not wanting), in order to provide for the fuller teaching of these subjects, more particularly of mathematics, that the classical languages should be altogether excluded from the schemes of instruction. But the existing endowments are very unevenly distributed over the country; in many of the large manufacturing centres no resources of the kind exist; private enterprise is clearly inadequate to do all that is required in establishing such schools, and we must look to some public measure to supply this, the greatest defect of our educational system. It is to be desired that, in the proposed reorganization of local government, power should be given to important local bodies, like the proposed county boards and the municipal corporations, to originate and support secondary and technical schools in conformity with the public opinion for the time being of their constituents.

Intelligent youths of the artisan classes should have easy access to secondary and technical schools by numerous scholarships, and the more promising students of them again to the higher technical colleges.

SCIENCE TEACHING IN THE ELEMENTARY SCHOOL.

For the great mass of our working population, who must necessarily begin to earn their livelihood at an early age and from whom our foremen will be mostly selected, it is essential that instruction in the rudiments of the sciences bearing upon industry should form a part of the curriculum of the elementary schools, and that instruction in drawing, and more especially in drawing with rule and compass, of a character likely to be useful to them in their future occupations as workmen and artisans, should receive far greater attention than it does at present. The importance of the first of these subjects has so far been acknowledged by the education department that in all infant schools simple lessons on objects and the more commonly occurring phenomena of nature have been made obligatory. This system of instruction, if properly illustrated by the exhibition of the object itself, or of diagrams or models of the same, or by the simplest kinds of experiments, is an excellent foundation for the subsequent teaching of elementary science.

When, however, the child enters the elementary school the teaching of science practically ceases until it reaches the upper division, inasmuch as the arrangement of the class subjects in the lower division is found in practice to exclude science from that division; only two subjects being allowed, of which "English" must be one and "geography" may be another, this latter being generally preferred to the alternative subject of "elementary science." It appears to us that geography, if properly taught, is a branch of elementary science which need not be separated from science generally, and can well be taught along with the other branches of science by means of the object lessons which are described in the code. Thus there would be only two class subjects instead of three, and in this way the connecting link which is now wanting between science as taught in the infant school and in the higher division of the elementary school would be supplied

HIGHER ELEMENTARY SCHOOLS.

We could hardly overstate our appreciation of the value of the plan of giving instruction in natural science by special teachers, as carried out in the board schools of Liv-

erpool and Birmingham, where the employment of a well qualified science demonstrator insures the sound character of the instruction, while the repetition of the lesson by the schoolmaster enables him to improve himself in the methods of science teaching. This should, however, be supplemented by the establishment of higher elementary schools, like those of Sheffield and Manchester, into which the more advanced pupils of the primary schools may be drafted, especially if the parents of those children should be able to keep them at school up to the age of fourteen or fifteen unassisted, or, if they are unable to do so, assisted by scholarships taking the place of the wages which they would otherwise earn. In these latter schools it is possible to provide efficient laboratories in which practical work is performed by the pupils, while this cannot adequately be done for the ordinary primary schools. Youths having the advantage of such instruction will be well prepared to avail themselves at a later period of the classes of the Science and Art Department and of the technical classes under the auspices of the City and Guilds Institute, which are now so numerous, and many of which are under excellent teachers.

The evidence given before us leaves no doubt that the directors of both these institutions use every effort in their power to secure sound and practical teaching in these classes, so far as that can be effected by assistance in training the teachers and by careful testing, in their examinations, of the results of the instruction given. In regard to the first, much is to be hoped for from the increasing number of teachers who are now able to take advantage of the high scientific instruction given in the Normal School of Science at South Kensington, as well as from the pecuniary assistance offered by the Science and Art Department to science teachers desirous of attending the courses and laboratories of various provincial colleges, while for teachers of technology a great step in advance will be made when the Central Institution of the City Guilds is in operation. As to the latter—that is to say, the thoroughness of the instruction given in the classes—more close and frequent inspection than at present is much to be desired, a higher payment for the more advanced grades of several subjects should be made than is now the case, and practical laboratory work in the higher grades in science should be more generally demanded.

An important point to which the attention of the inspectors should be more particularly directed is to ascertain that proper apparatus and appliances are provided for practical work in these classes.

ART SCHOOLS FOR ARTISANS.

With reference to the subject of drawing, we cannot too often call attention to the extraordinary efforts which are being made abroad for instruction in art, more especially as applied to industrial and decorative purposes, and to the important influence of this instruction in furnishing employment for artisans on the continent. Without depreciating what has been done in this direction by the schools and classes under the auspices of the Science and Art Department in this country, and while fully alive to the importance of the organization which tends to the diffusion of art instruction over a wide area, your commissioners cannot conceal from themselves the fact that their influence on industrial art in this country is far from being so great as that of similar schools abroad. This is due, no doubt, to some extent to the want of proper and sufficient preparation on the part of the students, owing to the inadequate instruction they have received in drawing in the elementary schools.

DRAWING AND MODELLING.

Your commissioners are aware that the number of children who are supposed to learn drawing in elementary schools is considerable, but it is small compared with the total number in attendance, and it is, we have reason to believe, diminishing. We have ascertained by inspection that the instruction is in far too many cases of little value. Instead of a mass of inferior drawings being sent up once a year to South Kensington for examination there, it is necessary that the instruction in drawing in elementary schools should be as carefully supervised on the spot by the Whitehall inspectors as is that in other branches of primary education. In nearly all the places abroad which your commissioners have visited they have found that drawing is an obligatory subject of instruction in the primary school and that it is regarded as of equal importance with writing. The number of hours which the children devote to lessons in drawing abroad is frequently as many as three per week, whereas in England the subject is not only not obligatory, but in about three-fourths of our elementary schools no instruction whatever is given in this subject, and in those schools in which drawing is taught the time devoted to it rarely exceeds one hour per week, and even that not always regularly. This want of attention, together with the absence of competent teachers, proper models and methods, and adequate inspection, fully accounts for the inferiority to which we have referred. The

training of teachers for the Irish national schools includes special instruction in drawing, and a grant for drawing is made to primary schools in Ireland by the commissioners of national education. The drawing in some of the schools of the Christian Brothers and in some of those under the board of intermediate education is good.

Your commissioners are of opinion that sound instruction in the rudiments of drawing should be incorporated with writing in all primary schools, both for girls and boys, by which, also, according to the experience of competent authorities, the writing would be much improved. Something in this direction has already been done in many good infant schools, where children of the age of six draw triangles, squares, oblongs, &c., on their slates. This exercise is repeated on the day of inspection, and is taken into account in estimating the value attached to "appropriate occupations."

We have observed with satisfaction the recent circular (Art Form, No. 1194) of August, 1883, prescribing the new exercise of drawing to scale. We believe the principle therein laid down to be excellent, and we trust that the school managers and teachers will avail themselves of the advantages offered to them in this alteration in the first grade work. The permission recently accorded to teachers to give instruction in drawing and modelling to the children of the elementary schools out of the ordinary school hours is also likely to prove very advantageous.

We are of opinion that more attention than has hitherto been devoted to it should be directed to the subject of modelling in the elementary school. We notice that by a recent addition to the art directory small classes in modelling may now claim a local examination; we believe this to be a most salutary regulation. Modelling is an exercise of great importance to the future workman, and its rudiments can well be taken up, as in continental schools, at the earliest age.

Assuming such preparation in the infant and elementary school as we have here suggested, the progress of subsequent instruction in art classes would be immeasurably more rapid. Whether the attendance in any given locality will ever be so great in this country, where the instruction has to be paid for, as in France, Belgium, and elsewhere, where it is gratuitous, is a matter for grave doubt. However this may be, there are two points in connection with the instruction in art schools and classes as bearing on industrial pursuits which require careful attention. The first is one which we are glad to perceive is now fully appreciated by the Science and Art Department, viz, the advantage of substituting practice in rapid but correct execution in place of the method of stippling, which was formerly not sufficiently discouraged in art schools and classes; greater attention also than hitherto should be given to modelling. The second point relates to industrial designing. This, for a variety of reasons, the chief of which are the want of sufficient knowledge of manufactures on the part of art teachers and the absence of sympathy evinced by the proprietors of industrial works, has, with some notable exceptions, not received sufficient attention in our art schools and classes. In fact, there has been a great departure in this respect from the intention with which the "schools of design" were originally founded, viz, "the practical application of (a knowledge of) ornamental art to the improvement of manufactures." Large grants of public money for teaching art to artisans in such classes can scarcely be justified on any other ground than its industrial utility.

APPLIED ART WORK.

On the subject of the teaching of industrial design, we are of opinion that the Science and Art Department may with advantage depart from their principle, as at first laid down, of granting encouragement to design only, so far as to award grants for specimens of applied art workmanship in the materials themselves, as a test of the applicability of the design and as a reward for success in overcoming the technical difficulties of the manufacture.

It seems scarcely fair that well executed art work by a student, say a richly chased piece of silver plate, should obtain only the same recompense as the design for the same object on paper. We are aware that special vigilance would in this case be required in order to prevent the use of such rewards for trade or for other than educational purposes.

It appears from the evidence, with which we include a remarkable letter from M. Willms, the eminent designer of Birmingham, that it would be well if persons practically acquainted with the application of design to industrial manufactures were more extensively consulted in the award of prizes for industrial design. We are aware that this is now done in some measure, but, however eminent may be the gentlemen whom the department has been in the habit of consulting, it is unlikely that the small number of these should be sufficiently familiar with the vast varieties of applications to have the special knowledge requisite for judges in the large number of trades in which design forms an important element.

INDUSTRIAL ART MUSEUMS.

Among the most important means of stimulating industrial art education and of spreading a knowledge and appreciation of art throughout the country is the foun-

dation of local museums of applied art of such a character as is best adapted to advance the industries of the districts in which they are situated.

Stimulated by the advice and influence of the director of the South Kensington Museum, and with the liberal aid of private benefactors, such collections have been provided in the local art museums at Sheffield, Derby, York, and elsewhere. In Manchester also, steps have been taken to found an industrial museum, and the corporation has acquired the famous Bock collection of textile fabrics for this purpose. The Manchester, Birmingham, Stoke, and other galleries are open on Sundays, and are visited by increasing numbers of orderly working people. It is very desirable that similar facilities should be provided for the inspection of our metropolitan museums and collections. We are of opinion that the connection between these museums and the local schools of art should be of an intimate character. Indeed, in this respect much may be learned from foreign countries, where many such museums exist and exert great influence on manufactures. Further, we must express strong approval, in which we merely repeat the opinion offered by competent witnesses both at home and abroad, of the system of circulating among the local museums collections of works of art from the national collection at South Kensington. The value and utility of these collections are greatly enhanced by suitable manuals and guide books well illustrated and sold at a cheap rate; these serve to explain to visitors of the artisan classes the features most worthy of notice.

While we fully admit the force of the contention that the contributions of the state to the foundation and maintenance of museums will be of the greatest service to the country at large, if applied mainly to central institutions like those of the metropolis, of Edinburgh, and of Dublin, we highly approve of the grants to provincial museums of reproductions, either gratuitously or at a very low price. Those grants may even, in the case of typical museums situated in some of the chief industrial centres, be extended with advantage to original examples of art and of manufactures calculated to increase the knowledge and improve the taste of those (more especially of the artisans) engaged therein.

GOVERNMENT BUILDING GRANTS.

Your commissioners believe that the grants now made in aid of the buildings for local schools of science and art and for industrial museums in connection with them, limited as they are to a maximum of 500*l.* for art schools and the same sum for science schools, coupled also with the requirements that they shall be given only for buildings under the free libraries act or in connection with schools of art require revision, and tend rather to discourage local effort than otherwise, inasmuch as they give an erroneous impression of what is really required in order that suitable buildings may be provided.

Your commissioners highly approve of the recent foundation of scholarships to promising students in the science classes of the Science and Art Department, enabling them to continue their education at various higher schools. The limitation of the available funds appears to have rendered necessary in consequence of this step the abolition of the Queen's prizes, given for success in the elementary stages, and the substitution of honorary certificates in place of them. We find there is an opinion prevalent that these certificates will not afford sufficient stimulus to certain students. It is to be hoped, however, that a small addition to the customary local prize funds will be readily subscribed to supply this deficiency.

But all these institutions and measures will not alone accomplish the object aimed at. For this the localities must rely far more than has been the case hitherto on their own exertions. Teachers should know that they labor under the eye of those who are interested in the work being thoroughly and conscientiously done. The organization and efficiency of the science schools at Oldham and Keighley are conspicuous examples of what may be done in regard to the scientific and technical instruction of artisans, where local employers take an active and intelligent interest in the work. The Oldham School of Science and Art may, so far as science teaching is concerned, be regarded as the type and example of what evening schools should be; and the existence of similar efficient and flourishing schools in all our industrial towns would greatly contribute to confirm our industrial position. The remuneration of teachers should not depend to so great an extent as at present on the grants from headquarters. School boards should be authorized to establish and conduct science and art classes for artisans, and where no school boards exist power should be given to the local governing bodies to establish or support such schools. If the teaching is not entirely gratuitous (and the regularity of attendance in the art classes in the French and Belgian cities and in the science classes in Liége, Seraing, and elsewhere shows that it is a prejudice to suppose that people only appreciate what they pay for), the fees ought to be on the lowest possible scale.

TEACHING AND APPLIANCES.

Your commissioners have had before them deputations of representative workingmen who have expressed their views on the wants of the working classes with respect to the teaching of science and art, and who have stated that the assistance afforded by the department is not sufficiently directed towards the requirements of their several trades. We believe that many workmen are disposed to attach too little value to the importance of acquiring a knowledge of the principles of science because they do not see their application. We are of the opinion that whenever it is possible persons engaged in the trade taught and having scientific knowledge should give instruction to workmen, and we have ascertained that a large number of such teachers are registered under the examination scheme of the City and Guilds of London Institute. We visited classes of this character at the Polytechnic Institution in Regent street, at the Manchester Technical School, the Lyceum at Oldham, and at other places, some of which were excellent.

The city guilds are trying a most important experiment in their practical classes. If empiricism be avoided, a great point will be gained by the attraction to working men and women of a mode of instruction in which the direct application of scientific principles is the means by which a knowledge of those principles is conveyed to their minds. As to this point, we refer to the almost unanimous expression of opinion contained in the letters of eminent manufacturers in reply to our circular asking their advice as to the best means of promoting technical instruction.

We cannot dismiss this branch of the subject without calling attention to the educational value of the museums of natural objects now found in many of the modern elementary schools of the continent. Probably the best examples of such collections are those of the Normal School of Brussels and of the elementary schools of Zürich. Collections of natural objects, pictures, and diagrams are of the greatest assistance for illustrating object lessons in rudimentary science to children of the earliest years.

Many persons who have paid attention to the working of free libraries in our large towns are of opinion that the benefit of these might be extended to elementary schools by placing at the disposal of such schools books of a character calculated to interest children of school age. Among these books some suitable technical works, especially illustrated ones, might be included. These school libraries would be of the nature of the branch libraries which are now attached to many of the free libraries of our large towns.

Your commissioners, after having had the opportunity of further considering the value of manual work as a part of primary instruction and after having seen such work introduced into elementary schools of various grades in other countries besides France, are able now to express a stronger opinion in its favor than at the time of their first report. They do this with greater confidence because, in consequence partly of the suggestion contained in that report, the experiment of introducing manual work into primary schools has been successfully effected by at least two school boards in this country, viz, those of Manchester and Sheffield.

MANUAL WORK.

Your commissioners have had the opportunity of inspecting the manual work of the pupils, both at the Manchester board schools and at the central school in Sheffield, and they are satisfied that such work is very beneficial as a part of the preliminary education of boys in this country who are to be subsequently engaged in industrial pursuits, even though it should not, as however it probably will do, actually shorten the period of their apprenticeship.

Your commissioners see no reason why, since grants are made on needlework in girls' schools, they should not be made on manual work in boys' schools. This instruction may be given so as not to interfere with the ordinary work of the school. It has been proved that this can be done, the boys being most eager to return for handicraft teaching after school hours.

Whenever more attention shall be given to drawing, and especially to mechanical and geometrical drawing, in the ordinary and the higher elementary schools, it will be proper and desirable that the work executed in the shops attached to these schools should be made from drawings prepared by the children themselves.

ATTENDANCE AT ELEMENTARY SCHOOLS.

We need scarcely say that the success, not only of technical, but of the ordinary elementary instruction of our working population depends upon the regular attendance of the children at school and upon their remaining there sufficiently long to insure that the knowledge acquired shall leave some lasting impression on their minds. As will have appeared from other parts of this report, the children of the

workpeople of Germany and Switzerland, with few exceptions, remain at school till the age of fourteen years, and in some of the German States are required to continue their elementary instruction two years longer in evening and Sunday schools, if their examination at fourteen has not been satisfactory. The wages of the parents in these countries are generally lower and the sacrifice of their children's earnings is consequently felt more than with us. The efficiency of the American workmen is mainly attributed, by all who have inquired into the subject, to the primary education acquired by them during a prolonged attendance at school. In our own country great diversity prevails as to the standard authorizing the employment of children as full-timers. In Scotland this will be remedied by the act of last session. After next year no child under the age of fourteen years can be employed on full time in Scotland, unless it has passed the fifth standard. We have no doubt that all classes interested in industry will quickly reap the benefit of this amendment of the law, and we see no reason why this regulation should not be extended to England and Wales, so far as it applies to factories and workshops.

COLLEGES AND THEIR TEACHING.

We have avoided in the foregoing statement making special observations on the merits or defects of the various scientific and technical colleges and schools which are at work or in course of establishment in this country, but we think it due to those who have founded and those who are conducting these excellent institutions to state that all of them, in each of the three divisions of the United Kingdom, are, in spite of limited means, producing good results. It is most praiseworthy on the part of the professors and teachers that they devote themselves to the important work of tuition for salaries so small as those which they as a rule receive, when many would, by employing their scientific and technical knowledge in private enterprise, obtain much larger pecuniary remuneration. We may remark concerning the colleges that it is not necessary that all of them should be of the highest type. To enable the relatively small number of persons capable of occupying the highest industrial positions to acquire the most complete education of which modern science admits, only a few well equipped institutions of high rank are needed. It is, however, of national importance that these few should be placed in such a position of efficiency as to enable them to carry out successfully the highest educational work in the special direction for which circumstances, particularly of locality, have fitted them. Your commissioners believe that no portion of the national expenditure on education is of greater importance than that employed in the scientific culture of the leaders of industry. Your commissioners fear that the belief in the efficacy of training of this *highest* character is, in England, at present small among those whom it will ultimately benefit; and yet there are few countries in which so many investigations have been made the practical bearings of which were not at the outset apparent but which have in the end led to the most important practical results. The discovery by Faraday of magneto-electricity and by Joule of the mechanical equivalent of heat at once occur as examples. The Englishman is accustomed to seek for an immediate return, and has yet to learn that an extended and systematic education up to and including the methods of original research is now a necessary preliminary to the fullest development of industry. It is, among other elements of progress, to the gradual but sure growth of public opinion in this direction that your commissioners look for the means of securing to this country in the future, as in the past, the highest position as an industrial nation.

We desire to express our satisfaction at the recent establishment of weaving and dyeing schools in the north of England, and of mechanical laboratories in several localities. The utility of weaving schools to proprietors and managers of factories, and to merchants who desire to become acquainted with the processes of the manufacture of the goods in which they deal, has been so clearly demonstrated on the continent that we need adduce no further arguments in their favor. The weaving and dyeing schools of Leeds have been established and are maintained entirely by the Clothworkers' Company of London. We regard this as one of the most useful and appropriate purposes to which a portion of their funds could have been devoted. The mechanical laboratoriesand mechanical drawing schools at Nottingham, Sheffield, Huddersfield, and elsewhere will be of the greatest service in enlarging the knowledge and experience of young artisans who are kept continuously at one branch in their daily work.

The teaching of art and science subjects in the training colleges of Great Britain for elementary school teachers is very defective. The inspection on the part of the Science and Art Department has until lately been greatly neglected, owing to the divided responsibility for the colleges of the Education Department and the Kensington authorities. The answers received by the examiners to such questions as the following: "Write out the heads of a lecture to an elementary class on the chemical and physical properties of water, mentioning the experiments which you would show and

your object in showing them," prove conclusively that the students have no idea as to how such a simple matter ought to be brought before a class. It would greatly conduce to sound and efficient training in science, and particularly in the methods of teaching, if those students in training who have shown an aptitude for science work could be sent annually to the Normal School of Science at South Kensington or to other approved efficient institutions. The provision for art teaching in most of the training colleges is inferior even to that at present made for science, and an entire reform in this respect is urgently needed; and similar measures should be taken for systematic instruction in art as in science. Considerable attention is, as we have said elsewhere, paid to drawing in the Normal School in Dublin, where it is taught by a competent art master.

The school boards of our great cities are fully alive to the defective character of the instruction of pupil teachers. In London, Liverpool, and elsewhere they have endeavored to apply a partial remedy by introducing joint instruction, under special teachers qualified in each subject, instead of having each headmaster to instruct the pupil teachers of his own school in every subject. The Education Department has also taken a small step in the right direction by somewhat limiting the number of hours that the pupils may be employed in teaching, so as to give them a little more leisure for learning. No considerable improvement can, however, be expected until the great school boards are authorized to establish colleges for training teachers. These colleges would be day schools and need not receive from the State enormous capitation grants like those now given to the English denominational training colleges, but only small allowances like these granted to the day students in those of Scotland.

CITY AND GUILDS OF LONDON INSTITUTE.

In concluding this part of our subject, we deem ourselves justified in giving, at the risk of repeating some of the statements we may have made in the earlier parts of our report, a short review of the work initiated, controlled, and contemplated by the City and Guilds of London Institute, inasmuch as this important organization has been created in order to promote the technical instruction of persons of every grade engaged in industry.

The institute had not been in existence very long when your commissioners were appointed, and consequently they have scarcely had the opportunity of estimating the value of the work it is doing in some of its branches. Even now that work is in many parts of the kingdom unknown, and this is particularly the case in Ireland. In Dublin, Cork, and in many other Irish towns nothing was known at the time of our visit of the encouragement to technical instruction offered by the institute's scheme of technological examinations, whereas in Belfast advantage has been taken of it, and the establishment there of a technical school for instruction in the weaving and dyeing of linen and in mechanical engineering is largely due to its action.

Central Institution.—The Central Institution, which is not yet opened, is intended by the institute to fulfil functions resembling those of the great polytechnic schools of the continent. Your commissioners have examined the proposed scheme of instruction embodied in the report of the institute, and they have also inspected the building, which is nearly complete. They consider that, as the number of technical classes and technical schools increases, as it is likely to do, the want of such an institution as that in Exhibition road for the training of teachers will be more and more felt. It will be of great advantage as a technical high school for the metropolis, which is in fact one of our greatest industrial centres. It is intended to afford additional facilities for the prosecution of original research in science. In order, however, that the institution may effect the purpose for which it is intended, it should be well endowed, both for the provision of adequate special instruction and also for the establishment of exhibitions to defray the cost of maintenance of poor students while pursuing their studies. Without expressing any positive opinion as to the amount required for this purpose, your commissioners fear that the annual sum at present subscribed by the livery companies is inadequate to the future requirements of the institution.

Finsbury Technical College.—As regards the Finsbury Technical College, your commissioners believe that the evening classes connected with it are giving valuable technical instruction, such as is greatly needed by the artisans of the district in which the school is situated. The practical laboratory instruction in the applications of electricity to trade purposes is worthy of special mention.

The program of the day school is well devised, and the offer of scholarships to the principal middle class schools of the metropolis, which enable select pupils therefrom to continue their education at the Finsbury College, is a good feature in the scheme. Considering the want that is generally felt of good trade schools into which promising pupils from the upper standards of the public elementary schools may be drafted, your commissioners are of opinion that a more intimate connection of the day department of the Finsbury Technical College with the elementary schools would also be desirable..

We think that similar trade schools, in which the curriculum consists mainly of practical science teaching, workshop instruction, drawing, and modern languages, might with advantage be established in other parts of London.

South London Technical Art School.—Your commissioners examined with great interest the work of the South London Technical Art School. The teaching of this school has had a direct bearing upon the important manufacturing works of Messrs. Doulton, and in few cases have we been able more definitely to ascertain the extent to which technical instruction has benefited a local industry. In many other branches besides that of the manufacture and painting of pottery, the teaching of design in connection with the material to which it is to be applied would be undoubtedly advantageous. In this school practical instruction is also given in wood engraving, and a class is about to be formed in enamelling; the City and Guilds of London Institute might usefully extend this kind of teaching in other directions.

Technological classes in the country.—By means of the institute's scheme of technological examinations, classes have been formed in all the large manufacturing towns, in which the instruction is more specialized, according to the requirements of persons engaged in different industries, than has been thought desirable in the state-aided classes which are held under the direction of the Science and Art Department. It will be seen by the collection of letters from eminent manufacturers, that classes of the former kind are greatly valued and regarded as deserving of continued encouragement.

The regulation of the institute which restricts the payment on results to the case of candidates engaged in the industries to which the examination refers, is a good one; and the introduction of practical tests and the importance which the institute attaches to preliminary science knowledge and to skill in drawing are to be commended. From the rapid increase in the number of candidates for these examinations during the last four years (the number in 1879 having been 202, and in 1883, 2,397), it may be assumed that, as they become more generally known, that number will still further increase, and that much larger funds will be required in payment to teachers on results.

We consider that the institute has rendered efficient service to technical education by means of the contributions it has given to the establishment of technical schools in the great centres of manufacturing industry, where they are even more necessary than in the metropolis. The institute appears to have distributed its grants with judgment and discretion, and in many cases, notably in Nottingham, Manchester, Sheffield, and Leicester, its contributions have had the effect of stimulating local effort in the establishment of new technical classes.

Your commissioners are able generally to indorse the several schemes of technical instruction now in operation or about to be carried on by the City and Guilds of London Institute, and in view of the efficient and permanent working of these schemes we should be glad to see the funds of the institute made fully adequate to the efficient carrying out of the objects it has in view, which, in our opinion, is not yet the case. We think it is of importance that the grants made by the contributing livery companies should be placed upon a permanent basis.

TECHNICAL INSTRUCTION IN IRELAND.

While the preceding remarks apply to the United Kingdom as a whole, including those portions of Ireland, and more especially of the province of Ulster, in which the factory system is fully developed, other portions of the latter country require to be separately considered. In saying this we refer more particularly to the poor and remote districts of the west.

Dublin.—Before proceeding to this part of the subject, however, we would refer very shortly to the question of technical instruction suitable for foremen and workmen in Dublin. While science and art classes, many of them very successful, are to be found in several of the important towns of Ireland, there are scarcely any science classes at work in Dublin. Various reasons were assigned to us for this state of things, some of them of a kind into which it is not expedient that we should enter. At the same time, there is in Dublin the Royal College of Science, with a staff of competent professors, an admirable technical museum, and laboratories fairly well equipped for practical work. It appears from the evidence that, of the small number of students who follow a complete course of instruction in this institution, about one-half are Englishmen, holders of the royal exhibitions of the Science and Art Department, scarcely any of whom become teachers of science in Ireland. There are no short summer courses at the college, like those at the normal school at South Kensington, for the instruction of science teachers. There are, we are aware, some courses of evening lectures, but, although the laboratories of the college are the only ones in Dublin available for practical evening instruction, such instruction in science and in mechanical drawing forms no part of the arrangements of the college. It appears that by the rules of the Science and Art Department the professors of the college cannot earn grants on the

results of instruction in science, as would be the case if they were ordinary science teachers. We are of opinion that so long as the effective work of the college in preparing associate students, and more particularly Irish students, is so limited in area as at present, evening classes with practical laboratory work should form a part of the regular college courses, and that the remuneration of the professors should depend in part on the success, or at any rate on the regular attendance, of students at such classes.

Irish intermediate schools.—We would also remark that we have received evidence of a very contradictory nature as to the teaching of science in the Irish intermediate schools. We believe, however, that it is engaging the attention of the board of intermediate education, and we only deem it necessary to state in reference to this subject that efficient instruction in science will not be possible in those schools unless they are provided with proper laboratories, which in most if not in all of them are at present entirely wanting.

But the most important part of our task with regard to Ireland is to consider the possibility of improving the industrial conditions of the poor and remote districts of the west by means of technical education.

Books used in Irish national schools.—By the courtesy of Sir Patrick Keenan, K. C. M. G., the resident commissioner of national education in Ireland, your commissioners have been furnished with what they understood to be a complete set of the books used in the Irish national schools. They find that these books are well adapted for the literary instruction of the children of various ages in those schools, and that they contain much interesting information on the natural features and resources of Ireland. But, except as to agriculture, they do not afford adequate assistance towards graduated instruction in industrial processes or in the rudiments of the sciences on which those processes are founded. As the Irish national education commissioners are by their regulations mainly responsible for the selection of the books used in the schools, this defect should receive their early attention.

Home industries and manual dexterity of Irish people.—There is a general consensus of opinion on the part of persons of all ranks in that country, whatever may be their views on other subjects, that the prosperity of the poorer districts of Ireland may be greatly promoted by technical instruction in handicraft and in home industries. There is a conviction not less general, and it is one which our visits have fully confirmed in our minds, that the children and young people of Ireland of the laboring class possess great manual dexterity and aptitude, which only require to be developed in order to be useful to themselves and to those among whom they live. As evidence of this we need only to refer to the remarkable success of the Christian Brothers and to that of the ladies of religious orders in training children and young persons for handicrafts in industrial schools and institutions of a like nature. There appears to be no reason why similar instruction to that which is given in these schools should not be given elsewhere if the necessary funds and teachers are forthcoming. We have shown that instruction of this kind given on the continent to persons in remote districts, who would otherwise be idle, has added materially to their resources, both directly and by training them for employment in larger industrial concerns, and we have ascertained that no great expenditure of public money has been required in order to produce these effects.

Not only is instruction of this kind deemed to be desirable, but we have found that there is a willingness on the part of benevolent persons in Ireland to assist its promotion by subscriptions and in other ways. It is true that by some it has been proposed that the government should itself initiate, if it did not entirely charge itself with, this work, but we were happy to find there were others who would be quite satisfied if its utility received the imprimatur of the government and if the state offered rewards for the ascertained results of instruction of this kind. We are of opinion that successful work of this nature, whether it be conducted by individuals or societies or by religious bodies, deserves the recognition and reward of the government. We think it no part of our duty to state which are the home industries best adapted to the conditions of different parts of Ireland. Each locality will be able to form its own judgment in regard to this, and due weight should be given by the government to such local expression of opinion, payment in all cases being dependent upon the results obtained in the schools or classes. We do not think it would be possible for the government to train teachers for a variety of home industries, but it might contribute to the payment of such teachers appointed by the localities, and it would be expedient to establish a class of itinerant teachers for service in districts where resident instructors cannot be maintained.

These suggestions apply even in a greater degree to the instruction of girls than of boys.

Instruction in the use of tools in Irish primary schools.—We need scarcely point out that, if it be deemed desirable to introduce manual instruction in the use of tools in elementary schools at all, this would apply in an eminent degree to the primary schools of Ireland. It was stated in evidence before us that in some parts of Ireland

ordinary handicrafts, like those of the mason, have become absolutely extinct. Whether the children remain in their own immediate localities or migrate to other parts of the country or emigrate to our colonies or to foreign countries, such instruction leading up to their apprenticeship as skilled laborers, instead of their fulfilling, as is now too much the case, the part of mere hewers of wood and drawers of water, would be of the greatest value to them. We are happy to find that the authorities of the national board of education in Ireland appreciate the importance of introducing instruction in manual work into their schools. They have already begun to give instruction of this kind to some few of their teachers, with a view to qualify them for imparting it to the children in the schools; but, in order that this instruction may be satisfactory, it is important that the training of the teachers themselves should be systematic and thorough; and, obvious as this might appear to be, we do not hesitate to impress it upon the minds of the authorities of the national board. Until the teachers are able themselves to give the instruction, it might be given by skilled and intelligent artisans. We have reason to believe that, whenever efficient teachers can be found, the national board will be prepared to pay for the results of manual teaching in the primary schools. It is scarcely necessary to say that our statement with regard to drawing, in reference to schools generally, applies with equal force to the Irish schools. We may remark that the progress of children in learning home trades will be much more satisfactory if they have been trained at school in the use of the ordinary tools for working in wood and iron and in drawing.

We shall deal with instruction in agriculture in Ireland in the succeeding subsection, in which we review the separate report of Mr. Jenkins and the evidence which we personally received in Ireland on that special branch of the subject.

Compulsory attendance in Irish primary schools.—While dealing with Irish education, we cannot refrain from expressing our satisfaction at having found that public opinion among all classes in Ireland is in favor of some measure for gradually making primary education in that country compulsory. The subject is one surrounded with difficulties of a nature which appear to us to place the discussion of its details beyond the scope of our commission. We consider, however, that we should not do our duty if we did not express our decided opinion that no marked progress in the direction of technical education can be effected in Ireland until primary education in that country has been placed on a proper footing.

AGRICULTURAL EDUCATION.

As stated at the commencement of this report, your commissioners did not think that an inquiry into the instruction of the industrial classes would be complete unless it included some notice of the instruction of the large and important class of agriculturists.

We were unable ourselves to conduct this branch of the inquiry, except partially in regard to Ireland, but we trust that those who read the report on agricultural education of our subcommissioner, Mr. H. M. Jenkins, the secretary of the Royal Agricultural Society of England, submitted herewith, will think that we have been well advised in placing the inquiry in his hands. As supplementary to his report, your commissioners refer to the Irish evidence in the appendix and to the narrative of their visits to the Royal Albert College, at Glasnevin, to the Munster Dairy School, and to parts of the south and west of Ireland. We have not inquired into the state of agriculture, as an art, abroad and at home; to have done this would have lengthened the inquiry beyond measure, and it was the less needed, as this branch of the question has been incidentally treated in the recent report of the royal commission on agriculture. It will, however, be seen from the report of our subcommissioner that those best able to form an opinion attribute a great and beneficial influence upon the progress of agriculture to the agricultural schools of various grades of the continent, and more especially to those like Hohenheim and Grignon, in which practice is combined with scientific teaching.

At a time like the present, when cheap railway and water conveyance of agricultural products from distant countries has completely changed the economical conditions of successful agriculture in Great Britain, it is of the greatest importance that those who are interested in the cultivation of the soil, whether as proprietors or as farmers, should not simply be familiar with existing practices at home, important as is such a familiarity, but that they should understand also the reasons which have caused these practices to prevail, in order to be able to decide to what extent they should continue to be pursued. They should likewise be acquainted with the nature and mode of cultivation of crops, the rearing and feeding of cattle, and the dairy practice of other countries.[1]

[1] The practice of growing beet roots for the manufacture of sugar has been attended with most beneficial changes in continental agriculture. This cultivation is carried on in countries varying remarkably in the conditions of climate in regard to heat and moisture. Should the recovery of ammonia in the manufacture of coke and from the raw coal used in the blast-furnace be attended with the success which there is every reason to anticipate, the cheapening of nitrogenous manures may indicate some considerable changes in the agricultural practice of our own country.

Higher agricultural schools.—To impart knowledge of this description is the proper function of the agricultural school. In Great Britain the agricultural department of the normal school of South Kensington, the Royal Agricultural College of Cirencester, and the College of Downton are the only institutions for higher agricultural education, the former principally for training teachers, the two latter for the education of land owners, land agents, and farmers. The first of these has been so short a time in existence that no definite judgment of its results can be formed by the test of practical success or failure. But we agree with our subcommissioner in thinking that the complete course of four years at the normal school is inconveniently and unnecessarily long, that at least all students who propose to become associates should on entrance prove that they possess the amount of practical knowledge of agriculture which can be acquired by a year's residence on a farm, and that visits to farms and factories connected with agriculture during the recess should be encouraged and rewarded by scholarships to those who have profited by them. Our subcommissioner considers that colleges like those of Cirencester and Downton do not require "propping" by the state, but that scholarships tenable at those colleges might be given by the government to deserving students in the agricultural divisions of county schools.

Secondary agricultural schools.—These agricultural divisions which are intended by our subcommissioner to provide secondary agricultural instruction have still to be created. Mr. Jenkins proposes that farms should be attached to county schools, in which the pupils in the higher forms should be taught the principles and practice of farming and should take part in farming operations and the management of stock. The experience of schools of this kind on the continent and of some isolated attempts in this country shows that they cannot be self supporting. He proposes that the locality (the county) should equip the school and, we suppose, the farm attached to it, and that the government should contribute as liberally to the buildings as to those of schools of science. We can see no objection to the latter proposal, and we approve of the suggestion that the governing bodies of counties should have the power of establishing and maintaining agricultural schools or contributing thereto under proper conditions; we should be glad to see this power conferred on them by the proposed measure for reorganizing county government. But it would also appear to us that an active participation in the encouragement of secondary agricultural schools would be an object well worthy of our great national agricultural societies. Their funds have hitherto been devoted mainly to the encouragement by premiums of improvements in cattle breeding and in agricultural machinery. The commercial demand for animals of a high class and for implements of the best construction is now so great that any other than an honorary recognition of merit seems to be no longer required; and, if a portion only of the money now distributed in prizes were offered in aid of local subscriptions for the addition of an agricultural department to the existing and in many cases flourishing county schools, it is probable that so desirable an experiment as that proposed by our subcommissioner would very soon be carried into effect.

We are aware that the fact of the number of competitors for the Royal Agricultural Society's junior scholarships having been small may not encourage that great society to increase its efforts in the direction of agricultural education, but we believe with Mr. Jenkins that the fault lies in a great measure with the want of competent teachers, a want which is now in the course of being supplied by the Normal School of Science and otherwise. With respect to the classes in the "principles of agriculture" in connection with the Science and Art Department, which properly come under the head of secondary instruction, Mr. Jenkins is of opinion that "the attempt to teach the principles of a subject without first teaching its facts and phenomena is very much like trying to build an actual castle in the air." We quite agree in this opinion, and we consider it essential, even if it should involve some change in the program of the department, that the examiners should so arrange their questions as to ascertain as far as possible from his replies that the student is acquainted with facts to which the principles are applicable, just as in chemistry, for instance, the examiner would not be satisfied with a mere knowledge of the laws affecting the combinations of chemical elements and compounds, but would expect the student to be acquainted with the nature and properties of the substances entering into combination. Unfortunately, there is not the same room for a practical examination in agriculture as that which is now very properly required by the department in other sciences. On the whole it may be expected that young men following the profession of farmers and acquainted with farming practice will derive advantage from the classes in the theory of agriculture which are held in county towns.

Farm apprentice schools.—Of our subcommissioner's suggestions in regard to lower agricultural education in Great Britain, that which recommends the apprenticeship of youths to selected farmers is very important if it can be carried out. There can be no doubt that, if competent farmers can be found willing to receive boys and girls as apprentices (the girls in the dairy), and to allow a part of their time to be spent in continuing their school instruction, as is suggested by Mr. Jenkins, there could

be no better training for the pupils. The French fermes-écoles and German Ackerbauschulen are examples of this kind of training.

Instruction in agriculture in rural elementary schools.—His recommendations in reference to elementary schools in rural districts are more definite. We agree with him in thinking that instruction in the theory and practice of agriculture should, in Great Britain, as it already does in Ireland, after suitable introductory object lessons, form in the upper standards a part of the ordinary elementary subjects of rural schools, and should not be relegated to "class subjects;" and that, if time cannot otherwise be found for them, which we scarcely anticipate, some of the elementary subjects, such as the higher branches of arithmetic, should be transferred from the former to the latter category; and, further, that encouragement should be given, by way of grants, to practical work on plots of land attached to such schools. One good result of this would probably be that children, taking a more intelligent interest in farm work, would be less anxious to migrate from the country into the larger towns.

It is probable that, if a demand existed for a practical knowledge of agriculture on the part of teachers in rural schools, some of the farmers' sons who at present unhealthily increase the competition for farms would qualify themselves to become elementary teachers.

Agricultural education in Ireland.—The subject of agricultural education, which is of national interest in Great Britain, is a question of life and death for Ireland. We are happy to find that this is thoroughly felt both by the government and by the people. There is progress in all directions. The Albert Agricultural Institution at Glasnevin, near Dublin, no longer confines itself to the instruction of young men who intend to become farmers or land agents, but is training teachers who will disseminate a knowledge of sound theory and likewise of successful practice throughout Ireland; for the Glasnevin farms, the 6-acre as well as the 100-acre, are pecuniarily successful. The Munster Agricultural and Dairy School, especially its dairy department, as will appear from the evidence given before us, is ascertained and acknowledged by all classes to be rendering eminent service to the farmers of the county of Cork. Every elementary teacher in Ireland is required to pass an examination in agriculture, and the science and practice of agriculture are taught to all boys in the three upper standards (or classes, as they are called in Ireland) of all rural schools. Last year nearly 45,000 boys were examined in this subject. Small farms are attached to some of these schools, and special grants are made for proficiency in practical agriculture as tested on those farms. What is most encouraging is that the authorities of the national board themselves are not satisfied with what is being done. They are anxious that more encouragement should be given to the patrons of schools to furnish them with small example farms; they admit that when this is done results cannot be effectively gauged by their single agricultural inspector, Mr. Carroll, in addition to his duties as head of the Glasnevin institution. Your commissioners believe that the board would gladly see the successful experiment of the Cork Dairy School repeated in other parts of Ireland, each such school being established, as at Cork, by local effort, conducted by local managers in accordance with the wants of the locality, and supported in part by local subscriptions. Your commissioners trust that the treasury would see its way clear to encourage and aid such schools by grants out of imperial funds.

The evidence shows that the members of some boards of guardians are not satisfied with the prevailing absence of agricultural instruction for the children in the Irish workhouses. They desire that the plots of land attached to the workhouses should be more generally used than they now are, for this instruction.

At the same time the faults of the past are acknowledged. It was stated in evidence before us that the failure to introduce the cultivation of flax in the south of Ireland was due in a great measure to the ignorance of the instructors and to their having persuaded the people to grow it on unsuitable land, with the result of stunted crops, badly prepared, and scarcely fit for the commonest tissues.

That some of the instructors were ignorant we cannot doubt; but the example of Flanders and other countries shows that flax can be grown on the poorest soils, provided that they are liberally manured and receive such painstaking and assiduous cultivation as the peasants of those countries bestow on them. Failures, however, like that of flax culture in the south of Ireland will induce the promoters of agricultural education in that country to proceed with caution, and not to raise a prejudice against it by schemes for which the teachers are not qualified and the learners are not ripe.

Following this summary the commissioners make a number of recommendations. Of these the following paragraphs give an account sufficient for present purposes in this country. The board recommends for "public elementary schools" that rudimentary drawing be incorporated with writing as a single elementary subject, and that instruction in elementary drawing be continued throughout the standards (classes);

that drawing from casts and models be required as part of the work, and that modelling be encouraged by grants; that a school shall not be deemed to be provided with sufficient and suitable apparatus of elementary instruction unless it have a proper supply of casts and models for drawing; that proficiency in the use of tools for working in wood and iron be paid for as a "specific subject,"[1] the work to be done, when practicable, out of school hours; that the collection of objects, casts, and drawings for school museums be encouraged; that children under fourteen in England, as already in Scotland, be prohibited from working "full time" in factories and workshops; and that, for the rural schools, instruction in agriculture be made obligatory in the upper grades.

The commissioners also recommend that the Science and Art Department should make instruction in science more practical and systematic, should admit artisans to the science and art classes without payment of fees, should insist on the applicability of artistic designs to the material in which they are to be executed, and should supply local museums of industrial design with original examples tending to improve the industries of the districts in which the museums are situated.

As to the "training colleges" (normal schools), they recommend that the teaching of science and art be made efficient and, for the most promising pupils, more extended.

Respecting public libraries, they advise that localities having less than 5,000 inhabitants be put on the same footing as those having more, and that ratepayers be given the power to increase the expenditure for libraries in their localities when desirable.

The remarkable document from which I have made these extracts was prepared under the direction of Messrs. B. Samuelson, H. E. Roscoe, Philip Magnus, John Slagg, Swire Smith, and William Woodall, the board of commissioners, of which Gilbert R. Redgrave, esq., was the secretary.[2]

THE PUBLIC INDUSTRIAL ART SCHOOL OF THE CITY OF PHILADELPHIA.

This school was established under the direction of Charles G. Leland and opened on the first Tuesday in May, 1881. It was maintained by an appropriation from the funds of the school board, under control of the art committee, Messrs. William Galagher, Wright, Sheddon, and Cooper. This appropriation for the first two years was $1,500, but only half the sum was spent by the school, the rest being devoted to teaching drawing in other schools, to an exhibition, &c.

The school began with 150 pupils of from 12 to 16 years of age, all sent from the public grammar schools, each teacher of which was allowed to select a limited number of applicants. Nine-tenths, if not more, of these were from 13 to 15 years old. They were divided into two classes of about 75 each, one attending on Tuesdays from 3 to 5 P. M., the other on Thursdays at the same hours. A class in brass repoussé was held on Saturday afternoons from 2 to 5.

All the pupils were obliged to begin with lessons in design, according to Mr. Leland's method of simple outline decorative work in curves. As soon as a boy or girl could make a design fit to be "put in hand," he or she was allowed to take up any branch of work taught in the school.

These other branches were embroidery, wood carving, modelling in clay with color and glaze, and rudimentary decorative oil painting—subsequently increased by carpenters' work, cabinet making, mosaic setting, inlaying, scroll sawing, and sheet leather work. There is no definite limit, however, as to the branches taught, the principle tested being this, that any pupil who can design and has learned to model in clay can turn his or her hand almost at once to any kind of decorative art. This has been fully

[1] The government grant to schools in England is distributed pro rata on "results" of inspection.

[2] This invaluable document, the Second Report of the Royal Commission on Technical Instruction, comprised in five octavo volumes, numbering about 550 pages each, may be purchased through Mr. B. F. Stevens, United States dispatch agent, No. 4 Trafalgar square, London.

tested, as there is no pupil in the second year who cannot turn his hand successfully to anything. The seeing others work, the being in an atelier where many kinds of work are going on, teaches them to regard them all as one.

The business of the school (i. e., purchasing art materials, paying all bills, keeping the accounts, calling the roll, and looking after the children) was in the hands of Miss Elizabeth Robins, who was also treasurer of the Ladies' Art Club.

The general direction of all branches of study, excepting design, was under charge of Mr. J. Liberty Todd. Both of these assistants gave their services gratis the first year.

The teacher of brass repoussé was Theo. Heustis; that of wood carving, Bernard Uhle; of embroidery, Miss L. Moss, who also gave her labor gratis for more than a year. Being obliged to leave on account of ill-health, her place was filled by Miss Annie R. Springer. Mr. Liberty Todd teaches modelling, painting, mosaic, and pottery. Carpentry, scroll sawing, cabinet making, and inlaying or marquetry are taught by Eugene Bowman (colored).

The school was from the beginning an experiment to ascertain what children could do, not an institute to teach art. A want of appreciation of this fact on the part of the public has been the only source of the only troubles which the school has experienced. The general outcry has been, teach boys while at school a practical trade, by which they can get a living. The Leland experiment was made solely to find out what boys and girls are capable of learning. The result has been to prove beyond doubt that all children taking one or two lessons a week in an atelier can in two years' time learn not one but several arts so well that they can obtain paid situations. On one occasion the head of a factory offered to take forty of the designing class at once into paid employment.

No effort was made to sell the work of the pupils, but much valuable and beautiful glazed and colored pottery was made which had a high market value. The panels produced by the wood carvers, owing to the ability of the teacher, Prof. B. Uhle, are decidedly superior to the average work seen in cabinet making. There are 30 boys and girls in this class (3 colored), and there is not one who could not earn $9 a week. All of the pupils can design a piece of work, model it in clay, and then carve it. All the wood carvers are encouraged to make their work up in the carpenter shop.

Orders are sometimes received and executed. These are for designs, repoussé, &c. It has been fully proved that, if the building or rooms can be provided with an outfit, such a school can be made to pay its expenses, as is the case with the Midhat Pasha school in Damascus. This would require, however, a special out-of-door agent to solicit orders and sell goods.

A close study of the pupils themselves by the director developed these facts:

(1) That one or two afternoons' work in the week at the art school, far from interfering with the regular school studies, seems to aid them materially. This is the opinion of the teachers in the grammar schools.

(2) That the pupils in the art school began to take a greater interest in reading of all kinds, and that in visiting exhibitions or when seeing art work or tasteful manufactures they criticize what is before them with more ability than grown persons display who have not been trained to understand design and its applications.

(3) That the children all regard the art work of the school as being as attractive as any amusement; and as the drawing is not mere copying, but original design, they regard it also as agreeable employment. If the bell did not ring to summon them to cease, the pupils would apparently never leave off designing, modelling, and wood carving. In one school of 87 pupils every one entered his or her name for a place in the industrial school.

CONGRESSES AND EXHIBITIONS.

The facilities afforded at international congresses and exhibitions for the exchange of ideas, processes, and products have been so thoroughly demonstrated in the past

that I need not dwell on this topic. The number and variety of such meetings are increasing year by year. Among those lately held, now in progress, or announced for the near future are the following:

The Central German Committee on Handicraft and Household Industries opened an exhibition in June, 1882, at Leipzig, of handiwork done by pupils in manual labor and industrial schools. In July, 1882, a Congress of Schools for the Blind was held at Frankfort-on-the-Main, at which Dr. Arends's ingenious system of stenography for blind persons was specially exhibited and advised as a subject of tuition. In May of the present year, the General German Teachers' Congress has been held at Bremen, and the exhibition of material illustrative of its researches was classified under twelve heads, viz: literature; geology, mineralogy, and biology; physics; chemistry; technology; geography; history; religion; elementary instruction; drawing; mathematics; and collective exhibits of schools and societies. A finely organized and most instructive exhibition of colonial development at Amsterdam was also opened in May and will continue till October, 1883, at which provision has been made for displays relating to schools and systems of elementary, secondary, middle, and higher education; to books and apparatus of instruction; to drawings and models of school buildings; and, finally, to the results of missionary labors on colonial populations. The International Fisheries Exhibition at London is attracting crowds of visitors and immense scientific interest. The government of Brazil announced an elaborate educational congress at Rio Janeiro for the summer months of the year 1883 (which, of course, are pleasantly cool in the southern hemisphere); the president of the congress is the Count d'Eu, son-in-law of the emperor, and the government has expressed a special desire that the education of this country should be exhibited on this occasion. The groups are school architecture, school furniture, apparatus and material for class room instruction, text books, and educational treatises and reports.

In order that the desires of the Dutch and Brazilian governments might be made known as widely as possible to Americans interested in these matters, I have taken special measures to place information relative to the exhibitions at Amsterdam and Rio Janeiro before the educators of the country.

An interesting exhibition for competitive designs and models of school architecture has just closed in Paris, and a Congress of Provident Institutions (such as school savings banks, &c.) is open there while I write. Without specifying minutely other international meetings announced for the future, I cannot close this brief enumeration before inviting special attention to the International Health Exhibition to be held at London in 1884, at which school hygiene will be fully represented, and to the International Prison Congress at Rome in the same year.

If this Office were put in possession of a small sum annually for the purpose, it could make effective and useful displays of American education on these occasions, and thereby largely increase the knowledge of other communities respecting the most unique feature of our national life.

Among domestic exhibitions every one will recall the excellently managed cotton exposition at Atlanta, Ga., during the winter of 1882–'83; the very large and well attended exhibition at Louisville, Ky., now progressing (in which this Office has made a small but typical exhibit); and the comprehensive and interesting display of her mineral resources that Colorado presented at the Denver exhibition. Interesting features in the future are the two large exhibitions during the coming autumn in Boston, one chiefly of foreign articles, the other chiefly domestic, at which North Carolina will make an unequalled display of her agricultural and mineral resources, as also the proposition to hold a great international exhibition in 1884 at New Orleans, with special reference to the development of trade between the United States and the Spanish Main.

FORESTRY.

The interest in forestry is increasing in extent and intensity as the injurious effects of the diminution of our wooded areas are more fully realized. Societies for the preservation of forests and the cultivation of trees are being organized and their gatherings attract much attention. The meeting of the American Forestry Congress at Montreal, August, 1882, was attended by many representative men from the Northern and Western States. The objects of this association are to discuss matters relating to arboriculture, collect forest statistics, advance educational, legislative, and other measures tending to the promotion of forest culture and preservation, unify the plans for work, and diffuse knowledge ascertained. A State Forestry Association exists in Ohio. It has a committee on arbor day. An extract from a circular issued by Hon. John B. Peaslee, of Cincinnati, chairman of the committee, will give an idea of the purposes it seeks to accomplish. After urging the importance of instructing youth in the value and utility of forests and the cultivation and protection of forest trees, the committee says:

The most impressive way of imparting the instruction and of interesting the pupils in the subject is through the celebration of tree planting. We therefore earnestly request you to have the pupils under your charge plant trees on arbor day, the fourth Friday of April, with appropriate ceremonies. We suggest that the trees be planted in the school grounds, by the roadside, or in parks or commons, and that they be planted in honor and memory of American authors, thus "making trees monuments of history and character."

We suggest also that the exercises consist of reading compositions on the importance and usefulness of forests, of reciting selections on trees from various authors, of giving extracts from and sketches of the life and writings of the particular author in whose honor or memory each tree or group is planted, of singing, of the ceremony of throwing the soil — each pupil in turn — about the trees, and of appropriate talks by trustees, teachers, and others.

In other States school authorities have encouraged the planting and protection of trees. Hon. B. G. Northrop, formerly secretary of the Connecticut State board of education, inaugurated a movement which is improving the surroundings of schools in rural districts almost beyond recognition. In West Virginia the State superintendent, Hon. B. L. Butcher, has made successful efforts to celebrate arbor day and otherwise to promote tree culture. The 27th of April, 1883, was recommended as a suitable occasion for planting trees for the adornment of school grounds, and was very generally celebrated in that way. This Office has published a letter, written by Dr. Franklin B. Hough, on planting trees in school grounds, which contains directions as to time and place of planting.

The study of forestry is pursued in the agricultural colleges of many States, especially in the West. Forest culture is under the charge of a separate professor of horticulture and botany in the Ohio State University and it is one of the junior year studies in the agricultural course of Purdue University, Indiana. Pomology and forestry are included among the special studies in horticulture in the Illinois Industrial University. Forest plantations, wind breaks, hedges, and ornamental trees are discussed in the Iowa Agricultural College, and its grounds are an object lesson in tree planting and cultivation. The study of arboriculture in the Minnesota State University includes the consideration of the reasons for planting forest trees, kinds to be chosen for planting, methods of propagating, care in the nursery, and special culture of each species.

The School of Political Science of the University of Michigan has an attractive course of instruction in forestry. The historical development of the science, the influence of forests on human affairs, the control of wood lands, and forest legislation in Europe and America are subjects considered. Prof. C. K. Adams, dean of the school, says:

The course on forestry has naturally attracted much attention; and it is not a little singular that a subject of so much importance has hitherto been entirely neglected by our colleges and universities. Within the past few years the necessity of some

care of our forests has impressed itself upon the people of our country as never before. Their rapid disappearance in some parts of the land is a matter of the gravest consequence. Not only are vast economic questions directly involved in the destruction of timber, but, what is, perhaps, of even greater importance, if this destruction is not properly guarded against or counterbalanced by the judicious planting and care of trees, even our climate is in great danger of being permanently changed. In this State our forests are a great source of wealth, and there is no one of our industrial resources that is worthy of more careful study. We have recently had painful admonitions that the unwise cutting away of our forests may be attended with the most appalling consequences. The mere statement of these facts is enough to show that the subject is entitled to the most careful consideration. In the Old World schools of forestry have long devoted themselves to a systematic study of the various ways in which the questions that now perplex us in regard to the care of forests are best to be met. As the fruit of studies carried on in these schools, and the consequent wise management of forests, Germany is much less likely to suffer in the near future from the want of the different kinds of the useful woods than is the United States. An important literature on the subject has grown up; and although it is not to be supposed that the methods adapted to European requirements can be transferred to America without essential modifications, yet it is certain that great advantage may be gained from a familiarity with the results of European study and experience.

Prof. J. T. Rothrock, of the University of Pennsylvania, has given from fourteen to eighteen lectures annually on botany and tree culture for some years past in Horticultural Hall, Fairmount Park, Philadelphia. I am indebted to Hon. Eli K. Price for the following account of the origin of this course of lectures:

The history of the free lectures in the Fairmount Park by Professor Rothrock is this: André François Michaux, of Vauréal, near Pontoise, France, by his will, dated 4th September, 1855, gave the income of his estate to his widow for life, and after her death $12,000 to the American Philosophical Society of Philadelphia and $8,000 to the Society of Agriculture and Art of Boston, Mass. By an earlier will, revoked by the last, his chief purpose was to promote the culture of trees, which himself and father had so much loved, and to that purpose the American Philosophical Society have devoted all the income of the legacy since the death of the widow, directly or indirectly. The direct mode is the gift of half the income in the purchase and planting of tree seeds and trees, and thence making distribution into our park and to other parks, the city, institutions, and individuals, and especially to churches and schools, meeting houses, cemeteries, and graveyards. The indirect mode is by applying the other half of the income in support of the lectures on botany, sylviculture, and forestry, as a basis to effect the further purpose of the testator, namely, by tree culture to promote agriculture; both as a protection from high winds and severe cold and as attractors of rain and the prevention of droughts, and also by the preservation of natural springs.

SUBJECTS RESERVED FOR SPECIAL TREATMENT.

Teachers' institutes, city school systems, instruction in shorthand, instruction in physics, the detection and measurement of impurities in the air, the study of hygiene, and decisions on questions of school law are among the subjects now being investigated under the direction of this Office. The results of these studies will be published as they are completed by the persons undertaking them. The appropriation and expenditure of money, the length of session, the plans of management, and results are topics to be discussed in relation to teachers' institutes. The plans and differences of administration of city schools, their courses of study, methods of government, and the management of details will be presented from a practical standpoint.

Instruction in shorthand has increased rapidly for a few years past, and the schools in which it alone is taught or is a prominent feature are becoming numerous. The statistics of the study are being collected in a most thorough manner and a bibliography of English and American works on the subject is being prepared. The growth of this study and the call for those skilled in the practice of the art indicate the interest now taken in the provisions made for instruction and in its literature.

The object of the inquiry respecting instruction in physics is to obtain a full discussion and comparison of views with regard to the systematization of the study of this branch of science, so that different classes of schools should give instruction of a different kind, according to their grade. This is made desirable because at present

the same ground is passed over in colleges that has previously been covered by the course in high schools and academies.

The inquiry into the study of hygiene is to cover the most practical ground, ascertaining the examinations of candidates for admission into various classes of schools, both as to their knowledge of the laws of hygiene and as to their physical condition; the gymnastic exercises or military drill required or expected of either sex; the provision for medical attendance upon students; the character and equipment of gymnasiums; the management of athletic sports and intercollegiate contests; and the opinions of experienced men on the effects of special forms of exercise.

The decisions relating to school law will be obtained by an examination of the cases which have been decided in the highest courts of the various States in recent years. Such points are to be selected from these as have a public bearing upon educational interests, such as the constitutionality of measures, the manner of conducting school meetings, the formation of school districts, and the administration of their affairs, the duties and liabilities of officers and teachers, and the discipline of the school.

RECOMMENDATIONS.

I recommend the publication of twenty thousand copies of this report for the use the Office. This will only enable it to supply its correspondents, and whatever may be deemed best to distribute under the personal direction of members of the Senate and House of Representatives should be in addition to this number.[1]

The organization of the educational museum in connection with this Office, which I have had the honor to recommend, now constituting a collection of great value and more and more visited and studied by teachers and school officers, should have a sufficient appropriation to enable it, by exchange and otherwise, to supply similar collections in the offices of the several State superintendents and the leading cities when desired. A new and important additional demand has been made upon the collection for supplying exhibits where educational collections are presented in State and other expositions. There can be no question of the effective aid these collections would render to the progress of education. Through this Office the best illustrations of improved appliances should be collected and distributed to all parts of the country.

The reports of efforts to educate the youth of 30,000 Alaskans continually disclose the embarrassments arising from all absence of local administration of law. It is said the parents are disposed to have their children taught and the pupils learn readily, but it is clear there can be no satisfactory success, that the entire youth cannot be reached, until some form of law is provided for the organization of society. The pledges of the past and the honor of the nation would seem to permit no delay. Some inexpensive form of organization can be devised, and an appropriation of $50,000, it is believed, would give the work of education an excellent start, and is earnestly recommended.[2]

I renew most earnestly the following recommendations:

(1) I recommend that the office of superintendent of public instruction for each Territory be created, to be filled by appointment by the President, the compensation to be fixed and paid as in the case of other federal appointees for the Territories.

(2) In view of the large number of children growing up in ignorance on account of the impoverished condition of portions of the country, and in view of the special difficulties in the way of establishing and maintaining therein schools for universal education, and in consideration of the imperative need of immediate action in this regard, I recommend that the whole or a portion of the net proceeds arising from the sale of

[1] As this report goes through the press Congress has passed a joint resolution ordering the publication of thirty-eight thousand copies of this report, twenty thousand for the use of this Office, as recommended, six thousand for the use of the Senate, and twelve thousand for the use of the House of Representatives.

[2] See pages xlv, xlvi, *note*.

public lands be set aside as a special fund, the interest of said fund to be divided annually pro rata among the several States and Territories and the District of Columbia, under such provisions in regard to amount, allotment, expenditure, and supervision as Congress in its wisdom may deem fit and proper. The returns of the last census emphasize the importance of this recommendation. The per cent. of illiteracy of persons 10 years of age and upward has decreased from 20.05 in 1870 to 17 in 1880, but the number of illiterates over 10 years of age has increased from 5,658,144 to 6,239,958 in the same period.

(3) I recommend the enactment of a law requiring that all facts in regard to national aid to education and all facts in regard to education in the Territories and the District of Columbia necessary for the information of Congress be presented through this Office.

(4) I recommend an increase of the permanent force of the Office. The experience of the Office indicates clearly that the collection of educational information and publication of the same, as required by the law regulating it, cannot be properly done with the present limited clerical force.

CONCLUSION.

I take pleasure in acknowledging my indebtedness to the faithful laborers in the Office and to all others elsewhere who have contributed to the success of its work.

I have the honor to be, very respectfully, your obedient servant,

JOHN EATON,
Commissioner.

Hon. HENRY M. TELLER,
Secretary of the Interior.

ABSTRACTS

OF THE

OFFICIAL REPORTS OF THE SCHOOL OFFICERS OF STATES, TERRITORIES, AND CITIES,

WITH

ADDITIONAL INFORMATION FROM VARIOUS SOURCES.

PREFATORY NOTE.

The following abstracts of education in the States and Territories are derived from a great variety of sources. First among these come reports of State officials, such as State boards of education and State superintendents of instruction; next, those of county and city superintendents, school committees, acting school visitors, and principals of State institutions. From these are derived nearly all the information given respecting elementary and special instruction, city school systems, and normal schools, and much of that relating to secondary schools, as the high schools of the States and cities. What concerns private secondary schools is almost wholly from returns made by the principals of these to the Bureau of Education, supplemented by catalogues and other documents.

For the matter relating to universities, colleges, and scientific and professional schools, dependence is placed on the annual catalogues of such institutions, on occasional circulars issued by them, and on special returns, made usually in the autumnal and winter months, in reply to circulars of inquiry sent them by the Bureau.

In every instance, official authority only is relied upon for statements distinctly and definitely made, the printed catalogues and reports being chiefly used for this purpose, though sometimes an item of interesting information from other than official sources may be given, with a reference to the quarter from which it is derived. In such cases, however, the effort is always made to verify the statement before it is committed to the press.

The matter derived from the various sources above indicated is formulated, in the abstracts of education for each State, substantially in accordance with the schedule given below.

GENERAL PLAN OF THE ABSTRACTS.

1. STATISTICAL SUMMARY ..... (*a*) School population and attendance.
   (*b*) School districts and schools.
   (*c*) Teachers and teachers' pay.
   (*d*) Income and expenditure.
2. STATE SCHOOL SYSTEM ..... (*a*) Officers.
   (*b*) Other features of the system.
   (*c*) General condition, marking specially anything new and noteworthy.
3. CITY SCHOOL SYSTEMS ..... (*a*) Officers.
   (*b*) Statistics.
   (*c*) Other particulars.
4. TRAINING OF TEACHERS ..... (*a*) Normal schools and normal departments.
   (*b*) Teachers' institutes.
   (*c*) Educational journals.
5. SECONDARY INSTRUCTION ..... (*a*) Public high schools.
   (*b*) Other secondary schools.
6. SUPERIOR INSTRUCTION ..... (*a*) Colleges for men or for both sexes.
   (*b*) Colleges and high grade schools for women.
7. SCIENTIFIC AND PROFESSIONAL INSTRUCTION .. (*a*) Training in scientific schools and agricultural colleges.
   (*b*) Training in theology.
   (*c*) Training in law.
   (*d*) Training in medicine, dentistry, and pharmacy.
8. SPECIAL INSTRUCTION ..... (*a*) Deaf, dumb, blind, &c.
   (*b*) Industrial and reformatory training.
   (*c*) Instruction in oratory, music, art, &c.
9. EDUCATIONAL CONVENTIONS ..... (*a*) Meetings of State associations.
   (*b*) Special meetings of teachers, school principals, and superintendents.
10. NOTEWORTHY BENEFACTIONS.
11. OBITUARY RECORD ..... (*a*) Brief memorials of teachers, superintendents, and other promoters of education who have died during the year.
12. CHIEF STATE SCHOOL OFFICER ..... (*a*) State superintendent.

The statistics furnished the Bureau in answer to its circulars of inquiry, for convenience of reference and comparison, are given in tables following these abstracts, while summaries of these statistics may be found under similar headings in the report of the Commissioner preceding.

For the general courtesy with which his circulars have been answered, alike by State and city officials, by college presidents and heads of schools, as well as for documents additional to these replies, the Commissioner of Education here tenders his cordial thanks to all concerned.

ALABAMA.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
White youth of school age (7–21)	217,590	224,464	6,874	
Colored youth of school age	170,413	176,538	6,125	
Whole number of school age	388,003	401,002	12,999	
Whites enrolled in public schools	107,338	107,949	611	
Colored enrolled in public schools	68,951	69,479	528	
Whole enrolment	176,289	177,428	1,139	
Average attendance of whites	66,840	67,381	541	
Average attendance of colored	48,476	47,146		1,330
Whole average attendance	115,316	114,527		789
SCHOOL DISTRICTS AND SCHOOLS.				
Number of school districts	1,776	1,776		
Public schools for whites	2,981	3,058	77	
Public schools for colored	1,591	1,566		25
Number of public schools reported	4,572	4,624	52	
Pupils in spelling	165,157	166,173	1,016	
Pupils in reading	114,544	120,339	5,795	
Pupils in writing	78,385	82,448	4,063	
Pupils in arithmetic	74,669	72,859		1,810
Pupils in geography	33,016	37,787	4,771	
Pupils in grammar	22,214	22,958	744	
Average length of school in days	81.21	79		2.21
Schools for whites	84	80.1		3.90
Schools for colored	76	78	2	
Valuation of public school property	$285,976	$264,457		$21,519
TEACHERS AND THEIR PAY.				
White teachers in public schools	3,053	3,056	3	
Colored teachers in public schools	1,645	1,508		137
Whole number of teachers	4,698	4,564		134
White male teachers	1,873	1,874	1	
White female teachers	1,180	1,182	2	
Colored male teachers	1,169	1,064		5
Colored female teachers	476	444		32
Average monthly pay of teachers in white schools.	$22 98	$21 52		$1 46
In colored schools	23 15	21 88		1 27
RECEIPTS AND EXPENDITURES.				
Total receipts for school purposes	$397,479	$392,905		$4,574
Total expenditure for same	410,690	403,602		7,088

(From reports of Hon. H. Clay Armstrong, State superintendent of public instruction, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

These are (1) a State superintendent of education, elected by the people; (2) a superintendent for each county, appointed by the State superintendent; (3) a township superintendent of schools, appointed by the county superintendent; and (4) a county board in each county, composed of the county superintendent and 2 teachers of his appointment, to examine teachers and organize institutes. The State, county, and township superintendents serve 2 years; the members of the county board, 1 year.

OTHER FEATURES OF THE SYSTEM.

The public schools are sustained from the following sources: 6 per cent. interest on the proceeds of sales of lands granted by the United States; 4 per cent. interest on United States surplus revenue deposited with the State; net proceeds of a poll tax of $1.50 on every male inhabitant over 21 and under 45 years of age; an optional local tax in each county (except Mobile) of not more than 10 cents on $100 (not less than one-half to be used for pay of teachers in the county thus taxed); the annual proceeds of the sales of lands that may be given for the support of the public schools; an annual appropriation of $130,000 from any money in the treasury not otherwise appropriated; and all sums accruing from escheats and licenses required by law to be paid into the school fund of any county. School moneys are distributed according to the number of children 7 to 21 years of age. No denominational school is to share in the fund; while separate schools for whites and blacks must receive their pro rata shares and the amount of poll tax paid in by each race. All children of school age are entitled to the benefits of any public school for their own race in their district or township. Public examinations must be held in the schools at least once each year; and students who have completed the course of studies required receive from the board of education a certificate to that effect. The school month is 20 days, of not less than 6 hours each; the scholastic year extends from October 1 to September 30. Teachers must be duly licensed, and they must make the required quarterly reports to the county superintendent before receiving their pay. They must attend at least one of the three annual institutes held in each county.

GENERAL CONDITION.

The State superintendent regards the public school system of the State as a well devised and good one, adapted to the wants and condition of the people, the only necessity being an adequate fund to properly administer it.

The statistics for 1881–'82 show an increase of 12,999 in school population over the previous year, while the school income was less by $4,574, with a decrease in expenditures of $7,088. Contrasting the two races, the figures show that while the white school population increased 3 per cent. the colored gained 3½ per cent. In nearly all other respects the contrast is largely in favor of the whites. Both had about the same proportionate increase in enrolment, while in average daily attendance (nearly 65 per cent. of the enrolment) the whites gained 541 and the colored lost 1,330. Schools for whites increased by 77, those for blacks decreased 25; the number of white teachers was increased by 3, that of colored teachers was decreased by 137. In the grades of spelling, reading, writing, geography, and grammar there was a large increase of pupils, while in arithmetic there was a decrease. The appeal of the State superintendent to the legislature, showing that with present means only 44.25 per cent. of the children of the State were enrolled and only 28.56 per cent. were in average daily attendance, it was hoped would secure the necessary aid, especially as the reduction of the school fund was made when the State was overburdened with debt and taxation, and now the time had come when the State could do tardy justice to her children.—(State report.)

AID FROM THE PEABODY FUND.

In fulfilment of the promise made the previous year, $5,000 of this fund were appropriated to Alabama for the scholastic year 1882; the sum was disbursed as follows: For 10 scholarships in the normal college at Nashville, Tenn., $2,000; for 16 scholarships in the State Normal School at Florence, $2,000; the remaining $1,000 was divided equally between the colored normal schools at Marion and Huntsville. In addition to this timely aid to the normal schools, which greatly enlarged the sphere of their usefulness, 25 Peabody medals were offered for the highest degree of attainment in scholarship and deportment; after a lively contest, they were about equally divided between white and colored pupils in the normal and leading city schools.—(State report.)

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

Montgomery and Selma are the only cities calling for notice that have city school systems separate from those of the counties of which they form a part. Each has a city board of education and a superintendent of city schools.

Mobile, reported under this head in preceding years, has neither city board nor city superintendent separate from those of the county of which the city is a part, and makes no report of city schools as distinct from the very numerous ones of the county. It is therefore omitted here.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Number of schools.	Enrolment in public schools.	Average daily attendance.	Number of teachers.
Montgomery	16,713	3,793	13	1,205	985	14
Selma	7,529	2,021	14	736	622	18

ADDITIONAL PARTICULARS.

Montgomery reported 2,054, or 54 per cent., of its school population as colored. There were 376 whites enrolled and 829 colored, with 360 whites in average daily attendance and 625 colored. In the white schools there were 47 whites to each teacher; in the colored schools, 138. The average length of schools for both races was 180 days as against 160 the year before.—(State report.)

Selma reported a school population of 863 whites and 1,158 colored; but, unlike Montgomery, had a preponderance of school attendance on the white side, 424 whites being enrolled against 312 colored, and 382 whites appearing daily in the schools against 240 colored. Two school-houses were reported, which, with other property, were valued at $10,000; there were 8 schools for white and 6 for colored pupils. With the same number of schools as in 1880–'81, there was an additional school building reported. Enrolment, however, was less by 151. The average time of school was 206 days, against 195 the year before. There were 12 teachers of white and 6 of colored schools, while under each of the white teachers there were enrolled 35 pupils and under the colored 52, the average monthly pay of the white teachers being $85.40 and that of the colored $73.—(State report.)

TRAINING OF TEACHERS.

STATE NORMAL SCHOOLS.

In 1881–'82 there were 4 normal schools under the care of the State, 1 for white teachers and 3 for colored, all reported to be doing good work, their graduates being called for from all parts of the State.

The *State Normal School* (for whites of both sexes), Florence, had 164 students in the school year 1881–'82, of whom 76 were normal, a gain of 8 over the previous year. The senior class of 7 received certificates of graduation, and 5 engaged in teaching, according to contract with the State. The school year opening September 6, 1882, promised still better results, the pupils in the first term numbering 12 more than in the previous session, 10 more being normal, and the class for graduation having 20 more members. Grateful mention is made of the help given to the school from the Peabody fund, by which 2 students have been able to complete and 14 others to undertake the normal course. Appropriation by State for payment of the faculty, $7,500.—(State report.)

The *Normal School for Colored Teachers*, Huntsville, with the aid of the State and the Peabody fund, purchased, before the opening of the session of 1881–'82, a desirable school building in the city for $3,000. It had, for the session, 3 teachers and 227 pupils in all departments, 68 of them normal, of whom 4 were graduated. The next session opened with 150, against 130 at the same time in the previous year. Its course of study covers 4 years. There is a model school for practice teaching. Music, vocal and instrumental, is taught. The school had a library of 217 volumes, 150 of which were added during the year, with 10 pedagogical works. There were also 4 educational journals and magazines taken.—(State report and return.)

Lincoln Normal University (for colored students), Marion, for the school year 1881–'82 reported 5 instructors and 174 students, 128 being normal, of whom 9 graduated from its 4-year course and engaged in teaching. A falling off of 50 from the attendance of the previous year was attributed to short crops and competition with other schools. There were 200 volumes in the library. There were the usual facilities for the study of drawing, vocal and instrumental music, chemistry, physics, and natural history.—(State report and return.)

Tuskegee Normal School (for colored teachers), Tuskegee, provided for by the legislature of 1880, opened July 4, 1881, with 3 instructors and 30 students, closing its first session of 36 weeks with 112. The regular 4 years of study include all the branches laid down in the State law, with some others. The town public school, being on the grounds of the normal school, is used as a model school for the normal students. The school has a farm of 100 acres, used by pupils studying agriculture to defray a part of their expenses. On this farm was erected a 3-story building containing recitation rooms, a chapel, a reading room, an office, and dormitories for girls. To meet various

expenses the people of Tuskegee and friends at the North raised $5,522 and the State gave $2,000, while 600 volumes for a library, a cabinet organ, and many other valuable articles were donated by friends. This prosperous beginning, it is said, is owing largely to the hearty coöperation of the white and colored citizens of Tuskegee.—(State report.)

OTHER NORMAL SCHOOLS OR DEPARTMENTS.

Rust Normal Institute (for colored), Huntsville, under the care of the Freedman's Aid Society of the Methodist Episcopal Church, had 2 instructors and 111 students in 1880–'81 and reported steady growth.

Emerson Institute (for colored), Mobile, conducted by the American Missionary Association, for 1881–'82 reported 9 instructors; 22 normal and 230 other pupils; a 4-year course of study, of 32 weeks each year; 100 volumes in the library, 25 of them pedagogical works, and 2 educational journals. Graduates receive diplomas, but are subject to examination as teachers in the State. The school building, having burned down a second time, was rebuilt on an enlarged scale, but at an expense not much above the insurance money.—(Return and American Missionary, 1882.)

Alabama Baptist Normal and Theological School (for colored), Selma, is reported to have been the first school of its kind established and managed by the colored Baptists in America. It aims to educate colored teachers and supply the colored churches with an educated ministry; has a 3-year course, including vocal and instrumental music; and in 1882 had 7 instructors and 151 students, normal students not designated.—(American Baptist Year Book.)

In the *normal department of Talladega College*, Talladega, the course of 4 years is intended to prepare students to teach in the most advanced schools in the South, and to meet the demand for better teachers special attention is given to strictly normal work. A teachers' institute is held at the close of the spring term. In 1881–'82 there were 36 normal students.—(Catalogue and American Missionary, 1882.)

TEACHERS' INSTITUTES.

The State superintendent reported that 122 teachers' institutes (voluntary organizations of teachers) were held in 1881–'82 in the different parts of the State and that the expenses of the same were a tax on teachers which he regarded as unfair. The institutes, he thought, should be sustained by public funds. He would have one held yearly in each county, for each race, during one month, to be conducted by a thoroughly competent instructor. The present law, while it provides for holding at least three institutes annually and requires teachers to attend one of them, fixes no penalty for non-attendance and forbids involuntary assessments upon members. The superintendent would have the law changed in this respect also, as county superintendents complain of the non-attendance of teachers and the want of power to enforce attendance.—(State report.)

EDUCATIONAL JOURNAL.

The Alabama Progress, a weekly educational journal edited and published by George P. Keyes, was established at Montgomery, April, 1882, under the auspices of the department of education, of which it is the official organ. The State superintendent speaks of it as steadily growing in popularity and circulation, and thinks it should be liberally supported by the friends of free education.—(State report.)

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

No provision for schools of this grade appears in the (latest) school law of 1879 and no mention of such schools is made in the State report for 1881–'82.

OTHER SECONDARY SCHOOLS.

For information concerning business colleges, private academic schools, and preparatory departments of colleges, see Tables IV, VI, IX, and X of the appendix, and the summaries thereof in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The *University of Alabama*, Tuscaloosa, was reported in 1880–'81 to have extended its curriculum and raised its standard of graduation. There were 2 general departments of instruction, academic and professional, but no preparatory department. The academic comprised scientific and classical courses and was arranged under 9 schools. Candidates for the degree of B. A. were required to take either the full classical or full scientific

course, each of 4 years. Students unable to complete all the studies of one of the regular courses are allowed to select a course of study from the 9 schools, and upon completion of the course of any school are entitled to a diploma of graduation in that school and are enrolled as alumni of the university. The session of 1881–'82 opened with 14 resident professors and instructors, 173 undergraduate students, the above mentioned collegiate courses of 4 years of 36 weeks each, and 6,000 volumes in the library. Students in the academic department are subject to military discipline and are required to reside in barracks.—(Catalogue of 1880–'81 and return for 1882.)

Southern University, Greensboro' (Methodist Episcopal South), reported in 1881 the presence of 69 students, under 6 instructors, with 2-year preparatory, 4-year classical, and 3-year scientific courses, arranged under 7 schools. To the 4-year classical course was appended a master's course of 1 year, the completion of which, after pursuing the regular course, was required for the degree of M. A. A return for 1882 reports a temporary suspension, but with a prospect of early reorganization.—(Catalogue and return.)

Howard College, Marion (Baptist), continued its courses of study in 11 schools, including the usual classical and scientific studies, with a business school and a school of military art and science. For the degree of B. A. 4 years of classical study are required. Certificates of distinction are given to undergraduates for distinguished attainments in any class of any school. A certificate with title of "distinguished undergraduate" is conferred on a student who secures high standing in any three schools within one session. There were 8 resident professors, 103 students, 20 of them preparatory, with 7 graduates at the end of the year.—(Catalogue and return.)

A return from *Spring Hill College*, Mobile (Roman Catholic), gives a total of 20 instructors and 168 students for the year ending October 1, 1882.

For full statistics of colleges reporting, see Table IX of the appendix; for summary of their statistics, a corresponding table in the report of the Commissioner preceding.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

For information regarding the colleges for this sex alone, reference is made to Table VIII of the appendix. A summary of this table will also be found in the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The State Agricultural and Mechanical College of Alabama, Auburn, has four regular degree courses, each covering 4 years of 39 weeks, viz, a course in agriculture, with degree of B. S. A.; in engineering, with degree of B. E.; in literature, with degree of A. B.; in general science, with degree of B. S. The studies are the same in all for the first two years and the full course is followed by a graduate course of 1 year, on the completion of which the graduate in engineering receives the degree of civil and mining engineer and the graduate in agriculture, literature, or science the degree of master in that course. There is also a department of military science and tactics, in which every able-bodied student is subjected to strict military discipline and training. There were 9 professors and instructors and 122 students, 81 in the scientific and 41 in the preparatory department. Since its organization 901 have been matriculated, while only 94 have graduated with degrees, owing to the large number of young men who, after two years' study, leave the college to enter business. To accommodate such students, a 2-year special course has been established. Since 1879–'80 the increase of the regular college classes studying for degrees had been from 67 per cent. in that year to 83 per cent. at the close of 1882. There were 2,500 volumes in the library, college property was valued at $100,000, and the productive funds were $253,500, affording an income of $20,280.—(Report of trustees, catalogue, and return.)

PROFESSIONAL.

Theological.—The Alabama Baptist Normal and Theological School, Selma, for 1881–'82 reported 1 instructor; 45 students; a 5-year course of 32 weeks each, including preparatory and literary studies; and 400 volumes in library.

The theological department of Talladega College (Congregational) had 2 instructors and 14 students. Its full course of study was 3 years of 34 weeks each; it had 1,000 volumes in the library, property valued at $5,000, a productive fund of $5,000; and received during the year $5,000 for scholarships from the estate of R. R. Graves, of Morristown, N. J.

The Institute for Training Colored Ministers, Tuscaloosa (Presbyterian Church South), reported 30 students, under 2 instructors; a 3-year course of study of 43 weeks each; about a thousand volumes in the library; property valued at $2,000; and an income from contributions of the churches amounting last year to $3,200, besides a gift of $100 from

the late Edmund H. Payton, of New Jersey. All these schools require an examination for admission.—(Returns.)

Legal.—The law department of the University of Alabama, Tuscaloosa, reported 3 instructors; 25 students; 15 graduates; 2 years of 36 weeks each in the full course of study. Instruction by a weekly lecture was given in international and constitutional law; in common and statute law and in equity jurisprudence, by lectures and recitations.—(Catalogue and return.)

The law department of the Southern University, reported as having been suspended in 1881, sends no report of resumption of studies in the ensuing year.

Medical.—The Medical College of Alabama, Mobile, for 1881–'82 reported 11 instructors; 60 students, 2 of whom had received degrees in letters or science; graduated 16 with degree of M. D.; required 3 years' study, of 20 weeks each; and had college property valued at $150,000. As many medical colleges have extended their courses of lectures and made instruction in the different departments more thorough and practical, the college announced that it would keep up with other institutions in every step to elevate the profession and raise the standard of medical education.—(Catalogue and return.)

The medical department of Southern University, said to have been suspended in 1881, has sent no report.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB AND THE BLIND.

The Alabama Institution for the Deaf and Dumb and the Blind, Talladega, was reported in 1880–'81 to have had a complete corps of instructors in both departments, the ordinary branches of a practical English education being taught. There was training in shoemaking, cane seating, mattress making, printing, plumbing, gas fitting, and agriculture. Articulation was not taught. The Annals of the Deaf and Dumb, published at Washington, D. C., gives an attendance of 48 for the year 1882—males 28, females 20—but there is no distinct statement whether these included the deaf-mutes alone; instructors, 5, 3 of them mutes; value of buildings, $60,000; expenditure for support, $10,886; pupils from the beginning, 175.—(Annals of the Deaf and Dumb.)

EDUCATIONAL CONVENTIONS.

STATE ASSOCIATION OF TEACHERS OF COLORED SCHOOLS.

The colored teachers and white teachers of colored schools, from all parts of the State, met in convention at Selma, April 6 and 7, 1882, when 60 members effected a permanent organization of a State Teachers' Association, adopted a constitution, and elected officers. Papers, which are said by the State superintendent to have indicated remarkable advancement by the colored race, were read on "The teacher and his work," by Prof. Martin, of Montgomery; on "Text books," by Prof. Silsby, Selma; "The Quincy method," by Prof. Patterson, Marion; "Model lessons," by Miss Holmes, Selma; "How to secure the coöperation of parents and guardians," by Prof. Miles, Marion; followed by discussion of the school law of the State, by Hon. H. C. Armstrong, State superintendent, and others. Prof. D. T. Washington, of Tuskegee, a colored graduate of Hampton, spoke with much force, it is said, on "Industrial education." Entire harmony and the best of spirit are said to have prevailed, and the association adjourned to meet again at Montgomery the first week in April, 1883.—(Journal of Education and Present Age.)

STATE ASSOCIATION OF WHITE SCHOOL TEACHERS.

The white teachers met in convention at Birmingham, July, 1882, for the first time in ten years, having about the same attendance as the colored convention. State Superintendent Armstrong was elected president. Among the papers read and the addresses made were "The schoolmaster," "Graded schools," "Educational wants of the present time," "Industrial education," "Text books: what they are and what they should be," "Normal schools," "Technical education of women," "How much and what mathematics should be taught in our common and high schools," "Educational literature," "Institutes, and how they should be conducted," "How to teach English composition," "Study of the classics," and "English grammar." The association adjourned to meet at Talladega, July 5, 6, and 7, 1883.

CHIEF STATE SCHOOL OFFICER.

Hon. H. Clay Armstrong, *State superintendent of education, Montgomery.*

[Second term, December 1, 1882, to December 1, 1884.]

ARKANSAS.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
White youth 6 to 21 reported	199,109	212,940	13,831	
Colored youth 6 to 21 reported	65,206	69,113	3,907	
Whole number of school age	*a*272,841	*a*289,617	16,776	
Whites enrolled in public schools		76,598

Whole number reported	2,169	*b*2,501	332	
INCOME AND EXPENDITURE.				
Receipts for public schools	$710,462	$574,543		$135,919
Expenditures for public schools	388,412	503,857	$115,445	

a Includes races not reported separately. *b* Includes those whose sex is not reported.

(From report of Hon. D. H. Pope, State superintendent of public instruction, for the years 1881 and 1882.)

STATE SCHOOL SYSTEM.

OFFICERS.

These are a State superintendent of public instruction, elected for 2 years; a State board of commissioners of the common school fund; an examiner for each county, appointed by the county court; and elective boards of 3 district directors, 1 to be changed each year.

OTHER FEATURES OF THE SYSTEM.

Public schools are supported from the income of a State school fund, a tax of $1 on men over 21, with such other appropriations as the legislature may make, and optional district taxes, which may not exceed 5 mills on $1. The apportionment of public funds is on the basis of resident youth 6 to 21. If in any district the public money, with the district taxes voted, should not suffice to sustain a school for 3 months, directors may determine that no school shall be taught during such year. Reports of school statistics must be made annually by all school officers. The law forbids the use of sectarian books in public schools, commands the separate instruction of white and colored, and provides for teachers' State certificates, valid during life, as well as for limited ones of 3 grades, and for teachers' institutes, to be held by examiners in each county and by the State superintendent in each judicial district.

GENERAL CONDITION.

An encouraging condition of public school affairs is reported. Prejudice against the system, engendered by unwise legislation and waste of school funds, was disappearing, and the people were coming to look on the public schools as the only means through which a large portion of the school population could obtain an education. The statistics, though imperfect and unsatisfactory, furnish abundant proof of progress. With but 16,776 more youth of school age than the previous year, the stated increase in public school enrolment was 18,952, although only about half the school districts reported on this point. The superintendent thinks the real increase in attendance was about 40,000, or more than twice as great as the increase of youth to be educated. More money was expended on the public schools. More teachers were employed, and the standard of qualification for them was raised; county examiners were more careful in granting certificates, and the consequence was better teaching. Although the number of school-houses built was less than in 1880–'81, those erected were better adapted to their purpose; many were more attractive in appearance and were supplied with improved furniture and apparatus. Several school districts had no schools during the year, preferring to use their funds to provide school-houses. The public schools in cities and towns were rapidly increasing in number and importance. Some of the more important towns failed to report, but such reports as were received showed increased attendance on schools and larger expenditures for them.

CITY SCHOOL SYSTEM OF LITTLE ROCK.

OFFICERS.

A law of 1869 provides for the election of 6 directors for the supervision of city schools, the directors being authorized to employ a superintendent, who may also be principal of a graded or high school established by the board.

STATISTICS AND ADDITIONAL PARTICULARS.

Little Rock had in 1880 a population of 13,138, and in 1882 reported 5,533 youth of school age, with 3,066 pupils in public schools and 1,742 in average attendance, a gain in enrolment of 428 over the previous year, with 2 more teachers.

The public schools are classed as primary, grammar, and high, each comprising 4 grades. The improvement effected during the year was as great as could be reasonably expected, considering the crowded condition of the lower grades. Two additional rooms were opened, making seats for 120 more pupils, but this is not sufficient, even for the present, and the school population is constantly increasing.

TRAINING OF TEACHERS.

STATE NORMALS.

The State continues its training of teachers in a normal department belonging to the Arkansas Industrial University, Fayetteville, and in a branch normal of the same at Pine Bluff, the former for white students, the latter for colored. Each of these schools in 1881–'82 offered 400 free scholarships, 63 more than the previous year, the university trustees having authority to decide as to the number. They are divided among the counties according to population. Of the 400 open to white students, 385 were vacant in 1881–'82. The literary requirements for admission were not high, but they embraced a thorough knowledge of the four fundamental rules of arithmetic, with decimal fractions, ability to read well in the fourth reader, a knowledge of primary English grammar and geography, the rudiments of penmanship, and the ability to spell ordinary words of the grade of the fourth reader. The course of study, covering 4 years in both schools, in addition to instruction in the branches taught in the public schools, includes training in methods of imparting instruction, in organizing and governing schools, and in the legal duties of teachers. The school for white pupils reports 56 in normal studies; that for colored pupils, 40 during the year.

OTHER NORMAL TRAINING.

By arrangement with the general agent of the Peabody fund, the State was entitled to 8 Peabody scholarships in the Normal College of the University of Nashville, which scholarships are filled by appointment upon competitive examinations.

Marianna College and Normal Institute, Marianna, reorganized September 15, 1882, under the supervision of the school board of Marianna and partly sustained by the public school funds, offered tuition free to residents of the district, the principal being allowed to receive paying pupils from outside. What normal training or normal students there were does not appear.

During the year, too, a normal department was added to the public graded school system of Russellville.

Normal instruction is given to colored students in *Southland College and Normal Institute*, Helena, under the direction of Friends, which, besides 248 other pupils in 1882, reported 36 under training for teaching.

TEACHERS' INSTITUTES.

Twelve normal institutes were held in the several judicial districts under the personal supervision of State Superintendent James L. Denton, assisted by Prof. O. F. Russell, whose salary and travelling expenses were paid out of an appropriation from the Peabody fund. State Superintendent Pope says too much importance cannot be attached to these migratory schools for teaching teachers how to teach, but that the shortness of the sessions has prevented the attainment of the best results. According to a recent rule made by the agent of the Peabody fund, the sessions of all institutes aided by that fund must henceforth be longer.

SCHOOL JOURNAL.

The Arkansas School Journal, the official organ of the public school system, continued to be published at Little Rock, under the editorship of the late State Superintendent Denton, until the death of that officer in October, 1882.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

In several of the principal cities and towns, public high schools formed a part of the graded system in 1882. Little Rock, Bentonville, Searcy, Fort Smith, Russellville, and Lonoke had such schools and other towns were proposing to establish them. Little Rock reports 2, one for white and one for colored youth, the average enrolment in the former being 69; in the latter, 20. There were 1,453 in the State studying the higher branches, a slight decrease during the year.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academic schools, and preparatory departments of colleges and universities, see Tables IV, VI, and IX of the appendix, and for a summary, see corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

UNIVERSITIES AND COLLEGES FOR BOTH SEXES.

Four out of 5 collegiate institutions in this State reported statistics for 1881–'82, viz: The Arkansas Industrial University, Fayetteville; Arkansas College, Batesville; Cane Hill College, Boonsboro'; and Judson University, Judsonia. All these were open to both sexes, as was also St. John's College, Little Rock, at last accounts; but no report from it has come since 1879.

The latest catalogues received from the 5 colleges show that all had preparatory and classical and that 3, the Arkansas College, Judson University, and St. John's College, had scientific and commercial courses; that all except Arkansas College report provision for instruction in music; that Cane Hill College offered a ladies' course of 3 years, and that the State University and St. John's College made some provision for the training of teachers. The whole number of young women availing themselves of the privileges offered them does not appear. Only the two universities distinguish as to the sex of students, the State University having 17 young women in the regular collegiate classes and Judson University 62 in all departments. None, except the State University, reports the number belonging to the collegiate classes. In Arkansas College, no special lines are drawn between classes; there is only a prescribed course for degrees, which may be completed in more or less time, according to the ability and industry of students. In Judson University and St. John's College also class distinctions were not observed, the courses being arranged in independent schools.

The *Arkansas Industrial University* offers nine courses of study: classical, Latin letters, modern languages, English, normal, and 4 scientific courses. A preparatory department gives the necessary training for admission, which in Latin includes only a mastery of the principles of the grammar and two books of Cæsar's Commentaries. Military instruction forms a part of the course for young men, and a department of music affords opportunity for thorough drill during the four years in vocal and instrumental music, including piano and violin. Evidences of substantial progress during the last few years were found in more students and teachers, more buildings, an extended curriculum, and more exacting standard. The average annual attendance during the last four years was 426, against 256 in 1877–'78, although the enrolment during the last year fell considerably below the average for the four, owing to various transient causes. The number of professor-

ships increased, during the same period, from 11 to 16. The State superintendent says the influence of the university has begun to be felt. Some of the graduates had obtained professorships, three or four were elected to the legislature, and many had turned their attention to teaching.

In addition to previous ones, three colleges — one for whites and two for blacks — seem to have begun at Little Rock in 1881–'82. The college for whites, Little Rock University, under Methodist influences, secured thirteen acres of land in the city and began its instruction in the fall of 1882. The institutions for blacks, Philander Smith College (Methodist Episcopal) and Edward Smith College (Congregational), took the preliminary steps towards organization by securing sites and preparing to build. The site for the last included fourteen acres, overlooking the city, purchased and fenced through funds furnished by Mr. Edward Smith, of Enfield, Mass.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

Provision for scientific instruction is made, as already noted, by the *Arkansas Industrial University* in 4 distinct courses, all extending over 4 years, one being in general science, one in agriculture, and one each in civil and mining engineering. These courses are nearly identical during the first and second years, the principal differences being in the last two years. Students receive the degrees of civil engineer, mining engineer, and bachelor of agriculture on completion of the corresponding courses. There is a small farm connected with the institution, on which labor is paid for at 8 to 10 cents an hour.

Cane Hill College, Boonsboro', presents a department of engineering, with a course extending over 4 years, while at *St. John's College*, Little Rock, and *Judson University*, Judsonia, general scientific courses are outlined.

PROFESSIONAL.

The medical department of the Arkansas Industrial University, organized in 1879–'80, reports its third annual course of lectures commenced October 5, 1881, and continued 5 months. There were 36 regular matriculates, 5 of whom were graduated. Among the requirements for graduation are 3 years' study of medicine, including attendance on 2 courses of lectures of 20 weeks each, and a satisfactory examination on the studies of the course.

There is no information of any other institution or department for professional instruction in the State, although it appears that there were 3 students of theology in Judson University, Judsonia, during 1881–'82.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The Arkansas Deaf-Mute Institute, Little Rock, is for the free instruction of children too deaf to be taught in the common schools. Pupils from 9 to 30 are received and may remain 7 sessions of 9 months each. Substantial improvements had been made in the erection of buildings and the introduction of trades. Printing, shoemaking, agriculture, housekeeping, and dressmaking are now taught, besides the common school branches. Attendance during the last 4 years has varied from 57 to 76. A proper appreciation of educational advantages would, it was believed, bring it up to 150 or 175, for there were on the books of the institute the names of 250 mutes, residents of the State, of proper age to be in school.—(Report of principal in State report.)

EDUCATION OF THE BLIND.

The Arkansas School for the Blind, Little Rock, gives instruction in all the branches of a good English education, besides training in music and in various handicrafts, with the hope of making many of them self-sustaining. The institute is reported as prospering in its work, notwithstanding want of room, limited means, and other drawbacks. During the two years ended September 30, 1882, more new pupils were admitted than ever before for the same length of time, the whole number under instruction reaching 67. The great want was more room.—(Report of superintendent in State report.)

EDUCATIONAL ASSOCIATION.

ARKANSAS STATE TEACHERS' ASSOCIATION.

The annual meeting of the State Teachers' Association was held at Hot Springs, June 20–22, 1882. President C. P. Conrad, in his opening address, touched on the educational progress made recently in the State and spoke of the necessity existing in the South for

aid from the General Government in the maintenance of schools. The second day came a paper on "What ought parents to do for their children?" one on the "Necessity of primary education," and one on "Make the children talk." All gave evidence of serious thought and were discussed at length by members of the association. In the afternoon papers were presented on "A graded course of study for the primary and preparatory schools of Arkansas," on the "Relation of the public schools to higher schools," and on "The Bible's place in our schools." In the evening a letter from Hon. J. L. Denton was read, expressing regret at his inability to be present and occupy his place on the programme, and a paper by H. C. Hammond on "Compulsory education" was discussed at some length. The subjects on the third day were "What are correct habits of study and how can we form them in our pupils?" "The profession of teaching: how can it be made more attractive, remunerative, and prominent?" "Expositions for our schools," "The county examiner: his duties and responsibilities," "Natural sciences," "Elocution," and "Value of teachers' meetings."

Among the resolutions adopted was one that in future each member who reads a paper before the association shall append to it such resolutions as shall call out the action of the body; another made it the duty of the executive committee to represent the public school interests before the legislature of the State and to memorialize Congress in regard to an appropriation in aid of public education in the Southern States; and still another called for the passage of a compulsory education law to secure the attendance of every child between 6 and 14 for at least 4 months of the year. The association also expressed approval of educational exhibitions and appointed a standing committee to make arrangements for them.

OBITUARY RECORD.

J. L. DENTON.

James L. Denton, late State superintendent of public instruction of Arkansas, was born in Johnson County, Arkansas, July 6, 1836. While still young he showed a great fondness for reading and for public speaking. The foundation of his education was laid in the country schools and academies of Washington County. At the age of 18 he taught school in that county and in Benton. Before attaining the age of 20 he was licensed to preach, and soon afterward was admitted to the conference of the Methodist Episcopal Church South, and appointed to the Clarksville circuit. In 1857 he was elected chaplain of the lower house of the State legislature. In 1858 he was stationed at Van Buren, and, in addition to his ministerial duties, assisted in teaching in the Wallace Institute, and continued his studies in the ancient languages at the same time. In 1859, he was stationed at Helena, where he remained until driven out by the Federal forces in 1862. In 1869 Mr. Denton was stationed at Little Rock, but was recalled to Helena in 1870, where he remained in charge of the same congregation for four years, after which he became interested in the insurance business, which he conducted for seven years. He was one of the ablest pulpit orators of the South. His sermons were practical, forcible, and inspiring, and always attracted large audiences.

In the fall of 1878 Mr. Denton was elected State superintendent of public instruction, and entered upon the duties of his office November 2. Besides attending to the details of office work, he delivered stirring addresses on education in the towns and villages, awakening public sentiment on the subject to an unusual degree. He then held a series of normal institutes, which served the double purpose of giving instruction and new energy to teachers and people and of strengthening the school system. He was engaged in this work at the time of his death, October 9, 1882, having been reëlected without opposition in 1880.

It would be but an indifferent comment on the earnest and devoted labors of this superintendent to say that he faithfully discharged the duties of his office. He assumed duties and responsibilities not imposed on him by law and gave all his time and energies to the work of building up the school interests of the State. Active and energetic, he devoted all his powers to the cause of popular education, creating in every part of the State a new interest in it, which was followed by better schools and by a general desire to be in harmony with the progressive spirit of the age.

CHIEF STATE SCHOOL OFFICER.[1]

Hon. W. E. THOMPSON, *State superintendent of public instruction, Little Rock.*
[Term, November 1, 1882, to October 31, 1884.]

[1] On the death of Superintendent Denton (October 9, 1882), Mr. Dunbar H. Pope was appointed to fill the unexpired term, comprising only the remainder of the month.

CALIFORNIA.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth of school age	211,237	216,330	5,093

a Besides nearly $300,000 not immediately available.

(From report of Hon. Frederick M. Campbell, State superintendent of public instruction, for the years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

For the State there are a board of education of three members and a State superintendent of public instruction, who is its secretary; for each county, a superintendent of public schools and a board of education for the examination of teachers, prescribing of text books, &c.; for cities, boards of education, with generally a superintendent of city schools and a city board of examination; for each school district not otherwise provided for, a board of 3 trustees, chosen at first for 1, 2, and 3 years, and subsequently one each year for 3 years. The State and county superintendents hold for 4 years. Women are eligible to school offices.

OTHER FEATURES OF THE SYSTEM.

The State system provides for a free school to be supported in each district at least six months in every year after the first year in which a school has been established. It includes primary and grammar schools and such high schools, evening, normal, and technical schools as may be established, but the entire revenue from the State school fund and the State school tax must be applied exclusively to the support of primary and grammar schools. Local boards and county superintendents of counties which may not have county boards of education adopt text books, to continue in use not less than four years, and also examine teachers for certificates.

Sectarian doctrine may not be taught in the public schools and no public money may be apportioned to any school district, town, or city in which denominational or sectarian doctrine is taught in any of the public schools. Teachers must be eighteen years of age and must have a certificate of qualification before assuming charge of a public school. In cities having graded schools beginners must be taught for the first two years by teachers who have had at least four years' experience, and such teachers rank in point of salary with those of first grade. Instruction must be given in manners and morals, in patriotism and good citizenship. The school day is of six hours; the school month, of twenty days. The public schools are sustained from the proceeds of a State poll tax of $2 on each male inhabitant over 21 and under 60 years of age, except paupers, &c., to be used for paying teachers; a county tax, not to exceed 50 cents on $100; and a district tax, not to exceed 70 cents on $100 for building or 30 cents on $100 for other school purposes.

GENERAL CONDITION.

The report of the State superintendent of public instruction indicates a decided advance in the public schools during 1881–'82, as will be seen from the statistical summary.

Among evidences of progress is the fact that a large majority of the district schoolhouses were supplied with ample accommodations for the pupils, had good ventilation, &c., and were generally surrounded by sufficient grounds. There was a decided improvement in the force of teachers, the number holding first grade county certificates having increased from 1,816 to 2,115. In other points there was a slight decrease: 3 fewer school-houses built, 42 fewer men teaching, and 26 cents less in the average monthly pay of women.

Superintendent Campbell says that, though highly satisfactory, the advance still falls short of the reasonable requirements and expectations of the people who furnish the means for carrying on the work of free public education. After visiting sixty-nine county teachers' institutes and conferring with teachers and hearing them discuss the educational problems of the day, the superintendent of the State says that, taken as a whole, the teachers of California are a body of earnest, thoughtful, educated men and women, doing good and thorough work. He strongly advocates a return to State uniformity in text books and urges that the legislature submit to a vote of the people an amendment to the constitution embodying this change. His only objection to the present system is the great variety of books upon the same subject, imposing heavy expense upon parents who remove from one district to another. The change retards the progress of the children of such families and is a source of embarrassment to teachers taking charge of new schools.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

The school officers of each city are a board of education, a board of examination, and a superintendent of public schools. Each city having over 30,000 inhabitants is allowed a deputy superintendent.

STATISTICS.

Cities.	Population census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Los Angeles	11,183	3,617			43	
Oakland	34,555	8,608	7,262	5,033	136	$156,505
Sacramento	21,420					
San Francisco	233,959	55,880	40,752	30,827	a687	735,475
San José	12,567	3,323	2,422	1,590	40	51,276
Stockton	10,282	2,310	2,187	1,390	b34	38,972

a Including principals, teachers in evening schools, and one teacher of music.
b Includes one special teacher of writing.

ADDITIONAL PARTICULARS.

Los Angeles city schools had, as above shown, 43 teachers, the rapid growth of the city requiring the employment of eight more than in the previous year. Three schoolhouses were built, and, still lacking room, the board rented seven rooms for the city high school and three primary classes. The grades appear to have embraced, as before, 5 primary, 3 grammar, and 4 high school divisions, covering 12 years. A commercial course, apparently of 2 terms, is also offered.

Oakland shows by a return the continuation of its graded system of schools (which embraced primary, grammar, and high) in 16 buildings, with sittings for 6,347 children. Music and drawing still entered into the instruction given, there being special teachers of these branches. The evening school before reported was also continued, with 1 teacher. The estimated enrolment in private and church schools increased 239. For the only further information available, see Secondary Instruction, page 18.

Sacramento, according to the Rules and Regulations of the City Board of Education, includes in its system some ungraded schools, with the usual primary, grammar, and high schools. The last three cover 11 years, 4 each in the primary and grammar grades and 3 in the high. Evening schools are also provided for, to afford the means of an elementary English education to boys and girls that cannot attend the day schools, as well as to adults who may wish to avail themselves of this means of remedying past neglect of training. Beyond this there is no information for the year.

San Francisco, with 765 more census children, shows an increase of 565 in public school pupils; a per cent. of attendance on the average number belonging higher than for two preceding years; an increase of 343 in the average daily attendance in all the public schools; and yet 14,189 children of school age that had not attended school at any time during the year, an increase of 1,216. This number did not include Chinese. In addition to the ordinary English studies, German was taught in two primary schools; French and German, in two grammar schools; and French, in the Boys' High School. Twenty substitute teachers and one teacher of music were employed. One school-house was built, at a cost of $4,449, while four rooms were added to another school. Evening schools were growing in favor and were reported to be the most useful and prosperous schools in the city. There were 3 such schools, with 905 young men and women in attendance, under the instruction of 21 teachers. Classification and promotions occur at the end of each term and as nearly as practicable the same course of study is pursued as in the day schools. The valuation of school property in San Francisco was $3,137,000, including $12,000, value of school libraries. The enrolment in schools other than public was 5,912.

San José shows a decrease in the city population, in children of school age, in enrolment in public schools, in average attendance, and in number of teachers, but a slight increase in the school expenditure was noted. The estimated enrolment in private and parochial schools was 600.

Stockton presents an increase of 106 in children of school age, of 51 in enrolment in public schools, and of 64 in average daily attendance, with the same number of teachers. There was a decrease of $6,622 in school expenditure. There were 246 pupils enrolled in private and parochial schools. Estimated value of school property, $145,137. There were four grades in the primary and two in the grammar schools; the studies of the high school occupy three years, with business, normal, literary, classical, and scientific, besides graduate, courses.

TRAINING OF TEACHERS.

STATE NORMAL SCHOOL.

The attendance on this school, located at San José, had increased about 60 per cent. in the years 1880–'81 and 1881–'82. Out of 216 applicants for admission, 177 succeeded

in entering. The highest number present at one time was 532. The average attendance for the term, exclusive of the training school, was 506, and the average daily attendance 495. A well organized training school is connected with the normal school and in this the pupil teachers find opportunity to apply practically the instruction received in methods of teaching. The legislature appropriated $100,000 to rebuild the normal school building destroyed by fire in 1880. This, with the $50,000 insurance on the former building, was deemed sufficient, and the cost not only came within the appropriation but left a margin of $1,063, which the trustees returned to the State treasury.

A building for a branch State normal school was erected at Los Angeles in 1882. Out of 82 applicants, 64 were admitted; 19 more afterwards entered, making a total of 83. A training school was organized, numbering 145 pupils, divided into three classes, whose teachers were graduates of the San José Normal School.

OTHER NORMAL TRAINING.

The normal department connected with the Girls' High School at San Francisco was established in 1876 and since that time has graduated 374 pupils. By resolution of the board, June, 1882, this department was restricted to one class of 50 pupils; the graduates now receive only second class certificates. Mr. Swett, the principal, strongly urges the erection of a building for the normal school.

Normal classes are formed towards the close of the collegiate course each year in Pierce Christian College, College City, and Hesperian College, Woodland, while the normal class in Pacific Methodist College, Santa Rosa, constitutes a regular department of the institution.

At San Francisco there were in 1881–'82 at least two Kindergarten normal schools, one under Miss Emma Marwedel, the pioneer in Kindergarten training on the Pacific Coast; the other under Mrs. Kate Wiggin, one of her graduates. The former had between 40 and 50 pupils in Kindergarten and primary departments, under 4 instructors, and graduated 15; the latter, not reporting the number of students in 1881–'82, graduated 15, all of whom engaged in teaching. Drawing and vocal music were taught in both schools, and that of Miss Marwedel had a gymnasium and a museum of natural history.

TEACHERS' INSTITUTES.

Superintendent Campbell states that teachers' institutes have been held in most of the counties of the State and have been productive of much good, not only to the teachers, but, through them, to the schools, and have awakened in the community a more lively interest in the public schools and in the cause of education generally. The number of institutes held during the year was 48; number of teachers attending, 3,298.

EDUCATIONAL JOURNAL.

The State board of education in 1877 designated as the official organ of the school department The Pacific School Journal, edited by Mr. Albert Lyser. It has since continued to be an important medium of educational information, not only for California, but for all the Pacific Slope.

The new California Teacher is understood to have been since adopted as the organ of the board.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

The State report shows an enrolment in 1881–'82 of 3,848 in high schools, but does not give the number of such schools.

San Francisco had 2. The one for boys had an enrolment of 327, of whom 34 graduated; while the girls' school had 930 and graduated 170. The total number in both schools, 1,257, was an increase of 82.

The number of pupils in the high school at Oakland was 296 and the graduates 24, 7 men and 17 women. The San José high school graduated 12 young ladies.

Stockton high school, numbering 99 students, at the last exercises graduated 14, 9 young ladies and 5 young men.

The Pacific School Journal shows the existence of a high school in Los Angeles, which graduated a class of 23 in June and was to be transferred to the new normal school building in the autumn.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academic schools, preparatory schools, and preparatory departments of colleges or universities, see Tables IV, VI, VII, and IX of the appendix following, and the summaries thereof in the report of the Commissioner preceding. Besides the separate business colleges, a number of the colleges in Table IX have either commercial departments or arrangements for instruction preparatory to a commercial life.

SUPERIOR INSTRUCTION.

UNIVERSITIES AND COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The University of California, Berkeley, continued its departments of instruction, comprising the college of letters, which includes the customary classical course, while scientific studies were presented in the colleges of agriculture, mechanics, mining, civil engineering, and chemistry. There were in addition a literary course, a course in letters and science, and certain irregular courses, besides professional courses, noticed elsewhere. The general funds of the university are devoted to the colleges of letters and science. The undergraduate colleges of letters, agriculture, mining, mechanics, civil engineering, and chemistry were the only ones included in the original organization in 1868. The professional colleges have since been added. State students receive free tuition. Those from other States are admitted to equal privileges on the payment of a small fee. All courses are open to both sexes without distinction. In both the scientific and literary colleges German, French, and Anglo-Saxon enter into the courses of the freshman and sophomore years. Provision is also made for the optional study of Spanish, Hebrew, Chaldaic, and Syriac. Latin up to 4 books of Cæsar, 6 orations of Cicero, and 6 books of Virgil and Greek up to 4 books of Xenophon and 2 of Homer are required for entering the classical course. The total number of students in 1881–'82 in the college of letters was 142, including 3 graduate students.

The number of other colleges continued to be twelve, California College, at Vacaville, suspended in 1881, not reporting and supposed to be still closed, and the College of Our Lady of Guadalupe returning to the list, but with uncertainty yet as to its collegiate standing. Five of the above colleges were under Roman Catholic influence, 3 under Methodist Episcopal, 2 under Christian, 1 under Protestant Episcopal, and 1 non-sectarian. Nearly all gave courses of fair standard and of four years' duration in their classical departments, with three or four years in the scientific and two or three in the preparatory departments. All gave instruction in music and modern languages.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Opportunity for the higher instruction of women was found in seven of the above named colleges and returns show 3 institutions designed for this sex alone: the Young Ladies' Seminary, at Benicia, with 12 professors and teachers; Mills Seminary, at Mills Seminary P. O., with 16 instructors; and the College of Notre Dame, San José. Music was taught in all these; also, French, German, and Spanish.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The University of California continued its scientific courses of four years each in the colleges of agriculture, mechanics, mining, civil engineering, and chemistry. In addition to these 4-year courses, the colleges of mechanics and mining had graduate courses, where advanced instruction was given in such studies as were necessary for the professional degree.

Upon recommendation of the faculty a diploma from the university entitled the holder to a teacher's certificate. The University of the Pacific gave a 3-year Latin-scientific course.

PROFESSIONAL.

The only distinctively *theological* schools in 1881–'82 were the two that have been reported in preceding years: (1) The Pacific Theological Seminary, Oakland (Congregational), with a 3-year course of study and a preliminary examination of candidates for admission that do not present evidence of sufficient scholastic preparation, and (2) the San Francisco Theological Seminary, San Francisco (Presbyterian), with the same length of course and the same rule as to examination. Some theological instruction was also given at the Franciscan College, Santa Barbara (Roman Catholic), at Pierce Christian College, College City, and at Hesperian College, Woodland (both Christian). In the University of Southern California, Los Angeles (Methodist Episcopal), students preparing for the ministry were offered instruction in Hebrew and in historical and systematic theology.

During the year under review the Pacific Theological Seminary received $56,000 for endowment, Mr. Moses Hopkins, of San Francisco, giving $50,000, and Mrs. Whitin, of Whitinsville, Mass., $5,000 of this amount, while 944 volumes were given the library by the sons of the late Dr. E. Pond, of Bangor, Me. Five students were graduated from the seminary, two more than in any previous year.

For *legal* instruction the Hastings College of the Law, San Francisco (the law school of the University of California), continued in 1881–'82 to require from candidates for its 3-year course of 40 weeks yearly preliminary evidence of literary training sufficient to

warrant their admission. It also required, as before, an examination at the close of the first and second years for an advance to the class of the succeeding year, as well as a final examination for graduation. Moot courts were held for the argument of causes and the discussion of legal questions. Instructors for the year, 4; students, 136.

For study in *medicine*, the medical department of the University of California, San Francisco, provided a 3-year graded course, with 20 weeks in each year (attendance on the preliminary or spring term of 12 weeks not being compulsory), and examinations at the end of the first and second years for promotion and final examination. The course of studies comprises clinical, didactic, and laboratory teaching, with dissections. Cooper Medical College (originally the medical department of the University of the Pacific) also gave a 3-year course of 20 weeks in the regular term each year, with annual examinations as above and a preliminary examination. The California Medical College (eclectic), Oakland, offered and recommended a 3-term graded course of instruction and required for graduation a course covering 2 years of at least 24 weeks each. The Woman's Medical College of the Pacific Coast, opened in 1881, with a course of 20 weeks each year, has thus far sent no further information of itself or of its work.

The dental department of the University of California, San Francisco (organized 1881, opened 1882), required for graduation two full lecture courses of 20 weeks each, a satisfactory final examination, a thesis, and approved cases of operative and mechanical dentistry. There is no preliminary examination till 1883; then it is to be required of all except such as present evidence of graduation from a high school or college.

California College of Pharmacy, San Francisco (a branch of the University of California), requires 4 years of pharmacal service, three and a half of these before graduation, with attendance on two full courses of lectures. Besides examination and additional professional service, there must be a joint recommendation from the faculty and the examining board before a diploma will be conferred.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB AND THE BLIND.

The California Institution for the Deaf and Dumb and the Blind, Berkeley, still continued its useful work. The increase of pupils indicated a healthy growth. The number on the rolls June 30, 1880, was 128, which had increased to 136 June 30, 1882, while 9 more were admitted during the year. The teaching force of the institution consists of the principal, 7 teachers of the deaf and dumb, a teacher of articulation and one of drawing, 2 teachers for the blind, and a teacher of music. The course of study embraces what is usually taught in the common and high schools of the State, and a limited number were prepared for college. Two deaf-mutes were in the university at the date of the report and held good positions in their respective classes. A new school-house was erected during the year, which combined the requisites of light, heat, space, ventilation, and facility of exit.

EDUCATION OF THE CHINESE.

The American Missionary Association reports 15 schools for the education of the Chinese, with a total enrolment of 2,567 pupils, an increase of 935 over the preceding year. At the close of the year there were 31 teachers, 11 of whom were Chinese. Eleven of these schools were sustained during the entire year. The Mission Home at San Francisco, under the auspices of the Women's Foreign Missionary Society (Presbyterian), had in 1882 an enrolment of 39 young women and girls, who were taught housekeeping, cleanliness and order, writing, reading, &c. There had been admitted to the home in the 10 years of its existence 129 women and girls. Two Sunday schools and one evening school were organized under the same influence, the former instructing 150 pupils; the latter, 140, of whom 60 were boys under 17. Another mission school at San Francisco, conducted by the same society, had 125 pupils, of whom 20 to 30 were boys. The Women's Foreign Missionary Society also had classes at Oakland, San José, and other cities. The Mission of the Methodist Episcopal Church, founded in 1868, had schools in San Francisco, San José, Oakland, Sacramento, and Chico. Schools, 5; teachers, 13, with 890 pupils and an average attendance of 188.

EDUCATION OF ORPHANED AND ABANDONED CHILDREN.

There were 21 institutions for the care and maintenance of minor orphans, half orphans, and abandoned children, receiving aid from the State to the amount of $190,486. No child is entitled to aid from this fund who is over 14. The course of study embraced the usual branches, with some instruction in morals and religion. The girls were taught plain and ornamental needlework, &c.

EDUCATIONAL CONVENTION.

STATE ASSOCIATION.

The State Teachers' Association held its sixteenth annual session in San Francisco, December 27–29, 1882, President J. B. McChesney in the chair. The meeting is said to have been one of the most interesting and valuable ever held. There were present nearly 170 members, including a large proportion of the representative educators of the State. President McChesney read an interesting address, devoted to the discussion of the functions of professional organizations like this association. Superintendent J. L. Shearer, of Napa, presented an able paper on "Our school work." Papers were read during the session by Professor Cook, of the State University, on "English in our public schools;" by Mrs. S. B. Cooper, on the question "Shall the Kindergarten be a part of the public school system of the State;" by Ex-Superintendent Mann, on "Arnold of Rugby;" and by Prof. Ira Moore, on "Graded schools." An address on "Physical, intellectual, and moral training" was made by State Superintendent Weleker, and there were also addresses by Governor Stoneman and Superintendent Campbell.

The discussions formed one of the important features of the meeting and general interest was manifested in all the proceedings. The subjects under discussion were "A proper course of study for our schools," "Free text books," "State publication of text books," and "Home and school study." A committee on spelling reform was announced by the president, and was instructed to report at the next annual convention. William White, of San Francisco, was elected president for the ensuing year.

SUPERINTENDENTS' MEETING.

The second Biennial Convention of County School Superintendents of California was held in San Francisco December 27, 1882, State Superintendent Campbell presiding. Albert Lyser, editor of the Pacific School Journal, was chosen secretary. Thirty counties were represented during the entire session. A large amount of work was done and many subjects were discussed; much time was given to the subject "Should the State print its text books and should it furnish them free?" the report of a committee of five on this subject being in the negative.

OBITUARY RECORD.

MRS. MARY ATKINS LYNCH.

Born in Jefferson, Ohio, July 7, 1819, Mary Atkins studied in the public schools and academies of the State. In 1835 she became a teacher in the public schools of New York. Six years later she entered Oberlin College, graduating with distinction four years afterward and becoming assistant principal of the ladies' department of the college; the following year she was principal of the girls' high school at Columbus, and then of the Woodward high school, Cincinnati, remaining till 1854. Called to the head of the Benicia Seminary for Young Ladies, Cal., which had been organized two years before, she infused her vigor and energy into the school, and for eleven years so managed it as to make it the leading seminary for young ladies on the Pacific coast. Disposing of her interest in the school she spent a few years in travel, to restore her impaired health, and then, at the instance of Superintendent Rickoff, resumed work, this time in the Cleveland (Ohio) high school. In 1869 she was married to Mr. John Lynch, of Louisiana, going back in 1877 to the Benicia School, with which she had been so honorably identified. She died September 14, 1882.

CHIEF STATE SCHOOL OFFICER.

Hon. FREDERICK M. CAMPBELL, *State superintendent of public instruction, Sacramento.*

[Term, January 5, 1880, to January 8, 1883.]

This term was one year shorter than the regular time, because of a requirement to that effect in the constitution of 1879, which shortened by so much the terms of all officers chosen at the first election under it, that subsequent elections might come in the years of even numbers.

In November, 1882, William T. Welcker was chosen to succeed Mr. Campbell.

COLORADO.

(From biennial report of Hon. Leonidas S. Cornell, State superintendent of public instruction, for the years mentioned.)

STATE SCHOOL SYSTEM.

OFFICERS.

These are (1) a State board of education; (2) a State superintendent of public instruction; (3) a superintendent of public schools for each county; (4) district boards of 3 or 6 directors, according to population; (5) a committee of 3, with the county superintendent

as president, for any union high school formed by uniting districts to establish one; (6) a board of 6 regents of the State University; and (7) a board of 4 commissioners of public lands. Women are eligible to district offices.— (Constitution and school law.)

OTHER FEATURES OF THE SYSTEM.

The public schools are sustained from the income of a State fund and a county tax of 2 to 5 mills on the dollar. An additional district tax may be levied for school buildings and furniture, and another, not to exceed one-tenth of a mill on the dollar, for the purchase of a school library. The public schools, except the high schools, are to be open at least 3 months in each year for the instruction of youth 6–21 residing in the districts, the district board having power to admit others, if thought best. Instruction must be given in English, though German or Spanish may be taught when demanded by the parents or guardians of 20 or more pupils attending any school. The district board must employ teachers, fix the course of study and the exercises and text books to be used, procure books for indigent children, require all pupils to be furnished with the books prescribed, exclude from school and school library all reading of a sectarian character, and require teachers to conform to the laws. School funds are apportioned according to the youth of school age in each district; and a school to receive its share must have been taught by a duly licensed teacher 60 school days. The constitution forbids sectarian instruction in the State schools, as well as a distinction or classification of pupils by race or color. Teachers must have certificates of qualification, and, besides the ordinary one, the State board issues certificates, good throughout the State, to teachers of two years' experience who are highly qualified. The public schools are organized as graded and ungraded, the graded having high school courses, open to all.— (School law.)

GENERAL CONDITION.

The year ending August, 1882, presents a large increase of school population and corresponding work on the part of State school officers. During two years the school youth had increased 13,642, and in the last year 8,404. To provide schools for these there were organized during the two years 97 new districts, 57 of them in 1881–'82; 78 new school-houses were provided and furnished, affording 9,910 additional sittings and increasing the value of school property $553,081, of which $258,278 were for the last year; 222 more teachers were employed, 99 of them the increase of the last year. Only 2,471 of the school population in 1882 could neither read nor write. The State superintendent speaks of this growing and organizing period as of great importance, though attended with the danger of giving more attention to securing school privileges than to having these of the best quality; still, he reports a steady improvement in the quality of the schools as well as an increase in number. In all the other items the statistics show a corresponding increase. Schools were taught an average of 100 days. The excellent school system of the State is ascribed to the character and intelligence of the people, a large per cent. of whom, from the earliest settlement of the State, have come from the best educational centres of the East.— (State report.)

SCHOOL SYSTEMS IN CITIES OF 7,500 OR MORE INHABITANTS.

OFFICERS.

Denver and Leadville have school boards of 6 directors, elected by the people for 3 years, with annual change of 2, each board appointing a superintendent of schools.— (State report and calendars.)

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Denver (school district No. 1).	35,629	7,300	4,820	3,084	*a*67	$255,586
Leadville	14,820	2,075	2,000	1,700	28	.....

a Number reported last year.

ADDITIONAL PARTICULARS.

Denver reports only the statistics of district No. 1, including five-sixths of the city, there being also one ward west of Cherry Creek and a district beyond the Platte, in each of which there was an independent school authority, making ample provision for public instruction. Enrolment and average attendance were greater in 1881–'82 than in any preceding year.

Hon. J. D. Philbrick, long the superintendent of schools in Boston, Mass., speaks as follows of the Denver schools, which he visited in the spring of 1882:

"In the latter part of April I made a thorough inspection of the school system of Denver, especially the division constituting the first district, which comprises the bulk of the schools. In the first place the school-houses were visited while occupied by the pupils, and their qualities, mechanical, economic, hygienic, and pedagogical, noted in detail. Superintendent Gove then, with documents in hand, went over to me, at great length, the organization and practical management of the system with respect to administration, supervision, instruction, and discipline. Thus instructed I applied myself to the inspection and examination of the classes in the school rooms, beginning with the lowest primary and ending with the graduating class of the high school, in the hands of Mr. Principal Baker. In this survey I observed carefully the methods of teachers, the proficiency of the pupils, and the spirit in which teachers and pupils were working for the ends in view. Finally, I had the privilege of meeting the teachers in a body and conversing with a considerable number of them.

"In the progress of this study of the system I could not but be impressed with the accumulating evidence of its efficiency and excellence. The result may be summed up by saying that I found the Denver school system to be admirable in all respects. Although its origin dates back scarcely more than a decade, its development has been so wisely and energetically conducted that already it fairly belongs to the front rank of city systems. It is pretty safe to say that the creation of a system of schools on so large a scale, of such exceptional merits, and in so brief a space of time, is a phenomenon to which the history of education affords no parallel."

Leadville is as remarkable for its progress in education as for its growth in material prosperity. Its public schools, begun in 1878, are primary, with 2 grades of a year each; intermediate, with 4 grades; grammar, with 3; and a high school of 4 grades. For these there were 4 school buildings, 2 of brick, costing with their furniture $102,000, and 2 of frame, costing $11,000. The buildings contained 22 schools, with 1,500 sittings, and were valued at $150,000. To provide for the rapidly increasing school population 2 of these, 1 of brick and 1 of frame, were erected during the year. Of the school population in 1881–'82, 82 per cent. were in average attendance. There were 26 regular and 2 special teachers (of German and music) employed at an average monthly pay of $92.13; the superintendent received $150. The superintendent thinks the school system of Leadville so complete that it offers in its fourth year as good facilities for public education as any city of its size in the United States.

TRAINING OF TEACHERS.

NORMAL SCHOOLS.

The *University of Colorado*, Boulder, has a definite normal course of 3 years. Applicants for admission to it must be at least 16 years of age, must declare their intention to become teachers, and must pass a satisfactory preliminary examination in elementary English studies. There were 17 normal students in 1881–'82. Three completed the normal course, 2 of whom were teaching.

Colorado College, Colorado Springs, had, at the last advices, a normal course of 4 years, requiring for admittance a satisfactory knowledge of the elementary English branches. It sends no report for 1881–'82.

The *University of Denver* provides a special course of studies for those who wish to prepare for teaching in the public schools.

Denver City has also a normal and training class, with examinations, for such as desire to teach in the city schools.

TEACHERS' INSTITUTES.

No information has reached this Bureau regarding teachers' institutes held during 1881–'82, and probably there were none, owing to the reason mentioned in the Bureau report of 1880–'81, viz, the great extent of territory in each county, and the consequent difficulty of gathering at any central point a sufficient number of teachers to make an institute successful.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

Denver and Leadville in 1880–'81 were reported to have fair high school studies, the former having 3 courses, each of 4 years. The course at Leadville was also of 4 years.

OTHER SECONDARY SCHOOLS.

According to the information at hand, there appear to be 4 church schools of academic rank, 2 of them, Jarvis Hall, for boys, and Wolfe Hall, for girls (Protestant Episcopal),

at Denver: 1, St. Mary's Convent Academy, for girls (Roman Catholic), also at Denver and Trinidad Academy (Congregational), the last believed to be open to both sexes. Five other Roman Catholic schools in different parts of the State are reported as academies in Sadlier's Roman Catholic Directory, but without such statement of courses as to indicate academic rank.—(Year books and Report for 1881.)

For statistics of business colleges, private or church academic schools, preparatory schools, and preparatory departments of colleges, see Tables IV, VI, VII, IX, and X of the appendix; for summaries of their statistics, see corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN AND FOR BOTH SEXES.

The *University of Colorado*, Boulder, is a part of the public school system of the State and is governed by a board of regents elected by the people. It aims to complete the work begun in the public schools by affording facilities for education in literature, science, and the arts. It has full preparatory courses of 3 years, leading to classical, scientific, and Latin-scientific courses of 4 years each, with special courses for students not candidates for graduation. The normal course has been already mentioned. Males and females are admitted on equal terms.

At the close of 1881–'82 there were, in all departments, 113 students: 72 in preparatory classes, 18 in collegiate, 17 in normal, and 6 special students; 19 completed the preparatory, and 6 who completed the full classical course were graduated in June, 1882.—(Calendar and State report.)

Colorado College, Colorado Springs (non-sectarian), has a preparatory, a classical collegiate, and a normal course, each of 4 years, and one of undefined length in mining and metallurgy. French and German are elective studies in the freshman and sophomore years, and Spanish in the junior year. There are also special lines of studies for such as cannot pursue full courses. Both sexes are admitted to all the courses. Two wings were added to the college building; the property of the college was valued at $75,000. The metallurgical department was in operation and scientific work was made more efficient by the addition of suitable rooms and apparatus.

The college held its first commencement in June, 1882, when two young men graduated and President Tenney was formally inaugurated.

The *University of Denver* (Methodist Episcopal) had, in 1881–'82, preparatory, classical collegiate, scientific, music, and mining engineering courses, each of 4 years, a medical course meant to cover 3 years, and normal and art courses not fully defined. There is also provision for commercial instruction when desired by 5 students. Instruction is given in French, Italian, German, and Spanish. Both sexes are admitted.—(Calendar.)

For statistics of 1881–'82, see Table IX of the appendix; for a summary of such statistics, a corresponding table in the report of the Commissioner preceding.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Up to 1881–'82 no institution of full collegiate rank exclusively for females had been established, but the 3 above mentioned colleges admitted them on equal terms with males.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The University of Colorado, Boulder, provides a scientific course. The well arranged courses of the University of Denver lead to the degrees of bachelor of science and mining engineer, while Colorado College limits its scientific instruction to mining and metallurgy. The State School of Mines, Golden, near Denver, works in the same direction through courses which in the first two years deal with the general elements of science and in the next two prepare especially for mining engineering, civil engineering, and metallurgy. The Colorado Agricultural College, Fort Collins, beginning also with general elements, branched from these in 1882, as previously, into studies relating to scientific agriculture: horticulture, botany, zoölogy, geology, and chemistry. A part of its teaching is also directed to preparation for practical mechanics, including the use of tools and materials, with the principles underlying the various trades. All these institutions, except the State School of Mines, offer instruction preparatory to the collegiate scientific courses presented.

For statistics of these schools, see Tables IX and X of the appendix; for summaries of their statistics, see corresponding tables in the report of the Commissioner preceding.

PROFESSIONAL.

Theological instruction was given in 1881 by the Protestant Episcopalians in the Cathedral Theological School, in Denver, by 4 instructors, but apparently to only 4 students. The required course is 3 years.—(Protestant Episcopal Almanac.)

There was also some ecclesiastical instruction given under the auspices of the Roman Catholic Church, as 12 ecclesiastical students were reported in 1881–'82.—(Catholic Year Book.)

Medical.—The only medical course reported in 1881–'82 was offered by the College of Medicine of the University of Denver, with a faculty of 17 professors and instructors. This college followed in its instruction the graded course recommended by the American Medical Association, although the completion of that course, which embraced 3 annual lecture terms of 20 weeks each, had not yet been made obligatory. Applicants for admission must pass an examination in the ordinary high school studies or give other evidence of fitness. The conditions of graduation were 3 years of study, attendance on two courses of 20 weeks, instruction in practical anatomy and chemistry during two sessions, the presentation of a medical thesis, and the passage of an examination before the faculty on the seven principal branches of medical science.—(Calendar.)

SPECIAL INSTRUCTION.

EDUCATION OF MUTES AND THE BLIND.

The Colorado Mute and Blind Institute, Colorado Springs, is a State institution, founded in 1874, with a course intended to cover 7 years. The State report discloses the presence of no blind pupils, and as to mutes only states that during the year there had been 49 in attendance, under 3 teachers; that in the domestic department some of both sexes were employed in the printing office; and that some girls were taught fancy work, dressmaking, and general housekeeping.—(State report.)

INSTRUCTION IN ART.

The University of Denver, in its College of Music and Art, presents a course of 4 years in music; also, one in painting, the length of which depends on the ability and diligence of the student.

In 1881–'82 there were in the former 49 students, under 2 instructors, and in the latter 17, under 1 instructor. Both courses appear to be thorough.—(Calendar.)

REFORMATORY AND INDUSTRIAL TRAINING.

The Colorado State Industrial School, Golden, incorporated February, 1881, was opened in July, 1881. During the year additions were made to the buildings, and the grounds were graded and improved, mainly through the work of the boys. Beginning with 3 boys, July 11, 1881, in November, 1882, there were 80 enrolled, most of them under 15 years of age. Of those received, 48 were committed for incorrigibility; 53 had been habitually idle and only 9 regularly employed. The board of control reported the school under thorough discipline, with energy and good management manifest in every department. It is made a principal object to teach trades involving the use of tools. Within two years, it is thought, the school will be required to care for 250 boys and 60 girls.—(State report.)

EDUCATIONAL CONVENTIONS.

COLORADO STATE TEACHERS' ASSOCIATION.

This body held its eighth annual meeting at Pueblo, opening Wednesday, December 27, 1882. For the first time in the history of the association the entire State was represented, delegates appearing from every educational institution, including the colleges and universities. On Thursday the president, James S. McClung, of Pueblo, addressed the convention, and this address, as well as each paper read, was followed by a general discussion. One read by Prof. Copeland, touching the work of teachers in the formation of character, led to much debate. Superintendent Gove held that there is no character worth having but Christian character, and earnestly objected to the least shadow of an inference that the schools of this country are not forming good character, saying that a purer, better, truer, and more noble body than our public school teachers does not exist. In the evening Prof. Paul Hanus, of the State University, gave a lecture on "Growth" to a large audience. After the election of officers, the association adjourned.—(Journal of Education.)

EDUCATIONAL CONVENTION.

At the call of the State superintendent a convention was held at Denver, June 17, 1882, to consider the need of a uniform course of study in the State public schools. The leading

educators of the State were present. Committees were appointed to report courses for the different grades of schools. The following resolutions were adopted: (1) That in all towns of sufficient size we deem it important that a 3-year high school course be established as soon as possible if not already in existence; (2) that so far as practicable the course of study in the high schools of the State should meet the requirements for admission to the State University; (3) that we recognize the necessity of encouraging a uniform course in both the graded and ungraded schools of the State. The superintendent was instructed to have full reports of the committees printed in his report to the governor, giving the courses of study for each grade.—(State report.)

CHIEF STATE SCHOOL OFFICER.

Hon. LEONIDAS S. CORNELL, *State superintendent of public instruction, Denver.*

[Term, January 13, 1881, to January 9, 1883, then to be succeeded by Hon. Joseph C. Shattuck, former State superintendent, for a term reaching to January, 1885.]

CONNECTICUT.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth of school age (4–16)	143,745	146,188	2,443	
Total enrolled in public schools	119,381	121,185	1,804	
Per cent. of enrolment to school population.	83.05	82.90		0.15
Average attendance in winter	76,028	77,041	1,013	
Average attendance in summer	69,050	69,836	786	
Attending other than public schools	12,475	12,899	424	
Attending schools of all kinds	131,856	134,084	2,228	
Per cent. in schools of all kinds	91.73	91.72		0.01
SCHOOLS.				
Number of school districts	1,471	1,447		24
Public schools	1,634	1,628		6
Number of these graded	314	313		1
Departments in public schools	2,627	2,649		22
Departments in graded schools	1,314	1,340	26	
School-houses built	16	17	1	
School-houses in poor condition	208	217	9	
In good or fair condition	1,446	1,416		30
Average public school term in days	179.98	179.66		0.32
TEACHERS.				
Men teaching in winter	680	617		63
Women teaching in winter	2,120	2,213	93	
Men teaching in summer	349	316		33
Women teaching in summer	2,432	2,503	71	
Continued in the same school	2,144	2,183	39	
Teaching for the first time	454	470	16	
Average monthly pay of men	$60 69	$63 44	$2 75

Receipts for public schools	$1,482,024	$1,563,750	$81,726	
Expenditure for public schools	1,476,691	1,553,065	76,374	
PUBLIC SCHOOL FUND.				
Amount of State school fund	$2,021,346	$1,997,549		$23,797

(From reports and returns of Hon. B. G. Northrop, secretary of State board of education.)

STATE SCHOOL SYSTEM.

OFFICERS.

A State board of education of six members has general charge of the school system. For current work it appoints a secretary to serve during its pleasure as general superintendent, and also an agent to enjoin the observance of laws respecting the employment of children. Towns choose boards of school visitors of 3 to 9 members, except where any have abolished their petty districts and been reconstructed as town districts; then they have school committees of 6, 9, or 12 members. Districts that continue to be only parts of towns have such committees of 3 members, save where they succeed former school societies; then they choose boards of education of 6 or 9 members. All these town and district school officers are liable to partial annual change.

OTHER FEATURES OF THE SYSTEM.

Public schools must be taught for at least 30 weeks each year in every school district in which the school population numbers 24 or more, and for at least 24 weeks in other places. All children 8 to 14, unless disqualified, must attend some school at least 3 months each year or be taught at home for an equal length of time, and such children may not be employed in any business unless they have been taught at least 60 days in the year preceding. School funds come from local taxation, the income of a State school fund and of town or district funds, and from a State appropriation of $1.50 for each child between 4 and 16, which ages are the basis of apportionment of all public school moneys. No district may receive its share unless schools have been taught therein the required length of time, nor unless an annual report has been made to the town board and satisfactory school accommodations are furnished. Towns neglecting to provide for support of schools forfeit to the State a sum equal to the amount which they were required by law to appropriate. Teachers must hold a certificate of qualification from the school authorities and must keep a register and report to school visitors, who, in turn, are required to report annually to the State board. The system comprises public school libraries, graded and high schools, a normal school, a reform school, and an industrial school for girls. Text books are furnished free of cost to pupils unable to pay for them.

AMENDMENTS TO THE SCHOOL LAW.

Among additions to the school law passed during the legislative session of 1882 are noted the following: Any town or school district failing to make the required annual returns of statistics by October 15 shall forfeit of the $1.50 State money for each census child 1 per cent. for the first week of such delay, 2 per cent. for 2 weeks, and 5 per cent. for four weeks, after which the loss is to be 10 per cent. The compulsory education law was modified by reducing the penalty for employing a child illegally from $100 to $60 and by making each week's failure on the part of parents to send their children to school a distinct offence punishable by a fine not exceeding $5. It was also made the duty of parents or others having control of children under 14 to furnish the employer of such children certificates from teacher, school visitor, or committee showing that the law as to attendance has been complied with; and it was also made the duty of employers to keep such certificates at their place of business and exhibit them to the proper officers on demand. Parents making false statements or causing children to make them, with intent to evade the law, are to be fined not more than $7 or imprisoned not more than 30 days. Members of district committees and janitors of school buildings were made eligible to appointment as special constables to arrest for truancy and certain other offences. School visitors are authorized, on petition of 12 adults, to order that instruction be given in the public schools concerning the effects of intoxicating beverages on individuals and the community. If any persons feel aggrieved by such action, on petition of 20 legal voters the question must be submitted to the next annual town meeting, which has power to decide it for one year.

GENERAL CONDITION.

The statistics show that with 2,443 more children of school age 1,804 more were enrolled in public schools; that there was a larger average attendance both in winter and summer, a small increase in the average monthly pay of teachers, and $76,374 (or about 5 per cent.) more expended for public schools, almost two-fifths of this being for teachers' wages. The sum raised by town and district taxes was 8 per cent. larger than the previous year and the receipts from all sources were $81,726 more, although a decline in the rate of interest on investments (with the increased enumeration) considerably diminished the amount per pupil received from the school fund. The secretary of the board of education considers that the increase in attendance about kept pace with that of school population, the number of school age reported as attending no school being slightly less than it was the previous year, although in regard to the latter he says there is always some uncertainty, for two reasons: first, reports from private schools are more or less imperfect, school officers having no authority to require them; second, the enumeration of school population is made on the 1st of January, while the reports of attendance cover the year ending with August. That so large a proportion of the children between 8 and 14 attended some school during at least a portion of the year is ascribed to the influence of the compulsory law and to the efforts of the secretary and agent in securing its enforcement. Of the teachers employed 470 were beginners, about the average number reported for each of the past five years. Only a small fraction of these, it is supposed, prepare themselves for teaching by study, observation, or apprenticeship. The result is that many schools are poorly taught, particularly small ones in the rural districts, although the evil was not confined to these. The remedy pointed out is in a public opinion that shall demand a special preparation for teaching corresponding to that required in other employments, which, it is believed, would very soon create a supply of competent teachers.

The compulsory education law continued to work well and to be approved by the people. Of the 26,100 youth of school age reported in no school, only 2,858, or less than 11 per cent., belonged to the period of required attendance (8 to 14), a proportion largely ascribed to the systematic efforts made to diminish absenteeism and to the labors of Mr. Potter, agent of the board. This officer reports that he found less neglect and carelessness of the right of children to an education than in any former year since his employment: that parents were more mindful of their duty and that employers generally demanded the certificates which the law requires. The Willimantic Linen Company posted notices that after July 4, 1883, ability to read and write would be a condition of employment in their service. The managers adopted this rule purely on business principles, believing that ignorant labor is expensive and that the amount and quality of work, as a rule, are proportionate to the intelligence of the laborers. The compulsory law was amended by the general assembly of 1882 and much improved; the penalty for its violation is made less severe, but its provisions are more easily executed and more effective. During the year 8 parents were prosecuted and fined for not sending their children to school, and one person for persistently employing children who had not attended. A father who defied the law, and could not pay the fine nor furnish bonds, was sent to jail, where he remained three weeks, the first case that has occurred in the State of the imprisonment of a parent for not sending his child to school. This case had the desired effect, breaking up a kind of conspiracy to resist the law. No prosecutions are ever made until personal efforts to secure compliance by persuasion and admonition have failed.

During the year the public schools lost the services of Secretary Northrop, who in October resigned the position he had held for 16 years of chief executive of the board of education. The State board ascribes the great advancement in school interests during this period largely to his influence. In 1868 Connecticut was the only State in New England which had not established free schools by law. The proposition to make them free met with strong opposition and was carried only by the persistent efforts of men who were ready to sacrifice popularity for the public good. To Hon. James E. English, then governor of the State, and to Secretary Northrop, more than to any other two men, belongs the honor of securing the passage of the free school law of 1868. The reëstablishment of the State Normal School, suspended in 1867, was another important measure secured through the secretary's influence, and many others followed. Among the results of his labors may be mentioned an increased attendance on teachers' institutes, improvement in school-houses and villages by the planting of trees, a repression of the sale of injurious reading and a dissemination of information regarding good books, the enactment of a compulsory law through which public school attendance was enforced, and other provisions for the care of neglected children and the repression of truancy.

KINDERGÄRTEN.

The 5 Kindergärten noted in Table V in the report for 1881 as existing at Bridgeport, Hartford, New Britain, New Milford, and Stamford appear to have been continued, one at New Haven being added in 1882.

SCHOOL SYSTEMS IN CITIES OF 7,500 OR MORE INHABITANTS.

OFFICERS.

These are boards of school visitors in some cases; in others, boards of education, and usually city school superintendents.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Bridgeport	29,148	7,587	5,482	3,608	91	$87,336

ADDITIONAL PARTICULARS.

The *Bridgeport* report shows a prosperous educational condition on the whole; enrolment and average attendance increased, as well as the number of youth of school age; but the percentage of attendance fell off slightly, tardiness increased nearly 6 per cent., and truancy did not diminish. The training school for teachers, a department of the public high school, sent out 11 teachers, all of whom received appointments in the various schools. Attendance on the evening drawing school was larger than during any previous winter, reaching 137, of whom almost all were mechanics and 80 beginners. The oldest student was 40, the youngest 16.

Greenwich reports an increase of interest in the public schools and a slight advance of average daily attendance, although only about two-fifths of the youth of school age, or 54 per cent. of the number enrolled, were in average attendance. In respect to attendance Greenwich ranks among the lowest 20 towns in the State. The reason given for non-attendance is not, as in many other towns, the employment of children in mills, but a lack of general interest in the schools.

In *Hartford*, the school work is said to have been systematic and thorough. No material changes were made in the system of instruction or the list of teachers. The only material drawback to an otherwise successful year was the loss by fire of the high school building, in January, 1882. Measures were immediately taken for the erection of a new one, which at date of the report was well under way. It is to be fire-proof, of two stories only, 236 by 95 feet, to cost, with furniture, $230,000, and will be one of the best structures of its kind in the country. The work of the high school for the year was especially satisfactory, considering the disadvantages under which all had to labor in the loss of the building. The evening schools were as successful as usual, but the question is being considered whether it would not be better to make 14 the minimum age for admission, instead of 12.

The *Meriden* school officers and teachers found truancy the most perplexing problem with which they had to deal, the chief cause of it being the carelessness of parents on the subject. More thorough work than ever before was done in the inspection of factories with reference to the employment of children under 14, and most of the employers showed a readiness to obey the law. The high school, established in 1881, was eminently satisfactory during its first year. Among other results of its influence was the arrangement of a course of study for the lower schools. These are now classed as primary, intermediate, and grammar, the whole course up to the high school comprising 9 years.

The *Middletown* report shows an advance in public school enrolment and average attendance, truancy decreasing from 143 cases in 1881 to only 50; also, a decided improvement in discipline and in the moral tone of the schools, the latter ascribed to the discontinuance of corporal punishment.

In the school affairs of *New Haven* the most important event of the year was the resignation, on December 31, 1881, of Mr. Ariel Parish, who had filled the office of school superintendent with great ability for more than 16 years. During that period public school attendance much more than doubled and the ratio of attendance to the enumeration increased by about 30 per cent., an advance much assisted by his conscientious and thorough management. Since the last report a portion of East Haven was, by act of the legislature, united to the city school district and placed under the care of the school board, thus increasing the need of school accommodations. Good health and good attendance helped to make the year a prosperous one in the schools. During the latter half of it a successful effort was made to have the "new methods" in primary teaching more universally understood and adopted. The evening schools were taught for 5 months and accomplished in many instances great good, the number enrolled being 575; average attendance, 150. An additional special school for neglected children was opened, 194 being transferred to such schools and 46 promoted from them to their own. Truants to the number of 417 were arrested and taken to school, and 14 boys were sent to the State Reform School. There were 3,018 visits made to families with reference to non-attendance, and 150 children were reported not in any school.

The schools of *Norwich* prospered, on the whole, with no marked changes in the management or methods of instruction. Irregular attendance continued to be the greatest evil experienced, and this increased during the year without the unusual sickness which excused it the year before. The only adequate remedy is thought to be the arrest of truants by civil authority and their return to school. In discipline an effort was made to develop the capacity for self government. The result was very general good order, only a few cases of insubordination calling for more severe treatment. Teachers' monthly meetings were well attended. An evening school, taught 14 weeks, accomplished a good work for the few who continued until the close of the term.

TRAINING OF TEACHERS.

STATE NORMAL SCHOOL, NEW BRITAIN.

About 175 pupils were connected with the school during the year and 39 were graduated. Nearly all the latter engaged in teaching, and the principal received calls for more teachers than he was able to supply. Little change took place during the year in the teaching force or in methods of discipline and instruction. The course covers 2 years. Applicants for admission must pass a satisfactory examination in the common English branches; they must also be at least 16 years old and of good moral character. Tuition is free to persons preparing to teach in the schools of Connecticut; the use of text books, too, is without charge.

NORMAL DEPARTMENTS.

Provision is made for the training of teachers in classes or departments of the public high schools in some of the larger cities, especially at Bridgeport and New Haven.

TEACHERS' INSTITUTES.

Nine institutes were held during the year, each for a single day or for two evenings and a day. The attendance and interest were such as to encourage these short sessions. Time enough is given in them for many practical hints as to mistakes to be avoided and the best methods to be adopted. Efforts were made to adapt the instruction to the needs of beginners without normal school training by giving special attention to the every day work of the school room.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

All towns in this State are authorized but none are required to establish public high schools; if established, they receive nothing from the State. Statistics of those in operation do not appear in the report for 1881–'82, but that for the previous year gave a list of 51 having claims to be considered such.

The high school in Hartford enrolled 345 students in its classical and 89 in its English department. There were also 6 engaged in graduate studies. Of the 72 graduates 45 were girls.

The New Haven high school had 597 pupils registered and 350 in average daily attendance, with 14 teachers; 58 graduates during the year (37 of them girls); a classical department, which prepared for the academical department of college; and an English department, which prepared for scientific study, for commercial and general business, and for teaching. There is also a special class intended particularly for those whose health is imperfect. Its members are required to be present only at recitation; they may, if they choose, take a single study at a time and eventually graduate with the same honors as the others, if as well prepared.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academies, and preparatory schools reporting, see Tables IV, VI, and VII of the appendix, and summaries in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

Yale College, New Haven, as heretofore, provides departments of theology, law, and medicine and one of philosophy and the arts, the last including graduate and undergraduate academical and scientific departments and a school of the fine arts, each with a distinct organization. During the year there was a total attendance in all departments of 1,096 students against 1,041 in 1881. In the academical department there was an increase of students and officers, although the number had been larger the previous year than ever before. The proportion of students who were non-residents of the State continued to increase. From the required examinations for the admission of students to this department, the subjects of geography and English grammar were omitted. Entrance examinations may hereafter be held at Andover, Mass. Provision has been made by which students of the academical department may hereafter receive such instruction in the general principles of jurisprudence, as well as in constitutional and international law, as all ought to obtain before receiving the degree of bachelor of arts. Plans for the projected physical laboratory, for which funds were given in 1881, had been nearly matured; the legacy of $10,000 left in 1881 by the late Lucius Hotchkiss,

for the aid of needy students, had been paid into the treasury, and a gift of $10,000 was received in 1882 from Hon. Elias W. Leavenworth, of the class of 1824.

The school of the fine arts, the only department of the college open to both sexes, has in view the cultivation and promotion of the arts of design, viz, painting, sculpture, and architecture, through practice and criticism. The exhibition of the year's work contained 516 studies, including drawings from the antique and from the nude living model, portrait studies, anatomical and perspective drawings, architectural designs, pen and pencil sketches, copper plate etchings, compositions and studies in oil and water colors.

During the year the college library was increased by 4,400 volumes and 20,000 pamphlets; the Peabody Museum received important additions; and gifts to the observatory came from various friends, amounting to $4,420, besides funds for the purchase of an equatorial telescope from one who withheld his name.

Trinity College, Hartford, reports 84 students in 1881–'82, a decrease for the year, and 17 degrees of B. A. and 10 of M. A. conferred, besides 2 honorary of M. A. Gifts were received from Col. C. H. Northam, of Hartford, amounting to $155,000, of which $50,000 were for the endowment of a professorship, $30,000 for a new building, and $75,000 for the general fund.

Wesleyan University, Middletown, the only one of the 3 colleges of this State which offers equal privileges to both sexes, continued to provide 3 regular collegiate courses of 4 years each, classical, scientific, and Latin-scientific. Of 170 students reported in regular undergraduate classes during the year, 14 were young women. One of the 6 graduate students and 3 out of 8 special students were also women.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

For statistics of institutions of this class, see Table VIII of the appendix, and the summary of it in the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The Sheffield Scientific School of Yale College, besides making ample provision for graduate study in the higher scientific branches, presents a number of undergraduate courses, extending over 3 years and comprising instruction in chemistry, civil and mechanical engineering, agriculture, natural history, biology (preparatory to medical studies), and studies preparatory to mining and metallurgy and to other higher studies. These courses all lead to the degree of PH. B., but the degrees of doctor of philosophy and civil and dynamic engineer are only obtained after at least two years of graduate study.

The progress of the school during 1882 was eminently satisfactory. A constantly increasing number of students were taking the course of instruction in biology, with a view to future medical study. The number in chemistry so increased that accommodations for all could not be furnished, and it was found necessary to give notice to the agricultural experiment station of Connecticut that the rooms occupied by it in Sheffield Hall must be vacated. These, when fitted up for laboratory work, will, it is hoped, furnish sufficient space for a few years to come.

PROFESSIONAL.

The schools for *theological* instruction in this State, as reported, are the Theological Seminary of Yale College (Congregational), Berkeley Divinity School, Hartford (Protestant Episcopal), and the Theological Institute of Connecticut, Hartford (Congregational). All have courses of study covering three years and demand a collegiate or equivalent preparation for admission, while the Seminary at Yale and the Institute at Hartford also make provision for graduate study. Of 97 students attending the Seminary at Yale, 7 were pursuing advanced studies in a graduate class, the work of which was carried forward with success even beyond that of the previous year. The new library building, completed in September, 1881, was made a memorial of Dr. Leonard Bacon, in whose death the department sustained a great loss. The Theological Institute also reports a new building, Hosmer Hall, recently erected at a cost of about $100,000, a gift of the late James B. Hosmer.

Legal instruction was given in the law department of Yale College to 73 students, including 5 of the senior class of the previous year in a graduate course, which, like the undergraduate course, extends over two years. Applicants for admission to the department must be at least 18 years old, of good moral character, and, if not college graduates, must pass an examination in history of England and of the United States and in the Constitution of the United States, unless they have already passed the examination for law students prescribed by the Board of Regents of the University of New York. The condition of the department is reported as satisfactory, having been advancing since its

reorganization in 1869. Prior to that period it graduated 194 persons in 27 years, and during the 12 subsequent years 248 were graduated and 21 degrees in a graduate course were granted.

In the *medical* school of Yale College attendance has decreased since the standard was raised in 1879. Since then an examination has been required for admission and the time of attendance has included the entire academic year. Notwithstanding this decrease, the wisdom of the change is not doubted. Other causes besides this elevation of the standard tended to lessen the attendance, among them an increase in the cost of attendance. This was again reduced in 1882 to an extent which it is hoped will result in bringing in a larger number of students. During the 3 years since the new plan of instruction was adopted there has been a steady increase in the number of hours given to instruction by the faculty, amounting in 1881–'82 to a gain of 144, not including the time spent in dissections and autopsies.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The *American Asylum for the Education of the Deaf and Dumb*, Hartford, gave instruction during the year to 219 students, of whom only 62 were from Connecticut, the others being from Maine, New Hampshire, Vermont, Massachusetts, and Rhode Island. The greatest number of students present at any one time was 183; average attendance, 180. No change has been made in the method of instruction already reported, which includes the manual alphabet, writing, articulation, and signs, the common school branches being taught, besides tailoring, shoemaking, and cabinet making to the boys. Although there was an unusual number of beginners in the shops, a gratifying interest was shown and very creditable work turned out.

Whipple Home School for Deaf-Mutes, near the village of Mystic River, is a family school, owned and conducted by Jonathan Whipple, its founder. The system of instruction is by articulation and lip reading; the methods employed are Whipple's natural alphabet, oral speech, and natural signs. As the pupil improves in speaking, the signs are discarded and speech becomes the medium of communication. Eleven pupils were under instruction during the year in the common English branches; also, in farming and gardening for boys and housework and sewing for girls.—(Circular and return.)

EDUCATION OF THE BLIND.

Connecticut has no institution for the blind, but provides for their instruction in the schools of other States.

STATE REFORM SCHOOL, MERIDEN.

This school reports a great improvement made during the last four years. Although the number of pupils has increased during this time from 240 to 380, better influences have so far prevailed that for more than three years no boy has been sent to the lockup or subjected to any of the severe forms of punishment formerly in vogue, and corporal punishment is seldom inflicted. It has been clearly demonstrated that the law of kindness has a greater power for good than any coercive restraints. The boys have shown their appreciation of the new system by a uniform regard for all the requirements of the school, quiet, respectful behavior, and willingness to do as required.

CONNECTICUT INDUSTRIAL SCHOOL FOR GIRLS, MIDDLETOWN.

This school, a private charity with State aid, receives girls from 8 to 16 years of age, bestowing on them like care to that given boys in the State Reform School. The conditions of commitment are truancy, vagrancy, and manifest danger of falling into vice. The common English branches are taught, including history and vocal music, also general housework, paper-box making, flower gardening, dressmaking, and fancy work. After leaving the institution a correspondence is kept up with former pupils, who are also visited by an agent. About 66 per cent. of those discharged are known to have become orderly and useful members of society. There were 181 under instruction during 1881–'82, of whom 21 were colored and 12 foreign-born.—(Return.)

TRAINING FOR NURSES.

Two training schools for nurses report from this State, one at New Haven, organized in 1873, and the other in Hartford, organized in 1877, the former having had 23 under instruction during 1881–'82; the latter, 16. Since 1873 the school at New Haven has given instruction to 200 pupils and has graduated 70. The school at Hartford has had 81 on trial, of whom 39 were discharged at the end of the trial month, or before completing the course, and 26 were graduated. The course of study in both extends over 18 months.—(Returns.)

EDUCATIONAL CONVENTIONS.

CONNECTICUT STATE TEACHERS' ASSOCIATION.

The thirty-sixth annual meeting of the State Teachers' Association was held at New Haven, October 26–28, 1882. After singing by a chorus of 128 members from the high school, showing superior musical training, President Warren delivered an inaugural address, after which a message was read from Mr. Ariel Parish, temporarily residing in Colorado. The address of the evening, by W. T. Harris, LL. D., of Concord, Mass., was on the theme "Do the public schools educate children beyond the position which they must occupy in life?" The speaker said, among other things, that we should consider what education ought to be as a whole; that in this country people make the laws as well as obey them, and that, therefore, education should not be wholly one of business. He opposed the idea that the common laborer ought to be contented with the lot in which he is placed by the accident of birth and said that no contented race has ever accomplished anything for which mankind are the better, that our civilization rewards the workman who is looking beyond the machine he is using to a better one that he has conceived in his mind, and that invention keeps pace with educated intelligence. The first exercise of the following day was on the Grube method of teaching numbers. Following the discussion on this was an illustration by a class, dressed in costume, of a method of calisthenics taught in the schools of Milwaukee, Wis. "The relation of the public library to the public school" was considered in a paper by H. F. Bassett, of Waterbury, and, after a discussion as to the character of reading matter which should be provided, it was resolved that a committee be appointed by the chair to consider the subject and report at the next meeting. Exercises were given in map drawing, in teaching language in the lower classes, and in giving first lessons in script. A paper was read by Charles G. Leland, of Philadelphia, on the question "Should hand work constitute a part of all education?" He claimed that the elements of hand work should be taught in the public schools, but not special technical instruction; certain arts, but not trades; that simple outlines of decorative art require but little time and may be properly introduced, one lesson a week being given. Mr. L. H. Marvel, of Boston, presented some pertinent facts, growing out of his experience in the supervision of a manual training school at Gloucester, Mass. A spirited discussion followed, participated in by Messrs. Beech of Windsor, Sheldon of Boston, Kellogg of New York, and others. An address by Rev. Newman Smyth, D. D., of New Haven, on "The art of thinking," called out a large audience in the evening. The opening paper of the third day, by E. Sawyer, A. M., was entitled "Less hours per day, more days in the year," advocating shorter vacations and longer school terms, embracing 45 or 48 weeks, with only three hours a day for study. A paper by T. I. Briggs, of Waterbury, on "The examination of teachers by the State," advocated the enactment of a bill before the legislature concerning a State board of examiners. After the adoption of resolutions and the election of officers for the ensuing year, the association adjourned.—(Journal of Education and State report.)

CONNECTICUT COUNCIL OF EDUCATION.

The State Council of Education met at Hartford, June 17, 1882, I. N. Carleton in the chair. The principal business before it was a consideration of the report of a committee appointed at the annual meeting to present the merits of the bill to secure the appointment of a State board of examiners to the State legislature. From the committee's report it appeared that the bill failed in consequence of the opposition of a few men from some of the large cities in the State, who feared that the measure might interfere with the operation of their city boards of education, although they acknowledged that it must do good in the sparsely settled districts for whose benefit it was especially intended. It was decided by the council that the bill, being in the line of true progress, must not be abandoned, and a new committee was appointed to bring the subject before the next legislature.—(Journal of Education.)

The sixth semiannual meeting was held December 29. A paper was read by Mr. M. S. Crosby, reviewing Dr. W. T. Harris on "The church, the state, and the school." Other papers, on the improvement of the present system of school supervision, on the conditions of growth in teaching power, and on the question whether there are too many studies in the public schools, were also presented.—(New York School Journal.)

OBITUARY RECORD.

J. E. SHEFFIELD.

Joseph Earle Sheffield, founder of the Sheffield Scientific School of Yale College, was born in Southport, Conn., June 19, 1793. His early education was obtained in the common schools, which he left in 1808 to become a clerk in a business house at New Berne,

N. C. In 1813 he formed a partnership with a house in New York, though continuing to live in New Berne; but afterward he transferred his business to Mobile, Ala., and soon became one of the largest shippers of cotton in the country. Returning to the North in 1835, he established himself in New Haven. A sagacious and successful business man as well as a generous giver, he was the chief projector of two railroads, was largely engaged in the construction of another, and was prominent in banking circles.

Mr. Sheffield's principal donations to Yale College were Sheffield Hall, twice enlarged and fitted up throughout; a fund of $130,000 for professorships; a library fund of $10,000, increased to $12,000; the Hillhouse Mathematical Library, costing $41,000; $2,700 to the Collier cabinet; North Sheffield Hall, erected and equipped at a cost of over $100,000; and numerous contributions to current expenses, amounting for ten years to $10,000 annually, to the Scientific School, and during 1881 to $20,000, this additional sum being intended to increase the pay of professors. He also made large donations to Trinity College, Hartford, and to the Theological Seminary of the Northwest, in Chicago. He established a parish home, costing $75,000, in connection with Trinity Church, New Haven, and gave liberally to a great number of public institutions of various kinds in New Haven and elsewhere, the aggregate of his educational benefactions alone exceeding $650,000, to be probably more than doubled by his final bequests for such purposes.

Mr. Sheffield was a prominent member of the Episcopal Church. His manner was that of the proverbial gentleman of the old school, gracious, gentle, charming, with the simplicity of the highest breeding and the kindliness of a noble heart that was always moved to helpfulness by a story of need or suffering. Until within the last two or three years he enjoyed good health, and even after eighty years of age his handwriting was as perfect and legible as that of a young man. He died February 16, 1882.

HENRY A. YARDLEY.

Henry A. Yardley, professor of Christian evidences and homiletics in the Berkeley Divinity School, at Middletown, Conn., born in Philadelphia December 20, 1834, died on Sunday, April 2, 1882, after a long illness. He was graduated at Yale in 1855, taking high rank as a scholar.—(Philadelphia Evening Telegraph.)

CHIEF STATE SCHOOL OFFICER.

Hon. BIRDSEY G. NORTHROP, *secretary of the State board of education, Hartford.*

[Since January, 1867, Mr. Northrop has served for four successive terms, the last closing January 1, 1883, at which time Mr. Charles S. Hine succeeded him.]

DELAWARE.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
White youth of school age	33,133			
Colored youth of school age	4,152

Teachers in schools for colored youth	56			
Average monthly pay of colored teachers	$22 00			
INCOME FOR PUBLIC SCHOOLS.				
Whole receipts for free white schools	$144,840			
Receipts for colored schools		$5,329		
STATE SCHOOL FUND.				
Amount of permanent school fund	$495,749			
Amount annually allowed the schools	28,870			

a Highest enrolment in any one month.

(From the report of Hon. James H. Groves, State superintendent of free schools, and the report of the Delaware Association for the Education of Colored People.)

STATE SCHOOL SYSTEM.

OFFICERS.

The officers of the State system are a superintendent of free schools, with an assistant, both appointed annually by the governor, and a State board of education, composed of the secretary of state, president of Delaware College, and the State superintendent. The president of Delaware College is president of the board, and the assistant superintendent, secretary. In each district, for schools for whites, committees of 3 members are elected by the people for 3 years, with change of one member each year.

OTHER FEATURES OF THE SYSTEM.

The State superintendent is required to report in writing to the governor annually the condition of the public schools and make any recommendations he may think proper.

The State board determines what text books shall be used in the free schools. The schools are sustained from "the school fund of the State of Delaware" (which cannot be used for academies, colleges, or universities) and from a local tax which, in each school district of New Castle County, amounts to $150, of Kent County to $125, and Sussex County to $60, yearly, to be applied to the support of schools in the district in which the tax is raised. In addition, under special acts, other needed sums are authorized to be raised either annually or for a limited time in various school districts of the State. Two or more school districts in any county may unite in supporting a free school for their common benefit. The State superintendent is to hold teachers' institutes of 3 days' session in each county once a year, which the teachers are required to attend in their respective counties. Teachers are required to submit to the proper authorities a quarterly report; otherwise their pay will be withheld.

For the instruction of colored children the Delaware Association for the Education of Colored People has in charge two separate funds, one of $2,400, annually appropriated from the State treasury since 1881; the other, a tax of 30 cents on the $100 of real and personal property and poll of colored persons, levied annually in aid of colored schools. The $2,400 is divided equally among the schools of New Castle, Kent, and Sussex Counties, no school receiving its pro rata unless it is sustained at least 3 months of the school year with an average attendance of at least 15 pupils. A body politic, called the "Indian River school districts for a certain class of colored persons," is exempted from the regular taxation and establishes schools of its own, voting the sum required, not to exceed $200 for the two subdistricts it embraces. Each school is to be open to the children of the persons specified, and is to receive a pro rata share of the school fund for colored people, provided that $25 have been raised by taxation for each school during the year and that the schools are taught at least 3 months in the year with an average attendance of 20 scholars.

GENERAL CONDITION.

The schools for colored pupils under the care of the Delaware Association for the Education of Colored People, with the aid of a State appropriation, have done better than ever before, nearly every locality that could support a school having had one. New Castle County, including 2 schools in Wilmington, had 6 more schools and 327 more pupils; Kent County, 6 more schools and 357 more pupils; and Sussex County almost doubled the number both of schools and pupils. The teachers are said to have been prompt, energetic, and competent.

CITY SCHOOL SYSTEM OF WILMINGTON.

OFFICERS.

Wilmington—the only city in the State with more than 7,500 inhabitants—has a board of public education composed of two members from each of its 11 wards. These members appear to be elected for 2-year terms, with change or reëlection of 1 each year. The board employs a superintendent of schools, who has not been changed for many years.

STATISTICS.

The population of the city, according to the school report, was 45,000; youth of school age (6–21), not given; enrolment in 1881–'82 in public schools, 7,123; average number belonging to these schools, 5,191; average attendance, 4,600; teachers employed, 117; expenditure for current needs of schools, $73,581; for new buildings, $15,791; total, $89,372.

ADDITIONAL PARTICULARS.

The schools were held in 1881–'82 in 19 buildings, with 116 rooms and 5,920 sittings; three new buildings were in course of erection, which it was believed would accommodate all likely to attend. The grades, probably only covering half a school year each, were 10 primary and 6 grammar, beyond which were 3 high school years. Industrial drawing enters into the studies of the grammar grades and geometrical drawing is continued in the first high school year. Four pupil teachers are reported as in training and on trial in as many divisions of the training school. These receive no salary.

TRAINING OF TEACHERS.

NORMAL TEACHING.

The normal class formerly taught at the State College, Newark, seems to have been dropped.

TEACHERS' INSTITUTES.

In place of the teachers' institute at Wilmington, formerly held for city teachers of all grades, Supertendent Harlan writes that he now holds grade meetings, including

only teachers of one grade at each meeting, for suggestions as to their special work. These are held after school hours about eight times a year. The training school for candidates for teachers' places is continued.

Of the county institutes held under the State law there is testimony from an unofficial source tending to show that the interest and enthusiasm of preceding years have not abated.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

No specific provision for this class of schools appears in the State law, but 2 have long been sustained at Wilmington, 1 for each sex, with 3-year courses, which include at present only advanced studies in English. These schools had 5 teachers in 1881–'82, with an enrolment of 110 and an average attendance of 83. A return from Dover shows also 2 high school rooms there, with 1 male and 1 female teacher and sittings for 96 pupils, but does not give the statistics of attendance.

OTHER SECONDARY TRAINING.

Fourteen academic institutions report from this State, most of them giving instruction in the classics and about half offering also modern languages. The Wesleyan Female College, Wilmington, has an academic preparatory course for such as intend to take the English collegiate course, adding Latin for those expecting to enter the classical course.

For statistics, see Tables VI and VIII of the appendix; for a summary, corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

STATE COLLEGE.

Delaware College, Newark, first opened as a preparatory school in 1830, then for some years known as Newark College, and finally chartered under its present title in 1867, has admitted both sexes since 1872. It has no preparatory department; its collegiate work is embraced in 3 courses: classical, scientific and agricultural, and literary. The last mentioned is open to all, but is more especially intended for young lady students. It embraces English studies, with German or French and Latin, as required parts of the course, Latin being optional in the senior year. The faculty includes 5 professors, besides the president; the students in 1881–'82 numbered 54, of whom 9 were graduated, 4 of them from the literary course, none from the classical. Students in the first session of the next year, 52.

COLLEGE FOR WOMEN.

Wesleyan Female College, Wilmington (Methodist Episcopal), was chartered in 1841 as the Wesleyan Collegiate Institute and in 1855 under its present title. It is the only college for women in the State; it has primary and preparatory as well as collegiate classes, and permits in the collegiate a choice between a 3-year English and a 4-year classical course. The former embraced at the last accounts English studies only; the latter added to these French, German, and Latin.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The scientific and agricultural department of the Delaware State College offers to students that can sustain an examination in the ordinary English school studies a well arranged course covering four years and leading to the degree of B. S. This includes Latin, French or German, civil engineering, the natural sciences, laboratory practice; some training in tillage, stock breeding and feeding, fruit and cereal culture; and the elements of veterinary science. Military drill is obligatory in the fall and spring terms. Selection of studies is allowed, but the full course is strongly recommended.

PROFESSIONAL.

No strictly professional schools appear to have been established. The State board of health examines candidates for medical practice who do not present diplomas from accredited medical schools.

SPECIAL INSTRUCTION.

EDUCATION OF DEAF-MUTES, BLIND, AND FEEBLE-MINDED.

Unfortunates of these classes continue to be either cared for by the authorities of their respective counties and by parents and friends or are sent for training to institutions in Pennsylvania and elsewhere. One feeble-minded youth from Delaware is reported in an

institution in Pennsylvania, and 13 deaf-mute pupils are in the Columbia Institution for the Deaf and Dumb, District of Columbia.

EDUCATION OF ORPHANS AND FRIENDLESS CHILDREN.

In a Home for Friendless and Destitute Children, Wilmington, about 700 in all had been under care and training up to the close of 1882, and out of about 70 inmates of the home some 50 were in the school connected with it.

CHIEF STATE SCHOOL OFFICER.

Hon. JAMES H. GROVES, *State superintendent of free schools, Smyrna.*

[Mr. Groves, appointed in 1875, has held by successive annual reappointments since. Mr. Thomas N. Williams succeeds him in 1883.]

(From biennial report of Hon. E. K. Foster, State superintendent of public instruction, for the years named.)

STATE SCHOOL SYSTEM.

OFFICERS.

The system of public instruction continued to be administered by a State superintendent, a State board of education, a board of public instruction and a county superintendent for each county, local school trustees, treasurers, and agents.

OTHER FEATURES OF THE SYSTEM.

The law provides that public schools shall be taught for at least three months each year, and any district neglecting to maintain them for that length of time forfeits its share of the common school fund during such neglect. They are sustained from the interest on that fund, a special tax of 1 mill on $1, and a county tax of not less than 2½ nor more than 4 mills on $1. The interest of the school fund and the proceeds of the 1-mill tax are distributed among the several counties according to the number of youth 4 to 21 years of age, but they are apportioned to the different schools in proportion to the average attendance of pupils between 6 and 21. The census of youth 4 to 21 and 6 to 21 must be taken every 4 years by the county tax assessor at the time of assessing taxes. Teachers' certificates are of three grades, the standards being fixed by the State superintendent. They are granted by county boards on examination and are good in the county for 1 year; they are also granted by the State superintendent, good in any part of the State during the time specified in them.

GENERAL CONDITION.

State Superintendent Foster reports that the cause of education advanced rapidly during the two years ending September, 1882, the number of public schools reported for that year being higher and the total enrolment greater than for 1879. The statistics for 1881 and 1882 also show advancement in most particulars, although it should be

noted that the reports are not sufficiently complete to render a comparison of much value. Thus, in 1881, 12 counties out of 39 failed to report the number of pupils enrolled, and in 1882 only 3 failed to give this item, while in both years 12 failed to report the number in average attendance. Still the amount spent for teachers' pay was greater in 1882 in almost every county; and this fact, the superintendent says, is worthy of notice as indicating an increasing demand for the public school and an encouraging growth in educational work. He hopes, however, that the time will come when teachers shall be paid according to their capacity and the character of their work, rather than on the basis of average attendance. He also suggests that the legislature enact a law with penalty attached requiring county superintendents to keep proper records and make full reports.

PEABODY FUND AID.

The trustees of this fund appropriated $1,900 for 1881–'82 in aid of graded schools at Gainesville, Starke, Quincy, Pensacola, and Tallahassee; with $1,825 for State scholarships in the Normal College at Nashville, Tenn., to prepare teachers for Florida schools.

CITY SCHOOL SYSTEMS.

OFFICERS.

There is no separate city school system in this State. City schools are controlled by county school officers and no separate reports are made.

STATISTICS.

Key West, including Monroe County, with a population of 10,940, reported 3,416 youths of legal school age, and 1,069 attending public schools, under 20 teachers; public school property was valued at $12,500, and about $7,000 were expended during the year for public schools.— (Return.)

Jacksonville continued at the last accounts to have the primary, grammar, and high schools reported in 1881, but no statistics of them have been received up to the time at which this goes to print.

TRAINING OF TEACHERS.

STATE NORMAL SCHOOL.

East Florida Seminary, Gainesville, organized in 1880 as a State normal school, is supported from the proceeds of the congressional land grant and gives free tuition to one student from each legislative district. There were 155 enrolled during 1881–'82, of whom 40 were in a normal course of study.

TEACHERS' INSTITUTES.

The State has long authorized the holding of teachers' institutes, but it appears that none were held in 1881–'82. The legislature is said to have since made an appropriation for them.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

Little information as to the public high schools of Florida for 1881–'82 has reached this Office. That at Jacksonville reported in 1881 a 3-year course, in which instruction was given in the usual high school branches, the school serving for Duval County as well as for the city. There is also high school training at Tallahassee, in the West Florida Seminary, and at Gainesville, in the East Florida Seminary.

OTHER SECONDARY SCHOOLS.

For statistics of any academic schools reporting, see Table VI of the appendix, and for a summary, see the report of the Commissioner preceding.

SUPERIOR, SCIENTIFIC, AND PROFESSIONAL INSTRUCTION.

STATE UNIVERSITY.

The State constitution makes it the duty of the legislature to establish a State university, but as far as has been learned no steps had been taken in 1882 to establish more than the agricultural and mechanical departments of it. Provision for instruction in the professions of teaching, medicine, and law is directed to be made in this university, and at least one medical school is likely to avail itself of this.

SPECIAL INSTRUCTION.

EDUCATION OF THE BLIND, DEAF, AND OTHERS.

The constitution of 1868 says that "it is the paramount duty of the State to make ample provision for the education of all the children residing within its borders, without distinction or preference." But thus far the blind, deaf, feeble-minded, and children needing reformatory training do not appear to have had any benefit from this provision. Superintendent Foster now suggests that, as the census shows 119 deaf-mutes in the State, 78 of them within the school age, some institution should be provided in which they may be taught the mute language. Nothing is said as to provision for the other classes indicated, though there were 215 blind and 369 feeble-minded also shown by the census.

EDUCATIONAL CONVENTIONS.

COUNTY SUPERINTENDENTS' MEETINGS.

The school law makes it the duty of the State superintendent to call meetings of county superintendents and other officers for obtaining and imparting information on the practical workings of the school system and the means of promoting its efficiency and usefulness. No information has been received of such meetings for 1881–'82.

CHIEF STATE SCHOOL OFFICER.

Hon. E. K. FOSTER, *State superintendent of public instruction, Tallahassee.*

[Term, January 1, 1881, to January 1, 1885.]

Information has come that Mr. Foster, chosen for a second term, retired before its close and was succeeded by Mr. A. J. Russell.

GEORGIA.

a Census of 1880.

b Including some corrections, and estimates for four counties not reporting, the superintendent makes this total 507,861.

(From reports of Hon. Gustavus J. Orr, State commissioner of common schools, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

For the State there is a board of education composed of the chief State officers, with the governor as president; there is also a State school commissioner, appointed by the governor every two years, who is the chief executive officer of the State board; for each county there is a board of education of 5 freeholders, holding office for 4 years, which elects a secretary, who is ex officio school commissioner; for each subdistrict into which a county may be divided 3 trustees are appointed by the county board for local supervision.

OTHER FEATURES OF THE SYSTEM.

The State school fund is derived from a poll tax of not more than $1, from a special tax on shows and exhibitions and the sale of spirituous and malt liquors, from the half rental of one railroad and dividends on stock held in another, from the proceeds of commutation taxes for military service, from a tax on dogs, and from such other sums as may be authorized to be raised by general taxation. High schools are not provided for except in districts chartered before 1877, as the constitution since then provides for the elementary branches only. The schools are free and provision is made for the separate instruction of white and colored children. Each county board of education prescribes what text and reference books shall be used, provided it does not introduce any books of a sectarian or sectional character or exclude the Bible. Ambulatory and manual labor schools are provided for in the school laws, as well as evening schools for such youth over 12 years of age as are unable to attend the day schools; but thus far none have been reported. Teachers, to receive their pay, must report to the county commissioner at the close of each term; he to the State commissioner, who reports annually to the general assembly. Primary schools, free to all, must be taught at least 3 months of the year to entitle a county to its proportion of the State fund. But when from sparsity of population a county cannot maintain a school for that time, the board may provide schools of at least 15 pupils, to continue 2 months, in places convenient to a majority of the children, the terms of which may be so arranged that the same teacher may serve in more than one of said schools. Each county commissioner examines candidates for teaching; he must also visit the schools in his county twice a year, enumerate the school population quadrennially, distribute the school fund on the basis of such enumeration, and report annually to the State superintendent.

GENERAL CONDITION.

The condition of the public schools seems to have improved, the enrolment of pupils increasing by 12,235, the average daily attendance by 14,272, the number of teachers by 223, and the receipts for school purposes by $85,642. For obvious reasons, the large additions to the average attendance and to the funds for support of schools are especially encouraging. As the reported attendance in elementary private schools continued to sensibly diminish, the number of teachers in such schools falling off still more, it looks as if the free State system would eventually absorb the private pay schools.

AID FROM THE PEABODY FUND.

The proceedings of the Peabody fund trustees at their meeting in New York City, October 4, 1882, show that for 1881–'82 Georgia received from the fund $8,590, of which $3,700 went for normal scholarships at Nashville for Georgia students; $800 to the public schools of Americus; $1,500 to Atlanta University, for normal training of colored students; and $2,590 for State teachers' institutes.

KINDERGARTEN.

The report of the meeting of the State Teachers' Association indicates that there were at least 12 children under Kindergarten training in a school of the Misses Chase and Thornbury, at Albany, Dougherty County; but no report from it has been received. A prospectus of the Atlanta Female Institute, Atlanta, for 1882–'83, shows that a Kindergarten department was to be established in that seminary in the autumn of 1882, under the charge of a young lady trained at St. Louis, Mo.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

Cities of over 2,000 inhabitants may have independent school systems under boards of education or trustees of schools, mayors of cities and judges of courts sometimes being ex officio members. Augusta, Macon, and Savannah combine county and city systems,[1] and each city employs a superintendent.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Atlanta	37,409	10,554	4,752	4,465	73	$73,710
Augusta	26,874	6,056	3,026	1,486	44	.....
Columbus	10,123	3,655	1,548	1,148	27	13,933
Macon	12,749	3,413	1,831	1,209	35	22,382
Savannah	30,709	7,745	3,155	2,776	57	39,900

[1] Only statistics of the cities, however, are given in the table.

ADDITIONAL PARTICULARS.

Atlanta, for 1881–'82, reported 10 schools, 7 for white children and 3 for colored. The total enrolment was, in high schools, 221 girls and 111 boys; white pupils in grammar schools, 2,943; colored, 1,477. There was still a lack of room in all grades, and there was room for only half of the colored children of the city. The employment of colored teachers for colored pupils is said to be a success. Private and parochial schools enrolled 1,000 pupils.

Augusta had a graded system of schools, classed as primary, intermediate, grammar, and high schools, the studies in the primary grades occupying 3 years; in the intermediate and grammar, 2 years each; and in the high school department, 3 years. There were two normal classes, one for white teachers and one for colored.

Columbus had 7 school-houses, with 1,282 sittings, valued, with grounds, buildings, &c., at $39,700. In the primary schools 992 pupils were enrolled and in the grammar 556. The estimated enrolment in private and parochial schools was 275.

Macon reports 8 school buildings, with accommodations for 1,420 pupils; value of buildings, including grounds, &c., $55,500. The primary and grammar courses cover 7 years and the high school 2. There were 2 normal classes gratuitously instructed by the superintendent. The graduates of the high school for 1882 numbered 18 girls and 14 boys, 7 more than ever before graduated during one year. The superintendent reports, too, that a much higher proportion of the graduating class were trained in the public schools exclusively; also, that there had been a steady advance in attendance and deportment. The enrolment in private and parochial schools was 400.

Savannah had 7 white schools and 2 colored, with an enrolment of 1,658 girls and 1,497 boys. Two high schools had an average daily attendance of 147. Below the high schools there are 8 grades, beginning with the lowest elementary studies. Although the estimated value of school property was $105,500, the city was in need of more school room to accommodate the growing enrolment. In private and parochial schools there were 600 pupils.

TRAINING OF TEACHERS.

NORMAL DEPARTMENTS.

There is no school under State direction especially devoted to normal training, but State Commissioner Orr earnestly recommends that a State normal school be established. This he does on the ground that the constitution requires a thorough system of common schools; that to such a system thoroughly prepared teachers are necessary, and that these can only be secured by means of a normal school.

The Peabody fund, by means of an appropriation of $3,700 for scholarships, provided for a number of specially selected white students from this State at the Normal College at Nashville, Tenn.

The *Middle Georgia Military and Agricultural College*, Milledgeville, and the *North Georgia Agricultural College*, Dahlonega, both offered free normal instruction to students of either sex who wished to become teachers. Certificates of proficiency granted by the faculty enable their holders to teach without further examination.

Atlanta University (for the superior instruction of the colored race) presented a 4-year normal course, in which were 61 students, of whom 10 (young women) were graduated in 1882.

Clark University, Atlanta, gives a 4-year course of normal training for colored teachers.

The *Haven Normal School*, Waynesboro', for the instruction of colored teachers, assisted by the Freedman's Aid Society of the Methodist Episcopal Church, presented a 4-year course of study. There appears to have been an enrolment of 80 pupils, under 2 instructors, the same as reported the preceding year.

Some normal instruction was given to the teachers of public schools in Augusta and Macon by the superintendents, classes being held so as not to interfere with school duties.

TEACHERS' INSTITUTES.

Superintendent Orr reports that, failing to obtain an appropriation from the general assembly for holding teachers' institutes, he applied to the agent of the Peabody fund for the necessary means, and had $2,000 put at his disposal. With this sum he conducted 3 institutes, at Americus, in South Georgia; Milledgeville, in Middle Georgia; and Toccoa, in North Georgia. Several eminent gentlemen visited the institutes and delivered lectures. They were held during the entire month of August. The one at Americus, W. H. Baker, superintendent, had an attendance of 41 white teachers and 41 colored, representing 22 counties. Daily instruction was given in common English branches and in the practical work of teaching. The institute held at Milledgeville, B. M. Zettler, superintendent, enrolled 68 white teachers and 47 colored, with an average daily attendance of 71 during the session of 4 weeks. In addition to the regular exercises, each

Friday was given to the discussion of questions relating to difficulties and matters occurring daily in school. The institute held at Toccoa, H. C. Mitchell, superintendent, had in attendance 45 white and 10 colored teachers and 15 county commissioners, representing 30 counties. The common branches were taught, with instruction in the hygiene of the school room and analysis of English poetry. The institutes are said to have accomplished much good for the educational interests of the State.

EDUCATIONAL JOURNAL.

The proceedings of the Georgia Teachers' Association for 1882 show that a periodical, entitled the "Musical Eclectic and Journal of Education," was established in the spring of that year at Macon.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

No provision is made in the constitution of 1877 for high school instruction in the public schools, but in a few cities and counties under local laws high schools are sustained. Atlanta, Augusta, and Savannah in 1881–'82 had each 2 separate high schools for whites, with courses of 3 and 4 years. Augusta had also one for colored youth. Those at Atlanta had 332 pupils, of whom 40 were graduated in 1882. The one for white girls at Augusta reported an enrolment of 100; that for white boys and girls, an enrolment of 22, under 3 teachers. The full course was 3 years. The cost for each enrolled scholar is reported to have been only $2.17 a month. Statistics of the third school (for colored boys and girls) are not given, but the school is said to be thoroughly taught. Macon Central High School, for white boys and girls, had 3 teachers and 111 pupils, of whom 32, the highest number ever reached, were graduated in 1882. At Savannah there was a high school for boys and also one for girls, with courses of four years and an enrolment of 186 pupils, under 5 instructors.

OTHER SECONDARY SCHOOLS.

For statistics of commercial schools, academies, special preparatory schools, and preparatory departments of colleges, see Tables IV, VI, VII, and IX of the appendix, and the summaries thereof in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The University of Georgia, Athens (non-sectarian), had for 1881–'82 collegiate, law, and medical departments. In the collegiate department there were 10 schools, but instruction was given in scientific and literary courses of four years each. The total number of students in all the departments, including four branch colleges, was 900.

Seven other institutions of different grades, but all claiming collegiate rank, present themselves, namely: Atlanta University and Bowdon College (non-sectarian), Clark University and Emory College (Methodist Episcopal), Methodist College (Methodist Church South), Mercer University (Baptist), and Pio Nono College (Roman Catholic). These all had classical courses of four years, some of them beginning at a low point, and all but Mercer did some preparatory work. College Temple, Newnan (non-sectarian), presents preparatory and collegiate courses, but not of high grade. Atlanta steadily advancing and Clark beginning full collegiate instruction, gave some industrial training to both sexes, teaching the young men the elements of mechanical trades and farming, and the young women cookery, nursing, sewing, and housework. Pio Nono offered graduate instruction, but had no students beyond the sophomore year. Clark University presented an English classical course.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Atlanta and Clark Universities, Bowdon College when last heard from, and College Temple gave equal instruction to young women. There were 16 institutions reported for young women alone, all giving instruction in music, drawing and painting, and modern languages. For statistics, see Table VIII of the appendix.

SCIENTIFIC AND PROFESSIONAL TRAINING.

SCIENTIFIC.

The State College of Agriculture and the Mechanic Arts offered courses of 4 years in agriculture, horticulture, and natural history; engineering; and chemistry; with a course in building and architecture of undefined length. To aid in the instruction in chemistry, the citizens of Athens gave a 3-story building, 100 by 50 feet, costing $25,000, and the

legislature added $15,000 to equip this with requisites for chemical and physical work, as well as with aids to instruction in engineering. Some scientific training was offered also in the four branch agricultural colleges and in the courses of Atlanta and Clark Universities; while at Mercer University, Emory College, and Pio Nono College there were special scientific courses, of 3 years in Mercer and Emory and of 4 at Pio Nono.

For statistics, see Tables IX and X of the appendix; for a summary of them, like tables in the report of the Commissioner preceding.

Of the 9 schools for superior instruction of young women mentioned on page 45 of the report for 1881 as having laboratories and apparatus for illustration of instruction in chemistry and physics, all but 3 continued to report these (Andrew College, Cuthbert, and Monroe College, Forsyth, not heard from, and Georgia Female College, Madison, said to have lost its buildings by fire). College Temple, Newnan, and Wesleyan Female College, Macon, are to be added to the list of those with such aids, and Columbus Female College, Columbus, reports considerable additions to its means of training in science.

PROFESSIONAL.

Theological instruction continued to be given to some extent in Atlanta University (Congregationalist), Atlanta Baptist Seminary, and Clark University (Methodist Episcopal), all at Atlanta and all for colored youth, as well as at Emory College, Oxford (Methodist Episcopal South), and at Mercer University, Macon (Baptist). Theological class at Atlanta University, 4 in 1882; at the Baptist Seminary, 44; at Mercer, 13; at Clark and Emory, some theological students in the courses, though not separately indicated.

Legal training, covering a collegiate year, was given at the University of Georgia and at Mercer University (the former recommending two years of study). Graduation admits to practice in any of the courts of the State except the supreme court. For men of business, there is at the former a course of instruction in legal forms and mercantile law to which seniors in some of the college courses are admitted. Professors and lecturers at the University of Georgia, 6; at Mercer University, 3.

Medical instruction has been brought under control in this State by an act of September 27, 1881, to regulate the granting of medical diplomas, which forbids the granting of a medical diploma to any person that has not attended two or more full courses of study in some regularly chartered medical college in good standing and passed an examination satisfactory to the professors of said college in all the branches usually taught in such colleges. A further act of September 28, 1881, regulates medical practice by requiring that no one shall practise medicine in the State without legal authority to do so, evidenced first by a diploma granted by an incorporated medical college, medical school, or university, and next by registration in the office of the clerk of the superior court of the county in which he practises.

The "regular" schools for instruction were in 1882, as in 1881, Atlanta Medical College and Southern Medical College, both at Atlanta, and the Medical College of Georgia, Augusta, a department of the University of Georgia, the first with 12 instructors, the second with 11, and the third with 15. All required the customary 3 years of study under a medical preceptor, with attendance for at least 2 years on the regular lecture courses, which are stated to be of only 19 weeks each at the Southern College, of 18 at the Atlanta College, and of 17 at Augusta, all 3 below the standard of the American Medical Association. The Savannah Medical College is reported to have suspended in 1880.

The College of American Medicine and Surgery, with 6 professors, and the Georgia Eclectic Medical College, with 8, the only schools other than the "regular" schools above mentioned, both had the same general requirements as those above referred to, but the annual lecture course at the latter was 20 weeks; at the former, only 16 weeks.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The Georgia Institution for the Education of the Deaf and Dumb, at Cave Spring, in 1882, had 86 pupils, 17 of whom were only semi-mute. There were 5 instructors; 1 of them was a deaf-mute and 2 were semi-mutes. The method of instruction was manual, the common English branches being taught, with shoemaking as the leading industrial occupation.

There is no official report available respecting the education of the blind in Georgia during 1882.

EDUCATIONAL CONVENTION.

TEACHERS' ASSOCIATION.

The sixteenth annual session of the Georgia Teachers' Association convened at Augusta May 2, 1882. There were 60 members present, President G. M. Dews in the chair. The first day was given to addresses, and in the evening session there was an interesting

discussion on "Methods of increasing the interest of the teachers in the association and its objects." There was a notable increase of members and visitors on the second and third days. Text books and the common English branches were discussed, and some of the methods of Kindergarten instruction were illustrated by Misses Chase and Thornbury, with 12 little children from their school at Albany. The members were encouraged by the result of the meeting and adjourned to meet at Athens in May, 1883.

CHIEF STATE SCHOOL OFFICER.

Hon. GUSTAVUS J. ORR, *State school commissioner, Atlanta.*

[Fifth term, January 1, 1883, to January 1, 1885. Mr. Orr has been reappointed for another term.]

4 E

ILLINOIS.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth of school age (6–21)	1,002,222	1,037,567	35,345	
Enrolled in graded public schools	277,586	295,620	18,034	
Enrolled in ungraded public schools.	419,909	417,811		2,098
Whole number in public schools	697,495	713,431	15,936	
Average daily attendance in them	425,858	452,485	26,627	
Pupils in private or church schools	59,924	67,380	7,456	
SCHOOL DISTRICTS AND SCHOOLS.				
Number of school districts	11,598	11,529		69
Number with 5 months' school or more.	11,398	11,339		59
Districts with schools of less than 5 months.	87	113	26	
Districts that had no schools	113	77		36
Districts reporting libraries	879	895	16	
Volumes in these libraries	58,133	59,855	1,722	
Public school-houses	11,936	11,914		22
School-houses built in the year	266	304	38	
Whole number of public schools	a11,962	a11,948		14
Graded schools, excluding high	948	976	28	
Number of high school grade	115	144	29	
Average time of schools in days	149	150	1	
Valuation of public school property.	$16,773,510	$17,994,176	$1,220,666	
Private or church schools	628	706	78	
TEACHERS AND THEIR PAY.				
Men teaching in public schools	8,438	8,076		362
Women teaching in public schools	13,695	14,225	530	
Whole number, male and female	22,133	22,301	168	
Number of these in graded schools	5,164	5,464	300	
Number that attended institutes	7,638	6,657		981
Whole number of different teachers.	19,919	19,649		270
Average monthly pay of men	$44 17	$46 86	$2 69	
Average monthly pay of women	35 49	37 76	2 27	
Teachers in private or church schools.	1,547	1,789	242	
INCOME AND EXPENDITURE.				
Whole receipts for public schools	$7,922,169	$8,280,450	$358,281	
Whole expenditure for them	7,858,414	8,567,675	709,261	
STATE SCHOOL FUNDS.				
Amount of such funds reported	$9,247,281	$9,372,754	$125,473	

a Buildings occupied by schools.

(From printed report of Hon. James P. Slade, State superintendent of public instruction, for the two years indicated, with written return from him for the former year and from his successor, Hon. Henry Raab, for the latter year.)

STATE SCHOOL SYSTEM.

OFFICERS.

A superintendent of public instruction has the supervision of all the common schools of the State, and it is his duty to report their condition biennially; a county superintendent visits the schools in each county to note the methods of discipline and teaching, and to assist teachers and school officers in improving them; while in each township a board of three trustees of schools has charge of public school-houses and sites, and under certain restrictions may divide or create districts, in which districts, however, when created, boards of 3 school directors[1] have supervision and control. All these officers are elected by the people, the State and county superintendents for 4 years, the others for 3 years, with annual change of one. By act of 1873 women were made eligible to any school office in the State and several have proved efficient county superintendents.

OTHER FEATURES OF THE SYSTEM.

The common schools of each district are free to all of school age (6–21) residing therein, irrespective of color. The studies to be pursued and the text books to be used are determined by the local school authorities; but no sectarian instruction is allowed and no change of text books may be made oftener than once in four years. The minimum school period which will entitle districts to a share of the school fund embraces 110 days of actual teaching in one year. The required studies are spelling, reading, writing, arithmetic, grammar, and geography; also, for higher classes, the elements of the natural sciences, United States history, physiology, and the laws of health. Other branches may be introduced at the discretion of the directors or voters of a school district. Free instruction is given in two State normal schools and in a State University. Persons undertaking to teach in any public school must prove their qualifications, moral and educational, before the proper officers, and must obtain certificates from them to secure employment; teachers must report, in legal form and time, to receive pay for their work. Towards this pay for teachers Illinois appropriates $1,000,000 annually. To prolong the yearly instruction to 9 months the directors of districts and the authorities of villages and cities are authorized to levy any year a tax on property not to exceed 2 per cent. for educational and 3 per cent. for building purposes. The State appropriation goes to townships, villages, and cities in which schools are taught 110 days, according to the number of persons under 21 years of age, as ascertained by an annual census. Any surplus of district, village, or city school funds may be expended for libraries and apparatus, and the statistics of the preceding table show that 895 districts have availed themselves of this permission.

GENERAL CONDITION.

In Illinois, with an increase of 35,345 in children of school age, there were fewer public schools reported by 14, fewer school-houses by 22, and fewer teachers by 270; notwithstanding this, 15,936 more pupils were in the State schools and 26,627 more were in average daily attendance. In new buildings for public schools there was an increase of 38 and public school property was rated $1,220,666 higher. Of the schools 1,120 were graded and 144 of these were high schools, an increase of 57 graded schools in all. In the graded schools 295,620 pupils were enrolled (41.4 per cent. of the whole public school enrolment), an increase of 18,034 pupils, or of more than 1½ per cent., while attendance in ungraded schools fell off 2,098. Receipts were $358,281 greater than in 1880–'81 and expenditures $709,261 higher, the latter partly due to an increase in the pay of teachers, averaging $2.69 a month for men and $2.27 for women.

IMPROVEMENTS RECOMMENDED.

While speaking well of the State school system as a whole, Superintendent Slade suggests and urges improvements at some points. As to text books, he says that, notwithstanding an explicit law for uniformity, many school boards do not prescribe the books for use within their districts and that in many other cases the books prescribed are not used because of the opposition of parents unable or unwilling to procure them. From this and other causes several different books are frequently in use in the same class, embarrassing the teacher and hindering effective work. He therefore urges the passage of a law by which school boards shall be authorized to purchase the text books for use in their respective schools and to furnish them to pupils without charge, except for misuse; the expense of this would be much less to a whole district than the present plan of individual purchase, and the advantage to the teacher and pupils from uniformity of books would be very great.

As to county superintendency, he repeats his recommendations (1) that only men of

[1] Districts with 2,000 or more inhabitants are exceptions as to the number and title of the school board. See School Systems of Cities with 7,500 or More Inhabitants, p. 52.

women whose qualifications have been carefully ascertained should be made superintendents; (2) that superintendents be required to inspect the schools of their counties, being allowed assistants for this purpose in the larger counties; and (3) that the pay of such officers be increased. The experience of the last two years has convinced him of the necessity of these amendments. As the present law leaves it to county boards to say whether county superintendents shall inspect the schools or not, only about one-third of the schools were visited by them in 1882. The amount paid county superintendents in 1872 was nearly double ($123,730) the amount paid in 1882 ($74,841), although the number of schools was smaller. In 1872, 9,243 schools out of 11,396 were visited once and 2,250 more than once; in 1882, 4,434 schools out of 11,948 were visited once and 941 twice. The pay has been so reduced that in more than two-thirds of the counties the best paid teachers could only accept the office of county superintendent at a pecuniary loss unless they failed to give their whole time to their work.

Compulsory education of children 8 to 15 years of age is also urged; and it is understood that the legislature to which the report embodying these suggestions was presented enacted a law to secure it.

KINDERGÄRTEN.

More than 20 of these means of instruction are reported in Illinois for 1881–'82, for statistics of which, see Table V of the appendix.

At Cook County Normal School 8 Kindergartners were graduated in December of the school year 1881–'82.

Under the auspices of the Free Kindergarten Association of Chicago, a new impulse was given to this class of instruction and its advantages were brought within the reach of a much larger number of children. The association seeks to extend these advantages to the poor as fast as funds and teachers can be secured.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

Chicago, under a special law for cities with more than 100,000 inhabitants, has a board of education of 15 members appointed by the mayor, with the advice and consent of the common council. Cities and school districts with 2,000 or more inhabitants not governed by special law have elective boards of education of 6 members till the population reaches 12,000, when 3 more members are added, and so on for every subsequent addition of 10,000 inhabitants. One-third of each board is liable to change each year. In most cases these boards employ superintendents and delegate to them the supervision of schools. Chicago has also a deputy superintendent.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Belleville	10,683	4,687	2,127	1,802	42	$27,552
Bloomington	17,180	8,700	3,441	2,451	67	50,169
Chicago	503,185	155,166	*a*73,015	*a*48,615	*a*1,032	*a*1,148,480
Decatur	9,547	3,487	2,016	1,503	31	22,967
Elgin	8,787	2,911	1,658	1,091	25	18,236
Freeport	8,516	.....	1,760	1,356	33	23,057

Rock Island	11,659	3,590	2,233	1,575	39	27,516
Springfield	19,743	.....	2,930	2,139	50	33,786

a Including the statistics of evening schools, which enrolled 4,401 and had 952 in average attendance, under 50 teachers.

ADDITIONAL PARTICULARS.

From Alton, Aurora, Cairo, Danville, Galesburg, Jacksonville, Joliet, and Peoria no information for 1881–'82 has been received.

Belleville, according to written returns, increased by 155 its youth of school age, by 136 its public school enrolment, and by 2 the number of teachers in 1881–'82; but showed a loss of 12 in average attendance; school property was rated $15,425 higher. To remedy overcrowding, the city board was preparing to make additions to the school buildings; the improved arrangements, it was hoped, would better accommodate the different grades, which were 8 in number, there being no high school. German appears to have been taught in all the grades by German teachers. Private and parish schools enrolled 675

pupils. It was from superintendent of schools in this city that Mr. Raab was promoted in 1882 to be State superintendent.

Bloomington shows for 1881–'82 an increase in youth 6 to 21. School property was rated at $300,200; the sittings for study numbered 3,100. The schools were held for 175 of 180 school days of the year in 10 different buildings, one of which contained 3 high school rooms. To aid in preparation for the various manufacturing pursuits open to pupils in the place, industrial drawing formed a part of the school course.

Chicago, reporting fully, both in print and by written return, indicates for 1881–'82 a growth of 18,131 in youth of school age and an additional enrolment of 5,473 in its day schools, with an additional daily average attendance of 3,462, under 54 more teachers. There were also 1,057 more enrolled in evening schools, with 98 more in average attendance. It seems from these figures that, with 7,038 additional pupils reported in private and church schools, more than 74 per cent. of the 18,131 new school youth were brought under instruction of some kind. One of the evening schools was a high school, in which advanced mathematics, book-keeping, chemistry, mechanical drawing, and stenography were taught. This had 274 pupils on its roll, most of whom were to attend only on alternate evenings; average attendance, 65. An evening school for newsboys was also held under city teachers at the Newsboys' Home, with an enrolment of 195 and an average attendance of 37. In the day schools instruction in German made considerable progress; two more schools began the language and the pupils studying it increased from 4,827 to 5,332; many of the most successful teachers of it were graduates of the city high schools. The 5 city schools for deaf-mutes were continued during the year under the same teachers, with 2 more pupils (57 in all); instruction in the articulation method was given to such as desired it, and instruction in morals and manners once a week. In the schools generally discipline is said to have been improved under the milder system of the last few years. Instead of teaching pupils to memorize merely, an attempt was made to teach them to observe and think. Drawing was prosecuted with new interest, especially in the higher grades and as a preparation for industrial and mechanical pursuits. Singing, under the interval system, is reported to have made great progress. Five new school-houses, with accommodations for 4,347 pupils, were completed at a cost of $232,639, school property advancing from $2,763,396 to $3,456,810. Other buildings were in process of construction.

Decatur gave all its teachers better pay; with 49 more children of school age, 104 more were enrolled and 101 more were in average attendance. The estimated value of school property was $106,000.

The increased enrolment in the public schools of *Elgin* almost equalled the increase in youth of school age, and with only two more teachers there were 191 more in average daily attendance. The valuation of school property was $12,170 higher than in 1880–'81 and accommodations were afforded for 136 more pupils.

Freeport, enrolling 60 more children in public schools, had 6 more in average attendance under 2 more teachers. In schools other than public there were 260 more pupils than in the previous year.

Lake and *Hyde Park* (townships in the suburbs of Chicago, with a total population of 34,096) are reported together by the superintendent of the Cook County schools. They included 7 districts, with 24 schools, all graded and 3 of them high. Out of a school population of 11,403 these schools enrolled 7,680 pupils, under 134 teachers. There are 8 grades below the high school. Drawing and music were taught, the former up to the sixth grade, the latter throughout the whole eight grades. The high school courses beyond these were of 3 years. The Cook County Normal and Training School prepared teachers for all the county schools, and was to have the author of the Quincy methods at its head in 1883. School property in Lake and Hyde Park was valued at $495,205.

Ottawa reports for 1881–'82 3 fewer teachers. School property was rated $1,110 higher. Estimated number in private and church schools, 273.

Quincy, with an increase of 452 in youth of school age, enrolled in its public schools 204 more and had 75 more in average daily attendance, under 3 additional teachers. The superintendent says that of children 6 to 16 years of age 54 per cent. attended public schools and 25 per cent. private or church schools. Seven additional rooms in a new building were occupied in December to accommodate the increased attendance, which, however, was afterwards diminished by an outbreak of disease. To this loss in attendance a decision of the supreme court of the State that colored children must be admitted to all schools equally with whites also contributed, many of the colored children being withdrawn from their own schools, although there was no accommodation for them in the schools for whites. The grades below the high school were changed from 7 to 8, the high school retaining its 4-year course, in which German, Greek, and Latin are optional. Drawing and music run through the 12 years.

While *Rockford's* public schools enrolled fewer pupils by 355, notwithstanding an addition of 526 to the youth of school age, the city increased its average attendance by

170 and its enrolment in other than public schools by 320, gave its teachers better pay, and added 210 new sittings to its public school accommodations, the valuation of school property advancing $11,159. Grades, primary, grammar, and high.

Rock Island, in returns for the 2 years ending June 30, 1882, reports the school population and number of teachers unchanged, with a decrease in the latter year of 15 in enrolment and of $2,700 in valuation of school property, but an increase of 11 in average attendance on public schools and of 144 in the enrolment in other schools.

Springfield enrolled 138 more pupils in 1881–'82, and had 66 more in average attendance, with 3 more teachers. The schools were uncomfortably crowded but the work of the year appears to have been successful. There are 8 school grades below the high school, the courses in which were of 4 years. Drawing and music formed a part of the instruction in primary and grammar grades, and the former was continued through the high school course. A teachers' institute, held every month during the school session, appears to have been of great practical value.

TRAINING OF TEACHERS.

STATE, COUNTY, AND CITY SCHOOLS FOR NORMAL TRAINING.

The *Illinois State Normal University*, Normal, and the *Southern Illinois Normal University*, Carbondale, both under State direction, continued in 1881–'82 their work of preparing teachers for the public schools, with incidental instruction of many others.

The Illinois Normal, with 14 regular instructors and 136 pupil teachers, had 474 different normal students in its 3-year course, 2 graduate students, 8 in special science studies, and 288 in the model school, which contains primary, grammar, and high school grades; total for the school year 1881–'82, deducting 40 counted twice, 732. In a special summer normal term for teachers, held in August, 1882, 261 were present at least 6 days each, of whom 171 had never been in the regular normal classes.

The Southern Illinois, which had 12 regular instructors and 22 pupil teachers, reported for the same period 184 different normal students in its 3 and 4 year courses, with 223 in the preparatory training school, 407 in all. At this school there was also a vacation summer institute in 1882, at which 59 were present.

Cook County Normal School, Normalville, prepares teachers for the schools of that populous county in a regular course of 3 years, of 3 terms each year, and in a special professional course which may be completed in 4 terms by graduates of high schools and persons with equivalent preparation. Its training school of primary and grammar grades exhibits and affords opportunity for practising the best methods of teaching, discipline, and classification. There was also a Kindergarten department, from which, at the close of 1881, 8 Kindergartners were graduated. Pupils in 1881–'82 in normal department, 202, under 10 instructors; in preparatory department, 162; in training school, 183; total, 547. Graduates of the year, 40.

A renewal in some form of the work of training teachers to supply vacancies in the Chicago city schools has been recommended by successive superintendents since the abolition in 1878 of the training class at the city high school, but the reports of the school board and superintendent for 1881–'82 give no indication that such a renewal is contemplated.

At Springfield a monthly teachers' institute for discussion of improved methods in all school work appears to serve the purpose of a continuous training school for the teachers in that city.

OTHER NORMAL TRAINING.

Fourteen academic schools offer instruction in school law, school studies, methods of discipline, &c., to persons desiring teachers' certificates or a better preparation for school work, and in 13 collegiate institutions normal training was continued. In addition to these means of normal training outside of the State normal schools and the Cook County Normal School, several private summer normals were in operation.

TEACHERS' INSTITUTES.

Of this important class of agencies for improving teachers already in the schools and of preparing candidates for effective future school work, 147 were held by county superintendents and 17 by other persons in 1881, covering 1,385 days in all and enrolling 7,638 teachers, at an expense to the counties of only $673. Besides these, 676 other meetings of teachers in townships and school districts were held for mutual improvement. In 1882 there were 151 institutes reported as held by county superintendents and 62 by other persons, covering 1,577 days and enrolling 6,657 teachers, at an expense to the counties of only $742. Of other teachers' meetings in townships or districts 519 were reported. This record for both years shows a decrease from 1880 in the number of institutes held and the number attending them. The Chicago Institute of Education cultivates pedagogy.

EDUCATIONAL JOURNALS.

Of these valuable aids to teachers there were 11 in this State in 1882: the Normal Journal, Carmi, in its first volume and the beginning of the second, which seems also to have proved its last; the Practical Teacher, Chicago, in its fifth; the Present Age, Chicago, in its first; the Western Educational Journal, Chicago, in its third; the School Herald, Chicago, in its first; the Schoolmaster, Chicago, in its second; the Normal Mirror, Danville, in its first; the American Educator, Lockport, in its seventh; the Normal Worker, Morris, in its third; the Illinois School Journal, Normal, in its first; and the Iapi Oaye, or Word Carrier, published at Chicago, in Indian and English, for the Dakota Mission at the Santee and Yankton Agencies, Nebraska. All are monthlies except the Present Age, which is a weekly.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

Superintendent Slade, in his excellent report for 1881–'82, gives statistics of 144 high schools belonging to the State school system, such only being in the list as had courses of 3 years or more. Of the 144 reported, 81 had courses covering 3 years; 3, courses between 3 and 4 years; 4, courses that might be of either 3 or 4 years, as students and parents should desire; 55 had 4 years in the regular course; and 1 had 5 years. One of these high schools had a session of only 6 months; another, of 7 months; 42, sessions of 8 months; 12, sessions covering more than 8 months but not reaching 9; while 62 had 9 months; 1, 9½ months, and 25 had 10 months. The enrolment in the schools thus enumerated reached 11,004 within the year; the average attendance, 9,060, or 82.4 per cent. of the enrolment. The teachers employed numbered 370, at salaries ranging from $20 a month to $250. The yearly cost for each pupil enrolled was only $23.21 for tuition, or $26.08 for tuition and incidental expenses. Thirteen of these high schools had separate buildings, valued, with grounds and furniture, at $399,250. A hundred and twenty-one of them had libraries, the volumes in these numbering 26,390, libraries and apparatus being valued at $69,018. Such full statistics as to schools of this class are rarely to be had, many States making no report of them and other States only brief and incomplete reports.

OTHER SECONDARY SCHOOLS.

Statistics of business colleges, private academies, independent preparatory schools, and preparatory departments of colleges and scientific schools may be found, as far as reported to this Bureau, in Tables IV, VI, VII, IX, and X of the appendix to this report; summaries of them, in corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The only institution for superior instruction under State direction was the Illinois Industrial University, Urbana, chartered in 1867 and organized in 1868. In its college of literature and science the chief studies of a good classical course are presented in a school of ancient languages. French and German are taught in the school of English and modern languages. The standard of admission to the university has been rising gradually for several years. As to the technical courses, it was satisfactory in 1882; but it is urged that the requirements for admission to the literary and classical courses should be immediately advanced. Preparatory instruction at the university, which it was hoped might be dropped in 1881, was continued; but as the State high schools become more efficient the faculty hope to be able soon to leave to them all preparatory work. In 1882 the list of schools allowed to send their graduates into the freshman classes without examination numbered 30, while 10 other schools examined candidates for admission, the papers being sent to the university for final decision.

As to other training in the 3 additional colleges and 2 scientific schools of the university, see Scientific and Professional Instruction, p. 56.

Besides the State University, 28 schools of recognized collegiate standing were on the list of this Bureau as colleges for young men or for both sexes in 1882, for statistics of which, see Table IX of the appendix. Of the 28 all but 3 make report in some form for the year. One of the 3 exceptions, Rock River University, Dixon, has not been heard from for several years; the other 2, Abingdon College, Abingdon, and Carthage College, Carthage, reported for 1881. The remaining 25 continued with but little change the preparatory, classical collegiate, and scientific collegiate courses that have been noticed in preceding years, the preparatory courses ranging from 1 to 3 years; the collegiate generally covering 4, though Rock River when last heard from had only 2 in its scientific course, and Monmouth only 3; Wheaton College, in its philosophical and laureate courses,

3; Lincoln University, in a ladies' course, 3. Almost all included 2 or more modern languages with their courses in the ancient languages; at least 23 taught music, most of them offering also instruction in drawing and painting; while 16 presented facilities for business training and 2 of them for telegraphy also. A few allowed elective courses, but did not advise them, and 9 afforded instruction in elocution and voice culture under special teachers. Lincoln University had prescribed courses for the degrees of A. M., M. S., and M. PH.; Illinois Wesleyan College, courses for graduates and non-residents, leading to the degrees of PH. B. and PH. D.

Eleven of the colleges report for 1881–'82 donations for buildings, current expenses, payment of debts, &c., amounting to $227,699. The amount in each case, the names of donors, and purpose of gifts may be found in Table XXIII of the appendix.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Twenty-four of the colleges for young men or for both sexes (including the Industrial University) offered women substantially the same opportunities for instruction as young men. Lincoln University, while opening all its courses to women, offers to such as desire it a shorter course of 3 years.

For women only there were 11 schools reputed to be of collegiate or approximate rank, for statistics of which, see Table VIII of the appendix. Of these all but one show preparatory courses of 1 to 3 years and classical collegiate of 4 years, 4 having also scientific courses and the same number adding literary or graduate courses. Instruction in music, drawing, painting, and in the French and German languages appears to be offered in them all.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

Of the 4 colleges that make up the Illinois Industrial University, 3 are distinctively scientific: the College of Agriculture, which gives instruction in scientific farming, gardening, orchard and plant culture, and in the care of farm animals; the College of Engineering, with schools of mechanical, civil, and mining engineering and architecture; and the College of Natural Science, with schools of chemistry and natural history. There is also a school of military science. The course in each of the 3 colleges covers 4 years; that in the school of military science begins with the third term of the freshman year and covers 2 years. A school of art and design aids the instruction in engineering and architecture and affords teachers in the public schools an opportunity to prepare for their school work in this direction. A school of domestic science, which existed up to 1880, does not appear in the report of 1881 or 1882.

Of the 28 other colleges in the State for young men or for both sexes all but 4 had scientific courses in 1881–'82 or slightly different ones entitled philosophical. The University of Chicago offered also training in astronomy, both to special students and to those in the regular collegiate courses, it having a well equipped observatory, with a special superintendent and instructor. St. Viateur's College and Chaddock College offered instruction in telegraphy.

In Chicago a movement was on foot for the establishment of a manual training school similar to that of Washington University, St. Louis, Mo., to give young men an opportunity for training in the use of tools and in the elements of the industrial sciences.

A school for supplementing the studies of the public system by instruction in scientific agriculture and horticulture for the benefit of farmers' sons, established in 1868 at Sugar Grove, Kane County, by the school authorities of that place, with aid from Mr. Thomas Judd, is reported as still continued.

PROFESSIONAL.

Theology was taught in 1881–'82 in at least 14 collegiate and theological schools[1] with courses of 3 or more years and in at least 4 others with courses of 2 years. These figures, however, do not clearly represent the standards of the several schools, as some of the 3-year courses followed 5 or 6 years of preparatory and collegiate study, while some of four years were preceded by only a small amount of such study. In several cases, too, the secular and sacred training went together; in others the latter followed the former. The theological department of Jubilee College (Protestant Episcopal) remained suspended, though plans were on foot for its reopening. Carthage College (Lutheran), which had a German theological class of 5 students in 1881, gives no information as to the instruction in it in 1882. Lombard University (Universalist) and Wheaton College (Wesleyan) instituted theological courses, of 4 years in the former case and 3 in the latter, for the year 1881–'82.

For statistics of all these schools, see Table XI of the appendix.

[1] Two of the schools here referred to — the Chicago Theological Seminary (Congregational) and the Presbyterian Theological Seminary of the Northwest — received in 1881–'82 donations amounting to $119,638. For particulars of these gifts, see Table XXIII of appendix.

Law was taught, as before, in the Bloomington College of Law of Illinois Wesleyan University, Bloomington, and in the Union College of Law of the University of Chicago and Northwestern University, near by, as well as in the law department of McKendree College, Lebanon, while Chaddock College, Quincy, instituted for 1881–'82 a law department. In the first 2 and last of these the course covered 2 years of 36 weeks each; at McKendree, 2 years of 40 weeks. At the Union College and at Chaddock a fair English education was expected of matriculates; at the others there was no requirement on this point.

For statistics, see Table XII of the appendix.

Medicine was taught in "regular" schools at the Chicago Medical College (a department of Northwestern University), the College of Physicians and Surgeons, Rush Medical College, and Woman's Medical College, all at Chicago. At a new school, the Quincy College of Medicine, also, "regular" instruction was begun in October, 1882. All had the common requirements of 3 years' study under a medical preceptor and of attendance on at least 2 annual lecture courses, varying in length from 20 to 24 weeks. All but Rush required an examination for admission except where there was evidence of a fair English education, and Rush was to require this from 1883. All had graded courses of study and desired to have these cover 3 years.

Of the schools not classified as "regular," there were continued the Bennett College of Eclectic Medicine and Surgery, the Chicago Homœopathic Medical College, and the Hahnemann Medical College and Hospital, all in Chicago. The requirements for graduation in the 2 schools first named were similar to those above, but the lecture courses were longer, being 26 weeks annually in the first and 29 weeks in the second. In the Hahnemann Medical College there were "two full lecture courses," with 26 weeks in each year.

The Chicago College of Pharmacy maintained essentially the same requirements as before, namely, 4 years of service in a pharmacy and 2 years' attendance on the collegiate lecture courses of 20 weeks each.

For statistics of all these schools, see Table XIII of the appendix.

A law of July 1, 1877, requires that in this State all persons desiring to practise medicine, if not graduates or licentiates of a medical school, shall be examined by the State board of health, a certificate of qualification from which board becomes a license. Those who possess diplomas of graduation from such schools must present them for verification as to their genuineness, and the certificate of the board that the diploma is of a satisfactory character renders it a valid license to practise. The certificates given are to be recorded in the office of the clerk of the county in which the holder resides, and a list of such certificates, indicating the persons by whom they are held, is to be always kept ready for inspection.

SPECIAL INSTRUCTION.

TRAINING OF THE DEAF AND DUMB.

The *Illinois Institution for the Education of the Deaf and Dumb*, Jacksonville, continued in 1881–'82 its instruction in school studies and in industries that prepare for self support to an average of 501 pupils, under 29 teachers, at a cost of $96,538. The number under instruction during the year was 550. Large as this number seems, the superintendent says that it includes only about half of the deaf-mutes in the State. Of the graduates of the school, the greater part are said to be doing well in useful and profitable occupations, while none have become inmates of jails or almshouses.

The *Chicago Deaf-Mute Day Schools*, under the charge of the board of education of the city of Chicago, still numbered 5, of which 4 were for comparatively elementary instruction and 1 for an advanced class. Instructors, 5; pupils, 57; each present, on an average, 139 days. The studies were "all those of a common school course, with the addition of morals and manners." No industries were taught. The articulation method was added during the year in the advanced class and one other.

TRAINING OF THE BLIND.

The Illinois Institution for the Education of the Blind, Jacksonville, had for 1881–'82 a total attendance of 128 pupils. The school studies begin with the alphabet and end with geometry. Music is also taught, with such industries as plain and fancy sewing for the girls and mattress making, broom making, and chair caning for the boys. The progress made, especially in music, is said to compare favorably with that of pupils gifted with sight. A large wing was added to the building during the year. Ordinary expenses for the year, $25,447; special, for building, &c., $37,056.

TRAINING OF THE FEEBLE-MINDED.

The Illinois Asylum for Feeble-Minded Children, Lincoln, aims to promote the intellectual, moral, and physical culture of this class of unfortunates, fitting them, as far as

possible, to earn a livelihood. The number present September 30, 1881, was 287; new pupils admitted during 1881–'82, 77; readmitted, 111; absent, discharged, or died, 173; leaving 302 present at the close. The classes for school studies numbered 11, each composed of pupils of one sex alone, while there were also classes for calisthenic exercises, for singing, for sewing, and for drawing and painting. The methods of instruction appear to be eminently practical, and great success was attained in developing imperfect faculties and awakening dormant intellectual life. Expenses for the year, $70,493.

EDUCATION OF ORPHANS.

At the Illinois Soldiers' Orphans' Home, Normal, there were 317 pupils, under 37 officers and teachers, in 1881–'82, being 8 more than in 1880–'81. The average attendance was 279; the number of days taught, 192; the grades, 9. During the year 2 pupils completed the studies of the ninth grade and a class of 6 was ready to enter on these studies at the opening of 1882–'83. Farming, gardening, and housework helped to prepare the pupils for self support. Expenses of the year, $50,036.

Besides this State school, 6 others under private or church control, in Addison, Chicago, and Quincy, report a total of 682 orphan pupils under the instruction of about 60 teachers and employés in school studies and domestic industries. Two others, known to exist, have made no report.

REFORMATORY AND INDUSTRIAL TRAINING.

The *Illinois State Reform School*, Pontiac, had been 11 years in operation at the date of the report for 1881–'82, and in that time has had over twelve hundred boys under its care, of whom 250 remained on September 30, 1882. The boys received instruction in common school studies, in shoemaking, cane seating of chairs, farming, gardening, cookery, baking, and kindred employments. Of the beneficial influence of this instruction in combination with moral training some striking instances are given. Overcrowding caused such hinderance to securing good results that a new building to separate the younger from the older boys was becoming a necessity.

The *Illinois Industrial School for Girls*, Evanston, conducted similarly to the one for boys, but a private corporation, had 82 under its care in 1881–'82, of whom 26 were sent to homes during the year and 56 remained on October 1. Sewing, housework, and cookery seem to have been the chief industries taught, while school training under a special teacher was supplemented by the home influences of a matron and superintendent and by moral and religious teaching.

The *Industrial School of the Women's Christian Home Mission*, Peoria, which aims to prevent pauperism and beggary by giving to the children of the poor instruction in sewing and other industries, had 300 such children on its roll in 1881–'82, whom it hoped to instruct eventually in all branches of household industry. Great care is taken to inculcate good manners and good habits. Singing was taught and pleasant readings were given.

TRAINING OF NURSES.

The Illinois Training School for Nurses connected with Cook County Hospital, Chicago, opened for instruction May 1, 1881, had in its first 5 months 8 pupil nurses under training and in charge of 2 hospital wards; in October, 1882, it had 21 in charge of 6 wards and receiving instruction from the medical staff of the hospital in anatomy, physiology, materia medica, therapeutics, obstetrics, surgery, electricity, massage, and bathing. A return of later date indicates 30 pupils and 6 graduates. The physicians and surgeons of the hospital testify with great unanimity as to the advantage of having these trained pupils in its wards.

TRAINING IN FINE ARTS.

Of the instruction given in this direction the information received is very limited, extending little beyond the facts that at the schools of the Chicago Academy of Design, Academy of Fine Arts, and Society of Decorative Art, as well as at the Hershey School of Musical Art, Chicago, and in the East Illinois Conservatory of Music, Danville, the preceding courses appear to have been continued, while at the State Industrial University and at many of the colleges for young men or for both sexes, as well as in high grade schools for young women only, instruction in music, drawing, and painting was provided for. Elocution was taught by specialists in at least 9 colleges, and at Chicago the training given by several local teachers was supplemented in the summer of 1882 by several weeks of instruction by an eminent professor of this art.

EDUCATIONAL CONVENTIONS.

ILLINOIS SOCIETY OF SCHOOL PRINCIPALS.

This society held its fourteenth annual meeting at Traverse City, Mich., July 3–5, 1882. It discussed such topics as "The responsibility of the teacher for the physical development of pupils;" "How can the teacher increase the moral power of his pupils?"

"Free schools the hope of a free people:" "Do our schools as now organized and conducted meet the wants of the times?" What conclusions were reached the brief reports received do not distinctly show.

SOUTHERN ILLINOIS TEACHERS' ASSOCIATION.

The second annual meeting was to be held at Vandalia, August 30 to September 1, with a well arranged programme of topics for discussion. There is no report at hand of the debates or the conclusions reached.

ILLINOIS STATE TEACHERS' ASSOCIATION.

The twenty-ninth annual session of this body was held, as in 1881, in the legislative hall at Springfield, the State capital, December 26–28, 1882. The address of the president, Superintendent N. C. Dougherty, of Peoria, was on "Needed legislation with respect to public schools," which recommended a truant law for cities, provision for well superintended county institutes, an organized township system of schools to control and improve the common district system, a better qualified and better paid county superintendency, and a fuller arrangement for free libraries as necessary adjuncts of the free schools. The discussion of these topics occupied most of the time in the first day's session and part of the succeeding day. The importance of a higher technical training to prepare for a successful prosecution of industrial pursuits was also brought forward in an excellent paper by Regent Peabody, of the State Industrial University, while another by William H. Smith, of Peoria, on "Education regarding amusements," excited considerable attention. Resolutions adopted at the close favored more thorough county supervision and a State system of county institutes as a most efficient means of aiding the schools at a comparatively small expense; called for laws to enforce the school attendance of truant and vagrant children, to substitute the township for the district as the unit for school purposes, and to establish and aid district school libraries; advocated township supervision as an effective auxiliary to the work of county superintendents; urged generous support of the Industrial University as a means of efficient training for important industries; and finally recommended that the subject of healthful and legitimate amusements for the young should receive careful attention from all teachers.

Other matters presented were "School hygiene," by Dr. H. Ziezing; "Educational ideals, past and present," by L. J. Block; "Memory in school," by Superintendent Howland, of Chicago; "Historical outline of the progress of education in the United States," by Hon. W. H. Wells; and "Influence of home on the school," by Miss Sarah E. Raymond.

After the adjournment of the association proper, the county superintendents' section discussed such subjects as "Preparing pupils for citizenship," presented by Miss M. A. West; "Grading of country schools," by Superintendent Mastin; and "Examination of township treasurers' accounts," by Superintendent A. G. Lane.

NOTEWORTHY BENEFACTIONS.

ENCOURAGEMENT OF INDUSTRIAL TRAINING.

It has been mentioned under Superior Instruction that $227,699 were given to colleges in this State in 1881–'82. Besides this, it is understood, on what appears to be good authority, that subscriptions to the amount of nearly $100,000 were made in Chicago towards establishing and equipping a manual training school for the instruction of young men in the use of tools, as well as in the elementary principles of mechanics and of the arts that prepare for useful trades.

OBITUARY RECORD.

DANIEL S. WENTWORTH.

The subject of this sketch was born at Parsonsfield, Me., March 3, 1824, and died at Denver, Colo., September 16, 1882. Mr. Wentworth was for 30 years a teacher of high repute, trained for his work at the Bridgewater Normal School and Phillips Academy, in Massachusetts. The ability developed in him at these schools, and shown afterwards in four years of teaching in the State, in 1854 brought him an invitation to the principalship of the Scammon School, Chicago, where he introduced the graded system of instruction and helped its introduction in all the public schools. With a brief interval, in which he was a member of the Chicago board of education, he was successively at the head of two of the most important city schools till 1867, when he organized the Cook County Normal School. Bringing to this work high intelligence, great energy, and thorough acquaintance with the science of education, he made the new school a remarkable success, training in it great numbers of effective teachers and securing for it a high reputation.

SAMUEL H. WHITE.

Mr. White began his life at Lockport, N. Y., October 7, 1830, and died at Mapleton, Iowa, March 9, 1882. When he was in his third year his parents carried him with them to Michigan, where, as he grew up, he made the most of his scanty opportunities of obtaining an education till at 16 he became a teacher, and then, alternately teaching and working on his father's farm, prepared himself for study at the University of Michigan, which he entered in 1852 and graduated from in 1856. Returning to Lockport, he taught in the high school for two years, studying law at the same time, and then went for another year to the Albany Law School. Thus equipped, he turned towards the West, with an idea of settling in Iowa. But while on his way through Chicago he entered an examination of candidates for the principalship of a new school in that city, and passed with such success that the city school board offered him the place, which he accepted, entering on his work September, 1859. That settled his vocation, and from the foremost in the city he soon became one of the foremost teachers in the land. He was prominent first in the Principals' Association of Chicago, then in the State Teachers' Association of Illinois, and finally in the National Educational Association, which last he did much to organize in 1870, in its present working form. Two years before this, in 1868, he had been called from Chicago to organize the Peoria County Normal School, and for 11 years he carried it forward with such success as greatly to increase his reputation and much improve the quality of teachers, both in the county and elsewhere. But continuous work (including editorship of the Illinois Teacher from 1863 to 1871) began, at length to tell so greatly upon his health that retirement became necessary. He retired in 1879, after 20 years devoted to education in Illinois, and sought recuperation in change of occupation. But it proved to be too late, and he survived only about three years.

CHIEF STATE SCHOOL OFFICER.

Hon. JAMES P. SLADE, *State superintendent of public instruction, Springfield.*

[Term, January 13, 1879, to January 9, 1883.]

Superintendent Henry Raab, of Belleville, was chosen in November, 1882, to succeed Mr. Slade on his retirement.

INDIANA.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
White youth of school age (6–21)	699,745	693,649		6,096
Colored youth of school age	14,598	14,947	349	
Whole number of school age	714,343	708,596		5,747
White youth in public schools	495,540	490,164		5,376
Colored youth in public schools	8,315	8,628	313	
Whole enrolment	503,855	498,792		5,063
Average daily attendance	306,301	305,513		788
SCHOOL DISTRICTS AND SCHOOLS.				
School districts reported	9,313	9,323	10	
Districts in which schools were taught	9,264	9,172		92
Districts without schools	49	151	102	
Schools for colored youth	136	106		30
District graded schools	317	438	121	
Township graded schools	278	192		86
Average time of schools in days	133	133		
Public school-houses reported	9,496	9,556	60	
School-houses built within the year	415	303		112
Value of public school property	$12,024,180	$12,310,905	$286,725	
Private schools in public buildings	610	565		45
Pupils enrolled in these schools	13,814	12,852		962
Average daily attendance in them	8,221	8,659	438	
TEACHERS AND THEIR PAY.				
White male teachers in public schools	7,381	7,194		187
White female teachers in same	5,747	5,932	185	
Colored male teachers in same	73	80	7	
Colored female teachers in same	52	53	1	
Whole number of teachers	13,253	13,259	6	
Average monthly pay of men	$38 40			
Average monthly pay of women	33 20			
INCOME AND EXPENDITURE.				
Whole receipts for public schools	$4,537,739	$4,551,000	$13,261	
Whole expenditure for same	4,539,665	4,793,704	254,039	
STATE COMMON SCHOOL FUND.				
Amount of fund available	$9,133,606	$9,207,412	$73,806	

(From report of Hon. John M. Bloss, State superintendent of public instruction, for the years 1880–'81 and 1881–'82.)

STATE SCHOOL SYSTEM.

OFFICERS.

These are a State board of education; a State superintendent of public instruction, who is ex officio president of the State board; a county superintendent for each county; 3 school trustees for each township, incorporated town, or city, except in cities with 30,000 or more inhabitants, which have a school commissioner for each ward; and a director for

each rural school. The membership of the State board includes the governor of the State and 7 educational officers named by the law; the State superintendent is elected by the people for 2 years; the county superintendents, by the assembled township trustees of each county for a like term; the trustees, by the electors in townships, common councils in cities, and boards of trustees in incorporated towns, usually for terms of 3 years, with partial annual change where they form a board; the director, by the patrons of the schools he is to care for.

OTHER FEATURES OF THE SYSTEM.

The public schools are free to all unmarried youth of school age as ascertained by an annual census. They are sustained from the income of a large common school fund and of the congressional township school fund, a State tax of 16 cents on each $100 of taxable property and 50 cents on each taxable poll, and the income from licenses for the sale of intoxicating liquors and from unclaimed fees, all which, without deduction for expense of collection, must be used for the payment of teachers. In incorporated towns there may be also levied a special tax, not to exceed 30 cents on each $100, for support of town schools. For school-houses, furniture, apparatus, and fuel, a special tax is authorized in townships, towns, and cities with less than 30,000 people, not to exceed 50 cents on $100 of property and $1 on each poll in any year; but in cities of 30,000 or more inhabitants it must not, for the same purpose, exceed 25 cents on each $100 for buildings, &c., or the same amount for payment of teachers. For the support of free libraries in connection with the common schools in cities of 30,000 or more inhabitants a tax not to exceed $\frac{1}{5}$ of a mill on the dollar and in any township where there has been or may be by private donation a library worth $1,000 a tax not to exceed 1 cent on $100 may be levied.

The trustees of two or more adjacent counties or townships may establish a new district when in their judgment it shall appear necessary. Trustees may establish graded schools, or any modification of them, and joint graded schools may be established by school trustees of two or more municipal corporations. To be employed, teachers must possess a State, county, or city license, covering 6, 12, 18, or 24 months, which may be revoked for incompetency, immorality, cruelty, or general neglect of the business of the school. At the close of each term of school, teachers must make to the proper trustee a full report of the required data, verified by affidavit, not more than 75 per cent. of their wages being paid them until such report shall have been filed. They are also required to attend the township institutes or forfeit 1 day's pay for each day's absence not due to sickness.

Separate schools for colored children may be established, with all the rights, privileges, and advantages of other public schools; but where no such schools exist colored children may attend the schools for whites. Any youth attending a colored school, on showing sufficient advancement, must be placed in a higher grade, and no distinction is to be made on account of race or color. German may be taught at the request of the parents or guardians of 25 or more children attending a public school. The Bible must not be excluded from the public schools. Women are eligible to school offices.— (School law, 1877, and general laws.)

GENERAL CONDITION.

As will be seen from the foregoing summary, the statistics of 1881–'82 compared with those of 1880–'81 indicate a general falling off in all important items except the number of school-houses, valuation of school property, income and expenditure, and the amount of the common school fund. State Superintendent Bloss offers no explanation in his report of the figures indicating so general a decrease, but he says that during his term of office, thus far, he has found much to commend and few things to condemn in the working of the school system; what he cannot commend he finds in the administration rather than in the system. He regards the organization of the schools as accomplished; the schools in cities and towns have been graded, those of townships have been classified, and in many counties they have reached a fair standard of gradation. More attention was given to the mental, moral, and physical education of the children; more thought to methods and subjects of instruction; greater efforts were made to train pupils to think for themselves; more attention was given to the formation of character and the inculcation of good habits. These things he regards as the true evidences of progress. He has aimed to lessen the defects in the working of the system by holding the county superintendents and school trustees strictly to their duties and has sought to improve the schools by improving the teachers. While Indiana has a fair proportion of good teachers, compared with other States, the superintendent thinks a very large number of them are not well fitted for their work. Still, the fact that, while 63,853 applied for licenses, 23,317 were rejected shows some care in the admission of teachers. Of the 13,259 now in the field, he says only a part have attended a normal school, college, or university, and comparatively few were graduates of any of these institutions.

As showing the need of fuller schooling, a table taken from the census and embodied

in his report shows that of the population of the State of 10 years of age and upwards in 1880 4.8 per cent. could not read and 7.5 per cent. could not write; of whites 7 per cent. and of colored 35.6 per cent. could not write.—(State report.)

KINDERGÄRTEN.

One of the Kindergärten reporting from Indianapolis was reported in 1882 as closed, the teacher, Miss A. Steiger, being engaged in one of the public schools with a view to introducing the system. For statistics of others reporting, see Table V of the appendix.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

These are a superintendent; a board of three school trustees, elected for 3-year terms by the common council of each city, with partial annual change; and, in cities of 30,000 or more inhabitants, a board of school commissioners holding office for three years, with annual change of part of its membership.—(School law.)

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Evansville	29,280	14,463	5,790	4,562	133	$80,927
Fort Wayne	26,880	14,128	3,616	2,751	96	65,373
Indianapolis	75,056	30,878	13,322	9,510	220	258,975
Jeffersonville	9,359	3,734	1,733	1,261	31	20,168
La Fayette	14,860	6,640	3,004	1,614	51	34,455
Logansport	11,198	3,922	1,962	1,363	34	21,693
Madison	8,945	3,858	1,503	1,065	34	25,358
New Albany	16,423	6,364	2,929	2,037	54	29,000
Richmond	12,742	4,975	2,298	1,624	50	37,600
South Bend	13,280	5,247	2,664	1,434	41	28,864
Terre Haute	26,042	9,695	4,516	3,278	85	60,544
Vincennes	7,680	3,842	1,204	842	20	11,360

ADDITIONAL PARTICULARS.

Evansville, reporting for 1881–'82 an increase of 822 youth of school age, still enrolled only about 40 per cent. of the school population; 78.7 per cent. of the enrolment were in average daily attendance.—(State report.)

Fort Wayne, with 9 public school buildings (3,972 sittings), provided for only about 28 per cent. of the school population; adding 3,600 sittings in private and parochial schools, only 53 per cent. had school accommodations. School property was valued at $227,500. While school population and enrolment slightly increased, there was a small decrease in average daily attendance. Of the 3,200 in private and parochial schools, about 2,200 were in average daily attendance, occupying 16 buildings, with 3,600 sittings for study. The public schools were in session 192 days. Special teachers in music, drawing, and penmanship were employed.—(Return.)

Indianapolis in 1881–'82 had 29 school buildings, with sittings for 10,755, only a fraction more than one-third of the school children. These buildings, with other school property, were valued at $920,137. While there was an increase of 1,919 in school population, of 504 in enrolment, and of 445 in average daily attendance, 13 fewer teachers were employed, with an increase of $27,517 in expenditure. For music and drawing there were special teachers. Only 43.13 per cent. of school population were enrolled in the public schools; and, if to this be added 1,053 in private and parochial schools, it shows only 46.55 per cent. in school.—(Return.)

From *Jeffersonville* the only three items of school statistics reported for 1881–'82 show a gain of 286 in school population over the previous year, of 109 in enrolment, and of 97 in average daily attendance. Only 46.4 per cent. of the children of school age were in the public schools during the year, while 72.2 per cent. of the enrolment was in average daily attendance.—(State report, 1882.)

La Fayette reported for 1881–'82 only three items of school statistics, which show an increase of 166 in school population, of 18 in enrolment, and of 4 in average daily attendance, enrolling during the year only 45 per cent. of its school children and having only 53.7 per cent. of the enrolment in average daily attendance.—(State report.)

Logansport in 1881–'82 had 6 school buildings, with 1,660 sittings, school property being valued at $145,900. This provides public school room for 42.3 per cent. of the school pop-

ulation. One special teacher in music was employed. There were 900 enrolled in private and parochial schools.—(Return.)

Madison reported 7 public school buildings, with 29 rooms for work, valued, with other school property, at $81,000. There was a falling off of 1,425 in school population and a decrease of 219 in average daily attendance, of 7 in teachers, and of $3,396 in expenditure. Its enrolment shows not quite 39 per cent. of its children of school age in the public schools; there were 750 in private and parochial schools. Schools were taught 196 of the 200 school days.—(Return.)

New Albany reported only 46 per cent. of its school population as enrolled and 69 per cent. of the enrolment in average daily attendance.—(State report.)

Richmond presents a full report, showing 10 public school buildings, with 51 rooms and 2,045 sittings. The 8 owned by the city and other school property were valued at $103,350. There were 46 schools, employing 50 teachers and 2 specialists in music and German. The enrolment exceeded that of last year by 131; the average daily attendance was 80 more; the public school enrolment was only 46.19 per cent. of the school population. There were 700 in private and parochial schools.—(City report and return.)

South Bend reports an increase of 542 in school population over 1880–'81, of 140 in enrolment, and of 175 in average daily attendance, this attendance being 69.47 per cent. of enrolment. The 7 school buildings, which furnished abundant sittings in the previous year, were insufficient in 1881–'82. With the rapid increase of school population additional school rooms were imperatively called for; school property increased in value from $131,350 to $134,000. The schools are classed as primary, lower and upper intermediate, grammar, and high, the course covering 12 years, giving 2 years to each lower department and 4 to the high, in which German may be substituted for Latin throughout the course, no Greek being required.—(City report and return.)

Terre Haute, to provide for an increase of 849 in school population, of 206 in enrolment, and of 131 in average daily attendance over 1880–'81, added 4 rooms to one of its 11 school buildings, making in all 73 rooms for both recitation and study and 13 for recitation only, with 3,900 sittings; school property was valued at $229,930. The full course covers 12 years, music and drawing, with instruction in good behavior, coming in each year below the high school, which has a 4-year course, in which Greek is elective. German, if elected, begins in the third year of the district schools or in the first year of the high school, and is taught by special teachers, while Latin is also elective in the first 3 years of the high school course. The work of the high school was satisfactory, the enrolment being up to that of former years and the average attendance better. The public schools enrolled only 47 per cent. of the school population.—(City report and return.)

Vincennes reported 4 school buildings and 20 rooms for both study and recitation, with 854 sittings. School property was valued at $44,500. There was an increase of 102 in enrolment, of 30 in average attendance, and of 2 in teachers. Special teachers in music and German were employed. There were sittings for only 22 per cent. of youth of school age. Including 700 in private and parochial schools, 49 per cent. of the school population was enrolled.—(Return.)

TRAINING OF TEACHERS.

STATE NORMAL SCHOOL.

The Indiana State Normal School, Terre Haute, prepares young men of 18 and young women of 16 for work in the public schools. To enter, all pupils must have at least a fair knowledge of common branches and a reputation for good moral character. It presents 3 courses of study: one of three years, for those needing a knowledge of the subjects to be taught, as well as of approved methods of teaching them; another, of 2 years, for persons of better education or of some experience in teaching, who need a closer insight into the principles and practice of effective teaching; a third, of 1 year, for college graduates and other high grade students who wish to study the philosophy of teaching and the best means of imparting knowledge. All that enter these courses are pledged to teach in the State schools twice as long as they attend the normal school, if practicable. To aid and illustrate the training given there is a practice department of about 200 pupils, under 4 critic teachers, and every student in the theory department is expected to spend from 1 to 3 hours daily in observing the work done in the practice schools, in teaching in them, or in some study relating to such work. The number of regular professors, besides the critic teachers above mentioned, was 12 in 1881–'82; the number of different normal pupils, 529; graduates for the year, 30, all engaged in teaching.

OTHER NORMAL SCHOOLS.

The Indianapolis Normal School and the Training Department of Public Schools, Fort Wayne, continued to give instruction in the work of teaching, with practice in model schools, granting diplomas on completion of required courses. The former, with a course of 1½ years, had 1 instructor and 39 students, graduating 19, who all engaged in teaching;

the latter, requiring 1 year of study after the high school, had 3 instructors and 9 students, all graduated and engaged to teach. Two opened in 1882: (1) the Elkhart Normal School, with 10 instructors, 23 normal and 19 other students, and a 2-year course; (2) the Kindergarten Normal Training Department of the Hadley and Roberts Academy, Indianapolis, with a 2-year course, 2 instructors, and 4 students, all engaged to teach in 1883. Normal training, in some cases separate from the regular course, in others connected with it, appears in the latest catalogues of a number of the colleges and universities.

The 5 private schools reported in 1880–'81, with large rewards for short courses, show no changes in 1881–'82. These are the Central Normal College, Danville; the Central Indiana Normal School, Ladoga; the Southern Indiana Normal College, Mitchell; the Southern Indiana Normal School, Paoli; and the Northern Indiana Normal School, Valparaiso. The last reported, for 1881–'82, 2,910 normal students, against 2,100 the previous year. For statistics of others reporting, see Table III of the appendix.

TEACHERS' INSTITUTES.

According to the law requiring teachers' institutes to be held in each county of the State at least once a year and in townships at least one Saturday of each month, 90 county and 4,299 township institutes were held in 1882. Of private normal institutes, 101 were reported as held, under 255 instructors, with 4,809 attendants.

These institutes are regarded as a most important factor in the school system, giving larger returns than any other local expenditure. To aid the instructors, the State board of education prepared outlines of the work in the county institutes to be held in 1881 and 1882. The State superintendent says that no work of the board has done more for the cause of education in so short a time or prepared the way for grander results for the future. During 1882 he visited 63 institutes, spending 1 day or more in each and delivering 160 addresses to teachers and the public in 78 different counties.

EDUCATIONAL JOURNALS.

The Indiana School Journal, Indianapolis, the organ of the State superintendent, began its twenty-seventh volume in June, 1882, continuing through the year. School Education, Terre Haute, which began its second volume December, 1880, appears to have suspended. The Normal Teacher, Danville, began its fourth volume in March, 1881, but the numbers necessary to complete the volume not having been received it is supposed to have suspended. The Normal News, also published at Danville, continued its publication through 1882 in quarterly numbers.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

The number of high schools is not reported, because not expressly provided for in the State law. They are, however, recognized by the State University and the State board of education under an arrangement which admits certified graduates of approved high schools without examination into the freshman classes of the State and Purdue Universities. Such graduates are also admitted in the State Normal School to advanced standing, by which they are enabled to complete the whole course in 2 years. Thirty-four such schools were commissioned for the school year 1881–'82.

OTHER SECONDARY SCHOOLS.

For detailed statistics of business colleges, private academic schools, preparatory schools, and preparatory departments of universities and colleges, see Tables IV, VI, VII, IX, and X of the appendix; for a summary of their statistics, see corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

Indiana University, Bloomington, waives the admission examination of graduates (of either sex) of approved high schools. Other candidates may be examined by any county superintendent who holds a commission from the university for that purpose. In all such cases the questions are prepared and the answers examined and graded by the university. All other applicants must be examined on the studies of the university's preparatory course of 2 years, the entrance examination being the same for all courses. The student on admission has his choice between three collegiate courses, one in ancient classics, leading to the degree of A. B.; one in modern classics, leading to the degree of LIT. B.; the other in science, leading to the degree of S. B. These courses are the same in extent and value, each requiring 4 years for its completion, and in culture and mental discipline they are as nearly equivalent as possible.

Catalogues of other universities and of colleges for 1882 show no material changes in the amount and character of their work since 1880–'81. The following continued their full classical, scientific, or philosophical courses of 4 years each, with preparatory courses of 2 and 3 years: Butler, Hartsville, Indiana Asbury, and Notre Dame Universities and Concordia, Earlham, Franklin, Hanover, Moore's Hill, Ridgeville, Union Christian, and Wabash Colleges. Franklin and Wabash had also English courses. Ft. Wayne, Moore's Hill, Notre Dame, St. Meinrad's, and Union Christian gave commercial training; Earlham, Ft. Wayne, Hartsville, Moore's Hill, Ridgeville, and Union Christian gave some normal training; all but Wabash and St. Meinrad's, instruction in music; 4 taught drawing and painting; all but 2 taught modern languages, while 7 gave ministerial training. Two universities have law courses of 2 years, and 2, medical courses of the same length, for which, see next page.

Ft. Wayne College does not attempt a full collegiate course. Though chartered as a college, it is thought best at present to do only academic and preparatory work, hoping with the increase of funds to be able to enlarge the course of study.—(Catalogue.)

For statistics of colleges, see Table IX of the appendix; for a summary of their statistics, a corresponding table in the report of the Commissioner preceding.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Of the 15 institutions for young men heretofore mentioned, 11 admit women on equal terms with men, while Purdue University, noted below, has from the first been open for the liberal education of women. Of those for young women only, the Moravian Seminary, Hope, was closed in 1882, and the Female College of Indiana, Greencastle (Presbyterian), has not reported for several years. The only definite information for 1882 is therefore from De Pauw College for Young Women, New Albany (Methodist Episcopal), and from St. Mary's Academic Institute, St. Mary's (Roman Catholic), the former with preparatory and collegiate courses of fair grade, in which were 45 preparatory students and 40 collegiate, besides 45 others, all under 8 instructors; the latter with courses less defined, in which were 148 pupils of all grades, under 25 teachers.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The Indiana University and 11 other colleges offered scientific instruction to some extent in 1881–'82.

Purdue University, La Fayette, was the only institution devoted exclusively to technical training. Such instruction was given in 3 departments: (1) the college of general science, with 3 general courses of 4 years each, scientific, agricultural, and mechanical; (2) six special schools: (*a*) school of agriculture and horticulture, 4 years; (*b*) school of mechanics, 2 years; (*c*) industrial art, 4 years, 2 given to industrial design and 2 to mechanical drawing; (*d*) school of chemistry, 3 years; (*e*) school of natural history, 4 years, 2 years each given to botany and zoölogy; (*f*) school of mechanical and civil engineering, reorganized in 1882; and (3) the university academy course of 2 years, which prepares students for admission to the college of general science and provides instruction in the higher common school branches for those not able to take a more extended course. Women are admitted on equal terms with men. Instruction in military tactics is given in three drills a week, under an officer detailed by the War Department. Under 13 instructors, including the president, there were 238 students (excluding duplicate enrolments), 129 in academy, 61 in special courses, and 99 in college.

Rose Polytechnic Institute, Terre Haute, founded by the late Chauncey Rose, was to be opened March 8, 1883, adding much to the means of scientific training in the State.

PROFESSIONAL.

Theological.—Theology was taught in 1881–'82, mainly, as in previous years, as a mere auxiliary to university and college courses, with but slight changes since 1880–'81. The exceptions, as before, were in Union Christian College, Merom (Christian), and St. Meinrad's College (Roman Catholic), both having special theological courses of 3 years each. In the biblical department of Butler College, Irvington (Christian); in that of Indiana Asbury University, Greencastle (Methodist Episcopal); and probably in connection with the elective Hebrew in Moore's Hill College, Moore's Hill (Methodist Episcopal), and of Notre Dame University, Notre Dame (Roman Catholic), some instruction was given in aid of those designing to enter the work of the ministry. Concordia College, Fort Wayne (Evangelical Lutheran), continued to prepare students for the Practical Preachers' Seminary, at Springfield, Ill., and Evangelical Lutheran Seminary, at St. Louis, Mo.

For statistics of theological schools, see Table XI of the appendix.

Legal.—The University of Notre Dame in 1881–'82 continued its law department with 3 professors, giving no statement of attendance. For admission to its 2-year course, a complete English education was expected and a classical training was advised. Students must pass an examination at the close of each term and present an essay on some practical topic. For graduation, proof must be given of proficiency in rhetoric, English literature, and logic, as well as in law. Indiana Asbury University, during the year, organized a department of law, under a faculty of 5 professors, with a class of 12 students for the first year.

Medical.—Medical instruction was given in 1881–'82, as in 1880–'81, by the following "regular" schools: Medical College of Evansville; Medical College of Fort Wayne (not to be confounded with the Fort Wayne College of Medicine, which remained under the ban of the American Medical College Association); Medical College of Indiana, Indianapolis; and the Central College of Physicians and Surgeons, Indianapolis.

The Medical College of Fort Wayne and the Central College, Indianapolis, lengthened their lecture courses, the former to 24 weeks, the latter to 21. Both offered (though without requiring it) a graded 3-year course.

Central Normal College, Danville, Northern Indiana Normal School, Valparaiso, and Notre Dame University announce courses preparatory to entering the regular medical schools.

The Indiana Eclectic Medical School, Indianapolis, continued its teaching in 1881–'82, graduating 7 students from a 2-year course of 20 weeks each year.

Dental.—The Indiana Dental College, Indianapolis, continued its instruction in 1881–'82 with increased facilities. As heretofore, it required 2 years of preparatory work and an entrance examination in common school studies when necessary. The course of training of 1, 2, or more years covered 5 months each year and an examination was required at its close. Women as well as men are admitted. Professors and instructors for the year, 11; graduated at its close, 15.

For statistics of medical and dental schools, see Table XIII of the appendix; for a summary of them, a corresponding table in the report of the Commissioner preceding.

SPECIAL INSTRUCTION.

EDUCATION OF DEAF-MUTES.

The Indiana Institution for the Education of the Deaf and Dumb, Indianapolis, had in 1882 a total of 374 pupils, 201 of them males and 173 females, under 18 instructors, of whom 4 were deaf-mutes and 5 semi-mutes; 83 of the pupils also were deaf-mutes. Of the 374 pupils for the year, 324 remained December 1, 1882. Whole number instructed from the beginning, 1,451. The instruction included common school studies, cabinet making, chair caning, and shoemaking for boys, with household industries for the girls. A library of 3,172 volumes aided and supplemented the instruction given, which combined the manual and oral methods. Valuation of buildings and grounds, $457,510; expenditures for the year: for support, $52,819; for buildings, $2,982.

EDUCATION OF THE BLIND.

Indiana Institute for the Education of the Blind, Indianapolis, reported for 1881–'82 10 teachers and 14 other employés, 4 of the last mentioned being blind, with 128 pupils. The common and high school branches are taught, and an additional 3-year course is given those who can advance so far. Special attention is devoted to music and piano-tuning. All are taught handicrafts; the girls, beadwork, sewing by hand and machine, crocheting, cutting and fitting dresses; the boys, broom making. The health of the inmates was good and satisfactory progress was made in the different departments. There had been 700 admitted since the opening.

EDUCATION OF THE FEEBLE-MINDED.

The Asylum for Feeble-Minded Children, near Knightstown, reported a decreased enrolment in 1881–'82, but the same number of instructors and other employés. Since opening (in 1879) 9 had been dismissed as improved. The children are taught reading, writing, simple numbers, music, and light gymnastics. Income from the State, $10,000.

EDUCATION OF ORPHANS.

The Indiana Soldiers' Orphan Home, near Knightstown, is under the same general supervision as the above, both being State institutions. Children to be admitted must be under 15 years of age, and on reaching that age have homes in good families provided for them. The older boys work on the farm. In school, reading, writing, arithmetic, drawing, and vocal music are attended to. Number of officers, teachers, and assistants in 1881–'82, 8; pupils, 154; pupils since opening, 1,232; State appropriation, $24,000.

Five other asylums supported by public charity report in 1881–'82: St. Ann's Female

Asylum, Terre Haute, and St. Joseph's Orphan Asylum and Manual Labor School, Rensselaer (Roman Catholic), are for girls, and teach domestic duties, knitting, sewing by hand and machine, and in school a common education, with music. They provide good homes for the younger and prepare the older ones to earn their own living. The former had 151 inmates, and 978 since opening; the latter, 42, and 358 since opening. The others are (1) the Jeffersonville Orphan Home, Jeffersonville (non-sectarian), supported by a local association; (2) the Wernle Orphan Home, Richmond, supported by the Evangelical Lutheran Synod of that and other States, which admits children 2 to 14 years of age, and teaches reading, writing, arithmetic, and music, girls being also taught to knit, sew, and do general housework, and boys to do farm and garden work; and (3) the Hamilton County Children's Home, Westfield, supported by the county, which admits children 2 to 16 years of age, gives a common education, with instruction in housework, laundry, needle and fancy needle work, and in farming, and at suitable age provides homes or employments.

Besides these are the Richmond Orphan Asylum, Richmond, and the Indianapolis Orphan Asylum, Indianapolis, from which no returns have come in.

FREE KINDERGÄRTEN.

During 1882, the Indianapolis Benevolent Society opened 2 free Kindergärten in parts of the city where large numbers of destitute families were found. Under the teachings of experienced and devoted instructors the results were so happy that the public promptly met the expenses, and this beginning was to be followed by the opening of others.

TRAINING OF NURSES.

The Flower Mission Cottage Hospital and Training School for Nurses, Indianapolis, begins its work in a 2-year course under a head nurse from Bellevue Hospital, New York. Work will be found in the hospital for 6 pupil nurses.

INDUSTRIAL TRAINING.

The Busy Bee, Richmond (Friends), gathers poor and idle children over 4 years of age, teaches them to sew, knit, work on cardboard, &c., and is supported by contributions. It had 22 female teachers and 105 pupils.

REFORMATORY TRAINING.

The *Reformatory Institution*, for women and girls, Indianapolis, had penal and reformatory departments under State control at a cost in 1882 of $28,000, and earned in that year by its industries $2,600. In the reformatory department children must be under 16 years of age to be admitted. During 1881–'82, 51 were committed, 61 discharged, and 144 retained. The inmates were in school one-half of the day and were taught the common branches. The industrial training included cane seating, laundry work, sewing, and all domestic employments. Of those gone out during the year, 88 per cent. were doing well, while of all released from the beginning 82 per cent. are known to have become useful members of society. Whole number committed since establishment, 492.—(Report and return.)

Indiana Reform School for Boys, Plainfield, is a State institution, and in 1882 cost $16,125, an average of $120 for each inmate. Boys are admitted between 10 and 17 and are taught the common English branches. They are also trained in farming, gardening, tailoring, carpentry, chair caning, shoemaking, and laundry work. During the year, 177 being committed and 183 released, there were 372 inmates, 16 more than the preceding year. The parents of nearly all were illiterate, and many of the oldest inmates, when committed, had never been at school. Their progress while in the institution was generally rapid. Since the opening 1,718 had been committed, and 95 per cent. of those honorably discharged were known to have become useful citizens.—(Report and return.)

EDUCATIONAL CONVENTIONS.

CONVENTION OF COUNTY SUPERINTENDENTS.

This body held its annual session at Indianapolis, June 20 and 21, with superintendents present from 58 counties. The meeting is said to have been one of the largest and most profitable ever held. Mr. Nowles, of Jasper County, chairman of a committee on a "system of graduation from district schools," reported for the committee, recommending that diplomas or certificates of proficiency be given to pupils who shall have completed the course of study in district schools and suggesting a plan for the accomplishment of this purpose. There is no record of any action taken on this report.—(Indiana School Journal, July, 1882.)

STATE TEACHERS' ASSOCIATION.

This body met in its twenty-ninth annual session at Indianapolis, Tuesday, December 26, 1882, and was called to order by the retiring president, H. B. Jacobs, who in a brief address insisted that good teaching does not consist in teaching many things but in teaching a few things well. Superintendent H. S. Tarbell, president elect, on taking the chair, delivered an admirable address on the "Relation of the imagination to educational work."

The first paper read on Wednesday morning was by W. F. Yocum, president of Fort Wayne College, on "Relative values of discipline and instruction in the public schools," which was discussed by Edward Taylor, of Vincennes; Dr. Brown and Michael Seiler, of the State Normal School; and W. A. Bell and J. M. Strasburg, of Richmond. There was presented a petition prepared by the Woman's Christian Temperance Union, to be signed and presented to the legislature, asking it to authorize the teaching of temperance in the public schools. Miss Lida D. Hadley, of Richmond, then read a paper on "Essentials in education," such as care of health, good primary training, pleasant moral influences, and judiciously planned courses of instruction. The discussion of this subject was opened by D. W. Thomas, of Wabash, in a well prepared paper, who was followed by Timothy Wilson in a short paper on the same subject. In the afternoon there was a carefully prepared paper on "Psychology and the preceptor," by Howard Sanderson, of the State Normal School. In opening the discussion, Professor Study, of Greencastle, said that the teacher should know the mind intrusted to him for development, but of this he feared the great mass of teachers almost entirely ignorant. Dr. E. E. White, of Purdue, said that the importance of a knowledge of the human mind must be conceded by all. He was glad the normal school had taken hold of this work, and hoped that the science of education would be so formulated that teachers might have something to study on this subject. Jesse H. Brown gave an exercise to explain drawing as taught in the Indianapolis schools, and Prof. L. S. Thompson, of Purdue, then presented some forms of it for use in country schools. At the evening session an address was delivered by Dr. Moss, president of the State University, on "Education and the Commonwealth."

At the morning session of the third day Mrs. L. D. Cunningham, of Madison, read a paper on "Cultivation of the powers of expression." After discussion of this paper Charles F. Coffin, superintendent of schools of New Albany, read a paper on "Teaching thrift in the public schools." This paper was discussed by Superintendent J. M. Bloss, Prof. Amzi Atwater of the State University, Prof. L. S. Thompson, and Dr. J. S. Irwin of Fort Wayne. In the afternoon William A. Bell, of the Indiana State Journal, read a paper on "Recent criticisms on public schools."

The usual officers and committees for the ensuing year were appointed and resolutions adopted, after which the association adjourned. There was an attendance of about 500 and a membership of 214, of whom 42 were new members.—(Indiana School Journal, February, 1883.)

SOUTHERN INDIANA TEACHERS' ASSOCIATION.

This body held its fifth annual meeting at Connersville, March 29, 1882. Several able papers were read and discussed, which, for want of space, cannot be fully noted in this report. It is said to have been one of the largest and most enthusiastic meetings ever held.—(Indiana School Journal, May, 1882.)

INDIANA COLLEGE ASSOCIATION.

This association held its fifth annual session at Indianapolis, December 26 and 27, 1882, the following universities and colleges being represented: Indiana, Indiana Asbury, Butler, Purdue, and Hartsville Universities and Hanover, Wabash, Franklin, and Earlham Colleges.

Prof. H. W. Wiley, of Purdue, read the opening paper, on "The disciplinary value of the study of the natural sciences," the discussion of which was opened by Prof. D. S. Jordan, in a paper on "The disciplinary value of the natural sciences."

Next came "The schools of the United States," from the president, D. W. Fisher, of Hanover College. The idea, he said, of a single organic whole, with the perfect articulation of a living creature, with no loss of time in the transition from one department to another, and friction at a minimum, has, in a large degree, been realized in our school system. But we must not refuse to see defects. Law and medical schools admit on too low a standard. The State should require a diploma of a chartered college as the lowest standard of admission. Of colleges we have none too many—only about 400. The fault with us is in a lack of means to do the work as it should be done in the time allotted to it. We are trying to do too much for the time. The high schools are the most important representatives of secondary instruction. There is need of them as the feeders of colleges, and they should have a uniform course. As to our intermediate and primary schools, we may be proud of them. The one defect in our whole system is lay-

ing too much stress on breadth and too little on depth and thoroughness. Yet with all the deficiencies, we need not be ashamed to submit our school system to the scrutiny of the world as one of the grandest features of our civilization.

Then came a paper on "Disciplinary value of philological study," by Professor Amzi Atwater, which was discussed at great length and was followed by an able paper on "College discipline," read by Dr. Lemuel Moss, defining discipline as having reference to conduct and character rather than to scholarship.

Dr. W. T. Stott, from the committee on degrees, reported that the association recommend to the colleges to make the amount of work necessary for the degrees of B. S. and B. PH. equal to that necessary for A. B., to give the second degree in course only upon application of the candidate and upon evidence of scholarly habits and activity, and to give the degree of PH. D. only upon satisfactory examination.

Prof. J. W. Moncrief then read the closing paper on "The place of American literature in the college courses."

Officers for the ensuing year having been elected, the association adjourned.

CHIEF STATE SCHOOL OFFICER.

Hon. JOHN M. BLOSS, *State superintendent of public instruction, Indianapolis.*

[Term, March 15, 1881, to March 15, 1883, then to be succeeded by John W. Holcombe, elected in October, 1882.]

IOWA.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth of school age (5 to 21)	594,730	604,739	10,009	
Enrolled in public schools	431,513	406,947		24,566
Per cent. of enrolment on school population.	72.5	67.2		5.3
Average attendance	254,088	253,688		400
Per cent. of attendance on enrolment	58.8	62.3	3.5	
Number attending private schools	15,098			
SCHOOLS.				
Public graded schools	503			
Ungraded schools	10,741			
Whole number of schools	11,244			
Average time of school in days	148	142		6
School-houses of brick or stone	938			
Whole number of school-houses	11,221			
Value of public school property	$9,533,493	$9,977,142	$443,649	
TEACHERS.				
Men teaching in public schools	6,546	6,044		502
Women teaching in public schools	15,230	16,037	807	
Whole number of teachers	21,776	22,081	305	
Average monthly pay of men	$32 50	$35 20	$2 70	
Average monthly pay of women	27 25	27 46	21	
Teachers' institutes held	98			
INCOME AND EXPENDITURE.				
Whole receipts for public schools	$5,006,024	$5,558,259	$552,235	
Whole expenditure	5,129,819	5,525,449	395,630	
STATE SCHOOL FUND.				
Amount of permanent school fund	$3,547,124	$3,732,174	$185,050	

(From report and return of Hon. C. W. von Coelln for 1880–'81 and return of Hon. J. W. Akers for 1881–'82.)

STATE SCHOOL SYSTEM.

OFFICERS.

A State superintendent, elected for two years, has general supervision of the public schools. A law of 1882 created a State board for the examination of teachers, to consist of the superintendent, the president of the State University, the principal of the State Normal School, and two persons, one of whom must be a woman, to be appointed by the executive council. Each county has a school superintendent; each township and independent district, a board of directors; and each subdistrict into which a township may be divided, a subdirector, the subdirectors of the subdistricts forming a district township board. Women are eligible to any school office in the State.

OTHER FEATURES OF THE SYSTEM.

Public schools must be taught in each subdistrict for at last 120 days in the year and are free to all resident youth of school age. They are sustained from the income of a

State school fund, from county taxes of 1 to 3 mills on $1, and from district taxes not to exceed 10 mills on $1 for a school-house fund and $5 a pupil for a contingent fund. Besides common schools the system includes high schools, a State Normal School, teachers' institutes, a State university, agricultural college, reform school, institutions for the blind, the deaf and dumb, and the feeble-minded. Teachers, to be legally employed, must have certificates of qualification. They must keep a register and make annual reports to the board of directors, which, in turn, reports to the county superintendent, and he to the State superintendent.

ADDITIONAL SCHOOL LAWS.

The legislature at its session in 1882 provided that boards of directors of each district, township, and independent district should cause to be set out at least twelve shade trees on each school-house site belonging to the district, in case so many were not already growing. It was made the duty of the county superintendent to see that this provision was complied with. It provided also that boards of directors of district townships should be authorized to obtain at the expense of the district township such highways for proper access to their school-houses as they might deem proper, and to use unappropriated contingent funds to effect insurance on the school property of their districts; that county superintendents should have $4 instead of $3 for every day necessarily engaged in the performance of official duties, and that they might visit the different schools of their counties in their discretion, and must, at the request of the majority of the directors of a district, visit the school in said district at least once each term; and, finally, that there should be a State board of examiners for teachers desiring certificates of qualification good throughout the State.

GENERAL CONDITION.

The printed reports of public education being biennial in this State and the last one being for 1880–'81, no information as to the condition of the public schools can be presented beyond what may be drawn from the above summary of statistics, which was prepared from figures kindly furnished by the State superintendent.

It appears that, with 10,009 more youth of school age in the State, there were 24,566 fewer pupils enrolled in public schools, the average attendance also decreasing, but in much smaller proportion; the ratio of average attendance to the number enrolled increased 3.5 per cent. The average school term was 6 days shorter. More teachers were employed, and their average pay was slightly greater. More money was received and expended for school purposes; the permanent fund increased by over $185,000 and the estimated value of public school property by nearly $450,000.

KINDERGÄRTEN.

Kindergarten instruction has been given in Cedar Rapids since 1877; in Des Moines, since 1876; in Manchester, since 1878; and in September, 1882, a Kindergarten was organized at Council Bluffs in connection with the public school system. West Des Moines introduced Kindergarten instruction the spring previous. For statistics of these schools reporting, see Table V of the appendix, and for a summary, see the report of the Commissioner preceding.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

Public schools are controlled by boards of school directors, numbering 6 members in cities of more than 500 population, and in smaller cities 3 members. City superintendents, appointed by the board, are generally employed.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Cedar Rapids	10,104	3,848	2,536	1,544	40	$33,542
Clinton	9,052	3,329	2,203	1,436	36	36,150
Council Bluffs	18,063	6,896	2,419	1,378	42	52,950
Davenport	21,831	.....	4,882	3,501	82	68,000
Dubuque	22,254	10,531	3,884	2,545	72	60,243
Keokuk	12,117	4,897	2,461	1,819	50	34,111
Ottumwa	9,004	3,042	2,000	1,440	26	54,470
West Des Moines	14,005	4,412	2,875	1,796	51	59,217

ADDITIONAL PARTICULARS.

The *Cedar Rapids* public schools, comprising primary, grammar, and high grades, with 12 years in all, were taught 178 days, in 9 school buildings having 38 rooms for study and capable of accommodating 2,024 pupils. About 300 attended private and parochial schools.

Clinton reports 32 public schools, primary, grammar, and high, taught for 184 days in 6 buildings valued, with other school property, at about $75,150. Besides the public school attendance noted above, Clinton had about 300 pupils in private or parochial schools.

The *Council Bluffs* public schools were taught 194 days in 12 school buildings. The enrolment reported above includes children 5 years old, who were taught in a Kindergarten.

Davenport had 73 public schools, including primary, grammar, high, city normal, and evening schools, the day schools being taught 193 days in 13 school buildings. Value of all school property, about $291,000. There were 1,200 pupils enrolled in private and parochial schools.

Dubuque reports her public schools (primary, grammar, and high) taught for 198 days in 9 school buildings, which afforded accommodation for 3,550 pupils. There were 2,620 pupils attending private and parochial schools.

In *Keokuk* public schools were taught for 186 days in 8 school buildings. Value of all school property, about $100,000. Besides the public school enrolment shown in the above table there were about 300 pupils in private and parochial schools.

Ottumwa reports 26 public schools, taught for 187 days in 3 buildings valued, with other school property, at $65,150, and a private school enrolment of about 200.

West Des Moines reported her public schools as taught for 187 days in 6 school buildings, valued, with other school property, at $247,500. The year was one of marked progress in school affairs, the enrolment increasing by 400, more than double the increase of the last year, a new building necessary to accommodate this increase being added and a training school for teachers established. The course of study begins with a year of Kindergarten work and includes beyond that 3 primary years, 4 grammar, and 4 high. A special effort was made to increase the practical efficiency of the schools. In arithmetic, business methods adapted to the ability of the children are used, and every example given is an actual problem drawn from business pursuits. Improvement in music was noticeable. The only drawback to the prosperity of the schools was the prevalence of scarlet fever, which, for a time, almost caused their suspension.—(City report and return.)

TRAINING OF TEACHERS.

STATE NORMAL SCHOOL AND STATE UNIVERSITY NORMAL DEPARTMENT.

The *Iowa State Normal School*, Cedar Falls, enrolled 352 students during the year, all but 7 of them being normal students, and graduated 37, of whom 28 engaged in teaching. Two courses are presented, a didactic course of 3 years, which prepares for teaching in common and high schools, and a scientific course, comprising one additional year and fitting teachers to be superintendents and principals of high and normal schools and academies. Tuition is free to normal students.

The *chair of didactics of the State University*, Iowa City, an elective course of the senior year, comprises a study of the history of education and of the works of the best educational writers, of national systems of education, practical educational topics, school management and supervision, and the principles of education. There were 29 pupils engaged in the course during 1881–'82 and 15 were graduated.

OTHER NORMAL SCHOOLS AND NORMAL DEPARTMENTS.

The *Eastern Iowa Normal School*, removed from Grand View to Columbus Junction, has been established in a new and convenient building costing $25,000, a gift from the people of Columbus Junction. Two normal courses of study are offered, an elementary of 3 years and an advanced which adds 2 more. There is also a commercial course of 2 years. Of 232 students attending, 110 were in the normal courses.

Southern Iowa Normal School and Commercial Institute, Bloomfield, offers preparatory, teachers', collegiate, commercial, fine art, musical, and telegraphic courses of study. The teachers' department comprises a course including among other branches mathematics, natural sciences, language, United States history, civil government, and the theory and practice of teaching. The course of 50 weeks is divided into terms of 10 weeks each. Beginning, advanced, and review classes are sustained each term, allowing persons of various degrees of advancement to enter during any part of the year; but special attention is given to review work during the fifth or summer term. There were 491 normal pupils enrolled during 1881–'82 and 20 were graduated.

Whittier College and Normal Institute, Salem (Friends), offers a teachers' course of 3

years, a scientific course which adds another year, and a course in business, as well as elective courses. Of 122 pupils attending during the year 38 were preparing for teaching.

Dexter Normal School, Dexter, reports an elementary normal course of 2 years, the full course adding one year; also, scientific and business courses and a course preparatory to the State University.

The *Normal School of the German Evangelical Synod of Iowa*, Waverly, reports a normal course of 3 years and 20 students engaged in it during 1881–'82.

The normal department of *Upper Iowa University*, Fayette, had 150 pupils in a 3-year normal course, and the normal department of *Oskaloosa College*, Oskaloosa, 217 pupils in a 4-year course.

Normal instruction was also given, either in the collegiate or preparatory department, at Iowa College, in a course of 1 year; at Amity, Tabor, and Western Colleges, in courses of 2 years; at Norwegian Luther College, in one of 3 years; at Cornell College, in one of 2 preparatory or two collegiate years; at Penn College, in one of 4 years; at Parsons College and in Iowa Wesleyan and Central Iowa Universities, in courses not defined. Callanan College, Des Moines, and St. Agatha's Academy (for women), Iowa City, also made provision for the training of teachers, the former in a course of 3 years, the latter in one not limited as to time.

A new normal college is reported in the Iowa Normal Monthly to have been established (apparently in 1882) at Shenandoah, under the presidency of I. E. Wilson.

Normal or training departments were also reported in connection with the city school systems of Davenport and West Des Moines, the former having 13 students enrolled, the latter 9.

TEACHERS' INSTITUTES.

Institutes for the instruction of teachers, to continue from 2 to 4 weeks, were advertised by the State superintendent to be held in all the counties of the State, but no further information regarding them has been received.

EDUCATIONAL JOURNALS.

The Iowa Normal Monthly, Dubuque, continued its useful career in 1882, being in Volumes V and VI and doing much to interest and aid the teachers of the State.

The Central School Journal, Keokuk, a monthly, was also in its fifth volume and did good service in the same direction as the Normal.

The Normal Index, Columbus Junction, monthly, worked together with the above, being then in a third volume; while the Normal Institute, Glidden, and a companion, the Glidden News Boy, gave considerable educational information.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

The number of high schools in Iowa cannot be definitely stated, but there were 25 in 1881–'82 approved by the State University as fitting schools for it, their graduates being admitted without the examination required of other applicants for admission.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academic schools, and preparatory departments of colleges, see Tables IV, VI, VII, and IX of the appendix, and for summaries of them, see the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The *State University of Iowa*, Iowa City, has collegiate, law, medical, and dental departments, noted under Professional Instruction. The collegiate department has 2 schools, 1 of letters and 1 of science, each with 2 courses of study, the former classical and philosophical, the latter engineering and general scientific, all requiring 4 years for completion. No preparatory work is done, the public high schools supplying most of the students. Graduates of approved high schools and academies are admitted without examination. The university fund arising from the sale of lands granted by the General Government has been supplemented from time to time by legislative grants, and the institution now receives an annual State appropriation. Tuition is free to 2 students from each county, also to all Iowa soldiers and orphans of soldiers, on payment of a small incidental fee. There were 272 students in the collegiate department (71 of them young women), against 242 the previous year.

Of 19 colleges and universities reporting for 1881–'82 or the preceding year all but 2

continued to be open to young women, the exceptions being Griswold College, Davenport (Protestant Episcopal), and St. Joseph's College, Dubuque (Roman Catholic); all except 2 (Amity College, College Springs, and the State University) were under the management of some religious denomination; all but the State University provided preparatory courses, generally of 2 years; all had classical collegiate courses of 4 years; 16 had scientific or philosophical courses, which in all but Amity and Griswold Colleges extended over 4 years. The State University and Iowa Wesleyan added courses in engineering also. Three provided 4-year courses especially for young women; 2, philosophical; and 6, commercial courses. Nearly all made provision for instruction in music and art, some having music courses of 2, 3, and 4 years, with facilities for advanced instruction in vocal and instrumental music. In 14, students intending to teach received instruction during either the collegiate or preparatory course; 6 had departments or courses in theology or sacred literature; 3, departments in law; 3, in medicine; 1, in dentistry; and 1, in pharmacy. In the 15 reporting statistics for the year there were over 1,100 students enrolled in regular collegiate classes, and in the 12 which reported the sex of pupils there were over 400 young women.

Eleven colleges received gifts amounting to over $134,000 during the year. To Griswold College $5,500 were given for scholarships and general expenses; to Drake University, $25,000 for endowment, $20,000 of it being from General F. M. Drake, of Centerville; Parsons College, $5,950 for general endowment; Upper Iowa University, $5,000 to endow a chair; German College, $600; Iowa Wesleyan University, $900; Cornell College, $18,000 for building; Penn College, $3,050 for endowment, &c.; Central University of Iowa, $56,000 for professorships and general purposes; Tabor College, $6,118 for endowment, building, and current expenses; and Western College, $8,000 for building.

For statistics, see Table IX of the appendix, and for a summary, see the report of the Commissioner preceding.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Reports come from 3 institutions either exclusively or principally for women, viz, the Immaculate Conception Academy, Davenport (Roman Catholic); Callanan College, Des Moines (non-sectarian); and St. Agatha's Academy, Iowa City (Roman Catholic), the last two authorized to confer collegiate degrees.

For statistics of colleges for women, see Table VIII of the appendix, and for a summary, see a corresponding table in the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

Iowa Agricultural College, Ames, established in 1858 to give a higher education to the industrial classes, afterward received the State's share of the congressional grant for the benefit of agriculture and the mechanic arts. The courses of study are general and technical. The general course aims to give a liberal culture in the sciences which underlie the industries, without regard to any special pursuit. Certain elective studies give it flexibility and adapt it to the wants of both sexes, affording the young women more time for domestic economy and kindred subjects and the young men more for those branches which are of especial value to them. The technical courses, while giving a liberal culture, aim to prepare for some special pursuit or profession. They are: (1) The course in agriculture, which requires 4 years of study and leads to the degree of bachelor of scientific agriculture; (2) the course in mechanical engineering of 4 years, and leading to the degree of bachelor of mechanical engineering; (3) the course in civil engineering of 4 years, leading to the degree of bachelor of civil engineering; and (4) the course in veterinary science, 2 years in length, leading to the degree of bachelor of veterinary medicine. Tuition is free. Of 238 students during the year in regular 4-year courses, 56 were young women.

The general scientific course and the civil engineering courses, before noticed as provided at the State University, Iowa City, were continued in 1882. The former affords a liberal culture on the basis of science, including enough laboratory work to make students familiar with the more important facts and laying a foundation on which they may build if they desire to become specialists in any line of work. The engineering course aims to lay a good foundation in the principles of engineering and to acquaint students with the best engineering practice. Drawing, surveying, mechanics, and military science and tactics are among the branches included. Cornell College, Mt. Vernon, also continued its 4-year course in civil engineering, besides one in general science of equal length. Twelve of the other colleges report courses leading to the degree of B. S. and extending over 4 years, except in two, Amity and Griswold Colleges, where the course was of 3 years.

PROFESSIONAL.

Theology was taught in 3-year courses at Griswold College, Davenport (Protestant Episcopal), and German College, Mt. Pleasant (Methodist Episcopal). Oskaloosa College, Oskaloosa (Christian), also offered 2 theological courses, an English of 2 years and a classical of 4. Drake University, Des Moines (Disciples), organized during the year, had a Bible department of 2 years, and Iowa Wesleyan University, Mt. Pleasant (Methodist Episcopal), continued to give some theological instruction during the collegiate course when desired.

For statistics, see Table XI of the appendix, and for a summary of them, see the report of the Commissioner preceding.

Legal instruction was given in the Iowa College of Law, a department of Drake University, opened for instruction in 1881. It was continued in the law departments of Iowa State University and Iowa Wesleyan University. In the State and Drake Universities (reporting, respectively, 126 and 17 students) the course required 1 year in the former and 2 in the latter; in that of Iowa Wesleyan the length of course is not defined, and the catalogue does not show that there were any students pursuing it.

For statistics of law schools reporting, see Table XII of the appendix, and for a summary, see the report of the Commissioner preceding.

Medical teaching in "regular" schools was continued in 1882 under 8 instructors, with 273 students, in the College of Physicians and Surgeons, Keokuk (organized in 1850), and under 11, with 151 students, in the regular medical department of the Iowa State University, Iowa City (organized in 1870). It was begun in the College of Physicians and Surgeons of Iowa, Des Moines (organized 1882), under 15 professors, with 9 students. A good English education was required in the 2 former, as well as 3 years of study in all, including attendance on at least 2 lecture courses of 20 weeks each in the two former and of 22 weeks in the last named.

Homœopathy was taught in the homœopathic department of the State University (organized in 1877), under 2 professors, 5 lecturers, and an assistant, with 46 students, the requirements being essentially the same as in the regular department. The final examinations in both are supervised by a board of examiners.

"Eclectic" medicine was pursued under 13 instructors, with 25 students, at the Iowa Eclectic Medical College, Des Moines, organized under this title in 1881 as a department of Drake University. It is understood to have since dropped the word "eclectic" from its title, but to have retained that system as the basis of its instruction.

A *dental* department in the State University, with 10 instructors, was established, as announced in 1881, in the autumn of 1882. It had 7 students for its first year.

Training in *veterinary* practice was given in one of the courses of the Iowa Agricultural College, Ames, which covered 2 collegiate years.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB AND THE BLIND.

The State makes provision for the free instruction of its deaf and dumb 10 to 25 years of age in its institution for them at Council Bluffs, and for the blind in the Iowa College for the Blind, Vinton. The latter had 141 pupils during the year and 34 instructors and other employés. The branches taught are those of primary, grammar, and high schools; the employments, broom and mattress making, cane seating of chairs, and sewing. The Institution for the Deaf and Dumb gave instruction to 276 pupils during the year. The employments taught were broom and shoe making, cabinet work, printing, and farming.

TRAINING OF THE FEEBLE-MINDED.

The feeble-minded are cared for at the Iowa State Asylum for Feeble-Minded Children, Glenwood, established in 1876. Here those who are so deficient in intelligence as to be unfit to attend ordinary schools receive physical and mental training suited to their condition. The age for admission is 7 to 18. Children whose parents or guardians are too poor to pay are supported by the State.

REFORMATORY TRAINING.

A State Reform School, with a department for boys at Eldora and one for girls at Mitchellville, undertakes the reformation, education, and industrial training of the youth committed to it for juvenile offences. In the boys' department, besides the common school branches, farming, gardening, stock raising, and shoe and hat making are taught. Every boy is required to attend school 4 hours each school day during the school months. It is visited every month, as the law requires, by the local school trustee. The girls must also attend school 4 hours each day and receive 4 hours' instruction in some branch of household labor. The aim is to prepare them to earn a living for themselves in domestic service.

INDUSTRIAL TRAINING.

To foster in the public schools an interest in useful industries and to give this interest a practical direction, Iowa by a law of 1874 encourages industrial expositions in connection with the public schools. Such expositions are to consist of useful articles made by the pupils, as samples of sewing and cooking, knitting, crocheting, and drawing, iron and wood work of all kinds, as well as farm and garden products that are the results of their own toil. The pupils are to explain the use and method of such work and the processes of culture of their farm and garden products. The papers of the State show that these exhibitions are often held, and they must prove very useful.

EDUCATIONAL CONVENTIONS.

STATE TEACHERS' ASSOCIATION.

The twenty-seventh annual meeting of the association, held at Cedar Falls, December 27–29, 1882, is described as a great event in the educational annals of the State. A hearty fraternal feeling prevailed; the programme was fully carried out, and the papers read were excellent. Those for the first day were on "Reading and elocution: province, character, and methods;" on "The vocal apparatus: its use and abuse;" and on "Drawing in the public schools." On the second day, after the announcement of committees, a paper was read on "County high schools: their objects and work," by the principal of the Guthrie County high school, and one on "The defects of our public schools and methods of instruction." The president of the association, R. A. Harkness, then delivered his annual address, after which Superintendent H. Sabin, of Clinton, read a paper on "The children of crime," the subject being continued by Superintendent B. F. Miles, of the Iowa Reform School, and by Mr. Lewelling, of the girls' department of that school. Prof. Emlin McClain, of the State University, read a paper on "The legal rights and duties of teachers." "The public desire for industrial education in the public schools" and "Character the product of culture" followed. On the third day, after the adoption of resolutions approving of congressional aid to education, the question "How can a taste for the reading of literature be formed?" was discussed. Prof. W. N. Hull, of the State Normal School, then gave a "Chalk talk," using the blackboard to illustrate his system of drawing; following which came a paper on the "Evil effects of overmethodizing in school management." In the afternoon, after the adoption of resolutions and short speeches by a number of superintendents, the association adjourned.

Meetings of the different sections of the association took place as usual during the sessions. Those of the Latin teachers' section, held during the morning of the 28th and 29th, were regarded by its members as highly interesting and instructive. The only papers mentioned in the report were one by Prof. Harkness, of Parsons College, on "Primary instruction in Latin," and one by Principal Cary, of the Des Moines high school, on "Methods of pronunciation." Each was discussed freely though informally, nearly all who were present participating.

In the college professors' section the first paper was by Prof. Cooke, of Cornell College, on "Elevation and uniformity of standards." After a discussion of it by President Beardshear, of Western College, Toledo, Prof. Wilson, of Coe College, Cedar Rapids, read a paper entitled "Things left undone." A discussion followed, generally in the line of commendation of the paper.

The county superintendents' section met December 27, and after introductory remarks by the vice president, Superintendent Frost discussed the question "To what extent should county superintendents require reports from teachers in country schools?" On the following day the main subject of debate was "What recognition should be given teachers who complete a graded course of study for normal institutes?" and on the 29th "What immunities from examination can we consistently give teachers holding certificates from other counties or applicants holding diplomas from colleges?" All three papers were quite freely discussed. When the last mentioned was disposed of, State Superintendent Akers offered suggestions of value to superintendents in their work.

In the city superintendents' and principals' section a paper was read by Principal O. C. Scott, on "The practical side of high school work."

SOUTHWESTERN IOWA EDUCATIONAL ASSOCIATION.

The fourth annual meeting of this association was held at Corning, July 5–7, 1882. After the adoption of a new constitution, among other papers read was one on "How can we inspire in our pupils a love for good literature?" Other papers read were on "The proper place of natural science in the public high school," on "The proper work of the public school," and on the question "How can teachers secure better wages?" In the evening State Superintendent Akers delivered a lecture on "The elevation of the

masses." The first topic of the following day was "The graded course of institute instruction: what are the results of the first year's work?" A lady spoke of the recognition that should be given teachers who complete this course, after which came a paper containing replies from county superintendents in response to inquiries made of them. After further discussion of the subject, a paper on "How to teach languages" was read and debated in a spirited manner, resolutions were adopted, and the association adjourned.

COUNTY SUPERINTENDENTS' CONVENTIONS.

At several conventions of superintendents held in different districts of the State during the summer of 1882, State Superintendent Akers presented such topics as "The duties of superintendents," "Changes in the school laws of Iowa," "Compliance with the law requiring school boards to plant shade trees and beautify school grounds," and on "Meetings of teachers." Other topics of discussion by different members at these meetings were "To what extent should a spirit of emulation be encouraged in the schools?" "The duties of the county superintendent in the school room," "The adoption of a course of study for ungraded schools," and "How to secure the best practical results in teaching."

CHIEF STATE SCHOOL OFFICER.

Hon. JOHN W. AKERS, *State superintendent of public instruction, Des Moines,*

[Term, January 2, 1882, to January 2, 1884.]

KANSAS.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth of school age (5–21)	348,300	357,920	9,620	
Enrolled in public schools	247,819	269,945	22,126	
Average daily attendance	139,853	162,017	22,164	
Pupils in private or church schools		6,170		
SCHOOL DISTRICTS AND SCHOOLS.

a Including 62 whose sex is not indicated.

(From returns and biennial report of Hon. H. C. Speer, State superintendent of public instruction, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

For the State and for each county there is a superintendent of public instruction, elected biennially by the people; for school districts, a board of 3 members, elected each for 3 years, one liable to change each year. For examining applicants for State diplomas and State certificates, there is a State board of education; for examination of teachers in counties, there are associated with the superintendent 2 holders of first grade certificates, each to serve 1 year. For the care of State school funds there is a board of commissioners consisting of the State superintendent, secretary of state, and attorney general. Women may vote and hold school offices.

OTHER FEATURES OF THE SYSTEM.

The schools of the State are of all grades, high and normal schools being included, with a State agricultural college and a State university. There are also schools for the deaf and dumb and the blind and a reform school, all sustained by the State. No sectarian doctrine may be taught in the public schools, but the reading of the Bible without comment is not prohibited. For the improvement of teachers, county teachers' institutes must be held annually; they are supported by an appropriation not to exceed $100 made by the board of county commissioners and by funds received from persons attending and from those examined for certificates. These certificates are of first, second, and third grades, and continue in force 2 years, 1 year, and 6 months. Teachers must report to county superintendents and county superintendents to the State superintendent. The State treasurer must also report semiannually to the State superintendent the amount of money in the treasury for the support of schools and subject to disbursement. There must be uniformity of text books. All public schools are free, and children from 8 to 14 must attend at least 12 weeks each year unless excused by the school authorities or taught elsewhere.

GENERAL EDUCATIONAL CONDITION.

The report of State Superintendent Speer shows very gratifying progress in the school work of the State for 1881–'82. The number of school districts organized was 111 more than in the preceding year; the number reporting, 86 more; the number with the minimum term of school or more, 289 greater; and, although the number of school-houses reported was less by 116, the accommodations were much greater, there being 241 additional school-rooms. The receipts for the free schools were $228,458 greater and the expenditure for the support of them $197,839 more. The enrolment advanced 22,126, being 12,506 more than the increase in youth of school age. The average daily attendance in public schools slightly exceeded even the increased enrolment. There were 208 fewer men employed as teachers and only 117 more women, the former at a considerable reduction and the latter at a slightly advanced pay. This record on the whole indicates a general zeal for public education that is creditable alike to the State and its children.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

Cities of more than 15,000 inhabitants have elective boards of education of 3 members from each ward, one of the 3 liable to change each year; cities with from 2,000 to 15,000 have similar boards of 2 members from each ward, one of the 2 liable to annual change. The larger boards may and the smaller must choose a superintendent.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Atchison	15,105	4,652	2,516	2,258	29	$19,526
Lawrence	8,510	2,868	1,935	1,437	24	20,686
Leavenworth	16,546	6,641	3,317	2,365	40	25,396
Topeka	15,452	5,561	3,915	2,323	46	33,835

ADDITIONAL PARTICULARS.

Atchison for 1881–'82 reports 5 different school buildings, with 14 rooms for primary classes, 14 for grammar, and 1 for high, all affording 1,650 sittings, a scanty supply for the 2,258 in average daily attendance. The schools, accordingly, were overflowing, many having to be turned away for want of room. The high school is reported to have had 90 pupils, with an average attendance of 88; private schools had an estimated enrolment of over 1,000.

Lawrence had 10 school buildings in 1881–'82, with 25 rooms for study and recitation and 2 for recitation only. These buildings, with grounds, furniture, &c., were valued at $104,200. There was an increase in the enrolment in the public schools of 56 over the last year and a gain of 158 in average daily attendance, with 1 more teacher. The high school enrolled 123 pupils.

Leavenworth public schools, classed as primary, grammar, and high, occupied 55 rooms. There were 7 school buildings, valued, with grounds, &c., at $178,000. There was a decrease in youth of school age, but a gain of 159 in the number enrolled and of 75 in average daily attendance, with 1 more teacher. The high school reports an enrolment of 200 pupils with 4 teachers, the regular course covering 4 years. Total receipts for the year, $29,895.

Topeka had 4 primary school buildings, 8 with both primary and grammar classes, and one high school building; an increase of 291 was reported in youth of school age, and of 804 in enrolment in public schools, with a gain of 15 teachers. There were 97 pupils in the high school, under 1 instructor. The 13 school buildings, with sites, &c., were valued at $179,800.

TRAINING OF TEACHERS.

STATE NORMAL SCHOOLS AND NORMAL DEPARTMENTS.

The *Kansas State Normal School*, located at Emporia, according to its biennial report, had just closed two of the most successful years in its history. The enrolment in 1881–'82 was 402, being an increase of 36 over the preceding year. The students in 1881 and 1882 represented 44 counties in Kansas, and 8 different States. The graduating class of 1881 numbered 21; that of 1882, 44, 40 of whom have since engaged in teaching. The library and apparatus were said to be insufficient for the needs of the work.

A well organized training school was connected with the institution, presenting instruction in Kindergärten, primary, intermediate, and grammar school grades. This school receives children at 3 years of age and provides a full course of study, which prepares for admission to the normal department.

The *University of Kansas* provides a 3-year normal course, in which there were 53 students, 33 of whom were young women, a total gain of 15 over 1881. Four of these were graduated and received from the State board of education State certificates good for 5 years. One of the students in 1882 was a resident graduate.

OTHER NORMAL TRAINING.

The *Kansas Normal College*, Fort Scott, organized in 1878, reports 105 students in its teachers' class for 1881–'82, of whom 55 were male, besides 162 other students, all under 7 instructors.

The *Kansas Normal School and Business Institute*, Paola, prepares for teaching and for business with a 3-year course. It reported to the State superintendent 228 normal students in 1882, besides 212 others. Children selected from the city schools form its training department.

The *Campbell Normal University and Commercial Institute*, Holton, a private enterprise, organized in 1882, with a faculty of 7 instructors, and with nearly 100 students enrolled in November, 1882, presents a 3-year collegiate course of 48 weeks each.

TEACHERS' INSTITUTES.

County normal institutes were advertised to be held in 54 counties during 1882. The union of two or three counties is permitted for this purpose where the population of each is less than 3,000.

A writer in The Educationist reports having visited 24 of these institutes during July and August, and says the work was of a high order, there being less talking and more teaching than the year before. Everywhere were displayed a spirit of thoughtful earnestness and a realization of the importance and responsibility of the work, but there was the same dearth of reference books noticed last year.

EDUCATIONAL JOURNALS.

The Educationist, published at Emporia by the former State superintendent of public instruction in Indiana, George W. Hoss, continued to be the official organ of public instruction and the chief medium for the diffusion of educational information throughout the State. The Industrialist, published weekly at Manhattan, is the organ of the Kansas Agricultural and Mechanical College, and is devoted specially to industrial education. The former was in its fourth volume in 1882; the latter in its eighth.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

The number of cities reporting high schools for 1882 was 30, with 1,700 pupils and 149 graduates. The length of the school courses varied, the shortest, at Chetopa, being of 12 months; the longest, at Winfield, of 45 months. The high schools recognized by the State University as qualified to prepare students for its courses were those of Abilene, Atchison, Beloit, Emporia, Junction City, Lawrence, Leavenworth, Neodesha, Peabody, Topeka, and Washington, 11 out of the 30 above mentioned.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges and private academies, see Tables IV and VI of the appendix following; for summaries of them, see corresponding tables in the report of the Commissioner preceding. For preparatory departments of colleges and scientific schools, see Tables IX and X of the appendix.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The University of Kansas, Lawrence, in its collegiate department presents classical, scientific, modern literature, civil engineering, natural history, chemical, and musical courses, each of 4 years, with a department of elementary instruction and 3 higher normal classes of 3 years each. The institution also provides a 2-year course in law and a preparatory course of a year in medicine. The total number of students in attendance (more than half of them in the preparatory department) was 443, 39 of them from other States. A graduate course for non-residents of 3 years beyond the regular collegiate is provided, examinations being required at the end of each year. All courses are open alike to both sexes. The Kansas Review, a monthly, is conducted by an association of the students.

Other collegiate institutions, 8 in number, were St. Benedict's College, Atchison, and St. Mary's College, St. Mary's (Roman Catholic); Baker University, Baldwin (Methodist Episcopal); Highland University, Highland (Presbyterian); Gould College, Harlan (founded in 1881); Lane University, Lecompton (United Brethren); Ottawa University, Ottawa (Baptist); and Washburn College, Washburn (Congregational). All report preparatory departments; all but Gould, classical courses of 4 years; all but St. Benedict's and St. Mary's, scientific courses also; while Baker, Highland, Gould, and Lane had normal courses. Baker, Highland, St. Benedict's, and St. Mary's taught music, more or less, and St. Benedict's had instituted an ecclesiastical course. All but the 2 Roman Catholic schools admit both sexes. For statistics, see Table IX of the appendix; for a summary of these statistics, a corresponding table in the report of the Commissioner preceding.

INSTITUTION FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

The College of the Sisters of Bethany, Topeka (Protestant Episcopal), chartered in 1870, continued to be for 1882 the only school of this class reporting. It had 17 instructors and an enrolment of 259 pupils, of whom 64 were in collegiate classes, 94 in preparatory and scientific, and 101 in Kindergarten and primary studies. Whole number of graduates, 39, 1 only at the close of 1881–'82. Estimated value of collegiate property, including furniture, site of 20 acres, and buildings, $150,000; collegiate course, 3 years. For further statistics, see Table VIII of the appendix.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The *University of Kansas*, Lawrence, provided general scientific, civil engineering, natural history, and chemical courses, each of 4 years.

The *Kansas Agricultural College*, Manhattan, has a general course in agriculture and science of 4 years. Three-fourths of the students come from the homes of farmers.

In January and February of 1882 a series of 6 farmers' institutes, conducted by members of the faculty, was held in as many counties, imparting some of the benefits of the collegiate instruction to those outside of the institution and bringing the college into closer relation with the farmers of the State.

PROFESSIONAL.

Theology.— St. Benedict's College, Atchison (Roman Catholic), in 1882 instituted an ecclesiastical course covering one preparatory and three theological years of study. Kansas Theological School, Topeka (Protestant Episcopal), continued its 3-year theological course, which by the canons of the Protestant Episcopal Church is ordinarily to be prepared for by a collegiate course or its equivalent. It reported 2 instructors and 4 students in 1882.

Law.— The law department of Kansas University (with 2 instructors and 7 senior students in 1881–'82) gave a course of law covering 2 annual terms of 7 months each.

Medicine.— The medical preparatory course of the University of Kansas, covering 2 terms of 20 weeks each, appears again in the university catalogue of 1881–'82, but no professors or students are indicated, nor do any appear in the opening term of the next session.

SPECIAL INSTRUCTION.

EDUCATION OF DEAF-MUTES.

The Kansas Institution for the Education of the Deaf and Dumb, Olathe, under the control of the State board of charities, reported for the year ending June 30, 1882, the same number of pupils as given in last year's report, 171 (males 89, females 82), under 7 instructors. They were taught the common school branches, the method of instruction being the manual and articulation combined. The course comprises also such employments as printing, cabinet making, shoemaking, sewing, and housework. Since

the foundation of the institution in 1862, 306 pupils have received instruction. The average time spent in the institution by each pupil is 3½ years. Tuition, board, books, and other necessaries are furnished free. The grounds, buildings, and apparatus were valued at $54,000.

EDUCATION OF THE BLIND.

The State Institution for the Education of the Blind, at Wyandotte, reports for the year ending June, 1881, an average attendance of 52 pupils, of whom 2 were graduated; for the year ending June, 1882, there was an average of 53, of whom 3 were graduated. Instruction was given in the literary branches of a good education, as well as in music, and broom making was taught to the boys. Through appropriations of $25,000 for additional buildings and $3,000 for steam heating, the accommodations were much improved.

REFORMATORY TRAINING.

No report for 1882 has reached this Bureau from the State Reform School for Boys, near Topeka, opened in 1881, which had 12 boys under its charge in July of that year.

EDUCATIONAL CONVENTIONS.

STATE ASSOCIATION.

The Kansas State Teachers' Association held its annual session at Topeka, December 26–28, 1882, the president, William Bishop, in the chair. The attendance was estimated at something over 400. President-elect George T. Fairchild delivered the annual address, "From childhood to manhood." Subjects under discussion the second day were "Elementary arithmetic," "United States history," "Elementary reading," "Elementary geography," "The care of buildings and grounds," "Elocution," "The relation of the teacher to the moral training of the pupil." The day closed with an address entitled "Paul and Plato." The subjects read and discussed on the third day were: "Natural and physical science," "The essentials of arithmetic," "School discipline," "Higher mathematics," "Punctuality and regularity," "National education," "German in our public schools," and "The teacher's work and aims." After listening to reports of committees and adopting resolutions, the association adjourned to meet in Topeka the following December.

SUPERINTENDENTS' CONVENTION.

The county superintendents assembled in convention at Topeka, December 27, 1882, State Superintendent H. C. Speer presiding. About 40 counties were represented. After appointing the committees the following topics were discussed, one hour being given to each: "Formation and alteration of school district boundaries," "Discussion of official visits of county superintendents," "Graded courses of study for country schools," "Uniformity of text books." At the opening of the convention on the second day, the report of a committee on school legislation was considered. Resolutions were passed that the time of the annual meeting be changed to the third Wednesday in June, that a tax of 2 per cent. be levied for school district purposes, that the people should not determine at the annual meeting whether a man or woman teacher shall be employed, that school district officers forfeit office by neglecting to qualify, that teachers should have power to suspend unruly pupils until action be had by the school board, that a county uniformity of text books should be adopted, and that county commissioners should appropriate not less than $50 nor more than $100 annually for a normal institute fund. Several other resolutions of less importance were adopted, after which the convention adjourned.

CHIEF STATE SCHOOL OFFICER.

Hon. H. C. SPEER, *State superintendent of public instruction, Topeka.*

[Term, January 10, 1881, to January 9, 1883.]

Mr. Speer was elected November, 1882, for another term extending to 1885.

KENTUCKY.

STATISTICAL SUMMARY.*a*

	1879–'80.	1880-'81.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
White youth of school age (6-20)	478,597	483,404	4,807	
Colored youth of school age (6-16)*b*	66,564	70,234	3,670	
Whole number of school age	545,161	553,638	8,477	
White youth in free schools	245,358	238,440		6,918
Colored youth in free schools	20,223			
Whole enrolment in free schools	265,581			
Average attendance of whites	158,218	149,226		8,992
SCHOOL DISTRICTS AND SCHOOLS.				
School districts for white youth	6,177	6,244	67	
School districts for colored youth	773	804	31	
Whole number of school districts	6,950	7,048	98	
Districts that had schools for whites	6,136	6,189	53	
Districts that had schools for colored	718	739	21	
School-houses for white youth	5,649	5,678	29	
Valuation of same, with sites, &c	$2,119,407	$2,286,104	$166,697	
School-houses for colored youth		429		
Valuation of same, with sites, &c		$109,648		
Average time of schools in days	102			
Private schools of all grades reported	1,044	1,148	104

Men teaching in schools for whites	4,418	4,195		223
Women teaching in the same	2,346	2,715	369	
Average monthly pay of teachers in counties.	$21 75			
Average monthly pay of men in cities.	98 00	$23 87		
Average monthly pay of women in cities.	43 00			
INCOME AND EXPENDITURE.				
Receipts for public free schools for whites.	$1,031,565			
Expenditure for them	803,203	$1,184,327	$381,124	

a No statistics for 1881–'82 have been received at the time at which this goes to press.
b By law of 1882 the school age for blacks was altered to 6–20.

(From report of Hon. Joseph Desha Pickett, State superintendent of public instruction, for the two years above indicated, with return from the same for the year 1879–'80.)

STATE SCHOOL SYSTEM.

OFFICERS.

A State board of education looks after the general interests of the free schools; a State board of examiners tests the qualifications of candidates for State school certificates; while a State superintendent of public instruction acts as president and executive officer of each board. Each county, through its presiding judge and justices of the peace at the

court of claims, chooses biennially a commissioner for general oversight of common schools, and he forms a board for the examination of teachers by associating with himself 2 other persons. Each school district for whites in a county has 3 trustees, all chosen together at the first election by the resident voters (widows with children to be taught being allowed to vote) and afterwards one each year. In districts for colored pupils, the white county commissioner appoints yearly 3 trustees from the colored race.

OTHER FEATURES OF THE SYSTEM.

Most of these remained in 1882 the same as previously reported, but an act of April 24 in that year did away with several distinctions made in 1874 between the systems for white and colored youth. The length of term, the course of study, the qualifications of teachers, and the rates of payment to these teachers in the schools for blacks were made to correspond as much as might be with those in schools for whites; the age for free instruction in the former (6–16) was changed to that for the latter (6–20). Both races, too, were made participants (on the same basis, the number of youth of school age) in the 6 per cent. interest from the State school fund ($1,327,000), as well as in the receipts from the State school tax, which tax, by the same act, was raised from 20 to 22 cents on $100 of property.

Some differences as respects the two races, however, are still maintained. One (for the benefit of colored schools) is that they continue to receive, with their share of the general school tax, the proceeds of fines, forfeitures, penalties, and taxes collected specifically from the colored race, except the capitation tax on negro voters, which is abolished. Two others, of a different character, are (1) that the colored people do not elect their own district school officers, like the whites, but such officers are chosen for them by the white county school commissioners, and (2) that, instead of putting their schoolhouses where most convenient, they must, if in the country, locate them at least a mile away from any school for whites, and if in cities, at least 600 feet away. Of course, there is also the prohibition, usual in the Southern States, of the union of the two races in any public school. Provision is made too for separate institutes and teachers' associations. The new law is on the whole a great step forward in the improvement of the colored race.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

For cities and towns there are boards of trustees, who appoint city superintendents. Some cities, under special charters, have boards for the examination of teachers.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Covington	29,720	10,519	3,378	2,475	67	$48,939
Lexington	16,656	.....	2,205	1,419	.....	.....
Louisville *a*	123,758	52,892	20,186	13,760	359	261,930
Newport	20,433	6,715	2,825	2,231	45	26,435
Paducah	8,036	2,096	968	759	15	8,953

a Not including, apparently, the statistics of colored schools.

ADDITIONAL PARTICULARS.

Covington in 1881–'82 more than recovered its losses of school population and attendance in 1880–'81, there being a gain in school population of 888 against a loss of 463, and in other points a proportionate gain. Six school buildings, having 4,000 sittings for study, with other school property, were valued at $204,500. The school course is a graded one covering 12 years. German is taught in 4 grades, and drawing in all below the high. Estimated enrolment in private and parochial schools, 2,560, only 818 less than in public schools. There is a board of examiners. The superintendent says that the work of the year had been satisfactory.

Lexington reported 5 white schools and 4 colored. The former enrolled 1,249, with an average attendance of 935; the latter, 956, with an average attendance of 484. In the total enrolment there was a gain of 23 over the previous year. No other information is at hand.

Louisville shows a gain of 4,055 in school population, exceeding that of the previous year by 1,805; also, a gain of 997 in enrolment against a loss of 801 the year before, and of 490 in average daily attendance, against a loss of 228. There were 30 school buildings, valued, with other property, at $875,144, in which were taught for whites 7 primary and branch, 18 secondary, and 5 intermediate schools, having 8 grades of 1 year each, and a high school for each sex, with courses of 4 years each. For colored there were 2

primary, 1 intermediate, and 2 secondary schools. Music was continued in all the grades below the high, and drawing throughout all. German, under special teachers, went through 7 grades below the high schools. The schools are opened daily with brief readings from the Bible without comment, and may be closed with singing. There were two boards of examiners, one for English teachers, the other for German.—(Manual and return.)

Newport, with a loss of 7 in school population, gained in enrolment and average daily attendance, the latter being 79 per cent. of the enrolment. There were 5 school buildings, with 2,510 sittings, the entire school property being valued at $133,500. In these buildings there were taught 44 schools, 1 high, 5 intermediate, 37 primary, and 1 colored, under 46 teachers, including a special teacher in drawing and penmanship. Schools were in session 202 days, with 1,002 fewer cases of tardiness, 10 per cent. fewer of corporal punishment, and none of permanent suspension. There is a board of examiners; also, provision for normal training. The president of the board of education, while reporting the schools in good condition, deplored the lack of school room, and the legislature, at its last session, authorized a vote of the city as to levying a tax of 5 cents on $100 for additional school buildings. Estimated enrolment in private and parochial schools, 700.

Paducah showed a gain of 116 in school population, of 128 in enrolment, and of 69 in average daily attendance, the number of teachers remaining the same. It added 1 school building, and school property was valued at $33,700. The schools, which were of 12 grades, were in session 205 days; the per cent. of average daily attendance on enrolment was 78 and on school population 36. Primary pupils make up nearly half the schools and fully a quarter of the school population. In the primary schools the boys and girls are about equal, but only 1 in 15 or 16 of the boys reaches the grammar school and only 1 in 100 the high, most of them leaving school at the end of their tenth year. The superintendent thinks the female sex is fast becoming the more cultured of the two. A weekly teachers' meeting was held. Estimated enrolment in private and parochial schools, 200.

TRAINING OF TEACHERS.

NORMAL SCHOOLS AND NORMAL DEPARTMENTS.

Of the 12 normal schools and normal departments reported in 1880–'81 only 4 report any statistics for 1881–'82 (for which see Table III of the appendix).

The Kentucky State Normal School, the superintendent says, was chartered for only two years and existed only to start such schools in the State. The Kentucky Female Orphan School trains its orphan girls with a view to fitting them for teachers' work. It reported for the year 5 teachers and 83 inmates; pupils are admitted at 14 years and upwards. The school has an endowment fund of $120,000.

TEACHERS' INSTITUTES.

It is presumed that the teachers' institutes required to be held annually in each county for whites, and allowed to be held for colored, were held in 1881–'82, but no report of their sessions has come to hand.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

Covington reported a high school, with a 4-year classical and a 3-year scientific course; 191 enrolled pupils; 155 in average daily attendance, and 13 graduated, all girls but 1.

Louisville had a high school for each sex for whites and one for both sexes for colored, the schools for whites with courses of 4 years and the school for colored with a 3-year course; there was a total of 645 enrolled and of 539 in average daily attendance.

Newport high school shows a 3-year course, with 73 enrolled, 58 in average attendance, and 8 girl graduates.

Paducah had a high school, with a 3-year course and 65 students, 60 of them girls.

OTHER SECONDARY SCHOOLS.

For statistics of schools of this class and of business colleges, see Tables IV and VI of the appendix; for summaries, the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

Of 17 universities and colleges, 15 make return for 1881–'82. Eight had preparatory courses of 2 or 3 years; 11, classical courses of 4 years; 1, a classical course of 3 years; 5, classical courses of undefined length. In the Kentucky Military College the B. A. course usually occupies 3 or 4 years, with a graduate course provided beyond this. Four offered

normal instruction; 10 had undefined commercial courses; 5 had literary courses, all but 1 of 4 years, and that of 3; 6 gave more or less training for ministerial work; 1 had a law course; 5 included music and 4 music and art in their courses; while in 10 French and German were among the regular or elective studies. South Kentucky College, Hopkinsville, was reopened in 1881 with a larger faculty, an extended course of study, an extension of its privileges to both sexes alike, and the addition of normal and commercial courses.

Kentucky Wesleyan College, Millersburg, was found by an examining committee of the Methodist conference to have an excellent curriculum and to require a high standard of proficiency. Central University, Richmond, during the year added to the department of mathematics and astronomy an optional course in theoretical and practical railroad engineering.

Ogden College, Bowling Green, reporting for the first time in 1881–'82, presents no fixed course, but arranges its studies in 8 schools, of ancient languages, of mathematics, of natural science, of philosophy, of civil engineering, of modern languages, of English language and literature, and of commercial science. It was founded by the late Robert W. Ogden, after whom it was named. In his will, among other donations, Mr. Ogden provided for 60 free scholarships. Though non-sectarian, it inculcates Christian morality and its course provides for weekly study of the Bible. Its property was valued at $20,000 and it has $120,000 in productive funds, yielding an income of $8,000.

For statistics of colleges of this class reporting, see Table IX of the appendix; for a summary of their statistics, a corresponding table in the report of the Commissioner preceding.—(Catalogues and returns.)

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Twenty colleges and seminaries for young women reported in 1881–'82 against 18 the previous year. All had preparatory courses; 18, collegiate courses of 4 years, most of them including drawing, art, music, German, and French. Bowling Green Female College arranges its studies in schools, not in years. Caldwell Female College, Danville, reopened in 1881, had 41 students in its collegiate course, not yet defined. All the 20 schools offered training in vocal and instrumental music; 15, in German and French, 1 adding Italian; 3, in German only; while 1 showed no modern language; 4 provided normal training for those who wish to become teachers.

In nearly all especial importance had been recently given to English language and literature. In 5 the study of the Bible and of the elements of theology was in the regular course; 2 offered graduate courses; 6 had gymnastic training. Most of them appear to have about the same classical training as the colleges for young men. The aggregate collegiate attendance of women for the year was nearly 3,000, about 1,200 more than the number of men in colleges.

Christ's Church Seminary, Lexington, Louisville Female Seminary, and Paducah Female College were not heard from.

For statistics of these schools, see Table VIII of the appendix; for a summary, the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The State Agricultural and Mechanical College, Lexington, reorganized in 1880, continued in 1881–'82 to give instruction in its 14 courses of from 1 to 5 years in length. The scientific course included, with the usual scientific studies, agriculture, horticulture, landscape gardening, civil history, and political economy, Latin, French, or German, and English language and literature. In the scientific department there were 11 professors and 321 students, a gain of 87 over the previous year. It has 400 State scholarships, not one-half of which were filled. Provision is also made for some free instruction in the normal department. The income for the year was $9,909 from a fund of $165,000, $17,000 from the State, and $2,000 from tuition fees. At the commencement 3 young men received degrees in arts and 3 in science.—(Register and return.)

Eleven other colleges reported courses in general science, those in 6 covering 4, in 3 only 3 years, in 2 not defined. Kentucky Military Institute reported a course in civil engineering.

For statistics of scientific schools and scientific departments reporting, see Tables IX and X of appendix; for summaries of these, corresponding tables in the report of the Commissioner preceding.

PROFESSIONAL.

Theological.—There were in 1881–'82 4 theological seminaries, 3 with 3-year courses, viz: Danville Theological Seminary (Presbyterian), requiring for admission a college diploma or an examination; Preston Park Seminary, Louisville (Roman Catholic); and

Southern Baptist Theological Seminary, Louisville. The College of the Bible, Lexington (Christian), in 1882 had a 4-year course open to young men without a classical education. Biblical instruction in connection with college studies was given in St. Joseph's, Berea, Eminence, South Kentucky, and Bethel Colleges and in Central University.

For statistics of theological schools reporting, see Table XI of the appendix; for a summary of such statistics, a corresponding table in the report of the Commissioner preceding.

Legal.—The law school of Kentucky University was not in operation in 1881–'82. With the exception of some preparatory legal studies in South Kentucky College, the Louisville School of Law alone seems to have afforded legal training. It requires for admission evidence of sufficient mental development to pursue advantageously the studies of the course. Though intended to occupy 2 years, the whole course may be completed in 1. Graduates are entitled to practise without further examination.

Medical.—Since 1874 there has been provision in this State for a board of examiners in each judicial district to test the qualifications of medical practitioners who have not diplomas of some chartered school of medicine; but it is said to have been little observed. Four medical schools, all in Louisville, reported for the year 1881–'82. These were Hospital College of Medicine, Kentucky School of Medicine, Louisville Medical College, and the medical department of the University of Louisville. All provided courses of medical study covering 3 years, including 2 terms of lectures of 21 weeks each. The examinations for the degree in all were the same on all the branches taught in the colleges. The Hospital College gave notice that after 1882–'83 a graded course of 3 years would be required. Candidates for graduation in this school who on final examination receive 90 credits in 100 are marked "distinguished" in the published list of alumni.

The Louisville College of Pharmacy continued in 1881–'82 to require for graduation an apprenticeship of 4 years and attendance on 2 courses of lectures; important additions made to its building, cabinet, library, and apparatus increased its facilities for instruction.

For statistics of the above schools, see Table XIII of the appendix; for a summary, a corresponding table in the report of the Commissioner preceding.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The Kentucky Institution for the Instruction of Deaf-Mutes, Danville, reported for 1881–'82 9 instructors, 2 of them semi-mutes, and 145 inmates, making 810 since its foundation. The average term of instruction is 7 years. Of the graduates 7 had become teachers. The pupils are taught the common school branches, including the elements of natural philosophy. For boys the employments are carpentry, printing, bookbinding, broom making, and gardening; for girls, sewing and housekeeping. Articulation was taught only incidentally. The State appropriation for the year was $27,000.

EDUCATION OF THE BLIND.

The Kentucky Institute for the Education of the Blind, Louisville, had 25 instructors and employés (8 of the last mentioned being blind), with 77 pupils for the year, and had had 441 since opening. In school elementary studies were pursued, with special training in music. The employments taught were broom making, cane seating, mattress making, fancy work, and sewing. A Kindergarten department had proved satisfactory. The president speaks of the year as one of the best in the history of the institution. There was a library of 1,200 volumes; property valued at $100,000; a State appropriation of $18,870; a total income of $28,859; and an expenditure of $20,084.

EDUCATION OF THE FEEBLE-MINDED.

The Kentucky Institution for the Education and Training of Feeble-Minded Children, Frankfort, reported 27 instructors and employés, with 132 inmates October 1, 1881, and 143 October 1, 1882. All the inmates were taught the common English branches; boys, to work in the shops and gardens; girls, to do laundry work, sewing, and housekeeping. During the year extensive improvements were made in the buildings, requiring the moving of a great amount of earth, which, with the help of 1 laborer, was done by the boys, the carpenter boys doing the wainscoting of the new rooms. The superintendent says that the workshop, laundry, and sewing rooms showed conclusively that feeble-minded children can be taught industrial occupations so as to make them self supporting. The State expended on this class of unfortunates $31,748 during the year.

INSTRUCTION OF ORPHANS.

There were 8 institutions for orphans and dependent children and 1 for the normal training of female orphans over 14 years of age. In all instruction was given, as

far as possible, in the common branches and in such industries as would facilitate self support. A constant endeavor was made to provide good homes or employment for their inmates.

For statistics of these institutions, see Table XXII of appendix; for summaries of them, a corresponding table in the report of the Commissioner preceding.

REFORMATORY TRAINING.

The Louisville House of Refuge does its work in three departments, 1 for white boys, 1 for colored boys, and 1 for white girls, each in a separate building, with its own playground, workshop, garden, and teacher, under 1 superintendent. Since opening there had been 1,508 inmates, and for the year 323. Of those taught during the year 28 had intemperate parents. Instruction was given in the common school branches, in shoemaking, cane seating, gardening, and farm work for boys; for girls, sewing, laundry work, and housekeeping. The earnings from shops, garden, and farm were $6,604; the additional current expenses, $19,868.—(Seventeenth annual report.)

EDUCATIONAL CONVENTION.

KENTUCKY STATE TEACHERS' ASSOCIATION.

This association held its eighth annual meeting at Hopkinsville, December 26–28, 1882. No other information of the session has been received except that it was regarded as the best meeting of the association since its organization. The number of teachers in attendance was not large, but a deep and active interest is said to have been manifest throughout.—(Journal of Education.)

OBITUARY RECORD.

PROF. NOBLE BUTLER.

Noble Butler was born in Washington County, Pennsylvania, July, 1810, and died at Louisville, Ky., February 12, 1882. His ancestors came to America with William Penn. When the boy was 7 years old his father settled near Madison, Ind. From the log schoolhouse there he went to Hanover College, Ind. In 1839 he became professor of Greek and Latin in the University of Louisville, giving his life to education and general culture. He was the author of a Practical and Critical Grammar, revised and edited Goodrich's series of readers, and afterward published a series of his own. He wrote a Theory of the Hebrew Tenses which was adopted as a standard. His last work was a Revised and Practical Grammar, issued a year before his death. He also entered largely into the field of general literature both as a critic and a poet. He was peculiarly an educator, having a rare faculty of imparting knowledge, and thus did much to cultivate a high taste for literature and love of culture in the city where he lived.

CHIEF STATE SCHOOL OFFICER.

Hon. JOSEPH DESHA PICKETT, *superintendent of public instruction, Frankfort.*

[Term, September 9, 1879, to September 15, 1883.]

LOUISIANA.

STATISTICAL SUMMARY.

	1880.	1881.	Increase.	Decrease.

a Not including New Orleans.

(From returns furnished by Hon. Edwin H. Fay, State superintendent of public instruction, and biennial report of the same for the two years indicated, no later returns being available.)

STATE SCHOOL SYSTEM.

OFFICERS.

There is a State superintendent of public instruction elected for 4 years; a State board of education, with the State superintendent as executive officer; and there are parish boards of not less than 5 nor more than 9 members, except in the parish of Orleans, which answer to county boards elsewhere. These last may appoint a parish superintendent, who becomes secretary of the parish board. Women over 21 are eligible to educational offices.

OTHER FEATURES OF THE SYSTEM.

The means for the education of children between the ages of 6 and 18 in this State come (1) from the proceeds of a State fund of $1,130,868, bearing 4 per cent. interest (which, however, is to be paid out of taxes "levied and collected for the general purposes of education"), to be paid annually to the townships; (2) from a poll tax of $1 to $1.50 on each voter; (3) from a State tax not to exceed 1 mill on $1; and (4) from a local levy of 2 mills on $1, which any parish may order. Teachers must receive a certificate of competency from the parish board, and those who maintain discipline without punishment, other qualifications being sufficient, are preferred. Each school must have at least 10 pupils and not more than 60 to each teacher.

No denominational or sectarian school is to be supported by public school funds.

GENERAL CONDITION.

Although no official report for 1882 comes from the State superintendent, it is evident from the Louisiana School Journal for that year, edited by a former superintendent, that the public school interests went from bad to worse. The poor pay of teachers, the insufficient provision for comfort in rural school-houses, and the inadequacy of funds for the support of even the New Orleans schools, together with the continued want of a definite school law corresponding with the new constitution, combined to make good

and efficient school work almost impossible. Teachers in the country schools, the superintendent said in his last report, had rooms almost destitute of educational conveniences, and those of New Orleans, in December, 1882, were still waiting for the pay which they had earned in 1881. To make things worse, the annual fund for the support of public schools—already charged by the constitution of 1879 with the payment of $45,235 interest on the school fund and with $14,551 interest on other funds—was further charged by the legislature of 1882 with the payment of $10,000 to each of the three State universities, one at Baton Rouge and 2 at New Orleans. As the annual school revenue was fixed at $107,000, these large deductions, with others for the pay of school officers, left less than $9,000 for the support of free schools throughout the State, exclusive of New Orleans, which depends largely on special appropriations. The result has naturally been that outside of New Orleans free education of the masses has been substantially suspended. Almost the only reliance for the maintenance of schools in the rural parishes is on volunteer taxation in addition to the poll tax, which latter under the constitution is to be retained in the parishes in which it is collected. This, an intelligent writer in the New Orleans Daily Picayune of April 24, 1882, says, if faithfully collected, should secure for the free schools at least $120,000 annually.

KINDERGARTEN.

The Kindergarten Institute of Mrs. J. E. Seaman, noticed last year in the report from this Bureau, was continued in 1882 with encouraging results. For statistics, see Table V of the appendix.

The Louisiana Journal of Education for November, 1882, says that in most of the private schools of New Orleans the experiment of connecting this form of education for young children with other preparation for higher classes has been tried with such good results as to justify the belief that it has become a permanent feature in primary school work. The children are said to be not only happier, but also more apt to learn, making better scholars in the more advanced grades.

AID FROM THE PEABODY FUND.

The two normal institutions for free education of white and colored teachers at New Orleans continued in 1881–'82 to be supported by the Peabody education fund, but doubt was expressed of the continuance of such support if the State failed to provide partially for their maintenance. The distribution to each of the schools is given in the report of the trustees as $1,500, with $1,000 for public schools, $200 for teachers' institutes, and $200 for the Louisiana Journal of Education.

CITY SCHOOL SYSTEM.

NEW ORLEANS.

Officers.—The public schools of this city are under a board of 20 directors, 8 appointed by the State board of education and 12 by the board of administrators of the city, with a superintendent appointed by the directors.

Statistics.—Population in 1880, 216,090; youth of school age in 1881, 61,456; enrolled in public schools in 1882, 24,976; average daily attendance, 15,224; number of teachers, 402; school buildings, 52; receipts for schools, $208,339; expenditures for them, $279,316; valuation of school property, $667,500; enrolment in private and parochial schools, 5,000.

Additional particulars.—Of the 52 schools under the care of the city board in 1881, 13 were for the exclusive use of colored pupils, with an enrolment of 5,473. The 12 buildings erected from the proceeds of the McDonogh school fund were commodious and comfortable, while the others, 13 of them rented, were poorly adapted to educational purposes, the rooms being too small, the light and ventilation defective, and the grounds insufficient.

In July, 1882, we learn from the Louisiana Journal of Education, contracts were signed for the erection of 2 new school-houses out of the McDonogh fund, now limited to the construction and repair of buildings. One of these was to take the place of a fine school-house in Algiers, destroyed by fire, the other to be a large and substantial structure of brick, in the third ward, with a capacity for about 700 pupils. These were to be finished in time for use in the fall session of the schools.

TRAINING OF TEACHERS.

NORMAL SCHOOLS AND DEPARTMENTS.

The *Peabody Normal Seminary*, New Orleans, gave free normal training to white graduates of high schools and colleges and other advanced students over 16 years of age from any part of the State. The normal department offered a 3-year course; in this course previous studies were reviewed and the members of the senior class were daily required

to teach classes of children in the model school for an hour or more. There was also a preparatory department for young ladies. The normal pupils for 1881–'82 numbered 48 young women; in the preparatory and model class there were 40; instructors, 4; 14 were graduated in 1882. This seminary is said by its principal to have prepared during the twelve years of its existence not less than 200 well qualified teachers for the public school system of the State.

The *Peabody Normal School for Colored Students*, New Orleans, presented two years of free normal training to graduates and advanced scholars of the higher grades over 17 years of age and fitted them for teaching; the school for 1881–'82 numbered 34 students, under 2 instructors. During the 5 years in which it has been in operation this school has furnished the public system 40 teachers.

Straight University, New Orleans (for colored), gave a 2-year course of normal training to 32 young men and 29 young women, under 3 instructors; number of graduates, 22 for the year, 12 of whom were teaching at the date of the report.

TEACHERS' INSTITUTES.

Teachers' institutes were held at New Orleans twice a month during February, March, and April. The largest number of teachers present was 150. The subjects discussed were arithmetic, elocution, drawing, history, the Kindergarten, methods of discipline, object teaching, patience in the school room, spelling, and the study of maps. Other sessions were held during the fall term.

EDUCATIONAL JOURNAL.

The Louisiana Journal of Education, published monthly in New Orleans and jointly edited by a former State superintendent and the present city superintendent of New Orleans, maintained in its third year its high standard of usefulness, giving valuable information to the teachers and efficient aid to the educational interests of the State.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

The two high schools in New Orleans continued their 3-year courses in the English branches. From the girls' school 37 pupils graduated in 1882; there was no class from the boys' school. In the boys' school there were 4 teachers and 80 pupils; while the girls numbered 138, with 5 teachers. Average daily attendance: boys, 68; girls, 114.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academic schools, and schools for preparing students for college, see Tables IV, VI, and IX of the appendix, and summaries of these in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The *Louisiana State University and Agricultural and Mechanical College*, Baton Rouge (non-sectarian), offers two courses, a classical and a scientific, of 4 years each, as well as agricultural and mechanical, of 2 years each. Military discipline is maintained. Residents of the State, on passing an entrance examination, are entitled to admission without distinction as to race or color. In 1882 there were 48 students taking the classical course, with 52 preparing for it, and 50 in the scientific department, with 29 in preparatory. The degree of B. A. was conferred upon two young men at the last commencement.

The *University of Louisiana*, New Orleans (non-sectarian), adopted by the constitution of 1879 as a State institution, had academical, medical, and legal departments, the first mentioned having schools of English, Greek, Latin, French, German, physics and mechanics, chemistry, &c. There were 250 students in this department and its adjunct high school, 77 of them collegiate; instructors, 12. The degrees conferred are B. A., B. S., and B. LIT., and students were advised to arrange their studies with a view to taking one of these. From the preparatory school, containing 173 students, 12 young men graduated in 1882 and entered the senior classes of the academic department.

Leland University, New Orleans (Baptist), had a new building in progress costing $12,000, largely the gift of Mr. Chamberlain, the founder, who also deeded the trustees property valued at $25,000 for the endowment of the institution.

Other institutions of this class were Centenary College, Jackson (Methodist Episcopal South); Straight University, New Orleans (Congregational); New Orleans University, New Orleans (Methodist Episcopal); Jefferson College, College Point, Convent P. O.; St. Charles College, Grand Coteau; and the Jesuits' College, New Orleans (Roman

Catholic). All provided substantially 4-year classical collegiate courses, with a fair proportion of scientific studies. Each of the Roman Catholic colleges gave a 4-year commercial course.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

New Orleans, Leland, and Straight Universities, the three Protestant institutions at New Orleans, gave equal privileges to young women. For information relative to schools exclusively for women, see Table VIII of the appendix.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The report from the State University and Agricultural and Mechanical College, at Baton Rouge, shows a 4-year scientific and a 2-year agricultural and mechanical course, following preparatory studies. The University of Louisiana, at New Orleans, and other colleges, as before stated, give scientific instruction in connection with classical.

PROFESSIONAL.

Theology.—Straight University, for the education of colored people, reported for 1882 a class of 16 students taking the 3-year course in theology, New Orleans and Leland Universities also present courses in theology, the former of 3 years, the latter of 2. For statistics of schools of this class, see Table XI of the appendix.

Legal.—The University of Louisiana and Straight University each gave a course of 2 years in legal instruction. In the former there were 27 students; in the latter, 28. For statistics, see Table XII of the appendix.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB AND THE BLIND.

The Louisiana Institute for the Education of the Deaf and Dumb, Baton Rouge, reported for 1881–'82 50 pupils, 23 of them young women, all under 3 instructors; 8 pupils and 1 teacher were semi-mutes. The boys are required to cut wood or work in the garden an hour a day, besides being taught printing or carpentry. The girls in charge of the matron are taught to sew and are drilled in habits of care and neatness in all the duties of housekeeping. The school hours are from 8 A. M. to 1 P. M., and the method of instruction combines oral and manual.

No statistics for 1881–'82 of institutions for the training of the blind are at hand.

ART CULTURE.

The Southern Art Union and Christian Woman's Exchange, New Orleans, appears to be doing good work in the way of art culture. Among the 75 pupils taught during the year were many who made rapid progress in sketching from life and in learning to paint and draw from nature.

A conservatory of music was organized which had over 100 pupils, with 15 classes and 18 professors. Musical instruction was also given at the Philharmonic Society by a single teacher.

CHIEF STATE SCHOOL OFFICER.

Hon. EDWIN H. FAY, *State superintendent of public education, New Orleans.*

[Term, January, 1880, to January, 1884.]

MAINE.

STATISTICAL SUMMARY.

a Excluding board, which cost the districts an average of $8.50 a month for each teacher. *b* In 1880.

(From reports of Hon. N. A. Luce, State superintendent of schools, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

For the State there is a superintendent of common schools, who is also superintendent of the State normal schools; for each township or plantation, a superintending school committee or a supervisor; for each school district in these towns or plantations, a school agent. The offices of member of superintending committee and supervisor of schools are open to women.

OTHER FEATURES OF THE SYSTEM.

The common schools of the State, of all grades, are for the free instruction of resident youth 4 to 21, and youth 9 to 15 are required to attend at least 12 weeks each year unless

excused by the school authorities. The studies (except in high schools established before February 24, 1873) are the ordinary English branches prescribed by the State superintendent and taught from text books selected by the town committees or supervisors. Text books are not to be changed oftener than once in five years except by vote of the town. Teachers are examined and licensed by the superintending school committees and are required to report to them. The expenses of the schools are defrayed out of an appropriation equal to 6 per cent of the State school fund, aided by a State tax on savings bank deposits of 2½ mills on the dollar and a State tax of 1 mill on the dollar on all other property, with local taxes of at least 80 cents for each inhabitant.

GENERAL CONDITION.

The statistics for 1881–'82 compared with those of 1880–'81 show a loss of 920 in school population and of 2,079 in enrolment, but an increase of 11,688 in average daily attendance. In view of these remarkable figures Superintendent Luce says that the almost constant decrease in school youth that has characterized the last 20 years goes on, though the decrease for the year was less than the average for some preceding years. Should this continue for another decade the condition of the schools in the older rural sections will be deplorable, for in those sections the decrease has been most marked. Already in many of the farming towns the majority of the schools register not more than a dozen pupils. The marked decrease in enrolment, he admits, is difficult to account for, especially in connection with the large increase in average attendance; but he suggests that as many pupils in the rural towns not only attend school in their own districts but also in the neighboring ones, they are counted but once as enrolled and counted twice in registered and daily attendance, so that increase in daily attendance does not, of necessity, indicate an increase of individual pupils. He relies upon the actual increase in the aggregate daily attendance as measuring the productive work of the schools, and thinks that as a whole the statistics of attendance show a healthier condition of school affairs than in the preceding year.

Statistics of graded schools appear for the first time. The ungraded schools improved in the scope and character of their work. A large increase in female teachers was not deemed indicative of less effective work, inasmuch as many of these were experienced, and districts were able to secure first class female teachers at less cost than third class male teachers. The abolition of the "outgrown, wasteful, inequitable, and iniquitous school district system" is said to have made slow progress during the year, only 2 towns having changed to the town plan. Nevertheless, taken as a whole, the superintendent regarded the statistics for the year as indicating that the schools were moving toward a higher state of efficiency. As compared with last year, the attendance had been more regular; better teachers had better appliances; instruction was broader and more practical; the schools were carefully and wisely supervised, and their financial management was more economical.—(State report.)

KINDERGÄRTEN.

For statistics of these schools, see Table V of the appendix; for a summary of them, a corresponding table in the report of the Commissioner preceding.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

These are school supervisors or superintending school committees, school agents, and, in Lewiston and Portland at least, superintendents.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Auburn	9,555	3,055	1,550	.....	51	$19,140
Augusta	8,665	2,060	.....	.....	.....	10,249
Bangor	16,856	5,390	3,072	.....	82	31,716
Bath	7,874	3,117	1,915	.....	38	17,397
Biddeford	12,651	4,210	1,874	1,292	38	22,915
Lewiston	19,083	6,408	2,538	1,705	62	32,662
Portland	33,810	10,973	6,737	4,412	139	91,144
Rockland	7,599	2,186	1,448	1,130	30	9,319

ADDITIONAL PARTICULARS.

Auburn for 1882 reported 30 school buildings, 2 less than the previous year, with 2,200 sittings, and entire school property valued at $105,000. Enrolment decreased 412 and expenditure increased $3,219. Schools were classed as primary, grammar, high, and rural mixed; they were in session 175 of the 180 school days. Estimated enrolment in private and parochial schools, 25.—(Return.)

Augusta reported 28 school buildings instead of the 33 of 1881 (probably from an additional building, erected during the year at a cost of $20,000, having accommodated the pupils of some smaller schools); but the value of school property rose to $75,000. There was a falling off of $9,547 in expenditure.—(State report.)

Bangor, for its school population of 5,390, had 35 school buildings, 1 less than the year before. Notwithstanding the loss of the high school building by fire, school property was rated at $122,000, or $47,000 more. In school population and enrolment there was a slight falling off from 1881, but an addition of 3 teachers and of $1,153 in expenditure. One special teacher in penmanship was employed. The superintending school committee reported a year of earnest work, though serious inconvenience was experienced from the burning of the chief school building. The experiment of the previous year in placing all the schools above the intermediate grade under the control of a principal had proved a marked success. Two ungraded schools were opened, to which were sent from the grammar schools such pupils as had failed to maintain their standing. The standard for promotion established the year before had been sustained. The school year was lengthened from 34 to 36 weeks.—(City report and return.)

Bath had 14 school buildings, 2 less than in 1881, 13 of them in good repair. The entire school property of the city was valued at $59,300. Enrolment increased 79; expenditure, $285. Schools were in session 204 days of the school year.—(State report.)

Biddeford reported 26 school buildings, a gain of 3, but the same number of sittings, 1,835, and the same estimated value of school property, $95,000. There was a loss of 17 in enrolment, of 43 in average daily attendance, and of 4 teachers. Schools were taught 184 days.—(State report and city return.)

Lewiston reported 29 school buildings, the same as in 1881, and entire school property valued at $174,700. There was a loss of 381 in enrolment, of 357 in average daily attendance, and of 7 teachers, with a decrease of $570 in expenditures. One special teacher of music was employed. Schools were taught 183 days. The estimated enrolment in private and parochial schools was 500.—(City report and return.)

Portland reported for the year ending March 6, 1882, the erection of 1 school building, costing $21,720, giving to all school property the value of $370,000, an increase of $20,000 over 1881. The schools were taught by 131 teachers for 190 days, and classed as primary, grammar, and high, with 1 ungraded and 1 for the deaf. Compared with 1880–'81, there was a gain of 129 in enrolment and of 7 teachers, and a loss of 91 in average daily attendance, owing to contagious diseases; while expenditure was increased $10,432. The chairman of the school committee says that the schools were in a more satisfactory condition than a year ago, although no marked change for the better could be expected in one year, in view of the excellence which their schools had attained. With less corporal punishment, truancy had in a measure been kept under control. Two special teachers in music and penmanship and drawing were employed. Estimated enrolment in private and parochial schools, 1,200.—(State and city reports.)

Rockland, so far as reported, shows no advance from the few statistics of 1880–'81. The schools, classed as primary, grammar, and high, were in session 150 days.—(State report.)

TRAINING OF TEACHERS.

STATE NORMAL AND TRAINING SCHOOLS.

The normal schools at Castine, Farmington, Gorham, and the training school at Madawaska, all under the care of the State, are reported as having about the same attendance as in 1880–'81. Though the attendance was less than it should be, the schools did valuable work, having 498 students, under 21 teachers, and having graduated 84 in 1882, of whom 78 were teaching in the State.

OTHER NORMAL TRAINING.

The practice school at Portland, sustained by the city, had 3 teachers, with 9 female students, and graduated 8, all of whom engaged in teaching. In a similar school at Lewiston 7 teachers were graduated. For local reasons, this school was discontinued at the close of 1881–'82.

TEACHERS' INSTITUTES.

Under the new law of 1881 changing the time of teachers' institutes to two days instead of five, teachers' associations were organized in every county in the State where they did not already exist. During the year there were 25 meetings, and the year's trial indicated the superiority of the shorter term over the former one. Nearly 2,000 teachers were thus associated, the number doubling in one year. As a specimen of the working of these institutes, the outline of the one held at Bethel, Oxford County, in December, 1882, is given. The first subject presented was "Opening exercises: their purposes, character, and methods of conducting them." Next came "Practical exercises in arithmetic," followed by "Arithmetic for practical ends." Then came an essay on "Morals and manners," another on "Reviews: their purposes, frequency, and methods," followed by still another on "School government: its purposes, means, ends, and methods." In closing, examples in reading and gesture were given by a class trained by Miss Mary M. Parker, teacher of elocution.

SECONDARY INSTRUCTION.

FREE HIGH SCHOOLS.

Free high schools in Maine are not a required part of the public school system, it being optional with towns and districts whether they will have such schools. In some cases they have become part of a graded system, though such cases are exceptional. A vote to establish one remains in force only a year. The superintendent says that these schools have been growing in public favor; for ten years they have existed in their present form, and have come to stay in some form. They are a necessity to the common schools below them and the seminaries and colleges above them. In 1881 there were 101 towns that had them, in 1882 there were 109, at a cost in 1881 of $69,469 and in 1882 of $88,372, enrolling 7,792 in 1881 and 10,374 in 1882.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academic schools, and schools devoted to preparing students for college, see Tables IV, VI, and VII of the appendix; for summaries of them, corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR BOTH SEXES.

Bowaoin College, Brunswick (Congregational), reported for 1881–'82 a faculty of 14 professors (3 non-resident), with 147 students in its 4-year collegiate course, in the junior and senior years of which a wide range of elective studies is allowed. For the departments of engineering, medicine, and military science, see Scientific and Professional Instruction, next page. Facilities for graduate instruction are provided for such as desire to pursue special studies after graduation, either with or without reference to an advanced degree. Special students may also enter the regular classes and remain in them at their pleasure. Gifts of $1,500 in aid of students and $1,500 for the libraries were received during the year. There were 44 specific scholarships, which were based on a fund of $46,859.—(Catalogue and return.)

Colby University, Waterville (Baptist), with a faculty of 9 in 1881–'82, had 124 students in its 4-year classical course, including 8 females and 2 special students. Women are admitted on equal terms with men. The university held 69 scholarships, with an aggregate fund of $50,000; had 17,763 bound volumes in the library, increased by 573 during the year, and productive funds amounting to $235,000. Much attention is given to the study of French and German, the natural sciences, art, and political economy.—(Catalogue and return.)

Bates College, Lewiston (Free-Will Baptist), reported for 1881–'82 a faculty of 7 resident and 3 non-resident professors, with 106 students in its 4-year classical course, 12 being women, who are admitted on equal terms with men. The preparatory work is done in the Nicholas Latin School, which, though owned by the college, is a separate school and had 63 pupils in 1882. There were 24 scholarships, sustained by a fund of $24,000. The degree of A. B. was conferred on 24 young men and 2 young women, and that of A. M. on 17 young men. A library of 6,883 volumes was increased during the year by 1,112, and nearly $20,000 in gifts were received.—(Return.)

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

For statistics of this class of institutions, see Table VIII of the appendix; for a summary of them, a corresponding table in the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The Maine State College of Agriculture and Mechanic Arts, Orono, reported no changes in its general workings since 1880–'81, having 9 professors and instructors, with 81 students in its 4 regular courses of 4 years each, 4 being females; also 4 in its partial and and 1 in its graduate course; total 86, a decrease of 17 from 1880–'81. The trustees reported a year of hard work and substantial results. Two much needed instructors were added, 1 in military science, the other in agriculture, thus providing in the latter for experimental and practical farming. In the shop decisive success was reached in vise and forge work, but carpentry, lathe work, &c., had not been added to the courses, for want of necessary buildings. At the last commencement 12 young men received the degree of B. S., 7 of B. C. E., 5 of B. M. E., 2 of C. E., and 1 of M. S.; 1 young woman took M. S.—(Report and return.)

PROFESSIONAL.

Theological.—Bangor Theological Seminary (Congregational), located at Hampden in 1816, was moved to Bangor in 1819, where in 1820 it graduated its first class. Up to 1880 its graduates numbered 600; counting 160 other students, educated for 1 and 2 years, the seminary had sent out 760 ministers. A majority of these are still living: 6 are college presidents; 13 have been college or seminary professors; 24 have been foreign and large numbers home missionaries. For 1881–'82 it had 5 professors, 28 students (of whom 7 had a degree in letters and science), and 11 graduated from the 3-year full course of 36 weeks each. An examination is required for admission. There were 15,500 volumes in the library, of which 300 were added during the year.—(Statement and return.)

The Bates Theological School, Lewiston (Free Will Baptist), in 1881–'82 had 4 professors and 20 students, 9 with a degree of letters or science. It graduated 6 from its 3-year full course of 36 weeks each. The library consisted of 3,000 bound volumes. An examination is required for admission.—(Return.)

Legal.—No law school reports for 1881–'82, and it is believed that none existed.

Medical.—The medical school of Maine, Brunswick, is a department of Bowdoin College and for 1881–'82 reported 7 professors and lecturers, 104 students (19 of whom had received a degree in letters or science), and 28 graduated from the full 3-year course of 16 weeks each. The library contained about 4,000 bound volumes. An examination for admission is required.—(Return.)

The Portland School for Medical Instruction is a high grade preparatory school not conferring degrees. It was organized in accordance with resolutions adopted by the American Medical Association, approving the establishment of private schools to meet the increasing desire of students for a higher grade of professional instruction than can be had by the usual study with a single instructor. The report for 1881–'82 shows 11 professors and 19 students, 6 having a degree in letters or science, and a 3-year course of 32 weeks each. An examination in English, Latin, and physics is required for admission. (Announcement and return.)

SPECIAL INSTRUCTION.

REFORMATORY AND INDUSTRIAL INSTRUCTION.

The *State Reform School*, Portland, admits boys 8 to 16 for any offence not punishable by imprisonment for life. In 1881–'82 there were 17 employed as officers, teachers, and assistants; 110 inmates, 106 native born and 4 foreign; 30 were committed and 33 discharged during the year. Since its establishment, 1,711 have been committed. The common English branches, including book-keeping and vocal music, were taught in school; the industries were baking, cane seating, house and laundry work, sewing, gardening, and farming. Many released on "ticket of leave" had been placed in good homes and some indentured until 21 years of age. The library contained 1,600 volumes.—(Return.)

The *Maine Industrial School for Girls*, Hallowell, was designed as a place of refuge for girls 7 to 15, who by force of circumstances are in danger of becoming outcasts from society. During the year 1881–'82 there were 44 inmates, 18 committed, 5 returned, 18 sent to homes provided for them, and 4 married. Since 1875 148 had been received, 112 sent to homes, 32 returned for a new trial, and 81 were in homes provided for them. A flower garden was one of the attractive features of the home, the whole work in it being done by the inmates, besides a large amount of sewing and knitting. Under the good discipline, running away had ceased, no locks were used, and as much freedom as possible was given to the girls.—(Report, 1882.)

EDUCATIONAL CONVENTION.

MAINE PEDAGOGICAL SOCIETY.

The Maine Pedagogical Society was organized in 1875, and, having similar aims to those of the Maine Educational Association, took its place in 1881, when the latter went out of existence. The third annual meeting of the society was held at Portland, and its first session opened in the afternoon of November 9, 1882, with Prof. H. L. Chapman, of Bowdoin College, in the chair, many of the prominent educators in the State being present. Hon. N. A. Luce, State superintendent, gave an address on "School supervision in the smaller towns," in which he defined the duties of school supervisors.

At the evening session, Professor Chapman, delivered the annual address on "The duty and the opportunity of the teacher in respect to the development of character in the pupil." He said that our conception of the teacher's duty is determined by our theory of education. The end of education is not reached when the intellect is informed and the reasoning power disciplined, as the intellect is not the man. To realize the object for which schools have been endowed, they should be something more than training places of special aptitudes or magazines of multitudinous facts. More and more will society distrust these educational agencies if they do not send forth successive generations of young people fitted to act wisely in the social conditions under which their lives must be passed. One of the foremost thinkers says: "It has come to be one of the chief endeavors of educational thought of to-day to go deeper, and moralize as well as mentalize children, and to develop the will as the chief factor of character." The teacher who does not aim to furnish the pupil with this equipment fails to appreciate the true ends of his calling. This idea of the teacher's mission of to-day was elaborated with much clearness and force.

Principal C. C. Rounds, of Farmington Normal School, then gave an account of the last session of the National Educational Association. Prof. E. W. Hall, of Colby University, read a paper on "Admission to college on certificates from fitting schools." After a discussion of some length the opinion was unanimous that colleges should not admit without the certificate of the fitting school. Prof. C. H. Smith, of Bowdoin College, read a paper on "Instruction in geometry," followed by a report from Mr. Rounds on "The study of arithmetic;" this by a paper on "The use and abuse of text books," by Dr. O. S. Lowell, of Ellsworth High School; and this by a paper from Principal Woodbury, of Castine Normal School, on "Professional enthusiasm." The "Ranking system in schools" was then discussed by Messrs. Frash, Chase, Rounds, Hon. W. J. Corthell, Prof. E. W. Hall, and Dr. D. O. S. Lowell, all expressing disapprobation of the system of marking as now practised.

The officers for the ensuing year having been elected and 15 new members received, the association adjourned. The session was said to have been of much profit to the teachers in attendance.—(Maine State Press.)

OBITUARY RECORD.

REV. ENOCH POND, D. D.

Rev. Enoch Pond, D. D., was born at Wrentham, Mass., July 29, 1791, and died at Bangor, Me., January 21, 1882. He graduated at Brown University in 1812 and entered at once upon the study of theology with Rev. Nathaniel Emmons, at Franklin, Mass. After a pastorate of thirteen years at Auburn, Mass., and editing the Spirit of the Pilgrims four years, he was elected professor of theology in the Theological Seminary at Bangor. He held this professorship twenty-three years, when he was transferred to that of ecclesiastical history and made president of the institution. Resigning the professorship in 1871, he retained only the general duties of president, which office he held till his death, having been connected with the seminary for nearly 50 years and having trained 700 young men for the ministry. He was also the author of about 50 volumes on theological and practical themes, besides preparing 115 articles for magazines, 70 of which were published in the Bibliotheca Sacra.

CHIEF STATE SCHOOL OFFICER.

Hon. N. A. LUCE, *State superintendent of common schools, Augusta.*

[Term, February 6, 1880, to February 6, 1883.]

Mr. Luce has been chosen for another term. He also served as superintendent from December 31, 1878, to April 16, 1879.

MARYLAND.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth 6 to 21 *a*	*b*316,182	*c*330,500		
Attending public schools	158,909	159,945	1,036	
Average daily attendance	79,739	83,189	3,450	
Colored pupils enrolled	26,887	29,146	2,259	
Colored in average attendance	11,661	11,760	99	
SCHOOLS.				
Public schools reported	2,039	2,058	19	
Average length of term in days		199		
Public schools for colored pupils	394	396	2	
Estimated value of school property		$2,900,000		
TEACHERS AND THEIR PAY.				
Men teaching in public schools	1,319	1,220		99
Women teaching in public schools	1,861	1,977	116	
Whole number employed	3,180	3,197	17	
Average monthly pay of teachers		$40		
Teachers in colored schools	494	499	5	
RECEIPTS AND EXPENDITURES.				
Whole receipts for public schools	$1,608,274	$1,618,030	$9,756	
Whole expenditure for public schools	1,604,581	1,651,908	47,327	
STATE SCHOOL FUND.				
Amount of available fund	$906,229	$906,229		

a This is the school age for whites; for colored it is 6–20. The age taken for distribution of school funds is 5–20 for both races.
b Census of 1880.
c Estimated.

(From reports and return of Hon. M. A. Newell, State superintendent of public instruction, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

State educational affairs are in the hands of a State board of education, composed of the governor and 4 persons appointed by him, with the president of the State Normal School, who is ex officio secretary and executive officer of the board and superintendent of public instruction; county school affairs are managed by boards of 3 school commissioners, appointed for 2 years by the judges of the circuit courts, this number being increased to 5 in counties having over 100 schools; district schools are under boards of 3 trustees selected by the commissioners.

OTHER FEATURES OF THE SYSTEM.

The schools for whites are supported from the income of a free school fund and from a State tax of 10 cents on each $100 of taxable property. If in any county these funds should prove insufficient to keep the schools open for the legal term of 10 months the commissioners are required to levy such a tax on the property of the county as will make good the deficiency, but not to exceed 10 cents on $100 unless with the approval of the county commissioners. If in any county on the 31st day of December the term for the year has been less than 7½ months, such county forfeits its instalment of the State school

tax in April. The schools for colored youth receive a State appropriation of $100,000 annually, and all the taxes paid by colored people for educational purposes are devoted to the support of colored schools. The funds for both races are distributed on the basis of the number of youth 5 to 20 years of age; but the legal age for free attendance for whites is 6–21 and for colored 6–20. It is the duty of the county school board to establish in each election district one or more public schools for colored youth. These schools are under the direction of a special board of school trustees, appointed by the county commissioners. If the average attendance does not fall below 15 they may be taught as long as the other public schools of the county. Orthography, reading, writing, geography, arithmetic, history of the United States, and good behavior are required studies in the schools for both races; other branches may be added when deemed expedient by the board of trustees. County commissioners select the school books, which must contain nothing of a partisan or sectarian character. The system provides for high schools, teachers' institutes, and a State normal school. Aid from public funds is also given to several colleges, which are required to make annual report to the State superintendent. The law recommends the establishment of district, county, and State teachers' associations; also, of district libraries, the latter receiving each $10 annually from county funds, provided the people of the district raise the same amount for the purpose. Teachers, in order to receive pay for services, must report quarterly to the county commissioners; county boards must report annually to the State board, and the latter to the governor. Teachers, unless graduates of the State Normal School, must have a certificate of qualification from the county examiner, the principal of the State Normal School, or the State board of education. Teachers for schools of high grade are trained in 4 colleges aided by the State.

GENERAL CONDITION.

The board of education reports another year of successful work by the public schools, and evidences of advance appear in almost every item of the above summary. The number of pupils enrolled increased by more than a thousand, and the number in average daily attendance by nearly 3,500; more teachers were employed, more schools were taught, and more money was expended on them. The report calls attention to the inadequacy of teachers' pay in some of the schools and to the very small enrolment in a number of schools, a single county reporting 21 schools with an average attendance ranging from 1 to 8. The law allows schools having less than 10 pupils in average attendance to be closed, but closing one is always unpopular, and school commissioners are reluctant to resort to it. It is suggested that in such cases the law might allow teachers to receive full pay for the first term and for succeeding ones pay in proportion to the average attendance, or else that the smaller schools be taught for a number of terms proportional to the attendance, the same teacher thus being employed in two or more schools. The necessity for some provision to secure statistics in regard to the number of pupils of school age in the State is presented by the report and a plan is proposed similar to one used in an adjoining State, in which it is made the duty of the principal teacher in every school district to make annually an enumeration of all the children in the district of school age. It is suggested also that information be added as to the causes of non-attendance. The superintendent remarks that such a plan, besides securing the desired information, would bring teachers into direct contact with parents and afford them an opportunity to explain to careless and indifferent parents the advantages their children lose by non-attendance.

In consequence of the complaint of a parent whose son had been unmercifully whipped for having missed lessons, the general question of corporal punishment in school came before the board for consideration. The result developed a decided opinion on the part of members that the best school management discards the rod. But in consideration of the faulty home training of many children it was believed that the abolition by law of corporal punishment would not promote the welfare of the schools at present. It was decided, however, that for missed lessons it is not a proper punishment, and no teacher will be sustained who resorts to it to correct scholars delinquent only in that respect.

CITY SCHOOL SYSTEM OF BALTIMORE.

OFFICERS.

The schools of Baltimore are controlled by a board of 20 school commissioners, appointed by the city council for 4 years, 5 going out each year. The board appoints a superintendent of public instruction for the city, who serves 4 years, devoting his whole time to the work; likewise, an assistant superintendent.

STATISTICS.

Population, census of 1880, 332,313; children of school age, 86,961; enrolment in public schools, 48,277; average daily attendance, 29,178; number of teachers, 818; expenditure, $692,740.

ADDITIONAL PARTICULARS.

The above statistics include 121 public schools, of which 14 for colored pupils had an attendance of 4,314. Sixty of the white schools were of primary grade and had 15,521 pupils; 39 were grammar schools, with 10,586; 5, with over 3,000 pupils, had been formerly English-German schools; 2 were high schools for girls numbering 947 pupils; while the city college for boys had 596. These schools were taught in 65 different buildings, of which the city owned 62; estimated value, about $1,200,000. Liberal appropriations were made during the year for the erection of new buildings and the repair of old, but still more money will be needed to make some of those in use comfortable and suited to their purpose. Additional and better accommodations were especially needed for the primary schools; had they been provided, more pupils would have attended the schools during the year. The number of different pupils in all the schools increased by 1,229, but the average attendance was lower, having been diminished by the prevalence of an epidemic. The percentage of attendance was about the same as during the previous year, ranging from 76.6 in the colored schools to 92.3 in the city college, and averaging 82 in all. The average cost per capita for education was $17.70. Teachers' associations, which meet monthly for professional improvement, and public libraries for the use of teachers and pupils, are a part of the school system. The schools are reported to be generally in good condition, giving evidence of progress and success. Discipline was good; while corporal punishment was not prohibited, the annual summary of cases showed that it was inflicted much less than formerly, the schools being satisfactorily controlled by other means. The primary and grammar schools, enrolling as they do a very large proportion of all the pupils, receive special attention from the board and superintendents. Each of these had 6 grades, requiring 3 years for completion, so that the child who enters the primary at the age of 7 generally finishes the grammar school course at 13. Physical training is not forgotten, a portion of each day being devoted to calisthenic exercises; and not more than 2 hours a day need be given by any grade of pupils to study out of school.—(City report.)

TRAINING OF TEACHERS.

STATE NORMAL SCHOOL.

The Maryland State Normal School, the chief agency for the training of teachers in this State, has been from its organization in 1866 steadily and sometimes liberally supported by the legislature. From the first, when 11 anxious pupils gathered around a no less anxious master in a rented hall, till 1882, when about 300 met 12 teachers in one of the most comfortable and best appointed school-houses in the country, there has been no change of administration or of plan. The principal has been at his post for 17 years, the vice principal for 16, and two other teachers 5 and 10 years respectively. During 1881–'82 there were 38 graduated from the course of study, which extends over 3 years, all but 3 of whom engaged in teaching. Diplomas, conferred after one year of successful work as teachers, authorize employment in the public schools without further examination. Tuition is free to 200 State scholars.

OTHER NORMAL SCHOOLS.

The *Baltimore Normal School for the Education of Colored Teachers* is reported to be in a very flourishing condition, with 6 teachers, 142 pupils on the roll, and a total enrolment during the year of 150, 25 of them in normal studies. There was a library of 1,100 good books in constant use by the pupils. Over 150 of the pupils of the school have been employed to teach at different times and in various localities of Maryland, Virginia, and North Carolina. An annual appropriation of $2,000 is made by the State, and the results from this expenditure are more satisfactory than could have been expected.—(State report and return.)

The *Centenary Biblical Institute*, Baltimore, a Methodist school for the education of colored preachers and teachers, reports a normal department in which only those studies are required in which candidates for positions in grammar schools must pass; but this department is intended only to meet the emergencies of the present.—(Report, 1882.)

TEACHERS' INSTITUTES.

The law requires a teachers' institute to be held in each county once a year, to continue in session 5 days and to be presided over by the principal or one of the professors of the State Normal School, if he can be present, assisted by the county examiner. It appears, however, that this law has not been carried out in all portions of the State. The school authorities are not always convinced of the necessity of such meetings, and it has not been thought advisable to hold an institute without the hearty approbation of county school boards.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

High schools or high school departments are reported by the State board as existing in 12 of the 23 counties. All the counties, however, report pupils in geometry and philosophy; 22 had students in algebra and physiology, and 21 in book-keeping. In 19 counties Latin was studied by over 600 pupils; in 2, Greek by 25; and in 2, French by 92. The course varies greatly in the different counties, since, although high schools are recognized as a part of the public school system, the law does not define what constitutes one. Some give adequate preparation for college in English, classics, and mathematics; in others the course is only an extension of the district school to a seventh, eighth, or ninth grade.

OTHER SECONDARY SCHOOLS.

State aid was given during the year to 15 academies and academic schools, amounting in all to $11,229. Of 788 students attending, 194 studied Latin; 32, Greek; 42, French; 30, German; 180, algebra, and 87, geometry. Pupils were also reported in trigonometry, natural philosophy, chemistry, physiology, botany, geology, logic, rhetoric, English literature, and instrumental music.

For statistics of these and other secondary schools reporting to this Office, see Tables IV, VI, and VII of the appendix; and for summaries, see corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

Johns Hopkins University, Baltimore, liberally endowed by the merchant whose name it bears and opened in 1876, presents two distinct departments, undergraduate, or collegiate, and university. Of 175 students enrolled during 1881–'82 under 43 instructors and lecturers, 99 (including 21 fellows) were university students, graduates of 50 collegiate institutions; 45 were undergraduates, candidates for the degree of A. B.; and 31 were admitted as special students to pursue courses for which they were fitted without regard to graduation. Of the whole number, 97 were residents of Maryland, 68 came from 21 other States, and 10 from foreign countries.

In the organization of this institution, the funds being ample and unrestricted, it was decided to follow no existing model but to create a true American university. The aim has been to select the ablest teachers whose services could be secured; to keep them free from petty cares and encourage them in original research; to maintain a high standard of matriculation and graduation; to allow wide latitude in respect to the choice of courses of instruction; and to give special facilities, such as fellowships and scholarships, to those who show unusual ability in any department of study. In the undergraduate department 8 different courses have been marked out and so arranged that before graduation all will have been trained in mathematics, Latin, German, French, and English, in one branch of science, and in some branch of historical or philosophical investigation. Graduate students are received with or without reference to candidacy for a degree and attend such lectures and exercises as they prefer and are fitted for. The university professors give personal counsel and instruction. Books and instruments adapted to investigation and advanced work have been liberally provided. The system of fellowships secures the presence of 20 students imbued with the university spirit. Seminaries, limited to a few advanced students, have been organized in Greek, mathematics, physics, &c.; societies devoted to philology, the sciences, metaphysics, and historical and political science afford opportunities for the presentation of original communications; there are clubs for the discussion of various topics; and lectures by specialists. Select libraries for the use of scholars are accessible. The university reading room is well supplied and every provision made not only to instruct, but to encourage original investigation.—(University Register.)

Besides Johns Hopkins University, which stands first among institutions for superior instruction, 10 colleges report, of which 4 receive a regular annual appropriation from the State. These are St. John's College, Annapolis; Washington College, Chestertown; Frederick College, Frederick; and Western Maryland College, Westminster. The last named is under Methodist control, the other 3 are unsectarian. All 4 report to the State authorities 337 pupils, a total of $20,290 received from the State, and in return 58 free scholarships given. These are for students selected by county boards, after competitive examination, and are good for the full course of 4 years, the holders being pledged to complete it and to teach in the public schools of the State at least 2 years after graduation. The remaining colleges are Baltimore City College, already noted under Secondary Instruction, but presenting a collegiate course of 3 years; Loyola College, Baltimore, Rock Hill and St. Charles Col-

leges, Ellicott City, and Mt. St. Mary's College, Emmittsburg (all 4 Roman Catholic); and New Windsor College, New Windsor, non-sectarian. The course of study in these 10 colleges remains essentially the same as reported for 1880–'81. All make provision for preparatory work and present classical courses extending in most cases over 4 years, 5 adding scientific courses of from 3 to 4 years. St. John's had a graduate course of 2 years and reports additional facilities for scientific instruction; Washington, a special course for non-matriculates; and Loyola, Rock Hill, Mt. St. Mary's, and New Windsor had commercial courses. Only two, New Windsor and Western Maryland Colleges, receive young women, providing for them separate departments and 3-year courses.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

Special facilities for scientific study are afforded by the Maryland Agricultural and Mechanical College, College Hill, the United States Naval Academy, Annapolis, and Johns Hopkins University, Baltimore, while, as already noted, courses in general science are presented by 5 of the other colleges, viz, St. John's, Baltimore City, Rock Hill, Frederick, and New Windsor.

The *Maryland Agricultural College* reports 40 students under 6 instructors, a decrease for the year of 15 students and 1 instructor. The withdrawal of the usual annual State donation of $6,000 made it necessary to add $75 to the annual charge for each student, and thus the enrolment fell off. This failure to afford the usual aid resulted, as the trustees were assured, from no dissatisfaction with the administration of the affairs of the college, but simply from an opinion that agricultural colleges are not required. Notwithstanding the discouragement resulting from this action, the several departments of the college were in good condition, even better than ever before. The faculty agreed to a reduction of 20 per cent. in their already moderate salaries, all the farm hands but one were discharged and the work done by students, and 7 young men who came well recommended were allowed board, tuition, and all other expenses in consideration of 5 hours' labor from them each day on the farm. Military tactics, as required by law, receives some attention in the course of study; English literature is studied by all; Greek, by 2; Latin, by 8; French, by 6; and German, by 10.

In the *United States Naval Academy* the course of study, comprising 4 years at the academy and 2 at sea, includes, besides literary and linguistic branches, all the higher mathematics, physics, astronomy, chemistry, dynamics, navigation, surveying, and steam engineering. The number of cadet midshipmen allowed at the academy is one for every member and delegate of the House of Representatives, who nominate them, and one for the District of Columbia and 10 at large, nominated by the President of the United States. In addition to these, 25 cadet engineers may be appointed each year by the Navy Department, after a competitive examination, those who possess the greatest skill and experience in the practical knowledge of machinery having precedence. The course of study for engineers, as for midshipmen, comprises 4 years at the academy and 2 at sea. Graduates are commissioned as assistant engineers in the Navy as vacancies occur. The stipulated age for engineers on entering is 16 to 20; that for midshipmen, 14 to 18.

Johns Hopkins University furnishes opportunities for advanced scientific study and investigation in its graduate department, while the undergraduate presents two courses in which general scientific studies are pursued, viz, a scientific and a mathematical course, the latter being intended for those who prefer mathematical studies with reference to engineering, astronomy, &c. Of 175 students in the university during 1881–'82 there were 33 engaged in mathematical studies, 24 in physics, 44 in chemistry, and 32 in biology. The university is provided with 3 scientific laboratories, fully equipped. Chemistry has a special building, with facilities for about 40 workers, and a well selected library. The physical department is furnished with apparatus from the best European and American makers. It was selected with especial reference to investigations, and is particularly valuable for researches in respect to electricity, magnetism, light, and heat. The biological laboratory, occupying the entire upper story of the university building, includes a general laboratory, several private work rooms, and a lecture room and cabinet. Over $43,000 have been expended for scientific apparatus.

For statistics of scientific schools, see Table X of the appendix, and for a summary, see the report of the Commissioner preceding.

PROFESSIONAL.

The *theological* schools in this State are the Theological Seminary of St. Sulpice, Baltimore, the Ecclesiastical Seminaries of St. Mary's College, Emmittsburg, St. Clement's College, Ilchester, and Woodstock College, Woodstock, all four Roman Catholic, and Centenary Biblical Institute, Baltimore for colored men, under Methodist influence.

The courses of study reported by the first named four are, respectively, of 5, 4, 6, and 7 years, but the portion which is strictly professional does not appear. The course in Centenary Institute extends over 9 years, 3 of these being theological. For statistics of theological schools, see Table XI of the appendix, and for a summary, see the report of the Commissioner preceding.

The *law* department of the University of Maryland reports 64 students, of whom 15 had received a degree in letters or science, and 30 graduates in 1882. The course of study comprises 2 years of 32 weeks each. There are four examinations each session, and in order to be graduated students must attain a grade of at least 75 per cent. in all the examinations. For fuller statistics, see Table XII of the appendix.

Four schools of *medicine* are reported from this State, all "regular" and all in Baltimore, viz, the School of Medicine of the University of Maryland, the College of Physicians and Surgeons, Baltimore Medical College, and the Woman's Medical College of Baltimore.

The School of Medicine of the University of Maryland, organized in 1807, presents a regular course of 22 weeks and a preliminary one of 10 days, recommends but does not require a 3-year graded course, and for graduation requires attendance on 2 regular courses. During the last 6 years 40 per cent. of the matriculates have graduated. Matriculates for 1881–'82, 197; graduates, 73; faculty, 10.

In the College of Physicians and Surgeons (organized in 1872) there is a regular course of 20 weeks and a spring course of 12, a 3-year graded course is recommended but not required, and there are no requirements for admission. To graduate, students must have a good English education and must have studied medicine 3 years and passed a satisfactory examination. Thirty-nine per cent. of the matriculates during the last 6 years have graduated. Matriculates, 346; graduates, 158; faculty, 10.

Baltimore Medical College, first opened in 1881, reports a lecture course of 30 weeks annually. Students, in order to graduate, must attend two of these courses and must pass an examination in the 7 branches of medical study. An examination in English studies is required of applicants for admission who are not graduates of some literary or medical school. Matriculates, 46; graduates, 17; faculty, 10.

The Woman's Medical College of Baltimore, organized in 1882, provides sessions of 28 weeks, advises a 3-year graded course, and as an inducement thereto offers free tuition during the third year; requires for admission an examination in English branches; for graduation, attendance on 2 full courses of lectures on clinics, at least 1 dissection, and an examination in all the branches of the course of study. Faculty, 8; matriculates, 19.

Besides the above, Johns Hopkins University, in a course preparatory to medical study, affords opportunity for students expecting to take up the study of medicine to become proficient in laboratory work while continuing their general education. Besides modern languages and other collegiate studies, the course includes physics, chemistry, and biology, the last being the dominant subject.

Dentistry is taught in the Baltimore College of Dental Surgery and the dental department of the University of Maryland. The former, organized in 1839, reports 1,906 students since then; 89 present during 1881–'82, of whom 10 had received degrees in letters or science, and 36 graduated from the 2-year course. The college removed in June, 1881, to new and commodious buildings. The dental department of the University of Maryland, first opened October 2, 1882, presents a 2-year course of lectures, each session lasting about 5 months.

Pharmacy was taught in the Maryland College of Pharmacy, Baltimore, to 98 students, of whom 17 were graduated. Besides attendance on 2 sessions of the regular course of lectures and on one course of analytical instruction, students, to graduate, must have served an apprenticeship of 4 years in the apothecary business and must have passed an examination (under the supervision of a board of examiners assisted by the professors) in each branch of study, at least 60 per cent. of the whole number of questions to be answered correctly.

For statistics of schools of medicine, dentistry, and pharmacy, see Table XIII of the appendix, and for a summary, see the report of the Commissioner preceding.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The Maryland School for the Deaf and Dumb, Frederick City, receives youth 9 to 21 years of age and gives free board and tuition to residents of the State unable to pay. Instruction is given in the elementary English branches, in the elements of philosophy and chemistry, in algebra, drawing, speech and lip reading; also, in such industries as shoemaking, cabinet making, printing, and needlework. There were 89 pupils in attendance during the year, under 10 teachers; and since the foundation of the school in 1867 instruction has been given to 248.

EDUCATION OF THE BLIND.

The Maryland Institution for the Instruction of the Blind, Baltimore, reports 70 pupils during 1881–'82. The course of instruction consists of English branches and music, besides broom and mattress making, sewing, and knitting. Pupils remain in school from 8 o'clock A. M. to 1 P. M., with intermission of 10 minutes each hour; from 2 to 5 P. M. they are employed in the shops, sewing room, and music classes. The age for admission is 9 to 18; expenses to each one, $300 a year, which is remitted, on consent of the governor, to those whose guardians are unable to pay.

The colored blind and deaf-mutes receive instruction in an institution organized for them in 1872 by the directors of the institutions for the blind and the deaf and dumb white children assisted by the State, which makes annual appropriations for its support. The building formerly occupied by the institution for blind white children is commodious, in good repair, and well adapted for the purpose. There were 28 pupils during the year, of whom 15 were blind and 13 deaf-mutes. Besides the public school branches, they were taught chair caning, broom making, sewing, and other employments adapted to their capacities and needs.

M'DONOGH INSTITUTE.

This school, which prepares poor boys for useful occupations, considerably increased its accommodations in 1882 by the erection of new buildings, the expense of which encroached somewhat on the principal of the endowment fund. Hence, no new pupils can be admitted for a time unless the trustees adopt a recommendation of the principal that boys of means be received, the fees from whom might add a free foundation. For the free pupils admission for some time has been allowed only on competitive examination, as, for 10 vacancies in 1882, there were nearly 70 applicants. The boys, in addition to instruction in school studies, work in the garden and on the farm in the afternoons and on Saturdays, and during the summer vacation are employed continuously in such outdoor occupation. They are also trained in military tactics. Pupils in 1881–'82, under 4 instructors and a principal, 50.

REFORMATORY AND INDUSTRIAL TRAINING.

There are 3 institutions for the reformation of youth under 18 (one of them for colored youth), besides one which receives inmates from 3 to 50 years of age, the last being under the control of the Roman Catholic Church, the others under State and municipal or private management. Of 3 industrial schools, 2 were under Roman Catholic influence, the other Protestant Episcopal. Two of the reformatory schools, the House of Refuge and House of the Good Shepherd, both in Baltimore, report a total of 421 inmates during the year. Most of those received into the House of Refuge were committed for incorrigibility, inveterate truancy, or for vagrancy or criminal practices. The object of the school, as distinctly stated, is reformation and not punishment. Besides the daily sessions of the schools, a portion of time is regularly devoted to industrial hand work. Systematic instruction is given in music as an element of moral training.

INSTRUCTION IN ART.

The schools of art and design of the Maryland Institute for the Promotion of the Mechanic Arts made marked progress during the year. The exhibition of students' work in June, 1882, showed advance in work of different kinds, especially in original designs for wall papers and other manufactured goods. Creditable work was also exhibited in the higher branches of art, particularly in drawing and painting from objects and life. In the lower grades applicable to industrial pursuits many young women have learned the art of decorating pottery, and some of them have obtained employment in decorating faïence, at which they can earn respectable wages. The night schools for mechanical drawing and design have increased in popularity and attendance, being, indeed, crowded beyond the limits of comfort. Artisans find that their surest way to promotion lies in a knowledge of drawing. Numerous instances have occurred of young men being promoted solely in consequence of being trained at these schools. The number attending at date of the report was about 700, under 13 teachers besides the principal.—(State report.)

EDUCATIONAL CONVENTIONS.

STATE ASSOCIATION.

The annual meeting of the State Teachers' Association for 1882, held at Cumberland in August, was well attended by representative teachers from all sections of the State, as well as by school commissioners and county examiners. The evening sessions were also attended by the citizens of Cumberland, who showed marked interest in the proceedings and by their hospitable attentions made the occasion one to be long and pleasantly re-

membered. The papers read were appropriate, interesting, and instructive, and the discussions which followed searching, animated, and often eloquent.—(State report.)

OTHER ASSOCIATIONS.

County and district as well as State associations are authorized and recommended by law as important agents for the improvement of teachers and the increase of professional spirit; and the report says all were conducted during the year "with a success proportioned to the amount of energy displayed." No particulars of the different meetings are given.—(State report.)

CHIEF STATE SCHOOL OFFICER.

Hon. M. A. NEWELL, *State superintendent of public instruction, Baltimore.*

[Eighth term, January, 1882, to January, 1884.]

MASSACHUSETTS.

SUMMARY OF SCHOOL STATISTICS.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Children of school age (5–15)	312,680	321,377	8,697	
Pupils of all ages in public schools	325,239	330,421	5,182	
Pupils over 15 years of age	24,344	23,198		1,146
Pupils under 5 years of age	1,685	1,646		39
Average membership for the year	262,031	265,442	3,411	
Average attendance for the year	233,108	235,739	2,631	
Per cent. of attendance on average membership.	89	90	1	
Enrolment in evening schools	10,294	11,214	920	
Average attendance in evening schools.	4,765	5,915	1,150	
Enrolment in high schools	18,900	19,256	356	
Pupils in charitable and reformatory schools.	945	1,002	57	
Pupils in academies and private schools.	25,911	29,865	3,954	
SCHOOLS.				
Number of public day schools	6,001	6,090	89	
Average time of these in days	178	178		
Number of evening schools	97	107	10	
Number of high schools	215	221	6	
Charitable and reformatory schools	15	14		1
Academies and private schools	417	409		8
TEACHERS AND THEIR PAY.				
Men teaching in public schools *a*	1,134	1,079		55
Women teaching in public schools *a*	7,727	7,858	131	
Whole number teaching in the year	8,861	8,937	76	
Teachers in high schools	595	605	10	
Teachers in evening schools	408	451	43	
Teachers in charitable and reformatory schools.	23	29	6	
Average monthly pay of men teaching.	$85 54	$102 90	$17 36	
Average monthly pay of women	38 49	34 32		$4 17
SCHOOL EXPENDITURE AND PUBLIC SCHOOL FUND.				
Expenditure for public schools	*b*$5,776,542	*b*$5,881,124	$104,582	
Permanent State school fund December 31.	2,086,887	2,711,263	624,376	
Income from this fund	138,775	137,465		$1,310

a Below high schools.

b Not including the cost of reform schools, schools for the deaf and dumb, &c., on which the State spent $186,264 in 1881 and $183,000 in 1882.

(From printed reports and written returns of Hon. J. W. Dickinson, secretary of State board of education, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

Since 1837 the State has had a board of education for the general care of public schools. This board has the aid of a secretary of its own choice, for office work and general supervision, and of 3 agents, for the local inspection of schools, holding of institutes, &c. Each town (township) has an elective school committee, for the direction and care of its schools, and may also have a superintendent. Cities have like arrangements. The old prudential committees of 1 in each district of a town ceased at the close of 1882 with the abolition of the old district system throughout the State.

OTHER FEATURES OF THE SYSTEM.

The State board holds for the Commonwealth the principal of a small fund in aid of normal schools and disburses the income of this for such things as are not provided for by legislative appropriations. One half of the income of a State school fund is also disbursed by it in aid of schools in towns and cities that maintain schools for at least 6 months each year, with a high school for 10 months where the town or city has 500 families or householders. The other half goes for general educational purposes in connection with the State system. The board is authorized to prescribe the form of registers to be kept in the schools, and the form of the blanks and returns to be made by school committees. Beyond this, however, it has no control of the free schools. The school committees engage teachers, fix their salaries, direct what text books shall be used, and prescribe the course of studies. They procure the books for use within their schools and furnish them at cost to pupils, and they may, under an ordinance of their city or a vote of their especial town, lend pupils the books they need and furnish them stationery. Under the State system local control of schools is dominant, while the State stimulates interest in them and gets full and regular reports by the distribution of a small fund.

Nor does the State content itself with this. It endeavors to make sure that all its youth are educated. For this purpose it requires the taking of an annual census of the children of school age; provides the needful teachers, school-houses, and funds for their instruction; exacts attendance on this instruction for at least 20 weeks each year by every child from 8 to 14 years of age not incapacitated or taught elsewhere; and provides vigilant school officers to see that the laws respecting attendance are enforced. No child under 10 years of age may be employed in occupations that hinder school attendance and no child under 14 is to be so employed, except during the vacations of the public schools, unless in attendance at some school for 20 weeks in the preceding year. Lest, after all, the schools should fail of due effectiveness through lack of sufficiently taught teachers, care is taken to have these teachers trained as thoroughly as possible in 6 good normal schools under State direction, in district institutes under agents of the State board, and in county as well as State associations, aided by State funds.

NEW LEGISLATION.

The only notable legislation for the year was an act to abolish at the close of 1882 the district school system, which for many years has been an incubus on progress in the little country neighborhoods where it had survived. This leaves the town as the unit of the school system and secures better supervision, with the likelihood of better schools, teachers, and school-houses.

GENERAL CONDITION.

Progress appears at almost every point, less marked, however, in some cases because of advances in 1880–'81, in which year public school enrolment rose 18,462, schools outside of the public system showing a considerable loss. In 1882 the private schools seem to have recovered what they lost in 1881. Still, with 8,697 additional children of school age, the State schools received 5,182 more pupils of all ages, average membership being 3,411 more and average daily attendance 2,631 more. The evening schools under public direction enrolled 920 more pupils and had 1,150 more in average attendance. Academies and private schools exceeded their enrolment for the previous year by 3,954, the average attendance in them not being reported. In all schools, not including colleges, there were thus 10,113 more youth brought under instruction than in 1881–'82, or 1,416 more than the increase in persons of school age. To meet the increase of attendance on the public schools there were 89 more schools in use for day pupils and 10 more for evening pupils. The cost of the public schools, exclusive of reform schools, instruction of the blind, deaf and dumb, &c., was $104,582 greater than in 1881.

It is evident from the State report that there is a steady though gradual advance in the quality of the teaching. This is attributed by the State superintendent to the fact that more than a quarter of the teachers in the State free schools have been trained in normal schools, nearly one-fourth being graduates. The influence of such a number versed

in scientific methods of instruction must be beneficial to the teachers of inferior preparation with whom they are brought more or less in contact. The labors of the travelling agents of the State board of education in visiting and examining the remoter schools and in holding institutes for the improvement of the teachers, tend also to elevate the standard of instruction, as do the discussions of school methods in the county and State teachers' associations and in the widely circulated educational periodicals.

KINDERGÄRTEN.

For information as to the numerous Kindergärten in this State, see Table V of the appendix; for a summary of their statistics, see the report of the Commissioner preceding.

SCHOOL SYSTEMS OF CITIES AND TOWNS WITH OVER 7,500 INHABITANTS.

OFFICERS.

For both cities and towns the general rule is that school committees of 3 members or some multiple of 3 are chosen for terms of 3 years, to have charge of the public schools. These committees may be changed in one-third of their membership each year. In cities they generally have superintendents for their schools, the mayor being ex officio chairman of the board. Boston, besides a superintendent, has 6 supervisors for special parts of the school work.

STATISTICS.[a]

Cities and towns.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Attleborough	11,111	1,991	2,082	1,331	62	$32,917
Beverly	8,456	1,454	1,421	1,114	34	19,325

Weymouth	10,570	2,040	2,175	1,650	61	40,909
Woburn	10,931	2,166	2,369	1,774	52	34,654
Worcester	58,291	11,363	11,447	8,069	215	200,485

[a] To secure uniformity the figures in this table, and largely in the Additional Particulars that follow, are taken from the State report for 1881–'82. The expenditures given only include money paid out of the proceeds of taxation.

[b] Census of 1880.

ADDITIONAL PARTICULARS.

Attleborough in 1882 regraded its larger district schools, making 4 departments, primary, intermediate, subgrammar, and grammar. Class promotions from grade to grade occur at the close of the spring term, but individual promotions whenever a scholar completes the work of any grade. High school courses of four years appear beyond these departments. Of the 62 teachers 20 were graduates of normal schools. With 125 more

children of school age the town enrolled only 24 more pupils in public schools and had 28 fewer in average attendance. In 3 private schools there were 60 pupils.

Beverly, with 13 more children of school age, enrolled 14 more and had 12 more in average attendance. In its high school, under 4 teachers, were 131 pupils; in 2 private schools, 52 pupils. Of the 34 public school teachers, 7 were graduates of normal schools.

Boston had 3,353 more children of school age, but, as far as the reports show, had only 232 more enrolled in its public schools, though there were 2,017 more in average attendance. In its 11 high schools there were 2,389 pupils, under 88 instructors; in 22 private academic schools, 5,107 pupils; in 70 other private or church schools, 2,761. Adding these private pupils to the 60,000 reported in the public schools, it appears that there were in all 6,812 more children and youth under instruction in the city than the whole number of school age, which, however, is only from 5 to 15. As to the quality of this instruction in the schools under the city system, Superintendent Seaver says that for most of the year he had been engaged in inspecting the primary schools, and from careful observation, visiting every room once and many twice or three times, he is convinced that the new methods of instruction, tried now for nearly 3 years, have borne good fruit. That they have not borne better is due largely, he believes, to ultra-conservatism in some of the old teachers, who cling tenaciously to former methods or admit new ones with reluctance. But he found by far the greater number enthusiastic as to the improvement due to the new methods, which include much object teaching, fresh reading, and free use of the pencil for expressing thoughts in writing. The superintendent thinks he sees in the improvement made in composition in these lower schools a token of a coming higher standard throughout all. A more uniform standard, too, he evidently believes, has in some degree resulted from the work of the 6 supervisors, though it seems to him that the control of the supervisors should be guarded lest it get beyond bounds. For improvement of the teachers outside of the 600 who were graduates of normal schools, Colonel Parker, late of Quincy, had a well attended course of Saturday lessons on psychology; Mr. Hitchings, director of drawing, another course on that element of instruction in the schools; and Mr. Holt, a special teacher of music, one on methods of teaching that subject. Twice also the superintendent called the teachers generally together, and with the aid of the 6 supervisors at the first meeting went over the work of the year, especially "methods of teaching reading." As to this he warned them against a too exclusive use of the word-method and urged a fair employment of the phonic method also. At the second meeting "methods of teaching music in primary schools," after introduction by the superintendent, were discussed by the head master of the normal school and the 3 special instructors in music. In 19 evening schools (one of them a high and 5 others drawing schools) there was an average belonging of 2,839 and an average attendance of 1,636, under 107 teachers. These schools were not so expensive as in 1880–'81, a circumstance due to some delay in opening the high school and to the closing of poorly attended schools; but the interest shown was stronger and the general results better than in one or two preceding years. Training in the use of tools was given in the Dwight School with great success, and in sewing in many of the schools.

Brockton increased its school children by 190; its enrolment in public schools by 239 (besides 30 in a private school); its average attendance by 26; its expenditure for schools by $17,026, $13,750 being for new school-houses. Of its 52 town teachers, 17 were normal graduates. Its high school had 3 teachers and 125 pupils.

Brookline, with 40 fewer children to be taught, enrolled 85 more than in 1880–'81, but fell 26 below that year in average attendance. Its high school had 4 teachers and 119 pupils. Seven private schools had 226 pupils.

Cambridge, with 192 additional school children, enrolled 375 more and had 145 more in average attendance, spending $5,343 more for school purposes. In its high school there were 481 pupils, under 12 teachers. Of the 207 teachers in public schools, 116 had attended normal schools and 98 had graduated from them. Twenty private schools reported the year before showed nearly the same attendance. The city schools were: 1 high, 8 grammar, 23 primary, 1 reformatory, and 2 evening drawing schools. Drawing and music formed a part of the instruction in all the day schools. An additional public school-house was completed in August, 1882, making 2 new ones within 2 years; but more are said to be needed. Improvement in the sanitary arrangements of existing schools was also greatly needed.

Chelsea spent of funds from taxation $6,808 more on its public schools than in 1880–'81, enrolled in them 274 more, its additional school children numbering 236, and increased by 70 the average attendance.

Chicopee had 2 high schools and 2 grammar schools, with intermediate, primary, and ungraded schools, the number of which is not given. Subject to the fluctuations in population that mark manufacturing towns, its public schools fell off 194 in enrolment and 99 in average attendance, though 2 parochial schools had rather more than the full number that had been reported in 5 non-public schools the year before.

Clinton enrolled 177 more pupils and had 72 more in average attendance. Its high school had 74 pupils, 3 more than in 1880–'81; a private school, 40, the same number as in that year. Evening schools were maintained. Drawing, introduced in the autumn of 1881, will be taught by a special teacher until the regular teachers are sufficiently trained to carry it on. An evening drawing school for mechanics had an average attendance of 19. Music was taught in the grammar and high schools.

Fall River, with only 489 more children of school age, enrolled 998 more, but the average attendance was only 286 greater than that of 1881. In other than city schools 900 additional enrolments were reported. Seventeen evening schools, opened in December, 1881, had an enrolment of 982 and an average attendance of 530. One of these was for advanced students. Respecting the training school, see Training of Teachers, p.115.

Fitchburg had 8 ungraded, 12 primary, 7 secondary, 6 intermediate, and 3 grammar schools, with 1 high school; special teachers of singing, drawing, and penmanship were employed; and the course is well arranged. An evening school for teaching drawing had an enrolment of 72 pupils, with 43 in average attendance. A teachers' association met once a month to discuss methods of teaching, &c. During the winter, grade meetings were also held by the superintendent to discuss topics relating to every day work in teaching and to get at the experience of different teachers. The increased enrolment in city schools exceeded the increase of youth of school age, and the average attendance reached 89 per cent. of the average membership. In the high school there were 185 pupils. Out of 72 teachers, only 12 had received a normal school training.

Gloucester paid $12,169 less for school purposes. The high school enrolled 205 against 145 the year before, and 2 private schools reported 70 students. No evening schools appear to have been held. In the day schools music and drawing were taught. Of its 100 teachers, 38 had attended normal schools. City school buildings numbered 22, primary, grammar, and high. The instruction in sewing and in the use of tools, given for some sessions through private liberality, was discontinued in 1881.

Haverhill had 28 more school children and enrolled 15 more, but had 86 fewer in average attendance. Its high school had 161 pupils; 2 private schools, 60 pupils.

Holyoke, with 373 more children, enrolled 299 additional to its previous roll, having 187 more in average attendance. In private and church schools there were enrolled over a thousand pupils; in the high school there were 105; in evening schools, 622. Among the studies in the day schools were music, drawing, and penmanship, all taught by special teachers. Language lessons continued to receive careful attention, drill in the correct use of English running throughout the course. Two of the schools had formed excellent libraries, one of them for pupils especially, the other rather for teachers, but with a department for pupils also. In the high school more attention was given to English literature; the study of elocution was begun; and the facilities for laboratory practice in chemistry were improved. Enthusiasm for the study of modern languages was awakened by the introduction of the conversational method.

Lawrence continued to do well, showing an enrolment of 150 additional pupils in public schools, out of 278 more children of school age, but an average attendance of 131 fewer than in 1880–'81. There were 1,200 pupils in private and church schools. The city high school had 246 pupils, an increase of 49. The payments for city schools were $15,688 more in amount than in the previous year. A new school course, entered on in 1882, gave 3 years each for primary and grammar studies and 2 for intermediate. All included drawing and music. The high school had 4 courses: English, of 2 and 4 years; classical, of 4; and one styled "mixed," in which Latin replaces certain English studies. French was optional in the 4-year English and mixed courses. Teachers of the city schools continued to be trained for their work in a 2-year course under the control of the city school officers. The evening schools had a drawing department for training in mechanical and architectural work, which covered 2 years. There was also an evening high school.

Lowell's school population increased 903, its enrolment in city schools 175, and its average attendance 159. There were 1,520 pupils in an academy and in 5 church schools. The city high school had 398 pupils, 41 fewer than the year before. Military drill introduced in 1881 was continued in it. Free text books were supplied to all. Six evening schools were maintained, one of them a free evening drawing school, which cost about $4,000. The reform school had 125 different scholars for the year 1882, 38 of them from the city.

Lynn also did well, with an increase of 168 school youth enrolling 173 more and having 96 more in average attendance. In the city high school there were 336 pupils against 265 the year before; in 7 private schools, 515 pupils. The public schools cost $31,622 more; 60 of the teachers had attended normal schools, 41 being normal school graduates. The ordinary evening schools were suspended, but an evening drawing school, with 3 teachers and 124 pupils, was maintained. Music and drawing appear to have been taught in all the city schools.

Malden, with a small increase of school population, enrolled in its 10 school buildings 61 fewer pupils and had 182 fewer in average attendance, though it paid for school purposes $14,484 more than in 1880–'81 and included among its teachers 12 graduates of normal schools. The high school had 180 pupils; 2 private or church schools, 570.

Marlborough reported 73 more children and enrolled in its 13 school buildings 65 more pupils, the average attendance falling off slightly. The number in its high school fell from 141 to 118. In 3 private or parochial schools there were 250, a diminution of 1 school and 40 pupils. Only 7 of its 51 teachers were trained in normal schools.

Medford's school statistics disclose a slight retrograde movement generally. The high school had 119 pupils; 1 private school, 20 pupils. In the free schools, 6 of the 33 teachers came from normal schools.

Milford had 15 teachers who had received normal instruction out of 45 in all. There were 24 fewer children of school age, 98 fewer on the list of enrolled pupils, and 67 fewer in average attendance. The high school had 203 pupils, an increase of 14; 2 private schools, 40 pupils.

Natick, with 23 teachers from normal schools out of 48 in its employ, also reported loss as to school children, enrolment, and average attendance, though no private schools appear to have competed with the public. The high school enrolled 125.

New Bedford, with a large but indeterminate increase in the number of children of school age, reports in its 1 high, 3 grammar, 11 primary, 6 country, 1 mill, and 1 farm school an increase of 191 in enrolment and of 115 in average attendance. There was also some increase in the membership of private schools. Two evening schools for adults enrolled 250, and there was an average attendance of 21 on an evening drawing school. Of its 115 teachers 24 were graduates of normal schools. Drawing was continued in the day schools, and Superintendent Harrington says that every boy or girl exhibiting special proficiency was in request long before the allotted time of schooling was over. Of the quality of the instruction, Professor Walter Smith, late State director of art education, said: "New Bedford has earned the right to say that in her public day schools industrial drawing has been developed more practically and with more general success than in any other city." The city high school had 236 pupils. Swain Free School, founded in 1881 by trustees under the will of the late William W. Swain, is meant to receive such graduates of local secondary schools as wish to continue their studies and "carry them on in their most essential and culturing pursuits to broader and higher reaches of attainment." New Bedford will thus have substantially a free college, though it does not take that title. The school, at its first session, had 87 pupils, mostly in English and other modern language studies and in industrial art, under 3 instructors.

Newburyport had 66 more school youth, enrolled 99 more, and had 22 more in average attendance. The high school had 135 pupils, an increase of 4. The cost of city schools was $2,443 greater than in 1881.

Newton paid $2,723 more for schooling its children, had 70 more of school age, enrolled 259 additional in its city schools (besides 94 in private schools and 247 in academies), but showed only 17 more in average attendance than in 1880–'81. Of its teachers 23 had attended normal schools and 19 were graduates of such schools. In its high school there were 313 pupils. Military drill for boys and calisthenics for girls formed a part of its exercises. Music and drawing were taught in all grades. Two evening schools had 100 pupils.

North Adams had more children of school age and a higher enrolment, but a diminished average attendance. Its high school had 1 more teacher, but 6 fewer pupils. The increase in the cost of public schools was $3,111.

Northampton enrolled only 62 more pupils, although there were 115 additional census children. Of its 73 teachers, 12 had spent some time at normal schools and 10 were graduates. Its high school had 1 more teacher, but 11 fewer pupils. There were accommodations for 2,540 pupils in 26 different buildings. Music was taught in the schools, but not drawing, though the population exceeds 10,000 and under the State law drawing must be taught in the public schools of towns having over 10,000 inhabitants.

Peabody's number of children of school age, enrolment in the public schools, and average attendance did not materially vary. Its high school had 72 pupils. The free schools cost $1,234 more.

Pittsfield reported more children 5–15 and more on its free school roll. The average attendance in public schools advanced 356. In the high school there were 160 pupils, against 96 the year before. Few of the teachers had studied in normal schools and only 5 were graduates. Vocal music and drawing were taught by special teachers and a free evening drawing school was held (embracing 4 classes and enrolling 73 pupils) for instruction in free hand, building construction, and machine drawing. A class of public school teachers was held on Saturday afternoons for special training in the methods of teaching this subject. Free text books greatly aided the instruction in city schools.

Quincy, with apparently 18 of its 64 teachers trained in normal schools, 8 of them

graduates, enrolled for this year 82 additional free school pupils, the additional children of school age numbering 189. Its high school had 107 pupils, against 154 in 1880–'81.

Salem, according to the figures of the State report, had in its 83 schools 1,027 fewer children in 1881–'82 than in 1880–'81, though the school population was 38 greater. Yet, with this great falling off in enrolment, the average attendance was higher by 100. The high school had 173 pupils, and on petition of citizens it was arranged that those pursuing only English studies in it should be allowed to graduate at the expiration of 3 years, those in classical studies remaining one year longer. Music was taught, apparently, in all the schools, and drawing in at least an evening drawing school. Two other evening schools were maintained, 1 for boys and 1 for girls, with special instruction of French speaking children.

Somerville decreased 850 in school population and 269 in the enrolment in its 82 free schools, as well as 211 in average attendance on them, although it expended for these schools $31,699 more than in 1880–'81. In private and church schools there was also a decrease of pupils from 540 to 500. The high school had 342 pupils. Two evening schools appear in a return, but without details.

Springfield added 420 to its youth of free school age, 147 to its previous year's enrolment, and 73 to its average attendance in 96 common schools. Its high school, however, had only 372 pupils, against 405 the previous year. In 7 private or church schools there were 470. The cost of public schools increased by $5,748. A return shows that the 3 evening schools reported last year were continued, enrolling 572 pupils and having 268 in average attendance. Music, drawing, and penmanship were taught by special teachers. Of the city corps of teachers, 33 had had some normal training and 24 were graduates of normal schools.

Taunton, with an increase of 146 school children, enrolled 210 more than in the year before in its 63 free schools and had 33 more in average attendance on these, while in an academy there were 72 and in a lower grade private school 44. The city high school had 149 pupils, against 161 the previous year. An industrial drawing school, said to have been highly successful, enrolled 278 pupils, 38 more than in 1880–'81, and continued for 16 weeks, 4 evenings each week. Its pupils were divided into 2 sections, each attending two evenings in the week separately.

Waltham paid for school purposes $22,242 less than in 1880–'81, but, with 137 additional children of school age, enrolled 86 more in its 38 free schools and had 54 more in average attendance. Its high school had 120 pupils. Two evening schools for instruction in common English studies were maintained, with an average attendance of 52, and an evening drawing school, with an average of 33. Vocal music had been taught in all the day schools for years with excellent results, and sewing was introduced in February, 1882, into 3 classes of the grammar schools, with great promise of future usefulness.

Westfield increased by $1,999 its expenditure for its 31 public schools, employed in them a large proportion of normally trained teachers, and though, with 55 more youth of school age, 57 fewer were enrolled, there were 33 more in average attendance. The high school enrolled 140, against 180 the year before.

Weymouth spent $8,545 more for its 48 free schools and had 12 more children of school age, but it enrolled 16 fewer than the year before and the average attendance was less by 50. Its high school also had 26 fewer pupils.

Woburn's statistics changed slightly. Recesses were abolished with the full approval of the pupils. Free text books, stationery, and other aids to study were supplied. The town high school increased its enrolment from 139 to 145, while a private school had 45 pupils.

Worcester, with 193 schools, paid $56,657 more than in 1880–'81, enrolled 560 more children, and had 372 more in average attendance; besides which number there were 150 in 2 academies and 2,000 on the rolls of 11 private or church schools. Of the teachers 149 were normal school graduates. The city high school had 570 pupils, 31 fewer than the year before. Besides special teachers of music and drawing for the day schools, 6 teachers of free evening drawing schools are reported for 1882, with 15 male and 15 female teachers of other evening schools, apparently for the latter part of that year.

TRAINING OF TEACHERS.

STATE NORMAL SCHOOLS.

The 5 State schools for ordinary normal training are at Bridgewater, Framingham, Salem, Westfield, and Worcester; for training in free hand, mechanical, and architectural drawing there is a normal art school at Boston, meant to prepare art teachers for the public schools of cities in the State. In the 5 first mentioned there had been taught, up to the close of 1882, more than 11,400 pupils, 5,700 of whom had completed the full course, which is of 2 years for those that propose to teach in lower schools and of 4 for such as aim at higher grades. In the normal art school, since its opening in 1873, there had been 1,194, of whom 260

had completed the work of the first year, 82 that of the second, 23 that of the third, while 32 had gone through the full 4-year course and had graduated as art masters or art mistresses, the others getting at the close of each year a certificate of their completion of that year's work.

The number attending each school for the year was: at Bridgewater, 194; at Framingham, 84; at Salem, 239; at Westfield, 136; at Worcester, 183; at the normal art school, 171—making a total of 1,007. The graduates for the year were: 47 at Bridgewater, 20 at Framingham, 68 at Salem, 29 at Westfield, 33 at Worcester, and 1 at the art school, making 198.

At the normal art school an important change was made in the retirement of Art Director Walter Smith, who had been principal since 1873, and the promotion of Vice Principal Otto Fuchs to the position of acting principal.

At the Salem school, composed wholly of women pupils, instruction in the use of carpenters' tools was introduced through the liberality of a lady of the city, and under the direction of a skilled conductor the senior class voluntarily prosecuted a course in this, covering an hour a week outside of the hours for regular school work. They thus learned to drive nails, to measure spaces, and to handle the saw and square and plane. The exercise was found by them to be as pleasing as it promised to be useful. It did not interfere with their usual studies and it is thought will prove of practical advantage to the pupils hereafter.

OTHER NORMAL TRAINING.

The *Boston Normal School*, with 3 regular instructors, including the principal, and with several lecturers, continued to prepare pupils, mainly from the high schools, for teaching in the city schools. Up to February, 1882, the average belonging was 92; average attendance, 90. Up to June the average whole number was 89; average attendance, 87. Graduates for the year, 58. The regular course is given by the principal as 1 year, but in a classified official table for June, 1882, the 87 above given are divided into 58 of a first year class and 29 of a second year class.[1]

Cambridge City Training School in 1882 lost the principal who for some years had been in charge, and no successor was elected, though an order was passed "that a training class should be established," the members of which should act as assistant teachers and as substitutes, whenever necessary, in the primary and grammar schools.

Fall River City Training School, begun in 1881, continued to give to approved graduates of the high school training in actual school instruction, under the guidance of regular teachers. The first year there were 18 pupil teachers; the second year, 25. The results of the 2 years' trial of this plan, while encouraging, were not quite satisfactory. Besides this training of young candidates the regular teachers were called together several times in the year for discussion of educational methods and principles.

Gloucester Training School, which was organized in 1879, was, for some unexplained reason, discontinued in 1882, though the city superintendent in his report for 1881 expressed the belief that it could not be suspended even for a year without serious loss.

Lawrence City Training School, the superintendent says, has fully realized in the school session of 1881–'82 the expectations expressed respecting it when it was established. In December, 1881, the course had been completed by 7 pupils, who were all doing well in the service of the city in other schools.

Harvard and *Wellesley Colleges* continued their training of teachers, the former largely in natural sciences in the Lawrence Scientific School, not only in term time but also in the summer vacation; the latter, in optional collegiate studies, meant to cover usually 2 years of work, with special instruction in microscopy. Students in this department numbered 80 in 1881–'82.

Other normal training was given, according to returns, in Cushing Academy, Ashburnham, where were 30 normal pupils in a 4-year course, under 6 instructors, with 140 other pupils; in the Kindergarten normal class of Miss Garland and Miss Weston, Boston, with 7 instructors and 15 pupils; and in the Training School for Kindergartners, Springfield, under Miss Angeline Brooks, which had 11 pupils, under 4 instructors.

TEACHERS' INSTITUTES.

The secretary of the State board of education, with its 3 agents and selected instructors and lecturers, in 1882 held 22 institutes for the improvement of the teachers of the State, especially in the small towns. The town committees usually coöperated, closing

[1] Besides this training for such as desire to teach in the city schools of Boston, teachers and others may attend the free lectures of the Teachers' School of Science and of the Lowell Institute, both annual courses in Boston provided by the liberality of private citizens. Many teachers are said to have availed themselves of the advantages of the former. A course of lectures on psychology was also given to the teachers by Supervisor Parker; another, on drawing, by Mr. Hitchings; and a third, of practical lessons on methods of teaching music in the schools, by Mr. Holt, one of the special instructors in that subject. In several other cities similar special instruction appears to have been given.

their schools that the teachers might attend the meetings and in many cases coming with them to render any necessary aid. The aggregate attendance was 1,941, an average of more than 88 per cent. of those registered at each place being present daily. Methods of teaching and of control formed the subjects for the daily exercises. The evening lectures were directed rather to awakening the people to a livelier interest in their schools and to coöperation with the teachers in efforts for improvement.

EDUCATIONAL JOURNALS.

The excellent Journal of Education, Boston, weekly, was in its fifteenth and sixteenth volumes in 1882, each volume of over 400 pages. The first half of each issue is largely devoted to educational ideas and methods; the second, to educational news.

Other publications from the same office in the year were: Education, a bimonthly octavo, for the discussion of the science, art, and literature of education, in its third volume; The Public School, a monthly quarto, for the presentation of principles and methods of teaching, in its first volume; the Primary Teacher, a monthly octavo, devoted to primary instruction, which closed its fifth volume June, 1882; and Good Times, for day school, Sunday school, and anniversary exhibitions, which entered on its sixth volume September, 1882.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

By law, any town in this State may establish a high school for instruction in higher English studies, civil government, and the Latin language. Towns with 500 families or householders must have such schools for the benefit of all the inhabitants, with at least 10 months of annual term, exclusive of vacations. Towns of 4,000 inhabitants must also include in the high school course instruction in French and Greek for such as desire it, with natural, intellectual, and moral science, rhetoric, logic, and political economy. The towns required to maintain the lower of these grades were 49 in 1881–'82; those required to maintain the higher were 84. Of towns not required to maintain such schools, 69 had them and 10 of the larger towns and cities had 2 or more. Boston, including its city normal school, had 11, the courses in 2 of them covering 6 years; those of 2 others, 4 years. The whole number of schools for the year was 221, with 605 teachers and 19,256 pupils, an increase of 6 in schools, of 10 in teachers, and of 356 in pupils.

OTHER SECONDARY SCHOOLS.

The number of academies reported to the State authorities for the year is 70, an increase of 2; the number of pupils in them, 9,151, an increase of 1,082. The estimated tuition fees received amounted to $451,846, an increase of $18,005.

For statistics of secondary schools, outside of the State system, reported to this Bureau, see Tables IV, VI, and VII of the appendix; for a summary of these statistics, see corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The institutions of this class in 1882 were, as last reported, 7: Amherst College, Amherst (Congregational); Boston College, Boston (Roman Catholic); Boston University, Boston (Methodist Episcopal); Harvard University, Cambridge (non-sectarian); Tufts College, College Hill (Universalist); Williams College, Williamstown (Congregational), and College of the Holy Cross, Worcester (Roman Catholic). The Massachusetts Agricultural College, which might also be included, will appear under Scientific Instruction, page 118. All had classical collegiate courses of 4 years, and nearly, all scientific courses of the same length.

Harvard College has for some years been raising its standards of study and admission. An important change, introduced after full discussion, allows candidates for admission to join the sophomore class, if, after passing a creditable examination for admission, they also pass upon three-fifths of the freshman work and pledge themselves to make up the remaining two-fifths during the 3 remaining years.

The college faculty and the academic council have abolished a distinction between undergraduate and graduate studies which had existed since 1877. The courses in any general subject, such as Greek or physics, are now arranged in one series and form one course. Special students have at length been admitted to all the privileges of undergraduates, except beneficiary scholarships and degrees. They may, therefore, now study anything taught in the university, be ranked with other students in the published rank lists, and be allowed also to compete for honors. A debated question as to the time and grounds for conferring the degree of M. A. approached a settlement, but did not quite

reach it. The effort is to make this degree an evidence of high attainments, instead of a mere honorarium coming almost of course two or three years after the degree of B. A. While ultimate success in this effort is assured, the way to reach all cases uniformly was not yet entirely clear.

The measures taken in 1880–'81 for preventing the continuance of an annual deficit were so well devised that in August, 1882, there was a balance of receipts over expenditures of $91,937, exclusive of gifts for the capital account.

The number of students in the 4 regular collegiate classes in 1881–'82 was 824, besides 37 unmatriculated; the number in the whole university, 1,397; professors, lecturers, and other instructors, 161. Students in summer courses (chemistry and botany), 27.

Boston University, while maintaining its high regular collegiate course, offers to admit to a 4-year course for the degree of PH. B. persons unable to take the full course in arts, but desiring to fit themselves for professional study or other liberal pursuits and showing their capacity for this by passing an examination on three-fourths of the requisites for admission to the freshman class. It also announces that, to accommodate mature students who desire to pursue the studies for the degree of A. B. with special thoroughness, in a different order or with greater leisure for reading or laboratory work, any such student passing the examinations for admission to the freshman class may matriculate as a candidate for the A. B. degree, with permission to take the studies required for this degree in whatever order he prefers, subject to the approval of the faculty. The instructors in the university for the year 1881–'82 numbered 94; students in its 3 colleges, of liberal arts, of music, and of agriculture, 146; in its 4 schools of theology, law, medicine, and all sciences, 429; in both colleges and schools, deducting 30 counted twice, 545. Of these, 117 were young women and 428 young men.

Amherst College introduced for trial a new system of college government, under which no student was required to attend any recitation; if present and showing due proficiency, the student is allowed to proceed with his class to graduation; if absent or reciting unsatisfactorily, he must pass an examination at the end of the term. The plan is said to have worked well and to have been much more satisfactory than the old methods of constraint.

Tufts College continued to confer special honors for advanced work in several lines of study and gave the degree of A. M. only to such graduates as should prove their proficiency in graduate studies covering not less than 2 departments and a year of study. Instruction in electrical engineering was to be added, but the addition was not effected in 1882. Students, not including theological, 71, of whom 8 were candidates for the M. A. degree, 6 for that of C. E., and 1 special.

Williams College, under its new president, declares its readiness to receive on the certificate of instructors students presenting evidence that they have completed a course of study fully equivalent to that required for admission to the college. More attention is to be given to the history, structure, and philological relations of the English language; the study of astronomy is to be aided by a new transit instrument, a refracting telescope, and a meridian circle, with the prospect of an observatory next year; the natural science collections are to occupy new buildings; and a new gymnasium and new dormitory building were to be added. Professors and other instructors in 1881–'82, 15; students, 253, of whom 18 were in partial courses.

Boston College and the *College of the Holy Cross* retained the same rudimentary, preparatory, and collegiate arrangements noticed in the former in 1879; in the latter, in 1876. The former had 1 graduate and 110 collegiate students; Holy Cross had 89 collegiate students.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

In Table VIII of the appendix may be found the statistics of 11 schools of this class, the same number that appeared in the table in 1881; the Swain Free School, New Bedford, having come into existence in 1882, is added, while the Oread Institute, suspended in 1881, is dropped. Of the 11, Smith and Wellesley Colleges (twin sisters of 1875) have regular charters from the State and are authorized to confer collegiate degrees; Lasell and Mount Holyoke Seminaries (organized respectively in 1851 and 1837) approximate closely to like collegiate rank, and to their thorough teaching of high grade studies add exercises in practical industries, Lasell having optional courses in book-keeping, cookery, dressmaking, and millinery, and Mount Holyoke engaging its young ladies for about an hour a day in the domestic work of the family. The remaining 7 (except Notre Dame Academy, Boston, incompletely reported) show fair provision for effective teaching, mostly in 4-year courses, which include Latin, German, French, and in several cases Greek, with music, drawing, painting, and generally gymnastic exercises. The new Swain School is meant to supplement high school or academic training, with 2-year courses in normal, miscellaneous, art, and special studies, all free to resident young women of New Bedford and adjoining towns.

Instruction was given in the Harvard annex by 5 professors, 7 assistant professors, and 11 others. The whole number of students aided was about 50, of whom 31 were from Massachusetts and 1 from Athens, Greece. In the 3 years of the annex instruction no case had arisen that called for discipline or even for remonstrance.—(Journal of Education, November 16, 1882.)

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The *State College of Agriculture*, Amherst, and the *Bussey Institution* of Harvard University, Cambridge, continued in 1882 their instruction in agriculture and botanical, chemical, entomological, and veterinary science. The first had a course of 4 years; the second, a course of 1 year for students with a thorough preparation and 2 years for others. Students at Amherst, 96 in 1881–'82, under 11 instructors; at the Bussey Institution, 7, under 7 instructors.

The *Massachusetts Institute of Technology*, Boston, retained its courses in engineering, geology and mining, architecture, chemistry, metallurgy, natural history, physics, and combinations of these, each course covering 3 years beyond a first year course that prepares for all. To these courses it added in the fall of 1882 another in electrical engineering, to meet the fast increasing need for such instruction. A school of mechanic arts exists also for those who wish to enter on industrial pursuits, its course covering a year in carpentry, wood turning, pattern making, and foundry work, with another year in iron forging, vise work, and machine tool work. Then, too, under the auspices of the Lowell Institute, there are given, usually in the evening, at the Institute of Technology, annual courses of free instruction in science, varied from year to year, which are open to both sexes. The Lowell School of Design in the Institute prepares students for industrial drawing and pattern work. Students in all courses, except the Lowell lectures, 516, under 43 instructors. There were 14 graduate students, 219 in regular 4-year courses, 57 in the school of mechanic arts, and 91 in that of practical design, the others being special students.

The *Lawrence Scientific School* of Harvard University maintained its courses, each of 4 years, (1) in engineering, (2) in chemistry, (3) in natural history, and (4) in mathematics, physics, and astronomy, with 31 students, under 27 professors, instructors, and assistants, 18 of the students being in special studies.

The *Worcester Free Institute of Industrial Science*, Worcester, combining academic culture with the practical applications of science, follows in general the teaching courses of the polytechnic schools of Europe and in mechanical engineering gives special attention to actual work. The machine shop, which is furnished with all facilities for such work in wood and metal, from the first elements up to the actual building of machines, aids the school in preparing mechanics, mechanical and civil engineers, and designers for the duties of their respective trades or professions. The course for mechanical engineers occupies 3½ years, that for all others 3 years, of 42 weeks each year. Students in 1882, 132, under 8 professors and 3 other instructors.

For more miscellaneous scientific training there was, as in previous years, the *Boston University School of All Sciences*, a department for elective graduate study only, in which were offered courses in philology, philosophy, languages, mathematics, and natural sciences, with others in law, literature, &c. Students in these, 53.

Besides the courses of the schools above mentioned, there are opportunities for scientific culture in the monthly meetings of the American Academy of Arts and Sciences and of the Society of Arts of the Massachusetts Institute of Technology, both in Boston; in the weekly meetings and laboratory instruction of the Boston Society of Natural History; in the Peabody Museum of American Archæology and Ethnology and the Museum of Comparative Zoölogy, both at Cambridge; and also in the museum and summer school of biology connected with the Peabody Academy of Science, Salem.

PROFESSIONAL.

Theology was taught in 1881–'82 in at least 6 schools, with courses of 3 years, meant to follow a collegiate course, without evidence of which there was an examination for admission. These schools were the Theological Seminary at Andover (Congregational), Harvard Divinity School, Cambridge (non-sectarian), Episcopal Theological School, Cambridge (Protestant Episcopal), Boston University School of Theology, Boston (Methodist Episcopal), Tufts College Divinity School, College Hill (Universalist), and Newton Theological Institute, Newton Centre (Baptist). In all these there were, under 53 teachers, 294 students, 207 of them in regular 3-year courses, 39 in partial courses, and 48 resident graduates. Of the 207, there were 171 college graduates. In the Roman Catholic diocese of Springfield there were also 50 ecclesiastical students; in the New Church Theological School, Boston, the number is not reported.

Law was taught in 3-year courses, for which a preliminary collegiate training was desired, in the law school of Boston University, under 15 teachers, and in that of Harvard University, under 5. To both schools graduates of colleges are admitted without examination; all others must prove their qualifications for pursuing the studies of the course, or for whatever advanced standing they may aim at, unless they desire to enter as special students of certain studies only, without reference to a degree. At Boston there are advanced courses of 2 years for the degree of LL. M. and of 4 years for that of D. C. L., the candidates for which degrees must be both bachelors of arts and bachelors of laws. In these courses were 3 students in 1881–'82, besides 6 other graduate students; 138 in the 3-year course, and 27 special students. Harvard offers the degree of LL. B. cum laude to law students that after 2 full years in the school as candidates for the degree pass examinations on the whole honor course of 3 years; but no such honor students appear there in 1881–'82, though there were 123 regular students in the 3-year course, besides 33 special students.

Medicine, according to the "regular" school, was taught at the Harvard University medical department, organized in 1782, and at the College of Physicians and Surgeons, organized in 1880, both in Boston. Both had graded courses extending over 3 years, the full 3 years being required at the Harvard School and a fourth year recommended, while the other required but 2 years of attendance and recommended a third year. The Harvard school also adopted a much higher standard for admission to its course, and its catalogue for 1881–'82 shows, besides 224 in the required 3-year course, 10 in the unrequired fourth year. The school employed 49 professors and instructors. The College of Physicians and Surgeons, which admits women as well as men, had 21 instructors and professors, 24 matriculates, and 4 graduates in its second year.

A third school, the Boston University School of Medicine, was of the homœopathic class, but of a standard for admission and graduation similar to that of Harvard, its annual course being of about 30 weeks and its examination for admission of all but college graduates high. The degree of M. D. is given for the regular 3-year course and for the 4-year course, the degree of surgical bachelor or medical bachelor being allowed for 3 years' work in the latter. Students in the 3-year course in 1881–'82, 90; in the 4-year course, 19, with 1 graduate student, all under 18 professors and instructors.

Dentistry is taught in two institutions, the Harvard University Dental School and the Boston Dental College, both in Boston. Each school has a 2-year course.

Pharmacy, in a 2-year course, was pursued at the Massachusetts College of Pharmacy, Boston, the term each year occupying about 6 months. Students in 1881–'82, 102, under 4 professors.

SPECIAL INSTRUCTION.

SOCIETY FOR THE ENCOURAGEMENT OF HOME STUDY.

The Society for the Encouragement of Home Study, organized in 1873, reports for the year 1881–'82 a membership of 988 students, of whom 732 studied at least 4 months and thus became entitled to some rank under the system, a larger membership than that of any previous year. There were 555 new students. Of the 433 old students, 2 entered for their eighth term, 7 for a seventh, 10 for a sixth, 48 for a fifth, 60 for a fourth, 97 for a third, and 209 for a second. The usual proportions of the departments were maintained, history numbering 381, English literature 367, art 107, the sciences 114, German 48, and French 34. One improvement noted during the year is that fewer studies were taken at once, the result being a higher rank in scholarship. The number of teachers among the students (154, or nearly 16 per cent.) is larger than ever before. The geographical distribution was wider, and more were from the Southern and Southwestern States. Missouri, Kentucky, and Tennessee gave nearly twice as many as last year, and Louisiana, Texas, the Carolinas, Alabama, and Mississippi, 35 per cent. more. During the year, 1,232 books were circulated by the lending library, which numbered 1,308 volumes. Since 1874 only 10 books have been lost, 6 in the mail and 4 by the carelessness of borrowers.

TRAINING IN MUSIC, ORATORY, AND LANGUAGES.

Advanced instruction in music was given in the New England Conservatory of Music, Boston, under Professor E. Tourjée; in the Boston Conservatory of Music, under Julius Eichberg; in the Mendelssohn Musical Academy; and in the musical courses of Boston University and Wellesley and other colleges.

The New England Conservatory of Music is planned upon a broad basis, embracing 16 separate schools and comprising instruction on the piano, organ, violin, and on all orchestral and band instruments, in the art of conducting, in harmony, composition, theory and orchestration, church music, oratorio, chorus singing, cultivation of the voice, and tuning of pianos and organs. Physical culture and the training of music teachers for the public schools are also included. A still more advanced course in music, leading

to the highest musical degrees, is offered in connection with Boston University; also, a collegiate course in the latter institution, with which this is intimately connected. The Conservatory also makes provision for the study of the common and higher branches in connection with the musical training, and offers special facilities in the study of French, German, and Italian, which are taught by professors of the Berlitz School of Languages on the plan originated by Professor Gottlieb Heness and carried forward by Professor S. M. Stern and Dr. L. Sauveur.

TRAINING IN THE ARTS AND TRADES.

Besides the industrial training given in the Massachusetts Institute of Technology, Boston, and the Worcester County Free Institute of Industrial Science, Worcester, already noted, instruction in various arts and trades is offered by a number of special schools, most of them in Boston.

The *Liversidge Institution of Industry*, Boston, established in 1881 in accordance with a bequest of Thomas Liversidge, is for the benefit of orphan and destitute boys of England and New England. The intention is to give them practical instruction in trades and industries; also, a good primary and grammar school education, 6 hours a day being devoted to school studies.

The *Boston Cooking School*, an enterprise of the Woman's Educational Association, gave instruction during the latter part of 1882 to over 500 pupils in its ordinary classes and to even a larger number in its free classes among the poor. During the four years of its existence the school has trained 18 women as teachers, all of whom found excellent positions.

TRAINING SCHOOLS FOR NURSES.

Three training schools for nurses reported, all connected with hospitals in Boston: the Boston Training School for Nurses, attached to the Massachusetts General Hospital; the Boston City Hospital Training School for Nurses, opened in 1878; and the Training School for Nurses of the New England Hospital for Women and Children, incorporated in 1863 but first opened in 1872. The last reports 16 pupils and 7 graduates during the year, and 150 students since 1872, of whom about one-third have graduated.

EDUCATION OF THE DEAF AND DUMB.

Provision is made by the State for the education of its deaf and dumb in the American Asylum, Hartford, Conn., the Clarke Institution, Northampton, Mass., and the Horace Mann School, Boston.

The *Clarke Institution* is supported partly from funds left by its founder, the late John Clarke, and partly from appropriations made by the State. Neither the manual alphabet nor the sign language is used here. Articulation, lip reading, writing, and reading are the only means used in communicating instruction. The pupils understand what is said by reading the lips of their teachers and others, and learn to speak, not with great distinctness or in tones altogether natural, but still so that they can be understood very easily by their teachers and generally by others. There were 91 pupils under instruction here during the year, of whom 74 were from Massachusetts.

The *Horace Mann School*, established by the Boston school committee, in connection with the State board of education, as a day school for deaf children, admits free of tuition any deaf child over 5 years of age residing in Boston not physically or mentally disqualified. Non-residents are charged the average cost of tuition for each pupil, unless received as State beneficiaries. The school aims to teach all its pupils to speak and to read the speech of others from their lips, and gives an elementary English education. Efforts to secure industrial training for the pupils have been to some extent successful. A donation of $250 from Prof. Bell, for the benefit of needy pupils, was partly used in payment of the tuition of 3 boys at the School of Mechanic Arts in the Institute of Technology, while the parents of 4 other boys paid the whole cost of tuition for them. All took great interest in the work, and their success warranted a return for a second year's training. Several girls who had shown much aptitude with the needle in the regular sewing instruction of the school were given special instruction in the art of needlework as an added preparation for self support. Some of these girls were aided from the donation of Prof. Bell. At the close of the school year, June, 1882, there were 84 pupils attending, 53 of them from Boston, 29 from towns in the vicinity, and 2 from other States.

EDUCATION OF THE BLIND.

The Perkins Institute and Massachusetts School for the Blind, Boston, admits blind children 9 to 19 years of age and gives free tuition on the governor's warrant to residents of the State whose friends are unable to pay. There were 165 pupils under instruction at the date of the report in 1882, of whom 145 were in the school proper and 20 in the workshop for adults. The usual course of study, with music, physical train-

ing, and handicrafts, was pursued during the year. In the literary department all suggestions of improvement in processes of mental development are carefully considered and several changes have been adopted. The aim is to give instruction in the most simple and natural way, and the objective method is used whenever possible. The music department enrolled 73, of whom 68 were learning the piano; 10, the organ; 21, reed and brass instruments; 47, class singing; and 21, harmony, 17 receiving private vocal training. There were 4 classes for instruction in the art of teaching music, with an average membership in each of 5. The tuning department continued to receive special attention, with the usual encouraging results; several improvements were made in the appliances and new facilities added for rendering the instruction efficient. The results of industrial training in the workshops for the boys and the workrooms for the girls were satisfactory, as usual. Special attention has also been given to physical training in 6 regular gymnastic classes, under experienced and prudent teachers, with results quite favorable to health and appearance. The work in the printing department of the institution has been carried on with unusual vigor, and a number of valuable books have been issued. A printing fund of $100,000 was completed during the year.

EDUCATION OF THE FEEBLE-MINDED.

Feeble-minded and idiotic youth receive training and instruction at the State school for them in South Boston, at a private institution in Barre, and at another in Fayville.

The *Massachusetts School for Idiotic and Feeble-Minded Youth*, South Boston, gives free instruction to residents of the State whose friends are not able to pay for their care, none, however, being received who are epileptic, insane, or incurably paralytic. The studies range from the simplest Kindergarten pastimes to the exercises of an easy primary or lower grammar class. There were 132 pupils at the date of the report for 1882, of whom 109 were entirely supported by the State and 10 partially.

The *Private Institution for the Education of Feeble-Minded Youth*, Barre, established in 1848, receives a limited number of pupils, from 6 years upward. They are instructed in the elementary branches, according to their capacity; also, in work. Special attention is given to health, exercise in the open air, and gymnastics. Military drill is also included.

Hillside School, Fayville, is a private home school designed for the instruction and training of children who cannot be properly taught in ordinary schools, whether they be blind, deaf and dumb, or feeble in mind or body. The English branches, music, drawing, painting, fret sawing, and physical exercises are taught. The number of pupils is limited to 12.—(Circular.)

CHARITABLE AND REFORMATORY INSTITUTIONS.

The State board of education reports 14 charitable and reformatory institutions, with over 1,000 different pupils under instruction during the year and 592 in average attendance, under 29 teachers.

Of these, the *State Primary School*, at Monson, an outgrowth of the almshouse, is peculiarly hopeful in its field of labor and successful in its results. Taking the children at an impressible age (the average being about 9 years) from the State almshouse, the streets, and the neglected abodes of poverty stricken or vicious parents, it puts them into a pleasant home, where they enjoy what is necessary to make childhood happy and where they are nurtured and trained till they can be placed in good families. Many of them are weak and diseased, either through heredity or neglect and starvation. Here they are supplied with an abundance of simple nourishing food and suitable clothing, cleanly habits and proper exercise and amusement in the open air being insisted on. Visible restraints are reduced to a minimum. Very few punishments are found necessary, and these are of the mildest character. There were 756 children in the school during the year, the average number being 448, of whom 183 were placed in families.

The *State Reform School*, for boys, Westboro', had 290 under training during the year, with an average number of 113, and placed out in homes 146. Of 108 committed during the year, 80 were 14 years old or more. The maximum limit of age for admission is 17 years, but some boys even older secure admission by the misrepresentations of friends who wish to spare them a greater disgrace. Thus many boys have found their way here who are too old and too hardened in crime to be managed by the methods of a reform school and who really belong in an intermediate institution between such a school and a prison. The trustees earnestly advise that the law be changed, fixing the limit of age at 14; they say that so long as the present condition is permitted the labors of the institution in behalf of the younger boys will be in a measure defeated by the influence of the older ones. Besides the common school branches, farm work and the caning of chairs are taught.

The *State Industrial School for Girls*, Lancaster, had nearly twice as many under its care in 1882 as in the previous year. This does not necessarily show an increase in crime,

but may indicate a fuller appreciation of the benefits of the school on the part of the courts and the guardians of girls committed. Of 229 on the list during 2 years, 26 were committed for stubbornness, 40 for larceny, 91 for immoral conduct, and 72 because in danger of falling into bad ways. During this period, 4 died after being placed out, 50 were discharged, 63 remained in the school (10 of whom were returned for misconduct), and 110 were placed out; on only 23 had the care apparently been wasted. Besides the common English branches the girls are taught plain sewing, cutting and making of their clothing, knitting, and housework, including washing and ironing. They are also employed on the farm and garden in work suited to their strength.

There are various private and church institutions for the care of neglected and orphan children. In the latter children are received at a very early age and retained until 14, 15, and 16, being taught the common branches of education, besides housework and various handicrafts.

EDUCATIONAL CONVENTIONS.

MASSACHUSETTS STATE TEACHERS' ASSOCIATION.

The thirty-eighth annual meeting of the State Teachers' Association was held in Boston, December 28–30, 1882, President Larkin Dunton, of Boston, in the chair. Among the subjects before the general meeting were "Sierra's enchanted valley, or the Yosemite and the big trees of California," illustrated by stereopticon views; "Bands of mercy: their purpose and formation;" "What place, if any, is religion entitled to in our system of public education?" "Illustrative drawing;" "The high school in our system of education;" "The duties of school committees," and "What is education?" General Francis A. Walker, president of the Massachusetts Institute of Technology, read a paper on "Industrial education," and Prof. John M. Ordway, of the same institution, one on slöjd schools, the latter being an account of industrial schools in Sweden and Norway. Discussion followed the reading of all the above papers, that of the last two named being of special interest and participated in by a number of members.

In the high school section the topics considered were "How to study English literature," "The realia of Greek literature," and "The rudiments of German," the method of instruction advocated by the last paper being illustrated by an exercise with a class of 9 boys from the English High School, Boston.

The subjects considered by the grammar school section were "Can history be taught as a natural science?" and "Geography and incidental lessons," a thorough discussion following both papers.

Before the primary school section were read papers on "Lessons on objects," "The four-process method of teaching numbers," and "The Kindergarten in its relation to the primary school," the last two topics being discussed by a number of members.

ASSOCIATION OF CLASSICAL AND HIGH SCHOOL TEACHERS.

The fifteenth annual meeting of the classical and high school teachers was held in Boston, April 7 and 8, 1882. The first paper read was on "Some needed reforms in the use of botanical terms as applied to schools;" the second gave "Some hints on science teaching." "English classics for high schools" was the theme of a spicy paper which advocated the more general and thorough study of the English language in the schools. "Out-of-school study" gave statistics collected in Fitchburg as to the number of hours spent by the pupils in study at home, the conclusion being that the amount of such study was not generally injurious to health. Other papers were on "The use of photographs in classical instruction," on "Voluntary work in schools," "Educational history," "The special aim of the teacher of language," "A plan for a town university," "The senses and geometry," "Some common errors and omissions of text books in physical science," "Botany as a mental discipline," "Chemistry in high schools," "Hints on high school discipline," and "An ideal linguistic requirement for admission to college," the latter being a protest against the common practice of devoting the principal work of linguistic preparation for college to the study of Latin and Greek.

SCHOOL COMMITTEE ASSOCIATIONS.

There were during 1881–'82 nine associations of local school committees, meeting twice a year to discuss educational matters, lay out courses of study for the adjoining towns, and adopt improved methods. These discussions have been of great benefit to the schools as well as to the committee. In each association the abolition of the district system was favored, some urging the formation of the small towns into groups, to be under superintendents to oversee the schools, each single town being too small to maintain a superintendent of its own.

OBITUARY RECORD.

PROFESSOR THEOPHILUS PARSONS.

Theophilus Parsons, professor of law in Harvard University from 1847 to 1870 and widely known as a writer of legal treatises, died at Cambridge, January 26, 1882, aged 85. He was born in Newburyport, Mass., in 1797. In 1800 his father moved to Boston, where the son was fitted for Harvard, graduating from that college in 1815. In 1849 he received from that college the degree of LL.D. Although engaged in the pursuit of law his exceptional talents as a writer found exercise in editorial work in connection with the United States Literary Gazette and other periodicals. He was a successful lawyer, but did not like practice, and was not sorry to retire from it when appointed professor in the Harvard Law School. He devoted himself to the preparation of legal treatises. In this work he was very successful, many of his books being considered the standard authorities on their subjects now. He continued in this work after his retirement from the law professorship, also writing works for the New Church (Swedenborgian), of which he was a devout and active member. His was a serene and happy old age. He was well read in the classics, ancient and modern, was proficient in natural philosophy and chemistry, and was thoroughly informed on all the important questions of his day, in which he took a lively interest.—(Boston Advertiser.)

HENRY W. LONGFELLOW.

Henry Wadsworth Longfellow, the poet, scholar, and teacher, died at his home in Cambridge, Mass., March 24, 1882, after an illness of less than a week.

Mr. Longfellow was born in Portland, Me., February 27, 1807, of New England stock, being descended from John Alden, of Plymouth colonial fame. His father, Hon. Stephen Longfellow, was a man of prominence in Maine, a leader of the bar, and representative in Congress. The son's early education was gained at the Portland Academy, where he was fitted for Bowdoin College, which he entered at 14. Even before this time he had written verses which always found ready admission into the Portland newspapers, and before graduation his reputation as a poet extended beyond the bounds of both college and State. He graduated second in rank in his class, and six months after was offered a professorship of modern languages and literature at Bowdoin, an office created for him. Such a professorship was at that time an exceptional thing among American colleges, the literature of Greece and Rome having hitherto been deemed sufficient for the purposes of college instruction. The appointment was accepted, but only on the condition that time should be allowed for study abroad before entering on it. He accordingly spent three years and a half on the Continent studying French, German, Italian, and Spanish. In 1829, at the age of 22, he entered on the professorship, in which he remained five years. During this time he wrote for the North American Review and translated the Coplas de Manrique, a work which placed him in the front rank of living poets. Outre-Mer: a Pilgrimage Beyond the Sea came out in 1835. In 1835 he was appointed to the professorship of modern languages and belles lettres in Harvard College, but before entering on it he again visited Europe, beginning his official duties at Cambridge in 1836 and continuing them till 1854. Meantime his career as an author went steadily on, each year adding to his fame both as a poet and prose writer. From his first connection with Harvard Mr. Longfellow lived in Cambridge, occupying, first as tenant and afterwards as owner, the mansion famous as being the headquarters of Washington during the siege of Boston. His professional services at Cambridge contributed in no small degree to his own fame and to that of the university, where he was always a favorite professor. The great charm of his presence and manner heightened the pleasure derived from his instruction, which, in the form of lectures, was chiefly in Italian and Spanish literature, especially the writings of Dante and Cervantes. His translation of Dante was originally a part of this class instruction.

Mr. Longfellow received the degree of M. A. from Bowdoin, LL. D. from Harvard, Cambridge (England), and Bowdoin, and D. C. L. from Oxford. He was a member of various learned societies in this country, also of one in Brazil, one in Spain, and one in Russia.

GEORGE C. MERRILL.

Prof. George C. Merrill died of consumption at Andover, April 19, 1882, after an illness of 18 months. He was born in Montague, in 1845, fitted for college at Andover, and graduated from Amherst College in 1865. After that he was a teacher of mathematics for four years in Phillips Andover Academy, and from 1869 to 1875 professor of mathematics and natural sciences in Washburn College, Kansas. In 1875 he went to Phillips Academy as Peabody instructor of the natural sciences, a position he filled acceptably till his health gave way in the fall of 1880. A year in Colorado failed to check the progress of his disease and in January he returned to Andover. Mr. Merrill was a man of much learning, successful as a teacher, and beloved and trusted as a Christian.

KO KUN-HUA.

Mr. Ko Kun-Hua, instructor in Chinese at Harvard College since 1879, died of pneumonia, after a brief illness, on the 14th of February, 1882, leaving a large family of young children in a helpless condition. These were sent back to Shanghai by the university, and a private subscription was raised sufficient to secure them against want until the children should be grown up and educated. Mr. Ko Kun-Hua was a refined, scholarly, and conscientious man.—(President's report.)

MRS. M. B. C. SLADE.

The Journal of Education of April 20, 1882, records the death of Mrs. M. B. C. Slade, of Fall River, aged 56, formerly assistant editor of the Journal and for the last four or five years editor of Good Times, a monthly magazine devoted to day school and parish recreations, Sunday school exercises, and mission and temperance entertainments.

Mrs. Slade was born in Fall River, where her home has always been, and prior to her marriage was a successful teacher. She has contributed to the literature of education in its varied forms for several years; was interested in the Little Corporal, published in Chicago; edited the School Festival; compiled from her writings the Holiday Concert; conducted a department in the School Day Magazine of Philadelphia; wrote for the St. Nicholas, Wide Awake, and other periodicals for the young; and published two books for young people, The Children's Hour and Exhibition Days, which were both very successful, the former comprising dialogues, tableaux, &c., for primary schools, and the latter, exercises suited to pupils in the common, grammar, and high schools. She gave sympathy and help to all who came within her influence.

WILLIAM B. ROGERS.

Prof. William Barton Rogers, for many years president of the Massachusetts Institute of Technology, died suddenly, May 30, while assisting at the graduating exercises of the class of 1882. The venerable ex-president—then in his seventy-seventh year—had been presented to the audience by his successor, Gen. Francis A. Walker, and welcomed with enthusiastic cheers. He responded by referring to the history of the school and expressing his own unabated interest in its progress and that of science in general, when he suddenly fell and in a few minutes ceased to breathe.

Professor Rogers, the second of four sons in a family noted for scientific acquirements, was born in Philadelphia in 1805 and was graduated at William and Mary College. In 1827 he succeeded his father, Dr. P. K. Rogers, as professor of natural philosophy and chemistry in that institution and in 1835 accepted the chair of natural philosophy and geology in the University of Virginia, which he held 18 years. During this period he devoted himself ardently and successfully to geology and mineralogy. He was at the head of a geological organization which made a survey of the State of Virginia and published annual reports of great value on the work. He also published a treatise on "The strength of material" and one on "Elements of mechanical philosophy." In 1853 he removed to Boston and at once identified himself with the educational interests of the city. He early conceived the plan for the organization of the Institute of Technology and was appointed its first president, which office he retained till 1881, although as early as 1868 illness obliged him to relinquish some of its active duties.

Professor Rogers added to extraordinary scientific attainments a personality which by its integrity, earnestness, simplicity, and warmheartedness attracted and developed all that was best and noblest in others. As a zealous promoter of scientific education among the industrial classes he had no superior. His writings have enriched the pages of all the leading scientific periodicals in Europe and America. He received the degree of LL.D. from Harvard in 1866.

CHIEF STATE SCHOOL OFFICER.

Hon. JOHN W. DICKINSON, *secretary of the State board of education, Boston.*

[Mr. Dickinson has been secretary of the board since 1877.]

MICHIGAN.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth of school age (5–20)	518,294	538,356	20,062	
In ungraded school districts	291,431	297,170	5,739	
In graded school districts	226,863	241,186	14,323	
Enrolled in public schools	371,743	385,504	13,761	
Enrolled in ungraded school districts.	219,700	224,250	4,550	
Enrolled in graded school districts	152,043	161,254	9,211	
Per cent. of school age enrolled	71.7	71.5		0.2
Estimated number of pupils in private or church schools.	19,788	20,577	789	
SCHOOLS.				
School districts	6,526	6,630	104	
Districts that maintained public schools.	6,281	6,523	242	
Number of public school-houses	6,575	6,728	153	
Sittings in public school-houses	454,624	481,955	27,331	
Average school term in days	154	148		6
Volumes in public school libraries	279,884	293,005	13,121	
Valuation of public school property	$9,384,701	$9,848,493	$463,792	
TEACHERS AND THEIR PAY.				
Men teaching in public schools	4,024	3,887		137
Women teaching in public schools	10,448	10,580	132	
Whole number teaching	14,472	14,467		5
Average monthly pay of men	$36 98	$41 56	$4 58	
Average monthly pay of women	25 78	27 44	1 66	
State teachers' institutes held	55	68	13	
Enrolment in teachers' institutes	4,548	5,566	1,018	
INCOME AND EXPENDITURE.				
Whole receipts for public schools	$3,772,321	$3,858,145	$85,824	
Whole expenditure for public schools	3,417,598	3,789,291	371,693	
SCHOOL FUND.				
Permanent fund available	$3,040,183	$3,262,321	$222,138	

(From reports of Hon. Varnum B. Cochran, superintendent of public instruction, for the two years mentioned.)

STATE SCHOOL SYSTEM.

OFFICERS.

The State school system is administered by a State superintendent of public instruction, elected by the people for 2 years; a State board of education, elected for 6 years, of which the superintendent is a member and secretary ex officio; and a board of regents of the University of Michigan, elected for 8 years. Local officers are district boards numbering 3 members in ungraded and boards of school trustees numbering 6 members

in graded school districts, elected for 3 years; township boards of school inspectors, and 3 county school examiners for each county, elected by the chairmen of the township boards.

OTHER FEATURES OF THE SYSTEM.

Public schools are sustained from the income of a State primary school fund, from a township tax of 1 mill on $1 (part of which is for the support of libraries), and from taxes voted by the districts, of such amount as is considered necessary by the district boards; provided that in districts having less than 30 scholars it must not exceed $50 a month (including amounts received from 1 mill tax and primary school fund) for the period during which school is taught in such district. Schools sustained by public funds must not be sectarian, and they must be taught at least 9 months in districts having 800 or more youth of school age, at least 5 months in districts having from 30 to 800, and three months in all other districts. They are free to all residents of the district 5 years of age and over, without distinction of race or color, and no separate schools for any race are allowed by the law. Teachers not graduates of the State Normal School must have certificates of qualification from the county examiners or from the State board of education. The county certificates, valid only in the county where issued, are of 3 grades, good for 1, 2, and 3 years. State certificates are valid throughout the State for 10 years. The State educational system includes graded, ungraded, and high schools, township and district school libraries, county teachers' institutes, a State teachers' association, normal school, university and agricultural college, institutions for the deaf and dumb and the blind, two reform schools, and a Public School for Dependent and Neglected Children.

GENERAL CONDITION.

The cause of education has shared in the general prosperity that marked Michigan affairs during the year 1882. With an increase during the year of 20,000 in youth of school age, there were 13,761 more enrolled in public schools, the percentage of enrolment on youth of school age remaining about the same. There was a larger number of public school districts and a larger number sustained public schools; 153 more public school-houses were built, increasing the estimated value of school property by nearly half a million of dollars and affording accommodations for over 27,000 more pupils, thus considerably more than keeping pace with the increase in school population. A corresponding increase is noted in the expenditure for public school purposes and in the principal of the available State school fund. While about the same number of teachers were employed as during the preceding year, that of men was 137 less and that of women nearly as many more, the average monthly pay of men advancing $4.58 and that of women $1.66. This increase in pay, which was almost confined to the rural districts, is ascribed to the operation of the new school law. As the severity of the examinations was increased, the supply of competent teachers was found inadequate, and the pay of men in the ungraded school districts advanced $4.61 and that of women $4.83, although, as stated above, the increase for the State was $4.58 for men and $1.66 for women. But this advance in pay, the superintendent thinks, will prove temporary only, since, owing to the greater inducements offered, unsuccessful applicants are endeavoring by hard study to fit themselves for the examinations and many old teachers who had ceased teaching on account of the poor pay are returning to the ranks; large numbers also are being prepared in normal schools, high schools, and colleges. It is noted that, while the number of graded school districts and the school population therein increased in greater proportion than the ungraded, the percentage of public school attendance in graded school districts was still smaller than in the ungraded. This state of affairs, however, was accounted for by an enrolment of over 20,000 in the private schools of the graded districts. The rural schools, while not up to what they ought to be, were doing their work with a degree of efficiency not surpassed in any previous year, and the general aspect of the educational field, despite some drawbacks, was such as to afford satisfaction and to give encouragement.

KINDERGÄRTEN.

Five Kindergärten, 1 of them organized within the year, report for 1881–'82. Three of these are at Detroit, 1 at East Saginaw, and 1 at Ionia. For statistics, see Table V of the appendix, and for a summary, see the report of the Commissioner preceding.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

Under a general law of 1875 these are boards of 6 trustees, elected for three years; but cities chartered before that time have different provisions. Detroit has a board of education of 12 and Grand Rapids one of 16 members. Superintendents are employed in all the larger and many of the smaller cities.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Adrian	7,849	2,605	1,446	974	29	$19,512
Ann Arbor	8,061	2,721	1,992	1,422	37	30,189
Detroit	116,340	40,210	17,272	12,061	271	267,259
East Saginaw	19,016	7,040	3,476	2,650	63	53,175
Flint	8,409	2,343	1,884	1,285	38	20,795
Grand Rapids	32,016	11,298	6,576	4,210	99	115,690
Kalamazoo	13,552	3,488	3,141	1,387	46	69,066
Muskegon	11,262	4,607	2,360	1,489	47	34,508
Port Huron	8,883	3,300	1,875	1,223	27	16,135
Saginaw	10,525	3,577	2,072	1,459	31	20,510

ADDITIONAL PARTICULARS.

The *Ann Arbor* public schools report an advance during the year in the number enrolled, but a decrease in average attendance in the primary and grammar grades, due to the prevalence of scarlet fever and measles. While work in these grades was conducted in much the same manner as usual, increased attention was given to handwriting, with good results. In nearly all the schools some time was given to committing and reciting choice selections of poetry. The superintendent thinks some progress was made in banishing the dime novel from the boys' stock of reading. In grammar grades such pupils as maintained a standing of 90 per cent. in any study, as shown by the monthly examination reports, were excused from final term examinations in that study, an innovation which lessened the strain of examinations on both teachers and pupils and seemed to work well. In a class of 56 promoted during the year from the grammar to the high school, 11 maintained a standing of over 90 per cent. in all their work. The number of pupils enrolled in the high school was larger than for any previous year in the history of the school, reaching 493, of whom 285 were non-residents. Good order was maintained in all the schools and with less corporal punishment than usual, only 19 cases being reported, against 39 the previous year and 50 the year before that.

Grand Rapids, with only 663 more youth of school age, reports an attendance on public schools of 723 beyond that of the previous year, by far the largest annual advance in one year in the history of the schools. To meet it more school buildings were provided and the corps of teachers was enlarged. The cost of schools increased $12,429. More attention was paid to the sanitary condition of school buildings. Drawing, music, and penmanship were taught by a special teacher for each, and with satisfactory results. Good discipline was maintained in most cases without corporal punishment, which was seldom resorted to by the best teachers. The evening schools were conducted on a new plan, only foreigners unable to read English being admitted, as it was not thought profitable to maintain such schools for young people. Attendance during the term was regular and the interest was well sustained, about 120 being enrolled, nearly all adults.

In *Muskegon* there was an increase in school population and school enrolment. There was also an advance in the average daily attendance and in punctuality. The schools became more efficient, largely, it was believed, through the selection of good teachers. Corporal punishment was eschewed, many teachers not reporting a case during the year.

No printed reports for 1881–'82 have been received by this Office from the other cities embraced in the above table, but such statistics as they have furnished in special returns will be found in Table II of the appendix.

TRAINING OF TEACHERS.

STATE PROVISION FOR NORMAL INSTRUCTION.

The *State Normal School*, Ypsilanti, reports an increased attendance during the year, pupils in the normal department numbering 330, against 318 the previous year, while the practice school increased from 174 to 181. Eighty-five students graduated in 1882, nearly all of whom engaged in teaching. With the increase of its students and graduates the influence of the school is becoming more widely felt. Additions were made during the year to the corps of teachers, the courses of study, and the facilities for work. A new building for the training school, erected at a cost of $25,000, was ready for occupancy in September, 1882. The library was enlarged by over a thousand well selected volumes, and considerable additions were made to the collections of scientific apparatus,

drawings, models, maps, globes, and charts. Students are offered a choice among 5 distinct courses of study, viz: scientific, language, literary, art, and common school courses, besides being allowed, in all courses except the elementary, an election of Latin, French, or German in place of certain specified subjects. The elementary course covers 2 years, while the other courses require 4 for completion.

The course in the science and art of teaching, connected with the undergraduate department of the *University of Michigan*, Ann Arbor, aims to fit university students for the higher positions in the public school service. It offers ample facilities for professional study, and is designed to promote the study of educational science, to teach the history of education and of educational systems and doctrines, to secure to teaching the rights, prerogatives, and advantages of a profession, and to give a more perfect unity to the State educational system by bringing the secondary schools into closer relations with the university. Various courses are marked out to suit the wants of different students, each requiring a year for completion.

OTHER NORMAL TRAINING.

Adrian and Hillsdale Colleges furnish opportunities for preparation to those desiring to become teachers, in courses extending over two years; Battle Creek, in a 4-year course; Olivet, in courses of 2, 3, or 4 years.

The Detroit Kindergarten Training School, having a 1-year course of study, reported 9 students, under 2 instructors, and 4 graduates.—(Return.)

TEACHERS' INSTITUTES.

The institutes of the year were unusually interesting; the instruction was in most cases practical, and the teachers manifested their zeal by regular attendance and by deriving the utmost advantage from the sessions. The number held was 68, an increase of 13 over that of 1881, while the aggregate attendance (5,566) was greater than the previous year by more than 1,000. Twenty-three of the teachers present had received State certificates, 88 normal school diplomas, 406 county certificates of first grade, 520 of second, and 2,848 of third. There were also 106 who had special certificates; these, being in the nature of permits to teach particular schools, are granted to candidates whose schools are to begin before the public examinations. Notwithstanding the fact that many of the institutes were held in the new counties, where teachers are few, accommodations limited, and facilities for travel poor, the average attendance was equally well sustained. An important agency in securing a large attendance at the institutes has been the county boards of examiners, who excited the interest of teachers and the community and contributed greatly to the success of the institutes.

EDUCATIONAL JOURNAL.

The Michigan School Moderator, a weekly journal "for the teacher, the school, and the family," published at Grand Rapids, commenced its third volume September 3, 1882.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

A table in the State superintendent's report gives statistics of 60 high school departments of graded school districts, having a total enrolment of 6,856 pupils, under about 170 teachers. It appears, too, that some of the higher branches were taught in other graded schools not comprised in the high school table. In a list of the graded schools of 255 cities, including the 60 high schools above referred to, 81 are reported as giving instruction in Latin, 50 in German, 25 in French, and 22 in Greek.

The largest high school in the State, that at Ann Arbor, reports an enrolment for the year of nearly 500 pupils, more than half of them non-residents, and 63 graduates. It is asserted that no other public school in America prepares so many pupils annually for college and university or has so many non-resident students. A new course of study has been added during the year, in which about a third of the work is music. Pupils may graduate from this on the same footing as from the other courses, it being considered that the mental discipline will be about equal to that in the other courses.

SUPERIOR INSTRUCTION.

COLLEGES FOR BOTH SEXES.

The *University of Michigan*, Ann Arbor, a part of the public educational system and governed by a board of regents elected by popular vote, is enabled, through funds provided by the United States and by the State, to offer its privileges without charge for tui-

tion to all persons of either sex who are qualified for admission. Students from abroad are received on the same terms as residents of the State, except that their matriculation fee is somewhat higher. The university is closely connected with the public schools, receiving pupils on diploma from such high schools as are approved by the faculty. It aims to complete public school work by furnishing ample facilities for liberal education in literature, science, and the arts and for thorough professional study of medicine, pharmacy, law, and dentistry. In the department of literature, science, and the arts, numerous elective courses are provided, leading to the degrees of bachelor of arts, science, and letters, with the corresponding masters' degrees; also, to the degree of doctor of philosophy and to those of civil, mechanical, and mining engineer. The work in this department was broadened by the establishment of a chair of didactics in 1879 and a school of political science in the autumn of 1881. The latter was attended during its first year by an encouraging number of students, the classes being instructed in political and constitutional history and law, political economy, natural, civil, and political rights, the science of forestry, and sanitary science. The last two, it is claimed, have never before been taught in any American university. The course in forestry has deservedly attracted much attention.

President Angell mentions various evidences of progress made during his two years of absence on a diplomatic mission to China, among them the erection of a new museum building and of an eye and ear infirmary and the enlargement of the chemical laboratory to nearly double its former capacity.

The number of students for the two years was greater than ever before, that for 1882, by a curious coincidence, being exactly the same as for the previous year, viz: 1,534. There were 435 degrees conferred in 1882, including 349 professional ones. Of the 75 bachelors' degrees, only 9 were in science, the rest being in arts, philosophy, and letters. Of the 11 masters' degrees, 4 were in arts, 3 in science, and 1 each in letters and philosophy, besides 2 doctors of philosophy.

Adrian College, Adrian, reports a larger attendance during 1880–'81 than for 12 years past, an advance in the entrance examinations in Latin and Greek, the establishment of a 3-year course in theology, a new chemical laboratory completed, and North Hall (which was destroyed by fire in November, 1880) rebuilt at a cost of about $13,000.

In *Albion College*, Albion, the courses of study have been reconstructed during the year in accordance with conclusions reached by the faculty as to the proper order of college work. Prevailing methods—placing as they do principles before facts, the abstract before the concrete, the remote before that which is near—the faculty deem unphilosophical, and the work has been planned so as to follow nature's order, as that is understood. Science is taught before the history of science. In languages English is studied first, then contemporaneous foreign languages, then Latin and Greek. Attendance had increased and with it the interest in study. A year has been added to the preparatory course, giving opportunity to test more fully the merits of the new plan. Another change noted is the introduction of university methods of study. Instead of daily recitations, a considerable portion of the work in the junior and senior years is now carried on through a system of individual investigations on the part of the student, aided by advice from the teachers.

Besides the university, 7 institutions in this State report themselves as engaged in collegiate work, viz: Adrian College, Albion College, Battle Creek College, Hillsdale College, Hope College (at Holland), Kalamazoo College, and Olivet College. In Grand Traverse College, Benzonia, there were no college students during the year. Classical courses of 4 years were provided by the institutions above named, and scientific courses by all except Hope College, the scientific also comprising 4 years in all except Battle Creek, where only 3 years were required to complete it. Besides the State University, Adrian, Albion, and Hillsdale Colleges add philosophical courses, Kalamazoo offers a Latin scientific course, and Olivet a course for ladies, all of 4 years. Business training was given by 2 colleges, normal by 5, musical by 6, art by 3, and theological by 3, while, as above noted, the State University makes provision for instruction in medicine, pharmacy, and dentistry. All are open to both sexes. Four received gifts of money during the year amounting in all to $46,658, as follows: Albion, $4,000, to erect an astronomical observatory; Hillsdale, $1,878, in small sums, to increase endowment; Hope, $37,350, of which $22,250 was to pay a debt, $12,102 for endowment, and the remainder for current expenses; and Kalamazoo, $3,430, in small sums, for current expenses. Grand Traverse received from L. Bailey and wife, Benzonia, a gift of 80 acres of land, to be disposed of for the benefit of the college.

For further statistics of the above colleges, see Table IX of the appendix, and for a summary, see a corresponding table in the report of the Commissioner preceding.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF WOMEN.

The only collegiate institution exclusively for women, Michigan Female Seminary, Kalamazoo, under Presbyterian influence, reported 45 students, under 7 instructors, and 2 graduates during the year.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The Michigan State Agricultural College, Lansing, first opened in 1857, has sent out 272 graduates, the class for 1882 numbering 28. The whole attendance was 219, of whom 200 were in regular undergraduate classes, 17 in special or partial courses, and 2 in graduate studies. Besides other branches necessary to a good general education, instruction is given in surveying, levelling, laying out of grounds, mechanics as applied to implements, building, stock breeding, agricultural chemistry, horticulture, and such practical applications of science as are specially useful to the farmer. Each student is required to perform 3 hours' work on the farm or garden in order to render him familiar with the use of implements and the principles of agriculture, as well as to preserve in him habits of manual labor and to foster a taste for agricultural pursuits. Most of the labor is paid for. A part of it is educational and is varied for the illustration of the principles of science. For some time a proposition has been under consideration to establish a department in mechanics, to be subsidiary to that in agriculture. A committee appointed to consider the subject has reported favorably and estimates of expenses have been submitted.

All the collegiate institutions of the State, except Hope College, as already mentioned, provide courses leading to the degree of B. S., the State University adding others in civil, mechanical, and mining engineering. The courses in the latter comprise mathematics, French, German, English, physics, general chemistry, mineralogy, astronomy, and drawing, besides the technical branches peculiar to each, and require 4 years for completion, as also do the scientific courses in all the other colleges except Battle Creek, where the degree is given after only 3 years' study.

For statistics of scientific schools and scientific departments of colleges, see Tables IX and X of the appendix, and for summaries, corresponding tables in the report of the Commissioner preceding.

PROFESSIONAL.

Theological instruction was given in Adrian, Battle Creek, and Hillsdale Colleges, all having courses of 3 years. In Adrian College, which is under Methodist influence, undergraduate students of the collegiate department are allowed to substitute theological studies for certain others in the collegiate curriculum and are thus enabled to complete the theological course in two years after graduation. Persons advanced in life or such as from other causes cannot devote 3 years to theological study are allowed to pursue a shorter course if in the judgment of the faculty they have a fitness for the ministry.

Hillsdale College (Free Will Baptist) offers 2 courses, a classical and an English, both of 3 years. Students who complete the former receive the degree of B. D.; those who complete the latter are given a diploma.

The department of theology in Battle Creek College (Seventh Day Baptist) includes a preparatory course of 2 years as well as a biblical one of 3, the latter including Greek and Hebrew.

For statistics of theological schools reporting, see Table XI of the appendix, and for a summary, see a corresponding table in the report of the Commissioner preceding.

Legal instruction is given in the law school of Michigan University in a course of 2 years, embracing the several branches of constitutional, international, maritime, commercial, and criminal law, medical jurisprudence, and the jurisprudence of the United States. Applicants for admission who are candidates for a degree must pass such an examination as will satisfy the faculty of the adequacy of their literary attainments, unless graduates of some collegiate institution, normal school, or other school of corresponding grade. Of 333 students attending during 1881–'82, there were 61 who had received degrees in letters or science. The graduating class numbered 170.

For further statistics, see Table XII of the appendix, and for a summary, the report of the Commissioner preceding.

The *medical* schools reporting are the medical department of the University of Michigan, Detroit Medical College, the homœopathic medical department of the University of Michigan, and the Michigan College of Medicine, Detroit. All follow the "regular" practice, except the homœopathic department of Michigan University. The 3 regular schools reported a total of 500 matriculates for the year and 121 graduates; the other school, 71 matriculates and 15 graduates.

The two medical departments of Michigan University offer and require for graduation a graded course of 3 years, the annual lecture term extending over 34 weeks. An examination for admission is also required. Before receiving a diploma students must pass a satisfactory examination on all the branches, practical anatomy and chemical analysis included. There are also two extended optional courses, one in physiological

and pathological chemistry, the other in toxicology. The course for women is in all respects equal to that for men. Practical anatomy is pursued by the two sexes in separate rooms, which is also the case in some of the lectures; but in most of the latter, also in public clinics, the chemical laboratory, and various other classes, it is found that both may with propriety be united.

Detroit Medical College offers and recommends but does not require a 3-year graded course of study. In order to graduate, students must take this course or else 2 full courses of lectures not within the same year, must pass an examination on all the branches taught in the college, take a full course in dissection, a course in the chemical and physiological laboratory, and 1 term in hospital and out of door clinics. An examination for admission is required of candidates not graduates of a high school or academy or matriculates of some college or medical school.

Michigan College of Medicine, Detroit, also recommends but does not require a 3-year graded course of study. To graduate, students must have studied medicine 3 years, including 2 full courses of lectures, each being of 23 weeks, and pass a satisfactory examination in all the branches. Applicants for admission not graduates of college, high school, or other recognized educational institution must pass an examination.

Dentistry is taught in the College of Dental Surgery of the University of Michigan, which strongly recommends a 3-year graded course of study, but presents a course of only 2 years for the convenience of those who cannot take the longer one. Three years' study of dentistry, however, is required for graduation, 2 of them to be in this college. Students attend the regular lectures in the department of medicine and surgery, thus receiving a complete course in surgery, both didactic and clinical; they are required to take a course in histology and in analysis of saliva; also, to attend lectures in inorganic and organic chemistry.

The school of *pharmacy* connected with Michigan University gives a training adapted to service in commercial, analytical, and manufacturing chemistry and pharmacy, laying a foundation for the practice of the dispensing pharmacist, the general analyst, the wholesale druggist, and the manufacturing chemist. The course is graded and occupies as yet only 2 years, but it is contemplated to extend it to 3. This is found necessary, more especially for the increasing number of graduates who become analytical and manufacturing chemists. Graduates must pass a satisfactory examination on all branches in the course, and they must have also passed a preliminary examination for admission. Experience in the business of pharmacy is not a requisite for a degree. A second degree is offered to resident graduates on presenting satisfactory work in original research to an extent representing the work of a full college year.

For statistics of medical, dental, and pharmaceutical schools reporting, see Table XIII of the appendix; for a summary of these statistics, a corresponding table in the report of the Commissioner preceding.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The *Michigan Institution for the Education of the Deaf and Dumb*, Flint, reports a full school list for 1881–'82. More pupils attended than could be well accommodated and an appropriation was asked of the State legislature to provide additional buildings. The whole number of pupils was 249; teachers, 13, of whom 3 were deaf-mutes and 2 semi-mutes. Only 4 belonged to the graduating class of 1882, a much smaller number than that of the classes in many preceding years, owing to the fact that the legislature has recently extended the time allowed to complete the course from 8 to 10 years, and many gladly availed themselves of the two additional years. The average time spent by each pupil is about 7 years. The latter part is equally divided between the different industries and the schools, which include primary, grammar, and academic departments. The training received in the industrial department is considered at least equal in value to that received in the schools. Many boys who are dull in their studies make the best mechanics and tradesmen. Cabinet making, boot and shoe making, printing, baking, and farming are taught to the boys; sewing, cutting, and fitting of garments and general housework, to the girls.

The *Evangelical Lutheran Deaf-Mute Institute*, Norris, is controlled by several Lutheran congregations. It owns 20 acres of land, the entire property is valued at $12,000, and 40 pupils attended during 1881–'82. Instruction is given by the articulation method in religion, the common branches, and natural history. No employments are taught, but pupils assist in the garden and in the kitchen.—(Return.)

The *Class in Articulation for the Deaf*, Marquette, a private institution, sends no report for 1881–'82.

EDUCATION OF THE BLIND.

The Michigan School for the Blind, Lansing, enrolled 63 pupils, a larger number than during the previous year; but, as in the case of the institution for the deaf and dumb,

the number received is limited by the lack of accommodations. A good common school education is given here; also, training in such occupations as pupils are best able to pursue. The work is carried on in three departments, literary, music, and handicraft, the first enrolling the whole number of pupils; the second, 39; the last, 62. . A specialty is made of music with a view to preparing pupils to teach this branch. Some increase is reported in the library facilities and other apparatus, but much more needs to be done in this direction.—(State report.)

REFORMATORY AND INDUSTRIAL TRAINING.

The *Michigan State Reform School*, near Lansing, received 392 boys during the two years commencing September 30, 1880. There were 76 more committed during the latter than the former of the two years, an increase, it is remarked, the continuance of which would necessitate an early extension of the accommodations. Fewer commitments would be made to the school, it is believed, if there were less desire on the part of many justices of the peace and constables to obtain fees and if more earnest efforts were made by agents of the State board of charities and corrections to find homes for those whose only crime is that they are homeless. Of the 346 boys who left the institution during the two years reported, 249 were discharged, 94 were granted leave of absence, 2 escaped, and 1 died. A practice recently inaugurated of granting leave of absence on trial to boys who by good conduct have merited confidence has resulted most satisfactorily, only 9 of the boys so released having been returned, and some of these through no fault of theirs, but from lack of good home surroundings. The average time spent in the institution by the boys released during the year was about 19 months, less by nearly 8 months than for several years. The intention is to give each a fair knowledge of the common English branches, except when he is to go to a home where he will be sent to school. All the boys attend school in the institution an average of 4½ hours each day for 5 days of the week and work the same length of time, performing the entire labor of the institution, including farming, house cleaning, laundry and dining room work, cooking, and making clothes, bedding, and shoes.

The *Michigan Reform School for Girls*, Adrian, opened in August, 1881, up to September 30, 1882, had received 85 girls. The courts have authority to commit to this school any girl between 7 and 17 years of age who shall be convicted of being a disorderly person or of having committed any offence not punishable by imprisonment for life, except she be deemed incorrigible. The sentence is until the girl is 21 years of age, but the time may be reduced by the board of control as a reward for good conduct. The great aim of the school is to surround the girls with the atmosphere of home and to develop in them the home instinct. They are housed in four pleasant cottages, the housework of which is all done by themselves under the supervision of teachers. A special sewing department, too, has been organized, with a teacher of dress cutting, fitting, and making. Connected with the chapel are school rooms where the afternoons are spent in study, with one hour in the evening. There is a well chosen library of 179 volumes, from which pupils draw books once a week.

EDUCATION IN PENAL INSTITUTIONS.

Within a recent period the authorities in charge have given considerable attention to furnishing instruction in the common branches of an English education to the inmates of the penal institutions in this State. At each of them a competent instructor is employed. At Jackson, 30 of the prison officers and at Ionia 13 inmate instructors aid the superintendent of the school in the work of instruction. The effect of the work is already apparent in its influence for good on the prisoners. During the year, 701 prisoners at Jackson and 335 at Ionia have availed themselves of the opportunity offered, and the progress made in many instances was surprising.

EDUCATION OF POOR AND NEGLECTED CHILDREN.

The State Public School for Poor and Dependent Children, Coldwater, receives children 3 to 12 years of age, trains them as far as practicable in school studies and industries, and finds homes for them in families till they are 18 years of age, retaining guardianship even later. Since its opening in 1874, homes have been provided for 1,231 children, 824 boys and 407 girls. In the beginning there was room in the institution for only 150, but its capacity has been gradually increased so that now more than 300 are accommodated. The demand for admission has been greater, too, since 1881, when a law was passed forbidding any children admissible here to be placed in county poorhouses or with adult prisoners in jails. Another amendment made in 1881 provides that children of this school who are ill, and such as would be admitted here if cured, are given treatment, board, and nursing at the university hospital, also transportation to and from it, free of charge. The experience of 8 years has confirmed confidence in the main principle on which the school is based, that it is only a temporary home for the child, who

is placed in a family home as soon as a suitable one can be found and the child can be prepared for it. The number received in 1881–'82 was 150; indentured, 175; returned to counties whence they came, 19; died, 2; remaining in school September 30, 1882, 311. The course of school study for such as can complete it apparently covers 6 years.

EDUCATIONAL CONVENTIONS.

STATE ASSOCIATION.

The thirty-second annual meeting of the Michigan State Teachers' Association was held in Representative Hall, Lansing, December 27–29, 1882. Several of the committee rooms were made headquarters for a variety of interesting exhibits of school work, including drawings, written class work, and philosophical apparatus. The sessions were numerously attended and productive of much profit. The papers presented were upon live subjects and, on the whole, were of unusual merit. The discussions were generally participated in and were real contributions to the consideration of the topics before the association. Among the topics considered were "The need of visible illustration and the proper use of apparatus," "Plans for country school-houses," "Ornamenting school grounds," "Science in primary schools," "Temperance," "From county institute to county normal," and "The microscope in our public schools."

MEETING OF COUNTY SCHOOL EXAMINERS.

In response to an invitation of the superintendent of public instruction to the members of the boards of county school examiners to meet in convention, a large number of these officers, together with other educationists of the State, met at Representative Hall, Lansing, December 27, 1882. After some remarks by State Superintendent Cochran, explanatory of the purposes of the meeting, reviewing the operations of the new school law, and relating to the outlook of the future, the following subjects were discussed by the convention: "Certificates: their grades and requirements;" "How to secure classification and grading in district schools;" "The duties of the secretary of the board of examiners," and "Ends to be attained and methods to be used by the examiners in their work for the schools."

OBITUARY RECORD.

REV. JOHN D. PIERCE.

Rev. John D. Pierce, "father of the Michigan school system" and first State superintendent of public instruction, died at the home of his daughter, in Medford, Mass., April 6, 1882, aged 85 years. He was born in Chesterfield, N. H., and lived with an uncle until twenty years of age. During boyhood he was allowed to attend school two months in each year. His uncle gave him his time a year before he arrived at his majority and then he worked as a farm laborer until he had saved $100. His grandfather gave him a like amount and then began the struggle for an education. Entering Brown University in 1818 and during his course teaching school three months each year to maintain himself, he graduated in 1822. He was one year principal of Wrentham Academy, Mass., and in 1823 entered Princeton Theological Seminary. In 1825 he became pastor of a Congregational church in Oneida County, N. Y., where he continued four years, then becoming principal of the Goshen Academy, in Connecticut. In 1831 he was sent by the Home Missionary Society to Michigan, where he labored as a missionary until 1836, when, on the organization of the State government, he was appointed superintendent of public instruction. The schools of the Territory up to that time had been little else than private enterprises, and to Mr. Pierce more than to any one else does Michigan owe her excellent educational system. Being an intimate friend of General Crary (a member of the convention which framed the State constitution and chairman of the committee on education), Mr. Pierce discussed with him the principles which he thought should be adopted in laying the foundation of a new State. They agreed that education should form a distinct branch of the State government and that the constitution ought to provide for an officer to have charge of the whole matter. This policy was adopted and Mr. Pierce was nominated by the governor and unanimously confirmed as the first incumbent of the office. During the next five months he perfected plans for the organization and support of primary schools and a university with branches, also for the disposition of the university and primary school lands, which were adopted by the legislature. The matter of devising a plan for a university caused him great anxiety, for it was said that no State institution of the kind had ever succeeded. It was proposed by some to name the several private colleges then existing on paper the "University of Michigan" and to distribute the income of the fund for the support of a university to them in proportion to the number of students. But Mr. Pierce opposed this scheme with all the influence he could

bring to bear and succeeded in defeating it, though only by one vote in the house. The effect of that one vote has been to give Michigan an institution of learning rivalling the best and oldest in the country. As State superintendent Mr. Pierce gave to school work five of the best years of his life, often travelling by night as well as day. In 1842 he resumed work in the ministry and continued it till 1847, when he was elected to the State legislature, where his influence was exerted against the extension of slavery in the Territories and in favor of the homestead exemption law. He was a member of the constitutional convention of 1850 and secured the incorporation of the homestead exemption measures and the provisions for free schools.—(Lansing Republican.)

PROFESSOR ZELOTES TRUESDEL.

The death of Prof. Zelotes Truesdel took from the ranks of Michigan educators one of the oldest, best known, and most active of the men whose names have been associated with the educational history of the State for the last quarter of a century.

Professor Truesdel was born in New York in 1829, and the family removed to Michigan in 1843. Entering the university at Ann Arbor in 1853, the young man graduated in 1857 with the degree of bachelor of science. He then taught school in Moline, Champaign, and Springfield, Ill. Returning to Michigan, he was at once recognized as a leader in educational affairs. In 1876, 1878, and 1880 he was the democratic candidate for superintendent of public instruction; although defeated, he received the hearty indorsement of his own party and many votes from political opponents. He was the first superintendent of the State Public School at Coldwater, and during the year and a half in which he held this position effected the thorough organization of the institution. For nine years he was superintendent of the public schools of Flint, Mich. He was afterward superintendent of the Pontiac public schools for four years, when, on the failure of his health, he retired to Ann Arbor for rest and recreation. Immediately elected a member of the county board of school officers under the law of 1881, the board at once appointed him secretary, a position that imposed on him many and onerous duties. He bore a long illness bravely, and died February 26, 1882, at Ann Arbor. As a student and scholar Mr. Truesdel was careful, thorough, and practical; as an organizer of schools, a manager and disciplinarian, he was exact; and in his political and public educational work he was outspoken, incorruptible, and fearless. His personal friends were all who knew him and his friendships such as all were proud to share.

CHIEF STATE SCHOOL OFFICER.

Hon. VARNUM B. COCHRAN, *State superintendent of public instruction, Lansing.*

[Term, January 1, 1881, to January 1, 1883.]

Hon. Herschel R. Gass has been chosen to succeed Mr. Cochran.

MINNESOTA.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth of school age (5–21)	----------	*a*289, 028	----------	----------

a Census of 1880. From 1870 to 1875, when an annual census of children of school age was taken, 61 per cent. of the school population enumerated was enrolled. Using the same proportion for 1882, the State superintendent estimates the present population to be 315,948.

b This is the number employed in winter schools, there being 1,625 men and 2,711 women. In summer schools there were 4,000 teachers: 662 men and 3,338 women.

(From the biennial report and return of Hon. D. L. Kiehle, superintendent of public instruction, for 1881 and 1882.)

STATE SCHOOL SYSTEM.

OFFICERS.

For the State there is a superintendent of public instruction, appointed for 2 years by the governor, with the advice and consent of the senate; he is a member ex officio of the board of regents of the State university and secretary of the board of directors of the State normal schools; he is also associated with the governor and president of the university in the State high school board. For each county there is a superintendent of schools, elected for every 2 years, who examines and licenses teachers. There is a board of 3 trustees for common school districts; for independent school districts, a board of 6 directors, which appoints 3 competent persons as school examiners and may elect a superintendent of schools. The members of each board are chosen for 3 years. Women may vote and hold any office pertaining solely to the management of public schools.

OTHER FEATURES OF THE SYSTEM.

The public schools are free to all resident youth of school age without regard to color or nationality; and county boards of trustees and boards of education have power to admit pupils over 21 years of age or non-residents upon payment of such tuition as may be determined upon by the board. The schools are sustained from the proceeds of a State school fund, from a county tax of 1 mill on $1, from the proceeds of liquor licenses, fines not otherwise appropriated, and the unclaimed proceeds arising from the sale of estrays, and from an optional district tax not to exceed 9 mills on $1 for schools or 10 mills for school-houses. Teachers must keep the registers properly on which the apportionment of State funds is based and return them to the district clerk at the close of each term;[1] in the absence of proof that this has been done the last month's pay will be withheld.

The State appropriates $3,000 annually to defray the expenses of such teachers' institutes and other normal training as the State superintendent may deem necessary. The superintendent must have charge of each institute, and it is the duty of all teachers to attend.

GENERAL CONDITION.

The statistics of 1881–'82, as compared with 1880–'81, show an increase of 13,257 in enrolment in the public schools and of 12,081 in average daily attendance in winter schools and 2,577 in summer schools. The enrolment was 119,305 less than the number of youth of school age as estimated by State Superintendent Kiehle, who also thinks that 20 per cent. of those enrolled attend so short a time that very little benefit is derived from the instruction they receive. In the available school fund there was an increase of $464,238; also, an increase in the income and expenditure.

KINDERGÄRTEN.

Five schools of this class reported for 1882, 3 at Minneapolis, 1 at St. Paul, and 1 at Winona, with a total enrolment of about 150.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

Cities, towns, and villages of over 500 inhabitants, not under special law, may be organized into independent school districts, with boards of education elected for a term of 3 years by the people. A superintendent is elected by the board, of which he is a non-voting member ex officio and executive officer.

STATISTICS.

Cities.	Population, census of 1880.	Children of schoolage.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Minneapolis	46,887	19,400	7,750	4,958	142	$125,576
St. Paul	41,473	.....	6,725	3,849	121	182,503
Stillwater	9,055	.....	1,247	802	22	.....
Winona	10,208	.....	1,805	1,353	38	23,491

ADDITIONAL PARTICULARS.

Minneapolis, whose schools are divided into primary, intermediate, grammar, and high, reports an increase since 1881 of 1,030 enrolled and of 483 in average daily attendance, with 9 more teachers. The estimated value of school property was $440,378, while the amount received for school purposes was $158,158. The high school had an enrolment of 241 pupils and graduated 16. The teachers met each month to discuss questions of discipline and teaching, and special subjects were selected for study by the teachers.

St. Paul for 1882 reports a large increase in enrolment and average daily attendance in the public schools. The schools included all grades from primary to high, with special teachers of music, drawing, and penmanship. There were 17 school-houses reported, valued, with grounds, &c., at $379,100. Enrolment in private and parochial schools, 3,610.

Stillwater reports a considerable increase in the last two years in enrolment in public schools and in average daily attendance. The average monthly salary of teachers below the principal was $54. The schools were taught 9 months.

[1] The basis of apportionment is the number of children 5–21 enrolled in public schools having an annual term of at least 3 months under a licensed teacher.

Winona reports 3 school-houses, with 1,826 sittings, valued at $147,500. The increase of enrolment for the year was 43, with a decrease of 32 in average daily attendance, but 8 more teachers. There were special instructors in music, drawing, and penmanship. Enrolment in private and church schools, 220.

TRAINING OF TEACHERS.

STATE NORMAL SCHOOLS.

The 3 State normal schools report a total of 34 teachers and 776 normal and 326 other students. The school at Mankato received $12,000 from the State; it gives 2 years to elementary studies and has a 3-year advanced course. St. Cloud normal receives the same amount from the State and, with two years of elementary study, gives an advanced course of 2 years. The Winona school, which receives $14,000 from the State, presents an elementary course of 2 years, a 2-year advanced course, and a course of 1 year of professional instruction for those who pass an examination on the academic work of either the elementary or advanced course. The Kindergarten at Winona is under the auspices of this school. Students are admitted free to any State normal school on passing the required examinations and agreeing to teach in the State at least 2 years. All report instruction in vocal music and drawing, laboratories for chemical experiments, and model schools for practice teaching. There were 76 normal graduates in the last scholastic year, 71 of whom have engaged in teaching.

TEACHERS' INSTITUTES.

The provisions of the act of the legislature of 1881 regarding institutes were fully carried out, and 1 teacher from each normal school was elected to serve in institutes during a term of 9 months. There were 41 institutes held during the year 1882, with a total attendance of 2,151, an increase of 1,321 over the preceding year. Every county applying was furnished with an institute and lectures were given gratuitously by teachers of the State University and normal schools. Educational subjects were thoroughly discussed with a view to gaining the best results of experience and applying them to the work of the State. The legislature appropriates $3,000 annually to defray the expenses of these institutes.

OTHER NORMAL TRAINING.

Summer courses of instruction in botany, geology, German, English, rhetoric, and elocution, with lectures and laboratory work, were opened at the University of Minnesota July 5, 1882, and continued 5 weeks. These courses offered to teachers the advantages of the State University in preparing themselves for teaching literature and the sciences. There were 73 teachers in attendance. Minneapolis Academy, Minneapolis; Gustavus Adolphus College, St. Peter; and Rochester Classical School, Rochester, continued their normal training.

EDUCATIONAL JOURNALS.

The Minnesota Journal of Education, a monthly begun in December, 1881, continued in 1882 to give efficient aid to the educational interests of the State, and was well supported by the teachers.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

State aid is afforded for the encouragement of higher education through the development of a system of secondary schools, which is in charge of the State "high school board." There were 39 graded high schools receiving aid from the State. Students graduated from any of these schools were admitted to the University of Minnesota without further examination.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The University of Minnesota, Minneapolis (non-sectarian), continued in 1881–'82 to offer free instruction to all persons over 14 years of age who passed the required examination. The university contains a collegiate department and colleges of mechanic arts, agriculture, and science, literature, and the arts. Colleges of medicine and law are projected.

The other colleges reported for 1882 were Hamline University, Hamline (Methodist Episcopal), Augsburg Seminary, Minneapolis (Lutheran), each with 4-year classical courses; Carleton College, Northfield (Congregational), with a 3-year preparatory department and 4 courses of study of 4 years each; St. John's College, Collegeville (Roman Catholic), giving classical, scientific, and commercial instruction in courses of varying length.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

The University of Minnesota, Carleton College, and Hamline University gave equal privileges to young women. St. Mary's Hall, Faribault (Protestant Episcopal), and Bennett Seminary, Minneapolis (non-sectarian), offered collegiate instruction to young women only. Both presented preparatory, collegiate, and English and classical courses of 2, 3, and 4 years, respectively.

For statistics, see Table VIII of the appendix; for a summary of them, the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The *State University*, in its College of Agriculture, follows up 2 years of work in the collegiate department with special training for 2 years in botany, zoölogy, anatomy, physiology, and other sciences relating to agriculture. Its College of Mechanic Arts also presents 3 courses of 2 years each, following 2 years of collegiate work. Graduates receive degrees in civil or mechanical engineering and in architecture. Day and evening courses are given in mechanical drawing. A course in shop work was instituted in 1881–'82 in a building constructed for that purpose and furnished with appliances for wood work, vise work, and forging; the appliances included a steam engine, forges, anvils, and forging tools. Ten young men took the vise or forge work under the direction of a professor. A summer school of science provided free teaching in botany, chemistry, and geology for public school teachers and others.

Carleton College is supplied with all the apparatus necessary for the practical study of meteorology and astronomy. It has also a "science building" for the pursuit of scientific studies and the higher grade of mathematics.

Augsburg Seminary, *Hamline University*, and *St. John's College* also offer special scientific courses.

PROFESSIONAL.

Theology is taught at Seabury Divinity School, Faribault (Protestant Episcopal), Augsburg Seminary, Minneapolis (Lutheran), and St. John's College, Collegeville (Roman Catholic). All have preparatory departments for those who are not college graduates and cannot take a collegiate course.

Medicine is taught at the Minnesota College Hospital, which was inaugurated in 1881 under a union of the faculty of the hospital with that of St. Paul Medical College. The full course of lectures covers 3 years of 19 weeks each. Candidates for admission must be at least 18 years of age and pass the required examination. The matriculates of 1881–'82 numbered 25, under 21 professors; graduates, 5.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The Minnesota Institute for the Education of the Deaf and Dumb, Faribault, reports for the two years ending November, 1882, an enrolment of 169 pupils, of whom 74 were girls. Eleven were graduated or discharged in 1881, and 12 in 1882. The average time in school is 5.3 years. The common English branches are taught, and about one-third are taught articulation and lip reading by a special teacher. The day is divided into two sessions, one for intellectual and the other for industrial work. The latter, with a foreman for each class, teaches sewing, shoemaking, tailoring, printing, and carpentry.

EDUCATION OF THE BLIND.

The State School for the Blind, Faribault, had in 1882 an attendance of 35 pupils under 7 instructors. In addition to the common school studies instruction is given in vocal and instrumental music. In the industrial department, in charge of skilled instructors, pupils are taught broom making, sewing, knitting, and the simpler kinds of housework. The course of study covers 8 years.

EDUCATION OF THE FEEBLE-MINDED.

The Minnesota Training School for Idiots and Imbeciles, Faribault, has become one of the permanent institutions of the State. The advancement in the school work is reported to be very encouraging. Children are taught to read, write, count, sing, weave mats, and do housework.

REFORMATORY AND INDUSTRIAL TRAINING.

The Minnesota State Reform School, St. Paul, in its report for 1882 gives 123 inmates, who were taught the common English studies, the hours out of school being devoted to learning some useful trade. The institution was organized in 1868, since which time 450 children have been connected with the school.

EDUCATIONAL CONVENTIONS.

MINNESOTA STATE EDUCATIONAL ASSOCIATION.

The seventh annual session of the Minnesota Educational Association was held at St. Paul, December 27–29, 1882, conducted by President Shepard. The following are some of the subjects of addresses and discussions: Current criticisms upon the public schools; penmanship and free hand drawing in the public schools; the law of evolution in education; educational conversation; industrial education. A lecture on national aid to education was delivered by Rev. A. D. Mayo, of Boston, Mass. There were 400 teachers present and the discussions were practical and excellent throughout. The association adjourned to meet at Minneapolis in 1883.

CONVENTION OF COUNTY SUPERINTENDENTS.

The second annual convention of the county superintendents met at St. Paul, December 26, 1882. There were 37 members present, with President O. M. Lord in the chair. The opening address was delivered by Hon. D. L. Kiehle, who said the all absorbing problem was "good teachers: how to get and how to keep them," and that the four elements of the best type of teachers are natural adaptation and character, academic knowledge professional training, and experience. Mr. Kiehle advocated a graded course of study and institute instruction. Normal schools, competent supervision, and remedies for tardiness and irregular attendance were freely discussed by the various superintendents.

CHIEF STATE SCHOOL OFFICER.

Hon. D. L. KIEHLE, *State superintendent of public instruction, St. Paul.*

[Filling the unexpired term of Dr. Burt, which terminates the first Tuesday in April, 1883.]

Mr. Kiehle has been reappointed for another term.

MISSISSIPPI.

(From report and return for 1880–'81 and from return for 1881–'82 of Hon. J. A. Smith, State superintendent of public instruction.)

STATE SCHOOL SYSTEM.

OFFICERS.

By constitutional provisions the officers for general supervision are a State superintendent of public education, elected at the same time as the governor, for 4 years; a State board of education of 3 members, including the superintendent, for the management of school funds; a superintendent of public education in each county, appointed by the State board for 2 years' service; and 3 trustees chosen annually by the patrons of each school in townships, or by the mayor and aldermen in incorporated towns, to select teachers, protect property, provide fuel, and visit the school or schools each month.

OTHER FEATURES OF THE SYSTEM.

The ordinary school districts in Mississippi are counties, but incorporated towns with 1,000 or more inhabitants may become separate school districts if the mayor and aldermen so determine. Schools for white and colored children, as elsewhere at the South, are required to be separate. Teachers must have certificates of qualification corresponding to the grade of school they are to teach, these certificates to be signed by the superintendent having supervision of the school. The minimum annual time of school is five months, except when the maintenance of one for that time would require for county school purposes a tax of more than $7.50 on each $1,000 of property, when it may be made four months. The support of the schools of the State system comes from a State distributable fund of $200,000 annually apportioned among the counties according to the number of children of school age in each; from township funds, mainly the proceeds of old land grants; and from municipal and county taxes.

GENERAL CONDITION.

For the year 1882 there is little information, the last biennial State report having covered the years 1880 and 1881. From a written return for 1882 it appears that there was a gain of 24,168 in school population and of $241,878 in receipts over 1880–'81, but a loss of 17,671 in average monthly enrolment, of 23,749 in average daily attendance, and of 805 in teachers. These apparent reductions, however, may be due to incomplete returns.

PEABODY FUND.

For 1882 the agent of the Peabody fund trustees allotted to the State $4,275, of which $1,200 went for teachers' institutes, $300 for public schools, and $2,775 for the training of specially selected teachers at the State Normal School, Nashville, Tenn. Since 1868 Mississippi has received nearly $70,000 from this fund.

KINDERGARTEN.

Only a single Kindergarten in this State is on the list of this Bureau for 1881–'82, and from that one no report has been received.

CITY SCHOOL SYSTEMS.

OFFICERS.

Any incorporated town of 1,000 or more inhabitants may constitute a separate school district, if the mayor and aldermen so elect; a board of 3 trustees may be appointed annually by the mayor and aldermen, to be governed by the same laws as trustees of other schools, the county superintendent having the same jurisdiction over city as over county schools.—(Code of 1880.)

STATISTICS OF VICKSBURG.

The only city with over 7,500 inhabitants, according to the census of 1880, was Vicksburg, with 11,814. In 1881–'82 a school population of 3,671 was reported, an enrolment of 1,220 in public schools, an average daily attendance of 900, 21 teachers, 2 school buildings, with 1,100 sittings, and school property valued at $14,400. In private and parochial schools there was an estimated enrolment of 500. The school sittings were more than sufficient for the actual attendance; but provided for only 30 per cent. of the school population, of which only 33 per cent. was enrolled in public schools. Adding the 500 in private and parochial schools, only 47 per cent. of the youth of school age were receiving instruction.—(Return.)

TRAINING OF TEACHERS.

STATE NORMAL SCHOOL.

The Mississippi State Normal School, Holly Springs, in 1881–'82 had 3 resident instructors and 136 students, of whom 91 were males and 45 females. Two graduates of the school engaged in teaching, having completed the regular 4-year course of 40 weeks each. The object of this school is simply to prepare teachers for their work, none being admitted who do not intend to become teachers. To be admitted, males must be 15 and females 14 years of age and must pass an examination in arithmetic, grammar, geography, spelling, and reading. The standard is raised every year to keep pace with the advancing standard of State requirements for teachers' licenses. All the studies of the course are compulsory. Tuition is free to all coming from the State, the appropriation for the year being $3,000.

OTHER NORMAL INSTRUCTION.

Iuka Normal Institute, for both sexes, Iuka, appears for the first time on the list of normal schools, it having been organized as a normal school apparently in 1882, with 6 professors and instructors. The scholastic year embraces 4 terms of ten weeks each. There is a course of 3 years, following a preparatory course of undefined length, but what portion must be completed in order to graduate is not distinctly stated. Special prominence is given to the training department.—(Circular.)

Natchez Seminary, Natchez, for training preachers and teachers for the colored people of the South, is under the care of the American Baptist Home Mission Society. In 1881–'82 there were 5 instructors and 80 male and 40 female normal students, of whom 7 graduated from its 3-year course of 34 weeks each and engaged in teaching. A library of 400 volumes was increased by 50 during the year. Each student pays $8 a year for tuition.—(Return and catalogue.)

Tougaloo University, Tougaloo, had 12 instructors and lecturers, 56 normal students, a library of 900 volumes, and a State appropriation for the year of $3,000. The annual charge for tuition is $8. The school has chemical and physical apparatus, a museum of natural history, a gymnasium, and a model school. Instruction was given in vocal and instrumental music. An English course prepares teachers for the common schools, and a normal course, for the higher grades of schools; each course covers 3 years. Pupils are admitted irrespective of sect or race. Every student is trained in some industry, being required to work 1 hour each day.—(Return and catalogue.)

The normal department of *Rust University*, formerly Shaw University, Holly Springs, continued in 1881–'82 to fit students of both sexes for the work of teaching, in a course of 4 years.—(Catalogue.)

The *Union Female College*, Oxford, reported in 1879–'80 a normal department, in which instruction was given in methods of teaching and school organization and management, using classes from the preparatory department as a model school. No later information rom it has been received.

TEACHERS' INSTITUTES.

While there is no State provision for holding teachers' institutes, $1,200 from the Peabody fund enabled the State superintendent to hold 5 in different parts of the State, under the instruction of L. A. Rainwater, of Mississippi, and E. S. Willington, of Tennessee. They are said to have done much good for the cause of education.

EDUCATIONAL JOURNAL.

There being no educational serial published in the State in 1881–'82, the American Journal of Education, at St. Louis, Mo., continued to publish a Mississippi edition, edited by J. M. Barrow. Considering the main defects in the present school system to be a lack of normal schools and teachers' institutes, with defective local supervision, Mr. Barrow was to give these matters his earnest attention.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

There appears no change in the law of 1878, which recognized private academies and colleges having suitable school buildings, libraries of not less than 200 volumes, and a faculty of good standing as high schools qualified to prepare students for the university. For such students an allowance is made equal to the estimated cost of their education in the public schools.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academic schools, and preparatory departments of colleges, see Tables IV, VI, and IX of the appendix; for summaries of them, corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The *University of Mississippi*, Oxford, continued in 1881–'82 its 3 general departments of instruction: (1) the preparatory or university high school, covering 2 years instead of the former 3; (2) that of science, literature, and the arts (including the courses for B. A. and B. S., each of 4 years), an elective course for B. PH. embracing the studies of any 7 of the existing 10 departments, and 2 graduate courses; and (3) that of professional education, for which, see Scientific and Professional Instruction, p. 143. In the preparatory department were 92 students, under 3 instructors; in the college, a faculty of 10 resident professors and instructors, with 108 undergraduate and 2 graduate students. Instruc-

tion is given in political economy throughout the fourth year of all the undergraduate courses. The libraries of the university contained about 6,000 volumes; the entire property was valued at $400,000; productive funds of $544,000 gave an income of $32,640, and there was a State appropriation of $10,500.—(Catalogue and return.)

Mississippi College retained in 1881–'82 its feature of estimating scholarship only by attainments, and conferred degrees on the mastery of studies, not when a fixed course had been pursued. Only in the preparatory department, covering 6 years, is there any regular curriculum. In the college there are schools of mental and moral sciences, Greek, Latin, mathematics, natural science, English, and modern languages; there is also a commercial department. No student falling below 6½ in his general average for the whole course (the maximum being 8) is entitled to a degree, while anyone reaching as high as 7½ in his general average for any year is enrolled as "distinguished." With a library of 2,000 volumes, property was valued at $30,000, and there were $8,000 in productive funds.—(Catalogue and return.)

Rust University changed its name from "Shaw" June, 1882, the statistics for the year ending at this date. There were 5 in the faculty, 4 of them residents, with 278 students, 51 being in college studies, of whom 14 were females. The college is open to both sexes. There is an academic course of 8 years, 4 of them preparatory, with a collegiate course of 4 years, but nearly three-fourths of the students are in the preparatory academic course. The department of music receives increased attention from year to year.—(Catalogue and return.)

For statistics of these colleges, see Table IX of the appendix; for summaries of them, a corresponding table in the report of the Commissioner preceding.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Out of the 11 schools of this class on the list heretofore reported, 8 make returns for 1881–'82, the same number as in 1880–'81; all, as then, reported preparatory training, and several preceded this by elementary English studies; all showed advanced English courses, and most of them classical courses of 4 years; while some so arrange their studies that each branch is taught in separate schools, with no specified time of study for each class, that depending on the ability and industry of the student. All offer training in vocal and instrumental music, 7 in drawing, and 6 in French and German.

For statistics of these schools reporting, see Table VIII of the appendix; for a summary of the same, a corresponding table in the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The *Agricultural and Mechanical College of Mississippi*, Oktibbeha County, had a 4-year collegiate and 3-year agricultural course. Tuition is free to students from Mississippi, and none others have thus far been received. Work on the farm is required of all students during 10 or 12 hours a week.—(Catalogue and return.)

Alcorn Agricultural and Mechanical College, Rodney, is the State institution for the scientific instruction of young colored men. It reports 4 instructors for 1881–'82, with 105 students, in its preparatory course of 2 years, and 3 professors, with 143 students, in its scientific course of 4 years. It had a library of 150 volumes, property valued at $43,000, and a State appropriation of $11,000 for the year.—(Return.)

PROFESSIONAL.

Theological.—The Bishop Green Associate Mission and Training School, Dry Grove, (Protestant Episcopal), heretofore reported as giving preparatory training in theology, furnishes no information for 1881–'82. The Protestant Episcopal Almanac reports 4 candidates for orders.

In Rust University, Holly Spring (Methodist Episcopal), students, while pursuing a full college course, take also such theological studies as are prescribed by the general conference.

In the Natchez Seminary, Natchez (Baptist), where the same system seems to prevail, there were 30 students preparing for the ministry.

Legal.—Law was studied by 12 students in a 2-year course (heretofore reported as 1 year) in the University of Mississippi, under 1 professor and 5 lecturers.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The Institution for the Education of the Deaf and Dumb, Jackson, showed an advance in its material condition since 1880–'81. A department for colored mutes was opened October 1, with 15 pupils, in a separate building a mile from the city, the white and

colored boys working together on the farm. During the year the grounds in the city had been enlarged and a school building erected, providing ample rooms and a chapel; a new shop building, for instruction in printing, carpentry, and shoemaking, was nearly completed; and the publication of a paper was to begin in the following February. There had been, since opening, 148 pupils under instruction, of whom 80 were on the roll during the year, 20 being semi-mutes. There were 6 instructors, 2 of whom were deaf-mutes and 2 semi-mutes. A new teacher of articulation had entered upon her work with promise of great success. Its school property was valued at $60,000, $20,000 being expended in buildings and $10,000 for other purposes of the school during the year. There was a library of 300 volumes.—(American Annals of the Deaf and Dumb.)

EDUCATION OF THE BLIND.

The Mississippi Institution for the Instruction of the Blind, Jackson, reported for 1882 14 instructors and other employés, 3 employés and workmen being blind, with 35 pupils. For industries the pupils were taught broom making, chair seating, mattress making, and upholstery; in the school, the usual English branches taught in first class schools. There were 490 volumes in the library, among which are the quota from the provision made by the General Government to furnish books and apparatus suitable for the blind and a Bible in raised print, given by a former pupil of the institution, now deceased, Miss Helen Wilbourn. The State appropriation for the year was $10,000. The property of the institution was valued at $45,000.

EDUCATIONAL CONVENTION.

TEACHERS' ASSOCIATION OF THE STATE OF MISSISSIPPI.

An act of March, 1878, requires the holding of an annual convention of principals and presidents of high schools and colleges, styled as above. It is believed that the annual meeting of 1882 was held, but no record of it has come to hand.

OBITUARY RECORD.

PROFESSOR ROBERT F. KEDZIE.

Prof. Robert F. Kedzie, of the Mississippi Agricultural College, died February 24, 1882, aged 29 years. He was a son of Prof. R. C. Kedzie, of the Michigan Agricultural College, from which college the son graduated with honor in 1871. After spending two years on a farm he became his father's assistant in the laboratory. Remaining here until 1877, he temporarily filled the position of his brother, Will. K. Kedzie, in the Kansas Agricultural College, returning at the end of a year to his former work at Lansing. In the spring of 1879 Gen. Fitzhugh Lee, president of the Mississippi Agricultural College, offered him the position of professor of chemistry and agriculture in his college. He accepted the place and filled it with honor until his death, three years later.

CHIEF STATE SCHOOL OFFICER.

Hon. J. ARGYLE SMITH, *State superintendent of public instruction, Jackson.*

[Second term, January 3, 1882, to January 5, 1886.]

MISSOURI.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
White youth of school age (6-20)	679,023	706,850	27,827	
Colored youth of school age (6–20)	40,779	41,790	1,011	
Whole number of school age	719,802	748,640	28,838	
White youth in public schools	448,482	467,911	19,429	
Colored youth in public schools	*a*26,028	*b*24,838		
Total reported attendance in public schools.	474,510	*c*492,749	18,239	
SCHOOLS AND SCHOOL PROPERTY.				
Schools for white youth	8,166	8,321	155	
Schools for colored youth	519	501		18
Whole number of schools	8,685	8,822	137	
Buildings used for school purposes	8,209	8,537	328	
Sittings for pupils in these buildings	504,919	516,492	11,573	
Estimated value of school property	$8,611,014	$7,521,695		$1,089,319
TEACHERS AND THEIR PAY.				
Men teaching in public schools	5,943	6,028	85	
Women teaching in public schools	4,577	5,776	1,199	
Whole number of teachers	10,520	*d*11,826	1,306	
Average monthly pay of men		$44		
Average monthly pay of women		38		
INCOME AND EXPENDITURE.*e*				
Whole receipts for public schools	$4,020,860	$4,277,876	$257,016	
Expenditure for public schools	3,152,178	3,753,224	601,046	
SCHOOL FUND.				
Estimated amount of permanent school funds.		$9,476,697		

a Five counties not reporting.
b Thirty-two counties not reporting.
c Owing to incomplete reports from nearly all the counties, the figure here reported is much below the real number of attendants.
d Including 22 teachers whose sex is not reported.
e The income and expenditure are given as returned by the State superintendent, notwithstanding conflicting statements in the report. The receipts include unexpended balances from the preceding year and the expenditures are known to be incompletely reported.

(From reports and returns of Hon. R. D. Shannon, State superintendent of common schools, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

For the general supervision of the entire educational interests of the State there is a board of education, composed of the governor, secretary of state, and attorney general, with a superintendent of public schools, elected every 4 years, who is president of the board and ex officio member of the board of regents of each of the State normal schools.

For each county there is a school commissioner elected biennially, whose duties are to examine applicants for teachers' certificates and to report educational statistics, &c., to the State superintendent. In each school district a board of school directors of three members, elected for terms of 3 years, chooses a clerk, employs the teachers, visits the schools, takes care of the school property, &c.

OTHER FEATURES OF THE SYSTEM.

The public schools are free to all persons from 6 to 20 years of age in the State. In addition to local taxation and 25 per cent. of the entire State revenue (a portion of this latter being used for the State university), they enjoy the income from a school fund (partly held in counties and townships) consisting of the proceeds of all lands not otherwise appropriated, the net proceeds of the State tobacco warehouse, of the sale of all property that may accrue to the State by escheat, from sale of estrays, from unclaimed dividends or distributive shares of the estates of deceased persons, or from fines, penalties, or forfeitures, and all unspecified gifts, grants, or devises. Local district taxes are not to exceed 40 cents on the $100 for school purposes, except that by a majority vote of taxpayers 65 cents may be allowed in country districts and $1 in cities and towns to purchase a site and build and furnish a school-house; besides which, an additional tax may be levied if two-thirds of the qualified voters vote in favor thereof. Provision is made for union districts. Separate schools must be established in districts containing 16 or more colored children. Teachers must present certificates from the State superintendent or county commissioner where they intend to teach and make monthly reports of all required statistics and a summary report of the whole term at its close.

GENERAL CONDITION.

The statistics of 1882 show an increase of 19,429 in the total attendance of white youth and an apparent decrease of 1,190 in colored. There were also 155 more schools for white children and 18 fewer for colored. The statistics are far from complete, since many counties failed to report. Although more school buildings were reported, the estimated value of school property had decreased $1,089,319. The average salary of teachers was not given for 1881, but in 1880 the pay of men was $35 and of women $30, and the returns for 1882 show an advance in two years of $9 for men and $8 for women. The schools seem to be in a very prosperous condition, and the State superintendent claims for Missouri the largest permanent productive school fund of any State in the Union.

KINDERGÄRTEN.

The St. Louis city report gives 8,730 children, nearly all under 6 years of age, as enrolled in the public Kindergärten in 1881–'82, 4,805 receiving Kindergarten instruction only. For other statistics, see Table V of the appendix.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

Any city, town, or village may constitute a school district, and for the management of its educational interests elect a board of 6 directors for 3 years; a president, secretary, and treasurer of the board are chosen from among its members. Graded schools similar to those of other public school districts are to be established by this board.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Hannibal	11,074	3,855	2,069	1,398	30	$37,355
Kansas City	55,785	20,018	8,442	5,055	103	134,911
St. Joseph	32,431	10,837	4,332	2,947	67	61,426
St. Louis	350,518	106,372	56,350	37,600	1,036	806,155
Sedalia	9,561	3,664	2,492	1,549	26	17,148

ADDITIONAL PARTICULARS.

Hannibal reported 3,146 white children of school age and 709 colored. The average salary of men teachers was $88.88, and that of women $36.94. Schools were taught 172 of the 175 school days. Cases of suspension numbered 44 and of corporal punishment 229. The estimated value of all school property was $58,700.— (City report.)

Kansas City's public graded schools, occupying 13 buildings, report an increase of 416

in enrolment. There were 6,400 sittings for study and 103 teachers employed. The estimated value of all school property was $356,055.

St. Joseph reported 67 graded schools taught in 17 buildings, with 3,610 sittings for study, valued, with all other school property, at $174,225. Schools were taught 197 days by 67 teachers, including 3 special teachers in music, drawing, and penmanship. There was an increase of 985 in youth of school age, of 260 in enrolment, and of 94 in average daily attendance. The total receipts for school purposes were $70,068. The enrolment in private schools was 635.

St. Louis grades its schools from Kindergarten to high and supports a girls' normal school and 16 evening schools, these last having an enrolment of 3,300 pupils, under 52 teachers, the average attendance in them being 1,655. In the day schools 2 special teachers of music and drawing were employed. Private schools enrolled 21,000. The total receipts for public schools amounted to $935,289 and the estimated value of school property was $3,079,699. The salary of a teacher is regulated by position, not sex, and many ladies, as principals of first class schools, receive the maximum annual salary of $2,000. Although married teachers may be employed or reappointed, the marriage of a female teacher is considered equivalent to a resignation. Nearly nine-tenths of the teachers are ladies. Notwithstanding the extra cost of the public Kindergärten, the president of the school board considers them amply justified on considerations of public policy. There were no considerable changes in the enrolment and attendance of the various branches of the city schools, but public educational work, as a whole, was reported to be in a satisfactory condition. A revival is noted in the study of German, the number of pupils at present engaged in acquiring the language being 21,712, about two-thirds of them in the primary grades. The St. Louis Public School Library numbers 52,000 volumes of well selected books.

Sedalia reported 26 schools, classified as primary, grammar, and high, in 5 buildings, with 1,790 sittings, valued, with grounds, &c., at $84,000. Schools were in session 179 of the 180 school days, and had increased in enrolment 476 in the last year. There were 300 pupils in private schools.

TRAINING OF TEACHERS.

STATE NORMAL SCHOOLS.

Missouri maintains 6 normal schools: one connected with the State University, Columbia, one with the State College, Rolla, and 3 others for white students, at Kirksville, Warrensburg, and Cape Girardeau, called first, second, and third district normal schools. Lincoln Institute, the normal school at Jefferson City, is for the education of colored teachers.

The district normals are under the control of boards of regents of 7 members, appointed by the governor for 6 years, the State superintendent being ex officio a member of each board. The 4-year courses of study in the district normals are substantially the same. Teachers' certificates good for 2 years in the State are given at the end of 2 years, certificates for 3 years at the end of another year of study, and a State certificate and diploma with appropriate degree to those taking the full 4-year course. Kirksville (first district) reported 481 students, with 10 instructors; 9 students were graduated in the last scholastic year, 8 of whom were teaching. Warrensburg (second district) gives 11 instructors, with 395 students in the normal department and 68 in the school of practice. There were 30 graduated from the 2-year course, 5 from the 3-year, and 9 from the 4-year course, 28 of whom engaged in teaching. Cape Girardeau (third district) had a faculty of 8 members, with 225 students and a graduating class of 25.

The dean of the normal department of the State University at Columbia has the assistance of 14 other instructors in the university. To graduates from the full course a permanent State certificate is given, and to those from the lower course a certificate good for 3 years. This department is sustained from the general fund of the university.

OTHER NORMAL INSTRUCTION.

La Grange College, La Grange, reports a normal department, in which instruction is given by the college professors in the general science of education and in the theory and practice of teaching. There were 54 students in this department, with 5 graduates.

The *St. Louis Normal School*, maintained by the city for the training of young women to teach in the city public schools, had a 2-year course. The students for the year numbered 68, 33 of whom graduated and received certificates to teach in the city schools without further examination.

The *School of Mines and Metallurgy*, Rolla, has a teachers' course covering 2 years, each year under the charge of a special teacher, the instructor for the first year being a lady. Graduates from this course receive first class certificates good for 2 years.

Lincoln Institute reports a 5-year preparatory and a 4-year normal course. Boys are

admitted at the age of 16 years and girls at 14. For 1882 there were 47 students in the normal department and 101 in the preparatory, with 6 instructors. Graduates from the full course, 6. In addition to the accustomed annual aid of $10,000 the last general assembly appropriated $6,000 for the erection of a dormitory and purchasing apparatus.

Normal courses were also reported at Southwest Baptist College, Bolivar; Christian University, Canton; Grand River College, Edinburg; Lewis College, Glasgow; and Stewartsville College, Stewartsville.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOL.

Kansas City reported a high school from which 22 pupils were graduated in 1882. St. Joseph high school had an enrolment of 228 pupils, under 5 teachers. The high schools of St. Louis reported an enrolment of 660, with a full course of 4 years; particular attention is given to the study of German. Sedalia high school enrolled 97 pupils, under 2 teachers.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academic schools, preparatory schools, and preparatory departments of colleges, see Tables IV, VI, VII, and IX of the appendix following.

SUPERIOR INSTRUCTION.

UNIVERSITIES AND COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The *University of Missouri*, Columbia, reported for 1881–'82 a faculty of 31 members, with 591 students, 82 being at Rolla. The departments of instruction are 10 academic schools (5 in science and 5 in the languages) and 9 professional schools, that of mining and metallurgy being at Rolla.

Washington University, St. Louis, in its Smith's Academy, for young men, and Mary Institute, for young women, gives thorough preparatory training for the collegiate courses in arts, philosophy, and science. Graduates of the two college courses of study of 4 years each are given the degree of bachelor of arts or bachelor of philosophy. There is a useful course in mechanical industries, combining English studies with shop work. Opportunity is also given for training in art at the St. Louis School of Fine Arts, connected with the university; also, free evening instruction at the polytechnic buildings as a preparation for industrial pursuits.

Among the other colleges nominally of this class the *Southwest Baptist College*, Bolivar, chartered in 1879, is reported to the Bureau for the first time, with a faculty of 8 members and 40 students, with 154 in the preparatory department. In addition to the 4-year scientific and classical courses, a commercial course is given, including instruction in drawing and shorthand.

La Grange, La Grange, and William Jewell College, Liberty (Baptist); Christian University, Canton (Christian); Central College, Fayette; Lewis College, Glasgow, and Central Wesleyan College, Warrenton (Methodist Episcopal); Drury College, Springfield (Congregational); Pritchett School Institute, Glasgow; Stewartsville College, Stewartsville (non-sectarian), and St. Louis University (Roman Catholic) all reported 4-year classical and scientific courses. St. Vincent's College, Cape Girardeau (Roman Catholic), with a collegiate department covering 5 years, presents a 2-year course in theology. Grand River College, Edinburg (Baptist), offers a 4-year classical course and a scientific course covering 3 years, leading to the degree of B. S. St. Joseph College, St. Joseph, and the College of the Christian Brothers (Roman Catholic), afford no certain indication of the standards maintained. Lincoln College, Greenwood (Methodist Episcopal), failed to report for 1882.

All of the above colleges reporting gave preparatory training of from 1 to 2 years. Christian and St. Louis Universities and Stewartsville College gave commercial courses. St. Louis University and Pritchett School Institute each provided a graduate course. Music, drawing, and painting were taught in several of the colleges above mentioned.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

All the above except Central, William Jewell, and the Roman Catholic colleges admit women as well as men.

For statistics of colleges for women only, see Table VIII of the appendix; for those of colleges for young men or for both sexes, Table IX of the same; for summaries of the statistics of both classes of institutions, see corresponding tables in the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The *Missouri Agricultural and Mechanical College*, at the University of Missouri, offers a 2-year scientific course. The first year is essentially horticultural and the student who completes it is entitled to the certificate in horticulture. The second year is agricultural, and its studies, with those of the first year and those required for entering the senior year, make the full agricultural course, graduates from which are entitled to the corresponding degree. To enter the junior class the student must pass a satisfactory examination in arithmetic, English grammar, and geography.

The *Missouri School of Mines and Metallurgy*, Rolla, had a preparatory department and three courses of 3 years each, leading to the degrees of bachelor of philosophy, mining engineer, and civil engineer. There is also a teachers' course; a girls' course in arts; and an optional course, including book-keeping, drawing and painting, and the languages.

The *O'Fallon Polytechnic Institute*, at Washington University, offers 5 courses, each covering 4 years, in civil engineering, mechanical engineering, chemistry, mining and metallurgy, and building and architecture. The studies are the same for all during the first two years, but in the junior and senior years they lead to their appropriate degrees.

The *Manual Training School of Washington University* had for its object instruction and practice in the use of tools, combined with the English branches of study, including drawing, the students dividing their working hours equally between mental and manual exercises.

PROFESSIONAL.

Theology.—Instruction is given in theology in a slight degree at Christian University, and more fully at Central, Central Wesleyan, La Grange, Lewis, and St. Vincent's Colleges. Concordia College, St. Louis (Evangelical Lutheran), has a regular 3-year course in theology. The Jeremiah Vardeman School of Theology in William Jewell College reports a full 2-year theological course; for those who desire, the course is so arranged as to be pursued in connection with a literary course which covers 5 years. Thorough instruction is said to be given in New Testament Greek.

Law.—Legal instruction is offered at the Missouri University in a 2-year course, from which 20 students were graduated and received the degree of bachelor of law in 1882. Students were also permitted to take an elective course. St. Louis Law School in Washington University also gives a 2-year course of legal instruction, leading to the degree of LL. B. A weekly moot court is held regularly throughout the year by the dean, conducted as nearly as possible with the forms of an ordinary court of justice. Graduates from both of these law schools are admitted to practice in the courts of Missouri without further examination.

Medical instruction was given in 1882 in 8 "regular" schools. The medical department of the University of Missouri required a preliminary examination in the English branches, with attendance subsequently on a 2-year graded course of 9 months each year, no student being allowed to attend both courses the same year. Kansas City Medical College and St. Joseph Hospital Medical College, St. Joseph, each had 3 years of study and 2 courses of lectures of 20 weeks each. Missouri Medical College, St. Louis, in addition to 2 courses of 20 weeks each for graduation, provided a graduate course for physicians desiring to perfect themselves in medical and surgical specialties. St. Louis Medical College had a 3-year graded course of study, of 21 weeks each, with regular lecture courses and final examination for the degree of M. D.

Joplin College of Physicians and Surgeons, at Joplin, organized in 1880, required a preliminary examination in English, with 3 years of study and 2 courses of lectures of 19 weeks. Regular attendance at dissection and clinics is required, and a satisfactory examination in all branches taught in the college entitles the graduate to practise. In 1881–'82 the faculty numbered 6 professors, 5 lecturers, and 1 demonstrator, with 45 students and a graduating class of 34.

The medical department of the University of Kansas City, organized in 1881, for 1882 had 3 years of study and 2 full lecture courses of 26 weeks each year, with clinical instruction and practical anatomy. Candidates for degrees must undergo a full and satisfactory examination in each branch taught. There is a spring course for graduate students and others. The college faculty numbered 25 members, including a demonstrator of anatomy, with 25 students and 10 graduates.

Kansas City College Hospital of Medicine, organized in 1882, with a faculty of 11 professors, 2 lecturers, and 1 demonstrator, provided 2 courses of lectures of 20 weeks' duration annually. A satisfactory examination was required at the end of the course on all branches taught in the college.

In all the "regular" medical colleges of the State 628 matriculates and 250 graduates were reported for 1881–'82; in the eclectic, 118 matriculates and 40 graduates.

The College of Medical Practitioners, St. Louis, organized in 1882 to afford medical practitioners, graduates, and others an opportunity for reviewing medical studies and receiving additional practical instruction, holds 3 sessions of 5 weeks each annually and gives a diploma of associate membership to graduates of recognized and reputable medical schools who have attended a full course of lectures and the clinics of all the departments in the college, passed a satisfactory examination, and furnished satisfactory specimens of physiological or pathological work done by them.

The American Medical College of St. Louis was the only recognized eclectic school in 1882. The faculty embraced 10 professors and 1 adjunct professor, the students numbering 118, with a graduating class of 40. A good elementary English education is required for admission, and for graduation 3 years of study, 2 courses of lectures of 20 weeks each, and a satisfactory examination at the close.

The Homeopathic Medical College of Missouri, for men only, was reorganized in 1882, taking the place of the St. Louis College of Homeopathic Physicians and Surgeons and the Hering Medical College. Credentials of suitable literary and scientific qualifications were required for admission, and for graduation 3 years of study and 2 full courses of lectures, of 19 weeks each, with a final and satisfactory examination.

Dentistry was taught at the Missouri Dental College, St. Louis. A preliminary examination in the English branches is required of all students who intend to take the full course. Although a 3-year graded course was announced for 1880–'81, two full courses of lectures only were still offered, with clinical instruction by the demonstrator. Like instruction was given at the Kansas City Dental College in operative and mechanical dentistry, covering 2 full courses of lectures, with a final examination for graduates. The Western College of Dental Surgery, St. Louis, in 1882 was suspended for the year.

The *St. Louis College of Pharmacy* in 1881–'82 required for a degree 2 years of instruction, 2 courses of lectures of 20 weeks each, and a final examination. Candidates for graduation were also obliged to give satisfactory evidence of having served 4 years in the drug business.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The Missouri Institution for the Education of the Deaf and Dumb, Fulton, for 1882 reported 12 instructors and 232 students, 94 being females. Instruction was given in articulation and the ordinary English branches, and the average time spent in the institution was 6 years. The employments taught were cabinet making, shoemaking, printing, and gardening. The grounds (100 acres) belonging to the institution, together with the buildings, are valued at $135,500. The State appropriated in 1882 $45,000 for the support of the institution.

EDUCATION OF THE BLIND.

The *Missouri School for the Blind*, St. Louis, reported for 1881–'82 an enrolment of 90 pupils who were receiving instruction in music and literature. The girls are instructed in machine knitting, sewing and fancy work, and all other work pertaining to the domestic department, and the boys in broom and brush making and in cane seating chairs. The State appropriated $52,000 for maintenance and salaries and $5,000 for repairs and refurnishing.

The *St. Louis School for Deaf-Mutes*, under the control of the board of directors of the public schools, had 50 pupils, of whom 21 were girls. The studies are in 5 classes, all in the English branches.

INDUSTRIAL TRAINING.

The Manual Training School of Washington University, St. Louis, had for 1882 a faculty of 10 members and 101 students. The course of study covers 3 years, and the students divide their working hours about equally between manual and mental exercises. The mental instruction included the English branches of high school study, and the manual a course of instruction in freehand, mechanical, and technical drawing, workshop training, and the study and management of steam. Before receiving a diploma each student has to construct a machine, which, with the drawings used, must remain in the school.

HOMES FOR ORPHAN OR DEPENDENT CHILDREN.

The St. Louis Protestant Orphan Asylum, Webster Groves, founded in 1835, in 1882 instructed 67 children and supported 155. The 3 Roman Catholic schools of St. Louis (St. Mary's Asylum, St. Bridget's Half Orphan Asylum for Girls, and St. Joseph's Asylum, for boys) had a total of 381 children. The boys over 9 years of age were taught farming and trades.

EDUCATIONAL CONVENTION.

STATE ASSOCIATION.

The Missouri State Teachers' Association held its meeting for 1882 at Brownsville, June 20–22, E. R. Booth presiding. The attendance was good, prominent educators from all parts of the State being present. During the first day two able addresses were delivered on the subject of "Relation of public instruction to citizenship;" the other subjects for the day were "Teachers as nonconductors" and "Natural sciences in public schools." The exercises of the second day began with a paper setting forth the educational demands of the age, followed by an interesting paper by H. M. Hamil, entitled "A comparison of Missouri with other States educationally." The statistics furnished by him were not very flattering to Missouri and an animated discussion followed, after which the following subjects were discussed: The necessity for public education, county supervision, text books, teachers' examinations, normal institutes, and schools. The subjects under consideration for the last day were "Music in our schools," "Wealth the product of intelligence and nature," "Instinct and reason," "Literature in the public schools," and "The teacher's profession." After the election of officers for the ensuing year an address was delivered by Mr. H. M. Hamil, the newly elected president, after which the association adjourned.

CHIEF STATE SCHOOL OFFICER.

Hon. RICHARD D. SHANNON, *State superintendent of public schools, Jefferson City.*

[Second term January 13, 1879, to January 8, 1883.]

Hon. W. E. Coleman was elected in 1882 to succeed Mr. Shannon.

NEBRASKA.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth of school age (5–21)	152,824	165,511	12,687

a Estimated, but believed to be more correct than figures heretofore given.

(Report and returns of State Superintendent W. W. W. Jones, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

A State superintendent of public instruction, elected by the people for 2 years, has general charge of the public schools, while a board of regents of the State University and a normal school board have control of the interests indicated by their titles. There is also a board composed of various State officers for the management of school lands and funds.

Local school officers are county superintendents of public schools, elected by the people for 2 years, and district boards of 3 trustees, elected for 3 years. Districts having more than 150 youth of school age may, if a majority of voters so decide, elect boards of 6 trustees. Women 21 years old who are residents of the district and owners of property or having children to educate may vote in district meetings.

OTHER FEATURES OF THE SYSTEM.

The public schools are free to all residents 5 to 21 years of age, and they must be taught at least 9 months of each year in districts having more than 200 pupils, 6 months in those having 75 to 200, and 3 months in those with less than 75. The funds for their support are derived from the income of a State common school fund, consisting of money, stocks, bonds, &c.; of such percentage as may be granted by Congress on the sale of lands in the State; of moneys arising from the sale or leasing of school lands; of the proceeds of all lands granted to the State, unless for other purpose distinctly stated; and of the proceeds of escheats and forfeitures. In addition to the income of this fund there is for public schools a State school tax of not more than 1½ mills on the dollar of taxable property, and taxes are voted by districts, which may not exceed 25 mills on the dollar. The income of the public schools is also augmented by various fines, licenses, &c. The State funds are apportioned by the State superintendent to the counties in proportion to school population, and by county superintendents to districts, three-fourths of the amount in proportion to the school population therein, the remaining one-fourth equally to the districts. Teachers must hold certificates of qualification and before receiving full pay must make monthly reports to the district director. The director reports annually to the county superintendent, the latter to the State superintendent, and he to the governor. The system of education includes public high schools, teachers' institutes, a State normal school, a State university, and a reformatory for children. Instruction in all schools supported or aided by public funds must be non-sectarian.

GENERAL CONDITION.

The statistics show 12,687 more youth of school age than during the previous year and 14,770 more enrolled in public schools, with a small increase in average daily attendance; 130 more school districts; 17 more with graded schools and 221 more with schools taught at least 6 months, the average term for the State being one day longer. Not so many houses were built as during the previous year, but the estimated value of school property increased by $180,415. More teachers were employed and the average monthly pay of men was $1 more, that of women $3.16 less. The increase in public school income and expenditure kept pace with that of the school population, the amount apportioned for each census child being about the same as during the previous year. A noticeable feature in the statistics is the large increase in the number of districts having more than 6 months' school. Very few of the districts failing to sustain schools ascribe their failure to opposition on the part of the people. Some of them are too small and weak to maintain and still do not wish to give up their organization; others are willing to be annexed to neighboring districts, but are prevented by neighborhood quarrels. Whatever the causes may be, however, the number of districts without schools is growing smaller. Although 269 new districts were organized during the last two years, there were 50 fewer in 1881–'82 than in 1879–'80 that did not maintain schools. The average length of term, too, is gradually increasing, being 2 days longer in 1881–'82 than in 1879–'80.

Over 400 school-houses have been built during the two years, many of them without much regard to health, beauty, or comfort. The department has frequently been asked to furnish plans for school-houses, but has been unable to do so, and a small appropriation is asked for to pay for the publication and distribution of such plans. The question of school furniture has received more attention than formerly.

The compensation of county superintendents was slowly increasing, but a majority were still very poorly paid, and as a consequence much inferior work was done. By the present law the compensation of superintendents is placed in the hands of county commissioners, the minimum sum being $3 a day. The State superintendent recommends an amendment allowing a fixed salary, the amount of which shall be based on the number of pupils in the county.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

These are boards of education comprising, according to the law, at least 6 members in cities of 2,000 or more population, and city superintendents elected by the boards.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Lincoln	13,003	.....	2,700	.....	31	.....
Omaha	30,518	*a*8,110	*a*4,118	*a*2,906	*a*83	*a*$131,173

a Owing to imperfect records these figures are only approximately correct.

ADDITIONAL PARTICULARS.

The *Lincoln* public schools increase in enrolment at the rate of about 300 a year. An excellent school building with four rooms was erected during the year, similar to one built in 1881, the two costing about $20,000. A new course of study has been adopted, differing somewhat from the former one and embracing 4 classes below the high school department. All pupils take the same studies till they reach the last two years of the course, when a choice is offered them between 4 courses, including scientific and classical courses, which prepare for college.

The school board of *Omaha* reports a rapid growth in the public schools since 1880. The number of sittings increased from 2,800 to 3,500, but this enlargement scarcely kept pace with the rapidly increasing enrolment. Other buildings, however, nearly completed at date of the report, were expected to afford ample accommodations for all. Ten beautiful, convenient, and durable school-houses, containing 74 rooms, were owned by the board. The revenue of the schools is ample, and under the present laws must continue to be more than enough. The amount derived from fines and licenses alone is sufficient to meet all ordinary expenses of the schools, and the rate of taxation is consequently very low. The course of study, which covers a period of 12 years, including the high school, was modern and progressive, and aimed to combine a practical education with the best possible culture. An evening school was taught during the winter, two teachers being employed. A special teacher of elocution devoted four hours a week to this branch in the five higher grades.

TRAINING OF TEACHERS.

STATE PROVISION FOR NORMAL INSTRUCTION.

The *State Normal School*, Peru, at one time prepared students for college and business as well as teaching, but it is now exclusively engaged in the preparation of teachers. There are two complete courses of study, an elementary of 2 years and a higher of 5. All the branches are pursued from a professional standpoint. Students in the elementary course are given a year's drill in school economy, methods and practice of teaching, under a skilled professional teacher; those who complete the higher course devote a year to the study of psychology, the science of education, and the art of teaching, all of which is reduced to practice in the school room. The year 1882 was the most prosperous one in the history of the institution. There were 318 students preparing to teach, representing 37 counties of Nebraska and 6 other States; 45 were graduated, of whom 10 were from the higher course.

The *Chair of Didactics of the State University*, organized in 1881, presents opportunity for electives in the junior and senior years, embracing the history of education, State and national systems, and school organization, management, and supervision. There were 21 students during the year, under a former State superintendent of instruction.

OTHER NORMAL TRAINING.

The Santee Normal Training School, Santee agency, established by the American Board of Commissioners for Foreign Missions for the purpose of training preachers, teachers, interpreters, and business men and educating the women of the Dakota Nation, furnishes facilities for thorough instruction in the English language and science; physical training and industrial education are also being made prominent. Normal students in the last half of 1882 numbered 4.

Training similar in character was given also at St. Paul's Boarding School for Boys, Yankton Reserve, with 36 pupils, under 5 teachers; at St. Mary's Boarding School for Girls, Santee Reserve, with 35 pupils, under 4 teachers; at St. John's Boarding School for Girls, Cheyenne River Reserve, with 34 pupils, under 3 teachers; and at Hope School for Boys and Girls, Springfield, with 24 pupils, under 2 teachers. All these schools for Indian youth were under the supervision of the Protestant Episcopal bishop of Niobrara. How many of the pupils may be reckoned normal does not appear, but all are trained in school studies and as far as may be in useful industries with a view to elevating and civilizing their people.

Professional instruction for teachers is also given at Doane College and Nebraska Wesleyan University; at Nebraska Conference Seminary, York; in Hastings College, Hastings (organized in 1882 with preparatory and normal departments); and in the Blake School, Beatrice, a select preparatory and normal opened in 1881. Doane College presents a course of 4 years designed to prepare students to be principals of common and high schools and school superintendents, special attention being given to the best methods of acquiring and imparting knowledge, to school organization and discipline, and to State laws concerning education. Nebraska Wesleyan University has a teachers' course of 2 years, which includes all the branches required for a first grade certificate.

TEACHERS' INSTITUTES.

Two kinds of institutes for teachers are provided for by law, one to be organized by the State superintendent and another by county superintendents. County institutes have been more successful and useful than the others, which have been generally attended only by the teachers of the counties in which they were held. For this reason none except county institutes were held during 1882, and the result was, as anticipated, a larger number of institutes and in many cases a larger attendance. The work, however, was hampered by a scarcity of good conductors and of funds. The State superintendent visited 31 counties, delivering lectures and talks to teachers, travelling about 8,000 miles, and endeavoring to awaken popular interest and cause an increased appreciation of the benefits to be derived from good schools. Fifty institutes were held, with an enrolment of 2,251, an increase during the year of 9 institutes and 395 attending.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

Statistics of graded schools for 1882 were incomplete, only 28 districts reporting, whereas 42 sent reports the previous year. These statistics show as many as 19 public high schools, with 991 pupils; the enrolment for 1881 was 1,458, 8 more schools reporting. The high school at Omaha, now having about 140 pupils, has grown rapidly during the last few years. That at Lincoln offers 4 different courses of study and fits for college. Courses of 4 years are also provided at Beatrice, Nebraska City, and Red Cloud, and of 3 years at Hastings, Grand Island, and Plattsmouth.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academic schools, preparatory schools, and preparatory departments of colleges, see Tables IV, VI, VII, and IX of the appendix, and corresponding summaries in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The University of Nebraska, Lincoln, has thus far established two of the five colleges contemplated in its organization, viz: a college of literature, science, and the arts, and an industrial college, the latter embracing agriculture, practical science, civil engineering, and the mechanic arts. In the college of literature, science, and the arts are offered classical, literary, and scientific courses of study leading to the degree of bachelor of arts, of science, and of literature. During the first two college years the studies are prescribed, while those of the junior and senior years are largely elective. Drawing, painting, music, modern languages, and didactics form a part of the course.

The other colleges are Doane College, Crete; Nebraska College, Nebraska City; Creighton College, Omaha, and Nebraska Wesleyan University, Fullerton. Late catalogues received from three of these showed classical courses, which covered four years in all, except Creighton College (Roman Catholic), which presents a classical course of six years and a commercial course of four years, besides a preparatory course of two years. Nebraska College sends no late catalogue, but when last heard from its curriculum comprised classical, scientific, literary, and theological studies. Doane College provides also scientific, literary, and normal courses, and includes instruction in music, painting, and drawing. Nebraska Wesleyan University, besides its classical course, offers a scientific one of three years, a Latin-scientific of four, normal, commercial, and musical courses, instruction in painting, drawing, and wax work, and a non-resident course. The latter is intended to meet a want of professional men and women in the West who desire to complete a collegiate course or of those who have done so in fact but not in form. Both sexes are admitted to this as well as to the State University and to Doane College.

Gifts amounting to over $16,000 were received during the year by Doane College and Nebraska Wesleyan University: $7,131 to the former, of which $6,000 was from Thomas Doane, of Charlestown, Mass., for endowment; and $9,000 to the Wesleyan University, from subscription of citizens, to be used for building and endowment.

For statistics of these colleges, see Table IX of the appendix, and for a summary, see the report of the Commissioner preceding.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Brownell Hall, Omaha, a Protestant Episcopal institution, and the only one of collegiate rank that is exclusively for girls in the State, had 33 students in its collegiate department in 1881; it sends no statistics for 1882.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The chief provision for scientific study is found in the Industrial College of the State University, in which agriculture, horticulture, civil engineering, and related subjects are the leading studies. The courses are each six years in length, including 2 of preparatory work. Students in engineering follow a course very nearly coincident during the first two years with the general scientific, while the junior and senior years are largely given to special studies in engineering and the higher mathematics. In the agricultural course prominence is given to the sciences in proportion to the directness of their relation to farming. Two or more agricultural or horticultural studies are pursued during each year. The course in horticulture is intended to give familiarity with plant and tree culture. Students in the agricultural course may be required to labor 2 hours a day for 5 days in the week and are paid from 10 to 15 cents an hour. The farm contains 320 acres, with orchards, vineyards, stock, and other illustrative material.

General courses in science are, as already noted, provided by the State University, Doane College, and Nebraska Wesleyan University, the last also offering a Latin scientific course.

PROFESSIONAL.

Opportunities for *theological* instruction are found in the Nebraska Divinity School, Nebraska City (Protestant Episcopal), which reported 3 students in 1882, and in the Nebraska Baptist Seminary, which was first opened for students in November, 1880. The latter reported in 1882 property worth $16,000, an endowment of $7,000, a good nucleus for a library, 6 teachers, and 111 students.

No schools of *law* report; but lectures in constitutional law formed a part of the course of study at the Nebraska Conference Seminary, York. The University of Nebraska provided similar instruction.

Medical studies are pursued at Omaha Medical College, Omaha, first opened in the fall of 1880, which reports 9 professors and 30 students during the year 1881–'82, of whom 8 were graduated. The 3-year graded course of study is strongly recommended, but diplomas are granted to deserving students who have spent 3 years in study, including 2 full courses of lectures, the last of them in this institution. Chemical laboratory work and a knowledge of medical botany are required. Candidates for admission must have a fair English education. Women are admitted on the same terms as men.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The Nebraska Institute for the Deaf and Dumb, Omaha, gives free instruction to deaf-mute residents of the State 7 to 25 years of age who are of sound mind and free from contagious disease; also, to persons younger or older, at the discretion of the authorities. The aim is to give a good common school education, and especially a good command of the English language. The manual alphabet, the sign language, and articulation by means of Bell's system of visible speech are all used. Some of the children were doing well in speech. During the year an oral class was taught for the purpose of cultivating hearing in those who retained the capacity to any extent, and of teaching speech by means of it, with the audiphone as an aid. Their progress was marked, and the class will be continued. Printing, carpentry, needlework, and cookery are taught, and drawing and painting have been introduced to a limited extent. During the two years ending November 30, 1882, there were 120 pupils in the institute, and 94 at date of the report.

EDUCATION OF THE BLIND.

The Nebraska Institution for the Blind, Nebraska City, reports steady and satisfactory growth during 1881 and 1882. The average attendance increased from 21 to 25, and the efficiency of the different departments of the school was materially advanced. Reading, spelling, arithmetic, grammar, analysis, composition, rhetoric, history, physiology, algebra, and geometry were taught, and the pupils, with scarcely an exception, received instruction in vocal or instrumental music or both. Two pianos and two organs were in constant use, two choirs met daily for vocal instruction, and considerable musical talent was being developed by the training given. The industrial department, which for several years has been self sustaining, received a fresh impetus in the last year. The brooms made here bring the highest market price and the cane-seating repairing of the city is done here. The girls have given special attention to various kinds of knitting and crocheting.

STATE REFORM SCHOOL.

A State Reform School was organized in 1881 at Kearney, the legislature having the previous year appropriated $10,000 for the purpose; but no report of its work has been received beyond the fact that the school was in successful operation.

CHIEF STATE SCHOOL OFFICER.

Hon. W. W. W. JONES, *State superintendent of public instruction, Lincoln.*

[First term, January 4, 1881, to January 4, 1883.]

Mr. Jones was reëlected in 1882.

NEVADA.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.

(From biennial report for 1881 and 1882 of Hon. D. R. Sessions, State superintendent of public instruction.)

STATE SCHOOL SYSTEM.

OFFICERS.

For the management of funds and for perfecting school organization there is a State board of education, consisting of the governor, State surveyor general, and State superintendent of public instruction, the last acting as secretary of the board and exercising general supervision over the school system. For each county there is a superintendent of public schools, with a board of examiners; for each district a board of trustees of 3 to 5 members, according to population.—(Laws of 1879.)

OTHER FEATURES OF THE SYSTEM.

The law provides for free schools for all youth 6–18. Schools are to be divided into Kindergärten, primary, grammar, and high schools in those districts in which the trust-

ees shall deem such grading advisable. The law requires all qualified children between 8 and 14 to attend a public school at least 16 weeks in each school year, 8 of which shall be consecutive, unless otherwise taught.

The schools are supported by the income from the State school fund and a tax of half a mill on the dollar, used only for the payment of teachers; an annual county tax of 15 to 50 cents on $100, to be used at the discretion of local officers for the purchase of sites and furnishing of school buildings and libraries, for paying teachers, or for contingent expenses; when necessary, a district tax sufficient to raise an amount which, with the appropriation for such district, will provide school 6 months. A special tax may also be levied by an affirmative vote of the district for extending the school term or furnishing additional school facilities. The trustees of any district may levy rate bills of tuition for the payment of teachers in a school prolonged beyond the 6 months in which it is free to all. Twenty-five per cent. of the State and county funds are apportioned among the districts in proportion to the number of teachers assigned to each on the basis of 100 census children or fraction thereof to a teacher; the remainder, to the several districts in the county in proportion to the number of children of school age.

To be entitled to any part of the public school moneys, schools must be non-sectarian and must have been taught at least 3 months in the year by teachers duly examined, approved, and employed by legal authority; they must also have used the text books ordered by the State board of education. Teachers, to receive their pay, must have been legally employed, must hold in full force and effect a certificate from the State or county board of examiners, and must have made full reports as required by law. No discrimination in the salaries of teachers is allowed on account of sex.

GENERAL CONDITION.

A comparison with the previous year shows that, while there were more districts, more public schools (both graded and ungraded) and more without rate bills, an increased school term, more teachers at better pay, higher receipts and expenditures, and a larger State school fund, there was nevertheless a considerable falling off in the value of school property and a slight decrease in school population, enrolment, and average attendance.

The State superintendent, in his report for 1881 and 1882, states that, while in some schools there was an advanced and healthy educational condition, in many others he found it quite otherwise; that his efforts to secure the new legislation needed to remedy existing defects in the school system were unavailing; that the State superintendent is really invested with no authority, no one being amenable to him, the most conspicuous duty required of him being to visit schools; and that the State board of education has really little to do with the public schools except to take charge of the public school moneys. While thus pointing out the defects of the school law, the superintendent is nevertheless struck with the attachment the people of the State have shown for the schools in the face of adverse circumstances, and with an improved school law he is hopeful of the future.

The Pacific School Journal of December, 1882, says that Nevada treats her teachers with great liberality, paying the highest salaries of any State in the Union;[1] moreover by paying men and women alike for equal services the State secures some of the ablest teachers on the Pacific coast. The Carson City schools, it is said, were not inferior to the best in California; a model school at Gold Hill was an honor to the city and to the teachers who had made it what it was.

KINDERGARTEN.

Although the law provides for Kindergärten in connection with the public schools, there seems to have been but one established. A Kindergarten department at Carson City was reported in 1881, but for 1882 there is no information from this, nor are any others known to exist in the State.

CITY SCHOOL SYSTEM OF VIRGINIA CITY.

OFFICERS.

Each village, town, or corporate city forms one district, the schools of which are under the control of a board of trustees, which in cities of 1,500 or more registered voters must consist of 5 members, and of 3 in smaller towns.

STATISTICS.

Virginia City, with a population of 10,917, had in 1882 a school population of 2,207, an enrolment of 1,854, an average daily attendance of 1,201, with 27 teachers, and an expenditure of $34,203. The schools were taught 204 days, in 4 buildings, 1 for the

[1] It would seem, however, from a remark in the State report that some payments for educational work are made in scrip worth only 40 cents on the dollar.

primary grade, with 17 rooms; 2 for grammar, with 10 rooms, and 1 for the high school, with 3 rooms, the entire school property being valued at $35,575. There was an estimated enrolment of 342 in private and parochial schools. Compared with 1880 there was a decrease of 352 in school population, of 406 in enrolment, of 75 in average daily attendance, of 5 in teachers, and a shrinkage of $35,925 in the value of school property. Nevertheless, the figures for 1882 indicate a satisfactory state of things as to attendance, the enrolment in the public schools being 84 per cent. of school population, and assuming the children in private and parochial schools to be of school age it would appear that 99.5 per cent. of such youth were in school.—(Return.)

TRAINING OF TEACHERS.

TEACHERS' INSTITUTES.

No normal schools are reported. According to the law under which the State superintendent, with the consent of the State board of education, annually convenes a State teachers' institute, a meeting was held at Reno, October 27–31, 1882. Seven counties were represented by the leading teachers of the State, Superintendent Bowen, of Washoe County, in the chair. Papers were read by Superintendent Bowen, Miss Ella McNeely, Rev. Geo. W. James, Superintendent C. S. Young, Mrs. H. M. Schofield, and others.—(Pacific School Journal, December, 1882.)

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Bishop Whitaker's School for Girls, Reno (Protestant Episcopal), reported for 1882 8 professors and instructors, 70 students (26 being in the preparatory, 34 in the collegiate department, and 10 in special and partial courses), a 4-year full course of studies, a scholastic year of 40 weeks, and a library of 280 volumes.—(Return.)

SPECIAL INSTRUCTION.

SCHOOLS FOR THE DEAF AND DUMB AND THE BLIND.

The State provides for the instruction of its deaf-mutes and blind youth at the school at Berkeley, Cal. The State superintendent reported but one deaf-mute remaining from Nevada in 1882. He reports but 7 deaf-mutes and 5 blind of all ages in the State, and speaks of the school at Berkeley as an excellent one, where the pupils, brought up to fill places of usefulness and respectability, are so educated as to suffer the least possible embarrassment from their affliction.—(State report.)

There is no indication of any provision for the feeble-minded. The need of a reformatory school is referred to in the State report.

TRAINING OF ORPHANS.

The State Orphans' Home, Carson City, in its biennial report shows an enrolment of 71 inmates in 1881 and of 57 in 1882. During these 2 years 40 had been discharged, 8 indentured, and 1 had run away. Since its foundation (in 1864) 297 had been sent to the home, 204 discharged, 46 indentured, and 4 had died, leaving 48 remaining December 31, 1882. Instruction is given in the elementary English branches and in vocal music, with evening sessions devoted to moral and religious instruction. The children participate in all the festivals and national holidays and have a picnic each summer, all the expenses, including Christmas presents, being provided for by the children's gift fund. There was a library of 760 volumes, and for the 2 years a State appropriation of $32,500.—(Biennial report, 1881 and 1882.)

CHIEF STATE SCHOOL OFFICER.

Hon. CHARLES S. YOUNG, *State superintendent of public instruction, Carson City.*

[Elected in November, 1882: term, January, 1883, to January, 1887.]

NEW HAMPSHIRE.

SUMMARY OF SCHOOL STATISTICS.

Total expenditure for public schools	577,022	578,702	1,680	----------

(From reports of Hon. James W. Patterson, State superintendent of public instruction, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

For the State, a superintendent of public instruction, a board of commissioners of the literary fund, and a board of trustees for the State Normal School; for towns, school committees, and a superintendent of schools in any town which may so elect; for districts, a moderator, a clerk, and a prudential committee. Districts comprising the whole town must and other districts may elect a board of education. Women vote in school meetings and are eligible to all school offices.—(Laws, 1878, 1879, 1881.)

OTHER FEATURES OF THE SYSTEM.

The public schools are sustained mainly from a town tax on polls and ratable estate of $350 for every dollar in the $1,000 of State tax which such towns are required to raise for general purposes; they may raise a larger sum than this, to be assessed in the same way. A literary fund, arising from a tax on the capital stock of banking corporations and from a tax on savings bank deposits, slightly increases a small permanent school fund derived from the proceeds of the sales of public lands, and the proceeds of sales of State lands augment the school fund, though not largely.

The public schools are free to all resident children of school age; and all 8 to 14 are required by law to attend a public or private school or receive instruction at home at least

12 weeks in every year, 6 of which, in the case of a public school pupil, must be consecutive. No child under 16 years of age may be employed in any manufacturing establishment unless he has attended school 12 weeks of the preceding year; none under 14 unless he has attended 6 months or the full term of the school taught in his district the preceding year; none under 12 who has not attended during the whole term; none under 16, unless in vacation, who cannot read and write; and none under 10 may be so employed at all.

The owner or agent of a manufactory employing a child under 16 years of age and uncertified by the school committee as eligible to be employed becomes liable to a fine not exceeding $20 for each offence. Parents or others having the control of children 8 to 14 violating the law are to forfeit $10 for the first and $20 for every subsequent offence. Towns may make by-laws concerning habitual truants and children 6 to 16 years of age not attending school, and require their attendance under a penalty of $10 for each offence or a sentence of 1 year in the State Reform School, and such towns may appoint 3 or more officers to enforce these laws. Teachers to be employed and entitled to receive their pay must present to the prudential committee a certificate of qualification from the school committee of the town in which the school is to be taught, nor is any teacher to receive payment for services unless a certificate of the school committee of the town that the required register of the school has been duly returned is delivered to the prudential committee.—(School law.)

GENERAL CONDITION.

The statistics for 1882 show improvement on the previous year. There was a small increase in the enrolment, in the average daily attendance, in the number in private schools, in the number of school-houses, and in those having maps and globes, and in youth out of school there was a decrease, as well as in school-houses unfit for use. With these gains, there was a decrease in common, graded, and high schools. There were fewer male and more female teachers, making a net gain of 9 teachers. There were fewer teaching successive terms and more from normal schools, with an advance in average pay, especially for men. In income and expenditures there was a slight gain.

The State superintendent says that many of the schools are extremely good but some deplorably bad. Some cities and towns have shown an enlightened liberality in the erection and furnishing of school buildings; others have manifested precisely opposite tendencies. The scholarship of many of the teachers, he says, is too limited and inaccurate. The most serious problem, he thinks, is in the agricultural districts, which are suffering constant depletion of school population from the inclination of youths to seek employment in manufacturing and business centres. Of the 2,644 public schools in the State, 753 enrolled 12 or under 12 scholars, and 310, 6 or under 6.—(State report.)

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

Towns and cities have school committees or boards of education for the control of public schools and may appoint a superintendent. Concord, although without a municipal school system, has a superintendent and a board of education, consisting of 8 members, for a union school district embracing most of the city, and superintending school committees for the other districts; Dover, under a new charter, has a school committee of 2 elected in each ward and 4 by the city council at large, instead of a former board of education; Manchester has a school committee of 2 from each ward, instead of 1, as heretofore reported, and a superintendent of public instruction; Nashua, a board of education and a superintendent of schools; and Portsmouth, a board of instruction.—(State and city reports.)

STATISTICS. *a*

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Concord *b*	13,843	.....	1,178	1,349	37	$24,536
Dover	11,687	2,059	2,029	1,440	46	22,882
Manchester	32,630	*c*5,460	4,095	2,712	78	55,782
Nashua	13,397	.....	2,755	1,841	55	35,521
Portsmouth	9,690	2,260	1,922	1,290	32	21,833

a With the exception of Concord, the official reports used in the compilation of this table do not discriminate as to school statistics between cities and towns bearing the same name, and the figures given therefore relate to the whole town. The same thing is true of the information given under the head of Additional Particulars.

b For the *town* of Concord the State report gives an enrolment of 2,445, an average attendance of 1,867, 87 teachers, and an expenditure of $40,946.

c Census of 1880.

ADDITIONAL PARTICULARS.

Concord for 1881–'82 reports 55 public schools, 53 having maps and globes. There was an increase of 176 in enrolment, of 195 in average daily attendance, and of 14 in teachers. There were 30 school-houses, valued, with other school property, at $183,352, an advance of $17,900 on 1881. Of the 87 teachers employed 3 were teaching for the first time, 48 had taught the same school for more than 1 term, and 12 were from normal schools. Of the 55 schools, 39 were graded.

In the city of Concord, after the primary, intermediate, and grammar courses, there was a high school department, with an English course of 3 years and academic and classical courses of 4 years each. The mixed school, heretofore introduced as an experiment to give instruction in special studies to those who could attend only part of the year, was continued during the winter term with increased attendance.

Instruction in music and drawing was given in all these schools. The superintending committee speak of the school year as having been, in the main, one of order and prosperity.— (State and city reports.)

Dover reports but one legally organized school district, with 41 different public schools, all having maps and globes; of these, 32 were graded schools and 1 a high school. There were 18 school-houses, valued, with other school property, at $141,100. In school population there was a loss of 270, teachers, enrolment, and average daily attendance remaining stationary. The schools reported 71 per cent. of the enrolment in average daily attendance. An evening school was open 12 weeks, averaging 85 pupils a night. The superintendent speaks of the schools as well graded and taught by efficient teachers, but reports the school-houses as needing extensive repairs and alterations.— (City report.)

Manchester, comprising one school district, for 1882 reported 75 different schools, classed as primary, middle, grammar, and high, the last having an English and French, a classical, and a college preparatory course, of 4 years each, and graduating 53. There were evening schools, with an average of 14 teachers and 164 pupils. The training school, opened the previous year, was thought to be adapted to its object. There were 24 school-houses, with 3,645 sittings, valued, with other school property, at $310,075. The work of the truant officer had nearly extinguished truancy in its worst forms and reduced the ratio of absenteeism 6 per cent. during the year. The estimated enrolment in private and parochial schools was 3,200, with an average attendance of 2,178, of whom 1,475 were Irish, 657 French, and 46 Americans. This large number is said to be owing to the extensive system of Roman Catholic parochial schools. As compared with 1881, city schools showed a decrease of 11 in teachers, of 255 in enrolment, of 106 in average daily attendance, and an increase of $1,657 in expenditures and $23,875 in the value of school property. In a general survey of their school system and its results, the school committee say it is gratifying to make so favorable a report, the city having a zealous superintendent, intelligent and faithful teachers, and a system of classification and studies at once elaborate and exacting.— (State and city reports and city return.)

Nashua, constituting 1 school district, had 17 school-houses, valued, with other school property, at $236,891, and 54 public schools, 51 having maps and globes. The schools are classed as high, grammar, middle, and primary, the first two each having 4-year courses, middle grade, 2 years; primary, 3. A special teacher of music gave instruction to the primary, middle, and grammar schools. Evening schools had an attendance of 346, under 17 teachers. As compared with 1881, there was a gain of 149 in enrolment and 3 in teachers, and a loss of 110 in average daily attendance, while expenditure increased $1,529 and the value of school property remained the same.— (State and city reports.)

Portsmouth for 1882 reported 1 school district, with 14 school-houses, valued, with other school property, at $82,600, and 32 public schools, all having maps and globes. The schools were classed as high, grammar, intermediate, and primary. The estimated enrolment in private and parochial schools was 150. There was a decrease of 12 in school population, of 481 in average daily attendance, and of $2,051 in expenditures. The public schools enrolled 85 per cent. of the school population, and adding the 150 in private and parochial schools 91 per cent. of it were under instruction.— (State and city reports and city return.)

TRAINING OF TEACHERS.

STATE NORMAL SCHOOL.

The New Hampshire State Normal School, Plymouth, in 1882 received a State appropriation of $6,750 and one of $1,200 from the city. There were 3 resident and 1 nonresident instructors, with 2 male and 49 female normal students, 10 of whom graduated and engaged in teaching. The full course of study requires 2 years. A certificate is given on the completion of the studies of the first year and a full diploma on the completion of the course. A training school is made up of 100 children, corresponding to the 5 lower grades in a city school. These are graded in groups of 10, each pupil teacher

having a class for 10 weeks and then being transferred to another class. For admission to the normal school, males must be 17 and females 16 years of age; all must declare their intention to fit themselves to teach. The State superintendent remarks that the State, which supports no institutes and only 1 normal school, is doing little for the improvement of its teachers. The attendance on the normal school he says should be twice what it is, no institution in the country being more professional or doing more thorough work. Large numbers are said to go to other States for normal instruction.—(State and city reports and city return.)

TEACHERS' INSTITUTES.

There being no provision by the State for institutes, the teachers maintain their voluntary organizations and support their yearly meetings at their own expense. The State superintendent justly remarks that it does not seem honorable to throw the expense of these institutes upon the poorly paid teachers.

EDUCATIONAL JOURNAL.

There being no educational journal published in this State, information as to its public schools is given in the National Journal of Education, Boston, which has a New Hampshire department.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

By law, any town, by a majority vote, or any district having not less than 100 youth 6–16, by a two-thirds vote, may become a high school district and establish a high school.

In answer to a circular sent out by the State authorities to all the high school districts in the State, some districts failing to report and so accounting for the decrease from last year, only 40 high schools reported for 1882 as against 60 in 1881. This number includes the State Normal School and the Littleton graded school, the latter probably having some properly high school studies. In the 40 schools reported there were 36 male and 61 female teachers, with 1,240 male and 1,648 female students, 1,911 pursuing the higher branches and 1,042 ancient and 329 modern languages. School property was valued at $717,575.—(State report.)

PRIVATE SECONDARY SCHOOLS.

The statistics of 53 of these schools reported for 1882 show 94 male and 67 female teachers, with 1,893 boys and 1,223 girls in attendance; 924 studied ancient and 545 modern languages.—(State report.)

For other statistics of such schools reporting, see Tables IV, VI, and VII of the appendix, and for summaries of them, the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

DARTMOUTH COLLEGE.

Dartmouth College, Hanover, the only institution in the State for superior instruction, reported in 1882 no changes from 1881. Its departments are academic, scientific, agricultural, and medical, for which last three, see Scientific and Professional Instruction, below. The collegiate standard is high, necessitating an advanced standard of admission, that the college courses may be properly pursued. Graduates of such preparatory schools as have a thorough preparation for college of at least 3 years are admitted without examination on the certificates of their principals that they have mastered the entire requisites for admission, the first three months of the freshman year being probationary, when those proving unfit to go on are dropped. The academic department has a 4-year classical course, with modern languages, mathematics, &c. After 1882 a course in elective studies for the junior and senior years will be provided. This department includes a Latin-scientific course, differing from the full classical course only in the omission of Greek and the substitution of an additional amount of mathematics, sciences, and modern languages.—(Catalogue.)

For statistics of this department, see Table IX of the appendix.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

For statistics of these institutions reporting, see Table VIII of the appendix; for summaries of them, a corresponding table in the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The *New Hampshire College of Agriculture and the Mechanic Arts*, Hanover, aims to give that practical education to the industrial classes which is needed in active life. Commencing with 1882–'83 the previous 3-year course will be changed to one of 4, with nu-

merous optional studies well adapted to the wants of students who desire a preparation for active life. The college is reported to be in successful operation. Besides a library of about 2,000 volumes of scientific works, a museum of general and applied science, and a chemical laboratory, the college is provided with instruments for practical surveying, the students having the benefit of the philosophical apparatus of Dartmouth College.—(Catalogue.)

The *Chandler Scientific Department of Dartmouth College* in 1881–'82 had 48 students in its 4-year course, and offered an additional year for resident graduates. The course is characterized by a practical scientific tendency and the study of belles lettres through the medium of French and German and by discussions and themes in English. The preparatory studies required are those pursued in the common schools of New England.

The *Thayer School of Civil Engineering*, another department of the college, had 7 students in its 2-year course. This is not only strictly a professional course, but it is essentially a graduate course, though open to any young man of sufficient maturity of mind and mathematical knowledge to satisfy the requirements for admission, which embrace, among other things, a rigid examination in the higher mathematics.

For further information as to these departments, see Table X of the appendix.

PROFESSIONAL.

No schools of *theology* or *law* in New Hampshire are known to this Bureau.

Medical.—The medical department of Dartmouth College in 1882 had 8 professors and 5 lecturers, with 96 students. Applicants for admission must be 18 years of age and, unless matriculates of some regular medical college or graduates of some respectable college, academy, or high school, must be examined as to their fitness to enter upon the study of medicine. For graduation, 2 full courses of lectures, 3 years of professional study under a regular practitioner, evidence of practice in dissection, and a dissertation on some medical subject are required. Besides the regular lectures, there is instruction by daily recitations from December to June.

For further particulars, see Table XIII of the appendix.

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB AND THE BLIND.

New Hampshire provides for the instruction of its deaf-mutes in the Clarke Institution, Northampton, Mass., and in the American Asylum for the Education of the Deaf and Dumb, Hartford, Conn., the former of which had 1 pupil, the latter 21, from this State in 1882. The blind are taught in the Perkins Institution, Boston, which, while not noting the number of New Hampshire pupils in 1882, shows receipts of $3,620 for blind pupils from the State.

REFORMATORY AND INDUSTRIAL TRAINING.

The State Industrial School, Manchester, had instructed 1,100 inmates since its establishment, and had 111 in 1882, 13 of whom went out on the expiration of their sentences, 11 went to homes provided for them, and 9 were honorably discharged.

In school all are taught the common English branches; out of school the boys work at farming, gardening, chair seating, and shoemaking. Of those discharged 75 per cent. are known to have become orderly and useful citizens.—(Return.)

TRAINING OF ORPHAN AND DEPENDENT CHILDREN.

The institutions for this work are the *Orphans' Home*, Concord, under Protestant Episcopal influence; the *New Hampshire Orphans' Home*, Franklin, a private and non-sectarian institution supported by voluntary contributions; and the *Children's Home*, Portsmouth, which receives orphan, motherless, or otherwise homeless children under 12 years of age, and trains them, without distinction of creed or color, in practical home duties and habits of honesty, truthfulness, purity, and industry, with literary instruction in the public schools. Statistics for all these are wanting for 1882.

EDUCATIONAL CONVENTION.

NEW HAMPSHIRE STATE TEACHERS' ASSOCIATION.

The twenty-ninth annual meeting of the State Teachers' Association was held at Concord, October 20–21, 1882, there being present 300 teachers. Superintendent William E. Buck opened the session with a paper on "Supplementary reading," giving a list of books which he regarded as safe and profitable reading for youth. Prof. E. H. Barlow, principal of the Tilden Seminary, West Lebanon, then read a paper on "A few things worth looking at." He held that the public school system is not meeting the wants of the boys and girls: the intellect is trained at the expense of the feelings and will; skill at handicrafts is not provided for; manual dexterity should be taught in all the

schools. "Shall the State be asked to reëstablish the county institute?" was answered in the affirmative by Professor Quimby, principal of the New Hampshire Conference Seminary, Tilden, who was indorsed by Principal Ham, of Farmington, as expressing the opinion of the entire association. Principal W. A. Robinson, of Franklin, then read a paper on "The town vs. the district system," advocating the former and giving a history of the beneficial effects of the change in Franklin. Next came a discussion on "The present situation and the future of our schools," opened by Colonel Parker, who was followed by Hon. J. W. Patterson, contrasting the school systems of the past and present and predicting what the system of the future will be. The second day's session was opened by the consideration of committee reports and the presentation of the resolutions adopted by the Concord Woman's Christian Temperance Union. These resolutions, urging the association to recommend the introduction into the schools of scientific instruction as to the physiological effects of alcohol, were favorably received. "Language in grammar and high schools" was discussed by Principal Powers, of Nashua, Profs. J. K. Lord and Pollens, of Dartmouth College, Bailey, of Keene, and Parker, of Boston, some favoring and others opposing technical grammar. The discussion was continued by a paper on "Language in the primary schools," from Miss Sprague, principal of the Manchester Training School for Teachers, who offered practical suggestions in regard to the teaching of language in all schools below the grammar grades. The closing paper was on "The high school," by Prof. A. S. Hardy, of Dartmouth College, which, on account of its excellence, was to be incorporated in the State superintendent's report. The officers for the ensuing year were then elected, and thus closed, it is said, one of the most interesting, instructive, and enthusiastic meetings the association ever held.—(Journal of Education.)

CHIEF STATE SCHOOL OFFICER.

Hon. JAMES W. PATTERSON, *State superintendent of public instruction, Concord.*

[Second term, June 21, 1882, to June 23, 1884.]

NEW JERSEY.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth of school age (5–18)	335,631	343,897	8,266	
Number of these enrolled in public schools.	203,542	209,526	5,984	
Average daily attendance	110,052	113,532	3,480	
Enrolled in private and church schools	43,656	44,560	904	
Whole enrolment in all schools	247,198	254,086	6,888	
Children not in school	87,112	89,254	2,142	
SCHOOL DISTRICTS AND SCHOOLS.				
Number of school districts	1,370	1,366		4
Public school buildings	1,585	1,577		8
Number of sittings in these	187,136	189,871	2,735	
Private and church schools	297	261		36
Number of buildings classed as poor	192	184		8
Number classed as medium	300	298		2
Number of good school buildings	509	524	15	
Number classed as very good	584	571		13
Districts with less than 6 months of school.	16	2		14
Districts with 6 to 9 months' school	80	65		15
Districts with 9 months or more	1,274	1,299	25	
Average time of school in days	190	192	2	
Valuation of all public school property	$6,275,067	$6,270,778		$4,289
TEACHERS AND THEIR PAY.				
Men teaching in public schools	926	911		15
Women teaching in public schools	2,560	2,594	34	
Whole number of teachers	3,486	3,505	19	
Average monthly pay of men	$51 07	$56 96	$5 89	
Average monthly pay of women	32 63	33 41	78	
Teachers in private and church schools	577			
INCOME AND EXPENDITURE.				
Whole receipts for public schools	$2,163,919	$2,142,385		$21,534
Expenditure for public schools	2,026,982	1,987,671		39,311

(From reports of Hon. E. A. Apgar, State superintendent of public instruction, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

The general supervision of the public school system is committed by law to a State board of education, which board elects by ballot every third year a superintendent of public instruction for the State and appoints a superintendent of public schools for each county, the latter subject to the approval of the board of freeholders in the county. For ordinary school districts (which must contain at least 75 children of school age) the county superintendent may appoint 3 trustees at the laying out of the district, the resident voters may elect these or others at the first annual district meeting, and annually thereafter these voters elect one in place of one of the 3 thus first chosen. The district trustees constitute a township board of trustees for each township, and as such meet the

county superintendent semiannually for consultation as to the management of schools. Women residing in a district are eligible to the office of district trustee in it, if over 21 years of age and able to read and write, which qualifications are required of men also. City and town districts (every incorporated city or town constituting but one school district) have elective school boards, boards of education, or boards of school trustees, according to their several charters, the members usually liable to partial annual change. Each district board has a clerk or secretary to record its proceedings, keep accounts, and take an annual census of school children. Besides the above mentioned, there are boards of examination to test the qualifications of applicants for teachers' certificates. These certificates entitle their holders to teach either in any part of the State or in any county or city by the examining authorities of which the certificate is issued.

OTHER FEATURES OF THE SYSTEM.

The public schools are free to all resident children 5 to 18 years of age, regardless of religion, nationality, or color. They are supported by the proceeds of a State school fund, by a State tax equal to $4 for each child of school age, and by additional amounts raised through township taxation. Each district is entitled to at least $200 of the school fund, and districts with 45 or more children get not less than $350, to be apportioned by county superintendents. To secure this aid, districts must provide suitable school buildings and must have maintained a public school for at least 9 months during the preceding school year. To entitle themselves to pay, teachers must hold certificates of qualification and present a duly kept register for the time for which pay is asked. Teachers may suspend pupils from school for cause, but may not administer corporal punishment. The State allows an annual appropriation of $100 for each county teachers' institute and teachers are required to attend the institute held in the county in which they teach. No portion of any school fund may be used for the support of sectarian schools. The county and city superintendents together constitute "The State Association of School Superintendents" and meet annually, as the State board of education may direct. The State offers to any city, town, or township that will raise not less than $3,000 a like sum for the establishment of schools for the training of pupils in industrial and mechanical pursuits, and afterwards an annual contribution equal to that contributed in said locality, not to exceed $5,000. The State also encourages district libraries by giving $20 to any public school which has raised a like amount, with an annual sum of $10 if the district shall have given the same.

GENERAL CONDITION.

The statements of Superintendent Apgar for 1881–'82 indicate a condition of school affairs not materially different from that reported in the preceding year. The percentages of enrolment in public schools and of attendance on both public and private schools were about the same. Against 8,266 additional youth of school age there appears an enrolment of 5,984 more in public schools and of 904 more in private schools, so that on the whole there were 6,888 more youths under instruction, 2,142 more than in the preceding year being reported as not in school. The number of public school buildings is reported as 8 less, but the sittings for pupils were 2,735 more. Private and church schools diminished apparently by 36. Notwithstanding a diminution of expenditure for public schools, the time during which the schools were taught was on an average 2 days greater for the State. The quality of the teaching force seems on the whole to have improved, the number of teachers holding State certificates, which imply a high grade of qualification, being 42 greater, the number holding city certificates being 80 more, and the first grade county certificates 33 more, making a total of 155 more teachers that may reasonably be considered well qualified.

EVENING SCHOOLS.

Free evening schools were held in 8 cities during 1881–'82, with a total enrolment of 5,681, an increase of 805, the average evening attendance being 2,456, an increase of 450. The number of teachers rose from 104 to 116, their average salary being $7.43 a week. The total amount appropriated for evening schools was $8,954.

KINDERGÄRTEN.

For information of schools of this class, see Table V of the appendix; for a summary of their statistics, see a corresponding table in the report of the Commissioner preceding.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

The school interests of each city or town are under the control of school boards, boards of education, or boards of school trustees, elected by the people. A city superintendent is usually the executive officer, and such persons as the board may appoint constitute a city board of examiners.

STATISTICS.[a]

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Bridgeton	8,722	2,237	1,554	963	28	$14,278
Camden	41,659	12,558	8,466	4,512	125	81,152
Elizabeth	28,229	7,858	3,501	2,156	51	37,674
Hoboken	30,999	10,377	5,504	3,214	100	71,041
Jersey City	120,722	47,552	21,151	12,884	329	185,875
Millville	7,660	2,494	2,266	1,068	34	17,821
Newark	136,508	41,498	19,762	12,431	285	254,255
New Brunswick	17,166	6,334	2,382	1,722	45	39,011
Orange	13,207	3,890	1,452	1,001	32	32,737
Paterson	51,031	16,022	10,643	5,824	121	87,483
Plainfield	8,125	2,250	1,278	846	23	22,481
Trenton	29,910	7,776	3,838	2,263	69	49,082

[a] To secure uniformity in comparisons, the figures in this table are taken from the State report for 1881–'82.

ADDITIONAL PARTICULARS.

Bridgeton public schools occupied 6 buildings, with 1,551 sittings for study, valued, with grounds, &c., at $38,000 and reported in good condition. There was room for 588 more than the daily attendance, and yet 642 children of school age in the city attended no school during the year. Private and church schools enrolled 112.

Camden received $93,089 for public school purposes. Its 13 buildings, with 6,505 sittings, were valued, with sites, &c., at $246,300, and were reported to be in very good condition. The enrolment in private schools was 771, and 362 children of school age were in no school. The pay of men averaged $107.50 and that of women was raised from $34.16 to $35.31.

Elizabeth reported primary, grammar, and high schools in good buildings, with 2,569 sittings for study, valued, with sites, &c., at $80,000. The total receipts for school purposes were $44,019. The accommodations being insufficient, the lower classes of the primary department were divided, one half attending in the morning, the other in the afternoon. There were 3 men teaching, at a salary of $140 a month, and 48 women, at $49. The number of children attending private schools was 2,889 and 1,468 were attending no school. The evening school enrolment was 517 and average evening attendance 127, with 8 teachers.

Hoboken in 1882 reported 12 schools, classed as primary, grammar, high, and evening. There was also a Saturday normal class. Drawing was added to the course of study in public schools, and a special teacher was appointed for the same. More room was needed to relieve the overcrowded condition of the schools. The evening school of 4 months enrolled 384 pupils, with an average attendance of 139, and was divided into 6 classes, 2 for boys and 4 for girls. The class for the benefit of Germans unable to speak English was continued. The teachers' monthly convention is said to be a valuable auxiliary to the teachers. The number of pupils in private schools was 1,473 and those attending no school 3,400. School property was valued at $132,500.

Jersey City reported primary, grammar, and high schools and a training class for teachers. The schools were housed in 20 buildings, with 14,443 sittings, and yet 1,309 children had to be refused admission to the schools for want of room. The city superintendent reported that about three-fourths of the children left school as soon as their labor could assist in supporting the families to which they belonged and that 13,201 attended no school during the year. The schools were taught 200 days, the pay of the men teaching in them averaging $131.86 per month; that of women, $30.80. School property was valued at $628,830. French, German, Greek, and Latin were taught in the high and normal schools. There were 13,200 pupils in private schools.

Millville reported primary, grammar, high, and evening schools, taught in 12 buildings, with 1,560 sittings, valued, with sites, &c., at $40,000. The average salary paid to men was $62.50; that to women, $37. Evening schools were taught 38 evenings by 18 teachers, at an average pay of $3.96 a week; the number enrolled was 576, with an average attendance of 228; total appropriation for evening schools, $800. There were 30 children attending private schools and 228 in no school.

Newark in 1882 had 34 school buildings, 6 of them rented, the others owned by the city. The 34 contained 293 class rooms, afforded sittings for 15,723 pupils, and were valued, with sites, furniture, and apparatus, at $907,500. The day schools were 2 industrial, 1 colored, 28 primary, 2 intermediate, 11 grammar, 1 high, and 1 normal, the last using as a training school one of the city schools. The enrolment in these was, for the year, 19,759; the average registration, 14,222; the average attendance, 12,436. The

increase in average enrolment was 400, in average attendance 291. Only 61 pupils were over 18 years of age, and 35 of these were in the city normal school preparing to become teachers. Five evening schools, one of them an evening drawing school, had an attendance of 1,646 pupils. These, with the day pupils, made a total of 21,405 under instruction in the city schools, adding to which 6,000 in private or church schools, it appears that out of the 41,498 children of school age 27,405 were under some school training The teachers employed by the city in its day schools were 17 men, at an average salary of $150.75 a month, and 268 women, at $51 a month. The evening schools were taught 57 evenings, at an average salary of $8 a week, by 36 teachers. The high school had for boys a commercial course of 2 years and classical, scientific, and English courses of 4 years; for girls, a 4-year course in English and Latin studies and a 1-year normal course.

New Brunswick reported graded schools conducted in 6 buildings, with 2,175 sittings, valued, with grounds, &c., at $125,200. There were 4 men teaching, at an average salary of $132.50 a month, and 41 women, at $41.93. About 1,000 children attended private schools and 2,952 were in no school.

Orange reported primary, grammar, and high schools, taught in 4 buildings, with 1,373 sittings, valued, with all other school property, at $100,000. Two men teachers were paid an average of $140 a month and 30 women $46. There were also 2 special teachers for music and drawing. About 1,000 children were in private or church schools and 1,438 in no school.

Paterson reported primary, grammar, high, normal, and evening schools, conducted in 30 buildings, with 8,710 sittings, valued, with sites, &c., at $304,800. There were 10 men employed in teaching, at an average of $108 a month, and 111 women, at $42. Evening schools were held in 9 buildings and had an enrolment of 2,225 pupils, with an average attendance of 949; and for them 63 teachers were employed, with two special teachers of drawing and penmanship. The appropriation for these schools was $2,327. The number of children in private schools was 1,500 and in no school 3,879.

Plainfield had 22 graded schools in 4 buildings, valued, with grounds, &c., at $63,750. The average salary of teachers a month was $80 for men and $59 for women. Music was taught in all; the length of term was 200 days. There were 305 children in private schools and 667 in no school.

Trenton for 1882 reported 58 class rooms in 11 buildings, with 2,632 sittings. One school-house had been built during the year and 10 had a system of ventilation. There were 3 more teachers employed than in the preceding year. Of the whole number 3 were men, with an average monthly pay of $106.66, and 66 women, with $44.86. School property was valued at $150,000. Private schools had an enrolment of 1,002 and 2,691 children were in no school.

TRAINING OF TEACHERS.

NEW JERSEY STATE NORMAL SCHOOL, TRENTON.

This school is under the management of a board composed of 14 trustees and the State superintendent. During the school year there were 233 pupils enrolled, the average attendance being 186. The total number was 3 less than the preceding year, but the average attendance was 5 more. The elementary course covers 2 years, and students, to enter the advanced course, must be familiar with the first year of the elementary course. Instruction was given in elocution, calisthenics, vocal music, drawing, and penmanship throughout both courses. There were 39 graduates in 1882, of whom 25 graduated from the advanced course; all the graduates engaged in teaching.

Graduates of the school (who comprise about 11 per cent. of all the teachers in the State) are permitted to teach without further examination. The school receives $20,000 annually from the State. A model school connected with the institution had an enrolment of 420 pupils, under 24 instructors. It furnishes students of the normal school an opportunity for observation and practice teaching; its course of study is graded from elementary English through high school studies, and boys may be thoroughly prepared in it for any class in college.

FARNUM PREPARATORY SCHOOL, BEVERLY.

This institution receives aid from the State, acts in conjunction with the normal school in preparing teachers for the public schools, and its graduates are received into the senior class of the advanced course of the State normal school. Its departments are primary, intermediate, preparatory, and senior. Instruction is given in music, drawing, and painting, French, and German, and pupils are prepared for business or college. The average attendance during the year was 114.

OTHER NORMAL TRAINING.

The *Newark Normal School* was established in 1879 to prepare teachers for that city. Its course of study covers a year, only graduates from the high school being admitted.

The special studies are mental and moral philosophy, theory and practice of teaching, and critical readings in English literature. The students spend two weeks or more in teaching in the city training school, 3 classes in this school being taught by them entirely. Resident instructors, 8; normal pupils in 1881–'82, 28, of whom 26 engaged in teaching. Three educational journals were taken, drawing and vocal music were taught, and there was a collection of casts, models, and other apparatus.

At *Hoboken*, the normal class heretofore noticed was continued on every Saturday forenoon during the school session. Fifteen graduates received certificates or diplomas. Instruction was given in the studies required for each grade, supplemented by ideas on teaching, plans for organizing schools, and methods of discipline. The registration for the year was 59; the average attendance, 41. The city teachers, forming a society for mutual improvement, met once a month for the discussion of topics connected with their work.

Jersey City continued the instruction given in former years in its high school to pupils that desired to prepare for teaching, and the report of the superintendent indicates that the number of such was 74 for the year. A training school connected with the high school gives opportunity for practice teaching.

TEACHERS' INSTITUTES.

During the year county teachers' institutes were held in the counties of Bergen, Cumberland, Essex, Hudson, Hunterdon, Middlesex, Monmouth, Morris, Passaic, Salem, Somerset, Sussex, Union, and Warren.

At Mount Holly, Burlington County, where many teachers have for several years met the county superintendent, Mr. Edgar Haas, monthly, in a voluntary institute, for systematic studies of an advanced character, an elementary course in English grammar, reading, arithmetic, and practical mensuration was pursued in 1881–'82. A similar association of teachers at Burlington, composed wholly of men, is reported by Superintendent Haas as having done superior work.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

The State report gives no definite information in regard to high schools in the State. In Elizabeth they were conducted in 3 buildings by 9 teachers, with an average daily attendance of 118, and in Jersey City High School 569 pupils were enrolled, with an attendance of 429 and 87 in the graduating class. High schools were also noted in Hoboken, Millville, Newark, New Brunswick, Orange, Paterson, Phillipsburg, and Plainfield, while there were high school departments also in the State Normal School, Trenton, in the city school system of the same place, and in the Farnum Preparatory School, Beverly.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academic schools, and schools specially preparatory to college, see Tables IV, VI, and VII of the appendix, and for summaries of the same, see corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR MEN.

The *College of New Jersey*, Princeton (Presbyterian), in 1882 (the one hundred and thirty-sixth year of its existence), maintained its classical, scientific, and elective courses of former years, with a faculty of 37 members and an enrolment of 541 students. Of these 9 were fellows and 54 graduate and 18 special students. Regular courses of study occupy 4 years. The entrance, promotion, and graduation of students were determined by examination, and the degree of bachelor of arts was conferred only upon students who passed a satisfactory final examination. Thorough graduate courses in biology and palæontology have been established, open to graduates of this and other colleges and leading to corresponding degrees. Attached to the diplomas issued to students in these courses is to be a statement that the degree has been awarded for proficiency in the above sciences. Any candidates for a degree who pass a satisfactory examination may compete for prizes, scholarships, and fellowships offered in the classes or departments with which they are connected. Biblical instruction is given each week by the president and 3 professors.

Rutgers College, New Brunswick, in the one hundred and twelfth year of its existence, reported for 1882 classical, scientific, special, and graduate courses, with a faculty of 15 members and 134 students, 15 of them graduates. The courses for graduation as bachelor of arts and bachelor of science cover 4 years. For higher degrees there are

graduate courses covering 2 to 5 years. French, German, Greek, and Latin enter into the regular A. B. course and Hebrew is offered as an extra study during the senior year for students intending to enter the ministry.

St. Benedict's College, Newark, and *Seton Hall College*, South Orange (both Roman Catholic), reported for 1881–'82 preparatory departments and classical and commercial courses of study; the former had 68 students, and the latter 100. The preparatory department at St. Benedict's embraces only elementary English studies. The standard at Seton Hall has been raised.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF WOMEN.

For statistics of schools of this class reporting for 1881, see Table VIII of the appendix, and a summary of it in the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

Rutgers Scientific School (constituted by act of the legislature the State College of Agriculture and the Mechanic Arts) presented for 1881–'82 full 4-year courses of instruction in civil engineering and mechanics, in chemistry and agriculture, and special courses in chemistry and agriculture covering 2 years, each 4-year course leading to its corresponding degree, while certificates alone are given to those students who pursue to their completion the special 2-year courses.

The *John C. Green School of Science*, connected with the College of New Jersey, Princeton, had 2 courses in general science: one of 4 years, leading to the degree of B. S.; the other, a course of at least a year in special departments of science for students who have received the first degree and are candidates for the degree of M. S. Students in the junior year desiring to devote to certain branches more than the usual time may elect one of 3 courses, which are in (1) mathematics and mechanics, (2) biology and geology, (3) chemistry and mineralogy. The course need not be selected before the close of the first term in the junior year. There is also a select course in physics that may be taken in the senior year by students that have chosen mathematics and mechanics. Then in the Green school there is a 4-year course in civil engineering, which for the first 3 years is the same for all, but in the fourth year may be varied by students showing marked advance in special branches of engineering. A course of 2 to 4 months, according to the preparation of the student, is provided for graduates of the school and special students intending to study medicine.

Stevens Institute of Technology, Hoboken, a school of mechanical engineering, offered in 1881–'82 a full 4-year course, each year divided into 4 terms, the first or preliminary term being devoted to experimental mechanics and shop work. The courses of instruction include mathematics, mechanical engineering and drawing, physics, chemistry, languages, and belles lettres. Admission, promotions, and graduation depend on the passage of examinations.

For statistics of these scientific schools, see Table X of the appendix, and a summary of the same in the report of the Commissioner preceding.

PROFESSIONAL.

Theology is the only professional training reported in 1882. The schools for it were the Theological Seminary, Princeton, the German Theological School of Newark, N. J., Bloomfield (both Presbyterian), Drew Theological Seminary, Madison (Methodist Episcopal), the Theological Seminary of the Reformed Church in America, New Brunswick, and the Diocesan Seminary of Seton Hall College, South Orange (Roman Catholic). The first 4 had full 3-year courses, with preliminary examinations for all who were not college graduates; the German Theological School had a 3-year preparatory course, and the instruction in theology at Seton Hall College was not separated from that of the collegiate course.

For statistics of theological schools, see Table XI of this volume.

SPECIAL INSTRUCTION.

EDUCATION OF DEAF-MUTES AND OF THE BLIND AND FEEBLE-MINDED.

The number of deaf-mutes educated by the State in special schools of other States was 156, number of blind 57, and of feeble-minded 41, and the cost to the State of such instruction was $69,616.

REFORMATORY AND INDUSTRIAL TRAINING.

The *New Jersey State Reform School*, for boys, Jamesburg, reported for 1882 the number of boys that had been in the institution during the year to be 419, embracing some col-

ored, 322 remaining under instruction October 31. They were taught the elementary English branches, with farm and shop work and brick making. The value of all the school property was $40,048 and the value of the farm products for the year $9,689.

The *State Industrial School*, for girls, at Trenton, reported 51 inmates during 1882, their average age being 14½ years. They received instruction in the common English branches; also, in sewing and house work. Particular attention was given to their moral and religious training.

The *Newark City Home*, a reformatory and industrial institution for boys and girls supported by the city, reports 74 received and 72 paroled during the year, leaving at the close of 1882 156 inmates. All are given school instruction, with vocal music; the boys are taught brush making and farming; the girls, tailoring, dressmaking, and plain sewing.

EDUCATION OF ORPHAN AND DEPENDENT CHILDREN.

Among the institutions of this class reporting are the West Jersey Orphanage, Camden, for destitute colored children; the Children's Home, Mount Holly, and the Newark and Paterson Orphan Asylums. These schools seem to be doing good work and are said to be conducted by earnest men and women. For statistics of these and similar institutions, see Table XXII of the appendix.

EDUCATIONAL CONVENTION.

STATE ASSOCIATION.

The New Jersey State Teachers' Association held its twenty-fifth annual meeting at Newark, December 26–27, 1882, President W. L. Dickinson, of Jersey City, in the chair. In his address of welcome the president warmly advocated the proposition that teachers should be men and women of thought and action, stimulating scholars to learn without too much explanation; he thought they should belong to the board of trustees and assert the dignity and importance of their position. Superintendent De Graff presented a paper on "A new departure in teachers' institutes," and offered resolutions that the association request the legislature at its next session to repeal the law for county institutes and establish for each congressional district a school to hold an annual 4-week session for normal training, $500 being given annually to each school. The resolutions were followed by a lively discussion and were finally referred to a committee, to be reported on at the next meeting. The general drift of sentiment appeared to be that normal training in some form was essential to right teaching, even for those who had passed through the school curriculum. The next day Principal Hasbrouck, of the Normal School, dwelt on the need of thoroughness in mental training. Papers were then read on the "Reformation of delinquents" and on "School libraries," followed by State Superintendent Apgar in defence of high schools, with an earnest appeal for retaining the county institute system. The resolutions relative to the system were referred to a committee, to be reported upon at the next meeting. Before adjournment, Randal Spalding, of Mont Clair, was elected president for the ensuing year.

CHIEF STATE SCHOOL OFFICER.

Hon. ELLIS A. APGAR, *State superintendent of public instruction, Trenton.*

[Term, 3 years.]

Mr. Apgar has served by successive reëlections since 1867.

NEW YORK.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth of school age (5-21)	1,662,122	1,681,161	19,039	
Public school enrolment	1,021,282	1,041,068	19,786	
Average daily attendance	559,399	569,471	10,072	
Attending private or church schools	108,309	115,646	7,337	
Attending academies	31,114	34,171	3,057

a Not including the United States deposit fund, which in 1878 amounted to $4,014,521.

(From reports of Hon. Neil Gilmour, State superintendent of public instruction, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

A State superintendent of public instruction, elected by the legislature for a term of 3 years, has general charge of public school interests. Academic, collegiate, and professional training is under the direction of a board of regents of the university. Local

school affairs are in charge of school commissioners elected by the people for 3 years (one for each school commissioner's district) and of district boards of trustees, of 1 or 3 members in ordinary districts and of 3 to 9 members in union districts. Women may hold school offices and vote in school meetings.

OTHER FEATURES OF THE SYSTEM.

Public schools are sustained by the income of a common school fund, of the United States deposit fund, and by State and local taxation. All residents of a district 5 to 21, and non-residents at the discretion of the trustees, are admitted, except Indian youth on reservations, for whom other provision is made. Separate schools for colored children may be established by the school authorities of cities or of union districts, but facilities for instruction equal to those in the schools for white children must be provided in them. Districts, to be entitled to their share of the public school funds, must have sustained a school taught by a qualified teacher for at least 28 weeks the preceding school year, and no public school moneys may be paid to an unqualified teacher. To be legally qualified a teacher must have a normal school diploma or a certificate of qualification from the State superintendent, school commissioner of the district, or school officer of a city authorized by special act to grant a certificate.

Provision is made in the law for district libraries, union or graded free schools with academic departments, teachers' institutes, and State normal schools; also, for the instruction of the deaf and dumb and the blind, for children in orphan asylums, for the care and instruction of idle and truant children, and for the compulsory attendance of children between 8 and 14 on some school for at least 14 weeks in each year, unless instructed at home in the common school branches. The employment during school hours of any child under 14 who has not received this amount of instruction during the year preceding is prohibited under a penalty of $50.

Free instruction in industrial drawing must be provided in all cities and in union and free school districts under special acts, unless such districts are excused by the State superintendent. All State normal schools must teach this branch.— (School laws.)

GENERAL CONDITION.

The statistics show an increase of 19,000 in youth of school age, of more than that number in public school enrolment, and of over 10,000 in average daily attendance, while, with the increased number of students in colleges, academies, normal and law schools, the whole number reported under instruction was over 30,000 greater than the previous year. Nearly half a million of dollars more was expended for public school purposes; more teachers were employed, at an increased average monthly salary; and over $58,000 more were spent for school-houses, school furniture, &c., although the estimated value of all school property was reported less than in 1881. "For many years there has been an annual increase in the number of teachers employed for the full legal term of school," a fact which, the superintendent thinks, shows an increasing interest in educational work, besides furnishing encouragement to teachers. The number of volumes in district libraries has been decreasing year by year, although the sum of $50,000 is annually appropriated for the purchase of books. This amount was in 1881–'82 divided nearly equally between the 744 city and the 11,257 rural school districts, the latter receiving, on an average, a little more than $2 each. The money, however, in a large majority of the rural districts, was used for the payment of teachers, the law authorizing this when the amount is less than $3. The superintendent advises that the annual appropriation for district libraries should be discontinued or else that the law be so amended as to materially improve the libraries.

A new plan was adopted at the last institute examination of teachers which has given general satisfaction. It had previously been required that each applicant for a certificate should pass in all the subjects prescribed. Now, should they fail in any branches, they are to receive credit for those in which they are successful, and are not required to pass an examination in them again, but only in those in which they failed. They must, however, pass in all the subjects within 3 years. The method of granting State certificates on examination, instead of on recommendation, required by a law of 1875, has been productive of much good in raising the standard of teachers' qualifications.

INSTRUCTION OF INDIAN YOUTH.

The report for 1882 gives 1,723 as the number of Indian children of school age in the State, the number of these enrolled in school as 1,169, and the average daily attendance as 645. One new school-house was in process of erection and 2 more were needed. The receipts for the year were $8,595; expenditures, $8,243.

NEW LEGISLATION.

No notice of any important changes in the school code has reached the Bureau except the following: (1) One requiring supervision of teachers' classes in academies and union schools from school commissioners, with some additional provisions as to incorporation of academies; (2) one forbidding the incorporation of collegiate institutions without the approval of the regents of the university; (3) one amending regulations as to admission to the bar of students from law schools or attorneys' offices.

KINDERGARTEN.

For information as to schools of this class, see Table V of the appendix.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

The schools of cities and incorporated villages not under special charters are, like other union school districts, governed by boards of education elected by the people for 3 years, one-third going out each year. A large number of the cities, however, have special school organizations under municipal charters; but all are under the supervision of boards variously styled boards of education, of trustees, or of supervisors, generally elected by the people. Nearly all the larger cities also have superintendents of schools. In New York City the mayor appoints the board, which is composed of 24 commissioners. He also appoints 24 school inspectors, 3 for each of the 8 school districts into which the city is divided. A superintendent of schools and 7 assistant superintendents are appointed by the board, also 5 trustees for each ward.

STATISTICS.

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Albany	90,758	35,411	13,984	9,350	233	$208,783

Yonkers	18,892	7,170	3,073	1,778	43	66,654

a Besides the numbers here given, the evening schools enrolled 5,406, had 3,262 in average attendance, and employed 200 teachers.
b Estimated in 1880.
c Including 120 in evening schools.
d Including 17 in evening schools.
e These statistics are for the Kingston school district only; the population of the city in 1880 was 18,344.
f Including 9,786 in corporate and 6,833 in evening schools.
g Including an average attendance of 109 in evening schools.
h Including 7 teachers in evening schools.

ADDITIONAL PARTICULARS.

Among several cities and villages containing 7,500 or more inhabitants, besides those enumerated in the above table, Hornellsville and Middletown had school systems organized under special acts, but no report of their statistics has been received for the year 1882.

Albany reports a new school building finished, with seats for 448 pupils and costing $17,642, and another commenced which will accommodate 600 pupils and cost about $25,000, exclusive of site. The tendency towards a decrease in attendance apparent in

the two previous years was arrested in 1882. While the registry remained about the same as the previous year, the average membership increased by 344 and the average attendance by 364. The half day absences fell off 11,898 and the cases of tardiness 2,794. The experience of individual schools tended to show that the effort to reduce tardiness need not result in an increase of half day absences. There were 650 cases of truancy, though the number of truants was only about 500. An inquiry made by the police, at the instance of the board of education, showed that there were on the streets at one time 28 truants and 132 non-attendants at school between 6 and 16 years of age. The establishment of an ungraded school for such children is recommended.

In December the board, after carefully considering the arguments pro and con, decided to suppress the forenoon and afternoon recesses, allowing a longer intermission at noon and dismissing pupils half an hour earlier in the afternoon. The first and second year classes were allowed 10 minutes of recess during the sessions and individual recesses were given freely on request. At the end of 3 months reports from all the schools as to the practical workings of the plan were so favorable that the new schedule was made permanent. The course of study continued substantially as before. The rehearsal of short quotations was made a part of the daily exercises in all the grades. Drawing continued to be taught with enthusiasm, and the influence of this instruction has already been seen in the workshops and studios of the city. Satisfactory progress in music was made. There was a reduction of about one-half in cases of corporal punishment and this without any increase in the number of suspensions. The schools are learning to do without the infliction of pain as a means of discipline, the proportion of pupils now subjected to it being but 1 in 3,300. The high school reports a year of successful work. A training department for teachers has been added to its curriculum. Of 233 teachers employed (only 24 of them men), 109 were graduates of the high school, 64 of normal schools, and 12 of colleges.

In *Auburn* the schools are graded as primary, grammar, and high, each department occupying 4 years, and the last having two courses, an academic and a classical. No new departures were made during the year in methods of teaching or in school management. Instruction in industrial drawing and in vocal music was given in all grades by special teachers. There was an increase of 124 in the number of pupils enrolled and of 65 in the average number belonging. As in 1880–'81, there was a decreased attendance in the advanced grades, owing to opportunities for employment offered by prosperous business interests. The sanitary condition of the schools was good, but some of the rooms were so crowded that a new building was ordered. The most pressing need of the school system was some suitable provision for the idlers and truants of the community.

Binghamton provides public school accommodations for 3,011 pupils, a few more than the number enrolled, in 9 school buildings, the latter valued, with other school property, at $204,367. The schools were classed as primary, grammar, and high and were taught 195 days.

Brooklyn reports an increase of 2,197 in pupils enrolled and of 12 in teachers employed. The per cent. of average attendance on the number enrolled was 59.5; on the average enrolment it was 88.5. It appears that attendance is kept down by the lack of school accommodations, which have been insufficient for years. While there was room for additional pupils in the higher grammar grades, the primary and lower grammar grades were overcrowded, and to reduce the latter to reasonable numbers and furnish accommodations for the children excluded 15 new primary school buildings were needed. The attendance in evening schools increased during the year, but not so much as that in day schools. Over 8,200 pupils were enrolled during the fall term and 5,406 during the spring term, the average attendance in each being about half these figures. Considering the few years that are spent by a majority of the public school children in school, the superintendent urges the importance of organizing an introductory class for children 5 to 7 years of age, in which such instruction should be given as would awaken a desire for knowledge and create some aptness in its acquirement; also, the adoption of Kindergarten methods in the regular school work of the lower grades. He emphasizes the necessity for a more generous support of the public schools and renews a former recommendation for the establishment of two training schools for teachers.— (City report, 1882.)

In *Buffalo*, with an increase of 2,081 pupils enrolled and of 1,134 in average attendance, under 13 more teachers, there was a decrease of $542 in public school expenditure. The average attendance was greatly lessened by sickness among the pupils, which, in some cases, led to closing the schools. Of the 20,687 pupils attending, only 5,460 were native Americans, 10,301 were Germans, 2,633 Irish, and 2,293 belonged to other nationalities. The system comprised 35 school districts and 55 grammar school buildings, of which 42 were district property, 36 of the latter being built of brick and 6 of wood. The rented buildings were unfit for school purposes, being too small, devoid of sanitary appliances, and ill ventilated. In several districts, moreover, the school accommodations, inferior as

they were, proved inadequate, many children being kept away through the want of room, while others remained out of school on account of the defective sanitary arrangements. The course of study, in the opinion of the superintendent, embraced more studies than can be pursued with advantage, and he thinks the least important subjects should be dropped, securing by this reduction more time for the studies of a practical character. Only 15 or 20 minutes, twice a week, can be given to drawing, and the same length of time, 3 times a week, to writing. More attention was given to the rudiments of music than previously. The German language was studied by about 2,000 pupils in 16 of the district schools and in the high school, under 17 instructors.—(City report.)

Cohoes, with public schools classed as primary, grammar, high, and evening schools, reports 1,983 sittings for study in 8 school buildings, valued, with other public school property, at $93,000. Public schools were taught 203 days during the year. There were about 600 pupils enrolled in private and parochial schools.

The *Elmira* public schools, classed as primary, grammar, and high, are taught in 8 buildings, affording 3,825 sittings for study. Besides the public school attendance above noted, there was an estimated enrolment of 631 pupils in private and parochial schools.

The public schools of *Hudson*, classed as primary, grammar, and high, were taught a term of 203 days in 8 buildings affording seats for 1,416 pupils. The estimated value of all property used for school purposes was $38,500. About 680 pupils were enrolled in private and parochial schools.

Ithaca reports an increase of 77 in youth of school age, of 28 in the number enrolled in public schools, and of 12 in average attendance. There was an increase in the number of days of absence, but diminished tardiness. The sanitary condition of the school buildings received careful attention and great improvements have been made within the last few years in respect to lighting, seating, warming, and ventilating. Very young children are taught reading objectively, the written names being associated with the objects represented by them. In the more advanced grades methods of instruction have improved; in English, pupils are taught to use language correctly before they take up technical grammar; in history, the endeavor is made to awaken a desire to know much more about persons and events than the text books contain; and birthdays of noted authors are set apart for memorizing and reciting choice selections from their writings. In the high school a few minutes each morning and an hour on Friday afternoons are devoted to talks by the pupils, who are expected, when called upon, to give extemporaneously what they have prepared.—(City report.)

The *Kingston* schools report a public school enrolment the same as in 1881, tardiness much less, order generally excellent, and corporal punishment seldom used. Commendable progress was made in drawing and good work was done in vocal music.—(City report.)

Lockport reports primary, grammar, and high schools taught for 194 days in 7 public school buildings affording 2,667 sittings for study and valued, with other property, at $105,000. About 500 pupils were enrolled in private and parochial schools.

Long Island City reports an increased enrolment of 353 in public schools and 9 more pupils in average daily attendance. The teachers showed more earnestness and diligence in their work and greater interest was taken by pupils in their studies. The expense for school books was 50 per cent. less than in previous years, a fact that is given as an indication that the character of teaching had improved.

In *New York* 298 schools under the supervision of the board of education and sharing in the public school funds reported an enrolment of 298,917 pupils, with 138,329 in average attendance, an increase for the year of 14,018 in enrolment and of only 3,769 in average attendance. Of these schools 48 were corporate, including industrial and reformatory schools, orphan asylums, &c.; 27 were evening schools; 2, a normal college and a training department; 1, a nautical school; 103 were grammar, 113 primary, and 4 colored schools. The grammar, primary, and colored schools report an increase for the year of 5,203 pupils in total enrolment, of 3,345 in average enrolment, and of 2,983 in average attendance, 91 per cent. of the average enrolment having attended every session during the year. About 66 per cent. of the pupils belonged to primary grades and 34 per cent. to the grammar schools, the same proportion as during 1881. Only about 26 per cent. of pupils who commence the lowest grammar grade enter the highest. Of the 3,544 teachers in all the schools sharing in public funds, 2,996 belonged to the primary, grammar, and colored schools and the training department, 209 of them being men and 2,787 women. Of 199 licenses to teach conferred during the year, 141 were given to women, of whom 49 were graduates of the Normal College. Provisional certificates, good for 6 months, are usually given to beginners; and, after satisfactory evidence of ability to teach and govern schools, a permanent license is given, which remains in force as long as the teacher retains the position and does good work. Teachers can only be removed for cause after a hearing and on the decision of the city superintendent and two inspectors, from whom an appeal lies to the State superintendent; by this stability in the ten-

ure of office a better quality of instruction is secured than would otherwise be possible. All the public schools improved in reading, the primary schools in spelling also, and nearly all in discipline, writing, and arithmetic. Discipline is carried on without corporal punishment, which is prohibited; pupils are kept so busy that there is little time for disorder or mischief. Only 10 classes out of 2,567, enrolling 20,000 children, or less than one-half of 1 per cent. of the classes, were found, on examination, to be notably deficient in discipline; and this result was obtained without frequent resort to suspension, there having been only 87 cases of this during the year. Marked progress has been made during the past 5 years in drawing, which is by State law a part of the course of study in all city public schools. Of the 2,500 classes examined in 1882, the work of 83 per cent. was excellent; of 15, good; and of 2, either fair or indifferent. The method of teaching music had also improved: there was less memorizing of exercises, with more attention to reading music at sight. Good results are reported in the study of German and French, which are taught in 86 out of the 103 grammar departments — German in 75, French in 11 — 29 special teachers being employed. The law allows the introduction of these branches as optional studies in any grammar department in which they are desired by the parents or guardians of at least 30 pupils. Improvement is reported in the sanitary condition of many of the schools. The means of ventilation were as good as in most public buildings; the modes of egress were, as a rule, ample; and the careful attention given to sanitary matters had favorably affected the health of pupils. Still there were some overcrowded class rooms, principally in the primary departments, showing the necessity for several additional school buildings.

The 27 evening schools, with 18,792 enrolled and 6,833 in average attendance, were divided into senior and junior schools; the former, having an optional course in reading, arithmetic, penmanship, book-keeping, and composition, admit only pupils 16 years old and over; the latter have a graded course in the elementary branches and admit pupils 13 to 18. In all there were classes for the instruction of foreigners learning English. The superintendent reports excellent discipline and instruction and general results fully justifying the expenditure for the support of evening schools. The 48 corporate schools enrolled 27,673 pupils, of whom 9,690 were in average daily attendance, under 204 teachers. Of these, 21 were sustained by the Children's Aid Society and 12 by the American Female Guardian Society. The instruction, which is improving year by year, was reported either excellent or good during 1882 in all the schools of the Children's Aid Society and in all but one of the Female Guardian Society. Classification and methods of instruction now conform to those of the public schools. Thousands of children who would otherwise find it difficult to attend school are instructed, some being able to attend only half a session each day, others even less.

The nautical school gave instruction to 98 boys during the year in the common English branches, as well as in practical seamanship. This school, established 9 years ago for the purpose of teaching seamanship to such young men as wish to become sailors, has proved a success. The demand for its graduates now exceeds the supply.

The board of education has made the enforcement of the compulsory education law one of the duties of the city superintendent, who is assisted in it by 12 agents of truancy. Their work during the year 1882 was satisfactory, both in character and amount. The efficiency of the truancy department increases with time and experience, though the complete enforcement of the law is an impossibility in some wards, inasmuch as the school accommodations are not sufficient for the children who desire to attend. The number of non-attendants placed in school during the year was 882, an increase for the year of 480. Nearly half of these were children of Italian birth or parentage, and about 800 other Italian children were placed in school by their parents, who had been aroused by the measures taken to secure attendance. During the year 2,495 cases of truancy received attention, and 1,617 of these were believed to be corrected, having been reported only once; of 878 who were reported more than once, 345, or 18 per cent. of the total number, were regarded as more or less incorrigible, a large decrease when compared with the returns of the previous year. Twice a year, and oftener if necessary, an examination is made into the condition of children employed in manufactories and other establishments. Employers cheerfully give their assistance in securing the enforcement of the law forbidding the employment of children who have not the certificates required. The good influence of the compulsory education act is shown by the fact that there were 1,764 fewer arrests and commitments of children 8 to 14 during the 5 years after its passage than during the 5 preceding years, a decrease of 29 per cent. The superintendent recommends the establishment of a reform school and three schools for truants or non-attendants, who are to be from them transferred to the public schools on proof of amendment, or, if incorrigible, to the reform school for confinement, discipline, and instruction.— (City report, 1882.)

Oswego.—Public schools, classed as primary, grammar, and high, were taught 194 days in 14 school buildings, capable of seating 3,610 pupils and valued, with other school prop-

erty, at $173,880. Over 1,300 pupils, it is estimated, were attending private and parochial schools.

Poughkeepsie reports a prosperous year in the public schools, progress having been made in all the grades, the most marked being in reading, writing, and drawing. The half day plan for the younger children proved satisfactory, resulting in a continued increase in promotions, good health of the children, and in a reduction of expenses; had it not been adopted, additional buildings must have been provided. The public library is extensively used and received from citizens important gifts both in money and books. There were 33,636 volumes circulated during the year, of which 21,221 were fiction, 6,630 juvenile, and 5,785 miscellaneous.—(City report.)

Rochester reports public schools, classed as primary, grammar, and high, taught 196 days, in 27 buildings, containing accommodations for 13,030 pupils and valued, with other property, at $501,039. There was an estimated enrolment in private and parochial schools of 3,500.

In *Rome* the public schools, classed as primary, grammar, and high, were taught 197 days in 8 buildings, capable of seating 2,000 pupils and valued, with other school property, at $71,000. About 365 pupils attended private and parochial schools.

In *Syracuse* the total public school enrolment was slightly greater than during the previous year. The percentage of attendance on the average number belonging (96) remained about what it had been for a number of years past. Comparing the average number belonging with the enrolment, or the latter with the school population, the figures are not so favorable: only about 80 per cent. of the number enrolled were in average attendance, only a little over 50 per cent. of the youth of school age were enrolled, and only 186 of the whole number were over 16 years of age. More than ample accommodations are provided, there being 1,092 more seats than the average number belonging and 1,430 more than the average daily attendance. Some needed repairs were made in the school buildings; and here, as elsewhere, increased attention has been given to the sanitary condition of the schools, particularly in regard to the care and preservation of the eyesight of pupils. The high school had 483 pupils enrolled, 346 in average attendance, and graduated 45; the department for the training of teachers graduated 23. An ungraded school which had been sustained for 20 years past for the benefit of boys and young men who were employed during the greater part of the year, and which usually enrolled from 50 to 150 pupils, was discontinued in 1882 for want of funds. The evening school would also have been suspended for the same cause but for the generosity of Mr. William A. Sweet, who furnished means to pay the teachers. The school was open 4 months and gave instruction to 30 or 40 young men 4 evenings of the week.—(City report.)

Utica reports 34 public schools, including primary, intermediate, advanced, academic, ungraded, and evening schools, a slight increase in enrolment, and a decrease in the number of cases of tardiness, which amounted to only 1 for each pupil, while 10 years ago there were 3 for each. The results of the year's work are considered very satisfactory. There was a general interest in the cause of education, and the people responded promptly to every demand for the improvement and extension of school facilities. An increase of population had rendered necessary additional school accommodations and a new building had therefore been commenced. The sanitary condition of the schools was satisfactory. The annual examination showed that progress had been made in every department of study and especially in spelling. Two evening schools had 334 pupils enrolled. The academy had 172 in attendance and graduated 42, of whom 26 had completed a 4-year course, 8 one of 3 years, and 8 a normal course of 2 years. The city library was reported in good condition. There was a marked improvement in the choice of books, the call for works of light fiction having been reduced from 68 to 54 per cent.

TRAINING OF TEACHERS.

STATE NORMAL SCHOOLS.

Eight normal schools have been established by the State, situated at Albany, Brockport, Buffalo, Cortland, Fredonia, Geneseo, Oswego, and Potsdam. An annual allowance of $18,000 is made by the legislature to each school, besides special appropriations, which are granted from time to time. The State superintendent has the supervision of all these schools, the regents of the university being associated with him in the case of that at Albany. These schools enrolled 6,170 pupils during the year, of whom about 3,000 were engaged in normal studies, preparing to teach, and 246 (49 men and 197 women) were graduated. The Albany school has graduated 2,584 pupils since its opening in 1844; the Brockport school, 281 since 1867; Buffalo, 242 since 1871; Cortland, 343 since 1869; Fredonia, 300 since 1868; Geneseo, 204 since 1871; Oswego, 1,060 since 1863, and Potsdam, 235 since 1869, a total of 5,249 graduates since the establishment of the first school in 1844.

In view of the fact that only 1,183 of the 31,233 teachers employed in the State during the year were graduates of the normal schools, the question has been asked whether these schools are worth what they cost. But the State superintendent suggests that in answering this question it should be borne in mind that the many who attend only a few terms and engage in teaching before graduating derive much benefit from their limited course and are far better teachers than they could be without such training; also, that those schools which are taught by persons who are graduates of normal schools are practically subnormal schools, and thus the influence of the system is extended.

To gain admission to these schools pupils must be at least 16 years of age (the Albany school requiring young men to be 18) and have good health and average abilities; they must pass a fair examination in reading, spelling, geography, and arithmetic (as far as the roots), and be able to analyze and parse simple sentences. Each county is entitled to twice as many pupils as it has representatives in the assembly. Appointments are made by the State superintendent, subject to the required examination, on the recommendation of the several school commissioners or city superintendents of schools, whose duty it is to use every reasonable means to secure the selection of suitable candidates. Tuition and the use of text books are free, and to those who remain a full term the amount of fare necessarily paid in travelling is refunded.

Three normal courses of study are arranged, an elementary of 2 years, an advanced English of 2, and a classical of 3, the last two courses requiring a preliminary examination on the first year of the elementary course. The school at Albany provides a single course; the other schools had students in both elementary and advanced courses. Besides the above strictly normal courses of study there are academic departments connected with all these schools, except those at Albany and Oswego. All have schools of practice attached to them, those at Oswego and Fredonia including also Kindergarten departments. The Potsdam school superintendent reports certain changes made during the year in the building, rendering it more convenient, and the beginning of a natural history museum. Methods of teaching geography and grammar were improved, there was a larger enrolment of normal and academic students than ever before in the history of the school; and a demand arose for teachers for union and graded schools, especially for those fitted to teach Latin and Greek, which it was impossible to supply. Greater attention is to be paid hereafter to methods, rendering the school more strictly normal.

OTHER NORMAL TRAINING.

The New York *Normal College* has come safely through the transition from a 3 to a 4 year course of study. By this change it is hoped to reduce the number of graduates until the supply shall be only sufficient to meet the demands of the public schools, besides giving the apprentice teachers an additional year of training. Notwithstanding this lengthening of the course the number of students increased during the year from 1,214 to 1,435. Such was the crowded condition of the college that for the first time in its history the drawing room was used for recitations; and such was the rush for admission to the model department that it became necessary to adopt measures to prevent overcrowding. That the college is doing good work is clearly indicated by the fact that parents are very anxious to have their children in its schools. During the year 1,692 children, mainly residents of the immediate neighborhood, were instructed by 588 pupil teachers, under the careful supervision of a superintendent, a teacher of methods, and 25 critic teachers. Owing to the addition of another year to the course of study there were no graduates in 1882, except 49 of the class of 1881, who chose to take the additional year as post graduates.—(Report of normal college.)

A training department belonging to the Syracuse high school, which gives a year of special study and practice in normal methods, graduated 23 pupils during the year; 8 students were graduated from the 2-year normal course of the Utica high school; and it was decided by the Albany board of education to organize a normal department in connection with the high school course of study of that city. Alfred and St. Lawrence Universities, when last heard from, provided courses of study for those desiring to become teachers, and Elmira College instituted in September, 1882, a teachers' class of 2 years.

Several schools for the training of teachers in Kindergarten work report from New York. Their statistics may be found in Table III of the appendix.

TEACHERS' CLASSES IN ACADEMIES.

Classes for the preparation of teachers are found in 80 academies and union schools. A law of 1877 authorizes the regents of the university to designate those schools in which instruction shall be given in the science and practice of common school teaching. Until 1882 no provision for their supervision had been made, although the want of it had been long felt. The present law provides that each class shall be subject to the visitation of the school commissioner of the district in which the academy or union school is situated; he

is also required to assist in the organization, management, and final examination of the classes, and to report thereon to the regents of the university.

TEACHERS' INSTITUTES.

Teachers' institutes were held during 1882, as in the previous year, in 58 counties; in 1882 they numbered 73 and enrolled 13,231 teachers, a slight increase over the attendance of the previous year. The cost to the State was $16,040.72, or an average of $276.56 for each county and of $1.21 for each teacher. The importance of these institutes is insisted on by the State superintendent and by reports of institute conductors published by him. One says the testimony as to their good results from commissioners, trustees, and patrons of schools is nearly universal. Another says that besides the original purpose of the institute, that of assisting young and untrained teachers, institutes have supplied a need felt by all classes of teachers, afforded a means of disseminating the latest views of teaching, of making general the gains in particular places, of unifying the teaching over wide areas, and of stimulating teachers to increased efforts. Another reports that institutes have resulted in an increased use of improved processes of school work not only in cities and villages, but in country districts, and in a marked increase of teaching power among teachers.

EDUCATIONAL JOURNALS.

Much educational information, very useful to teachers, was furnished in 1882 by the following educational journals: The School Bulletin, organ of the State Teachers' Association, a monthly, in its eighth volume; the School Journal, published weekly at New York City, in its twenty-fourth; the Teachers' Institute, published monthly at the office of the School Journal, in its fourth; the Kindergarten Messenger, published monthly at Syracuse, in its sixth; the Industrial News, published monthly by the Inventors' Institute, Cooper Union, New York City, in its third; the Scientific American, New York City, in its forty-sixth; the Penman's Journal and Teachers' Guide, New York, in its sixth; and The American Missionary, under the American Missionary Association, in its thirty-sixth. The last gives information in regard to the instruction of the colored race, the Indians, and the Chinese, but is specially devoted to the interests of the colored people.

SECONDARY INSTRUCTION.

ACADEMIES AND HIGH SCHOOL DEPARTMENTS.

Reports were received by the regents of the University of New York from 84 academies and 173 academical departments of union schools which were entitled to receive aid from the public school funds, all having an enrolment of 34,257 pupils, under 1,304 teachers, 9,874 of the students being allowed as academical out of 10,175 claimed as such. The academies are incorporated institutions, managed by boards of trustees; the academical departments are a part of the public school system and supported by taxation, but under the visitation and inspection of the board of regents in respect to their educational affairs and sharing equally with academies in the distribution of the literature fund. The conditions under which charters may be granted to academies and academical departments received under visitation were amended by the regents in July, 1882, with a view to raising their standard. The changes, however, refer chiefly to the equipment of the institutions, the old regulations having been made nearly half a century ago, when the State was poor and sparsely populated. Under the new rules academies must possess at least $5,000 above all encumbrances; their debts must not exceed one-third of the value of their property, which must include buildings worth at least $2,000, a library of suitable books, worth at least $500, and apparatus of equal value for instruction in physics, chemistry, and natural history. It must also appear that there is a reasonable prospect that the institution will be suitably supported and that it will be attended by at least 25 academical students.

The regents renew their recommendation to the legislature that measures be taken to increase the amount for distribution among the academies. The income available from the literature fund, $12,000 annually, is increased from the United States deposit fund to the sum of $40,000. This was the amount fixed on in 1840, when there were only 133 academies to participate in the distribution and only 10,881 scholars in attendance, the average amount for each academy in 1840 being $338, while for 1883 it will be only about $155.

OTHER SECONDARY SCHOOLS.

For statistics of business colleges, private academic schools, preparatory schools, and preparatory departments of colleges, see Tables IV, VI, VII, and IX of the appendix; and for summaries, see the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

UNIVERSITY OF THE STATE OF NEW YORK.

This university, which is unique in character, was organized in 1784 and reorganized with enlarged powers and duties in 1787. It is composed of all the colleges, academies, and academic departments of union schools established in the State. The institutions included under the term college are such as are legally incorporated and possess the power to confer collegiate degrees; they include, therefore, colleges of arts, law schools, medical schools, and professional schools of science, but not schools of theology. A law of 1882 provides that hereafter no literary or scientific college shall be incorporated under the general act without the approval of the regents of the university.

The colleges of liberal arts incorporated in the university numbered 22; the instructors in them, 363; the students, 3,769; the graduates of 1882, 503; the whole number graduated from the beginning, 16,631.

The amount of property owned by all the collegiate schools under the regents' care, including schools of law, of medicine, and of pharmacy, as well as those of literature and science, was estimated in 1882 at $22,955,943, exclusive of debts, an increase of $4,432,265 over the valuation of 1881. Adding the property of the academic schools ($3,046,912 over debts in 1882) there was a total of $26,002,855 under the university system of the State. Cornell and Columbia together held property valued at $12,241,768.

LITERARY COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

Of this class there were in 1882 connected with the university 17, which, given in the report for 1881 in the order of their age, are arranged alphabetically by their post offices as follows: Alfred University, Alfred; St. Bonaventure's College, Allegany; St. Stephen's College, Annandale; St. Lawrence University, Canton; Hamilton College, Clinton; St. John's College, Fordham; Hobart College, Geneva; Madison University, Hamilton; Cornell University, Ithaca; College of St. Francis Xavier, College of the City of New York, University of the City of New York, Columbia College, and Manhattan College, all in New York City; University of Rochester, Rochester; Union University, Schenectady (with professional schools at Albany), and Syracuse University, Syracuse.

Of the 17 mentioned, 13 were for young men and 4—Alfred, St. Lawrence, Cornell, and Syracuse—admitted young women also. In the whole 17 there were for 1881–'82, under 281 instructors, 3,198 students, of whom 435 were graduated. For the prevailing religious influences, if any, in the several colleges named, see Table IX of the appendix.

Six Roman Catholic colleges—St. Francis College and St. John's College, Brooklyn; Canisius College and St. Joseph's College, Buffalo; St. Louis College, New York City; and the College of our Lady of Angels, Suspension Bridge—and the Collegiate and Polytechnic Institute, Brooklyn (non-sectarian), are placed by the regents' report in the list of academic institutions.

All the colleges gave instruction in French and German, as well as in the traditional Latin and Greek, St. Stephen's, which prepares for a theological course, substituting Hebrew for German. Hobart College, preparing also to some extent for theological study, offered preliminary training in Hebrew, which language was offered, too, at Alfred and Madison Universities and at St. Bonaventure's College, all of which had theological courses. Sanscrit was offered at Cornell University and Columbia College, and Anglo-Saxon at both of these, as well as at Hobart College and Madison and Syracuse Universities. These offers were availed of at Columbia at least, which taught also Danish, Spanish, and Italian, and offered Icelandic. Cornell offered Swedish, Spanish, and Italian.

The College of the City of New York, formerly open only to students from the public schools, was in 1882 opened to all duly prepared male students residing in the city.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Of the high grade collegiate schools that go to make up the 22 in the university, 5 are for young women only, namely: Wells College, Aurora; Elmira Female College, Elmira; Ingham University, Leroy; Rutgers Female College, New York City; and Vassar College, Poughkeepsie. All have courses embracing the full 4-year classical curriculum, with French and German (usually optional, instead of Greek), drawing, painting, and music, and they are all well equipped for their work. The requirements for admission at Ingham and Rutgers are considerably lower than at the 3 other institutions, where they are as high as is usual in the better class of colleges for men. The property of Vassar was valued in 1881–'82 at $1,019,572, and it received that year $3,000 for a scholarship fund. Wells College came into possession of $100,000 for endowment, additional to a like sum previously received from the same person (Hon. Edwin B. Morgan) for the same purpose; the gifts of Mr. and Mrs. Morgan to the college aggregate over

$260,000. In these 5 colleges there were for the year 80 instructors and 569 students, of whom 56 were graduated.

Besides the 5 regents' colleges, 21 other schools for young women claim place among those giving superior instruction, for statistics of which, see Table VIII of the appendix.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The United States Military Academy, West Point, established to train skilled officers for the Army, gives this training in a 4-year course, including the study of the English, French, and Spanish languages; international and military law; mathematics; drawing; natural and experimental philosophy; geography, history, and ethics; chemistry, mineralogy, and geology; tactics; civil and military engineering; ordnance and gunnery; and practical military engineering, military signalling, and telegraphy. The examinations are rigid, and students failing any year to reach the standard for promotion are turned back for at least another year of study or discharged. Out of the graduating class of 37 in June, 1882, 11 had been in the academy more than 4 years and 13 of its original members were in the following class. There were 191 students in 1881–'82, under 47 instructors.

The scientific instruction given under the university system of the State comprised (1) courses of general science in 17 collegiate schools belonging to the university, which were of 3 to 4 years in duration and differed from the classical courses mainly in the substitution of French or German for Greek or of both French and German for Latin and Greek, sometimes with mathematics and natural sciences in place of literary studies; (2) courses more specifically scientific, such as the courses of 4 years each at Cornell University in agriculture, in architecture, in mechanic arts, in civil engineering, in analytical chemistry, in chemistry and physics, and in natural history; and the 6 others, also of 4 years, at Columbia College, in mining engineering, civil engineering, metallurgy, geology, analytical and applied chemistry, and architecture. Besides, there were civil engineering courses of 4 years each at Union College, Schenectady; at Syracuse University, Syracuse, and at Rensselaer Polytechnic Institute, Troy, with one of 3 years at the University of the City of New York and a graduate course of 2 years in the College of the City of New York. Columbia College had a school of political science for graduates, with a 3-year course leading to the degree of PH. D.

For statistics of scientific schools, see Table X of the appendix; for a summary of them, a corresponding table in the report of the Commissioner preceding.

PROFESSIONAL.

Theology.— A graduate course in theology of 1 year at St. Lawrence University, Canton (Universalist), and courses of 3 years, meant to follow a collegiate course, were continued in 1881–'82 in connection with St. Bonaventure's College, Allegany (Roman Catholic), and Madison University, Hamilton (Baptist), of the institutions forming a part of the University of the State of New York. Besides these there were the following theological schools: Auburn Theological Seminary, Auburn (Presbyterian); De Lancey Divinity School, Geneva (Protestant Episcopal); Hamilton Theological Seminary, Hamilton (Baptist); Hartwick Theological Seminary,[1] Hartwick (Lutheran); General Theological Seminary of the Protestant Episcopal Church, New York; Union Theological Seminary, New York (Presbyterian); Rochester Theological Seminary, Rochester (Baptist); Christian Biblical Institute, Stanfordville (Christian); St. Andrew's Divinity School, Syracuse (Protestant Episcopal); Seminary of Our Lady of Angels, Suspension Bridge; and St. Joseph's Provincial Seminary, Troy (Roman Catholic). All appear to have had 3-year courses except the Roman Catholic, which mingle collegiate and theological training. Union Theological Seminary, New York, has beyond its 3 years a graduate course of another year.

Law.— Four schools of law connected with the University of the State of New York for 1881–'82 reported to the regents 609 students, under 24 instructors, and 245 graduates, making a total of 2,850 graduates in law since the establishment of the university. These schools are the Albany Law School, Albany, a department of Union University; Maynard-Knox Law School of Hamilton College, Clinton; School of Law of Columbia College, New York; and the department of law in the University of the City of New York. All had, for the year reported, courses of 2 years, covering 35 to 38 weeks each year, for students that had no preliminary legal training, Albany taking off a year for any one that had previously read law for that time. Columbia required an examination for admission of students not shown to be college graduates who seek to get a degree from the law school, this examination being in the literary studies preparatory to the collegiate course. Its subsequent course appears to be exceptionally thorough also.

[1] A German-Lutheran theological school is also connected with Martin Luther College, Buffalo.

Under the laws of New York State, admission to the bar is regulated by the court of appeals, which promulgated amended rules to take effect July 1, 1882. These provide that a person must show his fitness to begin the study of the law by passing the regents' examination, unless he is a college graduate, after which, being over 18 years of age, he must serve a regular clerkship of 3 years in an attorney's office, or 2 years if a college graduate. Time actually spent in a qualified law school in operation 8 months of each year will be accepted in lieu of that required in the clerkship, but "in no case shall an applicant be entitled to admission as an attorney and counsellor without having served a clerkship in the office of a practising attorney of the supreme court for the period of at least 1 year." Vacations of the law school may be utilized in serving the clerkship. On completing his preparation, the applicant must pass an examination in the law, conducted by the judges of the supreme court at a general term or by not less than 3 practising lawyers, of at least 7 years' standing at the bar, appointed by the court.

Medicine.—Out of 17 colleges connected with the university the education in which is in some branch of medical science and the degree from which is a medical degree, 15 reported to the regents for 1881–'82 a total of 258 instructors and 3,127 students, of whom 949 were graduated, making 15,409 graduates since the foundation of these colleges. Of the schools reporting, 7 were "regular;" 2, eclectic; 1, homœopathic; 1, dental; 2, pharmaceutical; and 2, veterinary. One homœopathic college, not reporting to the regents but sending its statistics to this Bureau, adds 21 instructors, 42 students, and 10 graduates to those above given; besides which the Woman's Medical College of the New York Infirmary, not on the regents' list, and yet a high grade school, reports 22 instructors, 41 students, and 9 graduates. The figures of these schools, added to the regents' summary, make 301 instructors, 3,210 students, with 968 graduates for the year and 15,428 from the beginning.

As a rule, these schools continued to require 3 years of study under a medical preceptor and attendance on 2 regular lecture courses covering from 20 to 35 weeks each. This last (which was the highest) requirement as to time was in the medical department of the University of Syracuse, next to which in this respect came the Woman's Medical College of the New York Infirmary, with 34 weeks. Both require preliminary examinations of students that present no evidence of literary qualifications and both have graded courses of 3 years, with examinations at the close of each year for promotion and graduation.

The diplomas of the College of Physicians and Surgeons, Buffalo (eclectic), and the United States Medical College, New York, of the same school of practice, are not recognized by the Illinois State board of health as valid in that State.

SPECIAL INSTRUCTION.

EDUCATION FOR POLITICAL LIFE.

This went forward, as in 1880–'81, at Cornell University, Ithaca, and at Columbia College, New York City; at the former, in a course in history and political science that covered 4 collegiate years, the requirements for entrance being those of the course in arts and course in science combined; at the latter, in a school of political science that covered 3 years from the opening of the fourth collegiate year. The studies at Cornell were for the first 2 years largely in language and history; for the last 2, in American history and in political science, theoretically and historically considered. At Columbia the first 3 years are those of the collegiate course; the remaining 3 embrace subjects proper to a course in political science.

TRAINING IN FINE ARTS.

The *College of Fine Arts, Syracuse University*, continued in 1882 its 4-year courses in architecture, painting, and music, the schedules in which indicate especial thoroughness. Wells College, Aurora, had still its instruction in painting, drawing, and music in its college of fine arts and conservatory of music; Elmira College, in its school of arts of design and school of music; and Rutgers Female College, New York, and Vassar College, Poughkeepsie, in departments of drawing, painting, and music.

The *University of the City of New York* taught painting and drawing in its school of art, under a highly trained instructor, and, in common with Cornell University, Columbia College, and the College of the City of New York, taught architectural, free hand, and mechanical drawing in its civil engineering course.

The *Art Students' League*, New York, is reported to have had 100 different models employed in the life and portrait classes of 1881–'82, starting a still life class in connection with the latter. Its painting class had 77 members; the antique class, 152; the sketch class, 80; the composition class, over 50. The school had a reserve fund of $5,000.

The *American Art School*, New York City, offered instruction in free hand drawing and all branches of painting, including mineral, oil, and water colors, with coloring for photographs; also, in wood carving, etching on linen, and all styles of art needlework.

The *Decorative Art Society*, Buffalo, had classes in drawing, designing, sketching from life, flower tapestry, and china painting, embroidery, and clay modelling.

In the *Misses Osgood's Art School*, New York, instruction was given in painting on silk, satin, and plush with oil and water colors; in object drawing, crayon, landscape and figure painting, painting on china, tapestry, wood carving, &c. The school is open summer and winter, and since its opening to June, 1882, 9,000 lessons are said to have been given. Other statistics are wanting.

The *Woman's Institute of Technical Design*, New York City (established 1881), in 1881–'82 gave instruction to 41 pupils in designing for carpets, wall paper, lace, silk, chintz, calico, oilcloth, linoleum book covers, wood carving, embroidery, &c. A Jacquard loom was used for demonstrating, and it was said that its value to the pupils could not be overestimated. The effort was to make the course of instruction thorough in all its details, its aim being to fit graduates to fill positions in the design room for any branch of industry which they may have pursued in the institute. There were 475 drawings made by the pupils during the school year. A course of adjunct lectures was given by practical workmen in the different designs, which was largely attended by the pupils and their friends. Of the 41 pupils of the institute, 32 received certificates.

TRAINING FOR SEAMANSHIP.

The Nautical School of the Port of New York, meant to train pupils in the elements of an ordinary school course as well as in the science and art of navigating and managing a ship, had in 1882, the ninth year of its existence, 98 pupils, a diminution of 9 from the preceding year. It is housed in the school ship St. Mary's, loaned for the purpose by the United States Government, and spends about 6 months each year in school work and the same in practical seamanship. The demand for graduates from it is said to far exceed the supply.

SPECIAL INSTRUCTION IN MUSIC.

The New York College of Music, incorporated by the State, 1879, in New York City, offered a thorough course of instruction in vocal and instrumental music. The building is adapted to the methods of the institution, permitting separate lessons to be carried on in all departments of music at once, without one disturbing another. The present accommodations and faculty are sufficient for the separate individual instruction of 700 students. Public benefit concerts are to be given by the students for the endowment of a scholarship fund, the benefit of which will be awarded only to pupils of exceptional talent and limited means. Diplomas in art and degrees in music are conferred on the recommendation of the director and faculty, under the authority of the State. The total number of students under instruction at the college in 1881–'82 was 854.

From the Baxter University of Music, Friendship, no information for 1882 has been received, nor any from the Voght Conservatory of Music, New York.

INDUSTRIAL TRAINING.

Cooper Union, New York City, besides 936 in a free scientific course and 60 in a free class of telegraphy, taught 1,227 in its free evening art classes and 711 more continuously in its art schools for women, all meant to prepare for profitable industrial work and in many instances securing it. Two hundred were taught also in a literary class, and as many more in a class in elocution. A free reading room, visited by about 1,500 readers daily for current publications, and a library of the established literature of the language and of books in popular science and knowledge aided still further in the work above indicated.

The *New York Trade School*, occupying a building erected in 1881 by the founder of the school, R. T. Auchmuty, aimed to make efficient and practical mechanics who might become self supporting tradesmen. Instruction was given in bricklaying and sanitary engineering, house, sign, and decorative painting. There were also special courses in mixing colors, in fresco painting, and in polishing and repairing hard wood. During 1881–'82 there were 52 young men instructed in the school.

The *Kitchen Garden Association*, New York, has in that city a school for teaching girls the various branches of household industry by an adaptation of object teaching. The instruction is embodied in 6 lessons, each requiring one month's application. These lessons comprehend the details of chamberwork, sweeping, dusting, and arranging rooms, washing, preparing and cooking meats, and making pastry. The work for the last year is said to have been in every way successful, and through this simple Kindergarten system the children acquire the order and neatness essential to household service. The society has also aided in organizing like schools in various other cities through the agency of a travelling teacher of the system.

The *Workingmen's School*, established by the Society for Ethical Culture at New York

City, combines common school studies with industrial training, laying the foundation of instruction in the Kindergarten and carrying it on in graded courses of 2 years each. In the first 2 years (from 7 to 9 years of age) clay prepared for the purpose is used instead of wood, with suitable tools for the work; from 9 to 11 the children use wood and a small saw; from 11 to 13, the scroll saw, to work in wood at first and later on in zinc. At 13, beginning the seventh school year, the pupils are admitted into the large field of carpentry, with the complete outfit of a workshop. No statistics of the number of youth in training have been received for 1882.

The *Children's Aid Society of New York City*, recognizing that the criminal classes are filled from the neglected and outcast children of the city, has sought by early care and instruction of the young to prevent crime, reasoning that it is more economical to check it in its beginning by care than in its advanced stages by punishment. Some of the results of its labors are that during the 28 years of its existence 1,343,166 lodgings have been furnished, 14,832 wandering boys have been returned to their friends, and 20,720 boys have saved and placed in the bank $55,567; that hundreds of thousands have been trained in its 21 industrial schools or taught in its 13 night schools; and that thousands have been refreshed and restored to health by its Sick Mission and Summer Home. During the year 1881–'82 8,456 boys and 1,058 girls were sheltered, fed, and instructed in the lodging houses, of whom 1,392 were furnished employment and homes in the country and 571 returned to their parents and friends. In the industrial schools there were 9,337 boys and 4,631 girls taught during the year by 89 teachers, with an average daily attendance of 3,676 pupils. In the sewing machine school, instruction was given to 323 girls, while others were taught dressmaking and laundry work. The Italian school had an average attendance of 706 pupils, and through the efforts of the Italian truant officer the streets are gradually being relieved of Italian vagrant children, whose education and industrial training form an important branch of the work of the society.

The *Brooklyn Children's Aid Society* has two industrial schools for children, in which the pupils are not only instructed, but clothed and fed at need; a sewing machine school for girls; an evening school for newsboys; and a kitchen garden for very young children. In the sewing machine school 305 girls received lessons and 723 different children were in the industrial schools.

The *Brooklyn Industrial School Association* in its twenty-eighth annual report gives 1,079 as the number of children in attendance during the year in its 6 schools. Five of these schools were attended by pupils who had homes, the other was for the inmates of the Home for Destitute Children belonging to the association.

The *Industrial School Association of Brooklyn* reported 269 children cared for during 1881–'82 and 216 instructed in reading, writing and sewing in its school.

The *American Female Guardian Society*, New York City, for 1881–'82 had in its 12 industrial schools about 5,221 children too poor to attend the public schools, with an average attendance of more than 1,725, under 50 teachers.

The *House of the Good Shepherd*, Tomkins Cove, trains poor children of either sex for farmwork, for service, or for trades. It had 19 boys and 17 girls.

The *Five Points House of Industry*, New York City, taught 1,078 pupils in 1881–'82, with an average attendance of 377. There were 234 women, 340 boys, and 208 girls in the house. Besides common school studies the boys were taught printing; the women and girls, sewing and housekeeping. Religious training was also a feature of the institution.

The *Hebrew Benevolent Society*, New York City, reports that of 187 inmates in its orphan asylum (for boys) 130 were taught in the public schools and 57 in its home school, that in an industrial school 16 were trained in shoemaking or printing, and that of 115 girls in the female department 105 were taught in city primary and grammar schools and 1 at the Normal College, 9 remaining at the home.

The *General Society of Mechanics and Tradesmen of the City of New York*, in its ninety-eighth year, reports a school prosperous in condition and satisfactory in every branch, with an average attendance higher than for many previous years, but does not give statistics (except of $3,211 expended for salaries and supplies). The school consisted of a male department, in which instruction was given to a large number of young men and boys in free hand, mechanical, and architectural drawing, and of a female department, in which drawing from objects and designing are the principal studies.

Wilson Industrial School, for girls, New York City, in its day schools instructed 200 girls in elementary English branches, while in a kitchen garden they were taught household duties.

The *Industrial School of Rochester* still maintained its benevolent care of the poor and destitute children in the city, training them as far as possible in the simple industries of household life through kitchen garden and sewing instruction classes.

INSTRUCTION OF THE BLIND.

The number of pupils in the New York Institution for the Blind in 1881–'82 was 231. Of these, 22 were dismissed, leaving 209 under instruction at the close of the year. The school is graded, beginning with a Kindergarten and advancing on through a normal training department. Vocal and instrumental music were given, also industrial and physical training. Discipline was maintained without corporal punishment of any kind.

INSTRUCTION OF THE DEAF AND DUMB.

There were 1,333 pupils under instruction in the several institutions for the deaf and dumb during the year, of whom 738 were State pupils and 368 county, besides whom 122 were supported by the State of New Jersey and 105 by parents and friends.

Of the above number, 500 pupils were in the institutions at Washington Heights, New York City, 184 being females and 50 semi-mutes, all taught by 20 teachers, 5 of whom were deaf-mutes and 4 semi-mutes. In addition to school duties here the boys were taught cabinet making and carpentry and the girls baking and dressmaking.

EDUCATIONAL CONVENTIONS.

UNIVERSITY CONVOCATION.

This meeting, first held August 4 and 5, 1863, and since annually continued, consists of such members of the board of regents of the university and such instructors, officers, and trustees of the colleges, academies, and other seminaries constituting the university and subject to the visitation of the regents as may in each year attend. Held under the auspices of the regents and representing their 36 colleges, with some 10,000 students, as well as 266 academies and high schools, with about 30,000 scholars, it aims to advance the standard of education, to harmonize all action looking to this end, and to recommend to the institutions which it represents such action in these directions as may be expedient and lawful. Its session of July 11–13, 1882, was opened with an address from Hon. Henry R. Pierson, chancellor of the university, which showed the prosperity of its various institutions for the year, indicated the high character of its academic principals, and gave statistics of the examinations for certificates in its academic schools from 1866 to 1882, as well as of diplomas issued up to date and for the year. The remainder of the program for the session was as follows: "Libraries and how to use them," by Principal H. C. Kirk, of Phelps Union School; "Methods of instruction in English literature," by Prof. Gilmore, of the University of Rochester; "Theories in science," by Prof. Costin, of St. John's College, Fordham; "Realism and nominalism," by Prof. Wilson, of Cornell University; "French and German in colleges and schools," by Prof. H. S. White, of Cornell; "Regents' examinations," by Principal Bradley, of the Albany High School; "Military drill in colleges and academies," by President Waterbury, of the State Normal School at Albany; "Report on normal training in colleges," by a committee of 3 college professors; "Teaching physical science in academies," by Professor Cooley, of Vassar College; "Classes for instructing common school teachers in academies," by Principal Graves, of Bainbridge Union School; "Should American colleges be open to women as well as to men?" by President Barnard, of Columbia College; with necrological notices of Regent R. S. Hale and Hon. E. B. Morgan, both prominent in State affairs and the latter very liberal to education; of Clarkson Nott Potter, a distinguished lawyer and politician, trustee of Union University; of Prof. J. W. Mears, of Hamilton College, remarkable for his metaphysical researches and ability; of Chancellor Henry P. Tappan, professor for 6 years of moral and intellectual philosophy in the University of the City of New York and subsequently head of the University of Michigan, as well as author of important treatises on education and philosophy; of Principal James P. Harrington, of the Utica Advanced School, said to have been a model teacher; and of Prof. John W. Draper, author of various scientific treatises, of the History of the Intellectual Development of Europe, History of the Conflict Between Science and Religion, and of the Civil War in America. Of Professor Draper other notice will be found in an obituary, further on.

NEW YORK STATE TEACHERS' ASSOCIATION.

This association held its thirty-seventh annual meeting at Yonkers, July 5–7, 1882. In his address of welcome Mr. Smith, the president of the Yonkers board of education found encouragement in the fact that study is made more attractive than formerly, that exertion of the mental powers has become a pleasure. Though the main function of the public school, he said, is to produce facility in a few things rather than give a smattering of many, still the whole mind must be educated. State Superintendent Gilmour responded, saying that the office of education is to elevate and advance labor

and to improve mankind. The State believes that education has a business basis and that he who would teach well must be specially prepared for teaching. President Watkins in his address said that not only intelligent but healthy citizens were demanded of the public schools and it was therefore necessary to diffuse a knowledge of the proper means of bringing up children and to select those studies which would develop the mental powers. The public school must also impart a moral character to its pupils, teaching them to love truth and hate a lie, to cultivate honesty and to be worthy of trust. Mr. Humphrey read the report of the "committee on the condition of education," saying that a marked change has been going on, the most marked being instruction in language rather than in technical grammar; that more culture is given, but that the country schools still come short of what is to be desired; and that there is in these schools a field for real missionary work. The school commissioners too, he thought, are too much under the heel of politicians, and had to make themselves popular by giving certificates where they would "do the most good;" but one real improvement is that the office of institute conductor has been created and made permanent. A report on industrial education was read, which set forth a need of revision in the system of education, that the lower grades of work of the world are shabbily done, that there is a demand for better work and better workmen, that hand labor is a powerful factor in education, and that the public school should prepare for special industrial training. At the close of this report many questions were asked, showing that great interest had been aroused. Mrs. Hunt afterwards dwelt on the need of teaching temperance. United States Senator Warner Miller gave an address on the relation of education to the government, saying that education is one of the four great departments of state government, costing more than any other; that the teacher is a public officer, and as such entitled to a respectable social position. In common with a preceding speaker, the senator advocated industrial schools. Papers were then read on "Teachers' institutes" and on "Limits of oral teaching." Mr. J. A. Nichols was elected president for the ensuing year.

ASSOCIATION OF SCHOOL COMMISSIONERS AND CITY SUPERINTENDENTS.

The school commissioners and superintendents met at Albany January 25, 1882, G. V. Chapin presiding. Out of 135 members only 40 were present. President Chapin delivered an address advocating practical methods of teaching, urging that the child be studied, his capacities ascertained, and the supervision of the schools adapted to develop spirit, energy, and knowledge. Papers on "Examining and licensing teachers" and "The way in which normal schools can best serve the State" were read and discussed at length. In the latter paper Professor Palmer suggested that normal schools should give instruction in class subjects as well as training in methods, for in an examination in Michigan only 2 teachers out of 30 were able to explain what the mental faculties are. Superintendent Sanford proposed that all persons seeking licenses as teachers should at least hold a regents' certificate of academic qualifications.

The following resolutions were adopted: (1) To request a change in the beginning of the school year; (2) to urge the passage of the bill prescribing qualifications for commissioners; (3) to secure a township system; and (4) to foster a professional spirit among the teachers. At the election of officers Mr. Edward Wait was chosen president for the ensuing year, after which the association adjourned, to meet at Little Falls.

NOTEWORTHY BENEFACTIONS.

The returns show gifts received during the year by seven colleges and universities, amounting to $183,480, as follows: To St. Stephen's College about $12,000, for annual expenses and for scholarships, most of it from the Society for Promoting Religion and Learning; to Wells College $100,000, from Edwin D. Morgan; to Hobart College a house and lot, worth about $4,000, and $480 in cash; to Cornell University, from Hon. H. W. Sage, $2,000 for the department of history and political science; to Ingham University $20,000, from various friends, to liquidate indebtedness; to Columbia College $5,000, for the equipment of a department of architecture, but only to be applied to the purchase of models and drawings; and to Syracuse University $40,000, from several friends, to endow a professorship of Greek and ethics.

OBITUARY RECORD.

JOHN W. DRAPER.

Prof. John W. Draper, M. D., LL. D., died at his home, at Hastings-on-the-Hudson, January 4, 1882, in the seventy-first year of his age. Born at St. Helen's, near Liverpool, Eng., in 1811, he came to this country with his family in 1833. In 1836 he graduated in medicine at the University of Pennsylvania; became professor of chemistry and physi-

ology in Hampden Sidney College, Virginia, returning in 1839 to New York, to fill a like position in the University of the City of New York, in which he remained until his death. Dr. Draper's favorite study was chemistry, but his researches embraced a wide range of natural sciences. In spectrum analysis and photography his discoveries were of special value; he was the first to obtain a photographic picture from life, and also the first to secure a photograph of the moon in 1840, ten years before De la Rue, to whom Europeans ascribe the first success. His researches through the spectroscope were the first on this side of the Atlantic. He held the position of president of the Medical Society of New York University for many years. He wrote extensively, and his works have been translated into many languages. Few American books have been published in as many foreign tongues as Dr. Draper's most important literary work, the Intellectual Development of Europe. His Human Physiology has long been a standard work and has passed through many editions and his Chemistry and Natural Philosophy were very popular in the schools.— (Regents' report, 1883; The Congregationalist, January 11, 1882; Scientific American, January 14; The School Journal, January 7, 1882.)

DR. JAMES R. WOOD.

James R. Wood, M. D., one of the foremost of American surgeons, died in New York of pneumonia, in May, 1882, having reached his sixty-sixth year. He was born in New York and there he achieved his reputation and secured great benefits to medical education. He was a graduate of the old medical college at Castleton, Vt. To Dr. Wood were chiefly due the relief of Bellevue Hospital from political management and its establishment on an effective basis and the erection and use of the pathological building of Bellevue as a school to combine clinical with didactic instruction. Even the existence of Bellevue Medical College and the bill giving to medical and surgical institutions the bodies of vagrants for dissection, which spoiled the trade of the resurrectionists, were due to his efforts. Dr. Wood was for several years professor of operative surgery and surgical pathology in Bellevue, and after his resignation of this position was made emeritus professor of surgery. At the time of his death he was connected, for consultation, with a dozen hospitals, asylums, and dispensaries in New York and vicinity. It was said of him during his life by an eminent surgeon that no living surgeon had performed so many capital and minor operations as successfully and that he stood preëminent as a surgeon.— (New Hampshire Sentinel, May 24, 1882.)

CHARLES MURRAY NAIRNE.

Prof. Charles Murray Nairne, M. A., L. H. D., of Columbia College, died in May, 1882, at Warrenton, Va., where he had been residing for some months with a view to restoring his health. He was born in Perth, Scotland, April 15, 1808, and was graduated M. A. at St. Andrew's University, receiving the degree of L. H. D. in 1830. In 1847 he came to this country and settled in Albany, where he taught some years in the female academy. In 1857 he was called to the professorship of moral and intellectual philosophy and English literature in Columbia College, which he filled continuously 25 years. Professor Nairne contributed frequently to the college papers and was the author of several works, the most prominent being Lectures and Orations.— (Boston Journal, May 31, 1882.)

HENRY DRAPER.

Prof. Henry Draper, son of Dr. John W. Draper, died November 20, 1882, of pneumonia, resulting from a severe cold contracted while on a visit to the Rocky Mountains in October. He was born in Prince Edward County, Va., March 7, 1837; but, his father removing soon after to New York, Henry received his early education in the public schools of that city. At the age of 15 he entered the academical department of the university, but did not graduate there. At the end of his sophomore year he entered the medical department of the university, which his father had been prominent in establishing and from which the son took his medical degree in 1858. He at first thought of practising medicine, and received an appointment on the medical staff of Bellevue Hospital, which he held for 16 months; he then decided to abandon practice and give himself to teaching. He was elected professor of physiology in the academical department of the University of the City of New York in 1860 and in 1866 became professor of the same branch in the University Medical School; but, resigning this post in 1873, he taught advanced analytical chemistry in the academical department of the institution. Prof. Henry Draper, with his father, represents one of the double stars in the firmament of scientific celebrities, of which there is now a considerable catalogue. Inheriting not only his father's genius but also his subjects of research, his early education, carefully superintended by his father, was shaped with a view to the pursuits to which his life was devoted. His first scientific investigation, made at the age of 20 and embodied in his graduating thesis at the medical college, was on the functions of the spleen, and was illustrated by microscopic photography, an art then in its infancy. Soon after receiving

his degree he went to Europe, and while there visited the widely known observatory of Lord Rosse and studied his celebrated colossal reflecting telescope. This led him to consider the problem of using reflecting telescopes for the purpose of photographing celestial objects. He constructed one of 15½ inches aperture and with it took a photograph of the moon 50 inches in diameter, the largest ever made. He afterwards constructed an equatorial telescope of 28 inches aperture, designed mainly to photograph the spectra of the stars. It was finished in 1872, after a long series of experiments, and was pronounced by President Barnard to be probably the most difficult and costly experiment in celestial chemistry ever made. Professor Draper was the first to obtain a photograph of the fixed lines in the spectra of stars, and he continued the work until he had obtained impressions of the spectra of more than 100 stars.

When a commission was created by Congress for the purpose of observing the transit of Venus in 1874, Professor Draper, was placed in charge of the photographic department. He spent much time in preparation, for which he declined to receive any compensation. So signal was the success of his disinterested exertions that the commissioners had a gold medal struck in his honor bearing the inscription in Latin "He adds lustre to ancestral glory." In 1878 he went to the Rocky Mountains to observe the total eclipse of the sun, and there successfully photographed the spectrum of the solar corona. For the last two or three years he has been much engaged in the difficult work of photographing nebulæ, and he startled the scientific world by the announcement that he had obtained a fine photograph of the great nebulæ in Orion and of its spectrum. Professor Draper was not a prolific author. He only published one book, but wrote much for the scientific periodicals, giving the results of his work. Probably his most important work was his discovery of oxygen in the sun. It was the result of great sagacity, experimental skill, and an immense amount of labor.— (Popular Science Monthly, January, 1883.)

CHIEF STATE SCHOOL OFFICER.

Hon. NEIL GILMOUR, *State superintendent of public instruction, Albany.*

[Third term, April 7, 1880, to April 7, 1883.]

Then to be succeeded by Hon. William B. Ruggles.

NORTH CAROLINA.

SUMMARY OF EDUCATIONAL STATISTICS.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
White youth of school age (6–21)	293,780	286,324		7,456
Colored youth of school age (6–21)	174,292	176,836	2,544	
Whole number of school age	468,072	463,160		4,912
White youth in public schools	140,311	144,835	4,524	
Colored youth in public schools	100,405	88,236		12,169
Whole number in public schools	240,716	233,071		7,645
Average attendance of white pupils	*a*87,436	*b*90,805	3,369	
Average attendance of colored pupils	*a*55,384	*b*41,741		13,643

Amount of available State fund	$100,000	$99,250		$750
Estimated whole amount, including portion not available.	431,555	431,555		

a In 87 out of 96 counties.
b In 92 counties.
c In 85 counties.
d In 88 counties.
e Six counties not reporting and 4 only partially.
f Fifteen counties not reporting.
g Seven counties not reporting and 2 only partially.

(From reports of Hon. John C. Scarborough, State superintendent of public instruction, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

For the State, the law provides a board of education and a superintendent of public instruction; for counties, boards of education and superintendents; for each district, a school committee of 3.

OTHER FEATURES OF THE SYSTEM.

The public schools are free to all youth 6 to 21 of either race. They are sustained by the income of a State school fund; by at least three-fourths of the proceeds of a State and county poll tax, which under the constitution must not exceed $2; and by an educational tax of 12½ cents on the $100 of property and credits in the State and 37½ cents on every poll. A special tax may be levied annually in each county if the beforementioned tax be insufficient to sustain at least one school in each district for 4 months. The State board of education apportions the school funds to the counties on the basis of school population, ascertained by an annual census, and the county boards to the districts on the same basis, specifying how much is apportioned to white and how much to colored schools, the funds for each being kept separate by the treasurer of the county boards. No branches are taught in the public schools except spelling, defining, reading, writing, arithmetic, grammar, and history of the State and of the United States. Teachers are examined by county superintendents, and if found qualified receive certificates valid for 1 year in the county where issued. Provision is made for holding teachers' institutes in each county or in 2 or more counties combining, and when held the teachers in such county or counties are required to attend. Teachers are also required to make satisfactory reports to the district committees, the committees to the county superintendents, and they to the State superintendent. The schools for the two races are to be kept separate and sectarian or political books are not to be used in the public schools.—(School laws, 1881.)

GENERAL CONDITION.

The condition of the public schools, as shown by the State report for 1881–'82, is that of transition from a very bad state of things to a better one, during which a full and satisfactory report can hardly be expected. Compared with 1880–'81 there was a decrease in white youth of school age and an increase in that of colored; a gain in enrolment of white youth, but in that of colored a loss of nearly three times the gain in the former; while in average daily attendance the decrease of colored youth was four times the increase of the whites. In districts there was an increase of 3 and in public school-houses of 146, the value of school property rising $147,229, while the free schools were fewer by 354: 203 for whites and 151 for colored. As to teachers there was an increase of 364, of whom 105 were white women, 107 colored women, and 152 colored men, as against a decrease of 193 in white male teachers, or a net increase of 171 teachers. School expenditures, although less completely reported, increased $100,077.

The above indicates the state of things following the improved school system authorized by the law of 1881.

Under the old system there had been no county supervision, no provision for teachers' institutes or for adequate school funds. The new law provides for county superintendents, county teachers' institutes, and an increase of taxes from 8⅓ cents to 12½ cents on $100 valuation of property, and also an increase of the poll tax. The State superintendent says that on assuming their office the county superintendents found the school system and the schools in a very bad condition; that, with the people, the school committees, and even the county boards, there was no properly directed interest; that the people demanded a division of districts into smaller ones, each one wanting the school near his house; that half of the districts were without school-houses or money to build them; that the county boards, yielding to the pressure of petitions, divided a district already too small into two, leaving each with funds barely sufficient to support schools four weeks with an ordinary teacher; that confusion reigned supreme and the enemies of public schools increased; and that the larger number of school-houses were in a dilapidated condition or were built without reference either to neatness of appearance or comfort.

Although in an old community a new school system is of slow growth, the State superintendent is hopeful that the needed reforms may be effected, at least after years of patient toil, with the new system improved as experience may suggest, a largely increased corps of well trained teachers from normal schools, and the more enlightened work of the county superintendents. Already under the guidance of the county superintendents many counties have been wisely redistricted, information has been given to the people, teachers have been improved, the best in the old system made better in the new and incompetent ones dropped from the rolls.—(State report.)

KINDERGÄRTEN.

Wilmington reports the Tileston Kindergarten, opened in 1880, having 30 pupils in the principal school and 30 in a branch school. The Kindergarten connected with the Charlotte Female Institute was discontinued in 1881.

For full statistics of this class of schools reporting, see Table V of the appendix.

CITY SCHOOL SYSTEMS.

LEGAL PROVISION.

No special provision for city school systems is contained in the school law. Local officers arrange for schools within their respective jurisdictions, graded schools in townships with 5,000 inhabitants being recognized and a tax for them of one-tenth of 1 per cent. on property and 30 cents on the poll authorized.—(School laws.)

STATISTICS.

Raleigh and Wilmington are the only cities in the State having in 1881–'82 over 7,500 inhabitants, the minimum limit of cities the statistics of which are given in Table II of the appendix. Neither of these cities makes any return for 1881–'82.

TRAINING OF TEACHERS.

STATE NORMAL SCHOOLS.

The State aids 10 normal schools, 5 of which are for colored teachers. Eight of these were established in 1881, 4 for whites and 4 for colored. The following make report for 1882:

The *University Normal School*, Chapel Hill (1877), held its usual summer session of 5 weeks, with an enrolment of 352, under 13 instructors and 17 lecturers. There is no permanent faculty nor full course of study. State appropriation was $2,000; tuition is free.—(Return.)

Besides this school, the university offers a 2-year teachers' course for young men, embracing not only all the studies required by law, but several others useful to the teacher.—(Catalogue.)

The *State Colored Normal School*, Fayetteville (1877), has a 6-year course, the first 3 years of which are preparatory. It enrolled, in 1882, 123 pupils, under 3 instructors, and graduated 1, who engaged in teaching. The State appropriated $2,000, making tuition free. Its library contained 225 volumes. The increase in attendance was 12 per cent. over that of 1881. Since opening, 280 students have been admitted, of whom 39 have completed the full course of study and received certificates.—(Return, State report, and catalogue.)

The following schools for whites, established in 1881, held summer sessions during June and July:

The *Elizabeth City State Normal School*, Elizabeth City, with $720 State appropriation, had 60 students, under 1 instructor and 8 lecturers, with a model school.

The *Franklin Normal School*, Franklin, with an appropriation of $500 from the State, of $100 from the county, and of $220 from the Peabody fund, had 127 students, under 5 instructors, and a model school.

The *Newton Normal School*, Newton, had an attendance of 200 students, under 3 instructors and 7 lecturers, a model school, and a State appropriation of $500.

Three of the 4 colored schools established in 1881 report by return for 1882, as follows:

The *Franklinton State Normal School for Colored Teachers*, Franklinton, with $700 from the State, had 75 students, under 4 instructors and lecturers, 150 volumes in its library, and a model school.

The *Colored Normal School*, New Berne, with $500 from the State and $200 from the Peabody fund, had 95 students, under 4 instructors and lecturers, and 400 volumes in library, but no model school.

The *State Colored Normal School*, Salisbury, with $500 from the State and $50 from the county, had 65 students and 2 instructors, but no model school this year.

The State superintendent, with the concurrence of the board of education, decided that the colored normal schools should continue their sessions as long as the funds would allow, which proved to be from 4 to 9 months. The colored students seemed to need instruction more in the matter of the text book than in methods.

OTHER NORMAL TRAINING.

The *Whitin Normal School*, Lumberton, reports, for 1882, 80 pupils and 4 instructors, with 4-year courses and a model school.

The *normal department of Shaw University*, Raleigh, had 6 instructors and 133 students. It is estimated that 1,000 of its graduates have engaged in teaching. It has a library of 2,200 volumes and a model school.

Tileston Normal School, Wilmington, sustained not by the American Unitarian Association, as was wrongly said in the report of 1881, but by Mrs. Mary Hemenway, of Boston, Mass., graduated 7 at its commencement June, 1882, one of whom has entered the Massachusetts Institute of Technology.

Wilmington Normal School, under the care of the American Missionary Association, had 244 students, under 7 teachers, including the principal.

An academy was opened at *Kinston* during the year to prepare colored youth of either sex for teaching, so as to meet the coming demand for good teachers of their race.

Graham Normal College, Graham, and St. Augustine's Normal School, Raleigh, furnish no data for 1882.

TEACHERS' INSTITUTES.

Under the provisions of the law of 1881, 123 teachers' institutes were held during 1881 and 1882 in 58 counties, in which 2,260 white and 650 colored teachers were instructed, their usefulness being thereby much increased. Teachers' associations were organized in many of the counties, and through them much information was given to the people.

EDUCATIONAL JOURNALS.

The North Carolina Educational Journal, the official organ of the State Teachers' Association, published monthly at Chapel Hill, issued its first number January 15, 1881, and continues its regular issues, giving to the teachers of the State valuable information.

The Light-House and Tileston Recorder, a monthly journal published at Wilmington by students in the Tileston Normal School at that place, continues its regular issues, giving some general educational information, though mainly devoted to the interests of the normal school.

The publication at Raleigh of the North Carolina Teacher is announced; the paper is to be issued monthly, beginning June, 1883, and will be devoted to progressive education in the State.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

No general information as to high schools in the State has reached this Office.

The North Carolina Educational Journal for 1882 mentions one for boys at Laurinburg, with an average attendance of 100, and others at Jonesboro', Summerfield, Gilead, and Catawba. There seems to be an increasing interest in the establishment and work of graded schools. The Journal mentions this class of schools at Goldsboro', Wilson, Franklinton, High Point, Durham, Fayetteville, Raleigh, Salisbury, Greensboro', and Johnson, with Edenton, Readville, New Berne, Louisburg, and Rocky Mount moving in this direction, the last having raised $15,000 for the purpose.

OTHER SECONDARY SCHOOLS.

For statistics of private secondary schools, such as business colleges, academies, and preparatory departments of colleges, see Tables IV, VI, and IX of the appendix, and for a summary of the same, see corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The University of North Carolina, exclusively for young men, offers classical, philosophical, and scientific courses of 4 years each, which are pursued in subordinate colleges, so called, each of which presents certain schools or studies. Its optional course provides for such students as in proper cases and under special conditions may choose studies out of the regular courses. There are also graduate courses leading to the degrees of PH. D., A. M., and M. S. There was an attendance for the year of 199 in the various departments.—(Catalogue.)

Of the other 8 universities and colleges reported in 1880–'81, only 6 report for 1881–'82. Biddle University, Charlotte, and Davidson College, Davidson College Post Office (Presbyterian); Shaw University, Raleigh (Baptist); Weaverville College, Weaverville (nonsectarian), present classical and scientific courses of 4 years, and all, with the exception of Shaw, preparatory courses, with music, French, and German. Biddle, organized for the instruction of colored male youth, has classical and English preparatory courses of 3 years each. Rutherford College, Rutherford College (non-sectarian), admitting both sexes, arranges its studies under 6 schools, adding military drill and music. Shaw, organized for the instruction of both sexes of colored youth, gives normal, theological, medical, scientific, and musical instruction; while Trinity College, Trinity College (Methodist Episcopal South), arranges its whole course of instruction in 11 schools. Shaw reports an industrial department, in which a large class of young men are receiving instruction in carpentry and furniture making, while most of the young women receive

instruction in dressmaking and the domestic arts. Since its foundation in 1875 this institution has enrolled 947 students, 364 of whom were females; 699 were normal and 214 theological students.—(Catalogues.)

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

For statistics of this class of schools reporting for 1881–'82, see Table VIII of the appendix, and for a summary of them, the report of the Commissioner preceding.

The Estey Seminary building of the Shaw University is said to be the finest school edifice in the State and to have been the first erected of any considerable size devoted exclusively to the education of colored women. It has accommodations for 100 pupils and is named after Dea. Estey, of Brattleboro', Vt., who, with his sons, contributed largely to the building and furnishing of the seminary.—(Catalogue.)

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The scientific course of the State university, covering 4 years and leading to the degree of B. S., includes the studies that relate to the practical pursuits of life, especially agriculture and the mechanic arts. A philosophical course of 4 years is also provided for those wishing to study only one ancient language, which may be either Latin or Greek; it leads to the degree of PH. B. For students whose time and means are limited there is an optional course by which they may obtain purely agricultural instruction in branches deemed of special value. A museum was soon to be opened, with model plows and other agricultural implements, including specimens of the productions of the various soils of the State.—(Catalogue.)

Biddle and Shaw Universities and Davidson College show scientific courses of 4 years, though differing in the studies required, while Trinity College has a course of 3 years. Weaversville has an undefined course as to time, but, like Shaw, offers one for those who wish to pursue English and scientific studies to the exclusion of the classics. Rutherford College in its independent arrangement includes a school of natural science.—(Catalogues.)

PROFESSIONAL.

Theological.—Biddle and Shaw Universities continue to give theological instruction, the former in a course covering 3 years, and the latter in one of 2 years for those who have graduated from the academical department, with an English course for those who have not completed their literary studies. In Trinity College the theological instruction heretofore noted seems to have been discontinued.—(Catalogues.)

For statistics of these departments reporting in 1882, see Table XI of the appendix, and for a summary of them, the report of the Commissioner preceding.

Legal.—The State University continues its legal instruction in a course requiring 2 years of study, of 9 months each, on the completion of which the degree of bachelor of laws is conferred on such students as pass a satisfactory examination. Trinity College, heretofore reporting a 3-year legal course, no longer shows any trace of it.—(Catalogue.)

Medical.—The medical school of the State University offers a full course of study, covering 2 years, the sessions beginning and ending with those of the other departments of the university.—(Catalogue.)

The medical department of Shaw University was opened for instruction in 1882 in two large buildings erected during the year, known as the Medical Dormitory and Leonard Medical Building, the latter on a beautiful site given by the State. This new department is now provided for, and every effort will be used to make this school valuable to the colored people. Its course of study covers 3 years of five months each. It opens with 1 professor and 3 students, all with degrees in letters or science. The property of the school is valued at $35,000.—(Catalogue and return.)

Pharmacy.—The State university offers a course in pharmacy to extend over 2 sessions of 5 months each. Certificates of graduation are to be given to those who pass an approved examination on all the studies of the course. Those who have had 3 years' experience as drug clerks, in addition to the above requirements, are to have a diploma and the degree of graduate of pharmacy.—(Catalogue.)

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB AND THE BLIND.

The Institution for the Deaf and Dumb and the Blind, Raleigh, reports for the years 1881 and 1882 196 inmates, 105 being deaf-mutes and 91 blind. Of this number 60 were in the colored department, of whom 38 were deaf and 22 blind, this branch of the

school being a mile from the main building. During the two years 31 were admitted and 23 discharged. The State is said to have gathered children not only from good and poor homes, but from the haunts of vice, and it gave the institution $68,000 for the two years. The principal says that successful efforts were made to educate the inmates morally, mentally, and physically. In the department for the blind there was instruction in school studies and industries; in that for the deaf, classes in signs and articulation. In the boys' department, the shoe, broom, and mattress shops were operated successfully, but machinery, the principal says, has so changed the business of shoe and broom making that most of these pupils who attempt to gain a living by hand work at these trades will fail. The call is for land on which to teach them gardening and agriculture. For the females, besides the ordinary industries of sewing, &c., there is a cookery school, with a room fitted up with all the appointments of a well regulated kitchen. The report touches on the inexpediency of having the deaf and blind in the same institution, as there is no interest in common between them and can be no common system for their education.— (Report, 1882.)

EDUCATION OF ORPHANS.

The Orphan Asylum, Oxford, organized and managed by the State Grand Lodge of Masons, is for the education of indigent and friendless but promising orphans between 8 and 12 years of age. There were 187 inmates, of whom 47 were admitted during the year. A large majority of those discharged during the 10 years of its work are prosperous and useful citizens. In addition to the main building, a new one for boys was built and furnished during the year, and another for their dining room was under contract. Receipts for the year, $14,452: $2,000 from the lodge, $5,000 from the State, and the rest from the people, the institution being indorsed by the Protestant denominations of the State.

EDUCATIONAL CONVENTIONS.

STATE ASSOCIATION OF COUNTY SUPERINTENDENTS.

This body met at Chapel Hill, July 4, 1882, and was in session till the evening of the 7th, George R. McNeill, president, in the chair. Hon. K. P. Battle delivered the address of welcome, which was responded to by the president. There were 11 members present and 7 were added. On the 5th the opening address was made by the president, which was followed by a discussion on "The efficient superintendent," opened by Prof. Newell and continued by several others. Superintendent Duckett read a paper on "Public schools a necessity," which was fully discussed. On the 6th a paper was read by Superintendent Smith on "Our public schools and their critics," said to have contained valuable information as to the school history of the State and excellent suggestions in the line of improvements. This paper led to an extended discussion. "Teachers' institutes" was then presented in a paper by B. F. Grady, and discussed at some length, followed by a report from each county superintendent of his year's work. On the 7th several resolutions were passed looking to the work of the coming year and making the North Carolina Educational Journal the organ of the association, after which, officers for the ensuing year having been elected, the association adjourned. (North Carolina Educational Journal.)

STATE TEACHERS' ASSOCIATION.

This association held its annual session at Chapel Hill, July 7–8, 1882. But a brief account of this meeting is given. It was called to order by President G. T. Winston, who delivered the opening address, giving his views of the common school system of the State. A large number of new members were enrolled. A resolution was passed that the association urge the general assembly to pass a law giving the people the right of voting a tax for the establishment of graded schools or for a longer continuance of other public schools in any town or district desiring the same.

Officers for the ensuing year were elected; county superintendents were urged to organize county teachers' associations and send delegates from them to the next annual meeting of the association, and a resolution was passed that the office of county superintendent is indispensable to the efficient working of the public school system.— (North Carolina Educational Journal.)

STATE COLORED TEACHERS' ASSOCIATION.

An address was issued to the colored teachers of the State calling a convention to meet at Raleigh November 23, 1882, to organize a State Colored Teachers' Association and to consider the merits of organization, the best methods of teaching and school government, educational advancement, harmony of sentiment, and unity of action. The following gentlemen were engaged to attend and present the subjects assigned to them: Hon. J. C. Scarborough, Necessity of organization; Prof. John Duckett, Public schools

a necessity; C. W. Chestnut, Modern methods of school teaching; C. N. Hunter, Popular education; J. O. Crosby, Utility of school apparatus; N. F. Roberts, County teachers' institutes; Prof. H. M. Joseph, Teachers' qualifications. No report of this convention has reached this Office.— (North Carolina Educational Journal.)

COUNTY TEACHERS' ASSOCIATIONS.

The information in regard to these associations shows an increasing interest in them. Brief notices appear in the Educational Journal of meetings in Stanly, Rowan, Wake, and Iredell Counties. The State Teachers' Association at its last meeting urged the organization of them in every county in the State.

CHIEF STATE SCHOOL OFFICER.

Hon. JOHN C. SCARBOROUGH, *State superintendent of public instruction, Raleigh.*
[Third term, January 1, 1881, to January 1, 1885.]

OHIO.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Whites of school age (6–21)	1,039,041	1,056,247	17,206	
Colored of school age (6–21)	24,296	25,074	778	
Whole number of school age	1,063,337	1,081,321	17,984	
Whites in public schools	734,462	741,400	6,938

Average monthly pay of women	28 00	29 00	1 00	
INCOME AND EXPENDITURE.				
Receipts for public schools	$8,129,326	$8,763,781	$634,455	
Expenditure for public schools	8,133,622	8,820,915	687,293	

a So reported.

(From reports and returns of Hon. Daniel F. De Wolf, State commissioner of common schools, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

For general supervision of the public schools there is a State commissioner; under him are boards of education for city districts of the first class, city districts of the second class and village districts, township and special districts, and joint subdistricts. To test the qualifications of teachers there are boards of examiners for the State, for counties, and for cities and villages.—(Laws of 1880.)

OTHER FEATURES OF THE SYSTEM.

The public schools, free to all youth of school age (6–21), are sustained from the proceeds of an annual tax of one mill on $1 of all taxable property when no rate is fixed by the legislature, and of 6 per cent. interest on an irreducible common school fund. State funds, to be used only in the payment of teachers, are apportioned by the State auditor to the several counties according to the latest enumeration of youth therein, the county auditor apportioning them to the districts and fractions of districts. Expenses for continuing schools, for providing school-houses and sites, and all other contingent school expenses must be raised by a district tax not to exceed 7 mills on $1, except in Cincinnati, where the limit is 5 mills, and in Cleveland, 4½ mills. Each board of education must establish a sufficient number of schools for the free education of all youth of school age within the district under its control, and, if deemed necessary, may open one or more high schools. Each township board must establish at least one school in every subdistrict under its control. District boards may establish separate schools for colored children; in cities and villages, may provide evening schools; and, in children's homes, orphan asylums, and county infirmaries, may establish schools, for which teachers only are provided by the district. All children between the ages of 8 and 14 must attend the public schools for at least 12 weeks in each school year, 6 of which must be consecutive, unless the child's health, the needs of an indigent parent, brother, or sister, or the distance (2 miles or more) from the nearest school makes such attendance inexpedient, or the child's previous acquirements or its instruction being otherwise provided for make it unnecessary. The employment of any child less than 14 years of age under control of a parent or guardian and not dependent on its own resources is prohibited, unless the child has attended school for at least 12 weeks, nor shall it then be employed for more than 40 weeks unless exempted from compliance with the compulsory law.

Each board determines the text books to be used for three years without change in the schools under its control, and the studies to be pursued, all of which must be in English, unless German is demanded by 75 freeholders who represent 40 pupils entitled to attend such schools. No person may be employed as a teacher in any common school who has not obtained a certificate of moral character and qualifications from an authorized board of examiners, and, if employed, must present such certificate and the required report to receive pay. For district libraries the law allows an appropriation from the contingent fund; for city districts, a tax of one-tenth of a mill on $1 taxable property, except in the city of Cleveland, where it may be 2½ tenths of a mill on $1.—(Laws of 1880.)

GENERAL CONDITION.

The statistical summary for 1881–'82 presents a pleasing contrast to the unfavorable report of the previous year. There is shown a well proportioned advance along the whole line, with the slight exception of a decrease of 595 in enrolment in colored schools and of 20 in the teachers in them. Beginning with an increase of 17,984 in school population, there was a gain of 11,881 in the average monthly enrolment and of 15,091 in the average daily attendance. While in township districts there was no change, the subdistricts in them increased by 60, and in city, village, and special districts there was an increase of 15 and of 10 in their district subdivisions. There was an increase of 29 school-houses and 453 school rooms. Ninety-six more school-houses were built than last year, at an increased expenditure of $474,189, the total value of school property increasing by a million and a half. In teachers permanently employed there was a gain of 363, while $2 was added to the average monthly pay of men and $1 to that of women. The whole receipts for school purposes were $634,455 greater than in 1880–'81, and the expenditures $687,293 greater.

The problem of the advancement of the country schools still engaged the serious attention of the State commissioner. The difficulty of supplying competent teaches is due to the uncertain tenure of the teacher in these schools, where, in a majority of cases, a change is made every 3 months. A very suggestive comparison in the State report shows that it costs more by $2.46 per pupil to educate the children of Ohio than

those of Pennsylvania for the same time. With the same expense per pupil as in Pennsylvania, Ohio would educate her pupils with $1,837,959 less than it now costs. Even leaving out the expense in cities, with their full system of grammar and high schools and their substantial and often costly buildings, it costs $1.10 more per pupil to keep up the country schools of Ohio 30 weeks than it costs the Pennsylvania system in both city and country for the same time. About the same proportion is shown by a comparison with Indiana and Wisconsin. The commissioner repeats the recommendations of last year for new legislation: (1) to place the schools in each township under the management of a single board of education; (2) to make some provision by which teachers of primary and grammar schools may secure the advantages of State certificates; (3) to remove the disadvantage incurred by some localities from the formation of the best portions of a township into special districts.—(State report, 1882.)

KINDERGÄRTEN.

Thirteen schools of this class report for 1881–'82 468 pupils, under 32 conductors and assistants. For further information, see Table V of the appendix to this volume.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

Cities of 10,000 or more inhabitants have boards of education of 1 or 2 members for each ward, while cities of less than 10,000 inhabitants and villages have boards of 3 or 6 members for the whole corporation, with annual change of one-third in either case. Cincinnati has a board consisting of 12 members at large and 25 others, representing as many wards, and Cleveland a board of 18 members, being 1 for each ward.

STATISTICS.[a]

Cities.	Population, census of 1880.	Children of school age.	Enrolment in public schools.	Average daily attendance.	Number of teachers.	Expenditure.
Akron	16,512	5,702	3,343	2,481	59	$57,710
Bellaire	8,025	3,171	1,500	891	23	16,984

Lima	7,567	2,908	1,669	1,171	27	21,016
Mansfield	9,859	3,024	2,030	1,537	38	27,620
Newark	9,600	4,069	1,981	1,428	39	23,487
Portsmouth	11,321	3,767	2,962	1,541	44	27,262
Sandusky	15,838	6,300	2,565	2,026	52	48,132
Springfield	20,730	7,322	3,386	2,522	64	80,310
Steubenville	12,093	4,198	1,838	1,768	46	28,236
Tiffin	7,879	3,195	1,323	958	38	18,554
Toledo	50,137	18,686	7,826	5,640	140	179,479
Youngstown	15,435	6,596	3,096	2,062	48	40,256
Zanesville	18,113	6,126	3,031	2,255	71	71,705

a As in some other States, the statistics, both of the table and of the additional particulars following, are taken, for the sake of uniformity, from the tables of the State commissioner's report.
b This does not include the 3,742 enrolled in night schools.

ADDITIONAL PARTICULARS.

Akron had 10 school-houses, with 48 rooms for study, valued, with other school property, at $105,000. The public school enrolment comprised 58.6 per cent. of the youth of school age. Notwithstanding the existence of large factories and workshops, the efficiency of school management is seen in the fact that 43.5 per cent. of the school population was in average daily attendance; the percentage of the enrolment so attending was 71.22.

Bellaire had 5 school buildings, valued, with other school property, at $75,000. The schools enrolled only 47.3 per cent. of the school population and had only 59.4 per cent. of the enrolment in average daily attendance. Fifty-six pupils were enrolled in the high school.

Canton has 10 school buildings, with 47 rooms, valued, with other school property, at $80,000. Compared with the report for 1880–'81, there was an increase of 1,194 in

school population, of 311 in enrolment, and of 155 in average daily attendance. The public schools enrolled 57 per cent. of the pupil youth, and retained 68 per cent. of the enrolment in average daily attendance. There were 70 pupils in the high school. A return reports a night school, with 153 students, and an estimated enrolment of 600 in private and parochial schools.

Chillicothe provides 6 school buildings, with 53 rooms, valued, with other school property, at $150,000. The statistics show 55 per cent. of the school population enrolled in the public schools and 77.5 per cent. of the enrolment in average daily attendance. In school population and attendance the city showed slight gains as compared with 1880–'81, decreasing expenditures by $3,228. A return gives an estimated enrolment of 300 in private and parochial schools.

Cincinnati had in 1881–'82 57 school buildings, with 594 rooms for study, valued, with other school property, at $2,000,000. There were 28 white and 6 colored district schools, 4 white and 2 colored intermediate schools, 1 colored and 2 white high schools, besides intermediate departments in 12 district schools. In white district schools there was an enrolment of 26,561; in district schools for colored, 1,135; in intermediate schools for whites, 5,053; in same for colored, 180; in high schools for whites, 1,183, with 125 graduates; in same for colored, 72 and 7 graduates; in the normal school, 43; in the school for deaf-mutes, 27; in night schools for whites, 3,469; in same for colored, 273; while in private and parochial schools, excluding Kindergärten, business colleges, and higher institutions, there was an enrolment of 17,836. The results obtained in drawing, music, and penmanship are said to have been highly satisfactory. In the white district schools 15,457, or 56 per cent. of the pupils, were taught German; in the intermediate, 1,850, or 35 per cent.; in the high schools, 550, or 44 per cent.; in all, 17,857, or 52 per cent. of the white pupils enrolled in these schools. This instruction was given by 155 teachers of German, at an additional cost of only $2.91 for each pupil taught. If to the enrolment in day schools be added the 3,742 in night schools and the 17,836 in private and parochial schools, an approximate enrolment of 54,396 is obtained, the enrolment in Kindergärten, business colleges, and higher institutions being omitted. The public schools, enrolling only 35 per cent. of the school population, had 81 per cent. of their enrolment in average daily attendance. There was an increase of 6,168 in school population during the year, to meet which a new school building was erected, said to be one of the finest school-houses in the city, and another one of 15 rooms was in process of completion. To 2 buildings 6 rooms each were added, and to 2 others 4 each. The custom of celebrating the birthdays of authors by reading essays on their lives and works and by reciting selections from their writings continued with increasing interest. The memorial days of Garfield, Longfellow, and Webster were among those most effectively celebrated. "Arbor day" was introduced into the schools in 1882 at the request of the American Forestry Congress, then in session in the city. Acting in the spirit of the governor's proclamation calling on all the people of Ohio to devote April 27 to tree planting, the board of education dismissed the schools for 2 days, that teachers and pupils might join in the work. For this purpose 6 acres were set apart and called the "Authors' Grove," where each department of the schools planted a group of trees in memory of some author.—(State and city reports.)

Cleveland had 43 school buildings, with 427 rooms for study, valued, with other school property, at $1,789,194. There seems to have been an effort to provide, as far as possible, for the large increase in school population over 1880–'81, for, with 6,515 more youth of school age, an increase of 2,154 in enrolment and of 2,961 in average daily attendance, there were erected 2 new school buildings, at a cost of $42,800, and 78 more teachers were employed, the aggregate expenditures increasing $42,550. The public schools below the normal were classed as high, grammar, and primary; they enrolled 46 per cent. of the school population and had 74 per cent. of the enrolment in average daily attendance; they were in session 120 days. Vocal music and drawing were taught to all the pupils and 8,829 studied German.

Columbus had 26 school buildings, with 174 rooms for study, valued, with other school property, at $781,784. During the year 1 new building was erected, costing $80,036. There were 89 primary and 52 grammar schools and 1 high school, all taught by 16 male and 150 female teachers. The high school enrolled 573, averaging 499, with an average daily attendance of 479; the grammar schools, with an enrolment of 2,409, an average of 2,077, had 1,963 in average daily attendance; while the primary enrolled 5,451, averaging 4,384, and had 4,100 in average daily attendance. For colored youth of school age, numbering 605 in 1881, separate primary and grammar schools were formerly provided, but the graduates from these since 1874 have been admitted to the high school on equal terms with the whites. This was so much in accordance with public feeling that in February, 1882, the colored schools were closed and the pupils admitted to the white schools of all grades. White and colored youth now attend the same schools within the city limits. The statistics as compared with 1880–'81 show an increase of 662 in school

population, of 419 in enrolment, and of 439 in average daily attendance, requiring 13 additional teachers, and an additional expenditure of $82,761. The superintendent says that the fluctuation in attendance was less than it had been for several years. Schools were in session 195 days and enrolled 51 per cent. of the youth of legal age, having 78 per cent. of the enrolment in average daily attendance. The estimated enrolment in private and parochial schools was 1,800, which, added to the enrolment in public schools, shows 62 per cent. of the youth of school age under instruction.—(State and city reports.)

Dayton had 14 school buildings, with 132 rooms for study, the public school property of the city being valued at $360,000. There were 1 high, 1 normal, 1 intermediate, and 11 district schools, taught by 19 male and 116 female teachers. Instruction in vocal music was given to all the pupils, in drawing to 5,192, and in German to 1,711, special teachers being employed for music and for drawing. The high school numbered 214 pupils at the close of the year and graduated a class of 23 from its 4-year course, making the number of 493 during its history. There was a gain of 1,518 in school population, a loss of 304 in enrolment, and a gain of 39 in average daily attendance, while 5 more teachers were employed and an additional expenditure of $17,385 was incurred. The public schools enrolled only 49 per cent. of the children of school age, but had 76 per cent. of the enrolment in average daily attendance. A return gives 2,027 enrolled in private and parochial schools, which, added to the public school enrolment, shows 65 per cent. of the youth of pupil age under school instruction. The 4 night schools, having been more completely organized than ever before, secured much more favorable results, the attendance consisting largely of Germans. In 2 of these schools in which the ordinary branches were taught there was an enrolment of 246; in the school for freehand drawing, an attendance of 325, and in the school for industrial drawing, 201, a total attendance of 772. The superintendent says that in these drawing schools there seems to be no abatement in the interest manifested by the public, with a very considerable increase of attendance in the industrial drawing school. The teachers employed by the board were of the highest skill.—(State and city reports.)

Fremont reports but slight changes compared with 1880–'81, having 7 school buildings, with 15 rooms for study, valued, with other school property, at $50,000. With about the same attendance as last year, 6 more teachers were employed and $3,656 more expended. Of the school population 47 per cent. were enrolled in the public schools, which held 65 per cent. of the enrolment in average daily attendance. Schools were in session 190 days. The high school closed the year with 52 students and graduated a class of 7 young ladies, having had in all 127 graduates during its history.—(State report.)

Hamilton, with a gain of 139 in school population and a slight increase in attendance, shows 5 school buildings, with 35 rooms for study, the same as in 1880–'81; school property was valued at $150,000. With one more teacher employed, there was a reduction of $5,967 in expenditure. The schools were in session 200 days and registered only 41 per cent. of the youth of school age; but 75 per cent. of the enrolment was in average daily attendance. All the pupils were taught drawing and vocal music, and 858 German. The high school had 85 students at the close of the year and graduated 5.

Ironton advanced a little as compared with 1880–'81, except in enrolment, which was 101 less, employing the same number of teachers and decreasing expenditures by $538. The schools were in session 180 days and enrolled 55 per cent. of the youth of pupil age, with 75 per cent. of the enrolment in average daily attendance. The high school numbered 61 at the close of the year and graduated a class of 14. The report shows 8 school buildings, with 30 rooms, valued, with sites, &c., at $45,000.—(State report.)

Lima, expending for its public schools $5,358 more than in 1880–'81, had, as before, 2 school buildings, with 25 rooms, valued, with sites, &c., at $100,000. The city employed 1 more teacher, gained 348 in school population and 165 in enrolment, and lost 95 in daily attendance. Schools were in session 190 days and enrolled 57 per cent. of the youth of school age and had 70 per cent. of the enrolled in average daily attendance. There were 82 in the high school, which graduated 19.

Mansfield shows a small advance throughout from 1880–'81. Schools were in session 180 days, expenses increased by $1,797, and 6 buildings and other school property were valued at $150,000. The schools enrolled 67 per cent. of the school population. The high school numbered 99 at the close of the year, graduating 18.

Newark reports 2 high, 12 grammar, 22 primary schools, and 1 colored school. For these 37 schools there are 7 school buildings, with 38 rooms for study and sittings for 1,996. Schools were in session 190 days, enrolling 49 per cent. of the school population and holding 72 per cent. of the enrolled in daily attendance. With an increase of 201 in the youth of school age, there was a corresponding increase in attendance. The high school, in numbers, is said to have surpassed anything in its history, having 132 students and graduating 16.—(State and city reports.)

Portsmouth, compared with 1880–'81, shows an increase of 200 in youth of school age and of 747 in enrolment, and a falling off of 364 in daily attendance. The enrolmen

reached 79 per cent. of the school population, while only 52 per cent. of the enrolled were held in daily attendance. The schools, which were in session 190 days, were taught in 6 school buildings, with 43 rooms for study, valued, with sites, &c., at $182,000. The high school numbered 74 at the close of the year, graduating 13.

Sandusky had 9 school buildings, with 44 rooms for study, valued, with sites, &c., at $160,000. Compared with 1880–'81 there were small gains in school population and enrolment, but a loss of 157 in daily attendance. Three more teachers were employed, while expenses were less by $528. Schools, which were in session 200 days, enrolled 41 per cent. of the youth of school age, holding 79 per cent. of the enrolment in daily attendance. The entire number enrolled studied drawing and 868 German. The high school pupils numbered 93 at the close of the year, graduating 23.

Springfield erected 1 new school building during the year at a cost of $20,113, making 10 buildings, with 59 rooms for study, valued, with grounds, &c., at $110,560. It reports 1 high school, with 122 students, and 9 district schools, with 3,264, taught by 64 teachers, including 3 special teachers of music, writing, and drawing. Compared with 1880–'81 there were gains of 970 in youth enumerated, of 252 in enrolment, and of 174 in daily attendance. Schools were in session 185 days and enrolled 46 per cent. of the enumeration, retaining 74 per cent. of enrolment in daily attendance. Instruction in drawing and vocal music was given in all the schools and in German to 363 pupils.—(State and city reports.)

Steubenville shows a falling off of 1,775 in the youth of school age during the year and some decrease in attendance, this last owing, it is said, to the presence of infectious diseases. There were 6 school buildings, valued, with grounds, &c., at $127,000. The want of new school buildings is severely felt. Schools are classed as high, grammar, and primary, the last including a colored school. Schools were in session 200 days, enrolling 44 per cent. of the school population, with a fraction over 96 per cent. of the enrolled in daily attendance. A return gives 632 in private and parochial schools, which shows not quite 59 per cent. of the youth of school age under school instruction.—(State and city reports.)

Tiffin had 5 school buildings, with 25 rooms for study. Compared with 1880–'81 there was a loss of 184 in school population and a slight falling off in attendance, while 8 more teachers were employed and $1,543 less expended. Schools were in session 200 days, registered 41 per cent. of the children of school age, and had 72 per cent. of the enrolment in daily attendance. A return gives the valuation of school property at $75,000 and 700 pupils in private and parochial schools; this enrolment, with that of the public schools, leaves nearly 37 per cent. of the youth of school age unenrolled. Vocal music was taught to all the pupils, drawing to nearly all, and German to 245. The high school pupils numbered 64 at the close of the year, 8 graduating.

Toledo rated its school property, including 23 school buildings, with 118 rooms for study, at $590,000. With an addition of 1,107 to the school population of 1880–'81, there were gains of 149 in enrolment, of 639 in average daily attendance, and of 10 teachers, with an additional expenditure of $27,135. Of the 120 public schools, 2 were high, 6 grammar, 19 intermediate, 33 secondary, 53 primary, and 7 ungraded, all under 14 male and 126 female teachers. The schools were in session 200 days and registered 42 per cent. of the youth of school age, holding 72 per cent. of the enrolment in daily attendance. A return gives 3,000 enrolled in private and parochial schools, which, added to that in public schools, shows 58 per cent. of the school population enrolled. A table in the city report shows that 96½ per cent. of the enrolment were under 16 and over 62 per cent. under 11 years of age. Instruction in vocal music was given to all the pupils, in drawing to nearly all, and in German to 1,649. Out of the 4,116 examined, 3,193 were promoted. The 2 high schools enrolled 186 and had 146 in daily attendance. To meet the large increase in school population, the board made extensive additions to the accommodations and had a building on an original plan in process of erection.—(State and city reports.)

Youngstown, to provide for the large increase in school population and attendance, during the year erected 2 school buildings, making 8 in all, with 47 rooms for study, the entire school property being rated at $250,000. The studies reported indicate the usual primary, grammar, and high schools. Schools were in session 190 days and registered 47 per cent. of the youth of school age, having 67 per cent. of the enrolment in daily attendance. The high school registered 89 at the close of the year, graduating 14.

Zanesville during the year erected 1 school-house, costing $6,361, making in all 18 school buildings, with 67 rooms. With about the same attendance as the previous year, the same number of teachers were employed, while expenditures were more by $18,864. The schools, classed as primary, grammar, and high, were in session 200 days, showing an enrolment of 49 per cent. of the children of school age and 74.4 per cent. of the enrolled in daily attendance.

Summarizing the statistics of the 22 city systems thus briefly noticed, it appears that 44 per cent. of their school population were enrolled in the schools and 33 per cent.

were in average daily attendance; but it would be unjust to consider these figures as discreditable to the city systems of Ohio, since the comprehensive school age of that State, extending most freely the opportunities of instruction to all unmarried persons under 21, is apt to give an erroneous impression when the results of the school system are represented by figures. Nevertheless the attendance is not what the State intended it should be when enacting the law as to compulsory attendance, nor what the superintendent desired to accomplish by his suggestion on page 77 of the 1880 edition of the school laws. In fact, as to percentage of enrolment and of daily attendance the cities as a whole were exactly where they were the year before, but as they increased in population it may properly be inferred that, though relatively no more pupils were taught, absolutely more schooling was done, a fact corroborated by the considerable additions to the teaching force, the accommodations, and necessarily to the expenditures.

TRAINING OF TEACHERS.

PUBLIC NORMAL SCHOOLS.

The State makes no provision for the education of teachers, but normal schools are found in connection with the public school systems of Cincinnati, Cleveland, Dayton, Columbus, and Steubenville.

The *Cincinnati* school was opened in 1868, adding a German department in 1871. During the last session 43 were enrolled in the school, of whom 15 were Germans, and 39 graduated, of whom 12 were Germans. Of the 43 admitted, 37 were from the high schools. During the last session the highest standard of qualification since its organization was attained. The principal urges the advisability of lengthening the course to $1\frac{1}{2}$ or 2 years and of enlarging the practice department so as to include 4 schools instead of 2, which schools, he thinks, should not be from the lowest grades of the system.— (City report.)

The *Cleveland Training School* reported 5 instructors and 41 female students, 34 of whom graduated and engaged in teaching. The full course of study is 1 year of 40 weeks. There is a model school attached.

The *Dayton Normal and Training School* had 4 instructors, with 13 students, and graduated 12, 9 of whom engaged in teaching. The full course is 1 year. Provision is made for the most thorough examination of candidates for graduation, it being regarded of supreme importance that no one shall be graduated unless thought capable of becoming a successful teacher. There is a model school attached.

The normal school in *Columbus* held its 28 sessions on Saturdays, with an enrolment of 97 and an average daily attendance of 71. This school is open to such members of the junior and senior classes in the high school as intend to become teachers and to those already teaching who desire further instruction.

Steubenville, by adding one year to the high school instruction, established during the year a normal and training school to supply trained teachers for its schools. The first class consisted of 13 young ladies.

OTHER NORMAL INSTRUCTION.

The private normal schools reporting for 1882 are (1) *Northwestern Ohio Normal School*, Ada, with 1,420 normal students in a 3-year course and 498 others, in all 1,918, under 36 instructors, graduating 65; (2) *Ashland College Normal Training School*, Ashland, having a 4-year course and open to both sexes; (3) *Ohio Central Normal and Kindergarten Training School*, Fayette; (4) *Geneva Normal School*, Geneva, with 64 students in a 4-year teachers' course and 121 others, in all 185, under 11 instructors; (5) *National Normal University*, Lebanon, showing 1,672 normal students in a $2\frac{1}{2}$-year course, besides 160 others, under 25 teachers, graduating 101; (6) *Mansfield Normal College*, Mansfield, with 170 normal students in a 4-year course and 25 others, in all 195, under 4 instructors; (7) *Western Reserve Normal School*, Milan, which had 116 normal students under 5 instructors; and (8) the *normal department of Mount Union College*, Mount Union, which has a 3-year teachers' course.

Normal departments or teachers' courses also exist in connection with Antioch, Buchtel, Franklin, Hiram, Muskingum, Rio Grande, and Scio Colleges, and Baldwin, Ohio, Ohio Wesleyan, Otterbein, Wilberforce, and Cincinnati Universities; also, in the following academies: Academy of Central College, Atwood Institute, Dague's Collegiate Institute, Fostoria Academy, Geauga Seminary, Hopedale Normal College, Northern Ohio Collegiate Institute, and Western Reserve Seminary.— (Catalogues and returns.)

For statistics of normal schools reporting, see Table III of appendix; for a summary of same, a corresponding table in the report of the Commissioner preceding.

TEACHERS' INSTITUTES.

An institute at the expense of the institute fund may be held in any county where not less than 30 regular teachers shall declare in writing their intention to attend, the managing

committee to enter into bond in twice the amount in the county treasury for such institute and the institute to be held not less than four days. The institute fund is derived from fees of 50 cents from each applicant for examination as a teacher in the county; instead of turning the money into the county treasury, however, city districts may retain in their own treasuries the fees collected from applicants for examination and with the amount hold a district institute; the city failing to hold the annual institute, the money goes to the county.

During the year 95 institutes were held, with an aggregate attendance of 12,078, at a cost of $19,980, a gain of 10 institutes and of 1,406 in attendance over 1881. Five institutes were in session 4 days each; 62, 5 days; while 28 continued 10 and over; 3 reaching 15 and 3 others 20 days, all under 425 instructors.

EDUCATIONAL JOURNALS.

The Teachers' Guide, Mallet Creek, continued through 1882, expiring with the December number. The Ohio Educational Monthly, Salem, continues to be the organ of the State Teachers' Association, furnishing valuable information as to methods of instruction and government and also as to the progress of education in the State and elsewhere, being now in its twenty-third volume. The Vis-à-Vis continues to be published weekly at the State Institution for Deaf-Mutes, Columbus, and was in 1882 in its fifteenth volume.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

High school statistics for 1882 show 600 rooms in use, an increase of 25 over 1881; 546 men and 254 women teaching, a total of 800, an increase of 26; an enrolment of 29,372, a loss of 567; and an average daily attendance of 20,902, a loss of 63. There were 32 more male and 6 fewer female teachers. The average monthly pay of men in township district high schools was increased from $53 to $55, while that of women was reduced from $36 to $28. In city, village, and special districts the pay of men was reduced from $69 to $57, and that of women from $55 to $54. Of the enrolled there were 3,264 more females than males, and of the daily attendants, 3,246 more. The high schools of the State, as reported, graduated 1,125.—(State report.)

OTHER SECONDARY SCHOOLS.

For statistics of private academic schools, preparatory schools, or preparatory departments of colleges, see Tables VI, VII, and IX, and for business colleges, Table IV of the appendix; for summaries of the same, corresponding tables in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The *Ohio State University*, Columbus, reported for 1881–'82 a large increase in students and equipment and a reorganization of the curriculum. It is open alike to both sexes and offers a 2-year preparatory course, affording a fair opportunity for pupils of the common and high schools to enter the university. There are two literary courses and one in science, each of 4 years, called general courses, and four special courses, also of 4 years each. Military drill is required of all male students unless excused on reasonable grounds. The whole number in actual attendance was 340, a gain of 60 over 1880–'81. More accommodations and instructors were needed. With an appropriation from the State of $20,000, a chemical laboratory building was nearly completed. Provision was also made for the immediate erection of three faculty residences, at an aggregate cost of $15,124. The year began under a new organization of the various departments: instead of the previous classification of regular, special, preparatory, and unclassified students, came 4 schools, viz: the school of arts and philosophy, including those studies which enter into the course leading to the degrees of B. A. and PH. B.; the school of science, including studies which enter into the course leading to B.S.; the school of engineering, including the studies which enter into the course leading to the degrees of civil engineer, mechanical engineer, and mining engineer; and the school of agriculture, including the studies leading to the degree of bachelor of agriculture. The total value of endowment and property exceeds $1,000,000.—(Catalogue.)

The *University of Cincinnati* consists of three departments, viz: the school of design, or art department, organized in 1871; the academic, or department of literature and science, organized in 1873; and the observatory, or astronomical department, 1875. The endowment consists of an estate left by Charles McMicken, increased by donations from the Cincinnati Astronomical Society and individuals. It reports a faculty of 14 instructors in the academic and astronomical departments and 8 in the school of design. The course

in this last seems to occupy 5 years; the other regular courses cover 4 years each, with special ones of 1 year and graduate courses of 1 year leading to the degree of M. A., M. SC., or M. L., a similar course of 2 years leading to PH. D. The number of students for the year was 374, of whom 91 were academic, 281 were in the school of design, and 2 were in the observatory.—(Catalogue.)

Ohio University, Athens, shows classical and philosophical preparatory courses of 3 years each, followed by classical and philosophical courses of 4 years each, the last differing from the classical course in substituting French and German for Greek, thus allowing time for considerable attention to be given to the English language in the junior year. Extensive improvements were made during the year in facilities for instruction, and a new building, containing an assembly room and halls for the literary societies, was in course of erection. There were 72 in the preparatory department, under 3 instructors, and 32 in the classical and philosophical courses, there being in the last an equal number of males and females.—(Catalogue and return.)

Of the remaining universities and colleges, 34 reported for 1881–'82. The Miami Valley College has, since the last report, become extinct, while Richmond College, which had been discontinued for some years, was reopened in 1881. All, but the Hebrew Union, St. Xavier, Kenyon, Marietta, Richmond, and Geneva Colleges and Capital, Denison, and Urbana Universities, admit both sexes; all, except the University of Cincinnati, show preparatory courses of 2, 3, or 4 years; all have the usual classical courses of 4 years; all but 7, scientific courses of 4 years; while 8 have philosophical courses of the same length. Twelve show commercial courses; 18, arrangements for normal instruction, previously mentioned under Training of Teachers; while 13, to be mentioned under Professional Instruction, have departments of theology; 1, a department of law; and 2, departments of medicine. St. Xavier, University of Cincinnati, Oberlin, and Ohio Wesleyan continue their 4-year literary courses, that in the last being only for ladies. Five institutions provide elective and select courses, while all give instruction in either German, French, music, or drawing and painting.—(Catalogues and returns.)

For statistics of these institutions reporting, see Table IX of the appendix, and for a summary of them, a corresponding table in the report of the Commissioner preceding.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

Besides the institutions above mentioned, which admit both sexes, there are 10 other colleges designed especially for the superior instruction of young women.

The *Cincinnati Wesleyan College* follows its primary and preparatory courses of 3 and 4 years with classical and scientific courses of 4 years each and confers the degree of A. B. on the completion of the classical and scientific courses and that of A. M. on the completion of a graduate course of 2 years. In 1882 it opened a regular military department.

Mount Auburn Young Ladies' Institute, Cincinnati, aims to complete young ladies' education by giving systematic instruction in domestic art and science to the senior class.

There was an aggregate of 146 professors and instructors and 325 preparatory and 637 collegiate students, with 1,151 in all departments. All, except the Western Female Seminary, begin with preparatory and some also with primary courses of 3 and 4 years, while all have collegiate courses of 4 years each. Some offer special courses and all give instruction in music, drawing, painting, and modern languages.

For statistics, see Table VIII of the appendix, and a summary of it in the report of the Commissioner preceding.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

The *Ohio State University*, Columbus, continues its 4 distinct courses of technical study in addition to the regular scientific course of 4 years, viz: in agriculture, and in civil, mining, and mechanical engineering, each of 4 years, the first year being the freshman year of the scientific course. In the department of horticulture and botany instruction is given in lectures connected with laboratory practice and field work. The annual course of lectures to farmers given in January of this year was well attended and the interest of former years fully sustained.—(Catalogue.)

Otterbein College discontinued its old scientific course in 1881 and adopted a philosophical course, enlarged so as to be equal in extent to the classical, substituting French and German for Greek.

The *Ohio Mechanics' Institute*, at Cincinnati, organized in 1881, embraces the department of science and arts, sections of mechanics and engineering, of chemistry and physics, and a school of design.

Scientific courses of 4 years are offered by 29 other universities and colleges, the University of Cincinnati adding a course of 4 years in civil engineering, leading to the degree of C. E.

PROFESSIONAL.

Theological.—The schools of theology existing purely as such and having 3-year courses are Lane Theological Seminary, Cincinnati (Presbyterian); the Union Biblical Seminary, Dayton (United Brethren); the Theological Seminary of the Protestant Episcopal Church, Gambier; and the United Presbyterian Theological Seminary, Xenia. St. Charles Borromeo, Carthagena, reports a course of 8 to 10 years, including studies in philosophy and classics; and St. Mary's Theological Seminary, Cleveland, a course of 5 years; both are Roman Catholic.

The following have theological courses of 3 years: German Wallace College, Berea, (Methodist Episcopal); Capital University, Columbus (Evangelical Lutheran); Oberlin College, Oberlin (Congregational); and Urbana University, Urbana (New Church). Wilberforce University, Wilberforce (African Methodist Episcopal), for colored students, has a course of 4 years, partly literary. Wittenberg College, Springfield (Evangelical Lutheran), and Heidelberg College, Tiffin (Reformed Presbyterian), have courses of 2 years each; while Ohio Wesleyan University, Delaware (Methodist Episcopal), and Hiram College, Hiram (Disciples), show biblical studies in connection with college courses. The 2-year and 3-year courses are meant to follow a collegiate or high school training.—(Catalogues and returns.)

For statistics of theological schools and departments reporting, see Table XI of the appendix, and a summary of it in the report of the Commissioner preceding.

Legal.—The law school of the Cincinnati College had 127 students in its 2-year course for 1881–'82. There appears no advance in requirements for admission or graduation. For admission to the junior class, satisfactory evidence of a regular academic education is sufficient; to the senior class, a satisfactory examination in the studies of the junior year and a certification that the applicant has studied law for one year; for the degree of LL. B., regular admission to the senior class, attendance on the full course of senior lectures, and a satisfactory examination. Graduates having the necessary qualifications of age and citizenship are admitted to the bar of Ohio without further examination. A graduate course is added whenever a sufficient number call for it.—(Catalogue.)

The catalogue of Wilberforce University for 1881–'82 indicates the discontinuance of its law department.

Medical.—The following are the only regular medical schools[1] reporting for 1881–'82: The Cincinnati College of Medicine and Surgery, with 13 professors and 1 demonstrator; the Medical College of Ohio, with 10 professors and 15 assistants; and the Miami Medical College, with 11 professors and 8 assistants, all in Cincinnati; and the Columbus Medical College, with 12 professors and 3 assistants, and the Starling Medical College, with 14 professors and 1 demonstrator, both in Columbus.

The medical department of the Western Reserve University, Cleveland, a combination of the Cleveland Medical College and the medical department of Wooster University, was opened for students in September, 1881, the two bringing to the new institution a new faculty of 16 instructors.

For graduation, all required the usual 3-year course of study under a physician, including 2 regular lecture courses of 20 weeks each year in those at Cincinnati and of 24 in those at Columbus and Cleveland, the last of which courses must be in the college conferring the degree. All, except Columbus Medical College, offer a 3-year graded course, but do not require it. To induce students to pursue it, the Miami Medical College will demand fees for but 2 years of those who complete the 3-year course. The Cincinnati College of Medicine and Surgery announces the plan of giving special operative courses as a new and important feature of the spring session, having for its object the training of physicians and advanced students in making physical examinations of patients and performing operations.

The Eclectic Medical Institute, Cincinnati, with 8 professors and a demonstrator, had courses of 19 and 20 weeks yearly and recommended but did not require a 3-year graded course. For graduation, students must have studied medicine 3 years and attended 2 full courses of lectures, the last of which must have been in this school.

The Physio-Medical Institute, Cincinnati, with 12 professors and 2 assistants, requires 3 full years of study and 2 full courses of lectures of 20 weeks annually.

The Pulte Medical College, Cincinnati (homœopathic), with 10 professors and 3 assistants, and the Homœopathic Hospital College, Cleveland, with 10 professors and 3 assistants—each open to both sexes—continued to require 3 years of study, including attendance on 2-year lecture courses, the last of which must be in the college conferring

[1] Two other medical schools, the Toledo Medical College, Toledo, and Northwestern Ohio Medical College, Toledo, were in process of organization for 1883.

the degree. Both offer a 3-year graded course, but do not require it. The Hospital College offers special courses of instruction in those branches which cannot be conveniently taught in the regular course.

The Cincinnati College of Pharmacy requires attendance on 2 full courses of lectures in a regular college of pharmacy (the last in this college), an experience of 4 years with a qualified pharmacist, and a written examination.

The Ohio College of Dental Surgery requires attendance on 2 courses of lectures in a dental or medical college (the last in this school), a written thesis, a specimen case of artificial dentistry, and a satisfactory examination.

The 6 regular colleges reported for 1881–'82 900 matriculates and 676 graduates; the 1 eclectic, 272 matriculates and 100 graduates; the Physio-Medical Institute, 36 matriculates and 12 graduates; the 2 homœopathic, 208 matriculates and 60 graduates; total, 1,416 matriculates and 848 graduates.

For further statistics of schools of medicine, pharmacy, and dentistry, see Table XIII of the appendix, and for summaries of them, the report of the Commissioner preceding.

SPECIAL INSTRUCTION.

CLEVELAND EDUCATIONAL BUREAU.

This bureau, which is especially to benefit the working classes, provides lectures and publishes pamphlets and books for the people, embodying a large amount of useful information, of which 119,200 had been distributed. The work of the bureau for 1881, under the direction of C. A. Bolton, was so successful that the institution was made permanent and arrangements were made for the second season. During the first season the average evening attendance was from 2,500 to 4,000, the total receipts $5,000. During the second season, in 1882, the average attendance was 4,000 and receipts over $8,000. Among the lecturers were Joseph Cook, John B. Gough, and Governor St. John. General Eaton, United States Commissioner of Education, was present at a meeting and declared that no such work had been done anywhere else in the United States.

EDUCATION OF THE DEAF AND DUMB AND THE BLIND.

The *Ohio Institution for the Education of the Deaf and Dumb*, Columbus, for 1882 reported 513 different pupils, of whom 60 were in school for the first time, and 24 graduated, fairly equipped, it is said, for the duties of life; making 1,945 who had received instruction since the opening of the institution. Its property was valued at $500,000, including a library of 2,000 volumes. Articulation and lip reading were taught, there being 82 semi-mutes in the school. There was an increased interest in the arrangement of the industries taught so as best to fit the pupils to take their places as skilled and successful workmen. The report advises discretion in the selection of trades. Of the 4 now offered, carpentry and shoemaking should be taught to those from the rural towns, as in them there will always be a demand for such labor, while those learning printing and bookbinding must find their work in the larger towns. It was urged that tailoring be added, especially in the interest of the girls.

At a meeting of the *Ohio Deaf-Mute Alumni Association* plans were set on foot by the mutes themselves for the establishment of a home for aged and infirm mutes.

In the *Cincinnati Day School for Deaf-Mutes*, in charge of the city board of education, the enrolment was 27 and average daily attendance 22, under 2 teachers. The falling off from the previous year was due to the action of the legislature, which provided only for the payment of the teachers; previously a portion of the money appropriated for the school had been used to support its pupils for the 5 school days of the week.

The *Ohio Institution for the Education of the Blind*, Columbus, shows for 1882 a total enrolment of 226, an average attendance of 176, and 28 new pupils. Instruction was given in the common and some of the higher English branches, in vocal and instrumental music, in piano tuning, and such other industries as are taught in like institutions.

EDUCATION OF THE FEEBLE-MINDED.

The Ohio Institution for Feeble-Minded Youth, Columbus, suffered during the year for want of room, owing to the fire in 1881, which consumed the central part of the main building. It admits children from 6 to 15 years of age and instructs them in the common school branches. During the year there were 612 inmates, 5 being new ones. The completion of the buildings in process of construction it was hoped would increase the efficiency of the institution.

INDUSTRIAL AND REFORMATORY TRAINING.

The *Boys' Reform School* is located on a farm of 1,210 acres near Lancaster, on which there were 80 acres of vineyard, 8,000 peach trees, 30 acres of garden and nursery, and 400 acres under general tillage. Besides the main building, which is 161 feet long and

3 stories high above the basement, there are family buildings, arranged around the main building and named after the rivers of the State. On the spacious grounds are numerous other buildings, 8 of which are shops for as many trades. The first 10 boys received were from the Cincinnati House of Refuge in 1858, since which there had been received 3,717 boys. In 1882 the average number in the school was 499, of whom 196 received the highest badge, 168 were on leave of absence, 19 were apprenticed, and 9 had employments found for them. The superintendent says that of 45 per cent. released a large number were doing well and promised to become good citizens.— (Annual report.)

The *House of Refuge and Correction*, for boys, Toledo, had 237 inmates during the year, and 731 since opening.

The other institutions of this class heretofore reporting were the *Industrial School and Home*, Cleveland; *Toledo Industrial School; Girls' Industrial Home*, Delaware; *Cincinnati House of Refuge;* and the *House of Refuge and Correction*, Cleveland. All these schools give school, industrial, and religious training.

EDUCATION IN ART.

The *School of Design* in the University of Cincinnati, the *Woman's Art Museum Association*, and the *School of Design* in the Ohio Mechanics' Institute, all at Cincinnati, the *Columbus Art School*, and the *Toledo University of Arts and Trades* give instruction in the various forms of art. The School of Design in the University of Cincinnati, beginning in 1868 with 1 teacher and 30 students, entered upon a thoroughly graded course of instruction in the various departments in 1880–'81, showing in 1881–'82 a faculty of 7, with 300 pupils, most of whom were females; in wood engraving all were girls.

EDUCATION IN MUSIC.

Scientific musical instruction is reported to be given in the College of Music of Cincinnati, the Cincinnati College of Music, Cleveland College of Music, and Oberlin Conservatory of Music, Oberlin College, which last has a course of 3 years for the theory of music and from 3 to 5 years for the various forms of practice. This enrolled for 1881–'82 classes of 75 young men and 312 young women. Statistics of the other schools are wanting for that year, but it is hoped that they may be obtained for 1882–'83.

Another school heard of favorably is Dana's Musical Institute, Warren, Ohio.

EDUCATIONAL CONVENTIONS.

STATE ASSOCIATION.

The Ohio Teachers' Association held its thirty-third annual meeting at Niagara Falls, N. Y., July 5, 6, and 7, 1882. The superintendents' section was called to order by George W. Walker. J. M. Goodspeed, president of the section, gave the inaugural address, urging teachers to exert their influence in favor of legislation for a good school system, and William Hoover, of Dayton, read a paper on "A rational course in mathematics," full of matter that cannot be well condensed.

The general association was called to order by George W. Walker. President J. J. Burns delivered the inaugural address on "The evolution of a common school master;" Mrs. D. L. Williams, of Delaware, Ohio, read a paper on "Young teachers and their calling," followed by one on the same subject by Miss R. P. Cook, of Gallipolis, Ohio, both excellent and practical. These papers were discussed at some length and with much useful suggestion as to studies and methods. W. W. Ross, of Fremont, Ohio, read a long and admirable paper on instruction in history — local, biographical, and general — with information as to books for use in such instruction, as well as to the lessons to be drawn from the study of history. These papers, with the inaugural addresses and a very appropriate memorial address by W. W. Venable, of Cincinnati, on the death of Hon. William Downs Henkle, a former State school commissioner and long editor of The Educational Monthly, occupied the sessions of the association. Of Mr. Henkle there may be found a brief biography in the report from this Bureau for 1881, page 209.

OTHER TEACHERS' ASSOCIATIONS.

The Union Teachers' Association of Trumbull and Portage Counties met December 16, 1882, at Windham, with an excellent program, which was well carried out. O. F. Haymaker discussed industrial education.

The Auglaize County Teachers' Association held its first quarterly meeting at Wapakoneta November 10. Papers were read on "The dignity of the profession," "The scholar's mission," and "Practical education."

The Eastern Ohio Teachers' Association held its twelfth annual meeting at Steubenville December 1 and 2. The program is said to have been good, the papers and discussions spirited, and the attendance large. Commissioner De Wolf discussed the question "Is our American school system doing what it may for the interest of the public?"

The Northeastern Ohio Teachers' Association held its annual meeting at Cleveland December 9. Though the attendance was not as large as usual, the meeting is said to have been one of interest and profit. Superintendent Hinsdale, of Cleveland, discussed the subject of American history in the public schools; Sebastian Thomas, of Lodi, industrial training in German schools, a topic which awakened much interest.

The Southwestern Ohio Teachers' Association held its last session at Middletown April 22. A very fine paper is said to have been read by Mr. A. T. Wiles, of Newport, Ky., on "A course of study for public schools."

The Southeastern Ohio Teachers' Association met at Gallipolis April 28 and 29, but no account of the meeting has come to hand.

OHIO COLLEGE ASSOCIATION.

This association, begun about 20 years ago, is composed of the "presidents and professors of the colleges in the State of Ohio" (constitution, article 3). The governor of the State, the commissioner of common schools, and the president of the State Teachers' Association are members ex officio. After about a dozen years of peaceful life, it was thought necessary to determine what is a college in the State of Ohio. The association knew that no other body could make this definition as well as itself. It was entirely, in the view of its members, a matter of definition. After a year or two of consultation, upon the report of a judicious committee, it was resolved that certain named institutions, 15 in number, were the colleges in the State of Ohio. There might be other institutions which the State officers or the courts of law might call colleges, or even universities, but those named by the association were held to be the only ones in Ohio that were such in fact. Two others have since been added to the list, making 17. Nearly every year some institution presents a claim to membership, but fails of recognition. There has been talk of appointing a committee to investigate and revise the list, but no action has been taken.

At one time the association adopted minimum courses of study for degrees in the colleges connected with it; but having no power to enforce these they have become mere indications of a proper standard without any binding force.—(Letter from a member of the association.)

OBITUARY RECORD.

DR. JOHN PRATT.

Rev. John Pratt, D. D., founder of Denison University, died suddenly at Granville January 4, 1882, in the eighty-second year of his age. He was born in Connecticut, graduated at Brown University in 1827, and was the first president of the Baptist College at Granville, established in 1831 as Granville Literary and Theological Institution, made Granville College in 1832, and entitled to be called Denison University in 1856. He was professor of ancient languages there from 1837 to 1859, and then retired to private life, having given 28 years of untiring, self sacrificing toil to the educational and religious interests of his adopted State and of the college with which he was identified. He is said to have been born a teacher and bred a scholar, true, quick, and keen, with marvellous power to awaken the dormant energies of pupils and to develop their ability for independent thought. As a teacher of Greek and Latin he was reputed to be of remarkably high rank, with few equals and perhaps no superiors when in his prime.

DR. WILLIAM H. MUSSEY.

Dr. William H. Mussey, of Cincinnati, was one of the most distinguished and public spirited citizens of that city. He was born in Hanover, N. H., September 30, 1818, studied medicine in the Ohio Medical College, and graduated in 1848. He subsequently studied 18 months in Paris, and upon returning to this country settled in Cincinnati, where he made a specialty of general surgery. He was vice president of the American Medical Association in 1864 and afterward vice president of the Ohio State Medical Association. He also held various eminent positions in hospitals and colleges. He was commissioned brigade surgeon October, 1861, and lieutenant colonel and medical inspector of the United States Army in June, 1862, and was surgeon general of Ohio for several years. He was also president of the Natural History Society of Cincinnati. As a memorial of his father he founded the Mussey Medical and Scientific Library in Cincinnati and gave several thousand valuable publications to the collection. In 1857 he married Caroline W. Lindsly, of Washington, D. C.—(Boston Journal.)

CHIEF STATE SCHOOL OFFICER.

Hon. D. F. De Wolf, *State commissioner of common schools, Columbus.*

[Term, January, 1881, to January, 1884.]

To be then succeeded by Mr. Le Roy D. Brown.

OREGON.

STATISTICAL SUMMARY.

	1880–'81.	1881–'82.	Increase.	Decrease.
POPULATION AND ATTENDANCE.				
Youth 4 to 20 years of age *a*	61,641	65,216	3,575	
Enrolled in public schools	34,498	37,743	3,245	
Average daily attendance	25,196	27,347	2,151	
Attending graded schools	8,918	8,986	68	
Attending private schools	4,823	7,394	2,571	
Number reported as not in school	21,655	21,328		327
SCHOOL DISTRICTS AND SCHOOLS.				
Organized districts	1,037	1,093	56	
Districts reporting	988	1,026	38	
Graded schools reported	52	50		2
Average school term in days	86	90	4	
Number of private schools	186	193	7	
Value of public school property	$657,469	$684,298	$26,829	
TEACHERS AND THEIR PAY.				
Number of men teaching	591	662	71	
Number of women teaching	748	750	2	
Whole number of teachers	1,339	1,412	73	
Teachers in graded public schools	174	182	8	
Teachers with first grade certificates	691	745	54	
Teachers with second grade certificates	648	667	19	
Average monthly pay of men	$42 26	$43 95	$1 69	
Average monthly pay of women	31 72	31 63		$0 09
RECEIPTS AND EXPENDITURES.				
Whole receipts for public schools	$323,301	$338,307	$15,006	
Expenditure for public schools	318,331	346,961	28,630	
STATE SCHOOL FUND.				
Permanent school fund	$625,000			
Available school fund	610,000	$832,522	$222,522	

a The basis for appropriation of public money; the age for admission into public schools is 6 to 21.

(From the report of Hon. L. J. Powell, State superintendent of public instruction, for the two years indicated.)

STATE SCHOOL SYSTEM.

OFFICERS.

For the general administration of public school affairs there is a State superintendent of public instruction, elected quadriennially by the people. He, the governor, and the secretary of state constitute a State board of education. The local officers are county superintendents of common schools, elected biennially by the voters of the county; district boards of three directors, elected for three years; and a district clerk, elected for one year.

OTHER FEATURES OF THE SYSTEM.

Public school moneys are derived from a State school fund, from a county tax of 4 mills on $1, and from a tax which district meetings, legally called, have the power to levy on all the real and personal property in their districts. District meetings may also make any necessary appropriations for the support of schools. Only districts where schools have been taught three months are entitled to their proportion of the school fund; this restriction, however, is not to apply to a district until the fourth year of its existence. The State superintendent must report to the legislature biennially and county superintendents must report to the State superintendent annually, or be liable to removal; they must also hold quarterly examinations, and applicants rated number 1 at such examinations receive certificates good for two years; those rated number 2 receive certificates for six months. Life diplomas and State certificates, the latter for six years, are given on examination by the State board of education, both being subject to revocation by the board, which also grants certificates of the same force as those granted by county superintendents. High schools must be maintained in districts containing 1,000 youth of school age. In districts containing 10,000 inhabitants, upon petition of 100 residents, one or more of the common schools is to be taught in the German language. Any tax-paying citizen of the State who is 21 years of age is entitled to vote at any school meeting held in the district in which he or she resides.

GENERAL CONDITION.

The report for 1881–'82 indicates progress in all but two items, graded schools and the salary of women teaching, in which the reductions were trivial. The State superintendent says the greatest need of the schools is a more thoroughly trained class of teachers. To secure better supervision also, an increase of salary is recommended for county superintendents. A longer period of school during the year in the county districts is said to be necessary, as in 300 districts out of 1,026 in the State reporting the schools were taught but 3 months, or 60 days, during the year. The superintendent therefore recommends that the minimum school term entitling districts to their share of the school fund be 6 months instead of 3. He favors also an amendment to the law which shall require the levy of a State school tax of 2 mills on the dollar.

CITY SCHOOL SYSTEM OF PORTLAND.

OFFICERS.

The interests of the public schools of Portland are in charge of a board of 3 directors, a clerk, and a city superintendent.

STATISTICS AND ADDITIONAL PARTICULARS.

With an estimated population of 25,000 the superintendent reported the total number of youth of school age in 1881–'82 to be 5,314, including colored and 126 Chinese. Of this number 3,130 were enrolled in the public schools, with an average daily attendance of 2,166. The number of cases of corporal punishment was 96; of suspension, 6. The percentage of tardiness was reported the same as last year. The schools were taught 200 days by 5 men and 51 women. During the year extensive additions were made to the accommodations and the superintendent declares that no school room in the city could be classed as poor. The receipts for all school purposes were $86,245; the expenditures, $118,106. There were 72 pupils graduated in 1882 from the grammar schools, over 65 of whom entered the high school.

TRAINING OF TEACHERS.

STATE NORMAL SCHOOLS.

The *Oregon State Normal School*, Monmouth, organized in 1882 and made free to 62 State students, offers a subnormal or elementary course of a year, preparatory to the regular normal course, which covers 2 years. The latter includes not only the science and history of education, school methods, hygiene of the school room, school law, &c., but also mathematics, natural and mental science, English language and literature, rhetoric, elocution, music, and book-keeping. Beyond this there is a 2-year course of collegiate studies for such as may desire to prepare for higher work. There is also a commercial course for students preparing for business. Undertaking so much at the outset, the danger is that it may become rather a second rate college than a first rate normal school. Officers and teachers in the first year, 9; pupils, 104, without distinction of normal from others.

Ashland College and Normal School, Ashland, like the preceding formerly a private enterprise, with it, by act of the legislature of 1882, was made a State normal school. It offers

a 3-year normal course, covering 40 weeks each year, with a commercial and a college preparatory course, music, and penmanship. Its normal students have an opportunity for practice teaching in a primary and preparatory school. Teachers for the first year of its recognition by the State, 6; pupils in normal department, 21, besides 49 in the training school and 53 others.

The *collegiate department of the University of Oregon*, Eugene City, furnished for 1882 a 3-year normal course of English studies to a class of 10 students.

OTHER NORMAL TRAINING.

McMinnville College, McMinnville, and *Willamette University*, Salem, in their preparatory departments offered normal instruction, the former in a well arranged teachers' course of 2 years and the latter in one of 3 years. *Santiam Academy*, Lebanon, and *Wasco Independent Academy*, The Dalles, also offered like instruction.

TEACHERS' INSTITUTES.

The State superintendent is required by law to hold a teachers' institute in each judicial district annually, as well as a State institute at some central point. For the year 1881–'82 there were 20 institutes held, attended by 648 teachers, 7 districts not reporting. Teachers are required to attend all institutes held in the counties in which they reside, and for non-attendance without a good excuse the county superintendent may lower the grade or revoke the certificate of such teacher.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

In districts containing 1,000 persons 4 to 20 years of age, the law requires high schools to be maintained at least 6 months in each year, but the State report gives no information regarding such schools. The city superintendent of Portland reported 201 pupils in the high school of that city, of whom 30 graduated: from a 4-year language course, 12; and from a 3-year English course, 18. Of the pupils 121 were girls; there was not a case of tardiness during the year. The only punishment inflicted consisted of 3 suspensions.

OTHER SECONDARY SCHOOLS.

For statistics of private secondary schools and preparatory departments of colleges reporting, see Tables VI and IX of the appendix, and summaries of them in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The University of Oregon, Eugene City, in the sixth year of its existence in 1881–'82, continued its preparatory, classical, scientific, and normal courses, the preparatory of 1 year for the normal course and of 2 for the others, the classical and scientific collegiate of 4 years each, and the normal of 3 years. The scientific course differs from the classical mainly in substituting French, German, and mathematics for Latin and Greek. But the collegiate arrangements are still comparatively in their infancy. At least 1 free scholarship is allowed to each county, and it may have another for each member and joint member of the legislature to which the county is entitled. There appear to have been 72 free students holding such scholarships, with 71 other students, 143 in all, in what is called the collegiate department, which included not only 72 college students proper, but also 10 normal students and 61 classical and scientific preparatory; 74 English preparatory students, not counted as collegiate, made a total of 217, all under 7 professors.

Corvallis College, Corvallis; Pacific University, Forest Grove; Blue Mountain University, La Grande; McMinnville College, McMinnville; Christian College, Monmouth; Philomath College, Philomath, and Willamette University, Salem, have preparatory departments, as well as classical and scientific courses of 4 years, except Pacific University, which makes its scientific course 3 years. It has also a 3-year ladies' course. The studies of Corvallis College are divided into 7 schools, that of mathematics covering 4 years, the others of undefined duration. Philomath gives a 4-year ladies' course; Christian, Philomath, and Willamette offer business courses; all three, with Blue Mountain, give instruction in drawing, painting, and music. For statistics of these institutions, see Table IX.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.

All the above institutions are open to young women, Willamette University having a well organized woman's college, with a lady dean.

St. Helen's Hall, Portland, for girls only, presented for the year courses in collegiate studies occupying 4 years. Latin and the modern languages were taught, as well as music, drawing, and painting. For statistics, see Table VIII of the appendix.

SCIENTIFIC AND PROFESSIONAL INSTRUCTION.

SCIENTIFIC.

In addition to the scientific courses before noted an opportunity is given in the schools of engineering and agriculture at Corvallis College for the study of these sciences, the former offering instruction in drawing, descriptive geometry, and the general principles of civil engineering; the latter, in analysis of soils, modes of drainage, methods of preparing farm buildings, as well as in stock raising, fruit culture, &c. Graduates from these schools are entitled to the degree of B. S.

PROFESSIONAL.

The College of Medicine, a department of Willamette University, located at Portland, is the only professional school reporting for the year 1881–'82. The required course of study is 2 years of 20 weeks each year and an optional preliminary course of 4 weeks' duration annually. A 3-year graded course is recommended but not required. For admission a preliminary examination is required of applicants who are not graduates of a college, academy, or high school, and for graduation the student must have attended 2 full courses of lectures, have completed 3 years of study, have gone through a course of practical anatomy, and have passed a satisfactory final examination. The college in 1881–'82 had a faculty of 11; 29 students were matriculated and 9 graduated.—(Catalogue.)

SPECIAL INSTRUCTION.

EDUCATION OF THE DEAF AND DUMB.

The Oregon School for Deaf-Mutes, Salem, is a State institution under the management of a board of 9 directors. There were 42 pupils enrolled in 1881 and 1882, representing 12 counties in the State; average attendance, 26. Instruction in the English branches was given (manual method) by 3 teachers, 1 of them a deaf-mute. The school was occupying rented buildings, and consequently had no shops for industrial training, while other needed advantages for comfort and instruction were still wanting.

EDUCATION OF THE BLIND.

The Oregon Institute for the Blind, Salem, which was suspended in 1878, is to be reopened in 1883, the legislature in 1882 having made an appropriation of $8,000 for its support.

REFORMATORY TRAINING.

Mr. W. S. Ladd, a banker in Portland, has given the State $20,000 for the erection of a reform school and will pay all the expenses of maintaining it.

INSTRUCTION OF INDIANS.

The statistics for 1882 show a school population of 906 at the 5 United States Indian agencies in the State. Although there were school accommodations for 340 pupils, the average daily attendance was only 172. The school at Warm Springs agency was taught 11 months, those at Klamath and Siletz 10, and at Grand Ronde 5, at a total cost to the Government of $16,612. There were 381 Indians who could read, 40 having learned during the year. They were taught housekeeping, sewing, carpentry, and gardening, as well as common school studies, by 19 teachers.

The report from the Training School for Indian Youth, at Forest Grove, gives an attendance of 54 boys and 37 girls. The instruction was the same as that given at the agencies, blacksmithing, shoemaking, and farming being added.

EDUCATIONAL CONVENTION.

STATE ASSOCIATION.

The State Teachers' Association held its annual session at Salem, August 21–23, 1882, State Superintendent Powell presiding. The convention was well attended, though the number of teachers present was not given. Among the many interesting subjects was one presented by Dr. Fowler, of New York, advocating more thorough educational work. He recommended the old-fashioned drill course of mathematics, Latin, and Greek, and advised students aspiring to a future life of usefulness to take a full course. The subject of physical geography was treated in an interesting manner with simple illustrations, and

was followed by "Education and the state." An excellent paper, entitled "Necessity for better teachers and how to secure them," advocated normal schools supported by public funds; educational journals, as a valuable means of improvement to the reading teacher; and the encouragement of teachers by better pay, as those vocations which pay best usually attract the best material, and, while millions might be spent on normal schools, their graduates will not remain teachers unless paid to do so. The subjects of "Teachers' examinations," "Science in school," and "Relation of common schools to colleges" were also discussed, after which the association adjourned.

CHIEF STATE SCHOOL OFFICER.

Hon. E. B. McElroy, *State superintendent of public instruction, Salem.*

[Term, September 11, 1882, to January 1, 1887.]

PENNSYLVANIA.

SUMMARY OF EDUCATIONAL STATISTICS.

a United States Census of 1880. b Not including Philadelphia.

(From reports of Hon. E. E. Higbee, State superintendent of public instruction, for the two years indicated, with returns from the same for each year.)

STATE SCHOOL SYSTEM.

OFFICERS.

The public schools of the State are under the general supervision of a State superintendent of public instruction, with 2 deputies; local supervision is secured through county superintendents, one for each county, and through school directors in independent

school districts within the county, 6 for each district. In consolidated districts (cities or boroughs) there are directors in each ward to look after school property and buildings and the collection and disbursement of taxes in that ward, with a board of controllers composed of all of these directors for all other school matters of the city or borough. Women may hold any of these offices. The State superintendent is appointed by the governor, the senate concurring, every fourth year, and may be removed for sufficient cause by the same functionary at any time; county superintendents may be changed every third year; one-third of the directors in any district, every year. Philadelphia, Pittsburgh, and some other places, under special charters, vary somewhat from these arrangements.

OTHER FEATURES OF THE SYSTEM.

The public schools are free to all children 6–21 years of age, of whatever race or color, residing in a district in which they are taught. To support the system the State contributes $1,000,000 yearly and requires the levy of an annual tax in each school district, which shall not exceed 13 mills on the dollar for instruction and as much more for buildings. The sessions of the schools must cover from 5 to 10 months yearly. School teachers must have certificates of qualification from some recognized school officer and must report monthly to the directors under whom they serve; these directors, annually, to their county superintendent; he to the State superintendent, who, from the city, county, and other reports, prepares for the legislature a condensed statement of free school education for the year, adding information as to academies and colleges that have had aid at one time or another from the State. Ten normal schools under State direction continue to receive State aid, as do 2 schools for the deaf, 1 for the blind, and 1 for the feeble-minded; while graded schools, night schools, and city schools for the deaf come in for their share of the annual State appropriation.

GENERAL CONDITION.

The State report for 1881–'82 indicates fair progress. From the lack of an annual census of children of school age, the proportion of enrolment to the number entitled to instruction cannot be told; but, with 13,596 more pupils in the public schools and not less than 9,000 additional attending academies and other private schools, it is not unlikely that even pace was kept with the growth of school population. Accordingly, Superintendent Higbee estimates that only about 9,883 more youth than previously were without some form of schooling. At almost every point, indeed, there is a gain: 7 more school districts; 348 more free schools; 555 more schools graded; not including Philadelphia, 119 more buildings for free schools, 108 more rated as first class, and 849 more supplied with good school furniture, as well as a considerable increase of teachers who had either had 5 years' experience or had been trained to some extent in the State normal schools. If the statistics of the schools of Philadelphia were added where wanting to those above, the case would appear better still, as there the school buildings are among the best in the State, the teachers well trained in excellent city normal classes, and the appliances for instruction generally superior to those elsewhere. Almost the only thing that seems to be wanting to attain higher success is better pay for teachers; as the superintendent shows, the average pay of teachers in 1882 was only a little more than $200 yearly, not enough, certainly, to secure permanence in school work on the part of the class of teachers most to be desired.

KINDERGÄRTEN.

For the statistics and location of about 30 schools of this class in Pennsylvania, see Table V of the appendix; and for a summary of their statistics, a corresponding table in the report of the Commissioner preceding.

The Sub-Primary School Association of Philadelphia is reported to have established, from October, 1879, to March, 1882, in connection with ward associations in that city, 11 free Kindergärten, sufficing for the instruction of 405 children. Others have been added since that date. The school term is from the first Monday in September to July 1.

SCHOOL SYSTEMS OF CITIES WITH 7,500 OR MORE INHABITANTS.

OFFICERS.

The school government of cities is treated under the heading State School System, Officers. Philadelphia and Pittsburgh continued, under special laws, to have boards of education independent of the ward boards.

Any city of over 5,000 inhabitants may, by vote of directors, elect a school superintendent of skill and experience as a teacher, and 36 cities and boroughs have such superintendents.

STATISTICS. *a*

Cities.	Population, census of 1880.	Public schools. *b*	Enrolment in public schools.	Average number attending school.	Number of teachers.	Expenditure.
Allegheny	78,682	207	9,872	8,354	208	$202,081
Allentown	18,063	56	3,583	2,314	57	63,475
Altoona	19,710	49	3,126	2,494	51	36,813
Bradford	9,197	21	1,558	1,037	26	38,602
Carbondale	7,714	24	1,700	1,086	26	11,633
Chester	14,997	49	2,606	1,691	50	28,907
Columbia	8,312	21	1,431	978	24	17,022
Danville	8,346	27	1,709	1,123	29	11,692
Easton	11,924	44	2,267	1,651	50	52,535
Erie	27,737	104	4,658	3,136	104	69,613
Harrisburg	30,762	97	5,795	3,743	114	95,987
Johnstown	8,380	30	1,695	1,148	31	29,603
Lancaster	25,769	69	3,731	2,584	70	43,534
Lebanon	8,778	30	1,480	1,175	30	17,863
McKeesport	8,212	23	1,434	890	24	28,677
Meadville	8,860	36	1,758	1,273	36	27,641
New Castle	8,418	29	1,657	1,158	33	19,647
Norristown	13,063	44	2,225	1,548	44	34,070
Philadelphia	847,170	2,113	168,786	91,894	2,113	1,493,897
Pittsburgh	156,389	469	23,629	16,570	469	549,138
Pottsville	13,253	49	2,817	1,909	50	34,601
Reading	43,278	144	8,187	5,822	151	100,135
Scranton	45,850	90	9,016	5,993	188	106,404
Shamokin	8,184	26	1,817	1,058	29	21,710
Shenandoah	10,147	28	2,182	1,306	29	21,607
Titusville	9,046	26	1,698	1,196	32	34,277
Wilkes-Barre *c*	23,339	74	4,883	3,087	74	76,406
Williamsport	18,934	65	3,489	2,217	65	40,406
York	13,940	50	2,419	1,786	50	28,177

a For the sake of uniformity these statistics are all taken from the tables of the State report. As no census is taken of the children of school age, information on that point is wanting.
b These figures are believed to be exclusive of night schools, which existed in several cities.
c The educational statistics are for the three school districts of the city.

ADDITIONAL PARTICULARS.

Allegheny had 18 school buildings, valued, with other school property, at $280,000. School accommodations were increased by making additions to several of the buildings, nearly all of which are new, constructed of brick, and in the modern style of architecture. Few cities, it is claimed, are better provided with school-houses than Allegheny. The year is reported as one of substantial progress. Schools were in session 196 days. The enrolment in private and parochial schools was 3,000.—(State and city reports and return.)

Allentown had a high school with a 3-year course, 9 school buildings with 3,700 sittings, and her entire school property was valued at $450,000. The attendance suffered from the prevalence of smallpox, and yet the enrolment was increased by 725. Of the 57 teachers employed 30 were graduates of the city high school, 3 of a State normal school, and 2 held State certificates. A new brick building, with 4 large rooms, to be supplied, like all the others, with the most approved furniture, was nearing completion. Schools were in session 190 days.—(State report and city return.)

Altoona had school sittings for 3,010 and school property valued at $101,260. Compared with 1880–'81, enrolment increased 72. The best school building had but 4 rooms and is poorly heated and ventilated, and from want of room 5 schools of the lowest grades held half day sessions for some part of the year. During the last 8 years the school population had increased 60 per cent., while there had been no increase in the assessed valuation in that time. Schools were in session 187 days. An enrolment of 900 in private and parochial schools was reported.—(State report and city return.)

Bradford in 7 years has increased its school population more than twelvefold and the number of its schools in proportion. Within the last 2 years it has erected 3 school buildings and enlarged another, thus providing for 13 new schools without burdening the district with debt or impairing its credit. In 1881–'82 there were 4 school buildings, with 21 rooms. An increase of 337 in enrolment and of 358 in daily attendance was reported. A uniform salary of $50 a month was paid in all grades below the high, thus securing teachers of experience and culture, the best being selected for the primary grades. Schools were in session 219 days. Private and parochial schools enrolled 400. (State report and city return.)

Carbondale had 8 school buildings, the entire school property being valued at $25,200.

There was a decrease of 121 in enrolment. During the two years covered by the last report an effort was made to relieve the crowded condition of the primary schools by enlarging some of the buildings. The courses of study and grading were rearranged to give a course of 7 years below the high school. Schools were taught 190 days. Private and parochial schools enrolled 198.— (State report and city return.)

Chester had 10 school buildings, with 2,400 sittings, and rated them, with other school property, at $111,000. Attendance was well sustained, with slight gains. The principal change reported is the merging of the colored schools into those for whites without any troublesome results. More school room was needed and a new building was soon to be added. Schools were taught 195 days. There were 300 in private and parochial schools.— (State report and city return.)

Columbia in 1881–'82 had 3 school buildings, valued, with other property, at $28,000. The addition during the year of a new one, with 2 rooms, elegantly furnished and scientifically heated and ventilated, fully met the wants of the school population. Instead of the falling off in attendance reported in 1880–'81 there was an increase of 32 in enrolment. The schools were all furnished with charts and maps. A public school library, begun in 1862 with a donation of $500, had grown to be one of the largest district school libraries in the State. Schools were in session 194 days.— (State report and city return.)

Danville gives an increase of 42 in enrolment and school property valued at $60,000.

Easton reported for its 49 public schools an improved classification and better methods of instruction. The examinations inaugurated as tests of school work presented a gratifying exhibit of faithful teaching and intelligent acquisition. The indications of healthy growth were said to be unmistakable. The teachers employed gave proof of professional skill. A weekly teachers' institute, with a normal class attached, was well attended, but enrolment shows a slight falling off from the previous year.— (State report.)

The *Erie* public school system has enjoyed remarkable growth from an endeavor to keep abreast of the increase of school population. While the increase of the entire population during the last decade was 42 per cent., the enrolment of its schools was 75 per cent. There were 16 school buildings, with 4,800 sittings, valued at $320,700. Among these are 8 fine structures built since 1870. The attendance of 1880–'81 was sustained, the enrolment being only 24 less. The experiment adopted two years ago of carrying some of the natural science topics of the high school into the lower grades through talks of the high school teachers had proved advantageous in making the relations between the different grades more intimate and thus securing better results. The study of German is open to all grades. A mute school is sustained, in which articulation is successfully taught. Schools were in session 190 days. There were 2,000 enrolled in private and parochial schools.— (State report and city return.)

Harrisburg had in 1881–'82 21 school buildings, with 5,701 sittings, valued at $330,973. There was a gain of 128 in enrolment over 1880–'81. Improvements were seen in much of the work done in all the grades. While the teachers were faithful, many had never enjoyed any special training, and a number had but a limited experience. The high schools were more efficient than ever before. Schools were in session 197 days. Private and parochial schools enrolled 450.— (State report and city return.)

Johnstown in 1881–'82 opened its public schools for the first time as city schools, they having been separated from the jurisdiction of the county. The rapid increase of schools, which numbered 30 in 1881–'82, an increase of 3 over 1880–'81, with an increased attendance over any previous year, necessitated the appointment of a superintendent, under whose care a new course of study was being matured. A new high school building, said to be the finest and most suitably arranged of any school building in the county, was built at a cost of $21,000; a high school was then organized, with an attendance of 45 and a course of 3 years. The change in the management is said to have awakened public interest in the schools. School property was valued at $100,000.— (State report and city return.)

Lancaster reported for 1881–'82 school property rated at $204,000. Enrolment gained 290 over the previous year. The number of daily absences was 15 per cent. of the average monthly enrolment. There was one more school, with two more teachers, than in 1880–'81. The superintendent says that the schools are advancing in the extent and thoroughness of their instruction; that the program outlined last year embraces an unusually good course of study for all the grades below the high school; that there is instruction in more practical and scientific subjects; that a city teachers' institute is held, with instruction in the art of teaching; and that a teachers' library of professional works has been established. There were 1,000 enrolled in private and parochial schools.— (State report and city return.)

Lebanon had in 1881–'82 8 school buildings, valued at $75,200. While the statistics show a decrease of 20 in enrolment, the report indicates a gradual advance in several respects. The superintendent is changing the practice of employing young and inexperienced teachers for the primary classes. Moral culture is fostered as a valuable part of

education. Schools were in session 187 days. There were 350 in private and parochial schools.—(State report and city return.)

McKeesport reported in 1881–'82 its first year under a city superintendent. An effort was made to bring all the schools under a uniform course of study. There was an increase of 5 in schools and teachers over the previous year, with a gain of 117 in enrolment. Of the 4 school buildings, 1 was erected and occupied during the year. It is 3 stories high, has 10 rooms, with the conveniences of a first class school building and most approved furniture, costing in all $30,000. A high school, with a 3-year course, was organized during the year, and drawing was successfully introduced into all the schools.

Meadville, in 1881–'82 also making its first report under a city superintendent, had 5 school buildings, with 1,830 sittings, valued at $95,000. The average daily attendance was lessened by diphtheria. With the aid of teachers awake to the necessities of the hour and with professional work at weekly institutes, the superintendent thinks he will be able to make the transition from the old to the new with little friction. The high school has furnished most of the successful and accomplished teachers of the city and adjoining towns.— (State report and city return.)

New Castle reported for 1881–'82 the erection of a new first class school building of 8 rooms. Compared with 1880–'81 enrolment fell off 89. The high school, at first opposed, had come to be regarded as an educational necessity.

Norristown reports 6 fine school buildings, valued at $159,200, but a gain of only 7 in enrolment. Sickness was the principal cause of absence. Monthly teachers' institutes were attended with interest and profit. Drawing was taught in all the grades with good results. In the high school much interest was taken in an association for the study of natural history, called the Agassiz Association. Moral training received attention as part of the school work. Schools were taught 200 days and 300 pupils were enrolled in private and parochial schools.— (State report and city return.)

Philadelphia reports for 1882 38 more schools, as many more normally trained teachers, and $60,114 more expended than the preceding year, yet had 2,251 fewer pupils in average attendance and 491 fewer than in 1881 on the rolls. The average pay of teachers was reduced, in the case of men, $36.22 a month; in that of women, $6.05 a month. In consequence of the falling off in attendance 10 teachers were dismissed.

The normal class of the city high school for young men and the excellent city normal school for young women were continued, preparing all teachers needed for new schools or for vacancies in older ones. Drawing and vocal music received attention as before, with a view to training teachers and pupils. Instruction in the elements of several useful industries was given by Mr. Charles G. Leland to teachers and pupils from the different ward schools at a central city school; and, under the influence of the Philadelphia Public Education Association, instruction in sewing was made a part of the regular training in the normal school. This association also interested itself effectively in an effort to induce the city board of education to obtain for the city schools what they had long needed: the supervision of a skilled superintendent, with at least one assistant. After a protracted and careful consideration of the subject the board decided, April 11, 1882, that skilled specialists in the science of education were necessary to superintend and supervise the schools, and that an amount of money sufficient to begin the organization of a board of superintendents should be included in the estimate of expenses for 1883. The city councils assented and appropriated $15,000 to begin the organization of such a board, which has been since begun by the election of a superintendent and one assistant. The ground for this action appears in the fact that in 1882 there were in the city normal and high schools 1,539 scholars; in grammar schools, 16,124; in intermediate or "secondary" schools, 28,433; in primary, 57,606; and in evening schools, 12,190. Effective supervision of over 500 schools, with more than 2,200 teachers and 115,000 pupils, could hardly have been possible for a central board and ward boards composed of men extensively engaged in business during the ordinary school hours, and it seems amazing that such a system should have been continued to so late a day in the second city of the union.

The evening schools above referred to comprised 23 for men and boys, 12 for women and girls, and 9 for both boys and girls, making 44 in all. Of this number 7 were for colored pupils, 1 was for German and English studies combined, and 1 a school for artisans actually engaged in mechanical pursuits and seeking better qualifications for their work. The instruction in this included geometry, mensuration, penmanship, arithmetic, natural philosophy, and chemistry. The pupils in this school numbered 227. The session for 1882 covered 9 weeks, from October 16 to December 21, against 10 weeks the year before; another session of 2 months, covering January and February, 1883, was to follow this.— (State and city reports, &c.)

Pittsburgh had, in 1881–'82, 56 school buildings, valued, with furniture, at $2,000,000. The prevalence of smallpox reduced the enrolment 851 from 1880–'81. Night schools were open 60 evenings, under 41 instructors and with an average attendance of 826, at

a cost of $5.52 per student. The central high school had academic, normal, and commercial departments, with an aggregate attendance for the year of 253 and 3 graduate students. In the academic department there were 13 instructors and 31 pupils. A class of 30 graduated, two-thirds of whom were girls, nearly all preparing to be teachers in the city. German and mechanical and freehand drawing were taught by special teachers. In the normal department there were 11 instructors and 44 students, of whom 23 graduated. The diploma of this school is, by law, equivalent to a professional certificate. The commercial department, with 3 instructors and 2 assistants, completed its first year with 178 students and a graduating class of 34. Teachers' meetings were well attended and much interest is said to have been taken in the class drills in the several branches of school study. Vocal music was made a school study and taught by the regular teachers. The rapid growth of the city made new school buildings and additions an almost yearly necessity. In the "East End" the increase of average attendance was 160 per cent. in 13 years; that in "South Side," 50 per cent. in 9 years. The increase of accommodations in 1881–'82, at an expense of $29,353, did not keep pace with the increased attendance. In all the new parts of the city there was a demand for more school room.— (City and State reports.)

Pottsville reported 49 public schools in 13 school-houses, with 2,500 sittings, valued at $200,000. Within the year there was added 1 new school building. The enrolment increased 139, and daily attendance 9. The high school had a well graded course of 3 years. Schools were in session 200 days. Private and parochial schools enrolled 200. (State report and city return.)

Reading claims that its schools are better than their reputation and that most of the teachers are doing good work. All except 2 of the school buildings were in good condition, well furnished, and well arranged as to ventilation and light. One 2-story building, with 4 rooms, was erected during the year, and said to be, like all the other new ones, first class. Two others were needed. Enrolment shows an increase of 925 and daily attendance, of 449.

Scranton includes among its public schools 1 for deaf-mutes. During the last 2 years 4 new school buildings were erected and 2 others enlarged, adding 1,100 sittings, at a cost of $17,777, and making in all 30 school buildings, valued, with other school property, at $325,000. Slight gains were made in enrolment and daily attendance, and 18 more teachers were employed, perhaps from more frequent change. Besides improved furniture and apparatus, 20 cabinet organs were placed in the schools. Vocal music was added to the regular studies and taught in all the grades by a special teacher. Drawing, too, was taught in all the grades below the high school. Evening schools were open during the 3 winter months, with an average attendance of 1,075, taught by 46 teachers. Schools were taught 220 days. Private and parochial schools enrolled 2,000.— (State report and city return.)

Shamokin shows 6 school buildings, with 1,860 sittings, valued at $50,000. With 2 more teachers than in 1880–'81, there was a loss of 110 in enrolment. During the last 2 years 5 new primary schools were established. All the school rooms were furnished with approved desks and seats and 17 with fine furniture. A first class building was soon to be erected on a site already purchased. A new feature introduced consisted of having the children in all the grades memorize choice thoughts from some of the best authors. The primary schools were receiving the special attention of the board, as requiring the rarest skill in teachers. Some of the best were employed for them and wages were paid in proportion to experience. Schools were in session 181 days. The superintendent reports 2 years of substantial progress. There were 420 in private and parochial schools.— (State report and city return.)

Shenandoah had 4 school buildings, rated, with other property, at $61,000. There was a gain of 2 teachers, of 99 in enrolment, and of 63 in average attendance. Some substantial progress was made in school buildings. There was marked progress in primary work. The half day system was adopted in the first grade primary schools and was in the hands of the best teaching talent. The general condition of the schools was said to be highly satisfactory. They were in session 184 days.— (State report and return.)

Titusville shows an increase of 216 in enrolment and of 54 in average attendance, retaining nearly 71 per cent. of enrolment in actual attendance, notwithstanding the prevalence of smallpox. The general condition of the schools was better than in 1881. Less machine work was done and more of training children to think.

Wilkes-Barre reports the total statistics of 3 districts within the city limits. There were 16 school buildings, valued, with other property, at $181,872. In addition to the nearly 100 per cent. increase of attendance reported for 1880–'81, there was still a gain on that of 229 in enrolment, with the addition of 6 schools, 6 teachers, and an increase of $10,873 in expenditures. Schools were taught 190 days. There were 1,400 in private and parochial schools.— (State report and city return.)

Williamsport shows 25 school buildings, with 3,485 sittings, valued at $144,325. Enrolment gained 57. The course of study and statistics of the high schools show the or-

dinary grade of studies, with an enrolment for the year of 122 and average attendance of 103. The schools during the session of 9 months are said to have been prosperous. Private and parochial schools enrolled 1,200.— (State report and city return.)

York sustained 50 public schools (with a course of study covering 12 years, giving to the high school 4 years), and 1 evening school; had 10 school buildings, with 2,600 sittings, rated at $140,000. The superintendent says that during 4 months of the year a higher per cent. of attendance than ever was reached, but sickness during the other months greatly reduced the general average. Enrolment gained 140, average attendance losing 24. Increased attention was given to better instruction in the primary grades, the results of which were seen in the precision and accuracy of work in the secondary and grammar schools. Drawing was taught in all the grades, the eclectic system giving the most satisfactory results. The high school, under efficient teachers, did well, and graduated a class of 8. Schools were taught 176 days, and the advance, it is said, was steady, the work efficient. Private and parochial schools enrolled 300.— (State report and city return.)

TRAINING OF TEACHERS.

STATE NORMAL SCHOOLS.

The 10 State normal schools are State institutions only as being recognized and in part sustained by the State, the schools being each required to furnish buildings to accommodate 1,000 students and grounds of not less than 10 acres, which has burdened most of them with heavy indebtedness. Students who agree to teach in the common schools receive 50 cents a week and graduates who agree to teach 2 full years in the State schools may receive $50. These schools are not strictly professional, having, besides the normal courses, elementary, scientific, and classical courses. The whole attendance for 1881–'82 was 4,289; of normal students, 3,274: men 1,840, women 1,434; 475 graduated as teachers. The whole number of normal graduates since the recognition of the schools by the State is 1,726: 906 men, 820 women. All the principals of these schools report a year of progress, some the best in the history of the institution. All gave more importance to the professional work, some urging that all else should be dropped.— (State report.)

OTHER NORMAL TRAINING.

The *Normal School for Girls* of the City of Philadelphia and the normal class for boys in the *Central High School* of the same city in 1882 instructed 1,539 pupils in higher studies and in the science and methods of instruction.

At Easton, Meadville, Norristown, and Pittsburgh there were also arrangements for further training of teachers already employed.

The *Brethren's Normal College*, Huntingdon, had for 1881–'82, under 11 instructors, 80 normal students, 55 men and 25 women, and 9 normal graduates, of whom 6 were engaged in teaching. The school year is 42 weeks; course of study not defined.— (Return.)

Lycoming County Normal School, Muncy, had, during the school year of 20 weeks, under 6 instructors, 115 normal students, 89 men and 62 women, in its 3-year course. Of the whole number of graduates 140 were teaching. The graduates of this school were said to be in great demand, commanding the best positions and highest wages paid in the county. During the summer nearly every township was represented, more than one-half of the teachers in the county also being in attendance.— (Catalogue and return.)

Snyder County Normal Institute, Selinsgrove, is a summer school, with sessions of from 8 to 14 weeks, reporting for 1881–'82 12 students.— (Return.)

The *Institute for Colored Youth*, Philadelphia, gives instruction in the theory and practice of teaching to its 3 highest classes. During 1881–'82 there were 163 of these students: 57 men and 106 women.— (Thirteenth annual report.)

The *Philadelphia Training School for Kindergartners* and the *Centennial Kindergarten Training School for Teachers*, Philadelphia, had each a 1-year course of study, the former reporting for the year 28 students, all graduating, and 22 having engaged in teaching; the latter, with 20 students, graduated 19, 15 of whom engaged in teaching. The school year of the former is 34 weeks; that of the latter, 40.— (Returns.)

Swarthmore College, Swarthmore, gives teachers' diplomas to those graduates of the college who have taken as their elective studies the entire course in the theory and practice of teaching, and gives certificates to non-graduates who have done not less than 1 year's work in this department. Three graduated and 2 engaged in teaching.— (Return.)

TEACHERS' INSTITUTES.

Teachers' institutes, as provided by law, were held in all the 69 counties of the State between August, 1881, and January, 1882, 3 being in session 4 days, 60 for 5 days, and 6 for 5½ days. The average attendance of members was 13,078. The largest number of teachers present, 600, was in Schuylkill County; the next largest, 538, was in Lancaster County;

Pittsburgh, York, and Luzerne Counties having, respectively, 400, 445, and 488. There were 522 instructors and lecturers employed, whose pay, with other items, amounted to $31,395. Among other exercises 187 essays were read. There were present 2,457 school directors, 2,277 honorary members, and 33,580 spectators.—(State report.)

The holding of district institutes on two Saturdays in each month is authorized by law, but left discretionary with the board of directors. The two days thus spent are to be considered as part of the 22 days of the teacher's legal month. There were 539 of these institutes held in 1881–'82. The cities of Philadelphia, Pittsburgh, and Altoona have special institute laws.

Local institutes were organized in nearly every county in the State. In 12 counties 192 were held during the year. They are reported as being more popular than the county institutes, as they are conducted by the local teachers and directors and largely attended by the people. They are said to have become one of the powers in educational reform.—(School laws and State report.)

EDUCATIONAL JOURNALS.

The Pennsylvania School Journal, published monthly at Lancaster, was in its thirtieth and thirty-first volumes in 1882, and being the official organ of the department of education it gives much valuable information in regard to educational matters in the State.

The other educational journals were The Chautauquan, at Meadville, in its second and third volumes; The Teacher, Philadelphia, in its fourth volume; the Educational Review, Pittsburgh, successor to The Allegheny Teacher and the Educational Voice, in its first and second volumes; The Pennsylvania Teacher, Pittsburgh, in volume 9 of the old series; The Student, Westtown, in its second and third volumes; and two irregular papers published by the Indian Training School at Carlisle, the Morning Star, and the Eadle Keatah Toh.

SECONDARY INSTRUCTION.

PUBLIC HIGH SCHOOLS.

Without including Philadelphia, there were 2,270 public schools in which some of the higher branches were taught, a decrease of 30 from the previous year. Of these, 2,133 were in the 66 counties reporting and 137 in the 33 cities and boroughs reporting. As to the condition and progress of these schools the State report gives no information.

For statistics of business colleges, private academies, and preparatory departments of colleges, see Tables IV, VI, VII, and IX of the appendix, and summaries of them in the report of the Commissioner preceding.

SUPERIOR INSTRUCTION.

COLLEGES FOR YOUNG MEN OR FOR BOTH SEXES.

The colleges of Pennsylvania in 1882, as given in Table IX of the appendix, numbered 27. Adding the Pennsylvania State College, in which classical collegiate instruction is maintained in connection with training in agriculture and the mechanic arts, the number would be 28. The University of Pennsylvania, Lehigh University, Dickinson, Haverford, and Lafayette Colleges were still the only ones that confined their work strictly to collegiate instruction. The remainder had preparatory courses of 1 to 4 years in duration, with classical collegiate courses of 4 years, except 5 Roman Catholic institutions, where the length of the collegiate courses cannot be clearly determined. For scientifi courses, see Scientific Instruction, following. Haverford and Lafayette Colleges and Lehigh University offer advanced degrees only for higher study, prolonged beyond the collegiate course, instead of conferring them as a matter of course after a certain term of years. At the University of Pennsylvania there was lecture instruction, open to the public, in courses on German literature, on the older English classics, on national economy and civil law, on physics and astronomical physics, on inorganic and organic chemistry, and on classical archæology. The same university also instituted a faculty of philosophy, for the supervision of advanced study in the several departments of literature and science. The courses in this are to cover at least 2 years, are to be open to graduates of this and like institutions, as well as to others evincing a capacity to pursue them, and are to lead to the degree of PH. D. They include history, philosophy, philology, law, mathematics, and almost the whole range of natural sciences. This is true university work, and, under the supervision of intelligent professors, in the heart of a large city, where ample libraries and other aids to study are at hand, it opens opportunity for literary and scientific progress which doubtless will in time draw many eager students. Several other institutions, such as the Western University of Pennsylvania, Allegheny; Muhlenberg College, Allentown; Haverford College, Haverford; Lafayette College, Easton; and Lincoln University, Lincoln, offered graduate instruction, but none on so broad a scale as the above. Commercial courses, too, were offered by most of the Roman

Catholic colleges; some training in art by at least 9; and astronomy, with the aid of observatories, by the Western University of Pennsylvania, Lehigh University, and by Dickinson, Haverford, Washington and Jefferson, and Allegheny Colleges.

INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF YOUNG WOMEN.
