The crowning purpose of education.—George P. Brown, chairman of committee, National Council of Education: The crowning purpose of education is to make the will follow the lead of conviction in all matters involving the idea of duty. The moral will is the significance, so to speak, of all the other activities of the mind. Institutional life is the moral will as it has realized itself. The ethical ideal is actualized in human society to the extent that it is common to the particular members. The principle of conduct in the ethical world is what is known as the moral law. This law is the universal conviction that every act of each particular member of the ethical whole should be such that when universal, that is, becomes the act of all, it will return upon the doer to bless and not to curse him. In this way the institutional world becomes a ministration of grace, each citizen receiving a return for every good deed, the good increased a thousand fold.

Religious instruction in the schools of Ontario.—Hon. George W. Ross, minister of education: Every school is required to be opened by the reading of Scripture and by prayer, and closed with prayer. In the Roman Catholic separate schools the religious exercises are subject to the direction of the trustees. No pupil is required to attend upon the religious exercises of the public school whose parents or guardians notify the teacher of their desire that he should absent himself. Provision is made for religious instruction by arrangement with the trustees of any denomination at such hours as may be agreed upon.

Reform the home first.—Popular Science Monthly: If the clergy, instead of making futile demands for the teaching of theological dogmas in the schools, would try to rouse the minds of their adherents and followers to a sense of their personal responsibility for their childrens' characters, they might accomplish a more useful work. This is something which they should preach in season and out of season; and if they would do so with the earnestness which the occasion demands, the effect might in a few years be seen in the altered moral tone of a portion of the public-school teachers themselves; and thus, concurrently with the elevation of the home, we should have a notable improvement in the work of moral education as carried on in the schools. Reform the home, and the whole face of society will be reformed.

Catholic views on the right of the state to educate.—Declaration of principles by Cardinal Manning (English): 1. The children of a Christian people have a right by divine law to a Christian education. 2. Christian parents have a twofold right and duty, both natural and supernatural, to guard this inheritance of their children. 3. Christian children are in no sense the children of a state that has no religion. 4. Their teaching and training or formation as Christians is of higher moment than all secular instruction and may not be postponed to it or risked to obtain it. 5. In the selection of teachers by whom their children shall be instructed Christian parents have a right and a duty which excludes all other human authority. 6. To deprive the poor of this right and liberty, which is claimed by and yielded to the rich, is a flagrant injustice.

These also from Cardinal Manning[1]: State education is the worst form of education, fatal to the independence of national conscience, energy, and character. * * * You can force us to pay your rate, but you can not rob our children of their religion. * * * [The] moral unity of a people drilled by state education and state pedagogues and state policy is spectral and lifeless. * * * To compel the parents of a Christian people to send their children to schools where no religion is taught, as in America, or where the Bible is only read, without interpretation, or without its true interpretation, or, still worse, with erroneous interpretation, and by interpreters untrained and incompetent to interpret, is a violation both of natural and political justice. It is an outrage on the natural rights of parents and on the religious conscience of a Christian people. The common-school system in America is a case in point.

Rev. Thomas Bouquillon, professor of moral theology, Catholic University of America:[2] Civil authority has the right to use all legitimate temporal means it

[1] Quoted by John A. Mooney in the Educational Review, as are Dr. Becker and Hon. E. F. Dunne, further on.

[2] Education: To Whom Does it Belong? p. 12.

judges necessary for the attainment of the temporal common welfare, which is the end of civil society. Now, among the most necessary means for the attainment of the temporal welfare of the commonwealth is the diffusion of human knowledge. Therefore, civil authority has the right to use the means necessary for the diffusion of such knowledge, that is to say, to teach it, or rather to have it taught by capable agents.

John A. Mooney, in the Educational Review, in reply to the foregoing syllogism of Dr. Bouquillon: All that is necessary to the welfare of the State is not within its competence. If it were otherwise, then the State could claim a right to teach religion, for religion is necessary to the welfare of the State. There are legitimate and temporal means necessary for the temporal common welfare, and not within the State's right. The procreation of children, an able critic safely claims, is necessary for the welfare of the State, and a means both legitimate and temporal. Still no one will concede that the State may compel all the citizens to procreate children. Logically the state, in whose behalf the reverend doctor argues, is the socialistic state. The diffusion of human knowledge which he concedes to the State is, as we have seen, that large diffusion possible within the boundless limits of the three R's. One might as reasonably deny that this "education" is sufficient as to claim that it is necessary. And by what authority, some one will ask, does he determine that "the right to use the means necessary for the diffusion of human knowledge" is to be understood as "the right to teach it, or to have it taught?" Why shall not we define the "means necessary for the diffusion of human knowledge" as a something more or less than teaching?" The professor's conclusion agrees with his own views. It is, however, not a logical conclusion, but an assumption added to the various assumptions made in his premises. His critics have called Dr. Bouquillon's attention to these and to other defects in his method of reasoning. Having based himself on premises not true, and on a conclusion doubly illegitimate, was he safe in "affirming that the larger number of theologians admit that the State has the right to educate?" With perfect safety it may be affirmed that if the larger number do admit such a right, most certainly they base their admission on some more flawless syllogism. As a matter of fact, no theologian to whom the reverend doctor has appealed admits the right of the State to educate.

Right Rev. Thomas A. Becker, D. D., Bishop of Savannah: We do not doubt that the time is fast approaching when the State will confine herself to her legitimate duties, of the which there are enough, and those sufficiently onerous, without undertaking to supply us with a secular instruction which we do not want in any other manner than as a handmaid to religion, and with which, so accompanied, no government can furnish us. Were it even possible, such a power is too liable to abuse to be left in any governmental hands: and finally, upon parents, as such, devolves the responsibility for the souls of their offspring, and we dare not, even if we could, shift it from where the Almighty has placed it.

Hon. E. F. Dunne (in an address at the Catholic Congress, Baltimore, 1889): Morality is the only foundation of order. Therefore the State not only may but must assist in the production of morality. It must do it or die, for without morality order is impossible, and without order the State can not live. There can be no morality without religion. Therefore the State which wars upon religion undermines its own foundation—precipitates its own destruction. Moral culture is of more importance to the State than any other; instruction which does not give it is not education. Therefore the State should encourage education full and complete. To aid in education the State may endow schools and assist teachers, but—itself to teach? No! That is beyond its charter, beyond its rights, beyond its power.

Compulsory teaching is of inferior quality.—The School Journal: That teacher who is throwing out the strongest moral influences in her school is the least conscious of it. It is unconscious radiation, as flowers fill the air with fragrance. There is a certain benefit to a school, from carrying out a programme of morals—that is, a programme that has certain times and occasions and ways laid down for the imparting of moral instruction. But like all compulsory teaching it is of inferior quality compared with that which flows out naturally from every pore of the teacher's soul.

Not new.—H. C. Hardon, master Shurtleef School (Boston): That old lie that there is no religion in the schools.

XIV.—School Management and Discipline.

Uniformity and freedom.—F. W. Parker, Cook County Normal School: Uniformity may be a necessity in the evolution of a school system, or any other system; but there comes a time when this rough staging should be torn away. The next period of evolution must be a period of liberty, that liberty so restricted that it will lead to freedom. Merit in fixing uniformity is complete skill in routine duties, a strict compliance with conventional demands, the order that keeps pupils still; the teaching that complies with the letter of a course of study; the drill that passes classes *en bloc* from grade to grade; the spirit that humbly bows to dogmatic rules. Under uniformity, teaching is a business and not an art. A business is governed by fixed rules; an art by eternal principles.

Think for a moment of a great corps of teachers, each imbued with a divine enthusiasm of study and a firm devotion to the highest interests of humanity; each striving to find more and more of truth, and to apply it for the weal of the child. Think of each giving freely to all the treasures and truths that he finds, and receiving as freely from all, their discoveries. Under such circumstances we would not have to search with a Diogenes-lantern for a first-class teacher.

XV.—Secondary Education.

Free high schools unwise.—James P. Munroe, in the Educational Review: The maintenance of free high schools is unwise; first, because it obliges a whole community to pay for what only a limited number can enjoy; second, because, necessarily expensive, it robs the lower schools of funds essential to them; and, third, because it offers to boys and girls wholly unfit for secondary education a temptation to exchange the actual benefits of remunerative work at 15 years of age for the doubtful advantage of a training that can have no direct bearing upon their life work, and which, at the time of life it occurs, may do decided harm. The State must, of course, take the initiative in providing secondary schools separate from or in connection with those already established by private enterprise, and it must maintain such course of study as the needs of the community demand; but for these courses there should be a graded system of fees, regulated by the nature and extent of the studies pursued, and, while a certain proportion of the cost of their support might be assessed upon the taxpayers, the larger share should be borne by those in attendance. When such a school ceases to be mainly self-supporting, the town or school district should have power to suspend it until the demand for reopening justifies its revival. In this way only can the high school do the work that should be required of it; only by such a pruning can the primary and grammar schools receive the money and attention they deserve; and after such a bold first step can a real reform of the public-school system be begun.

Public high schools vs. academies.—Intelligence: The public high schools, especially those of New England, are steadily coming to the front as the schools which give the most thorough and useful preparation for college. Three times within a few years the valedictory at Yale has been awarded to a student whose preparatory studies were in the New Haven High School.

The rise of the public high school as the crowning feature of the system of common school education is a most interesting fact. In several of the New England States these schools have caused the delay of most of the old-time academies which were once flourishing institutions, or at all events their relative decay. Except a few which, by reason of their large endowment or some especially favorable condition, have grown with the growth of population, they have fallen into comparative obscurity.

Suggestions as to the curriculum of the preparatory school.—President D. C. Gilman (in the Cosmopolitan): Whenever the time comes for a revision of the curriculum of the preparatory school, three subjects should receive much more attention than is now given to them. The study of science should be so pursued that the habit of close observation and of reasoning upon ascertained facts should at least be initiated. Nature should be approached by the schoolboy as a willing and ever-present teacher. Her lessons should be the delight of every adolescent. When we remember that in contemplating the heavens, in watching the life of plants and animals, in the observation of the modes of motion and in studying the inorganic world there are innumerable and infinitely varied opportunities to awaken curiosity, to train the eye and the hand, to exercise the judgment, to reward investigation—how strange that so little progress is made in the introduction of scientific studies in elementary education! Modern lan-

guages also, especially French and German, are nowadays indispensable in a liberal education; and they are much more readily acquired in childhood than maturity. How are they to get just recognition in the preparatory schools? An acquaintance with the Bible should also be required of every schoolboy. College professors have lately been showing how ignorant the youth of America are of the history, the geography, the biography, and the literature of the sacred books. I do not now refer to its religious lessons, but I speak of the Bible as the basis of our social fabric, as the embodiment of the most instructive human experiences, as a collection of poems, histories, precepts, laws, and examples, priceless in importance to the human race. These Scriptures have pervaded our literature. All this inheritance we possess in a version which is unique. Its marvelous diction, secured by the revisions of many centuries, and its substantial accuracy, the care of many generations of scholars, are beyond our praise. But how little study does the schoolboy give to this book in secular or sacred hours; how ignorant may he really be of that which is supposed to be his daily counselor! Science, modern languages and the Bible have been so long neglected in preparatory schools that it is extremely hard nowadays to find effective teachers for these subjects. There is no consensus as to books, no tradition respecting methods. Perhaps we are waiting for the waters to be disturbed by the angel of deliverance, but we shall wait in vain unless we put forth efforts of our own to reach the true remedies. The day will come for better things; we can see its approaches.

XVI.—Teachers.

Is special preparation for teaching indispensable?—Superintendent Henry Sabin (Iowa): Shall we say that special preparation for the teacher's work is not desirable? Certainly it is very desirable, but it is not indispensable. There are only four indispensable requisites—knowledge of subject-matter, uprightness of character, a desire to improve, and common sense. With these as a foundation we may build an Arnold, an Agassiz, or a Philbrick. If any one of these requisites is wanting, no amount of professional study or reading of educational books can supply the deficiency. There has broken out lately a mania for high intellectual development, which the teacher expects to attain by reading a book a month. Teachers sometimes become gormandizers of books. Dickens says of one of his schoolmaster characters, after enumerating a long list of his requirements: "Ah, rather overdone, Mr. Choakumchild. If he had only learnt a little less, how infinitely better he might have taught much more!"

Superintendent J. M. Greenwood (Kansas City, Mo.): It might be as well to state clearly that all this talk about making good teachers without professional training is of little value to the schools. There is no equivalent for professional training. * * * Let us understand it, and not beguile ourselves into long-winded discussions in the vain search for temporary substitutes.

Superintendent Draper, of New York, remarked on this subject that he was sorry to note a disposition on the part of one or two speakers to disparage professional training altogether. It was too late in the history of educational progress to do this. Such sentiments are outlawed—are back numbers. It was not worth while to argue with men who had been enjoying a Rip Van Winkle slumber and were out of touch with the general educational sentiment of the country.

Four propositions worthy of consideration.—Superintendent Henry Sabin (Iowa): 1. Pedagogical research, educational inquiry, the study of methodology alone, can never constitute a man a teacher. The machine which makes the teacher a mere automaton is already producing alarming results in this direction. In many of our schools we are approaching the danger line of killing off individuality, of crushing out spontaniety, of dwarfing the teaching ingenuity by reducing everything to the dead level of certain so-called philosophical methods. We are training the teachers to follow the ruts.

2. There is a failure with teachers, if I may use the expression, to distinguish between an individual method and a representative method; between an arrangement which is the invention of the person using it, partaking largely of the nature of a device, and a method which is typical in its nature—which exemplifies the essential characteristics of all related methods. A device is the creation of the teacher—a method is based upon eternal truths.

Our schools of methods are very often only schools of devices.

3. The school which gives its students power of thought, clearness of expression, aptness of illustration, and a desire to grow, is a good fitting school for its teachers. What branches are taught there is of secondary importance.

4. To build a wall of partition in the normal school or in the college and say that the studies on this side are purely academic and those on that side purely professional is the concentration of stupidity. The most successful normal school is that which most closely combines in its daily work educational thought and educational practice. The attempt to separate them combines the worst elements of a blunder and a crime.

It is a fact that the colleges and normal schools do not realize that it is their province to prepare teachers for high-school work. When they reach this point certain results will follow. They will no longer attempt to prepare teachers for their work by reading and studying a few books during the last half of the course. The science and art of education will be taught during every exercise. There will be no less academic work, but it will be of a very different kind. Each lesson will be taught as based upon educational principles; the student will be required to study it with two ends in view—as he would teach his pupils to study it, and as he himself should study it if he were to teach it. Arithmetic or geography should be just as much a professional study in the normal school as psychology or the history of education. Every exercise should have a school-room side.

Of the value of scholarship.—Superintendent Henry Sabin (Iowa): The normal school which makes excellency of scholarship a subordinate aim makes a very grave mistake. On the other hand, the instructor whose only aim is to induce excellence of scholarship has no place whatever in a normal-school faculty.

Superintendent A. P. Marble (Worcester, Mass.): The young can not be well trained by an untaught teacher. It is not merely the prescribed curriculum that the pupil must be made acquainted with. This is the framework, so to speak, the skeleton, upon which must grow the parts that make up a symmetrical whole; and this symmetry is produced out of the well-stored mind of an educated teacher. The daily lessons must be enlivened and vivified by related facts and suggested ideas. This can be best done from the storehouse of a mind running over with knowledge, broad and deep, encompassing the subject-matter of the daily tasks.

To such broad culture the teacher should, if possible, by all means add an acquaintance with the science and the art of teaching. But valuable as this professional training is, it can never take the place of the indispensable qualification just named.

Theory and experience declare for scholarship.—B. A. Hinsdale: Which is better, much scholarship and little method, or little scholarship and much method? The answer to this question can not for a moment be held in doubt. Both theory and experience declare for scholarship. In fact, the enthusiasm of knowledge is a prime requisite of the best teaching. Few school spectacles are more painful than that of a poor teacher eking out slender learning with an excess of method. The good scholar without professional training will commonly stagger a good deal at first, but if he have the root of the matter in him he will soon find his feet; while the teacher of an ill-organized mind and small equipment gives little promise of ever overcoming his limitations. The *what* will catch the *how* long before the *how* will overtake the *what!* And this is why all sound educators plead for the improvement of the intellectual equipment of the teachers of the country.

The function of the normal school.—Edward T. Pierce, principal Chico State normal school (Cal.): The first requisite of good teaching is a thorough knowledge of the subjects taught; the second is an insight into the principles of education and the methods of applying them. If the subject matter is slighted, method is purposeless; and knowledge of methods presuppose an understanding of the subject in the teaching of which the methods are to be applied. Therefore the normal schools of this State must, at present, pursue two lines of work—academic and professional—and should slight neither.

J. W. Dickinson, secretary State Board of Education (Mass.): A normal school may be known from any other institution of learning by the character of the exercises to which it may be properly limited. If it devotes its whole attention to teaching the objects and subjects of knowledge in an academical way it has no claim to a distinct existence. Other schools are doing the same thing. If it teaches the philosophy of teaching and the method founded upon it, and the history of teaching from the earliest times to the present day, it is doing its legitimate work. If, at the same time, it attempts to teach the facts and truths of the various sciences, then it imposes a burden upon itself which circumstances may render necessary to a limited extent, but which should not be allowed to interfere with professional teaching beyond the necessity.

What may be required of all candidates.—State Superintendent A. S. Draper (New York): In our cities, the number of candidates for teachers' positions is so great, and the facilities for acquiring proficiency so many, that it is perfectly practicable to require that all candidates shall have completed the high school course and spent a year in a normal school or training class before being given authority to teach. We passed such a law in our State last winter. It was vetoed. But we will have it yet. Some of our cities are doing precisely this now without law. All can do it and have plenty of teachers. It is no hardship to young candidates. It will work incalculable advantage to the schools.

How a high school may prepare teachers.—Superintendent Henry Sabin (Iowa): Occasionally we find a high school which is renowned in all the surrounding country for sending out successful teachers. In such a school, if we investigate, we always find certain conditions:

1. Pupils are taught how to study with a view of getting the most out of a subject, not simply out of the book. They practice vivisection on every subject they take up.

2. They are taught to exhaust the means at their command. If it is only a dictionary, an encyclopædia, a few reference books at home or at school, they make the best use possible of them. Super-abundance of means is sometimes a source of waste to the student.

3. The pupils are expected to ask questions as well as answer them, and the teachers are expected to answer questions as well as ask them. The independence, which the pupil thus gains, goes with him into his school, and serves him well in the absence of strictly professional training. It enables him to solve, without the aid of a key, the innumerable problems which present themselves almost daily in the schoolroom.

Enthusiasm is the life of good school work. Thus the pupils during four years acquire so great devotion to their work, they become so aglow with the delight of acquiring and imparting knowledge that it becomes an appetite, as it were, and they are not happy except when under its influence.

Of extremely doubtful value.—The best psychology.—H. C. Missimer (Erie, Pa.): The young girls that go into our training classes fresh from the high school are too immature to understand mental philosophy or psychology. It will only befuddle them. The power to analyze, to dissect, to connect mental processes in their proper relations, is the last and highest achievement of the intellect. It is the result of much observation and wide experience. For a young girl to psychologize, to philosophize about the mental process of the child-mind, without knowing anything about children, or coming into actual mental contact with them is, if not the purest nonsense, of extremely doubtful value.

Again, the abstract study of psychology, as a preparation for teaching, is very apt to send the young teacher into the school with a tendency to impose and practice upon the children a theory instead of a disposition to study actual conditions out of which she ought to develop her own theories and her own methods.

Even the discussion of methods, before we are engaged in teaching, is of little value beyond conveying an idea of the nature of the work. The method of somebody else is of no value to me unless it quickens and expands ideas already existing in my own mind.

The best psychology for the teacher—the beginning teacher—is the psychology of vulgar practice. It is the right kind of psychology to rid our minds of foolish, impracticable, and short-sighted notions. It is the psychology that shows us where we shall probably fail, and where to concentrate our energies in order to succeed. Professional psychology should come after the teaching is begun, after common-sense study of the children after the study of actual conditions. Then it will develop, enlarge, and widen the teaching mind.

Special preparation may be exacted even in the country.—Superintendent A. S Draper (New York): We can not expect that all teachers will be as thoroughly prepared for their work as they may and ought to be in the cities. Yet experience shows that some special preparation may be exacted even in the country. Candidates will comply with what is required. Send all you can to the regularly established normal schools, but remember that there can never be enough normal schools maintained to supply all the teachers needed in the common schools, and also that all candidates can not afford to take a complete normal course for the sake of the mere chance of being employed at five or six dollars per week, with the likelihood of being turned out at the next turn of the political wheel. We need short-term training classes throughout the rural districts.

The use of teachers' examinations.—Superintendent A. S. Draper (New York): It is quite the fashion to discredit examinations. It is a foolish habit. The examination has its legitimate use. We do not use it to determine who shall be certified, but who shall not be. We do not say that all who pass an examination shall be certified by any means. We say that the local officer may withhold certificates from any candidate, no matter whether he passes the examination or not, and without giving any reason. We only say that he shall not issue a certificate unless the candidate attends upon a prescribed course of professional instruction or passes the prescribed examination. In the next world we may be able to accomplish ends without means but we can not in this world. * * *

We will continue to talk about innumerable things, but nothing can be of such supreme importance as the institution of efficient agencies for promoting the professional training of teachers and for preventing the certification of such as are not so trained.

The essential conditions of effective teachers' examinations.—George William Curtis: Teacherships in the schools are not popularly regarded as subjects of patronage. But are they not so practically, and is it wise that they should remain so? What is the present system? I believe that the requirement of certification or license before appointment is universal in all the States of the Union. The examination upon which the certificate or license issues is, then, the cardinal point. What are the vital, essential conditions of effective examination? To be properly effective the examinations must be uniform, entirely competent, and wholly independent of the appointing power. The examiners must be sincerely interested in education, familiar with the duties of a teacher and with the requirements of the art of teaching, and capable of conducting an examination to ascertain both the scholastic attainments and the specific professional fitness of the candidates. Wherever these conditions do not exist, the public school system, and therefore the whole community, suffers.

A reserve corps of teachers—The Milwaukee plan.—Superintendent William E. Anderson, of Milwaukee, Wis.: Some three or four years ago an inquiry into the frequency of teachers' absences, and the average number of substitutes employed to fill such absences, suggested a change whereby a larger number of well-qualified teachers than those assigned to places should be kept at the command of the board. In Milwaukee it was found that of a corps of 400 teachers employed at that time there was an average absence of 12 to 15 teachers a day, the absences some days exceeding 20. This includes all vacant places, permanent and temporary. It frequently happens that two or three vacancies exist for which there is no appointee at hand. It was customary, as in other places, to occupy these by so-called substitute teachers having no certificates, or by those having the certificate, but no experience. A rule was adopted empowering a committee and the superintendent to appoint a number of supernumerary teachers, to be called the reserve corps. These teachers were the best that could be obtained during the summer vacation. Their appointment was regular and their salary the same as that of assistant teachers, no deduction being made when their services were not required, providing they reported for service at the office. Members of the reserve corps have their predilections and aptitudes. These, known to the superintendent, are regarded when temporary assignments are made. A vacancy in a seventh or an eighth grade is supplied by a teacher who is supposed to have the capacity for teaching higher grades. A vacancy in the primary grade is supplied by a teacher who is supposed to be adapted to primary work. In the mean time the members of the reserve corps, being selected upon grounds of general efficiency, experience, and training, are eligible for appointment. Their service in temporary classes commends them for appointment, and their detail to occupy recently created vacancies is a kind of preparation for appointment. If the principal is satisfied, a resolution of transfer from the reserve corps to the corps of the school is all that is required. In this way we have been able to satisfy the prerogative of local commissioners who select their own teachers and with the improvement of the plan hope to introduce a larger number of capable teachers to fill vacancies. As the reserve corps is depleted it is recruited by the committee and the superintendent, whose business it is to keep a record of applicants and to hold frequent meetings for interviewing applicants for admission to the reserve corps. The corps was first organized under rules which prohibited the employment of any teachers who had taught in the schools previously. The restriction was, however, removed, and perhaps not for the best interests of the schools. Experience has shown that some teachers were kept drifting about upon the reserve corps for a

whole year without finding, in the good opinion of principals and commissioners, a transfer to a permanent place. It is best to discontinue such teachers from the service. Otherwise the reserve corps may become occupied by a class of professional substitutes and become an invalid corps instead of a reserve to supply capable and vigorous recruits. There are many good features and some unexpected drawbacks connected with the plan; but as a plan to enable the school board to establish a standard of professional training, to provide itself with a sufficient number of teachers duly qualified to receive appointment when such teachers are obtainable, it is abundantly successful.

Regardless of the interests of the school.—Superintendent William E. Anderson, Milwaukee, Wis.: The more widely the power of appointment is distributed the greater the weight and influence exercised in behalf of the would-be teacher and regardless of the interests of the school. We are all acquainted with the commissioner who would be good enough to give all persons certificates whose fathers are taxpayers, who look upon the maintenance of schools first of all with reference to the support of teachers, and who sees no farther into the problem of licensing and selecting instructors than what appears to be a charitable mission of giving to as many deserving young women as possible a chance to earn a decent living. The good man who feels that the place should be given to the applicant who comes first, to the girl who has a mother to support, to the graduate of his own school, the daughter of a local politician, or a member of the same church with himself, will always flourish in city school boards. He is frequently a good man for other purposes but hiring teachers, and there is no reason for disqualifying him for exercising that function, when his generous predilections may be rendered harmless by a little wise legislation.

The best way for teachers to acquire control.—J. W. Beeson (in the Educational Exchange, Alabama): There should be a love for children on the part of a teacher. It is a fact, recognized by all good educators of the present day, that the most successful way to govern a child is with love; that when a teacher wins the respect and love of a pupil he has no trouble in controlling or in teaching him. The best way to win this love of children is to love them first. "Love begets love" is a law of human nature. Besides, it seems impossible for one to do the greatest amount of good for those for whom they have no special love.

Guard the teaching force against incompetency.—Superintendent A. S. Draper (New York): I lay down the proposition as true that in nine-tenths of the cities of this country the board of education will be influenced in the appointment of teachers, and will appoint whomever the law and the existing regulations of that city will permit them to appoint as teachers, regardless of the peculiar fitness or adaptability of the applicant for the position. The conditions should be regulated by statute law. You must guard the teaching service against incompetency. I undertake to say that in nine-tenths of the cities of the country you will get a stronger corps of teachers from regulations which provide that only graduates of the city high school or the city normal schools or the training schools are eligible to appointment than you will if you throw the matter open and let the board select and bring in "the new blood," because the board, as a rule, will abuse the opportunity thrown open to them.

How shall he learn these things?—Principal George M. Grant, Queen's College (Ontario): That every future citizen shall be taught to read is much. That he shall be taught to observe and to think is more. But that he should learn to love, admire, and revere that which is worthy, and hate that which is unworthy, is most of all. But how shall the average boy learn these highest things save through the voice, tones, and whole life of his teacher?

Better even than mere learning.—Superintendent A. P. Marble (Worcester, Mass.): Better even than mere learning and professional skill is a sincere love for children and an earnest desire to lift them up. The teacher, filled with love for the little ones, will find a way to help them and improve them, far more than one filled with all knowledge and stuffed to repletion with methods, psychology, and the science of pedagogy, if in attaining all this the juice of human kindness has been squeezed out of her. Children must not be looked upon as specimens upon which to practice the arts of the profession. They are human souls to be developed and made manly and womanly.

Wasting their efforts.—Superintendent Henry Sabin (Iowa): I honestly believe that very many of our teachers are wasting their efforts and failing to do their best work, because they are neglecting to regard the things which pertain to

the present wants of their schools, in their desire to attain an undefined, intangible, impalpable something, of the nature and use of which they have no definite idea. I wish we had more institute instructors whose instruction is luminous with the light of common things.

The relations between teacher and pupil.—President E. B. Andrews, of Brown University, in School and College: We need, more than we have as yet done, to get upon a level of friendship with our pupils, not standing off from them, not looking down upon them. Present yourself to your pupils as their guide, friend, adviser, elder brother—one who, having the advantage of age and larger study, is able to assist them. The *in loco parentis* idea of the teacher's office is sometimes urged as an argument in favor of pedagogical sternness and severity. Not so. Parental authority itself is no longer exercised in the old way. How many civilized fathers horsewhip their boys nowadays? In the lower grades, and to an extent in all, authority must exist, but it should be kept as much as possible in the background. Never coerce a pupil save as a last resort.

Kindness to pupils is never exercised in vain. Strive by unselfishness and perfect uprightness to make your pupils regard you the finest man on earth. To this end do not assume infallibility, but, if mistaken ever, admit it. Be an original thinker, an authority in your department, no mere expositor of a book; yet if you pretend never to err, your dullest scholar knows better and puts it to your discredit.

Never use sarcasm toward a pupil or make fun of him. You are a coward if you do, taking advantage of position to enable you to hurt a fellow-being as good as yourself, and you will be despised as a coward deserves. But worse, when you treat a pupil so, you can teach him little more. The inclination on that learner's part to question you is gone forever, and has given way to timidity, or perhaps to a sullenness or obstinacy, which you can never overcome.

Until he withers into a machine.—Rev. Smith Baker: A teacher who simply hears children recite will grow less of a man or woman until he withers into a machine, like a circus clown or a magic-lantern lecturer, repeating the same performance; but the living teacher, though he remain in the same humble school for a generation, will, like a tree, grow broader and higher and deeper each year. His teaching will expand his manhood.

What the teacher is imparts itself.—Rev. Smith Baker: Every teacher is a picture. Eyes are following her while she is silently imparting ideas of life. Every teacher should be such a man as we want our boys to be; such a woman as we want our girls to be. No teacher can help being a character builder. What he is imparts itself to others. *The teacher of my boy is doing more for my boy by what he is than by what he says.*

The most powerful lesson.—Superintendent T. F. Wilson (Stillwater, Minn.): Set lessons are of but little value. The most powerful lesson by far is unconsciously given by the teacher whose life is a true type of noble manhood or womanhood. A teacher must live a life above reproach. This alone secures respect. Without respect nothing can be done. Once secure this respect and the frown of dissatisfaction or the smile of approval will cause deeper lessons to sink into a young heart than hours of admonition.

Women as school teachers.—Hon. John L. Buchanan, of Virginia: Among persons liberally educated more women than men find employment as teachers in the public schools. In fact, in a good many States public-school education is already largely in the hands of women teachers, as is shown by late school reports. In some States there is still an excess of male teachers, but it is constantly diminishing. * * * This preponderance in the number of female teachers is easily explained. The avenues of remunerative employment for women are more numerous at the present day than formerly. They are proving themselves faithful and efficient workers in many positions which in former days were thought to be unsuited to them or to which they were thought not adapted. Public sentiment has materially changed touching this matter and more liberal views prevail. But still the sphere of woman is much more restricted than that of the other sex, her range of occupation much more limited. Again, it is almost, if not quite, a universal custom to discriminate against her in the matter of compensation. Why the same service equally well performed should in one case have a different money value from what it has in another is hard to explain on any principle of justice. Yet such is the fact. But woman is the natural guardian of childhood. Her delicate sensibilities, quick perceptions, active sympathies, and unselfish affections peculiarly fit her for training and managing

children. Hence her success, especially in the primary departments of school work, suffers nothing by comparison with that of the other sex. And in higher departments also, and in positions requiring executive or administrative talent, her work is often at a premium rather than at a discount. Doubtless the best results in education are to be secured under the influence of accomplished teachers of both sexes. As skilled artists, the delicate feminine touch of the one and the vigorous masculine touch of the other are both necessary to give the highest beauty of form and finish to the plastic nature of youth.

The small proportion of male teachers to be deplored.—State Superintendent John W. Dickinson, of Massachusetts: The standard of qualifications for teaching has considerably advanced in ten years, so that the demand for men and women fitted to take important positions far exceed the supply. As a consequence women of experience are now called to positions formerly occupied by men who taught for a brief term to obtain pecuniary aid in preparing for other pursuits. The policy is doubtless as wise in many instances as it is economical, but the small proportion of male teachers is certainly to be deplored.

Why so?—The Chicago Evening Post: Shall a woman of strong character and great ability, who has made a long and honorable record in the public schools of Chicago, be refused promotion because she is a woman?

Why should they not do so?—Educational News: A New York journal publishes it as a fact that the Mercantile Library of New York has but one member who reads educational books, and adds that teachers ask for novels. Well, probably teachers find a better supply of novels in the Mercantile Library than elsewhere. If so, why should they not enjoy them? Probably, also, these same teachers have a supply of pedagogical literature at their homes, and they seek for the lighter and more entertaining reading elsewhere. If so, why should they not do so? The statement might mean much, and it may mean but little. We know of no class of people who would more fully enjoy the classical fiction or even the lighter literature of our language than teachers. Surely the constant strain which they suffer during the working hours of the day entitles them to whatever innocent recreation they can get, even if it be the novels of the Mercantile Library.

The supreme question.—Superintendent Henry Sabin (Iowa): Except only the question of moral training, all other questions sink into insignificance compared with this of supplying the schools in our smaller cities and towns and in our country districts with competent teachers.

The pensioning of teachers recommended.—The following resolution was adopted by the department of superintendence of the National Educational Association at its Philadelphia meeting (February, 1891):

Justice, as well as the best public service, requires the retirement and pensioning of teachers after a service of thirty years and upon carefully devised conditions. We recommend the enactment of laws in the several States to permit and to regulate the retirement and pensioning of professional teachers.

Against pensions.—C. W. Bardeen (Syracuse, N. Y.): Pensions after a certain amount of service will make it only the more difficult to get rid of incompetent teachers who wish to complete that term of service.

Master teachers wanted—How to secure them.—President D. C. Gilman in the Cosmopolitan: The tendency of our times is not toward the fostering of such teachers [as Arnold, Thring, Abbott, Taylor]. Many of the brightest Americans are attracted by business. The three professions traditionally called learned and the modern scientific pursuits enlist great numbers. Of those who devote themselves to teaching the most prefer to enter the service of the college or the university. Few only, so far as my acquaintance goes, seek permanent careers in the service of boys' schools; few declare that they will be satisfied with the opportunities and emoluments of a good and faithful teacher. Hence one of the most delightful of intellectual pursuits, one of the most useful, one of the most honorable, one of the most sacred, is in danger of falling into the hands of inferior men. The only remedy that I can see is for the head masters, trustees, and parents to be on the watch, and when a born teacher appears engage him, reward him, encourage him, retain him. See that his path is free from stones, that he is not overworked or harassed, and that he is kept contented in his lot. Let him be sure that as much respect and as much income will be his as would fall to his portion were he to enter the pulpit or be called to the bar. Let it never be forgotten that the teacher's gifts are as rare as the poet's. The methods of education can make scholars, pedants, specialists, and a very narrow man

may live in his den and benefit the world by patient observations and minute researches. But no process has been discovered for making teachers. They are like gems, that must be found, for they can not be produced. I would rather place a schoolboy under one "all-round man" whose manners, morals, and intellectual ways were exemplary, and who was capable of teaching him Homer and Euclid, than under a group of specialists selected simply as mathematicians, physicists, and linguists. Later on, when the character of a boy is established, when his habits are formed, when he knows how to study, when he has learned the art of acquiring knowledge and the graces of expression, let the specialists take hold of him. Even then let it be provided that the specialists shall not be too narrow.

XVII.—Text-Books.

The valid objection to free text-books.—S. S. Parr: All things considered, free books promise most to our schools. There is but one valid objection to this system, and that is the communistic one. The State undertakes to do what the individual should be left to do for himself. Doubtless, free books would be a long step towards solving the knotty problem of how to more efficiently educate the children of foreign-born parents, who are deterred from the full benefit of the public schools by the cost of books and appliances. They would also solve the questions of cost and economy.

A warning voice from out of the past.—Azariah C. Flagg (State superintendent, New York, in 1830): Great improvements are constantly going on in the character of school books. The greatest experience and much of the best talent of the country are enlisted in this business, and the fruits of their labors are constantly giving them new claims to the approbation of the public. The adoption of a particular book would amount to a prohibition upon all improvements and subject the inhabitants to a loss of the prohibited books on hand. The interests of the common schools may be seriously endangered and can not be essentially benefited by the adoption by law of any book or set of books.

The text-book system of Ontario.—Hon. George W. Ross, minister of education: No text-books can be used in any public or high school of the province until sanctioned by the department. There is now but one text-book in each of the subjects taught in the public schools. In the case of high schools more than one text-book is used in some of the subjects, although the tendency is towards the same limitation as prevails in the public schools. When a text-book ceases, in the opinion of the department, to serve its purpose it is set aside and a more advanced one substituted. The price of the text-book, the quality of the paper, style of binding, typography, etc., are all regulated by the department. Under a statute, boards of trustees may provide free text-books for pupils in cities, towns, and incorporated villages.

1.—ASSOCIATIONS.

Denmark.—From the 6th to the 8th of August, 1891, was held the sixth Scandinavian school meeting in Copenhagen. These meetings were at first frequented chiefly by primary teachers, as the topics discussed concerned primary schools solely, and secondary teachers had their separate philologists' meetings; but at the last two meetings there have been also lectures and discussions on subjects concerning secondary schools, the result of which has been a discontinuation of the previous philologists' meetings. The last conference numbered 5,300 visitors, 3,000 of whom were from Denmark, 1,100 from Norway, 1,000 from Sweden, and 200 from Finland. (Allg. D. Lztg.)

Germany.—The German National Teachers' Union had 44,449 members on July 1, 1891. Seventeen local teachers' associations joined the union during the last half year. (Paed. Ztg.)

Saxony.—The "Pedagogical Circle" of the women teachers in Dresden has closed the twenty-sixth year of its existence. The number of its members exceeds 300. The society has listened to several courses of professional lectures, and special courses in botany, French, drawing, and gymnastics that were arranged for the younger members. The society maintains a bureau of information for teachers without positions. It has a sick fund from which during the year 1890 eight members were supported for several weeks and even months. (Die Lehrerin.)

Prussia.—The pastoral letter of the bishop of Ermland (province of Prussia), in which he objects to independent teachers' associations, has had quite the contrary effect to what he aimed at. The teachers are clubbing together more than ever before. In resolutions couched in respectful terms, they say that while they shall never be found wanting in respect for the clergy, they energetically protest against ecclesiastical interference, and all inroads made into their natural and political rights. (Allg. D. Lztg.)

France.—The first timid attempts at holding national teachers' meetings in France for the purpose of discussing professional affairs date back to the year 1840; they were kept up for ten years, and then ceased, until revived in 1871. Not until that year did these meetings show a firm organization, adapted to promote the successful exchange of professional ideas and practical coöperation. The example of other states was decisive. The great educational meetings in Germany, Belgium, and Switzerland induced the French teachers to attempt similar meetings, and they were well and readily supported by the centralized state authority.

The first large teachers' meeting was held in 1878 in Paris. Though the elementary or common school claimed the lion's share of attention, it did not occupy the meeting exclusively. The elementary school did not then have the

excellent organization which to-day we have reason to admire; on the other hand, owing to several important events, political personages had to be drawn into the proceedings, persons who carried the discussions into the domain of higher education. Here, naturally, principles of pedagogy and general educational questions claimed the attention. The claim to an equal education for all citizens was urged. Upon this basis it was thought the endeavor to combine the different branches of instruction, as well as the different kinds of schools, might be successful. The result of this discussion was the adoption of ideas indicating fundamental reforms, according to which education was to be conducted "with motives of justice, freedom, and love for the young." Besides these questions, others relating to gratuitous, obligatory, and secular instruction were discussed.

As the work which had been laid out for this congress could not well be finished within the prescribed limit of time, another session was held in Paris in the year 1879, in which questions were discussed touching the protection of children, freedom of instruction, moral education, and instruction in civics, also concerning the teaching of language, drawing, and manual labor.

Although it can not be denied that the members of this congress were actuated by a great love for the cause of youth, one is on the other hand obliged to admit that their demands were pushed rather too far. They put in the claim that every school should possess a workshop, a garden, a library, a museum, and a laboratory; also a panorama of history and geography, and a hall for musical and other entertainments. They further insist that the site of the school buildings should be as attractive as possible, and that the buildings should have a handsome exterior. All these demands were naturally shipwrecked on the rock expense, especially as instruction was gratuitous; however, the congress had this good result: that public attention was directed towards the school question, and the school officers and functionaries spurred to renewed activity in this department, in which so much remained to be done. The school authorities henceforth gave much closer and more constant attention to the subject of instruction in manual labor, since they recognized how very important to a comprehensive education is the early training of hand, eye, and taste.

The next congress, which also held two sessions in Paris in the years 1880 and 1881, owed its existence to private initiative exclusively. It met to give expression to the wishes of the friends of education in France and other countries, who were joined by a small number of French public school teachers. The idea of educational congresses periodically meeting had not taken root very deeply among teachers of the public schools, and yet it was necessary to make teachers of the primary schools acquainted with important educational questions and to afford them an opportunity for exchange of opinions. Moreover, there were brought to discussion in parliament, owing to the interposition of the minister of instruction, Jules Ferry, legislative questions relating to school matters, the solution of which was anxiously looked for in every direction. The French Government, particularly at that time, voluntarily favored the wishes and endeavors of teachers.

Formerly, the national administration of education had been satisfied with assembling certain teachers to hold a sort of professional conference in which the wishes and projects of the government were submitted and discussed. But now the administration frequently called together conventions of teachers; their opinions were asked, and they were invited to propose principles and methods for the better regulation of instruction; but the administrative officers held themselves far aloof from all direct influences of teachers. This mode of procedure is still in vogue at the present time, and although the learned and far-famed M. Gréard, vice-rector of the Paris Academy and as such the representative of the government, constantly appears as the chairman of the teachers' convention in France, this surely is not done with the idea of winning the teachers over to the views of the government, or to allure them into the government's camp. The honorable character of the great savant is a sufficient guaranty against all that. The respect which is so universally manifested toward his experience and his stately presence, excludes anything like underhanded actions. He endeavors most strenuously to exclude every personal matter from the debates, and to insure free discussion to all. His work consists chiefly in devoting his ripe experience and his talents to the service of the good cause. He only takes part in debates in order, as he himself once remarked, "to obtain result (by means of votes) which may be recognized as the expression of the common views of those present."

Animated by this truly liberal-minded spirit the congresses met in the years

1880 and 1881, but their work not being finished, it was resolved to hold a third congress in the following year.

The first assembly united the male and female principals of the normal schools and a number of public school inspectors. The second consisted of the public school teachers, whilst the third saw in its midst the faculties of all the normal schools and the practice departments connected with them.

The questions discussed were as follows:

In the year 1880:

1. The educational organization of ungraded public schools.
2. The methods of obtaining a better preparation of students for the normal schools.

In the year 1881:

1. Means for improvement of school attendance.
2. Instruction and education in the lower grades of public schools.

In the year 1883:

1. What are the experiences that have been made up to this time with the newly organized normal schools in regard to teaching force, supervision, and dormitories?
2. What difficulties are encountered in carrying out the new courses of study, especially in regard to psychology and morals?
3. Organization of practice schools and their extension.
4. Questions concerning the service which a normal school can render the teachers of the province.

All these questions were discussed in a practical and definite manner; most of them had already been considered in the assemblies of the cantons and departments. After the congress had disbanded, its proceedings were given to the public on the part of the ministry. Cours Pédagogiques de 1881 et 1883 (Paris, Imprimerie Nationale).

The reproach has been cast upon this congress that it was entirely official; but although we recognize the importance of conventions perfectly independent and free from any official interference, yet, on the other hand, we must also admit that a liberal ministry not disinclined to reform will surely avoid everything that might arouse a suspicion of partiality. Judging by the spirit which characterizes the French educational administration, it can not be doubted that its aim was and is merely to learn the views of its most important fellow-workers in the great cause of education, and these most assuredly are the teachers. It invites them to conferences, follows their labors, tests their results, and carries out their plans as far as it is practicable. Although financial difficulties often frustrate the good intention of the French Government, we must for that reason not think that the government in its coöperation with superiors and subordinates fails to see the best solution of the difficult educational problems.

Thus, then, the first step toward inaugurating large teachers' meetings was made. Those who participated in the congress returned to their homes with the consciousness of having fulfilled their duty, but also with the wish that they might soon again take part in such an assembly; for they had the satisfaction of seeing that Parliament and school authorities hastened to embrace in legislative bills some of the requests which had been brought up in the congress. It was not long before the next great convention was held. It took place in the city of Havre, in the year 1885.

Havre had always been noted for her friendliness to the schools, as well as her excellent school institutions. Her public and business schools are considered the best in the whole country; her school buildings, as far as elegance and stately architecture are concerned, are unequaled in France. The city from time to time sends teachers to foreign countries in order that they may learn other systems of education, and it was first in Havre where a "Society for Objective Instruction" displayed in schools and societies by means of lantern slides the most important discussions of modern times, the miracles of nature and industry, in a manner suited to the ordinary understanding.

The suggestion to hold an International Congress of Teachers was made by the mayor of the city, M. Jules Siegfried. In his resolution relating to this measure, he emphasized the importance of congresses in all the departments and especially in that of education, because it was only in this way that valuable and tried improvements could find entrance. All partake of the benefit derived from them, teachers, pupils, families, and the country itself. The resolution was adopted, and a committee composed of representatives of the teaching profession and of the state officials was intrusted with the preparatory work. The assembly was to take place at the end of September, and at the beginning of August

twenty-five hundred persons had signified their willingness to participate. M. Gréard was asked to occupy the chair at the opening of the congress, which was to be divided into three sections; the minister of instruction had also promised to be present at the opening.

The assembly, which was well attended, was principally occupied with the consideration of four questions, to wit: (1) The benefit derived from national and international educational congresses; (2) instruction in manual labor in the public schools, and organization of schools for mechanics; (3) teachers' salaries in different countries; in what proportion should state and community contribute to the salaries of teachers? (4) the question of practical preparation of candidates for the position of teachers in the normal schools.

The discussions of the third question excited the greatest degree of interest, because the law of the 16th of January, 1781, relating to gratuitous instruction in the public schools afforded some natural advantages to the older teachers, but contained some rather unfavorable passages for the younger men. A rectification of this matter was demanded as far as the finances would permit. The demands of the assembly on this point were comprised in these, which were submitted to the government. The second and fourth numbers of the programme were also thoroughly considered; and again, a renewed interest was manifested in the question of manual training, the plan of which had been determined by the law of December 11, 1880, and by that of March 23, 1882. This subject, which, like no other one, is in need of the warm advocacy of inspired enthusiasts and requires as low penetration into the consciousness of the people at large, was also brought up before the international congress of the year 1889; yet even *now* it has not been settled in an entirely satisfactory manner, though all are convinced of the importance of this discipline in the educational work of the public schools, and would not agree to abandon it as a branch of instruction?

The question of the benefits of national and international congresses naturally could not be disposed of in one session; the discussion therefore ensued as to the intervals after which such conventions should be held; what persons should be invited as deputies, and what means should be employed for defraying the expenses. It was proposed to elect a permanent committee from the assembled delegates for the purpose of organizing congresses; but the idea was dropped at the request of the minister of education, who had himself expressed his willingness to convene such an assembly in case of necessity.

Mention should here be made of another, namely, the international, technical, commercial, and industrial congress, held in Bordeaux in 1886, which fell between the international congress of Havre and that of Paris in 1887, and enjoyed the patronage of the ministers of commerce and instruction and other high officials. The first subjects brought up were those relating to technical and commercial instruction; the next under consideration was that of the means of promoting the interests of the merchants and tradesmen of the future through public school instruction.

The Congress of Havre had expressed a strong desire to hold a similar congress in Paris in 1887. A journal entitled "Les Congrés Instituteurs" had been started in 1885, which had assumed the task of preparing the way for the Congress of Paris. The first appearance of this journal, issued by an educational society, at once opened the campaign for the idea suggested in Havre of forming a central union composed of the entire body of teachers in France. This journal desired to assemble a congress independently, although it was well-known that the minister had expressed his willingness to act in the matter. The result of the numerous meetings which were held for the purpose of preparing a national congress, was the unanimous adoption of the following resolutions:

First. A friendly league should be formed of all the teachers in each department. These unions collectively, are to form the "Union of Teachers of France,"

Second. The delegates, and all taking part in the congress of 1887, were to take upon themselves the organization of these unions. Third. The "union of the teachers of France" shall endeavor the establishment of permanent international educational congresses.

The most determined adversary of the project of a permanent congress was the minister of education at that time, M. Spuller. In a circular of September 27, 1887, addressed to the prefects, he announced his firm intention to oppose this idea, and also any confederation designed to carry it out. In his opinion the congress would not subserve the purposes of progressive thought, or afford a place for the free interchange of opinions, but would degenerate into a mere wrestling place of passions and a scene of disorder. The circular met with the most violent resistance. The teachers were of the opinion that as they were in

no sense state officials the rights to protect themselves against all political interference should at all times be permitted them.

It may easily be imagined that this delicate matter was broached at the Congress of Paris, yet, as the element of prudence was a prominent one, very little time was devoted to it. Besides, the work before the congress was of such a a serious nature as to absorb all the time and attention of the delegates. The work was divided into five sections, viz, pedagogy, professional interests, provision for old age, the organization of congress, and gratuitous instruction. As the greater part of the questions had been prepared at former discussions the congressional debates could be essentially shortened. The questions submitted to debate were those that occupied the teachers all over France, and their selection had been made by preliminary inquiries, so that from the beginning these topics met the approval of the majority.

The next and latest international congress in the interest of common-school affairs was held, opportunely, during the Paris Exposition of 1889. It was the result of efforts of the earlier educational congresses, and took the shape of an earnest manifestation of sympathy on the part of foreigners for the aspirations of the promoters of the educational system of France. The resolutions of this congress are still well remembered by all. (After L. Fleischer, Vienna.)

2.—Bibliography.

Book production.—The London publishers' circular presents the following analysis of the business done by the publishing trade in England during 1889:

Divisions.	1888.		1889.	
	New books.	New editions.	New books.	New editions.
Theology, sermons, biblical, etc	748	164	630	134
Educational, classical, and philological	630	149	557	124
Juvenile works and tales	357	113	418	93
Novels, tales and other fiction	929	385	1,040	364
Law, jurisprudence, etc	115	57	66	40
Political and social economy, trade and commerce	111	24	110	16
Arts, science, and illustrated works	184	69	112	34
Voyages, travels, geographical research	224	73	203	57
History, biography, etc	377	109	310	114
Poetry and the drama	163	68	133	54
Year books and serials in volumes	324	3	342	4
Medicine, surgery, etc	126	73	133	49
Belles-lettres, essays, monographs, etc	165	224	157	183
Miscellaneous, including pamphlets, not sermons	507	120	483	107
Total	4,960	1,631	4,694	1,373
		4,960		4,964
Total new books and editions		6,591		6,057

In looking over the analytical table of books published during 1889, which was printed on the last day of that year, an exceptional literary activity was revealed. The figures for 1889 are not quite so large, but still they mark a production of between three and four hundred books more than were counted up and classified in 1888. In other words, the statistics go to show that the year 1889 has produced about one work per diem, Sundays included, more than the output of 1888. Comparing or contrasting the number of publications in 1889 with those of 1888, we find in theology a slight decline, both in new books and new editions. In educational works, also, 1889 has fewer works to show than its predecessor. Books for young people, on the other hand, show a good increase. Of novels and stories there are noted no less than 1,040 new books, besides 364 new editions. This gives the ardent novel-reader as many as three novels for each week day, with a balance to spare, and one new edition for every day.

Germany.—The following table of new publications is from the Berliner Börsenblatt:

	1889.	1890.		1889.	1890.
Collected works, History of Literary Bibliography	482	519	Mathematics, astronomy	228	215
Theology	1,582	1,763	Military, hippology	525	569
Law, politics, statistics, etc	1,594	1,638	Commerce and manufactures	840	929
Medicine, veterinary	1,248	1,353	Building, machines, railways, mining, etc	383	446
Natural history, chemistry, pharmacy	852	909	Forestry and sports	109	100
Philosophy	188	152	Domestic economy, farming, horticulture	430	464
Education, school books, etc	2,111	2,132	Belles-lettres	1,715	1,831
Juvenile works	591	521	Fine art, shorthand	768	787
Classical and Oriental, archæological, mythological	644	626	Folk-lore, almanacs	723	796
Modern language; old German literature	591	602	Freemasonry	22	19
History, biography, memoirs	892	874	Miscellaneous	558	621
Geography, travel	534	600	Maps	421	509
			Total	17,986	18,875

It is significant that the book production in Germany since 1886 has been steadily increasing, and that the increase is altogether in the direction of the more solid branches of literature, as theology, law, medicine, and natural history. In fiction the advance is almost imperceptible, the increase in the whole department of socalled Schöne literatur (Romane, Gedichte, Theater, etc.) being but sixteen new works.

3.—Classic Languages.

Germany.—In Germany, during late years, the conflict between the gymnasia (classical high schools) and the realschulen (modern high schools) became heated, because all petitions for admission of realschulen graduates to the university were refused by the Government and the university faculties. This is a vital point if we consider that the *conditio sine qua non* of a professional man (no one speaks of women in this connection in Germany) is to have gone through the classical high school, *i. e.*, to have spent in the study of Latin and Greek respectively nine and six years. People that opined that one may become, if not a philologist and theologist, at least a physician or scientist and lawyer, without the knowledge of Greek, laid more stress on modern languages and insisted upon a combination of gymnasia and realschulen under the name of real-gymnasia. This kind of school was a hybrid which could not expect to live long, considering the capacity of the juvenile brain. The real-gymnasium endeavored to combine the advantages of the classical and modern high schools, and, of course, overburdened the pupils.

For twenty years the authorities permitted the problem to stand unsolved. Almost unbearable hardships resulted from the fact that the curricula of the high schools were inflexible, nonelastic, cast-iron. Ambitious parents of small means made heroic efforts at securing for their sons a better future than thought possible in modest occupations, such as trades and commerce. When the boys failed during their protracted course of professional training (*i. e.*, three years in preparatory classes, nine years in the classical high school, and four years in the university), their future was blighted; being "studied men" they were considered "spoiled" for trades and commerce, and thought themselves too good for manual work. Hence they joined the army of malcontents. Every kind of high school in Germany has special aims in view, hence shapes its course and modes of training accordingly. That a school, and even a college, should be what it is in England and America, a school of general culture, and not a place in which to obtain an education *ad hoc*, was vigorously preached by Dr. Wichard Lange, Dr. O. Frick, and many others. The educational press devoted much space to plans for a simplifications of curricula and a unification of schools. The literature of Germany on the subject of secondary schools, especially the "Einheitschule" (common school) is quite copious, but the reform made little if any progress.

Conservatism embodied in the highest school authorities of the leading states of Germany adhered to time-honored customs, until recently Emperor Wilhelm II, who has himself been a pupil of a gymnasium, and is fully aware of the un-

bearable conditions arising from the attempts at education *ad hoc*, and chiefly prompted by his desire to counteract the socialistic tendencies (centrifugal, destructive tendencies, as he calls them) of the present time, took the initiative in his capacity as King of Prussia, and called together a number of well-reputed educators, journalists, scientists, legislators, and representatives of the church for a special inquiry into the conditions of secondary instruction in his kingdom. This commission held its sessions from December 4 till December 17, 1890, in Berlin, and formulated a number of propositions for reform of higher education, among which are some that materialize a portion of the hopes of the advocates of "Einheitschulen."

In future, this commission decided, only two kinds of the sample card of secondary schools now existing shall be preserved: The *Gymnasium* and the *realschule;* that is, the classical and modern high school. The former is to prepare for entrance into the university where the learned professions are recruited: the latter to prepare for polytechnicums, for administrative officers, for commerce, agricultural, and technical colleges, etc. The hybrid form, "realgymnasia," is to be abandoned, all other secondary schools shall in due course of time conform with either of the kinds mentioned. Instead of a uniform, a dual system is advocated, not an "einheitschule," but a "zweiheitschule." Where not enough pupils are found in a small town to construct the entire nine years' course, the upper grades of the high schools of several towns are to be combined in one school in the most centrally located town. But in order to enable these two kinds of high school to follow their course undisturbed, it is thought best to give each its own preparatory classes. This latter measure makes illusory the efforts at unifying or fusing at least the lower classes, and the fiat has gone forth to establish a gulf between those who have means, inclination, or ambition to obtain a higher education and those who have not.

While the work performed by the commission may be said to be a step in the right direction, it does not seem in harmony with the democratic tendencies of the age, since it still necessitates an early decision on the part of the parents as to what the boy (mark the word boy, for the girls are not considered in this connection) is to become. It reëstablishes the predestination theory as it were, especially so, because a common substructure for both kinds of high school in form of a common preparatory department is rejected. When we see that the French Republic, with true insight into the best means for its perpetuation, establishes a common school which terminates in a high school and brings the lycées into organic connection with elementary schools; when we see the same organization adopted in the Swiss Republic we conclude that Germany will have a common school ("einheitschule") as soon as it becomes a republic, and not until then. [R. K., in Ed. Review.]

Switzerland.—The pastoral conference of the Canton Granbuenden, Switzerland, recently expressed its views concerning the teaching of the classic languages by adopting the following series of theses presented by Rev. Truog:

(1) Latin has become the language of learned men through school, asceticism, and humanism; but since the natural sciences have made their astonishing upward start the classic languages as a study have lost their position. Despite of that they have remained, or rather were kept the leading study in high schools, because they were, or their acquisition was, thought of peculiar pedagogical value.

(2) But the pedagogical value of (particularly) Roman classics is, as far as their contents are concerned, questionable. For the purpose of formative training of the mind, other branches of study are much better suited; moreover their acquisition will aim at general culture, a thing that can not be said of the contents of Latin authors.

(3) For theologians a certain limited quantity of Latin and Greek, however, seems an indispensable thing on account of the necessity of referring to original texts. The same may be true of other learned professions. But while we grant that a knowledge of Greek and Latin is desirable it would seem as though "less would be more"—that is to say, the knowledge referred to could be acquired during the last two years of the course.

(4) If, however, we can not do without the classics we might introduce them in translations. All church authorities who have written in Latin have been translated admirably, and there seems to be no urgent necessity for the physicians and lawyers either to surround themselves with a high wall of Latin.

(5) It is in our opinion best to replace Latin and Greek in the lower grades of secondary schools by other branches of study, such as stand in close relation to the urgent demands of modern life.

(6) Every high-school course should be so arranged as to offer during the first

two-thirds of the course a general culture desirable for everybody, and only during the last third of the course the demands of the learned professions should be heeded by offering Latin and Greek. (It must be borne in mind that European high schools have a six to eight, or even nine years' course, beginning with 9 or 10 years, and terminating rarely before the nineteenth year of age.)

(7) If the school is thus designed it will be able to do more for citizenship by teaching history better; more for man himself by teaching hygiene and physiology; more for the business career of thousands of young men by teaching commercial geography, bookkeeping, and modern languages; more for literary culture by teaching the literature of modern times, and more for the prosperity of the country by teaching physics, chemistry, mathematics, and engineering more thoroughly than heretofore; finally, something might be done in the way of technical and industrial training. But as long as the classics claim time and energy of teachers and students, we rear generation after generation of discontented men who can not find a place in this busy life of modern times.

We refrain from all reflections, and leave the thinking reader to rhyme these theses with his own views. Many will find it hard work; others will chime in readily. At any rate, there is no half way shilly-shallying about these theologians. And a decided view, be it right or wrong, is better than no view at all; hence the expressions couched in the foregoing seven paragraphs have a peculiarly refreshing flavor. (Schweitzer-Schularchiv.)

VIEWS CONCERNING THE PEDAGOGICAL VALUE OF LATIN AND GREEK—A SYMPOSIUM.[1]

Since this subject is still a point of pedagogical controversy, a few recent utterances of noted men may be quoted. (Editor "Paed.")

I. *Johann von Asboth.* (Proceedings of the Hungarian Parliament, Budapest, 1890.)

"If it is the policy of the State to eliminate the study of Greek, if it excludes the antique world from the secondary schools, that is from general national education, it robs the nation of that which can not be replaced. From that moment, especially since the religious ideas of the people are already shaken, a generation will arise that has no contact with the past; a society in which people will think it useless to know where their grandfathers are buried, and still more useless to know what they lived and died for. A generation will spring up which from its lofty summit of enlightenment will look down with derision upon its ancestor's piety and prejudices; it will, with strict logic, come to the conclusion, sooner or later, that reverence for parents has a practical justification only so long as the parents may be immediately useful to us. A generation will grow up indifferent to the past, indifferent also to the future, knowing no other interests than enjoyment, comfort, and tangible gain.

"And when this American view of things, this extreme of Western spirit, meets with the spirit of the East; when this Western longing for enjoyment and profit is not coupled with the feverish activity of the West, when Oriental indolence is not coupled with Oriental temperance and want of pretension, but when the longing for pleasure and gain meets with Oriental indolence and want of habits of industry—as they do with us, alas, so frequently—then this match will result in a degenerate and ever-sinking society, under whose guidance we shall become a depraved race, but never a nation.

"The proud-spirited Hungarian nation can not, in its present numerical relation to others, be satisfied with playing a subordinate rôle. My opinion is that it will be one of the most fatal errors to nurse the illusion that we, with our numerical strength in this portion of Europe, surrounded as we are geographically and ethnographically, could be able to maintain a state of the second or third rank—a state that need not trouble itself about others, and about which others would not trouble themselves. Such a so-called neutral middle state has never been able to be preserved in the southeast of Europe. The Hungarian nation will either occupy a prominent position in the empire which it supports (and that was the policy of the Arpades, the Anjous and the Hunyadys, and I venture to say was the fundamental principle of Francis Deák's policy), or it will be nothing but an oppressed and degenerate nationality. An intellectual prominence, or the most energetic exertion toward reaching it, is that with which we supplement our unfavorable numerical proportion.

"With this mission it in no way accords that we should eliminate from our national education those studies in which intellectual prominence is represented;

[1] Translated from "Paedagogium" (Vienna).

studies which give knowledge of the human heart and soul, and teach how to guide and govern the human being.

"We need not depreciate our own time. This era has its admirable acquisitions, its marvelous inventions which revolutionize material existence from day to day, and on account of its feverish activity this era is worthily called great. But it is obvious that the era of electricity, lightning trains, nerve-killing telephone, etc., can not be the time of intellectual concentration. It can not be a time of harmonious contemplation of men and the world. The antique world, with its simpler conditions of life, its incomparably fewer complications, was much more able than we to view the human being from a human standpoint. That is the reason why the sources of wisdom, of law, and art, are found in Greek culture, compared with which the Latin is only an imitation, a second-hand civilization. From these sources is fed, even to this day, our own material development; for, though we have acquired much new knowledge and are acquiring it daily, we can scarcely say that we are acquiring new ideas.

"Through this mental concentration history, legislation, and art of the ancients became instructive and sublime; through it the knowledge of the human heart and soul became profound and true. But all that can be acquired only in youth; that is, before life's combat robs us of the faculty to receive deep impressions and prevents mental concentration. Afterward, when greater maturity comes with its fever of passion and hot blood, the battle for subsistence opens, and the everyday humdrum business, the prose of debit and credit, overtakes us—then it is too late to acquire all that; and he who would endeavor to do so at that age could acquire it only with very much greater trouble, exertion, and loss of time, or by means of pale-complexioned and insufficient translations.

"It is a demoralizing argument, one that undermines the national ambition of youth, that we should throw out these studies to which all nations cling, great and insignificant alike, only because the mental exertion is too great for us Hungarians. That would not be a proclamation indicating intellectual superiority, but inferiority; it would be an abdication of the mission to guide other nations, and, indeed, an abdication of the place Hungary has in the galaxy of nations."

II. From a recent debate in the Norwegian Storthing (lower house of parliament).

Prof. Horst (of Tromsö): "The classical high school of to-day can not be regarded as a school of general culture. It may seem curious how a man who is himself a philologist, and who from early youth has been brought up entirely in the atmosphere of classical study; furthermore, one who has honestly endeavored to enter deeper into antiquity, how such a man can occupy a standpoint such as I do to-day. But I wish to remark that twenty years of teaching the classics has brought it about that I arrive at the conclusion mentioned before. I have also had ample opportunity to notice how little classic culture is serviceable in life. By the term 'general culture' we understand such branches which are necessary for life, and Latin and Greek are in this regard not any more essential than other branches, unless it be for such persons whose intention it is to spend their lives in studies of a similar kind. As far as Greek is concerned, too little of it is read to learn the language, and too much in comparison with the waste of time it necessitates." The speaker said he could scarcely find words strong enough to express the usefulness of the study of Greek. And yet he did not intend to abolish the study of the dead languages at once; "that would be a revolution, and in matters of school one should proceed with the spirit of reform, not in a revolutionary manner." Hence he suggested to do away with Greek in order to make a beginning with reform. "Nonprofessional men will be astonished not a little if I tell them that this opinion is generally shared by the younger philologists. I was struck with the fact that wherever I discussed this question with younger colleagues I found ready assent. You will find this to be the case all over the country and in small towns. What the weight of opinion is in the capital I have had no means of ascertaining as yet."

Prof. Koht (of Skien) said: "I, too, have arrived at a similar conclusion in consequence of my occupation in school. Classical study does not give what those need who from the threshold of school enter practical life. Development proceeds with inexorable logic, and it can not be prevented; that it will eventually exclude what is commonly called classical culture. What we need are schools of culture which are active in the service of the present time, not in the service of the past."

Rev. Weelsen pleaded for the abolishment of both Latin and Greek, saying: "Latin has no place in a school for general culture. It must be reserved for the university, and there taken up by those who need it for their professional studies. There is absolutely no reason why this language should be kept in the second-

ary schools. Its literature is antiquated and, according to my opinion, not only not beneficial but even dangerous under certain conditions. The importance ascribed to it in formative culture may be found in other branches. I believe that Latin as a requisite component of our higher education is a thing of the past."

Jacob Sverdrup (minister of education) also was of the opinion that the way to general higher culture for the majority in the future would be through the elements of modern education. According to his opinion there is no sense in abolishing Greek only. "Why put the ax to the root of the Greek tree and not to that of the Latin also? A common high school with a strong Latin tendency, that I consider a step backward." As a common foundation for higher education the speaker thought he would propose the native language, in connection with history. However, he did not think the time had come to suddenly dispense, scornfully, with classical education.

Ullmann: "I am thoroughly convinced that the only correct thing is to make a beginning: to abolish Greek entirely and to retain Latin as an optional study; that inevitably Latin will drop out of the foundation of higher education in the future and be only a secondary study for those who for practical reasons require a Latin vocabulary, for at present this is all the majority of persons need of Latin.

"If they know enough to understand a little about prescriptions and apothecary Latin and a few Latin proverbs it is really about all that the majority of persons have retained of Latin at the present day, unless one is a scholar and a specialist. In the treatment of this matter one constantly meets with the peculiar fact that the advocates of the classical languages constantly confound the subject of which they treat with the object in view. People talk as though to abolish Latin would be leading the people back into the times of barbarism. They are mistaken. To do away with Latin would not be detrimental to education. Latin is spoken of as if it were a great educational medium, and it is a mistake to imagine that this special study possesses such an importance, while, on the contrary, there are other studies from which more profit can be derived during the same length of time.

"It is a great misapprehension that it is really Latin which produces philanthropists, and should lead to human culture. For one may know Latin and still be a thoroughly brutal nature. But that which human education does give is the ability to participate in the great thoughts of culture and civilization of mankind: but one can not do that through Latin as the only means. On account of the study of Latin many other studies must be set aside that are most prolific sources of culture. I say this because I have heard rumors that possibly a direct proposition is to be made to adopt new school regulations—namely, such as are based upon the order that Latin be optional without exception.

"To such a motion I, for my part, shall give my consent with great pleasure, for I must admit that owing to the small remainder of philological conscience, which has nearly been ground up in the mill of my examinations, if there is anything unprofitable and foolish in the world for us Germanic people to do it is, above all things, the study of Latin. There is nothing gained by it, but a certain formal education which can be acquired as well through other studies, while in the mean time life and reality derive no benefit from this study."

Hertzberg (from Christiania, a former minister of education, a theologian): "So far as the two gentlemen are concerned who, as professors, occupy such important positions in our high schools, I must admit that their utterances have surprised me not a little. They are both, to my knowledge, men who not only work with zeal in the interests of the high schools, and especially as teachers of the classical languages, but they also understand how to awaken interest for these studies in their pupils. They must either fail to comprehend themselves, or they are in a very unenviable position, having to perform a task the value and importance of which they doubt. In opposition to this point of view, allow me to say, that I believe that classical education has withstood many a test and storm, much stronger and severer than that of to-day, and I trust that, also, in the future it will go through ordeals without being injured. Classical study has taken such firm root in the general European culture, that it has become a member of it, so to speak. And it will not do to pretend that this classical education is something antiquated.

"No, classical education can not become antiquated, it can not die, for it has grown up with the history of man from its infancy. The classical languages mark the way to learning that the generations must take, if they strive to reach the height of the culture of to-day, in case they do not wish to exclude them-

selves from this great work of general education that is now in progress in all civilized countries. Permit me to draw your attention especially to the importance of classical studies for our church. In case Greek should be omitted from our high schools, preparatory to the university, or in case it be postponed until the university years, I fear that this will give a mortal blow to the Protestant Church."

Ullmann: "When the delegate from Christiania, Mr. Hertzberg, tells us that classical education had stood many tests and weathered many a storm, and will continue to do so, I deny most positively the supposition from which he proceeds. Classical education has not withstood a single blow. All the assaults that have been made on this education have only caused philologists to open the door to the demands of the times, in that they have admitted first one and then another of the modern branches, and have given them a place by the side of their much-beloved Latin and Greek. They have done this with continual warfare and constant fear that they would lose their Latin and Greek, because mankind has become so godless that it wishes for other things than to wander in Ciceronian fields. No, classical education has stood no tests and warded off no assaults, but it has understood how to accommodate itself, and in this respect it has been very clever. It has filled the course with such a number of branches, beside Latin and Greek, that it succeeded in meeting the most pressing needs and demands, and hence we have obtained an organization which suffers from a multitude of studies. Never were the schools so crowded with studies as now. This condition is ample proof of the fact that classical education is 'piping on the last hole.' What remains to be done is to give a last decisive blow, so that the latest modern changes become the dominant influences. The modern branches have found their way into school, and now they are there by right and to be extended, while the classic branches become subordinate; their final elimination is only a question of time."

III. *Dr. Karl Walcker* (in Politik der constitutionellen Staaten. Karlsruhe, Germany, 1890):

"The Greeks were at least as much indebted to Oriental culture as we are to the Græco-Roman, but it did not occur to them to require of every gentleman (*καλὸς καὶ ἀγαθός*) the knowledge of Oriental languages. Many portions of the Old Testament are more beautiful and important than all Græco-Roman classics taken together; but for this reason the students of gymnasia are not compelled to learn the Hebrew language (excepting, perhaps, future theologians). Furthermore, one must not forget what all European nations owe to the ancients, including the Egyptians, the Hindoostanees, and especially the Assyrians. Shall our students for this reason learn Egyptian, Sanscrit, and Assyrian? It is worthy of notice that a philological professional man of conservative political tendency, the celebrated national economist, W. Roscher, justly asserts that one may become acquainted with the classics through good translations in the same manner in which most learned and educated men know the Bible from Luther's translation. Even future theologians, philosophers, nonclassical philologists, jurists, national economists, and physicians need not pursue the ancient languages in the way in which professors of secondary schools pursue them. Latin and Greek compositions are not necessary for them.

"Latin has long ceased to be the international language of the learned. For international intercourse, at the present day, English and French are used. The Berlin Labor Congress in the spring of 1890, for example, held its discussions in French. As far as I can see, future Christian theologians and scholars in Hebrew will never make Hebrew compositions. It would be absurd to assert that a country parson needs no English; that the Assyrian researches of the Englishmen and Anglo-American works and periodicals have no interest for him. Every intelligent person, generally speaking, must understand at least as much English as German students of gymnasia on an average understand French. It is to be regretted that English is not an obligatory study in gymnasia. In consequence of this 95 to 99 per cent of German students of law and national economy, prepared in classical gymnasia, understand no English. They make blunders in the pronunciation of the most ordinary words, and can not translate even the shortest, easiest English sentences. For philologists, national economists, jurists, naturalists, etc., the knowledge of English is indispensable."

IV. *Professor Dr. Herman Cohn* (Breslau, Germany) in Die Schule der Zukunft, Hamburg, 1890:

"That the ancient languages will claim much less time in the future than at present is quite certain. In the Middle Ages Latin and Greek were quite in place; to-day their details have become quite superfluous. It has been calculated that students of gymnasia spend 4,066 hours in the schools in the study of

Latin and Greek alone, not including work done at home. The student of medicine, on the contrary, spends only 2,160 hours for his preparation, even when he attends the clinics four hours every day for five semesters. And what has the student gained by his 4,033 hours? He knows bad Latin, which with genuine joy he strives to forget, and he knows less Greek, which he succeeds in forgetting without effort.

"The grammatocrats, as Prof. Esmarch so beautifully calls them, of course maintain that the grammatical exercises are mental gymnastics. I do not believe, however, that anyone can prove that the mental gymnastics are stronger when the beginner memorizes 'amo, amas, amat," that when he learns 'j'aime, tu aimes, il aime,' or 'I love, thou lovest, he loves.' Virchow justly affirms, 'that the ancient languages have somewhat of an ideal purpose, is only an opinion of obstinate philologists.' They naturally will always stubbornly uphold an idea which seems to live like an eternal malady, namely: 'The ancient languages sharpen the mind more than the modern,' for these men gain their livelihood by teaching the ancient languages. Grammatical instruction in general, however, does not afford mental gymnastics at all in any language, as is so brilliantly proven in the writings of Prof. Lowenthal; for memorizing grammatical rules is not brain work, but only cramming with words without meaning, which positively none of the present needs of children demand.

"I am far from wishing to deny the beauties of the Latin and Greek classics; but who will not acknowledge that there are also many beautiful things contained in Sanscrit and Hebrew books? And yet we are contented with good translations of these. It is also true of the ancient classics that only he who completely masters the languages can appreciate their beauty, and students of gymnasia do not progress as far as that. Gutzkow is quite correct in his theory that 'one will not discover the treasures of antiquity until one reads the classics in the schools in good translations, and leave the study of the original texts to scholars.'

"But as things are now, the most important time is squandered in studying grammatical and philological vexations of the dead languages, and especially in superfluous inverted translations from German into Latin and Greek, which in the schools of the future will have to give way to much more important things—the modern languages (French and English, which the citizen of the nineteenth and twentieth centuries finds absolutely necessary for life), mathematics, history, literature, geography, physics, chemistry, all of which for training the mind are incomparably more important than all the dead languages taken together. Also drawing, athletic sport, and manual labor will receive more attention than formerly. For in a harmonious development the hand will demand more consideration than is bestowed upon it now."

V. *Dr. Paul Güssfeld* (Berlin) in Die Erziehung der deutschen Jugend, Berlin, 1890:

"Graduates of the secondary school of the future who enter the university will be lacking much knowledge with which at present the students are quite familiar. They will not be masters of Greek and Latin grammar, nor be able to read the ancient authors in the original. This concerns philologists first, then lawyers, historians, and theologians. As Hebrew is a professional study of the theologians which is acquired in the university, so Latin and Greek will in time to come be taught there, and there only. It would seem best for that purpose to establish seminaries in connection with universities for the special benefit of those students only who have a vital interest in learning the classical languages. Their diligence will be greater, their progress much faster, for the simple reason that by virtue of their general intellectual culture they will be able to understand the grammar the more easily.

"The modern language which as a medium of culture and as a substitute for Greek and Latin deserves consideration above all others is the French. Its advantages are chiefly found in the grammar, which resembles in lucidity a Code Napoleon. Its rules are strict and clear. One does not venture to violate them, but enjoys following them. This feature may be traced through the entire French literature, and no revolution could effect any change in this. There is nothing holy and sublime in France that has not been dragged into the mud by party or faction; but no one dared to touch the language with unholy hands. Respect for the French language is shown everywhere in France, from the hastily penned advertisement of the merchant to the orations of the immortals in the French Academy, and every violation of the rules of that language is punished severely with ridicule. There is no room left for arbitrary construction in syntax, as is claimed in German and Latin by every writer and speaker. But

as a substitute for that want of liberty there is offered a wealth of words signifying similar things, so that the finest shading in expression is made possible. Thus it comes that the French language is equally well fitted for the presentation of mathematical theories and the expression of the most charming play of poetic thought.

"To master such a language, so that one may be able to express one's thoughts fluently in it without violating its grammar or groping for proper terms, is an object worthy of the highest human intellect and the most cultivated taste. The way to it, moreover, has the advantage of leading through alternately charming and grand but ever beautiful sceneries—French literature. He who sees in French literature only an accumulation of novels full of adultery betrays himself by his unjust and distorted judgment. Nor need we restrict ourselves in school to contemporaneous literature. If we exclude it there would still remain the works of many centuries to choose from."

4.—City School Systems.

Germany—The city of Berlin had in 1890-91, 290 public elementary schools and 82 private and Jewish schools; together, 352. An increase of 3 schools, 111 class rooms, and 3,518 pupils. The Protestant population in Berlin has increased 18 per cent within the last 5 years, the Catholic population 36 per cent, and the Jewish 23 per cent. The actual increase is 210,038 Protestants, 35,825 Catholics, and 14,881 Jews. Fourteen per cent of the Protestant population were found in the lower public schools; only 10 per cent of the Catholic, but 15 per cent of the Jewish population. Of the 3,141 classes in the lower schools, 3,021 had their own class rooms; 120 had to share class rooms with other classes; this was done by introducing half-day schools. Since 1889-90, the number of classes in houses belonging to the city has increased by 202, while the number of classes in rented quarters has decreased by 133. Half day instruction is given to children in primary grades and to those employed in factories. The schools of Berlin, though fully graded, have not as with us 8, but 6, grades. The following figures are instructive: of all the pupils there were in the lowest grade (1 year) 19 per cent; second grade (1 year) 19 per cent; third grade (1 year) 19 per cent; fourth grade (1 year) 18 per cent; fifth grade (2 years) 14 per cent; sixth grade (2 years) 11 per cent.

This is a distribution which few American schools can equal. What American school has still 11 per cent of its school population in the seventh and eighth grades? Toward the close of the year the average number of pupils to the teacher was 55. Besides the 3,141 teachers and 352 principals there is another corps of teachers engaged in the city schools, namely, the women who teach the girls to knit, embroider, sew, etc. Since 1863, when the first women teachers were employed, 1,325 have been in active service. Of these 956 were still in active service in 1891; 369 have dropped out (273 resigned, 222 of them have married, 32 were promoted to higher schools, 25 were pensioned, 39 died). It is found that the women teachers were absent on an average 8⅛ days per year within the first 5 years of service. The absence increased to 22½ days per year up to the fourteenth year of service. Up to the nineteenth year the average annual absences amounted to 8½ days; up to the twenty-ninth and thirtieth it increased to 8½ days, until in the forty-second years of age the absence amounted to 15.8 days. The calculations are not a good basis, for they offer too slender a premise. An anomaly is the fact, that in 35 Protestant city schools of Berlin instruction in Hebrew religion is given to the children of that faith. Another notable fact is that 18 principals, 91 male and 109 female and 16 industrial teachers asked for and received leave of absence or prolongation on account of impaired health. (Paed. Ztg.)

Austria.—Vienna has recently annexed its suburbs and thereby increased the number of its primary schools from 170 with 2,300 teachers, to 285 schools with 3,800 teachers and 140,000 pupils. Berlin had, in 1890, 184 schools with 3,800 teachers and 172,778 pupils.

5.—Compulsory Attendance.

The following countries have laws on their statute books which decree compulsory attendance at elementary schools. In many of these countries the law is of recent origin, hence has not had the results it will show 10 or 20 years hence. In England the law leaves it to local authorities to decree compulsory attendance at school, if they see fit.

Japan.

—(Accord. to Statesman' s Yearbook.)

Germany.—In Berlin 1,900 pupils of the public elementary schools were, in 1891, definitely excused from school at the close of the seventh year (at 13 years of age), owing to the poverty of the parents, who needed their children's aid. In 50 families, it was conclusively shown, the misery was so great that the children had to be excused at 12 years of age. The compulsory attendance law leaves such cases to be decided by the supervisory authority, to whom is given a wide margin of discretion. (Fr. pacd. Blaetter.)

England.—Concerning compulsory attendance at school in England, there is little known in this country, hence a plain statement of facts may be welcome. The "elementary educational act" of August 9, 1870, provides as follows:

"Every school board may, from time to time, with the approval of the education department, make by-laws for all or any of the following purposes: Requiring the parents of children of such age—not less than 5 years, nor more than 13 years—as may be fixed by the by-laws, to cause such children (unless there is some reasonable excuse) to attend school; imposing penalties for the breach of any by-laws. Any of the following grounds shall be a reasonable excuse: namely, (1) that the child is under efficient instructions in some other manner; (2) that the child has been prevented from attending school by sickness or any unavoidable cause; (3) that there is no public elementary school open which the child can attend within such distance—not exceeding 3 miles, measured according to the nearest road from the residence of such child—as the by-laws may prescribe. These by-laws were issued by the different school boards sanctioned by Her Majesty in council and published in the appendices to the annual reports of the education department. There still existed boroughs and parishes enough which did nothing at all in this matter.

To amend this elementary act, other acts were passed in 1873, 1876, 1879, and 1880, among which that of 1876 is most important as to compulsory attendance. Sections 4 and 12 of chapter 79 run as follows: (4) It shall be the duty of the parent of every child to cause such child to receive efficient elementary instruction in reading, writing, and arithmetic, and if such parent fail to perform such duty, he shall be liable to such orders and penalties as are provided by this act. (12) Where an attendance order is not complied with without any reasonable excuse, a court of summary jurisdiction, on complaint made by the local authority, may, if it think fit, order as follows: In the first case of noncompliance, if the parent of the child does not appear, or appears and fails to satisfy the court that he used all reasonable efforts to enforce compliance with the order, the court may impose a penalty not exceeding, with the cost, 5*s.*: but if parent satisfies the court that he has used all reasonable efforts as aforesaid, the court may, without inflicting a penalty, order the child to be sent to a certified day industrial school. Moreover, this act provides for the appointment of a school attendance committee for every borough and parish for which a school board has not been elected. The act of 1880, which is very short, provides that the education department may make by-laws for those districts which have not made them for themselves. By it compulsion was first fully and universally established. All public elementary schools are administered by these acts, as well as by codes, of which a new one is issued every year. (Gust. Lenz.)

6.—Crime.

Germany.—The numbers annually published by the German statistical bureau concerning crimes in Germany, or the number of convictions, may, in a sense, be considered a barometer of public morals. For several years a gratifying satisfaction was entertained at the decrease in the number of crimes against property, and it was concluded that the economic conditions of Germany were steadily improving. On the other hand, it was considered an ominous sympton that the number of crimes against state, public order, and religion, as well as against the person was steadily increasing. It was regarded as a ray of hope when, in 1888, a check in the increase was noted. That year was (since 1882) the first in which a notable decrease in the number of crimes of the second kind could be recorded.

At present the result of the statistical labors for 1889 is before us, but, alas, it does not show a continuation of the tendencies marked in 1888, for not only the number of crimes against state, public order, religion, and person has increased beyond expectations, but also the seemingly constant tendency toward decrease in crimes against property has ceased, and the year 1889 exhibits a deplorable increase.

Some characteristic numbers may illustrate the foregoing statements. The crimes against state, public order, and religion in 1882 numbered 51,623 (convictions are meant); this number rose until 1887, when it reached 62,348. The year 1888 showed a decrease, namely, 61,806 convictions. But the year 1889 again records an increase, the sum total during that year being 62,815. This increase is chiefly found in the great number of cases of breach of peace (16,244 as against 14,851 in 1888), inducement to perjury (292 as against 221), public resistance (364 as against 163), while the number of escapes from service in the army decreased from 21,421 to 19,683.

The number of convictions for crimes against the person was 107,398 in 1882. It rose to 137,745 in 1887. In 1888 it fell to 134,670, but in 1889 it again increased to 139,639. Especially the convictions on account of verbal offense (43,600 against 42,959 in 1888), assault and battery (19,730 as against 18,374), and inflicting wounds (57,191 as against 55,223) show a deplorable increase.

The crimes against property also exhibited a constant decrease in number from 1882 till 1887, namely, from 169,334 to 152,652. But the year 1889 again shows a remarkable increase, namely, to 165,623. In this increase may be recognized the characteristic feature of the criminality of 1889. It indicates a different direction from that illustrated by the numbers of 1882. The numbers especially interesting are 71,881 cases of petty larceny, (as against 65,060 in 1888); same with second conviction, 11,085 (as against 10,185); larceny, 7,978 (as against 6,972); burglary, 2,412 (as against 2,160); embezzlement, 15,888 (as against 14,781); defraudation, 15,205 (as against 13,493).

The increase of crimes against property is frequently considered to stand in intimate relation to the advance in prices of commodities and necessities: but it should be remembered that the prices of provisions did not rise until the second half of the year 1889, and that the general economic conditions of Germany were better in 1889 than in any previous year. Of course, though one is inclined to think that the rise in prices has something to do with causing the increase in the number of crimes against property, it can scarcely fully explain it when the increase in these crimes is taken in connection with that of others. One thing should be noticed, that during the reign of "protective tariff" a constant reduction in the number of crimes against property was noticeable.

How unfavorable the statistics of crime for the year 1889 are, may be seen from these totals:

Year.	Cases of conviction.	Increase.	Year.	Cases of conviction.	Increase.
1889	369,644	18,978	1885	348,087	*2,890
1888	350,666	*5,681	1884	345,977	15,849
1887	356,357	3,357	1883	330,128	160
1886	353,000	9,913	1882	329,968	

*Decrease

—(Düsseld. Anzeiger.)

7.—Exhibitions.

Italy.—An exhibition was held in Milan in the first week in May, 1891, for the education and hygiene of children. The character of the exhibits is best seen from the programme. In Class I, toys of every description; in Class II, children's implements, musical instruments for children, etc.; Class III, under the title "The Little Artist," a collection of tools for every kind of handiwork; Class IV, contains room games; Class V, little theaters; Class VI, garden games; Class VII, apparatus for gymnastics, fishing, hunting, swimming, etc.; Class VIII, velocipedes, carrousels (merry-go-rounds), swings, and hammocks. While this part is an international exhibition, the following is strictly national. It contains in section 1, text-books and other publications, drawings, models, apparatus for object lessons, furniture and tools for schools and kindergarten; in section 2, education, apparatus for teaching how to walk, food and clothing for children, etc.

France.—The commission charged with viewing the biennial exhibition of design and manual work in the primary schools of the Sarthe district, France, has made its report. It states that the teaching of design shows a marked tendency to become more rational. The copies of models are rarer and the designs are less ill-assorted. Linear design is not proportionally represented, and there are many patterns beyond the capacity of the child. The teaching of sewing has made a great advance in the line of common sewing and the making of simple garments for daily use. The method of teaching and the arrangement of the programmes is in need of improvement and revision. Too many teachers succeed in giving the little girls a taste for luxury and frivolity, besides causing them a loss of precious time. (Lond. Ed. Times.)

Monsieur Jules Simon has inaugurated a novel and interesting exhibition in Paris, organized by the hygienic society for children, a body established four years ago for promoting the health and welfare of the young. The exhibits consist of various kinds of hygienic, orthopedic, and surgical appliances, clothing, toys, industrial products, and other articles intended for the use of children in health or in sickness. The most remarkable feature of the exhibition is a very curious and complete collection of quaint cradles, chairs, and gocarts, dating, some of them, from extremely remote periods. One of these gocarts affords a most curious illustration of primitive ingenuity, having been made by hollowing out the trunk of a tree. There are also specimens of baskets and bags used by miners' wives for hanging up their babies while at work and a wooden "crêche," used for the reception of foundlings at Lille during the Middle Ages. (Lond. Jl. of Ed.)

The Pedagogical Museum of Paris is a permanent exhibition of all kinds of teaching material from abaci and alphabet cards up to the most delicate and complicated apparatus, and all the civilized nations of the world are laid under contribution. The minister of public instruction has lately decided to enlarge its scope by the addition of a section devoted to sample copy books and exercise books to show the handwriting of the French youth. The Revue Pedagogique characterizes the new departure as a happy idea. It quotes at length the official circular inviting the coöperation of the chief inspector in preparing for the exhibition. Every district of France is to be included, but both, the class (or grade) of pupils represented, and the variety of schools are to be changed from year to year. The caligraphy of both boys and girls is to be shown, and each primary inspector is charged to submit three specimen books from his district. The minister is careful to direct that the books should be the ordinary samples, and not specially prepared for transmission to the capital. At the option of the inspector the books may contain the teacher's correction of the day's work. (Schoolmaster.)

8.—Hygiene.

Germany.—The subject of mental overpressure is important not only for parental consideration, but for scientific investigation. The capacity of the child, the number and nature of the studies, and especially the length of the recitations, are features which ought not to be overlooked or be left to the discretion of educators. That much can be gained by experimental study of overpressure is shown by a paper read by Dr. Burgenstein, of Vienna, before the congress of hygiene in London, upon The Working Curve of an Hour. The writer had for his object the study of the mental power of children, and he arranged his experiments with a view to demonstrating the fluctuations of brain power in

children during one hour's occupation with a familiar subject. Simple addition and multiplication sums were given to two classes of girls, of an average age of 11 years and 11 years and 10 months, and two classes of boys of the average age of 12 years and 2 months, and 13 years and 1 month. After ten minutes' work the sums were taken away from the children; after a pause of ten minutes the work was resumed, the alternation continuing for an hour, so that there were three periods of work. The results were interesting. During the experiment 162 children worked out 135,010 figures, making 6,504 mistakes. It was found that the number of mistakes increased in the different periods and that during the third period the quality of work was at the lowest. The general result showed, according to the investigator, that "children of the ages stated become fatigued in three-quarters of an hour; that the organic material is gradually exhausted; that the power of work gradually diminishes to a certain point during the third quarter of the hour, returning with renewed force at the fourth quarter." The recommendation was made that no school lesson should last longer than three-quarters of an hour, and should be followed by a quarter of an hour's rest. Such a study is of especial benefit at the beginning of the school year. Children are often reprimanded for inattention when they are overfatigued, and are spurred forward when their minds need rest. "Mental overpressure" is the usual result. (London Journal of Education.)

In Germany an experiment was tried upon 162 children from 11 to 13 years of age, who were set to work out sums in simple addition and multiplication for ten minutes; then after five minutes' rest, for ten minutes more, and so on for four periods of ten minutes each in all. The result was that the total number of mistakes made was 6,504, the number increasing in the second and third period, but diminishing again in the fourth, which appears to have been better than the second. Regarding this as an experiment upon overpressure, the first thing that suggests itself is, that forty minutes of simple arithmetic, divided into periods of ten minutes each, with an interval of rest between, seems such a small amount of work to produce symptoms of fatigue that one is led to ask whether there may not have been some other cause to account for the deterioration observed? How were the intervals of rest employed? Is it not probable that such frequent interruptions may have produced a feeling of distraction and loss of concentration sufficient in itself to account for the falling off in the quality of the work? Again, 6,504 mistakes gives an average of one mistake per minute for every child; surely work so careless can not have been the cause of much mental pressure. It seems strange, too, on the evidence, that three-quarters of an hour should be proposed as the limit, taking no account, apparently, of the revival of energy in the last ten minutes of the hour. (London Ed. Times.

France.—A convention of school physicians in Paris has unanimously recommended to the city school authorities to provide every school with a set of surgical instruments for cases of emergency. Injuries, as they sometimes occur in schools, could then be attended to without delay by the teachers.

Sweden.—Dr. Wertlind, physician in the schools at Gotenburg, Sweden, has weighed the pupils of three girls' schools twice a year since 1870. During his observations, for the period of twenty years, he found that the increase in weight during the three vacation months (June, July, and August) was comparatively greater than during the remaining nine school months. The following table gives the exact average increase in Swedish pounds:

Age.	Increase.	
	During vacation.	During 9 school months.
	Pounds.	*Pounds.*
5 years	1.19	3.77
8 years	1.60	3.86
9 years	2.01	4.07
10 years	2.52	4.50
11 years	2.73	5.81
12 years	3.57	7.29
13 years	4.93	5.95
14 years	4.67	7.13
15 years	4.61	4.03
16 years	3.35	3.58

The Prussian Pädagogische Zeitung says:

From this table it is seen that after the eighth year of age the development of girls during the nine school months is not proportional to that which takes place during the three vacation months. Up to 9 years of age the girls are not materially checked in their bodily development, but from that year on the development is checked the more the older the pupils are. We must also, in scanning this table, remember that, as a general thing, the summer is not conducive to an accumulation of flesh and fat; hence these figures are more eloquent than would seem at first. But it does not follow from the facts here presented that it would seem better to keep the pupils out of school. All that follows is that school instruction should be attended by less worry and more cheerful play. If our girls must acquire mental development at the cost of nervous prostration, as is done so frequently, it certainly is too costly an article. (Paed. Ztg.)

Denmark.—A Danish school principal in Copenhagen, Dr. Vahl, publishes the result of his similar observations through a period of nine years. He weighed his pupils twice a year, on April 1 and October 1. His observations are very valuable, since they embraced children of prescholastic age. The remarkable fact was found that during the six summer months the increase in weight was on an average about one-third greater than through the winter months. Here are the figures:

Increase in weight.

Ages.	In Danish pounds.		In per cents.	
	In winter.	In summer.	In winter.	In summer.
4 years	1.45	1.94	4.58	5.99
5 years	1.81	2.23	5.06	6.23
6 years	1.85	2.45	4.63	6.22
7 years	1.99	2.61	4.49	5.97
8 years	2.14	2.86	4.39	5.91
9 years	2.38	3.15	4.42	5.89
10 years	2.87	3.43	4.86	5.89
11 years	3.50	4.40	5.34	6.82
12 years	4.17	5.12	5.72	7.08
13 years	4.93	5.63	6.04	6.92
14 years	3.79	6.23	4.16	6.86
15 years	4.08	4.25	4.22	4.41

—(Paed. Ztg.)

9.—Illiteracy.

Italy.—Mr. Bodio, director of the Central Statistical Bureau in Rome, has recently published a memorial upon the subject of elementary education in Europe, and particularly in Italy. In this book we find a complete summary of the results of education measured by the number of illiterates in the army during the last fifteen years. "This summary," says Mr. Bodio, "may cause us some mortification."

Per cent of illiterates.

Country.	1876.	1881.	1883.	1884.	1887.	1888.
Italy	51.99	47.74	47.96	47.22	44.98	42.93

Russia	80.39	79.04	.....	.....	.....	.....

Germany.—While the German nation has the smallest per cent of illiteracy of any nation in the world, yet neither the Catholic nor the Protestant element has the lowest rate of illiteracy. This belongs to the Jewish element. Of 100 Protestant children 91.63 per cent attend the elementary, 4.87 per cent the middle, 3.25 per cent the high school, and .25 per cent the university. For 100 Catholic children the 4 departments run respectively 97.21, 4.18, 1.48, and .13. While for the Jews the per cent in 100 children is 53.71, 24.40, 21.20, and 1.69. That is, of Catholic and Protestant children about 10 in 100 go beyond the first or elementary grade, while 47 in 100 of the Jewish children go beyond the first grade. These figures apply only to the city of Berlin, however, where the Jews are both numerous and wealthy. This is a most remarkable revelation, and the advantage is with Jewish children, not in Berlin alone, but also throughout the empire. It is said that the same fact holds true in our American schools. Why is it that the Jewish mind aspires to the highest plane in education? It would look as though the higher average of health among the Jewish race leads to a greater measure of mental activity and sustains it. The greater average in wealth also helps to the same end. The study is an interesting one, and a comparison of statistics covering all nations would be desirable.

The following comparative columns are highly instructive, inasmuch as they illustrate the effect of compulsory education in Germany:

Ratio of illiteracy.

Province.	1875–76.	1888–89.	Province.	1875–76.	1888–89.
	Per ct.	*Per ct.*		*Per ct.*	*Per ct.*
Saxony	0.23	0.01	Meinengen	0.82	0.24
Baden	0.22	0.02	Mecklenburg-Strelitz	0.54	0.25
Bavaria	1.79	0.03	Alsace	3.45	0.26
Würtemburg	0.02	0.03	Hamburg	0.45	0.32
Hessia	0.35	0.12	Waldeck	0.95	0.38
Mecklenburg	1.09	0.14	Reuss	1.42	0.44
Lippe	0.78	0.23	Prussia	3.19	0.94

The figures represent the ratio of illiteracy found among army recruits. (Centr. Archiv.)

General survey.—A French educational journal contains the following items of information. Some of these statements are not quite correct, compared with statistical information available in the Bureau of Education (see Annual Report of the Commissioner of 1888–89), but it is reasonable to suppose that the figures here presented are obtained by omitting (*a*) private, (*b*) secondary instruction; hence they are here reproduced as probably representing public elementary schools only.

I.—School Population.

The proportion of the total population that was enrolled in school in the principal countries of the civilized world was as follows:

Country.	Per cent.	Country.	Per cent.	Country.	Per cent.
Europe.		*Africa.*		*America*—Cont'd.	
Prussia	18.25	Cape Colony	23.00	Ecuador	2.00
England	16.20			Uruguay	5.00
Switzerland	15.00	*America.*		Venezuela	5.00
France	14.64				
Holland	14.00	Canada	21.50	*Oceanica.*	
Austria-Hungary	11.50	United States	20.20		
Belgium	10.00	Jamaica	11.00	Australia	18.00
Italy	9.00	Trinidad	9.00	Tasmania	12.00
Russia	1.80	Costa Rica	7.00	New Zealand	19.00
		Guatemala	3.00	Sandwich Islands	11.00
Asia.		Nicaragua	5.00		
		Argentine	6.50		
Japan	9.00	Chile	3.00		

II.—Illiteracy.

(*a*) *In general.*—Russia, Roumania, and Servia, about 80 per cent; Austria-Hungary, 42 per cent; Ireland, 21 per cent; France, 15 per cent; Belgium, 15 per cent; Holland, 10 per cent; United States (white), 8 per cent; Scotland, 7 per cent; Switzerland, 2.5 per cent. In Sweden, Denmark, Bavaria, Würtemburg, Saxony it is very rare to find a person that can not read.

(*b*) *Can read only.*—Germany, 94 per cent (evidently too low a figure); England, 91; Austria, 88 (does not agree with statement under "Illiteracy" *a*); France, 88 per cent; Italy, 74 per cent; Spain, 69 per cent; Russia, 53 per cent.

(*c*) *Can compute.*—Germany, 89 per cent; England, 81 per cent; France, 77 per cent; Austria, 75 per cent; Italy, 53 per cent; Spain, 49 per cent; Russia, 39 per cent.

(*d*) *Know another language than the mother tongue.*—Germany, 69 per cent; Austria, 61 per cent; England, 34 per cent; France, 29 per cent; Italy, 28 per cent; Spain, 13 per cent. (These statements are, to say little, very extravagant.)

(*e*) *Have received a classical education.*—Germany, 32 per cent; England, 21 per cent; France, 20 per cent; Italy, 17 per cent; Austria, 13 per cent; Spain, 7 per cent; Russia, 2 per cent.

These statements vary but little from similar ones published a year ago. (Revue Pedag.)

10—Language Study.

Learning languages through self-instruction.—In an age like ours that brings people of foreign tongues into contact so often, an age in which the polyglot literature of periodicals and books plays an important rôle, the number of adults who learn foreign languages through self-help is by no means small. Each of these self-made linguists is likely to have his own method and reach the goal he sets for himself in his own inimitable way. But though every road leads to Rome, a sensible pilgrim will want to know several to choose from. For this reason such quiet indefatigable workers may be reminded of the methods of two men who, by means of self-instruction, acquired an unusually great amount of linguistic kowledge and have become famous in this respect—Schliemann and Macaulay.

Schliemann, the distinguished German archæologist, who "first served as a commercial clerk, then, when he became head of a commercial house doing an extended and successful business, learned English, French, Dutch, Spanish, Portuguese, and Russian; later on, modern and ancient Greek; lastly, Latin." He writes of himself in his Ilios: "Then I occupied myself for two years exclusively with ancient Greek literature and, I may say, I read cursorily during this time nearly all the classics, and the Iliad and Odyssey several times. Of Greek grammar I merely learned the declensions and the regular and irregular verbs; but with grammar rules I lost not a minute of my precious time, for when I saw that not a single one of all the boys who had been tortured with tedious grammar rules for more than eight years was able afterwards to write a Greek letter without making hundreds of the coarsest errors, I concluded that the method followed in the high schools was radically wrong. My opinion is that one can gain a thorough knowledge of Greek or any grammar only through practice, *i. e.*, through thoughtful and attentive reading of classic prose, and through memorizing some of its best model pieces. Following the primitive method, I learned ancient Greek, and now can use it like a living language. I fluently write in it, and orally express my thoughts readily and without difficulty on any given subject, provided always I have thoughts to express on that subject. I am familiar with all the rules of grammar, though I rarely know whether the rules I follow in speech and writing are recorded in grammar or not." Schliemann fails to tell us how he read the first Greek work. Doubtless he did it with the aid of a translation, and not with a dictionary.

Lord Macaulay, the great English historian, learned modern languages in like manner. "When I want to learn a language," he wrote from Calcutta in 1836, "I always begin with the Bible, which I can read without a dictionary (Macaulay knew the English New Testament by heart). In the course of a few days I know the patch words (prepositions and conjunctions), and the commonest syntactical rules, and come into possession of a pretty large vocabulary. Then I attack some good classic work. Thus I learned Spanish and Portuguese, and a similar method I shall some day employ in learning German." A year later he wrote: "On my way home I intend to learn German. I am told that is a difficult language, but I do not believe that there is any language which I can not master in four months,

working 10 hours daily." And a few months later: "When I arrive in England I mean to have mastered German. In my leisure hours I have broken the ice by reading Luther's translation of the New Testament half through, and I am now quickly making my way through Schiller's history of the Thirty Year's War. Schiller's style pleases me very much. His history is rich in very correct and profound thoughts, expressed in so simple and pleasing a language that only blockheads can think him superficial.

The prodigious knowledge of languages of a Macaulay or Schliemann are usually explained by the supposition that they possessed an extraordinary lieguistic talent. However, that may be a fallacy. If we consider that these linguistic genuises were always persons who permitted themselves no other recreation and pleasure than reading, and consequently employed every available moment in reading, we shall look upon the wonderful results mentioned rather as a feat of enormous diligence and incessant practice. What Macaulay, outside of his professional and literary activity read, is truly fabulous. It seems as though he had read every English book published; the bad and unimportant books once, classic works repeatedly, and the historians (both English and foreign) incessantly. Hence the English saying: "A book which has not been read by anybody, save Macaulay."

On his way home from India he read Schiller's and Goethe's complete works, Müller's Swiss History, some works of Tieck and Lessing, as well as the works of other less noted German authors. In a letter to his sister he writes: "I have during the entire voyage read with grand enjoyment, having devoured Greek, Latin, Spanish, Italian, French, and English; folios, quarto, octavo, and other volumes." And to a friend he wrote more in detail: "I have read with a truly voracious appetite the Iliad and the Odyssey, Virgil, Horace, Caesar's Memoirs, Bacon's De Augmentis, Dante, Petrarch, Ariosto, Tasso, Don Quixote, Gibbon's Decline and Fall of Rome, Mill's India, all the 70 volumes of Voltaire, Sismondi's History of France, and the seven thick folio volumes of the Biographia Brittanica." Critical and æsthetic views, together with notes upon the impressions some of these works had made upon him, or upon the rising or sinking of an author in his estimation after having read him, form the conclusion of his letter.

Concerning the manner of his reading, he says "I do not read any longer as I read in college, but like a man of the world. If I come across a word I do not know I pass it unless it be that its sense is essential for the comprehension of the sentence."

Bulwer-Lytton, the romance writer, dramatist, and politician, expresses himself in a school oration concerning regular work as preferable to inborn linguistic talent by saying: "Only he can really accomplish much who does not attempt too much at one time. I have traveled much, have occupied much of my time with politics and other public and private business, and besides, have written more than 60 volumes, some on subjects which required much study and searching investigation. And now, how much time do you believe, my young hearers, I spent in study on an average, that is, in reading and writing? Three hours a day, and when Parliament is in session, even less. But during these hours my heart and soul are enlisted. It is therefore not necessary, that in order to accomplish much intellectual work, one should attempt to do much at a time; but it is absolutely essential that he work regularly and every day. If once a week you pour a whole tub full of water on a stone, no impression is made, but if you continually let a drop fall on it, the proverb tells you that the stone will be worn away."

From the foregoing we may take two lessons: (a) Do not base the study of a foreign language upon a grammar (with vocabulary, rules, etc.), but upon a work written in the respective language. (b) Work regularly and daily.

To use the same method with adults and young people would, however, not seem advisable. The school method must needs be different from the method of the adult "autodidact," self-teacher. The pupil is young and has a teacher who stimulates him; the autodidact has a mature mind and learns without a teacher and without stimulants. He who stands between the two as a link, is the student of the upper classes of secondary schools, the young man of 16 to 20 years of age. This youth is ripening in judgment and character and may, or ought to be led to treat himself as the autodidact does. When he enters life or a university he will be the better enabled to cope with difficulties, the more he has learned to help and teach himself. The "joy of learning" this wonderful stimulus must not be quenched by too much assistance. (After Schweiz-Lehrerztg.)

France.—The French minister of public instruction, noting that in learning English it is the pronunciation that is the most difficult part, has decreed, in accordance with arrangements made with the minister of posts and telegraphs, that in future the Paris-London telephone line is to be placed at the disposal of students of languages. Other international lines as erected are to be used in the same way.

11.—Libraries for Pupils and Teachers.

School Libraries in France.—There can be no doubt that the inhabitants of large cities can find the necessary and desirable books for recreative and instructive reading without difficulty, even though they may not have a well arranged public library such as nearly all American cities have. But it is quite a different thing in the country. Both the collection of books as well as the proper persons to advise in the purchase of books, are often wanting. This is the case in France more than in other countries. The inconveniences—want of books for those who have left the schools, and a proper person who could make a suitable selection in the purchase of books—have been met in France by establishing libraries in the city and village schoolhouses, the use of which is free for pupils and adults.

As early as the year 1860, M. Roland, the then minister of instruction, ordered that in the building plans of schoolhouses, the expense of which is partly borne by the state, should provide for a suitable library room. This order indirectly stimulated the establishment of school libraries. Previous to that, books had been procured, but despite liberal expenditures, the collection had melted away, owing, no doubt, to the want of proper supervision and administration.

A ministerial order of June 1, 1860, which with slight changes is still in force regulated the organization of new libraries. Article 1 of this order made it obligatory to establish a library in every public school which should contain (*a*) the books used by the pupils in the schoolroom and others to aid them in their studies; (*b*) instructive and entertaining works for the use of adults. The library should be placed under the supervision and management of a teacher of the school, and should at all times be subject to the inspection of the supervisory school authorities.

Of course the selection of books to be purchased offered various difficulties, hence it was determined that the school inspector of the district should pass judgment over the selection. However, it was soon found that this unduly increased the duties of the inspectors, burdened as they were, with the supervision of instruction and the keeping of records. Hence the minister of instruction created a permanent library commission, who were instructed to make and publish lists and catalogues of books suitable for pupils as well as for rural communities. This commission entered into an agreement with one of the largest publishing houses in Paris, which was to furnish the books mentioned in the catalogue to communities at reduced prices. The first catalogue of this commission appeared in 1868.

Aside of this action on the part of the Government, several bequests of private persons and subsequent State appropriations have made the rapid growth and spread of these libraries possible. While in 1864 France had only 4,873 of such school libraries, it had in 1878 20,871; and in 1889 their number had increased to 36,326. The number of volumes borrowed was 5,576,586 in 1889. The money derived from private persons, communal and provincial authorities, amounted to 4,680,689 francs in 11 years, from 1878 until 1889. During the same time the minister of instruction spent 2,250,000 francs for the establishment and maintenance of these libraries from appropriations made by the state for his department.

Now, as regards the rules and regulations in force, they date from the year 1862, as has already been stated, and have not since essentially changed, except the law of June 16, 1881, which decreed abolishment of tuition fees, affected these libraries; for since the school assumed the character of gratuitiveness a great number of very poor children entered it. Hence, the number of free textbooks had to be materially increased, which necessitated strict economy and even temporary cessation of the purchase of books for adults until the state came to the rescue.

It is quite interesting to peruse the catalogues published by the permanent library commission, the last one of which was published in 1888. It mentions 2,594 works, among which we find alphabetically and topically arranged diction-

aries, biographies, histories, books of travel, literature, national economy, morals, hygiene, agriculture, history of art, and miscellaneous books. Authors and publishers submit their works for examination, if they wish to have them recommended by the commission. The titles of those inspected and found suitable are first published in the bulletin administratif of the minister; after that they are inserted in the catalogues of the commission.

In order to cause the local school authorities as little expense as possible the mails transmit the books without postage, just as the United States Government does its own publications. Usually several communities combine to send one order blank filled out to the minister, who hands it over to the publisher with whom the agreement has been made.

According to the last census France had 36,121 communities. If we compare with this number the number of school libraries in existence, namely 36,336, it would seem as though every community of France had one or more of such libraries. That is, however, not the case. A great many large communities have several schools, while in some places a common library exists for two schools. In 1889 France had 25,402 boys', 23,452 girls', and 18,681 mixed schools, a total of 67,515. Now, if we compare the number of school libraries with this total number of schools we find that there are still 31,189 schools without a library.

The reports, which we have quoted at length, demand establishment of new libraries and increased purchase of books in order to promote the intellectual culture of the people. We read, "Every government of France, since the year 1789, has bestowed attention upon intellectual liberation of the people. Since the decree of the year 1894, which ordered that common gratuitous instruction should be introduced for all citizens and all stata of society until June 16, 1881, which brought the famous law that was the crowning of the work begun nearly a hundred years ago, the most distinguished men of France and lawgivers have occupied themselves with the necessity of intellectual development of the people through instruction and education. But school instruction can have an abiding result only when the pupils, after leaving school, are offered opportunities for further development." This correct, although not everywhere appreciated idea, gave rise to the establishment of continuation schools. However, this course of instruction, excellent as it may be, can not do all that is desirable, because French children go to work at a much earlier age than is customary in other countries; hence the absolute necessity of libraries. The countryman in the hamlet, the laborer in town, all find in them sources of instruction and recreation. Books at home are the most natural complement of school instruction. (After L. Fleischer.)

Pedagogical libraries in France.—The French pedagogical libraries, intended for the exclusive use of teachers, are in organic connection with the cantonal (or township) school conferences. A statute of February 10, 1837, mentions them first, and article 15 orders that they be preserved and increased by means of contributions of teachers, or other gifts and bequests. But when in 1849 all educational meetings were prohibited, on account of apprehension of their becoming political clubs, the libraries "melted away." In 1875 they were revived. A ministerial decree of January 4, 1876, promised active assistance on the part of the central government, which "recognized the just demands of many teachers for professional libraries." A later order, dated May 15, 1879, created a commission which was charged with designing a plan of organization for libraries, the object of which was to acquaint teachers with the best books and methods of teaching for elementary schools. This commission, of which the minister of public education was chairman, resolved to leave the establishment of such libraries to private enterprise, and confined its labors to issuing a catalogue containing the titles of books that deserved to be studied. This catalogue was published in 1880; a second, much larger, edition appeared in 1888. (Memoires et documents scolaires publiés par le Musée pedagogique" (1. serie) fasc. No. 22, contains this catalogue). Since 1880 the credit opened by the central government for teachers' libraries that had been made available by placing them in school houses, was raised 20,000 francs ($4,000); besides this sum, the minister of education allows the management of these libraries 30,000 francs ($6,000) annually.

The management of these teachers' libraries is not uniform throughout the many departments of France. The different rules and regulations in force vary considerably. Hence, in order to obtain an insight into the working of the libraries the different regulations would have to be compared. Most of the libraries are the result of coöperation on the part of teachers. When a respectable nucleus is formed the Government recognizes the institution and subsidizes it. The following are the leading rules:

ART. 2. This library is designed to supplement the private collection of books owned by teachers; it shall contain chiefly pedagogical works. It is under supervision of the school inspector of the "arrondissement" or "canton" (or school district as well as communal unit); a teacher of the district acts as librarian and treasurer.

ART. 3. The library is empowered to accept gifts and bequests in form of funds or books, but no book is to be placed on its shelves without the sanction of the "inspector of the academy" (or provincial school inspector).

ART. 4. A "founder of the library" is every one who pays an annual fee of at least 20 francs. A "contributor" he who pays an annual fee of at least 5 francs. The names of founders and contributors are placed in a conspicuous place in the hall of the library.

ART. 5. All teachers of public schools who desire to make use of the library are members after the payment of 2 francs per annum.

ART. 6. The library is managed by a committee of the school inspector, the librarian, and three teachers, annually elected by the members. Their functions are performed without remuneration.

ART. 7. This committee meets at least four times a year; it determines upon the purchase and acceptation or rejection of books given to the library; it reports upon its negotiations with authors, publishers, and private persons, etc. Its accounts are submitted to discussion of the teachers' conference.

ART. 8. At the meeting of the conference which takes place in December, the annual report of the treasurer is submitted.

ART. 14. The period for which a book may be borrowed must not exceed four weeks; 5 centimes fine are to be paid for each additional day.

These libraries are generally found at the central town of a "canton," in which the meetings are held; they are placed in schoolhouses centrally located. The minister of education presents each library annually with thirty to forty books selected from the official catalogue mentioned above. Certain city governments have recognized the importance of these libraries and opened an account for them in their budgets. Thus the city authorities of Toulon pay 600 francs per year to enable the teachers' library to subscribe for the most distinguished educational periodicals. The catalogue referred to contains three divisions, namely, (1) scientific works, (2) works upon education (theory and practice, psychology and history of education), and (3) reference books, to which division belong all official reports on education, home and foreign.

A desirable extension of the usefulness of these libraries is found in the so-called pedagogical reading circles. In some cities the authorities have reserved a room in the city hall for the teachers' libraries, which serves also for meetings of the "library society" or "reading circle." In Luneville a circle was organized in 1881 by the teachers then assembled in annual convention. The name adopted was "Pedagogical and Literary Circle of Luneville." It had the nucleus of a library, and now added a school museum. The annual dues were fixed at 2 francs. The teachers serve voluntarily as librarians and custodians. One of them is always found at specially designated days and hours in the hall of the circle. The city council defrays the expenses for furnishing, heating, and lighting the hall, and, besides, contributes to the institution a sum of money for the express purpose of subscribing for the six best educational journals of France. All substitute teachers and such as are not definitely employed are exempted from paying fees, but must, when needed, render aid to the librarian and custodian. The library consisted in 1889 of 1,308 volumes; the number of books borrowed and taken home was 245. The museum had 875 articles. The first Saturday evening of every month is devoted to lectures on pedagogical subjects which are in close connection with the practical work in school. For young men preparing for the teachers' examination special aid is offered in lessons and lectures. The first list of pedagogical libraries of France was published in 1879. In that year France had 926 such libraries, with 113,997 volumes. In 1880 the number was 2,068, with 361,898 volumes, and in 1888 the number had reached 2,683, with 895,367 volumes. The reports of the minister of education, however, reveal a surprising fact, namely, that the number of books borrowed is comparatively very small; in some provinces it sank to 5 in a year. In most of the others it varied between 20 and 40 per year, and only a few of these libraries are frequently used. The general impression gained from the official reports is that the present condition of the pedagogical libraries is not a satisfactory one; progress is shown only in isolated places. The causes may be found in circumstances of material nature, partly in the quite remarkable indifference on the part of the teachers.

Lately several attempts at improving the conditions of these libraries have been made; reforms were proposed from different sides. Thus, for instance, it

has been suggested to centralize the many cantonal (or district) libraries and establish departmental (or provincial) ones; others proposed a partial change by combining all small libraries of one school inspectorate to one good-sized one. Still another project was promulgated in 1874. A benevolent gentleman offered to give 30,000 francs in case the libraries were established according to the following plan: Each inspectorate should establish a central library containing all the more valuable books and books of reference, while the small local district libraries be kept intact. In these small libraries should be examined all the educational works published, and the approved ones be placed in the central library. But this plan found no approval, and the Government began to take other measures which found much praise in Europe, *i. e.*, it laid the foundation of good private libraries by offering and presenting books to individual teachers.

A circular letter of the minister of education of April 3, 1882, reads as follows: "In order that the teachers' normal schools should exercise an abiding influence upon the teachers, I am willing to present every graduate of a normal school who enters this year upon the profession a number of books selected from among those which appeared to him indispensable during his time of study. This small collection of books which he takes with him shall awaken and preserve in him a love for his profession; shall console and constantly aid him, even though fate may send him to the remotest corner of the country. If the young man adds to these books others, such as he can borrow from the pedagogical library of his school district and canton, as well as by mail from the 'Musée pedagogique' in Paris, he will never feel lonely, forsaken, and condemned to inactivity. He will be enabled to continue his studies and increase his knowledge. In order that this object may be secured without delay I empower the faculties of the normal schools to provide each graduate with a number of educational books that each may select himself, but the sum total of which must not exceed 70 francs for one teacher." It is to be regretted that subsequent legislative bodies did not provide for the requisite appropriation to carry out this plan, but the teachers in France hope that another year will see the plan of the minister revived and adopted by the Chamber of Deputies.

It is generally acknowledged as the best policy to leave the cantonal libraries intact, but to improve their management (1) by allowing the teachers the selection of books to be purchased, (2) by giving these libraries the franking privilege (through the mail), (3) by paying the librarians a salary, and (4) by interesting all the teachers through making them pay a compulsory annual fee. This last proposition has, however, found violent opposition, since its execution would violate the letter and spirit of the law which created these libraries. It is said that a reduction of the membership fee from 2 francs to 1 franc would be a wiser step.

The severest criticism these libraries have found is to the effect that they are exclusively pedagogical, *i. e.*, contain nothing except professional works, while "the truest pedagogical library is any well-stocked library," says one departmental report, which suggests the acquisition of other than purely professional books. This consideration seems to have prevailed, for the catalogue published in 1888 contains a number of titles of books of fiction and others. It is supposed that teachers who have performed a hard day's work in the schoolroom are not inclined to subject themselves to difficult scientific study. And in connection with this the normal schools are severely criticised for failing to awaken a love for reading in their pupils. "The study of literature suffers from the exclusive attention paid to professional studies in these schools." Some inspectors have succeeded in gaining a kind of control over the reading of their teachers by requiring a report of the names of books they have read, a statement as to their contents, and some criticisms, which are discussed in their regular monthly conferences.

In general the statistical data given show that the pedagogical libraries in France have made progress during the last ten years, and the interest exhibited by local authorities in their establishment and preservation is an encouraging sign. The authorities hope that the present indifference of teachers and school officials will slowly give way to greater professional activity. To this end the central departmental and cantonal authorities are joining hands. (After L. Fleischer.)

12.—Manual Training.

Germany.—Manual training at Leipsic. So much attention has been drawn to the Lloyd Seminary at Näas that the similar institution which is carried on in the old Thomas School at Leipsic, under the direction of Dr. W. Gotze, hardly gets the attention which it deserves. But to those who wish to pursue their

manual training studies, to those who can readily follow the lectures on the subject given once a week at the university at Leipsic, and to those again who, besides studying manual training, wish to perfect themselves in German and to see German life a little more from the inside than is possible in ordinary traveling—to all such we venture to think the Leipsic institution will prove more and more attractive every year. To a doctrinaire of the Nääs school Leipsic yields an admirable corrective. A list of subjects of the lectures given last August will suggest the bill of fare provided for those who have a good knowledge of German. "Herbart's Relation to the Manual Training Movement," "The History of Chip-Carving," and "Voices from the Middle Ages and from the Eighteenth Century in Aid of Our Contention," were among the subjects treated of last August. But even more stimulating were the addresses given by Herr von Schenckdorff and Dr. Gotze on their return from the Strasburg conference at the end of the month. Those who are less proficient in German may acquaint themselves with the history and objects of manual training in Germany by borrowing from the library of the institute some interesting documents by Dr. Gotze which have been translated into English, and they may in the mean time increase their knowledge of German by assiduous attendance at the excellent city theater, at which the cost of students' seats, numbered and reserved, is not more than 7½*d.* a night. Prominence is given to these particulars respecting the theoretical side of manual instruction, because it is the part which is most frequently neglected, especially in England, and because, too, contrary to the common opinion, it is hopeless to expect any useful results from manual training unless teachers attend as carefully to theory as they do to practice. With regard to the five subjects in which practical instruction is given at Leipsic—carpentry, light metal work, chip-carving, cardboard, and (for the first time this year) gardening—full particulars will be found in the prospectus. Any additional information will be readily given by Dr. Gotze, whose address is 19 Kaiser Wilhelm strasse. (Lond. Ed. Times).

The German Society for Manual Training has made extensive statistical inquiries concerning the present status and extent of manual training in Germany. The results of these inquiries are published by Mr. Sontag in pamphlet form. We cull the following items:

The greatest number of manual training schools in Germany are found in the Kingdom of Saxony, namely, 42; then follows the province of Silesia with 17; then the Thüringian principalities with 16, the Free Cities with 13, the province of Saxony with 10, the provinces of Hanover and Brandenburg with 9 each, Alsace-Lorraine with 7, and Bavaria with 6. Besides, there are over 50 of such schools in other parts of Germany; Rhenish Prussia has 5. The sum total is 186, situated in 120 cities and towns. The following parts of Germany have no manual training schools at all: Anhalt, Brunswick, Mecklenburg, Lippe, Hessia, Oldenburg, and Waldeck; neither the provinces of Pommerania and Westphalia. From this it is seen that most manual training schools are found in and around industrial centers. Schools for boys' hand work have been established in mountainous regions, where they are designed to aid the people to overcome the miserable industrial conditions under which they are suffering. In agricultural regions, on the contrary, the need of establishing such schools has not been felt.

Of the 186 manual training shops enumerated only a few in Silesia and Saxony have industrial purposes. The majority serve educational purposes. Sixty-seven of these, in 62 cities, were independent; 107 of them stood in some relation with the public or private institutions. Thus, for instance, 12 normal schools have introduced manual training (6 alone in Saxony). All these normal schools work according to their own plans, and harmony between the different schools in course of study and action is not found. Fifteen orphan asylums have introduced manual training, 12 private and public schools train in the use of tools, also 55 Knabenhorte asylums for boys after school hours. It is remarkable that of the institutions for abnormal pupils 24 have adopted manual training, namely, 10 reform schools, 2 schools for idiots, 5 blind asylums, and 7 asylums for deaf-mutes. That for the pupils of such institutions training in hand work is an essential requirement of success is seen from all the reports received from these institutions.

The establishment of manual training shops began about 1879. At this time manual training received a notable impetus in Germany by the vigorous action of Capt. Clauson von Kaas, who, in 1880, in Emden, and later in Dresden, trained a number of teachers in this new branch of study. Since that time several factors have been active as founders of manual training schools. Societies and private persons in some places, in others communal and state officials, are inter-

ested in promoting manual training. While in the year 1884 the number of shops was about 50, in 1888 the number had nearly quadrupled; in like manner the number of pupils increased from 2,080 in 1884 to 5,678 in 1888. The majority of these pupils, namely, 67 per cent, were less than 14 years of age, while 24 per cent were pupils of intermediate, high, and normal schools.

Concerning the subjects taught in these shops the report says that pasteboard work, wood-carving, and joiner work are everywhere taught first. These seem to be the chief occupations. In 1888 77 manual training shops had taken up pasteboard work, 61 wood-carving, 60 joiner work. Of the pupils 43 per cent were occupied with pasteboard work, 32 per cent with wood-carving, 31 per cent with joiner work. Seven of these schools teach forging, molding, and other light metal work; in three of them modeling is taught. Here and there are found painting on wood, scroll-saw work in wood and metal, turning, cane-braiding, brush and broom making, basket-braiding, straw-mat braiding, fillet-netting as branches of the course. These latter branches are offered only in places where the school is intended to aid the home industry.

It is pleasing to notice that most of the schools follow courses which are founded upon pedagogical principles: the models are made by teachers themselves or copied from the well-known Leipsic models.

Instruction in these manual training schools is given by 208 professional teachers and 48 artisans. The question whether artisans or teachers should be employed in manual training schools has been successfully solved by experience. Since 1880 the ratios of artisans and teachers in manual training schools have been:

	1880.	1881.	1882.	1883.	1884.	1885.	1886.	1887.	1888.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
Teachers	29	39	50	56	61	64	72	79	81
Artisans	71	61	50	41	39	36	28	21	19

The number of professional teachers instructing in the workshops has gradually increased to 81 per cent, while the number of teaching artisans has decreased accordingly. In training shops maintained solely for educational purposes professional teachers only are employed. Several reports state that in schools where artisans are still employed teachers are greatly to be preferred. In schools, however, that are intended for industrial purposes it is found that skilled artisans are preferable, because they have an eye towards practical utility such as professional teachers are not likely to have. Special courses for teachers in the Normal College of the German Society for Manual Training have been very successful in supplying schools with teachers preparing to teach manual work. Since the year 1880 about 1,000 persons have gone through a course of study in that school, which is situated in Leipsic.

The German teachers have been repeatedly charged with indifference toward the cause of manual training. This charge is only too true, but in a measure this indifference has its cause in stolid opposition to manual training. Manual training claims the assistance of the teachers, and very essentially changes and modifies the time-honored limits of a teacher's activity. Manual training has nothing to fear from opposition; on the contrary such opposition as it finds among the teachers proves to be a benefit. This is partly proved by the statistical data before mentioned. Any one who introduces manual training into his school is obliged to sacrifice time, and energy, and even means. Yet, wherever it has been introduced the initiatory steps were taken by schoolmen. Nine of the twelve independent workshops have been established by educators.

As far as the time of instruction is concerned most manual-training schools admit twice a year, in the spring and fall. The school is better attended during the winter than the summer semester. In Berlin, Posen, and Halle, vacation courses are offered. Generally 2 hours per day are devolved to hand work in the shops: in a few places 1 to 1½ hours; in others 2½ or 3 hours per day are set aside for it. The number of pupils in a class for pasteboard work is from 12 to 20: for wood carving, 10–24: in joiner work from 12–16. Tuition fee is charged in almost all schools. Very few offer gratuitous instruction. In some places the fee has to be paid in advance, in others a monthly fee is charged. The fee varies between half a mark and 10 marks per month (12½ cents to $2.50). The The average fee is between 1 and 2 marks (25 and 50 cents).

A number of manual-training teachers teach without special salary; others are satisfied with the small sum remaining after material, rent, and gas are paid for. Fixed salaries to teachers are paid here and there, and 1 to 2 marks per hour is about the usual price paid. The annual salaries range from 75 marks ($19) to 105 marks ($26).

The sums expended for the establishment and maintenance of manual-training shops are not very large if measured with an American standard. During the year 1888 the sum total raised and used for this purpose is estimated to have amounted to 50,000 marks, or $12,500. This insignificant sum was raised by school authorities, societies, private persons, subscriptions, tuition fees, and bequests. Pitiably small as the sum may seem to us, we must bear in mind that a mark goes as far in Germany as a dollar does in America; but even that would not come up to the sums spent in this country. Manual training has assumed enormous proportions in the United States, where entire city-school systems have adopted it. (After Paedagogium.)

13.—Medical Supervision.

Medical supervision of the schools in Paris.—The present institution of medical supervision of the schools in Paris does not date further back than 1884, although previous to that year the schools were not entirely without supervision by physicians. The law of 1833 (June 28) had charged the school committees of the respective towns and cities with the care of keeping the schoolhouses clean, while a royal ordinance of 1837 (December 22) made it a special duty of the female supervisors of maternal schools (kindergartens) to watch over the health of the little children in the infant asylums.

For the city of Paris separate governmental decrees had been issued, while the two decrees mentioned had reference to all the schools of France. The decrees of 1842 (December 20) and 1843 (May 19) ordered that every public boys' and girls' school should be visited by a physician who was to inspect the localities and the general health of the school children. For private schools and maternal schools similar regulations were issued. These school physicians of public institutions and the lady inspectors of maternal schools were appointed by the "prefect" of the department selected from nominations made by the mayor.

However praiseworthy this arrangement was, it had a great drawback. In the annual budgets of the communities no provision was made for paying these physicians, hence an appeal to the generosity of the medical fraternity was necessary. Many offered their services and acted gratuitously for many years.

In January, 1878, Messrs. Lauth and Harant, members of the general council of the Seine department, moved a reorganization of the medical service in school. Their endeavors were not without speedy success, for during the session of April 23, 1879, the council voted in favor of paying for medical supervision of the schools during the last six months of that year. The sum appropriated was 34,200 francs. New regulations issued by the prefect determined certain mooted questions and defined the duties of the physicians. The Seine department was divided into 114 medical districts, of which 85 were within the city of Paris. Each district contained between 20 and 25 schoolrooms.

The medical inspectors, who had to be graduates of well reputed schools of medicine, were nominated by the mayors of the different arrondissements (wards), and appointed by the prefect of the department.

Their term of office was three years, at an annual salary of 600 francs. They were obliged to visit the schools of their district at least twice a month, carefully inspect the localities, and remove any children found to be suffering from contagious or infectious disease. They even were empowered to order a school closed in time of epidemics.

During the absence of the physician, the principals of the schools had to watch over the health of the pupils in their respective buildings. In order to assist them in this, the authorities provided them with instructions issued by the supreme sanitary council of Paris, according to which they could detect the symptons of contagious and infectious diseases. In Paris the medical service in school stood under the immediate supervision of the mayor of the "arrondissement," while in the surburbs and the country the head of the "canton" watched over the faithful discharge of duty on the part of the physician.

Up to the year 1882 the entire expense for the new institution was defrayed by the "Department," but in that year the communal budget of Paris contained the item of 53,000 francs for salaries of school physicians.

The expenses made during the first period of three years of service had taught the authorities valuable lessons, which led to the following reforms: It was found that the number of schoolrooms (20 to 25), given to one physician to supervise, was too large; the consequence was that the examination of individual children with reference to their eyesight, ears and teeth (the seats of most children's diseases), could not be minute and exact enough, hence the city council appointed a commission which worked out and submitted a new statute, or set of regulations; this was adopted on November 7, 1883, and went into effect January 1, 1884.

The most important points of these regulations, which are still in force, are as follows:

ART. 2. The public schools of the city of Paris are for the purpose of medical supervision to be divided into groups of from 15 to 20 schoolrooms. Any maternal school is to be reckoned as two rooms. A redistricting takes place every three years. The prefect performs this duty. Newly opened schools are assigned to the nearest "medical group."

ART. 3. The salary of a school physician is 800 francs per annum ($160).

ART. 4. The physicians are nominated by the mayors and appointed by the prefect of the department.

ART. 5. The tenure of office of these physicians is for three years.

ART. 8. Every school physician must announce to the mayor his address of residence or office, and the hours at which he can be found there. This statement is published at a conspicuous place in the respective schools.

ART. 9. A book must be kept in every public school and maternal school, in which the school physician notes down his observations. This book must be submitted to the inspection of officials and supervisory authorities.

ART. 10. The school physician is obliged to visit every public and maternal school twice a month, but he must also appear there when the mayor or prefect may see fit to order a visit.

ART. 11. When visiting a schoolhouse the physician shall first thoroughly inspect the "localities" (corridors, stairs, waterclosets, etc.). In doing so the principal of the school is to accompany him, so that he may receive suggestions from the physician. Then the latter visits each class-room, and after he has inspected them with reference to light, heat, ventilation, and furniture, etc., he must proceed to examine the pupils separately, especially those who are pointed out by the principal and teachers as showing symptoms of indisposition. After the examination of a schoolroom and its inmates is completed, the physician enters the results into his book intended for this purpose. He answers the different questions and tabulates his answers in the columns provided for them. In the column "ad hoc" he enters the names of those children in whom he has noticed symptoms of approaching disease, states that their withdrawal from school proves necessary, and especially notes whether the disease is contagious. Finally he enters the number of pupils absent on account of sickness on the day of his visit, and inquires of the teachers what sickness, if any, seem to be prevalent at that time.

ART. 13. At least once a month a thorough examination of each child is to be made with reference to eyes, ears, and teeth, if the physician finds an inclination to disease, or if the general state of health of a child needs special attention on the part of the parents these must be notified by the physician's certificate, which is to be handed to the child.

ART. 14. Children in whom the physician discovers the symptoms of a contagious or infectious disease are to be sent home at once with a sealed letter, in which the physician states the cause of this step. In this letter the parents are notified that the child is not permitted to attend school until it comes with a certificate signed by a school physician announcing its complete recovery.

ART. 15. The principal of every school keeps at hand a series of instructions issued by the supreme sanitary council, in which the symptoms of contagious and infectious diseases are stated. If a child gets ill during the absence of the school physician, the teacher of the respective class room notifies the principal. If the latter finds symptoms of a contagious or infectious disease, he must send the child home with a sealed letter, in which he asks the parent or guardian to call at the office of the respective school physician during his office hours, which are mentioned.

ART. 16. A certificate of recovery may even be required of children who have been absent for any length of time on account of sickness, without having been sent home. In this case the nature of the illness is to be stated unless the child is subjected to a special examination by the school physician, and thus acquires a certificate of recovery.

ART. 18. Within twenty-four hours after each sanitary and medical inspection the physician is obliged to report to the mayor of the arrondissement (ward) about the sanitary condition of the school. Blanks for this purpose are furnished him.

ART. 19. The mayors of all arrondissements prepare summaries of the various individual reports, and submit to higher authority all those propositions and suggestions which seem of special importance. Propositions which are of a more general nature, and not very pressing, are referred to medical committees for deliberation and subsequent report. In case an epidemic breaks out, the mayor has the right, upon motion of the school physician, to close a school; but he is obliged to give notice of his action to the school inspector and his own superiors.

ART. 20. The mayor is required to report regularly every three months to his higher authority (the prefect of the department) concerning the sanitary and medical condition of the schools in the arrondissement. Semiannually he must send in a more elaborate report, containing suggestions for changes and improvements, such as are made by the physicians in their reports to him. Advice regarding changes and "adaptations" in buildings is equally welcome.

This supervision of the Paris elementary schools was, in 1889, performed by 128 physicians. The budget of the city for that year contained the sum of 100.800 francs for this institution. Medical supervision of schools in Paris has served as a model for similar arrangements in other French cities. By means of a ministerial order of November 14, 1879, the attention of all prefects was called to the instructions quoted above at length. But since then, through the school law of October, 30, 1886, as well as through ministerial decrees and orders dated November 18, 1887, medical and sanitary inspection has been made obligatory for all the schools, public and private.

A few years ago, the city council of Paris expressed the desire that with this institution of supervision be connected a free school dispensary. This suggestion is under advisement at present. These dispensaries, so it is intended, shall go further than the school physicians who are watching over the health of the children. These dispensaries shall take sick children and treat them in hospital wards, specially arranged for children, and provide them with medicine and surgical assistance.

As early as 1862, a few free dispensaries were in existence in Paris supported by charitable societies, notably the "Société philanthropique." These dispensaries were connected with the hospitals for children, but there is a difference between institutions founded and maintained by charity and those by law. In these private dispensaries children could not always have the desirable special treatment, medicine, shower baths, etc. To the city of Havre belongs the honor and credit of having founded the first public free dispensary for children. This institution is equipped with all the most desirable conveniences and all necessary appliances. In 1875 a physician, Dr. Giebert, aided by contributions of charitable persons, established an institution of this kind which had astonishing results, and was subsequently made a city institution.

In Paris the first children's dispensary was opened in the first arrondissement upon urgent solicitation of Dr. Dubrisay and M. Baudof. It found a home in Jean Lantier street, No. 15, in a house which was offered by the owners free of charge. Since the date of opening, April 1, 1883, the consultations in this institution have reached the enormous number of 60,000; in the first year the number was 5,087, then steadily increasing, it reached 19,000 in 1889. The expenses during 1889 were 5,980 francs, but the annual donations amounted to 8,205 francs.

The example set by the first arrondissement soon found imitators. To-day (in 1890) eight arrondissements have children's dispensaries partly supported by private persons (like those in the thirteenth and fourteenth arrondissements), partly by the city. The excellent influence these few institutions have exerted has awakened the desire of increasing their number and to provide every ward of the city with one, hence a credit of 100,000 francs was opened for that purpose in the city budget of 1890, and all indications point toward an early fulfilment of the desire mentioned above, namely, that the medical and sanitary inspection of the schools be supplemented by a great number of free dispensaries in which children will find the treatment needed in cases of sickness. (After L. Fleischer.)

14.—MISCELLANEOUS NOTES.

Canada.—A new feature has been introduced into some Canadian public schools, this being what is called "*grade conventions.*" It is carried out by the teacher of one grade visiting the room of a teacher of the same grade and ob-

serving the work in the room during the afternoon. At the conclusion of the teaching, when the pupils are dismissed, the teachers and inspector hold a consultation to talk over any points of interest they have observed, with a view to improving the methods of teaching. Some of the benefits of these conventions are obvious. The teachers observe the points of excellence and the defects in the room they visit, and all are benefited by the experience and exchange of ideas. Besides, they bring about uniformity in teaching and management, which is an essential feature in graded schools, where pupils pass from one teacher to another. The similarity in teaching saves much time, as the pupils do not have to learn or be taught new methods when they enter another room. (Schoolm.)

Belgium.—The State Savings Bank, of Belgium, in its report of 1890 contains a few interesting points concerning the mooted question of savings banks. Belgium had in 1890, altogether, 7,637 elementary schools attended by 896,787 pupils (449,497 boys and 447,290 girls). In 4,965 schools the custom of collecting savings has been fostered. The pupils own 167,696 savings books (92,975 boys and 74,721 girls). Besides these there are 38,907 pupils whose savings are so small that they have not acquired their own bank book. The amount saved by the children in 1890 was $808,430 (of which the boys contributed $443,344, the girls $365,086), an increase of $24,296 over the previous year. The province of Hennegan has the greatest number of juvenile savers, while Limberg has the smallest. The teachers are generally opposed to the institution of school savings banks, and expressed this in unmistakable terms at their last annual meeting. At the general meeting of the elementary teachers in Brussels, the school savings bank has been condemned by a vote of 117 yeas and 86 nays, on the following grounds: (1) What is saved is never sufficient to provide aid in case of sickness or accidents. Insurance companies and workmen's unions would be much better. (2) Saving makes young children selfish; the teaching at school ought to develop charity, not grasping. (3) As it is, it is seldom the children that save—it is the parents, who give their savings to the children to take them to the schoolmaster, who thus becomes the banker for the parents. (4) Several parents save from a desire to please the schoolmaster. (5) The practical good of the school savings bank, after a trial of twenty-five years, may be said to be *nil.* (Different educ. journals.)

Austria.—The annual report concerning the school kitchens in Vienna during the winter of 1889–'90 shows that indigent pupils were provided with a good dinner (soup, vegetables, and bread). The number thus provided for was 2,869 a day; but the real number is much greater. Many pupils come with their little brothers and sisters, and the cook is told to help the older children, who thus "provide for the family" more plentifully. Often children come to school who are not enrolled and ask for a dinner which is never refused. In one hundred and thirty-two days 381,577 dinners have been served, but if the foregoing is considered the number is more than 400,000. Lately these kitchens can not supply all the children who come; poverty and starvation are spreading in Vienna. (Oestr. Schulbote.)

Egypt.—In the government schools of Egypt it has been the rule for years that, in addition to Arabic, every pupil must learn English or French at his option. This is not merely as a linguistic study, but is gradually being made the medium of instruction in the ordinary curriculum and in science. In 1889 only 14 per cent of the pupils chose English in preference to French, but last year the proportion rose to 23 per cent. In order to meet the increased desire to learn English, a normal school for native teachers has been opened, and it has 30 students. Also 6 young Egyptians have been sent to normal colleges in England to qualify themselves as teachers in the government schools. On the other hand, about 100 pupils are studying in France at the expense of, or recommended by, the Egyptian Government, and a Government normal school exists in Cairo under French management. Hence, it would appear that the French have the inside track in Egypt. (Lond. Jl. of Ed.)

England.—The money-lender and the betting man are never greater curses of their race than when their wiles entrap school boys who have expectations of coming into the possession of property when they are of age. The English legislators have, to some extent, restrained the evils in other places, but the circulars of the betting agent and money-lender seem to have found the way without hinderance into both public and private schools. Recently Lord Herschell brought the matter before the House of Lords; and archbishops and bishops, the lord chancellor and lords justice, dukes, earls, and other lords were absolutely unanimous in supporting the measure for rendering it penal to send out

such circulars to boys at school and youths at college. Lord Herschell in introducing the bill said its object was to render penal the sending of what were known as touting, betting circulars to boys at school and youths at college; and it proceeded upon the assumption, in this case quite justifiable, that the receivers at schools and colleges were prima facie persons who were infants and known to be such, leaving it to the sender to show that in any particular case the person to whom a circular was sent was not an infant. He added that if he received encouragement he should be prepared to extend the scope of the bill by including the sending of money-lending circulars. (Schoolm.)

Germany.—The school board of Berlin has ordered the purchase of an ample number of cuspidors for use in the schools. The committee on science and medicine had recommended this on the ground that tuberculosis (consumption) is transmitted through germs in the air, hence that the expectorations of sick children are apt to cause contagion if not confined to spittoons filled with water. The vessels are placed in every class room, on stair landings and corridors, and are attended to twice a day. (Allg. Dr Lztg.)

England.—In 1849 a royal commission investigated the accounts of the eight so-called public schools of England, namely: Eton, Harrow, Winchester, Rugby, Shrewsbury, Charterhouse, Westminster, Merchant Taylors. The report of this commission revealed the following facts: Column 1 states the income of the principals; column 2, that of the first assistants; column 3 states the amount it takes to keep a boy at these schools a year:

Eton	$20,000	$11,000	$750–$1,050
Harrow	20,000	6,975	712– 900
Winchester	15,000	7,000	545
Rugby	14,785	8,085	450– 600
Shrewsbury	10,000	2,812	500
Charterhouse	6,000	4,000	484
Westminster	5,850	3,150	475
Merchant Taylors	5,000	2,625	*a*50

a This signifies only the tuition fee per year. In all the other cases board and lodging are included. (Zeitschr für Geeundhpfe.)

Various alphabets.—The Sandwich Islands alphabet has 12 letters; the Burmese, 19; Italian, 20; Bengalese, 21; Hebrew, Syrian, Chaldee, and Samaritan, 22 each; French, 23; Greek, 24; Latin, 25; German, Dutch, and English, 26 each; Spanish and Sclavonic, 27 each; Arabic, 28; Persian and Coptic, 32; Georgian, 35; Armenian, 38; Russian, 41; Muscovite, 43; Sanskrit and Japanese, 50; Ethiopic and Tartarian have 202 each.

Germany.—School gardens, of which there are more than 9,000 in Austria, are being laid out in different parts of Germany. Their object is to give methodical instruction in the cultivation of fruit trees and to be used in the teaching of botany.

The minister of education has sent a notice to the provincial councils, requesting them not to refer candidates for positions as school superintendents to him, but themselves to take the initiative in recommending suitable persons to him. "It is of extreme importance," he writes, "for the proper development of education in elementary schools, that the responsible office of school superintendent should be only in the hands of especially trustworthy men, those who have proved themselves to be efficient elementary schoolmasters. This applies equally to masters who have enjoyed a university education. I expect that the local authorities will not restrict themselves to an examination of those candidates who present themselves for election, but will, without regard to expected vacancies, keep themselves conscientiously informed of specially suitable candidates. The school inspections, and an understanding with the provincial school board, will offer ample opportunity to discover such persons." (Lond. Jl. of Ed.)

How to treat stutterers.—Dr. Schellenberg, in Wiesbaden, gives the following advice to teachers as to how to treat stutterers:

(1) Treat the stutterer most kindly, and try to win his entire confidence. (2) Prevent other children from making fun of his trouble, and if necessary punish them for it. (3) Infuse him with courage and self-reliance. (4) During the first few weeks of school ask him no questions in recitation; then begin with such easy questions that he can answer without reflection and hesitation. (5) Direct your attention away from the stutterer as soon as he betrays confusion and disquietude in his attempt at speaking; repeat your question when he has regained

composure. (6) Urge him to assume a straight posture when speaking. (7) See to it that while speaking he breathes through the mouth, not through the nose, and that he takes a deep breath when he comes to a period or other convenient full stop. He should also take breath before he attempts to answer a question. (8) Advise him to begin his speech slowly and in a lower pitch than usual. (9) If the first word of his sentence begins with a vowel, let him begin that vowel faintly and increase it in strength thus, A—sia. If the word begins with a consonant, let him blur over it to reach the vowel, dwell on that, and then go on thus, ba—thing. (10) The stutterer must learn to run his words into one another so that no hiatus occurs, which would, of course, facilitate or cause stuttering. He should at first speak thus: "A—ll'swellthatendswell," until he has to some extent mastered his infirmity.

These points are exceptionally well taken, and the present writer can confirm them, since he has found them of excellent use in the school room. The English language does not breed so many stutterers as the German, but there are still cases enough in our schools to make advice like the foregoing welcome to teachers of little experience, and of them, alas! we have more than is desirable. (Allg. D. Lztg.)

Saxony.—In the Kingdom of Saxony the lower schools have on an average 73 pupils to the teacher. The greatest number is found in inspection—District Loebau, namely, 95; then Chemnitz, with nearly 94; then Schwarzenberg, 92, and Marienberg, 91. The smallest number is found in Leipzig, where it is 43; in Dresden it is 44; other districts have respectively 67, 70, 71, 72, 73, and 74 pupils to the teacher. There are still 128 schools of three grades with but one teacher, and averaging 132 pupils. In 1,117 continuation schools (post-graduate courses of elementary schools) instruction is given all the year round; in 712 only during the winter. (Allg. D. Lztg.)

Germany.—The Society for the Promotion of Public Games for the young and for the people in Germany, which was founded in May in Berlin, has already begun to make itself felt. Committees have been formed under the direction of Dr. Eitner, of Görlitz, and Dr. Schmidt, of Bonn. The latter, who is also a member of the Committee of the German Gymnastic Society, announces that the latter society is ready to join in active coöperation for the promotion of healthgiving games for the people. The minister of education, Graf Zedlitz, has expressed his heartiest sympathy in the aims of the society. In June, 1891, a course of instruction in public-school games was held in Görlitz for the benefit of the teachers. Dr. Eitner and Herr Jordan, the head teacher of gymnastics, conducted the classes, which were numerously attended.

Görlitz, a very progressive town in the province of Silesia, which was one of the first cities in Germany which introduced manual training, again comes to the front with normal courses for teachers in public games. Public play, supplementary to gymnastic exercises, has recently become an object of much attention of the Government as well as educational circles. (German Ed. Press.)

France.—Levasseur, the noted French statistician, makes the following statements concerning the population in France: France (or Gaul) had at the time of Cæsar 6,700,000 inhabitants, estimated according to the size and number of Gallic tribes. Roman Gaul during the time of the Antonines is said to have had 8,500,000, but this is a mere hypothesis. At the time of Charlemagne Gaul is said to have had only 5,500,000 inhabitants, according to Irmions Polyptique, but 8,000,000 or 9.000,000 according to an estimate made at the time. During the first half of the fourteenth century Gaul had 20,000,000 or 22,000,000, estimated by means of the number of hearths. At the end of the sixteenth century Froumenteau credited Gaul with 20,000,000 inhabitants. In 1700 the number is said to have been 21,136,000, estimated in the "Memoirs of an administrative officer." In 1715 the estimate was 18,000,000. Numerous positive statements go to show that in 1770 the number of inhabitants was 24,500,000, and in the great memorable year of the revolution, 1789, it was stated to be 26,000,000. In 1801 a rectified census proved the inhabitants of France to be 27,347,800; in 1866, 38,067,064 (with Alsace-Lorraine); in 1872, 36,102,921 (without Alsace-Lorraine), and in 1886, 37,930,759.

Germany.—Recently statistics have been published concerning suicides of children in Prussia. The *Neue Freie Presse* of Vienna on May 26 published a statement which permits a comparison between Prussia and Italy. Since in population the two countries are nearly alike, a comparison seems just. The cases mentioned are all committed by children below 15 years of age.

Causes of suicides.	Boys in—		Girls in—	
	Prussia, 1869-'72.	Italy 1868-'77.	Prussia, 1869-'72.	Italy 1868-'77.
Insanity	117	138	91	300
Illness			45	
Being tired of life	25	28		
Passion	24			200
Home trouble	67	250	45	300
Financial losses	8	28	91	
Shame, fear of punishment	300		409	
Other causes	435	528	319	200
Vice	8	28		

Notice that in Prussia shame, fear of punishment, drives children to commit suicide, while in Italy the strongest motive is family or home trouble. The figures for Italy appear to be somewhat unreliable. The last column, particularly, looks suspiciously regular.

15.—Museums in School.

France.—In the year 1888, at the general teachers' meeting in Frankfurt-am-Main, a speaker claimed that every school should have its own local museum, in which should be kept not only the tools of all the trades and industries, but also the raw material necessary for those trades, as well as the finished products in their development from the smallest and simplest beginnings to their completion. This demand, made in all earnest, has been recognized as just in France for some years, at least partly. The school museums in that country (called local museums) form an indispensable means for object lessons. Their establishment was an unavoidable consequence of universal application of objective teaching, which had been advocated by such men as Montaigne, Rabelais, Fenelon, and Rousseau and others, especially after the great revival of popular elementary instruction (since 1871). Men of science and educational leaders were eloquent in advocating the teaching of visible things and processes in preference to empty words.

The French school museums contain natural and art productions which are suitable for offering clear concepts of things surrounding the child. All these objects are systematically and methodically arranged, and adapted to each grade of school. It is most instructive to learn the history of these museums. Their beginning dates back to the year 1867. At the "World's Exposition" in Paris a few collections of objects were exhibited and Madame Pape-Carpentier gave lectures in which she dwelt on the good use to which these collections might be put in schools. This suggestion fell upon fertile soil, and when in 1873 M. Buisson reported upon the Vienna Exposition he could already state, that France was not behind other countries in matters of school museums, and that some provinces (departments) possessed more than a hundred of them filled with agricultural and industrial objects. Their number has increased rapidly. It is noteworthy that most of them had their origin in the initiative of the teachers who began, aided by their pupils, to collect models and natural objects, and arrange them systematically. In 1890 France had over 14,000 school museums, which are to be distinguished from simple collections of beetles, mineral and the like, such as may be found in almost any school where natural history is the hobby of the teacher.

Legal provisions for the establishment of school museums are not in existence in France. It was not a question of introducing a new branch of study or a new method of teaching, but simply a question of procuring the means for teaching object lessons. The authorities merely issued some suggestions for managing the instructions and exhibited a lively interest in them. A new impetus was given the idea of school museums through the report of M. Buisson, mentioned above, in which the various collections for school purposes exhibited in Vienna were minutely described. This report did much to awaken interest among local authorities, so that a few years later—in 1882—all the inspectors (superintendents) reporting on the schools of their districts and provinces were unanimous in acknowledging the usefulness of these collections for elementary school instruction.

Through public lectures to teachers on the subject of objective teaching, M. Buisson, in 1878, succeeded in awakening great enthusiasm among teachers. On

returning home they resolved to follow the example set and establish museums. Soon after there was scarcely a province of France (department) in which teachers did not from the rostrum and through the press agitate the introduction of object lessons and school museums.

Most of the museums were established by teachers and pupils themselves, who bore the expense; hence material aid on the part of the state was not necessary. Some communities defrayed the cost of original establishment, others brought collections offered by private citizens. All were agreed upon the principle that instruction in things without having the things to show is irrational, and that both in the kindergarten and primary school the same method of object lessons should be followed which a mother applies in order to create ideas, namely, by means of objects and not words. The child must be led to know the objects within its vicinity distinctly. This is best accomplished by means of the intuitive method for whose application the reading lesson offers the best opportunity. During a reading lesson a great variety of objects are mentioned, and if they can be given into the children's hands attention is secured, the mind is being sharpened, the power of judgment developed: in short, the child is accustomed to distinct seeing and clear comprehension. The teacher is enabled to abridge verbal explanations where he has objects to show; he can thereby make his lessons more interesting, banish the ghost of indifference from his class room and keep alive the joy in work. After the children have left school they are not apt to lose the desire to observe, to reflect, and to judge. If the school museum had no other result than this that one alone would justify its establishment and maintenance. A school museum offers no little advantage also to the study of language; the child learns to express its ideas better; its vocabulary is increased more rapidly; it replies more fluently when it sees and handles things, and it certainly remembers technical terms more easily than in the utter absence of objects.

Experience has shown all this in schools where museums are kept, while in schools which are without museums the teachers have great difficulty in accustoming their pupils to a clear and distinct expression and flow of thought. It is generally considered best to have the museums established by the pupils themselves under the guidance of their teachers, aided by friends of popular education outside of the school. Care must be taken to proceed methodically, for it is not a question of preparing for exhibition some apparatus or objects of luxury or "curios," which must not be touched from fear of breaking or injuring them. The museum should contain those objects which illustrate the teacher's instruction; objects should be selected which cost little or nothing and may easily be procured by the pupils. The more the pupils participate in gathering the objects to be placed in the museum, the more intense will be the interest in the lessons, for every one wishes to view the objects his comrade has contributed. If these suggestions are followed the museum will be made by the school, for the school. It was a wise remark of M. Buisson when he said: "The great advantage of a school museum is, not in having it, but in making it."

In order that the objects brought to school be safely placed where they are protected from dust and remain visible and easily accessible, a good-sized cupboard with glass doors is recommended. In case the school authorities refuse to procure it, an appeal is made to a friend of the school, or to some wealthy parents of pupils. Such an appeal is rarely made in vain in France. In most schools a cupboard is used large enough to accommodate the juvenile library of the schools, as well as the museum of objects.

At first mistakes were made in getting school museums. Some teachers went too far in their zeal by collecting objects which stand in no relation to elementary instruction. Others, not intending to be surpassed, bought and procured more or less complete collections, instead of letting their pupils bring the objects as they were needed. It is evident that the true purpose aimed at was missed. Large museums which dazzle the eye of the children are injurious rather than useful in school; for since the children do not know all the objects exhibited they care little for them, and interest turns into indifference. Costly museums in which the "wonderful objects on exhibition" bear the label "Hands off!" are not in their proper place in the elementary school, which is to be a workshop for mental work. Neither will ready-made collections suffice: they serve for decoration more than for actual study.

However, these mistakes were soon rectified. The teachers now proceed methodically, generally classifying the objects according to the natural kingdoms. In Havre, one of the most progressive cities in France in educational affairs, another classification has been adopted. The school museums in that city are

divided into: (1) Objects of food; (2) objects of clothing; (3) objects pertaining to the dwelling; (4) miscellaneous objects. Each group has a number of divisions. This classification has recently been adopted by other schools, because it seemed more practical and suitable than the other, affording an easier finding of objects and also an easier cataloguing.

It goes without saying that the teacher is the chief custodian. He must not refuse a single object, in order not to hurt the feelings of his pupils. He must urge them all to bring objects for exhibition, so that they are able to say "our museum," not "the museum."

A chief characteristic of the school museum is that it is never complete. The pupils must know that there is always something missing. When, during geography lesson, for instance, it should be said, "Such and such a thing is needed to fill a vacancy in the museum," the pupils either individually or collectively procure it. Thus the museum remains an object of interest. Of course, every object found worthy of preservation is to be described, numbered, labeled, and placed in its proper compartment. The name of the donor may be attached, and this naturally incites further efforts. Many objects are collected during excursions which the teacher makes with his school into the country and the mountains, through factories, along wharves, and through parks. Thus it becomes possible to gather in these school museums all the objects illustrating the natural and artificial products of the town or village in which the school is situated. Commerce, various industries, agriculture, forestry, all are represented.

The law of July 27, 1882, prescribes for the elementary schools, "instruction in the elements of agriculture, horticulture, physics, and natural history." Though the mere rudiments is all that can be expected, the study of physics requires some apparatus. Some normal schools induce their students to get practice in making such apparatus themselves in their school workshops and then allow them to take these objects with them, if they are appointed to a teachership, to use them as a ground stock at their collection of apparatus. In the Grenoble Normal School every student is required to make a certain number of objects for illustrating the study of physics. The State pays for the material about 10 francs (or $2) per student.

To the legitimate contents of a good school museum belong pictures, charts, photographs, etc., for they aid instruction essentially. Generally, pictorial illustrations play an important rôle in French school instruction. Recently magic lanterns (solar and calcium light cameras) are used, owing to the active work of the "Society for Promotion of Object Lessons." These cameras are sold at very reasonable prices.

If the museums are thus provided with all the necessary and useful objects, selected according to pedagogical principles and local circumstances, an agricultural population will have a different collection in its schools from that of an industrial population, and a girls' school is apt to have a different collection from a boys' school. It goes without saying that the institution will be a prolific source of incentives to study.

The idea of school museums is not a new one. It was first carried out in Germany, but at present France has left Germany far behind in fostering and supporting the institutions. Victor Cousin once said: "The true greatness of a nation does not consist in not imitating others, but on the contrary, in borrowing good ideas from them and adapting them to the existing conditions of the culture at home." (After L. Fleischer.)

16.—National School Systems.

Argentine Republic.—When the Argentines freed themselves in 1810 from the yoke under which they had bowed for three centuries there was practically no education in the Republic. There certainly was a somewhat decayed university (for Spaniards and Indians) founded in 1622 at Cordoba, but its influence was as valueless as its work. The early history of the Republic was hardly favorable to the establishment of a regular educational system, but the clouds were gradually clearing away; and from the promulgation of the constitution of 1853, which received its final form in 1860, the progress of public instruction, until the temporary financial disturbances of a year ago, has been uninterrupted. There are 2 universities, Cordoba and Buenos Ayres (1821), 15 secondary schools, 35 normal schools, 2,396 primary schools, and 831 private schools. Primary instruction is free and obligatory for all children between the ages of 6 and 14 years of ages. Urban districts of between 1,000 and 1,500 inhabitants and rural districts of from

300 to 500 have a right to a public school. If the obligations laid upon the community by the state are satisfied by existing private schools, or by an individual family, there is no compulsion to attend the public schools. In such cases the progress of the children is regularly tested by the state by means of periodical examinations. If found unsatisfactory the aid of the law is invoked.

Besides the usual subjects of instruction in primary schools, it is worth noting that the Argentine curriculum involves instruction in morals and manners, hygiene, the duties of the citizen, and gymnastics. Girls are taught domestic economy and manual work; in the country lessons are given in agriculture. If a minimum of 15 parents claim religious instruction for their children the law authorizes the engagement of ministers of the different creeds for this purpose, the teaching to take place of the school hours. But the claim has never been advanced, so it may be said that instruction in the Republic is wholly secular. The administration of the schools is in the hands of a national council, guided by the minister of public instruction. Each province has a council with limited powers and each district a school council, generally composed of teachers, professors, and local dignitaries, the latter being appointed by the national council.

Hygienic inspection is undertaken by a body of doctors, under the direction of the Government. The teachers are as a rule trained in the normal schools; no one is allowed to teach in the public schools without the normal diploma, or if a foreigner without satisfying the authorities of the normal school as to his or her abilities, and in addition passing an examination in pedagogy. The teachers are allowed to retire after twenty years' service on their full pay at date of retirement; with three-quarters of their pay after fifteen years, and with half pay after ten years' service, or after accident or injury suffered in the service of the state. There is no corporal punishment. The hours are from 11 in the morning to 4 in the afternoon, broken by four periods of from ten to fifteen minutes each. The classes are not allowed to be larger than forty. Women are preferred to men as teachers, and where the schools are mixed there are only women employed; the head of the boys' schools is always a man, but most of the teachers are women. In 1888 there were 825 teachers—616 women and 209 men—employed in the capital alone. So much for primary instruction.

The oldest of the fifteen "national colleges," or secondary schools, was founded more than two hundred years ago; that of La Plata was founded in 1884. The secondary schools are under the immediate control of the minister, who appoints the principals and arranges the curricula. The principals only teach from four to eight hours a week, and after ten years' service may retire with half, after fifteen with two-thirds, and after twenty-seven with the whole of their pay as pensions. The boys on entry must have passed through the highest classes of the primary schools, or an equivalent, and on leaving they pass the baccalaurate examination; the whole course professes to be a complete preparation for the university. No Greek is taught, Latin is the subject of much dispute, and the whole level of the instruction given is very low. State scholarships have been suppressed, but a private association has founded eighty. There are 2,626 pupils at the schools, 927 of whom are at Buenos Ayres. In the capital there is a large foreign element in the faculties employed in secondary schools. The administration of the schools is in the hands of the national council, assisted by three superintendents.

The plan upon which the two universities are organized is uniform; there are only three faculties—law and social science, medicine, and physical and natural sciences. There is, however, a distinct feeling in favor of the establishment of a faculty of letters. The age of entry is 18, and the course is one of six years. Women are allowed to attend lectures in the faculty of medicine—one, in fact, recently took her M. D. with honors. (Lond. Jl. of Ed.)

Austria.—The latest data concerning the Austrian elementary schools are published by the Austrian statistical bureau. Austria had, in 1890, 3,335,674 pupils of school age (6 to 14 years); of these 21,895 could not attend school owing to mental or physical incapacity, while 365,593 normally endowed children were successfully withheld from being enrolled in school. The enforcement of the compulsory-attendance law made 185,464 judicial actions necessary; of these 68,590 were sentences imposing imprisonment of a few hours or days, while 116,874 imposed fines. Eighty-eight per cent of all lower schools in Austria proper, that is, the western half of Austria-Hungary, are for both sexes; 6.8 per cent were for boys only; 5.2 per cent for girls only; 12,465 schools were open all day; 3,210 were half-day schools, and 1,239 were partly half and partly whole-day schools. The number of male teachers was 44,838; that of female teachers, 13,913. The average number of pupils to the teacher was 72½. Eighty-three and

seven-tenths of the teachers were normal graduates, 11 per cent had only a diploma, and 5.3 per cent had not yet acquired their diploma. Of the 16,688 elementary schools more than one-half, or 8,400, were ungraded, 3,916 were divided into classes of two grades, and the rest up to six, seven, and eight grades.

Belgium.—The School Guardian (English), says of Belgian primary schools: "The buildings are two stories high, having a gallery on the first floor running round the quadrangle. Each class has its own separate room, lofty, well lighted, and ventilated, but only from one side. The furniture consists of small tables and benches, each sufficient for two or three scholars, and all facing the slightly raised platform for the teacher's desk. The tables have slates fixed horizontally in them. Blackboards are carried around the walls with compartments for the use of each scholar, on which he copies with chalk the sums or geometrical figures or sentences dictated to the class. This is done with a view to enabling the master or mistress to see at a glance the work of each without having to pass round the room. In this way, too, the children have the advantage of a change of posture and find relief from the monotony of the lesson. The teaching is in all cases simultaneous. As no reading is taught in the 'Jardins d'Enfants' or Infants' Schools, the lowest classes have to learn the letters and their simplest combinations. These they enunciate together, and great pains are taken to make them give each letter and syllable its full and correct sound. Writing is learned from a copy set on the blackboard. A round, vertical hand is taught without any distinction between the up and down strokes. Elementary drawing is obligatory in all the primary schools, and is taught by the ordinary teachers, who have no difficulty in teaching it, having practiced it in the normal schools as well as previously in their own school days. Some ordinary object is put before the class or drawn on the blackboard * * * ."

Bolivia.—Bolivia has four universities. The following figures are given for 1888: Primary schools, 506, with 707 teachers, and 24,583 pupils, of whom 8,822 are girls; secondary schools and colleges, 22, with 2,234 pupils; 774 students of law, medicine, and theology, with 55 professors in the universities. The Government's contribution to public primary schools in 1883 was 43,900 bolivianos.

Bulgaria.—In 1890 Bulgaria had 3,844 elementary schools, with 129,777 boys, and 42,206 girls as pupils. The total number of boys of school age is 275,756; of girls, 261,968. For education the state grants a yearly subvention of 2,000,000 lev. Education is free and nominally obligatory for a period of four years. About 81 per cent of the population can not read or write. There is a university at Sofia, with gymnasia in the principal towns, including four for girls, besides several lower middle-class schools. There is a free public library at Sofia. (Statesman's Yearbook.)

Ceylon.—The Buddists of Ceylon have taken a new departure. Hitherto their energy had been directed towards the welfare of the boys, for whom no less than forty schools had been opened within recent years under the auspices of the Theosophical Society. But it had been long ago pointed out by Col. Olcott that the Sinhalese girls should have a school of their own, where they might be brought up in harmony with their religious and national instincts. This idea was zealously worked out by a devoted Buddhist lady, Mrs. Weerakoon, and a band of her countrywomen, who, with praiseworthy activity, organized the Woman's Educational Society, now numbering over 1,800 members. Within one year this society opened four girls' schools—the Blavatsky school at Wellewatte, with about 100 children in daily attendance, and the girls' schools at Kandy, Gampola, and Panedura. (Lond. Ed. Times.)

China.—Education of a certain type is very general, but still there are vast masses of adult countrymen in China who can neither read nor write. There is a special literary, or lettered class who alone know the literature of their country, to the study of which they devote their lives. Yearly examinations are held for literary degrees and honors, which are necessary as a passport to the public service; and in 1887, for the first time, mathematics was admitted with the Chinese classics among subjects of the examinations. Recently, Western literature and works of science have been introduced in translations, and schools for the propagation of Western science and literature are continually on the increase. The principal educational institution for the purpose is the "Tung Wen Kwan," or College of Foreign Knowledge at Peking, a Government institution, where the English, French, German and Russian languages, and mathematics, astronomy, meteorology, chemistry, natural history, physiology, anatomy, and Western literature are taught by European and American professors, while the Chinese education of the pupils is intrusted to Chinese teachers. There are besides several colleges under the control of some of the numerous

Roman Catholic and Protestant missionary bodies at Shanghai and other parts where the English languages and lower branches of Western science only for the subjects of study. The Chinese Government has of late years established naval and military colleges and torpedo schools in connection with the different arsenals at Tientsin, Shanghai and Foochow in which foreign instructors are engaged to teach such young Chinese as intend to make their career in the army and navy off their country, Western modes of warfare, beside Western languages and literature. The Chinese newspapers have for several years flourished at Shanghai, and the success they have achieved has led to the establishment of others at some of the other treaty ports. (Statesman's Yearbook.)

Colombia.—In Colombia the religion of the nation is Roman Catholicism, other forms of religion being permitted, so long as their exercises are "not contrary to Christian morals, nor to the law." There are two universities and numerous colleges and special technical schools in the Republic. In 1889 there were 14 normal schools with 393 students, and 1,734 primary schools with 92,794 pupils. Primary education is gratuitous but not compulsory.

Costa Rica.—Education in Costa Rica is compulsory and free. In 1890 there were 300 primary schools with 15,000 pupils, besides 90 private schools with 2,500 pupils. In 1884 the number of children between 7 and 14 years of age was 27,245. In the budget for 1889–'90, $350,000 were devoted to education.

Denmark.—Elementary education is widely diffused in Denmark, the attendance at school being obligatory from the age of 7 to 14. Education is afforded gratuitously in the public schools to children whose parents can not afford to pay for their teaching. The University of Copenhagen has about 1,300 students. Connected with the university is a polytechnic institution with 20 teachers and 200 students. Between the university and the elementary schools there are 13 public gymnasia or high schools, in the principal towns in the Kingdom, which afford a "classical" education, and 27 modern high schools. There are five teachers' training colleges. Instruction at the public expense is given in parochial schools spread all over the country, to the number, according to the latest official statistics, of 2,940, namely, 28 in Copenhagen, 132 in the towns of Denmark, and 2,780 in the rural districts; with 231,940 pupils in all, or 123 per thousand of population. (Statesman's Yearbook.)

Egypt.—In a recent work on Egyptian education ("L'Instruction Publique en Egypte," by Yacoub Artin Pacha) is the following account of education that is pursued by the Egyptians—in fact, the education which has been in vogue with them for many centuries:

Reading and writing are the first steps taken by the child, who is at the same time set to learn a portion of the Koran by heart. As soon as he knows his letters and can read syllables he reads and writes the part of the "Koran" committed to memory, and so on, until the Holy Book is finished, a task generally taking 2 or 3 years. These exercises of the memory are carefully graduated according to the child's age and ability. Then comes the study of grammar, the rules being set in rhyme, a plan for facilitating the work of the pupil not confined to the Mussulman world. The study of grammar, logic, rhetoric, etc., takes 3 or 4 years. Then follow 8 or 10 years of commentaries on the "Koran," and after this period is completed the boy, who began at 6 or 8, is now, at 20 or 22, a full-blown *mondarris* (professor) or *cheikh* (doctor). Most children leave school at 10 or 12 to take up a trade; those who are intended for a profession or for business leave after the grammar course; only a few remain to pursue the higher course in religion and law. Of the latter some become *kadi* (judges) or *mufti* (lawyers); the rest become teachers. The ideal of the founders of the universities had been to preserve the language of the elect, the language of the "Koran."

Arabic was reserved as the language of religion, tradition, and law. Beyond these three subjects all other instruction was intrusted to foreigners, with the single exception of mathematics, which was in the hands of the Copts, who had distinguished themselves from early times as financiers. Mehemet Ali was the first to attempt to introduce European method into Egyptian pedagogy. In 1816 he sent a body of young Mamelukes to England and Italy to learn engineering, etc., and in 1825 he founded a school of medicine, restricted to Egyptian students. From 1826 to 1834 large numbers of young men were sent to France to complete their studies; and to the general spread of European culture, resulting from these wise measures of Mehemet Ali, Egypt owes her 50 primary and secondary and her 16 technical schools. A council of public instruction was instituted in 1836, but for 30 years the conservative influence of El Azhar was too strong, and progress was infinitesimal. Ismail Pacha undertook a general reorganization

of the educational system of the country, and founded schools of law, language, science, and art, and a normal school. Since 1885 progress has been as rapid as could be expected, as will be seen from the tables at the end of this volume.

A *modus vivendi* has been established between the state schools and the university and the divergence between the two systems is being gradually narrowed down. Artin Pacha looks forward, "patient in his impatience," to see the seed sown by the great political and intellectual regenerator of Egypt bearing its fruits; nor does he hesitate to express his belief that the "ancient and illustrious university mosque of El Azhar, animated by the scientific spirit which is urging us forward, will take its place by the side of its younger and more justly celebrated sisters, the universities of modern Europe, who have outstripped us in the past." The education of women is: First, religion, given by *chiekhs* or women teachers; and, second, domestic, *i. e.*, teaching, housekeeping, manners, embroidery, singing, and so on. Dancing, of course, is not a custom of respectable orientals. The age at which girls are married, viz, between 12 and 16, is a serious impediment to a complete system of instruction. Curiously enough, even the limited instruction given at present is partly due to the establishment of a midwifery school in 1836; the sages femmes were the partially innocent cause of the creation of a thirst for knowledge; at any rate they taught the elementary principles of hygiene in countless native families and this widening of the horizon was productive of immediate good.

France.—M. Antoine Albalat, in an article in the *Nouvelle Revue*, draws a most harrowing picture of the results of the purely theoretical educational system, which, until a few years ago, was looked upon as a panacea of all evils. France, nowadays, he says, is nothing but a large civil-service employment agency. And the struggle for life with us means the race for government and other posts. Thanks to political equality and free education, which have reduced all to a dead level, the French nation, once so fertile in ideas and so original, threatens to become nothing but a nation of civil servants and pedagogues. Just count the number of place seekers! The prefect of the department of the Seine published a few months ago the following list of vacancies and applicants in that department: Junior clerks, 4 vacancies, 4,398 applicants; male teachers, 42 vacancies, 7,139 applicants; drawing masters, 3 vacancies, 147 applicants; custom-house clerks, 165 vacancies, 2,773 applicants; surveyors, 1 vacancy, 1,338 applicants. The civil service, the post-office, the telegraph office, and the schools have all greatly increased their teaching force, and they are at present the bane of our country. France may be roughly divided into those who hold positions and those who seek them. The vast majority of Frenchmen have only one dream, to be kept by the state, to live on the public taxes. Parents have no other ambition for their children—the civil servant, the young man who draws Government pay, is their ideal son-in-law.

Even the sons of the soil are streaming into the towns, be it only to sit behind the pay desk. But the women are more to be pitied. In default of marriage, they are seeking work, especially as teachers. But how soon they are undeceived! Read the bitter plaints with which they continually fill the ears of the minister of education. The state promised them a peaceable, respectable life, with a secure income; and thousands of them are without positions, on the verge of despair, and fall an easy prey to temptation. No one will ever know the number of these victims of arithmetic and French history that are swallowed up by the great gulf of vice. "I know nothing more sad than this," exclaims M. Albalat. Here is the result of our theoretical, Utopian, and modern education! We talk of a fourth estate. There is a fifth estate, namely, the women who have to earn their living by their brains. (Lond. Jl. of Ed.)

Germany.—Prof. Weber, of Steglitz, near Berlin, who acted for some time as assistant principal in English schools, answers the question: "Do English schools deserve to be considered models for German schools?" in the negative.

"Any observant foreigner who has lived in England," says he, "even if only for a short time, must have been struck with the great self-consciousness of the Englishman, which quality is already developed to a high degree in the little boy. The Englishman is proud of the language of his country, of its riches, and of its institutions. As a consequence it is a common fault with him to depreciate other nations and to overrate himself and his own people. To this national self-reliance he adds a great love of individual liberty and self-dependence. He will not under any circumstances be deprived of them, either by the state or by the church, and he hates all bureaucratic ways, or, as he calls it, 'red-tape business.' Then he possesses a profound respect for the law and for the existing institutions of the state, as well as in general a true sense of religion, which sense is

greatly fostered and enhanced by his family life. Moreover, we find in the Englishman the singular inclination to ask first of all in everything he undertakes: 'Of what use is it?' 'Englishmen can not take anything easy,' says Karl Hildebrand in 'Briefe aus England,' 'neither can they take anything idealistically. They transpose everything at once into the practical. English idealism is always practical, in contradistinction to the German, which manifests itself in artistic contemplation.' To this practical sense the English partly owe their supremacy upon the seas, and we Germans, who but a short time since began to acquire colonies, may learn very much in this respect from the practical Englishman.

"These different peculiarities of the English character are distinctly expressed in the English schools; they exert a mutual influence upon each other and are mutually dependent upon one another.

"As the whole life of the Englishman is chiefly based on the principle of utility, so also in his school life he places this principle in the first rank.

"The average Englishman does not, as a rule, strive after knowledge if he does not see his way to make practical use of it; in other words, he does not pursue knowledge for her own sake. This principle is very dangerous and pernicious to the intellectual progress of a people, and it is not to be wondered that a notion or a true idea of the elements of science is unknown to the great masses.

"'For the language, literature, and the history of other nations,' Mr Brennecke rightly says, 'for efforts in art which adorn and cheer the inner life, the average Englishman, deducting, of course, amateurs, the upper 10,000, and specialists, have no time in life,' because, I add, he does not understand nor appreciate them. We Germans are, however, only too easily inclined to lay too much stress upon the scientific side of things, and in so doing to forget often the practical use of the results we obtain.

"The English system cares little about the acquirement of manifold knowledge by the pupils and the scientific treatment of the subjects, but it tries, before all, to fulfill two tasks: Firstly, to develop the physique of the pupil, to make him in all respects healthy and capable of resistance, and to harden him against physical and moral injury. This having been accomplished, the teacher's aim is to develop in the vigorous body an independent, firm character; he will accustom the boys to absolute truth, candor, and resoluteness; they must quickly and independently find the right thing and learn to execute. In a word, the English master educates; the German rather instructs.

"A great difference between English and German school arrangements consists in this: The English Government pays no attention to the higher and middle schools. An organization and superintendence of the schools by the state, as in Germany, does not exist; these schools are either a private commercial speculation or they have been founded by old and often very rich endowments or by corporations. The Englishman is far too independent to allow the state the right of prescribing for him the education of his children. But there are already reasonable Englishmen enough who believe that a firm organization of all schools by the state can do more for education in general than the doubtful trade of private schools, and they demand the same institution as in Germany. In Scotland state superintendence was introduced in 1885.

"Thus the state can give no prerogatives to schools, and that at least is very good, for the prerogatives given to our schools do a great deal of harm in hindering their free development.

"I will not, however, forget to mention that a certain supervision of schools is exercised in England by the press and literature, and the power of the press over the masses is much greater in England than with us.

"A certain uniformity in scholastic matters between the more superior public and even private schools is to be seen in the local examinations, which are held annually by the universities.

"Some secondary schools also submit voluntarily every year to regular examinations, for their own credit's sake, 'so as to give the world confidence in them.' But in comparison to a firm organization these examinations can be but a miserable makeshift. Mr. Raydt informs us that for some time there have been held regular meetings of school principals, which might, indeed, have a good influence upon the formation of a uniform plan of teaching; but why are the debates of these meetings not published, as in Prussia? By these means they would become of common service to every teacher. In this regard I can not sufficiently praise the reports of the school inspectors on the elementary schools inspected by them in their districts. These reports are printed in the Parliamentary papers and contain many interesting and useful points.

'It is the German elementary school work by which the English should learn how salutary is the supervision of schools by the state, and how they should especially reform their middle-class or secondary schools."

Guatemala.—Primary education in Guatemala is obligatory, maintained by the state, free and secular. The sum spent on education in 1887-'88 (ending June 30) was $525,625, of which $253,927 were for primary education. In 1887 there were 93,627 children of school age. At the end of 1889 there were, according to official statements, 1,327 primary schools of all kinds, attended by 47,907 pupils, and 66 higher schools, with 3,677 pupils. There were in addition 7 high and normal schools, with 1,185 pupils (315 females).

Montenegro.—Schools for elementary education in Montenegro are supported by Government; education is compulsory and free; there are (1889) 70 elementary schools, with 3,000 male and 300 female pupils. All males under the age of 25 years are supposed to be able to read and write. There is a theological seminary and a gymnasium or college for boys at Cettinje, and a girls' high school maintained at the charge of the Empress of Russia.

Hawaii.—The Kingdom of Hawaii (comprising eight large productive and thirteen small desolate islands), with 80,000 inhabitants, is of special importance for commercial intercourse between North America and East Asia. It is well known that the recently deceased King Kalakaua, in 1881, made an extensive tour through America and Europe. European institutions and therewith Christianity were introduced in Hawaii at the beginning of our century and special attention was given to education. The United States exert the greatest influence upon the administration of this Kingdom and covertly aim at the protectorate over the Kingdom. Its annexation on the part of the United States is only a question of time.

From the main island public education was diffused over the whole Kingdom in a comparatively short time. At the beginning of the second decade of our century the chieftain and his most distinguished subjects diligently studied reading and writing. This awakened everywhere the desire to learn these wonderful arts. The most able men among the adult students were sent as teachers to all parts of the country, and the throng to their schools was so great that in 1827 there were 52,000 persons studying in 900 schools, or more than half the number of the inhabitants were eagerly engaged in acquiring the elements of learning. In 1832 the number of natives who could read amounted to 32,000, of whom nearly all were also able to write. At present there is in operation in Lahainaluna a normal school for the training of preachers and teachers, who alternately devote themselves to intellectual and physical work, as the students earn their living by the tilling of a farm belonging to the institution. Manual work takes a prominent place in all schools of the little Kingdom. Education is obligatory for both sexes from 6 to 15 years of age (formerly 4 to 14). A peculiar feature is the regulation in force that anybody who can not read or write is prohibited from obtaining public office and also forbidden to marry.

The Kingdom is divided into twenty-three school districts, each of which is under the supervision of an inspector. This official superintends the management of the schools, both the instruction and the buildings and sites. He is required to furnish quarterly a report to the central authority. The school year has forty-one school weeks. The daily sessions are from 9 to 2 o'clock, with one or two intermissions. Sunday and Saturday are holidays. There are different classes of schools:

1. Primary schools (common schools), where the entire instruction is given in the Hawaiian language.
2. English schools, where the English language is the means of instruction.
3. Private schools, in which both languages are used.

The school at Lihue, on the island of Hawaii, in which German and English are taught, belongs to the third class and is attended by children of German workingmen only. For children of the aristocracy there is a kind of secondary school that took its name from the street in which it is situated, "Fort Street School." Protestant missionaries established near Honolulu, on the island of Qahu, the principal city of the country, the "Qahu College," after the pattern of French schools. Catholic missionaries also established schools whose textbooks are, with few exceptions, printed at Honolulu in the native language.

The direction of the entire educational system has been assigned to a "bureau" or "board," consisting of five members, of which three are natives who were educated in the country. The president, at present Mr. Bishop, was formerly secretary of the state department: previous to that, a member of the house of nobles and president of the legislative body. This bureau appoints the teachers and superintends the expenditure of the money appropriated by the representatives of the

people. It nominates a general superintendent for the whole educational system, who visits each school of the country twice a year to examine the pupils and the condition of the school. He reports to the bureau or board. In order to fulfill his duties the general superintendent is obliged every year to travel 800 miles on horseback and 1,600 miles by water. During the school year 1888-89, there were in the Kingdom 179 schools, 63 primary, 69 English and 47 private schools, with 8,770 pupils (4,952 boys, 3,818 girls), with a teaching force of 334 members (177 men, 157 women). At the last exposition in Paris, in 1889, there was on exhibition pupils' work from Hawaii, nearly all of which was expressed in good English and in pleasing form.

The educational system in Hawaii furnishes proof of how much one can do if stimulated by earnestness of intention. Scarcely sixty years have passed since the first pioneers of public education commenced their work in Hawaii, and already its public school system can compare with that of Europe.

The state, however, has easy sailing because it has the schools, and no obstacles are raised by the church, since religious societies and the clergy are excluded from the management of school affairs. (Freie päd Blätter.)

Hungary.—Count Albion Casky, the minister of public instruction in Hungary, has recently issued in the German language a synopsis of his annual report, in which he says that he considers professional supervision and a thoroughly trained corps of teachers the most important factors of progress in any school system. So far as figures can speak, certainly Hungary has made rapid progress during the last twenty years. The report shows a comparison between the state of affairs in 1859 and 1889, from which we cull the following items:

I. *Elementary schools.*—In 1889, 2,015,612 children attended school, while in 1869 only 1,152,115. In comparison with the number of children of school age between 1869 and 1889, an increase of attendance from 50.42 per cent to 80.65 per cent is recorded. While in 1869 1,598 communities were without any schools, that number had decreased to 244 in 1889. The number of schools in 1869 was 13,798; in 1889 it was 16,702. In 1869 the number of teachers was 17,792, while in 1889 it had increased to 24,645. The expenditures for maintaining elementary schools in 1869 were only $1,342,363, but in 1889 they amounted to $5,396,777. While in 1869 the state's subvention to elementary schools was only $14,556, it was $6,505,315 in 1889. The great increase recorded above is found only in those portions of the Kingdom inhabited by people of the Hungarian, German, and Ruthenian tongues. The attendance of Roumanian, Servian, and Slavakish children is in a rather backward condition.

II. *Secondary schools.*—The Kingdom has 180 secondary schools; that is, 151 gymnasia, or classical colleges, and 29 realschulen, or modern colleges. One hundred and thirteen are complete in their organization, while sixty-seven had not quite completed their organization, lacking the senior classes. The classical schools were attended by 36,367 students, or 83.3 per cent; the modern by 7,303 students, or 16.7 per cent. The minister remarks that the attendance in modern schools is increasing faster than in the classical schools.

III. *Superior schools.*—Concerning universities, technical and other superior institutions, the minister reports that the candidates for the profession of teaching and students of technical, agricultural, and military schools are increasing in number faster than those of the universities. In the universities he notices that the law faculties and academies are still overcrowded, as in former years, while the number of candidates for theology, medicine, forestry, and mining is decreasing. An interesting feature of the superior education in Hungary is this: The examination for graduation must be exceptionally rigorous, for of 877 candidates for the legal profession only 521 (that is, 59½ per cent) passed the examination; of 297 medical students, only 207 (or 69 per cent); of 140 students of the philosophic faculty, only 38 (or 27 per cent); of 210 students of the Polytechnicum, only 80 (or 38 per cent) passed.

Italy.—A new school for Italy is now under the consideration of the council of public instruction, and its provisions are foreshadowed in the "New Educator" of Rome. It is proposed to transfer the charge of the infant schools from the minister of the interior to the minister of instruction, and the age of compulsory attendance is raised to twelve years. The appointment of teachers is left in the hands of the communal boards. Teachers under 21 years of age will only be provisionally appointed; on coming of age their status will be improved, and at the age of 24 they will be recognized as fully responsible teachers. Thenceforth they will be removable only for grave offenses specified in the bill; their dismissal will have to be approved by the provincial board of education, and an appeal to the minister will probably be allowed.

School-inspector Gen. Pisani has recently published a book on the Italian schools which is designed to show what progress public education has made during recent years in Italy. The number of elementary pupils in 1889-90 was 2,102,615 (or 1,094,467 boys and 1,008,148 girls); this is an increase of 55,000 over the previous year. Of the sum total, 1,966,988 pupils were in public schools, 135,627 in private schools. The number of classes in the public schools was 78,675, hence the average number of pupils per class room was 25. The private schools had 8,791 classes, which is an average of 15 pupils per class room. The number of teachers, however, is not equal to the number of classes; it is only 41,336 for public and 5,063 for private schools. The number of teachers shows an increase of 1,500 over the previous year. It is evident that most of the teachers teach two classes a day. The hygienic conditions of the schools and the school furniture are said to be anything but satisfactory. The teachers are not well prepared for their profession and their standing in society is very inferior. The communal authorities are said to be irregular in paying their teachers. A law is being prepared which will protect the teachers from arbitrary action on the part of the local authorities, and securing the payment of a minimum salary by the state.

Japan.—The house of representatives in the new diet of Japan is extremely anxious to cut down the budget, and a conflict is imminent between it and the government on this subject. Its proposals are sweeping, and if carried out would cause no little consternation in the education department. The grant for schools would be reduced from $800,000 to about half that sum. Some five years since the late Viscount Mori, who perished by an assassin's knife on the day of the declaration of the constitution, just two years ago, established five great secondary schools in different centers throughout the Empire, to act as feeders for the university and to serve as a check on the growing congestion of students in the capital. These institutions are specially threatened by the parliamentary reformers, many of whom hold Spencerian views and dislike government control in education. Generally speaking, this is a critical time for education in Japan. The rising generation is growing up without those habits of instinctive obedience and reverence which characterized the previous civilization, and the capable teachers are all young and comparatively untried men. The question how to preserve sound morality and discipline in the schools is causing grave concern at headquarters. There is a conservative government at full flow just now; the demand for foreigners as teachers is at ebb, the schools in most cases preferring Japanese who can help them to translate. Foreigners have never been so unpopular since the great revolution.

There is a troublesome class in the capital known as *soshi*, a word which is difficult to translate so as to convey an adequate meaning. They are not students, though so described sometimes, but rather political unattached meddlers who would right all wrongs by use of the sword, sticks, and bombs. They profess to be intense patriots, and are certainly in many cases reckless of their lives and most deliberate in carrying out their plans. The only school in which anything of the *soshi* spirit has appeared is the secondary school of Tokio, some of the students in which have once or twice disgraced themselves. (London Journal of Education.)

Mexico.—The Pædagogium (Dresden and Vienna) of March, 1891, contains an interesting account of recent educational movements in our neighbor republic, written by a resident, whose name is withheld by the editor, Dr. F. Dittes.

For a number of years both the central government, as well as the officials of the separate states, have made praiseworthy efforts to promote public instruction, and particularly to bring the education of the masses to a level worthy our century, and by doing so to lift the degree of culture of the nation in morals, science, and material welfare, so that Mexico might occupy a place among the civilized nations of the world corresponding to its advantageous natural conditions and resources.

However, these efforts and the willingness to make grand sacrifices have not been crowned with the success which one would justly be entitled to expect, if the enormous sums are considered that were expended for the purpose.

The main causes of this lamentable fact are, the want of well-trained professional teachers; frequent misunderstanding of educational theories taken from foreign pedagogical works; the blind acceptation or rejection of new ideas, methods, and theories in accordance with the first impression; finally, the chaos arising from the fact that every state, however small it may be, and although all are subject to the same central government, has its own school legislation. Hence, in the preparation of teachers in the studies of elementary and secondary

schools there is no uniformity in the curricula, and from year to year, even within the course of one school year, changes are made which prolong or shorten the course. The student is obliged, under such circumstances, to lose time and means in order to adjust himself to the same conditions in case he moves across the border of his little state. More frequently he loses confidence in science and its teachers. The same chaos prevails in the philosophic fundamental principles according to which science is taught in the higher seats of learning.

While here pedagogy is taught after Herbert Spencer and psychology *a priori* after Jaime Balmes, at another place psychology is taught after Spencer and logic after Tiberghien; here flourishes the positivism of August Compte side by side with the rationalism of Krause and Ahrens, and again at another place we find the philosophy of St. Thomas of Aquino luxuriating under the shadow of Charles Darwin.

Orange Free State.—The system of education in Orange Free State is national. Small grants are also made to the Episcopal and Roman Catholic Churches. The government schools are managed by elected local boards, which choose the teachers, who are appointed by the President if he is satisfied with their qualifications. Education is not compulsory nor free, except for very poor children. In 1890, 17,000 livres was allotted to education, being a portion of interest on a capital of 200,000 livres set apart by the "Volksraad" for this purpose. In 1889 there were 49 government schools, inclusive of the two higher schools and the infant school at Bloemfontein, with 2,139 pupils and 74 teachers. Grants are made to private schools on certain conditions. In 1889 there were 14 such schools with 211 pupils. The Grey College, the highest school for boys, prepares candidates for the matriculation of the Cape University. There is a similar school for girls. (Statesman's Yearbook.)

Ecuador.—The religion of the republic of Ecuador, according to the constitution, is the Roman Catholic, to the exclusion of every other. Primary education is gratuitous and obligatory. There is a university at Quito and university bodies at Cuenca and Guyaquil. There are 37 secondary schools and 856 primary schools, with, according to official statistics, about 60,000 pupils. There is a scientific institution in Quito with 11 professors and 50 students. There are commercial, technical schools, and military schools.

Persia.—In Persia there are a great number of colleges (medresseh) supported by public funds, in which students are instructed in religion and Persian and Arabic literature, as well as in a certain amount of scientific knowledge, and many schools for children, while private tutors are very common, being employed by all families who have the means. A polytechnic school with a number of European professors, opened in Teherân forty years ago, has done much towards introducing the knowledge of Western languages and science into Persia. There are also military colleges at Teherân and Tabriz; but the bulk of the population are taught only to read the Koran.

Peru.—In Peru elementary education is compulsory for both sexes, and is free in the public schools that are maintained by the municipalities. High schools are maintained by the government in the capitals of the departments, and in some provinces pupils pay a moderate fee. There is in Lima a central university called "Universidad de San Marcos," the most ancient in America. Its charter was granted by the Emperor, Carlos V. It has faculties of jurisprudence, medicine, political science, theology, and applied science. Lima possesses a school of mines and civil engineering, created in 1874, with good collections and laboratories. There are in the capital and in some of the principal towns private high schools under the direction of English, German, and Italian teachers. Lima has also a public library with a rich collection, besides the one of the university and school of mines. There are two minor universities at Cuzco and Arequipa. (Statesman's Yearbook.)

Portugal.—In Portugal the superintendence of public instruction is under the management of a superior council of education at the head of which is the minister of the interior. Public education is entirely free from the supervision and control of the church. By a law enacted in 1844, it is compulsory for parents to send their children to a place of public instruction; but this prescription is far from being enforced, and only a very small number of children of the middle and lower classes really attend school. According to official returns of the total population at the close of 1878 the number of illiterate inhabitants in Portugal and its islands is stated to be 3,751,774, or 82 per cent of the total population, including, however, young children. The total school population in 1885 was 332,281. In the year 1887 there were 3,739 public primary schools with 179,089 pupils, and 1,608 private primary schools with 60,725 pupils. The total day school at-

tendance of 329,800 gave an average of 50.9 per cent per 1,000 inhabitants. For secondary instruction there were 22 lyceums with 215 teachers; 74 private schools and a royal military college with 272 students. For higher instruction there are (1887) the following schools and colleges: The University of Coimbra, founded in 1290, with faculties of law, medicine, mathematics, and philosophy, 774 students; the polytechnic schools of Lisbon, and Oporto, 354 students; the medical schools at Lisbon, Oporto, and Funchal, 286 students; a military and a naval school at Lisbon, an agricultural and veterinary institute at Lisbon, and a higher school of literature. For special instruction there are: The industrial and commercial institutes at Lisbon and Oporto with (1887) 1,222 pupils; 14 other industrial schools with 1,078 pupils, 4 artillery and 2 naval schools (corvettes) with together 314 pupils; and 15 teachers' seminaries with 3,838 students. The clergy are educated in 22 establishments, where most of them receive gratuitous instruction. Schools of agriculture are being established in various parts of the country.

The expenditure of the ministry of public instruction, according to the budget of 1890-'91, is 1,102,283 milreis, exclusive of 643,223 milreis to be expended through other ministries. (Statesman's Yearbook.)

Russia.—The Government is making strong efforts at Russifying the Grand Duchy of Finland. All the secondary schools have received a new course of study in which the Russia, language predominates. Thus the Baltic provinces with their almost exclusive German population and Finland with its Swedish population are to be made Russian provinces in fact as they are now in name. (Paed. Ztg.)

Roumania.—In Roumania education is free and compulsory "wherever there are schools," but is still in a very backward condition. There are about 3,000 primary schools with 130,000 pupils, or about 2 per cent of the population (in Great Britain the proportion is 12.3 per cent). There are 8 normal schools with 800 pupils; 54 high schools with 8,000 pupils; 2 universities (Bucharest and Jassy) with faculties in law, philosophy, science, and medicine, and having about 100 professors and teachers and 800 students.

Salvador.—Education is free and obligatory in Salvador. In 1888 there were 732 primary schools with 27,000 pupils; 18 higher schools (including 2 normal and 1 polytechnic school) with 1,293 pupils, and a national university with faculties of jurisprudence, medicine, natural sciences, and engineering, attended by 180 students.

In the capital is a national library and museum, and in the republic 13 newspapers are published.

Transvaal.—There are 10 English schools in Pretoria, and one or more in each of the other towns. According to the report of the acting superintendent of education for the year 1888, the sum of £24,987 was spent for the education of 5,475 pupils. In 1889 there were 28 village schools and 196 ward schools, besides a gymnasium with 173 pupils at Pretoria. The establishment of a university is contemplated and £20,000 were voted for the purpose by the Volksraad.

Santo Domingo.—Primary instruction in Santo Doningo is gratuitous and obligatory, being supported by the communes and by central governments. The public or state schools are, primary, superior, technical schools, normal schools, and a professional school with the character of a university. On December 31, 1884, when the last school census was taken, there were 201 municipal schools for primary instruction, with 7,708 pupils. It is estimated that there are now 300 schools with about 10,000 pupils.

There are several literary societies in the capital and other towns, and in the republic there are published about forty newspapers. (Statesman's Yearbook.)

17.—Pensions.

Scotland.—Glasgow has a scheme for the pensioning of teachers which it will be interesting for American leaders to study. The actuary has worked out the details with great care. It applies to all employés of the school board. There are six classes—headmasters, assistant male teachers, assistant female teachers, office staff, janitors, and compulsory officers. The first three classes only are considered in detail, and the assessments of salaries are made at the following rates: Headmasters, 8 per cent; assistant male teachers, 5 per cent, and assistant female teachers, 8½ per cent, the total amount of the capital fund required to be found at present being $300,000, or, including the other three classes, $350,000. There were in June, 1889, in the employment of the board 67 headmasters, ranging in age from 35 to 65; the average scale of salary ranging from $1,250 to $2,000

per annum. Of assistant male teachers, there were 216 who drew salaries ranging from $300 to $650, and averaging $465, and whose ages ranged from 20 to 59—only 6, however, being above 44 years. The assistant female teachers numbered 335, and the average scale of salary was from $250 to $450. Of these only 25 were over 40 years of age, the largest class being that between 25 and 29 years. Although, as a general rule, the rate of salary increases with age, that rule is not invariable. Among the female assistants the highest average salary is between the ages of 40 and 44, in which class the average is $455; and amongst male assistants the same class stands highest, with an average salary of $635. (Schoolmaster.)

England.—"It is indisputable," says the Birmingham Daily Gazette, "that a large percentage of school masters and mistresses would not be able to put by even a shilling a week without feeling the loss of it. In villages the salaries of mistresses range from $175 to $300 a year, and of masters from $200 to $350. It is by no means uncommon to find that on these earnings a man is keeping a wife and family, and, as is well known, it would be greatly to his disadvantage not to keep up the appearance of being fairly well off. To compel these people to make provision for old age is only to increase their present difficulties, and if any such scheme was adopted which required a pension premium, its operation would have to be limited to those cases in which fair salaries are paid. Take them altogether, teachers are not a particularly provident class, and considering that they are aware that old age and infirmity must disqualify them from performing their duties, it is remarkable that they so seldon think of the future and prepare to meet emergencies."

The leading exponent of the opinion of the Church of England has been turning to the subject of paying pensions to elementary teachers, and declares itself in favor of government interference. If one could "put back the clock" just 45 years to the time when licensed teachers were just being called into being, it would be easy, in the opinion of many, to say that each licensed teacher should pay $10 a year into a pension fund, to be met by a similar sum out of the Parliamentary grant, and thus secure a valuable sum, payable on death, should that event occur before the teacher has reached the age of 65, and an income of $200 a year forever afterward. And if some such rule had been adopted our English elementary teachers would now all of them be in the position of their fellow-workers in almost every continental European country, where, as Mr. Arnold testified, pension schemes for primary teachers are practically universal.

It is, of course, perfectly possible for Parliament (adds the Guardian) to enact such a rule in the case of all persons who in future shall join the ranks of the teaching profession. But what in the mean while is to be done with the 43,500 existing teachers for whom no such rule was made when it was possible for them to observe it? In the interest of education as well as humanity we plead for an early consideration of this question. Teachers who go about their tasks with a feeling of security as to the future will do infinitely better in their trying work than those for whom the future is a blank, unrelieved by any prospect but that of a cheerless old age in the workhouse. If the state assumed the whole responsibility for finding pensions at the age of 65 (still further contends the Guardian) for every licensed teacher, inasmuch as with the present total of 43,500 teachers there would probably never be more than about 6,000 over 65 years of age, the whole cost of pensioning those persons off at $200 a year would be less than a quarter of a million pounds. And what is a quarter of a million pounds (in this case $6{,}000 \times 200 = \$1{,}200{,}000$) for the worn-out teachers by the side of the £2,000,000 a year with which Parliament has just endowed the parents of elementary scholars?

18.—Psychology.

Synopsis of "Historical Sketch of the Idea of Apperception."—(1) Leibniz, who first used the term "apperception" gives it the significance of consciousness or distinct, conscious conceiving, coupled with remembrance, in contradistinction to weak perceptions which make impressions on the senses, but not in consciousness; and again he defines it as an act of taking hold of the contents of a concept by arbitrary attention or as a reflexive cognition of our inner conditions, or, in short, as self-observation. Apperception with Leibniz has the characteristic of spontaneity, only dependent upon the determinative influence of the existing—*i. e.*, accumulated—contents of the soul.

(2) Kant finds that the sense impressions and inner emotional experiences offer the raw formless material of cognitions. With the aid of imagination these cog-

nitions are fitted into forms of space and time already existing in the soul. But in order that they may obtain the significance of concepts, certain innate pure notions of the understanding are added so as to connect them. He assumes the existence of certain categories grouped under the heads of quantity, quality, relation, and modality. As he assumes two sources of knowledge, (1) sensual and emotional experience which offer the material, and (2) our self-active interior which molds the material into forms, so he assumes two faculties corresponding with these sources: (1) the faculty to receive impressions, (2) the faculty to call forth representations. The former is termed "receptivity of the senses," the latter "spontaneity of the understanding." But previous to all this are, "a priori" the pure concepts of space and time, as well as the pure notions of the understanding which we add to the experience as something inborn. This spontaneous activity, which combines in self-consciousness the various impressions entering through the senses, is called "apperception." He also calls it "self-consciousness."

(3) Herbart thinks that every perception entering consciousness through the senses acts upon the concepts present as an irritant or stimulant, pressing back everything contrary to it and attracting all similar concepts. All concepts in consciousness are grouped, and a new perception induces new conditions among them, *i. e.*, fusing or arresting a fusion of concepts. It is like a light casting its shine all around upon the existing mass of concepts. The new percept in the center at first has a controlling influence, and attracts similar and repels dissimilar concepts. It joins those with which it establishes relation and is assimilated by them. At times it is so powerful that it changes the complexion of the already accumulated group of concepts which it joins. This assimilation of the new matter by concepts already existing is apperception, and hence Herbart finds no spontaneity in it. Even the categories (see Kant) are to him results of adjustment between the simple concepts and groups of related concepts. Searching for the conditions of apperception, he recognized and emphasized the importance of that residue or store of concepts acquired in the course of life; that is, its importance for the acquisition of new impressions and experiences. With that the definition of apperception as a resultant of gradual development of the mind is given.

(4) Lazarus claims that in the process of apperception two stages must be distinguished: that of action and reaction. The soul may react upon sense impressions in two ways: first, according to its original nature, then according to the nature acquired by its previous activity. In the former case the result is perception, in the latter apperception. Every perception is also an apperception; that is, a reaction of the soul filled more or less with the contents of former processes (concepts). The soul, as a sensible being, perceives according to its original nature, and it apperceives according to the elements acquired through earlier actions. An apperception is not added to complete a perception, but perception is formed under the assisting and essentially determinative influence of apperception. Hence, generally speaking, apperception may be considered as a reaction of the soul (filled with contents of former action) against outer and inner perception. He also calls attention to the importance of unconscious perception, as well as that of feelings and tendencies, moods and volition.

(5) Steinthal sees in apperception a result rather than an action. The new percept entering consciousness through the senses meets masses of concepts and thereby cognition is generated (that is apperception takes place). The new percept seeks, as it were, memory images of the same or similar objects of observation, being interpreted by them, measured, and put in rank and file, to speak figuratively. Like other philosophers he lays much stress upon the emotional action of the soul in facilitating or checking these processes of degenerating, which by him are termed apperception. The soul's contents consisting of well articulated groups of concepts and series of thoughts react with different force. Some groups which are reproduced regularly, such as one's professional ideas, apperceive more readily. That group always apperceives which either absolutely, or only in the special case, proves the most powerful. A chief condition for the relative power of the concepts is interest which causes attention.

(6) Waitz speaks of residua, remainders, that is, after effects of perceptions in the soul by which all subsequent conditions of the soul are modified. In earliest childhood a confused mass caused by simultaneousness of different impressions, apperceives all separate sense impressions; but in later years no pure and isolated perception can take place because the interior is always preoccupied by a greater number of remainders of previous processes with which the new perception has to make terms.

(7) Wundt, using a simile, says: The concepts which at a given moment exist in consciousness differ with regard to their distinctness. This fact may be compared with a similar phenomenon observed in the act of seeing. The pictures of outer objects which are formed on the retina are most distinct at the point called the focus. Their clearness diminishes more and more the farther away they are from that point. Taking consciousness as an inner seeing it may be said that all concepts present at one moment are within the field of vision, while only one is in the focus of consciousness. The entrance of an image into the field of vision he defines as perception; its entrance into the point of vision (focus) as apperception, and to bring it to that point a definite psychical action is necessary, namely this: The image being present with others in consciousness as a percept is seized upon and brought to greater clearness by attention. But attention is an act of the will. Hence, apperception is an act of volition, a determinative action of the will upon the concepts. The will being an inborn faculty makes apperception a spontaneous action. He briefly defines apperception as conceiving activity of the mind, the sum and substance of our intellectual activity. (After Lange's "Apperception.")

19.—Religious and Moral Education.

Netherlands.—At the annual general meeting of elementary teachers, held this year at Sneek, in Friesland, the president made a reference to the state of primary education, as affected by the revision of the school law in 1889. The revised act provides for State aid to voluntary schools, or, as they are termed in Holland, schools with the Bible. At first the gravest fears were entertained by all the lovers of enlightenment and progress that the act would be interpreted in the narrowest sense, as has been the case with a somewhat similar change in Belgium. But thus far such apprehensions have proved groundless. The president called the new act one of pacification. It had been honestly and impartially administered by the government. There were, however, still some defects to be remedied, the principal of which was the abnormal size of the classes in some districts. When one teacher had charge of sixty children, as was too frequently the case, all talk of intelligent teaching was mere mockery. (Lond. Jl. of Ed.)

France.—Several voices are being raised against the nonreligious instruction by the public elementary schools. M. Keller, formerly member for Belfort, adjures the Catholics to come to the rescue, and open schools in opposition to the public schools. "The time is not far off," he writes, "when all the public schools, like the high public offices, will be in the hands of the freemasons, and when the children will receive an education no longer neutral in its character, but downright bad in its tendency." He advocates schools of a more pronounced religious character, in which religious instruction shall have the first place, and in which all the books, classics, prize books, and recitation books included, shall bear testimony on every page to God and his wonders. No science must be taught that is not illustrated from a religious point of view. Statistics, however, do not give such a desponding account of voluntary schools. In 1878 there were 8,110; in the following year 12,426, and at present there are about 13,000 Catholic voluntary schools. (Schoolmaster.)

At the instance of M. Causeret, a school inspector at Poitiers, the prefect of the district has lent his sanction to a plan for encouraging the moral development of children by establishing permanent records in the schools of notable acts of courage or devotion performed by pupils of the school. The proposal is universally approved. One teacher enlarges on the desire for praise existing among children, and considers that the plan will "inspire the pupils with the love of that which is good," while another affirms that "the best definition of virtue is a roll of the virtuous." The promoter has decided to enlarge the original scope of his plan so as to include not only present pupils, but those old pupils who have distinguished themselves by obtaining a medal or a diploma of honor for any act of courage or devotion. It is hoped by this means to "arouse in the children and develop all those civic virtues which make the strength of armies." The children will be stimulated against the time when they are called upon to serve "la patrie" by the example of those who, upon the battlefield have performed some striking deed or who have died for their country. In establishing the record of the brave the following order of procedure is laid down: (1) When the inspector reports a special act of bravery, the prefect should present a board and a book of honor to the school; (2) the young hero's name is to be written on the board and the official record of his deed, after publication in the local official journal,

is to be duly inscribed in the book of honor; (3) the pupils who have secured a medal or diploma for an act of bravery, or whose military service may have entitled them to the cross of the Legion of Honor or a medal shall have their names inscribed on the board; (4) the names of old pupils who have perished on the battlefield shall be carefully preserved ,and, if possible, engraved on a stone or marble tablet conspicuously placed in the schoolroom. (Lon. Jl. of Ed.)

Germany.—The Prussian minister of education has reversed the decision of a provisional council and declared that children of parents who profess no religious faith are not to be compelled to attend scripture lessons in schools, even when they receive no religious instruction in gymnastics at home. Moreover, such children are not to be refused admission to high schools and normal schools.

20.—Salaries.

England.—In England, out of 12,087 head masters, only 357 (less than 3 per cent) receive salaries of over £300 ($1,500) per year; and of 16,308 head mistresses, only 449 (less than 2.8 per cent) receive over £200 ($1,000). The average salary is £134 (about $670) for head masters and £82 ($420) for head mistresses.

Germany.—A new scale of salaries for teachers of elementary schools in Germany has been adopted by the city government of Bremen. In the primary schools of the city the salary of a principal will be hereafter from $875 to $1,125; that of teachers from $375 to $750; the higher salary mentioned to be reached after eighteen years' service. In the country districts of the city (it must be remembered the free city of Bremen, like Hamburg and Lubeck, own a limited territory outside of the city limits, analogous to Washington and the District of Columbia) the salaries of the principals are slightly less than in the city, but those of teachers are the same as those in the city. The principal of the normal school in Bremen has $1,500, rising to $1,650 in seven years, the professors begin with $650 and reach $1,125 after twelve years.

France.—The principals of boys' primary schools who formerly, that is, before the great revival of public education, had only from $500 to $700 annually, now have from $820 to $1,060. The principals of girls' primary, who formerly had from $460 to $710, now have $580 to $910. The male teachers, who had formerly had salaries ranging from $340 to $480, have now from $520 to $720. The female teachers, who had formerly salaries ranging from $340 to $420, now have from $380 to $620. The city appropriation for 1889 for current school expenses was $4,944,881, while in 1871 it was only $1,920,179; and during the years 1871 and 1887 the city paid $17,000,000 for the erection and remodeling of school buildings. (Allg. Dr. Lztg.)

Spain.—The library of Madrid has published a general view of the delays in the payment of Spanish teachers. A large number have not seen for twenty years a third or a half of their salary. More than 25,000 teachers have not received their regular payments. In all, the sum due to teachers amounts to 3,055,033 pecetas, or considerably over $700,000. A teacher in Benjarin, Grenada, was owed 2,124 pecetas, but as he could not get any money he took to selling matches, while his wife and daughters sought positions as domestics. Many teachers have been obliged to receive public charity. Many have closed their schools, not having the strength to continue their work. A teacher in Torviczon, to whom the commune owed 6,000 pecetas, was shut out of the schoolroom because the proprietor could not get his rent. While she was able she had paid the rent, adding this to the amount due her from the Government. The report leaves one wondering if all the public spirit in Spain is confined to public school teachers. (Freie päd. Blätter.)

Germany.—The Statist. Jahrbuch für höhere Schulen states that normal school teachers are paid:

Salaries for normal school teachers for 1890-91.

Country.	Annual salary.		Country.	Annual salary.	
Prussia	$425	$675	Hessia	$450	$1,075
Würtemberg		775	Oldenburg	500	950
Anhalt	525	750	Weimar	475	750
Hamburg	500	1,350	Brunswick	450	900
Bavaria	570	1,200	Bremen	675	1,000
Saxony	575	1,125	Alsace-Lorraine	400	1,025
Baden	450	900			

It must be remembered that these are not the salaries of teachers of primary and grammar schools, but of normal and training schools. In view of that fact, Americans are apt to consider these salaries pauper wages.

In *Prussia* the average salary in the country is $256, in the cities $319. To these cash salaries should be added 20 per cent for rent and fuel, which are free to teachers. They either live in dwellings especially built for the accommodation of teachers or in lieu of a dwelling a supplementary payment is made; hence the salaries may be said to range between $300 and $370. Principals of buildings, of course, get more, between $400 and $800.

In *Saxony* the beginning is $190. If the school has more than forty pupils the salary is raised progressively to $323. Principals receive a minimum salary varying according to the population; thus in towns with less than 5,000 inhabitants, $450; in towns of 5,000 to 10,000 inhabitants, $563; in towns of more than 10,000 inhabitants, $675.

In *Würtemberg* the scale of salaries rises from $225 to $500.

Hessia gives its teachers in the cities of less than 10,000 inhabitants from $225 to $450, and in larger cities from $300 to $550. Women get between $225 and $450.

The minimum salary in *Bavaria* is $200, the maximum $211, according to the size of the town. To that is added an annual increase, according to length of service, which ends when $300 per annum is reached.

In *Baden* the communities are divided into five classes with reference to salaries: I, $195; II, $210; III, $240; IV, $270; V, $300. In large cities higher salaries are paid.

Here are mentioned a few cities of *Germany* with two columns, showing minimum and maximum salaries of teachers (not principals) of elementary schools:

Lübeck	$225	$800	Mayence	$482	$703
Bremen	225	821	Heidelberg	480	705
Mannheim	517	667	Darmstadt	420	600
Crefeld	450	667	Zwickau	371	700
Chemnitz	412	750	Brunswick	325	714

Karlsruhe, Duisburg, Osnabrück, Freiburg (in Baden), and several other cities pay like Brunswick. Others, notably the wealthier and larger cities, like Hamburg, Frankfürt, and Berlin, treat the teachers better. The minimum in Frankfürt is $430; in Berlin, $390; the maximum in Frankfürt is $850; in Berlin, $810. The rectors or principals in Berlin get from $795 to $971. In Frankfurt the principals are all on a level with regard to salaries, they receive $1,050. Dresden pays to teachers $484; to principals, $1,200. To all these sums about 20 per cent should be added for rent and fuel.

Basil averages $643; Zurich, $446; Geneva, $438; Neuchâtel, $388; Wallis, $369; Schaffhausen, $350; Glarus, $322; some cantons make additional payments.

In Belgium, minimum for teachers $240, assistants $200.

Law fixes the minimum for principals in *Netherlands* at $294, for teachers at $252, for assistants $169.

Salaries rise in Sweden from $140 to $168 within five years of service. In some localities teachers get $380.

The lowest salary in Norway is $185, the highest $400.

The lowest in Denmark is $224, the average is $280, in some localities $392 is paid.

Salaries in Greece are $16, $20, or $28 per month, independent of an annual sum of from 20 cents to $1 per capita of pupils.

In Turkey a monthly salary of $37 if licensed, but only $22 if without diploma.

Italy brings us back to low averages: $112 and $244, with an increase of 10 per cent every six years.

In Spain salaries range according to population: $111 is the minimum, $370 the maximum.

In Russia the average salary is $97 per annum.

Minimum salary in Portugal is $113 per annum and an addition for regular attendance. After the first six years an increase of 25 per cent of the minimum salary is given.

In England, of 15,243 male teachers only 211 had the minimum salary of $250. The others ranged between $250 and $1,500. Of 22,434 women 1,394 had the minimum of $200. The others ranged between $200 and $1,000.

In Scotland and Ireland substantially the same salaries are paid to teachers which are paid in England.

Of course the fact must be considered that the purchasing power of money is greater in Europe than with us, but even with due regard to that a teacher's salary may be said to be low in Europe. (Revue Pedagogique.)

21. Secondary Schools.

Germany—Classical and modern high schools.—The facts presented here are gleaned from secondary schools in Prussia only; but the lessons they seem to teach are applicable to other states of Germany, though there are fewer classical and more modern high schools in southern Germany, notable in Würtemberg and Baden.

On February 1, 1890, more than 100 classical high schools (secondary schools) of Prussia[1] had in their lowest grades less than 25 pupils each, or an average of 18. Of these 20 had only an average of 10 pupils in the "sexta" (lowest grade). The school in Lauenburg needed a teacher for 6 "sextaners," that in Münstereifel 1 for 7, those in Hadamar and Rheinbach 1 for 8, those in Gentheim and Marue 1 for 9, those in Attendorn, Dramburg, Otterndorf, and Riethburg, and other towns 1 for 10 pupils. All these schools are classical high schools or gymnasia, in which the ancient languages claim the lion's share of time and energy.

A different picture is presented when we look at the high schools without Latin. Where all circumstances are equal, that is to say, where the number of inhabitants and the industrial, professional, artistic, and commercial pursuits of the people are about equal, we find that the classical school has an almost empty "sexta," while that of the modern school without Latin is overcrowded.

A comparison of a few cities may prove this. Take, for example, the high schools of Lüdenscheid and Bockenheim. In these cities of equal size and similar conditions of life, we find that Lüdenscheid, with 15,000 inhabitants, has only 17 pupils in the lowest grade of its gymnasium, the classical high-school, while Bockenheim, with 17,500 inhabitants, does not show the relative number 20, but 58 pupils in the lowest grade; but then its high school is one without Latin. Even in cities that have both kinds of schools, the same fact may be observed. Emden, for instance, has 20 pupils in the lowest grade of its gymnasium, and 34 in that of the modern school without Latin, which school is only a few years old.

Precisely the same facts are noticed in larger cities, and they prove most convincingly that though the people turn away from the classical languages, they do not mean to desert higher education. Merseburg, for instance, has 16,800 inhabitants, but only 23 pupils in the lowest grade of its classical high school. But annually 190 boys in that city reach the age of nine years, hence might enter the high school (the course of which covers the years from nine to eighteen), but 167 of them do not. It is reasonable to suppose that many of them would do so if a higher school without Latin was founded. Compare this with Emden. This city has only 14,000 inhabitants, but 56 pupils in the lowest grade of its high school without Latin, or about one-third of the boys of that age in that one year.

Here is another instance: Memel has 18,800 inhabitants and only 23 pupils in "sexta" of the high school, which is a classical one. How many of such pupils it might have may be seen from Graudenz, which has 17,300 inhabitants but 113 pupils in the lowest grade of its high school without Latin. Görlitz has 55,600 inhabitants and only one high school, a classical one. It has 55 "sextaners," while Potsdam, with 51,000 inhabitants and a modern high school, has 175 "sextaners."

How little the gymnasia answer the demands of modern life is seen from the way the people are deserting them. The gymnasium at Memel had in 1882 49, in 1890 it has 23; that at Friedberg had in 1882 35, in 1890 it has 18; that at Gumbinnen had in 1882 40, in 1890 it has 17; that at Havelberg had in 1882 46, in 1890 it has 19; that at Marne had in 1882 25, in 1890 it has 9; that at Oldesloe had in 1882 30, in 1890 it has 16 pupils in the lowest grade. Since the number of inhabitants of these towns has not decreased, but, on the contrary, increased during the eight years mentioned, it is plain that the cause is to be sought in the schools and the trend of the time. "If these towns had high schools without Latin more boys would aspire to a higher education," says the Zeitung für das Höhere Unterrichtswesen. "Despite the facts set forth, the Government of Prussia aids the establishment of new classical high schools and discourages that of modern schools. This is seen from the fact that during the school year 1889-'90 eleven new classical schools have been opened and only one modern high school with Latin." (Ztg. f. d. höh. Unterrichtswesen.)

England.—"We think that the time has come when the state might usefully take some degree of responsibility for the entire educational system of the country. What the degree should be will necessarily be a matter for discussion

[1] Prussia has about 300 classical high schools gymnasia.

whenever action is taken; but we entirely fail to see why only one class of schools should have the advantage of Government examination and encouragement. There is no reason to doubt that most of the secondary schools of the country are doing excellent work; but there are also some which might do far better work than they are now doing, and many which provide an education but ill-fitted for the necessities of the day. In addition to this, education in the middle and higher class schools is terribly expensive, and we do not at all see why one section of the community should have free education provided for their children while all the other sections, which find most of the money, get no benefit whatever. Our present educational system is entirely a class system. It benefits one class only; but it is easy to see that there are great numbers of people, such as professional men, tradesmen, farmers, and persons of small independent means, who want help in the education of their children much more than the well-paid artisan or mechanic. The classes we have named find a large portion of the money now spent upon elementary schools, which are of no use to them, and paying so heavily as they do for the benefit of other people, they are entitled to ask for a little advantage to themselves. We may rely upon it also that they will be certain to get an advantage if they ask for it with sufficient persistency." (Nott. Daily Guardian.)

France.—M. Dupuy, in his financial report to the chamber on public instruction (France), set forth as follows the chief causes of the decline of colleges and lycées: (1) The increase in the cost of board and teaching; (2) the incessant change of text-books, and the expenses thereby imposed upon parents; (3) the constant change in the programmes and the method of teaching; (4) the general state of instability in these institutions, which causes discouragement among the teachers. But to these causes must be added another not mentioned in the report, namely, a growing dislike of the French parent for the whole system of barrack-like education in the secondary schools of France.

Germany.—In the Kingdom of Prussia the classical high schools (gymnasia) are so well patronized that there is one student of a classical high school to every 384 inhabitants of the entire population. How greatly favored these schools are generally may be seen from the following list of cities in which the ratio of population is less than 100: Kiel has 1 student to every 99 inhabitants; Halberstadt, 1 to 81; Munster, 1 to 63; Treves, 1 to 62; Stolp, 1 to 60; Hildesheim, 1 to 58; Tilsit, 1 to 55; Ratibor, 1 to 47; Murbury, 1 to 40; Padeborn, 1 to 29; Freienwalde, 1 to 27; Ostrowo, 1 to 24; Marienwerder, 1 to 21. The number of university students has increased in entire Germany from 17,631 in 1869 to 34,118 in 1888. While the ratio of increase in the population during the same period was only 20 per cent, that of the number of students was 100 per cent. (Paed. Ztg.)

The Berlin city council sympathizes in the feeling against the abolition of the realgymnasium, and has presented a petition on the subject. They point out that the 11 gymnasia in Berlin were attended by 5,569 pupils in December, 1890, the 7 realgymnasium by 3,951. Consequently, the realgymnasium has on an average 58 pupils more than a gymnasium. This number is all the more remarkable when all the attractions and privileges of the gymnasium are taken into consideration. Again, the decrease in numbers in the year was in the gymnasium 219, and in the realgymnasium only 26. (This decrease is probably due to the erection of higher Burgerschulen.) Finally, it seems very probable that when the realgymnasium is abolished the gymnasium will be considered the more aristocratic school, and that the great social danger of sharply defined class schools will arise. The petition closes with this request: "To preserve the realgymnasium, and give the graduates the right to study medicine." (Allg. D. Lztg.)

The mayor of Brandenburg, Herr Reuscher, has sent to the magistrates of all the 280 towns in Prussia in which only one high school exists a document in which he calls their attention to the resolutions arrived at by the school conference in Berlin of December last, and to urge upon them to join in a petition on the subject to the Emperor. "In the towns," he writes, "where the realgymnasia is called in question by the sweeping decision of the conference the city authorities have already taken steps to prevent an utter annihilation of these institutions. The numerous Prussian towns, numbering almost 300, which have only one high school have urgent need of understanding the import of the conference resolutions and of averting the danger which threatens their interests in the immediate future. Not only is the existence of the nine-class realgymnasia, the seven-class progymnasia, and prorealgymnasia threatened in these towns, but also the three upper classes are concerned, in which the number of the pupils "does not justify their existence." This, naturally enough, is very

often the case in small communities. In order to attain this end a petition has been drawn up demanding the introduction of a common six-class lower school for all kinds of schools, thus directly opposing the resolutions arrived at last December by the school reform conference. (Allg. D. Lztg.)

During the summer of 1889 the gymnasia (classical high schools) in the Prussian province of Silesia had 51 per cent Protestants, 34 per cent Catholics, 0.2 per cent other Christians, and 14.8 per cent Israelite pupils. The realgymnasia (modern high schools) had 64.4 per cent Protestant, 22.7 per cent Catholic, 0.2 per cent other Christians, and 12.7 per cent Israelite pupils. In the citizens' schools (middle schools without Latin) the number of Protestants was 71 per cent, that of the Catholics 13.6 per cent, that of other Christians 0.7 per cent, and that of Israelites 14.7 per cent. Or, taking all these high schools together, the number of Protestants was 56.5 per cent, that of the Catholics 22.8 per cent, that of other Christians 0.2 per cent, and that of Israelites 14.5 per cent. (Allg. D. Lztg.)

In Germany parents are obliged to determine early whether their sons are to pursue higher studies or whether they are to limit their education to the elementary branches, for the high school has its own "feeder" (elementary classes), and rarely takes its pupils from the public elementary school. Moreover, the parents must determine before the boys have reached their eleventh year whether they are to pursue a course which will land them at the gate of the university or of a polytechnical or other professional school. Once fairly started in their career, there is no return possible, except at the sacrifice of some years which they must waste in order to "adjust themselves" to the different conditions, should they or their parents determine upon a change. This inflexibility is the reason why in Germany so many "miss their natural calling." It is the effect of conditions arising from the differentiation in society. An aristocracy of birth, education, or wealth seems a necessity as long as a monarchical form of government is maintained. A monarch must needs have a pedestal, which is found in an ascending scale of society. Hence there is in Europe no such exponent of modern civilization as our common school, which is the most powerful leveler of social inequalities yet devised. While it lifts the lower strata of society, it also drags downward those standing on an elevation; and it is quite immaterial whether this elevation be a money bag, or a pedestal of culture, or a genealogical tree. (Z. R. K. in the Teacher.)

Dr. Viereck, of Berlin, maintains that the educated proletariat is due to the excessive privileges granted to the gymnasiums. He says, "The conclusion is irresistible that the root of the evil is to be found in our scholastic system, which treats the secondary school merely as a step in preparation for the university. The development of political and commercial conditions has had an unmistakable influence in greatly increasing the number of students preparing for a professional career. The force of competition has brought about a more efficient mental training among men of business; for those possessing it are able to succeed where those without it fail. All these influences have worked together to send more students than ever before to the secondary schools. And here lies the difficulty. The students, as a rule, do not select the kind of secondary schools best suited to their wants, but the gymnasium, because of the marked privileges conferred by law upon its graduates. As a result every profession is overcrowded, and thousands of highly educated young men are unable to earn a decent living.

It has finally been decided that the graduates of the Oberrealschulen of Prussia are to be admitted to the university study of mathematics, natural science, architecture, engineering, mining, and forestry, with the prospect of obtaining posts as teachers. Moreover, they are qualified as candidates for posts in the telegraph and postal service and naval architecture and machinery. Realgymnasia receive the same privileges. The final certificate from the Bürgerschulen will qualify for admission into all civil-service posts, instead of only for the lower legal posts. The right to the one-year military service will be so arranged that for the pupils of the nine-year as well as for the seven-year institutions the privilege is discontinued of obtaining the right through mere promotion into the Obersecunda without examination. In the future an examination conducted by a commissioner of the government will be held at the end of a six years' course, and the certificate for the one year's service will depend on this examination. (Lond. Ed. Times).

Secular Sunday Schools.

Germany.—Sunday schools (nonreligious) are found all over Germany (notably in Prussia, Saxony, Bavaria, and Würtemburg), Austria, and Switzerland. Their purpose is either (1) to give pupils who have left the elementary school an ad-

vanced grade of elementary instruction; also, in certain cases, to mend that which was neglected by absence from day schools, in cases of sickness, or otherwise; or (2) to offer technical instruction *ad hoc;* that is, for special purposes, such as preparation for trades, agricultural, horticultural, and commercial pursuits, domestic economy (for girls). The character of these schools varies in accordance with the varying industrial and economic conditions of the towns. While in the Erzgebirge, in Saxony, straw-weaving and metal work are taught, in Switzerland it is clockmaking and designing, while in Dresden and Leipsic, again, schools of languages for hotel waiters, and in Berlin commercial Sunday schools are established.

Both kinds of schools are called "fortbildungs-schulen" (continuation schools), really postgraduate courses of the "volks-schule." They are partly evening schools, partly Sunday schools. The statistical sources at hand fail to show how many of these schools are open on Sunday. Bits of information, however, may be welcome.

Prussia.—The Handwerker-Schule in Berlin had 16 Sunday classes in 1884. The industrial art schools (schools of design) in Rhenish Prussia and other provinces are all open on Sunday from 8 a. m. till noon, as I know from personal inspection. Gewerbe-museums (museums of industrial art). Also fine art museums are open on Sunday.

Saxony.—This is the only country from which exact, though meager, data are at hand, to wit: Trade schools open on Sunday, 13 out of 65. Those not open on Sunday for regular instruction have occasional lectures on Sunday. Technical continuation schools open on Sunday, 22 out of 28. Agricultural schools ditto, 2 out of 9. Commercial schools ditto, 1 out of 32. Many private Sunday schools not accounted for. While these may not be considered formidable numbers, it must be understood that the elementary continuation schools (postgraduate courses) are not enumerated because they belong to the regular day-school system and have the same teachers who teach in day schools.

Austria—(Cisleithania) had in 1889 122,968 pupils and 8,678 teachers in technical, trade, professional, and other special schools, but the official reports fail to state which are open on Sunday. As a matter of fact I know that many utilize the Sunday morning either for regular instruction or for lectures.

Würtemberg.—The 173 continuation schools in Württemberg had in 1890 12,271 pupils in arithmetic, 8,459 pupils in language and composition, 2,935 pupils in bookkeeping, 2,921 pupils in calligraphy, 10,705 pupils in freehand drawing, 4,531 pupils in geometrical drawing, 6,346 pupils in technical drawing: namely, 1,627 woodwork, 857 metal work, 3,410 various trades, 326 industrial art, 126 lettering. A great number of these are apprentices and study on Sunday. The city of Stuttgart alone has a Sunday technical school, with 27 teachers and 334 pupils (1890).

Hungary.—(Transleithania) had in 1889 62,220 pupils and 2,449 teachers in similar schools. Same remark regarding Sunday.

Switzerland.—Here the continuation schools and courses are attended by 34,817 pupils, partly regular Army recruits. Time not stated, but it is will known in Europe that Switzerland is famous for its secular Sunday schools, being a poor country.

Since most of the technical and elementary continuation schools (both evening and Sunday schools) are supported by societies, trades unions, and only rarely subsidized by the state, centralized official statements as to their attendance and course of study are wanting. (L. R. K.)

23.—Special Schools.

Switzerland.—The Royal University at Geneva is to open a school for practical training of travelers, giving instruction in geography, geology, botany, geodesy, and other subjects required to fit them to make scientific observations and intelligently form collections of natural objects in distant lands. Similar work was undertaken some years ago by the Royal Geographical Society of London and the Berlin Geographical Society, and arrangements are also provided in Paris for giving such instruction.

Germany.—A number of the professors in the technical universities in Prussia have published a counter declaration to the one issued on December 1, 1890, that the course of study in a gymnasium or classical high school was not a fitting preparation for the studies of a technical university. The supporters of the counter declaration are of the opinion that the Realschulen do not fit the pupils any better than the gymnasia for the technical schools, and that when certain

defects are removed both kinds of schools will be on a level. Among the supporters of this declaration are Profs. Müller, Jürgens, Damert, and Lüders, in Aachen; Jacobsthal, Dobbert, Schäfer, Hauck, and Wintergarten, in Berlin; Hase, Köhler, Stier, and Backhausen, in Hanover.

Industrial Schools in Europe.—In almost all of the manufacturing towns of Europe during the last half century schools have been opened for apprentices in the industrial arts. In Russia there are no less than 1,200 of these schools with 20,000 pupils. Among justly celebrated preparatory schools are found the Ambats school at Amsterdam, the technical school of Birmingham, Heriot's Hospital of Edinburg, and the St. Luc schools of Belgium. All agree that industrial education can only be really given in a workshop where teachers will be able to instruct pupils by means of practical demonstration and by sketches of design. At Birmingham and Edinburg pupils are admitted to technical schools, which are considered merely as a sort of primary industrial school, where very fine chemical and physical laboratories are at their disposal and in which they acquire a certain practice in preparation for industrial work. The general result is that at the end of their studies the pupils are engaged by industrial superintendents as future apprentices.

In Ireland there is another kind of preparatory schools, to which are admitted only children who have lost both parents, and who are destined for domestic or rural professions. They here receive primary instruction, some knowledge of science and of art, and a sufficiently complete manual training. These institutions combine the two characters of schools and asylums. Beside the primary schools there is a superior kind called industrial and technical. These exist for the object of giving to apprentices and workmen some knowledge of science and art, which will increase the financial value of their work. This is the complete theory and practice of the industrial workshop. Belgium has founded 36 industrial schools, in which are given every evening and on Sundays the elements of a scientific and artistic knowledge corresponding to the profession of those who frequent them. The number attending exceeds 25,000.

In both England and Belgium the number of pupils in proportion to the population is about the same; that is, 4.2 for each 1,000. But instruction in the United Kingdom is better than anywhere else; it has a more scientific and practical character on account of the well-equipped laboratories and workshops, which are placed at the disposition of the pupils. In Holland there are 32 industrial schools and 25 professional schools, attended by about 7,000 pupils. The proportion of these is about 2 to every 1,000; but Holland, so cut up by canals, and with the sea continually breaking bounds, is rather a maritime than a manufacturing nation, so that there is nothing surprising in this proportion as compared with that of Belgium. Switzerland has no less than 87 schools, giving to apprentices and workmen professional instruction. The pupils number 8,000. There are others said to be highly developed, where drawing is a branch of instruction. Thus, in one of the poorest cantons, that of Appenzell, institutions of that class are met in every community, and the attendance is as obligatory as the snows will permit. The industrial population of the cantons is 200,000 persons in a total of 2,846,000 inhabitants, and this balances that of Belgium, where metallurgic and other manufactures are carried to a high point of development.

In Denmark, a country of 2,096,467 inhabitants, there are 77 schools for professional instruction of workmen with more than 6,000 pupils. The technical school of Copenhagen alone numbers no less than 2,000. In Sweden there are 28 industrial schools; that of Stockholm has 800 pupils, more than one-half per cent of the population of the town. Italy, which in 1885 had 136 industrial and art schools, with 16,274 pupils, has since then made great progress; but she is suffering, as England sometimes suffers, from an excess of manufactured articles, and these must be disposed of at any price in order to avoid a ruinous embarrassment. The school at Hamburg, under the direction of Marius Vachon, is the best institution in Germany, both on account of the principles which inspired its creation and the methods of instruction. In entering there, if the pupil is neither an apprentice nor workman he must choose a trade; these two classes of pupils constitute the principal number of the school population.

A law of the Hamburg senate imposes on all industrial superintendents the duty of sending their apprentices to this school for six hours every week. They are thus enabled to attend during three, four, or even five years, according to their disposition and abilities. The first part of the first year is exclusively devoted to the study of the primary elements of drawing. All drawings must be made from nature. After that comes instruction from professional designs. As

soon as the pupil can sketch he is given as models the objects which belong to his trade. In succeeding years professional drawing goes hand in hand with artistic instruction. Each pupil receives instruction, personal, varied, and rapid according to his temperament and tastes. The discipline is very severe, so that a pupil becomes accustomed to conduct himself as a serious man and to consider work as a social duty. The Hamburg school has served as a model to the schools of design in various parts of Europe. (English Educational Press.)

The Prussian Government has recently, more than in former years, bestowed much attention upon the promotion of so-called continuation schools (post-graduate courses of the elementary schools), as well as trade and technical schools. This is plainly seen from the increase in the sums annually appropriated for these institutions. In the state budget of 1885–86 the sum of $142,266 was designated to support these institutions, which in the nature of the case are directly benefiting the working. In 1890–91 the appropriation rose to $431,716, and in 1891–92 to $445,274. The Government makes the announcement that it is not satisfied with the system of industrial schools as it now exists, but wishes to see it extended over most of the various trades and occupations found at industrial centers. Especially the continuation courses will find encouragement. Through these the Government can reach a much greater number of pupils than through special technical schools. Naturally the latter will be able to offer a higher grade of technical education, and in due time there will, side by side with elementary or people's schools, spring up at convenient centers a system of elementary technical or trade schools, that will feed the secondary technical schools.

The Government intends to establish new elementary architectural schools, devoted to the building trades—one in Königsberg; one in Silesia, and one in Brandenburg. The city of Cottbus is negotiating with the royal government to have one of these institutions located within its precincts. The bureau of technical instruction in the department of public works is of the opinion that to open schools for the training of foremen, and technical schools for the promotion of shipbuilding in Danzig, Stettin, Berlin, Hannover, and Altona, will prove of incalculable benefit to the nation. The Rhenish-Westphalian mining school it is contempleted to remove from Bochum to Duisburg, with branches and "feeders" in the coal districts on the Ruhr-River. Gleiwitz, in Silesia, another mining district also, is to have a new mining school. The existing weaving school of Crefeld and Berlin are to be enlarged, and new schools, with courses for the training of foremen and experts for the cloth and buckskin manufactory, are in process of erection in Sommerfeld, Forst, and Finterwalde, and other centers of the cloth industry. Malhausen, in Thurengia, and Bleichrode, near Nordhausen, are each to have an elementary weaving school. The negotiations with the city of Bunzlau, with a view toward the establishment of a ceramic technical school, have been reopened. For the training of engineers and machinists on ocean steamers schools are to be opened in Stettin and Bremen. In Schmalkalden a school for the preparation of foremen in the so-called variety ironworks is to be established. This institution will have extensive shops for a great number of apprentices.

Schools of design and industrial art the Government intends to establish in all cities of 33,000 or more inhabitants. Where one is in existence others are to be added. Prussia has, according to the last census, 49 of such cities. Of these the following have each a flourishing school of design and industrial art: Aix-la-Chapelle, Cassel, Dusseldorf, Halle, Magdeburg, Hannover, Frankfort, and Berlin. Berlin needs another without delay. But Danzig, Elbing, Bromberg, and Posen have made no claim for such schools. They lean rather toward agricultural and forestry schools. The plans so far determined upon contain 18 new schools within the next six years; others are to be extended. Institutions which have been called into existence by the enterprise of the local authorities are well subsidized by the state and enlarged to meet the growing demands of the times.

The state authorities direct in every case where a subsidy is granted that the teachers' salaries be increased and new talent be drawn into the schools. Whenever the funds allow, these technical schools are made state institutions. The entire state subsidies for the establishment of new and extension of existing technical and trade schools are estimated at 1,078,000 marks ($269,500); this sum is not included in the annual current expenses mentioned in the beginning of this article.

The administration of continuation schools (post-graduate course of elementary schools), so far as they are technical or trade schools, will be turned over to the minister of agriculture, since most of these schools are situated in rural districts, and it is the intention to enlist the interest of agricultural people in these schools.

The recently submitted bill regulating trades (especially §120) is thought to be the best incentive to trade schools, and it would seem that the state, by promoting such schools, is obeying tendencies which may drive it further and further toward socialism as advocated by Marx. As soon as the bill becomes a law, the annual appropriations for technical schools will need to be increased to meet the requirements of the law. From all this it is plain that Prussia if following the illustrious example of the Kingdom of Saxony in preparing a great number of thinking artisans, foremen, designers, masterworkmen, and inventors, in order not to fall behind in the race with other nations, notably with France, in industrial and wealth producing pursuits. (Engl. Educ. Press.)

24.—Superior Institutions.

Germany.—The number of students in the polytechnicums of the German Empire, in the winter term of 1890–91, was 3,567 as against 3,372 in the previous year; the number of nonmatriculated students, 1,273 as against 1,106; and the number of casual attendants at single courses of lectures, 522 as against 343; on the whole, then, 5,362 as against 4,821 attendants at lectures. Of these Aachen numbers, 197; Berlin, 1,640; Brunswick, 273; Darmstadt, 316; Dresden, 480; Hanover, 580; Karlsruhe, 585; Munich, 882; Stuttgart, 486.

Hessia.—The Hessian Government has laid a bill before the Landtag for the erection of magnificen tnew building, for the polytechnicum in Darmstadt. The cost amounts to $3,912,500. The town has offered to pay $3,000,000, and the Government will supply the rest. The Grand Duke has consented to the appropriation of a part of the palace grounds for the erection of the new buildings.

France.—The French minister of public instruction has issued a circular in accordance with which young men and women who are preparing for the profession of teachers, and for diplomas generally, are to go through a solid course of "sound French literature of the nineteenth century stamp." "This means," says a Paris correspondent, "that they are to give up the old classical authors from Montaigne to Chateaubriand, and to devote their attention in preference to Thiers, Michelet, Victor Hugo, and Alfred de Musset."

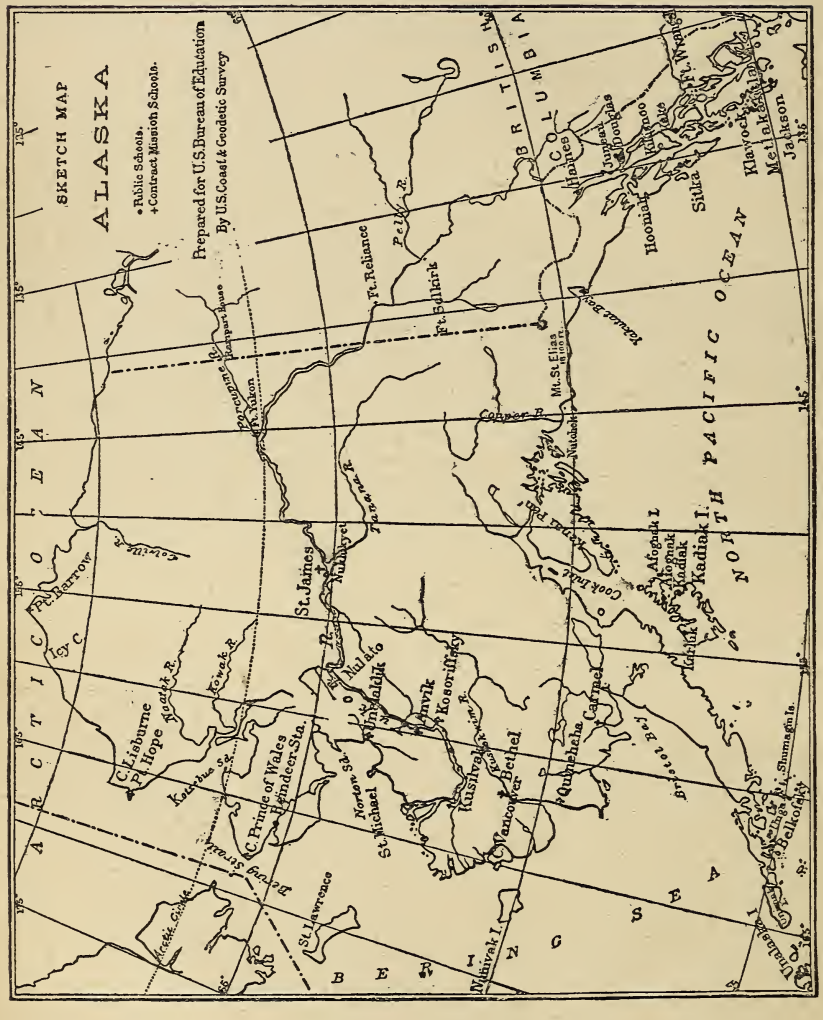
Saxony.—The theological faculty of the University of Leipzig, Germany, have, by desire of the minister of education, posted a notice on the university notice board, calling on the students of theology to attend lectures on pedagogy more regularly than they have hitherto done, and also not to neglect the practical side of their training. "A more thorough study of pedagogy and satisfactory practical training is more necessary to theologians now than it ever was."

Germany.—Latest statistics concerning German universities:

	Theology.	Law.	Medicine.	Philosophy.	Total.
Russia	10.9	10.4	17.9	13.2	52.4
Bavaria	9.3	30.6	16.8	11.7	68.4
Saxony	10.1	16.8	17.2	12.8	56.9
Wurttenberg	22.8	17.1	12.9	8.5	61.3
Baden	17.9	19.2	19.8	19.0	75.9
Hessia	10.9	23.3	23.3	22.0	79.5
Mecklenburg	16.5	16.3	23.1	18.5	74.4
Thuringia	16.1	15.4	16.8	18.2	66.5
Oldenburg	15.1	8.4	17.6	10.1	51.2
Brunswick	14.0	16.5	22.2	14.7	67.4
Anhalt	13.4	17.6	19.9	19.6	70.5
Hamburg	5.3	12.8	18.1	19.6	55.8
Bremen	12.1	16.2	30.6	31.8	90.7
Alsace and Loraine	5.2	6.0	8.5	7.4	27.1
Germany (average)	11.6	14.3	17.7	13.5	57.1

The foregoing table shows the ratio of students from the different German States for every 100,000 inhabitants. In other words, it tells that of every 100,000 inhabitants Germany has 571.10 in the universities, or 5.71 students of every 1,000 inhabitants, or 0.571 per cent. That of these, 0.116 per cent study theology, 0.143 per cent study law, 0.177 per cent study medicine, and 0.135 per cent study philosophy. The numbers are given for the winter semester, 1889–90. (Statist. Archiv.)

Algiers.—The Academy of Algiers had, in 1888, 223 students. In 1888 there were 1,547 pupils at the lycées of Algiers and Constantine; 8 communal colleges with 1,254 pupils; in 1889, 958 (113 private, mostly clerical) primary schools,



with 78,001 pupils; and 154 infant schools, with 24,354 pupils. There are 76 public primary schools for the natives, with 8,963 pupils (910 girls). Of the total children of school age (6 to 13) 611,720 receive no instruction; of these 535,389 were Musselmen.

25.—Teachers.

Prussia.—The proportion of female to male teachers in Prussia is very small. Of the 68,765 elementary teachers only 7,869 or 11 per cent are female teachers. In the private middle schools (private lower schools are very rare) 2,626 of the 3,459 teachers are women. Protestant Germany seems to have a much greater dislike to intrust women with teaching than Catholic Germany. In the whole of Prussia there are only 442 female teachers in the Protestant village schools, whereas over the same area there are 2,304 women teaching in Catholic schools. (Lond. Jl. of Ed.)

Berlin has at present in its public elementary schools 3,200 teachers, 2,182 men and 1,018 women. Of the men, 96.38 per cent had gone through a course of normal school training, 2.29 per cent were university graduates, and 1.33 per cent had prepared themselves privately and then passed the required examination. Three of the normal school graduates had afterward acquired a university education. Only 537 of these teachers were graduates of the normal school in Berlin, 1,640 came from other parts of the Kingdom of Prussia and 5 from other German states. Of the 1,018 women 883 were prepared professionally in Berlin, while 135 came from other parts of the kingdom. (Paed. Ztg.)

England.—Mr. Grasby, the English educator who recently so thoroughly examined the American school system, says of American teachers: "The special feature of the English teacher is technical skill in practical teaching; that of the American, an educated and cultured mind. The time one has spent in teaching or learning to teach the other has spent in study. The one has all along been subject to the influence of a narrowing occupation, and now oftentimes considers himself well-nigh perfect in his art; the other has been under the influences of a liberal training, is well versed in the principles of education, has had little practice in teaching; but is fully conscious of the fact, and therefore, ready to take advantage of every means to compensate for his lack. A conscious ignorance is often better than a self-satisfied knowledge. The average American teacher maintains better discipline with less force; is a superior educator, but less an adept than her English compeer in filling the pupil's head with facts."

CHAPTER XVII.

EDUCATION IN ALASKA.

REPORT OF THE GENERAL AGENT FOR THE YEAR 1889-90.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION, ALASKA DIVISION,
Washington, D. C., June 30, 1890.

SIR: In compliance with the rules and regulations for the conduct of schools and education in Alaska, approved by the Secretary of the Interior, April 9, 1890, I have the honor of submitting the following, as the annual report of the general agent of education for the year ending June 30, 1890:

A.—NUMBER AND GENERAL CONDITION OF THE SCHOOLS IN ALASKA.

Alaska has 15 day schools, supported wholly by the Government, with a total enrollment of 1,110 pupils; 9 contract schools, containing 302 pupils, which are supported jointly by the Government and the missionary societies; 10 mission schools, with an enrollment of 297 pupils, which are supported wholly from the funds of the churches, and two schools sustained on the Seal Islands by the North American Commercial Company, under contract with the Treasury Department, and containing 79 pupils, making a total of 37 schools and 1,788 pupils.

I.—PUBLIC SCHOOLS.

1.—UNALASKA DISTRICT.

Unalaska (John A. Tuck, teacher).—Enrollment, 30; population largely Aleuts.

Prof. Tuck reached Unalaska in September, 1889, and renting a house from the Alaska Commercial Company, opened school with an average attendance of 6 pupils. In the absence of any school building, one end of his residence was fitted up as a schoolroom. So much interest was developed in the school that the pupils, with but few exceptions, continued at school during the Russo-Greek Church festivals, which are very numerous. Among the pupils were the grown-up daughters of the Russian priest.

Prof. Tuck reports that the rate of progress was almost all that could be desired.

With the opening of the next school year it is expected that the ladies of the National Home Mission Society of the Methodist Episcopal Church will enter into an agreement with the United States Bureau of Education to take charge of the school, several thousands of dollars having already been raised for that purpose.

The building they propose to erect will be known as the "Jesse Lee Memorial Home."

Unga (John H. Carr, teacher).—Enrollment, 24; population, Russian and Aleut.

Gratifying progress was made in the usual school studies and in temperance hygiene by those who were regular in their attendance.

The teacher pleads earnestly for some rule to secure more regular attendance.

The ladies of the National Home Mission Society of the Methodist Episcopal Church have purchased and shipped to Unga the materials for a teachers' residence, to be known as the "Martha Ellen Stevens Cottage."

2.—KADIAK DISTRICT.

Kadiak (W. E. Roscoe, teacher).—Enrollment, 67; population, Russian.

At the solicitation of the parents, Mr. Roscoe commenced his school a week in advance of the regular time of opening. The progress of the pupils proved very satisfactory, and the attendance fairly so.

Much inconvenience resulted from the number of holidays of the Russo-Greek Church. These are more than 200 during the year, and they greatly interfere with the regular attendance of the pupils.

During the year the Government erected a comfortable school building, which was greatly needed.

Afognak (John Duff, teacher).—Enrollment, 38; population, Russian and Eskimo.

The Rev. James A. Wirth, who had taught the school from the beginning and was greatly beloved by parents and pupils alike, resigned on account of the health of his wife. His resignation was received so late in the season that there was no time to procure a teacher from the states, and Mr. John Duff, who was already in that region, was appointed.

School was resumed on the 3d of October with 16 pupils, the attendance increasing to 24 during the first week.

From the first many of the parents took an interest in the school and scarcely a day passed that one or more were not visitors.

Geographical exercises on the map were an unfailing source of interest: pupils that did not know half of their letters could point out the States of the United States and give their names correctly.

The ordinary school books speak of so many things that neither the children nor their parents have ever seen that it is difficult for them to understand what they are reading about. To remedy this somewhat Mr. Duff proposes to form a museum of common things in connection with the school and thus give the pupils object lessons in connection with their books.

An interesting feature of the year was the attendance of a number of children from outside villages.

The school has suffered greatly from intemperance, many of the children being on the verge of starvation because the parents had traded off the living of the family for liquor.

Frequently, in visiting his pupils, the teacher found them hungry and shivering in the corner of the room, and both the parents dead drunk.

A comfortable school building and teacher's residence were erected by the Government during the year.

Karluk.—A good school building and teacher's residence were erected during the year at this important point, and a school will be opened at the beginning of the next school year.

The number of villages of civilized Russians in this district requires many more schools than can be established with the amount appropriated by Congress for this purpose.

Professor Duff, of Afognak, estimates that there should be at least twenty additional schools in the Kadiak district.

3.—SITKA DISTRICT.

Sitka, No. 1 (Miss Ann D. Beatty, teacher).—Enrollment, 68, or one more than the total number of white children of school age in the village; population, American and Russian. Among the pupils of this school are the children of the civil and naval officials who are stationed at the capital of the Territory.

Sitka, No. 2 (Miss Gertrude Patton, teacher).—Enrollment, 83; pupils, native Thlingets.

With 280 native children between 5 and 17 years of age in the village, there ought to be some way of securing a larger attendance than 83. A simple obligatory attendance law would work a great improvement in school attendance among the native population.

Juneau, No. 1 (Miss Rhoda A. Lee, teacher).—Enrollment, 33; pupils, Americans.

This is one of the most advanced schools in the Territory. Year by year the public sentiment of Juneau is improving. More families are moving in, and the white school reaps the benefit of this growth.

Juneau, No. 2 (Miss Cassia Patton, teacher).—Enrollment, 51; pupils, natives.

The best portion of this school and the pupils that made the most rapid and gratifying progress in their studies were those that came from the Model Home,

conducted by Rev. and Mrs. E. S. Willard and their assistants, Miss E. Matthews and Miss Jennie Dunbar, of the Presbyterian Mission.

Douglas City, No. 1 (Mrs. W. S. Adams, teacher).—Enrollment, 50; pupils, Americans.

During the year a comfortable school building was erected by the Government. Owing to delay in its completion the school was not opened until the 1st of February, 1890. The opening of this new schoolroom for the whites allayed the friction of last year, when the children of the whites and natives were compelled to use the same room or not go to school at all.

Mrs. Adams reports that her advanced pupils, in addition to their ordinary studies, have taken up natural history, botany, and simple lessons in mental science.

Douglas City, No. 2 (C. H. Edwards, teacher).—Enrollment, 92; pupils, native.

Douglas Island being the principal center of the mining interests, many natives come from distant villages to secure work for a longer or shorter period. They are constantly coming and going.

This creates great irregularity in the attendance of the children and greatly increases the work of the teacher.

Killisnoo (Miss May Ransom, teacher).—Enrollment, 32; pupils, Russians and natives.

Wrangell (Mrs. Lyda McA. Thomas, teacher).—Enrollment, 84; pupils, natives.

During the year the chief of the village acted as special policeman to look after all truants from school. The result was good, securing greater regularity in the attendance and more rapid advancement in their studies.

Klawack (Mr. Henry C. Wilson, teacher).—Enrollment, 66; pupils, natives.

After the resignation of Mrs. Currie, in the summer of 1889, no teacher was secured until the following spring, when Mr. Wilson reopened the school on the 1st of May, 1890.

Jackson (Miss Clara A. Gould, teacher).—Enrollment, 87; pupils, natives. During the winter a number of parents moved into the village for the purpose of placing their children in school.

Metlakahtla (William Duncan, teacher).—Enrollment, 179; pupils, natives.

This school is of more than ordinary interest from the fact that this settlement is composed of Tsimpseans, who, a few years ago, came over in a body from British Columbia to Alaska in order to secure greater religious and political freedom.

Mr. Ivan Petroff, special agent for Alaska of the Eleventh United States Census, in his report to the Census Bureau, commenting upon the school attendance of the Sitka district, says: "Considering the nature of the population, widely scattered in small settlements, the showing of 1,049 scholars in attendance out of a total of 1,755 persons between the ages of 5 and 17 years is certainly a remarkable one. The number of natives speaking English does not much exceed that of the scholars enrolled."

II.—CONTRACT SCHOOLS.

1.—Sitka District.

Sitka Industrial Training School, Presbyterian (Prof. W. A. Kelly, principal with 17 assistants).—Boarding pupils, 164; natives.

Professor Kelly reports: "The past year has been one of marked progress, both in the schoolroom and in the industrial department. It is surprising how quickly the pupils learn English when deprived of their native tongue.

"Our school is distinctively coeducational. The boys and girls recite in the same classes, dine together in the same dining-room, and, under wholesome restraint, have opportunities for social intercourse.

"A few years of sedulous training have developed in some of our oldest pupils a spirit of emulation, a sense of personal responsibility, self-respect, self-reliance, and self-helpfulness which command respect. Most of our large boys, advanced far enough to read intelligently in the second reader, are learning a trade (all being in school half of each day and at work half a day), and the diligence with which they pursue their studies, the zest with which they enter upon industrial work day after day is most praiseworthy of them and encouraging to their instructors.

"All of the shoes for the pupils of our school are hand-made in our shop, under the direction of a competent foreman. Considerable custom work is also done.

"Our supply of barrels and half barrels far exceeds the demand, yet we con-

sider coopering an excellent trade for our young men. Owing to high freight, barrels are usually made at the fishing stations where needed, and coopers are in demand at those places.

"We are always pressed with work in carpentry. The variety and scope of work have proved a most valuable source of instruction to the boys, most of whom are aptly adapted to mechanical industry. The boys have made commendable progress during the past year. Young men who can do carpenter work fairly well can find opportunity to ply their trade in any of the villages of Alaska.

"We have eight model cottages, six of which are occupied by young married couples from the school. These young folks have been thrown entirely upon their own responsiblitiy and resources, and they are doing right well in earning a livelihood, while their houses are kept clean, neat, and homelike. The environments of family life among the young folk, in contradistinction to that in vogue among the natives, tend to create new conditions and inspire new impulses among their own people.

"The general work of the school, patching, mending, refitting, making new garments (aprons, towels, underwear, dresses), is no light task. Each girl 8 years old and upwards knits her own stockings, and the large girls find time to learn useful tidy work in order that they may be able to beautify their own homes with the work of their own hands.

"The girls are trained in every department of household industry, kitchen, dining-room, teachers' room, etc. Our girls numbering but fifty, the matron and her assistants find time to give each girl individual care in the details of housekeeping, thus gradually inculcating and developing a sense of personal responsibility.

"Our boys do the bread baking for the school, while the girls in turn are taught how to bake and cook for a family. This special instruction in the art of cooking is given in the teachers' kitchen, the cooking for the teachers and employés being done by our native girls. They are also trained to wait upon the table, and they serve the teachers and guests with grace and manners. Our young boys are also trained in our school kitchen and dining room.

"Our pupils, from the children to the adults, sing with a spirit and understanding that outrivals many of the public schools.

"Our brass band of 20 members dispenses music for the school and for the town on public occasions.

"We have a military company of 35 members. The guns were kindly loaned us by the governor of the Territory.

"Lessons in patriotism are constantly inculcated. The Alaskans are a loyal, patriotic people. Rev. A. E. Austin, the veteran missionary of the school, has charge of the religious and devotional exercises."

The time has fully come when a normal department should be added to this important school, and a beginning be made in training native teachers.

2.—Kadiac District.

As yet there is no contract school in this important district, but the establishment of one on Wood Island is urged by the teachers of the several day schools.

Prof. Duff, of Afognak, writes, under date of March 21, 1890: "We must have, and that very soon, an industrial school in this district, into which can be gathered and taught, the hundreds of orphans and neglected children. They are nearly all as white and as capable of improvement as the children of New England, or any other part of the country."

Prof. Roscoe, of Kadiak, writes, under date of September 29, 1890: "In every settlement through this part of the country may be found poor, defenseless children, clothed only in rags, with no one to provide suitable food or clothing, and living entirely on such charity as may be found among a heathen people. There are many destitute children, made so by the drunkenness and hence vagabond character of their parents. In addition to a kind of beer which the natives themselves make from sugar and graham flour, they succeed in buying large quantities of whisky from sailors and the more reckless class of traders. The salmon canneries are, generally speaking, a curse to the natives. The Chinese employés bring, or rather smuggle, immense quantities of "samshu" into the country, and peddle it out to the natives. In the Aleut settlement of Afognak, the natives have sold the very fur bedding from their huts to obtain this vile stuff. The winter is upon them, and until recently they had been so demoralized with liquor that they had not laid in the usual winter's supply of dried fish, their main subsistence. Without money and provisions and cloth-

ing, what misery and want will there be in that village this winter, all because of intoxicating liquor!

"White hunters, recently arrived from the westward, tell me it is the same out there. The natives are demoralized by drink. Now, the future of this race is that, practically, they will perish from off the face of the globe unless they are Christianized—and that soon. It is a fact that the children do not generally show this terrible craving for strong drink. The pupils of my school are ashamed of their parents' drinking, and we never see them drink any. It seems, therefore, to be rather an acquired habit than an inherited appetite. It is only right and just that our Government take orphan children and inebriates' children and put them in a good industrial school under religious teachers, who, in addition to moral and intellectual training, will teach them the cultivation of the soil, the rearing of cattle, sheep, hogs, and poultry, the elements of some of the mechanical arts; and the girls the arts of sewing and cooking. Such a school can be and should be established in this vicinity."

The establishment of such a school is under consideration by the Woman's American Baptist Home Mission Society.

3.—Unalaska District.

The great distance of this district from the Bureau of Education, its remoteness from a post-office (2,500 to 4,000 miles), and its inaccessibility, portions of the field having communication with the outside world but once a year, have led to the very general establishment of contract schools in this section of Alaska. In these schools well-known missionary societies share with the Government the expense and responsibility.

Unalaska.—The ladies of the Woman's Home Missionary Society of the Methodist Church are raising funds for the establishment of a school at this point.

Carmel (Moravian, Rev. Frank E. Wolff, principal, with 4 assistants).—Boarding pupils, 20; day pupils, 15; Eskimo. Of the boarding pupils 14 were boys and 6 girls. It is expected that additional buildings will be erected by the opening of the next school year.

Bethel (Moravian, Rev. J. H. Kilbuck, principal, with 4 assistants).—Boarding pupils, 30; day pupils, 9; Eskimo.

With regard to the school, Rev. J. H. Kilbuck reports, under date of May 28, 1890: "This past school year has been our best, more scholars having been enrolled, and in consequence a better average attendance.

"The great drawback we find to be the running back and forth of scholars to their homes, which is not conducive to progress. We are compelled to acquiesce at present in order to hold scholars who have parents. The orphans, of course, we have full control of, and we keep them steadily at school.

"The migratory habits of the people are the root of irregular attendance. The parents as a rule take out their children to help them in getting food and fur. It is only during the season of rest that we can hope to keep a large number of scholars. Of course it is absolutely necessary that the boys be trained early to get their living, hence we can not seriously object to the parents taking their children for this purpose.

"There are instances where parents send their children to school for the sole purpose of having them clothed, and then take them away after a short stay. This, however, never occurred before this year, and we will see to it that it will not happen again.

"As regards behavior we can not complain. There was a case or two of immorality, but severe and speedy measures soon put an end to that, and the general conduct of the boys has been more manly. Several of the boys have been taking music lessons during the year. They have made reasonable progress under the teaching of Signor Weber.

"From the reports you will see that brother Weber has taught the school all winter. Whenever I was at home I kept the boys in in the evening, when I would give them general instruction in descriptive and physical geography and physiology. These evenings were pleasant to teachers and scholars, and many of the latter took a deep interest in the lessons.

"In speaking English the boys, as a rule, make but slow progress. We will have to resort to compulsory measures before they will take up English in earnest.

"As in other years, the boys help in fishing, getting wood, and sawing and splitting firewood, and in general work they are quite a factor. As play is more pleasing to boy nature than work, it sometimes takes a good command of patience to keep them busy. The boys learn to get their food, as they supply us

with fresh meat during the winter and spring, with the aid of snares, powder, and shot, and traps."

Anvik (Episcopal, Rev. John W. Chapman, teacher).—Day pupils, 35; Indians.

During the summer of 1889, the school room was furnished with desks for 24 children, which to the gratification of the teacher, were filled. The progress of the scholars proved most satisfactory.

Rev. O. Parker writes, in connection with this school: "In closing this letter, I would say that both Mr. Chapman and I are still of the opinion that a boarding school is a necessary thing for the more successful carrying on of this work, and though we realize that a common school education should underlie all instruction in other branches, yet we feel it all necessary that mechanical branches should be taught as soon as possible. Perhaps a dozen boys' chests of tools and three or four sewing machines would enable us to make a beginning in that direction."

Kosoriffsky (Roman Catholic, Rev. P. Tosi, principal, with 6 assistants).—Boarding pupils, 29; Eskimo.

Nulato (Roman Catholic, Rev. A. Robaut, principal).—No report received.

Kingegan (*Cape Prince of Wales*), (Congregational, Messrs. H. R. Thornton, of Hampden Sidney, Va., and W. T. Lopp, of Valley City, Ind., teachers).—Population, Eskimo.

The teachers report: "The natives are peaceable, friendly, and intelligent, instead of ferocious, hostile, and stupid, as we were led to expect. We do not now entertain any fear of violence from them, and they already seem attached to us. In appearance they are a fine-looking set of people—robust and healthy—something like very good looking mulattoes, but with better features, and often brilliant color. In school they show as much intelligence as white children would under similar circumstances. We have now 65 pupils enrolled, although five-sixths of the population are absent on trading voyages. In fall, winter, and spring we think we shall have at least 300 pupils. This is the largest settlement on the coast and would form a valuable center of missionary work for the neighboring settlements at Port Clarence, the Diomede Island (middle of strait), Kotzebue Sound, Kings Island, etc.

The children are very sweet and attractive. We have never seen any signs of a fight or even a quarrel among them; nor have we seen any of them show any inclination to disobey their parents, a most remarkable fact, we think.

Point Hope (Episcopal, Mr. John B. Driggs, teacher).—Population Eskimo.

Point Barrow (Presbyterian, Mr. L. M. Stevenson, of Versailles, Ohio. teacher).—Population, Eskimo.

These last three schools are in Arctic Alaska, and will be noticed more at length later on in the report.

III.—OTHER SCHOOLS.

Unalaklik ("Swedish Evangelical Mission Covenant in America," Messrs. Axel E. Karlson and Aug. Anderson, teachers).—Pupils enrolled, 40 (31 boys and 9 girls); Eskimo.

Yakutat ("Swedish Evangelical Mission Covenant in America," Rev. Albert Johnson and Rev. K. J. Henrickson, teachers).—Population, Thlinget; pupils 30.

Nuklukahyet ("Church Missionary Society," London, England, Rev. and Mrs. T. H. Canham, teachers).—Population, Athabaskan Indians; pupils, 40.

This school was established in the summer of 1888, and has been taught in the Indian tongue. Drawing all of their supplies from England by way of Hudson Bay and across the continent by dog train the teachers have been much hampered by the want of suitable books and other facilities. Arrangements are in progress to transfer this mission to the Protestant Episcopal Mission Society of the United States and reorganize the school on an English speaking basis as one of the contract schools of this department.

Hoonah (Presbyterian, Rev. and Mrs. John W. McFarland, teachers).—Population, Thlinget; pupils, 126.

Juneau (Presbyterian, Rev. Eugene S. Willard in charge with 3 assistants).—Attendance, 21 Thlingets.

This is a home where these children are taken from their parents, or received as homeless waifs, and lodged, fed, clothed, and trained as in a Christian family. It is a practical exhibition of Christian philanthropy, and is accomplishing much good.

Juneau (Roman Catholic, Sisters of St. Ann, Sister Mary Zeno, superior, with 2 assistants).—Attendance, 40; mainly white children.

Douglass City (Friends, Mr. and Mrs. S. R. Moon in charge).—No statistics received.

Jackson (Presbyterian, Mrs. A. R. McFarland in charge with 1 assistant).—This is a home similar to the one at Juneau.

St. Paul Island (North American Commercial Company, Simeon Milevedoff, teacher).—Population, Aleut; attendance, 50.

St. George Island (North American Commercial Company, Dr. A. L. Noyes, teacher).—Population, Aleut; attendance, 29.

This and the preceding school on St. Paul are the two that are maintained on the Seal Islands in accordance with the terms of the lease issued by the U. S. Treasury Department.

Through the influence of the priest of the Russo-Greek Church, the people are reluctant to have their children learn the English language.

Mr. Charles J. Goff, Treasury agent in charge of the Seal Islands, writes in his annual report to the Department: "Mr. Milevedoff was energetic and untiring in his efforts to advance the pupils, but there is very little interest taken by them in English speaking schools, so that there was but little progress made."

Russian.—In addition to the above are a number of Russo-Greek parochial schools, supported by the imperial Government of Russia, which will be enumerated in the tables of school attendance.

The statistics of these schools have been furnished by Mr. Ivan Petroff, special agent for Alaska of the Eleventh Census.

B.—Rules and Regulations for the Conduct of Schools and Education in the District of Alaska.

During the winter of 1890 the rules and regulations for the conduct of public schools in Alaska, approved by the Secretary of the Interior, June 15, 1887, were revised and amplified by the Commissioner of Education, and approved by the Secretary of the Interior, April 9, 1890, and are as follows:

By virtue of the power conferred upon the Secretary of the Interior by act of Congress of May 17, 1884, authorizing him to make needful and proper provision for the education of children of school age in the Territory of Alaska, without reference to race until such time as permanent provision shall be made for the same, the following rules and regulations for the government of the public schools in Alaska are hereby promulgated:

GENERAL MANAGEMENT.

SECTION 1. The general supervision and management of public education in Alaska is hereby committed to the Commissioner of Education, subject to the direction and control of the Secretary of the Interior.

SEC. 2. The Commissioner of Education is authorized—

(*a*) To appoint district superintendents and local school committees.

(*b*) To establish common schools in every settlement where there are children in sufficient number, and at least one school in every tribe or large settlement of the natives.

(*c*) To enter into agreement with missionary societies for the maintenance of boarding and industrial training schools, especially among the wild tribes and more inaccessible regions.

(*d*) To provide plans and contract for the erection of school buildings, and where necessary, residences for the teachers.

(*e*) To approve of the appointment of teachers and regulate the amount of their salaries.

(*f*) To provide necessary books and other school supplies.

(*g*) To make such recommendations to the Secretary of the Interior as the interest of education in Alaska may seem to require.

SUPERVISION.

SEC. 3. A superintendent of education, to be known as the general agent of education for Alaska, shall be appointed by the Secretary of the Interior, upon the recommendation of the Commissioner of Education, and shall hold the position during the pleasure of the Secretary, and until his successor be appointed.

He shall receive from the Government for his services as general agent an annual salary of $1,200.

SEC. 4. The general agent of education shall have a desk in the Bureau of Education; but during the six months of the year (summer) when it is possible to go from place to place in Alaska, he shall give his personal attention and supervision to the school work in the Territory.

SEC. 5. He shall be allowed necessary traveling expenses while on duty.

SEC. 6. It shall be the duty of the general agent to exercise special supervision and superintendence over the public schools and teachers in the Territory, subject to the approval of the Commissioner of Education.

SEC. 7. He shall have power, subject to the approval of the Commissioner of Education—

(*a*) To select and appoint the teachers of the public schools, to prescribe their duties, and to fix their salaries.

(*b*) To provide general rules for the government of the schools and the attendance of the children.

(*c*) To prescribe the series of text-books to be used in the public schools and to require all teaching to be done in the English language.

(*d*) To select the location of schoolhouses, to provide plans for the same, to draw up contracts for the erection of said buildings for the approval and signature of the Commissioner of Education, and to lease houses for school purposes.

SEC. 8. Requisitions for all materials for the erection of school buildings, articles of school furniture, supplies of books, stationery, and other necessary materials for the use of the schools shall be made by the general agent upon the Commissioner of Education, and when such requisitions are approved by the Commissioner they shall be transmitted to the Secretary of the Interior for his approval, and when approved by him the supplies will be purchased by the Commissioner of Education, and paid for as hereinafter provided.

SEC. 9. The general agent of education, at least three months in advance of the close of the scholastic year, shall submit to the Commissioner of Education detailed estimates of the probable necessary expenses for the support of the Territorial schools for the next fiscal year, including therein the erection of school buildings, the pay of school officers and teachers and other employés, traveling expenses of the general agent and the district superintendents, rents, fuel and lights, furniture, school books, apparatus, and all other necessary expenses for the maintenance of the schools.

SEC. 10. All salaries, expenditures, and other claims for the payment of educational expenses in Alaska must be audited by the general agent of education, or in his absence by the assistant agent (hereinafter provided for), approved by the Commissioner of Education, and when approved by him transmitted to the Secretary of the Interior for his approval, and when so approved, will be paid out of the funds appropriated by Congress for the education of the children of the Territory.

SEC. 11. In cases of special emergency the general agent, district superintendent, or local school committee, may incur expenditures for immediate necessary school purposes in advance of the approval of the Commissioner of Education, but such liabilities shall be only for unforeseen and necessary purposes, and shall in no case exceed $100.

SEC. 12. Whenever such extraordinary expense is incurred the general agent, superintendent, or local committee making the same, shall make an immediate report thereon in writing, to the Commissioner of Education, setting forth the reasons for incurring said expense, and transmitting properly signed and audited vouchers for the payment thereof.

SEC. 13. In the preparation of estimates, vouchers, and other official forms and papers, the blanks approved by the Treasury and Interior Departments shall be used.

SEC. 14. As far as possible the general agent shall visit each school district once in two years.

SEC. 15. The general agent shall make a report at the end of the school year to the Commissioner of Education, which report shall embrace—

(*a*) Number and general condition of all the schools in the Territory.

1. Public schools in—
   - Unalaska district.
   - Kadiak district.
   - Sitka district.
2. Contract schools.
3. Other private and church schools.

(*b*) Rules and regulations prescribed by the general agent for the government of the schools and the duties of the teachers.

(c) School census, monthly attendance, etc.
1. Census of population and of children of school age.
2. Statistics of enrollment, average attendance, etc.
3. Branches of study taught and number of pupils in each.
4. Other statistics when possible.

(d) Personnel.
1. General agent, district superintendents, school committees, and clerk; their pay.
2. Government school teachers and their pay.
3. School policemen and their pay.

(e) School houses.
1. The number, location, and seating capacity of the school buildings owned by the Government.
2. The number, location, seating capacity, and rental of rented buildings.
3. The number, location, seating capacity, and cost of school buildings erected during the year.

(f) Any and all information, suggestions, and recommendations that may be useful for the advancement of education in Alaska or that may be required by the Commissioner of Education.

SEC. 16. The Commissioner of Education is hereby authorized to employ a person, to be known as the assistant agent, at a salary of $100 per month, to be paid out of the fund appropriated by Congress for education in Alaska, whose duties shall be, under the direction of the general agent—

(a) To attend to the Alaska correspondence.
(b) To take care of the Alaska files.
(c) To keep the accounts with the Alaska fund.
(d) In the absence of the general agent to audit the accounts of the teachers.
(e) And to prepare Alaska papers, vouchers, etc., for submission to the Commissioner of Education, and in every possible way to assist the Commissioner and the general agent.

SCHOOL DISTRICTS.

The Territory of Alaska is divided into three school districts, which shall conform to the geographical divisions known as Sitka, Kadiak, and Unalaska, as follows:

SEC. 17. Sitka, comprising all southeastern Alaska, with an area of 28,980 square miles.

SEC. 18. Kadiak, comprising the region from Mount Saint Elias westward to Zakharoff Bay, with an area of 70,884 square miles.

SEC. 19. Unalaska, comprising the region from Zakharoff Bay westward to the end of Aleutian Islands and northward to the Arctic Ocean, with an area of 431,645 square miles.

SEC. 20. In the Sitka district the Commissioner of Education shall appoint a district superintendent of schools at a salary of $40 per month, and he shall hold the position during the pleasure of the Commissioner and until his successor be appointed.

SEC. 21. It shall be the duty of the district superintendent to exercise local supervision over the Government schools and teachers in his district.

SEC. 22. He shall visit all the schools of his district at least twice a year and keep the general agent informed of their condition and wants as to school buildings, repairs, and supplies, the manner in which teachers perform their duties, and make such recommendations as may seem important to the best interests of the schools.

SEC. 23. He shall make an annual report to the general agent of education of the condition of schools in his district.

SEC. 24. He may once a year hold a teachers' association at such time and place as in his judgment will best promote the interest of the schools.

SEC. 25. He shall be allowed necessary traveling expenses in the discharge of his official duties.

SEC. 26. Until the schools become more numerous and the means of communication more frequent, the general agent of education shall be ex-officio district superintendent of the Kadiak and Unalaska districts.

SEC. 27. In any village in Alaska containing a sufficient number of suitable persons the Commissioner of Education may at his discretion appoint three persons who shall act as a local school committee.

SEC. 28. The duties of the school committee shall be—

(*a*) To visit and inspect the schools of the village, advise with the teachers, and make such recommendations to the district superintendent with regard to the schools as may seem proper.

(*b*) With the written approval of the Commissioner of Education, they shall provide fuel, make repairs on buildings, and purchase local supplies.

(*c*) If a school building is under contract in the village, it shall further be their duty to act at the building committee and see that the contractor fulfills his agreement. At the completion of the said building they shall examine the same and certify to the Commissioner of Education that the building has been erected and finished in accordance with the terms of the contract and in a workmanlike manner.

SEC. 29. The children shall be taught in the English language, reading, writing, arithmetic, geography, oral history, physiology, and temperance hygiene. No text-books printed in a foreign language shall be allowed. Special efforts shall be put forth to train the pupils in the use of the English language.

SEC. 30. All public schools shall be open to all children without reference to race.

SEC. 31. In suitable weather, at the opening of each school in the morning, a United States flag shall be raised, and at the close of school in the afternoon the the same shall be taken down.

SEC. 32. The Sitka training school shall teach the primary branches of industrial education. The boys shall be taught shoemaking, carpenter and cabinet work, printing, and such other trades as are of use in the Territory, while the girls shall be instructed in intelligent housekeeping and household industries.

Pupils in the Government day schools developing unusual aptness in learning and wishing increased advantages, shall be received into the Sitka training school upon the written request of the general agent or district superintendent.

The above "Rules and Regulations for the Conduct of Public Schools and Education in the Territory of Alaska," in sections numbered from 1 to 32, inclusive, are hereby approved to take effect July 1, 1890

JOHN W. NOBLE,
Secretary of the Interior.

Hon. W. T. HARRIS, LL.D.,
Commissioner of Education.
WASHINGTON, D. C., *April 9, 1890.*

D.—PERSONNEL, SALARIES, ETC.

General agent of education for Alaska, Dr. Sheldon Jackson, Alaska, $1,200.

BOARD OF EDUCATION.[1]

Name.	State.	Salary.
Governor Lyman E. Knapp	Vermont	$200
Judge John H. Keatley	Iowa	200
Hon. James Sheakley	Pennsylvania	200
Dr. Sheldon Jackson	Alaska	200
Mr. William Duncan	do	200

TEACHERS OF PUBLIC SCHOOLS.

Name of teacher.	State.	School.	Salary.
John A. Tuck	Maine	Unalaska	$1,000
John H. Carr	Washington	Unga	1,000
W. E. Roscoe	California	Kadiak	1,000
John Duff	Illinois	Afognak	1,000
Anna D. Beatty	New York	Sitka, No. 1	720
Gertrude Patton	Pennsylvania	Sitka, No. 2	720
May Ransom	California	Killisnoo	720
Rhoda A. Lee	New York	Juneau, No. 1	900
Cassia Patton	Pennsylvania	Juneau, No. 2	720
Mrs. W. S. Adams	Alaska	Douglass, No. 1	720
C. H. Edwards	Kansas	Douglass, No. 2	720
Mrs. W. G. Thomas	West Virginia	Fort Wrangell	900
H. C. Wilson	Ohio	Klawack	1,000
Clara A. Gould	West Virginia	Jackson	900

[1]In the new rules and regulations approved by the Secretary of the Interior April 9, 1890, this Board created in 1887 was discontinued, experience having proved that it did not work well, and a system of local school committees was inaugurated.

TEACHERS AND EMPLOYÉS IN CONTRACT SCHOOLS.

Anvik (Episcopal).—Rev. John W. Chapman, Vermont.
Point Pope (Episcopal).—John B. Briggs, M. D., Delaware.
Kosoriffsky (Roman Catholic).—Rev. Paschal Tosi. Mr. B. Cunningham, Mr. John Negro, Sister Mary Stephen, Sister Mary Joseph, Sister Mary Paulina.
Cape Vancouver (Roman Catholic).—Rev. Joseph Treca, Rev. Paul Muset, Mr. John Rosati.
Nulato (Roman Catholic).—Rev. Robaut, Rev Ragaru.
Bethel (Moravian).—Rev. John H. Kilbuck, Rev. Ernst L. Weber, Mrs. John H. Kilbuck, Mrs. E. L. Weber, Miss Lydia Lebus.
Carmel (Moravian).—Rev. Frank E. Wolff, Mrs. F. E. Wolff, Miss Mary Huber, Miss Emma Huber, Rev. J. A. Schoechert.
Cape Prince of Wales (Congregational).—Mr. H. R. Thornton, of Virginia; Mr. W. T. Lopp, of Indiana.
Point Barrow (Presbyterian).—Mr. Leander M. Stevenson, of Ohio.
Sitka (Presbyterian).—Mr. William A. Kelly, principal, Rev. A. E. Austin, chaplain, Mrs. A. E. Austin, Miss Anna R. Kelsey, Miss Mate Brady, Mr. J. A. Shields, Miss Carrie E. Delph, Miss Ida M. Rogers, Miss Kate A. Rankin, Mrs. A. T. Simson, Mr. A. T. Simson, Mrs. M. C. Devore, Mrs. Josie Overend, Mr. Ernest Struven, Mrs. Tillie Paul (native), Mr. William Wells (native), Mr. Edward Marsden (native), William F. Arnold, M. D.
Metlakahla.—Mr. William Duncan, teacher, with several native assistants.

TEACHERS IN PRIVATE AND CHURCH SCHOOLS.

Unalaklik (Swedish Evangelical).—Rev. Axel E. Karlson, Aug. Anderson.
Yakutat (Swedish Evangelical).—Rev. Alb. Johnson, Rev. K. J. Henrickson.
Hoonah (Presbyterian).—Rev. John W. McFarland, Mrs. M. D. McFarland, Miss Dora Davis (native).
Juneau (Presbyterian).—Rev. Eugene S. Willard, Mrs. E. S. Willard, Miss Elizabeth Matthews, Miss Margaret Dunbar, Rev. S. H. King, Mrs. S. H. King.
Jackson (Presbyterian).—Mrs. A. R. McFarland, Miss C. A. Baker, Rev. J. Loomis Gould, Mrs. J. L. Gould.
Juneau (Roman Catholic).—Rev. John Althoff, Sister Mary Zeno, Sister Mary Peter, Sister Mary Bousecouer.
Douglas (Friends).—Mr. S. R. Moon, Mrs. S. R. Moon, Mr. E. W. Weesner, Mrs. E. W. Weesner.
North American Commercial Company.—Simeon Milevedoff, St. Paul Island; A. L. Noyes, M. D., St. George Island.

E.—School Buildings.

During the year a comfortable frame schoolhouse and teacher's residence combined, 31 by 55 feet in size, were erected at Kadiak, Karluk, and Afognak, at a cost of $2,700 each; at Douglas a substantial frame schoolhouse, 20 by 30 feet in size, at a cost of $1,200, and at Chilkat a log schoolhouse, 20 by 30 feet in size, for $350.

EDUCATION IN THE EAST.

Of the Alaskan children at Eastern schools, Miss Frances Willard graduated in June, 1890, at a young ladies' seminary at Elizabeth, N. J. She will return to Alaska this summer, and be appointed assistant teacher in the industrial school at Sitka.

Mr. Frederic Moore, of the Hoochinoo tribe, whom I brought East in the fall of 1886, and placed in the school at Mount Hermon, Mass., will also return to Alaska this season as Government teacher of the school at Hoonah.

In the fall of 1887, at the expense of Mrs. Elliott F. Shepard, of New York, I brought to Eastern schools Frederic Harris, Henry Phillips, Minnie Shotter, Flora Campbell, and Florence Wells, native children, and Olga Hilton (Russian) from the industrial school at Sitka, and Blanche C. Lewis, native, from Fort Wrangel.

The two boys were placed in the Indian training schools at Carlisle, Pa., and the five girls at the young ladies' seminary, Northfield, Mass.

Frederic Harris, after making good progress in his studies and in learning the

tinsmith business, was taken sick from peritonitis, and died in the school hospital on the 10th of June, 1890.

Henry Phillips, having learned the printer's trade, has now gone into the machine shop, where he is making good progress.

Florence Wells, Blanche Lewis, and Olga Hilton are still at Northfield. Flora Campbell has been changed from the school at Northfield to one at Orange, N. J., where she is receiving drill as a kindergarten teacher.

Minnie Shotter having developed a weakness in her eyes, will return home to Douglas, Alaska, where she will teach instrumental music.

This coming fall, David Skuviuk and George Nocochluke, Eskimo boys from the Kuskoquim Valley, will be taken East by Mrs. Bachman, and placed in the Indian training school at Carlisle, Pa.

George and William Fredericks, of the Yukon Valley, will be sent by the Episcopalians to the Episcopal Institute at Burlington, Vt., Edward Marsden of the Presbyterian training school at Sitka, to Marietta College, Ohio, and Shawan Sheshdaak of Fort Wrangel, to the Educational Home at Philadelphia.

Through the liberality of Mr. Rudolph Neumann of the Alaska Commercial Company, I have arranged to send to the California normal school for teachers at San Jose, Miss Mattie Salamatoff, orphan daughter of a former Russo-Greek priest at Belkoffsky.

When Alaska secures much needed laws to increase regular attendance of the native children at school, then there will be room and a call for many native teachers.

SCHOOLS ESTABLISHED IN ARCTIC ALASKA.

In the extension of the school system over all Alaska a commencement has been made within the Arctic Circle. Contract schools have been established at Point Barrow, Point Hope, and Cape Prince of Wales, the three principal villages on the Arctic coast of Alaska.

This commencement involves much that is new and unusual in school work. The location of the schools is in a region so remote and inaccessible that they are outside the world's commerce. In August, when the ice will permit, a few whalers sail by, and a United States revenue marine steamer makes an annual call, bringing the yearly mail and supplies. With the departure of the steamer the settlement is cut off for another eleven months from the world. There are years, however, when the northernmost school, Point Barrow, can not be reached at all during the season, and the teacher will be two years without a mail or a fresh supply of provisions. And there is always the liability that a succession of severe seasons will isolate him for several years.

Under the shadow of this possibility it is a relief to know that at this station, where the greatest danger is, the Government has a refuge station for shipwrecked whalers, with provisions in store sufficient to last 20 men 5 years. If this supply should be exhausted before relief came, the teacher would be compelled to adopt the diet of the country, to wit, whale blubber and seal meat.

The food, clothing, and supplies for the teachers and the supplies for the schools must needs be taken annually on a Government vessel or a chartered schooner from San Franciso, between 3,000 and 4,000 distant.

In an area as large as all of the New England and Middle States combined, the three schools recently established occupy only the strategic places, separated hundreds of miles from each other. They are the central points from which future schools may be established.

The location of these schools in a region where the winter term is one long night presents new problems. The constant need of lamps in the schoolroom is a matter of course. But a greater difficulty is experienced in the confusion of time which arises from the absence of the sun to mark the alternate periods of day and night.

Without a marked difference in the light between noon and midnight, all knowledge of time among a barbarous people becomes lost. They know no difference between 9 o'clock a. m. and 9 o'clock p. m. Consequently, when the school bell rings out into the Arctic darkness at 9 o'clock a. m. some of the pupils have just gone to bed, and are in their first sound sleep. Roused up and brought to the schoolroom, they fall asleep in their seats. Many of the pupils have come to school without their breakfasts; with sleepy bodies and empty stomachs they are not in the best condition to make progress in their studies. Then, bearing in mind the fact that these children are wholly undisciplined and unaccustomed to restraint, the greatness of the task before the teacher begins to be appreciated.

The schools are for the Arctic Eskimo, with their strange tongue and unwritten language. Consequently at the opening of school the teacher could not understand what the pupils said or the pupils understand the instruction of the teacher. In two or three schools the teachers were unable to secure interpreters.

The schools being located among an uncivilized and barbarous people, living in earth huts and disregarding all the laws of health, it became necessary, not only to erect the schoolhouse, but also the teacher's residence, and, as far as possible, make both cold-proof with double walls, floor, and roof.

The materials for these houses had to be taken from San Francisco on a chartered vessel, landed through the breakers on a coast without a harbor, and carried on the shoulders of men and women to the site of the buildings.

Again, the schools were located among a people who were not only uncivilized, but also were reported by the whalers to be savages. At one of the stations whalers have for years been afraid to drop anchor lest they should be attacked and murdered by the natives. At that station two young men are in charge of the school. They are the only white men in that region and thousands of miles from troops or even a policeman. Further, the schools are located among a famishing population where the teachers have to do not only with the intellectual training, but also with the physical well-being, the general uplifting of the whole population out of barbarism into civilization. This involves questions of personal cleanliness, health, diet, improved habitations, drainage, and above all at present an increased food supply. The people are on the verge of starvation, and the schools must provide and instruct them in new industries which will furnish a better support.

As the schools will necessarily be much of the time out of the reach of control and supervision, the coöperation of well-known and responsible missionary organizations was sought, with the result that the American Missionary Association of the Congregational Church took charge of the school at Cape Prince of Wales, on Bering Straits, the Episcopal Missionary Society the one at Point Hope, and the Presbyterian Home Missionary Society the one at Point Barrow.

The money for the establishment of the school at Point Barrow and the erection of the buildings was contributed by Mrs. Elliott F. Shepard, of New York; that for Cape Prince of Wales by the Congregational Church of Southport, Conn.

Cape Prince of Wales is the most western school in America, and Point Barrow the most northern. Point Barrow is farther north than the celebrated North Cape of Europe. These schools are assisted by the United States Bureau of Education. While negotiations were in progress with the missionary societies, an appeal was published in a number of the newspapers of the United States for volunteer teachers for the schools to be established at Point Barrow and Cape Prince of Wales. The call set forth the facts that the schools were beyond the pale of civilization, where communication with the outside world could be had but once a year; that they were among a barbarous and perhaps savage people, where the risks were so great that ladies would not be allowed to go, and where the lives of the men would not be guarantied. Notwithstanding the hazardous and trying nature of the work, there were 24 applicants for the schools, some 12 of whom were ladies.

Prof. L. M. Stevenson, of Versailles, Ohio, was selected for Point Barrow; Dr. John B. Driggs, of Delaware, for Point Hope; and Mr. H. R. Thornton of Hampden Sidney, Va., and Mr. W. T. Lopp, of Valley City, Ind., for Cape Prince of Wales.

A vessel, the *Oscar and Hattie*, was chartered at San Francisco to take up the materials for the buildings and supplies for the teachers and schools. The teachers found passage as far as Port Clarence, Bering Sea, on the steamer *Jennie*, tender to the whaling fleet, and from Port Clarence to destination on the whalers.

I was kindly furnished transportation on the U. S. R. M. S. *Bear*.

At noon on the Fourth of July the *Bear* dropped anchor in the open roadstead off the village Kingegan, Bering Straits. That afternoon, on the shores separating the Arctic Ocean from Bering Sea, and in front of the snow-capped mountains of Asia, plainly visible for miles, we celebrated our Fourth of July by laying the foundations of the first public-school building in Arctic Alaska.

Upon the completion of the school building the *Bear* weighed anchor, sailed through Bering Straits into the Arctic Ocean, and 200 miles to the northward dropped anchor under the light of the midnight sun at Point Hope.

Here again all hands that could be spared were sent ashore to work at the

school building. After completing the building we again turned our faces toward the North Pole.

After various detentions by the great ice field of the Arctic, on the 31st day of July we reached Point Barrow, over 800 miles north and east of Bering Straits. The next day, running before a gale, we rounded the northern end of the continent and anchored on the eastern side of the Point.

On the northernmost bluff of the continent was established probably the northernmost school in the world.

SUPERVISION.

Through the special permission of Hon. William Windom, Secretary of the Treasury, and the courtesies of Capt. L. G. Shepard, Chief of the Revenue Marine Service, Capt. M. A. Healy, commanding the U. S. R. M. S. *Bear*, and Capt. A. C. Coulson, commanding the U. S. R. M. S. *Rush*, I was able to inspect, for the first time in four years, the schools at Afognag, Kadiak, Unga, and Unalaska, and also visit the settlements on the Bering Sea and Arctic coasts of Alaska.

Mr. Windom, in furnishing me with transportation, recognized the fact that the revenue vessels visiting the native settlements of Alaska had, "in addition to routine duties, the philanthropic work of caring for and assisting the native peoples."

In a letter concerning the trip he says: "The ordinary duties of the revenue marine have been greatly augmented on the North Pacific and Arctic station by the service which it renders in affording aid and protection to the natives, who are often in peril and distress from the rigors of the climate, the exposed condition of the country, and their lack of knowledge in the ways of civilization. The service is doing good missionary work, and is an important factor among the instruments which are being utilized to improve the interests of these people."

The trip of the U. S. R. M. S. *Bear* was the ordinary annual cruise of one of the U. S. Revenue Marine steamers in Alaskan waters.

Season after season she goes north in the spring to enforce the revenue laws and practically do police duty around the seal islands of Bering Sea and the native settlements stretching from Kadiak 1,500 miles to Attu, and from Unalaska 1,200 miles northward to Point Barrow. In vast stretches of coast (from 10,000 to 12,000 miles is a season's cruise), unknown to civilization, the flag of the revenue steamer is the only evidence of the authority of the Government ever seen and the only protection afforded. When Capt. Healy commenced cruising in these waters, schooners loaded with rum, were visiting every native settlement along the vast coast, and even some of the whalers were not above trafficking in the accursed stuff. The temptations were great, when a bottle of whisky would purchase $200 worth of furs, and the profits were a thousand fold. At that time intemperance was threatening the extinction of the native race. Through the vigilance and tact of Capt. Healy this trade has been almost entirely broken up.

It is also the duty of the revenue cutter, as far as possible, to be on hand to assist when disaster or shipwreck overtakes the whalers, to search after missing vessels, to note the bearing of different points of land, islands, etc., to determine the position of all bars and reefs encountered, to keep a record of tides and currents, to take meteorological and astronomical observations for the benefit of commerce, to investigate scientific phenomena, and inquire into the mode of life, political and social relations of the native population, and make collections for the Smithsonian Institution, and to perform many other services beneficial to commerce, science, and humanity.

This year, in addition to the ordinary routine, the commanding officer is charged with several special duties. In 1887–'88, Congress voted $1,000 for presents to the natives near Cape Navarin, Asia, as a reward for having fed and cared for some American sailors wrecked on their coast. These presents were to be distributed on this trip.

Then, scattered through Bering Sea and the Arctic Ocean are islands and lands so remote and inaccessible that the ordinary census taker can not reach them; hence the commanding officer of the revenue cutter was appointed a special agent for the taking of the Eleventh Census in those places. This gave me an opportunity of visiting these little known regions.

Again, the steamer was charged with the duty of conveying the material for a storehouse and a supply of provisions for the Government refuge station at Point Barrow; and last, but not least, the commanding officer was authorized to

furnish such assistance as he could in the erection of school buildings at Cape Prince of Wales and Point Hope, and give the general agent of education for Alaska every facility for visiting the native settlements on the coast.

At 4 o'clock on the morning of the 3d of June, 1890, we steamed out of the harbor of Seattle. At 9 o'clock that evening we swept by the light-house at Cape Flattery and passed out to sea.

For nine days and nights we sailed steadily west, without seeing land or sail and scarcely a bird or fish. On the evening of June 12 land was sighted, which proved to be Unimak Island. The next morning, rising early, we were passing through Akutan Pass. The storm and fogs and rough waves of the preceding days were gone: the water was as quiet as a millpond. Pinnacles of rocks, isolated and in groups, were to the right and to the left of us; bold headlands thousands of feet in height; mountain slopes covered with mosses of every variety of shade and great patches of snow; volcanoes with their craters hid in the clouds were on either side, and all lighted up by the morning sun made a scene of surpassing loveliness and beauty. In due time we swept by Cape Erskine, rounded Priests Rock, and were in Unalaska Bay. Twelve miles up the bay and we were at Iliuiuk, better known as Unalaska, the commercial metropolis of the Aleutian Islands and Bering Sea.

The Aleutian Archipelago consists of a narrow chain of islands, extending from the end of the Alaskan Peninsula in a general westerly direction for a thousand miles to Attu, the westernmost limit of the land possessions of the United States. This chain of islands separates Bering Sea from the Pacific Ocean, and gives coloring to the Russian claim of a "closed sea."

The discovery of these islands by Europeans is due to the unbounded ambition of Peter the Great of Russia, who, having founded a Russian empire in Europe and Asia, would also found one in America.

The western coast of America had been explored as far as Cape Mendocino, California, but from California north it was a vast unknown region—"the great northern mystery, with its Anian strait and silver mountains and divers other fabulous tales."

To solve these mysteries, to determine whether Asia had land communication with America, to learn what lands and people were beyond his possessions on the eastern coast of Siberia, and to extend his empire from Asia to America, Peter the Great, in 1724, ordered two expeditions of exploration and placed them both under the command of Vitus Bering, a Dane in the Russian service. The expedition set out overland through Siberia on January 28, 1725, under Lieut. Chirikoff.

Three days later the Emperor died, but the expeditions were energetically pushed by his widow and daughter. The first expedition, from 1725 to 1730, explored Bering Straits, and settled the question of separation between Asia and America.

The second expedition was fitted out by the Empress Catharine, and consisted of two vessels, the *St. Paul*, commanded by Bering himself, and the *St. Peter*, in charge of Alexei Ilich Chirikoff, second in command. The expedition was accompanied by several scientists and sailed from Avatcha Bay, Kamtschatka, on June 4, 1741. This ill-fated expedition discovered the mainland of Alaska and the Aleutian Islands. But the remnant that brought back the news of the discovery of northwestern America, also brought with them the beautiful furs of the sea otter, and wide-awake merchants were not slow to see their opportunity. As the adventurous hunt for the little sable had led the hardy Cossack and extended Russian dominion from the Ural Mountains across Asia to Kamtschatka and Bering Sea, so now the hunt for the sea otter was to extend Russian settlement 2,000 miles along the coast of America.

A few months after the return of Bering's expedition in the spring of 1743, Emilian Bassof formed a partnership with a wealthy Moscow merchant, built a small vessel named the *Kapiton*, and commenced the fur trade of the newly discovered islands. On his second trip, in 1745, he collected 1,600 sea otters, 2,000 fur seals, and 2,000 blue Arctic foxes.

This was the commencement on the part of the merchants of Siberia of a mad race after the furs of Alaska—a race so mad that they could not wait the securing of proper materials for the building of safe vessels and the procuring of trained seamen. Boats were hastily constructed of planks fastened together with raw hide or sealskin thongs. In these unseaworthy boats, without charts or compass, they boldly ventured to sea, and the half of them found a watery grave. Those that did return in safety with a fair cargo received from 2,000 to 3,000 roubles each as their share of the profit.

On the 26th of September, 1745, for the first time the discharge of firearms was heard on the Aleutian Islands. A native was shot on the island of Agoto by a party of Russians under Chuprof.

Then commenced a reign of lust, robbery, and bloodshed, which lasted for 50 years. One Feodor Solovief is reported to have alone killed 3,000 Aleuts. Veniaminof, who was the leading Greek priest and first bishop in Alaska, declares that during that dreadful period Aleuts were used as targets for Russian practice in firing; that one Solovief, finding the inhabitants of several of the Unalaska villages assembled on Egg Island, made an attack, slaughtering men, women, and children, until the sea was covered with the blood of the slain.

One Lazaref threw over precipices, cut with knives, and split open with axes a number of Aleuts.

Whole villages were massacred by the Russians, so that Lieut. Sary, chief of the Russian navy, who accompanied Capt. Billings's expedition in 1790, declares that it was a very moderate estimate to place the number murdered at 5,000.

This first half-century of Russian occupation can be roughly summarized as follows: On the credit side, from $15,000,000 to $20,000,000 worth of furs; on the debit side, thousands of Russians drowned, died of scurvy, and killed by natives, and thousands of natives needlessly murdered by the Russians.

A better day dawned for the poor natives of Alaska in the coming of Grigor Ivanovich Shelikof, a merchant of Okhotsk, who has been justly styled the founder of the Russian colonies in Alaska. He introduced reforms in the methods of hunting, redressed abuses, formed permanent settlements, and procured concessions and power from the Emperor.

The work commenced by him was afterwards enlarged by Alexander Baranof.

The largest and most important of the Aleutian Islands is Unalaska. This island is 120 miles long and 40 wide. It contains three separate groups of mountains. It also has an active volcano, Makushin, 5,474 feet high. From a cave at the southern end of the island were taken eleven mummies for the Smithsonian Institution.

It also possesses several deep bays, of which Unalaska is one of the longest. In their season codfish, salmon, halibut, and herring abound in those waters.

The island was first sighted by Lieut. Chirikof, of Bering's expedition, on the 4th of September, 1741. The first landing was made by a merchant of Turinsk, Stepan Glottof, in the vessel *Yulian*. This was in the fall of 1759. Glottof gave the world the first map of that region, and is said to have baptized many of the natives into the Greek faith.

To the average American the Aleutian Islands seem so remote, and concerning them so little is known, that but few think of them as having been the theater of stirring events and as having a history extending back one hundred and fifty years, but such is the case.

Unalaska shares with the other islands in that history. For thirty years it was a struggle between the rapacious, cruel, and bloody fur-trader and the Aleuts striving to preserve their homes and freedom. The end was the complete subjugation of the natives.

In January, 1762, a party of fur hunters, under the leadership of Golodof and Pushkaref, landed upon the island. Owing to their excesses against the natives, several were killed and the rest fled the island the following May. But the island was too rich in furs to be given up. That same fall another party came under the leadership of Drushinnin. Outraging the natives, the latter commenced on the 4th of December a series of attacks which resulted in the breaking up of the Russian settlement, only 4 out of 150 men escaping with their lives.

In August, 1763, Capt. Korovin, of the vessel *St. Troitska*, formed a settlement. This also was broken up by the natives.

In 1764 Capt. Solovief formed a settlement. His stay on the island was marked by such bloody atrocities that the few who survived were completely subjugated. His name has come through a hundred years of local tradition as the synonym of cruelty. Among other things, it is said that he experimented upon the penetrative power of his bullets by binding 12 Aleuts in a row and then firing through them at short range. The bullet stopped at the ninth man.

In 1770, when the American colonists were preparing themselves for the struggle for independence, the struggle of the Aleuts was ending. They had given their lives in vain. The few who were left could no longer maintain the unequal conflict and were reduced to practical slavery.

But Unalaska has since seen better days and been visited by a better class. On the 16th of September, 1768, Capt. Levashef, in charge of a Russian scientific expedition, dropped his anchor and wintered on the island.

In 1778 it was visited by the celebrated Capt. Cook with his ships *Resolution* and *Discovery*. On the 21st of July, 1787, Capt. Martine, in command of two Spanish vessels on a tour of exploration, landed and took possession of the island in the name of the King of Spain.

In 1709 Unalaska was visited by one of the most remarkable men of the day, Alexander Baranof, who was to rule Alaska for the next twenty-eight years, bring order out of confusion, and, carrying out and enlarging the plans of the merchant Shelikof, create a Russian empire in America.

On the 30th of September of that year, the ship *Trekh Sviatiteli*, upon which he had embarked for Kadiak Island, was wrecked and he was compelled to spend the winter at Unalaska. He improved his time by studying the character of the people with whom he had to deal, and forming the plans which he afterwards so successfully executed. In 1808 a rude log chapel was erected for the worship of the Greek Church. This was torn down in 1826 and a better church built in its place. In or about 1795 a Greek priest, Father Makar, took up his abode on the island, and had great success in baptizing the natives.

He was followed in 1824 by Innocentius Veniaminof, who was made bishop of all Alaska in 1840. He was subsequently recalled to Russia and made metropolitan of Moscow, the highest ecclesiastical position in the Russo-Greek Church.

On the 25th of June, 1791, the island was visited by Capt. Billings, in charge of the Russian "astronomical and geographical exposition for navigating the frozen sea and describing its coasts, islands," etc.

In August, 1815, the place was visited by the Russian exploring expedition in search of the "Northwest passage" on the *Rurik*, Otto von Kotzebue commanding.

In 1827 a Russian exploring expedition, under the command of Capt. Lutke, visited the island.

From the beginning of Russian rule to the present day, it has been the commercial metropolis of the Aleutian Islands and Bering Sea.

But after all this stirring history of a century and a half, it is rather disappointing to learn that up to twenty years ago, when the Americans took possession, it was still a small village of barabaras or dirt huts, partly under ground, the Russian conquerors having largely adopted native ways of living. Since then the village has been greatly improved and almost rebuilt at the expense of the Alaska Commercial Company. They have erected 18 small, but comfortable frame cottages for their employés, together with residences for officers, store, wharf, and warehouses. The village has a population of from 14 to 20 white men, two white women, and about 400 Aleuts and Creoles. The Greek Church has a church and parsonage and school-house.

Upon landing, I was met by Prof. John A. Tuck, who, with his estimable wife, is in charge of the Government school. The three days that the steamer remained at Unalaska were given to the work of the school.

The first year of their work has been unexpectedly successful, and I felt, with the teachers, that the time had come for the commencement of the "Home," which the Methodist Woman's Home Missionary Society of the United States have had under advisement for two or three years, and for which, under the leadership of Mrs. L. H. Daggett, of Boston, they have been raising funds.

During my stay I had the satisfaction of seeing the "Home" commenced by Professor and Mrs. Tuck taking into their family two orphan girls from the island of Attu. A suitable building for the "Home" will be erected by the Methodist ladies this coming spring.

On Sabbath morning I attended the Greek Church and saw the services in connection with the baptism of children. Fourteen infants were presented before the altar of the church. The priest had in his hand a silver spoon with a handle about a foot long, and a bowl about the size of that of a spoon for a salt-cellar. With this spoon the priest dipped water from a silver cup into the mouth of the babe, the attendant priest holding a napkin under the child's chin. After receiving the water, the cup was pressed to the lips of the babe. The mother or godmother then carried it to a side table, where it received a small piece of bread, and if old enough, a drink of water to wash down the bread. From the bread table, the child was carried to the altar platform, and its lips pressed to a picture of the Virgin and Child. The babe was then kissed by its god-mother. These babes were dressed in long white dresses, with a blue or red silk ribbon or sash around the waist.

On the morning of the 17th of June the *Bear* sailed for Bogoslof Island.

Four or five miles west of Unalaska Island is that of Umnak. From its northern side, stretching out for miles into Bering Sea, is a reef. At the time of

Capt. Cook's visit in 1778, the northern end of this reef was marked by a rock 875 feet high rising from the sea in the form of a tower. This he named "Ship Rock."

On the 18th of May, 1796, during a violent storm, from the northwest, the inhabitants of Unalaska and Umnak Islands were startled by distant explosions and rumbling shocks of an earthquake. On the morning of the third day, when the sky had cleared, it was found that an island 1¼ miles long, and three-fourths of a mile wide, in the form of a cone 2,240 feet high, had been thrown up out of the sea 1,200 feet distant from Ship Rock. Eight years afterwards, some hunters visiting the spot found the adjacent sea still warm and the rocks too hot for landing.

The island continued to grow in circumference and height until 1823. Since then it has gradually decreased in height until in 1884 it measured but 324 feet.

In 1882 the natives reported Bogoslof as again smoking. On the 27th of September, 1883, Capt. Anderson, of the schooner *Mathew Turner*, sailed partly around the island. He reported that a new island had appeared one-half of a mile in circumference, and was throwing out great masses of rock and smoke and steam.

On the 20th of October, 1883, a shower of volcanic ashes fell at Unalaska, and was supposed to come from this island. The first landing and official investigation was made on the 21st of May, 1884, by Capt. M. A. Healy, commanding United States Revenue Steamer *Corwin*.

The new cone proved to be about 1,760 feet from the old one, the two being connected by a low sandspit 326 feet wide, with Ship Rock on the spit between the two cones. The extreme length of the island was found to be 7,904 feet, its general trend SE. by E. and NW. by W.

From the 17th to the 22d of last February the sky was obscured with a cloud of ashes, a liberal shower of which fell in the village of Unalaska, 50 miles away. A pillar of flame and smoke ascended high into the heavens. It has been variously estimated from 4 to 15 miles high.

The first white man to pass by was Capt. Everett E. Smith, of the steam whaling bark *Balæna*, who reported the appearance of four new islands in the vicinity.

It was therefore with feelings of more than ordinary interest that in the early morning of Tuesday, June 17, we steamed from Unalaska, bound for Bogoslof. Long before we reached the island, great white clouds of steam were seen upon the horizon. As we approached nearer all eyes were eagerly bent and glasses trained upon the land looming above the horizon. But the captain was puzzled. He could not make out his landmarks. The two volcanic cones were all right, but where was Ship Rock? Soon we were among myriads of birds which had chosen these inaccessible and warm rocks for their breeding ground.

Capt. Healy with his glass went to the masthead. Two men were placed in the chains to throw the lead. We steamed on and on until it seemed as if we would steam into the volcano itself; sulphurous smoke enveloped us, almost strangled us. Amid the roar of the breakers and the screaming of the birds the leadman called out, "No bottom at 17." Where previously the captain had anchored in 8 fathoms of water, no bottom was now found at 100 fathoms. Apparently the bottom of the sea had fallen out, carrying with it the four islands reported only a few weeks before by Capt. Smith. We steamed in safety over their former sites. More than that, the center of the island had dropped out, and where for centuries Ship Rock had stood, a well-known mark to the mariner, was now a lake.

It was with peculiar sensations that we steamed partly around the island, so close that we could look into the sulphur-lined steam vents, and, enveloped in its steam, could almost imagine that we saw "fire and brimstone."

The captain had intended making a landing and an investigation of the phenomena, but failing to find an anchorage, and the wind having freshened so that it was unsafe landing through the breakers, he reluctantly turned away and steamed for the Seal Islands.

For years the careful observers of the movements of the seal among the early hunters on the Aleutian Islands had noticed that they went north in spring and returned in the fall, accompanied by their young, and a tradition existed among the natives that an Aleut had once been cast away upon islands to the north, which they called Amik. When in 1781 the usual catch of furs began to decrease upon the Aleutian Islands, efforts were made to discover this supposed island. In 1786 the search was joined by Master Gerassim Gavrilovich Pribylof, in the vessel *St. George*. But so well has nature hidden these islands, the favorite home of the fur seal, among the fogs of Bering Sea, that Pribylof cruised three weeks in their vicinity, with every evidence of being in the neighbor-

hood of land, and yet unable to discover it. But at length the fog lifted, and early in June land was sighted, which he called St. George. A party of hunters were left on the island for the winter and they in turn discovered the larger island of St. Paul.

Over 500,000 skins were taken during the year, and the islands early began to be the "bank" from which Baranof raised the funds to carry on his government in Alaska. If he needed a ship's load of provisions and supplies for his colonies, all he had to do was to kill more seal and pay in seal skins. So great was the slaughter that the Government was compelled to interfere and in 1805 prohibited their killing for a period of five years. From 1820 to 1867, the year of the transfer, 42,000 skins were annually exported to England, the United States, and Canada.

The first years after the transfer of Alaska to the United States again witnessed an indiscriminate slaughter by different firms, until Congress was compelled to interfere and authorize the Treasury Department to lease the islands under suitable restrictions to a responsible company.

This was the origin of the Alaska Commercial Company of San Francisco, which has held the lease for the past twenty years, paying the Government annually a rental of $55,000, and a royalty of $2.62½ on each of the 100,000 skins allowed to be taken. This produced a revenue of $317,500 per year. Last spring the islands were relet for another twenty years to the North American Commercial Company of San Francisco. By the terms of the new lease the Government will be the recipient of about $1,000,000 per year.

At 9:30 p. m. on June 18, the captain dropped anchor in Southwest Harbor, St. George Island. Being unable to land through the breakers, the next day the ship sailed around the southern end of the island and anchored at noon in Garden Cove. The chart said that there was a trail to the village, 2 or 3 miles distant. At the village they called it 4 miles; the young officers that walked it came to the conclusion that it was nearer 14 miles.

At 9:15 p. m. the anchor was weighed and we steamed northward for St. Paul Island.

Going on deck about 6 o'clock on the morning of June 20, the ship was abreast of St. Paul Island, in full sight of the village. Behind us was Otter Island with its bluff shore, and still further behind in the hazy distance the Island of St. George. To our right was Walrus Island, and to our left St. Paul, with its gentle slopes of green grass and moss, its bleak rocks and sand beaches covered in the season with the fur seal. To the right of the village were seen men driving a herd of seal to the killing grounds. Upon a hill near the village floated the stars and stripes, together with the flag of the North American Commercial Company, the lessees of the island. The stars and stripes also floated over the building occupied by Mr. Charles J. Goff, the United States Treasury agent.

From the bay the village presents a more pleasing and inviting appearance than any other in Alaska. The large houses occupied by the North American Commercial Company for their own use, the house of the Treasury agent, the Greek church and the priest's residence, the schoolhouse and the neat white cottages of the people, with their orderly arrangement by streets, ranged as they are on the gentle slope of a hill, make an attractive picture. Before we rose from an early breakfast, Messrs. Goff, Tingle, Redpath, and Elliott were announced. They had come to get their mail, which Capt. Healy had brought up for them. After breakfast I went ashore with Mr. Goff, who with his assistant, Mr. Nettleton, of Minneapolis, also Mr. H. W. Elliott, of Washington, and Mr. Tingle, the company's agent, did all in their power to make the day pleasant and profitable to me.

Soon after landing Mr. Goff announced that a killing had commenced, and we walked over to the grounds to witness the process. A band of 200 or 300 seals were huddled together in the care of keepers. From this band 15 to 20 seals would be taken at a time, and driven a few yards from the main band. Four or five men with long clubs then took charge of the small band, and selecting those of suitable size and age, killed them by one blow on the head. The men with clubs were followed by others with knives, who stabbed the seals to let out the blood. They were followed by the skin men, who took off the skin with the layer of fat adhering to it. These in turn were followed by those who separated the fat from the skin. The skins were then carried to the salting house, where they were carefully counted and salted down. While this was going on, a score of women and girls were filling skin bags with masses of fat, which were carried on their backs to their homes, and then fried out into oil (butter) for winter use. The flesh was also carried home, cut into thin strips, and hung on poles to dry.

After being dried, it is stuffed into the stomachs of the sea lion, which have been cleaned and prepared for the purpose. After filling it with the dried meat, seal oil is poured in, filling up all the vacant spaces. You then have a huge sausage between two and three feet in diameter. This is stowed away for winter use.

In passing through the village we saw women at work cleaning the intestines of the sea lion, very much as eastern farm-wives prepare intestines for sausages. After being cleansed they are hung out to dry; when dry they are slit lengthwise and form a band 3 or 4 inches wide and from 75 to 100 feet long. From these strips are made the famous kamileka, or waterproof coats worn by these people. These coats are much lighter, stronger, and dryer, resisting rain longer and better than the rubber goods of commerce. Among the Eskimo of the Arctic the larger intestines of the walrus are used, making a correspondingly wider band.

The Greek church at this place is the best painted and neatest kept of any that I have seen in the Territory. The silver candlesticks and other ornaments when not in use were kept from the dust by bag coverings. The church is rich, being supported by a certain percentage of the wages of the whole population. In the adjoining graveyard a large Greek cross made from 2-inch plank stood at the head of each grave. With but two or three exceptions, these contained no name or date, nothing to indicate who was buried there. A gentleman who has attended many of their funerals says he never saw any, even the nearest relative of the deceased, shed a tear or give any outward sign of grief. They say it is good to die. After the burial all the friends are invited to the former residence of the deceased to tea.

With Mr. Goff I also visited the company's schoolhouse. It is well built, commodious, and well furnished in its appointments. Owing to the opposition of the Greek Church, which does not wish the children to learn English, but little progress has apparently been made. The school has been in operation for twenty years, and yet I could not find a child who could converse in the English language, although I was informed that some of them understood what I said to them. I greatly regret that it was vacation time and that I could not see the school in session.

Mr. H. W. Elliott, who is here under appointment from the Secretary of the Treasury to report on the present condition of seal life, pointed out to me the location of the leading seal rookeries, and lamented the seeming fact that the seal were greatly decreasing in numbers. At dinner we were all the guests of Mr. Tingle; the principal fresh meat being roasted seal. I found it very palatable.

The population of the island consists of 5 whites and 217 natives. There are 23 boys and 41 girls between the ages of 5 and 17.

About 4:30, the tide favoring, we returned to the ship after a very enjoyable day on shore. At 5 p. m. the steamer got under way. We rounded the southern end of the island and fetched our course for Asia.

SIBERIA.

Siberia, the battle-ground of conquering Cossack and free-booting Promyshlenki in their century's march across Asia, is, in its northern and northwestern section, a dreary waste of low-rolling and frozen tundra or rugged, snow-covered and storm-swept mountains, the land of the fierce howling poorga, of wild beasts and scattered tribes of brave, hardy, and half-civilized people.

Its bleak, ice-skirted, snow-covered shore north of Kamchatka was our next landing place. Off this coast on the 5th of May, 1885, the whaling bark *Napoleon* was caught and crushed in the ice. The disaster came so suddenly that the crew had barely time to spring into the boats without provisions or extra clothing. There were four boats with nine in each. Four days after the wreck two of the boats were seen by the bark *Fleetwing*, and their crews rescued, five of them dying from the effects of the exposure. The remaining eighteen men after seven days' tossing about in the sea, took refuge upon a large field of ice, where they remained twenty-six days. During this time one-half of their number died from exhaustion and starvation. While on the ice all they had to eat were two small seals, which were caught. One of the men, Mr. J. B. Vincent, being unable to eat the raw seal, had not a mouthful of nourishment for eleven days.

On the 7th of June the nine survivors again took to the boat, and in three days effected a landing on the Siberian coast, to the southwest of Cape Navarin. The day after they landed, five of the remaining died, being so badly frozen that their limbs dropped off. Rogers, the mate, Lawrence, a boat steerer, and Wal-

ters, the cooper, were also badly frozen and helpless. These were cared for by the natives, who, though in a half-starving condition themselves, divided their living with them. The three men lived through the winter, subsisting on dried fish until March, when Lawrence died, followed the next day by Rogers, and shortly afterwards by Wallace, leaving Vincent the sole survivor of the party. Vincent, being in better physical condition than the others, was adopted by a family having a herd of domesticated reindeer, and therefore had more to eat. With them he remained for over two years until found and rescued July 15, 1887, by Capt. M. A. Healy, commanding the United States revenue marine steamer *Bear*.

While among the deer men, Mr. Vincent carved on a board with a knife the following message, and asked his new made friends on the coast to give it to the first ship they saw. On one side was "1887 J. B. V. Bk. Nap. Tobacco give." On the reverse side was "S. W. C. Nav., 10 M. Help Come." This piece of wood ultimately reached Capt. Healy and told the story, "1887, J. B. Vincent of the bark *Napoleon*, is 10 miles southwest of Cape Navarin. Come to his rescue. Give the bearer some tobacco for his trouble."

Capt. Healy was at Port Clarence when he received the message. With his usual promptness, he steamed over to the coast of Siberia, and after some difficulty in the fog, finally found and rescued the wrecked sailor.

During the following winter Congress made an appropriation for the purchase of presents with which to reward the natives for their care of Mr. Vincent and his comrades. Capt. Healy was delegated to distribute these presents, and for that purpose we were en route to Siberia.

Monday, June 23, opened very foggy, but about 8 o'clock the fog lifted, and Cape Navarin and the coast of Siberia were in full view. A more desolate and dreary scene it is hard to conceive of. A range of mountains with an elevation of about 2,000 feet lined the coast. Cape Navarin itself ended in a precipice 2,512 feet in height, the base of which descended into the sea. Although it was so late in June, the whole country was still covered with snow, except bare spots here and there. Sleds drawn by dogs and reindeer were still in common use. Even while approaching the coast, snow storms were seen sweeping through the cañons of the mountains. The temperature on deck at noon was 45°. A sharp lookout was kept for the native village which was located upon the map, but which was not found upon the coast. At length two tents were seen on the beach, and abreast of them we anchored at 2 p. m. The Captain and Mrs. Healy, Lieut. Dimmock, and myself went ashore. The captain at once sent messengers in every direction on dog-sleds to gather the people together. The main distribution of presents took place on the afternoon of the 24th, and consisted of 1,000 yards of drilling, 500 yards of calico, 100 packages of glovers' needles, 8 dozen hand looking-glasses, 1,500 pounds of ship bread, 2 half-barrels of sugar, 2 barrels of molasses, 1 chest of tea, 6 dozen combs, 5 dozen packages of linen thread, 4 dozen tin pails and pans, 1 dozen iron pots, 2 kegs of nails with hammers, files, gimlets, saws, braces, and other carpenter tools, 1 dozen rifles and one-half dozen shotguns, 125 pounds of powder, 300 pounds lead, 2 bags of shot and 20,000 caps, 1,000 cartridges, axes, hatchets, and butcher knives, 2 dozen fox-traps, 4 dozen pipes, tobacco, snuff, 1 box goggles, one package fish-hooks and lines, beads, and 1 box children's toys. Total value, $1,000.

There are three tribes or families of natives on the Bering Sea coast of Siberia: the Kamtchatkans, occupying the peninsula of the same name, the Tchuctchees, occupying the general region west of Bering Straits and the Gulf of Anadir, and the Koriaks, occupying the country between the former two. Our visit was to the Koriaks, although I afterwards met the Tchuctchees at East Cape. The Koriaks can be divided into three classes: the civilized ones that have come more or less under the influence of the Russian settlements in the interior, the coast men, who mainly subsist on the whale, walrus, and seal, and the deer men, who live off their herds of domesticated reindeer. The latter two classes are more or less nomadic and pagan. They are said to offer sacrifices of dogs.

We met the deer and coast Koriaks. They are a good sized, robust, athletic, and fleshy people, with prominent cheek bones, broad noses, black eyes, and a pleasant, good-natured expression. The men shave the crown of their heads, leaving a fringe of coarse, black hair round the forehead and sides, giving them the appearance of so many monks. They are said to do this that the flying of the hair in the wind may not frighten the wild reindeer when hunting.

The women wear their hair parted in the middle, the two braids hanging down the back. Some braid strings of beads around their necks or pendant from their ears.

The women are very generally tattooed down the center of the forehead and along each side of the nose to the nostril, and elaborate designs cover the cheek. I also saw tattooing on the hands, wrists, and arms. One girl had two waving lines from the forehead to the nostrils, and nine in a fan shape from the lower lip to the chin. Another, with the other marks, had an "X" on the chin at each corner of her mouth. Occasionally the men were tattooed. I saw a husband and wife marked exactly alike. They were dressed exclusively in skins and furs. Neither on their persons nor in the construction of their tents, furnishings, or bedding did I see as much as a thread of wool or cotton. Their clothing, tents, and bedding are made from reindeer skins. Their food is largely dried reindeer meat, supplemented with whale and seal blubber. Their thread is reindeer sinew, and from the reindeer horns are made many household implements.

The dress of both men and women is made of a large skin shirt, so constructed that the fur can be worn outside or next to the skin, as may be desired, and a pair of skin pants with the fur inside. These extend to the knee. Those of the women are wide, so that when tied at the knee, they present a baggy appearance similar to Turkish trousers. Then a pair of fur boots soled with seal or walrus hide. The tops of the boots are tied closely around the bottom of the pants. Suspended by a string around the neck is a fur hood, which can be pulled over the head when needed. The babe is carried inside the parka, or fur coat, on the back of the mother. A belt around the waist of the parka keeps the babe from slipping down too far. The dress of the babe consists of a single garment of reindeer skin, but this garment combines hood, coat, pants, shoes, and mittens all in one. When dressed, only a small portion of the face of the child is visible.

The sleds are made of birch runners. Over these are a half-dozen arches made of reindeer horns. These arches connect the runners and support the floor of the sled. At the rear end of the sled is a slight railing to support the back of the traveler. No iron is used in making the sled; all the parts are firmly lashed together with whalebone strips or rawhide. The runners are shod with bone. Before these are harnessed six dogs in pairs, or two reindeer. The reindeer are also driven side by side. The harness of the reindeer is very simple, being a strap around his neck connected with a trace between his legs.

The tents we saw are conical, like those of the Dakota Indians, the poles being covered with reindeer skins or walrus hides. In some portions of the country, where straight poles can not be had, whalebones are used for frames, and the tents are oval in shape. Within the tents for the sake of greater warmth are small inner inclosures made by hanging reindeer-skin curtains. These small inclosures are the sleeping places. As they follow their herds from one pasturage to another these tents are easily taken down, loaded on the sled, removed to the next camp and set up again.

They have two kinds of boats, consisting of a light frame of birchwoood, over which is stretched seal or walrus skin. The large, open boat is called by the natives oomiak, by the Kamtchatkans bidar. These will carry from 25 to 50 people. The smaller boat is intended for from 1 to 3 men, and is entirely encased in skin, except the openings left for the men to sit in. These are called kyaks, kaiak, or bidarka.

In hunting whales, walrus, and seals they use spears with ivory points set in bone sockets. Small birds and animals are trapped. Their gun is a miniature rifle with a barrel not over 2 feet long. To the stock are fastened by a hinge two light sticks, which are used as supports to the gun when firing. Powder and lead are so difficult to obtain and so expensive that the hunter runs no unnecessary risk in using it. It is said that sometimes they hunt to recover the bullet in order to use it again. I tried in vain to purchase one of these guns. They seem to have no chiefs, their organization being largely patriarchal. If one man accumulates more deer than his neighbors, he secures a certain amount of influence on account of his wealth. Poor men, who have no deer of their own, join his band, and assist in caring for his herd, in return for food and clothing. The only law that governs the community seems to be the natural law that is found in all barbarous tribes, that of retaliation. A few years ago a feud started between a band living on the coast, and a band of deer men living in the neighborhood, during which the latter band was exterminated.

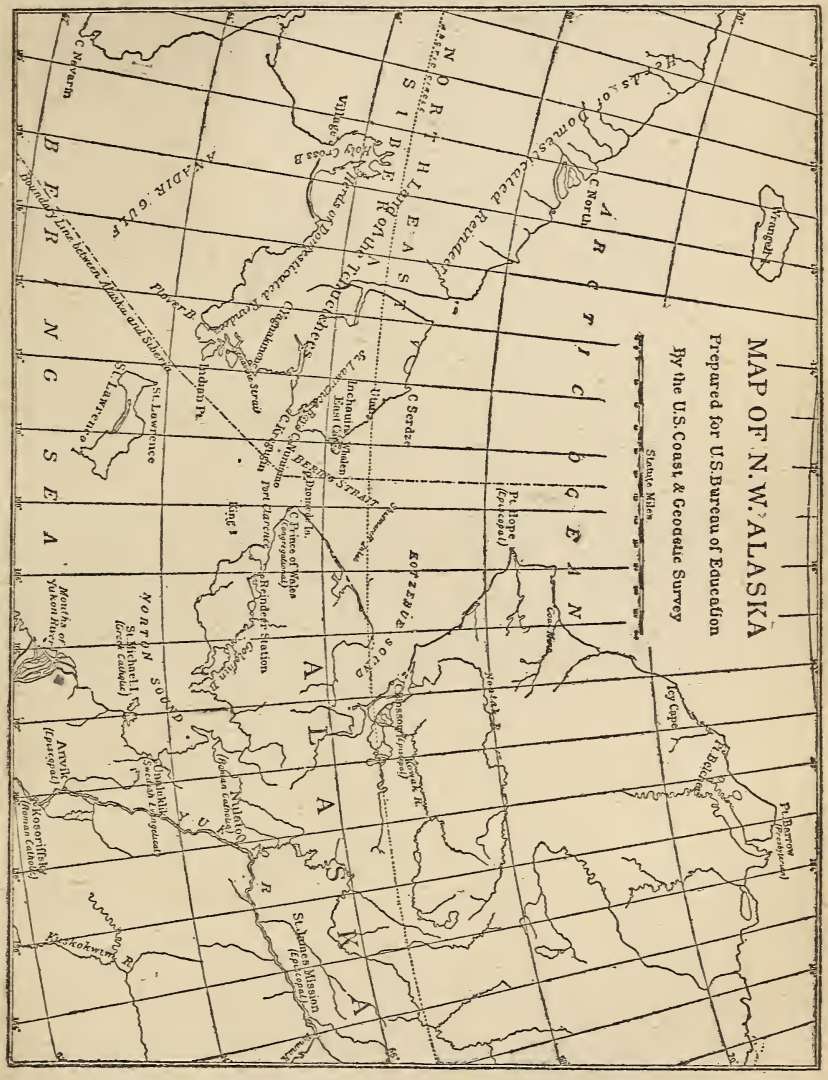
They impressed me as a very unselfish people. In the distribution of the presents none seemed to think that someone else was receiving more than he. The more frequent expression of anxiety seemed to be that no one should be overlooked. They also called attention to some who were unavoidably absent, and offered to take them their share. Evidently some of them had never been

upon a ship before, and they were naturally curious to look all over it. Sometimes when a family came off in their boat, at first only the men came aboard. After a while, as if gaining confidence, the women and children would venture. Frequently as soon as they were on deck they would sit down as if afraid to stand up. One woman reaching the deck in safety expressed her joy by throwing her arms around her husband's neck and they rubbed noses (their method of salutation in the place of kissing).

I secured from them for the museum of the Society of Natural History and Ethnography at Sitka, a number of things to illustrate their manner of living.

There being a herd of some 1,500 reindeer a few miles up the coast, in order that we might visit them and the ship procure some fresh meat, after the distribution of the presents the captain got under way and sailed up to the reindeer herd, where he again anchored. Going ashore, we found the herd on the beach, some of them apparently drinking the salt water. The winter with its unusual amount of snow had been severe upon them, so that they were very poor. They were also shedding their hair and their horns were in the velvet, so they did not make a very impressive appearance. Off to one side two sleds were standing with two deer attached to each. Getting upon one of the sleds, by motions I made them understand that I wanted a ride, and a short one was given me. The reindeer were much smaller than I had expected to find them, the majority of them being not much larger than the wild deer of other sections. The captain purchased four deer, which were slaughtered and dressed for him. When getting ready to lasso the deer the owner's family seated themselves in a circle on the ground, where probably some rites connected with their superstitions were observed. Upon attempting to approach the circle we were motioned away. After a little while the men went out and lassoed a selected animal, which was led out on one side of the herd. The man that was leading it stationed himself directly in front of the animal and held him firmly by the two horns. Another with a butcher knife stood at the side of the deer. An old man, probably the owner, went off to the eastward, and placing his back to the setting sun seemed engaged in prayer, upon the conclusion of which he turned around and faced the deer. This was the signal for knifing the animal. With apparently no effort, the knife was pushed to the heart and withdrawn. The animal seemed to suffer no pain, and in a few seconds sank to his knees and rolled over on his side. While this was taking place the old man before mentioned stood erect, motionless, with his hand over his eyes. When the deer was dead he approached, and taking a handful of hair and blood from the wound, impressively threw it to the eastward. This was repeated a second time. Upon the killing of the second animal the wife of the owner cast the hair and blood to the eastward. I did not remain to the slaughter of the other two. While the animal was bleeding to death several women and girls gathered around and commenced sharpening their knives on stones preparatory to skinning the animal, which they proceeded to do as soon as the deer were dead. Engineer Meyers photographed the herd.

At 4:15 on the morning of the 25th the ship was gotten under way and we started northward. After proceeding about 20 miles we ran into a large field of floating ice. The sun was shining brightly. Off upon the western horizon, clear-cut against the sky, glistening and sparkling in their covering of snow, were the Siberian mountains, while all around us, as far as the eye could reach, were great masses of heavy ice, rubbing and grinding against one another. We were six hours steaming through this ice. While in the ice the captain shot three, and secured two, hooded seal. Great numbers of waterfowl were in the open spaces among the ice.



It was here that the whaling bark *Sappho* was crushed and sunk in 1882, and the barks *Rainbow* and *Napoleon* in 1885, and the bark *Ladoga* in 1889. This last vessel escaped destruction and was repaired. Just to the northward, between us and our destination, St. Lawrence Island, in 1885 the bark *Gazelle* was crushed and sunk.

On Saturday afternoon, June 28, we sighted the snow-covered coast of St. Lawrence Island, and dropped anchor off the village Chib-u-chak on the northwest corner of the island. We are now in latitude 64 degrees north. The sun rises at 1:55 o'clock and sets at 10:05 p. m. Temperature at noon 40 degrees. This is the largest island in Bering Sea. It was discovered and named by Bering's expedition in the summer of 1728. In 1775 the island was sighted by Captain Cook and named Clark Island. On the 10th of July, 1817, it was visited by Kotzebuej's expedition in the *Rurik*, and in 1830 by Etolin in command of the brig *Chicagof*. Etolin found five native villages on the island. In 1878 the island was the scene of a great tragedy. Starvation and pestilence carried away over 400 of the people.

When the revenue cutter visited the island in 1880 not a man, woman, or child was left to tell the tale. In four villages the corpses of the population alone were found. All the villages on the island with the single exception of Chib-u-chak had been swept out of existence.

In 1884 Capt. Healy reports, "At the villages along the north shore no sign of living beings could be found, but the still decaying bodies of the unfortunate Eskimos were lying in and about the falling houses."

Before we dropped anchor four or five umniaks, loaded with natives, were waiting to board us. As soon as the anchor went down they paddled up to the

gangway, and from sixty to seventy men, women, and children came aboard, prepared to barter walrus tusks, ivory carvings, fur clothing, native boots and shoes, seal skin, etc. The women were more highly tattooed than any we have before met. As the captain wished to take the census of the village he had to go across to Indian Point (Cape Tchapalin), Siberia, for an interpreter.

It was a five-hours run. We reached Indian Point about 6 o'clock in the morning. The natives were soon off in force with the usual things for barter, and a few to secure the services of the ship's physician. The village consisted of some 2 dozen skin tents, also a few underground huts and one small frame house. Above the tide on the beach along the whole front of the village lay

the unbroken ice and snow. The village itself is on a low sandspit that projects out into the sea. The mountains back and above the village were covered with snow, and even while we were anchored there, a driving snow storm was sweeping over them. Small cakes of floating ice were drifting around the vessel.

Going ashore, I was greatly impressed with the number of the children. In all the journey I have not met so large a number. Being in Russia, our Alaskan school system can not reach them. They are an Eskimo colony, speaking the same language as the natives of St. Lawrence Island. Perhaps they could be induced to remove over there for the sake of schooling their children.

At Indian Point we had eider ducks for dinner, and found them good eating. Securing an interpreter, Tommy Tough by name, the captain, on the morning of June 30, returned to St. Lawrence Island. On our way across, although an allowance of 5 miles had been made for the current, the vessel was carried 10 miles farther out of its course, making a drift of 15 miles in a distance of 40. A dense fog having set in, the ship passed north of the island without seeing it. The fog lifting at 10:30 a. m., we retraced our course and soon after dropped anchor abreast of the village, and I went ashore with Lieut. Dimock, Dr. Holmes, and the interpreter.

The houses are from 20 to 40 feet in size. For a distance of 5 or 6 feet above the ground the walls are built of driftwood, whalebone, or timbers and planks from shipwrecked vessels. These are placed on end side by side, forming an inclosure in a circular or oblong form. The cracks between these planks are stuffed with moss. From the top of these walls rafters made of poles are extended across, meeting in the center. These are supported in the center by a ridge pole resting upon posts. These rafters are covered with walrus and seal skins, forming the roof. Some roofs are in the shape of a cone and others of a dome. Inside they are partitioned off around the sides with deer skin curtains. The spaces curtained off form the sleeping places. All around, inside and outside, are filth, dirt, sleds, spears, snowshoes, and household utensils. The houses and tents are located with no reference to order or street lines. The sleds are shod with bone. On a few small ones, the whole runner was made of a walrus tusk.

If the building is a very large one there is a row of supporting poles on each side, midway between the center and sides. Over the rafter poles are stretched walrus hides. These are held in position by rawhide ropes, attached to which and hanging down the sides of the building are the vertebræ of whales, large stones, and old iron from shipwrecked vessels. This anchorage both stretches the skins and prevents them from being blown off. These skins being translucent let in a great deal of light. There are no windows in the house, and but a small opening, from 2 to 2½ feet above the ground, for a door. Fire, when they have any, is made on the dirt floor in the center of the room. Each building is occupied by several families. Near the house is a scaffold made of posts of the jaw bones of the whale. These are 7 to 10 feet high and 10 feet wide. A series of these make the scaffolds from 20 to 30 feet long. On these are placed the skin boats, harness of the dogs, meat, etc., so as to be out of the reach of dogs. Upon one of these, attached to the whale bone cross beam, was a child's swing made of walrus thong rope.

I saw several excavations where underground houses had once been, and one such house still standing with the roof partially fallen in. The sides were composed of walrus skulls laid up like a New England stone wall. In this house were some corpses, together with the spear and arrowheads and personal belongings of the dead.

Large patches of snow and ice still remain in the village, some of them being from 3 to 4 feet deep. As we passed from house to house we were followed by a crowd of dirty, but bright-looking children. From the eldest to the child which was just able to talk, they asked for tobacco, which is used by both sexes and all ages down to the nursing child. Five little girls, from 4 to 10 years of age, gave me a native dance. They commenced with a swinging motion of the body from side to side, throwing their weight alternately upon each foot. This was accompanied by an explosive grunt, or squeak, as if the air was being violently expelled from the lungs. As they warmed up, they whirled around, writhed and twisted their bodies and distorted their faces into all manner of shapes and expressions, until they would fall down with dizziness.

The census revealed a total population of 270, of whom 70 were boys and 55 girls, living in 21 houses. This is a good village for a school. One established here ought to draw to it some families from Indian Point, Siberia. They are the same people, and the two villages are about 40 miles apart. During the summer of 1891 the Reformed Episcopal Missionary Society will establish a mission school at this village.

KING ISLAND.

Returning the interpreter to Indian Point, the captain steamed away for King Island, which we reached about 5 p. m. on July 1. This is one of the most remarkable settlements in America. The island is a great mass of basalt rock, about a mile in length, rising from the sea with perpendicular sides from 700 to 1,000 feet above the water. On the south side the wall is broken down by a ravine rising at an angel of 45 degrees, and is filled with loose rock. A great, permanent snow bank filled the bottom of the ravine from the water to the top of the mountain. On the west side of the snow is the village of Ouk-i-vak, which consists of some 40 dwellings or underground houses, partly excavated in the side of the hill, and built up with stone walls. Across the top of these walls are large poles made from the driftwood that is caught floating around the island. Upon these are placed hides and grass, which are in turn covered with dirt. A low tunnel or dirt-covered hallway, 10 to 15 feet long, leads directly under the center of the dwelling. This is so low that we had to stoop and often creep in entering. At the end of the hall directly overhead is a hole about 18 inches in diameter. This is the entrance to the dwelling above.

Frequently in summer, these caves become too damp to live in. The people then erect a summer house upon top of the winter one. The summer house consists of walrus hides, stretched over a wooden frame, making a room from 10 to 15 feet square. These summer houses are guyed to rocks with rawhide ropes, to prevent them from being blown off into the sea. The entrance is an oval hole in the walrus hide, about 2 feet above the floor. Outside of the door is a narrow platform about 2 feet wide, leading back to the side of the hill. Some of these platforms are from 15 to 20 feet above the roofs of the huts below them. Across the ravine from the village, at the base of the perpendicular sides of the island is a cave, into the mouth of which the surf dashes and roars. At the back of the cave is a large bank of perpetual snow. On the side of the mountain above there is a perpendicular shaft from 80 to 100 feet deep, leading down into the cave. This cave is the storehouse for the whole village. Walrus and seal meat is dropped down the shaft, and then stored away in rooms excavated in the snow. As the temperature in the cave never rises above freezing point, meat so stored soon freezes solid and keeps indefinitely. The women gain entrance to their storehouse by letting themselves down the shaft, hand over hand, along a rawhide rope.

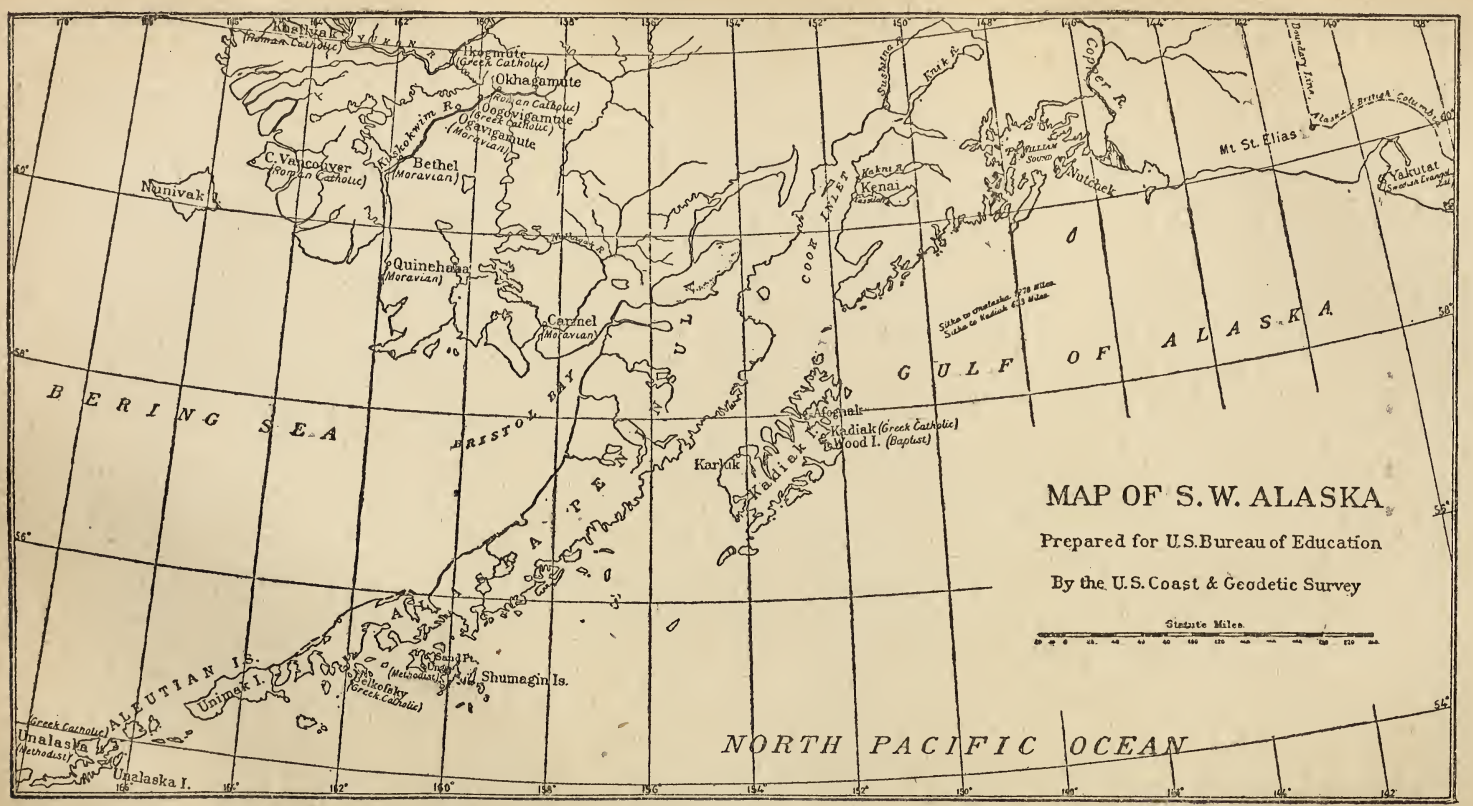
Capt. Healy had a census taken with the following result: Total population 200, of whom 33 were males and 45 females under 21 years of age. Here, as at the other native villages, I secured a number of articles of interest for the museum of natural history and ethnology at Sitka.

THE WHALING FLEET.

At 3:15 a. m. on the 2d of July the ship anchored at Port Clarence, in the midst of the Arctic whaling fleet. Eight steamers and eighteen sailing vessels, all flying the American flag, were an inspiring sight in this far off, uninhabited bay; almost within the Arctic Circle; and the more so, as a few months ago, in Washington, I heard a gentleman who had just returned from a trip around the world, say in a public address that in all his trip, he had seen but one vessel flying the Stars and Stripes. Many of the whalers leave San Francisco in January, and it is their custom to gather at this point about the 1st of July before entering the Arctic Ocean, to meet a steamer sent from San Francisco with a fresh supply of provisions, coal, etc.

Soon after anchoring, the captains of the whalers began arriving in order to get their mail, for the captain of the revenue steamer, among other good offices for humanity, brings up the yearly mail for the 2,000 whalers, traders, teachers, and missionaries, and whoever else may be living in the Arctic regions of the United States. For those who have had no tidings from their loved ones at home or returns from an important business transaction, the coming of the revenue steamer is an important event. Great bundles of letters and papers were piled upon the captain's table, and again and again they were carefully scanned, each captain picking out those that belonged to himself or his crew. Some of them did this so nervously, that though they personally looked over the packet three or four different times, they still missed some, which would be detected and handed out by some one following.

A few visiting Eskimos were camped upon the beach, some of them being dressed in bird instead of deer skins.



The day before we arrived the mate of one of the vessels had died, and an officer on another vessel was very sick, dying a few weeks afterwards. In a fleet with hundreds of sailors are some accidental cuts, bruises, etc., so that there were many calls for the professional services of the Government physician. This is another feature of the beneficent work of the revenue steamer. In Arctic Alaska in summer are 2,000 sailors on the whalers, a hundred traders and thousands of natives, covering an area of tens of thousands of square miles, and no physician except the one carried around on the annual cruise of this vessel. The value of such services can not be estimated.

During our stay at Port Clarence Capt. Healy, in the discharge of his official duty, as usual, sent officers on board of every vessel to search for liquors. The large majority of the captains of the whaling vessels are opposed to the trading of liquors to the natives for furs; but there are some who believe in it, and boldly say that if the cutter did not come and search them they would engage in it, and that they do engage in it on the Siberian coast, where the cutter has no jurisdiction. The result of the search was that 11 barrels of alcohol and 6 cases of gin were seized upon one schooner and emptied into the ocean. One captain, seeing the officer coming, emptied a barrel of liquor over the side of his vessel and threw three gallon cans after it. The cans, instead of sinking, floated by the searching officer. He, doubtless thinking them empty kerosene cans, did not take the trouble to pick them up. During the past ten years hundreds of barrels of vile liquors have been emptied into the sea as the result of the vigilance of Capt. Healy and the officers of the revenue cutter. The amount of crime, suffering, and destitution thus prevented can not be overestimated. The country and all who are interested in saving the natives of this coast from the demoralization of rum owe a large debt of gratitude to Capt. Healy, who has practically broken up the traffic on this northwest coast.

One of the captains reported a case of assault and battery with intent to kill. On the 30th of June his steward had dangerously wounded one of the sailors, cutting with a razor a gash 8½ inches long and to the ribs in depth. The steward had been in irons ever since. It was a small schooner and there was no suitable place for keeping the prisoner, who had threatened to kill the mate and fire the ship when he regained his liberty. Under the circumstances the captain was very anxious to get rid of him, and wrote Capt. Healy, as the nearest Government official, an urgent letter asking him to take the man off his hands. This is another phase of the many-sided work of a Government cutter in this vast land without law or courts. The steward being equally anxious to claim the protection of the Government, he was brought alongside in irons. The irons were taken off and he was assigned work. The commanding officers of all the revenue vessels visiting these outlying portions of the country should be clothed with the powers of a justice of the peace, so that offenses could be investigated, testimony taken, and offenders arrested and bound over for trial at the United States district court at Sitka. As it is, the captain could not legally have taken this man against his will, and when the vessel arrives at San Francisco the man can go ashore a free man, escaping not only all punishment, but even an official investigation.

In the harbor awaiting our arrival was the schooner *Oscar and Hattie*, Capt. J. J. Haviside master, laden with building material and supplies for the schoolhouses at Cape Prince of Wales, Point Hope, and Point Barrow. The schooner got under way that same afternoon for Cape Prince of Wales, about 30 miles distant. Upon the following day the schooner *Jennie* arrived with supplies for the whalers. She had on board the four teachers, Messrs. H. R. Thornton and W. T. Lopp for Cape Prince of Wales, Dr. John B. Drigg for Point Hope, and Mr. L. M. Stevenson for Point Barrow. At midnight we witnessed one of those gorgeous sunsets for which the Pacific coast is so famous.

On the morning of the 4th of July all the vessels "dressed ship" in honor of the day. At 8 o'clock a. m. we got under way, reaching Cape Prince of Wales at 1:25 p. m. The captain very kindly sent Prof. Thornton and myself ashore at once, and we celebrated the 4th of July, 1890, by locating at this extreme western end of the western hemisphere the site and laying the foundations of the first schoolhouse and mission on the Arctic coast of Alaska. From this school is visible to the north, the Arctic Ocean; to the south, Bering Sea, and to the west, Bering Straits, the coast of Siberia, and Diomede Islands. The cape is a bold promontory crowned with groups of needle rocks. As we had a teacher on board, we could trace the resemblance of one group to a teacher and pupils. Back of the coast the mountain peaks rise to the height of 2,596 feet. At the base of the promontory is a low sand spit, upon which is built the native village of King-e-gan. This school is one of the contract schools of the U. S. Bureau of Education and is in charge of the American Missionary Association of the

Congregational Church. The money needed for its establishment was contributed by the Congregational Church of Southport, Conn., Rev. William H. Holman, pastor.

At Port Clarence volunteers were called for and through the courtesy of the several captains the following carpenters offered their services without pay in the erection of the schoolhouses at Cape Prince of Wales and Point Hope: Charles Johnson, of the steam bark *Thrasher;* James Hepburn, of the *Balena;* Edward E. Norton, of the *Orca*, and A. S. Curry, of the *Grampus*. Capt. Healy sent off 2 carpenters and 10 or 12 men from the *Bear*.

While the house was building Capt. Healy took the ship over to (Krusenstern) Little Diomede Island to take the census of Imach-leet. Upon our arrival it was storming so badly that he was compelled to continue on over to the Asiatic side for a safe anchorage. On the third day, the storm having abated, we started for Imach-leet, calling at East Cape on our way. We also passed close to Inug-leet, on Ratmanoff Island, but did not go on shore.

Bering Straits, which separate the American and Asiatic continents, are 40 miles broad. These straits were first passed by Capt. Bering in August, 1728, who demonstrated the fact that Asia was separated from America. It remained for Capt. Cook, in August, 1778, to complete Bering's discoveries and give to the world the exact relations of the continents to each other. Nearly in the center are Big and Little Diomede (Ratmanoff and Krusenstern) islands. The former belongs to Russia, and the latter to the United States. As these islands are only 2 miles apart, Russia and the United States are here close together.

Imach-leet, like Inug-leet and Ouk-i-vak, is built upon the steep side of a mountain, and is the filthiest place yet visited. Being so close to the Asiatic settlements, it is the gateway of much of the liquor smuggled into this section of Alaska. A school with an efficient teacher at this place would prevent much of this illicit traffic and accomplish a great work.

As we returned to King-e-gan we sailed close to Fairway Rock, the Indian name of which is Oo-ghe-e-ak, and is said to signify, "Thanks to God," because there is room to shelter two native boats which may be overtaken in this part of the sea by a storm. Fairway Rock is a quarter of a mile in circumference and from 300 to 400 feet high. It is one of the natural danger-signal stations of Bering Sea and the Arctic, being occupied by myriads of birds, which, by their continual cries in thick and foggy weather, warn the navigator of his proximity to the rock.

At King-e-gan the captain picked up his carpenters and sailors, who had finished the school building, and on the afternoon of July 12 we started northward through Bering Straits into the Arctic Ocean. Twenty-four hours later we crossed the Arctic Circle and were in "the land of the midnight sun."

July 13 Capt. Healy anchored off Schishmareff Inlet to take the census. At the time of Capt. Beechey's expedition in 1826 there was a large native village here. Now it is reduced to a very small number.

In visiting the camp upon shore I came across the oldest-looking native that I have seen this season. A number of the natives visited the ship. Wild ducks were so plentiful that the captain bought a couple of dozen for the table at the rate of a cent apiece. The next morning we anchored off Cape Blossom, in Kotzebue Sound. This sound was discovered on the 1st of August, 1816, by Capt. Kotzebue, in command of the *Rurik*, fitted out by Count Romanoff, of Russia, to discover the northwest passage. In September, 1826, it was visited by Capt. Beechey in the British ship *Blossom*, who was coöperating with Sir John Franklin, Franklin working from the eastern side toward the west, and Beechey from the western side eastward. The two expeditions failed to make connection. While in the sound Capt. Beechey buried a cask of flour. In July, 1850, the ships *Herald*, Capt. Hellett, *Plover*, Capt. Moore, and the *Investigator*, sent by the British Admiralty in search of Sir John Franklin, and the schooner yacht *Nancy Dawson*, under her owner, Robert Shedder, visited the sound. The flour buried nearly a quarter of a century before was found in good condition, and a dinner party given, at which were cakes and pies made from it. In Eschscholtz Sound, the southwest arm of Kotzebue Sound, are cliffs from 20 to 80 feet in height, which rise into hills between 400 and 500 feet above the sea.

At the time of Kotzebue's visit this cliff was supposed to be an immense iceberg, covered with a foot of soil and grass, but was found by Capt. Beechey to be frozen earth. The interesting feature of the cliff is that it contains a large deposit of fossil ivory, mammoth tusks, teeth, and bones. I secured portions of two mammoth tusks and two teeth.

One afternoon Lieut. Buhner and myself started to visit some of the native villages. After going about 15 miles we got on the shoals and were compelled

to return to the ship. While absent we landed and visited some native graves. There is a row of them extending for miles along the beach. As there is a frozen subsoil, rendering it very difficult to dig graves, the dead are wrapped up in seal skins, which are securely tied and then deposited above the ground in the forks of poles or elevated platforms so high above the earth that the wild animals can not reach them.

The whole landscape out from under the snow was covered with beautiful wild flowers, and we were covered with mosquitoes that swarmed around us in clouds. We saw very few natives on the beach, they being largely at Sheshalik, on the north side of Hotham Inlet. When the ice leaves Kotzebue Sound in the summer the beluga, or white whale, comes in, and the natives come down the rivers by hundreds from the interior to hunt him and later on to barter with the coast tribes. About the middle of July the run of the whales is over, and that of the salmon commences on the Cape Blossom side of the inlet. The population then change their tents from the north to the south side of the inlet. In the mean time the Alaskan and Siberian coast natives are arriving day by day, until in August from 1,500 to 2,500 people are gathered on the spit north of Cape Blossom, fishing and trading. This is the great international annual fair and market of Arctic Alaska.

The natives of the interior here barter their beautiful furs with the natives of the coast for seal oil, walrus hides, and seal skins, and with the natives of Siberia for reindeer skins, whisky, and breech-loading firearms, cartridges, etc. Formerly these gatherings were visited by schooners, fitted out at San Francisco and Sandwich Islands, with cargoes of liquor in bottles labeled "Florida Water," "Bay Rum," "Pain Killer," "Jamaica Ginger," etc. This traffic has largely been broken up by the visits of the revenue cutters.

A schooner was at anchor off Cape Blossom when we arrived. Seeing the cutter it weighed anchor and sailed away, but not before an officer had been sent on board to search her. Although no unusual supply of liquor was found on board, yet that afternoon a native and his wife were found drunk from liquor received from this vessel. They were brought aboard the cutter, testified where they secured the liquor, received a reprimand, and upon the promise of not drinking again, were let go.

On the north side of the sound is the entrance to Hotham Inlet into which empty two large rivers, the Kowak and the Noatak. Although the existence of these rivers was known in a vague way by reports from native sources, they were first explored and mapped in 1883, 1884, and 1885 by expeditions fitted out by Capt. Healy, commanding the *Corwin*. As the larger number of natives whom I wished to see had not yet arrived the captain concluded to go on and fulfill his duties farther north and return here before the people should separate, consequently, on the morning of the 16th, with a fair wind, he sailed northward. We were soon abreast of Cape Krusentern, where, in July, 1886, the *John Carver* was crushed in the ice. On the morning of the 17th we dropped anchor off Cape Thompson to water ship. The ship's boats were taken ashore and filled with fresh water from a creek. The boats were then rowed back to the ship and the water pumped from them into the ship's tanks. By noon the tanks were full and we had on board a month's supply of water. In the afternoon the sailors were allowed to go ashore and wash their clothes. Soon after anchoring the natives began to come on board and the deck was covered with them all day.

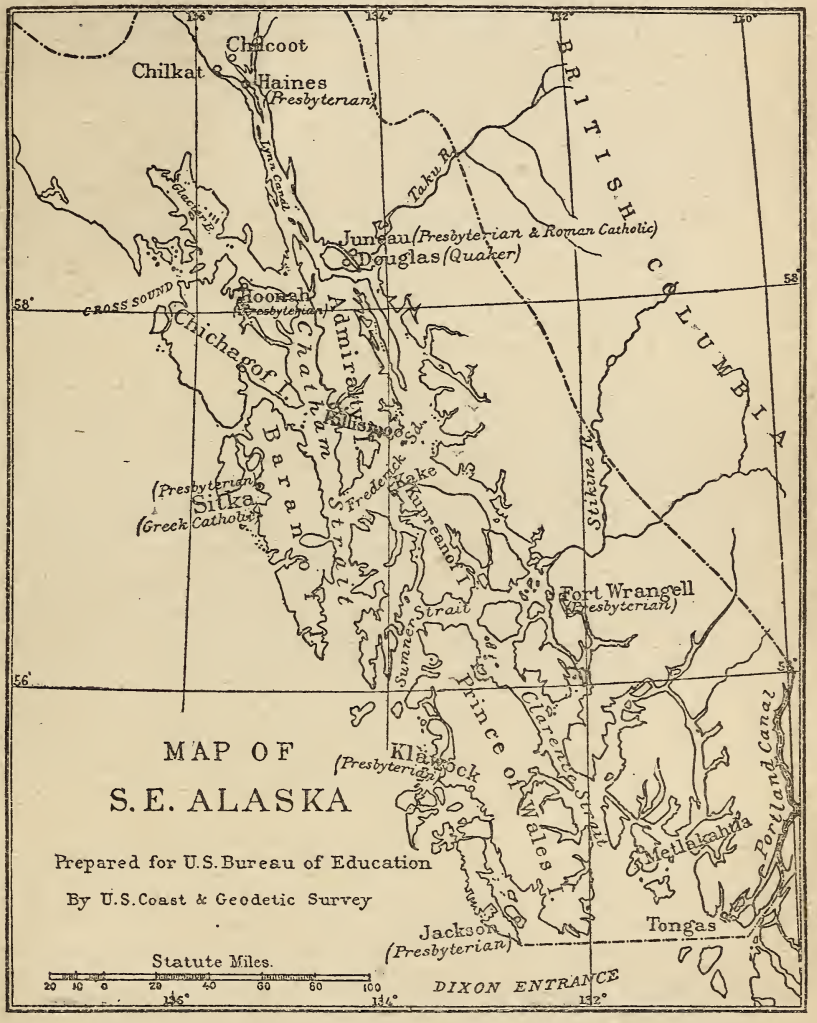
Cape Thompson is a bold, rocky bluff 1,200 feet high. It is a remarkable cliff geologically, showing a great fold of the earth's crust. The face of the cliff is also a great bird rookery, birds by the thousand and tens of thousands nesting in the cracks and upon the projections of the rocks. Wishing some egg shells a party of natives were hired for a few crackers to get some eggs. Taking a rope with them, they scaled the cliffs, and letting one of their number down the face of the precipice with the rope he soon gathered two bushels and a half of eggs.

Leaving Cape Thompson at 5 o'clock p. m. we reached Point Hope about 11 p. m., and dropped anchor in the midst of twelve vessels, largely belonging to the New Bedford whaling fleet. The captain immediately dispatched a boat for mail to the bark *Thomas Pope* that had come up from San Francisco with supplies to the whalers from New Bedford. In due time the boat returned with a batch of papers as late as June 10, but no letters. It then being nearly midnight I concluded to remain up and see the midnight sun, which dipped about half way into the water and then commenced to rise again. At the setting it was partially obscured by a cloud, but the rising was cloudless and beautiful.

Point Hope is a narrow stretch of land extending out into the Arctic Ocean, some 16 miles from the general line of the coast. This gives it its native name Tig-e-rach (Finger.) It has evidently been formed by two great fields of ice

grounding on the bottom and pushing the sand in a ridge before them, until the ridge rises above the ocean. Between these parallel ridges is a lake extending nearly the entire length of the peninsula. Formerly the cape extended still farther into the ocean, but one year the ice pack came along with such force as to cut the end off, sweeping away with it a number of underground houses.

For three days we lay at anchor riding out a southern gale. Ten days later (July 28), at the same place, in a similar storm, the *Thomas Pope*, having not yet finished discharging her freight was driven into the breakers and wrecked, and her crew was received on board the revenue cutter by Capt. Healy. On Monday, July 21, the storm having abated, the ship was moved nearer the village and I went ashore to inspect the school building, which was in process of erection by Capt. Haviside and the volunteering carpenters who had preceded us from Cape Prince of Wales, where Capt. Healy had remained to finish up the work on that school building. Capt. Healy sent his carpenter and a number of sailors on shore to assist in the work. By night the building was finished and ready for occupancy. This is the second of our new schools in the Arctic. It is a contract school under the supervision of the Mission Society of the Protestant Episcopal Church. The teacher is John B. Driggs, M. D. The advisability of the establishment of a school at this point was represented to me last fall by Lieut. Commander Charles H. Stockton, U. S. Navy, who had just returned from a cruise on this coast. Bringing the matter to the attention of Hon. W. T. Harris, LL. D., United States Commissioner of Education, and through him to the honorable Secretary of the Interior, I had the privilege of securing the establishment of schools for the Arctic Eskimo at that place.



While at Point Hope I visited the native village, but few of the people being home. I also visited the cemetery; the dead, tied up in deer and walrus skin blankets, are laid on platforms above the reach of dogs and wild beasts. The present population is about 300. But in the year 1800, when this was the leading tribe on the Arctic coast, the village is supposed to have had a population of about 2,000. In that year their power was broken by a great land and sea fight near Cape Seppings, between them and the Nooatoks of the interior. In this disastrous battle their leading hunters being killed, a famine set in which carried away half of the remaining inhabitants. During the day a number of natives came on board. Among them were three from Cape Prince of Wales. Last winter while out on the ice after seals, the ice broke loose from the shore and floated out to sea, carrying them with it. They were on the ice drifting helplessly about in the Arctic Ocean for a month or six weeks, when the floe finally went ashore at Cape Thompson, 150 miles north of where they started from. The party of five were reduced to the greatest straits for food, even eating up their boots. One died on the ice, and a second soon after landing, leaving three to be returned on the cutter to their friends and homes. Last winter two men on the ice hunting were drifted away from this place and have never been heard from.

Four ships have been wrecked here in late years. The *Louisa* and the bark *John Howland* in 1883; the *Thomas Pope* in 1890, and the *Little Ohio* in 1888. In connection with the latter wreck, the officers and 30 men were drowned. Among those that were saved was a sailor, who took a position at the whaling station. Last winter while en route from Cape Lisburne coal mines to Point Hope, he froze his feet so badly that mortification set in. Upon the arrival of the *Bear* he was received on board for medical attendance, and his toes were amputated by the surgeon.

In 1887 a San Francisco firm established a whaling station several miles from the village, the influence of which has been demoralizing. The natives are now recruiting their numbers by purchasing children from the interior tribes, which children, as they grow up, become a part of the tribe. The market price for a child is a seal skin bag of oil, or a suit of old clothes.

Having attended to everything that was necessary at Point Hope, and paid off the natives who assisted in the erection of the schoolhouse, our mail was sent over to the *Thomas Pope*, which was soon to sail for San Francisco, and at 10 o'clock a. m. on the 22d of July we sailed north with a fair wind, passing Cape Lisburne at 1:35 p. m. From Cape Lisburne the coast turns to the eastward at almost a right angle, the general trend being to the northeast until Point Barrow, the most northern limit of the continent, is reached. Cape Lisburne, 849 feet high, is a bold bluff of flint and limestone, abounding with fossil shells and marine animals. It is also in its season a noted rookery for birds. The immediate vicinity is said to be the flower garden of the Arctic (Koog-Moote) on account of the number and variety of the wild flowers. From Cape Lisburne there is a uniform descent and breaking down of the hills for 50 miles

to Cape Beaufort. At Cape Beaufort is the last point where the hills reach the coast. Soon after leaving the cape, the ice has pushed up the sand, forming a shingle or outer coast, running parallel with the real coast. This outer coast is a strip of sand with a varying width of 900 to 1,000 feet, about 6 feet above the level of the sea, and extending 120 miles north. The body of water inclosed between the two coasts is from 2 to 6 miles wide. From Cape Lisburne to Cape Beaufort are extensive coal mines, at which some of the steam whalers replenish their exhausted supplies. This season over 500 tons have been mined by the whalers. At Cape Beaufort the geological formation is sandstone, inclosing petrified wood and rushes, with veins of coal. Drift coal was found on the beach almost

up to Point Barrow. During the night the wind gradually grew stronger until towards morning, when we encountered a heavy southwest gale, causing the ship to roll until it was almost impossible to keep in bed.

At 11 o'clock a. m., on the 24th of July, we were in the midst of floating ice, and at noon anchored off Cape Collie. Soon the musquitoes began to swarm on board, and the captain moved his anchorage farther out to sea.

We were again in the midst of the whaling fleet, and at the edge of the ice pack which prevented farther progress to the north. The Arctic "pack" is the name given to that large body of perpetual solid ice in the Arctic Ocean extending from the coast of Alaska across to Siberia. Its southern limit is constantly

changing with the severity of the season, and the course of winds and currents. Its southern edge is also irregular, sometimes containing openings or canals extending into the pack for miles, these are called "leads." A wider and shorter opening is called a "pocket."

In August, 1778, Capt. Cook found the southern edge of the pack resting on Icy Cape, 40 miles south of our present anchorage. It was a compact wall of ice, 10 feet above the water and from 70 to 90 feet under the surface, extending west of north and east by south, from continent to continent. In 1826 Capt. Beechey did not meet it until near Cape Smyth, 120 miles farther north. August 20, 1879, the fleet reached the pack at Blossom Shoals, off Icy Cape. August 10, 1885, the pack was at our present anchorage. Cape Collie is at the north side of the entrance to Wainwright Inlet, an extensive lagoon into which empties a considerable river from the interior. After lunch I accompanied Lieut. Dimock and the interpreter ashore, on a visit to the native village of Koog-mooto. On account of the shore ice making out some distance from the beach, we had great difficulty in landing and still greater danger in embarking again. Along the outer edge was a mass of detached pieces of ice that under the influence of the waves were bobbing up and down and constantly shifting their position. The greatest care had to be taken lest our small boat should be caught and crushed. And when we got upon the ice and attempted to make our way from one cake to another the peril was still greater. Although our heads and faces were covered with musquito netting, the little insects managed to get inside and make our stay ashore a torment. Arctic ptarmigan were abundant. The first party of natives we met were eating reindeer meat. Taking a large chunk in the left hand and fastening upon it with the teeth, a knife held in the right hand was passed upward close to the mouth, severing a piece as large as could be conveniently chewed. I think a beginner at this method of carving meat would slice off the end of his nose.

I counted twelve underground huts in the village, none of which were occupied. The larger portion of the people were inland hunting reindeer. The few remaining at the village were living in tents, their winter houses being partly filled with water. While on shore I walked out on the ice to the hull of the *George & Susan*. This bark was wrecked on the 10th of August, 1885, together with the *Mabel*. Three of the crew were drowned in getting ashore, and some of those that escaped were in an exceedingly critical condition for several hours after they were rescued by Capt. Healy and taken aboard of the revenue cutter *Corwin*, which was anchored in the neighborhood.

Early on July 25 we started in search of the "ice pack," which we found 5 miles away. After skirting the pack a short distance, the captain returned in shore and anchored off Point Belcher. At this point is another small village (She-rah-rack) of twelve winter hunts, which I visited. But three or four families remained in the place, the others being off hunting the reindeer.

On July 26 it snowed nearly all day. At 11 p. m. the captain again started out to examine the condition of the ice. After skirting the edge of the pack for some distance we returned and anchored of Cape Franklin. In the afternoon the captain changed his anchorage a few miles north, off Sea Horse Islands. While lying here at anchor Capt. Healy secured for me two nests and eggs of the eider duck.

We are now in the midst of the Arctic graveyard of ships. In the last 20 years from 75 to 80 vessels connected with the whale trade have been wrecked on the American side of the Arctic coast, and from 15 to 20 on the Asiatic side. In 1871 33 ships were caught in the ice near here and abandoned, and 1,200 sailors were cast helplessly on this sterile coast, with an insufficient supply of provisions, and for 100 miles the ice pack was solid between them and escape. There was then no refuge station at Point Barrow, but fortunately they were able to get south along the coast until they met some ships that took them off. Again, in 1876, 13 whaling vessels were caught in the ice off these same Sea Horse Islands and drifted helplessly to the north of Point Barrow, where they were abandoned. To the northward the *Daniel Webster* was crushed in the ice in 1881, the steamer *North Star* in 1882, and schooner *Clara Light* in 1885. A little to the south of this point the bark *John Howland* was stove in by the ice off Point Lay in 1883, steamer *Bow Head* off Point Belcher in 1884, the *Mabel* and *George and Susan* off Point Collie. A little west of this point the barks *Mt. Wollaston* and *Vigilant* were caught in the ice in 1879, and no tidings have ever come from vessels or crews. On the 8th of August, 1888, the barks *Fleetwing*, *Young Phœnix*, *Mary and Susan*, and schooner *Jane Gray* were lost in the ice off Point Barrow, 160 of their crew being rescued by Capt. Healy, who was in the vicinity. It is when a ship reaches the ice that extreme watchful-

ness and care is demanded; the smallest change of wind, currents, or ice being noted and weighed, which means to the commanding officer days and nights of sleepless anxiety. It was in one of these seasons of anxiety that Capt. Healy spent 75 consecutive hours in the crow's nest at the masthead, his food being taken up to him.

On the 30th of July we were getting tired of our enforced delay. We had been a week off Point Belcher and Sea Horse Islands, waiting for the ice pack to swing off the shore and let us forward. That night, as we were upon deck watching the midnight sun, a large field of shore ice was seen drifting toward us. For a little the good ship held fast as the great cakes broke on her bow and ground against her sides; but by and by the pressure became too great and she dragged her anchor, and commenced drifting toward the shoals. Steam was at once raised, the anchor weighed, and the ship set at work bucking her way through the ice. Once under way the captain concluded to go on until again stopped by the ice. Threading his way carefully through masses of floating ice, he reached and anchored on the morning of July 31 off the village of Ootkeavie, near Point Barrow. Upon communicating with the shore it was found that the ice had left two days previous, and that the first vessels had arrived a few hours before. Masses of ice were still floating by in the current and grounded icebergs lay between the ship and the beach. Ootkeavie, next to Cape Prince of Wales, is the largest village on the Arctic coast, numbering about 300 people. In 1881, 1882, and 1883 it was occupied as one of the stations of the International Polar Expedition. The house built by Lieut. P. H. Ray for the use of the expedition has been leased to the Pacific Steam Whaling Company, and is used by them as a whaling station and trading post, the gentleman in charge being Mr. John W. Kelly, who has given the world an interesting monograph on the Arctic Eskimo, together with an Eskimo-English vocabulary. Both were published last spring by the United States Bureau of Education. This is also the location of the Government refuge station for shipwrecked whalers.

Within the past 10 years some 2,000 sailors have been wrecked on this Arctic coast. So far they have been fortunate in finding vessels within reach to carry them south to civilization, but the occasion is liable to come any season when they will be compelled to winter here. This to a large body of men means slow starvation and death. They could not subsist on the country, and there is no adequate provision within 1,500 or 2,000 miles; and when the long Arctic winter sets in no power on earth could reach them with help. To provide against any such horrible tragedy Capt. Healy early saw the necessity of having an ample supply of provisions stored at some central place in the Arctic. The plan grew and took shape in his own mind. He enlisted his friends and the men interested in the whaling industry, particularly in New Bedford and San Francisco, and finally, after many vexatious delays that would have discouraged a less persistent man, Congress voted the money for the erection of the buildings and the procuring of the provisions.

Last year Capt. Healy brought up the materials and erected the main building, which is a low one-story building, 30 by 48 feet in size. The walls, roof, and floor are made double, as a protection against the intense cold of this high northern latitude in winter. It will accommodate 50 men comfortably; it can shelter 100 if necessary. The house has provisions for 100 men 12 months, and is admirably adapted for its purpose. This year Capt. Healy had on board the material for the construction of a storehouse, also an additional supply of provisions, clothing, and coal.

The Ootkeavie is one of the villages selected by the United States Bureau of Education for the establishment of a school, the contract for which was given by Dr. Harris to the Board of Home Missions of the Presbyterian Church. The money necessary for its establishment was generously contributed by Mrs. Elliott F. Shepard, of New York. The teacher is Prof. L. M. Stevenson, of Versailles, Ohio, who reached the place on July 30, 1890. Owing to the shortness of the time and the great distance from the source of supplies, and the dangers of Arctic navigation, I was able to secure material this season for only two of the school buildings and teachers' residences to be erected in the Arctic. These were placed at Cape Prince of Wales and Point Hope. Next season I hope to erect one at Point Barrow. In the mean time, through the courtesy of Capt. Healy, representing the Treasury Department, I secured a room for the school in one of the Government buildings. This is the most northern school in America, and with but one exception in the world, being in latitude 71° 23′ north. At this point the trend of the continent turns to the eastward. However, on this point the ice has pushed a low ridge of sand, which extends from 8 to 10 miles farther north. On the end of this sand spit is a small village called Nu-

wuk. On the sand spit midway between the villages is a hunting station, where the natives congregate for weeks in summer to kill ducks, as they pass to and fro from water to water over the sand spit. Thousands upon thousands are killed here every season.

On the day of our arrival I spent the whole time on shore arranging for the school. That evening the wind that had been freshening up all afternoon increased to a gale. The barometer was going down, down, down; heavy masses of ice were drifting by when the captain gave orders to weigh anchor and make a lee on the northeast side of Point Barrow, whither 16 vessels of the whaling fleet has preceded us. In a similar storm last summer, shortly after the *Bear* left her anchorage at Ootkeavie, the ice came in and piled up 30 feet high on the very spot the vessel had left. The storm proved the severest we had encountered this season, changing the configuration of the coast line for miles. At Ootkeavie, 20 tons of coal just landed for the use of the Government school, was either swept out to sea or buried deep under the sand—no trace of it could be found.

All day long, on the 1st of August, the gale howled and shrieked through the rigging, but the *Bear* rode it out in safety. In the evening a new danger presented itself. It was found that the great ice pack, which was only 5 to 7 miles distant was closing in upon the shore, and soon we would be prisoners shut up in an ice trap. From this there would be no escape until the wind changed and drove the ice again off shore. This was the condition of things on August 1, 1888. A number of the whalers had shifted, for protection, their anchorage from the west side of Point Barrow to the east side. The wind that had increased to a gale suddenly veered around from the southwest to the north, causing a heavy sea to break upon the bar. At 9 o'clock that night, the schooner *Jane Gray*, parted her cables and drifted against an iceberg—knocking a large hole in her side. She filled rapidly and sank, the crew taking to the small boats. The next to slip her moorings was the bark *Phœnix*. She struck the bar and sunk. Her crew drifted about in small boats for six hours in that terrible storm before they were picked up. Then the barks *Mary and Susan*, and *Fleetwing* went on to the bar and pounded to pieces. Several other vessels parted their cables, sustaining more or less danger.

In that fearful storm, when the waters of the Arctic were lashed into billows of foam, hurling masses of ice about like driving snow flakes, in the midst of snapping chains and crushing spars and tattered sails, when it seemed certain destruction to lower a small boat, the revenue cutter *Bear* rode the storm in safety, and her trained crew, under the direction of Cap. Healy, were venturing their lives and performing prodigies of valor in rescuing shipwrecked sailors. When the storm abated, 160 rescued men were on the decks of the *Bear*. On this occasion, fortunately for us, the storm abated before the ice reached us, and August 2 gave us a beautiful afternoon, of which I availed myself to go ashore.

The western and northern coast of America terminates at Point Barrow in latitude 71° 23′ north and longitude 156° 10′ west. Beyond this the coast trends to the eastward and southward. On the east side of the point is the native village of Nuwuk, which consists of a number of underground houses. But few families were home at the time of our visit, and they were mainly living in tents outside of their winter huts. The first white man to visit this place was Master Elson, of H. M. S. *Bossom* (Capt Beechey's expedition), in August, 1826. One hundred and forty-six miles to the eastward in Return Reef, the westernmost point reached by Sir John Franklin in his journey to form a junction with Capt. Beechey's expedition. The next visit by white men, was that of Capt. Simpson, of the Hudson Bay Company, who, in 1837, made the journey from the Mackenzie River.

During the winters of 1852, 1853, and 1854 H. M. S. *Plover* wintered in Elson Bay to the east of the point. Now a United States revenue marine vessel and many whaling ships visit the place annnally.

Soon after returning to the *Bear* from the village, the captain was visited by Capt. Sherman, of the steam whaler *William Lewis*, and informed that the tender of the New Bedford whaling fleet, the bark *Thomas Pope*, which we had left but a few days before at anchor at Point Hope, was wrecked in the breakers at that point, on the 28th of July, and that the crew wished to be received on board the Government vessel and taken back to civilization. Consent having been obtained, the ten shipwrecked men were soon after sent on board. As the captain had on board the *Bear* the materials for a Government storehouse at the Point Barrow refuge station, he concluded to return at once to that place, and discharge his freight, that more comfortable quarters might be made for the shipwrecked sailors.

The weather was beautiful, the ocean smooth, and the sail exhilarating. At midnight the sun was visible in the northwest, and the full moon in the southeast. At 1 a. m., August 3, the ship anchored at Ootkeavie, where we remained a week while the ship's carpenters were building the Government storehouse, and the captain inspecting the refuge station. During the week, among the callers was Mr. J. B. Vincent, the hero of the shipwreck of the bark *Napolçon*, off the cost of Siberia. Mr. Vincent is now second mate on the whaling bark *Abram Barker*.

One afternoon Capt. Gifford, of the bark *Abram Barker*, came on board and represented that his engineer, a Russian, had made two or three attempts to disable the engine, upon which the safety of the ship depended, that he had the man in irons, and requested Capt. Healy to take him off his hands, as a dangerous character. The accused man himself joined in the request, and was received on board. This is another instance of the many sided and anomalous character of the officers of a revenue vessel in these waters beyond the reach of courts and law. This is another instance where the commanding officer of the revenue service should have power to investigate, arrest, and commit criminals to the United States district court for trial. As it is, a man who endeavored to wreck a ship, and endangered many lives, goes free.

In 1882 Lieut. Ray's party dug a well to the depth of 37.5 feet for observing the temperature of the earth. The entire distance was made through frozen sand and gravel. At the bottom of the shaft the temperature remained, winter and summer, uniformly at 12° F. At the depth of 20 feet a tunnel was run 10 feet and then a room 10 by 12 feet size excavated for a cellar. In this room the temperature never rises above 22° F. Birds and meat, placed in this room, freeze solid, and remain so until taken to the kitchen and thawed out for cooking. While at the station I descended into this unique storage house. The carcasses of several reindeer and dozens of eider ducks were taken from it, and presented to the ship, making a very welcome addition to our table fare.

In the spring of 1883, 500 ducks were stored there at one time. At Ootkeavie the captain, at the request of the father, received on board a half-breed Eskimo boy, about 5 years of age, who is to be forwarded to the industrial training school at Sitka, for an education.

On Saturday, August 9, the inspection of the refuge station being completed, the storehouse finished, and arrangements for the school perfected, preparations were made to return southward. At 4:10 p. m. the anchor was weighed and the vessel steamed north a few miles to procure the last letters of the whaling fleet. The Stars and Stripes were hoisted to the top of the mainmast as a signal that we were about sailing. Soon after anchoring in the midst of the fleet the boats began arriving, bringing off packages of letters. At 9:15 p. m. the flag was lowered, the anchor weighed, and the *Bear* steamed slowly away en route to civilization. As we passed by the ships, one after another dipped their flags and bade us an Arctic farewell, with many wishes for a safe voyage. Great masses of heavy black clouds lay along the whole northern horizon, like a curtain to hide the unknown regions beyond. To the east of us lay the low land spit that marks the northern limit of the continent, the native village of underground huts, and the white canvas and skin covered tents of the visiting natives from the interior. To the west of us the sun was preparing, at 10 o'clock p. m., for a most gorgeous sunset; and south of us, as if symbolical of the lands of light, privilege, and comfort, to which we were to return, there was not a cloud to be seen in the beautiful sky. At 10 o'clock p. m. we passed the school and refuge station, and soon they faded from sight and were left far behind us, in their Arctic solitude, until the *Bear* again visits them a twelvemonth hence.

On the 11th of August the captain anchored off Cape Sabine to water ship. In this vicinity are extensive and valuable coal banks. On the beach were several deserters from the whaling ships, who begged hard to be received on board and taken out of the country. One of their number had been drowned. Every year men desert from the whalers; some of these die from exposure, others are picked up by the *Bear*, as in the present case, and a few remain in the country, descending at once to the level of the natives, demoralizing and doing them much more harm than a missionary can do good.

On the 12th, in rounding Cape Lisburne in a gale, the jib boom and sails were carried away, and the ship ran back and anchored in the lea of the cape. The country in the vicinity of the cape has been called the flower garden of the Arctic, on account of the number and variety of beautiful wild flowers. On the 13th, although the storm had not fully subsided, the *Bear* was got under way, and that afternoon anchored by the hull of the wrecked *Thomas Pope*, abreast of the schoolhouse at Point Hope. I went ashore, but found the schoolhouse locked up, and Dr. Driggs, the teacher, absent.

On the morning of August 15, we bade good-by to Point Hope, and the following morning, at 8:40 o'clock, dropped anchor off Cape Blossom, Kotzebue Sound. The day being pleasant I accompanied an officer to the great international fair of the Arctic, some 12 miles distant from our anchorage. There were about 1,500 natives assembled from many and widely separated sections of the country—from Alaska and Siberia. Many were living in tents, but fully half had constructed shelters by turning their umiaks or boats upside down. As I passed their shelters, my attention was again and again called to the sick. To be sick beyond the reach of a physician, with poor care and poorer accommodations, and without knowledge of even the commoner remedies, is distress itself.

As I see these people, so kindly disposed in life, with a smile of welcome to the stranger, and then see them languishing in their comfortless shelters, with but a few days or weeks removed from death, my heart goes out to them in inexpressible longing, and I wish I could tell them the story of the Cross and introduce them to the hopes and joys of the gospel. Perhaps I may, at no distant day, secure for their children a mission and boarding school.

The beach was covered with racks, upon which hung long rows of salmon, drying for winter food. At 3:35 p. m., on the 27th, having a fair wind, the captain weighed anchor and sailed for Cape Prince of Wales. On the afternoon of the 19th, we passed through Bering Strait, and bade good-by to the Arctic Ocean. The sea was so rough that the captain gave up all hope of being able to land at the cape. But during the afternoon the wind died out and the sea calmed down, so that he was able to run in shore and anchor abreast of the village at 6 o'clock p. m. We could not have landed through the surf the day before, the day after, or at any other time that day. God's providence stayed the waves sufficiently long for us to visit the shore and transact our business.

Had we passed by without stopping the teachers would have been unable to send down their orders for the annual supply of provisions, and next year they would have been unsupplied. As it was I had four hours with them. The wind increasing, at 10 o'clock we were again under way. On the 20th we steamed by King and Sledge islands (the sea being too rough to land), and at noon on the 21st dropped anchor off St. Michael, Norton Sound. Soon after we had a call from Mr. Henry Newmann, agent of the Alaska Commercial Company, and Rev. William H. Judge, a Jesuit priest, who has lately come to the country to engage in the school work of the Roman Catholic Church on the Yukon River.

St. Michael is located on the first good site for a trading post north of the delta of the Yukon River, and is the headquarters of the trade of the Yukon valley. To this point the furs collected at the trading posts in the interior, some of them 2,000 miles distant, are brought for reshipment to San Francisco. About half a mile from the trading post is a small native village. The trading post was established by the Russians in 1835, and is now occupied by the Alaska Commercial Company. A blockhouse and some of the original buildings are still standing. Through the courtesy of Mr. Henry Newmann, two small Russian cannon, one of which was originally used in the defense of the place and the other in protecting the boating expeditions up the river, were secured for the collection of the Alaska Society of Natural History. At St. Michael I received a good account of the schools, nine of which receive their supplies and mails at this point.

It is said of one of the missionaries, who is some 2,000 miles, more or less, up the river, that when he saw his freight bill of $125 per ton for transportation from St. Michael to his station, he added a petition in his prayer that freight might be reduced. During the stay at St. Michael two interesting boys, William and George Frederickson, from Anvik, on the Yukon River, were received on board to accompany me East. Their father, a trader, is sending them to New York for an education. After a pleasant visit of two days, the *Bear* took her departure for Nunivak island. On the following Sabbath night, and through all Monday, we were steaming around the island, that the captain might secure the census. Finding that the people were scattered, hunting and fishing, and being warned by the few natives he met of dangerous rocks and reefs, and the waters being uncharted, on Monday evening the captain turned around and steamed for St. George Island, which we reached on the morning of August 27. Nearing the island, a schooner was seen crowding on all sail to get out of our way. As the captain had not yet received his instructions, which were awaiting his arrival at Unalaska, and had no authority to make any seizures, the schooner was allowed to proceed unmolested. She was one of the many piratical vessels that are fitted out at Victoria, British Columbia, and San Francisco, to hunt seals in Bering Sea contrary to law. In 1886 there were 21 such vessels from Victoria alone, and the catch was 35,556 skins. In 1887 there were

20 vessels from Victoria, 8 of which were seized; the catch was 27,624 skins. In 1888 there were 19 British vessels, with a total catch of nearly 30,000 skins. In 1889, 23 British vessels, and this year 22 British and 12 American vessels engaged in seal piracy. Their methods of operation are so wasteful that the number of skins taken does not begin to represent the number of seals killed. They necessarily hunt out to sea, where they largely kill the females heavy with their young. A large percentage of the seals shot sink before they can be secured, so that many authorities state that the 20,000 to 30,000 secured represent from 150,000 to 200,000 seals destroyed. This wasteful method is rapidly annihilating the fur seal, so that if our granddaughters are to have seal-skin sacques the Government will need to take more stringent measures for the protection of the seal. The indiscriminate slaughter of the seal while passing to their breeding grounds has caused such a scarcity on the seal islands, that while the Government allows 100,000 males to be taken annually, this year the vessels have been able to secure but 21,000 skins.

The piratical vessels fitted out at Victoria, British Columbia, to hunt seal have caused the international complications known as the "Bering Sea difficulty," which are now the subject of negotiations between the State Department and Great Britain.

WHALING INDUSTRY.

As early as the year 1841 fifty whaling vessels had found their way from New Bedford and Boston to Bering Sea. From 1842 and onward for a number of years annual complaints were made to the Russian Government by the Russian-American Fur Company of the encroachments of the Yankee whalers. In 1852 the whaling fleet had increased to 278 vessels, and the value of the catch to $14,000,000. This was probably the most profitable year of the whaling industry in Alaska. Since then it has, in the main, decreased, until in 1862 the value of the catch was less than $800,000. This increased again in 1867 to $3,200,000. In 1880 the first steamer was added to the whaling fleet, being sent out from San Francisco. Last year there were 26 vessels from San Francisco and 23 from New New Bedford engaged in the trade. They captured 151 whales, which yielded 213,070 pounds of whale bone and 12,243 barrels of oil. This season there are 10 steamers and 38 sailing vessels employed in these northern waters with a very light catch up to midsummer. The whaling vessels are manned upon the co-operative plan; the men instead of being paid regular wages receive a percentage of the profits. The captain on the sailing vessels receives a twelfth, the first mate a nineteenth, the second mate and boat headers each a twenty-fifth, the third mate a thirtieth, the fourth mate, carpenter, cooper, and steward each a fiftieth, and the sailors each a one hundred and seventy-fifth. On steamers the rates are a little lower. A captain's wages range from nothing to $7,000 or $8,000, according to the number of whales taken. If the ship gets six whales during a cruise the captain will have about $1,400 and a sailor $100. The sailors usually receive an advance of $60, and during the cruise are allowed to draw clothing, tobacco, etc., from the ship's supplies (called the "slop chest") to the amount of $60 to $80. Consequently if there are no profits to divide the sailor is sure of about $140. The captains and higher officers are usually men of more than ordinary character and intelligence—typical American seamen of the best kind. The common sailors on a whaler are made up largely of Portuguese, Italians, South Sea Islanders, and others of an inferior grade, some of them being, emphatically, hard cases.

A few years ago whales were plentiful in the North Pacific, Bering, and Okhotsk Seas. Then they were followed through Bering Straits a little way into the Arctic. Then farther and farther the whales have been driven into the inaccessible regions of the North, until now the whaling fleet annually rounds the most northern extremity of the American continent, and this year, for the first time, a few of them will winter in the Arctic, at the mouth of the Makenzie River. To escape this deadly pursuit the whales try to hide in the ice, and after them the whalers boldly force their way. The business is so dangerous that during the last 20 years more than 100 vessels have been lost. The value of the whale fisheries consists not so much in the oil taken, as in the whale-bone, which is taken from his mouth; this is worth between $4.50 and $5 per pound. The product of a fair sized, bowhead whale, at present prices, is worth about $8,000. A good sized whale weighs about 150 tons, and contains about 2,000 pounds of whalebone after it is cleaned. His tongue is 15 feet long, from 6 to 8 feet in thickness, and contains 12 barrels of oil. His open mouth is from 15 to 20 feet across;

his tail from 15 to 18 feet across. The blubber forms a coat around him from 10 to 22 inches thick. It is 4 feet from the outside of the body to his heart, and the heart is 216 cubic feet in size, while the brains will fill a barrel.

While lying at anchor at St. George, the United States Revenue Marine steamer *Rush*, Capt. Coulson commanding, dropped anchor near us, and we received two and one-half months later news from the outside world. With visiting on shipboard and on land, the day slipped by very rapidly and pleasantly, and the following morning we were under way for Unalaska, reaching there on the 29th of August. At Unlaska I received letters from Eastern friends, the latest being dated June 3.

THE ESKIMOS OF ALASKA.

During June, July, and August, I cruised 5,000 miles along the coasts of Asia and America, from the Aleutian Islands to Point Barrow, the northern limit of the continent, and back to Unalaska. I visited all the principal settlements of the coast, and saw much of the native people. These people all belong to the Innuit or Eskimo family. They occupy not only the Arctic and Bering Sea coasts, but also that of the mainland coast of the North Pacific, as far east as mount St. Elias, and number in all about 17,000 to 20,000. In the extreme north, at Point Barrow, and along the coast of Bering Sea, they are of medium size. At Point Barrow the average height of the males is 5 feet 3 inches, and average weight 153 pounds; of the women, 4 feet 11 inches, and weight 135. On the Nushagak River the average weight of the men is from 150 to 167 pounds.

From Cape Prince of Wales to Icy Cape, and on the great inland rivers emptying into the Arctic Ocean, they are a large race, many of them being 6 feet and over in height. They are lighter in color and fairer than the North American Indian, have black and brown eyes, black hair (some with a tinge of brown), high cheek bones, fleshy faces, small hands and feet, and good teeth. The men have thin beards. Along the Arctic coast the men cut their hair closely on the crown of the head, giving them the appearance of monks; this is done so that when crawling up to the deer, the latter will not be frightened away by the flutter of the hair in the wind. Some of the young are fairly good looking, but, through exposure and hardship, become old at 30 years of age. They are naturally intelligent, ingenious in extricating themselves from difficulties, fertile in resources, and quick to adopt American ways and methods when they are an improvement on their own. Physically they are very strong, with great powers of endurance. When on a journey, if food is scarce, they will travel 30 to 40 miles without breaking their fast. Lieut. Cantwell, in his explorations of the Kowah River, makes record that upon one occasion when he wanted a heavy stone for an anchor, a woman went out, and, alone, loaded into her birch bark canoe, and brought him a stone that would weigh 800 pounds. It took two strong men to lift it out of the canoe.

Another explorer speaks of a woman carrying off on her shoulder a box of lead weighing 280 pounds. This summer, in erecting the school buildings in the Arctic, there being no drays or horses in that country, all the timber, lumber, hardware, etc., had to be carried from the beach to the site of the house on the shoulders of the people. The women carried the same loads as the men. They are, as a rule, industrious; men, women, and children doing their individual part toward the family support. The hard struggle for a bare existence in the sterile region where they live compels it. In a general way they are honest. Property intrusted to them by the whites is kept secure. Property stowed away in a cache or tent needs no lock or watchman—it is safe. Small articles left lying around uncared for are soon picked up and carried off. Perhaps they look upon them as if they had been thrown away. A white man can leave with one of them who is an entire stranger to him $100 or $200 worth of goods, saying, "Buy me some furs and I will be back here next year." The following season the native, with the furs, is in waiting for the expected arrival. This is done every season. I have the account-book of one of these native traders in which he has recorded every skin purchased, and how much of each article paid for it. As the native can neither read, write, nor speak English, and his own language is an unwritten one, of course the accounts are kept by symbols and signs. They are shrewd traders. No matter how much is offered for an article, they ask for more. If they set the price themselves, and the purchaser accedes to it, they frequently attempt to raise it. They are exceedingly dirty and filthy in their persons and clothing. But perhaps this is somewhat excusable in a country where, in winter, water is scarce and soap scarcer. I remember once hearing a very successful missionary, who had spent many years north of the Arctic Circle, say that he

tried to make it a rule, when traveling with a dog sled, to wash his face at least once a week, but that he had not always been able to do it. The Alaska Eskimo is a good-natured, docile, and accommodating race. Wherever I met them, and under whatever circumstances, they had a smile of welcome, and in many ways showed a friendly spirit. They have also manifested an unexpected interest in the establishment of schools among them, which promises well for the future.

ORNAMENTATION.

Among the Thlinket people of southeastern Alaska the labret is worn by the women only. Among the Eskimo of northwestern Alaska, on the contrary, it is worn by the men alone. The use of it is almost universal.

During boyhood a hole is cut through the lower lip below each corner of the mouth and an ivory plug inserted until the wound heals. After healing, the hole is stretched from time to time until it reaches about half an inch in diameter. Into this they insert the labret.

These labrets are made of stone, jade, coal, ivory, bone, and glass. They are shaped like a silk hat in miniature. The labret is three-fourths of an inch in diameter, 1 inch in diameter at the rim, and 1 inch long. The rim is kept inside of the mouth and holds the labret in place.

Many wear this form of labret on the one side of the mouth, and on the other a much larger one, resembling a large sleeve-button, 1⅜ inches in diameter on the outside, 1¼ inches on the inside rim, and one-half inch neck.

Formerly they wore a large labret in the center of the lower lip. I secured a beautiful one of polished jade that has an outside surface 2½ inches by 1 inch.

The girls have their ears and sometimes their noses pierced, wearing pendant from them copper, ivory, and bone ornaments, also strings of beads. Sometimes these beads extend from one ear to the other, either under the chin or back of the head.

Both sexes tatoo, more or less elaborately, their faces, hands, and arms. Both sexes wear bracelets, amulets, and sometimes fancy belts.

DRESS.

They make waterproof boots of seal skin, with walrus or sea-lion hide soles. For cold weather the boots are made of seal or reindeer skin, tanned with the hair on, and walrus-hide soles.

The foot portion is made many times larger than the foot, in order to give room for a padding of grass. These boots are so much warmer and more comfortable than the ordinary leather ones that they are almost universally used by whalers and others who have occasion to visit Arctic regions. A fur shirt and a pair of fur pants complete the toilet. The shirt is called a parka, and frequently has a hood attached, which can be pulled over the head in a storm. Others have a fur hood which, when not on the head, hangs around the neck. Ordinarily in summer the head is uncovered.

In winter two suits are worn, the inner one with the fur next to the body, and the outer one with the fur to the weather.

The difference between male and female attire is in the shape and ornamentation of the parka. Among some of the tribes the pants and boots of the women are in one garment. There is also a fullness in the back of the woman's parka to make room for the carrying of the baby inside between the shoulders of the mother. These clothes are made largely of the skins of the reindeer, squirrels, and birds. From the intestines of the seal and walrus and also from salmon skins are made the famous kamleika, a waterproof garment, which is worn over the others in wet weather. The kamleika is lighter in weight and a better waterproof garment than the rubber garments of commerce.

The native dress, when well made, new and clean, is both becoming and artistic.

FOOD.

They live principally upon the fish, seal, walrus, whale, reindeer, and wild birds of their country. Latterly they are learning the use of flour, which they procure from the Government revenue vessels or barter from the whalers.

They have but few household utensels. A few have secured iron kettles. Many still use grass-woven baskets and bowls of wood and stone. Occasionally is found a jar of burnt clay. In these native dishes water was boiled by dropping in hot stones.

Among the more northern tribes much of the food is eaten raw, and nothing is thrown away, no matter how rotten or offensive it has become.

Some of their choicest delicacies would be particularly disgusting to us. Having, at one of the bird rookeries in the Arctic, gathered a number of eggs, it was found that many of them contained chickens. When about to throw them overboard, the native interpreter remonstrated, saying: "No! me eat them. Good!"

All classes have a great craving for tobacco and liquor. Even nursing babes are seen with a quid of tobacco in their mouths.

During the summer large quantities of fish are dried, and the oil of the seal, walrus, and whale put up for winter use. The oil is kept in bags made of the skin of the seal, similar to the water-skins of Oriental lands. The oil is kept sweet by the bags being buried in the frozen earth until wanted for use.

DWELLINGS.

The coast Eskimo have underground permanent houses in villages for winter, and tents that are frequently shifted for summer.

The Eskimo of the interior, being largely nomads, live in tents much of the time. The tents are covered with reindeer skins, walrus hides, or cotton canvas. In making a winter house, a cellar from 20 to 25 feet square is dug, from 3 to 5 feet deep. At the corners and along the sides of the excavation are set posts of driftword or whalebone. On the outside of these, poles of driftwood are laid up one upon another to the top. Other timbers are placed across the top, forming the roof or ceiling. Against the outside and upon the roof, dirt and sod are piled until the whole has the appearance of a large mound. In the center of the dome is an opening about 18 inches across. Across this is stretched the transparent bladder of the seal or walrus. This opening furnishes light to the room below. A narrow platform extends along one or more sides of the room, upon which are stowed the belongings of the family and the reindeer-skin bedding. The platform is also the sleeping-place of the family.

Large, shallow dishes of earthenware, bone, or stone, filled with seal oil, are the combined stove and lamp of the family. Some lighted moss makes a dull line of flame along the edge of the dish. Frequently a piece of blubber is suspended over the flame, the dripping of which keeps the lamp replenished.

Many of the houses were so warm that we found our usual outdoor clothing burdensome.

At one side of some rooms, and in the floor near the center of the room in others, is a small opening about 20 inches square. This is the doorway, and leads to a hall or outside room. If the opening is in the side of the room, a reindeer skin curtain hangs over it. This outer place is sometimes a hall 12 to 15 feet long and 2 feet wide and high, leading to a well or shaft. This shaft is 6 or 7 feet deep, and leads up a rude ladder into the open air. In other cases it is a large room 12 or 15 feet square, containing, on either side of the passageway through the center, a place to store the winter supplies of oil, fish, and flour. The exit from the storeroom is similar to that from the hall, up a ladder and through a small hole. When a storm is raging outside this hole is covered with a board or flat stone or large, flat whalebone.

All villages of importance contain a public room or town hall. This is built in the same manner as the private dwellings, only much larger. Some of these are 60 feet square, 20 feet high, and contain three tiers or platforms. This building is called the kashima or kashga. In them are held the public festivals and dances. They are also the common workshop in which the men make their snowshoes, dog sleds, spears and other implements.

The villages, from the deck of a coasting vessel, have the appearance of so many hillocks or dunes along the beach.

IMPLEMENTS.

The Eskimo of Arctic Alaska are still in the stone age. The manufacture of arrows and spear heads from flint is a living industry. Stone lamps, stone hammers and chisels, and to some extent stone knives, are still in ordinary use among them. Fish lines and nets and bird snares are still made of whalebone, sinew, or rawhide. Arrows, spears, nets, and traps are used in hunting, although improved breach-loading arms are being introduced among them, and will soon supersede, for the larger game, their own more primitive weapons.

For transportation on land they have the snowshoe, dog team, and sled; and on the water the kiak and umiak.

The kiak is a long, narrow, light, graceful, skin-covered canoe, with one, two, or three holes, according to the number of people to be carried. It is the universal boat of the Eskimo, and is found from Greenland around the whole northern coast of America, wherever that people are found.

The umiak is a long, skin-covered boat. This is the family boat or carryall. Those in use around Bering Straits are about 24 feet long and 5 feet wide. They will safely carry 15 persons and 500 pounds of freight, coasting in the sea. Those on Kotzebue Sound, in the Arctic Ocean, are 35 feet long, 6 feet wide, with a capacity of 3,000 pounds of freight, and a crew of 6. There are exceptionally large ones that will carry from 50 to 80 people. Both the kiaks and umiaks are made of walrus, sea lion, or white whale hides stretched over light frames of spruce wood.

MARRIAGE.

There seems to be no special ceremony among them connected with marriage. If the parties are young people, it is largely arranged by the parents.

Among some of the tribes the husband joins his wife's family and is expected to hunt and fish for them. If he refuses to give his father-in-law the furs he takes he is driven out of the house and some one else more active or obedient is installed as husband of the girl. Sometimes a young woman has ten or twelve husbands before she fairly settles down. Under this condition of things it is not strange that the women become indifferent and often untrue to their husbands. Love and mutual affection has so little to do with the relation that upon occasion husbands and wives are interchanged.

For instance, in one of the northern villages dwelt a family of expert fishers and another that was successful at hunting the reindeer. One year the fisherman thought he would like to hunt reindeer. Finding that his neighbor would like to try fishing, they exchanged wives for the summer. The woman who was a good hunter went off with the fisherman and *vice versa*. Upon reaching home in the fall, they returned to their respective husbands.

Again a certain man wished to make a long journey into the interior. His wife being sick and unable to endure the hardships of the trip, he arranged with a friend, who had a strong, healthy wife, for an exchange until he should return. This was done with the consent of all parties. Wives are frequently beaten by their husbands, and sometimes, to escape abuse, commit suicide. In the winter of 1889 a woman at Point Hope who had been beaten and stabbed by her jealous husband one night during a raging blizzard harnessed the dogs to the sled, then fastening one end of a rope to the sled and the other as a noose around her neck, she started up the team and was choked and dragged to death. Occasionally a wife resists, and, if physically the stronger, thrashes the husband. Polygamy prevails to a limited extent. Frequently the second wife is looked on and treated as a servant in the family. Among some of the tribes the custom prevails of the sons having the same number of wives as the father, without reference to their ability to maintain them. No more, no less, than a species of hereditary polygamy.

Among the Eskimo, the same as among all uncivilized people, woman's is a hard lot. One of the missionary ladies writes: "My heart aches for the girls of our part of Alaska. They are made perfect prostitutes by their parents from the time they are 9 or 10 years old until that parent dies. And yet, notwithstanding all their disadvantages, they have a voice in both family and village affairs. The husband makes no important bargain, or plans a trip, without consulting and deferring to his wife."

The customs pertaining to childbirth are barbarous, and it would not be strange if both mother and child should perish. Large families of children are the exception; few have above four. The drudgery of women is such that they often destroy their unborn and sometimes born offspring, particularly if the child is a girl. A missionary gives the following incident: "Some one tied a helpless little child of about two years down to the water's edge at low tide. Its cries attracted the attention of a passer-by, who found the water already nearly up to his back. The man took it to his home and cared for it. It was recognized as a child that had been left in the care of an old woman; the child was sickly, and doubtless was too much of a care for her. The only surprise expressed by the people was that any one should want to drown or kill a boy."

If a family is very poor they sometimes give away to childless neighbors all their children but one. Thus, during childhood, a boy may pass from one to another to be adopted by several families in turn. Children are also sold by their parents, the usual market price of a child being a sealskin bag of oil or an

old suit of clothes. During infancy children are carried under the parka, astride of the mother's back, being held in position by a strap under the child's thighs and around the mother's body across the chest. When out from under the parka, they are carried seated on the back of the mother's neck and shoulders, with the child's legs hanging down in front on both sides of the neck. The children are given the names of various animals, birds, fish, sections of country, winds, tides, heavenly bodies, etc. Sometimes they have as many as six names. Children are rarely punished—generally have their own way, and are usually treated with great kindness by their own or foster parents. Prominent events in the life of a boy, such as having his hair cut for the first time, like a hunter—his first trip to sea in a kiak—his first use of snowshoes, etc.—are celebrated by a feast if the family are not too poor.

FESTIVALS.

Different tribes have different festivals. Among others there is usually one for every animal hunted by the people. A whale dance, seal, walrus and reindeer dances, etc. There are festivities for the spirits of wives, land and sea, dead friends, sleds, boats, etc. Some of these are held during the long winter darkness, and others, with dancing, wrestling, and foot-racing, at the great annual gathering in summer.

SUPERSTITIONS.

Like all other ignorant people, they are firm believers in witchcraft and spirits generally. They also believe in the transmigration of souls. That spirits enter into animals and inanimate nature, into rocks, winds, and tides. That they are good or bad according as the business, the community, or the individual is successful or unsuccessful, and that these conditions can be changed by sorcery. By suitable incantations they firmly believe that they can control the wind and the elements, that they can reward friends and punish enemies.

The foundation of their whole religious system is this belief in spirits and the appeasing of evil spirits. This demon or evil spirit worship colors their whole life and all its pursuits. Every particular animal hunted, every phenomenon of nature, every event of life, requires a religious observance of its own. It is a heavy and burdensome work that darkens their life—it leads to many deeds of unnatural cruelty. At the mouth of the Kuskokwine River an old woman was accused of having caused the death of several children—of being a witch. This was so firmly believed that her own husband pounded her to death, cut up her body into small pieces, severing joint from joint, and then consuming it with oil in a fire.

SHAMANS.

The head and front of this great evil is the Shaman, or sorcerer. He is believed to be the only one that can control the evil spirits and protect the people from them. Mr. John W. Kelly, who has written recently an interesting monogram on the Eskimo, represents the Shamans as divided into seven degrees, being graded according to their knowledge of spiritualism, ventriloquism, feats of legerdemain and general cunning. It is claimed that those of the seventh degree are immortal, and can neither be killed nor wounded; that those of the sixth degree can be wounded, but not killed. The ordinary Shaman belongs to the lower degrees and only claims to go into trances, in which state his spirit leaves the body and roams abroad procuring the information his patrons are in search of.

As a rule the Shamans are unscrupulous frauds, thieves, and murderers, and should be put down by the strong hand of the General Government.

SICKNESS.

The prevailing diseases among the Eskimo are scrofula, diphtheria, pneumonia, and consumption, and the death rate is large. They have a superstitious fear with reference to a death in the house, so that when the sick are thought to be nearing death they are carried out of the home and placed in an outhouse. If they do not die as soon as they expect, they ask to be killed, which is usually done by the Shaman stabbing them in the temple or breast. The aged and help-

less are also sometimes killed at their own request. A prominent man in a tribe not long since tried to hire men to kill his aunt, who was insane and dependent on him. Failing to have her killed, he deliberately froze her to death. The cruelty of heathenism is almost beyond belief. The dead are wrapped up in reindeer or seal skins and drawn on a sled back of the village, where they are placed upon elevated scaffolds, out of the reach of animals, or upon the ground and covered over with driftwood, or, as among some of the tribes, left upon the ground, to be soon torn in pieces and devoured by the dogs of the village.

GOVERNMENT.

The Eskimos have no tribal organization and are without chiefs. The most successful trader among them becomes the wealthiest man and is called Umailik. By virtue of the influence that riches exert he is considered the leader in business transactions. In special exigencies, affecting a whole village, the old men assemble and determine upon a plan of action. The Shamans also have great influence among the people. It often happens that the Umailik and Shaman are the same person.

FOOD SUPPLY.

From time immemorial they have lived upon the whale, the walrus, and the seal of their coasts, the fish and aquatic birds of their rivers, and the caribou or wild reindeer of their vast inland plains.

The supply of these in years past was abundant and furnished ample food for all the people. But fifty years ago American whalers, having largely exhausted the whale in other waters, found their way into the North Pacific Ocean. Then commenced for that section the slaughter and destruction of whales that went steadily forward at the rate of hundreds and thousands annually, until they were destroyed and driven out of the Pacific Ocean. They were then followed into Bering Sea, and the slaughter went on. The whales took refuge among the ice fields of the Arctic Ocean, and thither the whalers followed. In this relentless hunt the remnant have been driven still farther into the inaccessible regions around the north pole, and are no longer within reach of the natives.

As the great herds of buffalo that once roamed the western prairies have been exterminated for their pelts, so the whales have been sacrificed for the fat that encased their bodies and the bone that hung in their mouths. With the destruction of the whale one large source of food supply for the natives has been cut off.

Another large supply was derived from the walrus, which once swarmed in great numbers in those northern seas. But commerce wanted more ivory, and the whalers turned their attention to the walrus, destroying thousands annually for the sake of their tusks. Where a few years ago they were so numerous that their bellowings were heard above the roar of the waves and grinding and crashing of the ice fields, this year I cruised for weeks without seeing or hearing one. The walrus as a source of food supply is already practically extinct.

The seal and sea lion, once so common in Bering Sea, are now becoming so scarce that it is with difficulty that the natives procure a sufficient number of skins to cover their boats, and their flesh, on account of its rarity, has become a luxury.

In the past the natives, with tireless industry, caught and cured for use in their long winters great quantities of fish, but American canneries have already come to one of their streams (Nushagak) and will soon be found on all of them, both carrying the food out of the country and by their wasteful methods destroying the future supply. Five million cans of salmon annually shipped away from Alaska—and the business still in its infancy—means starvation to the native races in the near future.

With the advent of improved breech-loading firearms the wild reindeer are both being killed off and frightened away to the remote and more inaccessible regions of the interior and another source of food supply is diminishing.

Thus the support of the people is largely gone and the process of slow starvation and extermination has commenced along the whole Arctic coast of Alaska. Villages that once numbered thousands have been reduced to hundreds; of some tribes but two or three families remain. At Point Barrow, in 1828, Capt. Beechey's expedition found Nuwuk a village of 1,000 people; in 1863 there were

309; now there are not over 100. In 1826 Capt. Beechey speaks of finding a large population at Cape Franklin: to-day it is without an inhabitant. He also mentions a large village of 1,000 to 2,000 people on Schismareff Inlet; it has now but three houses.

According to Mr. John W. Kelly, who has written a monograph upon the Arctic Eskimo of Alaska, Point Hope, at the commencement of the century, had a population of 2,000; now it has about 350. Mr. Kelly further says: "The Kavea county is almost depopulated owing to the scarcity of game, which has been killed or driven away. * * * The coast tribes between Point Hope and Point Barrow have been cut down in population so as to be almost obliterated. The Kookpovoros of Point Lay have only three huts left; the Ootookas of Icy Cape one hut; the Koogmute has three settlements of from one to four families; Sezaro has about 80 people."

Mr. Henry D. Woolfe, who has spent many years in the Arctic region, writes: "Along the seacoast from Wainright Inlet to Point Lay numerous remains of houses testify to the former number of the people. * * * From Cape Seppings to Cape Krusenstern and inland to Nounatok River there still remain about 40 people, the remnant of a tribe called Key-wah-ling-nach-ah-mutes. They will in a few years entirely disappear as a distinctive tribe."

I myself saw a number of abandoned villages and crumbling houses during the summer, and wherever I visited the people I heard the same tale of destitution.

On the island of Attou, once famous for the number of its sea-otter skins, the catch for the past nine years has averaged but 3 sea-otter and 25 fox skins, an annual income of about $2 for each person. The Alaska Commercial Company this past summer sent $1,300 worth of provisions to keep them from starving.

At Akutan the whole catch for the past summer was 19 sea otters. This represents the entire support of 100 people for twelve months. At Unalaska both the agent of the Alaska Commercial Company and the teacher of the Government school testified that there would be great destitution among the people this winter because of the disappearance of the sea otter. At St. George Island the United States Treasury agent testified that there was not sufficient provisions on the island to last through the season, and asked that a Government vessel might be sent with a full supply. At Cape Prince of Wales, Point Hope, and Point Barrow was the same account of short supply of food. At the latter place intimations were given that the natives in their distress would break into the Government warehouse and help themselves to the supply that is in store for shipwrecked whalers. At Point Barrow, largely owing to the insufficient food supply, the death rate is reported to the birth rate as 15 to 1. It does not take long to figure out the end. They will die off more and more rapidly as the already insufficient food supply becomes less and less.

INTRODUCTION OF REINDEER.

In this crisis it is important that steps should be taken at once to afford relief. Relief can, of course, be afforded by Congress voting an appropriation to feed them, as it has done for so many of the North American Indians. But I think that every one familiar with the feeding process among the Indians will devoutly wish that it may not be necessary to extend that system to the Eskimo of Alaska. It would cost hundreds of thousands of dollars annually, and, worse than that, degrade, pauperize, and finally exterminate the people. There is a better, cheaper, more practical, and more humane way, and that is to introduce into northern Alaska the domesticated reindeer of Siberia, and train the Eskimo young men in their management, care, and propagation.

This would in a few years create as permanent and secure a food supply for the Eskimo as cattle or sheep raising in Texas or New Mexico does for the people of those sections.

It may be necessary to afford temporary relief for two or three years to the Eskimo, until the herds of domestic reindeer can be started, but after that the people will be self-supporting.

As you well know, in the Arctic and sub-Arctic regions of Lapland and Siberia the domesticated reindeer is food, clothing, house, furniture, implements, and transportation to the people. Its milk and flesh furnish food; its marrow and tongue are considered choice delicacies; its blood, mixed with the contents of its stomach, is made into a favorite dish called in Siberia "manyalla;" its intestines are cleaned, filled with tallow, and eaten as a sausage; its skin is made into clothes, bedding, tent covers, reindeer harness, ropes, cords, and fish lines; the hard skin of the forelegs makes an excellent covering for snowshoes.

Its sinews are dried and pounded into a strong and lasting thread; its bones are soaked in seal oil and burned for fuel; its horns are made into various kinds of household implements, into weapons for hunting and war, and in the manufacture of sleds.

Indeed, I know of no other animal that in so many different ways can minister to the comfort and well-being of man in the far northern regions of the earth as the reindeer.

> The reindeer form their riches; these their tents,
> Their robes, their beds, and all their homely wealth supply;
> Their wholesome fare and cheerful cups.

Under favorable circumstances a swift reindeer can traverse 150 miles in a day. A speed of 100 miles per day is easily made. As a beast of burden they can draw a load of 300 pounds. They yield a cupful of milk at a milking; this small quantity, however, is so thick and rich that it needs to be diluted with nearly a quart of water to make it drinkable. It has a strong flavor like goat's milk, and is more nutritious and nourishing than cow's milk. The Laps manufacture from it butter and cheese. A dressed reindeer in Siberia weighs from 80 to 100 pounds. The reindeer feed upon the moss and other lichens that abound in the Arctic regions, and the farther north the larger and stronger the reindeer.

Now, in Central and Arctic Alaska are between 300,000 and 400,000 square miles (an area equal to the New England and Middle States combined, together with Ohio, Indiana, and Illinois) of moss-covered tundra and rolling plains of grass that are specially adapted by nature for the grazing of the reindeer and is practically useless for any other purpose.

If it is a sound public policy to bore artesian wells and build water-storage reservoirs, by which thousands of arid acres can be reclaimed from barrenness and made fruitful, it is equally a sound public policy to stock the plains of Alaska with herds of domesticated reindeer, and cause those vast, dreary, desolate, frozen, and storm-swept regions to minister to the wealth, happiness, comfort, and well-being of man. What stock-raising has been and is on the vast plains of Texas, Colorado, Wyoming, and Montana, reindeer-raising can be in northern Alaska. In the corresponding regions of Lapland, in Arctic Norway, and in Sweden and Russia are 27,000 people supporting themselves (besides paying a tax to the Government of $400,000, or $1 per head for their reindeer) and procuring their food and clothing largely from their 400,000 domesticated reindeer. Also in the corresponding regions of Siberia, with similar climate, soil, and environment (and only 40 miles distant at the straits), are thousands of Chukchees, Koraks, and other tribes fed and clothed by their tens of thousands of domesticated reindeer.

During the summer I visited four settlements of natives on the Siberian coast, the two extremes being 700 miles apart, and saw much of the people, both of the Koraks and Chukchees. I found them a good-sized, robust, fleshy, well-fed, pagan, half-civilized, nomad people, living largely on their herds of reindeer. Families own from 1,000 to 10,000 deer. These are divided into herds of from 1,000 to 1,500. One of these latter I visited on the beach near Cape Navarin. In Arctic Siberia the natives with their reindeer have plenty; in Arctic Alaska without the reindeer they are starving.

Then instead of feeding and pauperizing them let us civilize, build up their manhood, and lift them into self-support by helping them to the reindeer. To stock Alaska with reindeer and make millions of acres of moss-covered tundra conducive to the wealth of the country, would be a great and worthy event under any circumstances.

But just now it is specially important and urgent from the fact that the destruction of the whale and walrus has brought large numbers of Eskimo face to face with starvation, and that something must be done promptly to save them.

The introduction of the reindeer would ultimately afford them a steady and permanent food supply.

INTRODUCTION OF CHRISTIANITY.

In the Tenth United States Census Report, on page 2, it is recorded: "That no trace or shadow of Christianity and its teachings has found its way to these desolate regions; the dark night of Shamanism or Sorcery still hangs over the human mind. These people share with their Eastern kin a general belief in evil

spirits and powers, against whom the Shaman alone can afford protection by sacrifices and incantations. No philanthropic missionary has ever found his way to this Arctic coast, and unless some modern Hans Egede makes his appearance among them in the near future there will be no soil left in which to plant the Christian seed."

Such was the dark but true picture in 1880, but the dawn was near at hand. The needs of the Eskimos had long been upon my mind, and various plans for reaching them had been considered. In the spring of 1888, having an opportunity of visiting Bethlehem, Pa., I secured a conference with the late Edmund de Schweinitz, D. D., a bishop of the Moravian Church, and urged upon him the establishment of a mission to the Eskimo of Alaska. A few days later the request was repeated in writing, which letter, on the 23d of August, 1883, was laid before the Moravian Society for Propagating the Gospel among the Heathen. The request was favorably considered, and Rev. A. Hartman and Mr. Wm. H. Weinland were appointed a committee to visit Alaska and report on the advisability of commencing a mission. This tour of exploration was made in the summer of 1884, and is given in my annual report for 1885–'86. Upon their return they recommended the establishment of a mission on the Kuskokwim River, near the native village of Mumtreklagamute, 75 miles above the mouth of the stream. In the spring of 1885 Rev. and Mrs. Wm. H. Weinland, Rev. and Mrs. John H. Kilbuck, and Mr. Hans Torgersen were sent to the Kuskokwim River as the first missionaries to the Eskimo of Alaska. The present mission force consists of Rev. and Mrs. John H. Kilbuck, Rev. and Mrs. Ernst L. Webber, and Miss Lydia Lebus. In the summer of 1886 the Moravians sent out the Rev. Frank E. Wolff, who located a station and erected a mission station at the mouth of the Nushagak River. He then returned to the States for the winter. The mission was formally opened in the summer of 1887 with the arrival of Rev. and Mrs. F. E. Wolff and Miss Mary Huber. To the original number have since been added Rev. J. H. Schoechert and Miss Emma Huber. Both of these schools have been assisted by the United States Bureau of Education.

On the 1st of July, 1886, an agreement was entered into between the Commissioner of Education and the Missionary Society of the Protestant Episcopal Church for the establishment of a school in the great Yukon Valley. Owing to the impossibility of getting the supplies into that inaccessible region the school was maintained for 1886–'87 at St. Michael, on the coast, by Rev. and Mrs. Octavius Parker.

In the summer of 1887 Rev. John H. Chapman was added to the mission and the station was removed to Anvik. The present force of teachers consists of Rev. John W. Chapman and Mr. Marcus O. Cherry.

In 1886–'87 the Roman Catholics entered the Yukon Valley, and have established missions and schools at Nulato, Kosoriffsky, and Cape Vancouver.

In 1886 the Evangelical Mission Union of Sweden established a station among the Eskimos at Unalaklik with Rev. Axel E. Karlson, missionary. He is now assisted by Mr. August Anderson, and it is proposed that next year the school will be assisted by the United States Bureau of Education.

The new stations among the Arctic Eskimos at Point Barrow, Point Hope, and Cape Prince of Wales, have already been mentioned. During the summer of 1890 I established three schools and missions in Arctic Alaska. One at Point Barrow, with Mr. Leander M. Stevenson, of Versailles, Ohio, in charge. This is, next to Upernavik, Greenland, the northernmost mission in the world. Its establishment was made possible through the liberality of Mrs. Elliott F. Shepard. Mr. Stevenson, who volunteered to go to that distant point, organize the mission and erect the necessary buildings, will return in the summer of 1892 to his family. A permanent missionary for that place is desired. He should be a young married man, and both his wife and himself should be of sound constitution and good bodily health. They should be of a cheerful disposition, "handy" with various kinds of tools and work, ready in resources, and possess good practical common sense. A consecrated Christian physician accustomed to evangelical work would be more useful than an ordained minister without the medical training. Applicants can address me at the United States Bureau of Education, Washington, D. C. They will not be expected to leave home until the spring of 1892. The Point Barrow Mission is under the auspices of the Presbyterian Board of Home Missions.

The second school in the Arctic is at Point Hope, and is under the supervision of the Protestant Episcopal Church. The teacher is Mr. John B. Driggs, M. D. The third is at Cape Prince of Wales, Bering Straits, with Messrs. H. R. Thornton and W. T. Lopp, teachers. It is under the control of the American Missionary Association of the Congregational Church.

In the harbor at Unalaska, in September, 1890, lay at anchor the revenue cutters *Bear* and *Rush*. The *Bear* was soon to return to the northward and cruise around the Seal Islands; the *Rush* to arrest two men accused of murder, and convey them to the United States district court at Sitka. As the *Rush* was to call in at the principal villages en route, and would afford me an opportunity of inspecting the schools at Unga, Kadiak, Afognak, and Southeastern Alaska, Capt. W. C. Coulson kindly invited me to take passage with him. Accordingly on the 6th of September, I removed my quarters from the *Bear* to the *Rush*, taking with me the boys William and George Fredericks, and M. Healy Wolff. We were to have sailed at 3 p. m., on the 7th, but a southeast gale prevailing outside, the captain concluded to remain at anchor. It was nearly a week before the storm abated and we got started. After getting outside of the harbor the fog shut down so thick that the ship ran into the harbor of Akatan. This is a small village of 87 souls, 34 of whom are children, and greatly in need of a school. They live in the barabaras, or native sod houses. The Alaska Commercial Company have a small store at the place. The people are exceedingly poor; their whole catch for the past summer was 19 sea otters. This represents the moneyed support of the whole village for 12 months. In addition to the clothing and supplies which the otter skins procure them at the store, the bay yields them fish, which is their principal food. The next day we started out, but found the fog so dense that the ship again returned to anchorage. The second attempt was more successful, and we passed from Bering Sea into the North Pacific Ocean. Turning to the eastward, we steamed past the volcano of Shishaldin, its beautiful top covered with snow and its smoking crater alike hid in the clouds. On Sabbath we were abreast of Belkofski, at one time the richest village in Alaska. With the decline of the sea-otter trade its people are much impoverished. The population is about 250. This is one of the villages where a good school should be established as soon as the annual appropriation will justify it. Our stay at this place was just long enough for the surgeon to go ashore and visit the sick. That night we dropped anchor in Coal Harbor. Monday morning found us at Pirate Cove, a cod-fishing station of Lynd & Hough, of San Francisco. It was understood that a Mr. Clark, accused of murder, was there waiting to give himself up. Not finding him at that place we passed on to Sand Point, another fishing station, and from thence to Unga, where he was found. At Unga I made a thorough inspection of the school property and school supplies. The school was not in session, but a number of the children were brought together and examined. A meeting of the parents was also called and a general conference had with regard to school matters. Monday evening, with the prisoner and two witnesses on board, we sailed for Kadiak, which we reached early Wednesday morning. In company with Mr. Roscoe, the teacher, an inspection was made of the new schoolhouse, and many educational matters discussed and considered. During the forenoon, a pilot having been secured, the captain steamed over to Afognak, in order that I might visit that school also. The school being in session, an opportunity was afforded of seeing the good work done at that village by Mr. Duff, the teacher. A comfortable school building and teacher's residence had been erected during the summer. Returning to Kadiak, the evening was spent with friends. At Kadiak a creole accused of assault with intent to kill was taken on board, to be conveyed to Sitka for trial. His victim was taken along for medical treatment and as a witness.

Mr. M. L. Washburn, superintendent of the interests of the Alaska Commercial Company, gave me for the collection of the Alaska Society of Natural History an ancient Eskimo stone lamp that had been dug up on one of the islands. The traditions of the people are that 400 years ago their fathers came from Bering Sea and settled Kadiak Island, which they found uninhabited. The Eskimo settlements of the North Pacific coast extend from Nuchek Island on the east to Mitrofania Island on the west. On the trails between two settlements are frequently found at the highest point two heaps of stones, from 50 to 70 feet apart. These heaps are from 4 to 6 feet high, and were many years in building. Their purpose is not known. Every passer-by was expected to add a stone to the heap, but the custom of late years seems to have fallen into disuse.

There is a very pleasant custom connected with the stone heaps and stone lamp. A couple engaged to be married select a stone suitable for the manufacture of a lamp. This stone, with a flint chisel, is deposited at the foot of one of the stone heaps. Parties carrying loads or traveling from one city or another naturally sit down to rest at the stone heap at the top of the hill. Spying the stone, the traveler says to himself, "My hands may as well work while my feet rest. As some one worked my lamp, I will work for some one else." And picking up the flint, with a song, he chisels away at the stone. When he is rested,

he lays down the stone and chisel and goes on his way. The next traveler repeats the operation, and the next, and the next, until in about two years the lamp is done which will last hundreds of years. Thus the whole community shows its good will to the young couple. In these lamps they burn seal oil, with a cotton wick. If the cotton can not be procured, then the wick is a bit of moss. In former days, as soon as one lamp was finished and removed, another stone was placed there, so that one was always in process of making. These lamps furnish both light and heat.

Early Thursday morning, September 17, the captain weighed anchor and put out to sea, bound for Sitka. During the day the wind increased to a gale, and on Friday night the sea was so rough that the ship was hove to, and oil was strained over the bows into the sea to lessen the force of the waves. Nearly the entire trip of a week across to Sitka was in the face of a heavy equinoctial storm. It was so rough that several times the table could not be set in the captain's cabin, and we took our meals in our hands in the pilot house as best we could. Off Mount Edgecombe, the ship was again compelled to heave to. However, we finally reached the quiet harbor of Sitka on Thursday, September 25, and the rough part of our journey was over. The remainder of our journey was made in the smooth waters of the Alexandrian Archipelago.

I remained two weeks at Sitka, attending to school matters. Then being joined there by the Hon. James Sheakley, superintendent of schools in the Sitka district, we made a tour of inspection through southeastern Alaska, visiting, either separately or together, every school in that district, except those at Metlakahtla and Klawack.

At Chilkat a location was selected and arrangements completed for the erection of a cheap but substantial log schoolhouse. On November 11 I reached Washington, after an absence of seven months, having traveled 17,825 miles.

The success of the long trip was greatly promoted by the many facilities that were extended by Capt. Michael A. Healy, of the steamer *Bear*, and Capt. W. C. Coulson, of the steamer *Rush*, with whom I sailed, also of the several officers of their command.

NEW OFFICERS.

In accordance with the provisions of the rules approved by the Secretary of the Interior April 9, 1890, the following persons have been appointed to commence service on July 1, 1890:

The members of the school committees will continue in office until June 30 of the year set against their names.

Assistant agent, William Hamilton; superintendent for Sitka district, Hon. James Sheakley.

LOCAL SCHOOL COMMITTEES.

Sitka.—Edward De Groff, 1892; N. K. Peckinpaugh, 1893; John C. Brady, 1894.

Juneau.—Karl Koehler, 1892; John G. Heid, 1893; Eugene S. Willard, 1894.

Douglas.—P. H. Fox, 1892; G. E. Shotter, 1893; S. R. Moon, 1894.

Fort Wrangel.—William G. Thomas, 1892; William Millmore, 1893; Allan Mackay, 1894.

Jackson.—James W. Young, 1892; W. Donald McLeod, 1893; G. Loomis Gould, 1894.

Metlakahtla.—David J. Leask, 1892; Dr. W. Bluett, 1893; William Duncan, 1894.

Kadiak.—Nicolai Kashavaroff, 1892; Henry Bowen, 1893; Charles Brown, 1894.

Unga.—Nehemiah Guttridge, 1892; John Caton, 1893; Edward Cashel, 1894.

Unalaska.—N. S. Reesoff, 1892; Nat. B. Anthony, 1893; Rudolph Neumann, 1894.

VISITORS.

Of late years tourists have commenced to learn of the attractiveness of the trip from Puget Sound to southeastern Alaska, and increasing numbers from year to year are availing themselves of it. This season over 5,000 round-trip tickets have been sold. As the steamer fare from Puget Sound up and return is $100, only the wealthier and better classes make the trip.

It is a cause for regret that the tourist season occurs during the vacation of the schools. If the tourists could see the schools in actual operation it would greatly assist in creating a healthy public sentiment that would react in favor of larger appropriations by Congress. As it is, the industrial school at Sitka, which is in continuous operation, is the only one visited. This, however, shows what can be done, and is an object lesson that will not be forgotten by tourists.

One of them, after describing her visit to the homes of the natives and the sickening filth and squalor which she witnessed in Alaska, writes:

"And now, quite by accident, I had the most interesting experience of my whole trip, certainly one that has made an everlasting impression on my mind; an object lesson which often and often will set me thinking, a subject which would require a volume to do it approximate justice. The joyous shouting of half a hundred boys, some of them dashing across the road in pursuit of a football; well-clothed, well-fed boys; healthy, vigorous, intelligent boys; Indians, half-breeds, Muscovites, and a few Americans. What did it mean? From whence had they so suddenly come? From school. These were the beneficiaries of the Presbyterian Board of Home Missions, and the large building on the right of the road is the schoolhouse.

"Of course I had read about this mission. All the books on Alaska refer to it more or less. Yet the knowledge of its existence had brought no special desire to visit the place. To me Sitka was the vestige of a departed empire; the home of a decaying race of aborigines; a depot for the sale of Russi-Indian relics and curios; a pretty little town timidly hiding away in among the mountains, and for that I had come to see it and had been amply repaid. But the mission I had never thought of. Perhaps the book-writer had failed to attract me to it; perhaps my faith in missions generally was not very confirmed; perhaps I did not believe what I read about them. Be that as it may, hereafter no man, nor woman either, shall outdo me in words of praise and thanks for the glorious, godlike work which is being performed by the good people who are rescuing the lives, the bodies, and the souls of these poor creatures from the physical and moral deaths they are dying. I am not a Christian woman; my faith is that of a chosen people who were led out of Egyptian tyranny and darkness by the pillar of fire and the pillar of cloud; but my whole nature is in accord with these Christian men and women, whose immolation and sacrifices to regenerate their fellow-creatures will surely meet with heavenly reward, no matter what their creed. I wish I had had more time at my disposal to spend with the teachers and the scholars, so that I might now give even a skeleton outline of their daily life.

"There are about 100 boys and 50 girls in the institution, some of them being only 3 years of age and others as old as 22. The boys are instructed in carpentry, shoemaking, and blacksmithing; the girls are taught dressmaking and the use of the sewing machine. I went first into one of the class rooms, where I saw perhaps 20 dark-skinned Siwash Indian boys, whose Mongolian faces and almond-shaped eyes had assumed an expression of intelligence so different from the stupid, blear-eyed appearance of the same age and race whom I had seen in the rancherie that it was difficult to realize that they could possibly be twigs of the same tree. Upstairs we found the dormitories, like everything else about the establishment, orderly, neat, clean, due regard being paid to the number allotted to each room and to the subject of heating and ventilation. In the sewing department were several girls operating skillfully upon the sewing machine, others cutting from the piece, and younger ones basting for the sewing girls.

"It is said somewhere that it is only a single step from civilization to barbarism. Perhaps so; but I, and those ladies and gentlemen who accompanied me through the rancherie and the schools at Sitka, can vouch for the fact that it is only half a mile from savage, uncivilized ignorance, superstitution, filth, and immorality to education, deportment, thrift, domestic felicity, and all human happiness."

NEW BOOKS.

The growth of the public interest in Alaska is manifested by the number of books which are issuing from the press.

Since the list given in my report for June 30, 1888, the following books have come under my observation:

"Fifth Avenue to Alaska," by Edwards Pierrepont, B. A. Published by G. P. Putnam's Sons. New York, 1884. Maps and illustrations. 329 pages. Price, $1.75.

"Letters from Alaska," by Horace Briggs, PH. D. Published by Mrs. Dora B. North, 51 Park Place, Buffalo, N. Y., 1889. 87 pages. Paper cover. Price, $1.

"Cruise of the *Rush*, 1889," by Isabel S. Shepard. Published by The Bancroft Company, San Francisco, 1889. Maps and illustrations. 257 pages. Price, $1.50.

"Picturesque Alaska," by Abby Johnson Woodman. Introduction by Whittier. Published by Houghton, Mifflin & Co., Boston. Maps and illustrations. 212 pages. Price, $1.50.

"New Eldorado," by Mr. M. Ballou. Published by Houghton, Mifflin & Co., Boston, 1889. Price, $1.50.

"The Wonders of Alaska," by Alexander Badlam. Published by the Bancroft Publishing Company, San Francisco, 1890. Maps and illustrations. 151 pages. Price, $1.50.

"Pacific Coast Scenic Tour," by Henry T. Finck. Maps and illustrations. Published by Charles Scribner's Sons, New York, 1890. 309 pages.

"A Woman's Trip to Alaska," by Mrs. Septima M. Collis. Published by The Cassel Publishing Company, New York, 1890. Maps and illustrations. Heavy paper. 194 pages. Price, $2.50.

"Arctic Alaska and Siberia," by Herbert L. Aldrich. Maps and illustrations. Published by Rand, McNally & Co., Chicago, 1889. 234 pages. Price. $1.50.

"Thirteen Years of Travel and Exploration in Alaska," by W. H. Pierce. Published by J. H. Carruth, No. 1312 Ohio street, Lawrence, Kans., 1890. 224 pages. Illustrated. Paper, 60 cents. Cloth, $1.

"From Yellowstone Park to Alaska," by Francis C. Sessions, president of the Ohio Historical and Archæological Society. Published by Welch, Fracker & Co., New York, 1890. 186 pages. Price $1.50.

"Reconnoisance in Alaska, 1885," by Lieut. Henry T. Allen, U. S. A. Maps and illustrations. 172 pages. Government Printing Office, Washington, 1877.

"Contributions to Natural History of Alaska," by L. M. Turner. 1866. 226 pages. Illustrated. Government Printing Office. Washington, 1886.

"Report on Natural History Collections made in Alaska, 1877-'81," by E. W. Nelson. Illustrated. 337 pages. Government Printing Office. Washington, 1887.

"Fur Seal and other Fisheries of Alaska." Maps and illustrations. 324 pages. Government Printing Office. Washington, 1889.

"The Coast Indians of Southern Alaska," by Ensign Albert P. Niblack, U. S. Navy. Maps and illustrations. 158 pages. Published by the Smithsonian Institution, National Museum. Government Printing Office. Washington, 1890.

"Cruise of the Revenue Marine Steamer *Corwin* in the Arctic Ocean, 1884." Maps and illustrations. 128 pages. Government Printing Office. Washington, 1889.

"Cruise of the Revenue Marine Steamer *Corwin* in the Arctic Ocean, 1885." Maps and illustrations. 202 pages. Government Printing Office. Washington, 1887.

"Bean's Report on the Salmon Fisheries of Alaska." Maps and illustrations. Government Printing Office. Washington, 1890.

From Yellowstone Park to Alaska, by Francis C. Sessions. 8vo. 196 pages. Illustrated. Published by Welch, Fracker & Co. New York, 1890.

"California and Alaska," by William S. Webb, M. D. Quarto, 190 pages. Vellum paper. Illustrations, India proof etchings, and photogravures. Price, $25; popular edition of the same, $2.50. Published by G. P. Putnam's Sons. New York. 1891.

"Alaskana. The Legends of Alaska," in verse, by Prof. Bushrod W. James. Illustrated. 368 pages. Published by Porter & Coates. Philadelphia, 1892. Price, $2.

"Kin-da-Shon's Wife. A Story of Native Customs Among the Chilkats of Alaska," by Mrs. Eugene S. Willard. Illustrated. 281 pages. Published by Fleming H. Revell. New York and Chicago.

RECOMMENDATIONS.

The three most urgent needs of education in Alaska at present are:

FIRST—LARGER APPROPRIATIONS.

Fifty thousand dollars is a sum wholly inadequate for the establishing and maintaining of good schools for the 10,000 children of Alaska. The utmost care is taken to make it go as far as possible, and yet a number of communities are asking for schools, which can not be granted because of the insufficiency of the appropriation. I would most respectfully recommend that an appropriation of $75,000 be asked for the coming year.

The efficiency of the school service would be greatly increased if a permanent appropriation could be made for a term of five years, which would increase in regular amounts up to $100,000. This would enable the Bureau of Education to keep pace with the steady growth of the work. It would also enable the Commissioner of Education to more wisely plan his work.

The appropriation for education in Alaska is placed in the sundry civil bill. Every alternate year during the long session of Congress this bill is not enacted into law before July, August, or September. But the last vessel for the year that communicates with the teachers in northwestern Alaska leaves San Francisco about the 1st of June. Consequently the Commissioner of Education can not appoint teachers for that section until ten or twelve months of the school year have expired. Or, in other words, the teachers are compelled to teach the entire school year without knowing whether any appropriation has been made to pay them. This is an injustice to the Commissioner of Education and to the teachers.

SECOND—OBLIGATORY ATTENDANCE.

There is no one subject connected with the Alaska schools that teachers, superintendents, committeemen, and citizens are more united upon than that the highest interests of the children and the schools require that there should be some authoritative regulations that will secure the more regular attendance of the native children. Attention has been called to this in every annual report.

Mr. John H. Keatley, ex-judge of the United States district court of Alaska and ex-member of the Territorial board of education for Alaska, in an article in the Atlantic Monthly for August, 1890, on "The Race Problem in Alaska," says:

"The natives of Alaska realize that everything is changing about them, and are anxious to pattern after the whites in better dwellings, more comfortable clothing, and a greater diversity of food, but they fail to realize yet the importance of education. The adults are serious obstacles to the education of the children, and no radical change is possible until attendance at the Government schools is compulsory. It is not enough to provide schools and teachers at the public expense, but Congress must go further and authorize the employment of Indian policemen at every village to compel the attendance of the children.

"Some of the native schools have an enrollment of 60 pupils,[1] with an average daily attendance of 10. This is due to the total lack of means of enforcing attendance. The race problem presented in the subject of their education and possible participation in the political affairs of the country is of too serious a character to be thus ignored by those who are now responsible for their future development."

THIRD—AGRICULTURAL EXPERIMENT STATION.

Passing from northern Alaska, with its adaptation to reindeer-raising, we find the whole southern coast, stretching for thousands of miles, to possess a temperate climate. This is due to the "Kuro-siwo" or "Japan Current" of the Pacific Ocean. In this "temperate belt" it is probable that there are areas of greater or less extent that are adapted to agriculture. At least it is known that there are small farms or vegetable gardens on Kadiak and Afognak Islands, on the shores of Cook's Inlet, and in southeastern Alaska. It is also known that wild berries grow in great profusion and abundance in many sections. But no intelligent and continued experiments have been made to test the agricultural and horticultural capabilities of the country.

Until a quite recent period (1867) the European population were fur-trading Russians. They were followed by fur-trading Americans, and more recently by the gold-seekers. No one expected to remain long in the country, and there has been no incentive to carry forward intelligent experiments in agriculture.

As early as my first report to the Commissioner of Education (1885) I called attention to the fact that there was a very wide diversity of views concerning the agricultural and horticultural capabilities of Alaska, and necessarily very great ignorance; that no systematic effort intelligently prosecuted had ever been made to ascertain what could or what could not be raised to advantage; that it was of very great importance, both to the people of Alaska and the country at large, that careful experiments should be made, extending over a term of years, to ascertain the vegetables, grains, grasses, berries, apples, plums, trees, flowers, etc., best adapted to the country; the best methods of cultivating, gathering, and curing the same; the planting and grafting of fruit trees; the development of the wild cranberry; cattle, hog, and poultry raising; butter and cheese-making, etc. In 1886 my recommendation was taken up by the U. S. Commissioner of Agriculture, who, in his annual report for that year (page 20) says: "Something in the line of experimental work might also be undertaken

[1] This is true of a few, not of many schools.

in Alaska, possibly with profit. It is well known that the Department of the Interior has established an agency for the promotion of education in that territory."

"It has been suggested that a line of experiments, to be undertaken by this Department, would easily prove whatever of agricultural and horticultural capability may exist in the Territory. No careful attention seems to have been given there, as yet, to this branch of industry, and the resources of the country are quite unknown and undeveloped.

"The industrial training school at Sitka would furnish an admirable basis for a station, where could be conducted careful experiments to ascertain the agricultural products best adapted to the climate and soil of the Territory, and what breeds of cattle and other domestic animals are most suited to its climate and soil.

"Such an experiment ought to extend over a series of years, and the result would amply repay any expenditure that Congress may choose to make in this direction."

In view, therefore, of the national importance of introducing the domesticated reindeer of Siberia into northern Alaska, and testing the agricultural capacity of southern Alaska, I most earnestly recommend that you secure the establishment of an "agricultural school and experiment station" in connection with the system of industrial education in Alaska.

By an act approved July 2, 1862, Congress made provision for schools for the "benefit of agriculture and the mechanic arts." By an act approved March 2, 1887, provision was made for "agricultural experiment stations" in connection with the agricultural schools. And by the act approved August 30, 1890, certain of the proceeds of the sale of public lands were set aside for the better support of these agricultural schools.

These acts of Congress require the assent of the legislature of the State or Territory in order that their provisions may become available.

But Alaska has no legislature, and is governed directly by Congress. On this account, and partly because nineteen-twentieths of the children to be benefited belong to the native races, Congress has committed to the Secretary of the Interior the duty of making "needful and proper provision for education in Alaska." I would therefore recommend that an application be made to Congress to direct the Secretary of the Interior to extend to Alaska the benefits of the agricultural acts of 1887 and 1890, and secure the establishment of a school that can introduce reindeer into that region, and teach their management, care, and propagation, and also to conduct a series of experiments to determine the agricultural capabilities of the country.

To reclaim and make valuable vast areas of land otherwise worthless; to introduce large, permanent, and wealth-producing industries where none previously existed; to take a barbarian people on the verge of starvation and lift them up to a comfortable self-support and civilization, is certainly a work of national importance.

In the closing year of the existence of the Territorial board of education the following rules were enacted, viz:

First. From and after this date (October 27, 1888), corporal punishment in the public schools of Alaska is entirely and wholly prohibited.

Second. All religious services are prohibited in all the public schools of Alaska except Howkan Klawack, Metlakahtla, Fort Wrangell, Juneau No. 2, and Haines.

The above rules were carried by the deciding vote of the chairman. If Mr. Duncan, the absent member of the board had been present, they could not have been passed.

With the reorganization of the Alaska school system on April 9, 1890, the above rules were rescinded, and both school punishments and religious exercises left discretionary with the teacher and the local school committee.

To still further popularize the schools and create in the several communities a feeling of responsibility for the conduct of the schools and a personal interest in their success, I would recommend that in the villages containing a number of white people, such as Juneau, Sitka, and Douglas, the voters be allowed to elect their local school committee, and said committee be authorized to select teachers of the white schools, subject to the approval of the Commissioner of Education.

I remain with great respect, yours, truly,

SHELDON JACKSON,
General Agent of Education for Alaska.

Hon. W. T. HARRIS, LL. D.,
Commissioner of Education.

CHAPTER XVIII.

EDUCATIONAL NECROLOGY.[1]

1887.

ELIOT, W. G., D. D., at Pass Christian, Miss., January 23, aged seventy-five; was born in Massachusetts, descended from the same family as President C. W. Eliot of Harvard; graduated at Columbian University, Washington, D. C., and at Harvard Divinity School; during his long pastorate of the Unitarian Church in St. Louis, he was one of the most effective promoters of the social, intellectual, and moral uplift of his city and State. He was specially active in establishing Washington University, and finally became its chancellor.

1888.

CALLAHAN, Henry, died at Franklin, N. Y., February 7, aged seventy-seven; born in Andover, Mass., graduated at Union College 1836; studied at Andover Theological Seminary 1836–40, taught in New Hampshire, pastor in New York, and became chaplain of the One hundred and fourteenth New York Volunteers, and was on duty in hospital in New Orleans; taught two years in Delaware Institute, Franklin, N. Y., conducted Callahan Institute there for fourteen years.

WADLEIGH, Miss Lydia F., October 27, in Brooklyn, N. Y., aged seventy-one. She was born in Sutton, N. H., educated and taught at New Hampton, Hanover, Derry, Concord, Georgetown, D. C., Philadelphia, Pa., and Freehold, N. J.; in 1856 became principal of the senior department of the Girls' Twelfth Street Grammar School, New York City; here she advanced the course, won the girls to larger study, at her own expense provided text-books and diplomas, and in spite of criticism inaugurated annual commencements, prepared the public to demand and establish the Normal College, of which she became vice-president and professor of ethics in 1871, and so remained until her death, which occurred on her return from a visit to Europe.

1889.

ABBOTT, Amos, M. D., in England April 24, aged seventy-eight; born in New Hampshire; educated at Phillips Andover and Andover Theological Seminary, and in medicine in Philadelphia; missionary in India, 1834–47 and 1857–69; author of mission text-books; his arithmetics have been used forty years.

BRACE, Chas. Loring, in Germany, August 17, aged sixty-three; was born in Connecticut; graduated at Yale in 1846; studied theology there and at Union Theological Seminary; he went to Europe for study and observation; while in Hungary he was arrested for expressions of sympathy with the Patriot cause, and was only released on appeal of the American minister and the arrival at Trieste of two American frigates; returning, became interested in an effort to reduce the misery at Five Points, New York City, but declared it as he saw it a Sisyphus' work; began to form the plans which resulted in the Children's Aid Society in 1853, in which he sought to arrest degradation at its source in

[1] Often the information furnished the Office comes too late for insertion in the current report. Most of the persons named were correspondents of this Bureau.

childhood. Some of the wisest philanthropists joined him, and he found his life work. Boys and girls in need were taken in, and an effort made to elevate them. Lodging houses, newsboys' homes, night schools, free reading rooms, fresh air fund, and summer resorts were established. In his last report it appears that over 200,000 had been received at the lodging houses, over 70,000 had been transplanted to country homes, and not a few had risen to places of responsibility. The expenditure for that year reached $366,998.26. He was a correspondent of this Bureau and the Commissioner appealed to him to plant similar organizations in all of our large cities, but he did not see his way to the undertaking.

BRIGHAM, Miss Mary A., in a railroad accident at New Haven, June 29, aged fifty-nine years; born in Massachusetts, graduated and taught at Mount Holyoke Seminary; was principal of Ingham University, Leroy, N. Y., in 1863; assistant principal of Brooklyn Heights Seminary: was offered the presidency of Wellesley, but accepted that of Mount Holyoke, whose charter as a college she had been active in securing.

BURNHAM, Jonas, March 9, aged ninety years; born in Maine; educated at Phillips Andover, and Bowdoin College, 1823; teacher of academies at Saco, North Bridgton, Bath, China, Bridgton, Kennebunk, Hallowell, Augusta, Winthrop, Strong, and Farmington, Me.

a The small average daily attendance as compared with the total enrollment is due to the rapid growth of the city and of the schools.

TABLE 5.—*Ratio of male and female instructors and students in private secondary schools in the United States—1889-90.*

	Male.	Female.
Total number of instructors	3,272	3,937
Percentage of instructors	45.39	54.61
Total number of students	47,534	47,397
Percentage of students	50.07	49.93
Total number of students preparing for college classical course	11,220	5,429
Percentage of students preparing for college classical course	67.39	32.61
Total number of students preparing for college scientific course	6,326	3,323
Percentage of students preparing for college scientific course	65.56	34.44
Total number of students preparing for college classical and scientific course	26,298	8,752
Percentage of students preparing for college classical and scientific courses	66.72	33.28
Percentage of male and female students preparing for college, in both classical and scientific courses	63.30	36.70
Percentage of male students preparing for college, in both classical and scientific courses, to whole number of students	36.91	
Percentage of female students preparing for college, in both classical and scientific courses, to whole number of students		18.46
Percentage of both male and female students preparing for college, in both classical and scientific courses, to whole number of students	27.70

* Statistics of 1888–89.
a Richard C. Jones, LL. D., has since been elected president.
b Deceased. Eugene R. Long, PH. D., chairman.
c Resigned. Martin Kellogg, A. M., president-elect.
d Succeeded by D. C. Kelley, D. D.
e Succeeded by J. G. Huber.
f Succeeded by Rev. Henry E. Partridge, A. M.
g Suspended at close of year 1889–90.
h Succeeded by Rev. Frank J. Amis, B. S.

*Statistics of 1888-89.

NOTE EXPLANATORY OF TABLE ON FOLLOWING PAGES.

NOTE.—I. *The Manual Method.*—The sign language, the manual alphabet, and writing are the chief means used in the instruction of the pupils.

II. *The Oral Method.*—Articulation and speech-reading, together with writing, are made the chief means of instruction, and facility in articulation and speech-reading, as well as mental development and written language, is aimed at. Signs are used as little as possible, and the manual alphabet is generally discarded altogether. There is a difference in different schools in the extent to which the use of natural signs is allowed in the early part of the course, and also in the prominence given to writing as an auxiliary to articulation and speech-reading in the course of instruction.

III. *The Combined System.* Articulation and speech-reading are regarded as very important, but mental development and the acquisition of language are regarded as still more important.

A. The general instruction of the pupils is carried on chiefly by the manual method. Part of them receive special training in articulation and speech-reading.

AB. Part of them are taught by the manual method, others by the oral method. Of the former, part receive special training in articulation and speech-reading. All are permitted to mingle freely with one another out of school hours.

AE. The general instruction of the pupils is carried on chiefly by the manual method. Part of them receive special training in articulation and speech-reading. Some of the teachers also use articulation and speech-reading in addition to the manual alphabet and writing as a means of instruction with part of their pupils.

B. Some of the pupils are taught by means of the manual method and others by the oral method. These two classes are permitted to mingle freely with one another out of school hours.

BC. Some of the pupils are taught by means of the manual method, and others by the oral method. Of the latter, part are permitted to mingle freely out of school hours with the manually taught pupils; others are kept entirely separate from them and from those who mingle with them out of school hours as well as in the schoolrooms.

C. Some of the pupils are taught by means of the manual method and others by the oral method. These two classes are kept entirely separate out of school hours as well as in the schoolrooms.

D. The general instruction of the pupils is carried on chiefly by means of the manual alphabet and writing without the use of the sign language. All the pupils receive special training in articulation and speech-reading.

E. The sign language, the manual alphabet, writing, articulation, and speech-reading are all used as means of instruction by the same teachers and with the same pupils.

F. In addition to one or more of the methods above described, auricular training is given to a part of the pupils.

EDUCATION IN FOREIGN COUNTRIES.

The following table presents the statistics of public elementary schools, *i. e.*, schools intended for children of legal school age, generally 6 to 14 years, and supported wholly or in part by public funds. In a few instances the statistics are not strictly limited to these bounds.

For France, as will be seen by reference to columns 3 and 4, the enrollment in private elementary schools, which derive nothing from public funds, is included. As these schools are, however, under government inspection they pertain in a certain sense to the public system. For England and Wales and Scotland the enrollment includes pupils in infant schools and classes. Of the number tabulated, for the former 9 per cent. and for the latter 2.42 per cent. were under 5 years of age.

In Ireland only those pupils on the rolls who make at least one attendance in the fortnight preceding the government examination are included in the number recognized for the government payments. This number and the total enrollment for the year are both tabulated (see column 5). Private schools not aided by public funds are included in the enrollment for the Netherlands. The latest official statistics from Finland, *i. e.*, for 1889-90, give a very imperfect notion of the actual state of instruction in that country, as they include only organized schools, whereas the larger proportion of the population receive the elements of knowledge through the agency of ambulatory schools. The statistics of these as reported in 1886 are, therefore, given (see column 5).

The statistics of Upper Burmah, whose schools have recently been brought under the supervision of English officials, include 8,685 pupils in strictly private schools. For the remaining provinces of India the tabulated statistics include only public primary schools. The reports received show also an attendance in private native schools of elementary grade as follows: Bengal, 77,286; Bombay, 67,123; Lower Burmah, 35,003; North West Provinces and Oudh, 70,061; Mysore, 22,162.

Peculiar difficulties are encountered in the attempt to tabulate the current expenditures for elementary education. In some instances these are given in financial reports separate from the educational, and pertaining to a different year. Often the total expenditure for education is given without itemizing, so that the amounts devoted to the elementary schools can not be determined; thus, for example, in Russia in 1891 the school budgets of the different ministers having charge of educational institutions amounted to about $23,000,000, the proportion for elementary education not being separable.

In Roumania in 1891 the total budget for the various grades of education was $3,580,921.

The total expenditures are not made up in every case solely from public funds, governmental and local, church subsidies and tuition fees being often sources of revenue. In the German-speaking countries tuition fees form only an insignificant item in the total expenditure. In 1888 the principle of free education was established by law in Prussia, and is being carried into effect as rapidly as circumstances permit. In Belgium while subsidized private schools comprise 29 per cent of the enrolled pupils, tuition fees afford about 5.22 per cent of the total elementary school income, the maintenance of forty-nine normal schools being included therein.

About 25 per cent of the reported school expenditure for England and Wales was made up from tuition fees, which this year, for the last time, form an appreciable part of the income, the law providing for the remission of fees having gone into operation September, 1891. Scotland has completed a year's experiment in free education. Tuition fees are required in the public schools of the following British colonies represented in the table: Quebec, New South Wales, South Australia, Western Australia, Tasmania, Mauritius, Trinidad, Jamaica, and the provinces of India.

School of Mines, Colorado, programme of civil engineering course, 960, 1055.
Schools. This volume deals with instruction, which, the world over, is of three grades, elementary (given in "peoples'" schools in Germany, "primary" schools in Latin countries, "board" schools, when public, in England, and public or common schools in the United States); secondary (given in gymnasien and realschulen in Germany, lycées and colleges in France, "public" and secondary schools, etc., in England, and high schools, academies, etc., in America); and higher and professional including, for convenience technical and normal training. Proper entries and references are made, therefore, under the name of each grade. Private schools are classed with public.
