CONTENTS OF VOLUME II.

PART II.

CHAPTER I.—CITY SCHOOL SYSTEMS.

	Page.
Introductory remarks	603
Relative importance of city school systems (Table 1)	604
Comparison of city and country schools (Tables 2 and 3)	604
Comparative statistics for four years of all cities reported (Table 4)	605
Comparative statistics of attendance, teachers, accommodations (Table 5)	606
Comparative statistics of school property and expenditures (Table 6)	608
Number and population, by States, of cities of over 4,000 inhabitants (Table 7)	609
Explanation of the foregoing table	610
Summary by States of school enrollment and attendance in cities and villages of over 4,000 inhabitants (Table 8)	613
Summary of superintendents, teachers, property, and expenditures (Table 9)	614
Summary of public high schools (Table 10)	615
Summary of public evening schools (Table 11)	616

CHAPTER II.—SALARIES OF TEACHERS IN CITY PUBLIC SCHOOLS.

Annual salaries of teachers in 69 of the principal cities of the United States	617
Detailed statement of salaries paid in Baltimore, St. Louis, Boston, New Orleans, and Cincinnati each year since the establishment of public schools in those cities	647

CHAPTER III.—SCIENTIFIC TEMPERANCE INSTRUCTION IN THE PUBLIC SCHOOLS.

Historical sketch, text-books, course of study, topical outline of study, standard of enforcement, duties of school boards, etc.	695
Effects of alcohol on the system, and the method of teaching them, by Prof. A. C. Boyden	709
The legislation effected	713
Reports of school officials on the enforcement of the law	714
Report of State Agent George H. Martin upon results in Massachusetss	724
Objections to scientific temperance instruction stated	733
Answers to some false notions	737
Questions on physiology and hygiene, alcoholic drinks, and narcotics	739

CHAPTER IV.—HIGHER EDUCATION OF WOMEN.

General statement, new institutions	743
Summary of statistics	746
Courses of study for A. B. degree in fifteen institutions	750

CHAPTER V.—COLLEGES AND UNIVERSITIES OF THE UNITED STATES.

Brief discussion of the system of higher education	755
Summary of statistics	759
Distribution of students in degree courses	772
Endowment funds of colleges and universities	778
Grounds, buildings, and apparatus	779
State universities	780
Denominational institutions	787
Organization of a number of leading universities	788
Reorganization of Columbia College	789
New institutions	790
New buildings during 1889–90	795

107913

CHAPTER VI.—LENGTH OF COLLEGE CURRICULUM.

Page.
Introduction, average age of freshmen 799
Increased requirements for graduation 801
Average age of freshmen at Harvard 802
Remarks and opinions of prominent educators 804

CHAPTER VII.—GRADUATE DEPARTMENTS OF UNIVERSITIES.

Organization 815
Growth of graduate work in eighteen years 818

CHAPTER VIII.—UNIVERSITY AND SCHOOL EXTENSION.

Definition and description 827
Origin and history 828
The movement in Scotland and Ireland 830
In the United States 831

CHAPTER IX.—DIAGRAMS OF PROFESSIONAL EDUCATION.

Comparative diagrams illustrating the statistics of professional education during the decade, 1881–90 837

CHAPTER X.—CURRICULA OF PROFESSIONAL SCHOOLS.

Medicine:
Requirements for admission 875
Matriculates having degrees in letters or science 876
Changes in the medical curriculum during the decade 879
Text-book work 883
Practical work 885
Preparatory medical schools 895
Distribution of the studies in the course 897
How the standard of the medical profession may be advanced 911
Theology:
Introduction 913
Requisites for admission 918
Courses of studies 920
Changes during the decade 936
Law 943
Schools and colleges of applied science:
Requirements for admission 944
Civil engineering 945
Mechanical engineering 961
Mining engineering 986
Electrical engineering 990
Architecture 992
Chemistry 994
Agriculture 996
Biology 1013
Instruction in the art of teaching 1015

CHAPTER XI.—STATISTICS OF PROFESSIONAL INSTRUCTION.

Summary of statistics of schools of medicine, dentistry, pharmacy, etc 1021
Summary of statistics of schools of theology 1025
Of schools of law 1026
Of colleges endowed with the national land grant 1027
Of technological schools not endowed with the national land grant 1028
Income and property of the colleges endowed with the national land grant 1029
Income and property of the colleges not endowed with the national land grant 1029
Summary of statistics of public normal schools 1030
Finances and property of public normal schools 1031
Statistics of private normal schools 1032
Summary of degrees conferred by professional schools 1033
Statistics of schools of medicine 1034

Page.
Statistics of schools of dentistry 1039
Of schools of pharmacy 1040
Of nurse-training schools 1042
Of schools of veterinary medicine 1044
Of schools of theology 1045
Of schools of law 1051
Of schools of science endowed with the national land grant 1053
Of schools of science not endowed with the national land grant 1055
Of public normal schools 1056
Of private normal schools 1060
Of private normal training schools 1062

CHAPTER XII.

METHODS EMPLOYED IN THE REFORMATION OF JUVENILE OFFENDERS 1063

CHAPTER XIII.—EDUCATION OF THE COLORED RACE.

In the common schools 1073
In secondary and higher schools 1081
Industrial training 1093
Hampton Normal and Agricultural Institute 1098

CHAPTER XIV.

THE SWEDISH OR LING GYMNASTICS 1103

CHAPTER XV.—DISCUSSIONS OF EDUCATIONAL QUESTIONS.

Civic instruction 1109
Compulsory attendance 1110
Courses of study—Adjustment of school programmes 1111
Education 1135
Higher education 1143
Kindergartens 1147
Manual and industrial training 1148
Methods of instruction 1148
Physical training 1152
Private and parochial schools 1156
Limitation by statute 1157
Questions of expediency 1158
The Faribault schools 1158
Public schools 1158
Buildings and appliances 1162
The teaching service 1163
The work of the schools should be defined 1163
Compulsory attendance 1165
Reading and literature 1168
Religious and moral training 1171
School management and discipline 1176
Secondary education 1176
Teachers 1177

EDUCATIONAL NECROLOGY 1301

PART III.

STATISTICAL TABLES.

CITY SCHOOLS.

Statistics of population, private schools, and public school enrollment, attendance, supervising officers, teachers, and accommodations in cities and villages containing over 4,000 inhabitants (Table 1) 1318
Statistics of public evening schools in cities and villages containing over 4,000 inhabitants (Table 2) 1346
Statistics of manual training in city public schools (Table 3) 1351
Statistics of property, receipts, and expenditures of public schools in cities and villages containing over 4,000 inhabitants (Table 4) 1358

PUBLIC HIGH SCHOOLS.

Summary of statistics of public high schools, for 1889–90 (Table 1) 1388
Summary of number of students pursuing certain studies (Table 2) 1390
Percentage of male and of female students in public secondary schools pursuing certain studies. 1392
Statistics of public high schools for 1889–90 (Table 3) 1394

PRIVATE SECONDARY SCHOOLS.

Summary of statistics of endowed academies, seminaries, and other private secondary schools, for 1889–90 (Table 4) 1486
Ratio of male and female instructors and students in private secondary schools in the United States in 1889–90 (Table 5) 1488

Page.
Summary of certain studies pursued in endowed academies, seminaries, and other private secondary schools, for 1889-90 (Table 6) 1490
Percentage of male and female students in private secondary schools pursuing certain studies (Table 7) 1492
Percentage of students in each branch of study to the whole number of students (Table 8) 1492
Statistics of endowed academies, seminaries, and other private secondary schools, for 1889-90 (Table 9) 1494

COLLEGES FOR WOMEN.

Statistics of colleges for women, for 1889-90, Division A (Table 1) 1572
Statistics of colleges for women, for 1889-90, Division B (Table 1) 1574

UNIVERSITIES AND COLLEGES.

Statistics of universities and colleges for 1889-90—Part I (Table 2) 1582
Statistics of universities and colleges for 1889-90—Part II (Table 2) 1600

COMMERCIAL AND BUSINESS COLLEGES.

Summary of statistics of commercial and business colleges for 1889-90 (Table 1) 1610
Statistics of commercial and business colleges for 1889-90—Part I (Table 2) 1612
Statistics of commercial and business colleges for 1889-90—Part II (Table 2) 1621
Statistics of commercial and business colleges for 1889-90—Part III (Table 2) 1629

INSTITUTIONS FOR THE DEFECTIVE AND DEPENDENT CLASSES.

Summary of statistics of public boarding institutions for the deaf for 1889-90 (Table 1) 1632
Summary of statistics of public day schools for the deaf for 1889-90 (Table 2) 1634
Summary of statistics of private schools for the deaf for 1889-90 (Table 3) 1635
Statistics of public boarding institutions for the deaf for 1889-90—Part I (Table 4) 1636
Statistics of public boarding institutions for the deaf for 1889-90—Part II (Table 4) 1639
Statistics of public boarding institutions for the deaf for 1889-90—Part III (Table 4) 1641
Statistics of public boarding institutions for the deaf for 1889-90—Part IV (Table 4) 1644
Character of defect and age at which it appeared (Table 5) 1646
Statistics of public day schools for the deaf for 1889-90—Part I (Table 6) 1648
Statistics of public day schools for the deaf for 1889-90—Part II (Table 6) 1649
Statistics of private schools for the deaf and dumb for 1889-90—Part I (Table 7) 1650
Statistics of private schools for the deaf and dumb for 1889-90—Part II (Table 7) 1651
Summary of statistics of public institutions for the blind for 1889-90 1652
Statistics of public institutions for the blind for 1889-90—Part I (Table 9) 1654
Statistics of public institutions for the blind for 1889-90—Part II (Table 9) 1656
Statistics of public institutions for the blind for 1889-90—Part III (Table 9) 1657
Statistics of public institutions for the blind for 1889-90—Part IV (Table 9) 1659
Number of pupils congenitally blind in public institutions; number not wholly blind (Table 10) 1660
Summary of statistics of public institutions for the feeble-minded for 1889-90 (Table 11) 1661
Summary of statistics of private institutions for the feeble-minded (Table 12) 1662
Statistics of public institutions for the feeble-minded for 1889-90—Part I (Table 13) 1663
Statistics of public institutions for the feeble-minded for 1889-90—Part II (Table 13) 1665
Statistics of public institutions for the feeble-minded for 1889-90—Part III (Table 13) 1666
Statistics of public institutions for the feeble-minded for 1889-90—Part IV (Table 13) 1667
Statistics of private institutions for the feeble-minded for 1889-90—Part I (Table 14) 1668
Statistics of private institutions for the feeble-minded for 1889-90—Part II (Table 14) 1669
Statistics of public elementary education in foreign countries 1671

PART II.

CHAPTER I.

CITY SCHOOL SYSTEMS.

Relative importance of city school systems (Table 1)—Comparison of city and country schools (Tables 2 and 3)—Comparative statistics for four years of all cities reported (Table 4)—Comparative statistics of enrollment, attendance, teachers, and accommodations in the city schools of the several States (Table 5)—Comparative statistics of property and expenditures of the same (Table 6)—Number and population, by States, of cities, etc., of over 4,000 inhabitants (Table 7)—Explanation of the same—Summary, by States, of school enrollment and attendance in the same cities (Table 8)—Similar summary of supervising officers, teachers, property, and expenditures (Table 9)—Similar summary of public high schools (Table 10)—Similar summary of public evening schools (Table 11).

The tables immediately following (*i. e.*, Nos. 1, 2, and 3) are designed to indicate the differences in the conditions of work that exist between the city schools and those of rural districts. The tables are self explanatory, and even a cursory examination will disclose the importance of the facts they develop. A few of these may be mentioned.

Though 32.39 per cent of the total population is in the cities, only 23.43 per cent of the enrollment is in city schools. This is apparently an indication that education is appreciated more highly in the country and that, though school attendance is surrounded by greater difficulties, country children more eagerly accept the advantages offered. The attendance is more regular in cities, as would naturally be expected, owing to the greater distance as a rule that must be traversed by country pupils and the better highways in the cities.

In the length of the school term rural schools are at a great disadvantage and the same is true of the average duration of each child's attendance. These may arise from the more meager financial support accorded to rural schools and from the exigencies of farm life which demand the services of the older children for a great part of each year.

The number of teachers is relatively very small in the cities, and the number of buildings required for city schools appears insignificant until their greater size and value are considered.

The slight difference that exists between the average cost per day of tuition for each pupil is significant and might readily serve as a text for a lesson on the meagerness of the pay of country school teachers, for there are nearly twice as many pupils to each teacher in the city schools.

On the other hand, may it not be that the greater proportionate enrollment in the country is at least partially due to the smaller number of pupils to a teacher and consequently the more intimate personal relation that exists between teacher and pupil?

Tables 5 and 6 are similar to others that have appeared in the Reports of the three years previous, and in Table 4 are reproduced for comparison some of the ratios shown in those tables. The data presented do not cover sufficient time to form the bases for any important general conclusions. The method of keeping school statistics and the manner of collecting them are yet far from perfect, and a variation of a few tenths of a per cent affords no ground for startling assertions of progress or the reverse. Such conclusions may be justly reached only after the appearance of marked differences or a series of changes in the same general direction covering a considerable number of years.

For several years past there has been a desire on the part of those interested in the preparation of these statistics to present a series of tables showing with

reasonable accuracy the absolute totals of the several items for the entire Union. The first result of this was presented in the last Report, and similar tables are also included in this chapter as Nos. 8, 9, 10, and 11.

To prepare such tables it is first essential to perfect a list of cities of which all shall meet certain uniform conditions. This itself is very difficult even with the census reports at hand. Table 7, with the accompanying explanation, indicates some of the perplexities encountered. In the years other than census years the difficulties are of course multiplied, since dependence must be placed almost wholly upon local estimates.

Then, having the list of cities, the collection of complete statistics involves a task almost hopeless. Many cities fail to report every year, and in the returns of many more several of the most important items are omitted. As before explained, estimates were necessary to make good the deficiencies. The corrections and additions that the circumstances indicated having been made, the tables as they now stand are presumably fairly correct.

TABLE 1.—*Relative importance of city school systems; shown by comparison of the sum of results achieved by them, with similar data for the corresponding geographical divisions and for the United States. (See Tables 8 and 9 of this chapter, and Tables 1 to 15, chapter 1, Part 1.)*

[a] For the names of these cities and villages and their population see the tables of city school statistics in Part III, and also the list of cities annexed thereto from which no data are available.

EXPLANATION OF THE DIFFERENCES IN THE FOREGOING TABLE.

The difference between the list of "places" of over 4,000 inhabitants presented in Bulletin No. 165 of the United States Census Office and the list of "cities and villages" used in the compilation of the tables of this chapter may be explained as follows:

First. The population of the cities of Owego, N. Y., Evanston, Ill., and Salem, Oregon, was not separately reported by the enumerators of their respective localities. Consequently these cities were not included in the list of places in the census bulletin mentioned. All three cities are undoubtedly of the population requisite for representation in these tables; their school statistics are reported in due form, and no reason is apparent why they should not be inserted. The population assigned to them is estimated, the estimates being based principally upon the population in 1880 and the rate of increase of the several townships of which they are parts.

Second. The differences which appear in the figures for the six New England States require more extended notice, since the school data here presented will be used in comparison with similar items in future years, and it is important that persons so using them shall be in no doubt as to what the figures represent.

In New England, as it is well-known, the methods of local government are peculiar. Counties exist, but for judicial purposes only; in nearly all other matters what is there known as the "town system" prevails. The entire territory is divided into towns, which correspond in a measure to the western townships, but with the important difference that the New England towns are independent of the county in all matters of local concern. Villages in the towns are not recognized in the system and do not even have their boundaries defined. A "town" is made a city by simply changing the plan of government from a pure democracy to a representative form. This may be done when the people desire the change and the legislature sanctions it, after certain conditions have been reached, as, in Massachusetts for example, when the population is as great as 12,000.

The average area of the towns in Massachusetts is approximately 23 square miles; in Rhode Island, 30; in Connecticut, 29; in Maine, 60; in Vermont and New Hampshire, 38.

It is plain, therefore, that there are many towns in which a population of several thousand is so scattered over a large territory as to deprive them of every aspect of urban communities. Then, too, some of the "cities" consist of several distinct villages, between which original forests or agricultural lands still remain, although in most cases the incorporated cities are uniformly and thickly settled, and do not differ materially from cities in other parts of the country. But there are no boundaries recognized excepting those of the counties and towns or cities, organized as before explained; and the custom prevalent in that section of never considering the village apart from the town in official matters, evidently had its effect upon the census officials, for with a few exceptions they made no mention of the villages in their figures of population.

There is great difficulty, therefore, in making from such data a tabular statement of urban population in New England which will substantially correspond with the conditions elsewhere. Only two methods of dealing with the problem seem possible: First, disregard the great territorial extent of the "towns" and place them in the same category with the cities and villages of other sections; second, investigate the character of the population of the several towns, considering each one separately, and from the best data available make as close an estimate as possible of the urban population.

The first method was adopted by the census authorities in this city. It has the advantage of displaying no figures except those obtained by an actual count of something; but its disadvantage is obvious, since it makes the urban population appear to be far greater than it is in fact.

This method is particularly unsatisfactory in the matter of school statistics. "City school systems" are essentially those of dense settlements. The schools in rural, or sparsely settled, districts form a class entirely different in organization, in methods, and, as a rule, in results. It becomes important, therefore, to separate them as far as possible. As this could not be done under the classification of the Census Office the second method of obtaining the list of "cities" was adopted, although it involved the use of estimates in many cases.

The following may be given as the principal means by which the fitness or unfitness for these tables of individual localities was determined:

First. When a town was shown to contain more or less rural or scattered population, and a single village or borough whose population was exactly stated, or could be approximately determined from the school census or otherwise, the

town was disregarded and the village or borough was considered with sole reference to its own population. Cases of this kind arose principally in Connecticut and Vermont.

Second. When the only school statistics to be had were for the town as a whole, and it appeared that the town was composed wholly of a city or large village with its environs or "suburbs," as in the case of New Britain, Conn., the population of the town was used in preference to that of the city alone. This was necessary to make the figures of population correspond in area with the school data, and is in accordance with the general practice of including more or less of contiguous territory in the corporate limits of a city.

Third. When a town contains several distinct villages with separate interests, none of which had as many as 4,000 inhabitants, all were discarded, though the population of the entire town may have been a great deal more than the minimum limit. But when one of the villages evidently contained the required population that village was included in the list, with an estimate as accurate as may be of its population. Warwick, R. I., is an instance of the first class, and Lincoln, R. I., containing Central Falls, of the second class.

Fourth. When nothing definite could be determined concerning the villages in a town the population of the town as compared with its area as shown by the maps was taken as an indication of the density of its population, and consequently of the fitness of the town for use in the tables. But in all such cases the organization of the schools shown by the reports of the school committees was considered, for in New England small schools almost invariably indicate sparse population. In Massachusetts, and in some instances in other States, it was necessary to accept or discard each town as a whole according to these guides, which, it must be admitted, were by no means satisfactory.

It is to be remembered that the list as it stands is not claimed to be a perfect one, and persons with an intimate knowledge of the several localities may detect flaws in the conclusions reached regarding them; if so, any suggestion in relation thereto will be gladly accepted.

The following shows in detail the instances of difference between the Census Office tables and those of this chapter so far as they relate to New England:

[1] In the preparation of these summaries omissions and deficiencies in the returns of individual cities were supplied from the best sources available. If no accurate information could be had in any particular case, an estimate based upon the ratios developed in the other cities of the same State was used unless it appeared that the conditions were essentially different in the city for which precise data were lacking.

Blanks in the tables indicate that the number of cities which reported the item was not sufficient to justify an assumption of approximate correctness in an estimate for the deficiency.

TABLE 9.—*Summary*[1] *by States of supervising officers, teachers, property, and expenditures of school systems of cities and villages containing over 4,000 inhabitants.*

State.	Number of supervising officers.	Number of teachers.			Number of buildings.	Number of seats or sittings for study.	Value of all public property used for school purposes.	Expenditure for supervising and teaching.	Expenditure for all purposes except bonds and loans

2 teachers at	480

36 substitutes, day schools, paid by the day.

5 substitutes, evening schools, paid by the evening.

DENVER, COLO., DISTRICT NO. 1.

After a teacher has been with us one year she receives $760 a year, or $63.33 per calendar month. The pay is the same, without regard to the grade taught. The exceptions are, first, that the first assistant in a large building receives $45 a year more, and, second, the teachers of beginners, when they take charge of two schools or over 70 pupils, receive an addition of 25 per cent. Assistants in the high school receive from $500 to $1,200, according to the time of service and scholarship required.—[Sixteenth Annual Report of the Board of Education, 1889-90, p. 11.]

BRIDGEPORT, CONN.

[Compiled from the Fourteenth Annual Report of the Board of Education, 1889-90, pp. 38-42.]

EVENING SCHOOLS.

3 teachers, male	$650
2 teachers, male	250

EVANSVILLE, IND.

[Annual Report of the Public Schools, 1887-88, p. 106.]

Maximum salaries of assistants:

To those teaching in the—	
Second and third grades	$500
Fourth, fifth, and sixth grades	550
First, seventh, and eighth grades	600

INDIANAPOLIS, IND.

[Compiled from the Manual of the Public Schools, 1888, p. 56.]

Supervising principals:	
First year	$1,000
Second year	1,100
Third year	1,200
Principals of 1-room buildings	600
Principals of 2-room buildings	650
Principals of buildings of 3 or more rooms, $800; and $25 additional for each room over four.	
Maximum salaries of teachers:	
Those teaching second and third grades	500
Those teaching the fourth, fifth, and sixth grades, and German	550
Those teaching the first, seventh, and eighth grades	$600
All teachers receive salaries proportioned to their experience as follows:	
First 5 months in practice schools	150
First year thereafter	350
Second year thereafter	450
Third year thereafter	500
Fourth year thereafter	550
Fifth year thereafter	600

The rule as to experience does not operate to give to any teacher a higher salary than that fixed as a maximum for the grade taught. Those who teach both English and German receive $25 additional, and all teachers of German only, who teach part of a day in one building and part in another, receive $25 additional. Teachers of pupils studying German in the sixth, seventh, and eighth grades receive $600 per annum maximum.

Substitutes in primary grades receive $2 per day; in grammar grades, $2.50 per day, and in the high school $4 per day.

The board of school commissioners annually fix the salaries of the superintendent, assistant superintendents, special teachers, critic teachers, and teachers in the high school.

DES MOINES, IOWA (WEST SIDE).

2 teachers, female	540

ELEMENTARY SCHOOLS.

Principals receive for the first room actually used as a session room, $500; for each additional session room, $25. Salaries of assistant teachers in charge of rooms shall be based on experience, as follows:

Experience.	First to third grades, inclusive.	Fourth grade.	Fifth grade.	Sixth grade.	Seventh grade.	Eighth and ninth grades.
First year's experience (cadetship)	$200	$200	$200	$200	$200	$200
Second and succeeding years of cadetship	300	300	300	300	300	300
Second year of experience, first year in charge of room	350	350	350	350	350	350
Third year of experience, second year in charge of room	400	400	400	400	400	450
Fourth year of experience, third year in charge of room	450	450	450	450	450	500
Fifth year of experience, fourth year in charge of room	475	475	475	500	500	550
Sixth year of experience, fifth year in charge of room	500	520	540	560	580	600

Class-room teachers receive the same salaries as teachers in charge of rooms of the next lower grade.

SAGINAW (EAST SIDE), MICH.

[Report of the Public Schools, 1887-89, p. 134.]

The salaries of teachers are as follows, unless otherwise specified by the board:

First year's service	$300
Second year's service	325
Third year's service	375
Fourth and subsequent years' service	400
Pupil teachers	50

Teachers holding certificates of the first grade are entitled to $25 additional to the above rates, but teachers without experience do not receive this additional amount until the second year's service. After four years' continued service for every three years further service an additional $25 may be granted to teachers holding either grade of certificate.

Substitute teachers receive $2 per day, but if the salary of the absent teacher is less than that sum the substitute receives the per diem of the absentee.

MINNEAPOLIS, MINN.

[Fourteenth Annual Report of the Board of Education, 1890-91, p. 61.]

Female assistants in male grammar schools:	
First-class assistants	$1,116
Second-class assistants	1,020
Third-class assistants	933
Fourth-class assistants	855
Fifth-class assistants	786
Sixth-class assistants	726
Seventh-class assistants	675
Eighth-class assistants	633

Female assistants in mixed grammar schools:	
First-class assistants	$1,086
Second-class assistants	990
Third-class assistants	903
Fourth-class assistants	825
Fifth-class assistants	756
Sixth-class assistants	696
Seventh-class assistants	645
Eighth-class assistants	603

[See explanation of method of assigning salaries at the end of the schedule for female grammar schools.]

FEMALE GRAMMAR SCHOOLS.

Principals in schools having an average attendance of—	
100 or less	$1,200
101 to 150	1,300
151 to 300	1,500
301 to 500	1,600
501 and upwards	1,700
Vice-principals in schools having an average attendance of a grammar grade of—	
250 or less	1,000
251 and upwards	1,200

Female assistants:	
First-class assistants	$1,056
Second-class assistants	960
Third-class assistants	873
Fourth-class assistants	795
Fifth-class assistants	726
Sixth-class assistants	666
Seventh-class assistants	615
Eighth-class assistants	573

Where eight female assistants are employed in any grammar school there is allowed one of each class of male, mixed, or female grammar salaries, as the case may be.

Where more than eight are employed, there is added one salary of each class of similar salaries, beginning with the lowest, and repeating, if necessary, until the required number is reached. But there is not allowed to any grammar school more than one salary of the first or second class, two of the third class, three of the fourth class, four of the fifth class, five of the sixth class, or six of the seventh class.

Where less than eight are employed, there is deducted one salary of each highest and lowest class alternately, beginning with the lowest, until the required number is reached.

Female first assistants who teach the first grammar grades alone or in connection with other grades in mixed grammar schools where boys and girls are instucted in the same class, and where no male assistant is employed, and where the average attendance exceeds one hundred and fifty, are not counted under the foregoing provisions, and they are paid a special salary of $1,440.

PRIMARY SCHOOLS.

Principals in schools having an average attendance of—	
200 or less	$1,000
201 to 400	1,100
401 to 500	1,300
501 to 600	1,400
601 to 850	1,500
851 to 1,000	1,600
1,001 and upwards	1,700
Vice principals in schools having an average attendance of—	
Less than 325	850
325 to 500	900
501 to 1,000	1,000
1,001 and upwards	1,200

Female assistants:	
First-class assistants	$900
Second-class assistants	834
Third-class assistants	774
Fourth-class assistants	720
Fifth-class assistants	672
Sixth-class assistants	630
Seventh-class assistants	594
Eighth-class assistants	564
Ninth-class assistants	540
Tenth-class assistants	522
Eleventh-class assistants	510
Twelfth-class assistants	504

Where twelve assistants are employed, there is allowed one of each class of primary salaries.

Where more than twelve are employed, there are allowed additional primary salaries in the same manner as in the grammar schools. But there are not allowed to any primary department or school more than one salary of the first, second, third, or fourth class, two of the fifth or sixth class, three of the seventh or eighth class, four of the ninth or tenth class, or five of the eleventh class.

When less than twelve and more than five are employed, there is deducted

one salary of each of the highest and lowest of the evenly numbered classes alternately, beginning with the lowest until the required number is reached.

Where less than six are employed, there is allowed one salary of each alternate class, beginning in each school with the class next below the highest class allowed in a school of the next larger size and proceeding until the required number is reached.

TEACHERS OF LONG EXPERIENCE.

Principals who have been so employed for fourteen years, and whose record for five years preceding the application has been meritorious and uniformly excellent, may be paid not less than the following annual salaries:

Principals of male and mixed departments	$3,000
Principals of female departments	1,900
Principals of primary departments and schools	1,750

Assistant teachers whose services have been meritorious and extending over a period of fourteen years receive not less than $750 per annum.

INEXPERIENCED TEACHERS AND SUBSTITUTES.

Assistant teachers of less than one year's experience are known as junior teachers, and are paid for the first year's service: Males, $720 per annum; females, $408 per annum; and on the expiration of the year's service they cease to be considered as junior teachers, and are entitled, as assistant teachers, to the salaries prescribed in the preceding sections.

Substitute teachers are paid $1.20 per day.

SPECIAL TEACHERS.

No salary paid to a teacher of vocal music in a grammar or primary school, or to a teacher of French or German in a grammar school may exceed $1.50 per hour for the time actually employed in instruction. No salary paid to a teacher of drawing in a grammar school may exceed $2 per hour.

a See, also, Table 12, page 666, showing the number of teachers of each rank, and Table 13, page 667, showing the number receiving each amount.

b For salaries paid under this schedule see pages 659 to 661.

c "The class to which a school belongs is determined by the number of regular assistants to which the school is entitled. The grade of pupils taught does not affect the classification of the school.

"A school entitled to 18 or more regular assistants ranks as first class; to 13 and not more than 17 assistants, as second class; to 10 and not more than 12 assistants, as third class; to 8 or 9 assistants, as fourth class; to 6 or 7 assistants, as fifth class; to 4 or 5 teachers, as sixth class; to less than 4 teachers, as seventh class."

"In the assignment of teachers there shall be an average of at least 1 assistant for each 20 pupils in the Normal School, 1 assistant to teach 30 pupils in the High School, 1 assistant to each 50 pupils in the fifth, sixth, seventh, and eighth years, and 1 to each 60 pupils in the first, second, third, and fourth years in the district schools."

CHAPTER III.

SCIENTIFIC TEMPERANCE INSTRUCTION IN THE PUBLIC SCHOOLS.

CONTENTS:

I.—Historical sketch, text-books, course of study, topical outline of study, standard of enforcement, duties of school boards, etc. (pp. 695–709).
II.—The effects of alcohol on the human system, and the method of teaching them, by Prof. A. C. Boyden (pp. 709–713).
III.—The legislation effected (pp. 713–714).
IV.—Reports of school officials on the enforcement of the law (pp. 714–724).
V.—Report of State Agent Geo. H. Martin upon results in Massachusetts (pp. 724–733).
VI.—Objections to scientific temperance instruction stated (pp. 733–737).
VII.—Answers to some false notions (pp. 737–742).

It is now about a decade since the first organized effort was made to cause all public-school pupils to be taught the laws of health and in that connection the evil effects of alcoholic beverages, tobacco and other narcotics; that their use in whatever degree is dangerous because of their power to create an uncontrollable appetite for more; that the indulgence of such an appetite is unqualifiedly detrimental to the physical and moral well-being of man; and that the only safe course to pursue with regard to these substances is one of total abstinence.

HISTORICAL SKETCH.

This movement was started by Mrs. Mary H. Hunt,[1] through the Woman's Christian Temperance Union. The previous experience of Mrs. Hunt as a professor or teacher of chemistry in an eastern college had led to her assuming practical oversight of the education of her only child, who was a student in the Massachusetts Institute of Technology from 1872 to 1876. "While thus engaged," she says, "the question concerning alcohol as a chemical reagent led to inquiry as to its origin, nature, and effects upon the human system as found in the popular alcoholic beverages. This study became an absorbing research that filled me with alarm for the future of a nation whose people were consuming such vast quantities of alcohol."

As a result of this study the conviction was forced upon her "that intemperance could never be prevented until people were taught the real nature and effects of alcoholic drinks, and that this must be done through the schools." The National Temperance Publication Society of New York made several tentative movements in that direction, principally under the direction of Miss Julia Coleman, whose Juvenile Temperance Manual, published in 1878, was subsequently introduced into a few public schools.

The town of Hyde Park, Mass., at the instigation of Mrs. Hunt, was the first to introduce the study of scientific temperance into its public school curriculum. No suitable text-book had been prepared, and for the time being use was made of The Temperance Lesson Book, written by Dr. B. W. Richardson (London, 1887).

Action of the Woman's Christian Temperance Union.—The first official action of the Woman's Christian Temperance Union was taken, in response to Mrs. Hunt's earnest importunity, at their Indianapolis meeting in 1879, when the following resolution was adopted:

Resolved, That this convention consider the introduction of scientific temperance text-books into the regular course of study in our public schools as a most hopeful line of work. We therefore urge the various States here represented to take immediate action to secure this important study taught in the schools of their several localities.

[1] It is proper to say that Mrs. Hunt kindly undertook the revision of the proofs of this historical sketch.

A standing committee, of which Mrs. Hunt was made chairman, was chosen to carry the above resolution into action. But difficulties were soon encountered in the way of accomplishing any uniform work through a committee widely separated; and at the Boston meeting of the Woman's Christian Temperance Union the ensuing year (1880) a department of scientific temperance instruction in schools and colleges, under a national superintendent, was created, to take the place of the standing committee. Mrs. Hunt, who was chiefly instrumental in bringing about this change, was made superintendent of the department, a position she still holds. It was made her duty in that capacity "to originate, advise, and direct plans of work," which are carried out with the assistance of auxiliary superintendents in all the States and Territories, who are under the direction of and report to the national superintendent.

Subordinate assistants were appointed for the minor civil divisions of the State, so that the organization is somewhat military in character. Prompt, vigorous, and effective action has been thereby secured, with the ability to concentrate effort at any desired point. This centralization of authority has been one great secret of success.

The labors of the first year, 1880, were chiefly "confined to organizing the work throughout the country and to creating public interest in the proposed study through the press and lectures by the national superintendent before popular audiences, educational bodies, churches, and philanthropic conferences."

In her Brief History of the First Decade, from which the foregoing has been chiefly condensed, as also much which follows, Mrs. Hunt goes on to say: "Some teaching from Dr. Richardson's Temperance Lesson Book and a little work by Miss Coleman, entitled Alcohol and Hygiene, followed these efforts, by order of local school boards. The sporadic character of these results deepened the conviction that the study must be mandatory or it never would be systematically pursued. Experience soon proved the soundness of my position from the first, viz., that text-books on temperance *only* would not fully meet the need. In order to understand the consequences of violating hygienic law in all respects, but especially in the use of alcholic drinks and other narcotics, pupils must know something of relative physiology and general hygiene; therefore the study should be incorporated with these topics."

What the doctors said.—In the efforts of the leaders in the movement to make progress the stock objection that met them on every side was, "There is nothing definite that can be taught about the effects of alcoholic drinks upon the human system." "The doctors are not agreed about it." It became evident that no progress could be made in getting legislation until an authoritative reply to this objection could be produced.

Mrs. Hunt, therefore, went before the American Medical Association at its meeting at St. Paul, in June, 1882, and asked them for some expression as to the evil nature and effects of alcoholic drinks. She presented the following resolutions on behalf of the Woman's Christian Temperance Union:

Whereas alcoholic intemperance is a prolific cause of disease, and prevention, through the education of the people, is one of the most powerful antidotes,

Resolved, That we approve teaching the children and youth in the schools and educational institutions in this country, as facts of hygiene, the physiological dangers and evils resulting from the use of alcoholic beverages; and

Whereas it is the acknowledged duty of the State to provide for such education of the people as is essential to good citizenship,

Resolved, That we recommend the State legislature to enact laws requiring the physiological dangers and evils resulting from the use of alcoholic beverages taught in all schools supported by public money or under State control.

These resolutions were referred to the section on State medicine, which after some discussion adopted the following as a substitute:

Resolved, That the association reaffirm the resolutions in regard to the abuse of alcoholic liquors passed at Buffalo in 1878, and further urge that all State legislatures introduce hygiene as one of the branches to be taught in the schools.

The resolutions of 1878 so reaffirmed are as follows:

Resolved, That in view of the alarming prevalence and ill effects of intemperance, with which none are so familiar as members of the medical profession, and which have called forth from eminent practitioners the voice of warning to the people of Great Britain concerning the use of alcoholic beverages, we, the undersigned, members of the medical profession of the United States, unite in the declaration that we believe alcohol should be classed with other powerful drugs, that when prescribed it should be done with conscientious caution, and a sense of great responsibility.

Resolved, That we are of the opinion that the use of alcoholic liquors as a beverage is productive of a large amount of physical and mental disease; that it entails diseased appetites and enfeebled constitutions upon offspring, and that it is the cause of a large percentage of the crime and pauperism of our cities and country.

Resolved, That we would welcome any change in public sentiment that would confine the use of intoxicating liquor to the uses of science, art, and medicine.

No one can doubt that these resolutions placed a powerful weapon in the hands of the promoters of the new study, or that it was most effectively used. "The favorite objection," wrote Mrs. Hunt at the time, "of opponents is silenced, for no one can hereafter say that the doctors of this country disprove the statement of facts against alcoholic beverages that we would teach the rising generation."

The end achieved.—A course of thorough and systematic agitation was entered upon to create a public sentiment in favor of compulsory temperance education and to influence law makers in the desired direction. As a result, the first compulsory temperance education law was enacted in Vermont, in November, 1882. By this law there was added to the branches to be taught in the common schools "elementary physiology and hygiene, which shall give special prominence to the effect of alcoholic drinks, stimulants, and narcotics, upon the human system."

In the ensuing year laws to the same effect, more or less stringent in their requirements, were enacted in many other States. A tabular statement giving the date of enactment of these laws and their general features will be found on page 713.

TEXT-BOOKS.

A difficulty was experienced at first in the matter of text-books. Dr. Richardson's Temperance Lesson Book proved too technical for common school use, and like Miss Coleman's book, contained only temperance matter, but no physiology or other hygiene which the State laws were demanding. Publishers and authors were slow to believe there would be a permanent market for this kind of literature.

The first physiological temperance book indorsed by the superintendent of the Scientific Department of the Woman's Christian Temperance Union was written by Dr. Steele, and published by A. S. Barnes & Co., the latter being actuated in their venture by philanthropic as well as business motives.

The design of the promoters of the movement was to have "all pupils in all schools," receive a temperance education, and to this end a series of at least three text-books would be necessary, one each for high, intermediate, and primary grades of schools, and four for schools closely graded. It was deemed best that these books should be issued by regular school-book publishing houses.

In 1884, after a search for authors and publishers, and the disappointments of authors of manuscripts rejected because unsuitable, and wrath of publishers books who secould not be indorsed, two books were pronounced ready for use, one for high schools (Steele's Hygienic Philosophy) and one for intermediate grades (Hygiene for Young People). The book for primary grades was still wanting. Mrs. Hunt says in her report of that year:

"Large numbers of publishers and authors have rushed into our field with books containing the old and disproven theories concerning alcohol, badly arranged and badly graded, and otherwise inadequate to the demands of the laws and the needs of the schools. These works are defective in their treatment of alcohol, and have not the proportion or arrangement of temperance matter that is intended by the spirit and letter of this legislation."

The ensuing year (1885) the set of three approved text-books, known as the Pathfinder series, was made complete by the addition of the Child's Health Primer, prepared under the direction of the scientific department of the Woman's Christian Temperance Union.

As the temperance-education movement began to assume large proportions, publishers ceased to entertain doubts about a market for this kind of school literature. About thirty works on physiology for school use were issued by different houses immediately after the passage of the New York law in 1884. "Most of these were the old-time physiologies with a little temperance matter tacked on the back of the book as an addenda, where pupils would rarely reach it. The embarrassing position of the national superintendent in not being able to indorse these books can hardly be appreciated."

The laws passed by the Legislatures of Massachusetts and Pennsylvania in 1885 excluded text-books with temperance matter in the appendix. This aroused the opposition of the publishers, but to no purpose; they were obliged generally to remodel their books, "putting the temperance matter where it belongs, in each division of the subject of physiology with the other hygiene. Although this was the first step toward the satisfactory revision that came in later years, yet these books, in quality and quantity of temperance matter and adaptation to grade, were still so defective that they could not be indorsed," as was the Pathfinder series.

Rigid text-book requirements in Vermont.—The Vermont law, as amended in 1886, required that "all pupils in all public schools of the State shall be taught the nature of alcoholic drinks and other narcotics. Children too young to read shall receive oral instruction, and those who can read shall use a text-book." Text-books were required to devote one-fourth their space to this subject, and schools not giving the statutory instruction forfeited their share of the public money.

Other States followed the example of Vermont in requiring one-fourth of the space of text-books in physiology to be devoted to temperance instruction.

The great petition to publishers.—In order to bring a strong pressure to bear upon publishers, a syllabus was compiled in 1887 of what should be taught in the schools as scientific temperance, and after having been signed by over two hundred leading American citizens, "representative of the best medical, physiological, chemical, educational, legal, and ethical opinion in our country," was presented to publishers in form of a petition asking for a revision of their imperfect text-books upon this subject. As a whole, this petition constituted "an expression of the best expert sentiment of our country, in favor of teaching to the children of the United States the full truth of science against strong drink and in favor of total abstinence."

After this petition was sent to the publishers its syllabus of requirements was adopted as their standard for temperance text-books by the National Woman's Christian Temperance Union, at Nashville, November, 1887, and became their creed, or "articles of faith," so to speak.

The full text of the petition is as follows:

A PETITION TO PUBLISHERS OF TEMPERANCE TEXT-BOOKS.

1. Thirty-two States and Territories now require scientific temperance instruction in the public schools, and the question whether the children shall receive such instruction is seen to depend largely upon the character of the text-books employed.

2. It was the intention of those who secured these laws that the children should have the latest science concerning the dangerous and hurtful qualities of alcohol used in any degree, and the peril of forming the habit of its use. The law requires this. Nothing less than this will ever satisfy its friends.

3. Those text-books that are largely physiology, with a minimum of temperance matter that only points out the evil of drunkenness and the danger of excessive use of alcoholic drinks and narcotics, do not meet the requirements of the law, and do not satisfy those who secured its enactment and who are determined to secure its enforcement.

4. Therefore, the undersigned legislators who voted for these laws in various States and in the National Congress, the representatives of temperance organizations, and who are familiar with the sentiment and are entitled to speak for the very numerous membership of different churches and other bodies, extending widely throughout the land, and citizens who speak for ourselves, do make respectful and earnest appeal to all publishers of text-books on this subject to revise their publications to conform to the latest results of scientific inquiry, and to meet the terms and spirit of these statutes in making the temperance matter the chief and not the subordinate topic in these books, so that public and authorized expressions of approval and indorsement of all such books can be issued and given wide circulation.

5. In urging this appeal we beg leave to represent that if this new education is to give to the world a coming generation of intelligent total abstainers, as we expect, its manuals of instruction must conform to the following specifications:

(1) They must teach with no uncertain sound the proven findings of science, viz:

(*a*) That alcohol is a dangerous and seductive poison.

(*b*) That beer, wine, and cider contain this same alcohol, thus making them dangerous drinks, to be avoided, and that they are the product of a fermentation that changes a food to a poison.

(*c*) That it is the nature of a little of any liquor containing alcohol to create an appetite for more, which is so apt to become uncontrollable that the strongest warning should be urged against taking that little and thus forming the appetite.

(2) They must teach also the effect of these upon "the human system," that is, upon the whole being—mental, moral, and physical. The appalling effects of drinking habits upon the citizenship of the nation, the degradation and crime resulting, demand that instruction here should give clear and emphatic utterance to the solemn warnings of science on this subject.

(3) This instruction must be as well graded to the capacities of each class of pupils as the modern school readers are. A book fit for high schools put into primary or intermediate classes will make the study a failure there. Truth is just as true and as scientific when told in easy words as when put into stilted technicalties the child can not understand.

(4) This is not a physiological but a temperance movement. In all grades below the high school this instruction should contain only physiology enough to make the hygiene of temperance and other laws of health intelligible. Temperance should be the chief and not the subordinate topic, and should occupy at least one-fourth the space in text-books for these grades. As only a small portion of the pupils in our public schools attend high schools, and vast numbers leave with the primary, this instruction should be early and ample. It is not desirable to have a separate book for the physiology heretofore studied in the high school or to limit the amount, but at least twenty pages out of that ordinarily required should be given to the question of the danger of alcoholic drinks and other narcotics, in a text-book for these classes.

(5) This effort to disabuse the minds of the rising generation of fallacies which lead to drink habits should purposely avoid reference to the medical use of alcohol, except to state that as by common consent its lay prescription is condemned, the question of its use as a remedy may properly be relegated to medical treatises, as out of place and misleading in a school text-book.

Lacking in any of these points, a text-book on scientific temperance is incomplete, and the use in the schools of such a book will not result in a strong temperance sentiment among the pupils using it.

Because the question of total abstinence for the children of this country, and therefore of their well-being and that of the land soon to be governed by them, depends so largely upon the teachings in these books, we make this appeal.

As a result of the foregoing petition nearly all of the publishers of temperance text-books expressed the desire to have their books remodeled in conformity therweith. This work of revision was taken up and carried on in 1888 under the supervision of Mrs. M. H. Hunt, the national superintendent of the scientific department of the Woman's Christian Temperance Union, with the assistance of the following advisory board: Albert H. Plumb, D. D., president Massachusetts Amendment Society; Daniel Dorchester, D. D., vice-president Massachusetts Total Abstinence Society; William E. Sheldon, president National Teachers' Association of 1887; Rev. Joseph Cook, of Boston Monday Lectureship.

Upon consultation with authors it soon became apparent that there was not so much difference of opinion about what was true concerning the subject as misapprehension as to what special truth should be brought forward. "Some writers were misled by supposing that exhortation or appeal after the style of the temperance lecture was desired. These difficulties vanished when they found that we wanted no fanatical preaching, but instead a full statement as to the origin, evil nature, and effects of alcoholic drinks and other narcotics, all told in language that the various grades of pupils can understand."

"The great men among these authors who are fully abreast with the researches, experiments, and proven facts of modern science on this subject were first to come into accord with the petition standard."

Now fully equipped.—Mrs. Hunt, writing at the beginning of 1892, says: "The study that was thus hampered and halting at the first is now fully equipped. What it then lacked is now supplied. Everything is ready. As the teachers translate these methods into actual school-room work, the intent of the law will be accomplished in the generation of intelligent total abstainers that will come from our schools."

Endorsed text-books (1892).

Primary text-books:

Health for Little Folks.
No. 1 of the Union Series.
Child's Health Primer.
House I Live In.
Published by the American Book Company, N. Y.
Good Health for Children.
Published by Leach, Shewell & Sanborn.
Physiology for Little Folks.
Published by Lee & Shepard, Boston, Mass.
A primer of Health.
Published by Silver, Burdette & Co., Boston.

Intermediate text-books:

Young People's Physiology, (or)
Hygiene for Young People.
No. 2 of the Union Series.
Youth's Temperance Manual.
Published by the American Book Company, New York.
Stowell's Healthy Body.
Published by Silver, Burdette & Co., Boston.
Blaisedell's Pysiology for Boys and Girls.
Published by Lee & Shepard, Boston, Mass.
Brand's Health Lessons for Beginners.
Published by Leach, Shewell & Sanborn.

Advanced grammar grade text-books:

No. 3 of the Union Series.
Johonnot & Bouton's Lessons in Hygiene.
Published by the American Book Company, New York.
Essentials of Health.
Published by Silver, Burdette & Co., Boston.
Young Folks' Physiology.
Published by Lee & Shepard, Boston.

High school text-books:

Tracy's Outlines of Anatomy, Physiology, and Hygiene.
Steele's Hygienic Physiology.
Eclectic Guide to Health.
Published by the American Book Company, New York.
Martin's Human Body and the Effects of Narcotics.
Published by Henry Holt & Co., New York.

Charts.—With reference to charts Mrs. Hunt says: "To be worth anything to the cause the endorsement of this department on scientific matter must represent accuracy. Realizing the injury to the work sure to follow any accusation of inaccuracy that could be well sustained, we have hesitated about placing our endorsement upon physiological charts. We are yet waiting for the chart that shall be pronounced accurate, as to delineation and coloring, by the best physiological experts, and that shall give a due representation of the evil results of narcotic indulgence. We would advise our friends to delay the purchase of charts until some that are authorized are issued."

Course of study.—In order to assist in finding a place for this study, and to determine how much to teach each year and in what grades to teach it orally, "a carefully graded course of study in this branch has been prepared covering all these points." "It also shows the grades or classes in both graded and ungraded schools to which the various books are adapted." This course of study is as follows:

NATIONAL AND INTERNATIONAL DEPARTMENT OF SCIENTIFIC INSTRUCTION OF THE WOMAN'S CHRISTIAN TEMPERANCE UNION.

A Schedule of Courses of Study in Physiology and Hygiene, with Special Reference to the Nature and Effects of Alcoholic Drinks and Other Narcotics.

This plan provides for three lessons per week for fourteen weeks of each school year, after which the subject may be dropped for the remainder of the year, to be taken up with a more advanced treatment for the same length of time the following year. These courses, with well-graded text-books that contain the truths the law requires taught, will, if faithfully pursued, with oral or written reviews, cover the subject, and will not unduly crowd other studies.

GRADED SCHOOLS.

Course A.[1]—*For graded schools having eight years below the high school.*

[Pathfinder series of text-books.]

First, second, and third year.—"Child's Health Primer," in hands of teacher for oral instruction. Lessons three times per week. Facts drawn from text-book.

Fourth year.—"Child's Health Primer," in hands of pupils. Recitations three times per week until the book is completed.

Fifth year.—"Hygiene for Young People," in hands of pupils. Recitations three times per week until first half of book is completed.

Sixth year.—"Hygiene for Young People," in hands of pupils. Recitations three times per week until last half of book is completed, reviewing from beginning.

Seventh year.—"Lessons in Hygiene, No. 2 of Appleton series," in hands of pupils. Recitations three times per week until first half of book is completed.

Eighth year.—"Lessons in Hygiene, No. 2 of Appleton series," in hands of pupils. Recitations three times per week until last half of book is completed, reviewing from first chapter.

High-school year.—"Steele's Hygienic Physiology," in hands of pupils until book is completed.

Course B.[2]—*For graded schools having eight years below the high school.*

[Appleton series of text-books.]

First, second, and third year.—"Health for Little Folks," in hands of teacher for oral instruction. Lessons three times per week. Facts drawn from text-book.

Fourth year.—"Health for Little Folks," in hands of pupils. Recitations three times per week until book is completed.

---

[1] In schools having seven years below the high school, more time per year should be given to the study, so as to complete Lessons in Hygiene during the seventh year. If there are only six years below the high school, enough time should be given to complete "Hygiene for Young People" during the fifth year, as well as Lessons in Hygiene during the sixth year.

[2] Schools having seven years below the high school can complete "Lessons in Hygiene" during the seventh year. Those having six years below the high school can, in addition, complete "Young People's Physiology" during the sixth year.

Fifth year.—"Young People's Physiology," in hands of pupils. Recitations three times per week until first half of book is completed.

Sixth year.—"Young People's Physiology," in hands of pupils. Recitations three times per week until last half of book is completed, reviewing from first chapter.

Seventh year.—"Lessons in Hygiene," in hands of pupils. Recitations three times per week until first half of book is completed.

Eighth year.—"Lessons in Hygiene," in hands of pupils. Recitations three times per week until last half of book is completed.

High-school year.—"Outlines of Anatomy, Physiology, and Hygiene," by Roger S. Tracy, M. D., in hands of pupils until book is completed.

COURSE C.[1]—*For graded schools having seven years below the high school.*

[Union series of text-books.]

First, second, and third year.—"Number One" of the Union series, in hands of teacher for oral instruction. Lessons three times per week. Facts drawn from text-book.

Fourth year.—"Number One" of the Union series, in hands of pupils. Recitations three times per week until book is completed.

Fifth year.—"Number Two" of the Union series, in hands of pupils. Recitations three times per week until book is completed.

Sixth year.—"Number Three" of the Union series, in hands of pupils. Recitations three times per week until first half of book is completed.

Seventh year.—"Number Three" of the Union series, in hands of pupils. Three recitations per week until last half of book is completed, reviewing from first chapter.

High-school year.—Steele's "Hygienic Physiology," or "Outlines of Anatomy, Physiology, and Hygiene," by Roger S. Tracy, M. D., or "The Human Body and the Effects of Narcotics," by H. Newell Martin, M. D. In hands of pupils until book is completed.

COURSE D.—*For graded schools having six years below the high school.*

[Eclectic series of text-books.]

First, second, and third year.—"House I Live In," in hands of teacher for oral instruction. Recitations three times per week. Facts drawn from text-book.

Fourth year.—"House I Live In," in hands of pupils. Recitations three times per week until book is completed.

Fifth year.—"Youth's Temperance Manual," in hands of pupils. Recitations three times per week until first half of book is completed.

Sixth year.—"Youth's Temperance Manual," in hands of pupils. Recitations three times per week until last half of book is completed.

High-school year.—"Eclectic Guide to Health," in hands of pupils until book is completed.

COURSE E.—*For graded schools having eight years below the high school.*

[Blaisdell Revised Physiology series.]

First, second, and third year.—"Physiology for Little Folks," in hands of teacher for oral instruction. Lessons three times per week. Facts drawn from text-book.

Fourth year.—"Physiology for Little Folks," in hands of pupils. Recitations three times per week until book is completed.

Fifth year.—"Physiology for Boys and Girls," in hands of pupils. Recitations three times per week until first half of book is completed.

Sixth year.—"Physiology for Boys and Girls," in hands of pupils. Recitations three times per week until last half of book is completed, reviewing from first chapter.

Seventh year.—"Young Folks' Physiology," in hands of pupils. Recitations three times per week until first half of book is completed,

[1]Schools having six years below the high school can complete "Number Three" of the Union series during the sixth year.

Eighth year.—"Young Folks' Physiology," in hands of pupils. Recitations three times per week until last half of book is completed, reviewing from first chapter.

High-school year.—Steele's "Hygenic Physiology," or Tracy's "Outlines of Anatomy, Physiology, and Hygiene," or Martin's "Human Body and the Effects of Narcotics," in hands of pupils until book is completed.

UNGRADED SCHOOLS.

In an ungraded school, three classes should be formed, one for advanced pupils, one for those who rank as intermediate, and another for primary. All pupils in the school should be divided according to their attainments among these three classes.

Is it necessary to have a separate book for each of the three classes referred to in an ungraded school? Yes, emphatically yes. All pupils in ungraded schools where there are advanced pupils can not be taught as the law requires with less than three grades of books. The primary or lower grade pupils need a book they can understand; the next grade should have one a little more advanced; and pupils who correspond to the high-school grade should have a book adapted to their acquirements. This study has often been made a ridiculous failure by the attempt in ungraded schools to make one book (and that often a high-school book) fit all pupils.

COURSE A.—*For ungraded schools, or schools having two, three or four departments.*

[Pathfinder series of text-books.]

Primary class.—Pupils reading in the primer, first, second, and third readers. "Child's Health Primer," in hands of teacher for oral instruction. Lessons three times per week. Facts drawn from text-book.

Intermediate class.—Pupils reading in Fourth Reader. "Hygiene for Young People," in hands of pupils. Recitations three times per week until book is completed.

Advanced class.—Pupils reading in Fifth Reader and higher books. "Physiology and Health, No. 3 of Union series," in hands of pupils. Recitations three times per week until book is completed.

COURSE B.—*For ungraded schools, or schools having two, three, or four departments.*

[Appleton series of text-books.)

Primary class.—Pupils reading in the primer, first, second, and third readers. "Health for Little Folks," in hands of teacher for oral instruction. Lessons three times per week. Facts drawn from text-book.

Intermediate class.—Pupils reading in Fourth Reader. "Young People's Physiology," in hands of pupils. Recitations three times per week until book is completed, reviewing from first chapter.

Advanced class.—Pupils reading in Fifth Reader and higher books. "Lessons in Hygiene," in hands of pupils. Recitations three times per week until book is completed.

COURSE C.—*For ungraded schools, or schools having two, three, or four departments.*

[Union series of text-books.]

Primary class.—Pupils reading in the primer, first, second, and third readers. "Number One" of the Union series, in hands of teacher for oral instruction. Lessons three times per week. Facts drawn from text-book.

Intermediate class.—Pupils reading in fourth reader. "Number Two" of the Union series in hands of pupils. Recitations three times per week until book is completed.

Advanced class.—Pupils reading in fifth reader and higher books.[1] "Number Three" of the Union series, in hands of pupils. Recitations three times per week until book is completed.

[1] Where there are pupils of high-school grade in ungraded schools, they should have a high-school text-book, either Steele's "Hygienic Physiology," or "Outlines of Anatomy, Physiology and Hygiene," by Roger S. Tracy, M. D., or "The Human Body and the Effects of Narcotics," by H. Newell Martin, M. D.

COURSE D.—*For ungraded schools, or schools having two, three, or four departments.*

[Eclectic series of text-books.]

Primary class.—Pupils reading in the primer, first, second, and third readers. "House I Live In," in hands of teacher for oral instruction. Lessons three times per week. Facts drawn from text-book.

Intermediate class.—Pupils reading in fourth reader. "Youth's Temperance Manual," in hands of pupils. Recitations three times per week until book is completed.

Advanced class.—Pupils reading in fifth reader and higher books.[1] "Eclectic Guide to Health," in hands of pupils until book is completed.

COURSE E.—*For ungraded schools, or schools having two, three, or four departments.*

[The Blaisdell revised series of text-books.]

Primary class.—Pupils reading in the primer, first, second, and third readers. "Physiology for Little Folks," in hands of teacher for oral instruction. Lessons three times per week. Facts drawn from text-books.

Intermediate class.—Pupils reading in fourth reader. "Physiology for Boys and Girls," in hands of pupils. Recitations three times per week until book is completed.

Advanced class.—Pupils reading in fifth reader and higher books. "Young Folks' Physiology," in hands of pupils. Recitations three times per week until book is completed.

REASONS FOR THE ADOPTION OF A COURSE OF STUDY AS OUTLINED.

The reasons to be urged in favor of adopting a definite course of study in this topic, which includes text-books in the hands of all pupils above the primary, are as follows:

First. Such a course gives the definite time and place to the branch that the law demands.

Second. It points out the grade for which oral instruction is adapted, and those in which instruction should be given from text-books in the hands of pupils.

Third. It specifies the grade for which each book is adapted. The pupil just learning to gain information from a text-book needs one in which the style and vocabulary is very little in advance of his own. As soon as he gains ability to master a more advanced style and treatment he needs a more advanced book. To keep him longer in the book he has outgrown is to stultify his developing faculties. On the other hand, to give him a book too advanced is to discourage him and lead to a distaste for study. Either course is false economy and contrary to all educational principles.

Fourth. The use of text-books as specified secures the teaching of truth instead of the notions and traditions of some teacher who has had no special education on this topic.

Fifth. It will, in nearly all cases, prevent outside topics, such as the legal or political phases of the temperance question, from being brought into the recitation under the guise of scientific temperance instruction, which sometimes gives rise to trouble.

Sixth. It takes less time from the overcrowded school course than anything like an honest attempt above the primary class to teach the subject orally, which is always liable to cause waste of time through branching out into unimportant collaterals.

TOPICAL OUTLINE OF COURSE OF STUDY.[1]

[*Prepared by Department of Scientific Temperance Instruction, W. C. T. U.*]

This age needs men and women who are wise to resolve, strong and quick to act. Such men and women are the result of the right development of the threefold human system, mental, moral, and physical, and are the object sought by this study.

[1] This topical outline has been furnished by Mrs. Hunt in advance of publication.

Because the use of alcoholic drinks and other narcotics is a prime obstacle in the way of such development, a knowledge of their origin, their inherent evil nature, and of their destructive effects is an objective point in the study of scientific or physiological temperance. But it is by no means all. This study does not stop with teaching the consequences of evil. It at the same time shows the road to the ideal.

As demanded by law and presented in all approved manuals of instruction, it teaches the all-round physical education that leads to strength, health, and such physical development as will make the body an efficient servant of a rightly trained mind—a meet temple for the divine indwelling. In showing the consequences of broken natural law, it is also a powerful moral teacher.

As some knowledge of structure is an essential basis, enough anatomy and physiology to make the various laws of hygiene intelligible is a part of the study. The whole subject may be classified under the following divisions:

Ten divisions.

(There may be differences of opinion as to the order of presenting these divisions. It is not essential that the same order be always followed, provided the division treating of the nature of alcoholic drinks and other narcotics precede those treating of the various organs and the effects of these narcotics upon them.)

1. *Food.*—This division includes the uses of and kinds of food and rules for their selection and proper preparation, together with hygienic rules in regard to eating.

(For reference and personal study the teacher should have some one of the high-school books mentioned on the last page of this circular, and for guidance in the selection of matter appropriate for primary grades, one or more of the primary books there mentioned.)

2. *Alcoholic drinks and other narcotics.*—This division has for its object to show when and why healthful fruit juices and grain infusions become poisonous drinks that should be avoided. The instruction therefore covers the changes that take place in these liquids during fermentation, the causes of such changes, and the nature of the changed liquids.

(For full information on these points the teacher should study this division of the subject in some one or more of the text-books mentioned above, and for the selection of matter adapted to grade, the primary text-books before mentioned.)

3. *Digestion.*—Its anatomy, physiology, and hygiene, and the effects of alcoholic drinks and other narcotics.

4. *Circulation.*—Its anatomy, physiology, and hygiene, and the effects of alcoholic drinks and other narcotics. In this division the controlling action of the vaso-motor and inhibitory nerves should be brought out as early as possible, because many of the contradictory appearances concerning the action of alcoholic and other narcotics on various portions of the body are only intelligible when this is understood.

5. *Respiration.*—Its anatomy, physiology, and hygiene, including the effects of alcoholic drinks and other narcotics, with special emphasis on the importance of breathing pure air, of full and deep breathing, and of right positions for securing this; also of simple methods of ventilating rooms in which no provision for ventilation has been made. Such information, put into actual practice in the schoolroom, will be carried home by the children and correct many of the bad habits in this direction that lead to unhealthful conditions of the body and to drink.

6. *The nervous system.*—Its anatomy, physiology, and hygienic laws that govern the best development of nerve and brain tissue, and the consequences of disobeying these laws in the use of alcoholic drinks and other narcotics. The shock of all narcotic indulgence falls with greatest force on the nervous system. Instruction at this point should therefore be full and emphatic. Effects on the intellect, will, and moral character, as a result of its effects on brain and nerve tissue, should be fully brought out, as is done in all the approved text-books, which also indicate how much of each topic may be appropriately presented in each grade.

7. *The bones.*—The anatomy and physiology of bone tissue and its hygiene, including the effects of alcoholic drinks and other narcotics. Special stress should be laid on the fact that growth lost through wrong habits during the growing time of life can never afterwards be made up, of the importance of right position, and the relation of proper food, and the effects of alcohol, tobacco, and other narcotics in preventing healthful growth.

8. *The muscles.*—The anatomy and physiology of muscular tissue and its hygiene, including the effects of alcoholic drinks and other narcotics. This division of the subject includes in its hygiene systematic exercises for the development of the various tissues of the body, such as calisthenics, gymnastics, or what are called physical-culture exercises.

9. *The skin.*—Its anatomy, physiology, and hygiene, including the relation of exercise, pure air, right food, bathing, and proper clothing to the hygiene of the skin, and the evil effects of alcoholic drinks and other narcotics upon the same.

10. *The senses.*—Their anatomy, physiology, and hygiene, including the effects of alcoholic drinks and other narcotics.

Gradation.

In physiological temperance, as in other branches which extend through several years of the school life, a few of the simple elements should be taught in the lowest grade, and these reviewed and more added from year to year, until an advanced treatment of the whole topic is completed in the high school.

In the lower primary grades a few lessons on the parts of the body should precede the work on the other divisions, which, in the lower grades, should consist chiefly of hygiene with only a very little physiology and almost nothing of the anatomy of internal organs.

Methods for primary grades.

Simple truths should be selected for first, second, and third year pupils under each division of the subject, to be developed by means of simple stories, objects, or pictures, or questions relating to the pupil's previous experience. The following indicates what may be taught under the division of alcoholic drinks and other narcotics to *first-year pupils*, to be reviewed with added truths for second or third year pupils:

First lesson:

1. There are ferments on the dust on grapes.
2. There is sweet juice inside the grape.
3. When the juice is pressed out the ferments get into it.
4. The ferments take away the sweetness of the juice and leave a poison in it

Second lesson:

1. Poisons can do us harm.
2. Poisons may kill.
3. Alcohol is a poison.
4. We should never take any drink that has alcohol in it.

Third lesson:

1. Cider is made from apples.
2. Ferments change the juice of the apples after it is pressed out.
3. We should not drink cider, for there is alcohol in it.
4. Wine is made from grapes.
5. We should not drink wine, for there is alcohol in it.
6. There is no alcohol in grapes or apples.

Methods for lower intermediate grades.

The law, in saying that this study should be introduced and taught as a regular branch, virtually says that the established methods of teaching other branches with text-books when pupils are able to read, and orally before, is to be the method here. But the books used should be adapted to grade. Where such books are in the hands of the pupils three lessons per week for fourteen weeks of the school year will allow time for covering as much of each division of the subject as the pupils are capable of understanding, without repetition or crowding other branches. When pupils have mastered so much of a topic as is adapted to their grades, they should not go over and over the same with needless repetition. The subject, after suitable reviewing, should be dropped for the remainder of the year and something else take its place.

Fourth-year pupils.—Pupils in the fourth year of school are ready to begin to learn to use text-books, and should at this point begin to pursue this branch as a regular text-book study. The matter contained in the indorsed primary text-

book has been carefully culled with special reference to what is adapted to this grade of pupils.

Fifth and six year pupils.—Pupils in these grades are prepared for a larger discussion of the subject, which should here, as in all grades above the primary, be a text-book study. More time would therefore be required to cover the subject, which may here be distributed over a period of two years. Fifth-year pupils may take a part of the ten divisions, as food, alcoholic drinks, and other narcotics, digestion, circulation, respiration. [The hygiene of the last three will include the effects of alcoholic drinks and other narcotics.]

Sixth-year pupils, after reviewing the work of the fifth year, may take the remaining divisions, as bones, muscles, skin, the nervous system, the senses [each including in its hygiene the effects of alcoholic drinks and other narcotics].

For the use of pupils in these grades a large variety of books that contain the matter that should be taught at this stage, expressed in language adapted to the comprehension of the pupils, without the use of technical terms, are ready and indorsed by the friends of the movement.

Advanced grammar grades.

For *seventh and eighth year pupils* the topics may be apportioned as in the fifth and six year grades; but the pupils will require text-books containing a more advanced treatment of the subject. Nothing is more detrimental to the object sought by this study than attempting to make one grade of books on temperance physiology fit all grades of pupils.

High-school grades.

The spirit and letter of the law requires this to be a text-book study in this grade. High-school pupils are capable of comprehending the partially technical treatment found in the indorsed high-school physiologies mentioned on p. 699. This can be easily mastered the first year of the high-school course. Where examinations show that it has been so mastered the study is completed and should be dropped and not repeated through the other years. Pupils in the second and third years of the high school who have not had this study should take it up in those grades.

Ungraded schools.

The divisions are the same here as in the graded schools. The pupils should be arranged in classes according to their attainments, ordinarily three—a primary, an intermediate, and a more advanced. Each class of pupils able to read should have books corresponding to their various grades. At least three grades of books on this subject are generally needed for ungraded schools.

THE SPECIAL WORK OF 1890.

"The special work of 1890 has been careful planning for thorough enforcement of legislation that has made scientific temperance a mandatory study. Two States, Massachusetts and Pennsylvania, began this year what may be termed campaigns for this enforcement. The State organizations, after voting to make this a leading line of work, provided funds for paying the expenses of county superintendents or other organizers to go through the counties securing local workers; also for the necessary literature and postage. Literature, showing the local superintendents, as fast as they were appointed, exactly what to do in every detail of the work, was then sent out from State and national headquarters."

"As soon as active work for enforcement was begun it became apparent that an accepted standard as to what constitutes an honest enforcement of a temperance education law is as necessary as the standard for temperance text-books proved. Time and experience have established something like school-room standards for the pursuit of other branches; but the conceptions as to how this new subject should be studied and taught were vague, various, and indefinite. From consultation with eminent educators and comparison of the fruits of varied experience the following standard was wrought out. This is being sent to superintendents of public instruction intrusted with the enforcement of temperance education laws in various States. Its specifications as to minimum of time, necessary means, and method for the pursuit of the study is receiving their cordial indorsement:"

A STANDARD FOR THE ENFORCEMENT OF A TEMPERANCE EDUCATION LAW

1. *Minimum of time.*[1]—The pursuit of the study of physiological temperance by "all pupils in all schools," as the law demands, requires at least three lessons per week for fourteen weeks of each school year below the second year of the high school. After an adequate and well-graded portion of the topic assigned for this time is thoroughly learned, the subject may then be dropped for the remainder of that year. The following year a little more advanced treatment of the subject should be pursued for the same length of time. Allowing twenty minutes to a lesson for all grades or classes above the primary, this requirement would amount to only fourteen hours per year; but if carried through the several years between the primary and the second year of the high school or corresponding class of ungraded schools, would give sufficient time for a thorough comprehension of the subject without encroaching upon other studies.

2. *Necessary means for the fulfillment of the law.*—Well-graded text-books on physiology and hygiene that contain also the "special" facts concerning the nature and effects of alcoholic drinks, tobacco, and other narcotics, that the law requires taught. These facts can not be treated in less than one-quarter of the space given to the physiology and hygiene appropriate for primary and intermediate grades, or in less than twenty pages of the ordinary high-school book. These books should be as well graded to the capacities of pupils as modern school readers are.

3. *Necessary method.*[2]—Text-books in the hands of pupils who use text-books in studying such other branches as arithmetic or geography, and oral instruction, not less than three times per week, for those not sufficiently advanced to use text-books.

4. *Examinations or tests.*[3]—As thorough examinations or tests should be required in this study as in other branches, the same marking system should be used, and such marks should enter into the general average which decides the rank of the pupil.

The above standard of requirement for the enforcement of a temperance education law is both fair and just. Anything less would not represent the spirit and letter of this legislation, and would not be a pursuit of the subject "as a regular branch" by "all pupils in all schools," as the laws of many States demand.

(Signed)

HENRY SABIN,
Superintendent Public Instruction for Iowa.

A. A. MINER,
Member of State Board of Education of Massachusetts.

ALICE FREEMAN PALMER,
Member of State Board of Education of Massachusetts.

ELMER H. CAPEN,
Member of State Board of Education of Massachusetts.

J. ESTABROOK,
Superintendent of Public Instruction, Michigan.

N. A. LUCE,
Superintendent of Common Schools of Maine.

GEO. J. LUCKEY,
Superintendent of Pittsburg Schools, Pennsylvania.

W. H. JACK,
State Superintendent of Public Education for Louisiana.

D. J. WALLER, JR.,
Superintendent Public Instruction for Pennsylvania.

THOS. M. BALLIET,
Superintendent Schools, Springfield, Massachusetts.

RICHARD EDWARDS,
Superintendent Public Instruction for Illinois.

W. B. POWELL,
Superintendent Schools for Washington, D. C., and District of Columbia.

IRA G. HOITT,
Superintendent Public Instruction for California.

A. N. RAUB,
President State Board of Education, Delaware.

BENJ. S. MORGAN,
State Superintendent Free Schools, West Virginia.

GEO. W. WINANS,
Superintendent Public Instruction for Kansas.

JOHN HANCOCK,
State Commissioner of Common Schools for Ohio.

JOHN OGDEN,
Superintendent Public Instruction for North Dakota.

W. C. DOVEY,
Superintendent of Public Instruction for Nevada.

---

[1] Three lessons per week for fourteen weeks is specified, instead of one lesson per week for forty weeks, or two lessons per week for twenty-one weeks, because when the lessons come farther apart the pupils forget the last before they reach the next; the subject as a whole does not become so readily a part of the intelligence; more time has to be taken in reviewing the last lesson before taking up the new; the pupil's interest is not so well sustained, nor proficiency so easily acquired, as when the lessons are given in closer succession.

[2] Without well-authenticated text-books in the hands of pupils, error is as liable to be taught as truth, for teachers have rarely received even a brief course of instruction in the subject, and their knowleege of the same is therefore made up of as much folklore as fact. Much time is also liable to be wasted over matters that are entirely irrelevant, such as the legal or political phases of the temperance question, whenever the text-book is not followed.

[3] Teachers will be more thorough in teaching a subject in which the pupils, and hence their faithfulness in teaching it, are put to a test. The pupils will also study a subject more faithfully when they know that their standing or promotion depends upon their ability to pass an examination in it.

The following, relating to the requirements of institute instructors and the duties of school boards, is taken from Mrs. Hunt's work, "A Brief History of the First Decade," before referred to:

INSTITUTE INSTRUCTORS.

There is now great need of trained institute instructors on this topic. Great harm has been done this cause, and the study has been brought into disrepute, by persons going before institutes and attempting to give instruction when they were not qualified to do so, and were not prepared to answer the questions propounded by critics, friendly or otherwise.

An institute instructor on this topic should have the following qualifications:

1. He, or she, should be a good physiologist.

2. Should be thoroughly familiar with the biological side of the question as revealed by the researches of the last few years. Should be well read in the works of Pasteur, De Barry, Troussart, Shurtzenberger and others on fermentation.

3. Should know enough of modern investigation to be able to refute, on the testimony of scientific experts, the popular fallacies concerning the nature of alcohol, especially as found in the most common drinks, beer, wine, cider, etc.

4. Should be familiar with the great physiological authorities on the subject of the effect of these narcotics upon the human system, mental, moral, and physical.

5. Should be familiar with all the school literature on this subject and be able to point out quickly where one book is defective and where and why another is sound.

6. Should understand thoroughly the matter of grading the topic, *i. e.*, what should be taught the first year and what enlargement of the subject should be added each succeeding year, through all the grades, in order that "all the pupils in all schools" may be taught the subject as the law demands without unnecessary repetition.

7. Should be familiar with modern methods of teaching as based upon psychological principles, so as to be able to present this subject in harmony with the same.

8. Should have also what is called "platform powers," *i. e.*, ability to present this subject with clearness, enthusiasm, and the magnetism which holds an audience.

The subject of physiology and hygiene, with special reference to the nature and effects of alcoholic drinks and other narcotics, is a large one requiring exact knowledge on the part of anyone who would attempt to instruct teachers. For those who can fully meet these requirements there is a wide opening, and correspondence with such is invited by the national superintendent of this department, Mrs. Mary H. Hunt, Hyde Park, Mass.

A bureau for the training of such instructors on this topic for teachers' institutes is already under way. Applicants for the course of training will be required to present testimonials as to previous education, capacity for study, aptness to teach, and power to interest an audience. The instructors now preparing for this work have had experience as institute instructors on other topics, and have established a reputation in that direction.

THE SCHOOL BOARD.

The parties who ought to take the first official steps in the enforcement of a temperance education law are ordinarily the local school boards. These steps, if rightly taken, are:

(1) The adoption of a definite course of study, with time and place given to it as to other branches, and for each grade of pupils.

(2) The recommendation of text-books containing the facts the law requires taught, graded to the capacities of the several classes of scholars.

In the discharge of these duties on the part of the school boards, there is wide room for improvement. They have too often recommended books notably lacking in temperance matter, and so absolutely out of grade as to be practically useless. Conscientious teachers in such cases have tried to give oral instruction, but they have not had the previous drill in this branch that they have had in others. When neither the teacher nor the books are in possession of the facts to be taught, it is not strange that the teacher soon runs out of matter for the so-called oral instruction.

Oral instruction on this topic, in all grades above primary, has been, and still is, a signal failure. We must insist upon text-book study in all grades using text-books for other like branches, if we would not be mocked with disappointment in results.

A master in a city school, under temperance education law, recently said: "I can and will teach this branch when it is put into my course of study and books containing the subject are put into my hands and those of my pupils, but the school board must do that first. If they fill my course of study absolutely full with other branches, leaving no time for this, and in addition, neglect to give me or my pupils any adequate text-books, I can not do much."

This statement represents the relation of school boards to the enforcement of these laws, and reveals the greatest hindrance to be overcome. The neglect with these officials is often due to misapprehension or indifference, and sometimes to positive opposition. The appeal in the latter case is to the people for the election of persons who will execute the law. The man who would withhold this instruction from the children of a city or modify its full truth for fear of injuring the brewing or other liquor interests is most unfit to be intrusted with any care of the education of the children in this age. Misapprehension on the part of school boards can be enlightened; that should be the work of the local superintendent. The indifferent can ordinarily be aroused; if not, they should be retired.

Hard indeed must be the heart of the man or woman who could deliberately withhold the utmost warning science has against strong drink and other narcotics from the children under his or her care. If we deliberately or otherwise withhold a given information from a child are we not responsible for what may follow to that child's future and to others through him because of such withholding? Is it too much to say that the officials who carelessly, negligently, or purposely fail to provide for the full enforcement of the temperance education laws in the schools under their control, are incurring a fearful and personal responsibility for the drunkenness of the future? The time has come for calling attention to this from pulpit, platform, and press.

II.—THE EFFECTS OF ALCOHOL ON THE HUMAN SYSTEM AND THE METHOD OF TEACHING THEM.

By Prof. A. C. Boyden, of Bridgewater, Mass.

[From proceedings National Educational Association, 1886.]

* * * Two very practical questions remain for us as teachers. The two are these: What shall we teach? and How shall we teach it? That is, what shall we select from all the mass of material that has been prepared upon this subject for the young pupil? Much is especially adapted to them. Much we can give them with assurance. Many of the facts can be presented correctly, simply, and effectively to the children. And when we have made our selection, the important question comes, how shall we present the subject according to the best methods of teaching and in such a way as to lead to conviction on the part of the young. Let me say, what I am going to repeat a great many times throughout this discourse, that it is not mere knowledge that we are to teach—it is conviction that we are to bring to the minds and the wills of these pupils. Stopping with mere knowledge will not accomplish the work. What shall we teach?

First. A knowledge of the human body: Its external parts; the relations of those parts to each other: the uses of these parts, and especially the proper care of them; a knowledge of these delicate organs, the senses that we have and the work which they do for us, and the care which we should take of them; the work done by the important systems within our bodies, the way in which they do that work, and the care which they should receive from us—not merely a knowledge that we have certain parts, that we use them in certain ways, and that they can be taken care of in certain ways, but we should lead the mind to a profound conviction of the marvelous construction of our body, the delicate arrangement of its parts and the duty of each one of us to take the very best care of these houses of our souls. Not the mere knowledge, we repeat, but the conviction of the duty to care for these. This work is the preparation for the later work.

Second. A knowledge of the origin, properties, and uses of the various stimulants and narcotics; that the children may recognize them when they see them;

that they may know the properties, and the effects upon the human body, and that they may know why alcohol has this certain influence upon the human body.

Third, and most important: That these narcotics, especially alcohol, tobacco, and opium, upon the human body; what they do and why they do it. Now, with your indulgence, I shall hope to offer a few suggestions in answer to these two questions, what shall we teach and how shall we teach it, with some very simple experiments. I have gone to the extreme of simplicity in order to avoid the objections which come from so many teachers who say: "I have had no practice in any laboratory. I am situated in a school where very few, if any, appliances are given to me." I wish to present that which can be used by every man and woman in every schoolhouse in this land; requiring no previous laboratory work, requiring no great outlay or expense. Of course in those schools which are more favorably situated, more advanced experiments may be conducted; but I intend to present those experiments which will give a sufficient knowledge of the effects on the human body, so that if it is taught rightly the children will be saved. Now, in this work, so far as I can show it before such a large audience, I will leave the subject of general physiology, and come directly to the subject of narcotics, their origin, their properties, and uses, and what they do to the human body; and I have selected for their principal work,

ALCOHOL.

I.—ORIGIN OF ALCOHOL.

1.—*In fermented liquors.*

Experiment 1. Add molasses to water in a bottle till it is of a deep brown color, then add a teaspoonful of yeast; allow it to stand in a warm place for a day or two. Observation: The mixture has the odor of alcohol, later a sour, acid odor; the mixture has a sharp taste. Inference: The little yeast has changed the sugar of the molasses to alcohol; this will change to acid if left alone. Call the yeast plant a "ferment," and the process of changing "fermentation."

Experiment 2. Allow apple juice to stand exposed to the air for a few days. Observation: The liquid has the odor of alcohol, also the biting taste. Later it has a sour, acid taste like vinegar. Inference: Very small ferments from the air have changed the sugar of the apple juice to alcohol. Call the liquid "cider." The alcohol will change to vinegar if left exposed to the air.

Cider is formed by the fermentation of apple juice in the air.

Wines are formed by the fermentation of grape juice, etc., in the air.

Ales and beers are formed by the fermentation of the sugar of grains. (Malt liquors.)

Alcohol is an essential constituent of all these fermented liquors; nature will change it to an acid if left to itself.

2.—*In distilled liquors.*

Experiment 3. Heat cider or wine in a test tube over an alcohol lamp: pass the steam through a glass tube into a bottle which is wrapped in a wet cloth to condense this steam. Observation: The odor and taste are more marked than in the fermented liquors; often there is a bitter taste. Inference: The condensed liquor is stronger than the fermented liquor and is changed into new substances oftentimes. Call this process of evaporating and condensing "distillation," and the resulting liquid a "distilled liquor."

Brandy is distilled from wines.

Gin is distilled from beer and flavored with juniper berries.

Whisky is distilled from the wort of fermented grain.

Rum is distilled from fermented molasses.

II.—PROPERTIES AND USES OF ALCOHOL.

Experiment 4. Examine alcohol for its color, odor, and taste. Place a little on the hand. Observation: Alcohol is a transparent liquid, has a strong odor, and a biting taste. Inference: The rapid evaporation of the alcohol makes the hand feel cool—it is a volatile liquid.

Experiment 5. Place a little in a spoon; apply a lighted match. Observation: It burns in a blue; hot flame. Inference: Alcohol is inflammable because it unites easily with the oxygen of the air.

Experiment 6. Shake a little powdered resin in alcohol. Observation: The alcohol changed to the color of the resin; finally the resin disappears. Inference: Some resinous substances are soluble in alcohol.

Experiment 7. Mix a little oil of turpentine with alcohol; shake. Observation: The turpentine mixes with the alcohol. Inference: Alcohol will mix with some oils.

Experiment 8. Add alcohol to the white of an egg (albumen). Observation: The albumen changes the moist, mucilaginous albumen to a white, stringy solid. Call this "coagulation." Inference: Alcohol coagulates albuminous substances by extracting the water from them.

Properties.—Alcohol is a transparent liquid, odorous, has biting taste, is volatile. It dissolves many resinous substances, and mixes with most oils. It is inflammable, has great affinity for oxygen. It coagulates albumen, has attraction for water. Uses (resulting from these properties), external application to allay inflammation. Alcoholic lamps for heating purposes. A solvent for gums in preparing varnishes. In preparation of perfumery, medicines, etc. Preservation of museum specimens.

III.—EFFECTS OF ALCOHOL ON THE HUMAN BODY.

1.—*Alcohol impairs digestion.*

Experiment 9. Place with the finger a little alcohol on the inside membrane of the mouth (a mucous membrane);[1] repeat this several times. Observation: The membrane stings, the saliva flows freely, finally there is a dry, puckery feeling. Inference: Alcohol inflames the membrane, excites the flow of the liquid which it secretes, and absorbs the moisture in it.

Application.—The lining membrane of the mouth also lines the stomach and the other organs of the digestive system. A small amount of alcohol will cause a profuse flow of the gastric juice and pass very rapidly into the blood. A larger amount inflames and irritates the lining membrane of the stomach. A continued use weakens the quality of the gastric juice by the unusual and irregular flow, also impoverishes the blood from which it comes. It irritates the constantly inflamed membrane of the stomach, leading to an ulcerous condition and chronic inflammation.

Experiment 10. Add alcohol to raw meat, also rub some meat in water till it is well colored with blood, add alcohol to this blood. Observation: The liquid is full of white particles and the meat seems hard. Inference: The alcohol has coagulated the albumen of the meat and blood.

Experiment 11. Add alcohol to some of the pepsin of the gastric juice. Observation: The pepsin contains white, stringy particles. Inference: Alcohol coagulates pepsin.

NOTE.—To prepare the pepsin get from the butcher the inside membrane of a pig's stomach, cut into fine pieces and soak it in glycerine for a few hours. The glycerine dissolves the pepsin; strain through a fine cloth. Prepared pepsin can be bought of the druggist.

Application.—Pepsin is the active solvent of the gastric juice. Alcohol tends to harden the food and coagulate the pepsin, thus retarding digestion. Continued use tends to chronic indigestion and to the intensifying of any disease of the digestive system.

2.—*Alcohol absorbs the water of the body.*

Refer to experiments 8 and 9. Alcohol not only absorbs water from the albumen which it coagulates, but the whole system floods it with water to dilute it and render it less harmful. Hence alcohol absorbs the water of the saliva, of the gastric juice, of the blood, of the tissues, and of all the secretions. This soon results in a craving for fluid to supply the body, really a "thirst" for water, requiring time for its absorption throughout the system, but temporarily satisfied by more exciting drink.

3.—*Alcohol destroys the blood corpuscles.*

Experiment 12. Prick with a pin under the finger nail and draw a drop of blood; place this on a bit of glass and examine with a magnifying glass. Observe the way in which the little blood corpuscles are arranged. Touch them with the smallest amount of alcohol. Observation: The corpuscles are of an

[1] I would never do that or teach others to.—M. H. Hunt.

irregular shape and have lost part of their color. Add more alcohol. Observation: The corpuscles are an irregular mass of a whitish color. Inference: Alcohol coagulates the albumen of the corpuscles and dissolves the coloring matter. Refer also to experiment 5.

Application.—Alcohol at once enters the blood, seizes the oxygen that the red corpuscles are carrying to the various parts of the body, dissolves the coloring matter, and coagulates the albumen of these corpuscles; hence the blood partially fails in its work of carrying new matter to the tissues and in eliminating the waste matter. The result is a clogging of the system with effete matter, poisoning of the blood, diseases of the skin, liver, and kidneys. The retarding of the combustion within the body lowers its temperature in direct proportion to the amount of alcohol taken.

4.—*Alcohol ruins the blood vessels.*

Observe the crust of earthy matter on the inside of bottles of grape wine. Inference: The earth matter which was soluble in the grape juice is thrown down by the alcohol in the wine.

Application.—The mineral matter is being carried by the blood to the bones, is precipitated by the alcohol, and forms a crust in the blood vessels and in all the tissues, making them weak and brittle. As a result blood vessels burst under any unusual strain, and apoplexy results.

5.—*Alcohol paralyzes nerve matter.* (*A narcotic.*)

Experiment 13. Etherize or chloroform a frog by soaking a wad of cotton and putting it in his mouth, or place a spoonful of ether in a jar of water and immerse the frog. When insensible carefully cut upon the skin and flesh of the leg till the nerve is exposed. Touch a drop of alcohol to the exposed nerve. Observation: The nerve becomes stiff and white, the trembling of the limb ceases. Inference: Alcohol has paralyzed the live nerve matter.

Application.—A small dose of alcohol causes incipient paralysis of the nerves of the tissues and brain; this causes an extra activity for the purpose of diluting and expelling the poison from the system, manifested by the "animated appearance, the throbbing of the arteries, the flush of the face, and the sparkle of the eye." This paralysis also numbs any feelings of pain, apparent benefits arising from previous paralysis. The paralysis of the nerves controlling the muscular walls of the capillaries weakens their elasticity, at the same time the heart increases its action, hence the blood tends to remain near the surface, and an extra radiation of heat takes place, a second reason for the lower temperature of the body.

Increase the dose and the paralysis of the brain increases in this order: First, of the delicate nerve matter of the superior brain (cerebellum), blunting the highest functions, reverence, modesty, love, etc., its reflex action is the loss of control of the connecting nerves, thus moral power fails and the lower nature is supreme; second, the part of the brain controlling voluntary motion is paralyzed, and also that part which is said to preside over the thoughts (cerebrum), at the same time the nerves are paralyzed, resulting in an insensibility to pain and injury—this goes on till a person is "dead drunk;" third,—the last part of the nervous system affected is that which controls the involuntary actions, breathing, etc.—this paralysis causes death.

Continued use leads to a degeneracy of nerve matter and tissue by the constant paralysis and repair, because the structure of the nerve matter is changed, hence "disorders occasioned by the strain imposed on the system, diseases traceable to the general degeneration of the system, and diseases which might otherwise be averted or resisted;" finally the insatiable demand for alcohol: diseases of the nerve, delirium, and death.

This extra exertion of the organs tends to weaken them, which accounts for the fact you are all familiar with, namely, that when a person is taken with a serious disease and is brought to the hospital the first thing the physician or surgeon who comes to him says is: Has this person been using alcohol? Yes; and he shakes his head. There is a question about that. That extra exertion of those organs which has been going on eliminating poison from that man makes it impossible for those organs to resist the terrible strain of a new disease. The physician says to another: Has this person used alcoholic liquors? No. Then we will try to pull him through. Those organs have not been exerted under that terrible strain. Now the effect on this nerve matter of pulling

it down, paralyzing it to-day, then mending it, pulling it down, and to-morrow mending it, paralyzing it a little more the next day, and mending it again, changes the constitution of that nerve matter so that it gets into what we call a diseased condition. And there is a second reason for this terrible thirst that comes over a man. Such thirst that nothing, as he says, in heaven or earth will stop him in getting that liquor; and why? Because of the changed condition of that nerve matter, and it looks as if there was no remedy for him. Surely it is a terrible condition for a man to reach.

Now, without going further, I think I have made the points that I desire: That in teaching these points we should lay the foundation on simple experiments (with substances which are the same or similar to those of the human body), performed by the pupils themselves. That, I say, should be the foundation. Then we should apply these facts and explain the action on the human body. This may be supplemented by reading, not from one book, but from many books, of the effects, which can not be shown by simple experiments, but which are the result of difficult scientific experiments and of medical experience.

Now let me leave these thoughts with you: Teach very carefully out of a full knowledge of the subject; discriminatingly, not with exaggeration, but for the purpose of finding the truth, the whole truth, and nothing but the truth. Teach scientifically, according to the principles of the very best science, basing the work upon experiments in the hands of the pupils. Teach impressively. As I said at first a person may know all about these facts that I have presented and yet go right on doing just the same thing as before. The lessons should be taught in such a way by the teacher as to bring conviction and decision to the minds of each one of the children. Any teacher that fails to reach that point has failed in moving the wills of the children. Teach for the sake of developing right habits and good character.

III.—THE LEGISLATION EFFECTED.

The following table shows what States have enacted compulsory temperance education laws and gives the principal features of the different laws:

Table showing the States having temperance education laws; also the date of enactment and the chief requirements of the different laws, as compiled by Mary H. Hunt.

Explanation of marks.

× The cross signifies that scientific temperance is a mandatory study in public schools. (Column 3.)

* The star signifies a penalty attached to the enforcing clause of this statute in the State or Territory to which it is affixed. (Column 4.)

† The dagger signifies that the study is not only mandatory, but is required of all pupils in all schools. (Column 5.)

‡ The double dagger signifies that the study is required of all pupils in all schools and is to be pursued with text-books in the hands of pupils able to read. (Column 6.)

‖ The parallel indicates that the study is to be taught in the same manner and as thoroughly as other required branches. (Column 7.)

§ The section mark indicates that text-books on this topic used in primary and intermediate schools must give one-fourth their space to temperance matter and those used in high schools not less than 20 pages. (Column 8.)

¶ The paragraph indicates that no teacher who has not passed a satisfactory examination in this subject is granted a certificate or authorized to teach. (Column 9.)

The States in italics have no temperance education law.

IV.—THE ENFORCEMENT OF TEMPERANCE EDUCATION LAWS.—REPORTS AND OBSERVATIONS OF SCHOOL OFFICIALS.

ALABAMA.

The Alabama law of 1885 required that "instruction shall be given all pupils in all schools and colleges, supported in whole or in part by public money or under State control, in physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system."

In 1889, out of 261,667 pupils, 19,211 are reported as studying "physiology and hygiene."

In 1891 a law more rigid in its requirements was enacted.

CALIFORNIA.

[*From Report of State Superintendent Ira G. Hoitt, 1890.*]

Teaching desultory and results inappreciable.—The provision in our law requiring scientific temperance instruction to be given in all grades was adopted by the legislature of 1887.

Up to the present time the teaching has been desultory and the results inappreciable. Some teachers are earnest and enthusiastic on the subject, many take hold of it in a cold, perfunctory way, and many, I fear, neglect it altogether. Some teachers, when the law was passed, found themselves unprepared to do anything in that line, and, not having the fear of an examination before them, failed to make any adequate preparation. Some of the county boards very properly required an examination of their teachers in this subject and entomology before issuing renewals of certificates. The course of study suggested by the State board of education supplies the data for some years only.

I would suggest that county superintendents give this subject a more prominent place at their institutes and in their teachers' examinations and that pupils be examined thoroughly in the work prescribed for each grade: also, that by legislative enactment scientific temperance be added to the branches in which applicants for teachers' certificates must be examined, and that the words "intemperate habits" be added to the clause bearing upon the revocation or suspension of certificates.

If this were done the almost universal desire which I have observed among our superintendents and teachers to uphold the law would produce beneficial results in this direction.

SAN DIEGO.

Methods of instruction.—Eugene De Bum, superintendent of San Diego schools: In connection with the work in physiology, alcoholic drinks and narcotics are treated of as fully in each grade as the comprehension of the pupils will permit. The teacher talks with the class of the manufacture of alcohol, its uses in the arts, and the beverages in which it is found. A brief history of tobacco is given with the process of manufacture and the ways in which it is used. The description, uses, and hygiene of each part of the body; the skin, the muscles, the bones, the stomach, the lungs, etc., are taught; the effects of alcohol and tobacco are given with the hygiene. Caution as to using other narcotics, as opium and morphine, is given the pupils. This work is not only laid out in the course of study, but it is done in the school room.

COLORADO.

Generally observed.—State Superintendent L. S. Cornell reports (1888): The temperance law passed by the last legislature has been generally observed throughout the State. In all of our schools instruction as to the effect of alcohol and narcotics on the human system has been given. The law, as passed, is somewhat vague and indefinite, yet it has been obeyed as the school boards understood it.

Douglas County reports (1890) the law as "generally enforced."

CONNECTICUT.

REPORTS OF SCHOOL VISITORS.

Lack of text-books and of interest.—The evident intention of our legislators in the law requiring the study in our schools of physiology as connected with alcoholism is not being realized as it should be, owing to a lack of appropriate text-books, as well as a lack of interest in all concerned. The devastation, moral, physical, and financial, resulting from the drink traffic, calls for a more full and clear understanding of the direful effects of indulging in alcoholic drinks, and also tobacco in its various forms, that those who persist in going the downward road may not present the plea of ignorance as an excuse. Statistics of classes pursuing a college course show conclusively that those who indulge in the use of the weed rarely attain to the highest position mentally or physically. Fashion and habit hold a tyrant's sway over the boys who think they have attained to manliness when they can sport a cigar, or flood the spittoon, the floor, or the walk with foul tobacco juice: and we know the natural tendency of this habit is to lead on to the saloon. The moral obtuseness of those addicted to the use of strong drink is something startling to every thoughtful mind. The great majority of the accidents and crimes which are so appalling are directly traceable to alcohol, which is the provocative of nearly every sin in the calendar. I shall probably be accused of want of liberality in this matter, but when our law-

makers in their wisdom have seen fit to place such a law on the statute book, it is well for us to heed it, especially when we are charged with the moral and physical, as well as mental, wellbeing of the young in our communities.—Plymouth, L. D. Baldwin, acting visitor.

Regularly and faithfully taught.—The subject of physiology and hygiene has been regularly and faithfully taught. A conscientious effort has been made to select and teach the facts best adapted to the mental status of the pupil, and to impress him with the importance of obeying the laws of health which a consideration of the body and its complicated machinery suggests. So far as practicable scientific terms are avoided, and the matter is presented in language within the comprehension of the pupil.

The composition and nature of alcohol and tobacco are studied, and the effects which they produce when taken into the system. The evils which flow from their long-continued use are pointed out, and the effort made to create an impression which will result in total abstinence.—Norwich Central District, N. L. Bishop, superintendent.

DELAWARE.

Growing more and more popular.—Superintendent James H. Ward, of Sussex County, reports: The study of physiology and hygiene is growing more and more popular every year. Three years ago these two branches were introduced into our schools. During the first year comparatively few schools used the book, but now nearly all the schools in the county are making use of it; and very soon none, we think, will be without it. The teachers prove themselves in the examinations to be much more conversant with these subjects now than they were three years ago, and their interest will, of course, to a great extent assure us of the interest and advancement of the pupils in this part of a popular education. We feel gratified that the people begin to show themselves interested in this work, and begin to feel that the laws of health should be taught in our schools, and that the principles of temperance instilled into the children's minds should be considered a part of a good, substantial education.

ILLINOIS.

State Superintendent Richard Edwards (1890): During the last session of the legislature a law was passed requiring that instruction be given in the laws of health and in regard to the effect on the human system of narcotics and alcohol. Whatever opinions may be held concerning the liquor traffic, every intelligent man will welcome all honest efforts to enlighten the people in regard to the physical effects of narcotics and intoxicants.

IOWA.

[*From Report of State Superintendent Henry Sabin, 1888-89.*]

Scientific temperance instruction.—The law requiring that regular instruction shall be given in all the public schools of the State having special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system has been the subject of much thought and attention. I believe the law has been steadily growing in favor, and that its provisions are generally complied with by our teachers. Not only has the attention of teachers been called to the absolute necessity of obeying the letter of the law, but in most of our county institutes valuable instruction has been given in methods of teaching this branch and in the arrangement of the subject-matter, so as to make the teaching most effective.

In response to many inquiries, in May, 1888, the following circular was distributed among the teachers for their guidance and direction:

To county superintendents and teachers of Iowa:

We are often asked as to the limit of instruction in the branch of scientific temperance instruction.

The evident intent of the law is to place the teaching of the nature and effects of stimulants and narcotics upon the same basis as other branches taught in our public schools. The pupil gains his knowledge of arithmetic by successive steps; he must pass an examination in one part of the subject, and show his familiarity with it before he is advanced to the next division. Scientific temperance instruction should be treated in the same manner. One portion should be thoroughly mastered before the next is entered upon. If this is well done, the teacher will often find work enough in one part of the subject to employ and interest the pupils during a whole term. Careful consideration will convince us that the work in this branch of study is too superficial in many of our schools, because we are attempting more in a given time than can be done well. Temperance instruction needs to be reduced to a system.

We suggest the following plan:

In the first division, intended for little children, let the work be entirely oral, and confine the subject-matter largely to the simple rules of health, as cleanliness, exercise, and habits of eating and drinking, with but little of physiology or anatomy.

In the second division, instruction should still be given orally, but an advance may be made, in that the pupil should be required to carefully reproduce what has been given him, and to commit to memory facts and principles, so as to make them his own. The department of hygiene may be enlarged, and something of the mechanism of the body may be added. It is to be noticed, however, that this oral work should be very carefully prepared, with method and thought, in order to adapt it to the capacity of the pupils. It is of especial importance in these two divisions that you give, if possible, a strong bent to the child's mind against the use of liquor and tobacco.

In the third division the use of the text-book should begin. Here more individual study and work on the part of the pupil is necessary. It would not be well to endeavor to cover the whole ground of physiology and hygiene. The functions of the more important organs only should be thoroughly studied and explained. The action of stimulants and narcotics upon these organs should be faithfully impressed upon the child's mind.

In advanced divisions the whole subject of the human body, its mechanism, its needs and protection, may be carefully studied. At this stage a few of the more important technical names may be learned, and the functions of the various organs more minutely described.

In all your work care should be taken to give instruction in accordance with the spirit of the law. Total abstinence should be taught as the only sure way to escape the evils arising from the use of alcoholic drinks and tobacco. This systematic plan, if carefully followed, will insure a more thorough understanding of the subject, and teachers will not complain that they have used up all their material.

Allow me to suggest to county superintendents that you give this study, especially as it has reference to the effects of stimulants and narcotics upon the human system, the attention which it deserves at your coming institute; and that at examinations you submit to your teacher short but comprehensive questions to test their knowledge, as required by section 3 of the law. * * *

Reports from every county in the State indicate that there is a very general desire to administer the law faithfully. Considering the difficulties naturally arising when a new branch is introduced into the course of study, the progress made is very encouraging. The attention the subject received last year in institutes greatly assisted teachers in their work. Our confidence in the fidelity of the school officers and instructors of Iowa to any trust imposed upon them makes us certain that much more will be accomplished during the coming year. To assist in this important work the hearty coöperation of all is invited.

HENRY SABIN,
Superintendent of Public Instruction.

DES MOINES, *May 20, 1888.*

The code should be amended so as to require the teacher to include in his register, which he files with the secretary at the close of his school, a certificate that he has fully complied with the provisions of the law. Section 1745 should also be amended, so that the secretary should be required to furnish the county superintendent with a transcript of the action of the board, as required by laws of 1886, and also with the names of those teachers who have and those who have not filed the required certificate.

The attempt to teach the children and youth the injurious effects of stimulants and narcotics promises great good to the cause of temperance. The aim of such instruction should be to fortify the child against the formation of bad habits in his youth, and to lay the foundations upon which to build the higher work of strengthening the will, so that he may be able to resist temptation from whatever source it may come. In this connection I am free to say that I believe there should be upon our statute book a law making it a misdemeanor, punishable by a heavy fine, to sell tobacco in any form to a minor under 16 years of age. The necessity of such a law is becoming more apparent every day, and we ought not longer to delay its enactment.

Statistics.—Reports from the township boards indicated "that the law had been complied with in its spirit" in every township without exception; also that the teachers were "skillful in giving the instruction required by law."

In 1890, out of 15,762 schools, the effects of stimulants and narcotics were taught in 15,097.

KANSAS.

We should unite to make the teaching a success.—State Superintendent J. H. Lawhead (1886): A vigorous mind inhabiting a healthy body can do more for the State than the same mind can in a body that is weak and diseased; and as the public school is sustained at public expense upon the theory that the permanency of the State depends upon the intelligence of its citizens, the State claims the right to have those branches taught in her schools that will best secure these results. Now a thorough knowledge of the human system is essential to its preservation and highest development, which can only be secured by a study of its physiology and hygiene, and the effects of such substances as may be deleterious to its growth and the healthy exercise of its various functions; and it has

been decided by the best medical authority, as well as by universal observation of mankind, that both alcoholic stimulants and narcotics exert a baneful and destructive influence, not only upon the body and its various functions, but it likewise destroys the intellect and deadens the moral sensibilities. In view of all these results, we, as school officers and good citizens, should unite to make the teaching of the effects of alcoholic stimulants and narcotics upon the human system a success. We should supply our teachers with all the necessary appliances to secure the best results, and furnish our schools with the best maps, charts, and books, to enable the teacher to perform his part in this great work. I am pleased to note that teachers throughout the State have, in most instances, taken hold of this subject with an earnestness that is full of promise for good results.

MAINE.

Obstacles to the execution of the law.—State Superintendent N. A. Luce reports (1890): The results of the law requiring instruction in the hygienic effects of stimulants and narcotics have not been fully up to what was hoped and expected when enacted. Three obstacles have stood in the way of such results:

1. In the smaller rural schools where failure has been most general, the incompetence of the teachers has been the cause of such failure. In such schools of necessity the instruction must be largely oral because of the primary character of those to be taught, and such instruction to be efficient presupposes teachers of higher professional grade than is required to give instruction from text-books. Efficient oral work, except in rare cases, can be done only by those trained and practiced in such work.

2. The unwillingness of parents to purchase text-books has hitherto been an almost insurmountable obstacle not confined to any class or grade of schools. While oral teaching in this as in other branches is most efficient with primary classes, it is otherwise with those more advanced. With these the text-book is a necessity.

3. The inertia of public opinion—a quite general feeling that this instruction is of minor importance—has not only been in large measure the producing cause of the two obstacles already cited, but an obstacle in and of itself. Schools both in their instruction and supervision are quick to respond to the condition of public opinion. Had there been sharp public demand that every child in every school should be taught as the terms of the law require, a demand watchful and exacting, there can be little doubt that cases of utter ignoring of law would have been rare, and that pupils and teachers would everywhere have been affected by that demand.

The first of these obstacles can be removed only by such reform in our system as will lift these poorer schools out of their present condition. The second has been largely removed by the furnishing of free books. The third will disappear only as the result of a "campaign of education." To bring this instruction up to the efficiency desired by those who believe in its vital importance, calls not for law but for labor. Law can not create public opinion, but public opinion will compel the observance of law. Labor with teachers is needed to awaken them to deeper interest and more earnest effort; with school officers to force them to full exercise of their authority; and especially with the people to educate them to an intelligent appreciation of the value of the results sought. Such labor is the privilege, and the duty as well, of those by whose efforts the law was enacted and of all others who believe in its wisdom.

Statistics.—In 1889, out of 3,894 ungraded schools, 2,557 had classes in physiology.

In 1890, out of 3,909 ungraded schools, 2,426 had classes in physiology.

MASSACHUSETTS.

Object and methods of the instruction—Exaggerated statements to be avoided.—G. T. Fletcher, agent of the State board: This is required to be given in connection with "physiology and hygiene, which are to include special instruction as to the effects of alcoholic drinks, stimulants, and narcotics on the human system."

Right and faithful teaching in this line may prove of great value to the Commonwealth, and the subject should secure careful consideration from school officials and teachers. The reports of school committees seem to indicate that some effort is made in every town to comply with the requirements of the law.

My personal observation convinces me that the methods and results are not satisfactory. Many teachers desire to do justice to the subject, but they plead,

as an excuse for neglect, lack of time and knowledge. Perhaps a brief consideration of the object of the instruction may suggest a method.

The teaching is to lead the child to form temperate habits of living. His knowledge of the danger of indulgence in the use of narcotics and intoxicants must lead to a development and exercise of will power sufficient to enable him to resist temptation. The education must be intellectual and moral, to induce the habits of thought and action necessary to good citizenship. The instruction should be true, simple, and earnest, largely objective; illustrations may be drawn from life, pictures, and recorded facts. Personalities and allusions that will wound the feelings of children should be avoided. No exaggerated statements of the evils to be shunned should be made; they are not wholly true, and they will react against the cause.

For young pupils good temperance stories are valuable. I am inclined to think that most temperance teaching should be oral, the school being supplied with such books and charts as will be helpful to teacher and pupils for reference. Truths from scientific investigations, and facts and figures from other reliable sources, may prove valuable. Not so much for school as for life the children need temperance instruction, and the teacher should honestly, faithfully, as well as intelligently, endeavor to make lasting impressions.

Begin with the teachers.—State board of education: The statutes require that physiology and hygiene shall be taught in all the public schools as a regular branch of study, and that the teaching shall have special reference to the effect of stimulants and narcotics upon the human system. The board has instructed its agents to make particular inquiry as to the manner in which this requirement is met. They report that the disposition is very general to comply with the law, but that very much of the teaching under this head is defective and of little value, owing to the inability of teachers to deal with the subject. In the judgment of the board, therefore, especial attention must be given to the training of teachers to teach this branch of learning before the results expected from its introduction into the schools will be produced.

MICHIGAN.

Overteaching is perilous.—State Superintendent Theodore Nelson (1886): In my opinion it is the design of the law to give to this class of studies the same status it gives to other practical topics, such as reading or grammar, *i. e.*, that somewhere in his course the pupil shall be taught the physiological and moral effects of narotics and alcoholic stimulants upon the whole being of man. To my mind this is quite enough. Less would be insufficient; more would be unnecessary, and possibly harmful. It is to be regretted that in any public school the full requirements of the law should suffer neglect; yet it would be a mistake quite as serious to give to these special studies a disproportionate, unequal place in the school curriculum—to coördinate them, as some extremists insist upon doing, with every other subject from the low zones of a, b, c up to the high regions of calculus. Overteaching upon a subject which relates to moral conduct, especially if it concerns the appetites or passions, is really perilous. Too constant dwelling upon topics of this character has a tendency to invoke morbid conditions in the mind of the youth which either provokes or fascinates him to attempt dangerous experiments. Were you to teach a boy the flagrant wickedness of burglary it would not be expedient, nor would it be necessary, to induct him into the mysteries of picking a lock. The specialist finds a peculiar charm in the ugly spider; he sees a thousand beauties in the bright colors and sinister eyes of a loathsome snake. We may well fear the consequences of making our boys and girls too familiar with nauseating details of any evil which we desire them to shun. The teacher or parent can not be too earnest to enjoin correct principles, to give warning of penalties, and to himself exhibit a blameless example; which having done he can effectively add nothing further, except to devoutly leave the result with God.

Statistics.—In 1890, out of 10,810 school districts, 5,701 reported physiology taught, and 4,768 reported physiology not taught; 341 districts failed to report.

MINNESOTA.

Temperance in the broader sense.—State Superintendent D. L. Kiehle (1888): The reports from the counties indicate a purpose to honestly execute the law. The subject is doubtless as well taught as others are. The children are easily

interested, and I have no doubt will derive much permanent good through the skill and example of good teachers. Nothing should be left undone that will fix in the minds of our youth a sense of the folly and danger of the use of alcoholic beverages, and a resolution to entirely abstain from their use. I therefore cordially support this law, and have, so far as I know, used every means to administer it thoroughly. It ought, however, to be noted in a report upon education, as this assumes to be, that temperance in the restricted sense of abstinence from the use of any kind of food or drink is in itself but a negative virtue, and must therefore in an educational view take a subordinate place in any curriculum of instruction. Character is determined by what a man is, and not by what he is not, by what he does, and not by what he does not do. Hence, education having to do with the whole man in his health, intelligence, and character, it has chiefly to do with the positive virtues of temperance in the broader sense of self-control and the subordination of appetite and passion to the authority of the higher moral and intellectual natures, of high purposes in choosing worthy objects of life, of pure tastes in the love of the good, the beautiful, and the true. These receiving the first place, a secondary consideration should in reason be given to what is destructive and inconsistent with what every wise man should be, and for what he should live.

Reports of county superintendents—(1890).

Anoka County.—No opposition has been made to the instruction in temperance hygiene. Both teachers and pupils seem to enjoy this subject. Anatomical charts have been purchased for about two-thirds of all the schools. The greatest difficulty seems to be in getting parents to supply the children with books.

Douglas County.—Instruction in temperance hygiene has been systematically and regularly given in all schools, since the law requiring it became operative. The books recommended by the commission have been used exclusively and have given the best of satisfaction.

Lac qui Parle County.—No objection to the teaching of this subject in the schools has been heard. In nearly all of the schools it is taught, and I believe there is no subject more entertaining to the little ones, or one that will be of more importance to them in their general education. The teachers in nearly all of the schools use the book recommended by the commissioner.

Meeker County.—Temperance hygiene has been taught in every school without exception. In some instances, however, threats had to be resorted to in order to induce school boards to do their duty in this respect. All the teachers have been loyal and active in doing their parts in fulfilling the law.

Redwood County.—The temperance hygiene work is quite satisfactory. Teachers feel the need of good, earnest work on this subject. Nearly all make place for it on their programme. Some try it on the three times a week plan. What have we accomplished in the work, no one can tell. We shall know more five years hence.

Swift County.—Temperance hygiene has found a place on every programme in our schools, and the law is well observed.

Wilkin County.—Instruction in temperance hygiene has been given in this county, I think, very thoroughly and has been met with no opposition.

MISSOURI.

The law a farce and a fraud.—The law on teaching the evil effects of alcoholic stimulants and narcotics upon the human system is a farce and fraud. It is virtually a prohibition against temperance instruction in the public schools. And strange as it may appear, those who claimed to favor proper legislation upon this subject, favored this measure, while they rejoiced over the defeat of Senate bill No. 52, which required such instruction in all schools of the State. The law as it stands is worthless, and should be repealed or amended. (State Superintendent W. E. Coleman.)

MONTANA.

Montana without a law.—State Superintendent John Gannon (1892): The only law upon our statute books relating to the teaching of the effects of stimulants and narcotics is that known as the "Blair bill," approved May 20, 1886; but as that applied only to the Territories, it became void upon the admission of Montana into the Union, and has not been reënacted by our legislature; though

teachers are still examined in "physiology and hygiene, with special reference to the nature and the effects of alcoholic drinks and other narcotics upon the human system."

Statistics (1890).—Out of three hundred and sixty-one school districts in the State, physiology and hygiene were taught in three hundred and thirty-six.

NEVADA.

Scientific knowledge necessary.—State Superintendent W. C. Dovey (1890): The legislature passed an act in 1885 which provides that elementary physiology and hygiene, which shall give special prominence to the effect of alcohol and narcotics upon the human system, shall be taught in the public schools. No wiser provision is found in our school law. Scientific knowledge on this subject, though very primary, will do more in shaping the habits of the children in this respect than can be done by appeals to his moral nature or by reviewing the terrible degradation and ruin which its use has inflicted upon the human family. Reasons, stronger than sentimentalism, excite in him a wise fear of the tippler's habit. The following figures show that the great body of our teachers are in hearty accord with this law: Number of children studying physiology in 1885, 365; in 1886, 851; in 1887, 1,602; in 1888, 2,150; in 1889, 2,265; in 1890, 2,283 [out of 7,387 pupils enrolled]. In six years the number has increased from 365 to 2,283. This item is a source of thankful congratulation to every intelligent friend of the rising generation.

NEW HAMPSHIRE.

Nearly all schools complying with the law.—State Superintendent J. W. Patterson (1890): In the year 1883 an act was passed, without any material opposition in either house, which required school boards to prescribe in all schools sufficiently advanced the study of physiology and hygiene, with special reference to the effects of alcoholic stimulants and narcotics upon the human system. To prevent evasion by those not favorable to the law, it was amended in 1887 so as to require the introduction of this study in "all mixed schools and in all graded schools above the primary."

Being deeply interested in the execution of the law, I endeavored to inform myself as to how far it had been complied with and the spirit with which the subject was taught. It took a year or two to qualify the teachers to do even respectable work in this branch. There were a few towns which ignored the law, as every sensible man knew there would be, and there were others that complied with the letter of the law and violated its spirit. But as time went on I was gratified with what seemed to me as general a compliance with the law as any one had reason to anticipate.

I was, therefore, greatly surprised and not a little annoyed when his excellency the governor, in his inaugural, stated that so far as he could learn the law had been "almost entirely disregarded." I said to myself, either I am mistaken or the governor has been misinformed, and the public has a right to know whether the law is a dead letter or not. I therefore inserted the following questions in the statistical blanks sent to the school boards for their annual returns: 1. Give number of schools in which physiology and hygiene are taught with text-book. 2. Give number of schools in which they are taught orally.

All but eight towns in the State responded to these questions, and the result is as follows: In 946 schools physiology and hygiene are taught by text-books, and in 817 they are taught orally. This gives us 1,763 schools out of 2,302 in the State in which the law has been regarded, leaving only 539 in the whole State in which the subject is not taught. This number would be considerably reduced by the statistics from the eight towns not heard from. It is gratifying to learn from the school boards, who know the facts, that nearly all the schools of the State, except the primary, in which the subject is not required to be taught, are complying with the requirements of the law. Clearly his excellency the governor, whose scrupulous loyalty to facts and fearless fidelity to the cause of temperance all men must respect, was misinformed by parties who presumed to advise on matters in respect to which they had no definite knowledge.

I do not claim that the subject is taught with great thoroughness in some of the schools, but I presume it is up to the average teaching in other studies in those schools. The limitations are in the qualifications of the teachers, and will be removed with their improvement.

NORTH DAKOTA.

Statistics.—In 1889, out of 30,024 pupils, 18,523 studied physiology and hygiene. In 1890, out of 30,821 pupils, 21,301 studied physiology and hygiene.

OHIO.

Statistics.—In 1889: Number of pupils, 777,162; number studying physiology, 155,621.

In 1890: Number of pupils, 797,439; number studying physiology, 236,901.

PENNSYLVANIA.

Such knowledge is of vast account.—State Superintendent E. E. Higbee (1885): In regard to the recent law requiring physiology and hygiene to be taught as part of the necessary curriculum of our public schools, a word here may not be out of place. Of course, where children can not read intelligently or with ease, it would be a monstrous perversion of ordinary common sense to expect them to use a text-book. Their instruction, to be such and not a farce, must be oral; and such instruction must and ought to be given, properly adapted to the age and attainment of the pupil. In higher grades, text-books in full conformity with the meaning and purpose of the law should be used; and thus all pupils, whether of low or high grades, will receive instruction. Only enmity to the law can warrant such an interpretation as will defeat its own purpose, which plainly is, that all our children shall gain as much knowledge of physiology and hygiene as our common schools, with their limited sphere, can give, accompanied at each step with a proper practical application of this knowledge in reference especially to the effects of alcohol and narcotics on the human system. Such knowledge is in itself of vast account; and such special application of it, in way of warning, properly belongs to the moral discipline which should characterize all teaching, whether required by definite statute or not. The law-abiding habits of teachers and directors give abundant assurance that this law will be fully obeyed. We are willing that time shall demonstrate how far it may serve to remove one of the greatest curses that pollute social life. The fathers and mothers of this Commonwealth will be more than thankful for anything which may aid their children in keeping away from those temptations which they themselves so much fear, and from which so many of them have been made miserable and broken hearted.

In harmony with public sentiment—The right to impart such instruction unquestionable.—State Superintendent E. E. Higbee (1886): The practical operation of the act of assembly requiring the subject of physiology and hygiene, with special reference to the effects of alcohol and narcotics upon the human system, to be introduced in the schools as a legal branch of study, strengthens and confirms our belief in the wisdom of the law. The act was approved April 2, 1885, and went into effect at the beginning of the school year, in June following.

The commendable spirit in which the measure was so generally acquiesced in by the patrons of the schools, its prompt enforcement by directors, the earnest coöperation of superintendents, and the willingness of the teachers to comply with its provisions by a ready performance of the duties required of them, offer an unanswerable argument in proof of the fact that such instruction given to the children in the public schools is in favor with the people, and in harmony with a strong and growing public sentiment throughout the Commonwealth.

There have been shortcomings in some instances and partial failures in others, but there are few indeed in comparison, and occasioned more, we believe, by a misunderstanding of the law's requirements than by a disposition to evade its provisions. All things fairly considered, the friends of the measure have cause for congratulation, and even the most sanguine and hopeful of its advocates can find much to commend in the work of the first year.

The good results that will come from judicious and timely instruction in the subject will in the near future demonstrate the practicability of temperance teaching in the public schools, and will fully justify the policy of the course pursued.

The principles underlying moral instruction in the schools as a proper preparation for good citizenship, as well as to afford protection and safety to the individual, are pressing themselves more forcibly to-day than ever before upon the

earnest attention of our teachers. The causes, only too clearly discernible, that make such teaching an absolute necessity need not here be referred to.

The right to impart such instruction can not be questioned with any degree of sincerity or consistency, and when made an imperative and lawful requirement by the State, it becomes the duty of all concerned to render willing obedience thereto.

Gaining favor with teachers and pupils.—State Superintendent E. E. Higbee (1888): Scarcely any difficulties have arisen in reference to the comparatively new study of physiology and hygiene made obligatory by law. The teachers at the outset, in preparing themselves for this work, have very naturally given themselves to the study as a science, and no doubt in many instances have made this so prominent in their teaching as to overshadow the moral side in not fully discussing the vast evils of intemperance to both body and soul. In our judgment, however, there has been little if any conscious attempt to evade, in any way, the explicit requirements of the law, and the science, together with its hygienic applications, is gaining favor with teachers and pupils.

There should be no indifference to the serious moral import involved in such instruction. To avoid the evils of intemperance requires, of course, the firm exercise of will, which in most cases, when habits are already formed, needs the power of Divine grace to secure a lasting victory; yet it must be plain that a clear knowledge of the evils, as affecting body and soul, especially with the young, can but be of great service in helping them to shun the temptation when in subsequent years the tempter meets them with his specious pleas. Prudent treatment of any vice is not only therapeutic in the way of applying remedies for the disease already in existence, but prophylactic as well in guarding against its threatened attack.

General compliance with the law.—State Superintendent D. J. Waller, jr. (1890): The reports made to this office indicate a very general compliance with the spirit as well as with the letter of the law. The penalty for failure to comply with its provisions has proven to be sufficient to secure obedience on the part of those not specially interested in the subject.

An instance of harmful legislation—Results opposite to what intended.—Superintendent C. F. Foster, of Chester, Delaware Co., (1891): With all respect for the philantrophic and Christian women who have secured the present scientific temperance law, we can only characterize it, after a thorough test of six years in a strict observance of all its details, as an instance of harmful legislation. We have followed its requirements to the letter. We have used only the authorized text-books.

Every grade, from first primary to high school, is taught physiology and hygiene, "including special reference to the effect of alcoholic drinks, stimulants, and narcotics upon the human system." The result upon the minds of the pupils, and too often upon their personal habits, is the opposite of what was intended. The way in which this effect is produced, for aught we know, may be that illustrated in the oft-repeated lines of Pope:

> "Vice is a monster of so frightful mien,
> As, to be hated, needs but to be seen;
> Yet seen too oft, familiar with her face,
> We first endure, then pity, then embrace."

It is certain that a repetition of any precept, whether in abstract or concrete form, during twelve or thirteen years of a school course, must produce weariness and eventually disgust in the pupil's mind, and that the natural perversity of the human heart will, in not a few cases, assist to produce a revulsion in sentiment and practice. I am ready to affirm that in this community the evils which this legislation aims to check are constantly on the increase in spite of the most thorough temperance instruction in the schools, and that the best results in this line have been reached by a few teachers, who, in a kindly, yet conservative way, have gained the confidence of their pupils, and by the voluntary organization of children in "bands" or "societies," have kept them interested in the various features of moral and social reform. There can be no objection to the requirement by which scientific temperance instruction is made a part of the public-school course within certain limits, but when it becomes like the image set up in the plain of Dura, claiming universal homage, it is well to ask "*cui bono?*"

SOUTH DAKOTA.

Not received the attention which it should.—State Superintendant G. L. Pinkham (1890): The impetus given this matter by national legislation, while we were yet under territorial government, has been preserved by the passage, at the first

session of the State legislature, of a bill, with stringent provisions, for teaching in our schools the facts concerning the nature and effects of alcoholic drinks and narcotics upon the human system. I am not able to state how universally in our schools the provisions of this law are complied with, but I aprehend that the matter has not received in all places the thorough attention from school officers and teachers which it should. Its provisions are not too strict when we consider the importance of the subject.

After June 1, 1891, teachers are required by this law to be examined with special reference to their knowledge of the nature and effects of alcoholic drinks and narcotics. As the questions heretofore prepared by the state department have quite thoroughly covered this ground, the teachers and schools are presumably in full harmony with the spirit of this law, and the only change will be that of the text-books that do not comply with the provisions of the statute.

Statistics 1890.—Number of pupils, 66,250; number studying physiology and hygiene, 26,732.

VERMONT.

Let the children be taught to form good habits.—State Superintendent Justus Dartt (1886): The startling fact that so large a number of school boys are forming the habit of using tobacco by smoking cigarettes, thus retarding physical development, disordering the nervous system, and weakening their mental power, is a sufficient incentive to all the effort that has been or can be put forth to forearm the children against this evil. Above all things else, let the children be taught to form good habits.

V.—AN INQUIRY INTO THE RESULTS OF TEMPERANCE TEACHING IN MASSACHUSETTS.

REPORT OF GEORGE H. MARTIN, AGENT OF THE STATE BOARD OF EDUCATION.

[The following report of Mr. Martin was taken from the Massachusetts School Report of 1890-91, pp. 312-326.]

Under the law of 1885,[1] which requires physiology and hygiene, with special reference to the effects of stimulants and narcotics, to be taught as a regular branch to all pupils in all schools, there is great diversity of practice. I have made it a subject of special inquiry, and have gathered a large amount of material in the form of written papers. These papers have been furnished by the most advanced classes in the grammar schools. The pupils have been asked to write for me what they could recall concerning the effects of alcohol and tobacco on the human body. They were not required to put their names to the papers, so that they wrote without constraint, usually taking all the time they wanted. To judge of the work most intelligently, one should read all the papers; but in this report I can use only enough to illustrate the classes of work, or special features of the instruction. Read with the allowance which all written papers need, they are useful. They are printed as written.

The cities and towns within my inspection may be roughly grouped in four classes: (1) those in which oral instruction is given during three or four years of school, with the use of text-books during the remainder of the course, from four to six years; (2) those using text-books only in the last one or two years, confining all earlier work to oral instruction; (3) those using no text-books, but having regular oral instruction throughout; (4) those having only oral instruction, of an occasional, desultory sort. The first three classes might each be subdivided into those having regular oral and written examinations, and those having none. For the use of the teachers in giving oral instruction one or more books are usually furnished, from which the teachers gather material for talks, or from which they read.

Of the work of the schools in the fourth class, it is perhaps enough to say that it does not meet the requirements of the law. Physiology is to be taught as

[1] The Massachusetts act of 1885 provides that "physiology and hygiene, which, in both divisions of the subject, shall include special instruction as to the effects of alcoholic drinks, stimulants, and narcotics on the human system, shall be taught as a regular branch of study to all pupils in all schools supported wholly or in part by public money, except special schools maintained solely for instruction in particular branches, such as drawing, mechanics, art, and like studies. All acts or parts of acts relating to the qualifications of teachers in the public schools shall apply to the branch of study prescribed in this act, and all penalties now fixed for neglect to provide instruction in the branches of study now prescribed by law shall apply to this branch of study."

a "regular branch." This can mean nothing less than it shall have a permanent place in the programme of school exercises. How frequently the periods given to it shall recur, the law does not attempt to prescribe; but that they should recur at stated intervals, and frequent enough for teachers and pupils to consider them essential parts of the school exercises, there can be no doubt.

The word occasional is so elastic that the results attained in schools of this class may vary widely. In some schools few facts have secured a lodgment in the pupils' memory, though there is a decided impression of the harmful character of alcohol; for example

EFFECTS OF ALCOHOL AND TOBACCO.

The effects of alcohol is bad because it injures your health and body and in a little while it will kill you. When you are cold and take alcohol in liquor it will warm you up for a while and in case of sickness the doctors will give it to you in liquor.

THE EFFECTS OF ALCOHOL.

I have heard that the effects of alcohol on the human body is a ruination to the person who uses it It burns the person in side and doen't him any good but does him harm. They say it is good for medicine but I do not know. I think we could get along with out it. If it is good they abuse it by puting it into intoxicating drinks which is very injuriou to the human body.

TOBACCO.

If the persons smoke it will make cancers come on their lips and will make the cancer in the stomach. Tobacco often leads to drinking. Tobacco is sometimes made in filthy places and is not good for persons to use.

In other schools of this class the best pupils are are able to write as intelligently as when more formal work is done:

Alcohol is a stimulant when taken in small quantities, in larger quantities it is a narcotic. Its immediate effect is exhilerating but after working through the system it stupefies the brain and makes the body unfit for use. It destroys many of the small glands of the stomach and alimentary canal and makes those that are left hard and ropy. It makes ulcers on the small intestines. It destroys pepsin which is the fluid that digests the food taken into the stomach, It makes the blood flow much faster than is necessary and consequently wears out the heart much quicker than it naturally would, It makes a man a beast, It in time takes the place of food, and makes the stomach a good pouch for holding alcohol, but useless to digest food. The poison in tobacco is called nicotine, a drop of this fluid will instantly kill a dog. The general effect of tobacco is the same as that of alcohol although it is not so violent, it produces ulcers in the throat.

THE EFFECTS OF ALCOHOL AND TOBACCO ON THE HUMAN BODY.

When a boy begins to smoke young his growth is stunted, his complexion is sallow, his teeth become yellow, and his breath bad. It also works on the brain. It does not effect one right off but by degrees The man who drinks a little at a time does not think he is doing any harm to his body, but he is, His stomach is burning by degrees and finally when he becomes a drunkard he has no stomach at all, (so to speak). It works on his nerves and his muscles, and he finally looses all his power.

The weaker ones have little to say, but contrive to express their feelings:

ALCOHOL AND TOBACCO.

The effect of alcohol on the human system is to produce raw sores in the intestine. In time it produces a disease of the brain known as delirium tremens. A man who drinks intoxicating liquors is slowly poisoning himself and if he keeps on he will die. Tobacco contains a deadly poison called nicotine. When the young use it, it dwarfs the body more or less.

ALCOHOL AND TOBACCO.

Alcohol makes any one nervous and irritable. If any one begins to drink, it is very hard to leave off. It irritates the stomach and heart.

In schools where the instruction is all oral, but regular, the pupils write more fluently than in schools of the fourth class. Their knowledge of the subject is apt to be more comprehensive, but it is still general. The effort to be specific is not often successful:

THE EFFECT OF ALCOHOL ON THE HUMAN SYSTEM.

Alcohol is one of the worst enemies of mankind, yet many people, falling into the habit of drinking this disastrous spirit, could not live without it. If they could see the picture of their system before and after using the alcohol they would not care to drink another drop. When it passes down the throat it burns off the skin leaving it bare and burning. It causes the heart to beat many unnecessary times and after the first dose the heart is in danger of giving out so that it needs something to keep it up and therefore the person to whom the heart belongs has to take drink after drink to keep his heart going. This unnecessary work soon wears the heart out. The liver is also effected by alcohol. Before the use of it, the liver is smooth and velvety. After long use of it, the liver is turned to a different color, and there are large pimples growing out on it. These look like nails and the liver is called "Hob nail liver."

THE EFFECT OF ALCHOHOL ON THE SYSTEM.

Alchohol poisons the human system. After a man has been drinking alchohol his brain becomes cloudy and he is unfit for work. Many people think that alchoholic drinks help men to do their work better, but after they get used to drinking alchoholic drinks, it is hard for them to work without it, and they do not do their work so well.

Statements like the following abound in the average papers: "Makes the mind dizzy;" "The skin on the organs cracks out;" "Before alcohol is put into the body, the liver is soft and flat, but after a person drinks it for two or three years, that organ becomes hard and full of holes like a sponge, and instead of being flat, it is round;" "Every drop that is taken rushes to two little cups in the brain." The more illiterate pupils here, as in the other schools, are firmly impressed that alcohol is an evil.

Alcohol, to those who drink it makes great blotches on your face, and makes it red. If you drink much of it, it will make you drunk. Its makes your liver like leather, and is called the hob-nailed liver. It affects your whole body and makes you die sooner. It affects your heart the most.

THE EFFECT OF ALCHOALL ON THE HUMAN SYSTOM.

When aman gets adrinking rum, which contains alchoall, it goes to his brain, and makes him unsenseable. Alchoall will quicken the pults, and the hart will beat faster than usual Alchoall is poision, and will poision the blood.

In some schools the moral and social side of the drink question seems to be made more prominent in the oral instruction than the physiological side. Some of the best papers, from a literary standpoint, are from these schools. Such are the following, which are scarcely better than the average of the whole class:

THE USE OF ALCOHOL.

Alcohol is a spirit of wine. It is very injurious to the system, and sometimes causes paralysis of the nerves, which also leads to blindness. The use of alcohol by grown up people, sets a bad example to the young, who surely can not help from seeing intoxicated men and sometimes women staggering along the street. It seems as if young people might resist the temptation of what they know will be an injury to them, when they see the effects; poverty, cruelty, murder, suicide and many others.

A man who comes home under the influence of alcohol, with his mind dazed, is often cruel to his family, and what might be a happy home is an *un*happy one, on account of the father's habit of drink.

In many homes wine is on the table daily, and the children see it drank before them, and some are even allowed to taste it.

I think the whole country suffers from it, and it should be put down as it has in some places. Attempts have been made in Boston, but the prohibitionists have not succeeded. Some of the business men say it will hurt business, but I should like to have it tried.

THE USE OF ALCOHOL.

Alcohol is a kind of ardent spirit. It will paralyze the nerves when taken as a drink. Alcohol is generally used to put in drinks, such as rum, ale, and lager.

When once a man begins to drink things in which alcohol is put, it is very hard for him to stop. A man who drinks, almost invariably, is robbing his family of the money which they aught to have and which he is spending for his cravings of liquor.

It is one of the great topics of the day whether or not drinks, which contain alcohol shall be sold, made or imported into this country.

Young men who begin to drink do it because they think it a smart thing They do not look forward to what will become of them when they grow up to be men. They perhaps do not think or know that nations have been ruined by this curse.

Every day this curse is getting a stronger hold on our nation. Every day it is growing larger and larger. Shall we allow this curse to ruin our nation. No! Somehow it must be stopped but how.

THE USE OF ALCOHOL.

The pure alcohol is a liquid of about the color of water. The Bible says "It biteth like a serpent and stingeth like an adder."

It is mixed with wine and sold to people as a beverage. To such people the ordinary food is not strong enough to satisfy their appetites. They sometimes eat garlic with their food.

A liquor saloon is a very poor thing to have in a community. It is generally brilliantly lighted in the evening to attract the young men. They will stay away from home for the sake of being in this gay company. They may loose their position in business if found intoxicated. It is the ruin of a man to take liquor as a beverage.

Drunkenness leads to many evils. When intoxicated murder may be committed, rash acts, stealing, and sometimes suicide.

A large part of the money spent in the Union is for liquor, wines, and tobacco. Good could be done in every way with the money spent for these purposes.

In the effort to have the pupils receive their information in more definite form and retain it, some teachers arrange the leading physiological facts in form and order and require the pupils to memorize the statements. In classes where this practice obtains, the papers are essentially alike:

Alchohol is a drug of very great power It weakens the nervous system and often leads to paralysis. It causes a disease of the liver, stomach and kidneys, and often leads to dyspepsia, which is caused by indigestion. It lessens the mental powers, so, that a child using would not be able to learn or think as quick as he otherwise would. It often dwarfs the body.

It weakens the whole nervous system and often causes paralysis, epilepsy or insanity. When used in small quantities it is a stimulant, when used in large quantities it is a narcotic.

The higher faculties are first paralyzed leaving the victim under his lower and meaner nature.

Alchohol weakens the muscles of the heart causing it to beat more rapidly, distending the blood-vessels, and overcharging them with blood.

Alcohol, irritates, weakens, and inflames the stomach, liver, and kidneys and often causes fatal diseases in these organs.

Alcohol weakens the muscle of the heart causing the blood to flow too rapidly and thus distending the blood-vessels. By use of alcohol the brain is first excited, then paralyzed. The higher faculties are first paralyzed leaving the victim under control of his lower and meaner nature. It weakens and exhausts the nervous system and sometimes causes paralysis, epilepsy and insanity.

EFFECTS OF TOBACCO ON THE SYSTEM.

Tobacco is very injurious to the young and no child which uses it is ever a good scholar. It dwarfs the body and lessens the mental power when first used by the young it makes them feel sick, stupid and drowsy, and gives them a yellowish or sallow look. It hurts the action of the heart, persons using it are hardly ever if ever healthy. Tobacco is a drug of very great power, a drop oil extracted from it placed on a dogs tongue will kill him nearly as quick as sprucid asic.

EVIL EFFECTS OF TOBACCO.

Tobacco is a drug of very great power a drop of oil exacted from it placed on a dog's tongue would kill him nearly as prusic asid.

Tobacco when used by young is always injurious. It oftens duarfs the body and always lessens the mental powers. No child usuing it is ever as good a scholar as he otherwise would be.

Tobacco also causes diseases of mouth and throat.

Passing to consider the schools where text-books are used for a longer or shorter time, the character of the papers presented seems to depend more on the general character of the school and the ability of the pupil than on the number of years spent in the study of alcohol.

If we select a number of schools in which the subject is studied from text-books one, two, three, or more years, we shall find the best papers presented will cover essentially the same facts in all the schools. On the other hand, the average papers, after one year's use of the book, may be better than other schools will furnish after five or six years' study. For example:

A.—Text-book one year; two lessons a week.

EFFECTS OF ALCOHOL.

Alcohol at first acts as a stimulant, but when the stimulant has spent its force it leaves the body in a very weak condition It paralyzes the nerve centres, and causes a fatty deposit around the heart and enlargement of the liver. When alcohol is first taken into the system it quickens the action of the heart and afterwards leaves it very weak so that it cannot perform its work properly Continued use of alcohol produces delirium tremens which sometimes ends in death. The appetite for alcohol may be inherited In persons who use it the nerves are so weak that they cannot resist the temptation to drink.

B.—Text-book one year; four lessons a week.

EFFECT OF ALCOHOL ON THE HUMAN SYSTEM.

When a person first tastes any alcoholic liquor, as a rule, they do not like it; but they often try it again just to see if they don't like it. Gradually they learn to like it. Some persons drink to such excess that their whole system is saturated with liquor and it would kill them to go without.

Alcohol weakens the muscles and makes them flabby. When alcohol is first taken into the system it exhilarates the person and makes them lively; but it soon produces a stupor. Alcohol weakens the heart, so that it is not able to perform its work thoroughly. It eats out the coats of the stomach, and of course the stomach is not able to perform its work of digesting the food thoroughly, thus causing indigestion. Nothing will quench the thirst of a man who drinks alcohol but alcohol.

C.—Text-book two years; two or three lessons a week, with written examinations.

EFFECT OF ALCOHOL ON THE HUMAN SYSTEM.

Alcohol drys the blood, weakens the mind, deadens the nerves, causes sickness, sores, cancers and in every way weakens and poisons the body. It has a great craving for water and therefore it takes the most necessary thing from our body. It weakens the blood-vessels so much that the blood, which flows with much force when alcohol has been taken into it, burst them, this causing death. The blood often stagnates in the blood-vessels near the skin, causing it to have a red appearance.

It weakens the mind, causing the victim to stagger. It also puts one in such a way as to murder, steal and to even worse things. The man does know he is doing anything because the alcohol has weakened his mind so much that he does not think.

The liver, stomach, lungs, and intestines are weakened and poisoned more or less.

The teeth have a soiled appearance, and the gums are spungy. The breath also has a disagreeable odor.

The habit of drinking alcoholic drinks often leads to insanity.

D.—Text-book five years; two lessons a week during last two years.

PHYSIOLOGY.

Alcohol in any form, is very injurious to the body. Young children should never use it, because it checks their groath. It weakens the brain, and makes them seem very stupid at times.

People who begin to use it, and think it will do them no harm, find out in after years that it has power over them, and they cannot control their appetite. It also makes them have an uncontrolable temper.

Alcohol hurts the stomach very much. Without realy giving strength, they give a feeling of strength and confidence. Their sensibilities become lively Alcohol often causes paralysis and insanity, and often enlarges the small blood-vessels. People who use alcohol have very impure blood.

E.—Text-book three years; two lessons a week; written examinations.

EFFECTS OF ALCOHOL ON THE SYSTEM.

Alcohol is the fermentation of fruits and grains. The different liquors made from it are cider, beer, wine, whisky, brandy, and gin. Alcohol is a clear colorless fluid and is lighter than water. Alcohol could not be a food for the body because it does not nourish the body. The alcohol makes the person dry and want to drink a good deal after using it. It also takes water from other parts of the body where it is needed. It turns the blood to water, and it does not satisfy the hunger because hunger needs solid food to satisfy that, and it does not help to digest the food. It does not keep the body warm as some persons think it does It flushes the face, deadens the body and makes the face red and bloated. Alcohol poisons the stomach and bowels. When the person first commences to use this for a drink it makes him sick to his stomach, and the food does not agree with them. And after awhile the stomach gets diseased and flamed and the person dies. Alcohol might be looked upon as a medicine and never should be used for any other use. It is a real poison and if persons regarded it so the better their health would be. It is a cause of thousands of peoples death and nervous diseases. And children inherit bad habits, and are likely to be weak minded.

F.—Text-book three years; weekly lessons.

THE EFFECT OF ALCOHOL ON THE HUMAN SYSTEM.

When alcohol is first taken, it goes first to the stomach, where it does its first harm. It begins to absorb the gastric juice, so that there will not be enough to mix the food. Then it is carried into the blood, which it poisens. Then it does a great harm in the brain. It destroys the nerves centered there, and so the person that takes the poisen, does not feel the cold or heat as he ought. The alcohol in the blood, makes the flesh look bloated and discolored. Sometimes persons grow crazy from the effect of strong drink. So, we see what a great harm it does.

G.—Text-book five years; semiannual written examinations.

THE EFFECTS OF ALCOHOL ON THE HUMAN BODY.

Alcohol is a stimulant and narotic. It causes disease of stomach and congests the blood-vessels. It impairs the appetite for food It delays and impairs digestion. It thins or coagulates the blood It collects in the brain and causes death. It affects men of all temperments It causes delirium-tremens if taken into the system frequently

Alcohol makes you lose your self-control. It draws water from the nerves and injures them It quickens the beating of the heart and wears it out. It hastens circulation. It leads to crime of all sorts. It injures the thought-producing power. It causes paralysis. It causes insanity.

H.—Text-book five or six years; two or three lessons a we

EFFECTS OF ALCOHOL UPON THE BODY.

Alcohol is a poison, which has great effect upon the body. It injures the brain so it cannot think properly, it burns the stomach, so that it cannot digest the food, it makes the heart beat faster, and if it is drank continually it will finally kill a person, it also poisons the blood.

I.—Text-book six years; weekly lessons; class marking; term examinations.

EFFECT OF ALCOHOL ON THE HUMAN SYSTEM.

Alcohol is very injurious to the human system. It effects every part of it. It stops the growth of the bones. It makes unhealthy fat on the muscles so that they cannot work with much force and are not so elastic. It enters the stomach and does great harm there. It separates the pepsin from the gastric juice and makes sores all over the stomach. It gets into the blood and makes it impure, and also injures the blood vessels. In the lungs it injures the thin membrane or lining to the them and makes the breath smell bad. The heart is a muscle so that it injures that in much the same way as other muscles and also makes it work harder.

The nerves and brain are also injured: Alcohol deadens the nerves and often people will do things when intoxicated that they would think very wrong when sober. Alcohol also causes consumption instead of curing it as some people think. If children have drinking parent they often weak and sometimes idiots. Alcohol is used by some people because they think that it will warm them but it does not only for a little while then they are colder than before. It has been found that people can work better without alcohol than with it.

THE EFFECT OF ALCOHOL.

(*a*) The effect of alcohol is that of a narcotic; it destroys character, destroys the vital functions of the body & has the effect of a slow poison.

(*b*) The action of the heart is increased & "fatty heart" is often the result.

(*c*) The lungs are affected by having more work & the influence of bad surroundings.

(*d*) The bones are affected by having their growth stunted by poor blood & the injuring of the pieroistum.

(*e*) The blood as the life fluid is affected by a loss of red corpuscles, the minute bodies which carry oxygen, & from this loss comes a disease known as Aneamia; Of course there is a large increase of fat which is entirely useless.

(*f*) The effect upon the brain in slight does; as a glass or two at a fashionable ball, is to increase or stimulate the action of the cerebrum. In larger doses the nerves are deadened or the person is hateful & finally sleeps it off. In a regular spree Delirum Tremins is often the result.

(*g*) All the senses are deadened.

(*h*) The pepsin in the gastric juice is separated from it, & sinks to the bottom of the *stomach*, stopping digestion till more can be thrown in & digestion completed. The lining is also irrated to the extent of cancers & sores.

(*i*) The liver becomes of an immense size, swollen, or "hob-nailed." Also a bad secretion of bile.

(*j*) An extra growth of the connective tissue is caused in the muscles.

The last two papers are from a school where the instruction has been most thorough and systematic, and continued through the longest period; probably in no town in the State has more time been given to the subject.

These are specimens of the best papers; from them the others shade down to almost zero; for example, in schools where a text-book has been studied for five years many of the pupils can write but two or three lines:

ALCOHOL AND TOBACCO ON THE SYSTEM.

Alcohol has a bad effect on the system. It makes the head feel thick and heavy and also stupefies.

ALCOHOL.

Alcohol is a stimulant and narcotic, it interfers with digestion, causes congestion of the blood vessels, and if you once take it you will want it all the time. Food is delayed by Alcohol.

EFFECTS OF ALCOHOL.

Alcohol weakens the muscles. Alcohol affects the nerves. Alcohol affects the brain.

TOBACCO.

Tobacco injures the spinal cord. Tobacco injures the brain. Tobacco injures the blood.

In many of the country schools the amount of information retained and ready for use is very small. The poorer scholars, whose deficiency is marked by faulty English, are often stronger in their expressions than the more cultivated pupils:

ALCORHALL.

All liquor contanes alcharhall. It poisions the syliava and the gastrit juice when it mixes withe the food it stops the works and the food layes in the stomacke, which causes it to ache. When the juice mixes with the blood it poisons it. Next the man is sick with blood poison and dies and the people wonder what made him have that.

THE EFFECTS OF ALCOHOL.

Alcohol is another very injurious thing to the body. It is very injurious to the heart especially and there are a great many men that die from the use of alcohol sooner than those that don't. Some men go crazy from the use of alcohol or they are called delireum tremans, and a great many men the have used alcohol have become ministers and their advice to boys or anybody not to use alcoholic drink's.

Alcohol is very bad for the stomach and is good for the head ack and it is a strong smell and It will stop any one from fainting.

THE EFFECT OF ALCOHOL.

It will gradually eat away the flesh. If any one drinks it, it will pickel the inside of the body.

THE EFFECT OF TOBACCO ON THE HUMAN SISTEM.

The effect of tobacco on the sistem it deadens the brain and the user it is said to have a sore heart which in the gets clogded and they die quicker than if they did not use it. it softens the brain.

In schools where the text-book is begun early, I have sometimes called for papers from the sixth grade, a class which has used books for two or three years. Here the amount of information retained is usually scanty, and in crude form. The following are the best papers from school I, sixth grade:

EFFECTS OF ALCOHOL.

Alcohol weakens the body and makes the heart beat too fast, it also makes the blood-vessels enlarge and weakens the walls of the blood-vessels.

Alcohol makes a man have a red face because when the blood-vessels enlarge they show out.

When alcohol is taken into the system it makes poor circulation. The brain wants good blood but when alcohol is taken it does not receive it. When alcohol is taken the brain cannot send the messages so well. Livinstone found that in Africa that the men could do better without it and could endure more heat. And in the Artic Regions the explorers can do better without it because when they take alcohol they do not know so much and can do great deal better with

out. A man said once that he would not have any alcohol used in his factory because they did not work so well, and if any did use it he would discharge them.

Alcohol also makes the muscles weak and fat so that they cannot work so well.

If a person once takes some alcohol he will keep wanting more because his appetite for it is so strong.

ALCOHOL ON THE BODY.

When a man drinks the first glass he cannot stop but wants more It burns his stomach and fills the blood vessels so full with the watery substance that they cannot bear the strain so sometimes an artery breaks and death occurs instantly.

About one-fifth of all the water that is in the body is in the head around the soft fibers of the brain and the alcohol mixes with it and takes it away from where it is needed. It deadens his nerves so that the messages do not obey and he does not know what he is doing. Many people are in prison for murder or some other wicked thing because they are under the influence of licquer.

A story is told of a great murderer who was about to kill a baby when the little creature looked up in his face and smiled so he did not like to kill it, so he took a glass of brandy and he did not care.

Insurance men will not insure the lives of licquer sellers because they are most always beer drinkers.

Some times when a person is dying the doctor gives him alcohol to make his heart beat faster till he can give him some other medicine and thus sometimes save his life.

From school H, sixth grade, the following are the best:

The effects that alcohol has on the body is that it poison the blood, and hardens the albuem of the brain, just as it hardens the egg as if it was boiled, and it does harden the brain, so that we can not think as we could if we did not drink the alcohol, and it hurts the heart because it makes the heart beat to fast because heart wants to drive it out quick, and this wears the heart out, and so we know alcohol does harm to the body.

Alcohol poisons the blood and hurts the brain so it is not able to think well, It poisons the heart and lungs it makes people stuid and they don't don't walk straight. And it makes them have diseases

Sometimes it makes the heart stop beating and then they die. Alcohol makes them so stuid that they do not know what they are doing part of the time.

Alcohol makes bad blood and bad blood makes poor bones. Alcohol makes them unhealthy and so shortens their lifes. When people first begin to drink alcohol it seems bitter, but they keep on and so get used to it.

I have culled the following statements of the effects of alcohol on the stomach and brain from a large number of papers. Most of them are from the better class of papers, as the poorer scholars make few specific statements: "It separates the pepsin from the gastric juice, and makes sores all over the stomach;" "Destroys the fine membrane that lines it;" "Inflames the lining of the stomach;" Inflames the sides, and changes the pinkish lining to a bright red;" "By taking the gastric juice from the stomach, so the stomach has no juice to aid in digesting the food;" "Inflames the membrane, and causes sores to come inside;" "It uses up all the tissues lining around the stomach, and it uses all the saliva in the body so that we cannot digest the food;" "Will make the lining of the stomach fat;" "The pepsin in the gastric juice is separated from it, and sinks to the bottom of the stomach;" "Takes the gastric juice of the lining and turns the lining into fat;" "Irritates the lining, and takes the water from the gastric juice;" "The alcohol in the system lies at the bottom of it until the glands can pour in enough gastric juice to dissolve the alcohol;" "Burns the stomach so as to raise little blisters on the inside of it;" "Eats the lining;" "Burns off the coating;" "Makes cancers come in the system;" "Makes the lining of the stomach tough;" "His stomach becomes black, and covered with cancers. The moderate drinker's stomach is not quite so black;" "Hardens the mucuous membrane, so that the digestive juice can not get through;" "Makes the gastric juice flow fast, until it becomes so weak it can not perform its part;" "Causes the stomach to be dry and hard;" "It draws the pores of the stomach

so tight that the first coating on the stomach is so hard that it can not perspire;" "The stomach becomes coated with a sort of crust, and disease sets in;" "Hinders the action, and makes it look like raw beef;" "Makes great sores in the stomach, because alcohol burns the stomach;" "Gastric juice becomes thick and ropy;" "The blood oozes out from the flesh into the stomach;" "Eats the stomach until, after a time, a man has no stomach at all, so to speak;" "It hurts the brain by injuring the nerves, and often the nerves break, and people have apoplexy;" "It causes more blood to go to the brain;" "When alcohol is taken, the brain can not send the messages so well;" "About one-fifth of all the water in the body is in the head around the soft fibers of the brain, and the alcohol mixes with it and takes it away from where it is needed;" "About one-fifth of the blood is in the brain, and around the soft gray matter, and among the white fibers are tiny blood vessels, and the blood vessels are injured from the drinking of alcohol, and then the blood sometimes becomes stagnant, and headaches often follow after a glass of liquor."

I have endeavored to show as clearly as possible in a limited space the present condition of the physiological work of the schools. To show the work completely would necessitate printing all the papers. After a careful study of these papers, I am lead to the following conclusions. 1. The phrase, "scientific temperance instruction," sometimes applied to this work, is a misnomer. There is, and in the nature of things can be, no such instruction. The two essential elements of scientific study—observation and inference—are necessarily wanting; neither the pupil nor the teacher can have first-hand information; 2. That the outcome in accurate knowledge, resulting from much of the work done, is meager and out of proportion to the time spent upon it; 3. That many false impressions are left in the minds of the students; 4. That physiological details are not suited to young children; 5. That, however defective the instruction may be, the sentiment of the schools is sound—the conviction that alcohol and tobacco are bad things to use seems universal; 6. That the strength of this sentiment does not depend upon the amount of information acquired; 7. That, where exaggerated notions of the effects of stimulants have been acquired, there is danger of a reaction of sentiment in the light of after knowledge. From these conclusions I venture the following suggestions: 1. That committees and superintendents give more careful attention to work in this department, prescribing definitely its limits, and requiring the prescribed work to be done as well as work in other subjects, using the same means for judging of its progress and results; 2. That teachers who are called upon to give oral instruction prepare themselves with great care for the exercise, and see that their statements are true, and by frequent tests, oral and written, ascertain that their teaching is intelligently comprehended by all the pupils; 3. That, when no text-book is used in any grade, the teachers prepare for the highest classes a summary of the effects of stimulants and narcotics upon the different systems of the body, aiming at clearness of statement, and avoiding exaggeration; 4. That the use of text-books be limited to the older pupils; 5. That so much of explanation accompany the use of the book as may be necessary to guard against error and insure exact knowledge; 6. That, as far as possible, technicalities be avoided; 7. That the pupils have frequent opportunities to express their knowledge orally and in writing; 8. That throughout the course the moral and social effects of the use of intoxicants be made prominent, and abstinence be inculcated from higher ends than such as concern only the body.

Respectfully submitted.

GEO. H. MARTIN.

VI.—OBJECTIONS TO SCIENTIFIC TEMPERANCE INSTRUCTION STATED.

SCIENCE IN HARNESS.

[*From the Popular Science Monthly, November, 1887.*]

No journal has upheld more steadily than the Popular Science Monthly the principle that, as far as they are established, the truths of science shall be applied to useful purposes and through popular education be made as widely available as possible for the general guidance of life. And yet we can not look with favor upon what many persons doubtless regard as a very signal and happy example of the utilization of scientific conclusions. We mean the authoritative

and dogmatic teaching as to the effects of alcohol now provided for by the school laws of many States. It is only right, therefore, that we should assign our reasons for holding that this is not a case of the legitimate application of scientific truths to practical life.

In the first place, it is an abuse of power on the part of the majority. In the "temperance" controversy as a distinct social issue we have no wish to interfere; but we can not ignore the fact that there is such a controversy, nor can we consent to believe, with the advocates of prohibitory legislation, that their opponents are necessarily persons devoid of all high motives and hardly to be distinguished from the criminal population. But if a minority in the State is to be respected so long as it is law-abiding, its opinions are also to be respected; and to seize hold of the school machinery of the State to inculcate opinions that are not accepted by the minority, and that tend to set the minority in a very unfavorable light, is not right nor just. If every triumphant party were to seize the public schools for the inculcation of doctrines favorable to its own party interests, there would soon be an end of our public-school system. It would always be easy to invoke the name of science. If it were desired to rear a race of protectionists, it would only be necessary to claim that you were teaching the truths of political economy. The proper text-books would be prepared, and teachers, on pain of dismissal, would have to enunciate the doctrines of Henry C. Carey and Horace Greeley; and so in the days of slavery, the science of ethnology might have been invoked either on the side of abolition or in defense of the slave system, according to the leaning of the majority. At this moment we have the president of a New England college recommending the majority in the several States to use their power to enforce the teaching of certain specific views of New Testament history which he is pleased to declare all competent critics have accepted.

"But," say the advocates of the teaching to which we refer, "we only wish to inculcate the real results of scientific research in regard to alcohol." To which we rejoin that, in a community like this, it is too soon to inculcate the truth, supposing you have it, if the issue is still practically open, and if large numbers of your fellow-citizens are not persuaded that what you call the truth is the truth. Minorities have their rights even when they are in the wrong, and to use a school system which the minority support to teach opinions which the latter do not believe to be true is unfair.

But there is another view of the matter. Are the advocates of such instruction prepared to have it communicated in a thoroughly nonpartisan spirit? Are they prepared to have the whole truth taught, or do they want only that part of the truth which is favorable to the specific end they have in view? Are they prepared, for example, to give any fair representation to the views of those who consider that alcohol has its important uses, dietetic and social? A few years ago the Contemporary Review opened its columns to a discussion of the alcohol question; and we are safe in saying that there was a preponderance of opinion among the many eminent men who joined in the discussion in favor of a moderate use of alcoholic beverages. In the August number of the North American Review, a well-known physician of this city enters a plea against the indiscriminate condemnation of narcotics and stimulants. Is all this opinion to go unrepresented when the alcohol question is introduced into the schools? Of course it must, or the specific object of the teaching would be ruined. We say, therefore, that this is not teaching science; it is harnessing science to the "temperance" cart, and driving her under instruction from "temperance" headquarters.

THE RESULT OF SCIENTIFIC TEMPERANCE INSTRUCTION.

[From Science, July 29, 1887.]

Will the reader please cast his eye upon the following questions: 1. How can it be proved that nicotine is a poison? 2. Why are cigarettes especially harmful? 3. Is alcohol a food? 4. What is the effect of disuse upon a muscle? 5. Under what names is opium sold? 6. Under what name is alcohol drunk? 7. What is the difference between a food and a poison? 8. Is anything gained by changing from one narcotic to another? 9. What is the effect of beer as a drink? 10. How does cheerfulness help the muscles? These are the questions given as a test in physiology in the public schools of a prominent Eastern city. They are not addressed to young men about to leave school. No; they are asked of little boys and girls of from 8 to 10 years of age. This is the examination paper at the end of the first year's elementary instruction in physiology. Of ten questions, eight relate to drinking and smoking; the physiology is a mere side issue. These children, who ought to have about as much knowledge of such matters as they should of the methods in vogue at the stock exchange, are

actually forced to learn by rote the details of human vice; and that, too, under the name of "physiology," the only science which they learn. Unconsciousness, naïveté, is the symbol of childhood. The fact that physiology, even if well taught, tends to destroy this trait is the chief objection to its early study. Instruction such as the above implies crushes the most valuable trait in the child, directs curiosity to what is morbid, and forces into precocious development all its dangerous elements. Not enough that the newspaper and the dime novel proclaim in glaring colors the story of crime and sin; some notion of the perversity of human nature must be mixed with the food of babes. That the result of this teaching is to excite in the children a morbid curiosity to experiment for themselves in such matters; or (with the boys) to regard the whole thing as a lesson in "goody-goodiness," to which they forthwith decide to show themselves superior; or to regard their father who takes his glass of wine at dinner as an incipient criminal—this could easily have been foreseen and goes without saying. If there is one method better than all others to produce a race of drunkards, this has good claims to that distinction. If there is a degree of wrong in such superlatively perverse methods, then it is still worse that the fair name of science should be outraged in this cause. Not only that this kind of teaching necessarily depends upon catechism methods (that the answer to the second question, for example, is to read that the especial perniciousness of cigarettes is due to the fact that they are usually made of decayed cigar stumps), but that the entire idea of science thus implanted is as wrong as it well can be. Better far revert to the old days when there was no science on the curriculum than have science thus taught. The crowning educational virtue of science is that it leads to the use of scientific methods of teaching; this usurper chokes up all possibility of an interest in the scientific. The temperance question is doubtless one of the most important with which our age has to deal; sufficiently important, perhaps, to make some consideration of it in the public schools a legitimate proceeding, but it must be done at the right time and in the proper way. Nothing can excuse the conversion of a text-book on physiology into a "temperance" tract; nothing can excuse the sacrilege of presenting this story of disgusting vice under the name of "science."

TEMPERANCE INSTRUCTION IN SCHOOLS.

[*From the Medical Record, September 24, 1887.*]

Probably no class of men in the community are better fitted to give a calm, unprejudiced opinion on the alcohol question than physicians. In their capacity of public sanitary guardians, they feel an interest in all practical measures designed to limit the deleterious effects of the use of liquors upon the human systems. The latest effort in this direction is the introduction into the public schools of several States of so-called "temperance" text-books and other paraphernalia of teaching. Some communities have already experienced the first fruits of this new system of instruction. These results are somewhat curious. It is found that the incidental facts designed only to lead up to the one great moral are more prominent in the pupils' minds than the moral itself. The various charts which portray stomachs, livers, and other viscera diseased from alcohol are regarded much in the light of picture-books on a large scale. They produce no more impression on a child's mind than the sight of a tattooed man, or some "freak" of a dime museum.

It is right that the question of temperance should be brought down to the scope of a child's ideas; right from a medical standpoint as well as from a moral one. But it is hardly the judicious course to teach him to regard alcohol as a deadly poison under every circumstance. He will be disillusioned as he grows older, and will look back to his text-book teaching as a mass of overstated facts. The trouble with many of the text-books on temperance used in schools is that they are not physiologically correct. They are written by persons with more zeal than accurate knowledge, and consequently we have sometimes ludicrous statements from pupils. The description of the distillation of alcohol strikes the child as a very interesting thing, and so the fact designed to be taught—its pernicious effects—fails to make a lasting impression.

We think that a better state of things could be brought about if physicians could be led to take a more active management in the public schools. Ministers, lawyers, business men, and professional politicians are always represented upon school boards, but rarely physicians. They are the very ones who should be fully represented. They can, by their advice, better than any other class, conduce to bring up a class of pupils who shall have sound minds in sound bodies. They can prevent the introduction of text-books on temperance or any other topic having a reference to physical matters which are not written with a due

regard for truth and for the receptivity of the minds which are to grasp it. It is coming more and more to be realized that a physician's duty to the community oversteps the sphere of mere sanitary matters and lays hold upon social factors as well. Much of the teaching in schools nowadays is one-sided, because the mind is regarded as something apart from the body and taught accordingly. No one so well appreciates the relation of one to the other as the physician.

HOW WE TEACH INTEMPERANCE.

[*From the Popular Educator, December, 1891.*]

At the Norfolk County teachers' convention, recently held in Boston, a paper was read on the teaching of physiological temperance (or intemperance) in the public schools; and, a little more than a week after, the same subject was presented for our consideration at a teachers' meeting in Hyde Park.

At the former meeting it was very noticeable in the discussion that followed the reading of the paper that those who objected to this scientific teaching, taking the moral side instead, met with greater favor from the audience as a body, judging from the heartiness of the applause, than the paper itself. Possibly, if those gentlemen who advocated the strengthening of the moral nature as the best preventive of intemperance had explained their position more fully, this article would not have been written.

There is, as I believe, a radical error at the basis of this scientific teaching of intemperance, or its causes, to little children. Let me illustrate.

On our way home from the convention we were discussing this subject, and one of our party related the following incident which had come under her notice:

A teacher, who was an enthusiast on this subject, had taken the fruit into the schoolroom and taught the children the process by which the pure juices of the grape and apple were changed into alcohol, and its effect upon the body.

A short time after, one of the boys who had been instructed by her remarked to some one that he had learned the taste of all the liquors in his father's store (he was a saloon keeper), and could readily distinguish one from the other.

How much fear of the effects of alcohol upon his body do you suppose had been created in this boy's mind by this teaching? Instead of this, it would seem there had been aroused in him a curiosity to know more of the things about which he had been taught.

How many of these boys, think you, went home, took their grapes and apples, and made their own wine and cider?

All might not do this, of course, but, judging human nature as it appears, and especially child nature, there seems to be a strong desire to do that which is forbidden.

I know the thought has been, and still prevails, that to avoid evil we must know something about it.

What is our practice in educational matters?

Formerly teachers used to put mistakes upon the blackboard to correct, but now the best teachers claim that children should see only the perfect form of word or letter.

We teach children to be pure in thought, word, and deed, but would never think of specifying the evils to be avoided.

No wise parent or teacher would ever say to a child, "You must not read that book. It contains that which will poison your mind and give you wrong views of life."

Nevertheless, I did hear of a teacher not long ago who advised her girls not to read a certain book which she named, and immediately they sought and obtained the book, of which they had not known before, and read it, although warned against it.

No doubt all who read this can recall many instances of like character.

> Vice is a monster of such frightful mien,
> That to be hated, needs but to be seen;
> But seen too oft, familiar with her face,
> We first endure, then pity, then embrace.

As the world is to-day, the children can not but see that which we call evil all about them; but if they have been taught to love the good, the evil will be hated, or perhaps not recognized by them; while, if we continually keep it before their minds, even though we teach them to avoid it, we make it a familiar object of thought which can not but produce bad results.

"As a man thinketh in his heart, so is he."

"Whatsoever things are true, whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely, what-

soever things are of good report; if there be any virtue, and if there be any praise, think on these things."

We all know what great imitators children are, and that with them example goes further than precept. How, then, can we teach them the bad effects of alcohol and tobacco so they will feel it and never touch them when fathers and brothers and men who hold high places in the community and are respected by everyone are slaves to one or both of these habits? We must find some other means of teaching them the truth so they also shall not be led into this captivity to the senses, than that recommended at the convention.

Teach temperance, not intemperance; health, not disease; truth, not error; purity, not impurity; goodness, not badness; teach the positive, not the negative.

A TEACHER.

"EFFECTS OF ALCOHOL."

[*From the Journal of Education (Boston), December 31, 1891.*]

May I again call attention of the importance of strictly adhering to truth in teaching concerning the effects of all drugs upon the body. On page 359 of the Journal we are told, "Whatever effect is produced upon the albumen of the egg by contact with the alcohol the same thing must happen when alcohol is mixed with food in the stomach."

This is incorrect: 1. Because blood albumen is not egg albumen. 2. Because the blood albumen is greatly diluted, while the egg albumen is concentrated. 3. Because in one case the alcohol used is concentrated, in the other greatly diluted. 4. The experiment in the test tube is performed away from the "life forces," while in the body "life forces" modify chemical forces. In a word, a laboratory experiment must not be taken to explain literally what occurs in the body. The boy, taking a drink of beer, finds he is not killed by it, and soon comes to reject all that he has been taught in reference to the effects of stimulants. Harm is done by our inaccuracy.

G. G. GROFF, M. D.,
President State Board of Health, Pennsylvania.

CHILDREN CAN BE TAUGHT TO THINK ABOUT BETTER THINGS.

An effort has recently been made to fight intemperance by teaching, in connection with the subject of physiology, the effects of alcohol and narcotics on the system. It is an open question whether the results are all that were anticipated. It seems that in many places the craze after cigarettes and old cigar stumps is worse than ever before, notwithstanding the fact that the schools are giving instruction along this line. Why is this? It is quite possible that many teachers use both time and text book in such a way as to injure the cause of temperance. To spend a portion of each recitation in talking about rum and tobacco is, to say the least, unwise on the part of the teacher. Instead of this let him class rum, tobacco, and opium with other things that should be let alone, and let him speak of them only as occasion requires. The better way will be to see that none of these things are found on or about the school grounds. Milton has not increased our hatred of Satan by making him a hero in Paradise Lost. Why should rum and tobacco be the "heroes" in so many school rooms? Children can be taught to think about better things. (J. D. Meese, Southwest State Normal School, Pennsylvania.)

VII. ANSWERS TO SOME FALSE NOTIONS.

BY MRS. MARY H. HUNT.

The following misconceptions have arisen in certain quarters concerning the teaching of physiological or scientific temperance:

First, that "temperance is a moral not a scientific question; therefore, if taught at all in the schools it should be from the moral standpoint only." "The strengthening of the moral nature is the best preventive of intemperance." "You should strengthen the will to prevent the pupil from drinking," these objectors say.

Second, "If you teach the pupil the evil character and effects of alcohol, tobacco, etc., the law of perversity in his nature will make him want to try those things for himself," etc.

Third, "As long as the fathers smoke and drink it is not only of no use to teach the children not to, but such teaching is disrespectful to parents."

In answer to the first objection that "temperance is a moral, not a scientific question," etc., let us inquire:

(1) Is it not true that a moral question is one that considers what is right or wrong in action on the part of beings capable of choice?

(2) Are there not certain facts which are the reasons for an action or course of action being right or wrong?

(3) If these facts, the reasons for the right or wrong, are duly arranged in the case of each obligation, do they not form the science of that special obligation? Webster says that "Science is knowledge duly arranged."

(4) Can a person be taught the principles of morality in any case, or to intelligently choose the right without being taught the facts which show why one course or set of acts is right and another wrong; are not these facts the science of the case?

To illustrate: Moral obligations may be classified under three general heads:

(1) Duties to our Maker.

(2) Duties to our fellowmen.

(3) Duties to ourselves.

The facts that are the reasons for our duties to our Creator are set forth in the science of theology.

Those in the case of our duties to our fellowmen are classed as the science of sociology.

The facts that prove our moral obligations to ourselves in the case of alcoholic drinks and other narcotics are very properly termed the science of temperance; and here, as in the case of other duties, no person can fully comprehend the extent or scope of that obligation without knowing the facts.

The answer to the question, "What is the nature and effects of these substances," is the facts in this case, on which the whole temperance question rests.

There is no such thing as moral question without a basis of fact that is the science of the question. These are not the days of dogmatic morality. Modern morality teaches the reasons for the right, shows why, and thus "strengthens the moral nature."

The objector says, "Strengthen the will to resist temptation." How do we strengthen the will? The will is the faculty in us that acts on choice, and our choices are more or less influenced by our knowledge or ignorance of the facts in the case. How would you strengthen the will of a boy against the temptation to row across the Niagara River a little way above the falls—by telling him he must not, it would be wrong, or by explaining to his reason the perils that inhere in that fatal current? How would I strengthen a boy's will against intemperance? I would try to give him intelligent reasons on which his will should act. Just as I would teach him the character of the Niagara Rapids I would teach him the nature of those other, the alcoholic rapids, that lead to a worse, a more hopeless plunge into utter darkness. While I would never exaggerate, I would search for the truth on this topic as for "hid treasures," and then teach it, abating not "one jot or tittle," leaving the consequences with Him who said "I am the Truth." He has so made the human mind that it is moved by truth that warns as well as promises. I would teach the boy before appetite is formed the dangerous and deceptive character of alcoholic drinks and other narcotics, especially that proven fact that a little alcohol in any liquor has the power to create an imperious, uncontrollable, and destructive appetite for more, and therefore its use in any quantity is never safe. I would show him that there is a scientific connection between the first glass and the drunkards' fate. I would not preach at the boy nor weary him with repeated homily, but I would lead him, through the study of the laws of his own being, to see and understand for himself that the inestimable blessing and happiness of a strong, healthy, useful life are the result of obedience to laws that are written in our living tissues, and that the penalty of disobedience inheres in the law itself. I would strip the wine cup, and the whole brood of strong drinks, the pipe, the cigar, and the cigarette of the glamor with which ignorance and tradition have decked them, and help the boy to see them and their consequences as labeled by modern science—narcotic poisons.

In answer to the second objection, that teaching the evil character of alcoholic drinks will make the pupil want to try them for himself, we reply: If we tell the boy the perils of the rapids in the smooth, safe-looking stream above the falls, will he immediately wish to embark thereon? Is it a rule that teaching the consequences of evil is only furnishing a motive for immediately plunging into the evil? If so, there must be something radically wrong in the most authoritative of all teaching, for all through the Bible the blessings of right doing are coupled

with vivid descriptions of the consequences of following the wrong. Gerizim and Ebal stand together. I am sure the great body of teachers in our land will agree that it will be safe for us to follow in method the great Teacher. He made the human mind, and He knows the laws of its development far better than we ever can, after all our study.

We teach the need of pure air and good ventilation by showing its importance and relation to health, and how to get it, and the consequences of its absence. If you teach the need of oxygen by showing the consequences of breathing vitiated air, are you thereby teaching imperfect ventilation? Such a claim would be absurd. And yet a recent writer refers to teaching the evil nature and effects of alcoholic drinks, etc., as "teaching intemperance." Then the vivid descriptions of intemperance in the "woes" the Bible pronounces upon drunkards is "teaching intemperance." These objectors certainly need a new and expunged version of the greatest of all manuals of instruction.

Experience must, after all, decide, and happily we are not without precedent. Wherever in the thirty-five States of our country the spirit and letter of the law requiring this study are obeyed, and well-graded text-books on this topic containing the truths the law requires taught are used, with the same wise and thorough methods of teaching as in the case of other branches, pupils thus taught have not consequently rushed headlong to the saloons. On the contrary, an intelligent aversion to strong drinks and other narcotics is manifest; fewer cigarettes are smoked, and pupils are more careful to obey other laws of hygiene.

Giving an occasional temperance exhortation in the schoolroom may take less time and study on the part of the teacher, but, compared with the results of carefully prepared lessons that guide the pupil in finding and intelligently understanding the reasons for total abstinence from alcohol, tobacco, and other narcotics, and for obedience to other laws of health, the mere exhortation or so-called moral homily falls immeasurably short.

The prophet said, "My people are destroyed for lack of knowledge," not for lack of exhortation. To a right-minded child or youth the most impressive of all moral lessons is the one that convinces his understanding and is thereby lodged in his reason. That all children and youth are not right-minded towards alcohol and tobacco is evidence of the deep wound these substances have made upon our humanity through inheritance upon children and "children's children." That some of these, heavily weighted with the sins of the fathers, will go wrong anyway, does not prove that faithful instruction is useless in all other cases.

To the third objection we would put the question: Shall we make no attempt to teach the children better because the fathers drink and smoke? Because some parents murder the Queen's English, we do not therefore think it useless or disrespectful to their parents to teach the children correct speech, and as a consequence the generations rise in the scale of better utterance.

The difficulties are appreciated of teachers who were commanded to teach this topic and given nothing to do it with but the imperfect, badly graded books first put upon the market. But a better day has dawned. Well-graded manuals of instruction, that contain these truths adapted to all classes, are published in great abundance and variety.

Truth is the lever of Archimedes that moves the world. The truth concerning the evil nature of alcoholic drinks and other narcotics is the lever destined to overthrow their use. To the teacher has come the opportunity to scatter that truth. Opportunity is God's command.

VIII.—QUESTIONS ON PHYSIOLOGY AND HYGIENE, AND THE NATURE AND EFFECTS OF ALCOHOLIC DRINKS AND OTHER NARCOTICS.

Published by the scientific temperance department of the Woman's Christian Temperance Union for use in the preparation of essays, examination papers, etc., for the World's Columbian Exposition, Chicago, 1893.

FOR PRIMARY GRADES.

In this subject, as in other branches which extend through several years of school life, a few of the simple elements of each topic are taught, where the subject is properly pursued, in the lowest grade, to be reviewed, with additions from year to year, until an advanced treatment of the whole subject is completed in the high school.

The work of the first year, therefore, properly consists of oral lessons on parts of the body, sight, hearing, taste, smell, touch, cleanliness, and very simple les-

sons on the harm that comes from the use of tobacco and the common alcoholic drinks.

Second year pupils review these topics with additional matter and add lessons on care of the bones, the hygiene of eating and drinking, breathing, etc. The special points brought out in these lessons will be written out by the children at the close of the lesson, and from these written exercises selections may be made and sent on to the exhibit with photographs of class, etc., as above.

Third year pupils, reviewing the ground already covered, learn more on each topic, and add a few simple facts about muscles, nerves, the organs of digestion, circulation, respiration, etc.; the best of their written exercises may also be selected.

In response to request, the questions given below are suggested by the department of scientific temperance instruction.

QUESTIONS ON THE SENSES FOR FOURTH YEAR PUPILS.

[NOTE.—Other topics studied during the fourth year are, food, alcoholic drinks and other narcotics, digestion, circulation, respiration, the skin, bones, muscles, and nervous system, the hygiene of each being chiefly developed. As it is manifestly impossible in the time allowed for preparing papers for this exhibit to cover all the topics studied in any one grade, a selection has been made of one or more for each grade, with questions covering salient points.]

2. How may the eyes be injured? 3. What is a good thing to do when specks get in your eye? 4. What is the outside part of the ear for? 5. Where is the hearing part? 6. How does the brain know about sounds?

1. Why can you feel better with the ends of your fingers than with the back of your hand?

1. What tells your brain that sugar is sweet when it is dissolving in your mouth?

1. How does the brain find out about odors? 2. Upon what does the right action of all our senses depend?

1. What do alcohol and tobacco do to the senses, as of sight, taste, etc.? 2. How will our comfort and pleasure be affected if we blunt or injure our senses with alcoholic drinks or tobacco?

QUESTIONS ON THE ORIGIN AND NATURE OF ALCOHOLIC DRINKS, FOR FIFTH YEAR PUPILS.

[NOTE.—According to the plan of grading this study, now in most successful operation, only a part of the topics included in the whole subject, as food, alcoholic drinks, digestion, circulation, and respiration, are taken up during the fifth year; the remainder, bones, muscles, skin, nervous system, and senses, being left for the sixth year. But the work, though more exhaustive than that in the fourth year, still leaves much that the pupil is not yet prepared to comprehend. The same plan is again pursued for the seventh and eighth years, the seventh year taking up the same topics as the fifth, *i. e.*, food, alcoholic drinks, digestion, circulation, respiration, but with a more thorough and comprehensive treatment; the eighth taking the same topics as the sixth-year grades, *i. e.*, bones, muscles, skin, nervous system, and senses, with more comprehensive treatment. The topics covered by the questions are selected in accordance with this plan.]

1. When the juice pressed from apples, grapes, or other fruits is left in a moderately warm air what change soon takes place in it? 2. What causes this change? 3. Where are the ferments before the apples are ground? 4. How do they get into the juice and what do they do there? 5. What is alcohol and how does it differ from water? 6. What is vinous fermentation? 7. What does fermentation always change? 8. How is this law illustrated when cider changes to vinegar? 9. Why are wine, cider, and beer dangerous drinks? 10. Show how the law of fermentation applies to beer-making. 11. How does beer-drinking give a false appearance of health? 12. How do the results of fermentation differ in bread-making from those in beer-making? 13. Why is there no alcohol in well-baked bread? 14. What is meant by distilled liquors? 15. Mention some of the more common distilled liquors and tell why they are destructive to health and character. 16. What is the alcoholic appetite and how does it differ from a natural appetite? 17. Why should not alcoholic liquors be used as a flavoring for food?

QUESTIONS ON DIGESTION AND MUSCLES FOR SIXTH-YEAR PUPILS.

[The teacher may choose either subject to be written upon if both are considered too long.]

DIGESTION.

1. Explain how food is made ready to mix with the blood and what is meant by digestion. 2. Describe the organs of digestion and tell what they do. 3.

Tell what you can about the liver. 4. What can you tell of Alexis St. Martin? 5. Tell how the nutritious part of food is taken into the blood. 6. What general rules should guide us as to what we should eat? 7. Explain in a general way how we should eat, how much, and the importance of proper cooking. 8. What care should be taken of the teeth? 9. What is the effect of alcohol on digestion and how does it affect the liver? 10. What is the effect of tobacco on digestion?

MUSCLES.

1. What are muscles, voluntary and involuntary, and what purpose do they serve? 2. What are tendons and their uses? 3. Why do we need exercise? 4. What are the advantages of walking as an exercise? Of light gymnastics? 5. What is the effect of alcoholic drinks on the muscles? 6. What is the effect of alcoholic drinks on the strength? 7. How do alcoholic drinks injure a workman's power of doing fine work? 8. What can you say of the effect of tobacco on the muscles?

QUESTIONS ON THE CIRCULATION AND RESPIRATION FOR PUPILS OF THE SEVENTH-YEAR GRADE.

[The teacher may choose between these subjects the one to be written upon if both are too long.]

CIRCULATION.

I. 1. Describe the blood and its uses. 2. Describe the different kinds of blood vessels, their uses, and the pulse. 3. Describe the heart. 4. Starting in the aorta follow the blood in its course through the blood vessels until it has returned to the heart. 5. Follow the course of the blood through the heart and describe the action of each part. 6. How is the action of the heart regulated? 7. How does the heart gets its rest? 8. What are some of the avoidable causes of palpitation and other heart troubles? 9. What is a smoker's heart?

II. 1. How is the circulation regulated? 2. What effect has bodily inactivity on the circulation? 3. Why is outdoor exercise necessary to healthful circulation?

III. 1. What effect have alcoholic drinks on the blood? On the beating of the heart? 2. How does alcohol deprive the heart of a portion of its rest? 3. What effect may alcohol have on the structure of the heart? 4. Explain the cause of the flushed face that follows taking alcoholic liquors? 5. What other parts besides the face are also flushed? 6. How does alcohol affect the blood vessels? 7. How do alcoholic drinks interfere with the proper distribution of the blood?

RESPIRATION.

I. 1. What bodily need is more pressing than the need of food and drink? 2. How does expired air compare with inspired air in its composition?

II. 1. Describe the organs of respiration and their use. 2. What reason for breathing through the nose rather than through the mouth? 3. Trace the blood-vessels from the heart to the lungs and back.

III. 1. What effect has purity of air on the blood? 2. What is the work of the corpuscles?

IV. 1. What makes air impure, and how does nature preserve the purity of the outdoor air? 2. Why is it so difficult to secure pure air for breathing indoors? 3. What is a good test of the character of the air of a room? 4. Tell what you know about ventilation and how it may be secured.

V. 1. What effect have alcoholic liquors on the blood vessels of the lungs? 2. How does alcohol affect the substance of the lungs? 3. What disease of the lungs is caused by alcohol? 4. What effect has tobacco on the throat and nose?

QUESTIONS ON THE NERVOUS SYSTEM FOR EIGHTH-YEAR PUPILS OR FIRST YEAR BELOW THE HIGH SCHOOL.

I. 1. Describe the nerves and the brain and tell what you can of their various uses. 2. Where is the spinal cord situated, what is its appearance, and over what movements does it preside? 3. Why are sensation and motion lost below an injury of the spinal cord? 4. What is the condition of a person whose nerves are incapable of action? 5. What are some of the avoidable causes of disease of the nervous system? 6. How much time should be spent in sleep? 7. Name two safeguards of the nervous system. 8. What is the effect of excessive excitement?

II. 1. How does alcohol reach and affect the nerve centers? 2. Show the fallacy of the supposition that alcoholic drinks aid brain work. 3. Show how alcohol through its action on the brain affects the judgment, the will, the character. 4. What change may alcohol make in the structure of the brain? 5. What inheritance may a drinking or tobacco-using parent leave his children? 6. What effect is tobacco likely to have on the brain and nerves of a boy who uses it?

QUESTIONS SUGGESTED FOR THE USE OF HIGH-SCHOOL PUPILS IN PREPARING EXAMINATION PAPERS ON THE SUBJECT OF PHYSIOLOGY AND HYGIENE, INCLUDING THE NATURE AND EFFECTS OF ALCOHOLIC DRINKS AND OTHER NARCOTICS, FOR THE WORLD'S COLUMBIAN EXPOSITION.

I. 1. Describe the cell as found in the human body; a tissue; an organ; a system.

II. 1. Why do we need food? Discuss kinds, sources, and proper preparation of food.

III. 1. What are healthful drinks? 2. What change takes place when the juices of fruits are pressed out and allowed to ferment? Tell what you know about the causes of this change. 3. What is present in the liquid after it has fermented that was not there before and how did it get there? 4. Show the fallacy of supposing that beer, wine, and cider are good because made from healthful grains, grapes, or apples. 5. What characteristic of alcohol makes any liquid containing it a dangerous drink? 6. Describe the alcoholic appetite and its causes.

IV. 1. Describe the organs of digestion, and the office of each, and tell what harm alcoholic liquors and tobacco do the same.

V. 1. Describe the blood, the organs of circulation, and the function of each. 2. The need of pure blood, showing causes that make the blood impure. 3. What is the immediate effect of alcohol upon the blood vessels and why? 4. Upon the heart and why? 5. What changes may be brought about in the blood vessels and the heart by continued use of alcohol and why? 6. How may tobacco affect the heart?

VI. 1. What are the organs of respiration and what are their functions? 2. Tell why pure air is a necessity and how to get it. 3. How are the organs of respiration and the voice injured by alcoholic drinks or tobacco?

VII. 1. What are muscles and their functions? 2. How is strength of muscles affected by lack of exercise, tight clothing, or improper food? 3. Explain the effect of alcohol upon muscular strength and precision.

VIII. 1. Describe the brain, nerves, and spinal cord, and the uses of each. 2. How is brain power developed? 3. How are habits formed? 4. What is the relation of habit to character and success in life?

IX. 1. What causes the flushing of the face which usually follows taking an alcoholic drink? 2. Describe the effect of alcohol upon the higher faculties of the brain? 3. What changes in the brain may the use of alcohol produce? 4. What are the results upon character? 5. What institutions supported by tax on the general public are made necessary largely by the effect of alcohol on the brain? 6. What diseases of the nervous system and what hereditary consequences are due to the use of alcohol? 7. How does tobacco affect the brain and nerves? What is its effect upon brain power and scholarship? 8. What of opium on the nerves and brain?

CHAPTER IV.

HIGHER EDUCATION OF WOMEN.

General statement.—Description of new institutions: Barnard College; Woman's College of Baltimore; Cleveland College for Women; Evelyn College.
Summary of Statistics: Number of Institutions; Endowment Funds; Scientific Apparatus; Benefactions; Income; Degrees.
Course of Study for A. B. degree in fifteen Institutions.

GENERAL STATEMENT.

The higher education of women continues to receive marked attention in this country, several institutions for this purpose having been established during the past few years. These institutions make provision for instruction of collegiate grade and are not merely "finishing" schools. The tendency seems to be to establish these institutions as colleges affiliated to universities already established, or at least to locate them in cities where leading universities exist, thus securing to these new schools the advantages of large and well-selected libraries, museums, etc., facilities which otherwise could not be obtained until after a long period of years. Another advantage gained by locating them in university towns consists in this, that very frequently the services of some of the university professors or instructors whose time is not fully occupied with their regular duties can be easily secured for a part of the day. In this manner nearly all the instruction in a few of the more prominent of these institutions is provided by university professors, and this fact has done much toward making their work successful. A short account of the establishment of some of the institutions recently founded is here given.

DESCRIPTION OF NEW INSTITUTIONS.

Barnard College.—Since the year 1885 Columbia College, New York, has granted the degree of bachelor of arts to women who have pursued a course of study equivalent to that for which the degree is conferred in the school of arts. Notwithstanding the degree was conferred by the college no provision was made by which the women pursuing this course could obtain instruction from the faculty, although those who had secured this degree might study for higher degrees under the direction of the professors of the college. The suggestion was therefore made to found a college where women studying for the Columbia degrees could receive instruction from the college faculty. This proposal received the official approval of the trustees of Columbia in March, 1889, and the college was opened for instruction in the following October. The name given to the new institution is Barnard College, in honor of the late Dr. F. A. P. Barnard, who had always taken great interest in the higher education of women and had advocated granting to women full opportunity for collegiate training. The course of study is identical with that of the School of Arts of Columbia College, and is intended to give to the girls of New York and its vicinity the same instruction that is given to the boys. In order that the status of this institution may be made clear the following is reprinted from the first report of the academic committee:

"The entrance examination papers are the same for the students of Barnard and Columbia, the papers are passed upon by the same examining board, the course of study is the same, and at the end of the course the degree awarded is the same. These facts are emphasized because nothing is so constantly mis-

understood as the fact that Barnard College has no separate academic existence. Educationally considered, Barnard is Columbia. Its only autonomy is administrative and financial."

The establishment of Barnard College rendered unnecessary the continuance of the collegiate course for women by Columbia, and no new students in that course are received; but those who have already been admitted to the course will be allowed to complete it.

Barnard College does not yet possess an endowment fund, but depends for its support upon the fees from its students and upon yearly contributions. Strenuous efforts are being made to raise an endowment sufficient to make the institution in a measure independent of students' fees.

Although Barnard has no productive funds,[1] on account of its relations with Columbia College it has been able to exact that its students should be fully prepared to enter upon the course as laid down. It has been decided by the authorities, as a result of the experience of the first year, to accept, at least for some years to come, only regular students in its undergraduate classes. This was rendered necessary by the large number of students who wished to enter upon special courses. Students who wish to pursue special courses in botany and chemistry only will be admitted, but such students must pass the examinations required for admission to the freshman class. The first year's work of the college proved successful. There were thirty-six students in attendance, which number was increased to forty-five at the beginning of the second year; of these, eighteen are in the regular classes, eight are graduate students, and sixteen are specials in chemistry and botany only, while three are specials from last year who are permitted to remain.

Woman's College of Baltimore.—Another addition to the institutions for the higher education of women is the Woman's College of Baltimore, Maryland. This institution was first opened for instruction in September, 1888, with fifty students, while the number in attendance during the year 1889-90 was two hundred and eighty-three. Of this number only thirty were in attendance upon regular undergraduate courses, one hundred and thirty-three were in special or partial courses, while the remainder were in the preparatory department. The name of this department has been changed to Girls' Latin School of Baltimore and the purpose is to give it a separate organization.

The institution was founded "to provide women with the best facilities for securing liberal culture. Its primary purpose is to meet the educational demands arising in the Methodist Episcopal Church. It was established by action of that church, and is conducted under its fostering care. At the same time it was not planned and is not managed in an exclusive or sectarian spirit."[2]

The buildings, three in number, have been erected since 1887 and are valued at $340,000, while the productive funds of the college amount to $150,000. The president of the institution is Rev. John F. Goucher, D. D.

The scheme of instruction consists of four years' courses of study leading to the degree of bachelor of arts, supplemented by such instruction in subcollegiate courses as may be found necessary. No election of studies is allowed in the first collegiate year and but little in the second. In the third and fourth years a wide range of choice is permitted, to accord with individual tastes or to meet the demands of preparation for practical work.

Cleveland College for Women.—The Cleveland College for Women, Cleveland, Ohio, was first opened for instruction in 1888 as a department of Western Reserve University. At the same time the trustees of the university decided to receive no more women into Adelbert College. That the success of the new school might be assured, the faculty of Adelbert College generously offered their services for a term of years as instructors. During the first year twenty-three young women were admitted, but two of whom were in the regular courses. During 1889-90 the number of students increased to thirty-eight, eleven of whom were in the regular courses, of which there are three, viz, the classical and modern language courses, leading to the degree of A. B. and the Latin English course to that of PH. B. The institution received $100,000 from Mrs. Eliza A. Clark, one-half of which is to be used for the erection of a building and the remainder invested as an endowment fund.

Evelyn College.—In 1887 Evelyn College, an institution for women, was opened at Princeton, N. J. Its location at this place gives the institution very great advantages, inasmuch as the use of the libraries and museums of the College of

[1] On the settlement of the Fayerweather estate, New York, Barnard will receive a fund of $100,000.

[2] Annual catalogue, 1890.

New Jersey, popularly known as Princeton College, are granted to the students. The college offers the following courses of study:

I. A classical and scientific course corresponding to that of Princeton College, including the lectures of the professors and examinations upon them.

II. Post-graduate courses under the direction of the professors of Princeton College.

III. A special or elective course with lectures and college advantages, in which French and German may be substituted for Latin and Greek, and other modifications made to meet the requirements of those who, for want of time or for other reasons, are prevented from taking the full college course.

IV. Preparatory classes, with reference to either collegiate or special work.

V. Opportunities for the study of music, art, and modern languages, including constant conversation in French and German.

Evelyn College grants its own degrees, and in this respect it differs from Barnard College, whose students receive the Columbia degree. Another point of difference between these two institutions is that while Evelyn gives instruction in preparatory studies, Barnard receives only those as students who are already prepared to enter the freshman class. Thus of the forty-six students in attendance at Evelyn during the year 1889–90, only four are reported as in the regular undergraduate courses.

PREPARATORY DEPARTMENTS, ETC.

It can not but be deplored that so many of the higher institutions of learning in this country are compelled, either through the lack of good preparatory schools or on account of insufficient endowment funds, to maintain preparatory and other departments which are neither collegiate, professional, nor post-graduate. The maintenance of such departments calls for a part of the valuable time of a number of professors which otherwise could be devoted entirely to the collegiate classes or be spent in the necessary study and research so indispensable to the college professor of the present time. But the large number of institutions claiming to give higher instruction, especially those for women, renders it necessary for the larger part of them to maintain all grades of instruction, so that a large number of students may be enrolled, the tuition fees of whom are necessary to meet the expenses of the institutions. Some idea of the amount of labor that is imposed on some of the professors of colleges may be formed from the fact that in one of the colleges for women five professors give all the instruction to sixty students in the preparatory department, twenty students in the seminary or academic department, and fifty students in the collegiate department, to say nothing of the instruction in music and art, which of course is furnished by these professors.

A majority of the colleges for women are without endowment and are therefore compelled to rely in great part if not entirely upon the fees received from the students. This is especially the case with the large number of such institutions in the South, where more than 68 per cent of all the institutions for the higher education of women exclusively are situated.

The list of colleges for women contains a large number of institutions which should really be classed as secondary schools, but which, by virtue of the authority to confer degrees granted them by the several State legislatures, demand to be included in the table devoted to colleges for women. This fact necessitates the incorporation in this table of institutions not authorized to confer degrees, but which maintain courses of study that are by far superior to the courses for which regular collegiate degrees are conferred by a large number of the institutions. In order to show how easy it is to obtain a degree in one of these the following course of study for which the degree of A. B. is conferred is taken from its catalogue:

JUNIOR CLASS.

First Semester.	*Second Semester.*
Latin Grammar and Reader.	Latin Grammar and Reader.
Arithmetic, Mental and Written.	Rhetoric.
Algebra.	History of England.
Physiology,	Algebra.
Civil Government.	Botany.

MIDDLE CLASS.

Latin, Cæsar.	Latin, Cicero.
Latin Composition.	French or German.
French or German.	English Literature.
Algebra.	Studies in English.
General History.	General History.

SENIOR CLASS.

Latin. Virgil.	Latin. Horace.
French or German.	French or German.
Plane Geometry.	Solid Geometry.
Zoölogy.	Physics.

FOURTH YEAR CLASS.

Critical Readings.	Logic.
Trigonometry.	Astronomy.
Chemistry.	Geology.
Psychology.	Evidences of Christianity.
Physical Geography.	Ethics.
	Senior Review.

A comparison of this course with the admission requirements of institutions like Wellesley, Bryn Mawr, etc., shows that the above course for the first three years is little more than what is required for admission to the freshman classes of institutions like those above named. Again, it will be seen that Greek has no place whatsoever in the curriculum. The above course is a fair sample of the courses of study offered by a number of colleges for women and shows that there is room for considerable improvement in this class of institutions.

This state of affairs is due, without doubt, to the lack of endowment funds. In connection with this subject W. Le Conte Stevens says: "Experience has amply demonstrated that no institution of learning can preserve a high standard of scholarship and present an extensive course of studies for selection unless possessed of a permanent endowment, so as to be wholly or partly independent of the fluctuations of patronage. Without this it is like an engine without a fly-wheel."[1] A glance at column 17 of the table of colleges for women will show that this important feature of institutions for higher education is rendered prominent by its infrequent appearance in the tabulation of the statistics. The table on the following page shows that the total amount of endowment funds reported by the 179 institutions is $2,609,661, of which amount $1,901,461, or 72.8 per cent, is reported by 12 institutions of the North Atlantic Division.

In a large number of cases the institutions are either owned by the president or leased to him by the owners, and he makes out of it whatever he can. In this respect these institutions differ very materially from the coeducational and male institutions, where the president is generally engaged by a board of trustees, by whom his work and actions are controlled and from whom he receives a stated salary.

SUMMARY OF STATISTICS.

The following table presents the summary, by States, of the statistics of colleges for women for the year 1889–90:

The total number of colleges and seminaries for women reporting to the Bureau during 1889–90 was 179, which is 19 less than were included under the same category in 1888–89. A number of institutions hithertore ported as colleges or seminaries for women have been classed this year as secondary schools. This action was warranted either by some statement of the reporting officers or by the work of the institutions as shown by an examination of the catalogues. Owing to the widely diversified characteristics of these institutions it is a very difficult matter to devise some standard of classification which, if adopted, would give due credit to all the institutions for the work which is done by them. A few of the better class give instruction which will compare favorably with that afforded by some of the best male and coeducational institutions. But the large majority of the institutions do not come up to this standard. They begin by admitting pupils to the primary and preparatory departments, usually organized on the plan of a graded school. and conduct the pupils by successive stages, through the academic and collegiate departments. The course in the last-named department would not in a large number of cases take a student farther than the end of the sophomore year in a college for males.

An examination of a number of the catalogues also shows that with some exceptions Greek is entirely omitted from the curriculum. We also find that some institutions will give the degree of A. B. for a course which is considerably inferior to courses which in other institutions are not accorded a degree. It will therefore be seen that a classification based only on the authority to confer degrees would not be a just classification in this case. Until a suitable standard shall be decided upon, the classification adopted a few years ago will be continued.

A glance at Division A of the table[1] of colleges for women will show that the number of institutions in this division has been increased from 8 in 1888–89 to 14 in the current year. This increase resulted from the establishment of a few new institutions and the reorganization of several others, through which reorganization they were raised to the regular college grade. In a few cases the number of students in the collegiate departments is very small, but such is nearly always the case in newly established institutions or in newly organized departments of institutions.

Endowment.—The institutions in Division A are as a rule fairly well endowed, differing somewhat in this respect from the institutions included in Division B. The total amount of permanent productive funds reported by the institutions in both divisions of the table was $2,609,661, of which amount $1,970,461, or 75.5 per cent, was reported by 10 of the institutions in Division A, while the remainder was reported by 24 of the institutions in Division B, thus leaving 145 institutions not reporting any productive funds.

Scientific apparatus.—The total value of scientific apparatus reported was $418,900, of which $305,391, or 72.9 per cent, was reported by 12 of the institutions in Division A, while the remainder was reported in small amounts by 97 of the institutions in Division B. This latter fact would seem to show that very little attention is paid by the institutions in this division to the practical study of chemistry, physics, astronomy, etc., for the prosecution of which apparatus is absolutely necessary.

Benefactions.—One evidence of the greater popularity of the institutions in Division A is shown in the column of the table devoted to benefactions. The total amount of gifts and bequests to the 179 institutions during 1889–90 was $303,257, and of this amount $193,502, or 63.8 per cent, was reported by 9 of the 14 institutions in this division, while the remaining $109,775 was reported by 29 of the institutions in Division B. The latter amount was reported in sums varying from $15 to $20,000, while the former was comprised of sums ranging from $465, reported by Bryn Mawr College, to $61,000, reported by the Woman's College of Baltimore.

Income.—The attempt to tabulate and publish the income of these institutions has been abandoned for the present. It was found that the reports on this subject were so meagre that the totals would not be valuable for any purpose whatsoever. As said before, a large number of these institutions are owned or leased by the presidents, who manage and conduct them for the profits that can be made. In such cases the questions relating to finances of the institutions remained, as a rule, unanswered, and when they were answered, the replies to the inquiry asking for the amount received from tuition fees usually included the amount received for board, lodging, etc. As it was desired to learn the amount

[1] See table of statistics of colleges for women.

expended purely for educational purposes, it is evident that such answers could not be used and were practically useless.

Degrees.—The following table presents the summary, by States, of the number of different degrees conferred by colleges for women in 1889–90:

Course of study.—In the report of the Bureau for 1888–89 appears a table giving the courses of study in one hundred colleges and universities, including a few of the colleges for women of Division A. A similar scheme, somewhat condensed, has been devised for the comparative representation of courses leading to the degree of A. B., as given in fifteen of the institutions included in Division B. All the studies have been grouped under five headings, viz, language, mathematics, natural science, history and geography, and philosophy and civil government. An examination of the table will show that while a few of the institutions have a fairly good course for the degree of A. B., in other cases the same degree is earned quite easily. The course, as set forth in the latest catalogues of the several institutions, is as follows:

TABLE 3.—*Courses of study leading to the degree of A. B. in 15 colleges and seminaries for women.*

Name.	Languages.	Mathematics.	Natural science.	History and geography.	Philosophy and civil government.
1. Alabama Conference Female College, Tuskegee, Ala.	Freshman—Latin grammar and reader (Harkness), selections from Cornelius Nepos, English composition, rhetoric. Sophomore—Cæsar, Cicero, mythology, rhetoric. Junior—Rhetoric (higher), critical study of English classics, Virgil, French or German. Senior—Studies in English classics, history of English literature (Gilman), French or German (Stern).	Freshman—Arithmetic (Robinson), algebra (Wentworth). Sophomore—Arithmetic (reviewed), higher algebra. Junior—Geometry (Davies's Legendre). Senior—Plane, analytical and spherical trigonometry, mensuration (Davies), astronomy (Lockyer).	Sophomore—Physiology (Hutchinson), botany (Gray). Junior—Natural philosophy (Peck's Ganot), chemistry (Houston).	Freshman—History of England, general history. Sophomore—History of Rome (Sewell). Junior—History of Greece (Sewell). Senior—History of England (Montgomery), physical geography (Appleton), history of United States (Chambers).	Senior—Psychology (McCosh), moral science (Seelye's Hickok), evidences of Christianity. Bible studies throughout the course.
2. Santa Rosa Ladies' College, Santa Rosa, Cal.	Freshman—Virgil, prose composition, Horace, Homer's Iliad, Odyssey, English composition and rhetoric, elocution. Sophomore—Cicero, prose composition, Herodotus, Sophocles; English literature, English composition, elocution. Junior—Tacitus, Demosthenes. rhetoric, English composition, elocution. Senior—English literature, Anglo-Saxon, history of Roman literature, history of Greek literature, English composition.	Freshman—Algebra, geometry, bookkeeping. Sophomore—Trigonometry, bookkeeping. Junior—Bookkeeping, astronomy.	Freshman—Natural history, botany, zoölogy, physiology. Sophomore—Chemistry, biology. Junior—Geology, mineralogy. Senior—Astronomy.	----------	Junior—Logic (McCosh), political economy, civil government. Senior—Mental philosophy (Porter), moral philosophy, Christian evidences.
3. Wesleyan Female College, Macon, Ga.	Freshman—Word lessons (Reed), higher lessons in English (Reed and Kellogg), Latin grammar (Harkness), Cæsar, Ovid, French Principia (Part I), elocution, composition. Sophomore—Composition and rhetoric (Hart), Latin grammar, Cæsar, Cicero, Latin prose composition, Greek grammar and reader (Bullion), French Principia (Parts I and II), practical elocution (Shoemaker). Junior—Rhetoric (A. S. Hill), English literature (Shaw, Tuckerman, Backus), classic English reader (Swinton), Latin grammar, Horace, Livy, Latin prose composition, French Principia (Part II), French prose classics, Gastineau's conversation method, Greek grammar, Greek testament, Anabasis, German Principia (Part I), Studien and Plaudereien, practical elocution. Senior—Tacitus, Cicero, Latin prose composition, remnants of early Latin (Allen), Greek grammar, Homer, Greek testament.	Freshman—Arithmetic (Robinson), algebra (Wentworth). Sophomore—Geometry (Wentworth). Junior—Geometry, trigonometry and conic sections (Loomis). Senior—Astronomy (Snell's Olmstead), bookkeeping.	Sophomore—Chemistry (Clark). Junior—Physics (Gage), botany (Wood). Senior—Physical geography (Appleton), geology (LeConte).	Freshman—History of United States (Derry). Sophomore—History of England (Montgomery). Junior—Modern history (Myers).	Junior—Moral philosophy (Peabody). Senior—Logic (Jevons-Hill), political economy (Chapin), mental philosophy (Haven), Christian evidences (Fisher). Study of the Bible throughout the course.

	French tragedy and versification, Gastineau's conversation method, selections from best German writers, German composition, English literature, Milton's Paradise Lost, Lycidas, Life of Thackeray, English humorists (Thackeray), Henry Esmond, Shakespeare's Hamlet and Merchant of Venice, practical elocution, composition.				
4. Rockford Seminary, Rockford, Ill.	Freshman—Livy, Horace, Latin prose composition, *Homer, Herodotus, Xenophon, Hermann und Dorothea* or *Iphigenie auf Tauris, Deutsche Grammatik* (Gurke), *Wallenstein's Tod, Nathan der Weise, Littérature Classique to the Seventeenth Century, Le Cid, Athalie und Iphigenie, Le Misanthrope, Tartuffe*, rhetoric, elocution. Sophomore—Tacitus, *Cicero, Horace, Juvenal, Homer, Plato, Sophocles, Faust (Part I), Geschichte der deutschen Literatur, Otto, Littérature Française from the Seventeenth Century, selections from French authors*, English literature (Shaw), rhetoric, elocution. Junior—Rhetoric, elocution, *Cicero, Thucydides, Faust (Part II), Corneille et son Temps, Horace, Italian grammar and prose composition, Primo Libro di Lettura, Plautus, Æschylus, Causeries historiques et littéraires* (Souvestre), *Pensées (Pascal), Terence, Aristophanes, selections from Italian classics, history of Italian literature.* Senior—Rhetoric, elocution, *Tacitus, Plato, Aristotle, Nibelungenlied* or *Parzival und Titurell, Mme. de Staël, Vita Nuova, L'Inferno, Lucretius, Bernardin de St. Pierre, Cousin, Il Purgatorio, old and middle English, history of ancient literature, later Latin writers, Victor Hugo, Il Paradiso.*	Freshman—Advanced algebra, plane trigonometry (Chauvenet), solid geometry (Wentworth). Sophomore—*Analytical geometry, spherical trigonometry.* Junior—*Physical astronomy, mathematical astronomy* (Godfray). Senior—*Modern synthetic geometry, differential calculus, integral calculus.*	Freshman—Practical physiology, botany (Gray). Sophomore—*Botany*, theoretical chemistry, *zoölogy.* Junior—*Physics.* Senior—*Mineralogy, physiology, geology.*	Freshman—Bible. Sophomore—*History of Greece, history of Rome, mediæval history*, Bible. Junior—Bible, *modern history.* Senior—*History of art, constitutional history of United States, historical exercises, history of music, constitutional history of England.*	Junior—Logic (Jevons-Hill). Senior—Psychology (Dewey), evidences of Christianity, principles and practice of morality (Robinson), history of philosophy (Schwegler), *political economy, Jowett's dialogues of Plato.*
5. Logan Female College, Russellville, Ky.	Freshman—Cæsar, Latin prose composition, rhetoric (Kellogg), elocution. Sophomore—Cicero, Virgil, Latin prose composition, history of literature (Shaw). Junior—Livy, Latin prose (Daniels), studies in English (Smith), Shakespeare. Senior—Horace.	Freshman—Higher algebra (Wells). Sophomore—Geometry (Wells). Junior—Trigonometry (Wells). Senior—Astronomy (Young).	Freshman—Physiology (Brown), zoölogy (Steel). Sophomore—Physics (Norton), physical geography. Junior—Chemistry (Eliot & Storer), botany (Gray). Senior—Geology (Dana).	Freshman—History of England (Berard). Sophomore—History of modern Europe (Shaffer). Senior—General history (Sheldon).	Junior—Civil government (Andrew). Senior—Political economy (Ely), psychology (Hill).
6. Silliman Collegiate Institute, Clinton, La.	Higher lessons in English (Reed and Kellogg), elocution (Kidd), analysis (Green), English classics, outlines of history, composition, English literature (Kellogg), rhetoric (Kellogg), essays, Latin grammar and reader (Bingham), Cæsar, Virgil, Cicero, Horace, Chouquet's First French lessons, French grammar (Pinney and Arnoult), French reader (Collot).	Arithmetic (White), algebra (Wentworth), geometry (Wentworth), plane trigonometry.	----------	History of United States (Thalheimer), history of England (Thalheimer), studies in general history (Sheldon).	Mental philosophy (Haven), logic (Coppée), evidences of Christianity (Alexander), science of government (Alden).

TABLE 3.—*Courses of study leading to the degree of A. B. in 15 colleges and seminaries for women*—Continued.

Name.	Languages.	Mathematics.	National science.	History and geography.	Philosophy and civil government.
7. Maine Wesleyan Seminary and Female College, Kent's Hill, Me.	First year—Livy, Cicero, Ovid or methods of teaching, French, French composition, French literature. Second year—Tacitus, rhetoric, German. Third year—German, German composition, English literature, German literature, elocution. Fourth year—German, *Horace*, elocution.	First year—Algebra, drawing. Second year—Geometry, trigonometry, astronomy. Third year—Analytical geometry.	First year—Physiology, physics. Second year—Chemistry, comparative zoölogy. Third year—Botany. Fourth year—Botany, geology, *practical chemistry and mineralogy.*	First year—History of Rome. Second year—Physical geography. Third year—English history, American history. Fourth year—History of civilization.	Third year—Political economy. Fourth year—Mental science, theism and Christian evidences, moral science, logic.
8. Albert Lea College, Albert Lea, Minn.	Freshman—Cicero, Latin prose composition (Daniel), lectures on Roman law (Hadley), Livy, Xenophon, Greek prose composition, Lysias, study of words (Trench), English composition, elocution. Sophomore—Demosthenes, Plato, Thucydides, Herodotus, Horace, rhetoric (Whately), history of rhetoric, composition, philosophy of style (Spencer), analyses of orations, etc.; German grammar (Whitney), Im Zwielicht, Der Neffe als Onkel, or French grammar (Keetel), Petites Causeries (Sauveur), La Fontaine's Fables, Le Roman d'un Jeune Homme Pauvre (Labiche), Le Cid; Grecian literature, elocution, Roman literature. Junior—Critical study of English authors, English language and literature (Kellogg), American literature, Tacitus, Pliny, Plautus, Latin thesis, Euripides, Sophocles, Greek testament, German grammar, Wilhelm Tell or Athalie (Racine), Le Misanthrope, composition. Senior—Linguistic science (Whitney), history of literature or history of art, Homer.	Freshman—Plane trigonometry (Loomis), higher algebra, surveying. Sophomore—Analytical geometry (Loomis). Senior—Astronomy (Newcomb and Holden).	Sophomore—Physics (Ganot), botany (Gray). Junior—Chemistry (Eliot and Storer), physiology (Martin), geology (Dana).	Freshman—Ancient history, Bible—Sophomore—Bible. Junior—English history (Green), American history, history of France (Brewer), Bible. Senior—Bible.	Junior—Constitutional law (Andrews). Senior—Metaphysics (Bowen's Hamilton), logic (Jevons), political economy (Ely), Christian evidences (Fisher), moral philosophy (Calderwood), history of philosophy (Seelye's Schwegler, Haven).
9. Blue Mountain Female College, Blue Mountain, Miss.	Freshman—Higher lessons in English (Reed and Kellogg), rhetoric (Hart), Latin grammar and reader (Bingham). Sophomore—History of English literature (Shaw), choice specimens of English literature (Shaw), longer English poems (Hale), rhetoric (Hart, Kellogg), Latin grammar and prose composition, Cæsar, Cicero. Junior—Anglo-Saxon primer (Sweet), Anglo-Saxon reader (March), history of English language (Lounsbury), rhetoric (Kellogg), Latin grammar and prose composition, Virgil, Horace. Senior—Selections from Chaucer, Milton, Shakespeare,	Freshman—Grammar-school arithmetic (Wentworth). Sophomore—Elementary algebra (Wilson), bookkeeping (Groesbeck). Junior—Algebra (Wentworth), bookkeeping. Senior—Geome-	Sophomore—Physiology, natural philosophy. Junior—Geology (Steele), botany (Wood). Senior—Chemistry (Steele).	Freshman—Geography (Maury), physical geography (Maury), history of United States (Barnes). Sophomore—Historical and biographical readings. Junior—General history (Barnes).	Sophomore—Intellectual and moral philosophy (Wayland). Junior—Political economy (Wayland and Chapin). Senior—Logic (Jevons-Hill), mind (Watts).

	rhetoric, Latin grammar and prose composition, Livy, Tacitus.	try and trigonometry (Wells), astronomy, high-school arithmetic (Wentworth).			
10. Stephens College, Columbia, Mo.	First year—Latin grammar and reader, rhetoric. Second year—Cæsar, Cicero, Latin composition, English literature, studies in English, French or German. Third year—Virgil, Horace, French or German. Fourth year—Critical readings.	First year—Arithmetic, algebra. Second year—Algebra. Third year—Plane geometry, solid geometry. Fourth year—Trigonometry, astronomy.	First year—Physiology, botany. Third year—Zoology, physics. Fourth year—Chemistry, geology.	First year—History of England. Second year—General history. Fourth year—Physical geography.	First year—Civil government. Fourth year—Logic, psychology, evidences of Christianity, ethics.
11. Mary Sharp College, Winchester, Tenn.	Freshman—Latin grammar (Allen and Greenough), Latin exercises (Jones), Latin reader, English grammar (Whitney), rhetoric (Hill). Sophomore—Cæsar, Virgil, Greek grammar (Goodwin), Greek lessons (Leighton), Anabasis, Mueller's grammar and reader, Anglo-Saxon grammar (March), study of words (Trench), rhetoric (Hill's Science), French grammar and reader (Fasquelle), Contes Choisis, (Télémaque). Junior—Cicero, Latin prose composition (Allen), Horace, Xenophon, Demosthenes, Greek prose composition (Boise), Morris's Accidence, French and German plays and dramas, American poems (Scudder). Senior—Livy, Tacitus, Latin prose composition, Thucydides, Plato, Æschylus, Greek prose composition, Hale's English poems, Shakespeare's plays.	Freshman—Arithmetic (Robinson), algebra (Robinson), plane geometry (Robinson). Sophomore—Algebra, solid geometry, trigonometry (Robinson). Junior—Astronomy (Norton), conic sections and analytical geometry (Robinson). Senior—Calculus (Olney).	Sophomore—Botany (Gray). Junior—Mathematical philosophy (Kimball and Snell's Olmstead), chemistry (Shepherd), physics (Peck's Ganot). Senior—Geology of Tennessee, geology (Dana and Le Conte), electricity and magnetism (Deschanel).	Sophomore—German history (Wanger).	Senior—Logic (N. K. Davis), analogy (Butler), metaphysics (Hamilton).
12. Baylor College, Belton, Texas.	Freshman—English grammar, English composition, beginners' Latin book (Collar & Daniell), fables, Cæsar. Sophomore—Rhetoric, English prose and prose writers (Hunt), Cæsar, Virgil, French grammar (Keetel) and prose readings or German grammar (Otto), Grimm's Märchen and English into German. Junior—History of English language and literature (Backus's Shaw's Manual, Lounsbury), Horace, Cicero, French grammar, composition, and readings or German grammar, composition, Hermann und Dorothea, and Wilhelm Tell. Senior—Critical study of Shakspeare (Hudson & Rolfe) and other principal poets, philology of the English tongue (Earle), lectures on the masters of English style and the masterpieces in English literature, Livy, Tacitus. Latin grammar and written exercises extend through the course.	Freshman—High-school arithmetic (Wentworth), algebra (Robinson's elementary). Sophomore—Algebra (Robinson's University), elementary geometry (Hill). Junior—Plane geometry, solid geometry, and conic sections (Wentworth). Senior—Trigonometry (Loomis), surveying (Loomis), navigation and spherical trigonometry, astronomy (Hooker).	Freshman—Physiology and hygiene (Hitchcock). Sophomore—Zoölogy (Nicholson), physics (Avery). Junior—Chemistry (Steele), botany (Wood). Senior—Geology (Le Conte).	Freshman—Physical geography (Maury). Junior—Ancient history (Myers). Senior—Mediæval and modern history (Myers), history of civilization (Guizot).	Junior—Political economy (Wayland). Senior—Mental philosophy (Upham), logic (Coppée), moral science (Alexander), evidences of Christianity (Alexander).

TABLE 3.—*Courses of study leading to the degree of A. B. in 15 colleges and seminaries for women*—Continued.

Name.	Languages.	Mathematics.	National science.	History and geography.	Philosophy and civil government.
13. Stonewall Jackson Institute, Abingdon, Va.	Freshman—Rhetoric (Clark), history of English language (Shepherd), Latin grammar, Cæsar, elocution. Sophomore—American literature (Beers), English literature (Brooke), elocution, Virgil, Cicero. Junior—English literature, Horace, Livy. French or German may be substituted for Latin. English composition and penmanship throughout the course.	Freshman—Algebra (Wentworth). Sophomore—Algebra, geometry (Hill or Wentworth). Junior—Geometry, trigonometry (Wentworth). Senior—Review of arithmetic and algebra, astronomy.	Freshman—Botany (Steele). Sophomore—Zoölogy (Steele), geology (Steele). Junior—Physics and chemistry (Steele).	Junior—General history. Senior—General history, physical geography (Maury).	Senior—Evidences of Christianity (McIlvaine), psychology (Baker).
14. Wheeling Female College, Wheeling, W. Va.	First year—Latin grammar, Cæsar, Greek grammar, Greek lessons. Second year—Latin grammar, Sallust, Virgil, mythology, Greek reader, Greek grammar, Anabasis, Herodotus, Antegenitus, rhetoric. Third year—English literature, Latin grammar, Cicero, Homer, Horace. Fourth year—Elements of criticism (Kame). Greek is optional with a foreign language.	First year—Algebra. Second year—Geometry. Third year—Trigonometry, astronomy.	First year—Physiology. Second year—Natural philosophy, zoölogy. Third year—Chemistry, botany. Fourth year—Geology, mineralogy.	First year—United States history, physical geography. Second year—History of England, Roman history, Grecian history.	Third year—Mental philosophy. Fourth year—Moral philosophy, logic, philosophy of history, evidences of Christianity, United States Constitution, political economy.
15. Downer College, Fox Lake, Wis.	Freshman—Virgil, Livy, rhetoric. Sophomore—Horace, Cicero, elocution, rhetoric. Junior—Rhetoric and science of language, English literature, Juvenal, Tacitus, Cicero, Roman drama, elocution. Senior—Rhetorical work, elocution, English literature, critical study of modern English prose, Shakespeare, and the drama.	Freshman—University algebra, solid geometry, trigonometry. Sophomore—Analytical geometry. Senior—Astronomy.	Freshman—Zoölogy, botany, hygiene. Sophomore—Physiology, chemistry. Junior—Analytical chemistry or mineralogy, physics. Senior—Geology.	Freshman—Bible. Sophomore—History of England, Bible. Junior—Bible. Senior—Bible, history of the United States, or history of civilization or library work, history of art or history of philosophy.	Sophomore—Logic (Jevons). Senior—Political economy, psychology, moral philosophy, evidences of Christianity.

CHAPTER V.

COLLEGES AND UNIVERSITIES OF THE UNITED STATES.

I.—Brief Discussion of the System of Higher Education: Number of Institutions; Tendency of Institutions to Adopt Pretentious Names; Increase in Number of Institutions Due to Various Causes; Character of Universities and Colleges; System and Methods of Instruction; Union College, N. Y., and Scientific Education; Degrees; Value of the Ph. D. Degree.
II.—Summary of Statistics; Coeducation; Teaching Force; Students; Location of Institutions; Distribution of College Students; Income; Income from Productive Funds; Benefactions; State or Municipal Appropriations.
III.—Distribution of Students in Degree Courses from 1880–87 to 1889–90.
IV.—Endowment Funds of Colleges and Universities.
V.—Grounds, Buildings, and Apparatus.
VI.—State Universities.
VII.—Denominational Institutions.
VIII.—Organization of a Number of Leading Universities.
IX.—Reorganization of Columbia College.
X.—Brief Description of New Institutions.
XI.—New Buildings during 1889–90.

I.—BRIEF DISCUSSION OF THE SYSTEM OF HIGHER EDUCATION.

Number of institutions.—The number of colleges and universities from which this Office has received reports for the year under consideration is 415. The number is constantly increasing; a condition not to be regretted, provided the institutions do work for which they are prepared and equipped and not attempt to give courses of study for the successful prosecution of which they lack both the necessary appliances and finances. As is well known higher education is not and can not be self-supporting and needs considerable aid from outside sources, either in the form of endowment funds or annual gifts or appropriations for current expenses. Notwithstanding this fact it often happens that no sooner is an institution established whose real work ought to be secondary instruction than it organizes a college of commerce, so-called normal, collegiate and graduate departments, and calls itself a university, even if it has no endowment and relies almost entirely for support upon the tuition fees received from the students.

It is frequently the case that some of the smaller institutions of the country advertise graduate or university courses of study, when, in fact, they often have not a sufficient number of professors and instructors to carry on properly the undergraduate work of the institution. In order to make a success of graduate work—work which renders necessary considerable independent research—it is desirable, if not absolutely necessary, for the student to have, at his or her command, large and well-equipped laboratories and libraries such as are far beyond the means of our smaller institutions. Such work ought, therefore, to be left to those institutions that are well endowed enough to provide the appliances which are indispensable for the successful prosecution of the work. The discussions of the relations of institutions to scholastic work and requirements have been intensified and extended by the action of the Harvard faculty in its attempt to shorten the time necessary for the acquisition of the A. B. degree.[1]

Increase in number of institutions.—The age of the institutions for higher education in the United States is inconsiderable when compared with that of European institutions. The first of our colleges, Harvard, was founded in 1638 under circumstances which are familiar. From that time on new institutions were gradually established until now the number exceeds four hundred. This large increase in the number of institutions is due to the munificence of wealthy people who wish to promote the advancement of knowledge, to religious zeal, and to the formation and settlement of new States. The large majority of the

[1] For the discussion of this subject, see p. 799.

people settling the new States are people of moderate means, who wish to give their children a good education, but who are frequently not able to spend the sum necessary to send them to an institution at a considerable distance from their homes. The desire for an institution of their own naturally follows, and the attempt to establish one succeeds in the larger number of cases. In most of these attempts the object is accomplished through the aid of some one of the religious denominations by whom the controlling power is retained. The rivalry existing among the several churches frequently causes the establishment of weak colleges in places where more good would be effected by devoting the money thus used to the enlargement and better equipment of some existing institution.

General character of colleges and universities.—Speaking of the general character of the universities and colleges of the United States the Hon. James Bryce, M. P., in The American Commonwealth, says: "Out of this enormous total of degree-granting bodies very few answer to the modern conception of a university. If we define a university as a place where teaching of a high order, teaching which puts a man abreast of the fullest and most exact knowledge of the time, is given in a range of subjects covering all the great departments of intellectual life, not more than twelve and possibly only eight or nine of the American institutions would fall within the definition. Of these nearly all are to be found in the Atlantic States. Next below them come some thirty or forty foundations which are scarcely entitled to the name of universities, some because their range of instruction is still limited to the traditional literary and scientific course, such as it stood thirty years ago; others because, while professing to teach a great variety of subjects, they teach them in an imperfect way, having neither a sufficiently large staff of highly trained professors, nor an adequate provision of laboratories, libraries, and other external appliances. The older New England colleges are good types of the former group. Their instruction is sound and thorough as far as it goes, well calculated to fit a man for the profession of law or divinity; but it omits many branches of learning and science which have grown to importance within the last fifty years. There are also some Western colleges which deserve to be placed in the same category. Most of the Western State universities belong to the other group of this second class, that of institutions which aim at covering more ground than they are as yet able to cover. They have an ambitious programme, but neither the state of preparation of their students nor the strength of the teaching staff enables them to do justice to the promise which the programme holds out. They are true universities rather in aspiration than in fact.

"Below these, again, there is a third and much larger class of colleges, let us say three hundred,[1] which are for most intents and purposes schools. They differ from the *gymnasia* of Germany, the *lycées* of France, the grammar schools of England and high schools of Scotland, not only in the fact that they give degrees to those who have satisfactorily passed through their prescribed course or courses, but in permitting greater personal freedom to the students than boys would be allowed in those countries. They are universities or colleges as respects some of their arrangements, but schools in respect of the educational results attained. These three hundred may be further divided into two subclasses, distinguished from one another partly by their revenues, partly by the character of the population they serve, partly by the personal gifts of the president, as the head of the establishment is usually called, and of the teachers. Some seventy or eighty, though comparatively small, are strong by the zeal and capacity of their teachers, and while not attempting to teach everything, teach the subjects which they do undertake with increasing thoroughness. The remainder would do better to renounce the privilege of granting degrees, and be content to do school work according to school methods."

System and methods of instruction.—About thirty or thirty-five years ago nearly all the colleges and universities of the country prescribed a regular four years' course of study. The course consisted of classics and mathematics followed by the elements of mental and moral philosophy, and at its completion the degree of A. B. was conferred upon the students. The system of a prescribed inflexible course has been abolished by the greater part of all the institutions, and considerable latitude in the matter of choice of studies is allowed. The adoption of the elective system, as it is called, was due to the demand for instruction in scientific studies, in addition to those of the old time curriculum.

Provision for a choice of studies has been made in two different ways, viz, by offering to students the choice of separate and distinct courses of study, and by

[1] The figures here used were taken from the Report of the Commissioner of Education for 1885-86, when the total number of colleges and universities was 345.

offering electives in a course of study. This latter plan was in vogue to a limited extent in Harvard University as early as 1843–44. The following extract from the catalogue for that year will show the arrangement at that time: "The laws of the University allow, after the freshman year, to the parents or guardians of undergraduates a selection in respect of certain specified studies. This selection must be made known to the faculty on or before the first day of June, in each year. If no notice of such selection be received, in respect of any student, the faculty themselves proceed to assign to such student the elective studies they deem it best for him to pursue. No student is allowed to select or have assigned to him more elective studies than will occupy, with the required studies in recitation and lectures, every week twenty-one hours." At the date specified all the work of the freshman year and a comparatively large part of the work of the sophomore, junior, and senior years remained as required studies. The amount of "required" work has been gradually reduced, and the "elective" increased, until at the present time the only required studies in Harvard are in the freshman year: Rhetoric and composition (three times a week), chemistry (lectures, Thursday, first half year), and German or French for those who do not present both of these languages for admission (three times a week); in the sophomore and junior years the prescribed work consists of themes and forensics; in the senior year no studies are prescribed.

The action of Harvard in offering electives to students was naturally followed by other institutions. These either offered similar privileges or formed new courses of study from which the student could take his choice. It may be well to note the fact that down to the present time none of the institutions allow as much freedom in this respect as Harvard. In many instances election is not allowed until the beginning of the junior year, while in some cases, especially in those institutions that are not well endowed, the prescribed courses are still adhered to. This action is very often a matter not of choice but of necessity, for an elective system can be maintained only by institutions where the teaching staff is able to do justice to a wide range of subjects.

Union College, N. Y., and scientific education.—Union College, Schenectady, N. Y., claims to have been the first college to provide a scientific course of study. The essential features of this system, as originated by Dr. Nott and now so generally adopted, was the substitution of the modern languages and an increased amount of mathematical and physical science in place of the Greek and Roman classics. A scientific course of study was offered by Union in 1833. This course, in 1838–39, was as follows:

FRESHMAN CLASS.

First term:
- Sallust.
- Horace and Latin prosody.
- Herodotus and Thucydides.

Second term:
- Xenophon's Cyropa and Anabasis.
- Horace, Roman Antiquities.
- Cicero de Officiis, de Amicit., etc.

Third term:
- Livy, with composition and declamation.
- Algebra (Bourdon).
- Lysias, Isocrates, and Demosthenes.

SOPHOMORE CLASS.

First term:
- History.
- Arithmetic (Hassler).
- Algebra (Bourdon).

Second term:
- History (Tytler).
- Natural theology (Paley).
- Plane geometry (Legendre).

Third term:
- Natural history (Ware).
- Solid geometry (Legendre).
- Logic (Whately).

JUNIOR CLASS.

First term:
- Trigonometry and applications (Hassler).
- Algebra (Bourdon).
- Rhetoric (Blair).

Second term:
- Chemistry.
- Descriptive geometry (Davies), analytic geometry of two dimensions (Boucharlat).
- Natural philosophy (Farrar's Mech.).

Third term:
- Differential and integral calculus (Boucharlat).
- Analytic geometry of three dimensions (Boucharlat).
- Natural philosophy (Farrar's Mech.).

SENIOR CLASS.

First term:
- Mechanics (Boucharlat).
- Electricity and magnetism, optics (Biot).
- Elements of criticism.

Second term:
- Astronomy.
- Moral philosophy.
- Chemistry (Kames, and lectures).

Third term:
- Law (Kent or Blackstone).
- Anatomy and physiology.
- Chemistry, botany, mineralogy, technology, synoptical view of the sciences.

The studies of the freshman year, as given above, are the same as were pursued at that time by students in the classical course. It will be seen that in the above course of study neither ancient nor modern languages were pursued after the freshman year. This was changed shortly afterwards, for, in the catalogue

for 1842 we find that Latin (Tacitus and Juvenal) was studied in the first and second terms of the sophomore class and German during the second term of the junior class. French was first offered as an extra study in 1843, and was made a required study during the second term of the junior class in 1850.

From 1838 to 1853 the requirements for admission and the studies of the freshman year of the classical course were identical with those of the scientific course, and election between the two courses was made at the beginning of the sophomore year. In 1854 the scientific course was remodeled, with the result that ancient languages disappeared entirely from it. The requirements for admission, which were necessarily modified, demanded that the candidate "be thoroughly prepared in English grammar and the other usual elementary studies, and be quite familiar with practical arithmetic.

From what has here been said, it will be seen that a student can at the present time pursue almost any studies above what is generally required for admission to college during a period of four years, and at the completion thereof receive his degree. Through the adoption of the elective system it naturally follows that a degree given by one college does not necessarily mean the same thing as the same degree given by another college. In fact, some institutions frequently confer the same degree upon students who pursued widely different courses of study. Harvard, for instance, offers for 1890-91 219½ full courses of instruction, of which 18.2 courses must and 25.2 courses may be taken to obtain the A. B. degree. From this total number of courses it will be seen that a large number of combinations, each leading to the A. B. degree, could be made.

Degrees.—The fact that no fixed value is attached to the degrees in this country causes considerable confusion, especially among foreigners. Respecting the significance of the degrees given in this country, Professor Bryce, in the American Commonwealth, says: "As regards the worth of the degrees given, there is, of course, the greatest possible difference between those of the better and those of the lower institutions; nor is this difference merely one between the few great universities and the mass of small colleges or Western State universities, for among the smaller colleges there are some which maintain as high a standard of thoroughness as the greatest. The degrees of the two hundred colleges to which I have referred[1] as belonging to the lower group of the third class have no assignable value, except that of indicating that a youth has been made to work during four years at subjects above the elementary. Those of institutions belonging to the higher group and the two other classes represent, on an average, as much knowledge and mental discipline as the poll or pass degrees of Cambridge or Oxford—possibly rather less than the pass degrees of the Scottish universities. Between the highest American degrees and the honor degrees of Oxford and Cambridge it is hard to make any comparison."

The number of different kinds of degrees conferred by American colleges and universities is constantly increasing and is very often the cause of considerable confusion. Thus, for instance, we find that the degree of Ph. B. (bachelor of philosophy) is given by one institution at the completion of a course of study for which in another institution the degree of B. S. (bachelor of science) is conferred.

Value of the Ph. D. degree.—For some time past many of the leading colleges and universities and a few scientific associations of the United States have attempted, by resolutions and by example, to restore its original value to the degree of Ph. D. In Germany this degree is the reward purely of scholarship, which must be shown by examinations and other tests; but in this country the value of the degree has been greatly impaired by the fact that many of the colleges confer it as an honorary doctorate. To such an extent has this custom spread that the American Philological Association, at a meeting in Cincinnati, Ohio, July, 1881, adopted the following resolution:

> Whereas many colleges in the United States have in recent years conferred the degree of doctor of philosophy, not by examination, but *honoris causa:* Be it
> *Resolved*, That this association deprecates the removal of this degree from the class to which it belongs (namely, B. D., LL. B., M. D., and Ph. D., degrees conferred after examination), and its transfer to the class of honorary degrees.

This resolution was concurred in by the American Association for the Advancement of Science, at its meeting, held in Cincinnati, August, 1881.

The following table, compiled from the annual reports of the Bureau from 1873 to 1890, shows the number of honorary Ph. D. degrees conferred and the number of institutions so conferring the degree:

---

[1] See p. 756.

Year	Number of colleges conferring Ph.D.	Number of honorary Ph. D.'s conferred.	Year.	Number of colleges conferring Ph.D.	Number of honorary Ph. D.'s conferred.	Year.	Number of colleges conferring Ph. D.	Number of honorary Ph. D.'s conferred.
1873	12	17	1878	21	31	1884	26	36
1874	10	15	1879	18	33	1885	19	25
1875	12	19	1880	19	29	1886	18	22
1876	20	26	1881	29	49	1888	----------	29
1877	14	19	1882	21	30	1889	31	50

From this table it would appear that the protest from the above-named societies had a temporary effect, as both the number of honorary Ph. D. degrees conferred and the number of colleges conferring the degree was considerably less in 1882 than in 1881; but, though the number of such degrees conferred in succeeding years fluctuates considerably, there does not seem to be any tendency to abolish the custom, as will be seen by looking at the last year of the above table. During this year both the number of degrees conferred and the number of schools conferring them exceeded the numbers of any previous years.

The custom is opposed by many colleges. President Pepper, in his annual report to the board of trustees of Colby University in 1887, says:

"The faculty desire respectfully through this report to express to the board their conviction that the degree of Ph. D. should never be conferred as an honorary degree, but only, as is now the custom in the best colleges and universities, on those who by completing courses of study prescribed by the faculty under conditions also prescribed, shall merit the degree. It seems to the faculty that Colby, in consistency with its past history, should do nothing to lower, but everything to maintain or raise, the value of the symbols of scholarship."

That this recommendation was adopted is shown in the report of President Small for 1890, which contains the following statement:

"The faculty wish to express their gratification that the trustees voted at their last annual meeting to adopt the recommendation made in 1887 by Dr. Pepper, with reference to the degree of doctor of philosophy. * * * The ground upon which the faculty based their support of Dr. Pepper's recommendation was that the degree referred to had a distinct meaning abroad, and that the leading universities of this country had attempted to reserve it for the same use in the United States. The degree is intended not as a distinction for men who have shown marked ability, or performed conspicuous service, but it is now used as a certification that, in addition to college instruction, the person upon whom it is conferred has had at least three years of university training in the processes of original investigation, and has proved his right to recognition as a 'master workman' by university examination and the publication of some results of original research." He also says: "It is also manifestly improper for an institution to grant that degree when it makes no pretension of furnishing the training which qualifies for it."

The sentiment here expressed by Dr. Small seems to be shared by the authorities of Rock Hill College, in the catalogue of which the following appears:

"Application is sometimes made to the college for the degree of doctor of philosophy. This of all degrees ought to be the reward of high merit, whether for work actually done in the field of philosophy or for an examination rigidly gone through before a faculty of philosophy. It is not within the scope of a faculty of science or a faculty of arts to pass upon this degree. It can be legitimately conferred only by a university having a school and faculty of philosophy. Proceeding from any other source it is valueless and misleading."

If this sentiment was shared by a large number of the institutions which confer the Ph. D. as an honorary degree the evil would be rapidly diminished, but so long as a few of our leading universities persist in this custom it is not to be supposed that the smaller colleges will drop it.

Many of those who receive this degree for work done at some of the leading institutions make it a practice to write after the degree either the name or an abbreviation of the name of the institution by which the degree was conferred. If this practice were more generally followed by people who earn the degree it might have some effect upon those colleges who do not provide courses of study leading thereto.

II.—Summary of statistics.

The following table gives a summary by States of some of the more important statistics of universities and colleges for the year 1889-90:

TABLE 1.—*Summary of statistics of universities and colleges for 1889-90.*

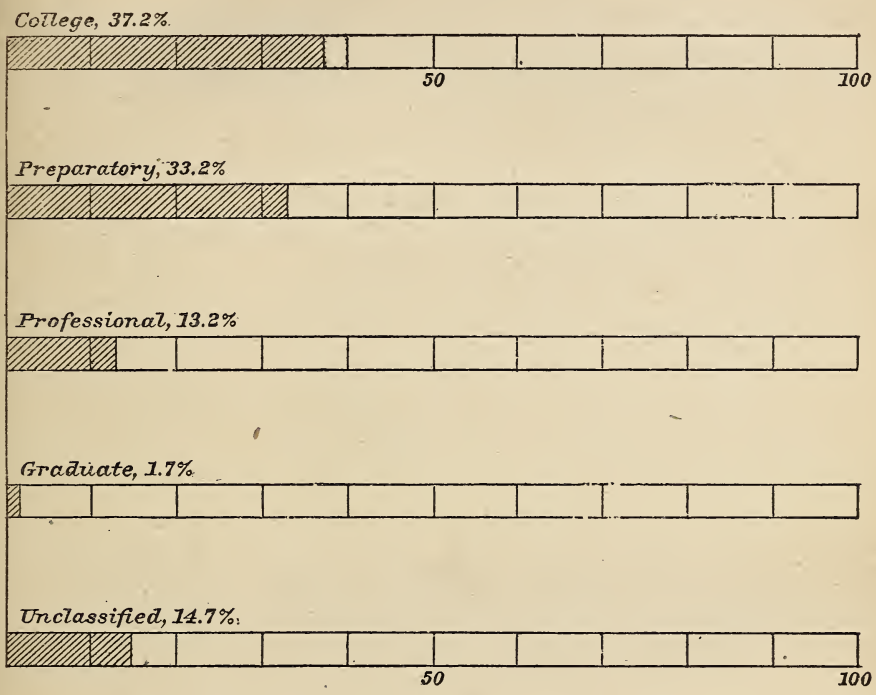
Coeducation.—The fact that increasing attention is being bestowed upon the higher education of women is apparent not only from the number of colleges for women that are constantly being established, but from the number of institutions that are continually removing the barriers against the admission of women to their privileges. The great advance that has been made in this direction during the past ten years may be graphically presented by means of the following diagram. This shows the ratio of coeducational institutions to the total number of colleges and universities (excluding colleges for women) for the years 1880 and 1890:

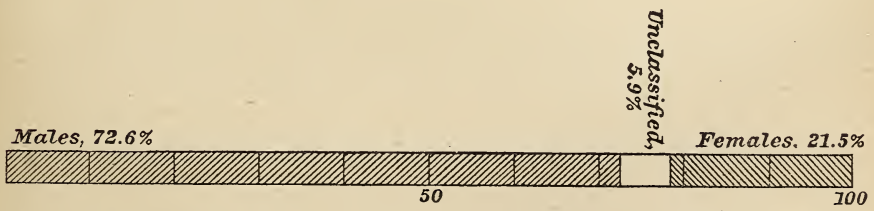
I.—Diagram showing the ratio of coeducational colleges to the total number of colleges (excluding colleges for women).

Teaching force.—The total number of professors and instructors employed in the 415 institutions during the year under consideration was 7,918. This number includes the instructors in all the departments of the institutions. The distribution of instructors among the several departments is shown by the following diagram:



II.—Diagram showing the distribution of professors and instructors among the several departments of colleges and universities.

From this representation it will be seen that a little more than half the total number of professors instruct in the collegiate department, counting those instructing in both collegiate and preparatory departments. Of the 7,918 professors and instructors reported 1,083 were women. The great majority of this number were engaged as instructors in music, art, and elocution, or as assistants to professors. An examination of the catalogues of the 272 coeducational institutions shows that in 134 of them women have charge of some regular college studies. This includes not only the cases where women have the title of "professor," but also cases where they are called "instructor," but have charge of the subject specified. Nearly all of the coeducational institutions have women in their

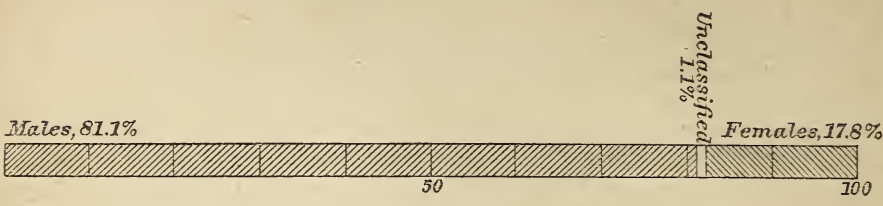


corps of instructors, but, as said before, the large majority of these are engaged as assistants or as instructors in music, art, etc. The same investigation also showed that 24 of the coeducational institutions have women as members of their boards of trustees.

Students.—The distribution of the 118,581 students among the several departments is shown in the following diagram:

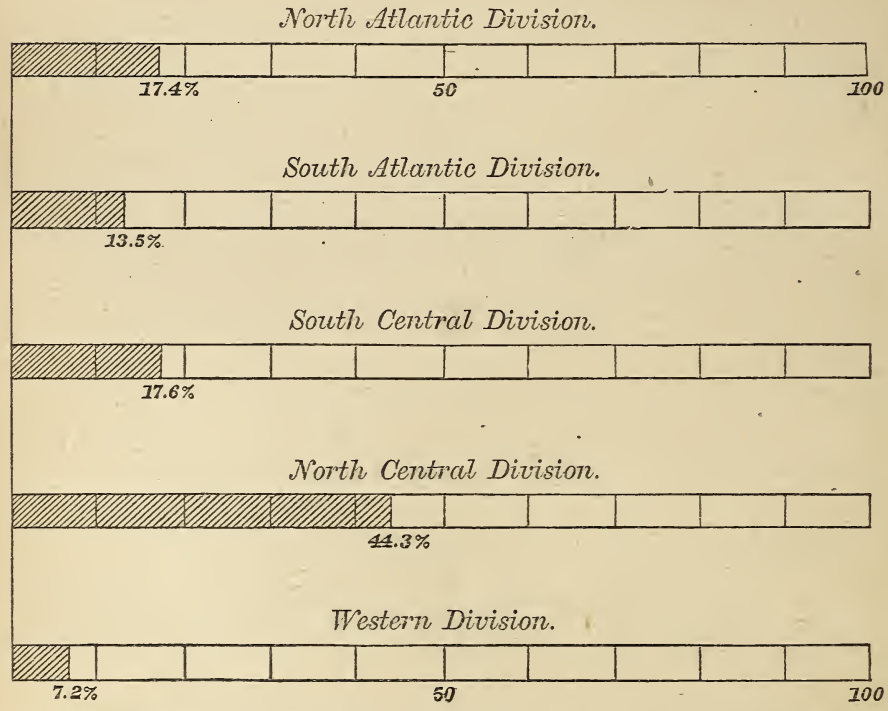
III.—Diagram showing the distribution of students among the several departments of colleges and universities.

The graduate students form a very small percentage of the total number, notwithstanding the remarkable increase in this respect during the past twenty years.[1] As would naturally be expected, much the larger proportion of all the students are males, though this ratio is being constantly decreased. The accompanying diagram shows the proportion of males and females reported in all departments of colleges and universities:



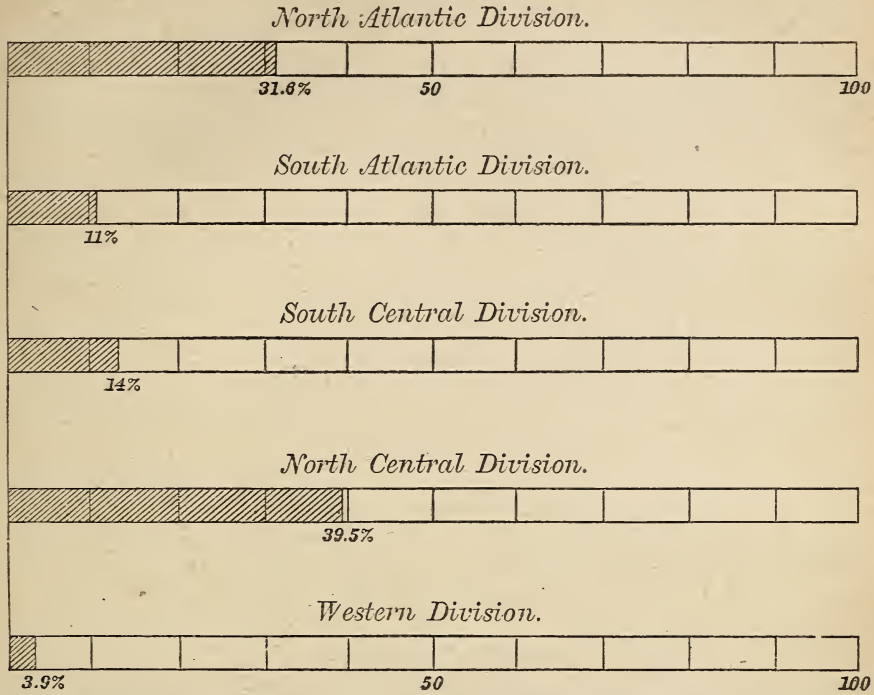
IV.—Diagram showing the sex of students in all departments of colleges and universities.

Taking only the regular college students—that is, students pursuing undergraduate college courses, we find that the proportion of males is larger than when the students in all departments are considered. The total number of stu-



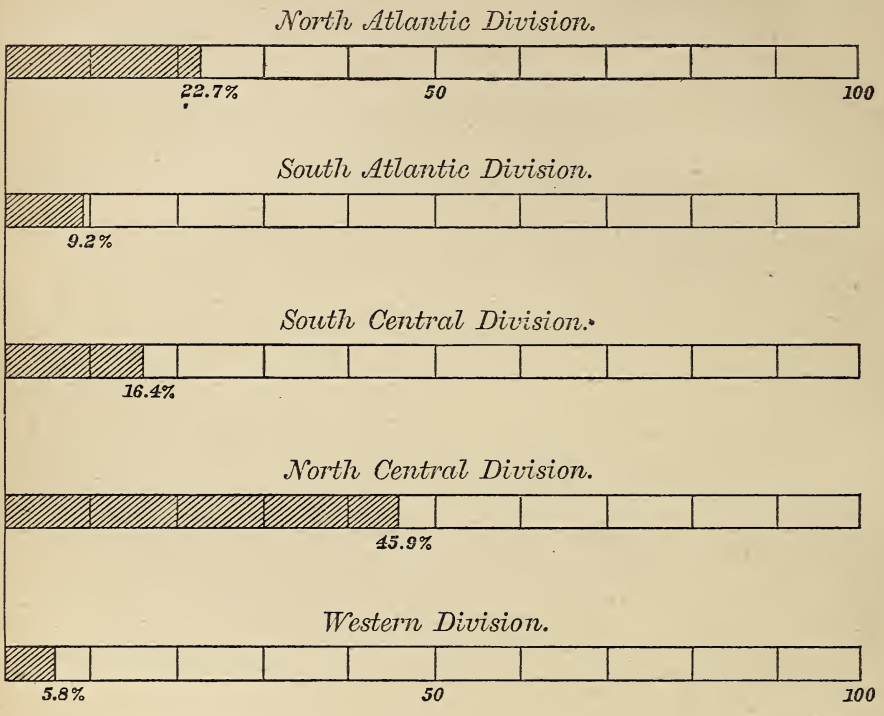
[1] See p. 819.

dents reported as being in the collegiate departments was 44,133, and the classification according to sex is given in the following diagram:



V.—Diagram showing the sex of students in collegiate departments.

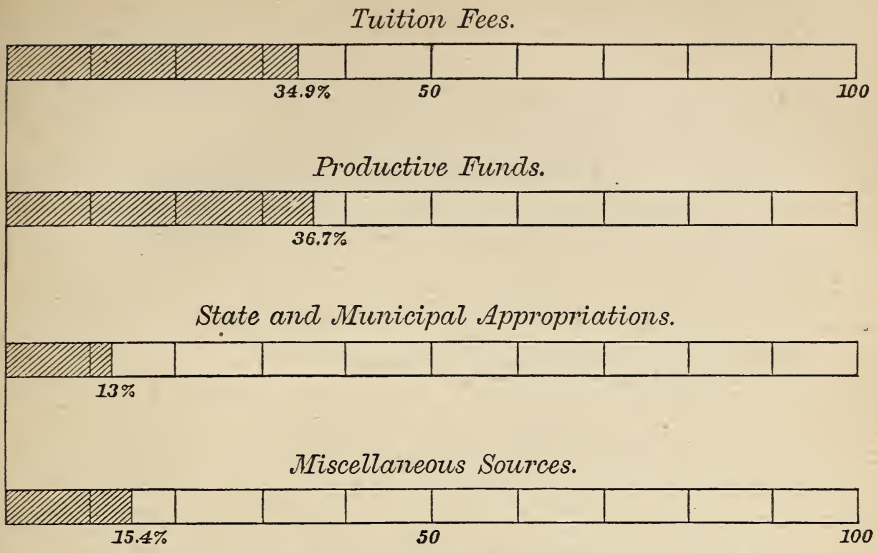
Location of institutions.—The distribution of colleges among the several geographical sections of the United States is shown in the following:



VI.—Diagram showing the distribution of 415 colleges and universities among the several geographical divisions of the United States.

Distribution of college students.—The proportion of regular college students enrolled in the several divisions is shown in Diagram VII.

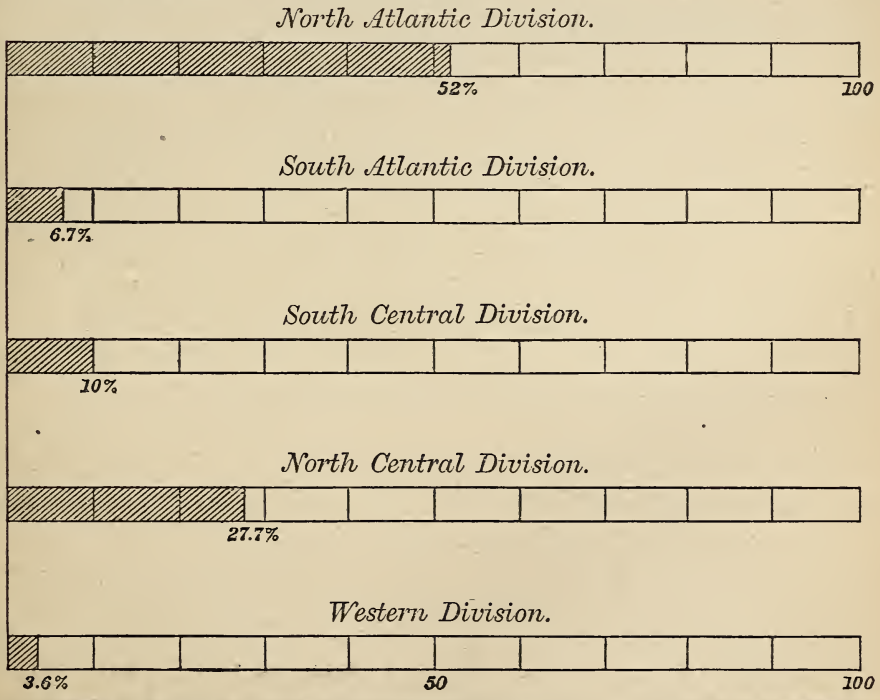
VII.—Diagram showing the distribution of regular college students among the several geographical divisions.



Comparing Diagrams VI and VII it will be seen that the North Atlantic Division is the only one in which the proportion of college students is greater than the proportion of institutions. This is somewhat changed when we consider the students in all the departments, the distribution of which is as follows:

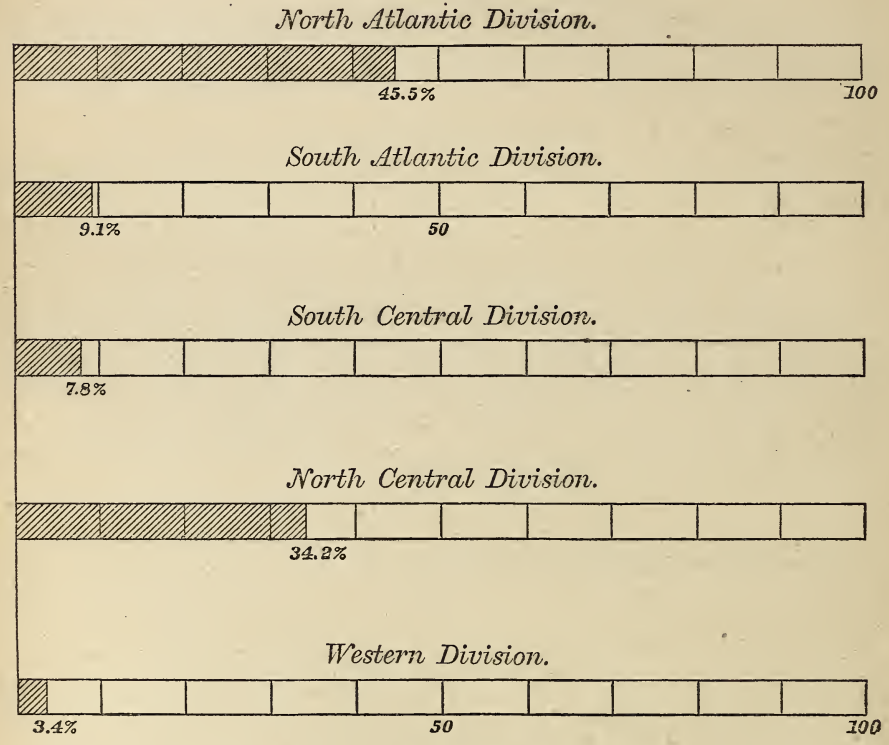
VIII.—Diagram showing distribution of total number of students among the several geographical divisions.

Comparing the above diagram with Diagram VI we find that in this case both the North Atlantic and North Central Divisions have a larger proportion of students than institutions. With respect to the North Central Division this fact is due to the large number of preparatory students. Nearly 53 per cent. of the total number of such students reported are found in this section—*i. e.*, the North Central. Here also are found a large number of students in business, music, and art departments. In the North Atlantic Division the proportion of preparatory students is comparatively small. This is especially the case in the New England States, where the total number, 112, is reported by one institution. The excellent secondary schools maintained by this section of the country relieve the colleges and universities of preparatory work, thus allowing their entire resources to be devoted to higher education. Preparatory departments in other sections of the country are being abolished as fast as the high schools attain a standard which will allow such action to be taken.



Income.—The sources from which colleges and universities draw their annual income forms another interesting subject for investigation. The total income reported for 1889-90 was $10,801,918, derived from tuition fees, productive funds, State or municipal appropriations, and from miscellaneous sources. The ratio which the income derived from each of these sources bears to the total income is shown in the following diagram:

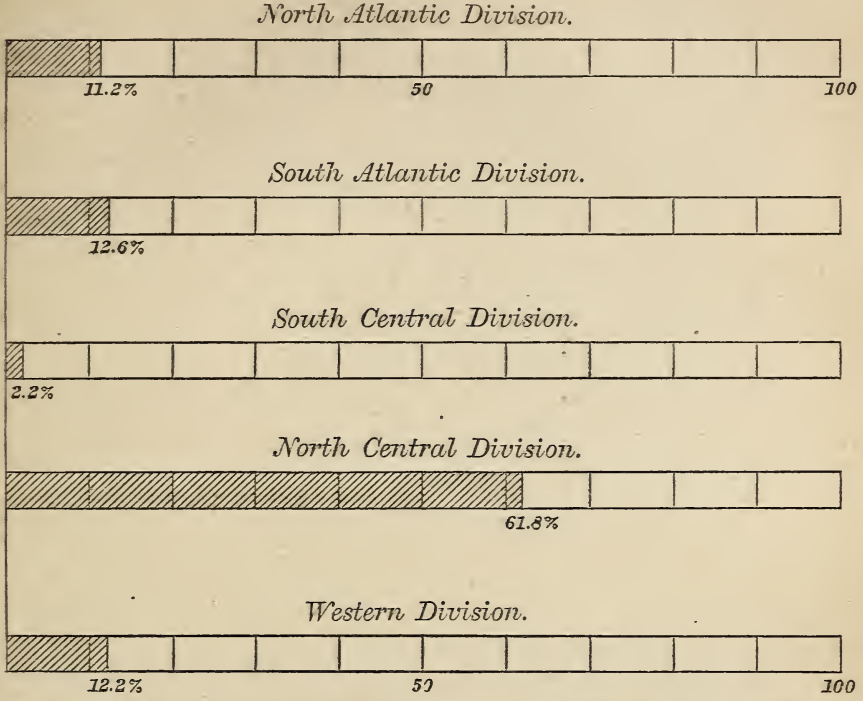
IX.—Diagram showing the sources of income of colleges and universities.



As would be expected, the amount of income derived from productive funds is greater than that from any other source, while the amount derived from tuition fees is but a little more than one-third of the total. As institutions supported by tuition fees nearly always expend their total annual income the small proportion of the cost of college education paid by students is again forcibly brought out. The inference is that vigorous institutions for higher education can not be self-supporting, but must receive aid from sources other than tuition fees.

The income derived from permanent funds was $3,966,083, distributed among the several geographical divisions as follows:

X.—Diagram showing the proportion of income from productive funds reported by the colleges and universities of the several geographical divisions.



Comparing diagram VI (p. 766), showing the ratio of institutions in the several divisions with the above diagram, it will readily be seen that the institutions of the North Atlantic Division are more generously endowed than those of the other divisions of the country. The institutions in this section are, comparatively speaking, old institutions with well-established reputations, having alumni scattered throughout the entire country. The rich man with money to give for educational purposes naturally turns to his *alma mater*, and, if he is not a college graduate, he designates an institution or institutions with well-established reputations. Thus the older institutions are constantly receiving large and numerous benefactions. The gifts and bequests to colleges and universities amounted in 1889–90 to $6,006,474, the distribution of which is shown in the following diagram:

XI.—Diagram showing the proportion of benefactions received by the colleges and universities of the several divisions.

The institutions of the North Atlantic Division received, as will be seen, 45.5 per cent of the total amount. The advantages possessed by this division in the matter of productive funds and benefactions are somewhat offset in some of the other divisions by State appropriations for current expenses.

The total amount of State or municipal appropriations in 1889–90 amounted to $1,406,117, distributed as follows:

XII.—Diagram showing the proportion of State or municipal appropriations received by the colleges and universities of the several divisions.

The North Atlantic Division reports 11.2 per cent of the appropriations here considered. Nearly the whole of this was received by the College of the City of New York from the city of New York, which it serves as a high school. The North Central Division reports 61.8 per cent of the total. In this division State universities have met with considerable favor, and the States have, as a rule, dealt with them very generously. It will also be seen that although nearly all the States comprising the South Central Division have State universities, the amount appropriated for their support was exceedingly small. They depend chiefly for their support upon students' fees and the income from productive funds. In a large number of the State universities tuition is free to residents of the State, and in the few cases where tuition is not free the charges have been made as low as the resources of the institutions would allow.

III.—Distribution of students in degree courses.

Table 2, page 773, presents, in a form convenient for comparison, the distribution of undergraduate students in the several degree courses for the successive years from 1886–87 to 1889–90. During the past few years the statistics necessary for the compilation of this summary have been given by the different institutions with a marked degree of accuracy and in considerable detail, thus enhancing the value of this representation.

The summary furnishes an indication of the trend of college education, which is virtually determined by the relative predominance of different courses of study for a period of time.

From an examination of the statistics included in this table it appears that the ratio of students in what is known as the classical or A. B. course is slightly decreasing. The greatest decrease is shown in the South Central Division, where the ratio in the classical or A. B. course has dropped from 59 per cent in 1886–87 to 47.9 per cent in 1889–90. It will also be seen that the South Atlantic Division continues to draw a larger ratio of its students to the A. B. course than any other section of the country. The movement here indicated, *i. e.*, the decrease of students in the A. B. course, will not be a surprise to anyone who has studied the subject of collegiate education in America during recent years. The colleges and universities of the country are continually forming new courses of study for which evidently there is a demand. But, notwithstanding the multiplication of courses leading to degrees other than the A. B., the number of students pursuing the A. B. course is still greater than the sum of all the students pursuing other degree courses.

The degree of A. B. does not at present necessarily imply that its possessor has acquired a classical education, for there are institutions that confer this degree on the completion of courses of study in which neither Latin nor Greek are included.

It is a matter of great regret that statistics showing the classification of students by courses for a long period of years can not be obtained. In making comparisons the data used should be for at least a period of ten years, so that temporary fluctuations of any sort whatsoever would be avoided. But, since such complete data do not exist, the reader and investigator must content himself with the briefer record.

A glance at the statistics will show that the percentage of students pursuing regular degree courses has increased with considerable regularity since 1886-87, the time when these statistics were first collected. It will also be noted that it is in the older portions of the country, the North and South Atlantic Divisions, in which the classical course has the deepest hold upon college students, while in the more recently settled regions more attention is given to the sciences and courses of study in which the ancient classics seldom find a place.

a Includes 2 bachelors of surgery. *b* Includes 2 dynamic engineers. *c* Includes 2 sanitary engineers and 6 metallurgical engineers.

IV.—Endowment funds of colleges and universities.

Although the number of colleges and universities in the United States is constantly increasing, both by the foundation of new institutions and by the development of institutions from secondary schools to colleges, this increase in the number of institutions has not thus far affected to any perceptible degree the increase in the endowment funds of the older institutions of the country.

The gifts of the people to higher institutions have been large and numerous and seem to be keeping pace with the increase in the population and wealth of the country. During the past few years a number of rich bequests have been made to old institutions, and also in not a few cases for the foundation of new institutions. The most notable of the latter are Clark University, Worcester, Mass., University of Chicago, Chicago, Ill., Catholic University, Washington, D. C., and Leland Stanford Jr. University, Palo Alto, Cal.

On account of the failure of a number of institutions to report to the Bureau from year to year a comparison between the total amounts of productive funds in 1880 and in 1890 would not show the true rate of increase in the funds during the last ten years.

The following tabular statement includes, first, only the institutions that reported on this subject in both 1880 and in 1890, and, second, all the institutions that reported in either year. From the first showing the average rate of increase may be inferred.

States.	Number of institutions.	Productive funds.		Increase.	1879-80.		1889-90.	
		1879-80.	1889-90.		Number of institutions.	Productive funds.	Number of institutions.	Productive funds.

North Central Division—Continued.				*Per ct.*				
North Dakota							2	$25,000
South Dakota							4	11,000
Nebraska	1	$25,000	$43,140	72.6	1	$25,000	7	1,236,700
Kansas	5	165,755	330,000	99.1	5	165,755	15	463,500
Western Division:								
Montana							1	3,000
Colorado							4	354,000
Nevada	1	90,000	91,000	1.1	1	90,000	1	91,000
Washington					1	5,000	2	12,000
Oregon	3	97,000	187,000	92.8	7	247,000	4	237,000
California	5	1,771,204	2,179,096	23.0	6	1,771,204	9	2,232,596

From this table it will be seen that, while the increase in the productive funds of the 191 institutions distributed over the entire country is 77.3 per cent, the largest increase has taken place in the forty-two institutions of the North Atlantic Division, which reported, in 1889–90, more than 56 per cent of the total amount included in the above table. The poorest showing is made by the institutions of the Western Division, but this can be accounted for in a measure by the small number of institutions reporting in 1880 and the number of new institutions that have been founded during the decade.

The most remarkable increase recorded is in the State of Louisiana. This is due to the establishment of the Tulane University of Louisiana, which is the successor of the old University of Louisiana. It has at present an endowment fund of more than $1,000,000.

The total number of colleges and universities reporting to the Bureau in 1889–90 was 415, and of this number but 315 answered the question relating to productive funds. Among those not answering this inquiry were Clark University, Princeton, Rutgers, Dartmouth, and Haverford, all of which have large endowment funds, and would have materially increased the total amount for 1889–90. The figures here given show an increase of 71.6 per cent, which would be considerably larger if all the institutions had reported.

V.—Grounds, buildings, and apparatus.

In considering the resources of institutions for higher education the material equipment, such as grounds, buildings, and apparatus, must not be lost sight of. The increase in the value of appliances is due, in great measure, to the increased attention given to the sciences and the consequent erection and equipment of laboratories for experiments and research. The substantial and ornamental style of architecture which has been adopted in the erection of college buildings has increased the cost of buildings while adding considerably to the general appearance of the college campus. In the following table an attempt is made to present in a convenient form the value of grounds, buildings, and apparatus of colleges and universities for the years 1879–80 and 1889–90. In order to show the rate of increase the table is divided into two parts, the first part containing statistics of such institutions only as reported in both 1879–80 and 1889–90, while the second part includes all the institutions that reported in either of the years under consideration.

States.	Number of institutions.	Value of grounds, buildings, and apparatus.		Increase.	1879-80.		1889-90.	
		1879-80.	1889-90.		Number of institutions.	Value of grounds, buildings, and apparatus.	Number of institutions.	Value of grounds, buildings, and apparatus.

a Decrease.

VI.—STATE UNIVERSITIES.

The establishment and management of State universities form an interesting subject for study and investigation. As early as 1787 the General Government passed an ordinance setting aside two townships of land in what is now Ohio for the support of a "university," and this precedent has been followed in the case of nearly every State since admitted into the Union. The funds derived from the sale of these lands have in almost every instance been devoted to the support of State universities, and if properly managed would have yielded handsome en-

dowment funds for such institutions. But in many cases the persons to whom the management of the lands was intrusted were in too great a hurry to dispose of them, often sacrificing them at a ridiculously low figure: in some cases they served as a means of "booming" a particular State, the lands being advertised and sold at very low rates, thus inducing settlers to locate; in a few cases, where the States disposed of the land and assumed the indebtedness therefor, the funds have been mismanaged and sometimes very much impaired.

The mismanagement of these lands and the funds derived therefrom has served one good purpose. The newer States, profiting by the experience of the older, are disposing of their lands advantageously, and by the time all of them are sold their universities will have endowments far exceeding those of the older institutions.

In a number of cases the funds derived from the sale of university lands have been considerably augmented by the land grant of 1862, which was given by some of the States to the State universities, while in other cases the fund was used for the establishment of separate and distinct institutions.

The State universities have also as a rule been generously treated by the legislatures of their respective States in the matter of annual and special appropriations. Very recently the legislature of Missouri granted to the State University at Columbia the direct tax refunded to the State by the General Government, amounting to $647,900. This amount is to be added to the permanent endowment fund, increasing the latter to $1,180,946.

The statistics of State universities for the year under consideration are given in the table on the following page.

TABLE 4.—*Statistics of State universities for the year 1889-90.*

Name.	Colleges of arts and science.				Number of students in graduate department.	Professional schools.			Total number of instructors.	Total number of students.	Number of endowed professorships.	Number of State scholarships.	Number of other scholarships.	Number of volumes in library.	Value of grounds, buildings, and apparatus.	Amount of productive funds.	Income from productive funds.	Receipts from tuition fees.	State appropriation.	Total income.	Benefactions.
	Preparatory department.		Undergraduate department.			Number of schools.	Number of instructors.	Number of students.													
	Number of instructors.	Number of students.	Number of instructors.	Number of students.

The following shows the present organization of the State universities and the manner in which the controlling power is chosen:

The *University of Alabama* comprises—

I. Academic Department—
- Classical course.
- Scientific course.
- Literary course.
- Civil engineering course.
- Mining engineering course.

II. Law Department.

It is controlled by—

Board of Trustees—
- Governor of State, *Ex officio.*
- State superintendent of education, *Ex officio.*
- 9 trustees appointed by the governor and confirmed by the senate.

The *University of California* comprises—

1. College of Letters—
   - *a* Classical course.
   - *b* Literary course.
   - *c* Course in letters and political science.
2. College of Agriculture.
3. College of Mechanics.
4. College of Mining.
5. College of Civil Engineering.
6. College of Chemistry.
7. Lick Observatory.
8. College of Law.
9. College of Medicine.
10. College of Dentistry.
11. College of Pharmacy.

It is controlled by—

Board of Regents—
- Governor. *Ex officio.*
- Lieutenant governor. *Ex officio.*
- Speaker of assembly. *Ex officio.*
- Superintendent of public instruction. *Ex officio.*
- President of State Agricultural Society. *Ex officio.*
- President of Mechanics' Institute of San Francisco. *Ex officio.*
- President of university. *Ex officio.*
- 16 regents appointed by the governor and confirmed by the senate.

The *University of Colorado* comprises—

1. Department of Philosophy and Arts—
   - Bachelor of arts.
   - Bachelor of philosophy.
   - Bachelor of science.
   - Bachelor of letters.
   - Master of arts.
   - Master of science.
2. Department of Medicine.
3. Normal School.
4. Preparatory School.

It is controlled by—

Board of Regents—
- President of university, *ex officio.*
- 6 regents elected by the people.

The *University of Georgia* comprises—

1. Franklin College—
   - Bachelor of arts.
   - Bachelor of science.
   - Master of arts.
   - Master of science.
2. State College of Agriculture and Mechanic Arts—
   - Bachelor of agriculture.
   - Bachelor of engineering.
3. School of Technology.
4. School of Law.
5. School of Medicine.

It is controlled by—

Board of Trustees—
- Governor. *Ex officio.*
- President of board of technological school. *Ex officio.*
- One from each Congressional district of the State, four from the State at large, and two from the city of Athens, appointed by the governor and confirmed by the senate.

The *University of Illinois* comprises—

I. College of Agriculture—
- Course in agriculture.
- Junior course in agriculture.

II. College of Engineering—
- Course in mechanical engineering.
- Course in electrical engineering.
- Course in civil engineering.
- Course in mining engineering.
- Course in architecture.

III. College of Natural Science—
- Course in chemistry.
- Course in natural history.

IV. College of Literature and Science—
- Course in English and science.
- Course in Latin and science.
- Course in ancient languages.
- Course in philosophy and pedagogy.

Other courses—
- Course in military science.
- Course in art and design.
- Course in rhetoric and oratory.

It is controlled by—

Board of Trustees—
- Governor of State. *Ex officio.*
- President of State Agricultural Society. *Ex officio.*
- State superintendent of public instruction.
- 9 trustees appointed by governor and confirmed by senate.

The *Indiana University* comprises—
I. College Department.
II. Law Department.
It is controlled by—
Board of Trustees—{5 elected by board of education.
{3 elected by alumni of university.

The *State University of Iowa* comprises—
I. Collegiate Department—{Classical course.
{Philosophical course.
{General scientific course.
{Literary course.
{Civil engineering course.
{Electrical engineering course.
II. Law Department.
III. Medical Department.
IV. Homeopathic Medical Department.
V. Dental Department.
VI. Pharmaceutical Department.
It is controlled by—
Board of Regents—{Governor.
{Superintendent of public instruction. } *Ex officio.*
{One member from each Congressional district who are elected by the general assembly.

The *University of Kansas* comprises—
I. Department of Literatures, Sciences, and the Arts—{General scientific course.
{Latin scientific course.
{Classical course.
{Modern literature course.
{Latin English course.
{General language course.
{Civil engineering course.
{Electrical engineering course.
II. School of Law.
III. School of Music.
IV. School of Pharmacy.
It is controlled by—
Board of Regents—{6 appointed by governor and confirmed by the senate.
{Chancellor—elected by the regents.

The *Louisiana State University and Agricultural and Mechanical College* comprises—
I. Subfreshman Department.
II. Collegiate Department—{Literary course—A. B.
{Agricultural course—B. S.
{Mechanical course—B. S.
III. Commercial course.
It is controlled by—
Board of Supervisors—{Governor of State.
{Sup't of public education. } *Ex officio.*
{President of university.
{12 members appointed by the governor and confirmed by the senate.

The *University of Michigan* comprises—
I. Department of Literature, Science, and the Arts, comprising courses leading to—{Bachelor of arts.
{Bachelor of philosophy.
{Bachelor of science.
{Bachelor of letters.
{Civil engineer.
{Mechanical engineer.
{Mining engineer.
{Electrical engineer.
{Master of arts.
{Master of philosophy.
{Master of science.
{Master of letters.
{Doctor of philosophy.
{Doctor of science.
{Doctor of letters.
II. Department of Medicine and Surgery.
III. Department of Law.
IV. School of Pharmacy.
V. Homeopathic Medical College.
VI. College of Dental Surgery.
It is controlled by—
Board of Regents—{President of university.
{8 regents elected by popular vote for terms of 8 years.

The *University of Minnesota* comprises—
I. College of Science, Literature, and Arts—{Classical.
{Scientific—School of Mining and Metallurgy.
{Literary.
II. College of Mechanic Arts.
III. College of Agriculture.
IV. Department of Law.
V. Department of Medicine—{College of Medicine and Surgery.
{College of Homeopathic Medicine and Surgery.
{College of Dentistry.

VI. Department of Veterinary Medicine.
VII. Graduate Department.
It is controlled by—

Board of Regents: Governor; Superintendent of public instruction; President of university. (*Ex officio.*) 7 members appointed by the governor and confirmed by the senate.

The *University of Mississippi* comprises—

I. Department of Science, Literature, and Arts: Bachelor of arts; Bachelor of science; Bachelor of philosophy; Master of arts; Doctor of philosophy.
II. School of Law.
It is controlled by—

Board of Trustees: Governor, *ex officio*. 15 members appointed by the governor and confirmed by the senate.

The *University of the State of Missouri* comprises the following schools:

I.—The Academic Schools.

A.—*Language.*

I. English.
II. Latin.
III. Greek.
IV. Modern Languages.
V. Hebrew.
VI. Sanskrit.
VII. Comparative philology.

B.—*Science.*

VIII. Metaphysics.
IX. Mathematics.
X. Physics.
XI. Chemistry.
XII. Geology and mineralogy.
XIII. Biology.

II.—The Professional Schools.

XIV. Agriculture.
XV. Pedagogics.
XVI. Law.
XVII. Medicine.
XVIII. Mining and metallurgy.
XIX. Engineering.
XX. Military science and tactics.
XXI. Art.
XXII. Commercial.

It is governed by—

Board of Curators: Consists of 9 members, appointed by the governor and confirmed by the senate.

The *University of Nebraska* comprises at present—

I. College of Literature, Science, and Arts: Classical; Literary.
II. Industrial College: Agriculture; Practical science; Civil engineering; Mechanic arts.
III. Latin or Preparatory School.
It is governed by—

Board of Regents: 6 members, elected by popular vote for terms of 6 years.

The *University of Nevada* comprises—
I. School of Liberal Arts.
II. School of Agriculture.
III. School of Mines.
IV. Normal Department.
VI. Business Department.
It is governed by a board of regents, consisting of three members, elected by popular vote.

The *University of North Carolina* comprises—

I. Undergraduate courses: Classical course; Philosophical course; Scientific course; Literary course; Engineering course.
II. School of Law.
III. School of Medicine.
IV. Graduate courses.
It is governed by—

Board of Trustees: Governor; Superintendent of public instruction. (*Ex officio.*) 80 members elected by the joint vote of the general assembly.

The *University of North Dakota* embraces—
I. Preparatory Department.
II. Collegiate Department: Classical course; Scientific course; Literary course.
III. Normal Department.
IV. School of Mines.
It is governed by a board of five trustees appointed by the governor and confirmed by the senate.

The *Ohio State University* comprises—

I. School of Agriculture
- Bachelor of agriculture.
- Short course in agriculture.

II. School of Engineering
- Civil engineering.
- Mechanical engineering.
- Mining engineering.
- Short course in mining.

III. School of Pharmacy.
IV. School of Veterinary Medicine.
V. School of Science.
VI. School of Arts and Philosophy
- Classical course.
- Philosophical course.

It is governed by—
Board of Trustees—7 members appointed by the governor and confirmed by the senate.

The *University of Oregon* comprises—

I. Collegiate Department
- Classical course. } A. B. degree.
- Scientific course. } A. B. degree.
- Literary course. } A. B. degree.
- English course. } A. B. degree.

II. Law School.
III. School of Medicine.
It is managed by—
Board of Regents—9 members appointed by the governor and confirmed by the senate.

The *University of South Dakota* embraces—
I. Preparatory Department.

II. Collegiate Department
- Classical course.
- Philosophical course.
- Scientific course.
- Literary course.

III. Music Department.
IV. Commercial Department.
The government of the university is vested in a board of nine regents, who appoint five trustees for the current management of the institution.

The *University of Tennessee* comprises—

A.—ACADEMIC DEPARTMENT.

I. College of Agriculture, Mechanic Arts, and Sciences.
- Literary scientific course.
- Latin scientific course.
- Course in agriculture.
- Course in civil engineering.
- Course in mechanical engineering.
- Course in chemistry and mining engineering.

II. University Department
- Courses leading to degrees of A. M., M. S., PH. D., C. E., MIN. E., MECH. E.

B.—PROFESSIONAL DEPARTMENTS.

I. Department of Law.
II. Department of Medicine.
III. Department of Dentistry.
It is controlled by a board of trustees, which is, in a measure, self-perpetuating. The board nominates members to fill vacancies, but the election is vested in the general assembly.

The *University of Texas* embraces—

I. Academic Department
- Bachelor of arts.
- Bachelor of letters.
- Bachelor of science
  - General course.
  - Engineering.
  - Chemistry.
  - Physics.
  - Geology.
- Special course in letters leading to a certificate.

II. Law Department.
It is governed by—
Board of Regents—8 members appointed by the governor and confirmed by the senate.

The *University of Virginia* comprises—

I. Literary Department.
II. Scientific Department.
III. Law Department.
IV. Medical Department.
V. Pharmaceutical Department.
VI. Engineering Department.
VII. Agricultural Department.

It is governed by a rector and board of visitors appointed by the governor and confirmed by the senate. They are nine in number.

The *State University of Washington* comprises—
I. Preparatory Department.

II. Collegiate Department
- Classical course.
- Latin scientific course.
- English scientific course.

III. Normal Department.
IV. Music and Art Department.
It is governed by a board of regents consisting of 7 members, who are appointed by the governor and confirmed by the senate.

The *West Virginia University* comprises—
I. Preparatory Department.
II. Collegiate Department—{Classical course. Scientific course.
III. Military Department.
IV. Law School.
V. School of Civil and Mining Engineering.
It is governed by a board of regents consisting of one member from each senatorial district and is self-perpetuating.

The *University of Wisconsin* embraces—
I. College of Letters and Science—{1. Graduate and fellowship courses. 2. Ancient classical course. 3. Modern classical course. 4. General science course. 5. English course. 6. Civic-historical course. 7. Special science course. 8. Special course for normal school graduates.
II. College of Mechanics and Engineering—{1. Civil engineering course. 2. Mechanical engineering course. 3. Mining and metallurgical engineering courses. 4. Railroad engineering course. 5. Electrical engineering course.
III. College of Agriculture—{1. Experiment station. 2. Graduate courses. 3. Long agricultural course. 4. Middle agricultural course. 5. Short agricultural course. 6. Dairy course. 7. Farmers' institutes.
IV. College of Law.
V. School of Pharmacy—{Graduate course. Pharmacy course.
It is governed by—
Board of Regents—{Superintendent of public instruction, President of university (*Ex officio*). 2 members from the State at large. 1 member from each Congressional district, appointed by the governor.

The *University of Wyoming* embraces—
I. Academic Department—{2 years' academic course. Sub-preparatory course. Business department.
II. College of Liberal Arts—{Classical course. Scientific course. Philosophical course. Literary course.
III. Normal School.
IV. Agricultural College.
V. School of Mechanics and Manual Training.
VI. School of Irrigation Engineering.
VII. College of Mechanic Arts.
It is governed by—
Board of Trustees—{President of university, Superintendent of public instruction (*Ex officio*). 9 members appointed by the governor.

VII.—DENOMINATIONAL INSTITUTIONS.

The majority of institutions for higher education in this country are at present carried on under the auspices of the several religious denominations. As stated before, the total number of institutions reporting to the Bureau in 1889-90 is 415, and of this number but 99 claim to be nonsectarian, leaving 316 that are under the control of some religious sect. It must not, however, be inferred that the instruction in denominational institutions has a sectarian bias. On the contrary a large number of them state particularly that their teaching is entirely unsectarian and that students will not be disturbed in their respective religious beliefs.

These denominational institutions have been the pioneers of higher education in several States, and have, at least in the Western States, prepared the way for the establishment of good State institutions. This they have succeeded in doing, not by advocating the establishment of such institutions, but by creating and fostering a desire for knowledge and making the people of the several communities realize the value of a liberal education. This much accomplished, the establishment of a State university naturally followed, the funds having been provided by the land policy of the General Government in setting aside certain tracts of land for the purpose of founding institutions of learning.

The proceeds arising from the sale of these lands are generally used in the establishment of new institutions in preference to giving the money to some one

of the institutions already in operation. This is rendered necessary by reason of the denominational relations of nearly all institutions for higher education not under State control. To give public money to any one of these institutions would cause a great deal of jealousy and bitterness throughout the State. Again, if the money were distributed among the different institutions of the States a great deal of its effectiveness would be destroyed. Thus it will be seen that the States have, as a rule, adopted the most feasible plan. The number of institutions under the control of the several religious denominations is as follows:

VIII.—ORGANIZATION OF A NUMBER OF LEADING UNIVERSITIES.

Having shown the organization of the State universities, an attempt is here made to present in a somewhat similar manner the organization of a number of other leading institutions for higher education in the United States. These institutions are well equipped not only with able professors and instructors, excellently chosen libraries, and scientific apparatus, but with valuable buildings and large productive funds, both of which are necessary for effective work. Nearly all of the selected institutions provide for advanced work in graduate departments in addition to the regular undergraduate and professional courses. They are well supplied not only with endowed professorships, but also with fellowships and scholarships to assist students in obtaining an education.

As will be observed, all the institutions with two exceptions are located in the extreme eastern section of the country, and among them are included the oldest institutions of the country. They are arranged in the order of their organization. The number of professors and students in the several departments in 1889-90 is given.

Name of institution.	Number of professors and instructors.	Number of students.	
		Male.	Female.
Harvard University	217	2,126	0

[a] The organization of Clark University is fully explained on p. 790.

IX.—Reorganization of Columbia College.

One of the most significant occurrences of the year was the reorganization of Columbia College, New York. President Low, in his report for 1889–90, treats this subject very fully, and the following facts are taken therefrom.

On the 6th of February, 1890, Columbia College in the city of New York, consisted of the School of Arts, the School of Law, the School of Mines, and the School of Political Science. In addition to these schools, which are under the direct control of the trustees of the college, the College of Physicians and Surgeons had become the Medical Department of Columbia College. The president, however, and the board of trustees have no responsibility as towards the medical department.[1]

Each of these schools, the School of Arts, the School of Law, the School of Mines, and the School of Political Science, had its own faculty, and each was administered without any reference to the others, almost without any consciousness of the others. There were indeed students of one school taking some

[1] This state of affairs has since been changed, and the medical department now enjoys the benefits of the reorganization of the university.

studies in one or another of the other schools, but in order to do this they were obliged to matriculate and pay the fee of $5 in each school in which they studied. Seniors in the School of Arts were permitted to elect certain subjects in the other schools. In fact, the attitude of the institution towards the student was one of multiplied opportunities, but opportunities held more or less out of relation to each other. What seemed especially to be needed, from the point of view of the student, was such a unification of the institution as would make its varied opportunities more available to those students whose equipment and capabilities justified them in desiring to study in more than one school.

The graduate work also stood in need of organization. It had grown to considerable proportions, but depended too much upon individual professors. There was no general standard to which all must conform.

"For this purpose," says President Low, "it was necessary to secure a body which could, in effect, direct the graduate work where it concerned itself with more than one school and provide a common standard for all the schools. Incidentally it was desirable, if possible, to place this work, in its general phases, under the charge of faculties rather than of individuals."

A faculty of philosophy was formed to take charge of the advanced work in philosophy, philology, and letters. The central body or university council was then formed, based primarily on the four university faculties of law, mines, political science, and philosophy, which between them comprise all the professors entitled to a seat in any faculty, and yet no professor sits in any more than one of them. The council was made to consist of twelve members, four of whom are men of letters, four of whom are men of science, and four of whom are men of law and political science.

It was decided that every student should matriculate simply as a student of Columbia, paying but the one matriculation fee, and thereafter that the facilities offered by any faculty or by all should be open to him, subject, of course, to any necessary regulations. Thus at one stroke Columbia ceased to be divided into fragments, and took upon herself the aspect of a university, wherein each department was related to every other and every one strengthened all.

The general control of the graduate work was also placed into the hands of the university council. "The result," says President Low, "has been to secure a common basis of requirement for the degrees of master of arts and doctor of philosophy, under whatever university faculty they may be obtained, which common basis represents a combination, for the most part, of the best requirements hitherto maintained in any quarter."

"The most important result of the reorganization of the institution thus far attained in its bearing upon the college proper is seen in the enlarged option already given to the members of the senior class. By a unanimous vote of the faculty of the School of Arts, it was resolved that courses under any university faculty designated by such faculty as open to seniors should be accepted as optional courses for seniors in the School of Arts. This action, being referred by the trustees to the president and university council with power, was unanimously indorsed by them. The senior year is thus made the point of contact between the college and the university. This arrangement, while it has the advantage of maintaining the dignity of the faculty of the college proper as a degree-granting faculty, has the other undoubted advantage of making the bachelor's degree seem, not so much the end of a student's course, as what it ought to be, merely an incident on the way to the true goal, the professional degree, or the degree of doctor of philosopy. While it in no way cheapens the bachelor's degree, it does shorten by one year the time required for the college and professional course combined."

X.—New Institutions.

Clark University, Worcester, Mass., was first opened for instruction, October 2, 1889. This institution was founded and endowed by Mr. Jonas G. Clark. Among the reasons given by Mr. Clark for choosing Worcester as the seat of the new foundation is the following: "Because its location is central among the best colleges of the East, and by supplementing rather than duplicating their work, he hopes to advance all their interests and to secure their good will and active support, that, together, further steps may be taken in the development of superior education in New England."

The corner stone of the main building was laid on October 22, 1887. The building is plain, substantial and well appointed, 204 x 114 feet, four stories high, and five in the centre, with superior facilities for heating, lighting, and ventilation, and has been constructed of brick and granite, and finished throughout in oak. The chemical building, erected in 1888, is constructed throughout of brick. The

dimensions of the building are 134.6 x 135 feet; the main body of the building is three stories, and the southwestern wing is two stories high. Another department building is in course of erection.

On April 3, 1888, Dr. G. Stanley Hall, then professor of psychology at Johns Hopkins University, was invited to the presidency. The official letter conveying this invitation contained the following expression, showing the liberal spirit animating the trustees and their confidence in the man whom they wished to honor: "They desire to impose on you no trammels; they have no friends for whom they wish to provide at the expense of the interests of the institution: no pet theories to press upon you in derogation of your judgment; no sectarian tests to apply; no guarantees to require, save such as are implied by your acceptance of this trust. Their single desire is to fit men for the highest duties of life, and to that end, that this institution, in whatever branches of sound learning it may find itself engaged, may be a leader and a light."

Having accepted this invitation, Dr. Hall was granted a year's leave of absence with full pay in order to inspect universities in Europe. During this year he visited every European country but Portugal, conferring with ministers of education, heads of universities, and leading scientific men. As a result of his investigations Dr. Hall, in his first annual report to the board of trustees, thus defines the work of Clark University:

"1. It must be of the highest and most advanced grade, with special prominence given to original research. This our country chiefly lacks and needs for both its material and educational welfare. This is in the current of all the best tendencies in the best lands, and is the ideal to-day of, I believe, about every scientific man, who is able and in earnest, throughout the world. For this our location offers the rarest opportunities and inducements yet possible in this country.

"2. We must not attempt at once to cover the entire field of human knowledge, but must elect a group of related departments of fundamental importance, and concentrate all our care to make these the best possible. Each science has become so vast and manifold that it is impossible to cultivate the frontier of all at a single university. This is more and more recognized abroad, and is still more true under our American system of private endowment than on the European plan, with a national treasury to draw from. If coming universities, instead of imitating, would supplement others, will elect each its group of studies, all the gain in economy and effectiveness which skilled labor has over unskilled will be secured in the field of highest education.

"3. For our group we chose at first five fundamental and related sciences. Work in science can be quickest organized. Great libraries and museums, and everything else that only age can bring, can be dispensed with at first, and a complete outfit of the best apparatus and of all needed books can be gathered in a short time. Again, this is a practical country, and its industries are sure to depend more and more on the progress of science. So far, we have utilized science with extraordinary ingenuity in our inventions, but have done comparatively little to create or advance it. We desire to make a patriotic endeavor to develop American discoverers as well as inventors. Finally, and above all, science, with its modern methods, has become an unsurpassed school of discipline, culture, and reverence.

"4. We must seek the most talented and best-trained young men. We must not exploit them for the glory of the institution, work them in a machine, nor retard their advancement, but we must give them every needed opportunity and incentive. Their salaries must be among the very best in the country; yet we must not ask them to spend their best energies in teaching and earning tuition fees for the university, and must leave open all possibilities, should such problems as individual fees, a periodic year in Europe, etc., arise later. We must give to those who know how to value it such facilities as we are able, that they may work for science and for themselves, requiring in return only a limited amount of mutual instruction, special and advanced enough to aid rather than divert from research (and no one is so eager and so able to teach the few fit as a discoverer), and careful conformity to a few obvious regulations."

The five sciences selected by the university are mathematics, physics, chemistry, biology, including anatomy and physiology, and psychology, including neurology, anthropology, criminology, and history of philosophy. In addition to these, modern languages are taught in a way to meet the practical needs of students in these departments. The policy of the institution is, first, to strengthen the departments already established, and then proceed to the establishment of those which are scientifically most closely related to the established departments.

According to the register for 1889-90, no clearly marked lines exist between instructors and students. Fellows and scholars who have attained some degree of mastery in a special line of work give brief special courses, which are often attended by professors. This is a stimulus to the student, and both tests and exhibits his powers in teaching. The total number of professors and students during the first session of the institution was 60, selected in part only from about 900 applicants for various positions. The number selected included graduates from forty-eight different universities and colleges. Only graduate students, or those of equivalent attainments, are admitted, unless in rare and special cases. The tuition fee is $200 per annum.

The University of the Northwest, Sioux City, Iowa, was opened for instruction in September, 1890. It is located at Morningside, a suburb of Sioux City, and is reached by the elevated railway. The institution is under the fostering care of the Methodist Episcopal Church, but is free from sectarianism, and will be conducted on broad Christian principles. The following departments have been established: Preparatory department; college of liberal arts; college of commerce; college of didactics; college of law; conservatory of music, and college of medicine. The college of medicine will be opened in September, 1891.

Lake Charles College, incorporated under the Louisiana statutes, June 22, 1887, is located at Lake Charles, in southwestern Louisiana. The college, preparatory and academic departments were opened for instruction, October 1, 1890. The institution is open to both sexes. The home life of the college is after the "cottage plan," and separate cottages are provided for young ladies and gentlemen, each accommodating about thirty students. Each cottage is under the care of a matron.

Parker College, Winnebago City, Minn., was founded by the Free Baptists, and was first opened for instruction in September, 1888. The college has $100,000 worth of property, $65,000 of which is productive endowment.

Cotner University, Lincoln, Nebr., was first opened for instruction in 1889, under the name of Christian University, which was changed to its present name on the 1st of June, 1890. This institution was established by the Christian Church of Nebraska, and is under the presidency of David R. Dungan, A. M. The courses already established are collegiate preparatory, normal preparatory, special Biblical, and medical. Other courses will be established when needed.

Black Hills College, Hot Springs, S. Dak., was founded by the Black Hills Mission of the Methodist Episcopal Church, and opened for instruction on Thursday, September 11, 1890. The college building is constructed of gray sandstone. It is 54 feet wide, 74 feet long, and three stories high. The recitation halls are large, commodious, and well lighted. The campus is a gently rolled tract of land comprising 20 acres situated in the very center of the town.

University of Chicago, Chicago, Ill.—One of the most generous benefactors to the cause of education is Mr. John D. Rockefeller, a prominent member of the Baptist church. When the Board of American Baptist Education Society, in May, 1889, decided to establish a well-equipped college in the city of Chicago, Mr. Rockefeller made a subscription of $600,000 towards the purpose, which sum was increased during the succeeding year by about $600,000 more in subscriptions, representing more than two thousand persons. Three months after the completion of this subscription, Mr. Rockefeller made an additional proffer of $1,000,000. The following are the formal terms in which these subscriptions were made:

MAY 15, 1889.

Rev. FRED. T. GATES, *Corresponding Secretary*
AMERICAN BAPTIST EDUCATION SOCIETY:

MY DEAR SIR: I will contribute $600,000 toward an endowment fund for a college to be established at Chicago, the income only of which may be used for current expenses, but not for land, buildings, or repairs, providing $400,000 more is pledged by good and responsible parties, satisfactory to the Board of the American Baptist Education Society and myself, on or before June 1, 1890, said $400,000, or as much of it as shall be required, to be used for the purpose of purchasing land and erecting buildings, the remainder of the same to be added to the above $600,000 as endowment.

I will pay the same to the American Baptist Education Society in five years, beginning within ninety days after completion of the subscription as above and pay 5 per cent each ninety days thereafter until all is paid; providing not less than a proportionate amount is so paid by the other subscribers to the $400,000; otherwise this pledge to be null and void.

Yours, very truly,

JNO. D. ROCKEFELLER.

CLEVELAND, OHIO, *September 16, 1890.*

To the Board of Trustees of the University of Chicago:

GENTLEMEN: I will contribute $1,000,000 to the University of Chicago, as follows:

Eight hundred thousand dollars, the income only of which shall be used for nonprofessional graduate instruction and fellowships, and not for land, buildings, or repairs.

One hundred thousand dollars, the income only of which shall be used for theological instruction in the divinity school of said University, and not for land, buildings, or repairs.

One hundred thousand dollars for the construction of buildings for said divinity school.

I will pay the same to the said University in seven years, beginning October 1, 1890, and pay one twenty-eighth each three months thereafter in cash or approved securities at a fair market value, until the whole is paid, it being understood that a certain pledge made July 15, 1890, for $56,500 to the Baptist Union Theological Seminary of Chicago shall be included in the above $1,000,000; and also that the said seminary is to become an organic part of the said University; and also that the transfer of said seminary to the grounds of the University of Chicago shall be made within two years from this date; and also that a thoroughly well-equipped academy shall be established in the buildings hitherto occupied by the said seminary on or before October 1, 1892.

Yours truly,

JOHN D. ROCKEFELLER.

The institution was chartered September 10, 1890, as the University of Chicago, and the management of the corporation is vested in a board of twenty-one trustees. The qualifications of the trustees and of the president of the University are thus set forth in the application for the charter:

"At all times two-thirds of the trustees and also the president of the University and of its said college shall be members of regular Baptist churches—that is to say, members of churches of that denomination of Protestant Christians now usually known and recognized under the name of the regular Baptist denomination; and as contributions of money and property have been and are being solicited, and have been and are being made, upon the conditions last named, this charter shall not be amended or changed at any time hereafter so as to abrogate or modify the qualifications of two-thirds of the trustees and the president above mentioned, but in this particular this charter shall be forever unalterable.

"No other religious test or particular religious profession shall ever be held as a requisite for election to said board, or for admission to said University, or to any department belonging thereto, or which shall be under the supervision or control of this corporation, or for election to any professorship, or any place of honor or emolument in said corporation, or any of its departments or institutions of learning."

The site of the University consists of three blocks of ground lying between the two South Parks of Chicago, and fronting on the Midway Plaisance, which is a park connecting the other two. One-half of this site was given by Marshall Field, of Chicago, and the other half was purchased at a cost of $132,500.

William R. Harper, Ph. D., professor of the Semitic languages and Woolsey professor of Biblical literature in Yale University, was elected to the presidency at the first meeting of the board. He has decided to accept the position to which he was elected by the unanimous vote of the board.

The work of the University will probably be begun in October, 1892, and is thus set forth in Official Bulletin No. 1, published by the trustees:

The work of the University shall be arranged under three general divisions, viz., The University Proper, The University-Extension Work, The University Publication Work.

1. THE UNIVERSITY PROPER will include—

(1) *Academies:* The first academy of the University will be established, in accordance with the terms of the gift of Mr. John D. Rockefeller, at Morgan Park, Ill. Others will be organized or affiliated as rapidly as favorable opportunities are presented.

(2) *Colleges:* Of these there will be organized—

(*a*) The College of Liberal Arts, in which the curriculum will be arranged with a view to the degree of B. A.

(*b*) The College of Science, in which the curriculum will be arranged with a view to the degree of B. S.

(c) The College of Literature, in which the curriculum will be arranged with special view to the study of Modern Languages and Literature, History, etc., with a view, likewise, to the degree of B. S.

(d) The College of Practical Arts, in which the curriculum will be arranged with greater reference, than in the other Colleges, to the practical departments of business and of professional life, with a view to the degree of B. S.

(3) *Affiliated colleges:* The character of affiliation will be determined by existing circumstances in particular cases.

(4) *Schools:* Of these, there will be organized—

(a) The Graduate School, which will include all graduate work of a nonprofessional character.

(b) The Divinity School, which will include the curriculum of study ordinarily presented by Divinity Schools.

As soon as the funds of the University permit, there will also be established—

(c) The Law School.

(d) The Medical School.

(e) The School of Engineering, which will include civil, mechanical, and electrical engineering.

(f) The School of Pedagogy.

(g) The School of Fine Art.

(h) The School of Music.

2. THE UNIVERSITY EXTENSION WORK, which will include—

(1) *Regular courses of lectures*, delivered in and about the city of Chicago, in accordance with the best developed plans of University Extension.

(2) *Evening courses* in college and university subjects, in and about the city of Chicago, for men and women whose daily occupation will not permit them to take advantage of the regular college and university courses.

(3) *Correspondence courses* in college and university subjects for students residing in all parts of the country whose circumstances do not permit them to reside at an institution of learning during all of the year.

(4) *Special courses* in a scientific study of the Bible in its original languages and in its translations, to be conducted by University instructors at the University at times which shall not conflict with University work.

(5) *Library Extension*, in connection with the preceding forms of University Extension work.

3. THE UNIVERSITY PUBLICATION WORK, which will include—

(1) The printing and publishing of University bulletins, catalogues, and other official documents.

(2) The printing and publishing of special papers, journals, or reviews of a scientific character, prepared or edited by instructors in the various departments of the University.

(3) The printing and publishing of books prepared or edited by University instructors.

(4) The collecting, by way of exchange, of papers, journals, reviews, and books similar to those published by the University.

(5) The purchase and sale of books for students, professors, and the University library.

The general regulations published by this institution will undoubtedly attract considerable attention on account of the many new features that will be introduced. Instead of the customary three months' suspension of work during the summer, the year is divided, for the purpose of instruction, into four quarters, beginning on the 1st day of October, January, April, and July, and continuing twelve weeks each, thus leaving a week between the end of one quarter and the beginning of the next. Each quarter is divided into two terms of six weeks each. Students will be allowed to take as vacation any one of the four quarters, or two terms of six weeks in different parts of the year. By attending four quarters per year, students will be able to complete the course in three years.

The courses of instruction will be classified as majors and minors. The major will call for 10 to 12 hours of class-room work each week, the minor for 4 to 6 hours. All courses are to continue six weeks, but the same subject may be continued through two or more successive terms either as a major or a minor.

The regulations regarding the teaching body will be fully appreciated by the members thereof. Each resident professor or teacher shall lecture thirty-six weeks of the year, 10 to 12 hours a week, and no instructor shall be required to lecture more than this amount. For any time that he may teach in addition to the three-quarters required, he shall receive either an extra two-thirds pro rata salary or an extra full pro rata vacation. A teacher who has taught three

years of 48 weeks each, or six years of 42 weeks each, will thus be entitled to a year's vacation on full salary.

XI.—NEW BUILDINGS DURING 1889-90.

Selma University, Selma, Ala.—A four-story brick building for dormitory and school purposes.

University of California, Berkeley, Cal.—A large and commodious building, costing $60,000, to be used as a chemical laboratory.

Napa College, Napa, Cal.—An astronomical observatory, equipped with an eight-inch equatorial telescope.

Hesperian College, Woodland, Cal., has sold its building and erected a new one one-half mile from the old site. The new building consists of three stories; the first is set apart for a boarding department; the second consists of the chapel and recitation rooms, while the third is used for societies, art department, laboratory, and library.

University of Colorado, Boulder, Colo.—Woodbury Hall is a new dormitory for male academic students, with accommodations for 48 young men.

Yale University, New Haven, Conn.—Osborn Hall, used as recitation rooms for the academical department, was erected in 1889 at a cost of nearly $200,000. Chittenden Library was erected in 1890.

Mercer University, Macon, Ga., has in process of erection a large building of brick and stone, three stories high, 102 by 155 feet, to cost about $25,000. It will contain a library room, a chapel, and several recitation rooms.

University of Illinois, Champaign, Ill., reports the erection of a new military building, 100 by 150 feet, in one grand hall for drill purposes and large audiences upon special occasions. The cost of the building is $15,000.

German-English College, Galena, Ill., will be removed in the fall of 1891 to Charles City, Iowa, where new buildings are in course of construction. The city gives to the college $30,000 cash, a campus, and the use of city water for ten years.

Illinois College, Jacksonville, Ill., will erect during 1891 a new gymnasium to cost $10,000, which will be equipped with apparatus, etc., costing $2,000.

Northwestern College, Naperville, Ill., has erected a new building, 71 by 41 feet, which provides, among other accommodations, a limited number of rooms for lady students.

Indiana University, Bloomington, Ind., reports the completion of library hall, 140 by 75 feet. The central part of the building is occupied by the book stacks. The ends of the building are two stories high and contain rooms used for various library purposes, seminary rooms, etc.

Wabash College, Crawfordsville, Ind.—Yandes Hall, the new library building, is expected to be completed in June, 1891. It is fireproof and built in the form of a cross, extending 110 feet east and west, 90 feet north and south, and is two stories high.

Hanover College, Hanover, Ind., reports the completion of an astronomical observatory. It consists of a central building two stories high with wings on the east and west sides. The telescope, which is on the second story of the central building, is a 7½ inch. A good transit instrument is placed in the eastern wing, while the western wing is occupied by a Howard astronomical clock.

Butler University, Irvington, Ind.—A building for the preparatory department was erected in 1890 at a cost of $20,000. An astronomical observatory has also been completed and equipped.

Earlham College, Richmond, Ind., has completed the erection of a wooden structure, 60 by 40 feet, to be used as a gymnasium. It is well furnished with modern apparatus, and is under the charge of a director.

Luther College, Decorah, Iowa.—The main building (170 by 52 feet, four stories besides basement) was destroyed by fire May 19, 1889. A new building reared on the foundation of the old, and of the same dimensions, was dedicated and occupied on October 14, 1890.

Drake University, Des Moines, Iowa, reports that the Alumni Science Hall, a new brick building 60 by 80 feet, is being erected. It is three stories in height besides the basement, and will be occupied by laboratories, museum, gymnasium, etc.

Lenox College, Hopkinton, Iowa, has erected Clarke Memorial Hall at a cost of $8,000. It is to be used as a boarding hall for young ladies. An astronomical observatory has also been erected.

Two buildings were erected by *Simpson College*, Indianola, Iowa, during 1889 and 1890. Science Hall contains the laboratory, museum, study and recitation rooms, and music and art rooms, while Ladies' Hall affords facilities for accommodating young ladies with rooms and board.

The *State University of Iowa*, Iowa City, will soon have two new buildings upon its campus. The twenty-third general assembly appropriated $50,000 for a building to be used as a chemical laboratory. It was begun in August, 1890, and will be ready for occupancy in September, 1891. The sum of $35,000 has been subscribed for a new building for the Christian associations. It will contain a large assembly hall, gymnasium, reading rooms, and bath rooms, and will be completed by September, 1891.

Iowa Wesleyan University, Mount Pleasant, Iowa, has in course of erection a new Chapel and Science Hall. The building will be 102 by 95 feet and will be used as chapel, laboratories, recitation rooms, professors' rooms, etc.

The main building of *Western College*, Toledo, Iowa, was destroyed by fire December 26, 1889. A new building much superior to that destroyed is now finished and occupied.

Washburn College, Topeka, Kans., reports the erection, at a cost of $37,000, of a new chapel building, of stone, 112 by 90 feet. Besides the audience room the building affords nine recitation rooms and a Y. M. C. A. room.

Johns Hopkins University, Baltimore, Md., reports the construction of a hall for the uses of the Y. M. C. A. The building is the gift of Mr. Eugene Levering, of Baltimore, and contains a large reading room, a room for devotional services, a committee room, an office for the dean, and a large assembly room where 429 persons may be seated.

Harvard University, Cambridge, Mass., has erected a substantial brick athletic building for the use of members of the principal teams and of other students. It has a floor area of 7,848 square feet and was the gift of Henry A. Carey, who gave $36,000 for its erection.

University of Michigan, Ann Arbor, Mich.—The State legislature and the city of Ann Arbor together appropriated the sum of $75,000 for the erection of a hospital building, which will greatly increase the facilities for clinical instruction.

Olivet College, Olivet, Mich., reports the erection of Burrage Hall and Adelphic Hall. The former, which is used as a library, is 110 by 52 feet and has a capacity of 100,000 volumes. Adelphic Hall, which is the home of the Adelphic Society, contains an auditorium, reception rooms, cloak rooms, library, committee rooms, and janitor's room.

University of Minnesota, Minneapolis, Minn.—Pillsbury Hall and Museum, the gift of Hon. J. S. Pillsbury, is used for instruction in science and for a museum. It is 245 feet in length and is built of stone. The Chemical and Physical Laboratory is built of Roman brick with red sandstone basement, 192 feet front, and furnishes accommodations to the departments of physics and chemistry. The Law building, 80 feet front, built of pressed brick with red sandstone trimmings, was finished in 1889. It contains a large room for library, a large lecture room, four smaller lecture and recitation rooms, and offices for the dean and professors.

The *University of Mississippi* reports the erection of a library building containing four large rooms and constructed on the modern style of architecture.

Bellevue College, Bellevue, Nebr., now furnishes boarding facilities for young ladies. Elwina Hall, a four-story building containing a dining room, kitchen, laundry, housekeeper's rooms, library, reception room, halls, and twenty-two rooms for young ladies was erected during 1889–90.

The *College of New Jersey*, Princeton, N. J., reports the erection of Albert B. Dod Hall to be used as a dormitory, of the magnetic observatory and of a dynamo building. A number of other buildings have been contracted for or are in course of erection.

Colgate University, Hamilton, N. Y., reports the erection in 1889 of a new library building. No particulars are given.

Cornell University, Ithaca, N. Y., reports the completion of Morse Hall. This building, which is for the exclusive use of the chemical department, is built of brick and is nearly fire-proof. It is 130 by 70 feet, with high basement and two stories, and contains forty rooms besides a large sub-basement. Additions have also been made to Sibley College.

Syracuse University, Syracuse, N. Y., has erected two fine buildings during 1889. The Library Building, erected at a cost of $40,000, is of limestone and Trenton brick with terra-cotta trimmings. It has abundant room for library appliances and shelving in the stack room for 135,000 volumes. The John Crouse Memorial College Edifice, built and furnished by the late Mr. John Crouse, and his son Mr. D. Edgar Crouse, is of Long Meadow red sandstone, with granite

foundations. It is four stories high, 162 by 190 feet. The amount expended upon the structure was $450,000.

Mount Union College, Alliance, Ohio, reports the erection of the Morgan Gymnasium at a cost of $10,000. It is 50 by 80 feet and built of brick. The basement contains bath rooms, lockers, bowling alley, and base ball cage. The main floor is devoted to gymnastic performances of all kinds, while in the second story there is a roomy, running gallery.

Calvin College, Cleveland, Ohio, has acquired and equipped Pestalozzi Hall, a large new building for the preparatory department.

Ohio State University, Columbus, Ohio.—The Electrical Laboratory, a two-story brick building, 75 by 45 feet, was erected in 1889. The first floor contains the engine and dynamo room, office, and washroom. On the second floor are a lecture room, a photometric room, a library room, and three measurement rooms. The building and its outfit are valued at $16,000. The Chemical Building was completed in 1890, and is occupied by the departments of general chemistry, agricultural chemistry, mining and metallurgy, and pharmacy. It is a two-story and basement brick building, 179 by 132 feet. The building and contents cost about $62,000.

The University of Oregon, Eugene, Oregon, erected a new building to be used as a gymnasium. It is built of brick and cost $4,500.

Pennsylvania College, Gettysburg, Pa.—The Recitation Hall, completed in 1889, contains on the first floor, library room and office, president's office, reception and recitation rooms. The second floor has recitation rooms. The third floor contains a museum room, mineralogical laboratory, infirmary, and two society halls, while the basement is designed for a physical laboratory. Brua Memorial Chapel was erected in 1889-90, and is used for morning chapel service, commencement exercises, lectures, and other occasions requiring a large audience room.

Bucknell University, Lewisburg, Pa., reports the erection of two new buildings. Bucknell Laboratory is 43 by 86 feet and has two stories above the basement. On the first story are a lecture room and a working room for individual work in chemical analysis; the second floor contains a lecture room and one room each for quantitative and qualitative analysis; the basement has a dark room for photometry, a room for applied chemistry, another for electricity, and a fireproof room. The Tustin Gymnasium is built of brick and stone, and contains, in the basement rooms for lockers, wardrobes, dressing rooms, shower baths, furnaces, and coal. The second story rises 22 feet from the main floor to the square and is open to the roof. At the height of 12 feet a running track gallery, 6 feet wide, surrounds the room.

The *University of Pennsylvania*, Philadelphia, Pa., reports the erection of a large library building. The storage capacity is for 350,000 volumes, but the book stack admits of indefinite extension. The building is fireproof, and the plans for the erection of it were subjected to severe criticism and were widely altered in many respects before final adoption.

The Young Men's Christian Association of the *University of Tennessee* has erected a handsome separate building for the association. The building is a substantial structure of pressed brick and stone, covered with slate, and was planned with special reference to its uses. The building affords ample facilities for physical culture and is equipped with a complete set of standard gymnastic apparatus.

Carson and Newman College, Mossy Creek, Tenn., reports the erection, in 1890, of a college building costing $20,000.

Fisk University, Nashville, Tenn., reports the erection of a gymnasium and workshop. The gymnasium is furnished with apparatus both for the young men and for the young women.

University of Texas, Austin, Tex.—Brackenridge Hall, to be used as a club house, was erected in 1890 at a cost of $16,000. It is a hall for students, containing lodging rooms and a restaurant. The building is of brick, trimmed with stone, and is four stories high. Besides the large dining room, kitchen, etc., the building contains twenty-four rooms, each 22 by 15 feet. The erection of the central building in 1889 at a cost of $75,000 is also reported.

The *University of Vermont*, Burlington, Vt., reports the completion of the Billings Library at a cost of $153,000. The building has a shelving capacity of 100,000 volumes and contains the general library of the university and the special collections. Three new houses for professors were erected in 1889-90 at a cost of $12,000 each.

Randolph-Macon College, Ashland, Va., has erected a new Science Hall costing $10,000, to be used for lecture rooms and laboratories for practical work in physics and biology.

Three buildings were erected in 1889 by *Emory and Henry College*, Emory, Va. The William Morrow Science Hall contains a chemical lecture room, chemical laboratory, physical lecture room, cabinet of minerals and fossils, apparatus room, room for chemical calculus, etc. The Sam W. Small Gymnasium is a large octagonal building constructed with reference to a double use, viz, during the session, for bodily exercise, and at the close, as a public auditorium. Its seating capacity is about 1,600. Byars House is the college boarding house and hotel. Students are not allowed to room in this building, as the rooms are kept for hotel purposes. The third floor of the building is occupied by two society halls.

Washington and Lee University, Lexington, Va., reports the erection of a gymnasium. No particulars are given.

West Virginia University, Morgantown, W. Va., reports the erection of a new hall to be used as an armory, gymnasium, and commencement hall.

Beloit College, Beloit, Wis., reports the completion of Scoville Hall at a cost of $25,000. This building is for the use of the preparatory department.

MISCELLANEOUS NOTES.

The *College of St. Augustine*, Benicia, Cal., reports that it was suspended during 1889-90 on account of the murder of the vice-president of the college by two students who were refused their diplomas, having been found deficient in mathematics.

Wesleyan University, Middletown, Conn., reports the organization of a department of English language.

Moore's Hill College, Moore's Hill, Ind., established a normal school simultaneously with the abolishment of the De Pauw Normal School.

Kentucky University, Lexington, Ky., was opened to women in 1889. The president says that coeducation has proved a success with them.

Kentucky Classical and Business College, North Middletown, Ky.—The building with its contents was burned in November, 1889, and will not be rebuilt at present.

Kentucky Wesleyan College has been removed from Millersburg to Winchester, where new buildings have been erected.

The trustees of the *University of Mississippi* have decided to establish a department of pedagogy.

Trinity College, North Carolina.—In March, 1890, Mr. Washington Duke, of Durham, N. C., offered to give $85,000 to the college in building and endowment, and Mr. J. S. Carr agreed to donate a magnificent tract of 63½ acres of land lying on the west of Durham as a site on condition of the removal of the college to that city. These offers were promptly accepted and buildings are now in course of erection. The main building to cost $50,000 will be three stories high and will have a main front of 200 feet long and 50 feet wide, with two end wings, extending 50 feet back. This building contains 60 dormitories, each consisting of a bedroom and study, 12 lecture rooms and offices, laboratories for the use of the professors, apartments for assistants and employés, and a basement under the entire building. The technological building contains separate apartments for the manual training school, the schools of civil, mechanical, and electrical engineering, two laboratories, two lecture rooms, a carpenter shop, machine shop, and a blue print and photographer's room. The Dining Hall and Chapel contains on the first floor, a dining hall with a capacity of 200 seats, and the second floor a chapel with a capacity of 500. The gymnasium is 80 by 40 feet, and will be furnished with good gymnastic appliances. In addition to the foregoing buildings there have been erected a laundry building and seven residences for the faculty and officers.

CHAPTER VI.

LENGTH OF COLLEGE CURRICULUM.

Introduction—Reduction of Course Recommended in the Interest of Medical Students—Average Age of Freshmen—Increased Requirements for Graduation (Course of Study in Yale, 1824–25 and 1890–1891)—Average Age of Freshmen at Harvard—Method of Computing Average Age at Harvard—Remarks and Opinions of Prominent Educators: President Eliot and the Action of the Harvard Faculty—Ex-President Andrew D. White, of Cornell—President Gilman, of John Hopkins—Action of Columbia College—President Adams, of Cornell—President Angell, of University of Michigan—President Hyde, of Bowdoin—President Capen, of Tufts—President Warren, of Boston University—President Andrews, of Brown University—Mr. George L. Fox, of Hopkins Grammar School—Prof. Tracy Peck, of Yale—Significance of the A. B. degree.

INTRODUCTION.

The subject of higher education has been so ably discussed and set forth during late years by the leading college men of the country that it will be profitable to reproduce here some of their remarks.

Prominent among the subjects which have engaged attention is that of shortening the time required to complete the college course. The proposition took practical shape in the attempt made by the faculty of Harvard College to reduce the time required for obtaining the A. B. degree.

This attempt was made in the interest of those students who, after completing a college course take a full four years' course in medicine. By the method now in practice the average age at graduation of such students, according to President Eliot, is between 26 and 27 years. That this is an evil and that something ought to be done to remedy it is generally admitted; but considerable opposition has been developed to the propositions advanced with this end in view, more especially by the smaller colleges of the country. To these institutions the abridgment of the course would mean, for some time at least, a diminished attendance and consequently a diminished income from tuition fees, while to replace this loss a larger increase in the productive funds of the colleges would be required than there is any reasonable hope of obtaining.

The Harvard plan of shortening the course is given farther on. Another and less radical measure looking to the accomplishment of the same purpose as the shortening of the college course has been proposed. This plan allows seniors to elect the first year studies of the professional department which they propose to enter; but this plan, it is evident, can be adopted only by those institutions which have professional departments in close proximity to the college.

Age of freshmen.—Before giving the views of college presidents on this subject it may be well to consider the age of college students. An inquiry on this subject was addressed by this Office to the colleges and universities of this country, 220 of which have returned fairly satisfactory answers. The inquiry was worded as follows: "How does the average age of the members of the freshman class in your institution compare with the average age ten years ago?"

Of the 220 institutions replying, 102 reported the average age as being the same as ten years ago; 65 reported a lower average, and 53 a higher average. Of the 65 institutions in the second category 52 give the age as "slightly lower," or "less than one year;" 9 report it as being between one and two years lower, and 4 report it as between two and three years lower. Of the 53 that report the age as higher, 36 say it is slightly or less than one year higher, 12 report it as being between one and two years higher, and 5 report it as between two and three years higher. But we must not lose sight of the fact that in a large number of these institutions the requirements for admission have been raised considerably

during the last ten years, which would naturally have a tendency to raise the age at admission, provided no improvement had been made at the same time in the secondary schools preparing for the colleges. Of the 220 institutions answering the inquiry as to the age of their students, 81 say that the requirements for admission have been raised; and of these 81 institutions the standard of 54 has been raised without increasing the age; in fact, 23 of these 54 institutions say that the age is lower than ten years ago. The requirements for admission have been raised in 27 of the 53 institutions that report the age as having increased, and it may be well to note the fact that of the 12 institutions in the North Atlantic Division reporting an increased age, 10 show an increase in the requirements for admission.

The foregoing information, summarized by States, is given in the following table.

Average age of freshmen as compared with the average age ten years ago.

States.	Number of schools reporting.	Number reporting the age as—			Number in which the requirements for admission have been raised, and reporting the age as—		
		Same.	Lower.	Higher.	Same.	Lower.	Higher.
United States	220	102	65	53	31	23	27

Increased requirements for graduation.—A comparison of the following courses of study in Yale College for the years 1824–25 and 1890–91 will give some idea of the increased requirements for graduation in this country.

1824-25.

FRESHMAN CLASS.

First term.—Livy, two books; Adams' Roman Antiquities; Webber's Arithmetic reviewed; Day's Algebra begun.

Second term.—Livy continued through five books; Græca Majora; Xenophon's Cyropædia and Anabasis; Day's Algebra finished.

Third term.—Græca Majora, Herodotus, Thucydides, Lysias, and Isocrates; Morse's Geography; Murray's Grammar.

SOPHOMORE CLASS.

First term.—Horace, Odes and Satires; Græca Majora, Demosthenes, and Xenophon's Memorabilia; Playfair's Euclid, six books.

Second term.—Euclid finished and reviewed; Horace finished and reviewed; Græca Majora, Plato, and Aristotle; Day's Mathematics; Plane Trigonometry; Nature and Use of Logarithms; Mensuration of Superficies and Solids, and Isoperimetry.

Third term.—Græca Majora, Vol. I finished; Cicero de Officiis, de Senectute, and de Amicitia; Day's Mathematics, Mensuration of Heights and Distances, Navigation and Surveying; Dutton's Conic Sections and Spherical Geometry; Jamieson's Rhetoric.

JUNIOR CLASS.

First term.—Cicero de Oratore; Homer's Iliad, Robinson's; Dutton's Spherical Trigonometry; Enfield's Philosophy, four books.

Second term.—Tacitus; The History de Moribus Germanorum and Agricola; Græca Majora, Vol. II; Sophocles and Euripides; Enfield's Philosophy finished and reviewed.

Third term.—Enfield's Astronomy; Lytter's History; Vince's Fluxions; Græca Majora, Vol. II continued, or Hebrew.

SENIOR CLASS.

First term.—Blair's Rhetoric; Hedge's Logic; Locke's Essays.

Second term.—Paley's Natural Theology; Stewart's Philosophy of the Mind.

Third term.—Paley's Moral Philosophy; Paley's Evidences of Christianity.

1890-91.

FRESHMAN CLASS.

Greek.—Homer's Odyssey, five books: Xenophon's Hellenica; Herodotus, seventh book.

Latin.—Livy, Books XXI and XXII; Tusculanæ Disputationes, De Amicitia, and De Senectute of Cicero; Satires of Horace; Prose Composition; History of the Roman Republic.

French or German.—Three hours a week throughout the year. Students may at their option either continue the study of the modern language presented for admission or begin the study of German in case they have not previously pursued it.

Mathematics.—In Geometry: Planes, polyhedrons, cones, cylinders, and spheres. Projection of figures with exercises on models (Chauvenet).

Plane Trigonometry: Solutions of Triangles, Mensurations, and Surveying (Richards); Trigonometric Analysis (Case).

Algebra: The geometrical interpretation of the Theory of Equations, Imaginaries, and the Solution of Higher Equations (Phillips and Beebe).

Oriental History.—One hour a week. A general view of Egyptian, Assyrian, and Babylonian and Persian history, with special reference to Biblical and classical history.

SOPHOMORE YEAR.

Greek.—Sophocles' Antigone and Electra; Euripides' Medea; Thucydides, first book; Isocrates' Panegyric; Plato's Apology.

Latin.—Pliny's Letters; Agricola and Germania of Tacitus; Odes and Epodes of Horace; Menæchmi of Plautus; Andria and Adelphi of Terence; sight reading.

Modern Languages.—Advanced French or German, two hours a week.

Mathematics.—Trigonometry: Spherical Trigonometry; Applications to Navigation and Astronomy (Richards).

SOPHOMORE YEAR—continued.

Analytical Geometry: Plane and Solid, with application to map projection (Loomis).

Mechanics.—Kinematics, Kinetics (or Dynamics), and Statics (Dana).

Astronomy.—Loomis.

English.—Half year, readings in Addison, Lamb, De Quincey, Macaulay, Ruskin, and Arnold; half year, compositions connected with the theoretical study of rhetoric.

Compositions.—Throughout the year.

JUNIOR AND SENIOR YEARS.

The prescribed courses of junior year occupy six hours per week, and those of senior year two hours per week. In addition, each member of the junior class is required to select nine hours per week and each member of the senior class thirteen hours per week from a list of elective courses.

PRESCRIBED STUDIES OF JUNIOR YEAR.

Physics.—Ganot's Physics: First term, liquids, gases, sound, and light, and part of the subject of heat; second term, heat, electricity, and magnetism.

Logic.—Jevons's Logic; Fowler's Inductive Logic; lectures.

Psychology.—Porter's Elements of Intellectual Science; lectures.

Ethics.—Porter's Elements of Moral Science.

Theism and Evidences of Christianity.—Lectures.

PRESCRIBED STUDIES OF SENIOR YEAR.

Philosophy.—One course of two hours per week in psychology, ethics, or history of philosophy.

Average age of freshmen at Harvard.—The following table showing the age of freshmen at Harvard College is taken from the report of the president of that institution for the year 1889-90:

Age of students who entered the freshman class of Harvard College, 1856-1890, inclusive.

Year.	14-15.	15-16.	16-17.	17-18.	18-19.	19-20.	20-21.	21-22.	22-23.	23-24.	24-25.	25-26.	26-27.	27-28.	28-29.	29-30.	30-31.	32-33.	44-46.	Average age.	No. admitted.[a]
																				Yrs. M.	
1856	4	16	44	34	29	7	1	4	----	3	----	2	----	----	----	----	----	----	----	17 7	144
1857	----	6	31	27	25	8	3	3	----	5	----	----	----	----	----	----	----	----	----	17 11	108

a On the assumption that all who ever joined each class were admitted as freshmen. *b* 45 years old. *c* 44 years old.

From this table it would appear that the average age has been increased in thirty-four years by a little more than seventeen months. But let us inquire into the manner of arriving at these results. The secretary of Harvard University, in a communication received August 16, 1890, gave the average age of the freshman classes for the last ten years as follows:

	Years.	Months.		Years.	Months.		Years.	Months.
1880	18	11⅔	1884	18	9 7/10	1888	18	11⅔
1881	19		1885	18	10 1/12	1889	18	11⅓
1882	19		1886	18	11⅝	1890	18	9½
1883	18	9	1887	18	11⅙			

As the figures in the president's report did not agree with those given by the secretary, a letter was written to the latter asking him which of the two sets of figures should be used in the compilations of the Bureau. The following reply was received March 5, 1891:

"The table in the President's report is the best authority, as it contains all recent changes and corrections in the age statistics.

"The most marked changes are due to the embodying in the figures of persons entering the classes of 1890, 1891, 1892, and 1893 (*i. e.*, the freshman classes marked 1887, 1888, 1889, and 1890) with advanced standing. For example: If a man comes from Yale or Amherst after graduation and enters our senior class

his age is added to the freshman table of that class as though he had entered three years earlier as a freshman.

"As 73 men were admitted to advanced standing this year, you can readily see that the chance of change in the average is very strong. * * * From what I have said you will see that the present figures for 1888, 1889, and 1890 will change slightly until the classes of '92, '93, and '94 have been graduated."

Prior to 1873 the catalogues of Harvard do not show the presence in the undergraduate department of students who had already taken the A. B. degree at some other college. In 1873 three such students were enrolled in the senior class, but the year when such degrees were received is not given until the year 1887. In order to show the number of such students in the different classes a rigid examination of the catalogues has been made, with the following results:

1873. Senior class, 3.
1874. Senior, 2; junior, 2.
1875. Senior, 5; junior, 1.
1876. Senior, 7.
1877. Senior, 5; junior, 1.
1878. Senior, 1: sophomore, 1.
1879. Not noted.
1880. Senior, 2.
1881. Senior, 6; junior 6.
1882. Senior, 9; junior, 6; sophomore, 1.
1883. Senior, 8; junior, 4; sophomore, 1.
1884. Senior 15; junior, 4.
1885. Senior, 8; junior, 6.
1886. Senior, 8; junior, 1; sophomore, 1.
1887. Senior, 1 (1883); 4 (1885); 3 (1886); 1 (1887).
1888. Senior, 2 (1887); 6 (1888); junior, 2 (1887); 4 (1888); sophomore, 1 (1885); 1 (1886).
1889. Senior, 1 (1880); 1 (1886); 2 (1887); 5 (1888); 4 (1889); junior, 1 (1887); 3 (1889); sophomore, 1 (1889).
1890. Senior, 2 (1887); 4 (1888); 7 (1889); 14 (1890); junior, 1 (1883); 1 (1887); 1 (1890); sophomore, 1 (1889).

The figures from 1873 to 1886, inclusive, have not much significance beyond giving the number of such students, inasmuch as the years when the students had received the A. B. degree are not given. In order to show to what an extent the aggregate age of the Harvard freshman classes are raised by the methods of computation employed by that institution, let us examine into the probable ages of students who had received the A. B. degree and were members of the senior class in 1889-90. By looking at the table above given we find that a member of that class had received his A. B. degree in 1880. Supposing that he was 22 years of age when he received his degree he would have been 31 years old when he entered the senior class of Harvard. According to the method of computation there, as given by the secretary, his age as a freshman at Harvard is used as 28 years, when really he was a freshman at some other institution ten years before and had never been in the Harvard freshman class. By means of such methods thirty-four years were added to the total of the ages of members of this freshman class by taking the ages of students who had already received the degree of A. B. elsewhere. In our investigations no note was made of students who had received a degree other than A. B. Of these there are quite a number; there are also students who had not taken a degree, but were admitted to advanced standing. Some idea of the number of such students in the different classes may be formed from the fact that in 1890 seventy-three students were admitted to advanced standing, while the catalogue shows the presence of but thirty-one students in the college who had already received the degree of A. B. at some other institution. The number of such students entering the undergraduate department of Harvard is constantly increasing, and this fact will of course have the tendency to continually increase the average age of the freshman classes as this is now being computed. Nor is it likely that a large number of the graduates who thus raise the age will ever pursue the study of either law or medicine, but are merely pursuing liberal studies and very likely fitting themselves to teach. Speaking of these students, the dean of the graduate school of Harvard says: "A large proportion of these students should properly be classed in the graduate school; but many of them have elected to enter the undergraduate department in order to avail themselves of Price Greenleaf aid and of scholarships which can be given only to students of the college."

From the above statement of the dean it would appear that these students are not actuated so much by the desire to obtain the Harvard A. B. as by the desire to receive Harvard aid for the purpose of pursuing post-graduate studies, and it seems that such students should not be included in the computations. The real average age of a freshman class is the average obtained from the ages while they are freshmen, and the average age of a senior c ass should be obtained by adding the ages of the members of the class and dividing it by the number of members in the class, and not by adding four years to the average age of the freshman class, for a sufficient number of students might have been dropped to change

materially the average age. From these statements and explanations it will be seen that in comparing the age of the Harvard freshman class with that of other institutions it must be borne in mind that the methods of computation employed by Harvard are different from those generally used, and the result does not represent the age of the freshman class as such.

Having shown that the increase in the average age of freshmen during at least the last decade is not general, as proved by the facts collected from the colleges throughout the country, we will now proceed to set forth the views of the most prominent educators upon the length of the college course and the propriety of reducing it. In collecting these expressions of opinion, an effort has been made to present it from every point of view. It is a matter of great regret that the opinions from the smaller institutions are so few. This is owing to the very small number of such institutions that publish the annual reports of their presidents. It is in these reports, and not in the general reports or catalogues, that remarks and recommendations upon subjects pertaining to general college matters are as a rule found.

PRESIDENT ELIOT AND THE ACTION OF THE HARVARD FACULTY.

The first remarks of President Eliot of Harvard on this subject appear in his annual report for 1885–86, where he calls attention to the comparatively advanced age at which graduates of colleges and scientific schools begin the study of medicine. In connection with this subject he says: "The average age at which Harvard graduates get the degree of A. B. is about 22 years and 7 months. If such bachelors of arts then spend four years in the study of medicine, they are 26 years and 7 months old when they are ready to begin the practice of their profession. The faculty consider this unreasonable postponement of entrance into practice a serious evil, which it is their duty to combat, since more than half of their students—and that much the best half—are graduates of colleges or scientific schools. They therefore laid before the academic council in June last a plan for the abridgment of the college course by those students who go from college directly into one of the professional schools of the university."

The medical faculty proposed that the first-year studies of the medical school be counted, under certain conditions, for the degree of A. B., which proposal was concurred in by the law faculty. This would have resulted in shortening the college course by one year for students who should pursue their professional studies to the full limit in the Harvard schools. The general subject of shortening the college course was then (December, 1887) submitted to a committee of nine professors, appointed by the president, who were to consider the subject in all its relations. No report seems to have been made by the board when President Eliot made his annual report for 1888–89, in which he again says: "Wherever the fault and whatever the remedy, it is clear that the degree of bachelor of arts is taken in the United States later than in any other country in which the degree is used, and too late for the best interests of the individuals who aspire to it and of the institutions which confer it."

On account of the pressure of other matters the college faculty was unable to give this subject full consideration until the year 1889–90, when eighteen meetings of the faculty, from November to March, were spent in its discussion. At last, March 25, 1890, the following was communicated to the president and fellows by vote (not unanimous) of the faculty:

"The faculty desires to modify its present regulations in accordance with the following propositions:

"1. That the requirements for the degree of bachelor of arts be expressed under suitable regulations with regard to length of residence and distribution of work, in terms of courses of study satisfactorily accomplished.

"2. That the number of courses required for the degree be sixteen.

"3. That when a student enters college there shall be placed to his credit, towards satisfying the foregoing requirements of sixteen courses, (1) any advanced studies on which he has passed in his admission examination beyond the number required for admission and (2) any other college studies which he has anticipated.

"4. That a student may be recommended for the degree of bachelor of arts in the middle as well as at the end of the academic year.

"In case the measures here proposed shall be adopted, it is the purpose of the faculty to encourage the anticipation of college studies by students at the time of their admission and to facilitate the attainment of the degree of bachelor of arts in less than four years.

"The faculty further proposes to advise parents and teachers that eighteen years is a suitable age for entering Harvard College."

A comparison of these propositions with the present requirements for the degree of bachelor of arts shows that, though the faculty does not, in so many words, advocate the reduction of the course from four to three years, it proposes by a slight reduction in the requirements to make it possible for close or diligent students to attain the degree in three years. The requirements for the degree at present are 18.2 courses and in three years the student completes at least 14.2 courses; so that, if the proposition to reduce the requirements to sixteen courses should be adopted and the conditions should remain the same, the student will complete the course in about three and one-half years, though, by anticipating some studies or by taking extra courses, as is frequently done even now, hard-working students would be enabled to complete the course in three years. It is to be remarked, however, that, although under the present conditions it is possible for students to complete the course in three years, very few have thus far accomplished it. According to the report of the dean of Harvard College for the year 1889-90 the number so completing the course during the last ten years was twenty-seven,[1] ten of whom graduated in 1890.

In the same report the dean says: "Among the great mass of the present students there is unquestionably a sentiment in favor of the traditional four years' course. If it should be made possible by moderate exertion to graduate in three years, there is nothing in the present attitude of the students to indicate that the majority would restrict their liberal training to this three years' minimum, any more than they are disposed to confine themselves to the minimum requirement of courses in any year. And these facts may well reassure those who fear that a general lowering of the standard of education would result from the adoption of the faculty's proposals." Another point that the dean emphasizes is that even if the course be reduced as proposed the standard of the degree will still be considerably higher than it was twenty years ago.

At the meeting of the Board of Overseers, October 8, 1890, the committee, to whom these propositions had been referred, submitted its report—only a qualified approval of the suggested changes—which was laid over for future action. The following are the principal recommendations made by the committee:

"*Voted*, That the Board of Overseers concurs with the corporation in the approval of the fourth proposal of the college faculty: that a student may be recommended for the degree of bachelor of arts in the middle as well as at the end of the academic year.

"*Voted*, That the Board of Overseers concurs with the corporation in its approval of the third proposal of the college faculty, provided it be amended by striking out the words 'the foregoing requirement of sixteen courses' and substituting therefor the words 'the requirements for the degree of bachelor of arts;' so that it shall read as follows: 'That when a student enters college there shall be placed to his credit towards satisfying the requirements for the degree of bachelor of arts any advanced studies on which he has passed in his admission examination beyond the number required for admission and any other college studies which he has anticipated.'

"*Voted*, That the Board of Overseers does not concur with the corporation in its approval of the first and second proposals of the college faculty: that the requirements for the degree of A. B. be expressed under suitable regulations with regard to length of residence and distribution of work in terms of courses of study satisfactorily accomplished; that the number of courses required for the degree be sixteen.

"*Voted*, That the Board of Overseers recommends the modification of the present regulations of the college faculty in accordance with the following proposition: That a senior intending to enter the medical school and to take the full four years' course therein may, under proper supervision, include in the requirements for the degree of bachelor of arts the courses on physiology and anatomy required in the first year of the medical school, each of said courses to count as one full elective course."

The committee thinks that if any time is lost it is in the preparatory schools, where considerable attention is given to athletics, etc.

The Board of Overseers, at a meeting in April, 1891, finally decided to reject all the proposals of the faculty.

[1] This includes, of course, only those students who entered as freshmen and completed the course in three years.

EX-PRESIDENT ANDREW D. WHITE.

Andrew D. White, LL. D., in an article entitled "The future of American universities," published in the North American Review for October, 1890, urges the reorganization of our college and university system. He calls attention to the very large number of colleges and universities in this country, especially to the number of small colleges with still smaller endowments, which possess all the powers of universities[1]. Although Dr. White does not expressly recommend the shortening of the college course, his plan for the reorganization of our university system would nevertheless accomplish that purpose, as well as reduce the age of college graduates. His plan is as follows:

"Let institutions of small endowment, whether called colleges or universities, frankly take their rightful positions; let them stop claiming to do work which their authorities know well that they can not accomplish in competition with the largely endowed universities. Let them accept the situation and begin their freshman year two years earlier than the present freshman year at most of the better colleges; that is, let them put their roots down into the great public-school system of the country and draw copiously from it. A course of instruction thus formed would begin with the beginning of the higher arithmetic, algebra, geometry, the principal modern languages, the elements of the natural sciences, and, for those who wish to study them, one or more of the ancient languages.

"Next, let this course in the intermediate college be continued up to the point which is at present reached, as a rule, in our colleges and universities of a good grade at the beginning of the junior year. After its four years' work, let the college bestow its diplomas or certificates upon its graduating classes and then let those who desire it be admitted into the universities upon the presentation of these certificates and diplomas.

"Next, as to the universities. In these let there be courses of advanced study, general, professional, or technical, covering, we will say, three years, and graduating men into the various professions."

According to this plan the degree of bachelor would be received two years earlier than it is at the present time. But let us see what effect this would have upon the significance of the degrees. At the present time some of the large institutions that confer the degree of doctor of philosophy demand three years of study after receiving the bachelor's degree and none demand less than two years; while, according to Dr. White's plan, but one year's study in addition to the time now required for the bachelor's degree would suffice for the attainment of the PH. D. degree.

PRESIDENT D. C. GILMAN.

Johns Hopkins University, Baltimore, Md., has for some time been maintaining courses of study leading to the degree of bachelor of arts and which were designed to be completed in three years. In view of this fact, it might easily be expected that President Gilman would be an enthusiastic advocate of the shortening of the college curriculum, but, as will be seen, he is very conservative on this subject. In an article entitled "Shortening the college curriculum," published in the Educational Review for January, 1891, he says:

"No general conclusion can be quickly reached on such a question. It must be settled in each institution according to its own circumstances. It must be tried in the local court before it is submitted to the court of appeals; that is, to the public. It does not follow that if one institution, even the strongest and most influential, decides to shorten its course, others will likewise do so. * * *

"The curtailment of the curriculum is chiefly urged for this reason: The number of persons who proceed to professional schools after taking a college course is much smaller than it should be; it is diminishing; and those who pursue a collegiate and then a professional course postpone till too late a period the actual business of life. For all such persons a year of preparatory work can well be spared."

Farther on he says: "As remedial agencies for this acknowledged difficulty I make the following suggestions:

(*a*) The authorities in our educational system should really, as well as nominally, distinguish between the requirements of three scholastic periods, namely:

---

[1] The chief blame for this condition in our country rests with the legislatures of the several States which grant these powers to institutions without defining the qualifications to be demanded for the attainment of degrees.

The school, the college, and the university; or, in other words, between what is essential, what is liberal, and what is special in a prolonged education.

(*b*) The period of college life, which of late years has been carried forward so that it extends on the average from 18.5 years to 22.5 years (in many, perhaps, most of the older colleges), may be brought back to an earlier age, say, from sixteen to twenty years.

(*c*) The significance of the baccalaureate degree should be restored, so that it may be, at least, a trustworthy certificate, an approximate measure, both of the capacity and of the acquisitions of the possessor. In one way or another a consensus should be reached as to the dignities, rights, and privileges to that degree appertaining.

(*d*) The rigidity of the class system should be relaxed, so that those who are exceptionally favored or exceptionally strong may, if they choose, run the course in less than the average time, and likewise so that any who are embarrassed by ill health, the necessity of earning a support, or the inadequacy of their early opportunities may spend more than the usual time without any implied discredit, indeed without attracting any attention.

(*e*) The enormous waste of time and energy at the school period, the time of preparation for college, must be stopped.

Dr. Gilman says that the result of the adoption of these remedies would be that school life would usually end at sixteen years of age, college life at twenty, and the young man would receive his professional certificate or his diploma of doctor of philosophy at the age of twenty-three years or thereabouts.

He also says: "If then the stronger universities would take the ground that, as a rule, none should be admitted to the professional courses or to the freedom of university instruction until they had attained a bachelor's degree, or in some other way acquired a corresponding preparation for advanced work, the reproaches of which we are conscious would soon disappear, and higher education would be more generally diffused, more wisely ordered, and more serviceable to the public."

ACTION OF COLUMBIA COLLEGE.

Although Harvard may have been the first to call attention to the excessive age of those students who, after completing a college course, enter professional schools, Columbia College, New York, was the first to make provisions by which students can complete both courses at an earlier age. In order to accomplish this end an entire reorganization of the institution was rendered necessary. As a result of this reorganization,[1] seniors in the School of Arts may select as optional courses such courses under any university faculty as may be designated by said faculty as being open to seniors. The senior year is thus made the point of contact between the college and the university. President Low, in speaking on this subject, says: "This arrangement, while it has the advantage of maintaining the dignity of the faculty of the college proper as a degree-granting faculty, has the other undoubted advantage of making the bachelor's degree seem not so much the end of a student's course as, what it ought to be, merely an incident on the way to the true goal, the professional degree or the degree of doctor of philosophy. While it in no way cheapens the bachelor's degree, it does shorten by one year the time required for the college and professional course combined."

PRESIDENT CHARLES KENDALL ADAMS, LL. D.

In his annual report for 1889–90, President Adams of Cornell University says there ought to be some means by which the work done in the last one or two years of the undergraduate course could be made to apply directly in the interests of those professional studies which students might desire to take up after completing their undergraduate work. After discussing the plan put in operation by Columbia College and that proposed by the faculty of Harvard University, he says:

"It is not my object in this connection to express an opinion in regard to either of these methods, but simply to point out that, whatever the weakness of either system may be, the substantially simultaneous efforts of two institutions as prominent as Harvard and Columbia to reduce the number of years necessary to complete the requirements for an advanced degree is one of unmistakable significance. The movement will unquestionably have not a little importance in influencing the development of higher education within the next few years."

---

[1] See p. 789.

PRESIDENT JAMES B. ANGELL, LL. D.

President Angell of the University of Michigan has a few words to say on this subject in his last annual report. He remarks:

"It certainly is desirable, and I believe possible, to save some time in the education of the men who take four years' work in college and then their professional training. I am convinced that considerable time can be gained in the better arrangement of the work in schools. After the student is prepared for college, two plans for completing his education in briefer time than has usually been consumed are possible:

"First. Only three years of college work may be asked for the bachelor's degree. In that case the student must be required to do more work in each year than he has done heretofore in college, or the standard of attainment for graduation must be reduced.

"Second. Substantially the plan which we have followed for several years may be adopted. The condition of attaining the bachelor's degree is not meeting a requirement of time, but of work. One must complete so many courses of study, a part of which are fixed, a part elective. While in order to avoid cramming there is a limit to the number of courses which a student may undertake at once, still, with the liberty given, a capable and industrious man may easily meet the requirements for the degree of bachelor of arts in three and one-half years, and a few exceptionally strong men in each class may do it in three years. But in case they are within half a year of graduation at the beginning of their fourth year, we allow them to enter any one of our professional schools and continue half work in the literary department. Having planned their course in advance, they have always elected some studies—the law students, constitutional history; the medical students, biology and chemistry—which either form a part of the professional course or are closely allied to it. Thus they are able without overwork or cramming to complete the college course and the first year's course in the law school or the medical school. This plan, which has been followed several years, has worked on the whole satisfactorily. Of course, it could be followed only by a university which has upon the same grounds its collegiate and its professional departments."

But President Angell doubts the expediency of the reduction of the college course from four to three years by the University of Michigan on account of the effect it would have upon the standard of education in the West. In this connection he says: "Without assuming too much for ourselves, we can hardly doubt that if we made the proposed change our example would compel the smaller colleges in this region and probably tend to bring all State universities in the West to make the change also. One who is familiar with the range of work now generally done in the Western colleges and universities can hardly think that it would be beneficial to the West to reduce the standard of graduation by a year's study, at least until the requirements for admission are considerably raised."

PRESIDENT HYDE OF BOWDOIN.

The November (1891) number of the Educational Review contains an article entitled The Policy of the Small College, which was contributed by Rev. William De Witt Hyde, D. D, president of Bowdoin College, Brunswick, Me. This article coming from a man who is himself at the head of one of the smaller colleges is so suggestive that extracts therefrom are here reproduced. He begins his article as follows:

"Now that we have the germs, more or less developed, of eight or ten universities, the college must prepare to take second place in our educational system. To ape the university and try to spread over the whole field of higher education, or to be jealous of the university and set up as its rival, is equally absurd and suicidal. Its proper policy is to accept with modesty and self-respect its new position, and by losing the old life of self-sufficient independence to find the new life of membership in the highly differentiated educational organism of which the kindergartens are the feet and the university is the head.

"There are three classes of educated persons: First, those whose knowledge of reading, writing, arithmetic, grammar, geography, modern history, descriptive science, and their native language and literature enables them to do ordinary business, to enter good society, and to enjoy periodical and popular literature. Second, those whose knowledge of ancient and modern languages and literatures, higher mathematics, experimental science, political and economic history, psychology, ethics, and sociology enables them to grasp the principles

of medicine, or law, or politics, or theology; to guide social progress and form public opinion; to enjoy the companionship of wise and good men of all lands and ages; and to appreciate the results in some department of scientific investigation or historical research. Third, those whose special training qualifies them to discover and interpret new truth within some chosen field of knowledge.

"To make scholars of the first class is the business of the school; to make scholars of the second class, and to discover and encourage those capable of entering the third class, is the business of the college; to train the chosen few who constitute the third class into full possession of productive powers is the business of the university."

The requirements for admission and the course of study to be maintained by the college are then discussed. He proceeds to show wherein the requirements for admission ought to be modified in order to bring the secondary schools and colleges into close connection. On this subject he says:

"The change is destined to become universal in the near future. As soon as the high schools are able to teach experimental science, French, and German as well as they now teach Greek and Latin, it will be the policy of the college to require for admission mathematics and English as at present; ability to read easy prose at sight in Latin, and either Greek, French, or German, and evidence of a thorough course in experimental science. We shall then have a considerable number of students fitting for college in the high schools, who will be for the most part in the same classes with the students who are not intending to enter college, instead of the small number who pursue a separate course, and thus receive an undue amount of the time of the teacher and an unjust proportion of the public school fund.

"This modification in requirement will necessitate some corresponding modifications in the course of study. It will be necessary to offer an elementary course in Greek, as well as in German and French, for those who wish to begin this study after admission to college. There should be a course in the history, literature, mythology, and archæology of Greece required of every student who has not studied the Greek language as a part of his preparatory or college course.

"The multiplication of highly specialized electives is not the province of the college. The expense is too great, and the profit to students at this stage too small.

"There are two fundamental lines of scholarly interest and two corresponding types of mind, the literary and the scientific.

"The college should, by its required courses, insure to every student an acquaintance with the first principles in both these fundamental lines of study. The college may wisely require of its candidates for a degree, ability to read both French and German, to write correct English, the elements of political and economic science, psychology, and ethics on the side of the literature and life of man, and higher algebra, geometry, and trigonometry, and the elements of chemistry, physics, and biology, on the side of mathematics and physical science.

"For the remaining half of the course sufficient electives should be offered to allow concentration on either literary or scientific studies, according to the taste and interest of the individual student.

"Such a readjustment of the conditions of admission and the course of study, together with improved methods of teaching in the lower schools, will allow pupils to enter college a year or two earlier than at present. No shortening of the course will be necessary. The difference between the best academies and high schools and those of inferior grade will express itself by the increased number of students who will enter college a year in advance.

"A. B. should be the ordinary college degree, and it should be given without reference to the precise nature of the course pursued. The degree means simply that the recipient is a liberally educated man. Attempts to discriminate between the educational value of courses of equal length and thoroughness in the same institution of liberal learning are relics of an educational superstition from which it is high time to emancipate ourselves.

"In order to encourage continued study during the year immediately following graduation the college is justified in granting the degree of A. M. to graduates who give evidence of having done the equivalent of a year's graduate study. Beyond this the college has no right to go. It owes to its undergraduates the full expenditure of its income and the full time of its professors, and if it attempts to divide its strength between graduates and undergraduates it does an injustice to both. It is the duty of the small college to drive away grad-

uates who desire a prolonged course of systematic instruction to larger institutions, which make graduate instruction their main concern.

"The degree of PH. D. no mere college has a right to confer, and the conferring of this degree by institutions which make no adequate provision for graduate instruction is the gravest breach of educational propriety."

PRESIDENT CAPEN, OF TUFTS COLLEGE.

The purpose of the Office being to present this subject impartially, the most strenuous objections that have been advanced to a change in the college course are here presented. The first of these is from President Capen, of Tufts College, who protests most vigorously against any reduction in the requirements for the degree.

In the course of his remarks on the subject he says: "Of course, if knowledge be substituted for discipline and culture; if the cramming process takes the place of those calm and thoughtful methods by which the intellect of man finds its most complete development, it is possible that many young men might cover the ground embraced by the college curriculum in three years. But if the attainment of the bachelor's degree is to be put within the reach of the majority of undergraduates in the shorter time by diminishing the courses of study now regarded as essential to it, few persons who have given attention to the subject will fail to esteem it as a lowering of the standard of general education."[1]

He does not agree with those who say that 27 is too advanced an age for a man to commence the practice of medicine. In connection with this he says: "It may well be asked who wants a stripling by the bedside of those whose lives are most precious to him?"

He also says that if the age of college graduates has been increasing in recent years it is due to the increase in the requirements for admission, and the remedy would be either to abridge these requirements or to so improve the facilities for secondary education that men may be brought to college at an earlier age. "For," says he, "if a youth has but seven years to give to study from the time he enters the secondary school until he receives the degree of bachelor of arts it is better that he spend three years in the fitting school and four years in the college than four years in the fitting school and only three years in the college."

PRESIDENT WARREN, OF BOSTON UNIVERSITY.

One of the leaders of the opposition in this matter is President Warren, of Boston University, who has done his utmost to arouse popular disapproval to the proposals of Harvard. His remarks have been given great publicity through the medium of the public press, so that but fragments thereof will be here presented. In an open letter to one of the overseers of Harvard University he says: "The scheme which I thought to propose is this: That every American classical college retain its present four-years' course, and simply notify all students of their successful completion of the junior year by conferring upon them at that point the title A. B. (Harv.), reserving the proper and legitimate A. B. as now for those who complete the entire course. This ought to satisfy Harvard, since it would greatly multiply the representatives of her ideas and standards, while, on the other hand, it would permit the other colleges to go on as usual, protecting and promoting the interests of liberal education, properly so called. This happy compromise seems to me so just and conservative of all interests that I take great pleasure in presenting it for your consideration and for the consideration of your distinguished colleagues."

Again, on October 31, 1890, the Boston Post contained a communication from Dr. Warren, from which the following is taken:

"As critical action is to be taken within a few days by the last of the governing boards of Harvard University, it may serve a useful purpose to set before the interested public a few pertinent facts and suggestions.

"First. The new measure now pending at Harvard makes no provision whatever for a compensative increase of the present requirements for admission to the freshman class.

"Second. The college is not understood to claim that its present requirements for admission are more exacting than those of any first-class American college. In fact, in consequence of their flexibility and of the provision for maxima and minima many a student now enters Harvard College who can not pass the en-

[1] Annual report of the president of Tufts College for 1889-90.

trance examinations at Yale, Brown, Amherst, Wesleyan, and similar colleges. Few people seem to be aware of this fact.

"Third. The new movement aims to cut down the requirements for the A. B. degree to such a point that any apt and industrious student can acquire the degree of A. B. in three years. In point of fact, an exceptionally brilliant student, taking as many hours per week as some of the more hard-working frequently take, could finish the proposed sixteen courses and win the degree in two and a half years.

"Fourth. So far as yet appears, no effort is to be made to limit the present range of election allowed to the student, so that the A. B. degree on the new terms, as on those now in force, may be taken by persons whose entire undergraduate course is spent in Harvard, and yet who have never studied Latin, or Greek, or French, or German, or mathematics, or history, or philosophy, a single day in Harvard College.

"Fifth. The new proposal, if adopted, will make the Harvard A. B. the least significant and least valuable in New England. There is even danger lest the 'A. B. (Harv.)' become a byword.

"Sixth. No body of American students has ever asked for such a cheapening of the degree. Even at Cambridge the students are reported to have voted against it.

"Seventh. The Harvard alumni have never asked for the change, and many have expressed themselves in terms of the strongest opposition to it.

"Eighth. Still less have the American colleges, or any class of them, or any association representing them, asked for such a surrender as the proposals of the Harvard faculty contemplate. On the contrary, the authorities of every college in New England, if not in the United States, deprecate the movement as fraught with grave and far-reaching evils in all the colleges, Harvard included.

"Ninth. The fitting schools have not desired the change. On the contrary, nearly all yet heard from deplore even the discussion of so demoralizing a proposition.

"Tenth. Massachusetts, which has ever felt a special ownership and pride in Harvard College, has required no such action as that proposed. Had the legislature, five years ago, required it, how furious a storm of indignant opposition and expostulation would have raged from one end of the land to the other! Courts would have been appealed to, constituencies instructed, new legislators elected, to frustrate so pernicious a measure. Yet, *quod non fecerunt barbari, fecerunt barbarini.* What the Philistinian "rural members" did not do, that the faculty and corporation of Harvard are doing their best to accomplish.

"Eleventh. No ecclesiastical or religious body has called for the innovation. All the religious bodies, even to those which are popularly supposed to care least for culture, seem stoutly to oppose so needless and harmful a capitulation.

"Twelfth. The entire movement is self-originated in Harvard University, and herein, for the first time in all her noble history, Harvard appears before the American public and the world as the sole leader in a confessedly and disgracefully downward and backward movement in liberal education.

"On careful consideration of this matter, several questions suggest themselves—questions which the Harvard overseers and all custodians of the higher education should take time to investigate. For example, it has been jauntily assumed that the age of Harvard undergraduates is too high, and that the only problem is how to reduce it. Would it not be eminently appropriate for all concerned, first of all, to make a few inquiries like the following:

"1. Is it a fact that the majority of the youth entering Harvard and other colleges are any too mature for that self-direction in study now expected of them?

"2. Is it a fact that they are any too mature for that manly self-government in conduct now expected of them?

"3. If younger would their power of sustained and accurate abstract thinking be sufficiently developed within the limits of their course to enable them thoroughly to master the fundamental, philosophical, ethical, and sociological sciences as now taught?

"It has been assumed that the age of those entering our colleges is higher than it was fifteen years ago. Precisely the contrary is the truth in Boston University, and it might be well for all concerned in the discussion to inquire:

"4. Whether the age of the majority of students in college has not of late years steadily fallen in all or most of our classical colleges.

"It has been assumed that the growth of the higher education in our country has not kept pace with the growth of population, and the short-weight degree

(which may also be spelled short-wait) has been represented as the only cure for the evil. As the first allegation does not accord with the results of my investigations, nor the second with my judgment, I venture to suggest two further questions:

"5. Whether the relative significance and power and growth of the higher education were ever as great in the United States as to-day. And

"6. In case they are not, whether the best way to cure the evil would be to raise up a larger crop of superficial and one-sided smatterers chiefly interested in obtaining the earliest possible chance for money-getting?

"It has been assumed that many of the students who now enter schools of medicine would first have taken an A. B. course, had this required but three years instead of four. As in all my life I have never yet learned of one such student, it might be well to institute another inquiry and to ascertain—

"7. Whether ten such students can be found in all the scores of medical schools in the United States taken together?

"It has been assumed that the required attendance upon college four years makes the collegiate medical students far older on graduation than they ought to be. Inasmuch, however, as the statistics of the Harvard Medical School show that the noncollegiate members of the school are but seven months younger than the collegiate, it would be wise to inquire—

"8. Whether a four years' course in liberal arts may not abundantly pay for seven months' delay in entering upon medical practice?

"It has been assumed that a three years' course in arts would attract far greater numbers of young men than can be induced to take a four years' course. Inasmuch, however, as many of the best colleges of the country have for many years offered both three years' and four years' courses, under the same teachers and with degrees conferred by the same authorities, the three years' course invariably offering even greater privileges of election than the four years' course, and still many times more students have always chosen the four years' course than the three years'—it is certainly fitting to start another inquiry, namely:

"9. Whether untested assumptions are to be made the basis of far-reaching and revolutionizing measures in educational administration?

"It has been assumed that Harvard College, without consulting with any other colleges of the country, has the full right to cut down the A. B. course to three years. Might it not be well to discuss for a little—

"10. Whether she has not an equal right, if it please her, to cut it down to two years, or to one, or to six months?

"It has been assumed that if Harvard were to cut down her course, all the other classical colleges would do the same. In view hereof, might it not be well to ask—

"11. Whether, in case they were to do so, it would be a good thing for American education—a thing for which, in history, Harvard University would be pleased to take the responsibility? And

"12. Whether, in case they were not to do so, it would be a good thing for Harvard College?

"In closing, I may be permitted to say that Harvard College is the one institution whose leadership the other colleges of the country will gladly accept and follow so long as she is true to her own illustrious traditions. If just now these other institutions break with her and revolt, it is because they can not recognize her in her strange new rôle. She is not herself. Her face is set the wrong way. She is marching, not at the front forward, but at the rear backward. The warmth of our remonstrance is simply an index of our habitual love and loyalty."

This letter was written a few days before the meeting of the Harvard board of overseers, at which meeting it was supposed that the question of shortening the course would be decided, and it was undoubtedly intended to influence this decision.

PRESIDENT ANDREWS, OF BROWN UNIVERSITY.

The fifth annual meeting of the New England Association of Colleges and Preparatory Schools was held at Boston, Mass., October 17 and 18, 1890. At this meeting President Andrews, of Brown University, delivered an address on "Shall the college course of study for the bachelorship in arts be reduced?" As a representative of one of the smaller institutions, it was to be expected that he would uphold the negative side of the question, which he did in a very able manner. His address was discussed freely and brought forth the fact that the men at the head of some of the leading institutions for secondary instruction are greatly dissatisfied with the present state of our educational system. While

they did not definitely declare for the reduction of the course of study, they were emphatic in the expression of the opinion that something ought to be done to make our system more elastic, "so that those who feel the need of starting in their life work as soon as possible, and are ready to put forth extra effort, would be encouraged to finish their course in three years rather than four."

During the discussion Mr. George L. Fox, rector of the Hopkins Grammar School, New Haven, Conn., said: "I am aware that this [completion of the course in three years] is often done at Harvard, but so far as I know, at other colleges, while in rare instances it may be done, there is not the disposition to encourage any such efforts. If such a possibility could be distinctly held out to men having a college course under consideration, some worthy men would be deterred from the unwise step of entering the professional school without college training, as they do now."

Another objection to the proposed change was advanced by Prof. Tracy Peck, of Yale. In the course of his remarks, on the negative side of the question, he said: "If there is a widespread call in the thoughtful part of the community for reducing the college course of liberal study to three years, I have not been able to discover it. There certainly are many earnest young persons whom poverty or other circumstances prevents from pursuing a full or even any course of liberal study. Such cases appeal strongly to our sympathies, and most colleges provide for the support of the meritorious; but no reduction in the conditions of time or other requirements can reach them all, and it would be unjust to the majority of students if their privileges were to be diminished because of the unfortunate few."

Exception may well be taken to that part of Prof. Peck's remarks which relate to the curtailment of the privileges of the majority of the students. Let us consider whether in fact these privileges would be diminished by the shortening of the present college curriculum. It appears not, for the reason that the graduate department would still be at the command of such students as might wish to pursue still further those studies which comprise what is known as a liberal education, and their privileges would be at least as great as they are at the present time. The shortening of the undergraduate course would not by any means carry with it the abridgment of any of the opportunities or facilities for advanced study now offered by our institutions of learning, but would very probably be the means of inducing a larger number of young men to pursue such studies, since they would be enabled to enter thereon one year earlier than at the present time.

Another objection to the proposed reduction is that it would mean the degradation of the A. B. degree. If this degree had a fixed meaning, or meant in one part of this country the same that it means in another part, this might perhaps stand as an objection; but we are sorry to say that such is not the case, and will not be so long as State legislatures continue to grant to institutions the power of conferring degrees without defining the requirements to be demanded therefor. Should this reduction be made by Harvard and other leading institutions, it is certain that even then the A. B. degree conferred by these institutions would still mean at least as much, if not more, than the A. B. given by a large number of institutions in the United States.

The full discussion which the subject has excited has the great advantage that those upon whom the final adjustment of the matter will devolve will act in full view of all the difficulties to be met and of all possible means which experience suggests for the solution of the problem.

CHAPTER VII.

GRADUATE DEPARTMENTS OF UNIVERSITIES.

Organization—Development of graduate departments in four institutions: Yale; Harvard; Princeton; Columbia—Nonresident courses—Growth of graduate work in eighteen years—Number of students in graduate departments from 1871-72 to 1889-90, inclusive—Statistics of graduates in individual institutions—Effect of the opening of Johns Hopkins University on other institutions—Drawing power of three typical institutions. Harvard, Johns Hopkins, and the University of Michigan, as shown by the State residence of the graduate students—Probable causes of the popularity of Johns Hopkins University—States in which graduate students of Harvard, Johns Hopkins, and the University of Michigan received their first degrees.

ORGANIZATION.

The organization and maintenance of departments for the prosecution of graduate or advanced study and research is of comparatively recent date. By this we do not mean that before the establishment of such departments graduate students did not remain in residence at the universities, for we find that in some cases such students remained in residence before special provision had been made for their instruction. An attempt is here made to trace the progress made by a few institutions in this direction.

Yale College.—The catalogues of Yale College show that although graduate students were in residence as early as the year 1836–37, no mention was made of any provision for their instruction until the year 1844–45, when the catalogue for that year contained the following: "Instruction is also given by the professors to resident graduates, provided a sufficient number present themselves to form a class." A few years later the catalogue for 1847–48 announced the establishment of a new department, in the following terms:

"It has long been felt at Yale College to be important to furnish resident graduates and others with the opportunity of devoting themselves to special branches of study, either not provided for at present or not pursued as far as individual students may desire. With the hope of accomplishing this object more fully and systematically, the corporation at their meeting in August, 1846, appointed a committee to take this subject into consideration, and in accordance with the report of the committee, at their next meeting in August, 1847, established a new department called the department of philosophy and the arts. The branches intended to be embraced in this department are such in general as are not included under theology, law, and medicine; or more particularly mathematical science, physical science, and its application to the arts, metaphysics, philology, literature, and history. Instruction in this department may be given by professors not belonging to the other departments, by the academical professors, and by such others as the president and fellows may approve. The instructors for the year, with the president, compose the faculty of the department. The instructions in the department are intended for graduates of this and other colleges, and for such other young men as are desirous of pursuing special branches of study; but it is necessary for all students in philology and mathematical science that they be thoroughly grounded in those studies."

The greater portion of the students enrolled in this department were not graduates, but may perhaps properly be called *special* students, who wished to pursue studies not given in the regular academical department. A school of applied chemistry was made a part of the department from its organization. The catalogue for 1852–53 shows that a school of engineering had also been established, and that of the 55 students enrolled in the department during that year, 51 were connected either with the school of applied chemistry or the school of engineering. The same catalogue also contained the following respecting degrees: "The degree of bachelor of philosophy will be conferred by the president and fellows upon students in the department of philosophy and the arts, after being connected with the department for two years and passing a satisfactory examination in three branches of study."

The catalogue of 1854–55 shows that the chairs of chemistry and engineering received the name of Yale Scientific School some time during the year 1854, and that several new professors became connected with it. The following extract from The History of Yale College shows the development of the department from this time:

"The 'scientific school' now entered upon a rapid career of extension. Mr. Joseph E. Sheffield began his remarkable series of gifts. The 'school,' in honor of its distinguished benefactor, was called in 1861 the 'Sheffield Scientific School,' and a large number of new professors were appointed. Thus the 'scientific school'—a section of the department of philosophy and the arts—had now become one of the most flourishing and valuable branches of the college. Its origin was due to the effort which had been made, in 1846, to establish what was then called a 'fourth department,' the primary object of which was to provide instruction for graduate students in all branches of knowledge. But till this time everything had been in a formative state. There had been all along a small body of graduates who went on with their studies in history, philology, and literature; there had been also graduates among the students in the scientific section of the 'department,' who pursued advanced studies under the instruction of the scientific professors: but it was found by experience that the larger proportion of those who applied for admission to the Sheffield school had not received the proper preliminary education which would enable them to pursue the study of any of the higher branches of science to advantage. Accordingly, in 1860, substantially what is the present organization of the school was decided upon; the courses of instruction being adapted to the educational wants of those persons who resorted to it, and to the somewhat general public demand for what was beginning to be known as the 'new education.' A scheme requiring three years of study was planned after the methods followed in the academical department, characterized mainly by the omission of classical studies and the prominence given to scientific studies."

This new arrangement of the scientific section was undoubtedly the cause of the readjustment of the whole department, which occurred in 1872. According to this reorganization the department of philosophy and the arts was made to include the undergraduate academical department, the Sheffield scientific school, the school of fine arts, and the school for graduate instruction. This organization is still in force. It will thus be seen that a distinct school for graduate instruction was not organized until 1872.

No degree for advanced work seems to have been given by Yale prior to 1860–61. In that year the catalogue contained the following:

"It is required of candidates for the degree of doctor of philosophy that they shall faithfully devote at least two years to a course of study selected from branches pursued in the department of philosophy and the arts. The selection may be made from the studies of either or both sections, but must belong to at least two distinct departments of learning.

"All persons who have not previously received a degree furnishing evidence of acquaintance with the Latin and Greek languages will be required, before presenting themselves for the final examination for the doctor's degree, to pass a satisfactory examination in these languages, or in other studies (not included in their advanced course) which shall be accepted as an equivalent by the faculty.

"The degree of doctor of philosophy will be conferred on all members of the department who, having complied with the conditions above stated, shall pass a satisfactory final examination, and present a thesis giving evidence of high attainment in the branches they have pursued."

The requirements in vogue at the present time require the student to have taken a bachelor's degree, to have a good knowledge of Latin, German, and French, and to have pursued for two years studies in the graduate department.

Harvard University.—The history of graduate instruction in Harvard is ably set forth by James Mills Peirce, secretary of the academic council, in his report to President Eliot for the year 1879–80. In this report he says:

"As no report has heretofore proceeded from this (the graduate) department, it seems to be desirable that I should take the occasion to present a brief sketch of its history. The residence of graduates at the university for the purpose of pursuing advanced studies is a practice probably as old as the college itself. Traces of it are to be found in the ancient records of the faculty, and it has always been felt that the presence of such persons, even when their connection with the university has been of the slightest kind, has had a tendency to heighten the serious scholarly feeling of the place. At the time of the foundation of the scientific school, under the administration of President Everett (1846-1849), one

of the main objects had in view was the provision of instruction suited to the wants of the most advanced students, and it will be remembered that, in the first organization of that school philological studies were represented in the faculty as well as the natural and practical sciences. In point of fact, the scientific school did, within the boundaries to which it was soon restricted, fulfill an important function in regard to higher work, and had a considerable influence in preparing the way for what is now the graduate department. Until the great extension of the elective system of the college ten years ago (1870), and the establishment of the degrees of Ph. D. and S. D. somewhat later (1872), it was the only department of the university that offered the opportunity of obtaining a degree by the performance of special work of a high character in pure science. It was resorted to by college graduates and other advanced students who desired to make a real beginning of a scientific career. Its opportunities of study, under professors of rare eminence, not overburdened with undergraduate work, and eager to promote genuine scientific achievement, were exceptionally fine, though inadequately represented in any printed record, and the degree of the school soon attained a very high estimation.

"The next step that was taken towards the provision of instruction for graduates was the institution of the system of 'university lectures' during the administration of President Felton [1860-1862]. Early in 1863, under the presidency of Dr. Hill, these courses of lectures, having been practically discontinued, were resumed on a plan of increased extent and efficiency; and at the same time it was ordered by the corporation that 'the president, with the professors in all departments of the university, be authorized to meet and associate themselves in one body for the consideration of its educational interests, and for the arrangement of such courses of lectures as may be thought expedient for the benefit of the members of the professional schools, graduates of this or other colleges, teachers of the public schools of the Commonwealth, and other persons.'"

The university lectures do not seem to have been very popular. In the seven years from their establishment in 1863, seventy-four courses of lectures were delivered, of which number sixty-seven were upon scientific subjects. The seven exceptional courses were delivered before 1866.

At the beginning of Dr. Eliot's administration graduate instruction was placed upon a permanent and more efficient footing. In 1869 two courses of instruction, one in philosophy and the other in modern literature, were opened to "graduates, teachers, and other competent persons (men and women)." Thirteen teachers took part in the two courses, 7 in the first, and 6 in the second. Twelve students were in attendance upon the courses, 4 of whom presented themselves for examination on the course in philosophy. In his report for 1871-72 President Eliot says: "The university lectures have now been tried for nine years. Although some temporary advantages and certain improvements have resulted from them, it must be confessed that they have distinctly failed as a scheme for giving advanced instruction in philosophy, history, and the humanities, and that they have failed hopelessly and in an unexpectedly short time. They have not induced bachelors of arts of this university to remain in Cambridge for purposes of systematic study, and they have not attracted to the university advanced students from other places. Advanced students want profound, continuous, and systematic teaching. The university lectures, taken together as a body of teaching, have been discursive, heterogeneous, and disconnected." The best results were obtained in 1869-70, when the courses in philosophy and modern languages were given. Nevertheless, even these two long courses, given by a succession of five or six different teachers, lacked consecutiveness and unity of plan and method.

In 1872 the corporation and board of overseers adopted a statute of which only a summarized statement can be given. "The scheme contemplates residence of one year for the masters' [A. M.] degree, of two years for the degree of doctor of philosophy, and of three years for the degree of doctor of science, examinations for all degrees, and the presentation of these by candidates for either doctorate." This action of the university immediately attracted an increased number of students, as will be seen by a glance at the table on page 819.

Princeton.—The catalogues of Princeton do not show the presence of graduate students at the institution prior to 1870–71, in which year there were 3 in attendance. In 1870 three fellowships were created, and the students referred to were the holders of them. The conditions on which the fellowships were bestowed were such as to require the holders thereof to pursue advanced studies for at least one year. The number of fellowships was gradually increased, thus increasing the number of graduate students; but it may be well to remark that until the year 1877–78 no graduate students, excepting fellows, were

in attendance at the college, although a few such students had been in attendance at the scientific school. In 1877 Dr. McCosh made a report to the board of trustees on the course of study in Princeton College. In this report he says:

"In the last few years there have been a few graduates receiving instruction from individual professors. The board of trustees has now sanctioned post-graduate courses. They have been started this year experimentally, and the trial has been successful beyond all expectation.

"The aim of every college should be to secure a fair amount of scholarship from every student. No college can make all its students great scholars. But there is a certain proportion, say one in ten, or one in five, who as having the taste and the talent may be made so. This is to be done by postgraduate courses. We have at present no fewer than 42 graduates, mostly from the College of New Jersey, but a number from other universities in America and Great Britain, attending classes in our college, chiefly in philosophy and physics."

From that time the graduate courses of Princeton have been well attended. In 1890-91 graduate courses will be offered in the following subjects: Theoretical ethics, science and religion, Pluto and his philosophy, modern philosophy, history, Latin, pedagogics, Greek, architecture, archæology, English language, Sanskrit, Semitic languages, physics, higher mathematics, theoretical astronomy, biology.

Columbia College.—The graduate department of Columbia College was not organized until 1880, although graduate students were enrolled as early as 1874-75. Here, as at Princeton, the first graduate students enrolled were induced to pursue advanced studies through the instrumentality of fellowships. The holders of these fellowships were not importuned to pursue studies in the college itself, but were encouraged to resort to foreign universities, and the only conditions imposed upon them was to report the character of their work periodically to the president. But on the organization of the graduate department a new departure in this respect was made, which was the adoption of a plan for the appointment of fellows with tutorial duties. This scheme was first put into operation at the close of the school year 1883-84, and marks a considerable increase in the number of students in the graduate department.

Nonresident courses.—In addition to the institutions that provide courses of study for resident graduates, there are a number of institutions that provide similar courses for nonresidents. Such courses were established as early as 1874, and are, as a rule, taken by large numbers of students. In such cases the students pursue their studies at home, and, after a satisfactory examination, the appropriate degree is conferred upon them. At least one institution, the Illinois Wesleyan University, also offers a nonresident course of study for undergraduates, which leads to the degree of Ph. B. These courses are intended for persons whose circumstances and occupations are such that they would be unable to obtain a higher education if residence at an institution were insisted upon. In some cases where a demand arose for an opportunity to do advanced work for which credit would be given, nonresident courses were established in preference to resident courses, because the time of the professors was so fully occupied with other duties that they could not give the time that would be demanded by resident graduates.

GROWTH OF GRADUATE WORK IN EIGHTEEN YEARS.

The growth of graduate work in American colleges and universities during the past twenty years has been remarkable, the number of students in graduate departments of such institutions having increased from 198 in 1871-72 to 1,998 in 1889-90. This increase has been due, probably, to the greatly increased facilities which have lately been provided for the prosecution of advanced study and research in the older foundations and to the establishment of new institutions in which advanced work is the chief if not the only feature. Of the latter class the number is very small, Johns Hopkins University, at Baltimore, Md., opened for instruction in 1876, and Clark University, at Worcester, Mass., opened in 1889, being the only representatives. The larger part of the students of the former are registered in the graduate department; the latter admits such persons only as have already received their first degree or have otherwise prepared themselves to enter upon advanced study.

The number of students in the graduate departments of colleges and universities in the United States from 1871 to 1890 was as follows:

Year.	Students.	Year.	Students.	Year.	Students.
1871–72	198	1877–78	414	1884–85	869
1872–73	219	1878–79	465	1885–86	935
1873–74	283	1879–80	411	1886–87	1,237
1874–75	369	1880–81	460	1887–88	1,290
1875–76	399	1882–83	522	1888–89	1,343
1876–77	389	1883–84	778	1889–90	*a*1,998

a Includes 281 nonresident graduates.

As will be seen from the above, the increase in numbers has been fairly regular, especially during the last ten years.

Statistics of graduates in individual institutions.—In order to show the increase in individual institutions, and the fluctuations caused in some of them by the establishment of new institutions, the following table has been prepared. The statistics have, with few exceptions, been taken from the annual catalogues of the institutions concerned. In a few cases where catalogues were not available the statistics were taken from the annual reports of the Bureau:

Number of students in graduate departments.

Year.	Harvard.		Johns Hopkins University.	Yale University.	Princeton.	University of Michigan.	Columbia College.	Cornell University.	Boston University.	University of California.	University of Minnesota.	University of Kansas.	Lafayette College.	University of Pennsylvania.
	Graduate department.	Graduate students in undergraduate department.												
1870–71	8	------	------	24	3	6	------	------	------	------	------	------	2	------

a Includes nonresident graduate students.

Effect of the opening of Johns Hopkins University on other institutions.—From the foregoing table it would be inferred that the opening of Johns Hopkins University caused a temporary diminution in the number of graduate students in nearly all of the institutions presented. This should not, however, cause surprise to any one who is acquainted with the favorable conditions the new institution afforded for advanced study. At the time of its establishment few institutions in the United States could offer inducements in the form of fellowships. In this respect Johns Hopkins University had a decided advantage, as it possessed twenty fellowships available upon terms which naturally attracted the graduates of other institutions. The natural result in the course of time was that other universities secured funds for the same purpose.

The readiness with which the graduates from the graduate departments of the leading universities receive appointments to professorships in educational institutions has undoubtedly created a desire for advanced study among the young men. This fact, together with the multiplication of fellowships, has been an important if not the chief cause of the increase of students in graduate departments. The number of fellowships has increased from 19 in 1872 to 172 in 1889–90.[1]

[1] For value of fellowships, see Annual Report for 1888–89, pp. 649–654.

State residence of graduate students at three typical institutions.—In connection with this subject of graduate students it may be interesting to know the sections of the country from which the different institutions recruit these advanced departments; for, the standing of a school is shown not only by the number of students that flock to it, but also by its drawing power or the geographical extent of its influence.

In order to give a fair representation of the drawing powers of three typical institutions, the annual catalogues of Johns Hopkins University, Harvard University, and the University of Michigan for the four years 1885-87 to 1889-90, inclusive, have been carefully examined with the view of ascertaining the home residences of the students in the graduate departments. In an investigation of this kind a fairer representation can be made by taking the statistics of a series of years than by taking the statistics of but one year. The result of the examination indicated is as follows:

Residence of students in attendance upon graduate departments of Johns Hopkins University, Harvard University, and the University of Michigan during the years 1886-87, 1887-88, 1888-89, and 1889-90.

a The residence of seven students not given.

This tabulation indicates that Johns Hopkins has a stronger drawing power than either Harvard or the University of Michigan. It is also noticeable that notwithstanding the fact that the North Atlantic Division has more institutions offering the advantages of well-equipped graduate departments than any of the other divisions, Johns Hopkins draws more students from this than from any other division excepting the South Atlantic in which it is situated. It is a well-known fact that institutions nearly always draw much the larger part of their students from the immediate locality in which they are situated.

Taking the figures as given above, we find that while Johns Hopkins draws 55 per cent of its students from sections other than the division in which it is located, Harvard draws but 25 per cent, and the University of Michigan but 20 per cent from such sections. It will be observed further that the number of foreign students in attendance at Johns Hopkins exceeds the number in attendance at the other two institutions.

Probable causes of the popularity of Johns Hopkins University.—The large number of students from the North Atlantic Division attending Johns Hopkins suggests that some department of this institution is superior to the corresponding departments of the institutions in that division. In order to arrive at some conclusion with respect to this matter the catalogues of Johns Hopkins have been examined with particular reference to the students from New York and Massachusetts, with the following result: The 57 students from New York were distributed among the studies as follows: Chemistry, 12; pathology, 7; history, 7; physics, 6; English, 5; biology, 4; astronomy, 4; mathematics, 3; Latin, 3; Romance languages, 3; geology, 1; histology, 1; and Semitic languages, 1. The thirty-nine from Massachusetts were divided as follows: History, 9; biology, 6; chemistry, 5; Greek, 5; geology, 4; Germanic languages, 3; mathematics, 2; philosophy, 2; Assyriology, 1; English, 1; and Sanskrit, 1. It will thus be seen that the two departments of history and chemistry include 33, or about one-third, of all the students from the two States specified, and may very properly be said to be the most popular departments of the institution. This statement is substantiated by the annual report of the president of Johns Hopkins, in which it is shown that more students are entered for those departments than for any other.

Probably, however, the true cause of the superior drawing power of this institution is to be found in the manner of making appointments to the fellowships. While a large number of the Harvard fellowships are open only to Harvard graduates, all of the Johns Hopkins fellowships are open to graduates of any institution. Thus, although the number of fellowships possessed by Harvard exceeds the number possessed by Johns Hopkins, the chances of obtaining a fellowship at Johns Hopkins by a graduate of another institution are larger than at Harvard.

It has been suggested that the place where a student received his first degree might have some influence in the selection of an institution for the prosecution of advanced study and research. In order to arrive at some conclusion with respect to this subject the catalogues for the past four years of the three institutions which have thus far been made the subjects of special study and investigation were again examined. Before giving the results of this investigation it may be well to state that of the 243 students registered in the graduate department of the University of Michigan during that time but 133 were resident students, the remainder pursuing advanced study at a distance. In this investigation the latter could not be included, as the catalogues do not give the desired information concerning these students. For the same reason 118 of the students at Johns Hopkins University who were attendants at single courses only could not be included.

While the investigation was being made it was found that the institutions represented were so numerous that it was deemed impracticable to give the names of the institutions. It was then decided to give merely the State residence of the students and the States in which they received their first degrees. So as to make the representation as simple and complete as possible the results have been incorporated in three separate tables, which are as follows:

Table giving residence and State in which graduate students at Johns Hopkins University from 1886-87 to 1889-90, received their first degrees, so far as reported.

Washington	2																2		
Oregon	1																	1	
California	1																	1	
Foreign countries	4								2										2
North Atlantic Division	10	1		1		6						2							
South Central Division	2						1	1											
North Central Division	111		1	3	1				10	8	6	72	1	5	1	3			
Western Division	6													2			2	2	
Total	133	1	1	4	1	6	1	1	12	8	6	74	1	7	1	3	2	2	2

The facts here presented are so simple that an extended explanation of them appears entirely unnecessary. The tables show that a comparatively small proportion of the students concerned left their own geographical sections for their first degrees. We also find that the students who had received their first or bachelor's degrees in the several geographical sections of the country were registered in the graduate departments of Johns Hopkins, Harvard, and the University of Michigan as follows:

Divisions.	Total number of students.	Johns Hopkins University.	Harvard University.	University of Michigan.
		Per cent.	*Per cent.*	*Per cent.*
North Atlantic Division	534	43.3	54.3	2.4
South Atlantic Division	277	96.8	3.2	0
South Central Division	47	76.6	19.1	4.3
North Central Division	319	52.7	12.2	35.1
Western Division	20	50.0	30.0	20.0

We thus find that Johns Hopkins University draws heavily from the institutions of all divisions. An examination of the tables will show that while but 21.8 per cent of the graduate students at Johns Hopkins received their first degrees in Maryland, 64.4 per cent of those at Harvard received theirs in Massachusetts and 55.6 per cent of those at the University of Michigan received theirs in Michigan.

CHAPTER VIII.

UNIVERSITY AND SCHOOL EXTENSION.

Definition and description—Origin and history—Cambridge University—Oxford University—London Society for the Extension of University Teaching—University Extension in Scotland—In Ireland—In the United States—Chautauqua Literary and Scientific Circle—Johns Hopkins University and University Extension—University Extension in Pennsylvania—University and School Extension Movement in New York.

1. DEFINITION AND DESCRIPTION.

By the term university extension is meant that movement by which higher education is provided for all classes of people who are unable to attend the universities where such instruction is imparted. The definition given by Prof. R. G. Moulton, A. M., one of the Cambridge University extension lecturers, is "University education for the whole nation, organized upon itinerant lines." He says that university education has nothing to do with universities, that is, has no necessary connection with universities, and in order to support this statement he shows that one of the three great branches of the movement in England is not managed by a university, but by an association which simply goes to the universities for lecturers just as one would go to a grocery store to provide for the household. He claims that university education must be defined in antithesis to school education. School education is compulsory and administered under discipline, while university education is purely voluntary; school education is limited, while university education begins where school education ends, and is practically unlimited, as it may be kept up during a man's whole life. "The essence of university education," says Prof. Moulton, "is that it is education for adults; it is voluntary; it is unlimited in scope; unlimited in age; it applies to a man's whole life. If that be the true view of university education you will see that it has no necessary connection with universities, but it is equally the interest of all adults who have a desire to take part in it."

The methods adopted by the different branches for the extension of university education in Europe do not differ very materially. The elements employed are lectures, class, syllabus, weekly exercises, examinations, and certificates.

The lectures are open to everybody and the audience is expected to be as miscellaneous as the congregation of a church. But in every audience there is expected to be a nucleus of students. By this is meant persons who wish to learn more than is brought out in the lectures. For such persons the syllabus which contains the lecturer's own outline for the whole work of his course is provided. With the syllabus as a guide the student can employ the time between lectures very profitably in reading what is required. In addition to the outline of the course of lectures and references for reading, the syllabus contains a list of questions, one set of which is to be answered weekly. This is known as the weekly exercise, but is widely different from our examinations. The exercises are to be written at home, and any and all assistance that the student can derive from books, papers, or any source whatsoever is allowed. The exercises are not intended to find out how much the student remembers, but simply to train him to work for himself.

The class is held on the day of the next lecture either before or after the lecture. It usually occupies an hour, and during this time the students can ask any questions they desire. Very frequently the lecturer discusses points brought forth in some of the exercises, or repeats some bright saying made by a student. But it should be borne in mind that the exercises are treated as being confidential, and it is the lecturer's aim to see that the feelings of no student are hurt in the class.

At the close of the course of lectures a final examination is held. This is a written examination and is open to those only who have done the weekly exercises in a manner satisfactory to the lecturer.

The granting of certificates depends equally upon the lecturer's reports of the exercises throughout the term and the result of the final examination.

2. ORIGIN AND HISTORY.

The term "university extension" seems to have become current in England as early as 1850, but the movement as it is now known was not started until more than twenty years thereafter. For a few years prior to the establishment of the university extension scheme, educational associations for mutual benefit had been formed in many of the towns in England, and university graduates had been engaged as lecturers. The associations thus established found the greatest difficulty in securing competent teachers, and therefore requested the University of Cambridge to supply them with lecturers and draw up a scheme of higher education suitable to the wants of the towns. "After careful consideration the university, in 1872, appointed a syndicate (or committee), and instructed them to inquire into the best methods of dealing with the subject, and afterward empowered them for a period of two years to try the experiment of holding courses of lectures and classes in a limited number of populous centers, and of testing the work by examinations. The result of the experiment proved satisfactory, and the syndicate were accordingly made permanent and invested with power to organize and superintend courses of lectures and classes in such populous centers as the syndicate might approve, where the necessary funds should be guaranteed from local sources."[1] The plan proved to be very successful, for we find that from 1873 to 1881 the Local Lectures Syndicate had conducted lectures in over sixty towns. In some of these places the scheme assumed a permanent form, either by association with some institution already established or by the erection of a college, while in others the syndicate was compelled to abandon the work, owing to a want of sufficient support.

The unit adopted by Cambridge University is a three months' course of lectures, one lecture being delivered each week. Arrangements can not be made for less than the unit unless it is to introduce or start a movement in a new place. When this is desired, a lecture upon some interesting subject is given, during the delivery of which the university extension movement is fully explained and its advantages freely set forth. Generally the people are so well pleased with the lectures that they wish them to be continued, and wherever a number of people sufficient to pay the expenses of a course of lectures evince such desire, centers are established. The university undertakes the educational organization of the course, while the towns must provide the funds and undertake the local management.

The university fee for a three months' course of lectures is £45, while the local expenses for hall, lighting, etc., are about £20. This sum must be raised by the local committee, but the manner of raising it varies widely at different centers. In a few cases sums of money have been obtained from concerts, etc., with which the centers were endowed, thus making them in a certain sense permanent.

Considerable care is taken in the formation of the local committees. These should be representative, and political or religious bias should be avoided. The committees should include teachers, artisans, ladies, and especially young people, who will be very useful to circulate information or sell tickets.

In 1887 Cambridge University, in order to maintain a high educational standard in its university extension movement, adopted what is known as the affiliation scheme. By this scheme students who attend a course of lectures prescribed by the university for a term of three years, and at the completion of which receive a certificate, may at any time thereafter proceed to the university and obtain its degrees with two years' residence instead of three, and are known as affiliated students of Cambridge University. The following-named towns have adopted the Cambridge University affiliation scheme, viz, Derby, Exeter, Hull, Newcastle, Plymouth, Scarborough, and Sunderland. The course for affiliated students is as follows:

1. Special series of courses.—This consists of six single courses, consecutive, thus extending over three years. They must be in the same group, but not necessarily on the same subject of the group.

2. General series of courses.—This consists of two single courses in a group other than that in which he takes the special series. It need not be consecutive, and may be taken before, during, or after the three years of special series.

3. Elementary examination on Latin and one other foreign language, Euclid, I–III, and algebra to quadratics.

Another important factor in the movement for the extension of the influence and teaching of the universities is what is known as the summer gathering. In-

[1] Calendar of Cambridge Local Lectures, 1880–81.

vitations are extended to extension students to come to the universities for a certain length of time during the summer months and make use of the extensive laboratories, museums, and libraries. Cambridge limits its invitation to those more earnest students who have obtained certificates during the courses of lectures in the winter, and desire to supplement their theoretical knowledge by practical work. The Cambridge summer classes appeal to the few, and their purpose is to add to the educational efficiency of the work. During August, 1890, forty-one students attended the Cambridge summer classes. The mornings were devoted to practical classes in chemistry, physics, and geology (palæontology), while the afternoons were devoted to courses on Greek arts, architecture, early inscriptions, engraving, Egyptology, and single lectures on other subjects.

Some idea of what has been accomplished by Cambridge University can be formed from an investigation of the following summary:

Summary for the years 1873–74 to 1889–90.

Year.	Number of courses.	Average attendance at lectures.	Average attendance at class.	Average number of weekly papers.	Number examined.
1873–74	23–29	3,200	----------	----------	368
1874–75	*a*30–40	*a*3,500	----------	----------	*a*984
1875–76	*a*56	*a*7,273	----------	----------	1,724
1876–77	33	7,511	4,833	----------	1,075
1877–78	59	5,940	4,138	----------	1,088
1878–79	48	4,920	3,201	1,272	556
1879–80	47	5,009	3,748	1,293	694
1880–81	37	4,369	2,624	887	573
1881–82	43	3,406	2,100	822	502
1882–83	63	6,274	3,438	1,337	906
1883–84	66	7,878	4,783	1,649	1,175
1884–85	73	7,259	4,152	1,528	1,093
1885–86	80	8,557	4,380	1,893	1,378
1886–87	100	10,494	4,820	1,885	1,341
1887–88	98	9,509	4,653	1,975	1,531
1888–89	89	9,295	4,476	1,945	1,420
1889–90	125	11,595	5,405	2,458	1,732

a The figures are for but one term.

OXFORD UNIVERSITY EXTENSION LECTURES.

The extension movement was taken up by Oxford University in 1878. The plan of forming centers and the methods followed by Oxford are similar to those used by Cambridge. One of the most important points in which the two differ is in the number of lectures constituting a course. As has been said before, the least number for which Cambridge will make an engagement is for a single course of twelve lectures, while Oxford maintains courses of from six to twelve lectures, but certificates are not issued for attendance at courses of less than twelve lectures.

While the main point with Cambridge seems to be to maintain a high educational standard in the movement, it appears that Oxford does not lay much stress upon this point, but aims to extend the influence of the University as far as possible. This difference between these two branches is very apparent even at the summer gatherings. We have seen how chary Cambridge is with her invitations, but not so with Oxford, which welcomes all who care to come, irrespective of particular educational qualifications and whether university extension students or not. The courses of lectures are of general interest, and designed to meet the most varied tastes. The Oxford meeting touches the many and tends to extend more widely the influence of the university. The third meeting at Oxford, in August, 1890, was attended by 900 persons, just as many as attended the first meeting, in 1888.

The cost of the lectures ranges from £21 12*s.* for a course of six lectures to £54 12*s.* for a course of twelve lectures.

The number of towns in which local committees, acting in concert with Oxford University delegates, have been established is 132, and the number of students attending extension courses in 1888–89 was 14,351 and in 1889–90 the number was 17,904.

LONDON SOCIETY FOR THE EXTENSION OF UNIVERSITY TEACHING.

The London Society for the Extension of University Teaching, which was the first body to follow the lead of Cambridge, dates its foundation from a public meeting held at the Mansion House, June 10, 1875, at which the following resolution was adopted:

"That the principle of the Cambridge University Extension Scheme be applied to London, and that the various educational institutions of the metropolis be requested to coöperate in an endeavor so to apply it."

The principal educational institutions acceded to this request, and are represented on the council of the society. Furthermore, the Universities of Oxford, Cambridge, and London appointed three members each to form a universities' joint board, to nominate lecturers and examiners, and undertake (in conjunction with the council) the general supervision of the teaching, and thus give that university status to the work which the absence of a teaching university in London rendered necessary. The existence of this board has further secured for the London society the advantage of a wide choice of lectures and a close connection with both the old universities.

The first courses were given at permanent institutions, but the size of the audiences soon proved this to be a poor plan. Special committees were appointed in the central and suburban districts, who arranged for courses of lectures in local halls, which led immediately to a great improvement not only in the size of the audiences, but also in the character of the work done. As the years passed by the difficulty of providing special courses of lectures for the most advanced students of the different centers presented itself. This was partly met in 1888 by the kindness of the Gresham committee in placing at the disposal of the society the Lecture Theatre at Gresham College, where central courses for students from the various local centres were established.

Another great difficulty seems to have been to obtain continuity in study. But this also has been remedied in a marked degree by the institution, recently, by the Universities' Board, of Sessional Certificates and Certificates of Continuous Study.

In order to show the progress of the work done by the London society and the favor with which it is meeting, the following tabular form is taken from the University Extension Journal of February 1, 1890:

Periods.	Number of courses.	Number of entries for the courses.	Average number of weekly papers.	Number of certificates awarded.
October–December, 1876	7	139	----------	----------
First year, 1877	18	601	----------	----------
Second year, 1878	19	604	----------	57
Third year, 1879	32	1,374	----------	91
Fourth year, 1880	44	2,237	----------	219
Fifth year, 1881	43	2,489	----------	199
Sixth year, 1882	65	3,214	610	288
Seventh year, 1883	50	3,421	625	293
Eighth year, 1884	53	3,662	625	330
Ninth year, 1885	63	5,195	803	405
Tenth year, 1886	61	5,084	806	482
Eleventh year, 1887	65	5,662	868	612
Twelfth year, 1888	80	7,150	1,204	859
Thirteenth year, 1889	100	10,982	1,882	1,361
Fourteenth year, 1890	130	12,923	1,972	1,350

IN SCOTLAND.

It is said that as early as the year 1874 the university extension movement was started in Scotland. Several Dundee citizens formed a guaranty fund, and arranged for five courses of lectures to be delivered by professors of the University of St. Andrews, three of the courses—chemistry, natural history, and physiology—being of twenty lectures each. This work was carried on for two years, but was rendered unnecessary by the establishment of University College, Dundee.

The movement was again started in 1888, and is now under the direction and supervision of the universities of Glasgow, Edinburgh, and St. Andrews. Although the work has been going on for but two years, the reports show that satisfactory progress has been made.

IN IRELAND.

In Ireland the movement has been started recently by the Belfast University Extension Society. The first three courses of lectures arranged under the auspices of the society were very successful, as the following statistics will show:

Subject.	Average attendance.	Average number of weekly papers.
Geology	200	12
Shakespeare	134	19
Representative writers	182	17

Each course consisted of twelve lectures, and the number of certificates awarded was 30.

IN THE UNITED STATES.

The University Extension movement, as it is known in England, had no existence in the United States until 1887. The field of home study had, however, been occupied for some time by other educational agencies, which have, in a manner, paved the way for the adoption of the university extension movement. The foremost of these agencies is what is known as the Chautauqua movement.

CHAUTAUQUA LITERARY AND SCIENTIFIC CIRCLE.

This movement originated in the brain of Bishop J. H. Vincent, D. D., more than twenty years ago, and the first meeting was held in the summer of 1874 at Lake Chautauqua, New York, and was known as the Chautauqua Summer Assembly. The purpose was first to bring together Sunday-school teachers for conference and for a course of systematic instruction in biblical knowledge; and, second, to eventually include all learning, secular as well as sacred.

The plans were matured by Dr. Vincent during a return trip from Europe, and are stated as follows:

"It was to involve a course of reading and study covering the principal subjects of the college curriculum, but omitting of necessity its drill in languages and mathematics, giving to the English reader an outlook over the field of learning and some acquaintance with the masterpieces of literature, ancient and modern, employing handbooks and compendiums for the mastery of outlines and appointing more extensive work to be read—a course which the individual could pursue alone, if necessary, yet adapted for associated study. It was sufficiently simple to invite masses and to lead them on without discouragement from its difficulties or its extent, yet so thorough as not to be deemed superficial by the more learned. Above all, it was to bring the six secular days of the week into harmony of purpose with the Sabbath, not only by recognizing the Bible as a department of its study, but more especially by having the entire course penetrated with the spirit of reverence and faith."

The following statement of the methods of the Chautauqua Reading Circle was given by Mr. George E. Vincent, of the Chautauqua Assembly, October 10, 1889:

"The Chautauqua Literary and Scientific Circle was organized at Chautauqua, N. Y., in 1878. The central idea was to provide systematic and definite aid to earnest people who desire to pursue progressive courses of study. Large numbers were at once enrolled, and the membership has steadily increased. Nearly 150,000 people have been at different times members of the circle, and at any given time 50,000 are pursuing the course faithfully. It was the belief of the originators that thousands of people were ambitious to do systematic work, and needed only specific directions. The plan comprises a carefully selected course extending over four years, divided as follows:

The four-years' course of the Chautauqua Literary and Scientific Circle.

1889-90.	1890-91.	1891-92.	1892-93.
Roman history.	English history.	American history.	Greek history.
Latin literature.	English literature.	American literature.	Greek literature.
Human nature.	English composition.	History and literature of the far East.	Greek mythology.
Political economy.	Astronomy.	Physiology and hygiene.	Ancient Greek life.
Art.	Geology.	Questions of public interest.	Circle of the sciences.
Philosophy.	Pedagogy.	German literature.	Zoölogy.
Physics.	Readings from French literature.	Religious literature.	Chemistry.
Physical geography.	Social questions.		Philanthropy.
Uses of mathematics.	Religious literature.		Religious literature.
Religious literature.			

A half dozen volumes approved by a council of six prominent men; a monthly magazine with supplemental readings, outlines of study, annotations, and other sources of aid; memoranda papers to be filled out either from memory or by reference to authorities, not examinations, but as means of fixing facts in their proper relation, and as thorough reviews of the subjects taught. At the close of the course those who have, upon their honor, done all the required reading, and filled out the memoranda papers, are given certificates, not college degrees.

"The promoters of the Chautauqua Reading Circle have invariably held up the college as the highest standard, as unquestionably offering the best opportunities for education. But at the same time they maintained that those who can not attend college ought to be given every encouragement to educate themselves. The eagerness with which people have availed themselves of the definite and intelligent plans offered by the Chautauqua organization is positive proof that there is a widespread ambition among the people at large to do systematic intellectual work. It is a source of gratification to the original circle of the United States that a home reading club should have been organized in England avowedly modeled on the Chautauqua system.

"As an outgrowth of the original plan, which provided only for individual study, readers in towns and cities have been drawn by a community of interest into organizations known as local circles. These clubs have proved of great value, not only in aiding members in their individual work, but in arousing an interest in intellectual things and in fostering a taste for better literature."

The following statistics were furnished by Miss Kate F. Kimball, the office secretary of the Chautauqua Literary and Scientific Circle;

Class of—	Number enrolled.	Number graduated.	Class of—	Number enrolled.	Number graduated.
1882	8,000	1,700	1888	20,000	4,000
1883	9,000	1,300	1889	23,000	3,850
1884	7,000	1,470	1890	25,000	3,700
1885	6,000	1,300	1891	24,000	----
1886	14,000	4,000	1892	16,000	----
1887	18,000	4,500	1893	13,500	----

Johns Hopkins University and university extension.—Dr. Herbert B. Adams, of Johns Hopkins University, in an article entitled University Extension in America, says "the first conscious attempts to introduce English university extension methods into this country were made in 1887 by individuals connected with the Johns Hopkins University." In 1887–88 Dr. Edward W. Bemis, a graduate of Johns Hopkins, gave a course of twelve lectures in one of the class rooms of the Buffalo (N. Y.) Library upon Economic Questions of the Day. The average attendance at these lectures was 250, of which number more than 200 usually staid to hear the class discussion.

In 1888–89 Mr. Edward C. Lunt, a graduate of Harvard University, gave a course of lectures at the Buffalo Library upon American Political History. The same year Dr. Bemis repeated his course on Economic Questions of the Day in Canton, Ohio, where he lectured two evenings in the week for a period of five weeks.

The work in Baltimore, Md., is described by Dr. Adams as follows: "The first practical beginning was made with a class of young people, who met once in two weeks, throughout the winter of 1887–88, in the reading room of a beautiful modern church close by the Woman's College. After an introductory talk upon

university extension by a Hopkins instructor the class was intrusted to a graduate student, Mr. Charles M. Andrews, now professor of history in Bryn Mawr College, who gave a series of instructive lectures, accompanied by class exercises, upon the History of the Nineteenth Century, with Mackenzie for a textbook on that subject. * * *

"Following the young people's course, the like of which is entirely practicable in any church society with a college man for class leader, came a coöperative and peripatetic course of twelve lectures for workingmen on The Progress of Labor by twelve different men from the historical department of the Johns Hopkins University. These twelve apostles of extension methods swung around a circuit of three different industrial neighborhoods in Baltimore, each man repeating his own lecture to three different audiences. * * *

"Every lecture was accompanied by a printed syllabus in the hands of the audience, and was followed by an oral examination and a class discussion. Every man lectured without other notes than those contained in his outline of topics. The courses were organized upon a business basis and not upon the theory of giving something for nothing. This coöperative experiment in university extension work was, however, only moderately successful. Probably it was more useful to the lecturers than to their hearers. It is the conviction of the writer that it is mistaken zeal for university men to attempt to lecture to workingmen, as such, or indeed to any class of people. University extension should be for citizens without regard to their occupation.

"The most successful educational experiments by Johns Hopkins men have been in connection with teachers' associations and Young Men's Christian Associations in Baltimore and Washington. Under such auspices coöperative and class courses in American history and economic and social science, with printed syllabuses, have been given before audiences varying from 150 to 1,000 appreciative hearers. Chautauqua circles in Baltimore have also been found intelligent and responsive to student lectures. Under the direction of Hopkins men a three-year's graduate course of study in English history has been successfully carried on by more than 1,000 students, who had already finished the four years of required study in the Chautauqua literary and scientific circles. A very elaborate syllabus based on Green's History of England and select volumes of the Epoch Series, has been the means of guiding this interesting work now in progress in all parts of the country. In connection with the Chautauqua College of Liberal Arts more detailed courses in ancient and modern history have been conducted in the same way, with monthly written examinations, the papers being in most cases set and read by Hopkins graduates, working under direction after the manner of Prof. W. R. Harper, of Yale University, president-elect of the new university at Chicago, who is the recognized leader in the recent higher educational work of Chautauqua."

University extension in Pennsylvania.—The following note, in reference to the starting of university extension in Pennsylvania, was furnished by George F. James, A. M., general secretary of the American Society for the Extension of University Teaching:

"There has been recently an interesting development in education in Pennsylvania. Many of the leading educators of the State have become interested in the English plan of popular education known as university extension, and in February of this year a meeting was called by Provost William Pepper, of the University of Pennsylvania, for a discussion and explanation of the system. The scheme, as it was presented, met with universal favor. On further consultation with men connected with the higher educational institutions of the State it was decided to form a society for the purpose of introducing and establishing university extension in this country. On June 1 [1890] the Philadelphia Society for the Extension of University Teaching was organized in that city with Provost William Pepper as president. A fund has been raised by subscription for the initial expenses of the society, and the secretary will be sent during the coming summer [1890] to England, where other influential members of the society will unite in a careful examination of the origin and development of university extension, and a study of the best forms of general and local organization. An earnest effort will be made by the society to adapt this system to American conditions. It seems clear to those interested in the movement that it promises valuable results to American education along many lines.

University and school extension.—The following extracts from the circular of the university and school extension for the year 1889-90 will give a fair idea of the purposes of this movement:

"The design of the university and school extension" is, in the words of the circular announcing its purposes, "to supplement and to strengthen the univer

sity and the school system, to increase the culture and to promote the interests of teachers as members of a profession, and in general to advance the knowledge of letters and of the arts and sciences.

"The work is not, however, restricted to teachers; it is open to all persons of the required age. No one can expect, through the university and school extension, to secure a university education; but university graduates and others, ladies and gentlemen, will thus have an opportunity of continuing or of taking up each year some one or two studies under university guidance and recognition.

"The courses in university extension will be parallel to those of the universities and, within the necessary limitations, of the high grade maintained in the best universities. The work in school extension, which will be slower in development, will be in the subjects taught in schools. It will also include the methods and the principles involved in teaching the respective subjects."

METHODS.

"The features of the work are home study, class work, lectures, instruction by correspondence, lectures by correspondence, the library, public examinations, prizes, and certificates—various marks of honor for work of high grade, but no degrees."

"Each registered member is entitled to one of the following syllabi, and may procure the others from the general secretary." [There are twenty-five of these syllabi, laying out courses of study, preliminary and advanced, in literature, history, psychology, political science, French, German, mathematics, astronomy, physical geography, geology, physics, chemistry, and philosophy of education. These are prepared by professors of Harvard, Yale, Columbia, Princeton, and by Superintendent Calkins.]

CLASSES.

"Any person may form a society or a class to study any one of the prescribed courses. A class should consist of from three to twelve students. The best talent available should be secured to lead or to assist in the work. The general secretary will assist in forming classes in New York, in Brooklyn, and in other places. A class can pay its registration fee and class instruction by charging its members a small fee.

"The class meetings may not only be made the occasion for pleasant social and intellectual intercourse, but the exercise may be varied by readings, essays, and discussions. It is suggested that small circulating libraries for the use of a class may be formed by the gift or loan of one or more books by each member of the class.

"A student who has no associates with whom to form a class should pursue his studies with the assistance of the correspondence courses. Registered members will, however, be advised as to the formation of classes."

CORRESPONDENCE.

"Registered members desiring to join correspondence classes should communicate with the general secretary. These classes will be formed only when a sufficient number of students express a desire for them. The correspondence will be under the personal direction of a university professor. Most of the professors in the university extension have consented to teach the correspondence classes in their respective studies.

"Correspondence classes are suggested for each of the following topics: Greek, Latin, French, German (the language and literature of these languages for a four or five years' course), English literature, psychology, political science, American and European history, physical geography, geology, chemistry, physics, astronomy, algebra (a two years' course), geometry, trigonometry, physical training, the philosophy and history of education."

LECTURES.

"The class and the lecture systems, as the work is developed, will be thoroughly well organized. During the year 1889-90 there may be a few lectures in New York or Brooklyn. It is expected that members of the university and school extension will have the opportunity of attending, each year, short courses of lectures by university professors."

LIBRARY.

"In most of the syllabi the professors have outlined their subjects by topics; and after each topic they have referred in many cases, by chapter and page, to the best reading on the respective topics. The student has the benefit of readings selected in each subject by an acknowledged expert."

FEES.

"The registration, or membership fee for the present year, is $1 for one student or a small class, and $5 for a large class or a society.

"Ladies 18 years of age or older and gentlemen of 20 years or older, and also classes and societies, may become registered members.

"The fee for instruction by correspondence will be $10 for each study, but no correspondence class will be formed nor will the money be received until a sufficient number have expressed a desire to join the respective classes.

"All the lines of work, including the examinations, are entirely optional with members, nor will any charge be made for any part of the work unless that part is chosen by the member."

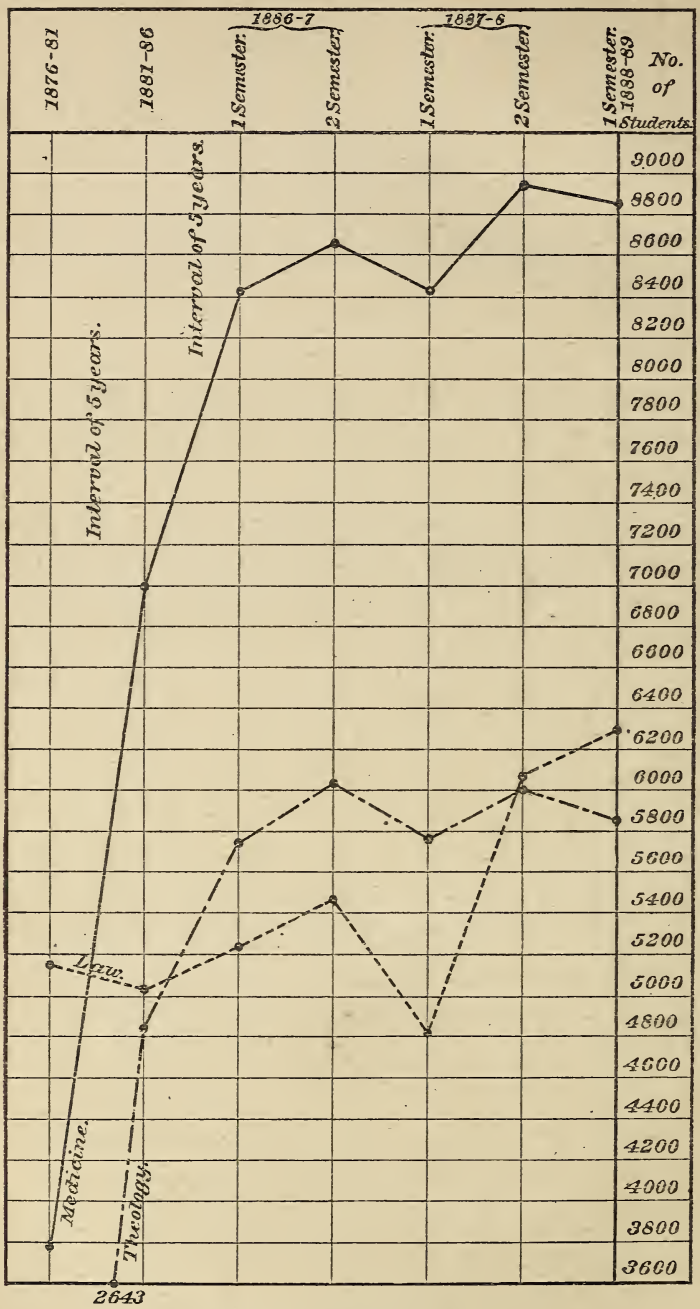
"The class registration fee of $5 entitles a class to 12 syllabi. Additional syllabi may be had by members at 25 cents each, or 6 for $1.

"Send registration fee with address to the undersigned."

SETH T. STEWART,
General Secretary,
Box 192, Brooklyn, N. Y.

CHAPTER IX.[1]

COMPARATIVE DIAGRAMS ILLUSTRATING THE STATISTICS OF PROFESSIONAL EDUCATION DURING THE DECADE 1880–90.



Before entering upon an exhibit of the statistics of professional training in the United States for 1889–90, with particular reference to the statistics of the nine preceding years and incidentally to those of France and Germany for the same period, the attention of the reader may with great propriety be called to certain facts too important to be lost sight of.

Both in Germany and France education, higher and lower, since the beginning of the century has been in the hands of the State, and, as a result, the Government of France and of the several German States may each demand statistical information and compel its stipendiary to furnish it. On the other hand the information annually obtained by this Bureau is due to the courtesy of its correspondents who are under no other obligation to furnish their statistics to the Federal Government, or in many cases even to the government of the State in which they are located. From this it naturally follows that several delinquent correspondents will be found each year, though not infrequently as many as four blanks are sent out to such on as many occasions. When these delinquencies happen it is the custom to use the statistics furnished by the delinquent institution the preceding year, indicating the fact by a footnote. When an institution fails to report for two successive years it is taken out of the table unless there is evidence that it still exists. In the following diagrams it has been the object of the compiler to fill up such lacunæ whenever it appears that the institution still exists or has, after a period, been restored to the table.

A still more formidable difficulty, however, is presented by the dissimilarity of institutions which bear the name of college or university or normal school and the like, but beyond cautioning the reader in the matter it is advisable to leave the subject to a future occasion, though whatever can at present be attempted in this line is given in Chapter X, which deals with the curricula of the schools whose attendance is given in this.

CHAPTER X.[1]

CURRICULA OF PROFESSIONAL SCHOOLS.

If a certain number of individuals have a common quality that may be represented in numbers a statistical table may be formed. But if this common quality is expressed in a very general way, such as by the term "medical students in 1889-90," it will happen that students who are pursuing a three-years course of medicine count for as much as those who are pursuing a four-years course. It is therefore quite as important to know what and how the students in medicine for 1889-90 were taught as to know how many of them were taught in medical schools during that period.

In taking up in order the several classes of professional schools, the requisites for admission to them will be considered first, then their curricula. Statistics for the last ten years have been given in the preceding chapter, and those for the year 1889-90 will appear in full detail in the chapter which follows.

MEDICINE.

REQUIREMENTS FOR ADMISSION.

If we begin by inquiring what was required of the applicant for matriculation in 1880-81, it is shown by an inspection of the announcements and catalogues of about 80 medical schools that the situation was, in general terms, as follows:

Ten had examinations for admission covering several subjects and 14 employed some slight tests of an applicant's fitness to study medicine. The subjects of examination were elementary physics in 8 schools, arithmetic in 7, elementary Latin in 5, grammar in 4, geography in 4, algebra in 4, geometry in 3, and history in 2. Grammar and composition were determined usually from the papers submitted. The amount of physics required was generally a knowledge of Balfour Stewart's Primer of Physics or its equivalent. The Latin requirements were varied, and were intended to show the familiarity of the applicant with declensions, conjugations, common words, and simple constructions. Algebra to quadratic equations and two books of geometry were usual requirements in these branches. The Michigan College of Medicine allowed a substitution of either Greek, French, German, botany, or zoölogy in place of other studies mentioned above (except Latin). French, German, algebra, geometry, and botany were alternative subjects at Harvard Medical School, on one of which the candidate must be examined. Botany and chemistry, as found in the Science Primers, were required by the Woman's Medical College of the New York Infirmary. College diplomas, degrees from scientific schools, graduation from acceptable high schools and academies, and licenses to teach public schools were among the proofs of a candidate's fitness which were accepted in lieu of examination. In the Medical School of Missouri University all students before entering the senior class were required to pass a satisfactory examination on English grammar, rhetoric, history of the United States, and arithmetic through common fractions.

In examining the announcements of the requirements demanded of matriculates, in 1890 the reader is struck with the very frequent use of the expression "all the branches of a good English education," to which is added in the majority of cases "including mathematics, English composition, and elementary physics or natural philosophy." The phraseology varies, however; sometimes it is a "fair English education;" in other connections it is the "common-school

[1] Prepared by Mr. Wellford Addis, specialist in professional education.

branches." In many other cases the requirements are "proficiency in grammar, arithmetic, geography, history," and even reading, writing, and spelling, and proficiency in all these subjects may be taken as a definition of a "good (or fair) English education." Such an education ought to be given in the public schools, and thus it follows that the requirement of the great majority of the medical schools of the country is a thorough common-school education. The entrance requirements of the medical schools of France are considerably higher, for in that country the matriculate must have obtained the degree of bachelor of letters and another degree, which is called bachelier ès sciences restraint pour mathématiques, and the curriculum of the German gymnasium, which is preparatory to a course of medical instruction, is quite as high and as thorough as that of the French Lycée. What the requirements in Great Britain are may be inferred from the special matriculation examination of the Bellevue Hospital School for those students who expect to present their diplomas for recognition in Great Britain. This examination embraces the following subjects: English language, including grammar and composition; arithmetic, including vulgar and decimal fractions; algebra, including simple equations; first two books of Euclid; Latin, translation and grammar, and one of the following subjects: Latin (first two books of Cæsar), Greek (St. John's Gospel), French (the first chapter of Télémaque or Charles XII), German (first part of Adler's Reader), natural philosophy, including mechanics, hydrostatics, and pneumatics (Peck's Ganot's, or Parker's Philosophy).

There are some exceptions to the average requirements in the United States which call for attention. In several instances a familiarity with Latin grammar is demanded, though in four instances this familiarity may be obtained during the course of medical instruction. For admission to the department of medicine of Harvard University the requirements are that the applicant shall write an English composition of two hundred words and write English prose from dictation, translate easy Latin prose, possess such a knowledge of physics as may be obtained from Balfour Stewart's Elements, and elect one of the following subjects: French, German, elements of algebra or of plane geometry, or botany. At the Yale Medical School the requirements, with the exception of the languages, are about the same. In the case of the department of medicine of Michigan University stress is put upon a competent knowledge of zoölogy, and languages are not required, while in the case of the medical department of the University of Minnesota the examination embraces an English composition of two hundred words, Latin, French, German, or a Scandinavian language, an examination in algebra, plane geometry, or botany, and in physics. The College of Physicians and Surgeons in the City of New York (Columbia College) has an entrance examination in which the Latin (Cæsar or Sallust), algebra, and geometry are fully equal to the requirements in those branches demanded by the above-named institutions. These schools are connected with our highest and wealthiest institutions of learning, and if they are unable to ask as much as the departments of arts, with which they are affiliated, how is it to be expected that non-university schools, wholly dependent upon themselves for support, both moral and pecuniary, can ask as much?

In addition to the examination as to intellectual attainments a certificate as to moral character is required.

It is not to be supposed, however, that the attendance at these schools is made up for the most part of those who pass an examination which is "satisfactory to the faculty" of the school; for that examination is only required when the candidate can not present a diploma from a college, high school, or academy, normal school, or, in some cases, a teacher's certificate entitling him to teach in a public school of his State.

The number of the matriculates who have obtained a degree in letters or science has been collected by this Bureau for a number of years. Consulting this record, which is by no means as perfect as it should be, the following facts are developed:

Of the 96 institutions reporting to the Bureau in 1881, 42 returned 1,111 students having a degree in letters or science, and 3 report definitely that they had no scholar with a degree. In these 45 institutions there were 6,625 students. Thus in every hundred students there were 17 who, it may be said, had been liberally educated. If the other institutions (51) had reported specifically that they had no student who had received a degree in letters or science, the whole attendance as far as reported to this Bureau (11,399) could be compared with the number of students who were reported as having obtained a degree by the schools which answer the question definitely in the affirmative or negative and no error occur.

If we assume, however, that these 51 institutions had no matriculate in attendance having a degree in letters of science, then, to do justice to the different parts of the country, comparison may take the following form:

	New England and Middle States.	South Atlantic States.	South Central States.	North Central States.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*
Ratio of matriculates having degree in letters or science to students in all medical schools of each section of the country	14	6	2	7
Ratio of matriculates having degree in letters or science to students in medical schools that report students with such degrees in each section of the country	20	11	8	15

Continuing this sifting process by considering eleven schools of medicine which are departments of a university, it appears that at—

	Attendance, 1880–81.	Had a degree in letters or science.
		Per cent.

Total	2,635	*a*22

a Average per cent.

In 1886–87, 60 schools reported the number of their matriculates that had received a degree in letters or science and 5 schools definitely reported that they had no person thus distinguished among their students. In these 65 schools there were 6,690 students, of whom 15 in every 100 had received a degree in letters and science. Taking the same individual schools as before, the showing is as follows:

	Attendance, 1886–87.	Had degree in science and arts.
		Per cent.
Harvard Medical School	260	55
Yale Medical School	23	31
College of Physicians and Surgeons (Columbia College) *a*	606	31
University of Pennsylvania, medical department	406	23

Total	2,659	*c*23

a The total number of students (188) possessing a degree at time of matriculation is taken from president's report, 1890.
b No answer.
c Average per cent.

These figures show a slight increase during the six years; but, if the institutions making no answer could have been included, a decrease might have resulted, which would have tended to confirm the average for the 65 schools which furnished definite reports for 1886–87.

Finally let us consider the statistics of the year 1889–90. One hundred and ten institutions have reported to this Bureau, 78 of which report definitely the number of students having a degree in letters or science or that they have no student possessing such a degree. In these 78 schools 15 per cent of the matriculates had obtained a degree before entering upon the study of medicine. The absolute figures are, 16 schools with no students enrolled who had obtained a literary or scientific degree, 62 schools with 1,382 students having a degree; total enrollment in the 78 schools, 9,389. Adding to the enrollment of the 78 schools the enrollment of the 32 which answer "Don't know," "No data," etc., the total enrollment of the 110 schools reporting is 13,793. Comparing the enrollment in these 110 schools with the number of matriculates reported by the 78 schools as having degrees, the result is that 10 per cent of the enrollment in the medical schools of the country were possessors of a degree in letters or science. Considering the States by sections and including only the 78 schools which report 15 per cent of their matriculates having a degree in letters or science, it is found that 18 per cent of the matriculates in the medical schools of the North Atlantic Division had a degree in letters or science. 13 per cent of the South Atlantic division, 18 per cent of the South Central division (including Tulane University, estimated at 25 per cent), 9 per cent of the North Central Division, and 9 per cent of the Western Division. These figures show a diminution for the schools of the North and an increase for those of the South.

Considering the statistics of the eleven individual medical schools as before, at—

	Attendance, 1889-90.	Had degree in science or letters.
		Per cent.
Harvard Medical School	290	43
Yale Medical School	55	30
College of Physicians and Surgeons (Columbia College) *a*	619	36
University of Pennsylvania, medical department	485	26
Medical School of Maine (Bowdoin College)	81	21
Medical department of the University of the City of New York	633	17
Medical department of the University of Vermont	205	19
New Hampshire Medical Institution (Dartmouth College)	83	16

Department of medicine and surgery, University of Michigan	372	10
Medical School of the University of the State of Missouri	21	6
Total	3,081	*b*23

a These figures are taken from the president's report for 1890. The medical department made no report on the blanks prepared for replies from such schools sent out by this Bureau.
b Average per cent.

From the foregoing statements it appears that there has been a slight reduction in the number of matriculates (17 in every 100 in 1881, 15 in 1890) at medical schools, who had received a degree in letters or science; while the statistics of the eleven departments of universities (where one would expect a large per cent of the matriculates to have obtained degrees) show that there has been an increase of but 1 per cent in the matriculates who had obtained a degree in letters or science. Indeed in the instance of the College of Physicians and Surgeons (the medical department of Columbia College) of New York City a decrease of 2 per cent is shown when the per cent of enrollment for the decade 1870–1880 (37 per cent) is compared with that for 1880–1890 (35 per cent); or comparing the per cent for the first half of the decade 1880–1890 with the second half, a reduction of over 3 per cent is shown.

The question, then, is: Has there been no improvement in the scholarship of the matriculates at medical schools?

The first of several questions asked on the form of inquiry sent out at the close of the school year 1889–90 was "Have you noticed during the last decade that the students of later years were in a scholastic sense better prepared to enter upon the study of medicine than those who preceded them?" Of the 86 "regular" schools reporting, 75 answer the question, 67 in the affirmative and 8 in the negative. Of 7 "eclectic" schools only 1 answers "no." Of 13 "homeopathic" schools, 12 answer yes, 1 fails to answer.

How are these facts to be reconciled? Statistics show that the number of matriculates having a degree is not increasing relatively to attendance (see

diagram 15, Chapter X), and yet the medical schools are almost unanimous in asserting that there has been an improvement in the scholarship of the matriculates. Is this unanimous report as to advanced scholarship to be attributed to an increased attendance at the secondary schools of the country? Are more graduates of high schools matriculating at medical schools? If we compare the attendance of secondary schools (exclusive of public high schools and departments of normal schools and of institutions for superior instruction) for 1880–81 with that for 1888–89 we find that there has been an increase in the attendance of schools for secondary instruction of 13 per cent. If we compare the attendance at the public high schools of one hundred and thirty-two cities in 1880–81 with the attendance in the public high schools of those cities in 1887–'88 an increase of 37 per cent is shown. Or, speculating upon the subject from the still more general standpoint of population and considering that the public high school is always a feature of urban life, it may be concluded that the increase of 7 per cent in urban population during the decade 1880–1890 has increased the high-school attendance of the country at large.

Some confirmation of the idea that the improvement in the scholarship of matriculates at medical schools is due to high schools is found in the great protest against secondary and collegiate education because it tends to overcrowd the learned professions, especially those of law and medicine. But a protest is entirely too insecure a foundation to build a theory upon. What is necessary is information as to the localities whence the matriculates at medical schools come, whether from towns and cities or from the rural districts, for public high schools with few exceptions are located in centers of population and rest on a system of grades beneath them from which they are fed. The public high school of the rural districts it should be said is, in many cases, the State normal school or agricultural college.

In examining the reports made to the Bureau some expressions are found that corroborate what has been suggested above. A medical school of California, in answering the question as to a better scholarship, answers, "Decidedly so," and adds: "18 had attended universities, academies, or colleges, 12 were graduates of high schools, 17 were graduates of State normal schools, or held educational diplomas or first-grade certificates, and 40 passed examinations." A southern school, in denying improvement, adds: "The common-school system has destroyed the private schools, and only an elementary education can be had outside." (There is no normal school in this correspondent's State.) The medical department of a celebrated university of the Northwest replies: "Our students average far better now than formerly, as nearly all who enter now [who are not possessors of a degree] are graduates of high schools;" while one of the foremost universities of the Southwest reports in the affirmative, adding, "many of our matriculates being graduates of high schools or universities." A college of Ohio makes a very striking answer in saying: "Yes, as to students who entef under 25 years of age; no, as to those over 25 years;" and a Southern collegr answers: "I have noticed an improvement in this respect, but it must be rememe bered that the students from the South now seeking admission to our colleges received their education (literary) during the decade following the war when educational matters were chaotic."

Of 110 schools, 88 answer the question: "Has the average age of matriculates advanced?" Two-thirds of these answers are no, and 10 of them say the average has diminished. The Hospital College of Medicine (Central University) reports the age of seniors in 1880 as 26, in 1885 as 28, and in 1890 as 27. One college reports "age diminished; mental caliber advanced."

THE CURRICULUM.

THE CHARACTER OF THE CHANGE IN THE COURSE DURING THE DECADE AS REPORTED BY THE DEANS OF THE SEVERAL SCHOOLS.

In reply to a general question as to the character of the changes during the decade in the medical curriculum, especially in regard to practical instruction, one-fourth of the schools answer "no change," or ignore the question. The general tenor of the affirmative responses may be classified under two heads, to wit, increase of the time devoted to the study of medicine, and increase in the time devoted to laboratory and chemical instruction. The answers as to the time devoted to study may be classed under two heads, one class of answers showing a very decided movement to increase the course from two to three years and to grade it, and the other a tendency to prolong the session from five or six to eight months. The replies indicate a strong tendency to introduce laboratory instruction, chemistry and histology being the subjects most frequently mentioned. Clinical in-

struction also appears to be a subject in which improvement has been made. Entrance examinations, higher requirements for graduation, and recitations from text-books are only mentioned four or five times in each case. It is not to be supposed that all these subjects should occur to the gentlemen who answered the inquiry as they read the question on the blank. One thing would suggest itself to one and another to another. What appeared to each at the moment as most important was jotted down in the small space allowed for the answer. It is, therefore, surprising to find so many, though relatively few, answering the question in the same way.

With this preliminary view of the character of the advance during the decade, and a reference to the summary of the condition of medical instruction in 1881, let us attempt to ascertain its condition in 1890.

The first question that naturally is asked is, "What is considered to be a good preparation for admittance to practice medicine?" The regulations of the U. S. Army require the candidate to pass in the following subjects:

I. The physical examination will be rigid; and each candidate will, in addition, be required to certify "that he labors under no mental or physical infirmity, nor disability of any kind which can in any way interfere with the most efficient discharge of any duty which may be required."

II. Oral and written examinations on subjects of preliminary education, general literature, and general science. The board will satisfy itself by examination that each candidate possesses a thorough knowledge of the branches taught in the common schools, especially of English grammar, arithmetic, and the history and geography of the United States. Any candidate found deficient in these branches will not be examined further. The examination on general science will include chemistry and natural philosophy, and that on literature will embrace English literature, Latin, and history, ancient and modern. Candidates claiming proficiency in other branches of knowledge, such as the higher mathematics, ancient and modern languages, etc., will be examined therein, and receive due credit or their special qualifications.

III. Oral and written examinations on anatomy, physiology, surgery, practice of medicine, general pathology, obstetrics and diseases of women and children, medical jurisprudence and toxicology, materia medica, therapeutics, pharmacy, and practical sanitation.

IV. Clinical examinations, medical and surgical, at a hospital, and the performance of surgical operations on the cadaver.

Due credit will be given for hospital training, and practical experience in surgery, practice of medicine, and obstetrics.

The Illinois board of health, so well known by its activity in investigating the value of medical diplomas, has a schedule of minimum requirements of ten subjects—anatomy, physiology, chemistry, materia medica, and therapeutics, theory and practice of medicine, pathology, surgery, obstetrics, and gynæcology, hygiene, and medical jurisprudence.

But these curricula are a mere framework, so to speak, to be clothed with flesh according to the taste and conscientiousness of the instructors and examiners. Nor is the order indicated in which these special studies should be pursued, much less the reason why they should be pursued at all. If we turn to France we may obtain some information on both these points.

It is well known that professional instruction in France has been remodeled during the last ten or twelve years. The reform began with the schools or faculties of medicine, and in 1878 the following decree was issued by the minister of public instruction:

"ARTICLE 1. The course of study leading to the degree of doctor of medicine lasts four years. Of this period the first three years may be spent in the 'faculties' [*i. e.*, schools taught by the faculty using that word in our sense] or in the schools of full exercise [*i. e.*, schools taught by a corps of instructors who can not grant degrees], or in preparatory schools of medicine and pharmacy [*i. e.*, those which only educate for an inferior grade of physician or pharmacist]. The studies of the fourth year can only be pursued in a faculty or a school of full exercise.

"ART. 2. * * * The student undergoes five examinations and sustains a thesis. The second, third, and fifth examinations are divided into two parts. Examinations at the end of each year are suppressed.

"ART. 3. The five examinations are as follows: First, physics, chemistry, medical natural history. Second, part 1: Anatomy and histology; part 2: Physiology. Third, part 1: Surgery, accouchements, operative medicine; part 2: Medicine (pathologie interne), general pathology. Fourth: Hygiene, medical

jurisprudence, materia medica, and pharmacology. Fifth, part 1: Surgical and obstetrical clinics (clinique externe et obstétricale); part 2: Clinical medicine, practical evidence of work in pathological anatomy (clinique interne, épreuve pratique d'anatomie pathologique).

Thesis: The candidate sustains this test upon a subject chosen by himself.

"ART. 4. The first examination comes off between the fourth inscription and the fifth [*i. e.*, after 12 or 15 months of study]; the first part of the second examination between the tenth and twelfth inscriptions and second part between the twelfth and fourteenth inscriptions. The third examination can not be taken before the expiration of the sixteenth trimonthly period of study. Every candidate who shall not have passed the first examination by November at the latest shall be adjourned to the end of the year and can take no inscription during the course of that year.

"ART. 5. Candidates for the doctor's degree, the students of the schools of full exercise and the preparatory schools, are examined before the faculties at the times stated in the preceding article; the first examination, however, may be taken, after the twelfth inscription. In such cases they must stand both parts of the second examination before taking the thirteenth inscription, but the student following this course is subjected during each semester beginning with the second year of studies to interrogations the results of which are transmitted to the faculties that they may be considered in the final examination for the degree.

"ART. 6. The inscriptions for the degree of officer of health (the lower medical grade) shall in no case be converted into an inscription for the doctor's degree. This conversion, however, may be authorized in the case of officers of health who have practiced medicine during two years at least.

"ART. 7. Practical work in the laboratory, dissection, and hospital attendance are obligatory. Each annual period of work in the laboratory, and in dessecting covers a semester. The hospital attendance (le stage près des hospitaux) shall be two years at the least."

When satisfied that an attempt at reform is not merely a whim or the ignorance of the reformer, the intelligent inquirer immediately asks to know the grounds upon which the change is made. What then is the motive that has induced the French legislature to modify the law of 1803? M. Wurtz,[1] as a member of the superior council of public instruction, gives several in reporting on the desirability of adopting the provision contained in the above decree. His remarks are in brief as follows:

The old law of 1803 prescribed that an examination should be made at the end of each of the first three years of the course (without value in obtaining the degree however), and then five examinations more when the fourth and last year of study had been completed. In 1825 the examinations at the end of the year were abolished and the five final examinations distributed through the course of four years. But this was found to bring the examinations too near together and to cause the student to slight his studies (la scolarité était abrégée), inasmuch as the most important examination (on clinical surgery and medicine and accouchements) was put off until the last year. This caused a new regulation in 1846, which, rejecting the examinations for the degree at the end of the whole course, instituted examinations at the close of each year. Although these annual examinations kept the student busy, thirty years of experience had shown their weakness as tests of capacity and as a means of discipline. The object in drawing the above law was to divide the four years of study into periods, in such a manner that each period would be devoted to several related subjects and could be closed with a test examination on those subjects.

The question then became a purely pedagogic one. In what order should the periods follow each other? The degree of bachelier ès lettres testified to the medical student's literary qualifications, and the modified degree of bachelier ès sciences testified to his proficiency in the natural and physical sciences. Should the student, possessing such intellectual maturity and such knowledge of those sciences which are the necessary introduction to the study of medicine, proceed immediately to the study of anatomy and physiology, which are the foundation of medicine? No, says M. Wurtz, the medical student must study physics, chemistry, and natural history in a course that is neither a repetition nor even a development of his scientific studies in a lycée. The student is now to study these subjects as applied sciences, and to them he is to devote one year.

[1] Dean of the Paris Faculty of medicine from 1836 to 1874, member of the institute, professor of chemistry at the Sorbonne, senator of France, etc., etc.

But will one year fix these subjects indelibly, especially if the first examination is the only one upon them? This was precaution the old programme had taken by keeping up the examination on physics and chemistry to the end of the course. But what followed? The first examination was frequently weak; the students were careless and the examiners indulgent; while towards the end of the course it was intolerable for the student to take his mind from his proper professional work to rectify the neglect of the first year of his course. The new programme attempts to remedy this, says M. Wurtz. The applications of the sciences to physiology, to hygiene, and to pathology [subjects of the second and third examinations] have now become so important, that it is easy to introduce in the programmes corresponding to the examinations many questions touching the application of pure science to the subjects of these examinations.

To prevent crowding the programme of the examination—a fault of the old examination scheme—an innovation was made which is the distinguishing characteristic of the new one. The second, third, and fifth examinations are divided into two parts. In the middle of the third year of the course, and eighteen months after the first examination, the candidate undergoes the first part of the second examination; at the close of the third year he undergoes the second part, after taking the twelfth inscription. In the second part of this second examination the chemistry of digestion, respiration, nutrition, composition of the blood, etc., is studied, as also the physical phenomena of hearing, seeing, and respiration as a source of heat, all very much specialized, it is true, but fruitful because of the solid foundation laid in the first year. The division of the two professional examinations, in the practical sense of the term—the third and fifth—was demanded by the faculties of medicine; for it was thought that it was too much to ask that both parts of these examinations be taken in immediate succession. It was found that under the old scheme mediocre candidates would neglect one part of the examination and prepare for the others, counting upon the benevolent intervention of an easily satisfied examiner and the indulgence of the others.

But there is another position from which the subject of teaching may be viewed. At an early meeting of the French society for the study of subjects related to higher instruction the question "of what faculties should a university be composed" was formally put to the society by its president. Dr. Le Fort, of the celebrated faculty of medicine of Paris, on this occasion, after stating the views of his faculty as far as the matter related to the faculty of medicine, proceeded to express his own, as follows:

"The place to study medicine is in the hospital and only in the hospital. Some medical savants devote themselves to laboratory study. Nothing can be better. But for the physician, who should above all things learn to care for and, if he can, cure his patients, the only school is the hospital. There may be courses in hygiene and medical jurisprudence, but there can be no theoretical course in medicine, none in surgery; there is only a course of clinics, and the professor at the same moment teaches the students the theory (of which they have obtained the principal notions from the books) and the practice."

Dr. Le Fort, speaking for himself and not for the faculty with which he is connected, may have been induced to speak so very practically in view of his opposition to bringing a faculty of medicine under the control of a contemplated "University Senate;" but it can not be denied that public opinion is with him. His position seems to be, to judge from his remarks, that instruction in medicine consists of two operations—getting the principal notions out of the books and seeing practical work done and hearing it explained at the hospital.

It is quite supposable, however, that the curriculum of a medical school has the especial object to assist the student to obtain the principal notions from the books and to obtain them correctly. At all events, we shall assume that in America the original intention of the lecture course was to perform this service (generally imperfectly performed by the physician under whom a student has been placed), that by degrees, where possible, the hospital became the field for professional sight-seeing, and in many cases a good deal more, and that during the last decade the laboratory has been added to the instruction of the lecture-room and the clinic, as the biologist opened up a science of histology.

In conducting the following inquiry, as to the curriculum, then, three points will be considered. The manner in which the student obtains the "principal notions" of medicine from the books, clinical instruction and dissecting, and laboratory work. The curriculum of the schools having a graded course will be used as best adapted to the purpose in hand.

TEXT-BOOK WORK.

Beyond the ability to read the printed page, which may in a measure be a mere mechanical operation, certain intellectual attributes are requisite for getting the principal notions out of the books. In the first place (presupposing a logical arrangement of the text-book) it is highly advantageous for the student to have attained an intellectual maturity sufficient to enable him to understand the system on which the text-book writer has arranged his matter, and, in the second place, the mental alertness to recognize the parts of the arrangement and their relations as they are filled in, so that what is material may be given the study due to its importance and the lesser matters be noted as such. Perhaps not less important in this process of getting the ideas of an author out of his book and into one's own head is a cultivated perception of the meaning of phrases and sufficient continuity of thought to carry a term, or phrase, or sentence in the mind until the idea it contains as an isolated part of the discourse has been reduced to its proper value by the modifying phrases or sentences which generally accompany the principal part of a sentence or of a paragraph.

Thus we see why in some quarters so much stress is laid on a thorough literary education as a preparation for the study of medicine. Even during the eighth decade of this century, when the theoretical or literary science of the class and lecture room had reached its maximum and was soon to begin to give way to laboratory instruction, the well known German evolutionist, Prof. Ernst Haeckel, could say from his own experience that "in comparing graduates of classical colleges (Gymnasien) and those of scientific colleges (Realgymnasien), I have always observed an intellectual superiority in the former, despite their defective knowledge, and have even found during the teaching of my own specialty, zoölogy, that the former enter more easily into the higher and more general problems of science than the latter. I am, therefore," he continues, "against the admission of Realschul graduates to the medical schools (faculties), and I base this conclusion on my own experience."[1]

But since the distinguished professor wrote these words a new class of medical schools has arisen in America. At the beginning of the decade there were three or four courses of study whose object was to prepare the student for the study of medicine. The course covered two years, and was chemical and biological in character. At Cornell the student intending to pursue a preparatory medical course was advised to secure a degree in letters or science; at Johns Hopkins the course led to the bachelor's degree (A. B.). To-day we find three or four times as many such courses, as will be shown later on. In the mean time let us examine into the manner in which the student (much the larger number) who has neither the experience of the preparatory school, or the ability to collect, digest, and formulate his knowledge given by higher literary education, is instructed by the American medical colleges.

Until comparatively recently the method of didactic (*i. e.*, nonclinic) instruction, called repetitional, held almost undivided sway. The essence of this system of instruction is the well-known pedagogical—that is to say psychological—fact that repetition and attention are the most important elements in the acquisition of knowledge. The application of this not very obscure principle of pedagogy to medical instruction was made this way: There were so many "didactic" professors in the school. Each of these gave the same course of lectures every year. The student listened to them during his first year and again during his second year, and had he attended a third year he would have heard them for a third time. This system has been severely criticised during the ten years past. It has, especially of late, been rapidly giving place to the graded or progressive course, which can not be finished in a single year by a well-prepared, intelligent, and laborious student, as at a celebrated southern university. But it is instructive to hear what may be said for the repetition principle by a department of a large university of the northwest, which sought to retain the

[1] To the same effect Dr. Zarncke, professor of modern languages and literature, when dean of the faculty of philosophy of the University of Leipzig, says: "There is a second view, which I call the pedagogic view. There is no better means of training the mind than the thinking and observing that the study of the classic languages necessitates. There is something mysterious in this result, and still an experience of many years has confirmed it. I am a member of two examining boards, one of which examines young men who have received their training in a gymnasium on a classical basis, while the other young men are without this foundation. The latter are very often superior to the former in information (Kenntnissen), but when mental maturity is tested by written work the graduates of the gymnasium surpass those of other schools to such a degree that a comparison can scarcely be instituted."

repetition feature in conjunction with a progressive course of three years. This defense is as follows:

"The course of instruction consists of three collegiate years of nine months each. The work of the course is systematically arranged, and so graded that the more elementary branches and the practical courses are first taken by the student, while the more advanced courses and theoretical subjects are presented later in the course, so as to secure, as far as practicable, an orderly succession of studies; while the more fundamental subjects are presented a second time during the course, so as to secure a more perfect comprehension of their principles and relations, and to fix the facts more firmly in the mind. The hours of the required lectures are so arranged that but few are given at the same time, and every facility is afforded for students to attend the repetition of the principal lectures as often as may be thought profitable. The faculty recognize, what is evident in the experience of all medical students, that attendance upon lectures on the same subject a second time, after other related branches have been studied, is much more interesting and profitable than the first; and hence they require students to attend lectures on all the leading subjects more than once."

In the catalogue giving the reorganized course of four years, however, nothing is said of the repetitional features.

But more particularly to facilitate the comprehension of the text-book matter and impress the principal notions which it contains, two methods have been adopted in America in addition to the "didactic" lecture. These are the recitation and the "quiz," neither of which are employed in the schools of university grade in Europe. Indeed, in America the lecture system may be said to be gradually becoming complementary to the text-book, just as in Europe the seminarium or conference is becoming supplementary to a course of lectures. Thus we are informed by the Yale Medical School that "in reorganizing the school as an integral part of Yale University in 1884, the inherent defects in the older and still common method of instructing chiefly by didactic lectures were recognized and the methods now employed are similar to those in vogue in the other departments of the university. Didactic lectures are still employed as best in some branches, but *recitations* from assigned readings, with explanatory lectures, laboratory work, and personal instruction in the clinics constitute the main portion of the curriculum." At the Albany Medical College it is believed that instruction by recitation is as essential in medical as in literary colleges, and the faculty have greatly enlarged and extended this department of the teaching in this college. The recitations, which have hitherto been held during unoccupied hours in the evening, are now made part of the regular curriculum. Every study taught in the college by lectures is also made the subject of recitations, the ratio of the number of lectures to that of recitations being in general two to one.

The Long Island College Hospital, having the old system of lecture courses, has adopted a reading and recitation term, which begins at the close of the regular term and continues until June. It is designed to thoroughly prepare the student for attendance on the lectures of the ensuing regular term. Clinical instruction for advanced students is continued during the reading and recitation term. As the laws of the State of New York require three years' study of medicine, students are advised to commence their study at the beginning of the reading and recitation term.

The daily and weekly quiz appears to be but a modification of the examination at the end of the year or term without the breadth or formality of that ancient contrivance for testing the memory of the student or his ability to grasp the idea expressed by the words in the examination paper before him. At the University of Virginia it has been found that "the daily oral examinations on the subject of the previous lecture are of great value in stimulating the student to regular and systematic habits of study, and furnishing the professor an opportunity of discovering and removing the difficulties met with by the student."

At the Medical College of Alabama still stronger language is used in favor of these daily oral examinations, and it announces that "so important is this method of impressing the leading facts considered in the lecture hour, and so useful is this method of instruction in obtaining systematic and accurate information considered, that members of the faculty will, after the middle portion of the term is reached, establish a daily quiz, which will be so arranged as not to interfere with any lecture or other duty, and will be of great interest, especially to those who contemplate applying for graduation."

As medicine principally deals with diseased conditions of the human body in an effort to restore it to health, it is not difficult to illustrate the lecture on anatomy, physiology, surgery, and even the practice of medicine by demonstrations,

specimens, models, and charts, and in this way even the "didactic" lecture has a semblance to the clinic. Without dwelling further on the subject of the didactic lecture, we now pass to the clinic, which must be treated with equal brevity.

PRACTICAL WORK.

In his Life of Macaulay, Trevelyan gives an extract from his uncle's diary in which the historian gives the argument by which he dissuaded the Prince Consort from attempting to give the English universities a Continental form by introducing a faculty of medicine. Macaulay explained to the Prince the great difficulty there would be in getting distinguished physicians to exchange a princely revenue in London for the salary and retirement of a university professor at Oxford or Cambridge.

But there is another reason of still greater importance for locating a first-class school of medicine in a large city. "The workingman feeds the hospital, and to enable a faculty of medicine to exist a great industrial center is necessary."[1] This sentiment is supported by the testimony of the Harvard Medical School, which says that it was established in Boston in order to secure those advantages for clinical instruction and for the study of practical anatomy which are found only in large cities.

Practical instruction in medicine may be classed under two heads: There is, first, the nonpathological form, which goes by the name of dissection, and, second, the clinic, which may be subdivided into three forms, in one of which the subject is operated on in the amphitheater before the class: in the second the class, or a portion of it, is taken to the bedside, and in the third the advanced student acts as a physician or as an assistant.

The amount of work required in dissection is not uniform throughout the country and is still less uniformly stated. From 91 schools whose catalogues mention the work in dissection required for graduation, the following information has been obtained:

Work required of student.	No. of schools.	
Dissection of entire body	34	
Dissection of three parts at least	7	
Dissection of two parts at least	6	
Two courses of dissection	10	
One course of dissection	3	
Must dissect during two sessions (or courses)	4	
Must dissect during one session	1	
		65
Studied practical anatomy during two sessions	11	
Pursued one course of practical anatomy	5	
		16
Must attend dissections while in school	2	
Must attend clinical lectures and dissections	1	
Must present certificate that necessary dissections have been made	1	
Must produce evidence of attendance in practical anatomy	2	
Must produce evidence of having been adequately engaged in study of practical anatomy	1	
Must produce evidence of having pursued the course of practical anatomy	1	
Must spend required time in practical anatomy	1	
A satisfactory course in practical anatomy	1	
		10

The modification of the didactic lecture by the previously "assigned reading" by the Yale Medical School has been noted; it would appear that the method in vogue there for studying the framework of the human body is no less complete and systematic. This system of instruction in anatomy is as follows:

"As in the other fundamental branches of medicine, the instruction in anatomy is chiefly by means of recitations and laboratory work. The course extends through two years, with examinations at the end of each year. At the beginning of the course each student is provided with a box containing all parts of the skeleton for home study, and during the first term two weekly laboratory lectures are given on osteology and syndesmology, alternating with recitations from the text-book. After a thorough knowledge of the bones, ligaments, and muscular attachments has been obtained, the student enters upon laboratory work on the soft parts, in which eight hours weekly are required until the dissection of all parts of the body has been made. Preparations of the different

[1] Le Fort, at the meeting of the Parisian group of the Society for Higher Instruction in France.

parts are made, showing muscles, arteries, and nerves, satisfactory demonstrations of which must be given before the professor at their completion. Preliminary to the dissection of the human body, a brief laboratory course is pursued in the anatomy of the cat. All laboratory work is under the immediate instruction of the professor. The written examination at the close of the year is upon osteology, syndesmology, and the trunk viscera. The instruction the second year is by alternating lectures and recitations, and includes the remainder of systematic anatomy, with topographical and superficial anatomy, illustrated by preparations, models, and several hundred lantern slides."

At the University of Virginia the course in dissection appears to be carried out with equal thoroughness. "For the course in practical anatomy, dissecting material, obtained under the permissive law of the State, is abundantly supplied without cost to the student. Each medical student, however many sessions he may have attended, is required to dissect under the constant and careful supervision of the demonstrator. Attendance in the dissecting room is compulsory, a strict record being kept in the case of each student. Besides the oral examination which precedes each lecture, and the other examinations, each student is required to stand seven practical examinations, one upon osteology, four upon different parts of the muscular system, one on the viscera, and one on the vessels and nerves. These examinations are oral and private, each student being examined alone. They consist of the identification of the truths of anatomy on the bones, the cadaver, and the dissected cadaver, and are thus a perfect test of the student's acquaintance with the gross structure of the human body."

As the attendance at neither of these schools is large as compared with the attendance at the schools of Philadelphia, New York, and Chicago, the following course of dissection may more nearly represent what the great schools can do and the average school does do.

During each session every student of the first and second classes will be required to dissect all regions of the human body. The first dissection of a region will be mainly of the nature of a preliminary study, the student being required to examine the attachments and relations of muscles and the general course and situation of the great vascular and nervous trunks. The second dissection of a region will be as exhaustive as it is practicable to make it, all the structures being as completely displayed as the time at the disposal of the student will allow. The demonstrator of anatomy will examine the students from time to time during the progress of their dissections, and, if he finds that they have not properly displayed the structures or have no accurate knowledge of the parts dissected, he will require a new dissection of the same region upon another subject. He will certify to the professor of anatomy the satisfactory completion of each dissection. It is recommended to students of the third class that they perform upon the cadaver such surgical operations as may be practicable, such as ligations of arteries, amputations, etc. Material for this purpose will be furnished. Dissecting will commence October 15 and continue until the following March. The room will be open daily for students and the demonstrator or his assistants will be present. During the session there will be given special demonstrations of the brain, of the thoracic and the abdominal viscera, and also of other difficult or obscure regions of the body. The demonstrator and assistants will have general supervision and direction over all students while in the dissecting room.

In two schools with very large attendance a rather novel course is pursued in aiding the student in his study of osteology. Instead of providing him with a complete skeleton, as at Yale, individual bones are loaned the student, as books are loaned at libraries. At the Columbia College school this "new and useful feature" is transacted in the "bone-room," where a large number of disarticulated skeletons are kept under an ostelogian, it is presumed. In the other school, the celebrated medical school of the University of Pennsylvania, the "bone-room" is dignified by the technical term Osteo-syndesmological Laboratory.

Upon the question of clinical instruction the medical fraternity agree: Clinical instruction is necessary to fit the student for the practice of his profession. Following out this conclusion, a class of hospitals has arisen which in the strictest sense are clinical. In some cases hospitals have been attached, as it were, to a college, as in the case of the medical department of the Tulane University of Louisiana and the School of Medicine of the University of Maryland. In others the hospital has founded a school, as in the case of the Bellevue Hospital Medical College and the Woman's Medical College of the New York Infirmary, and in others the school has founded a hospital, as in the case of the University of Pennsylvania, of Michigan, and of Wooster; of the Jefferson Medical College and Medico Chirurgical College, both of Philadelphia; the Long Island College

Hospital, and of the homeopathic medical colleges and hospitals of New York and Philadelphia. As a general introduction to the programmes of clinical instruction which follow, the opinion held by the faculty of the Tulane University medical department will be used as expressing the views of every reputable school.

"It is universally admitted that, without abundant anatomical and clinical material, no medical school, however numerous or eloquent its professors, can possibly fit its pupils for practical professional life. It is scarcely necessary to state that it is only in large cities that such advantages can be procured; but it is of paramount importance that the opportunities there afforded should be properly utilized; that the students should be required, under the direction of the teacher, to examine patients for themselves, to keep record of cases, to note daily changes which may occur, and thus acquaint themselves by personal observation with the progress and termination of diseases and accidents. The mere introduction of a patient into an amphitheater and the discussion of his case by the professor in the presence of a large class are no substitute for bedside instruction, and no reduction of lecture fees, not even their entire abolition, can possibly compensate for the lack of such opportunities."

In the medical department of the University of the City of New York, a very largely attended school, the graduating class is divided into sections of about twenty-five each, which receive separate instruction for one or two hours daily throughout the term. This instruction is under the immediate direction and management of nine professors and is carried on partly in the wards of Bellevue Hospital and partly in the college building. The students receive practical instruction in operative surgery upon the cadaver, in the examination of medical and surgical cases for the purpose of diagnosis, in the application of dressings and apparatus, and in the use of the laryngoscope and ophthalmoscope. In the hospital, students are taken to the bedside of the patient and are exercised in making diagnosis under the direction of the instructor, and in dressing wounds, and are enabled to watch the progress of cases. In the dispensary they have similar opportunities to become familiar with the methods of diagnosis, the treatment, and the course of those diseases which do not require confinement in bed. "The success of this system of instruction," says the faculty, "has been very marked in the past, and it has given much satisfaction to both students and teachers; it enables the students to become practically familiar with many of the things which they have learned from their text-books or in the lecture room, to cultivate their powers of observation, and to aid their memory. The importance which the faculty attaches to it is shown in the fact that it involves an increase in the time given to instruction of more than twenty hours each week."

To the same effect the School of Medicine of Columbia College speaks of the recent founding of the Vanderbilt Clinic and Sloane Maternity Hospital, as branches of the school, as being especially beneficial in enabling the school to organize a system of practical clinical teaching, whereby each member of numerous small classes may be brought into direct personal contact with the cases under examination. This teaching takes the following form under the title of "Practical Clinical Instruction:"

General medicine.—Diagnosis, including so-called physical diagnosis, and treatment.
General surgery.—Diagnosis and treatment, including minor surgery, bandaging, and the application of antiseptic dressings.
Midwifery.—Attendance upon cases of labor at the Sloane Maternity Hospital by advanced students, under the direction of the obstetricians of the hospital.
Gynecology.—Practical instruction in diagnosis and treatment, including the use of instruments.
Diseases of children.—Diagnosis and treatment.
Diseases of the genito-urinary organs.—Diagnosis and treatment.
Diseases of the nervous system.—Examination of cases, including electrical tests; diagnosis and localization of lesions; electro-therapeutics.
Diseases of the skin.—Diagnosis and treatment.
Diseases of the eye.—Diagnosis, including the tests for errors of refraction and accommodation, and the use of the ophthalmoscope, and treatment.
Diseasees of the ear.—Diagnosis and treatment.
Diseas s of the throat.—Diagnosis and treatment, including the use of the laryngoscope and rhinoscope.

At the Yale Medical School the instruction is given in the New Haven Hospital and at the college dispensary.

"In the medical clinics at the dispensary the preliminary examination is made by a student, and this is reviewed and extended as far as necessary by the instructor; the latter explains the relations of the symptoms, makes the diagnosis, and gives the student in charge general directions for treatment; the student, subject to correction, gives the precise directions to the patient. All symptoms

and physical signs are demonstrated to all the members of the class, and examinations of urine, sputum, gastric contents, and blood are made, when called for, by the student, under the supervision of the instructors. It is the especial aim in these clinics to familiarize the student with all methods and instruments of diagnostic examination, and the instruction is made as personal as possible. Cases which need to seen at home are put in charge of the senior students, and obstetrical cases are assigned to them. In such cases the professor of clinical medicine or his assistants give counsel whenever called on. At the hospital one medical clinic is held each week; these are general medical clinics, but particular attention is given to the demonstration of the various signs of importance in physical diagnosis. Opportunity is also here provided for the study of those severer cases which the dispensary service does not furnish, and care is taken to have the students see the same patient in various stages of his disease, and, in fatal cases, to demonstrate the lesions."

The "clinical out-practice," referred to in the above quotation, illustrates the usage of other schools. At the Jefferson Medical College the professor of practice will, during his clinical term, devote a number of hours to clinical conferences. During these the advanced student will have a case assigned him, which he will be required, with the aid of the chief clinical assistant, to examine beforehand, and which then, with remarks on the diagnosis, prognosis, and treatment, he will present to the class. The Bennett Medical School, of Chicago, goes further. Students in the senior year, by assignment, will be given the care of out-patients from the clinic, thus giving the experience in actual bedside practice, in such cases as fevers, rheumatism, treatment after surgical operations, obstetrical cases, etc.

But it is in the dispensary that this "out" instruction is most frequently given. At the Chicago Medical School of the Northwestern University, for instance, the members of the clinical class may serve as assistants to the physicians and surgeons of the several departments of the dispensary, and to the pharmacist of the dispensary, and receive certificates of such service. Members of the attending staff and the dispensary pharmacist appoint their own assistants, and the term of service is six weeks. At the Kansas City Medical College every member of the senior class served a period of two months in each of the departments of the dispensary during the sessions of 1889–'90.

To illustrate the order of clinical exercises, the following programmes are given:

Roster of hospital practice and laboratories for the third-year students of the Jefferson Medical College.

SESSION OF 1891-92.

[The class is divided into eleven sections, A to K, inclusive, serving as follows, in periods of two weeks each, the dates being included.]

Clinics, etc.	Oct. 12 to 24, inclusive.	Oct. 26 to Nov. 7.	Nov. 9 to 21.	Nov. 23 to Dec. 5.	Dec. 7 to 19.	Jan. 4 to 16.	Jan. 18 to 30.	Feb. 1 to 13.	Feb. 15 to 27.	Feb. 29 to Mar. 12.	Mar. 14 to 25.

Bellevue Hospital Medical College.

ORDER OF LECTURES—REGULAR SESSION, 1890–1891.

Hours.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
10	----------	Surgical clinic, until Jan. 1; Medical clinic, after Jan. 1.	Section teaching, Bellevue Hospital. Histology, etc., Carnegie Laboratory, from 10 to 12.	Gynecological clinic, Prof. Lusk.	----------	----------
2	Eye clinic....	Medical clinic, Sept., Oct., Nov., Dec.; children's clinic, after Jan. 1.	Surgical clinic until Jan. 1; mental diseases, after Jan. 1.	Medical clinic.	Medical clinic.	Surgical clinic at 1½.

SPRING SESSION, 1891.

Hours.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.
11	Juniors, microscopical examination of urine at 10.	----------	----------	Genito-urinary clinic.	----------
2	----------	Clinic, diseases of children.	Surgical clinic, until May 1; after May 1.	Gynecological clinic.	Medical clinic and exercises in diagnosis.
3	----------	Demonstrations in gross pathology, Dr. Biggs.	----------	Clinic, diseases of the throat, after May 1.	----------
4	Demonstrations of surgical dressings, Dr. Silver.	Demonstrations in anatomy, dissecting room.	Demonstrations in anatomy, dissecting room.	Demonstrations in anatomy, dissecting room.	Demonstrations in anatomy, dissecting room.

Schedule of hospital and college clinics for students of second and third years of the Chicago Medical College of the Northwestern University.

MERCY HOSPITAL.

Hours.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
9 to 10	Medical	----------	Gynecology	----------	Medical	----------
2 to 3	----------	Surgical	Oral surgery	Eye and ear	----------	----------
3 to 4	----------	----------	----------	----------	----------	----------

ST. LUKE'S HOSPITAL.

1.30 to 2.30	----------	----------	Eye and ear	Oral surgery	----------	----------
2 to 3	Autopsies	----------	Gynecological	Surgery	----------	----------
3 to 4	Medical	----------			----------	----------

COLLEGE CLINICS.

2 to 3	Surgical	Dermatology	Diseases of children.	Gynecology	Eye and ear	Laryngology, rhinology.
2 to 4	----------	----------	----------	----------	Medical	----------
4 to 5	----------	----------	----------	----------	----------	Nervous diseases.

Schedule of hospital and college clinics for students of second and third years of the Chicago Medical College of the Northwestern University—Continued.

DISPENSARY CLINICS.

Hours.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
2 to 3	Medical Surgical Throat and chest. Gynecological. Eye and ear. Diseases of children.	Medical Surgical Throat and chest. Gynecological. Eye and ear. Diseases of children. Nervous diseases.	Medical Surgical Throat and chest. Gynecological. Eye and ear. Diseases of children.	Medical Surgical Throat and chest. Gynecological. Eye and ear. Diseases of children. Nervous diseases.	Medical Surgical Throat and chest. Gynecological. Eye and ear. Diseases of children.	Medical Surgical Throat and chest. Gynecological. Eye and ear. Diseases of children. Nervous diseases. Skin diseases.

Hospital and dispensary clinics of the medical department of the University of California.

Hours.	Tuesday.	Thursday.	Saturday.
9 a. m.	Clinical medicine	Clinical medicine	Clinical medicine.
	Examination of the patient by student, etc.		
11 a. m.	Clinical surgery	Clinical surgery	Clinical surgery.
	Especial attention is given, in a ward devoted to the purpose, to the conduct of disorders of the genito-urinary organs and venereal diseases.		
		Operative gynecology and practical obstetrics.	
4 p. m.	Dispensary clinic	Dispensary clinic	
	Eye and ear clinic twice a week.		
	Autopsy three times a week.		

College and hospital clinics of the Kentucky School of Medicine at Louisville.

Hours.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
8 to 9 a. m.	Venereal and skin diseases.	Diseases of rectum.	Diseases of women.	Medical clinic.	Medical clinic.	Diseases of children.
2 to 3 p. m.			Hospital clinic in afternoon.		Hospital clinic in afternoon.	Diseases eye, ear, and throat.
4 to 5 p. m.	Surgical clinic.			Surgical clinic.		Surgical clinic.

The clinics of the New York Homeopathic Medical College and Hospital.

Monday	Therapeutics.
Tuesday	Dermatology, Physical diagnosis.
Wednesday	Surgery. Ophthalmology.
Thursday	Heart and lungs, Otology, Nervous diseases.
Saturday	Genito-urinary, General medicine, Gynecology. Outdoor children's department, Outdoor obstetrical department.

LABORATORY WORK.

The most noteworthy innovation of the decade has not been the lengthening of the course of instruction, many years ago recognized as too short, not the better and completer organization of the clinic, which in a great part no longer renders the "study under a physician" indispensable, but the introduction of laboratory work in chemistry, physiology, and especially in normal and pathological histology or, more generally, biology. Perhaps the introduction of laboratory work has played a great part in lengthening the course of medical instruc-

tion, as it certainly has given it status as a course in science. It is certainly so in the case of the Medical School of the University of Michigan, for its faculty states explicitly that the extension of the course from three to four years "is largely due to the need for the more through instruction in laboratory work," for the student who spends but "three years in attendance upon lectures and one year of study with a preceptor can not reap the advantage of the full course of laboratory instruction."[1]

Laboratory instruction as given in the American colleges of medicine may, in view of the laboratories in which it is given, be classed under six heads, to wit:

1. Dissection or "Practical Anatomy."
2. Chemical manipulation (general and analytic).
3. Physiological.
4. Histological.
   a. Normal.
   b. Pathological.
5. Bacteriological.
6. Materia medica.

Dissection has already been spoken of; normal histology will be spoken of further on: while other than noting that it affords each student the opportunity to go through a course of chemical experiments, the instruction of the chemical laboratory calls for no special mention except as to that form which at the Yale Medical School is called the course in physiological and medical chemistry.

This course consists of recitations and a practical laboratory study of the composition and reactions of the various animal tissues and fluids, the processes of metabolism and digestion, and the action of ferments. Due attention is paid to the composition of foods, the physiological use of the digestive preparations, and other matters of medical interest, especially to the recent analytical methods employed in clinical work. The study of normal urine is supplemented by abundant practice in the chemical and microscopical examination of pathological specimens. At the Jefferson Medical College, the same tendency towards the pathological side is shown in the instruction in its laboratory of practical chemistry. The student there examines the normal and abnormal products of the human body as aiding diagnosis, and studies practically the "morbid chemistry of the bile and blood" and the most approved methods of examining urine. At the University of Michigan there are two courses, one in qualitative chemistry and the other in urinalysis as applied to chemical uses and physiological study; but, in addition to them and at the option of the student, two other courses are offered, one in physiological chemistry and the other in pathological chemistry. The first of these optional courses deals with the analysis of the solid and fluid parts of the body, the other embraces courses in qualitative and quantitative analysis and the examination of foods and of the tissues and fluids of poisoned animals. One might venture to call this specialization of chemistry diagnostic chemistry. Toxocologic chemistry also appears as a department of the chemical laboratory, but sometimes is connected with medical jurisprodence.

The physiological laboratory, of which there are very few in the country, is to the medical school what the mechanical or testing laboratory is to the college of technology, and in some schools (which care to mention the fact) what the biological laboratory is to the vivisectionist. The instruments with which such a laboratory is fitted up and the use made of them may be illustrated by the laboratory of the Jefferson Medical College. The teaching of this college in its course of experimental physiology embraces the demonstration of the essential phenomena of digestion, absorption, circulation, respiration, excretion, the functions of the nervous system, including the special senses, the reproductive apparatus, and development of the embryo. For these demonstrations, as well as for original research, the laboratory is equipped with the following apparatus. For the study of—

Digestion and absorption.—Chemical appliances for the investigation of the properties of the albuminous bodies, the chemistry of the tissues, the composition of the digestive fluids, blood, etc., instruments for making gastric and intestinal fistulæ, water baths, and dialysers, and apparatus for recording rate of secretion.

[1] This school, with great propriety, classes dissections as laboratory work. Other schools, seemingly with less propriety, also class the witnessing an autopsy as laboratory work, considering it as a part of the work of the pathological laboratory. It would be scarcely permissible to call a "didactic" lecture on chemistry, illustrated by experiments, a laboratory exercise. In both the autopsy and the chemical lecture the student is a spectator and listener, not an active agent. At Harvard, however, and at the Bellevue College, the student is called upon by turns to make an autopsy.

Circulation.—Czermack's holders; kymographion clockwork motor; Foucault's regulator and three recording cylinders, including those for continuous traces; mercurial manometers; Bernard's differential manometers; Brindley's and Sanderson's cardiographs, cardiophone with telephonic attachment, Haldat's and other apparatus for demonstrating hydrostatic phenomena; Marey's simple cardiograph and sphygmograph with Sanderson's modification; Marey's apparatus of rigid, elastic, and vertical tube; arterial schema; Hawksley's vascular schema; Majendie's cardiometer; Fick's spring kymograph; Marey's cardiac clamp; Coat's apparatus with Brubaker's modification; Franck's double myograph; Marey's cardiac sounds for horse, apparatus for retardation of pulse, cardiograph for small animals, Ludwig's stromuhr, and apparatus for studying capillary circulation, the warm and electrical stages, gas chambers, Gower's apparatus for counting blood corpuscles, also a hæmoglobinometer.

Respiration.—The Pettenkofer-Voit respiration apparatus; Regnault and Reiset's respiration apparatus; Ludwig's respiration apparatus; Valentin's respiration apparatus; Hutchinson's spirometer; recording stethometer; Marey's pneumograph; Bamberger's apparatus; Rosenthal's apparatus with Brubaker's modification; aërotonometer; Gréhant-Alverguiat gas pump; apparatus for artificial respiration, with water motor; anemometer scales turning the beam at the $\frac{1}{750}$ of a grain, and standard barometer; Calliburce's instrument for vibratile cilia.

Calorimetry.—Thomson's and D'Arsonval's calorimeters; thermometers, etc.

Secretion.—Roy's kidney onkometer and onkograph. Apparatus for determining rate and amount of urea.

Nervous system.—Du Bois-Reymond's indication apparatus with Helmholtz's modification; spring myograph; muscle telegraph, nonpolarizable electrodes, diverting chambers, key, rheocord, round compensator, resistance box, whippe; commutator; moist chambers; Wiedemann's galvanometer, including telescope and scale; Thomson's Elliott galvanometer, including shunt, scale, lamp, etc.; Bunsen and Daniel batteries; Page's vibrator; metronome; chronograph; tuning forks, marking keys; Bernstein's differential herotome; Helmholtz's electro-magnetic rotator and myophone with telephonic attachments and pendulum myograph; Pflüger's myograph; Gréhant's chariot with clockwork motor; Brubaker's apparatus for electrotonus; apparatus for reflex movements, and Ludwig's section-cutter for spinal cord.

Vision, voice, and hearing.—Models of eye; Kuhne's artificial eye; Helmholtz's ophthalmometer; models of larnyx and ear; acoustical apparatus, including air pump and bell; Helmholtz's siren; acoustic bellows; sonometer; rods, membranes, plates, pipes, resonators, oboe vox humana; Koeing's manometric apparatus.

Embryology.—An incubator, capable of holding one hundred eggs for the study of development, and numerous microscopic sections.

Comparative physiology.—This collection, embracing several hundred specimens, many of which are extremely rare, illustrates the comparative physiology of the teeth, stomach, etc., of the circulatory, respiratory and genito-urinary organs, of the nervous system, and of the successive stages in the development of the human embryo. The collection is used in supplementing the experimental demonstrations.

Arrangements have been made through which the laboratory can be also supplied from time to time, as required, with living fresh-water and marine objects for biological study, as well as ample material for dissection.

The physiological and histological department has been especially arranged with reference to the wants of the members of the attending class, the laboratory demonstrations constituting a part of the regular instruction during the winter session.

At the Loomis laboratory of the University of the City of New York, in addition to the recording and other instruments used by physiologists, the laboratory contains a large tank for administering to animals air or oxygen, compressed under many atmospheres of pressure; an air pump for experiments upon animals with rarefied air; hot-air chambers for the study of the effects of external heat on body temperature; large automatic models of the heart and spinal cord and of the mechanism of gland secretion, urine secretion, and micturition.

At the University of Michigan medical school the subjects commonly embraced in the practical course relate to the physiology of the special senses, muscular contraction, nerve, reflex action, circulation, and respiration. A smaller room is devoted to advanced work and original investigation. Conveniently situated are an apparatus room, a dark chamber for optical experiments, an incubation closet, and a large workshop containing machinists' and carpenters' appliances.

The instruction in physiology given by several schools is by means of a course in vivisection or lectures illustrated by vivisection.

The laboratory instruction (excluding dissection as such) the most generally introduced is in histology. Although there is a tendency on one side to class the work in medical chemistry and other laboratory work under the general head of microscopy, as, for instance, at the Tulane University school, where there has been since 1889 a "microscopical laboratory for the better study of normal and morbid anatomy and bacteriology," there is also a tendency to group these subjects under the head of histology. Thus, at the University of Pennsylvania school, "each student of the second year is provided with a separate table and microscope and receives personal instruction in pathological histology, in micology, and in the microscopy of urine," in the "pathological laboratory." A term frequently used is histological and pathological laboratory or histology and pathological anatomy, in which the term histology appears to indicate the microscopic anatomical study of undiseased matter, and the term pathological anatomy the microscopic study of diseased parts.

The laboratory work in histology consists of two parts: One, the preparation (cutting, staining, and mounting) of the specimens and the manipulation of the microscope, the other the study of the import of the specimens. At the University of California school the second process is thought to be attained by the mere mechanical work of the first, "which illustrates and fixes in the mind of the student" the general principles of normal growth and development and the operation of pathological laws. At the Columbia College school the course of mounting, etc., teaches the "methods" not only of preparing, but of studying normal and diseased tissues, and furnishes the student specimens from which he prepares a series of outline sketches.

On the other hand, at the Northwestern University school, students of the first year work two hours a week in cutting, staining, and mounting normal histological sections. Material for this course is furnished in abundance and each student secures a full series of normal histological slides. Free-hand drawing of a large number of the sections mounted in this course is compulsory. Students of the second year devote two hours each week to the study of mounted sections of pathological tissue already cut and stained for them. Free-hand drawings of the sections is compulsory, and the quality of a student's work in this course is considered in his grading in the department of pathology. In the four years' course the work in the microscopical laboratories will be more extensive. All of the work in the microscopical laboratory is done in the presence and under the supervision of the demonstrators of the respective departments. Students are required to furnish their own slides, cover glasses, mounting needles, and spatulæ.

At the Yale medical school histology is treated from the embryological standpoint. By this method the student is enabled to gain not only a thorough understanding of the structure of the various tissues and organs of the body, but also to trace their development and growth. The course of instruction consists of lectures, recitations, and laboratory work. The lectures are very fully illustrated by lantern transparencies made from photographs of typical sections and drawings. These are accompanied by recitations from a standard text-book. In the laboratory, each student receives carefully prepared sections and specimens of all the tissues and organs of the body, both in the adult and embryonic condition; these are mounted for permanent preservation and from them careful drawings are made. Practical instruction is given each student in the technology of the subject. The laboratory cabinet contains an extensive reference collection of histological specimens and serial sections of embryos; this, together with the most recent instruments and publications and an abundant supply of material, affords good facilities for advanced work.

The University of Maryland school announces that, with the introduction of the three-years course, a laboratory of normal and pathological histology will be opened and that constantly increasing attention will be devoted to the development of this laboratory work, as the faculty fully recognizes its all-important influence in modern medical education.

The bacteriology course is frequently united with the work in histology, but in perhaps half a dozen cases it has a laboratory of its own. At the University of Michigan school work of this character is done in the laboratory of hygiene. The work is, in an elementary way, on the model of that done in the laboratories of Koch and Pasteur.

The several laboratories of materia medica and experimental medicine may be illustrated by that of the University of the City of New York. This laboratory is provided with a full assortment of the various articles of the materia

medica to be used in giving the students a practical acquaintance with each drug and its preparation. Classes will be formed to work in the laboratory under supervision, for the purpose of insuring familiarity with the compounding and administration of medicines. In addition to this, practical instruction will be given in the use of remedies which are not medicines. This will include a special course in electrical therapeutics, for which purpose the laboratory has been fully equipped.

Incidentally the programme of laboratory instruction has been given in the programmes of clinical instruction on pages 888 and 910. It is therefore only necessary to give by way of illustration the special rosters of the University of Pennsylvania school.

Roster of laboratory instruction in pathology and instruction in orthopædics, for students of the third year.

I.

For attendance upon these courses, the third year class is divided into four sections, A, B, C, and D, which attend as follows:

First period, from Thursday, October 3, to Friday, November 15, inclusive.

	Monday.	Tuesday.	Thursday.	Friday.
Pathological histology	D	A	B	C
Orthopædics	A B C			

Second period, from Monday, November 18, to Friday, January 10, inclusive.

Pathological histology	C	A	B	D
Orthopædics	A B D			

Third period, from Monday, January 13, to Friday, February 28, inclusive.

Pathological histology	B	A	C	D
Orthopædics	A C D			

Fourth period, from Monday, March 3, to Friday, April 11, inclusive.

Pathological histology	A	B	C	D
Orthopædics	B C D			

The instruction in orthopædics is given at the university hospital at 11 o'clock; in pathology, in the pathological laboratory.

II.

Special roster of laboratory instruction in histology, osteology, and syndesmology for students of the first year, session 1889-90.

For instruction in these laboratories the first-year class is divided into five sections, A, B, C, D, and E, which attend throughout the entire session as follows:

	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
Histology	A	B	C	D	E	
Osteology	B C D		All.	E and A		

All students not occupied during the above hours dissect from 12 to 2 daily, and from 9 to 11 Friday.

PREPARATORY MEDICAL SCHOOLS.

The law of 1801 of the French Republic fixed the number of medical schools at six, of which three had been established by the date of 1840. In the meantime there had gradually grown up a lower kind of school for the purpose of initiating students of medicine into the elements of the art of curing disease. During 1820 these schools were placed under the control of the State educational authorities called the "university," and in 1840 they were reorganized by the minister. The eighteen schools whose instruction was thus unified had been founded independently, and on no common principle, and therefore were very diverse in their organization. Some had endowments, some lived on the meager diet of tuition fees, but the most were supported by the city or department, or by grants from the Governmental hospital bureau. In all the amphitheaters dissecting material and chemical advantages were poor or wholly absent. In 1840 a uniform course was given them as follows:

Chemistry and pharmacy; natural medical history (botany) and materia medica; anatomy and physiology; pathology (medical clinic); pathology (surgical clinic); accouchement, and diseases of women and children.

One of the great advantages of these schools, said the minister, is "that they give opportunities for anatomical study, that essential of medical study which can not always be furnished by the higher medical faculties (*i. e.*, schools), where the students are frequently too numerous to follow with profit all the demonstrations." In each school there were to be six professors and two adjunct professors and the cities were required to furnish the necessary anatomical material and the hospitals at least fifty beds for clinical purposes.

In 1854 the American Medical Association had adopted a resolution "cordially approving of the establishment of private schools to meet the increased desire on the part of a respectable number of medical students for a higher grade of professional education than can usually be acquired by 'reading medicine' under the direction of a single instructor." In 1856 Drs. Dana, Robinson, and Fitch, of Portland, opened the Portland Medical School for Preparatory Instruction. Dr. Robinson representing materia medica, midwifery, and diseases of women and children; Dr. Dana, physiology, pathology, and practice; Dr. Fitch, anatomy, surgery, and chemistry. The school was located in the Portland Dispensary and opened with two students. The faculty of the school now consists of 9 professors and three adjunct instructors, and the student is requested to remain at least one year, which constitutes the course. The departments of instruction are four. In the first, systematic recitations are held in anatomy, materia medica and therapeutics, surgery, theory, and practice of medicine, and obstetrics. In the second, familiar lectures and demonstrations are given on the physical exploration of the chest and diseases of the heart and lungs, on minor and operative surgery, on diseases of women, and on physiology. In the third, clinical instruction at the school and various charitable institutions. Cases of midwifery will be furnished to advanced students as far as possible. In the fourth department the study of practical anatomy is a prominent feature of the winter term and during the last weeks of this term the recitations are omitted and the whole attention of the student given to dissections, lectures, and clinical study. No degrees are conferred.

At present fourteen institutions report preparatory courses in medicine; and two, including the Portland school just mentioned, report themselves as wholly engaged in such work. These courses are, with two exceptions, of two years, and it is sometimes indicated, in the remarks which explain why they have been formed, that they are for those who wish to prepare to pursue the study of medicine without spending the time required by a collegiate course. The proposition of the president of Harvard to reduce the four-year curriculum to three years, and the adoption by Columbia College of that period as a college curriculum leading to a degree to be given when the student has pursued the first year's course of the medical or other professional school is seemingly promoting the rapid creation of those preparatory medical courses in our higher institutions of learning. None of these courses by itself leads to a degree, even the four years' "special science course, antecedent to medicine" of the University of Wisconsin does not lead to the bachelor of science degree. Their object is very well, stated by the University of Pennsylvania in the following terms:

"This course preparatory to medicine was established in 1885 for earnest students who can not present the requirements for admission to the regular college courses or are unable to devote four years to the preparatory work, and yet desire some systematic training in scientific and liberal studies. The results have already shown conclusively that such a course was greatly needed and that the men who have faithfully pursued the work have excelled in their subsequent professional studies."

The course of the University of Pennsylvania, given below, is, generally speaking, the type of those of the Northwestern, Wake Forest, and Wisconsin universities. At the Northwestern University, however, mathematics takes the place of history in the first year, and logic, psychology, and physics the place of physiology and botany in the second. Mathematics, psychology, and physics also appear in the course of the Wisconsin University, while "rhetorical work and military drill are required as of other students." The course at Cornell University agrees with the type in having French or German, and with the Northwestern University in having logic and psychology. Closely related to the Pennsylvania type is another furnished by three elective courses, each of two years, which are prefaced by one or two years of collegiate study, the entire course of three or four years being capped with the degree of bachelor of science. The institutions at which these courses obtain are the Johns Hopkins University, the John C. Green School of Science (Princeton College), and the Sheffield Scientific School (Yale University). They are in reality academic courses in biology, for they are of sufficient completeness to be rewarded with a degree, and are by no means preparatory to the study of medicine in the sense that the first year of a graded course of a medical school is preparatory to the study of the second year. Were this distinction not a true one every academic course in biology might be classed as a medical preparatory course, which is not the pedagogical function of biology as a collegiate study. This type, therefore, is not represented in the curricula that follow.[1]

Truer preparatory courses are those offered by the University of Virginia and others. In one of these, that of the University of West Virginia, the instruction is given in a "school of biology," it must be admitted; but it is stated that "practical anatomy" is required of those who intend to *study medicine;* while the others study general anatomy only. The question of priority of establishment is always a dangerous one to discuss; but as it appears that the University of North Carolina was the first to inaugurate a course of this kind, its course, were it not of a single year, would be used to illustrate the type of curriculum now under discussion, instead of that of the University of Virginia. The course of the latter institution was established for the following reasons:

"Graduation in medicine, as in the other departments of the University of Virginia, does not depend upon the time which has been spent in the study of medicine, but upon the preparation of the student as indicated by rigid written examinations which he is required to pass. It is possible, therefore, for a well-prepared and laborious student to graduate in one session, and examples are not wanting where such graduates have attained conspicuous success in professional life. But the severe and protracted labor necessary for this purpose is attended with evils of which the medical faculty is fully conscious. And while the regular course is complete as far as professional studies are concerned, it leaves the student without the benefit of certain scientific studies, which furnish an admirable preparation for and enlargement of the strictly professional course. Students are therefore advised to devote two sessions to the work; and for the benefit of those who can afford the time to pursue them, special courses in biology and physics have been arranged with particular regard to the training needed for medical studies."

From an examination of the curriculum given below it will be seen that the repetitional feature is strongly emphasized.

Now what value do the medical schools of the country place upon these various kinds of preparatory courses? In the case of the course at Princeton College the faculty of the Medical School of Columbia College will accept it as equal to six months study under a preceptor in case the student attends three sessions at that medical college, while the Chicago College of Physicians and Surgeons, Rush Medical College, and the Chicago Medical College "have approved the four years' course [of the University of Wisconsin], and will accept it as the equivalent of one year's study." The course of the Portland Preparatory School is to supply the place of the preceptor not of the medical college, and what the introductory courses of the Universities of Virginia and Pennsylvania are intended to do has already been very fully explained in the words of their own competent faculties.

[1] It will be noticed that the department of biology of the Illinois State University (p. 1013) has a special course preparatory to medicine.

Course preparatory to medicine in the University of Pennsylvania.

FIRST YEAR.

First term.	*Second term.*
English, three hours a week.	English, three hours a week.
History, two hours.	History, two hours.
Latin, French, or German, four hours.	Latin, French, or German, four hours.
Drawing, three hours.	Drawing, three hours.
Chemistry, 5 hours.	Chemistry, five hours.
General biology, six hours.	General biology, six hours.
Mineralogy, two hours.	Mineralogy, two hours.

SECOND YEAR.

First term.	*Second term.*
Latin, or German, or French, four hours.	Latin, or German, or French, four hours.
Chemistry, seven hours.	Chemistry, seven hours.
Geology, two hours.	Geology, two hours.
Zoology, one hour.	Zoology, one hour.
Invertebrate morphology, six hours.	Vertebrate morphology, six hours.
Histology, seven hours.	Embryology, seven hours.
Structural botany, five hours.	Systematic botany, five hours.
Physiology, two hours.	Physiology, two hours.

Preparatory course for students of medicine of the University of Virginia.

This first year of preparatory work will comprehend—

1. The course in general chemistry attended by all medical students.
2. A special course in physics.
3. A special course in biology and comparative anatomy.
4. The course in anatomy required of all medical students.

Those who are graduated in this preparatory course will attend for the second session—

1. The regular courses in physiology and surgery.
2. The regular courses in medical jurisprudence, obstetrics, and practice of medicine.
3. The course in materia medica.
4. The regular course in practical anatomy repeated.

THE PLACE OF THE STUDIES IN THE COURSE.

The admission requirements, the didactic, the clinical, and the laboratory instruction of the medical schools of the United States have in turn received attention. It has been shown how an effort is being made to dispense with a course in the humanities by inaugurating a preparatory course in science, and it now is necessary to examine the character of the medical curriculum as a whole, just as in the foregoing its parts have been discussed.

In 1876 on the call of several colleges a convention was called to meet at Philadelphia. This convention became the American Medical College Association, which adopted a scheme of instruction consisting of eight chairs. In 1882 the scheme of minimum requirements of the Illinois State Board of Health, adopted in 1880, went in effect. For convenience these curricula and that of the U. S. Army medical service are placed side by side.

Scheme of the—		
American Medical College Association.	Illinois State Board of Health.	U. S. Army medical service.
1. Anatomy (with dissection).	1. Anatomy.	Anatomy,
2. Physiology.	2. Physiology.	Physiology.
3. Chemistry.	3. Chemistry.	Pharmacy,
4. Materia medica and therapeutics.	4. Materia medica and therapeutics.	Materia medica and therapeutics.
5. Obstetrics.	8. Obstetrics and gynæcology.	Obstetrics and diseases of women and children.
6. Surgery.	7. Surgery.	Surgery.
7. Pathology.	6. Pathology.	General pathology.
8. Practice of medicine.	5. Theory and practice of medicine.	Theory and practice of medicine.
	9. Hygiene.[1]	Practical sanitation.
	10. Medical jurisprudence.	Medical jurisprudence.
		Toxicology.

At their first meeting the Association of American Medical Colleges adopted the following:

Whereas a knowledge of the elementary branches of medicine should precede a study of the practical branches:

Resolved, That in the hope of inducing students to prolong and systematise their studies, this convention recommends to all medical colleges to offer to students the option of three courses of lectures, after a plan similar to the following: Students who have attended two full courses on anatomy, chemistry, materia medica, and physiology may be examined upon any of these subjects at the end of their second course. During their third course such students may devote themselves to the lectures upon the theory and practice of medicine, surgery, obstetrics, and diseases of women and children, upon which subjects only they shall be examined at the final examination for the degree of M. D., their standing, however, to be determined by the results of both examinations.

We now turn to the examination of the curricula of the schools having graded courses. In the first year we find invariably instruction in chemistry, anatomy, physiology and histology, and dissection. Materia medica in the majority of cases also comes in the first year. In half a dozen instances minor surgery is introduced thus early, and in eleven cases, at least, clinics, "general and surgical," as at the University of Pennsylvania, or medical, surgical, eye, and gynæcological, as at the University of Wooster, are also held. At least 9 colleges have instruction in hygiene during the year. Gynæcology, physical diagnosis, pathology, principles of surgery, medical jurisprudence, ethics, and physics have place in the first-year course of one or more colleges.

Comparing these figures with those of ten years ago, and remembering that 43 graded courses (several not obligatory) are represented now against 13 in 1881, it appears that in the main features no change has been made and that chemistry, anatomy, and physiology are the groundwork of medical instruction.

Twenty-six schools report definitely as to the examination at the close of the first year. General chemistry is disposed of by the great majority of the 26 schools and normal histology and materia medica by a great many. Several schools have a final examination on the bones and ligatures. It is impossible to speak with more than approximate accuracy on the character of the examinations of the first year except to say that the final examinations on the fundamental subjects of anatomy, and physiology, and the subject of materia medica are passed during the second year, to the curriculum of which we now turn.

The principal studies of the second year are anatomy, theory and practice of medicine, surgery, therapeutics and materia medica, obstetrics, medical chemistry, and physiology. Clinical instruction is very generally given during this year. In twenty cases diseases of women and in fifteen, diseases of children are a part of the curriculum, and in ten physical diagnosis and hygiene. The special branches—eye, ear, throat, chest, and nervous disease—are represented in from three to five schools, and medical jurisprudence in six schools. Minor surgery and toxicology are each represented in four schools.

The language used by the schools in their curriculums is not uniform, but it appears that of 43 schools having graded or progressive courses but 3 do not have anatomy during the second year. One of these has "surgical pathology," another pathological anatomy, and the third pathology illustrated with morbid specimens. Ten schools do not report physiology, at least under that name, though it may be included in "medical chemistry," which is specifically named by 8 of these 10 schools. But the new studies of importance of the year are theory and practice of medicine, surgery, and therapeutics. Pathology and clinical instruction are also mentioned, in many cases alone, in others in connection with medicine and surgery. Occasionally there is a term such as this: "Theoretical, operative, and clinical surgery," or "theoretical and clinical medicine or obstetrics."

At the close of the second year the final examinations in anatomy, physiology, materia medica and therapeutics, pathological anatomy, and chemistry take place, and in several schools an examination in medicine and in surgery occurs.

The third is the practical year of the three-year course. Medicine, surgery, and obstetrics are represented in the curriculum of every school, while the subjects diseases of women and of children are not reported by 4 and 12 respectively. The new subjects of the year are the special branches, which are clinically taught, to wit, diseases of the eye, ear, throat, skin, nose, and nervous and mental diseases. Pathology, materia medica, medical jurisprudence, and hygiene are important features. In several schools orthopædiatrics, electrotherapeutics, and bacteriology are mentioned as subjects of study.

The character of the four years' course is illustrated by the following programmes:

The following tabular view illustrates the distribution of studies throughout the year.

1890–91, from September 25 to June 24.

U. H. = University Hospital.

Schedule of studies of the University of Michigan.

FIRST YEAR.

FIRST SEMESTER.

Lectures and recitations:
- Descriptive anatomy.
- Osteology.
- Materia medica.
- Analytical chemistry.
- General chemistry.
- Hygiene.

Laboratory work:
- Pharmacognosy, 1 to 4 p. m., twice a week for one semester.
- General chemistry, 2 to 5 p. m., twice a week for one semester.
- Qualitative chemistry, 1 to 5 p. m., daily for one semester.
- Practical anatomy *a*, 1 to 5 p. m., daily for ten weeks.

SECOND SEMESTER. *b*

Lectures and recitations:
- Descriptive anatomy.
- Materia medica.
- Analytical chemistry.
- Pharmacy.
- Organic chemistry.
- Hygiene.
- Physics.

SECOND YEAR.

FIRST SEMESTER.

Lectures and recitations:
- Physiological chemistry.
- Histology.
- Descriptive and surgical anatomy.
- Therapeutics.
- Toxicology materia medica.

Laboratory work:
- Qualitative chemistry, 1 to 5 p. m., daily for one semester.
- Practical anatomy, 1 to 5 p. m., daily for ten weeks.
- Practical hygiene, 1 to 5 p. m., daily for twelve weeks.
- Electro-therapeutics, 1 to 4 p. m., daily for six weeks.
- Elementary histology, 1 to 4 p. m., twice a week for the semester.

SECOND SEMESTER.

Lectures and recitations:
- Physiological chemistry.
- Physiology.
- Descriptive and surgical anatomy.
- Therapeutics.
- Electro-therapeutics.

Laboratory work: *c*
- Qualitative chemistry.
- Practical anatomy.
- Practical hygiene.
- Electro-therapeutics.
- Advanced histology.

THIRD YEAR.

FIRST SEMESTER.

Lectures and recitations:
- Theory and practice.
- Surgery.
- Diseases of children.
- Diseases of women and obstetrics.
- Physiology.
- Meteorology and climatology.

THIRD YEAR—Continued.

FIRST SEMESTER—continued.

Laboratory work:
- Analysis of urine, 1 to 5 p. m., daily for twelve weeks.
- Practical pathology, 2 to 5 p. m., daily for six weeks.
- Practical hygiene, 1 to 5 p. m., daily for twelve weeks.
- Optional:
  - Advanced hygiene, 1 to 5 p. m., daily for one semester.
  - Sanitary examination of water, 1 to 5 p. m., daily for twelve weeks.
  - Detection of adulterations in food and drink, 1 to 5 p. m., daily for one semester.
  - Physiological chemistry, 1 to 5 p. m., daily for one semester.

SECOND SEMESTER.

Lestures and recitations:
- Theory and practice.
- Surgery.
- Diseases of women and obstetrics.
- Embryology.
- Dermatology.

Laboratory work:
- Analysis of urine. *d*
- Practical pathology. *d*
- Practical hygiene. *d*
- Practical physiology, 1 to 5 p. m., daily for the semester.
- Operative surgery.

FOURTH YEAR.

FIRST SEMESTER.

Lectures and recitations:
- Theory and practice.
- Surgery.
- Diseases of women and obstetrics.
- Diseases of children.
- Ophthalmology.
- Pathology.
- Diseases of nervous system.

Laboratory work:
- Clinical.
- Bandaging and dressing.
- Practical obstetrics.
- Physical diagnosis.
- Bedside practice.

SECOND SEMESTER

Lectures and recitations:
- Theory and practice.
- Surgery.
- Diseases of women and obstetrics.
- Laryngology and otology.
- Diseases of the nervous system and insanity.
- Pathology.
- Medical jurisprudence.

Laboratory work:
- Clinics and hospital practice.

Three lectures are given each forenoon: while the afternoons are devoted to laboratory and clinical work.

---

a Each dissection requires ten weeks of afternoon work in the anatomical laboratory. There are two sections yearly, beginning in October and in January. Students may complete one dissection in their first year, and must complete the work by the end of the second year.

b Laboratory work, the same as in the first semester.

c Hours required, same as in the first semester.

d Hours required, same as in the first semester.

Present four-years' course of Boston University School of Medicine (homeopathic)—Arrangement of studies.

The course of lectures of the medical depart

Date.	Chemistry.	Anatomy.	Physiology.
First week, beginning November 3, 1890.	Physical phenomena and force; physical properties of matter.	Introductory—Histology; mouth.	Introductory: Chemical and histological composition of the body.
Second week	Physical properties; heat.	Alimentary canal	Normal histology; histology of tumors.
Third week	Light	Abdominal and pelvic viscera.	Digestion
Fourth week	Electricity, magnetism, galvanism, etc.	Male organs of generation.	Digestion; absorption.
	Inorganic chemistry:		
Fifth week	Nonmetalloids, nomenclature, affinity.	Heart and respiratory organs.	Absorption; sanguinification.
Sixth week	Metalloids, physical and chemical properties of.	Nervous centers	The blood
Seventh week	Metalloids, physiological, pathological, and toxicological properties of.	Organs of special sense.	The blood: circulation.
Eighth week	Demonstrations with non-metallic elements and compounds.	do	do
Ninth week	Metallic elements, chemical, nomenclature, and affinity.	Osteology	Respiration
Tenth week	Metals, physical and chemical properties of.	Osteology; articulations.	Secretion and excretion.
Eleventh week	Metals, physiological, pathological, and toxicological properties of.	Articulations; muscles.	Excretion, renal
Twelfth week	Demonstrations with metallic elements and compounds.	Muscles	Nutrition and animal heat.
	Organic chemistry:		
Thirteenth week	Carbon and its compounds.	Muscles; arteries	Contractility and locomotion.
Fourteenth week	Organic acids; sugar; fermentation, oils.	do	Nervous system, chemistry and histology of.
Fifteenth week	Alkaloids	do	Functions of the spinal cord and nerves.
Sixteenth week	Proximate principles of the human body.	Veins; lymphatics	Functions of the brain.
Seventeenth week	The urine	Nerves	do
Eighteenth week	The blood	Nerves; surgical anatomy.	Functions of the cranial nerve.
Nineteenth week	Toxicological experiments.	Surgical anatomy	Functions of the sympathetic system; special senses.
Twentieth week	Organic chemistry	do	Special senses
Twenty-first week	do	Development of the organs.	Review

a One lecture per week will be devoted to the subject of hygiene.
b All teachings illustrated clinically in the amphitheater of the Charity Hospital and at the bedside in the wards of the same institution.

schools still retaining the nongraded system are given.

ment of The Tulane University of Louisiana.

Materia medica therapeutics and hygiene.*a*	Practice of medicine.*b*	Surgery. *c*	Obstetrics and diseases of women and children. *d*
Therapeutic resources; foods—Remedial agents; hygienic measures.	General pathology and therapeutics.	Acute inflammation; phenomena, causes, and treatment of.	Introductory: Female organs of generation.
General therapeutics; absorption, elimination; action of medicines.	Theory of fever; treatment of febrile state.	Treatment of acute inflammation; chronic inflammation.	Ovulation, menstruation, conception, development of ovum.
Special therapeutics; classification.	Diatheses and cachexiæ.	Local effects of inflammation.	Decidua, chorion, placenta, etc., changes during and signs of pregnancy.
I. Agents acting locally.			
------do------	Causes of disease, epidemic and sporadic.	Diffuse inflammatory erysipelas; thrombosis, embolism, pyæmia.	Disorders of menstruation; abortion.
II. Agents acting systematically:			
1. Influencing nutrition.	Epidemic diseases ----	Tumors, benign------	Abortion; duration of pregnancy; molar pregnancy.
a Promoting digestion.			
b Modifying tissue change.	------do------	Tumors, malignant and semi-malignant.	Super and extra fœtation; missed labor; spurious pregnancy.
Promoting constructive change.			
------do------	------do------	Injuries, constitutional and local effects, contusions, wounds.	Gravid uterus, palpation, pelvis.
Promoting retrograde change.	Diseases of digestive apparatus.	Tetanus; burns; effects of cold.	Fœtal head; labor.
------do------	------do------	Hemorrhage ----------	Stages and management of labor; puerperal state.
------do------	------do------	Injuries and diseases of arteries, veins, and nerves.	Presentations: Vertex, face, pelvis.
c Modifying body temperature.	Diseases of circulatory apparatus.	Injuries of bones; contusions and fractures.	Presentations: Shoulder, funis, placenta.
2. Acting against microbic poisons.	------do------	Fractures ----------	Tedious labor.
3. Acting on special organs.	------do------	Injuries of joints; contusions, wounds, dislocations.	Tedious labor, postpartum hemorrhage; rupture of uterus.
------do------	Diseases of respiratory organs.	Dislocations ----------	Inversion of uterus, retained placenta, puerperal mania.
------do------	------do------	Diseases of bones and joints.	Eclampsia; puerperal fever.
------do------	------do------	Anæsthesia; operations in general.	Eclampsia; puerperal fever; phlegmasia dolens; induction of labor.
		Regional surgery:	
------do------	Diseases of urinary apparatus.	Head ----------	Obstetric operations: chloroform.
Acting on circulatory system.	------do------	Face, nasal and buccal cavities; throat.	Obstetric emergencies.
Acting on nervous system.	Diseases of the nervous system.	Cervical region -----	Do.
------do------	------do------	Thorax and abdomen.	First dentition: Convulsions, cholera infantum.
------do------	------do------	Pelvis ----------	Catarrhal affections of children.

c Diseases and injuries of genito-urinary organs, syphilis, and many other affections, not mentioned above, are demonstrated in the amphitheater and wards of the Charity Hospital.

d Surgical diseases of women are taught in the wards and amphitheater of the Charity Hospital.

Schedule of didactic and clinical lectures given in the Long Island College Hospital and the Hoagland Laboratory during the regular term.

	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
8 a. m.	Practical histology and pathological anatomy, Prof. Van Cott, Hoagland Laboratory.	Practical histology and pathological anatomy, Professor Van Cott, Hoagland Laboratory.	Practical histology and pathological anatomy, Professor Van Cott, Hoagland Laboratory.	Practical histology and pathological anatomy, Professor Van Cott, Hoagland Laboratory.	Practical histology and pathological anatomy, Prof. Van Cott, Hoagland Laboratory.	
9 a. m.	Operative surgery, Professor Wight.	Practice of medicine, Professor McCorkle.	Practice of medicine, Professor McCorkle.	Gynecology, Prof. Skene.	Until December 21, diseases of the mind and nervous system, Prof. Shaw. January to March, medical jurisprudence. Hon. C. E. Pratt, justice of supreme court.	Practical histology and pathological anatomy, Prof. Van Cott, Hoagland Laboratory. Practice of medicine, Prof. McCorkle.
10 a. m.	Anatomy, Professor Lewis.	Anatomy, Professor Lewis.	Obstetrics, Professor Jewett.	Anatomy, Professor Lewis.	Until December 21, genito-urinary diseases, Prof. Rand. January to March urinary pathology Prof. Bartley.	Obstetrics, Professor Jewett.
11 a. m.	Materia medica and therapeutics, Prof. West.	Surgery, Professor Rushmore.	Materia medica and therapeutics, Prof. West.	Surgery, Professor Rushmore.	Surgery, Prof. Rushmore.	Pathological anatomy, Professor Ferguson, Hoagland Laboratory.
1 p. m.	Clinical teaching in the wards of the hospital and maternity, general clinics in the dispensary, instruction in physical diagnosis, and demonstrations in physiology.					
2 p. m.	Medical clinic, Prof. McCorkle.	Clinic for disease of women, Professor Skene.	Surgical clinic, till 4 p. m. Professor Wight.	Clinic for diseases of children, Professor Read.	Medical clinic, Prof. West.	Practical chemistry, 2 to 3.30 p. m., chemical laboratory.
3 p. m.	Until December 21, diseases of the skin, Professor Sherwell. January to March diseases of the mind and nervous system, Professor Shaw.	Physiology, Professor Raymond, Hoagland Laboratory.		Physiology, Professor Raymond, Hoagland Laboratory.	Until December 21, ophthalmology, Prof. Prout. January to March, otology, Prof. Mathewson.	Practical anatomy in dissecting room every evening (except Sunday) from 8 to 10 p. m., Dr. Wm. W. Browning, demonstrator.
4 p. m.	Organic chemistry, Prof. Bartley; inorganic chemistry, Dr. Hutchinson.	Diseases of the throat and nose, Professor French.		Practical chemistry and urine analysis, till 5.30 p. m.; chemical laboratory.	Organic chemistry, Prof. Bartley. Inorganic chemistry, Dr. Hutchinson.	

SUGGESTIONS AS TO HOW THE STATUS OF THE MEDICAL PROFESSION MAY BE ADVANCED.

In response to an inquiry for opinions as to the manner in which the status of the medical profession might be advanced, as far as it is influenced by the instruction in a medical school, about fifty replies were made, all, with three or four exceptions, from "regular" schools. These are grouped under four heads: Suggestions that all candidates be examined and licensed (*a*) by State boards, (*b*) by national boards, (*c*) that the course be extended two or three years, and (*d*) suggestions not falling in *a*, *b*, or *c*.

The drift of the suggestions in regard to the establishment of a State board is that it should examine the student as to his competency to practice medicine after he has obtained a certificate or diploma from a medical school or college, the State examination to be independent of the college. The dean of the Yale medical school puts the matter thus: "(1) No practice without registration; (2) no registration without diploma or examination; (3) an impartial board to determine what diplomas could be registered (desirable for effect on schools and as best meeting the conditions in the different States); (4) registration only by examination, but not until conditions are more uniform in different States."

In eight cases a national board (or boards) of examination is suggested. In two of these the matter is expressed by saying that it would be of great advantage if the laws relating to medical education were uniform throughout the country.

A third of the deans think that the course should be lengthened to three years of lectures or graded course, and in some cases four years of study. As this is what is being very rapidly done, no comment is required.

In the miscellaneous category are suggested a preliminary examination, more laboratory work, and compulsory graduation from a medical college. From Iowa it is answered: "A change in the law that now requires a student to study practical anatomy and then makes him a criminal for obtaining the material would materially advance the status of the profession." Another correspondent says: "The first law in Tennessee was passed by the legislature of 1888 and 1889. Having gained this one great step I think it unwise to attempt more too soon lest reaction result and we lose all."

Reply from the faculty of the medical department of the University of the State of Missouri.

Dr. WILLIAM T. HARRIS,
Commissioner of Education, Washington, D. C.:

DEAR SIR: Dr. A. W. McAlester asks me to reply to the request made on the back of the circular sent out by your Bureau for the purpose of obtaining statistical information of the medical schools of the country. I do so with some diffidence, and beg to call your attention to two things in this connection:

The first is, that length of course should, in my judgment, be measured by something else or additional than mere length of time; system, manner, and kind of instruction are of more importance in laying the foundation of a good medical education than time. The knowledge and mental discipline which the average medical student brings to the school or college of medicine is limited and deficient; to what extent this is the case no one connected with any medical school likes to tell. Such as he is, the medical student, hears five or six or even seven lectures a day; no one, I presume, will affirm that he masters them; and when the process is repeated another term, and may be a third, any general discernment has been sacrificed for the possession of disjointed and loose parts. The more a student at the beginning of his career is encouraged to attend to clinics and hospital practice, the more certain is this result attained: a certain handiness has effectually taken the place of knowledge. There are three things to counteract and overcome these tendencies:

1. A graded course, strictly adhered to and guarded well at the entrance; students should be made to take a narrow path rather than to spread themselves over the whole subject.

2. Lecture and text-book instruction not merely descriptive, but to stand in organic relation to the whole, and to be in themselves logical treatises of the subject they deal with.

3. Lectures to alternate with recitations; no quizz classes, where the aim is to rote and cram, but proper lectures and wise questions to strengthen as well as to test the intelligence, understanding, and progress of the students.

The other point is, that a difference should be made between a college of medicine and a medical school; the former teaches medicine as a science, the latter mainly as an art; the former attempts to make scientific physicians, the latter practitioners. A State university has no more business to make practitioners in medicine or advocates in law than it has to make carpenters or shoemakers. If the State desires to do so, it could establish technical or trade schools, of which the so-called agricultural and mechanical colleges are types. They stand in my judgment coequal with the university, each called into life by the foresight of the General Government, and each for a distinct purpose, their connection being, I take it, somewhat like this:

I. State university:
- *a.* Academic college.
- *b.* College of medicine.
- *c.* College of law.

II. Agricultural and mechanical college:
- *a.* School of agriculture.
- *b.* Mining school.
- *c.* Engineering school.

This dissociation between the schools and colleges could of course be carried farther, but as I have already spoken at some length, I will only add that I believe it to be rash to set up the claim that a medical graduate is, in virtue of his graduation, a skillful and experienced physician; he should, after graduation, receive one or two years hospital practice, which in no case is rendered unnecessary on account of clinical attendance while a student.

Respectfully yours,

P. SCHWEITZER.
WOODSON MOSS, *Secretary.*
A. W. MCALESTER, *Dean.*

Reply from William M. Thornton, chairman of the faculty of the University of Virginia.

The following are recognized as the reforms most urgently needed in medical education:

1. The separation of the teaching and licensing bodies already carried out in Virginia should be adopted in all the States. This reform was advocated by the late Prof. James L. Cabell, of this State and University, in 1847, in an address before the American Medical Association; was persistently urged by him, and was finally carried into effect in 1885 in Virginia.

2. The grading of the course of medical studies and the inclusion of biology and comparative anatomy, as follows:

First year course: Chemistry, physics, biology, and comparative anatomy, with laboratory practice in each case.

Second year course: Human anatomy, physiology, histology, with laboratory practice in each case.

Third year course: Pathology (with laboratory practice), obstetrics, gynæcology, surgery (with laboratory practice), practice of medicine, materia medica, medical jurisprudence, clinical surgery.

3. The extension of the term of study to nine months in the year.

The step indicated in 3 has been approved by the faculty, but the visitors consider it one for which the public is not prepared.

WILLIAM M. THORNTON,
Chairman of the Fculty.

Reply from H. D. Didama, M. D., LL. D., dean of the College of Medicine of Syracuse University.

"If you had asked for opinions instead of information I might have answered:

"'Observation proves that higher matriculation requirements and better systems of education do not originate with the great schools in the State of New York, but are forced upon them by the profession through the legislature.

"'The schools did not adopt a matriculation examination of any value. Some had no examination whatever. Most of them had been content with the old unnatural two six-months' courses, both exactly alike, so that if the student had a good memory one course would have been all sufficient.

"'The profession should demand enactments requiring fitness at the entrance, a thorough graded course of three years of eight months each, and a rigid examination at the termination of the three courses, if not at the end of each year. But you asked only for information, and I forbear.'"

"H. D. DIDAMA,
"*Dean.*"

Reply from I. T. Talbot, M. D., dean of the Boston University School of Medicine.

The great difficulty is, and has been in the past, that the student entering upon the study of medicine is often entirely lacking in qualification. This oftentimes arises from the fact that many men as ignorant as themselves, often holding diplomas, acquire reputations and large incomes. To obviate this state of affairs this school requires the first of its four years to be devoted to the preparatory or foundation studies of a course of medical instructions. These include, in addition to a good English education, Latin, physics, biology, zoölogy, microscopy, chemistry, botany, human osteology, comparative anatomy, and animal dissections. Many of these can be studied in the last year of a college course in arts, while the remainder can be pursued under the direction of a medical instructor or in the first year of a medical school. Knowledge on these subjects must be tested by a thorough entrance examination to the second year of the medical course. Such students will be prepared for thorough subsequent work.

I. T. TALBOT,
Dean.

THEOLOGY.

A comparison of the annual reports received from theological seminaries and departments during the ten years last past shows the necessity of having some standard by which may be determined the characteristics of a department or school of theology. There seems to be a distinction of some kind made by the management of higher institutions of learning in which theological instruction is given; for frequently the forms sent out by this Bureau are returned with the indorsement: "Not a regularly organized school of theology," or the Bureau fails to obtain a response at all.[1] Either of these circumstances vitiates the comparison of statistics of one period with those of another, for the school which appears in the report for 1881, but thereafter fails to report or reports that it is not a theological school for two successive years, will not appear in the report for 1883.

On the other hand there is still more embarrassment as to what constitutes a theological curriculum. Some colleges having a course in theology return the whole number of the students within their walls as members of the theological department. The effect of this may be illustrated by the reports of an institution during a series of years, as follows:

	Reported students.
1884 (in the theological department)	33
1885 }	137
1886 } (the whole college attendance)	152
1887 }	152
1888 (in the theological department)	38
1889 (the whole college attendance)	147
1890 (in the theological department)	47

When the catalogue is at hand these errors can be rectified, but as the false figures are usually prepared for the printer long before the catalogue containing the true ones is received they become a matter of record.

Still referring to the curriculum of a true theological school, the question may be asked: "Of how many branches is that curriculum composed?" In the case of medicine anatomy and physiology are undoubtedly the groundwork of the study, but pathology, therapeutics, theory, and practice, etc., are also indispensable to complete the training of a skillful and legitimately successful physician. And we see how unremittingly the profession of medicine is laboring to awaken the

[1] The following letter admirably illustrates the above remarks:

McKENDREE COLLEGE,
Lebanon, Ill., October 22, 1890.

COMMISSIONER OF EDUCATION:

DEAR SIR: Recently I received from your department a circular asking for information as to the theological department of McKendree College, Lebanon, Ill. In reply permit me to say that McKendree College has no theological department or school. There is a small theological class of ten to twelve students who pursue a limited irregular course of study in some branches of theology. This class can not be regarded as a department.

Yours,

T. H. HERDMAN,
V. P., McKendree College.

legislative conscience to the necessity of passing laws that will prevent the profession from being embarrassed by the practice of inadequately educated men.

It may indeed be said that the ancient universities of Oxford and Cambridge have been in a certain sense theological seminaries, as the garb their students wear indicates, and that our own Harvard and Yale were theological seminaries to all intents and purposes in their early days. But if the interpretation of the term theological curriculum were to be based on such a plea, the difficulty of the statistician would not be solved. The question would no longer be what should be considered a curriculum of a theological school, but what difference if any is there between a school of theology and a college; for even in the sense that a study of the Bible and of the history of the Christian religion is enough to constitute a foundation for a pastorate, every German college (gymnasium) might be called a theological school, for in it some time is spent every day upon the Bible and church history. Under certain conditions there is much to be said for a course of instruction in theology that is not too advanced or too long, but it is mere justice to the advanced schools of theology that they should be classed by themselves.

Without pursuing further the discussion of so delicate a topic, the Bureau illustrates the idea of a theology school as held by two European countries, placing them in juxtaposition with several American curricula, one of which is a type of the several seminaries of the highest class that exist in this country and may therefore be compared with the faculties of France, especially those maintained by the Catholic Church, for the French state faculties of theology are all protestant institutions.

Course of lectures in the theological faculty of the University of Berlin.

General discussion of the sphere of theology (encyclopedia) and introduction to theological study on Wednesday and Sunday, 1 hour.

Introduction to the Old Testament, 5 hours. History of the text of the Old Testament, Sunday. Interpretation of Genesis, 4 hours. Interpretation of the Psalms, 5 hours. Interpretation of Isaiah, 5 times. Hebrew grammar for beginners (with exercises) 4 times. Exercises of the Institutum Judaicum (Society for Jewish Missions), 1 hour. The people of the Old Testament, 1 hour.

Introduction to the New Testament, 6 hours. Introduction to the synoptical Evangels, 1 hour. Biblical theology of the New Testament, 4 hours. Interpretation of the synoptical Evangels, 4 hours; of the Evangels and the Epistle of John, 4 hours; of the Epistle to the Romans, 4 hours; of the Epistle to the Galatians, 1 hour. Early history of the church, 5 hours. History of the church during the middle ages, 4 hours; in modern times, 5 hours. History of dogma, 4 hours. General history of religion, 4 hours. The early Christian and old Jewish burial places, especially the catacombs at Rome, illustrated by the monuments in the museums, 2 hours Sunday evenings. The edifices of the Evangelican faith, their construction and interior decoration, illustrated by the contents of museums[1] and by visits to the churches of Berlin, 1 hour. Explanation of selected old Jewish inscriptions found in Italy, 1 hour. Relation of Judaism to Chistianity, 1 hour. Exercises on the history of the church, 2 hours. St. Augustine's confessions, 1 hour.

Philosophy in its application to religion, the proof of a Divine Being, etc., are taught in the faculty of philosophy.

Symbolism, 4 hours. Christian dogma, (apologetic), 4 hours; (systematic), 5 hours. ethics, 5 hours. The recent opinions held as to Christ and the Christian dogma (Die neueren Ansichten von der Person Jesu und das christologische Dogma), 1 hour. Dogmatic society, 2 hours. Theological society, 2 hours.

System of practical theology, 4 hours. Homiletics and catechetic, 3 hours. Pedagogy and catechetic, 4 hours. The pedagogical system of the nineteenth century, 1 hour. Practical explanation of pastoral letters, 2 hours Sunday evenings. Introduction to practical sermon writing. Sermon writing, 2 hours.

Courses of instruction in the divinity school of a university of the United States.

As more courses are presented than are required for the degree of D. B., a certain amount of election will be allowed. Students must, in every case, submit to the faculty for its approval a list of the studies which they propose to take.

Old Testament.—1. Hebrew. Davidson's Grammar. Harper's Hebrew Method and Manual. Harper's Elements of Hebrew. Explanation of parts of the Pentateuch, Historical Books, and Psalms. Three times a week. 2. Hebrew (second course). Interpretation of parts of the Prophets and Poetical Books. Twice a week. 3. Jewish-Aramaic. Kautzsch's Grammar. Brown's Aramaic Method. Interpretation of selections from Daniel, Ezra, and the Targums. Twice a week, during the second half year. 4. History of Israel, political and social. Twice a week. 5. Old Testament Introduction. Twice a week. 6. History of the religion of Israel, with comparison of other Semitic religions. Twice a week. 7. Assyrian. Lyon's Assyrian Manual. References to Delitzsch's Assyrische Grammatik. Delitzsch's Assyrische Lesestücke. 8. Assyrian (second course). Delitzsch's Assyrische Grammatik. The cuneiform inscriptions of western Asia (interpretation of selections). Prof. Lyon.

Other Semitic courses are given, namely, two in Arabic, each twice a week; one in Ethiopic, once a week, and one in Babylonian-Assyrian, once a week.

The Semitic Seminary meets on the first and third Mondays of every month except June. At each meeting a short paper is read by a student or an instructor, and its subject-matter discussed; in this way the class work is brought into practical use, and various matters studied which do not come up in the class instruction.

New Testament.—1. New Testament times: the political, social, moral, and religious condition of the world when Christ appeared. Twice a week, during the first half year.

[1] The Union Theological Seminary of New York City has a museum of this kind, as perhaps have other American seminaries.

Courses of instruction in the divinity school of a university, etc.—Continued.

2. Outline lectures on Theological Encyclopædia and literature; the characteristics of the New Testament Greek; the Septuagint; textual criticism; the life of Christ. Study of the Gospels. Essays and criticism. Twice a week. 3. New Testament introduction.—The origin, contents, and history of the New Testament writings, together with the formation of the canon. Twice a week during the second half year. 4. Outline lectures on the life of Paul; study of the epistles; essays and criticisms. Twice a week. 5. Lectures on our English Bible and its recent revision. Lectures on topics in biblical theology. Exposition of difficult texts. Essays and criticisms. Twice a week. 6. Biblical interpretation: Its history, its methods, its principles, and their application (to New Testament passages of historical, prophetical, ethical, and doctrinal import). Once a week. 7. Classical Aramaic (Syriac). Grammars of Nöldeke and Hutchinson-Uhleman. Roediger's Chrestomathia Syriaca. Reading of selections from the Peshitto Gospels, the Chronicles of Barhebräus and the Hymns of Efrem. Twice a week during first half-year.

The New Testament Seminary meets on the second and fourth Mondays of every month for the reading and criticising of essays by the students upon topics relating to the New Testament.

Church History.—[1. The conflict of Christianity with Paganism. Origin and development of the Roman primacy to its alliance with the Holy Roman Empire. A. D. 800. Twice a week. Omitted in 1889-90.] [2. The Mediæval Church, with especial reference to its effect upon public life and upon intellectual and social progress. Twice a week. Omitted in 1889-90]. [3. The era of the Reformation in Europe from the rise of Italian Humanism to the close of the Council of Trent 1350-1563. Twice a week]. [History of Christian doctrines. Twice a week. Omitted in 1889-90]. [5. Advance study and research in Church history in connection with courses 1 and 2. Omitted in 1889-90].

Comparative religion.—Studies in the comparative history of religions, particularly the Vedic religion, the Hindu philosophies, Buddhism, Mozdaism, and the Chinese religions. Twice a week.

Ethics.—Practical ethics of social reform; an examination of the problems of charity, temperance, labor, divorce, prisons, the Indian question, lectures, essays, and the study of institutions. Twice a week.

Theology.—1. The Philosophy of religion; an introduction to the study of theology. Once a week. 2. Systematic theology begun. The Psychological basis of religious faith. Once a week. 3. The same continued. The content of Christian faith. An elaborate essay on some theological subject is expected from each student taking this course. Three times a week.

The Theological Seminary meets on the first and third Wednesdays of every month.

Homiletics and pastoral care.—The structure and analysis of sermons. Once a week. 2. Each student writes six sermons during the year, three of which are preached before the two upper classes and criticised by students and instructor; the rest are criticised privately, both as to composition and delivery, in preparation for the public preaching named below. [3. Liturgies and the history of Christian worship: its prayers, its hymns, and its preaching. Once a week. Omitted in 1889-90.] 4. Pastoral care and the conduct of Christian worship. Lectures. Once a week during the second half year.

Elocution.—1. Class work, twice a week, supplemented by private instruction. 2. Similar to the above.

General exercises.—Preaching by students in the chapel of the school, open to the public. Once a week. Meetings for debate. Once in two weeks. Meetings for religious conference, conducted by students, alternating with the above. Once in two weeks. Morning prayers, conducted by professors and students.

Special lectures.—A special course of six lectures by officers of the University who are not teachers in the Divinity School will be given.

Course of study in a Northern theological seminary.

FIRST YEAR.

Old Testament Literature: General Introduction; Hebrew. New Testament Literature: General Introduction; Special Introduction to the Gospels; Exegesis of selected Epistles of Paul. Sacred Geography and Antiquities. Old Testament History. Relations of Philosophy and Science to the Christian Religion; Theism; Theological Encyclopedia. Ecclesiastical Theology: Homiletics; Elocution.

The Junior Class has five weekly exercises in Hebrew; two in Introduction to the Old Testament and Archæology; one in Introduction to the New Testament; two in the Exegesis of Paul's Epistles; two in Old Testament History; two in Theism; one in Homiletics, and one in Elocution.

SECOND YEAR.

Old Testament; Hebrew; Special Introduction to the Poetical Books; Special Introduction to the Historical Books. New Testament. Life of Christ and Exegesis of the Gospels. Didactic Theology: Theology Proper, Anthropology begun. Church History. Government and Discipline of the Church: Homiletics; Criticisms of Sermons; Elocution.

The Middle Class has three weekly exercises in Church History; three in Didactic Theology; five in Old Testament Literature and Exegesis; two in the Life of Christ and Exegesis of the Gospels; two in Homiletics and Church Government, and one in Elocution.

THIRD YEAR.

Old Testament: Hebrew; Special Introduction to the Prophets; Biblical Theology. New Testament: Acts of the Apostles; Special Introduction to the Epistles; Biblical Theology (Elective). Didactic Theology: Anthropology, Soteriology. Eschatology. Church History. Relations of Philosophy and Science to the Christian Religion: Christian Ethics and Christian Social Science. Pastoral Care: Ordinances of Worship. Homiletics: Analysis of texts; Homiletical Criticism; Elocution.

The Senior Class has three weekly exercises in Didactic Theology; two in Old Testament Literature and Exegesis; one in Biblical Theology of the Old Testament; two in New Testament Literature and Exegesis; two in Church History; two in Homiletics and Pastoral Theology; two in Christian Ethics and Christian Social Science, and one in Elocution.

FOURTH YEAR.

The regular course is completed in three years, but students may, with great advantage, continue to prosecute their studies in the seminary for a longer period. It is not thought best to prescribe a fixed course of study for graduates. Each is at liberty to devote himself to those branches of theological learning for which he has the greatest aptitude, or which he judges to be most necessary or profitable to himself. Accordingly graduate students may at their discretion attend the lectures and recitations of the regular classes for the review of their previous studies; or they may individually conduct original investigation under the direction and advice of the professors and with the aid of the library.

SEVERAL TYPES OF CURRICULA OF THEOLOGICAL SCHOOLS IN THE UNITED STATES.

Course of instruction in the divinity school of a university.

JUNIOR YEAR.

Encyclopædia and Literature of Theology, 1 hour; Grammar of the Hebrew Language, in connection with the first 8 chapters of Genesis, 5 hours; Critical Study of the Greek Testament, consisting of two courses, (1) the Life and Teaching of Christ, as Presented in the Synoptic Gospels; (2) Studies in General and Special Introduction to the New Testament, and Methods and Principles of Textrial Criticism, 5 hours; The Philosophical Basis of Theism and the Self-Revelation of God, 2 hours.

MIDDLE YEAR.

Systematic Theology, 5 hours; Old Testament Bible Theology with special reference to the progressive stages of Divine Revelation to Israel, Biblical Aramaic (optional). The instructor in Hebrew will read with the class, (1) the more important prophecies of Isaiah in connection with a consideration of his entire work and the principles of Old Testament prophecy; (2) the earlier Psalms, with a General Study of the Hebrew Psalter, its origin, structure, and contents; General Church History, including its nature, divisions and sources, and the literature and the character of the societies among which Christianity spread, 3 hours; Lectures on the Epistles to the Romans and Corinthians, with special reference to the doctrinal and practical contents, 2 hours; Lectures and Criticised Exercises on the Principles of Ministerial Rhetoric.

SENIOR YEAR.

Homiletics, 4 hours during first half of year; Class Exercise in the Criticism of Sermons and Plans of Sermons, 1 hour; Pastoral Theology, 3 hours during the last half of the year; Class Discussions of Questions of Practical Interest Relating to the Work of the Church, History of Christian Doctrine and Symbolical Theology, 3 hours; Biblical Theology of the New Testament, 2 hours. The Prophetical Books of the Old Testament and reading once a week (or oftener) with those who wish to study Syriac, the Peshito version of the New Testament. The president of the university will lecture once or twice a week on one or more of the books of the New Testament.

Course of instruction in the divinity school of a university—Continued.

GRADUATE OR FOURTH-YEAR CLASS.

For the year 1889–90 the following subjects of special study were announced, not excluding others which might be desired by members of the class:

I. Special topics in philosophy and theology.
II. Examination and discussion of a number of the more important marginal readings in the Revised Old Testament, as compared with the text now standing in the Revision.
III. A review of systematic theology in the reading and examination of Dr. Dorner's system of Christian doctrine, with free colloquial discussion.
IV. Weiss's Life of Jesus, with comments on the author, and conversational discussion and special investigations and essays by members of the class.
V. Schools of preaching and the history of preaching; with critical exercises and discussions.
VI. Weiss's Introduction to the New Testament. In addition to the discussion of the opinions of the author, the students will be directed in making investigations for themselves in other writings upon the same subjects and in the original sources.
VII. Schürer's History of the Jewish People in the Time of Christ; with special reference to the literature and thought of Judaism at this period as bearing upon New Testament interpretation.

English course of a seminary of theology.

A course which may be pursued by those who do not select the study of either the Greek or Hebrew language or only one of those languages.

JUNIOR YEAR.

Instead of the Hebrew and Greek there will be special exegetical exercises in the English scriptures and in bibical history, sacred geography, and antiquities. Origin, history, and canon of the Bible. Interpretation of the scriptures. Natural theism. The authority and inspiration of the Bible. Analytic rhetoric, study of expression in English. Drill in breething, vocalization, and elocution. Exercises in composition and criticism. Extemporaneous debates. Instruction is also given during the year in mental and moral science and to religions other than Christian.

MIDDLE YEAR.

Two exercises each week in the study of Old Testament criticism and exegesis. Two exercises each week in the study of New Testament criticism and exegesis. Old Testament theology. Systematic theology. History of the Church. Homiletics.

SENIOR YEAR.

Two exercises each week in the New Version of the Old Testament and two in that of the New Testament. Old Testament theology, History of the Church. Homiletics. Sacred rhetoric. Pastoral theology. Bibical homileties, consisting of a homiletical study of the discourses of our Lord, of those of Paul and Peter and other bibical preachers, and a homiletic study of epistles, psalms, and prophecies.

Theological department in a college.

This department is designed primarily to prepare young men to preach the gospel. It is open, however, to all students who wish to qualify themselves for Christian life and work. Of this privilege a number have already availed themselves, and it is the wish of the college authorities that their action should become general.

The following are prominent features of the work done in this department:

1. Direct contact of the student with the Bible itself is emphasized. 2. The historical portions of the Scriptures are studied early in the course. 3. Careful study of Hebrew and Greek is required of all who wish to complete the course. 4. Biblical antiquities and ancient history receive attention. 5. A knowledge of church history is given.

Students are graduated from this department on the following conditions: (1) There must be conclusive evidence of Christian character; (2) In addition to the studies of this department of theology the classical and scientific course must be completed. For either of these the student may substitute an equivalent course if he has taken it in another institution.

SOPHOMORE CLASS.

1. The Old Testament: First Division—Genesis to Ruth (three terms); Second Division—Samuel and Later Historical Books (three terms).
2. The Gospels (three terms).

JUNIOR CLASS.

First term.

Acts of Apostles.
New Testament Greek.
Hermeneutics.

Second term.

Acts of Apostles.
New Testament Greek.
Exegesis—Romans.

Third term.

Scripture topics.
New Testament Greek.
Exegesis—Hebrews.

SENIOR CLASS.

First term.

Hebrew.
Plan of Redemption.
Church History.

Second term.

Hebrew.
Evidences.
Homiletics.

Third term.

Hebrew.
Evidences.
Homiletics.

POSTGRADUATE COURSE.

First year.—Old and New Testament Introduction—History of Christian Doctrines.

Second year.—Theism and Anti-Theistic Theories, Relations of the Christian Religion to Philosophy and Science.

The school of theology in a college.

This school gives a two years' course of nine hours a week in the essentials of theological learning.

Leading topics of study:

1. Biblical theology.
2. Exegetical study of Old and New Testaments.
3. Church history, homiletics.
4. History of doctrine.
5. Christian evidences. Theism.

Students preparing for the Christian ministry or any others may count these courses in the required amount of study for the degree of bachelor of divinity.

This degree will be conferred upon any resident student completing academic courses of eighteen hours a week with New Testament Greek in it, together with all of the studies offered in the schools of metaphysics, history, physics, and theology.

Ministerial students are expected to engage in some systematic professional work during vacation under some regular pastor or presiding elder.

REQUISITES FOR ADMISSION.

As is to be expected, the utmost unanimity prevails among the schools as to the desirability of excluding persons either morally or intellectually unfit to enter upon the sacred calling. While almost every school will admit an applicant who belongs to another denomination than that to which the school pertains, all demand that he shall be in full communion with some Christian (in two cases with an "Evangelical") church. The evidence of this is given by letters of recommendation from pastors, churches, or, in the Presbyterian church, from the presbyteries under whose care the student is requested or required to place himself. Nor does the precaution taken cease with the student's admission within the walls of the institution; in several cases at least some months elapse before he is admitted formally as a member of the school. There is another qualification that sometimes is mentioned as a prerequisite, which is called by one institution "earnestness of purpose" and by others a "call to the ministry."

As to the literary qualifications demanded by the schools, some diversity exists. It may be said, speaking generally, that a college education, at least that of a first-class high school, is the qualification that is thought requisite. But there are several ways in which this requirement is sometimes modified or dispensed with. It is modified when the scholastic deficiences of the pupil are compensated for by natural ability and when the course of the seminary is five or more years in duration, as is the case with many Roman Catholic seminaries, the Moravian Seminary, and others. It is dispensed with when the Greek and Hebrew Testaments are eliminated from the curriculum and the English Bible substituted. To enter upon the English course some institutions require that the applicant for admission be at least 25 years of age.

The instruction and lodging at these schools of theology being gratuitous and in the great majority of the schools pecuniary aid being furnished to the student, it is natural that a benefaction so wide in its scope and operating constantly in favor of new individuals, should seek to secure the attention of the student to the instruction which it provides. Indeed, in addition to the testimonials as to moral and intellectual fitness spoken of in a preceding paragraph, some schools are known to require a declaration in writing from the student on his admission, which may be represented by the following formula:

"Deeply impressed with a sense of the importance of improving in knowledge, prudence, and piety, in my preparation for the gospel ministry, I solemnly promise, in reliance on divine grace, that I will faithfully and diligently attend on all the instructions of this seminary, and that I will conscientiously and vigilantly observe all the rules and regulations specified in the plan for its instruction and government so far as the same relate to the students; and that I will obey all the lawful requisitions and readily yield to all wholesome admonitions of the professors and board of trustees while I shall continue a member of the institution."

Of the 145 schools given in Table 16 (p. 1045), 104 answer specifically the question addressed to them, "Have you noticed during the last decade that the students of later years were better prepared to enter upon the scientific study of their intended profession than those who preceded them?" In some cases the school had not been in existence for ten years, in others the dean had recently assumed charge. In many others the inquiry was passed by with a mere scratch of the pen, etc. Of the 104 specific answers, two say outright that they have nothing to base an opinion on, which leaves 102 schools whose answers are of service in the canvass of this important matter. Of these 102 answers 78 are in the affirmative, the greatest number being simply "yes," but 17 answer "decidedly," or "very much," or "marked or decided advance," as the case may be,

while about half a dozen answer "slightly" or "somewhat," etc. Twenty schools answer "no," two of them adding that they are getting fewer graduates in letters or sciences. There are two classes of statements that deserve consideration, to wit: Those relating to the effect of the elective system in colleges and those giving the reason why the scholastic character of the applicants for admission has improved.

"One of our important seminaries in New England answers the question thus: The optional system tends to make the Greek preparation deficient; history is lacking; the English language and literature do not seem to have adequate attention. Students are not able to read Latin with facility; the philosophic systems seem to be a priori. We do not find a better average than in previous years."

By another eastern seminary of the highest standing we are informed: More come now than formerly with some preparation in Hebrew, which is a distinct gain. On the other hand, the spread of the elective system in colleges, with other causes, has probably lowered the average quality of preparation in Greek. From the Upper Mississippi Valley it is learned that "the scientific courses in colleges make more students enter the seminary knowing little or no Greek," but otherwise no change has been noticed.

From Pennsylvania one school reports that the students have much general intelligence and are equal to those who preceded them in training of faculties, but are behind them in the classical training especially called for in theological schools. By another, it is said that their college training has been broader and more varied, but it is not apparent that there has been any better mental development than under the earlier systems of college study when the curriculum was narrower. Depth has been sacrificed to breadth. From a third the answer is received: "No; as a general thing it may be said that classical schools have not yet distinguished themselves for thoroughness of mental training."

The Harvard and Yale divinity schools, on the other hand, assure the Bureau that there has been a very undoubted improvement, the latter school attributing it to stricter requirements for admission. The Harvard school instances the fact that all but one of its members were degree men, adding that a few years ago this would have been impossible. A half a dozen other seminaries attribute the improvement in scholarship of those they are admitting to their having exacted more elevated attainments for admission. Several attribute the fact to the advance of education in the South or West, as the case may be.

To the question Has the average age of the freshman advanced? an almost universal No is returned. In a university for the colored race, the dean answers that, whereas some years ago the students of the divinity school were ministers seeking further education, now the students come fresh from the preparatory school. Two seminaries give statistics. The dean of the Augustana Seminary at Rock Island gives the average age as varying from 27½ to 29½ during the last years; in some of the earlier classes it was over 30. Union Theological Seminary reports a slight increase, as follows:

1880-81	23.6
1881-82	24.6
1888-89	24.97
1889-90	25.1

Taking the answers to the two questions as to scholarship and age and considering them together some corroboration is found for the remarks upon the influence of the high schools, made under medical instruction (p. 878). But though the great extension of public higher elementary instruction, or, as it is called, secondary instruction, is in all probability subserving in America the purpose accomplished by the colleges of Germany and France (Gymnasien and lycées) it is still interesting to note the percentage of college graduates in attendance at our seminaries of theology. In attempting such a showing the Bureau must ask the indulgence of the reader who expects the utmost mathematical exactness. The diagrams given on pp. 846–7 are accurate as far as the schools have reported. But many schools will not report or insist in reporting by making a scratch of the pen so that it is not possible to tell whether they mean that an account of such matters has never been taken or that there are no students of the kind in their institution. The table which follows is an attempt to represent the percentage of college graduates in theological seminaries, by showing the percentage that has been reported by 27 schools in various parts of the country for the 10 years last past. Before canvassing the table, however, it may be said that, in the schools reporting an improvement in the scholastic attainments of their freshmen, 30 per cent of the attendance were students having a degree in letters or science.

From the table it appears that there is a decrease in the number of graduates of colleges seeking admission to the theological seminaries (columns 2, 4, and 6) and that this decrease has been constant during the ten years last past. The general average for the ten years (column 8) for the New England and Middle States is the same, while that of the schools representing the West is much lower. Had the statistics of other sections of the Union been at hand the table might have been made more complete in its attempt to represent the condition of affairs in the country at large:

Students having degree in letters or science in twenty-seven schools of theology that report for each of the ten years 1880–81 to 1889–90 (omitting 1882–83).

CURRICULUM.

LENGTH OF THE COURSE.

The course of the theological seminary proper is three years. The principal exception to this is in the case of the seminaries of the Roman Catholic Church, where the course is four, five, or six, or even more years in duration. The regular course of the Catholic University of America covers four years. Other exceptions are the schools having a shorter (not necessarily an English) course or a postgraduate course. In the schools of New York and New England, and of Chicago there are from two to six postgraduate students. The reason for the length of the course in Catholic seminaries, excluding the course of the

Catholic University, is shown by the following; there are really three courses, one dovetailing into the other:

The object of the Salesianum is the remote and immediate preparation for the holy priesthood, and only such students are received as express their intention of becoming priests.
In accordance with this object, the education imparted embraces the classical studies, philosophy, and theology, nine years in all, with the following courses:

I. CLASSICAL COURSE (embracing five years).

The following branches are taught during this course:
1. Christian doctrine.
2. Ancient languages:
   (*a*) Latin (Schultz's Grammar and Exercise-book, Nepos, Cæsar, Cicero, Virgil, Horace).
   (*b*) Greek (Spies's Grammar, Exercise-book, Xenophon, Homer).
3. Modern languages:
   (*a*) English.
   (*b*) German.
   (*c*) French (optional).
4. Mathematics:
   (*a*) Arithmetic.
   (*b*) Algebra, as far as logarithms, inclusive.
   (*c*) Geometry (stereometry, trigonometry.
5. History and geography.
6. Natural philosophy.

II. PHILOSOPHICAL COURSE.

This course embraces:
Philosophy.
Church history.
Natural philosophy.
Hebrew.

III. THEOLOGICAL COURSE.

This course embraces:
Dogmatic theology.
Moral theology.
Church history (continued and finished).
Canon law.
Introduction into the Holy Scripture.
Exegesis.
Homiletics.
Liturgy.

This system, though not characteristic of, is not unrepresented among Protestant schools.

The two-year course is the English course. No better illustration can be given as to what this course is than the English course of Oberlin Theological Seminary. This course has been established in view of the present urgent need of more ministers and of the fact that many young men now in secular business would be willing to give their lives to the preaching of the gospel, but can not pursue a course of preparation extending over 10 years. It is designed for mature young men of at least 25 years of age, who, though possessing perhaps but a common English education, have acquired, in practical business, familiarity with affairs and acquaintance with men. It is believed that men of this class by two years of judiciously applied study can acquire such a knowledge of the English Bible, of systematic theology, and of other fundamental branches as will qualify them for great usefulness in many fields. Should a sufficient number apply, some special additional instruction will be provided for those looking forward to Y. M. C. A. secretaryships as a substitute for the homiletic training of candidates for the pulpit. The programme is as follows:

Tabular view of the English course of Oberlin Theological Seminary.

	Fall term.	Winter term.	Spring term.
First year	1 English New Testament. 2 Homiletics, 45 hours. 2 Rhetoric, 25 hours. 3 Psychology and logic.	1 English New Testament. 2 Homiletics, 12 hours. 2 Rhetoric, 48 hours 3 Logic and moral philosophy, 56 hours. 3 Home missionary lectures, 12 hours.	1 English New Testament. 2 Homiletics, 29 hours. 2 Moral philosophy, 20 hours. 3 Christian evidences.
Second year	1 English Old Testament. 2 Theology. 3 Pastoral theology.	1 English Old Testament. 2 Theology. 3 Homiletics.	1 English Old Testament. 2 Theology. 2 Modern skepticism. 3 Positive institutions. 3 Church polity.

Another species of the two-year course is shown by the course of the Jeremiah Vardeman School of Theology in William Jewell College, Liberty, Mo. The regular course of this school is intended for two years in the case of those who are fully prepared to proceed with the study of the Scriptures in the Greek or Hebrew or who have taken the first degree in college; but, to afford profitable instruction to those who have not a classical education and to those who desire to study theology at the same time that they pursue their literary studies, the

course is so arranged as to be pursued in connection with a literary course, and parts of the theological course which are adapted to the development of mental power are taken by agreement of the faculty, in lieu of proportionate parts of the literary course in the examination for the degree of A. B. Theological students who are candidates for the degree of A. B. may substitute, in each year after the freshman, one class in theology for one other class with an equal number of recitations, except in Latin, Greek, English, and geology.

Still another kind of two years' course is shown by the curriculum of the Moravian Theological Seminary. The course of study, arranged for six years, is divided into two departments: (1) Classical, of four years' duration, and (2) theological, of two years' duration. A class graduates and a new class is formed every alternate year. Hence only three classes of the six are in existence at the same time. The number of lectures and recitations for each class ranges from 20 to 25 per week. The figures in parentheses indicate the number of hours a week.

Theological department [of the Moravian Seminary].

First year (5th year).

Introduction to the Old and New Testaments (4).
Old Testament (4).—History of Israel.
New Testament (4).—The Synoptical Gospels.
Church History (4).—Fisher's Manual, from the Reformation.
Moravian Church History (2).—The Ancient Church of the Brethren. De Schweinitz: Unitas Fratrum.
Homiletics (2), with written sermons.
German (4).—Essays, orations. Reading of German authors.

Second year (6th year).

Old Testament (4).—Isaiah and Minor Prophets.
New Testament (4).—St. John's Gospel. Epistles.
Systematic theology (4).—Lectures.
Moravian Church History (2).—The Renewed Church of the Brethren.
Pastoral Theology (2), with sermons, written and delivered.
Liturgics (2).—Results of the General Synod. Provincial Digest.
German (4).—Essays, orations. Reading of German authors.

A three years' English course is offered by Hillsdale College, the last year being the course followed by the student in the "full course."

English theological course.

Preparatory.—Fall: English grammar; arithmetic; United States history. Winter: English grammar; arithmetic; elementary philosophy. Spring: Reading and orthography; civil government; composition and rhetoric.
Junior.—Fall: Systematic theology; inorganic chemistry; ancient history. Winter: Systematic theology; organic chemistry; Roman history. Spring: Systematic theology; elementary botany; English history.
Middle.—Fall: Systematic theology; mental philosophy; logic. Winter: Systematic theology; evidences; rhetoric. Spring: Sytematic theology; moral philosophy; English literature.
Senior.—Fall: English Bible; pastoral theology; historic doctrines. Winter: English Bible; homiletics; historic doctrines. Spring: English Bible; homiletics; historic doctrines.

As illustrating a composite course (academico-theological) the course in divinity of the Southwestern University is given. The curriculum of this university is arranged on the coördinate school principle, the completion of the course of a certain number of schools entitling the student to a degree. The divinity course is the only professional course as yet established in the university. It was organized by the board in June, 1885, and has been in operation for five years with the most satisfactory results. The various schools and departments of this course stand in the same relations to the university as the academic schools. The two faculties are in reality but one, and have the same government and discipline. The chancellor is the chief executive and the presiding officer of the whole. Schedule of recitations is as follows:

I. 8:45 to 9:30—Jun. French, bookkeeping, Monday, Wednesday, and Friday; Sen. French, Tuesday, Thursday, and Saturday; Jun. Greek, El. Latin, 5 days.
II. 9:30 to 10:30—Sen. Latin, Sen. Ec. Hist., Jun. Met., Monday, Wednesday, and Friday; Int. Latin, Sen. N. P., Sen. Met., Tuesday, Thursday, and Saturday; Jun. Hebrew, 4 days; Subj. Math., El. Algebra, 5 days.
III. 10:30 to 11:30—Jun. N. T. Greek, Sen. German, Int. Greek, chemistry, Jun. Bible, Monday, Wednesday, and Friday; Sen. Greek, Jun. Ec. Hist., Geol., etc., Int. Bible, Jun. History, Tuesday, Thursday, and Saturday; Sen. Theol., 5 days.
IV. 11:30 to 12:30—Sen. Math., rhetoric, Jun. Lit., Monday, Wednesday, and Friday; Sen. Hebrew, Int. Math., ethics, Pol. Econ., Tuesday, Thursday, and Saturday; El. Greek, 5 days.
V. 12:30 to 1:30—Sen. N. T. Greek, Jun. N. P., Sen. Bible, Monday, Wednesday, and Friday; Sen. Lit., Tuesday, Thursday, and Saturday; Jun. Math., Jun. Theol., arithmetic, 5 days.
VI. 1:30 to 2:15—Sen. Hist., Monday, Wednesday, and Friday; Jun. German, Tuesday, Thursday, and Saturday; Jun. Latin, 5 days.

Three years, however, is the time devoted to study in our seminaries of theology. The studies pursued during that period group themselves around certain

central or leading ideas, but so homogeneous is the course that as you move from the center of one group towards that of another it becomes more and more difficult to distinguish the periphery of the one from that of the other.

EXEGESIS.

This department may be considered under three heads, the first of which is concerned with commentaries on or introductions to the study of the text of the Greek and the Hebrew Testaments, and the second and third with the personal study of the text of those works. It is evident however that the translation of the Greek and Hebrew Testaments may be made partially an exegetical exercise, even in the case of the tyro in Greek or Hebrew, and may become wholly so in the case of well-prepared students. In the larger seminaries of the country the chairs of exegesis are known as "New (or Old) Testament language and literature" or as "Literature and interpretation of the Old (or New) Testament," as the case may be, or words to the same effect. Occasionally there is an instructor in Greek or Hebrew to assist the chair. The arrangement of one of the important theological schools of the country will illustrate, however, that the name of the chair is not always indicative of the special work performed by its occupant. In this school the philological and exegetical work is distributed among two chairs (both endowed) and an associate professor of biblical philology. The titles of the chairs are "Hebrew and cognate languages" and "sacred literature." The professor of the Hebrew and cognate languages leaves the philological work in Hebrew to the associate professor of philology and confines himself, in the regular course, to the higher exegesis of the Old Testament, while the professor of sacred literature devotes himself to teaching both New Testament Greek and exegesis.

The threefold character of the work of the department of exegetical study is rather clearly indicated during the first year of the American theological course, inasmuch as the work in Greek and Hebrew of that year is probably more philological than theological; though the language exercises are generally accompanied by study of a work on the harmony of the gospels and sometimes by the principles of higher criticism. How far the preparation of the students will permit of the lower or textual criticism of the languages in which the testaments are written, it is impossible to say. The Greek text read is usual one of the synoptic Gospels or the Acts, sometimes it is John, at other times the Septuagint, or one or more of the Pauline Epistles. The study of Hebrew is usually concerned with the grammar of the language and obtaining a vocabulary.

In the second year of exegetical study in the higher order of seminaries the text of the testaments becomes the foundation of the work and there is unity given to the department that justifies the inclusion of the study of Greek and Hebrew as a branch of exegesis. In Greek the Pauline epistles and in Hebrew the historical and prophetical writings and the Psalms are the principal exegetical studies of the second year, the text giving occasion for an excursus in one or another direction, as may be illustrated by the following course:

FIRST TERM OF SECOND YEAR.

1. Lectures on the higher criticisms of the poetical and prophetical books once a week by the professor of Hebrew.
2. Hebrew poetry: Exposition of selections of various kinds of poetry from the earlier periods of Hebrew history twice a week by the same professor.
3. Exposition of the Book of the Acts or of the epistles of the imprisonment, with special lectures on practical exposition as related to preaching, twice a week by the professor of sacred literature.

SECOND TERM OF SECOND YEAR.

1. Hebrew poetry: Exposition of selections from the later periods of Hebrew poetry twice a week, including portions of Proverbs, Job, Song of Songs, and Ecclesiastes, with the professor of Hebrew.
2. Critical and poetical exposition of the Epistle to the Romans, Galatians, or First Corinthians, twice a week with professor of sacred literature.

In the third year exegetical study approximates, from the Old Testament side, the history of the Messiah—that is to say, the early history of the Christian religion—and, from the New Testament side, the history of its earliest teaching. The study of the prophets, and especially of the facts of Messianic prophecy is preëminently the final study in Hebrew exegesis, while the study of the Pauline epistles, especially those to the Romans and Hebrews, and the catholic epistles is equally preëminent in the exegesis of the New Testament. From an examination of the programmes of the theological seminaries of the country, a tendency is shown to take up the historical books of the New Testament as introductory and follow them with the Pauline epistles during the middle and senior years.

In the Hebrew testament the same course appears to be followed: Genesis, the historical books, in selections, the Psalms, but finally and specially Messianic prophecy. But it is better, perhaps, to turn from such generalizations to compare what is taught as Old Testament exegesis in one of our first-class seminaries, with what is taught in the Hebrew Union College.

Department of exegetical theology.

Old Testament. (Professor Bissell).—Junior class, five hours per week during the first semester: The principles and forms of Hebrew grammar and a sufficient vocabulary to enable the student to read at sight the narrative portions of the Hebrew Bible; four hours per week during the second semester: reading considerable portions of the Hebrew text, with a review of the grammar; one hour per week during the second semester: lectures on general introduction to the Old Testament. Middle class, four hours per week during the first semester, divided as follows: exegesis of prophetical books, two hours; interrelations of the Pentateuchal Codes, one hour; institute work in Pentateuchal criticism, one hour. The institute work will include the examination of selected passages and the reading and criticism of essays on assigned topics. An optional in Hebrew sight-reading, not exceeding one hour per week during the second semester. Senior class, two hours per week during the second semester: lectures on Messianic prophecy and study of the more important Messianic passages; also lectures on special introduction to the disputed books of the Old Testament. An optional in biblical Aramaic, open to all students one hour per week throughout the year, and an optional in Arabic, open to the senior class one hour per week during the second semester. [A special class, if desired, will hereafter be formed in junior year for those who have studied Hebrew before entering the Seminary.]

Bible, ancient version and commentaries.[1]

(*a*) *Thorah.*—Taught by Rabbi Davidson in junior and second collegiate classes, with Targum, Rashi, and Ibn Ezra; Leviticus, chapters xix, xxi, xxiii, xxiv, xxv. In first collegiate class: Deuteronomy, with Targum and Rashi, chapters xxix, xxxii, xxxiii, xxxiv. In A Grade: Genesis, with select portions of Rashi in chapters i, vi, xii, xiii, xviii, xxii. Taught by Preceptor Mannheimer in Grade B: Leviticus, chapters xvi to xxvii, with cursory reading of Rashi. Taught by Assistant Preceptor Feldman in B Grade: Leviticus, chapters i to xv.

(*b*) *Former Prophets.*—Taught by Preceptor Mannheimer in Grade D: Joshua; Judges, chapters i to viii. Taught by Professor Zirndorf in B Grade: I Kings and II Kings, chapters i to iii.

(*c*) *Latter Prophets.*—Taught by Preceptor Mannheimer in junior and second collegiate classes: Jeremiah complete. In first collegiate class: Isaiah, chapters xiii, xiv, xxi, 1–10; xxxiv, xxxv, and xl to the end of the book: memorized, chapters xl, liii, lviii.

(*d*) *Hagiography.*—Taught by Preceptor Mannheimer in senior class: Job complete. In Grade A: Daniel, Ezra, and Nehemiah, with Aramaic grammar and translations from the Aramaic into Hebrew. Taught by Professor Zirndorf in A Grade: Proverbs, chapters i to xviii. Taught by Assistant Preceptor Feldman in Grade D: Psalms, chapters i to v, viii, xiii, xv, xix, xiii to xxv, xxvii, xxx, xxxiii. Taught by Rabbi Charles Levi during second semester in B Grade: Psalms, chapters civ (committed to memory), cxx to cxl.

The order followed in New Testament exegesis may be represented by the following:

Department of New Testament Exegesis.

I. GENERAL SUBJECTS.

Principles of interpretation; Biblical criticism: its history, principles, and results as related to the text of the New Testament. Archæology and geography of the New Testament period. The method of study in these subjects is by lecture, recitations from text-books, and essays prepared by the classes.

II. INTRODUCTION.

General and special introduction to the books of the New Testament, with an examination of the history and special characteristics of each book, and an outline analysis of its contents. This occupies one exercise a week throughout the course, and is intended to secure, on the part of the student, the careful translation or reading of all the books, with a study of the plan and argument of each book and of passages of special interest in it, together with an investigation of its canonicity and of other questions belonging to introduction.

III. EXEGESIS.

First year.—1. The Gospels: Translations and exegesis of select passages, embracing the chief events in the life of Christ, the miracles, the parables, and several of the principal discourses.
2. The acts and the Epistles of Paul: Translation and exegesis of select passages from each book, in connection with the studies of its plan and an outline analysis of its course of thought.
Second year.—The Epistle of Paul: Translation and exegesis of Romans and Hebrews.
Third year.—The Catholic Epistles and Revelation: Translation and exegesis of James, First Peter, First John, and of select portions of the other Catholic epistles, with the translation of a part of the Book of Revelation and an examination of the current theories of its interpretation. Also a comparison of the style, composition, and the type of doctrine in the several New Testament writings.

---

1 This College consists of two departments, the preparatory and the collegiate. The preparatory consists of Grades D, C, B, and A, and the collegiate consists of first collegiate, second collegiate, junior and senior classes. No C grade this year.

Biblical archæology (or "antiquities") is usually classed under exegesis and perhaps should have been made a fourth division of the subject. But its study does not yet appear to have been introduced with the thoroughness that warrants such prominence, though lately a Hull professorship of Biblical geography and archæology has been established in the Ryder Divinity School of Lombard University. More prominent as an exegetical study than archæology is the study of the Semitic languages and of the hieroglyphics and cuniform characters, the last two being, indeed, a prerequisite for first-hand archæological study in the present conception of the term. As these philological studies are optional they will be spoken of after the remaining three heads of the theological course have been given.

In closing this brief summary of the exercises of the department of exegesis a word of explanation may be permitted. In several cases the philological instruction in Greek and Hebrew is not called exegesis but philology; in other cases the instruction in the works written in one or the other of these languages and in books written about those works is called Biblical study, and in others still Old and New Testament study and interpretation. In distributing the matters taught in the way of exegesis under the heads of commentary and study of the texts it must not be supposed that this Bureau has attempted or desired to improve theological terminology, but that convenience alone has been consulted. The information possessed by the Bureau will not permit a close classification into philological and exegetical study, the proper distinction, and it is not impossible that such a classification can only be made after a thorough personal study of the syllabus of the various courses in exegesis as they are actually given. Indeed, when the question of philology is up as a department of study in a theological seminary it is advisable to consider that at the Harvard Divinity School German is required for the degree of bachelor, and that the German is recommended to be taken in the junior year, "as a knowledge of this language will be found of great service during the remainder of the course." Nor should it be forgotten that in the Western Theological Seminary and elsewhere Augustine's De fide verum quæ non videntur, and Thomas Aquinas's In Symbolum Apostolorum Expositio, etc., are read in the original, and that "high latinity" is a study in the French faculties of theology.

THEOLOGY.

In natural sequence though not in importance the department of theology follows that of exegesis. This department of the curriculum may be treated under two general heads, the first of which may take the name of systematic theology or dogmatics, and the second that of apologetics or polemical theology. The first head may certainly be subdivided into theology (proper), anthropology, soteriology, and eschatology. Perhaps Christology (as far as it can be separated from exegetical work and soteriology) angelology, and finally ecclesiology (as far as it can be separated from the material facts of ecclesiastical organization on one side and from soteriology and Christology on the other) should be added.

The course in systematic theology is usually introduced by a general survey of the subject which it may be permitted to call encyclopædia. Occasionally this is made to bear upon the work of the student by pointing out methods that he should follow or aids that he should avail himself of, while pursuing his studies. Christian ethics also appears in the first year of the course, though it frequently comes among the studies of the third year. Frequently theology proper (the being and attributes of God) is begun during the first year, but the subject is always finished with the second. Closely connected with theology proper is the study of man, his spiritual nature and fall, called anthropology, and this leads naturally to soteriology or the doctrine of salvation, and that to eschatology. Sometimes all these several divisions of systematic theology are taken up and finished during the second year, but the rule is that eschatology comes in the third year, leaving anthropology and for the most part soteriology as the second or middle year subjects in this department. In addition to the headings already given the terms angelology and pneumatology occasionally occur and those of Christology and ecclesiology often, especially in the case of the former. In one institution the division of soteriology is composed of objective soteriology, which includes "the covenant of grace, Christology, the person, offices, work, and states of Christ," and subjective soteriology, which includes "The Holy Sprit, calling, regeneration, faith, etc." At another institution the subject of Christology is defined perhaps with perfect accuracy, as "Christ's Theanthropic person, divinity, and humanity." Ecclesiology may be said to be a third-year study.

In the third year eschatology, ecclesiology, apologetics, and a general review of the studies of the course, figure prominently. In addition soteriology appears so frequently that it is doubtful whether it is not as much a third year as a second year study. Christian evidences comes frequently in the first year, though under the title of apologetics it is here included among the third year studies.

As in the schools of the Episcopal church there seems to be a variation, indicated either by the phraseology or by the text-book employed, from the usual curriculum of the department of theology, it seems advisable to insert a curriculum of one of the seminaries of that denomination. In selecting this illustration a curriculum has been taken that will not only exemplify sectarian as opposed to "nonsectarian" instruction, but also be of more general interest as showing the plan upon which the professor of divinity conducts the exercises of the department under his direction.

Systematic divinity.

In this department will be carried on two lines of study. In one, begun in the junior year and extending into the years following, under the direction of the assistant professor, the object will be:

First, to ascertain the Scriptural support for the received doctrine of the church;

Secondly, to trace the history and development of doctrine till it has reached its present form.

The text-books used will be namely: Pearson on the Creed; Brown on the Articles; Bruce on the Humiliation of Christ; Oxenham on Atonement; Mason's Faith of the Gospel; Martensen's Dogmatics; with partial study of Scott's Christian Life, Liddon's Bampton Lectures, Hooker's Ecclesiastical Polity, and Magee on Atonement.

It is not thought needful to mention here the many books of reference whose consultation is advised so far as there is time, unless it be Dorner on the Person of Christ, Pusey and Richey on the Filioque Clause, and Bull on Justification.

The second course, begun in the middle year and continued in the senior year will consist entirely of lectures by the professor of divinity, and its object will be to mould Christian doctrine into a coherent whole, giving it philosophic vindication by relating it to all truth. In this course will be read, parallel with the lectures, the professor's own work, "Christian Doctrine Harmonized, and its Absolute Rationality Vindicated."

In several institutions of another denomination it is customary to take a general and final review of the whole subject of theology in relation to the tenets of the denomination which supports the school. Thus in one school, during the latter part of the third year, a "special series of lectures will be delivered on the Westminister symbols, including the history of their formation, their doctrinal contents, and their influences and claims." In another seminary the subject of "Christian theology" is finished by a critical study in the Westminster confession as a final review of systematic theology; while at a third seminary of the same denomination the subject is broadened out during the second term of the final year into the subject of "symbolics," which deals with "comparative theology," being an exposition of the doctrinal differences between Romanism and Protestantism, and the variation of the protestant churches, and is treated from the denominational standpoint during the first term under the head of church polity.

The following syllabus will show, though with the mere accuracy of a numerical average, the type of the course in the department of theology; it may be added, however, that it seems exceptionally full on the subject of apologetics which here enters into the curriculum of two of the three years of the course, and is conducted by a specialist with the title of "Instructor in Apologetics."

Department of systematic theology.—Mr. Gillett, Junior Class, two hours per week during the first semester; Historic Apologetics, including both the Ecclesiastic and Christian divisions. Middle Class, three hours per week during the first semester: Philosophic Apologetics, including the Anthropic and Theistic divisions.

Professor Beardslee, Junior Class, two hours per week during the second semester: Theology proper, treating of the being and attributes of God, decrees, creation, providence, angelology, demonology, and theodicy Middle Class, four hours per week during the first semester: Anthropology, including Biblical psychology, man's original state and fall, hamartialogy, soteriology, including the person and work of Christ, and the application of redemption; three hours per week during the second semester, continuation of the same studies. Senior Class, two hours per week during the first semester: The work of the Holy Spirit, ecclesiology, eschatology, and inspiration; four hours per week during the second semester, Christian ethics. The entire course is pursued by means of an inductive study of the Bible, requiring constant individual investigation in the original languages, and in connection with each leading doctrine an examination of ecclesiastical theology from the sources.

CHURCH HISTORY.

The third great department of the theological course is the history of Judaism as precursory to Christianity and the history of Christianity. The department has several names—Ecclesiastical (or Church) History, Historical Theology, Biblical and Ecclesiastical History, History of Religion. Sometimes the term Church Polity is added to the name Ecclesiastical (or Church) History, and

when this happens the combination may be taken as a definition of what is meant by historical theological.

Two types are shown by the courses of this department. One treats of the historic connection between Judaism and Christianity and of the apostolic age as the first period, the patristic and consolidating epochs as the second, and the epoch of protest or Reformation and the results as the third. But the more usual division is to make the point of departure for each period, (1) the beginning of our era, (2) the Council of Nicea, and (3) the Reformation. The treatment of Jewish history shows some variation. At one institution the "history and the religion" of that people is treated of in the junior year as Biblical Theology, while under the general head of "History," "Apostolical Christianity" is given, the professors in each branch being widely known as specialists in their respective departments; but not every institution can afford this wealth of instruction. The Old Testament has, in addition to its sacred, a historical character, but it is impossible to say how far the exegetical work in Hebrew brings out the history of the people of Israel. In one institution, at least, the Old Testament is studied as history "directly from the text," for two hours a week during the first semester of the junior year and three hours during the second semester.

As the occasional use of the term church-polity in connection with church history indicates, and the logical development of the results of the reformation offers the occasion, the organization of the Roman Catholic and Protestant churches becomes a subject of examination and the examination is naturally made with relation to the particulars of the faith professed by the denomination to which each school pertains. In the foregoing we have found the Episcopalian Church introducing the study of its creed and articles of faith in the second year, but the study of the "confessions" or, to use the scholastic expression, the differentia of the beliefs held by the Christian peoples, is usually deferred until the final year in the department now under consideration. A pronounced instance of this is shown by the following course:

JUNIOR YEAR.

The Biblical Geography will occupy ten weeks of the first term, and the remainder of the year will be devoted to Sacred History, including both the Old and New Testament, and lectures on Biblical Archæology. This requires two hours per week in the recitation room.

MIDDLE YEAR.

History of the Christian Church from the Apostolic age to the present. This will include lectures on Patristics and the Councils. This is required three hours a week. Christian Biography and History of Special Churches are electives for one hour a week.

SENIOR YEAR.

History of Methodism will seek to give a general view of the origin, growth and work of the church. Weekly recitations will be held in History of Doctrines throughout the year. The History of Methodism, Comparative Symbolics of American Churches and Hymnology are required two hours a week. They will be taught by lectures in connection with a printed syllabus. Comparative Religions, Christian Art, and statistics of Religious Progress are elective two hours a week. Throughout the entire course students will be assigned subjects which they are to study in the library, and present these upon the same in the class. The aim from first to last is to lead the student as far as practical to depend upon his own careful study of the topics.

HOMILETICS AND PASTORAL THEOLOGY.

The fourth department of the theological course is practical and is usually called homiletics when dealing with the preparation of the sermon, and pastoral theology when it is concerned with the other practical work of the minister. It is the intention here to treat of both these as divisions of the department of practical theology. As a general introduction to the subject the following is taken from the catalogue of a theological department in a western university:

PRACTICAL THEOLOGY.

"The importance of the instruction of this department to young men proposing to enter upon the work of our ministry may be seen by reference to the fact that most young ministers are now required to begin their labors without the care and oversight once given by the senior preacher. Formerly the junior preacher was expected to engage for several years in acquiring the needful experience before assuming the management and responsibilities of a charge. But in these days, a young man upon leaving school is required to perform the full work of an experienced minister, with but the scant advice and direction of his presiding elder, as occasion may serve once or twice a year. The chair of practical theology is intended to supply by direct instruction that which was

once furnished in some measure by the senior minister. The object is in part to teach the student how to put into practice that which he has mastered in the other departments of the school, especially that which relates to Christian character and conduct. Homiletics and pastoral theology will have a large place in the work of this department. Further, it is important to his interests and to the work as well, that he should become acquainted with the principles and law of our church, so as to wisely administer its discipline in the interest of the Gospel, and that he should be thoroughly acquainted with the great connectional plans and purposes of the church, so as to enter intelligently and enthusiastically upon the work of our ministry. During the first year, attention will be given to homiletics, pastoral theology, and preaching before the school. Lectures on the articles of religion, the discipline, constitution, and polity of the church will mainly occupy students of the second year. Questions of ecclesiastical law, courts of trial and appeal, church benevolences, and Sunday school and general church work will, during the third year, receive attention."

The study of homiletics is begun more frequently perhaps in the first than in the second year, and is, of course, accompanied by drill in elocution. The study is a special case of literary analysis, appreciation, and use, the models being found in sermons by eminent divines or much more frequently in compendiums on pulpit oratory or in the professorial or other criticism of the class room. In several cases lay rhetoric is studied. Extemporaneous work is, seemingly, accented and oral delivery of excogitated work insisted upon. The endeavor is to make the work as practical as possible, and in one instance the students are called upon to "participate in the conduct of a large children's [Sunday school] class led by the professor each week." So important is this subject of homiletics that one school speaks of "the paramount importance of the ministers' pulpit work.

The work in pastoral theology, though less brilliant, is certainly not less valuable. In the proper acceptation of the term it treats of the pastor as an agent and administrator rather than as an orator. But as the duties of these lines of activity require, if they are to be well performed, traits of a high order, the attributes desirable for the pastor to possess also receive great consideration. Occasionally church polity is included under this head. Sunday school and other religious agencies for recruiting the congregation, the conversion of the heathen in foreign parts, etc., also fall within its scope. The following courses will render further remark unnecessary:

Course of the theological department in a university of the South.

Homiletics and Pastoral Theology.

In the Trinity term the studies of the junior class seek to make clear such fundamental questions as what a pastor is? What are his relations toward God and toward man? What are his motives, responsibilities, and helps? What should be the main outline of his continuous and lifelong course of study? And what is the best method of preparation of sermons, whether unwritten or written? Distinctly to understand these questions is of highest importance, as well for its influence upon the student's devotedness and zeal, as for the advantage of applying homiletic theory to immediate practice in sermon writing and in preaching during his seminary life. Hence, these topics are placed at the beginning of the junior year, and that they may be perfectly understood they are taught in the threefold way of (*a*) the text-book and recitations; (*b*) printed lectures selected by the professor and read by the students in turn, and (*c*) the instructions of the professor. Then, throughout the remainder of the three years this knowledge is made use of in the writing of sermons, and in extemporaneous speaking, for which the Homiletical Society of St. Luke's Hall and the literary societies of the university furnish the opportunity at least once in every week.

In the senior year the studies are upon the administration of the sacraments, the performance of the occasional office of the Book of Common Prayer, and the practical detail of pastoral duty. Much attention is given to the reading of the service, and in particular to an accurate and intelligent reading of the lessons from Holy Scripture. The regular course of study in this department is supplemented by the able and instructive lectures of the right reverend the bishop of Louisiana.

Course of a seminary of the Middle States.

Department of Pastoral Theology.

I. *Church polity.*—The church; its membership, internal organization, external relations, officers, discipline.

II. *The ordinances.*—Their nature, efficacy, and obligation; baptism, its significance, form, and subjects; the Lord's Supper, its significance, and the qualifications for partaking of it.

III. *Pastoral duties.*—Call to the ministry; settlement; public worship; subject-matter of preaching; administration of ordinances; social religious meetings; pastor and Sunday school; the pastor as an organizer of the social and religious forces of the church; pastoral visitation; studies of a pastor; personal spirit and life.

Department of Homiletics.

The course in this department extends through two years. It furnishes stated exercises to secure, on the part of the student, a mastery of principles and methods, and to form in him

correct habits in the preparation and delivery of sermons. These exercises consist of recitations from standard treatises, with lectures, elucidations, and criticism; carefully prepared analyses and written criticisms by the student of sermons by eminent preachers; presentation of plans of sermons before the class, with criticism by students and by the officer; and the preparation and delivery of sermons before the seminary, with criticism by students and officer.

In all cases of criticism before the classes and the seminary, in addition to the negative criticism to which the student is subjected, the professor holds himself responsible for an independent treatment of the text, or the subject, that the student may not be left conscious simply of his defects and errors, but may have suggested to him a method by which he may improve his own ideal and work.

Course of seminary in New England.

Department of Practical Theology.

Junior class, two hours per week during the first semester: Introduction to practical theology. The foundation for the whole course is laid by an expository study in the Gospels of the Lord's selection of His disciples, and of the personal training that he gave them in character, faith and methods of work. The first principles of the construction of the sermon are inductively drawn from the Biblical history of preaching. Constant practice in sermon analysis is required. Middle class, one hour per week during the first semester, four hours a week during the second: The study of Homiletics is completed, the practical exercise of making and delivering sermons is continued. Christian nurture, theoretical and practical, is also studied. Practice in preparing sermons, addresses, and class exercises for children, and participation in the conduct of a large children's class, led by the professor each week, supplement the study of theories. The history and methods of the Sunday school, Young People's Endeavor Societies, and Christian associations are objects of original research. A preliminary course in congregational polity is also given. Senior class, four hours per week throughout the year: The principles and methods of evangelistic work, pastoral care, Christian economics, and Christian benevolence, ecclesiastical polity and administration, and practical liturgics. One half the year is devoted the comparative study from the sources of Christian sociology. Preaching before the seminary is required. In all classes, besides the constant homiletic drill, practical personal work in Sunday school teaching, evangelistic efforts of many kinds, reformatory and preventive agencies, charity methods, and labor with individuals for their conversion and upbuilding are expected of each student under the supervision of the professor.

Course of a department in a college of the West.

Homiletics and Pastoral Theology.

Homiletics.—In the fall term, lectures five days a week for the first nine weeks, on homiletics, treating of the different classes of sermons, the principles of their construction, the use of texts, the nature and value of expository preaching, the method of preparation and production of the extemporaneous and the written sermon, the respective advantages which belong to each style of preaching, the homiletic habit, and the paramount importance of the minister's pulpit work. In connection with these lectures there are special exercises for the illustration and practical application of the principles of homiletics, consisting of the analysis of the sermons of eminent preachers, and the criticism of sermon plans presented by the different members of the class.

In the winter term the lectures are continued once a week upon the delivery of the sermon, the conditions of ministerial success, the ministerial spirit, the ministers theme, the method and range of the minister's studies, and the invention of thought for sermons.

In the spring term, the professor lectures five days a week for four weeks upon sacred rhetoric, discussing the properties of style adapted to the pulpit, the study, the characteristics of oral address, and the method of culivating it. (Seventy-seven hours.)

Pastoral Theology elective.—Lectures five days a week throughout the term, treating of the following topics, viz: The conduct of public worship, Sunday schools, the pastor's special work for the children, the relation and the duty of the minister to missionary societies and other organizations for Christian work, the best method of educating and training a church to systematic beneficence, the advantages of a settled pastorate, prayer meetings, revivals, the instruction of religious inquirers and young converts, pastoral visiting, church organization, ministry to the sick, the afflicted, and the poor.

The members of the class, under the professor's direction, prepare to be read before the class during the year elaborate "studies in biography" of distinguished preachers, in which their special merits and methods of ministerial work are described and commented upon. (Seventy hours.)

Course of a seminary in the West.

Sacred Rhetoric and Pastoral Theology.

The work in this department begins with the junior year and extends throughout the entire course of study, enlarging as the student advances to graduation. For the fullest benefit it is indispensable that the drill and discipline cover three years.

A series of exercises in extempore expositions and explanations of scripture, or lecture-room talks, extends throughout the junior year; also, exercises in the reading of scriptures and of hymns.

A course of lectures on the sermon is given the middle class, together with a discussion of style as related to the literature of the pulpit. The preparation and criticism of sermon plans are also required. The lecture-room talks founded upon assigned passages of scripture are continued.

The senior class is given a course of lectures on preaching, embracing methods of preparation, delivery, etc. Critical exercises in sermon plans are continued throughout the year. Essays are also required from the seniors on topics closely related to this department. Preaching in chapel before all the students, and conducted by the members of the senior class in succession,

Lectures are also given in pastoral theology on the following and kindred topics. The pastor's personal character, habits, manner; the pastor in the study, in the prayer meeting, in the Bible school, in the homes of the people, in revival, in inquiry meeting, in the pulpit. This department covers, also, the call to the ministry and the choice of a field of labor.

Personal private drill in the reading of scripture and of hymns and in the delivery of sermons will be given by the professor to the seniors.

Sacred music, choir drill, Mondays, 5.15 p. m.; classes, Thursdays, 7.30 p. m., with Prof. Herman.

EXAMINATIONS.

The academic year consists of two terms, the first beginning with the third Wednesday of September and ending with the Christmas holidays; the second beginning immediately after those holidays and ending with the Tuesday next preceding the second Thursday of May. Examinations will be held during the last week of each term upon the studies then completed. These examinations are conducted by the faculty with the coöperation of committees of the directors. The Presbytery of New York is represented by a committee at the intermediate examination, the Synod of New York at the final examination.

VIRGINIA.

THEOLOGICAL SEMINARY OF THE DIOCESE OF VIRGINIA.

Scheme of lectures.[1]

Monday.—9 to 10 a. m., middle class theology, junior Greek; 10 to 11 a. m., senior history, middle class Hebrew; 11 a. m. to 12 m., junior Hebrew; 12 m. to 1 p. m., middle class English, Bible; 1 to 2 p. m., senior class polity, junior history.

Tuesday.—9 to 10 a. m., senior Hebrew, middle class history; 10 to 11 a. m., middle class theology, junior Hebrew; 11 a. m. to 12 m., senior class polity, junior class natural theology; 12 m. to 1 p. m., senior English Bible, middle class Greek; 1 to 2 p. m., junior history.

Wednesday.—9 to 10 a. m., senior history, junior Greek; 10 to 11 a. m., senior Greek, middle class theology; 11 a. m. to 12 m., junior apologetics; 12 m. to 1 p. m.,[2] senior theology (homiletics), middle class Hebrew; 1 to 2 p. m., junior history; 5 p. m., exercises in homiletics and the use of the prayer book which all the students are required to attend.

Thursday.—9 to 10 a. m., senior Greek, middle class history; 10 to 11 a. m., middle class theology, junior Hebrew; 11 a. m. to 12 m., senior Hebrew; 12 m. to 1 p. m., senior theology, middle class Greek; 1 to 2 p. m., junior history.

Friday.—9 to 10 a. m., senior Greek, middle class history; 10 to 11 a. m.,[3] senior history (canon law), middle class theology, junior Hebrew; 11 a. m. to 12 m., junior apologetics; 12 m. to 1 p. m., senior theology, middle class English Bible.

TEXT BOOKS.

The necessary information is not possessed by this Bureau to enable it to discuss the subject of text books with any degree of thoroughness. The following scheme will show very succinctly a peculiarity of the catalogues of the schools of the Episcopal Church, to wit: The text and reference books are invariably

[1] In order that the main outlines of the curriculum may be presented clearly, some of the briefer courses, which occupy only a fraction of a session, and the exercises in elocution are not noted in this scheme.

[2] For half the session this hour is given to homiletics; but throughout the whole session exercises are given in analyzing texts and constructing sermons.

[3] This hour is given to canon law during the latter part of the session.

mentioned. To compare with it a programme of the Mount St. Mary's Ecclesiastical Seminary (Roman Catholic), and another of the Augustana Theological Seminary (Lutheran) are inserted:

Scheme of study.

Studies.	Junior year.	Middle year.	Senior year.
Hebrew and Greek.	Tregelles' Heads of Hebrew Grammar. Readings from the Pentateuch and the Psalms. Gesenius' Hebrew Lexicon. Readings from the Septuagint.	Readings from the Messianic Psalms, and Extracts from the Prophets. Gesenius' Hebrew Lexicon.	
Exegesis	The four gospels; the Acts of the Apostles. Gardiner's Harmony of the Gospels.	The Epistles of St. Paul, with Ellicott's and Lightfoot's Commentaries.	Christological portions of the Old Testament in Hebrew, with Commentaries.
Ecclesiastical history.	First six centuries: Mahan, Blunt, Burton and Robertson's Church Histories. Bates' Lectures on Christian Antiquities. Mosheim's Commentaries.	Seventh to fifteenth centuries, inclusive: Hammond on the canons. Newman's History of the Arians. Hardwick's Middle Ages. Robertson's Church History, 3d ed. Milman's Latin Christianity.	Sixteenth century to present time: Hardwick's Reformation. Burnet's History of the English Reformation. Carwithen's and Perry's Histories of the English Church. Perry's and Wilberforce's Histories of the American Church.
Systematic divinity	Bishop Butler's Sermons at the Rolls. Christian Ethics. Adams' Elements of Christian Science.	Pearson on the Creed. Hooker on the Incarnation.	Bishop Browne on the Thirty-nine Articles.
Pastoral theology	Lectures by the Professor. Gresley's Ecclesiastes Anglicanus. Amer. ed. Brooks' Lectures on Preaching. Bishop Ellicott's Collections on Homiletics. Lectures on Homiletics, by the Professor. Four sermons by each student.	Blunt's Parish Priest. Bishop Burnet on Pastoral Care. Bishops White and Wilberforce on the Ordinal. Bishop Ellicott's Collections on Pastoral Work. Lectures on Pastoral Duties, by the Professor. Five Sermons by each student.	Wheatley and Procter on the Book of Common Prayer. Hooker's Ecclesiastical Polity, Book *vs.* Lectures on Liturgics and Pastoral Work, Conscience and Human Law, by the Professor. Six Sermons by each student.
Ecclesiastical polity and law.		Abp. Potter on Church Government. Wordsworth's Outlines of the Christian Ministry. Lectures by the Professor.	Haddan's Apostolical Succession. Canons and other Ecclesiastical Laws. Lectures by the Professor, with Exercises on books of reference.

MOUNT ST. MARY'S ECCLESIASTICAL SEMINARY.

Cursus theologicus quatuor annos complectitur.[1]

Auctores vero qui in scholis adhibentur sunt sequentes.
Theologia Dogmatica: Jungmann et Schouppe.
Theologia Moralis: Gury-Ballerini. Ad consulendum, Lehmkuhl.
Introductio in Sacram Scripturam: Ubaldi.
Introductio Critica Hermeneutica Biblica et Archæologia Biblica. Commentarii: Piconius et Estius.
Historia Ecclesiastica: Wouter.
Jus Canonicum: Soglia-Vecchiotti.
Sacra Eloquentia: Potter.
Liturgia Sacra: De Herdt, O'Brien et O'Kane
Lingua Hebraica: Vosen.
Cantus Planus: Magister Choralis.

[1] The programme is prefaced by the following statement as to admission:
Nemo in Seminarium admittetur nisi studia ad classes optatas præparatoria jam sufficienter excoluerit, quod per examen constare debebit. Ante omnia autem literas testimoniales ab Instituto cui forte fuerit adscriptus, necnon a proprio parocho vel alio superiore ecclesiastico secum portare tenebitur.

AUGUSTANA THEOLOGICAL SEMINARY.

Text-books and books recommended.

EXEGETICAL THEOLOGY.

1. Weidner's Theological Encyclopædia, vol. 1.

6. Palmer's Catechetics.
7. Kubel's Pastoral Theologie.
8. Holmström's Kyrkorättslära.

CHANGES DURING THE DECADE 1880–90.

ELECTIVES.

Before speaking on this, in college history, well-worn question, let us distinguish between a special or nondegree course in a theological school and a course composed of a certain number of studies chosen by the students from among a category of subjects offered by the faculty in lieu of an invariable curriculum. To state the question thus is to answer it. The special courses for ministers or for others who seek to extend their acquirements in languages will be spoken of under the head of optional studies.

In 1885, the Theological Department of Oberlin College introduced the elective system for one-half of the course for B. D. For this degree students were required to complete work amounting to 1,050 hours of lectures. The required studies demanded 485 hours, the elective studies might extend to 1,252 hours, but 565 hours were required. At present the daily exercises are as follows:

Hour.	Fall term.	Winter term.	Spring term.
8 to 9 a. m	Hebrew, a. (70); *church history, a.* (70).	Hebrew, b. (60); *church history, a.* (60).	Hebrew, c. (40); church history. b. (40).
9 to 10 a. m	*Elocution;* Hebrew, d. (70).	New Testament, b. (60); Homiletics, b. (60).	Church history, c. (40); Semitic or Septuagint (40); New Testament, c. (25).
10 to 11 a. m	*Natural theology,* (45); *revealed theology,* (25); *Homiletics, a.* (45).	*Greek, a.* (60); *revealed theology* (48); *homiletics, a.* (12).	*Natural theology* (15); *modern skepticism* (20); *science and religion* (20).
11 a. m. to 12 m	*Greek, a.* (25); pastoral theology (70).	*Elocution;* history of doctrine.	*Homiletics, a.* (20); positive institutions (20); *Greek, a.* (40).
4 to 5 p. m	----------	Old Testament introduction and theology (48).	Homiletics, c. (20).

The courses printed in *italics* are required studies; the others are elective. The required courses amount to 628 hours; the elective courses offered in three years amount to 1,250 hours. For the degree of B. D., students must have completed work amounting to 1,138 hours of lec-

tures upon this system. The studies of the several departments may be pursued in such order as is necessary to secure the desired electives: but continuous courses, such as church history a, or homiletics a, should never be interrupted until completed.[1]

The study of Syriac in the second year and the study of Chaldee in the third year were elective in the Hamilton Theological Seminary as early as 1885, they being optional studies at the date of 1881. In this institution the student may pursue a "full course" or a "Greek-English course" (which dispenses with Hebrew and begins the study of Greek) or an "English course" (which dispenses with both Hebrew and Greek).

About 1886 or 1887 "electives" were introduced in the Newton Theological Institution, the prescribed studies requiring from 9 to 10 hours a week. Most of the elective courses being open to more than one class, they are not arranged according to classes, but according to the term in which they are given. No elective course is begun unless there is an attendance of four or more students. In the first term the electives are the Semitic languages, including Assyrian and Biblical Greek, exegetical work in Old and New Testament apologetics, Christian theology according to John, inspiration, comparative religion and history of missions, and preaching and methods—14 courses in all of 1 or 2 hours a week, some open to all students, others open only to the middle and senior classes. The second term, for it appears that each course only continues one term, is very similar to the first in character, being, it would seem, a sort of continuation of the first term, though the courses of both terms are numbered consecutively from 1 to 30, course 15 being the first course of the second term. A peculiarity of the courses of the second term is indicated by expressions such as this "Course 15, 1891, and every third year Old Testament history; Course 17, 1889 and 1891, rapid reading of Hebrew Testament."

From the dean of Harvard it is learned that during the decade "the studies have gradually changed in the way of enlargement, the elective system having been introduced to some extent," while the acting warden of the Seabury Divinity School informs the Bureau that "We hope soon to introduce the elective system," and that "the German seminary system is increasing in favor." This seminary system is in vogue at Harvard; and perhaps elsewhere, without designation as such.[2]

With the year 1890–91 the system of elective studies will be introduced in the Andover Theological Seminary in order to encourage a degree of specialization and to offer an increased number of subjects, particularly in Biblical studies. While the study of theology is in itself an election, says the faculty, and necessarily includes foundation work in Hebrew, Greek, dogmatics, church history, homiletics, and other branches of sacred learning, there may properly be opportunity for more extended research in one or another of the principal departments, and in accordance with the tastes and aptitudes of the students. The amount of prescribed work by lecture hours is therefore somewhat reduced in the middle and senior years, and several courses are offered from which a required number of hours is to be chosen. All the elective courses of each year are offered to both classes, and entirely different courses are offered in alternate years. A sufficient number shall be chosen to make, with prescribed studies, an average of 12 hours a week in the middle and 10 in the senior year. Old Testament studies include the three courses of introduction, exegesis, and Biblical

[1] The following course is recommended by the faculty for the general student:

	Fall term.	Winter term.	Spring term.
Junior year	8 to 9 a. m., Hebrew, a.; 9 to 10 a. m., *elocution;* 10 to 11 a. m., *natural theology; Greek, a.*	8 to 9 a. m., Hebrew, b.; 9 to 10 a. m., *elocution;* 10 to 11 a. m., *Greek, a.*	8 to 9 a. m., Hebrew, c.; 10 to 11 a. m., *natural theology;* 11 a. m. to 12 m., *Greek, a.*
Middle year	10 to 11 a. m., *revealed theology; homiletics, a.;* 11 a. m. to 12 m., Old Testament, d.	10 to 11 a. m., *revealed theology, b.; homiletics, a.;* 11 a. m. to 12 m., New Testament, b.	9 to 10 a. m., Semitic, or New Testament, c.; 11 to 12 m., pos. institutions; *homiletics, a.*
Senior year	8 to 9 a. m., *church history, a.;* 9 to 10 a. m., pastoral theology.	8 to 9 a. m., *church history, a.;* 11 a. m. to 12 m., homiletics, b.	8 to 9 a. m., church history, b.; 10 to 11 a. m., *science, religion, modern skepticism.*

[2] As, for instance, at the Chicago Theological Seminary, where the professor of church history conducts a "Historical Society," in which he reads with the students of all classes who may desire it selections from patristic works, *e. g.* First Apology of Justin Martyr.

theology. New Testament studies include the three courses of introduction, exegesis, and the life of Christ. Courses are offered also in social economics, Christian ethics, and the philosophy of religion.

A feature of the Southern Baptist Theological Seminary requires notice. The plan of instruction is quite similar to that of the University of Virginia. Every department of study is elective, and a separate degree is given upon graduating in each department; and the degree of "full graduate" when all have been completed or "English graduate" when all, except Hebrew and Greek. Many students remain only one year, others two, electing certain departments at pleasure, with advice of the professors. "We are satisfied from thirty years of experience," says Dr. Broadus, "that the elective works best when complete and consistent."

OPTIONAL STUDIES.

The optional studies of the theological seminaries are languages and those special courses of individual or collective inquiry and mutual criticism that are called seminariums, or, to use the Latin form, seminaria. An illustration of this seminarium may be found in the case of the Lane Theological Seminary, which has as an optional course a "special class for the study and criticism of the literary sources of ancient church history," once a week throughout the year, the chief subject of investigation during 1889-90 being the formation of the New Testament canon.

But the great optionals are the Semitic languages, the Egyptian hieroglyphics, and perhaps the German language, which shows some indications of becoming as much the language of Protestant theology as Latin is of the Roman Catholic. At Yale it is noted that Sanscrit may be studied under Prof. Whitney, of the college proper. Of the twelve or thirteen schools reporting optional courses in the languages with which Hebrew is cognate but two mention in addition the study of the hieroglyphics. One of these, the Theological Seminary of the Dutch Reform Church, offers in each of its three years a course in Coptic or Hieroglyphic, while the other, the theological seminary at Andover, Mass., offers instruction to the middle and senior classes in Egyptology, including the elements of the hieroglyphs, or in Assyriology. The course of the schools then, taking them altogether, is well confined to the languages of the Semitic group, with a preference for the northern branch, as might be expected from the religious literature its languages contain, though the study of the ancient or Biblical Hebrew should not be classed among the optional studies of our seminaries.

The following statements will illustrate various phases of the course of instruction in the optional languages:

1.—*As to organization of the classes.*

THE COGNATE ORIENTAL LANGUAGES AT UNION THEOLOGICAL SEMINARY.

(See page 933 for time table.)

All the studies in this department are optional.

The class in Biblical Aramaic will study the grammar of that language with selections from the Aramaic of the Bible, in the second term, with Prof. Brown.

Those who have already studied Hebrew and Biblical Aramaic may unite with the Syriac and Arabic classes, which are organized in alternate years (1889–90, Syriac; 1890–91, Arabic), so that in regular order the three classes may pursue Biblical Aramaic, Syriac, and Arabic. The Syriac class will study Syriac grammar, and read selections from the Peshitto version in the first term, and read selections from Bar-Hebraeus and Ephraem Syrus in the second term with Prof. Briggs. The Arabic class will study the Arabic grammar, and read selections from the version of Saadia in the first term, and read selections from the Koran, in connection with a more particular study of Arabic syntax, in the second term with Prof. Briggs.

There will be two Assyrian classes, composed of those who have already studied Hebrew, and two of the Cognates. The one will study the Assyrian characters and grammar, and read selections from the historical inscriptions during the second term with Prof. Brown. The second class will consist of those who have already passed through the first class. They will read selections from the historical and mythological inscriptions and the syllabaries. Lectures will also be given on Babylonian and Assyrian literature, and on the history of the Assyrian language and the cuneiform signs. This course will be extended through both terms with Prof. Brown.

2.—*As to character of course offered.*

DEPARTMENT OF SEMITIC LANGUAGES AND OLD TESTAMENT EXEGESIS OF HAMILTON THEOLOGICAL SEMINARY.

SEMITIC LANGUAGES.

First year.

1. Hebrew:
   (1) Grammar, with practical exercises.
   (2) The prose accents and accentuation.
   (3) Translation and study of selections from the historical books.
2. Elements of comparative Semitic philology.

Second year.

1. Hebrew:
   (1) Prosody, with practical exercises.
   (2) Poetic accentuation.
   (3) Translation and study of selections from the poetical books.
2. Syriac (elective):
   (1) Grammar, with practical exercises.
   (2) Translation and study of selections from the Peshitto Old Testament.
   (3) Translation and study of selections from historians and commentators.
3. Assyrian (optional):
   (1) Grammar, with practical exercises.
   (2) Translation and study of transliterated texts.
   (3) Translation and study of cuneiform texts.

Third year.

1. Hebrew: Reviews.
2. "Chaldee" (elective):
   (1) Grammar, with practical exercises.
   (2) Translation and study of selections from the Targums.
   (3) Translation and study of Biblical "Chaldee."
3. Syriac (optional):
   (1) Translation and study of selections from the Peschitto New Testament.
   (2) Translation and study of selections in verse.
4. Assyrian (optional):
   Translation and study of cuneiform texts.
5. Arabic (optional):
   (1) Grammar, with practical exercises.
   (2) Translation and study of selections from the Koran and the Arabic Bible.
   (3) Translation and study of selections from the poets.
6. Comparative Semitic philology and grammar (optional).

To illustrate the intermitting system of the elective course the work at Oberlin Theological Seminary is given:

Comparative Semitic and Septuagint Greek.—In 1890, and every second year, a class will be formed in the Greek of the Septuagint with special reference to the influence of the vocabulary and grammar of that important version upon the New Testament Greek. In 1891, and every second year, a class will make a beginning in comparative Semitic grammar by reading comparatively the first four chapters of Genesis in Hebrew, Aramaic, Syriac, and Arabic; 40 hours.

At the Southern Baptist Theological Seminary, whose peculiarity of independence of schools has been noted, twelve collateral studies, previously irregularly pursued in private classes, have been organized into definite specialties for resident or under-graduates. The first four of these schools deal with Arabic, Aramaic, Assyrian, and the Coptic languages, but it is of the sixth, the eighth, and the twelfth that mention is made here. The sixth course is in Patristic Greek, and during the year "The Teaching of the Twelve Apostles" and portions of Justin Martyr, etc., were read. The eighth course is in Patristic and scholastic Latin, with readings in Tertullian, Augustine, Bede's History, and the Imitation of Christ. The twelfth course deals with German, as is shown by the following:

Theological German.—The importance of the German language is appreciated by numbers of students in theology. A special class has been regularly organized for beginners; advanced students who shall prosecute with the professor a course of reading in German works of exegesis, church history, systematic or practical theology, will in the future be entitled to a diploma for attainments in this course. The junior class for the present year has mastered the forms and read considerably in the New Testament. The senior class has read largely in the Old Testament.

At the School of Theology of Boston University Spanish is an optional study for those intending to labor among Spanish-American populations. The instruction is given in this as in a number of other studies in the College of Liberal Arts of the University. The same advantages are offered at Yale and other seminaries which are university departments.

POST GRADUATE COURSES.

Postgraduate work is individual, and when such students are congregated into classes their work is but the work of the seminarium. A fourth year of work was established at the Andover Seminary as early as 1858, but only survived for a short period. In 1881 it was again established and on a firm basis.

FOREIGN DEPARTMENTS.

When George Primrose, the son of Goldsmith's Vicar of Wakefield, went to Holland to teach the natives English he found his purpose frustrated by his inability to speak Dutch. It has long been found necessary to teach the missionary to the Indian the language of those among whom he is to labor and even to send out native preachers, and quite an effort has been made by several schools during the last decade to educate a ministry that is to deal with our foreign populations. This effort is not only Christian and denominational but patriotic. At the Old German Theological School of Newark (Presbyterian) it is held as a fundamental principle that "to reach any powerful body of foreign people in a large way there must be a native ministry springing from among the people themselves. In view of the great power of the German people in this land it is wise to concede the German language during the period of transition. Success in German churches among adult Germans by ministers preaching exclusively in the English tongue is exceptional, depends on special individual genius, and can not be depended upon for a general system of evangelization. * * * In order to bring the German mind—educated through a long history so entirely different from our own—into sympathy with our doctrine and practice, a rightly devised and wisely conducted indoctrination of the German mind is necessary. * * * The instruction should be in both languages. * * * The graduate as an individual should gravitate towards the German flock, the pastor and flock as a mass should gravitate towards the American life. * * * The practical effect of the education of German ministers by our established American theological seminaries has been to educate the student away from the German people, thus gaining the individual pastor but losing the flock."

The German Baptist churches in America, according to the Rochester Theological Seminary, were, in 1850, only 10 in number[1] and, as their number increased many young men of mature years felt themselves called upon to preach the gospel to their countrymen, and the course of the German department, established many years ago, was arranged to suit their scholastic attainments. The course of instruction is subject to modification, according to the needs of the students. The study of the English language does not cease with the second year, but is continued by attendance at many of the lectures and other exercises of the English department. The course of instruction, now extended to six years, is divided into two parts; first, a preparatory or academic course, embracing the three lower classes; and, secondly, the theological course proper, embracing the three higher classes. Students in these higher classes not infrequently continue at the same time their academic studies.

To meet "manifest and growing needs" the German department of the Chicago Theological Seminary was opened in 1882, the Dano-Norwegian in 1884, and the Swedish in 1885. "The German department is in close connection with the German Seminary at Crete, Nebr., and has already received students from it. The Swedish department has the approval of many of the Swedish churches in this country, both among those which are independent and those which belong to the 'förbundet.' The Dano-Norwegian department has no ecclesiastical connections. It originated in the suggestion of a banker in Chicago, a Norwegian by birth, who has rendered it pecuniary aid." These foreign sections of the school are thus described:

The departments are under the charge of able and judicious teachers of high Christian character, graduates of foreign universities. The instruction given to the students in these departments is similar to that of the special [English] course, and it is expected that they will, as far as possible, attend lectures in the middle and senior years with the regular classes. It is required, also, that all foreign students shall take at least two exercises a week each year in their own languages. They are allowed to omit in the English course, in the first year, homiletics and natural theology; in the second year, Old Testament introduction; and in the third year, pastoral theology. They have an equivalent for these studies in their own languages. Instruction in English is given

[1] Now 150.

to those who are not familiar with that language by Rev. Reinert August Jernberg, a native of Norway, a graduate of Yale College and of Chicago Theological Seminary.

The Slavic department of the Oberlin Seminary was opened at the instance of the officers of the American Home Missionary Society, and has for its object the training of young men of Slavic descent for missionary work among their countrymen in the United States. The course of study now occupies three years, and is pursued in English and Bohemian. In Bohemian, the students are taught by a native teacher the correct use of the language, and are drilled in the preparation and delivery of such addresses as are likely to be required of them. The students for this department are obtained through the instrumentality of the superintendent of missionary work among the Slavic people.

Quite as near to national sympathy, and, in a certain sense, still more deserving of it, are the descendants of those who occupied the territory now covered by a European civilization and also of those who were brought here for the purpose of being sold into perpetual slavery. An interpretation of the Constitution[1] has made the Indian a peculiar kind of foreigner in our imperium, and an amendment to the Constitution has made the negro a member of our body politic. The General Government cares for and educates the first, while the other has been launched into the struggle for existence without further provision than the constitutional provision referred to, and an education in the public schools of his native State. The improvement effected in the social condition and enlightenment of these two races is largely, if not entirely, due to religious enthusiasm. There is not an American denomination of wealth or power that has not distinguished itself in this work, and it would be invidious to make distinction further than to say that the Protestant churches have operated largely in the South as well as in the West, and that the Roman Catholic Church has also been eminently successful in missionary work among the Indians.

If we bear in mind the injunction of the German Theological School and the practice of the foreign departments of certain seminaries, one Indian school especially calls for our attention. The Santee Normal Training School was established in 1870 for the purpose of educating native teachers, preachers, interpreters, and business men for the Dakota or Sioux Nation. The great object of the work is to prepare a native agency which shall work the regeneration of a race "which is so thoroughly controlled in all their ideas and customs by their own religion that no change of life is possible except through the substitution of another." Hence, while the students are fitted for citizenship, care is taken to maintain their common interest in, and sympathy with, their own race. This gives law to the methods and makes it needful to use two languages in order to make the student a competent instructor among his own people. The very idea of education had to be planted in the Indian mind, says Dr. Riggs, the principal. The following are the studies pursued:

WOONSPE KUWAPI.

[1] Worcester *vs.* State of Georgia, 6 Peters. The Rev. Samuel A. Worcester, having been seized while performing, under the sanction of the chief magistrate, the duties of a minister of the gospel among the Cherokees, and having been condemned for thereby violating as an intruder a law of Georgia, to four years' hard labor, appealed to the Supreme Court of the United States, which declared the Cherokees a nation, over which Georgia had no control, Chief Justice Marshall delivering the opinion.

The language of the American negro being English and as he is no longer a heathen, the scope of instruction of the colored theological school is to educate the colored pastor as well as train him as a minister. Thus it follows that the course in a majority of the theological institutions or departments is very simple, being confined in its religious branches to the study of the Bible and of church history. Of the seminary type, however, is the course the Gammon Theological Seminary and that of the theological department of Howard University. In both, however, Hebrew and Greek are optional. In regard to the course in these languages the dean of the latter institution informs the Bureau that they are "for those who have had the advantages of a college education. Most of the students take the English course of study."

In closing this subject, which might as well have been headed "missionary" as "foreign departments," a project of the Boston University to enlarge the usual missionary department into a distinct course, is to be mentioned. In its scientific aspect the course might be called a department of the philosophy and comparison of religions with special reference to missionary labor. As sketched the course is of three years.

CHAIRS ON THE RELATION OF SCIENCE TO RELIGION.

One of the results of the conflict between science and those who believe in revealed religion appears to be the foundation and endowment of new chairs in our theological seminaries, with the view of studying the matter, which may be considered, in military parlance, as carrying the war into Africa. The theological seminary at Columbia, S. C., has a Perkins, professor of natural science in connection with revelation and Christian apologetics; the seminary at Princeton, N. J., has a Stuart, professor of the relations of philosophy and science to the Christian religion; the San Francisco Seminary has a Montgomery professor of apologetics and missions, while the seminary at Oberlin has a Douglass lectureship on the relations of science and religion, and on comparative religion. The scope of this instruction, as might be expected, is very intimately connected with apologetics. At least this is the case at the Columbia (S. C.) Seminary, whose course in the department of natural science, in connection with revelation and Christian apologetics, is concerned in its first year, with the philosophy or basis of religion, in its second with comparative religion, or the study of the forms in which theism has manifested itself, and in its third year with the connection of science with revelation. Of a less apologetic nature from the standpoint of Christianity as a revealed religion and more related to the science of religions, if such a term be allowed, is the comparative study of the religions of the world. The great enterprise of Oxford in publishing the sacred books of Oriental peoples, the remarkable interpretations of Greek, Roman, and Teutonic mythology and folklore, a revival, it would seem, of the exegesis of later Hellenic writers,[1] the work of Sanskrit scholars, Egyptologists, and Assyriologists in France, Germany, and England, have created an enthusiasm in the direction of inquiry into the scientific basis of theism that has forced its way into the professional schools of Christian theology, though the study is apologetic only so far as it brings out in strong relief the religion of the peoples of Europe against the background furnished by the religions of the conservative peoples of the Orient. The work of the Divinity School of Boston University will illustrate a course in—

Comparative theology.—Introduction to the history of religion, comparative theology, and the philosophy of religion; special examination of the Chaldæo-Assyrian, the Egyptian, Persian, Indo-Aryan, Chinese, Greek, and Teutonic religions; comparative cosmology and mythical geography of the most ancient nations; essays and discussions.

The courses of the Presbyterian seminaries at Princeton and San Francisco are more particularly concerned as yet with theism and anti-theistic theories. The Princeton course does not seem to be definitely fixed. The dean of the Ryder Divinity School of Lombard University informs the Bureau that the course of that school gives prominence to the relations subsisting between science and religion. The course of the department of the seminary at Columbia, S. C., is given in full.

---

[1] Hibbert Lectures for 1888, Lecture III.

NATURAL SCIENCE IN CONNECTION WITH REVELATION AND CHRISTIAN APOLOGETICS.

The instruction in this department is given by means of lectures and recitations. No text-books are prescribed, but books of reference are recommended. Oral and written exercises are regularly required in the class room.

Each year a course of lectures is given to the several classes in the seminary. In these courses the ground of Christian apologetics is covered in a general way. In all the courses attention is directed to the scientific aspects of the various topics under discussion; and during the senior year special attention is given to the relations of natural science and revelation.

1. *Junior year.*—The nature, scope, spirit, and aim of apologetics; the theory of knowledge, and the relations of knowledge and belief; the nature of the religious consciousness and theistic belief; the various theories to explain the origin of religion; theistic arguments in detail, and their precise import; antitheistic theories: Atheism, agnosticism, positivism, materialism, and materialistic evolution, pantheism and idealistic evolution, deism, socialism, secularism. Other topics required from time to time in defense of Christianity will be taken up.

2. *Middle year.*—Comparative religion: Islam, religions of Egypt, Canaan, Phœnicia, Assyria, Babylon, Greece, Rome, Persia, India, China, Japan, Western Europe, and savage tribes. The supernatural in its historical manifestation. Revelation as historical: Higher criticism and false historical theories of the Scriptures. The Miracle: Its historical evidence and import. The Christ of history: Discussion of false historical views of Christ and the Gospel narratives. The supernatural in a kingdom: The church historically considered. The evidences in general, external, internal, and experimental.

3. *Senior year.*—The connection of science with revelation: Several preliminary questions considered. The field of scientific inquiry will be reviewed and results compared with the Scriptures at various points of contact. Physics: Matter and force briefly considered. Biology: Nature and origin of life. Origin of species by the theory of descent: Anhropology, relation of man to the brute creation, the races of men, the unity and antiquity of the race, man's primitive condition, the pre-Adamite theory. Geology: Specially in its bearing on Genesis. The Deluge: Astronomy and chronology as they relate to the Bible, creation and evolution.

At New Haven a university professorship of music has been created, which is for the divinity school as well as for other departments of Yale. In fact music, elocution, and physical culture appear to have been assuming considerable proportions as concurrent theological studies or exercises.

LAW.

Through a committee, the National Bar Association has for nearly a year been making an investigation of the condition of instruction in jurisprudence, not only in America, but the world over. By the agency of this Bureau a circular of inquiry has been distributed, the answers to which are now receiving the attention of the committee. In a few days their report will be given to the public, and there is therefore no necessity of instituting for the law schools such a far less pretentious and thorough study as has here been made for the schools of medicine and theology.

[NOTE.—As these pages go through the press it can be definately stated that the final report of the committee will appear as a part of the annual report of this Bureau for the school year 1890–91, and also, at an earlier date, in phamplet form.

The report as thus presented will contain the results of the very thorough study which the committee made of the methods in vogue in a number of our representive schools of law, and a supplementary series of essays dealing with the study of jurisprudence in European schools, the curricula (in tabular form of the American schools of law, and with the study of law in collegiate institutions and commercial schools.]

SCHOOLS AND COLLEGES OF APPLIED SCIENCE.

REQUIREMENTS FOR ADMISSION.

The colleges and departments endowed with the national land grant of 1862 may be divided into two classes when taken with reference to their requirements of admission. One class—not quite half of the whole number—is composed of those who require nothing more than proficiency in the studies of the grammar grade of the public schools, while the other class requires in addition the elements of algebra and geometry. In several cases, however, algebra to quadratic equations and plane geometry are deemed sufficient, while in one case, to algebra and geometry completed is added trigonometry. Botany, chemistry, or physics is required in several schools and in one Latin and in another French. As about half of the schools have preparatory departments, it would seem that any deficiency on the part of the candidate might there be made good before he entered upon his course in the collegiate department. The arrangement of the University of Minnesota in this respect is unique; it has a preparatory department, but even that is an agricultural course. In the catalogue for 1891–92 the reasons for the institution of two agricultural courses are given with considerable force, as follows:

"Observation and experience have shown that all the facilities afforded by the regular colleges of the country for agricultural education have failed to attract any large number of farmers' sons. The requirements for admission are such as to compel the boy to leave home for one or two years to secure such preparation, and this, together with the four years necessary to complete a full course, entails an expenditure of time and money which comparatively few can afford, and the education thus received, while valuable in itself, fails in many respects to furnish the training and knowledge needed by young men for the practical duties of the farm. In order to meet this want the board of regents of the university has established a "school of agriculture" with a full equipment of buildings and instructors on the experiment farm, where students live, work, and study during the three years devoted to this department. * * * Students will be received without examination in subjects on which they can furnish the certificates of high schools or of county superintendents."

Graduates of the School of Agriculture are admitted to the college. In the catalogue above cited the number of students in the College of Agriculture is given as 5, all freshmen; in the School of Agriculture, 104. In two or three institutions a shorter course is provided, generally of two years, which serves the purpose of the school of agriculture of the Minnesota University.

Turning now to the technological schools not endowed with land grant the same subjects are required as in the case of the schools endowed with the land grant. At the Lawrence Scientific School of Harvard, the John C. Green School of Princeton, the Chandler Scientific School of Dartmouth, the Towne Scientific School of the University of Pennsylvania, the Polytechnic School of Washington University, and the Lehigh University, it is not surprising that the requirements in mathematics should be uniformly high; but the distinguishing feature between the school attached to a school of belles lettres and the isolated institution for the benefit of agriculture and the mechanic arts is the demand for literary culture, as shown by the requirement of a foreign language by the departments of colleges and universities. The Sheffield School of Yale and the Massachusetts Institute of Technology show the same characteristic as the nonendowed departments just named. Cornell, endowed with the national land grant, does not require a foreign language in the preliminary examination unless the candidate enters for a degree.

There is a requirement of the Lawrence Scientific School that merits attention. In physics the candidate is examined "either in (1) astronomy (Lockyer's elementary lessons) and physics (Avery's elements of natural philosophy or Gage's elements of physics); or (2) a course of experiments in the subjects of mechanics, sound, light, heat, and electricity, not less than forty in number, actually performed at school by the pupil. These experiments may be selected from A. M. Worthington's Physical Laboratory Practice or from the 'New Physics,' by John Trowbridge, or from any similar laboratory manual."

Literary astronomy and physics call for no particular mention, but a course of forty experiments in the subjects of mechanics, sound, light, heat, and electricity, actually performed at the school by the pupil, is an important innovation. The principal difficulty in the way of this kind of instruction has been very ably expressed by Prof. Trowbridge, of Harvard, in the preface to his "New Physics," as follows:

"The teacher may grant the comparatively small result which is obtained from the study of physics by the method of lectures and recitations; but he will immediately ask, 'How can we obtain the time for laboratory work in physics—crowded as we are with so many studies?' Moreover, the subject of physics is unlike that of chemistry or botany. In these subjects the cost of the apparatus and material is comparatively small."

It would be interesting to know how many of those applying for admission to Harvard have availed themselves of this election, but efforts to ascertain the fact have failed.[1]

In almost every school there is a "formal" examination for admission.

The selection of the beneficiary varies considerably among the institutions endowed with the land grant. In some cases it is the county judge, court, or superintendent that selects the pupil, in others the appointment is in the hands of the members of the legislature, and sometimes the selection is made by means of a competitive examination. In the Georgia School of Technology there is a scholarship for every member of the House of Representatives, filled by competitive examination. The State board of education fills the scholarship at the Worcester Free Institute, and the city school board of Philadelphia the 31 city scholarships of the Towne Scientific School of the University of Pennsylvania.

I.

COURSE IN CIVIL ENGINEERING.

Perhaps the only thing that is absolutely agreed upon as an essential for the successful practice of the profession of civil engineering is a general culture of the mind. For it seems to be thought that this general culture will give the ability of forming general ideas and of speculating upon things, the prerequisites of a scientific method.[2]

The conception of Gen. Thayer in founding the postgraduate school of Dartmouth College, which bears his name, as to what this general culture should be was more technical. He required for admission knowledge of mathematics that could only be obtained at a college or a high class technological school, and the pupil when once entered upon the course of study has his attention confined to "surveying in general," "construction in general," and special applications. (See Table A.)

The civil engineering course of other American high-class technological schools is arranged upon an entirely different plan, being, in a word, a compromise. Instead of the two years of concentrated work on this specialty as at the Thayer school, the compromise course is lengthened to four years, its admission requirements are lowered to admit the high school graduate, and the first two years of the course are partly given to laying a foundation for general culture and partly for a specialty.

Turning to Europe a different condition of affairs is shown. In Germany there are 10 technical universities, called generically the Technishe Hochschulen. Admission to these technical universities is obtained under the same condition as that to the literary institutions called universities, the possession of the Reifezeugniss of a gymnasium or of a realgymnasium. An examination of the programme of the civil engineering course of the Technical University of Hanover given in Table B will show that nothing of a literary nature is there taught, for the general culture of the intellect is supposed to have been accomplished by the course in the gymnasium and to be certified to by the certificate of maturity or Reifezeugniss, which gives the student admittance to the university. What that general culture is will be shown by the courses of the Gymnasien, which are given beside the civil engineering course of the technical university. It is perhaps too much to say that the course of these Gymnasien is equal to the course of our colleges; but the programmes that follow fully explain themselves. (Table B.)

---

[1] At a recent meeting the Association of Colleges in New England "invited the attention of the public" to the advisability of making the following change in the programme of the New England grammar schools:

"2. The introduction of elementary physics into the later years of the programme as a substantial subject to be taught by the experimental or laboratory method and to include exact weighing and measuring by the pupils themselves."

[2] Discussions on technical education at the Washington meeting of the American Institute of Mining Engineers, and at a joint meeting of the American Society of Civil Engineers and the American Institute of Mining Engineers.

The course of civil engineering in France is best illustrated by the programme of the celebrated "School of Bridges and Roads" (Table C). With that logic for which the French are noted the instruction of an engineer is a series of interdependent courses in three different schools. The first of these, the lycée, corresponds to the German gymnasium as an institution of culture, though in its internal arrangements it bears a pretty close resemblance to our colleges that have a course in the ancient languages, a Latin scientific course, and also an English scientific course. On the contrary in the German college or gymnasium one, and only one, curriculum is followed, in the realgymnasium, or gymnasium without Greek there is also only one course, and in the realschule, which has neither Latin or Greek, the same unity prevails. Thus the Germans have a separate school for each separate curriculum. But in France the gymnasium and the realschule are contained in the same institution, the course corresponding to the gymnasium is called l'enseignement classique, and that corresponding to the realschule is called l'enseignement special, while to supply the place filled by the realgymnasium in the German system the enseignement classique has, after the completion of the third class, an enseignement scientifique dans les classes de mathématiques (instruction in science in the mathematical classes). Mathematics has ever been considered in France as fully entitled to be called a science as physics is, though in translating the programme the writer has adopted the fashion of English programmes. Thus in France in the same school, the lycèe, there are three concurrent curriculums. But it is only the mathematical classes that are to be considered here.

Now, it is customary for those students who intend to enter upon a course of instruction under a Faculty of Sciences or upon the course of the military school at St. Cyr, to take the first two years of Division of Science, called, respectively, the preparatory and the elementary class of science. Having finished the studies of these two years, the degree of Bachelor of Science is conferred.[1] But for those who desire to enter the school for preparing teachers for the lycée (École Normale Supérieure), or those who desire to enter the quasi military École Polytechnique, a more extended knowledge of mathematics is required, which is given in a class called special mathematics. The École Polytechnique is the second course in the education of the French engineer, but its course is concerned with unapplied science. "The course forms a great physico-mathematical encyclopædia, the instruction there given is a general instruction destined to develop the scientific mind and to furnish each pupil with the tool that later on will serve him when engaged in personal work. In a word, the school neither produces engineers nor officers. Its rôle is at once more elevated and more modest; it wholly consists in preparing students for special schools whose business is to make engineers and officers. It is at the artillery school, at the naval school, etc., during two years, and at the schools of bridges and roads, and of mines during three years, that technical instruction is given."[2]

Table C will show the character of the programmes of several French schools which form a course of instruction:

TABLE A.—AMERICA.

AN EXAMPLE OF A HIGH-GRADE COMPOSITE COURSE IN CIVIL ENGINEERING.

REQUISITES OF ADMISSION.

Short English composition and correction of ungrammatical language, geography, history of United States, arithmetic, algebra, Wentworth's Elements, plane geometry, French or German grammar, and translation of easy prose.

COURSE.

FIRST YEAR.

Common to all regular courses.

First term.—Solid geometry, algebra, general chemistry, chemical laboratory, rhetoric and English composition, French (or German), mechanical drawing, free-hand drawing, military drill.

Second term.—Plane and spherical trigonometry, general chemistry, chemical laboratory, political history since 1815, French (or German), mechanical drawing, free-hand drawing, military drill.

---

[1] This arrangement, especially as relating to the diplomas granted on the completion of the courses of the Lycée, was somewhat modified by the decree of August, 1890.

[2] Revue Scientifique, 1st vol. of 1887, p. 784.

SECOND YEAR.

First term.—Surveying and plotting, topographical drawing, descriptive geometry, descriptive astronomy, analytic geometry, physics, political economy, German.
Second term.—Surveying and plotting, differential calculus, physics, physical geography, English literature, German, mineralogy.

THIRD YEAR.

First term.—Railroad and highway engineering with field work and drawing, stereotomy, advanced surveying, integral calculus, general statics, physics (heat), physical laboratory, structural geology, German, English composition.
Second term.—Railroad and highway engineering with field work and drawing, advanced surveying, elements of construction, elementary design, spherical and practical astronomy, physical laboratory, historical geology, German, strength of materials, kinematics, and dynamics.

FOURTH YEAR (PURELY PROFESSIONAL).

First term.—Theory of structures, bridges and roofs, hydraulics, strength of materials, theory of elasticity, metallurgy of iron, elements of geodesy. Options: 1. Sanitary engineering, bridge design, hydraulic measurements and sanitary field work; 2. Railroad engineering, railroad management, bridge design; 3. Least squares, geodesy, physical laboratory, hydraulic measurements.
Second term.—Theory of structures, bridges and roofs, English composition, business law, thesis work. Options: 1. Hydraulic engineering, machinery and motors, bridge and sanitary design, public hygiene; 2. Railroad engineering, machinery and motors, bridge design; 3. Hydraulic engineering, geodesy and map projection, design, differential equations.

The Curriculum of the Thayer School of Civil Engineering.

REQUISITES OF ADMISSION.

Candidates for admission must pass a thorough examination in the following subjects:
(1) English grammar; (2) geography; (3) history of the United States; (4) arithemetic; (5) bookkeeping, only the simpler principles and methods of single and double entry; (6) algebra, Bourdon; (7) geometry, Legendre; (8) trigonometry and mensuration; (9) compass surveying, Murray; (10) descriptive geometry, including shades, shadows, perspective, Church, and isometrical drawing, Warren: (11) analytic geometry, Bowser or Church; (12) calculus, Rice and Johnson or Bowser; (13) analytic mechanics, Wood's elementary; (14) chemistry, any good elementary work including brief treatment of organic chemistry, *e. g.*, Barker's; (15) physics, Ganot; (16) astronomy, Newcomb and Holden; (17) physical geography and meteorology.

COURSE.

SURVEYING IN GENERAL.

A.—Instruments and fundamental operations.—Construction and adjustments of all essential instruments used in the field and office. Principles and practice of location and measurement of lines and of the measurement of angles.
B.—Surveying and location.—Of lines and areas; leveling; triangulation; topography, including hydrography; mining surveying; city surveying; geodesy, including practical astronomy (as to location of meridian and determination of latitude, azimuth, and time), outline of principles and methods; office work; computing, adjustment, and comparison of observations, plotting, and estimating.

CONSTRUCTION IN GENERAL.

C.—Mechanics and general applications.—(*a*) Mathematical theory of motion; (*b*) physical science of motion in general; (*c*) statics and dynamics of rigid bodies; (*d*) statics of fluids; (*e*) dynamics of fluids; (*f*) principles of graphical statics; (*g*) elements of mechanism.
D.—Nature of materials.—(1) Physical and chemical properties, by general description and analysis, of all materials used for construction, including a suitable course on mineralogy; (2) mechanical properties, considered analytically and experimentally.
E.—Fundamental applications of materials.—(1) Special forms of materials and structural elements, including stonecutting, carpentry, ironwork, workshop appliances, etc.; (2) masonry and foundations—nomenclature, principles, methods, and appliances; theory of retaining walls and arches; (3) estimates, specifications, and contracts.

SPECIAL APPLICATIONS.

F.—Bridges and roofs.—Trusses, arches, and suspension bridges; mathematical and graphical analysis of stresses; general study of construction and preservation; tours; designing.
G.—Rockwork, tunneling, and mining.—Outlines of geology; explosive agents and blasting, theory and practice; special appliances and methods in subterraneous works.
H.—Highways and railways.—Surveys, construction, maintenance, and operation—leading principles and practical details.
I.—Hydraulic engineering.—Principles and data of hydraulics; collection, storage, and distribution of water; Hydraulic motors—theory, construction, and operation.
J.—Heat and heat engines.—Principles of thermodynamics; fuels and their combustion; steam—heat engines—construction and operation of typical forms; application of laws.
K.—Sanitary engineering.—Drainage and sewerage—systems and appliances, governing principles; heating and ventilation.
L.—Rivers and harbors.—Principles relating to improvement; surveys and observations; constructions in different cases; methods and means of procedure.

An Example of the Usual Course in Civil Engineering.

REQUISITES FOR ADMISSION.

Arithmetic.—Examples in all the fundamental rules, together with reductions in the metric system of weights and measures.
Algebra.—Fundamental principles and operations, factoring, least common multiple, greatest common divisor, fractions, involution, evolution, radicals of the second degree, simple and simultaneous equations of the first and second degree.
Geometry.—Plane and solid.
English.—The principles of English grammar and composition.
Chemistry.—Eliot and Storer's Elementary Manual of Chemistry, or an equivalent.
Physics.—Stewart's Elementary Physics, or an equivalent.

COURSE.

FIRST YEAR.

First term.—Algebra and trigonometry, chemistry (lectures), chemical laboratory, rhetoric, French, mechanical drawing.
Second term.—Analytical geometry, chemistry (lectures), chemical laboratory, English literature, French, descriptive geometry and drawing.

SECOND YEAR.

First term.—Surveying, analytical geometry, descriptive geometry, physics (lectures and recitations), German, French, drawing.
Second term.—Surveying and leveling, calculus, shades, shadows, and perspective, physics (lectures and recitations), French, German, drawing.

THIRD YEAR.

First term.—Railroad engineering, strength of materials, mechanics, physics (lectures and laboratory), topography, German, mineralogy, drawing.
Second term.—Railroad engineering, mechanics, machine drawing, stability of structures, physics (lectures and laboratory), stereotomy, German, geology.

FOURTH YEAR.

First term.—Astronomy, graphical statics, steam engine, hydraulic engineering, roofs and bridges, architecture.
Second term.—Engineering construction, details of practice and design, specifications and contracts, sanitary engineering, geodesy, thesis work.

Table B.—GERMANY.

Course of the Gymnasium of Stettin, in Pomerania (a Town of 116,000 Inhabitants).

REQUISITES FOR ADMISSION.

Religion, German grammar, reading, memorizing, orthography, geography, fundamental rules of arithmetic and denominate numbers, writing. [These are the studies of the last year of the Vorschule or preparatory school.]

COURSE.

Sexta.—Bible history, German (exercises in reading and repetition of what has been read, grammatical and orthographic exercises, memorizing poems, to wit: (1) Der Gute Kamerad, Uhland; (2) Wandelnde Glocke, Göthe; (5) Des Deutschen Knaben Tischgebet, Gerok; (6) Die Wacht am Rhein. A written exercise weekly, Latin grammar and reading book, history, and geography (Greek and Roman biographies, non-European lands), arithmetic, botany, writing, drawing.
Quinta.—Religion, German, Latin, French, history and geography, arithmetic, botany and zoölogy, writing, drawing.
Quarta.—Religion, German, Latin (Nepos), French, history, geography, business arithmetic, geometry, natural history, drawing.
Untertertia.—Religion, German, Latin (Cæsar and Ovid), Greek grammar, French history (German history to 1648), European geography, geometry, algebra, elements of biology.
Obertertia.—Religion, German, Latin (Cæsar, Ovid, and Curtius), Anabasis, French, English (optional), history (1648-1870), geography, algebra, geometry, mineralogy, and zoölogy.
Untersekunda.—Religion, German (study of Schiller's dramas and Göthe's Hermann and Dorothea every 4 weeks as composition), Latin (Cicero and Livy), Greek (Odyssey, Anabasis, and Hellenica), French (Voltaire and La Fontaine), Hebrew (optional), English (optional), history and geography, algebra, geometry, physics.

Obersekunda.—Religion, German, Latin (composition, (1) Tarquinius Superbus Roma expellitur; (3) Hannibal bellum contra Romanos parat), Greek, French, Hebrew (optional), English (optional), history and geography, algebra, trigonometry, physics.
Unterprima.—Religion, German, Latin (Cicero, Tacitus, Horace), Greek (Plato and Demosthenes), French, Hebrew (optional), English (optional), history and geography, algebra, trigonometry, physics.
Oberprima—Religion (the Gospel according to John, the forerunners of the Reformation, etc.), German (a study of the life and works of Göthe and Schiller, with compositions on (1) How far is the observation of nature on one side depressing, on the other elevating? (2) Life is indeed a gift, but before all a duty. What influence had his residence at Strasburg on Göthe? etc.), Latin (Cicero pro Sestro, Tacitus, Horace. Theses: (1) Fortunæ inconstantiam summum quemque antiquitatis virum exportum esse; (2) De Polycrate Samis; (3) Comparantur Camillus et Themistocles, Tertium bellum Punicum narratur, etc.), Greek (Thucydides, Plato, Sophocles), French (Corneille's Cid, Molière's Femmes Savantes, conversation, written extemporalia), Hebrew (optional), English (optional), history and geography, physics, mathematics, algebra, stereometry, trigonometry, geometrical analysis.

Course of the Realgymnasium of Stettin, in Pomerania.

REQUISITES FOR ADMISSION.

Religion, German pieces in prose and verse, natural history of the surrounding country, fundamental rules of arithmetic and simple denominate numbers, writing. [These are the studies of the last year of the Vorschule, or preparatory school.]

COURSE.

Sexta.—Bible history of Old Testament to Psalms, etc., study of pieces read in class, learning poetry, words, and the declensions, simple sentence, writing and reading every week a composition, Latin grammar to verbs, third, conjugation in io. every week a Latin exercise, Greek and Roman myths (Sagen), globes and non-European countries, arithmetic, study of twenty-five plants with easily determined organs, animals of the first two classes, drawing from straight-line figures.
Quinta.—Bible history, German, Latin, French, German myths, geography, arithmetic, natural history, drawing.
Quarta.—Religion, German, Latin, French, history, geography, geometry, arithmetic, natural history.
Untertertia.—Religion, German, Latin (Nepos and Cæsar) French, English, history, geography, geometry, algebra, natural history, drawing.
Obertertia.—Religion, German, Latin (Cæsar and Ovid), French, English (Scott's Tales of a Grandfather), history, geometry, algebra, botany, zoölogy, drawing (freehand and mechanical).
Untersekunda.—Religion, German (essays on masterpieces), Latin, French, English, history and geography, geometry, algebra, goniometry, physics, mineralogy, perspective.
Unterprima.—Religion, German, Latin (Sallust and Livy), French (Racine and Molière), English (Shakespeare and Macaulay), history (1517–1763), plane and spherical trigonometry and stereometry, algebra, physics, chemistry, drawing.
Oberprima.—Religion, German, Wallenstein, Macbeth, Egmont, Göthe's Iphigenia in Tauris compared with that of Euripides, Iphigenia in Aulis of Racine compared with that of Euripides, the Orestes of Æschylus and the Electra of Sophocles, lesser writings of Schiller, some of the more difficult poems of Schiller and Goethe, elements of empirical psychology, rhetoric (selected portions) Theses, (1) examples of everyday sense deceptions, (2) discussion of ideas, the fancy, and hope in connection with Goethe's poem, entitled "Meine Göttin," (4) Was Schiller right in his "Critic of Egmont?" (8) the groundwork of Schiller's "Was heisst und zu welchem Ende studiert man Universalgeschichte?" (8) characteristics of the clergy, the nobility, and the commercial class of cities (Städtewesens) during the Middle Ages; What is culture? Latin (Horace, Cicero, Tacitus, Livy), French, English, history (1763–1871), analytical geometry, new geometry, physics (experimental physics), chemistry (the metals), drawing.
Optics.—Colors, spherical lenses, the focus, enlarging apparatus.
Mechanics.—Motion of falling bodies, friction, elasticity, unelastic bodies, the pendulum, centrifugal force, the comparison of living forces.

Course of the Division for Civil Engineers (Bau-Ingenieurwesen) in the Technical University of Hanover.

REQUISITES FOR ADMISSION.

The certificate of maturity (Reifezeugniss) of a German gymnasium, or real gymnasium, or a Preussische Oberrealschule.

FIRST YEAR.

Winter session.—Differential and integral calculus (4½ hours lectures, 1 of practice), analytical geometry, plane and solid (3 hours), algebraic analysis and trigonometry (3 hours average), descriptive geometry (3 hours lectures and 6 hours of practice); physics (4 hours), mechanics (3½ hours), elements of mineralogy (2 hours), freehand drawing (6 hours); in all, 23 hours of lectures and 13 of practice.
Summer session.—Differential and integral calculus (3 hours lectures, 1 of practice), descriptive geometry (3 hours of lectures and 6 of practice), plan drawing (4 hours of practice), physics (4 hours), mechanics (7 hours), elements of chemistry (6 hours), elements of mineralogy (2 hours), freehand drawing and coloring (6 hours practice); in all, 25 hours of lectures and 17 of practice.

SECOND YEAR.

Winter.—Differential and integral calculus (4 hours), surveying (4 hours lectures, 2 hours practice), elasticity (5 hours), geology (2 hours), construction of buildings (4 hours lectures, 6 of practice), elements of machine construction (3 hours lectures, 4 of practice), building technology (metallurgy, wood, etc., 3 hours).

Summer.—Surveying (2 hours lectures, 6 practice), graphic statistics (2 hours lectures, 2 practice), hydraulics (2 hours), analytical mechanics (3 hours), geology (2 hours), construction of buildings (4 hours of lectures, 6 of practice), elements of machine building (3 hours lectures, 4 of practice); in all, 18 hours of lectures and 18 of practice.

THIRD YEAR.

Winter.—History and styles of architecture (3 hours), building construction (2 hours of lectures, 4 hours of practice), embankments and road-making (erd und strassenbau) (2 hours), railroad building (2 hours), stone bridges (2 hours lectures, 4 practice), iron bridges (2 hours lectures, 4 hours practice), hydrology and hydraulic engineering (4 hours lectures, 2 hours practice), elements of machinery (3 hours); in all, 20 hours lectures, 14 hours practice.

Summer.—Styles of architecture (4 hours practice), embankments and road-making (2 hours), railroad construction (2 hours lectures, 2 hours practice), stone bridges (2 hours lectures, 4 hours practice), iron bridges (4 hours lectures, 4 hours practice), hydrologic and hydraulic engineering, locomotives, and cars (2 hours).

FOURTH YEAR.

Winter.—Sketches of simple buildings (2 hours lectures, 4 hours practice), transportation[1] (2 hours), railroad construction (2 hours lectures, 4 hours practice), tunneling (2 hours), iron construction (2 hours lectures, 2 hours practice), iron bridges (2 hours lectures, 4 hours practice), hydraulic engineering (4 hours lectures, 4 hours practice); in all, 16 hours lectures and 18 of practice. In addition may be taken up the following: Theory of elliptical functions (3 hours), surveying and projection (2 hours), telegraphy and telephony (2 hours), political economy.

Summer.—Transportation (2 hours lectures, 2 hours practice), railroad construction (2 hours lectures, 4 hours practice), iron construction, etc. (2 hours practice), iron bridges (2 hours lectures, 4 of practice), hydraulic engineering (2 hours lectures, 4 of practice); in all, 8 hours of lectures and 16 of practice. In addition may be taken up the following: Selected parts of higher mathematics (4 hours), surveying and projection (3 hours practice), astronomical demonstrations (2 lectures), protection from lightning (1 lecture), political economy (2 lectures).

TABLE C.—FRENCH.

COURSE OF SPECIAL MATHEMATICAL INSTRUCTION IN THE COLLEGES (LYCÉES) OF FRANCE, PREPARATORY TO THE ÉCOLE POLYTECHNIQUE OF PARIS.[2]

General studies.

ELEMENTARY DIVISION OF THE LYCÉE.

Preparatory class.—(Child supposed to be 8 years of age): French, 9½ hours a week; English or German, 4 hours; history, 1½ hours; geography, 1½ hours; arithmetic, 2½ hours; lessons on common mineral substances, etc. (coal, iron, water, air, animals), 1 hour.

Eighth class.—French, 9 hours; English or German, 4 hours; history, 1½ hours; geography, 1½ hours; arithmetic, 2 hours; lessons on minerals, as before, 1 hour; drawing, 1 hour.

Seventh class.—French, 9 hours; English or German, 4 hours; history, 1½ hours; geography, 1½ hours; arithmetic, 2 hours; elementary ideas about the rocks and soil of the earth, 1 hour.

EXAMINATION FOR PROMOTION TO THE DIVISION OF GRAMMAR OF THE LYCÉE.

Sixth class.—French, 3 hours; Latin, 10 hours; English or German, 2 hours; history, 2 hours; geography, 1 hour; arithmetic and geometry, 1 hour; zoölogy, 1 hour; drawing.

Fifth class.—French, 2 hours; Latin, from 8 to 10 hours; Greek, 2 hours from January 1 to close of year; English or German, 2 hours; history, 2 hours; geography, 1 hour; arithmetic and geometry, 1 hour; botany, 1 hour; drawing.

Fourth class.—French, 2 hours; Latin, 5½ hours; Greek, 6 hours; English or German, 2 hours; history, 2 hours; geography, 1 hour; theoretical geometry (first two books), 1 hour; geology, 1 hour; drawing.

EXAMINATION FOR PROMOTION TO THE UPPER (SUPÉRIEUR) DIVISION OF THE LYCÉE.

Third class.—(Student supposed to be 14 years old): French (Corneille's Cid and Horace, Racine's Iphigénie, les Plaideurs, history of literature and composition), 2 hours; Latin (Livy 21st and 22nd books, Cicero, De Suppliciis, Pliny, Sallust, Virgil, compositions), 5 hours; Greek (Odyssey, Heroditus, Memorabilia, Lucian), 5 hours; English or German (Goldsmith's Vicar, Macaulay's History, or Göthe or Schiller), 2 hours; geography, 1 hour; arithmetic, algebra, and geometry (theory of numbers, algebraic computation, regular polygons, circle), 2 hours; physics (gravity, equilibrium, liquids and gases, heat), all taught in an essentially experimental way, 1 hour; drawing.

[1] History of ways of transportation, technical and commercial management of lines of transportation, etc.

[2] This was somewhat modified in 1890.

EXAMINATION FOR PROMOTION TO THE CLASS OF PREPARATORY MATHEMATICS IN THE SECTION OF SCIENCE.

Special mathematical classes (Section of Science).

Preparatory class.—Mathematic, algebra, geometry, cosmography, 10 hours; natural history, 1 hour; French, 3 hours; Latin (Cæsar, Cicero, Virgil, Horace), 2 hours; English or German classes, 2 hours; history and geography, 4 hours; drawing.

Elementary class.—Arithmetic, algebra, geometry, cosmography, trigonometry, elements of descriptive geometry and of mechanics, 10¾ hours; physics (gravity, heat, electricity, acoustics, optics, and inorganic chemistry, 6¾ hours; French and Latin, 2 hours; English or German, 2 hours; history and geography, 3 hours; philosophy, 1 hour; drawing.

Class of special mathematics.—Revision of arithmetic, revision and completion of algebra, geometry, and trigonometry, descriptive geometry, analytical geometry of two and three dimensions, 11 hours; physics reviewed and completed, 3 hours.

COURSE OF THE ECOLE POLYTECHNIQUE (FROM AMONG WHOSE GRADUATES THE STUDENTS FROM THE ECOLE DES PONTS ET CHAUSSÉES ARE SELECTED).

The course is of two years and is given under the following heads:

Analysis.—Differential and integral calculus. This course lasts two years. It is completed by conferences upon the immediate application of the subject studied. In addition the students may be called upon to show their knowledge of the subject on paper.

Descriptive geometry.—Different modes of representing bodies, study of the principal geometric surfaces. This course occurs during the first year.

Stereotomy.—Carpentry and stone-cutting. Course occurs in second year.

Mechanics and machines.—Course of two years. Completed by designing of the parts of a machine.

Physics.—Thermodynamics, electricity, and magnetism (first year), acoustics and optics (second year). Completed by experiments.

Chemistry.—Metals (1 year), organic chemistry (second year). Completed by experiments.

Astronomy and geodesy.—Course occurs in the second year. Completed by experiments.

Architecture.—Course is of two years. Completed by designs and projects.

Military art.—Course of the first year.

History, geography, and literature.—History of the political, military, and moral greatness of the principal states of Europe in modern and contemporaneous times. Course of two years and is completed by essays upon historical subjects.

German, drawing, coloring drawings, during two years.

COURSE OF THE ECOLE NATIONALE DES PONTS ET CHAUSSÉES AT PARIS.

First year.—Resistance of materials, construction of ways of communication, mineralogy and geology, use of wood and iron in construction, decoration of bridges, political economy, general procedure in construction, applied chemistry.

Second year.—Hydraulics, canals (navigation intérieure), construction of bridges, steam engines, use of wood and iron in construction, decoration of bridges, administrative law (first part).

Third year.—Construction of railroads, construction of maritime works, administrative law (second part), fortification.

In addition to the general course given above, the curriculum comprehends the study of the German and English languages. In each division the students are exercised in practical work, to wit, graphic representation, drawing, water color, manipulation and tests of building material, leveling and drawing plans, drawing engines and buildings. They draw up plans for construction.

These courses comprise the normal instruction of the school, but in addition there are regular conferences upon telegraphic construction, photography, management of railroads, and fish-culture. There are also other conferences whenever a discovery or the prosecution of some great work demands it.

The school possesses an experimental shop, where the students attend upon a series of operations and practical experiments.

Having thus attempted to give some idea of a course in civil engineering both at home and abroad we may venture to examine a little more closely the character of this course in the schools of the United States that have been endowed by national or by private munificence for the purpose of benefiting agriculture and the mechanic arts. This term, civil engineering, we are told by the faculty of the Rose Polytechnic Institute, is somewhat vague. Sometimes it means land-surveying, sometimes topographical mapping, and often railroad construction. In the Rose Polytechnic it means "all these and more." Let us use the catalogue of this school, then, not only for this reason, but because, having out of consideration the catalogue of the Technical High School (University) of Hanover and of other German states or provinces, and the catalogue of the Massachusetts Institute of Technology, it is among the most thoroughly and ably prepared catalogues that are in the files of the Bureau.

The details of the purely civil engineering in the Rose Polytechnic part of the course are exhibited in the schedule below. The complete course in civil engineering will be shown by substituting the several blocks of this schedule for the "shop practice" of the general course in mechanical engineering.[1]

[1] See p. 968.

Purely technical instruction in civil engineering at Rose Polytechnic.

	FIRST TERM.	SECOND TERM.	THIRD TERM.
Freshman year	[Same as "Dynamics," p. 968.]	[Same as "Dynamics," p. 968.]	Land surveying—the adjustments and use of instruments used in land-surveying; chain surveying; compass surveying; calculations of areas; supplying omissions, etc. (8 hours.)
Sophomore year	Theory and practice of surveying; field practice with transit and level; partition and division of land; city-surveying; mine-surveying, etc. (10 hours.)	Topographical drawing; United States Government system of land-surveying; railroad curves; turnouts, etc.; computations of earthwork. (10 hours.)	Field practice with transit level, plane table, solar compass, sextant, etc.; railroad surveying. (10 hours.)
Junior year	Railroad-surveying; map-drawing; retaining walls and theory of foundations. (16 hours.)	Algebraic deduction of stresses in framed structures, including roofs and noncontinuous bridge trusses; applications of the method of least squares. (16 hours.)	Graphical deduction of stresses in roof and noncontinuous bridge trusses. (10 hours.) Stereotomy. (6 hours.)
Senior year	Algebraic and graphical deduction of stresses in arches and continuous trusses; suspension bridges. (14 hours.)	Designing and dimensioning structures according to the best specifications. (14 hours). Laboratory practice. (6 hours.) Thesis work.	Lectures and reading; foundations, hydraulics, sanitary engineering, etc. (14 hours); laboratory practice (6 hours); thesis work.

Less adapted to show an actual course of civil engineering, but excellently-adapted to show how mining, mechanical, electric, and sanitary engineering, and even practical work in geology and chemistry are connected with civil engineering, is the scheme of the Massachusetts Institute of Technology. The first column of the following schedule, it is hardly necessary to say, shows the department of civil engineering, the second the method by which it is taught, the third the instructor, the fourth the course or courses which include the particular department of civil engineering, the fifth the year, and so on. The first year of study is general and resembles that of the school whose curriculum is given first in Table A:

Purely technical instruction in civil engineering at the Massachusetts Institute of Technology.

Subject.	Lect., rec., lab., draw., or field.	Instructor.	Taken by students in—	Year.	Term.	Number of weeks.	Hours per week.
Surveying	Lect., rec., field, draw.	Burton, Robbins, Stanwood.	Civil, mining, sanitary engineering, geology.	2	1,2	30	6
Surveying instruments (six lessons).	Lect., field	Burton, Robbins	Mechanical engineering.	3	2	----	----
Surveying	Lect., field	do	Mining engineering	2	1	15	4
Topographical drawing.	Draw	do	Civil, mining, and sanitary engineering.	2	1	15	2
Surveying	Lect., field, draw.	Burton, Robbins, Stanwood.	Civil and sanitary engineering, geology.	3	1,2	30	2
Geodesy	Lect., field	Burton	Civil engineering	4	1,2	30	2
Goodesy	Lect.	do	do	4	1	15	1
Geodetic surveying	Lect., field	do	Geology	4	1	15	2
Railroad and highway engineering.	Lect., rec	Allen	Civil, mining, and sanitary engineering.	3	1,2	30	3
Railroad field work and drawing.	Field, draw.	Allen, Robbins	do	3	1,2	30	4
Railroad engineering	Lect., rec., draw.	Allen	Civil engineering	4	1,2	30	3

Purely technical instruction in civil engineering at the Massachusetts Institute of Technology—Continued.

Subject.	Lect., rec., lab., draw., or field.	Instructor.	Taken by students in—	Year.	Term.	Number of weeks.	Hours per week.
Railroad management	Lect	Allen	Civil engineering	4	1	15	2
Stereotomy	Lect., draw	Porter	Civil and sanitary engineering.	3	1	15	4
Theoretical hydraulics	Lect., rec	do	Civil, mining, mechanical, electric, and chemical engineering.	4	1	15	3
Hydraulic and sanitary engineering.	do	do	Civil and sanitary engineering.	4	1	15	3
Sanitary designing	Draw	do	do	4	2	15	2
Hydraulic motors	Lect., rec	do	Mechanical and chemical engineering.	4	2	15	2
Hydraulic engineering	do	do	Civil, mining, and sanitary engineering.	4	2	15	3
Hydraulic measurements and sanitary field work.	Field, draw	do	Civil, mining, chemical, sanitary engineering, and geology.	4	1	15	2

Bridge design	Draw	Swain, Robbins Stanwood	Civil engineering Sanitary engineering	4 4	1, 2 1	30 15	6

Having now obtained what we want, that is to say, the details of a purely technical course of civil engineering, it is useless to encumber the page with other courses. In examining the above courses the reader observes that the first year is wholly or almost wholly devoted to preparatory study and the technological work does not begin until the second year; for during the preparatory year algebra, geometry, trigonometry, chemistry, or physics, and the mother tongue or another language are studied. He also will observe that during the remaining three years (those represented in the above schedules) no mention is made of geometrical and mechanical or of free-hand drawing, or of that species of drawing called descriptive geometry. Topographical and "railroad" drawing, map-drawing, and plane table surveying, etc., occur, but nothing is said of the general kinds of delineation, whether free-hand or mathematical. It must not be supposed, however, that general mathematical delineation ceases to be a subject of instruction in the two schools whose courses are represented. At the Rose Polytechnic mechanical drawing is given throughout the second and third years and descriptive geometry during the second year. At the Massachusetts Institute five hours a week for fifteen weeks of the second year, first term, are occupied with descriptive geometry. It is the same with language and the higher mathematics. They are not treated as an integral part of civil enineering, though studied concurrently by the students of the course in civil engineering. So strictly is the connotation of the term civil engineering observed at the Massachusetts Institute of Technology that not only pure, but even applied mathematics are considered as coördinate departments with that of civil engineering. The scheme of the department of applied mathematics at that school is therefore given.

Applied Mechanics.

Subject.	Lect., rec., lab., draw., or field.	Instructor.	Taken by students in—	Year.	Term.	Number of weeks.	Hours per week.
Statics and stresses in frames.	Lect., rec	Sondericker	Civil, mechanical, mining, electrical, sanitary and chemical engineering, architecture, and physics.	3	1	10	2
Strength of materials; kinematics and dynamics.	Lect., rec	do	As above, with the omission of architecture.	3	2	15	3
Strength of materials	Lect., rec	do	Architecture	3	2	10	3
Strength of materials; theory of elasticity.	Lect., rec., lab.	Lanza, Merrill	Civil, mining, and sanitary engineering.	4	1	15	3
Strength of materials, friction.	Lect., rec., lab.	do	Mechanical, mining, and chemical engineering and architecture.	4	1	15	3
Strength of materials	Lect., rec., lab.	do	Architecture	4	1	7	3
Strength of materials; stability of structures; theory of elasticity.	Lect., rec., lab.	do	Mechanical, mining, and chemical engineering.	4	2	15	3
Machinery and motors	Lect., rec	Lanza	Civil, mining, and sanitary engineering.	4	2	15	3

Of the subjects composing the course of pure mathematics in the Massachusetts Institute, calculus and analytical geometry enter into the curriculum of the civil engineering and every other course, except that of biology and the general course, during the second or third year. Differential equations, theory of probabilities, and spherical and practical astronomy, are features of the fourth year of the civil engineering course for two hours a week for fifteen weeks, in the case of the first subjects and in the case of astronomy for five weeks for three hours a week during the third year. Though less radical in its treatment of applied mathematics, the Rose Polytechnic also deems that pure mathematics are not civil engineering, though they are indispensable to the student of that subject.

Mathematics at Rose Polytechnic.

	FIRST TERM.	SECOND TERM.	THIRD TERM.
Sophomore year	Analytic geometry: Loci; treatment of point, straight line, circle, by cartesian and polar coördinates; also parabola, ellipse, hyberbola (three times a week). Determinants: Introduction to the theory of determinants, with applications (once a week).	Analytic geometry: General equation of the 2d degree between two variables; introduction to modern geometry; introduction to solid geometry. surfaces of the 2d degree, surfaces of revolution (three times a week). Calculus: Introduction to differential calculus (once a week).	Calculus: Introduction to differential and integral calculus (four times a week).
Junior year	Differential calculus: Successive differentiation, developments, series, partial differentiation, maxima and minima, tangents and normals, asymptotes, multiple points, envelopes, points of inflection, radius of curvature, evolutes, involutes, tracing curves, roulettes transformations, problems (five times a week).	Integral calculus: Elementary integrals, rational fractions, integration by parts, by rationalization, by series, definite integrals, problems (five times a week).	Differential equations (five times a week).

As the methods of instruction—recitation, lecture, or field—are given in full by one of the other of the schedules of the two courses just commented upon, it is time to turn from the technical to the statistical side of the course in civil engineering in order to inquire how the time devoted to the course in other institutions compares with that given in the courses just mentioned.

The summary of the hours of public study and practice (lecture, recitation, etc.) at the Massachusetts Institute, at the Rose Polytechnic, and at the Technical University at Hanover is as follows:

	Average number of hours of recitation.		
	Second year.	Third year.	Four h year.
Massachusetts Institute:			
Civil engineering (proper)	7	12	*a*16
Applied mechanics	0	2.2	1.5
Pure mathematics	5.3	1.2	1.5
Miscellaneous	13	8	1.5
Total (catalogue)	25.3	23.4	20.5
Total (Special Report)	27	25	23
Rose Polytechnic:			
Civil engineering	10	14	*a*14
Laboratory practice	0	0	*b*4
Pure mathematics	4	5	0
Mechanical drawing and descriptive geometry	8	6	0
Miscellaneous (not including English essay)	3	3	?
Total (catalogue)	25	28	18
Total (Special Report)	31	30	31

Technical University at Hannover (Germany)—First year: winter, 34; summer, 43. Second year: winter, 33; summer, 35. Third year: winter, 36; summer, 36. Fourth year: winter, 30; summer, 30.

It is evident that the schedules of the American catalogues do not give all the work performed; and it is necessary to obtain this by special inquiry. A preparatory step to such an inquiry was made in the form for 1889-90, sent out by this Bureau in June, 1890, its object, however, being to ascertain what courses had been introduced and were being followed in our technological institutions, and the duration and character of such courses. All these facts should be brought out, it is thought, by the following scheme though the time devoted to each course cannot be accurately indicated on so condensed a form.

Students (technological only) by courses.

Studies.	Years required to complete course.	Hours a week devoted to—		Pupils in the course 1889-90.
		Theory.	Practice (shop or laboratory).	
1. Civil engineering				
2. Mechanical engineering				
3. Mining engineering				
4. Electrical engineering				
5. Applied chemistry				
6. Architecture				
7. Agriculture, including horticulture				
8. Students in partial courses				
9.				
10.				
11.				
12.				

Some eight or nine months later the enterprise of the editor of Engineering News caused that journal to issue a circular of six foolscap printed sheets, that if answered will be a monument of the courtesy of its correspondents, and will place the public interested under obligations to the periodical which has carried

a Does not include thesis work. *b* Average.

through such an undertaking. In June, 1891, the question represented by Table D. was sent out by the Bureau. The results of that inquiry are tabulated as they have been returned. Neither the question of 1889-90 nor that for 1890-91 was made with the ambitious design of showing statistically the history and condition of the engineering courses. Indeed, the Bureau was under the impression that such facts could not be obtained with sufficient fullness by the ordinary means of distributing circulars, and it was not prepared to formulate its desires until a study of the answers to the questions on its form and of the annual catalogues of the schools had shown that the time had come when such an inquiry would give fully satisfactory results. As said before a technical journal has undertaken the inquiry, has placed the results in the hands of an expert to be edited, and will soon publish them.

Thus relieved of any scruples in slighting the subject of technological instruction, one may turn to the consideration of a very energetic protest that has been caused by the question which forms the several headings of the following Table D. The point to which the Bureau would call special attention is expressed as follows: "This question [all the headings of Table D], although it can be readily and fairly answered by some and perhaps many of the land-grant colleges, is so unsuited to our methods that even with the best intentions I see no way of fairly and honestly answering it in figures alone." In the case of the institution thus spoken of the question served its purpose. For years past the following colleges, endowed with the proceeds of the act of 1862 for the benefit of agriculture and the mechanical arts, have found it impossible to separate their technical work from that of their technical departments and have elected to be considered as colleges of letters rather than of technology:

List of agricultural and mechanical colleges whose work can not be separated from that of the State universities of which they are departments.

Location.	Name.
Berkeley, Cal	College of Agriculture, Mechanics, Mining, Engineering, and Chemistry (University of California).
Athens, Ga	Georgia State College of Agriculture and Mechanic Arts (University of Georgia).
Baton Rouge, La	Louisiana State University and Agricultural and Mechanical College.
Minneapolis, Minn	College of Agriculture and Mechanic Arts (University of Minnesota).
Columbia, Mo	Missouri Agricultural and Mechanical College (University of Missouri).
Lincoln, Nebr	Industrial College of the University of Nebraska.
Reno, Nev	University of Nevada.
Chapel Hill, N. C	Agricultural and Mechanical College (University of North Carolina).[1]
Columbus, Ohio	Ohio State University.
Providence, R. I	Agricultural and Scientific Department of Brown University.
Columbia, S. C	South Carolina College of Agriculture and the Mechanic Arts (University of South Carolina).[1]
Knoxville, Tenn	University of Tennessee and Agricultural and Mechanical College.
Burlington, Vt	University of Vermont and State Agricultural College.
Morgantown, W. Va	Agricultural Department of West Virginia University.
Madison, Wis	College of Arts (University of Wisconsin).

[1] Now a separate institution.

The protest to which reference has been made is as follows:

SHEFFIELD SCIENTIFIC SCHOOL OF YALE UNIVERSITY,
New Haven, October 24, 1891.

Hon. WILLIAM T. HARRIS,
Commissioner of Education, Washington, D. C.:

DEAR SIR: In the absence of President Dwight the inclosed schedule has been placed in my hands to answer. I have spent some considerable time in trying to answer the questions as fully and as correctly as is possible; but the fact is that several of the more prominent ones can not (or ought not) be answered in the shape they are asked. Some can not be answered because of the way our school is organized as a department of this university, or because of the complications incident to its age, and others ought not, because, if answered according to the schedule, the bare figures tell but part of the truth, and if tabulated along with answers to the same questions from certain other institutions, are misleading, a thing I know you wish to avoid.

The truth but half told may be as misleading as a positive falsehood, and is much harder to meet and explain when made use of as an argument in discussion or criticism. Some very bitter criticisms and many unjust charges have been brought against sundry of the land-grant colleges in the last few years, based nominally upon statistics. In most of these cases the statistics were unfair, if not positively false, in that the figures used either told but part of the truth or else meant different things when applied to contrasting colleges having different systems of classification or different methods of instruction. Several prominent institutions, North, South, East and West, have suffered from this and I think that few have entirely escaped. The fact that these colleges have suffered so much more in that respect than classical institutions I believe to be in part due to the nature of the statistics put forth, in which things essentially unlike are classed together, or things alike are called by different names. I am sure that you do not mean to help along this evil.

The land-grant colleges are so very varied in their organization, methods, scope, grade, and aims that tables of statistics made from the answers to the same questions by the different institutions may be made to show almost anything the user wants them to show. The answers to your schedule, stated in figures alone, mean very different things in the different institutions.

I have, therefore, written at more length explanations of some of my answers and the causes of my failure to answer others.

Question 6. [Table D.] This question, although it can be readily and fairly answered by some, and perhaps many, of the land-grant colleges, is so unsuited to our methods that even with the best of intentions I see of no way of fairly and honestly answering it in figures alone.

Our institution is not so organized that specific figures can be given to these questions without being misleading when the figures are used as components of statistical tables made out of the reports from several of many institutions. Many of the land-grant colleges are so organized that specific figures can be given in answer to most of these questions; ours is not.

The numerical data given in these tables would be very differently interpreted by different persons studying the figures for unlike objects. Some of the figures, even when correct, would tell but part of the truth and be misleading, and inferences very unfair to our college could be drawn from them. I know you do not wish that kind of statistics.

Please let me explain some of the more serious difficulties. First, as to what is "theory" and what "practice." When at the Washington meeting of the American Association of Agricultural Colleges, in August last, I took pains to get the views of a number of the college officers there present on this very matter, and I found the interpretation of these terms so very different by the different teachers consulted that the same facts returned according to your schedule questions by these different teachers would be very differently tabulated. Let me illustrate:

Mechanical drawing, as taught in these colleges, is certainly "technical;" it is taught in special rooms and with special appliances as truly as is the "work" in the "shops." Some teachers therefore call it "practice," but others call it "theory" and limit the term "practice" to "shop work" (done with the tools of the mechanic).

Botany and mycology are sciences necessary in teaching scientific agriculture or horticulture. They are pursued in specialized laboratories, with special appliances, and require skillful technique. Are these scientific studies "theoretical" or "practical," and is this laboratory work "theoretical" or "practical" work? Some teachers in agriculture call it theoretical, others practical, more especially if in mycology. Some call the laboratory work "practical work;" others limit the use of the term to manual labor on the farm or in the garden, barn, or greenhouse. I feel sure that were we to return the hours spent in the drawing rooms and laboratories by our students in mechanical engineering or our students in agriculture as "practice," rather than "theory," many good people who know that we have neither farm nor machine shop for manual labor would feel that we had misrepresented things.

Your section 5 of question 6 relates to "applied chemistry." Does your term "practice" include all chemical study pursued by the students in the laboratory? All our undergraduates have such practice, those in engineering during the first year only, those in agriculture for two years, those in the chemical course three years. In each case it is our way of teaching the science of chemistry, and would be called "theoretical" study by most of those who discuss "industrial education." To tabulate as "practice" the laboratory work done in elementary

chemistry by our mechanical engineers during their freshman year, would, I think, make us liable to the charge of misrepresentation by that large and earnest class who think that "practice" is synonomous with "practical work," and that "practical work" means only "shop work," or its equivalent, farm work.

We have no workshops for teaching the handicraft of the trades, nor land for teaching the art of farming. We are, therefore, especially liable to a certain kind of hostile criticism by those who think that the especial function of these institutions is to teach the trades and occupations. The figures derived from our classes, stated in the terms of your schedule, would tell only a part of the truth, and tell it in such a way as to give a handle for use in unfair criticism whichever way we state them. If we do not tabulate all our laboratory work as "practice" we do not conform to your schedule. If we make the figures include, as "practice" in the technological courses, all our laboratory work, it makes it look as if we were doctoring the figures for the purpose of making our course seem less "theoretical" and we want to avoid the appearance of dodging these questions. We believe our method is a good and sound one and are willing that it stand squarely upon its merits.

Again, as to the "hours a week devoted to." In our system of instruction, except for recitations and lectures, we measure little by hours. We have not a single requisition which can be "made up" or "worked off" in any specified number of hours.

There is a minimum of work which a student must do before he can get a degree. But this is not measured by the number of hours spent in the class room or laboratory although a record is kept of attendance and any considerable irregularity is not tolerated.

A pet idea in our system and methods is to give each and every student a chance to do his best, to encourage acquisition by work rather than to consume time by the hour. The facilities of our class rooms and laboratories and the division of the classes into sections are in accordance with this idea and largely directed to this end. The laboratories are open much beyond the times of "required" attendance. The minimum requisition for a degree does not represent in any sense the number of hours devoted per week to any subject. So far as hours represent anything, it is the minimum attendance of the very poorest student who ultimately graduates. Consequently, we have never yet compiled and published, even for our own use, a complete tabulated statement of the number of hours per week required for all the various sections of this school other than the regular programme of daily exercises. Such a table might be made, but if we made it, it would be with the understanding that it was for the lowest possible grade of work allowed.

Again, the Sheffield Scientific School is a department of the university in which department none of the students are pursuing a classical or merely literary course in the sense in which these terms are used in classical colleges. Yet I think that it would be untrue as well as misleading to class them all as "technological" students, although everyone is pursuing some of the studies classed as technical in the great majority of the land-grant colleges.

I have given the figures which are called for in the last column, but when tabulated along with the figures from many other colleges, as from Cornell, for example, are very misleading. In Cornell, and, I think, all those colleges where there is also a classical course, the technical and scientific courses are distinct or recognized from the very entrance. Here the studies are the same for all our students during the freshman year. The classes here do not differentiate into courses until the beginning of the second year, therefore the numbers I have given include only those in the last two years. They do not include the 137 undergraduates who are not officially in the courses specified, although they are pursuing the studies required as a part of the technical courses. Nor does it include the 29 graduate students who are pursuing the higher studies supplemental to the undergraduate courses. The total is therefore smaller by over 160 than the same students would be tabulated in most of the colleges.

I have gone at length into this question, and I think you will see the force of the difficulties and the importance of the matter, especially in these times, when so many of these institutions are being made the subject of sensational criticism and hostile attack.

Question 8. (*a*) This is no State appropriation but the income from the fund derived from the land grant of 1862. The State still holds that, paying us only the income. We receive no State appropriation. (*b*) This is as it appears from the books of the college treasurer.

Question 9. No part of this question can be satisfactorily answered. I will remark on the three items.

(*a*) The Sheffield Scientific School is but a department of the university, and all of its instruction was carried on in buildings belonging to "The President and Fellows of Yale College" for the first twenty-five years of its existence. Now, three large and several small buildings are used by this department exclusively, but much of the instruction goes on in buildings whose use is shared by other departments of the university. A part of the drawing is taught in the Street Art School; geology, mineralogy, palæontology, and zoölogy in the Peabody Museum which contains the university collections belonging to these sciences. Then, too, the university library, gymnasium, reading room, etc., etc., are used by our students in common with the rest of the university. To include all these in the property of the Sheffield Scientific School would be untrue and would grossly overrate its riches and possessions. On the other hand, to leave them all out would be to untruthfully underrate its facilities for instruction. As a part of the university, this school gets more or less benefit of all the varied possessions which constitute the material part of the university, the ownership of which is peculiarly complicated. They represent the growth of two centuries. Of the buildings in our exclusive use, two were originally built for other purposes, and later adapted to our use. I have never seen any inventory of the grounds and buildings of the university, as a whole, nor any attempt to estimate what the value of those of our department would be without the others.

(*b*) The same is true of apparatus and collections; some belong to the Scientific School especially and some belong to the University. I am not aware that any attempt at an inventory has ever been made, and any estimate would be but a rude guess. The collections are largely the collections of the University and represent the accumulations of about a century. The apparatus in the exclusive use of the Scientific School represent the accumulation of about fifty years. A set equivalent to the latter could probably be got together for $40,000, but it cost originally very much more than that. Some of it now has merely a historical or sentimental value, hard to estimate in money, yet it has still an educational value.

(*c*) "Productive funds." Here the answer is still more difficult, as it is more complicated. Some belong to the Scientific School, some to the University, a portion is for special purposes, others for general purposes. We now have the income of some university funds, which we may not have when certain university instruction is given in some other way. We have some funds of our own; we share in the use of others for general university uses; we share in still other special endowments: and any statement we might make would be a matter of bookkeeping rather than an exhibit of the capital of the Sheffield Scientific School. The treasurer's report gives the names and status of the various funds, but of some of these funds even he does not attempt to decide whether they should be considered in this schedule as belonging to "The Sheffield Scientific School" or "Yale College" or "Yale University." They are in the possession of the Yale corporation for certain uses. The University can apply the income for instruction or use in the department which it thinks fulfills most nearly the objects intended by the donor. I have spent some time with the treasurer trying to compile satisfactory answers, but I can not answer either division of this question in a way that will be both truthful and satisfactory, or that will show the money value of the educational plant we have here. For a solution we would have to go away back to colonial times for a part, and the answers are complicated in a great variety of ways.

Question 10. This refers to the special library in the school. This department shares in all the use and facilities of the university library, hence there is no attempt to make a large collection of books of our own; most of our books are to supplement those in the main library, or else those needed in the laboratories, or for handy reference.

Yours, truly,

WM. H. BREWER.

a See explanation, page 956. *b* Topographical and railroad curves. *c* For first term. *d* For four and one-half months in theoretical, eight hours in practice. *e* Course of five years. During fifth year fifteen hours a week are devoted to theory and six to practical work. *f* Half days. *g* Plus four hours thesis work during spring term.

II.

COURSE IN MECHANICAL ENGINEERING.

The instrument of the civil engineer is the transit and his sphere of practice the open country, but the instrument of the mechanical engineer is the hammer and his place is in the shop. The Roman roads and aqueducts are standing evidences of the skill of the Roman people, the pyramids and Lake Moeris testify to the ability of the Egyptian engineer, and the cathedrals of France to that of the master masons of the Middle Ages, but an "industrial revolution" waited for the invention of a steam engine that was something more than a curiosity or a toy. This industrial revolution may be said to have reached its majority, so to speak, about the middle of the present century, at least in England, where from peculiar circumstances it found a congenial soil. Progress in industry, however, must not be confounded with progress in that kind of industrial education which is given in schools. Neither the Greek literary and artistic genius nor the English industrial and political genius was born within the walls of an educational edifice. But when a nation has manifested its genius it is possible and desirable to have persons study the manifestations of that genius, formulate and teach the results, and thus mechanically a naturally less gifted or enterprising nation is elevated to a stage of culture in which the less gifted nation may reap the same intellectual or material benefits the more gifted enjoy.

In 1855, at the time of the reorganization of the Rensselaer Institute, a department of "Mechanics, Machines, and Constructions" was established in the school, with a set of text-books printed mostly in Paris and London, and in two cases in Germany, but there was no course leading to a degree in mechanical engineering, the instruction in that art being a part of the course in civil and mining engineering. At the Massachusetts Institute of Technology in 1864 there was in the fourth year a course of mechanical engineering separate from the civil engineering course after the close of the third year. At the School of Mines of Columbia College, New York City, "a course of machines which is essential in a course of mining engineering" was given, about 1864, during the third year. The first practical schools of mechanical engineering were the Worcester Institute and the Stevens Institute of Technology, though it may be objected to them that they are schools for making master workmen rather than engineers. Nevertheless, as the practical work of the course of mechanical engineering is what distinguishes the institutions in which it obtains from all other educational institutions, it is well to begin with a consideration of it.

At the Worcester Institute the regular course of instruction is prefaced by an "apprentice half year," in which the four studies that the average student of mechanical engineering has been found to be deficient in are followed from January to June. These studies are English and French literature (6 hours a week), free-hand drawing (6 hours a week), and shop practice in woodwork and moulding (36½ hours a week). Then during the three years of the course 10 hours a week are devoted to "practice, which in the second term of the last year includes machine design.

In this shop practice two principles are observed: First, that while labor with hand tools and machines should be wisely blended, yet since machinery has a constantly increasing share in the conversion of material into useful forms, the educated mechanic should know how to design, construct, and assemble the parts of a machine as well as how to make its product; and, second, that excellence in construction is to be sought as a most valuable factor in instruction. The power of the engineer, says the faculty, to decide upon general grounds the best form and material for a machine and to calculate its parts is greatly increased by blending with it the skill of the craftsman in manipulating the material, and the fact that the product is to be tested and used kindles interest in its manufacture and furnishes additional incentive to thoroughness and exactness. After the earliest lessons the practice is on commercial goods and follows the best methods of commercial production. Thus, while the institute offers a good education, based on mathematics, the living languages, physical sciences, and drawing, and sufficient familiarity with some branch of applied science to secure to its graduates a livelihood, its two peculiar features are: (1) that in addition to the general course of study and to the regular work of all students in the laboratories each student devotes at least ten hours weekly to practice in the department he has chosen; and (2) that the practice of the students in the department of mechanical engineering is in well-equipped shops in which a manufacturing business is carried on. *Construction accompanies instruction* at every step.

The printed page is not adapted to describing the technicalities of a machine shop and even photo illustrations are more useful as evidences of the equipment of the school than of the value of its work to the future engineer. It will, then, suffice to say that in the third year of the Worcester Institute the students build one or more machines from their drawings, which, though made from definite specifications, are intended to afford ample field for the personal responsibility and originality of each student in making correct design and arrangement of parts of the machine in hand. While the work is not copying, it must not depart essentially from the best practice among manufacturing mechanics. Thus one class has constructed a 25 horse-power Corliss engine, another a 10 horse-power upright reversible engine, another a 40 horse-power Buckeye engine. The class of 1885 constructed an engine lathe 18 feet in length: the class of 1886 a Hendey shaper, etc.

The Stevens Institute is, as its catalogue claims, "a school of mechanical engineering." There are departments of physics and of chemistry, and applied electricity is taught, but the object of the school is to provide a systematic course in the theory of machine construction and a study of existing systems. Mathematics, pure and applied, mechanical drawing, shop practice and experimental mechanics, experimental physics, and chemical analysis, all are more or less powerful auxiliaries to the object of the systematic course in the theory of machine construction and the study of existing systems. But as we are now particularly concerned with the shop work, it is necessary to keep to that.

The work-shop course of the institute is intended to supply the student with a knowledge, as complete as possible, of the best existing methods and processes necessary to the construction of such mechanical designs as the theoretic part of the course will enable him to originate. But dependence is not entirely placed on the necessarily elementary and limited instruction that can be given in the machine, blacksmith, and carpenter shops, and the iron and brass foundry; but, after differences in machines, tools, and methods of manipulation are comprehended by the student, he is taken to establishments where real work is being carried on. The usual tour of the senior class is as follows:

April 1.—Bethlehem. Eagle Hotel. Steel and zinc manufacture. Bethlehem Iron and Zinc Works.

April 2.—Philadelphia. Girard House.

(1) Welding, fitting, and testing of wrought-iron pipe. Morris & Tasker's Pascal Iron Works.

(2) Arrangement and outfit of first-class machine shops. Seller's Machine Works.

(3) Locomotive manufacture. Baldwin Locomotive Works.

(4) Marine engines and shipbuilding. Cramp Ship Yard.

April 5.—Hartford. Allyn House.

(1) Machine tools, taps and dies, and standard gauges; gear-cutting by machinery, and drop forgings. Pratt & Whitney Company.

(2) Improvements in automatic screw machinery; recovery of oil from metal cuttings; straightening of bar iron. Hartford Screw Company.

(3) Machinery for manufacture of repeating rifles: manipulation of Gatling gun; construction of disc and Baxter engines; automatic wood-screw machinery; latest attempt at setting type by machinery. Colt's Armory.

(4) Latest methods of heating and ventilation. Hartford statehouse.

(5) Extreme case of use of fast-speed engines for large steam-power plant. Willimantic Linen Mill.

April 6.—Springfield. Massasoit House.

(1) Construction and use of turbine water wheels. Holyoke Machine Works.

(2) Testing of turbines. Holyoke Testing Flume.

(3) Manufacture of paper. Dickinson Paper Mills.

April 7.—Boston. United States Hotel.

(1) Most improved machinery for rapid working of brass. Hancock Inspirator Company's shops.

(2) Testing of large sizes of materials. Emery testing machine. Watertown Arsenal.

(3) Types of modern pumping engines. Leavitt walking-beam and fly-wheel type and Worthington direct-acting type. Boston sewage-pumping station, Dorchester.

April 8.—Providence. Narragansett House.

(1) Manufacture of machines in duplicate by most improved machine processes. Wilcox & Gibbs's sewing machine, machine molding, pickling and annealing of cast iron for milling machine work. Brown & Sharp Manufacturing Company.

(2) Supply water to cities and towns; direct distribution. Hope street station. Corliss (5) cylinder direct engine and Nagle geared form of engines. Reservoir

distribution, Pawtucket Water Works. Corliss compound engines and Swan turbine water wheels.

April 9.—Fall River. Wilbur Hotel.

(1) Manufacture of cotton fabrics and standard single Corliss engine. Bernard Mills.

(2) Medium high-speed engines and latest types of compound mill engines Globe Mills.

The shop exercises of the institute are finished before the close of the third year, the course being of four years. The time devoted to shop work by each student is distributed as follows:

	Hours.
Metal lathe	225
Pattern-making	100
Metal planer	65
Vise work	40
Molding	40
Wood-turning	40
Blacksmithing	40
Miller	32
Drill press	24
Millwrighting	24
Carpentry	25
Brass-turning	20
Steam-fitting	16
Steam boilers	16
Metal-testing	8
Elasticity of pine beams	8
Flow of water through pipes	8
Friction of belting	8
Indicator card	8
Total	*a*747

a This total has been very materially reduced of late.

It will be observed that 40 of these hours are consumed in what is called experimental mechanics, and so can not be called shop work in the sense of manual labor. For the fourth-year class there is a regular course in experimental mechanics given during a supplementary term of three weeks. Assistants chosen from the last graduating class take charge of a group of exercises and aid other students to secure without loss of time the data belonging to experiments. As soon as the data of any one experiment are secured the students report to the chief instructor, who directs such calculations as are necessary to be deduced. This done the next exercise is entered upon. The following chart will explain the character of this laboratory work:

Order of exercises in experimental mechanics, class of 1891.

The figures 1 to 18 represent groups of students, consisting of generally two each, who are due at the test opposite their group number horizontally and at the date opposite their number vertically.

There must be just twice as many groups as there are exercises, so that every other day can be devoted to a test and to the computation of that test alternately. The instructors are always graduates, either of the last senior class or earlier ones. The exercises really consist of nine groups, each of which is so designed as to afford experimenting sufficient to occupy a full day of eight hours, and the computations occupy another interval of eight hours.

Group of exercises.	Subjects.	Time of starting tests.	June.					July.										
			24	25	26	27	30	1	2	3	7	8	9	10	11	14	15	16	17	12
A	Metal tests	9:00	1	10	9	18	8	17	7	16	6	15	5	14	4	13	3	12	2	11
B I	Hot-air engine	10:00																		
B II	Dynamometers	12:00	2	11	1	10	9	18	8	17	7	16	6	15	5	14	4	13	3	12
C I	Properties of ammonia, latent heat, heat of absorption, etc	10:30																		
C II	Manipulation of different gears	2:30	3	12	2	11	1	10	9	18	8	17	7	16	6	15	5	14	4	13
C III	Barrus Universal calorimeter	3:00																		
D I	Buckeye engine, noncondensing	9:00																		
D II	Buckeye engine, condensing, surface condenser	10:00																		
D III	Buckeye engine, condensing, jet condenser	11:00	4	13	3	12	2	11	1	10	9	18	8	17	7	16	6	15	5	14
D IV	Compound engine	12:00																		
D V	Webb dynamometer	2:00																		
E I	Centrifugal fan and jet blower	9:00																		
E II	Tests of lubricating oils	10:30	5	14	4	13	3	12	2	11	1	10	9	18	8	17	7	16	6	15
E III	Flow of water through orifices	3:30

F II	Analysis of chimney gases	9:00	6	15	5	14	4	13	3	12	2	11	1	10	9	18	8	17	7	16
F III	Coil and superheating calorimeters	11:00																		
G I	Rotary-engine efficiency test	9:00																		
G II	Steam-pump efficiency test	11:00	7	16	6	15	5	14	4	13	3	12	2	11	1	10	9	18	8	17
G III	Flow of steam through orifices	2:00																		
H I	Injector efficiency test	9:00																		
H II	Safety valves, pop *vs.* common lever type	12:00	8	17	7	16	6	15	5	14	4	13	3	12	2	11	1	10	9	18
H III	Pelton water-wheel efficiency test	2:00																		
H IV	Hydraulic ram	3:30																		
I I	Test of thermometers and indicators	9:30																		
I II	Exercises with slide rule	2:00	9	18	8	17	7	16	6	15	5	14	4	13	3	12	2	11	1	10
I III	Calibration of water meter	3:00																		
I IV	Radiation steam coil	4:00																		

Scheme of several exercises.

Exercise D (IV). Compound engine.

Time.	Number of revolutions by counter.	Cubic feet of condensing water by meter.	Reading of tachometer.	Pressure of steam in pounds per square inch above the atmosphere.	Barometrical pressure in inches of mercury.	Temperature of engine room.

Exercise F (I). Boiler test.

Time.	Reading of meter in cubic feet.	Steam pressure by gauge.	Draft, in inches of water.	Height of water in water glass, in inches.	Temperature in degrees F.				Barometric pressure in inches of mercury.	Remarks.	Coal record.	
					Feed water.	Chimney.	Boiler room.				Time.	Weight, in pounds.
							Wet bulb.	Dry bulb.	Furnace.				

Friction of belting.

Revolutions per minute.		Weight, in pounds.		Remarks.
Driving shaft.	Driven or Prony brake shaft.	On platform scales.	At end of Prony brake shaft.	

At the Massachusetts Institute the time devoted to the shop and laboratory is as follows:

	Hours.
Shop:	
Carpentry and wood turning	60
Pattern work	30
Forging	90
Chipping and filing	40
Machine tool work	144
	364
Laboratory of engineering	150
Total	514

At Cornell shop work is given 3 hours a week throughout the course of 4 years, except that during the spring term of the last year 12 hours are allowed to investigations and work. Work in the mechanical laboratory is given during the last two years for two hours throughout, except in the case of the spring term, as above specified.

At Purdue University the régime is as follows:

	Hours.
Bench work in wood and turning	75
Pattern making	92
Molding and casting	23
Iron and steel forging	75
Machine and vise work in iron	115
Total	380

Let us now consider a class of schools of quite a different character as far as manual training is concerned. As a type we may take the Lehigh University course in mechanical engineering. The object of its course is the study of the science of machines. The principal subjects taught are: The nature, equivalence, and analysis of mechanisms, the mechanics or theory of the principal classes and practice of machine design. To obtain "the practical engineering data which they will most need when beginning their work as mechanical engineers the students are required to pursue a course of shop instruction which does not necessarily involve manual labor and manipulation of tools, but is principally devoted to familiarizing them with those points in patternmaking, molding, forging, fitting, and finishing, which they will need to know as designers of machinery." In brief, the student is an observer, and is familiarized with processes as a foreman rather than experienced in carrying them through to a successful issue as a mechanic. To insure the attention and develop the reason, a full description of the process under observation and the means by which it is accomplished are required of each student during a series of properly graded examples of patterns, castings, forgings, and finished pieces which are not being constructed in the shops at the time, the blue prints for which have been given to them on entering the shops. The attention of the student is directed by these drawings, a printed programme, and a teacher who examines the pupil's notes and sketches and questions him. The works of the Bethlehem Iron Company, the railroad shops at Easton and other engineering establishments in the vicinity are visited, each visit having a definite object in view.

As this approaches, perhaps, in a measure, duplicates, the characteristics of a German Technische Hochschule or Polytechnicum, an illustration of the programme of one of these schools is given. The periods represented are the first semester of the first and of the fourth years of the course. The charts are given to illustrate the way in which the German school carefully notes the difference between the lecture during which the student listens and the hour during which he is an active agent while working at drawing or descriptive geometry. Such work is called Uebungen [practical exercises] in German, and the word seems to have been understood in some of our schools to mean practical work. Thus, when it is asked, How many hours do you devote to theory, how many to practice? the correspondent is nonplussed to know whether we mean to include an exercise in descriptive geometry as practical work or not. This opportunity may therefore be taken to say that drawing in any of its forms, even designing machinery which is to be made, or making out specifications of buildings or works to be constructed, is not considered by this Bureau as practical work. Some years ago when the polytechnic idea reached America it might have been considered such, but the advance of the age in the way of organizing industrial instruction has rendered a truer definition of the term practical work necessary, or at least rendered it necessary to reserve it for the work done in the shop, laboratorty, or field.

Winter semester, first year of Technical University at Hanover.

Hours.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
8 to 9 a. m.	(Lecture.) Analytical geometry.	(Lecture.) Descriptive geometry.	(Lecture.) Descriptive geometry.	(Lecture.) Descriptive geometry.	(Lecture.) Analytical geometry.	(Lecture.) Analytical geometry.
9 to 10 a. m.	(Exercise.) Free-hand drawing.	(Exercise.) Descriptive geometry.	(Exercise.) Descriptive geometry.	(Exercise.) Descriptive geometry.	(Exercise.) Machine drawing.	(Exercise.) Free-hand drawing.
10 to 11 a. m.						
11 a. m. to 12 m.	----------	(Exercise.) Building construction for mechanical engineers.	(Lecture.) Physics.	(Lecture.) Building construction for M. E.		(Lecture.) Differential and integral calculus until Jan. 1; mechanics after.
12 m. to 1 p. m.	(Lecture.) Physics.		(Lecture.) Building construction for M. E.	(Lecture.) Physics.	(Lecture.) Physics.	
3 to 4 p. m.	(Lecture.) Algebraic analysis and trigonometry until Jan. 1.	(Exercise.) Mechanics after Jan. 1.	----------	----------	(Lecture.) Algebraic analysis and trigonometry.	
4 to 5 p. m.	(Lecture.) Differential and integral calculus, one lecture.	(Lecture.) Differential and integral calculus until Jan. 1.	(Lecture.) Differential and integral calculus, one.	(Exercise.) Differential and integral calculus, one.	(Lecture.) Differential and integral calculus, one.	
5 to 6 p. m.	(Lecture.) Differential and integral calculus, one, until Jan. 1; mechanics afterwards.	(Lecture.) Algebraic analysis and trigonometry until Jan. 1; mechanics afterwards.	(Lecture.) Algebraic analysis and trigonometry until Jan. 1; mechanics afterwards.	(Lecture.) Algebraic analysis and trigonometry until Jan. 1; mechanics afterwards.	(Lecture.) Algebraic analysis and trigonometry until Jan. 1; mechanics afterwards.	

Winter semester, fourth year of Technical University at Hanover.

Hours.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
8 to 9 a. m	(Lecture.) Geology.	(Lecture.) Metallurgy.	(Lecture.) Geology.	(Lecture.) Construction of manufactures.	(Lecture.) Metallurgy.	(Lecture.) Locomotive construction.
9 to 10 a. m		(Lecture.) Ship-building.	(Lecture.) Ship-building.		(Lecture.) Ship-building.	
10 to 11 a. m		(Exercise) Ship-building.	(Lecture.) Hot air and gas machines.	(Exercise.) Construction of manufactures.	(Exercise.) Ship-building.	(Exercise.) Locomotive construction.
11 to 12 a. m	Qualities of metals, alloy, and woods.					
12 m. to 1 p. m.				(Lecture.) Locomotive construction.	(Lecture.) Hot air and gas machines.	
2 to 3 p. m	(Exercise.) Experimental hydraulics.					
3 to 4 p. m				(Lecture.) Experimental hydraulics.		
4 to 5 p. m	(Lecture.) Heating, ventilating and lighting.	(Lecture.) Qualities of metals, alloys, and woods.	(Lecture.) Spinning, weaving, and paper-making.	(Lecture.) Heating, ventilation, and lighting.	(Lecture.) Spinning, weaving, and paper-making.	
5 to 6 p. m			(Lecture.) Industrial economy. (Special.) "Political economy."		(Lecture.) Industrial economy.	
6 to 7 p. m			(Lecture.) Principles of electro-technics.	(Lecture.) Principles of electro-technics.		

To illustrate the character of the "dynamic" element in a course of mechanic Institute; on the opposite pages are given in one column the course of me-proper:

Year.	First term.		Second term.
	Course.	Dynamics.	Course.
Freshman	Algebra, geometry, free-hand drawing, elementary physics, English, practice in wood shop.	Practice in wood shop; use of hand tools, chisels, saws, planes, bits, etc.; laying out frames from working drawings; use of the turning lathe, circular saws, jig saws, planing and boring machines (16 hours a week).	Algebra, trigonometry, free-hand drawing, elementary chemistry, German, practice in wood shop.
Sophomore	Determinants, analytic geometry, descriptive geometry, elementary mechanics, free-hand drawing, chemistry and chemical laboratory, German; practice in machine shop, blacksmith shop, and foundry; care of boilers and engines.	Elementary mechanics.—Mass, momentum, collision, force, work, energy, power, units (two lessons a week). Practice in machine shop, with instruction in the use of machine tools and the various operations of machine construction; turning, planing, drilling, boring, filing, thread-cutting, scraping to a true surface, finishing, etc.; construction of simple machines; forging of simple machine parts; foundry practice; care and management of engines and boilers (10 hours per week).	Analytic geometry, introduction to differential calculus, descriptive geometry, elementary mechanics, mechanical drawing, chemistry and chemical laboratory, mineralogy, German; practice in machine shop, blacksmith shop, and foundry; care of boilers and engines.
Junior	Differential calculus, mechanical drawing, analytical mechanics, French and German; practice in machine shop, blacksmith shop and foundry.	Analytical mechanics.—Equations of motion; attraction, potential, hydrodynamics (five lessons a week). Practice in machine shop; construction of useful machines from working drawings, such as foot lathes, drill presses, engine lathes, steam engines, etc.; forging tools for use in machine shop, care of boilers and engines, practice in brass foundry and moulding room (10 hours a week).	Integral calculus, mechanical drawing, physics, lectures on the method of least squares, French and German, lectures on astronomy, practice in machine shop, steam-engine and general machine-tool construction.
Senior	Applied mechanics, thermodynamics, chemical technology, English literature, physical laboratory, machine design, engineering laboratory, practice in machine shop, steam-engine and machine-tool construction.	Rankine's applied mechanics; forces in straight-line, parallel, and inclined forces; stress, ellipse of stress (four lessons a week). Machine design, with lectures on the proportional parts of machines; design of simple machines (6 hours a week). Laboratory work (6 hours a week). Practice in machine shop; construction of high-class machine tools, steam engines, etc.; making and tempering of standard tools, reamers, drills, milling cutters, gauges, etc (8 hours a week.	Applied mechanics, thermodynamics, chemical technology, political economy, physical laboratory, machine design, engineering laboratory, practice in machine shop; making of standard tools, including forging, tempering, etc.; thesis work.

ical engineering, recourse is again had to the curriculum of the Rose Polytechchanical engineering and in the next the development of the mechanical feature

Second term.	Third term.	
Dynamics.	Course.	Dynamics.
Practice in wood shop of first term continued (14 hours a week).	Algebra, spherical trigonometry, mechanical drawing, elementary chemistry, German, practice in wood shop.	Practice wood shop continued, construction of patterns of a simple character (14 hours a week).
Elementary mechanics.—Composition of velocities and accelerations, parallel forces, center of gravity, simple machines, friction (two lessons a week). Practice in machine shop of first term continued (10 hours a week).	Introduction to integral calculus, descriptive geometry, elementary mechanics, mechanical drawing, chemistry and chemical laboratory, mineralogy, German; practice in machine shop, blacksmith shop, and foundry; care of boilers and engines.	Elementary mechanics.—Projectiles, periodic motion, harmonic motion, pendulum, moment of inertia, etc. (two lessons a week). Practice in machine shop of first term continued (10 hours a week).
Practice in machine shop of first term continued (10 hours a week.	Differential equations, mechanical drawing, physics, French and German, practice in machine shop, steam-engine and general machine-tool construction.	Practice in machine shop of first term continued (10 hours a week).
Applied mechanics, continued; frames, strength of materials; practical application to joints, pipes, boilers, beams, etc. (four lessons a week). Machine design, continued; complete detailed drawings, with tracing and blue prints, of machines and their parts (6 hours a week). Laboratory work (6 hours a week). Practice of first term in machine shop, continued (8 hours per week).	Applied mechanics, thermodynamics, chemical technology, lectures on geology, Constitution of the United States, physical laboratory, machine design, eugineering laboratory; practice in wood shop, construction of patterns for foundry use from working drawings of machines designed by members of the class; thesis work.	Applied mechanics, continued; dynamics of rigid bodies with applications to mechanism; machine design continued, with lectures on slide valve, link motion, and other forms of valve gearing (6 hours a week). Laboratory work (6 hours a week). Practice in wood shop, construction of patterns for foundry use from working drawings of machines designed by members of the class (8 hours a week.)

The following curricula will represent in some measure the various courses of mechanical engineering that obtain at home and abroad. Attention is called to the commercial instruction in the French schools.

A.

COURSES OF MECHANICAL ENGINEERING WHOSE PUPILS VISIT MANUFACTURING ESTABLISHMENTS, BUT DO NOT WORK IN A SHOP.

CURRICULUM OF THE COURSE IN MECHANICAL ENGINEERING IN A UNIVERSITY NOT ENDOWED WITH THE NATIONAL LAND GRANT.

REQUISITES OF ADMISSION.

English grammar, geography, history of the United States, arithmetic, algebra through equations of the second degree, geometry, first six books of Chauvenet's Geometry, elementary physics.

COURSE.

FRESHMAN CLASS.

First term.—Geometry completed, elementary chemistry, French or German, drawing, exercises and declamations in English, physiology and health, gymnasium.
Second term.—Algebra completed (2 hours), plane and spherical trigonometry and mensuration, and use of logarithmic tables (2 hours), French or German (3 hours), drawing or machine design (5 hours), exercises and declamations in English (2 hours), gymnasium (2 hours).

SOPHOMORE CLASS.

First term.—Analytical geometry (4 hours), physics (5 hours), machine design (2 hours), visits of inspection (2 hours), French or German (2 hours), English exercises and declamations (1 hour), gymnasium (2 hours).
Second term.—Differential and integral calculus (4 hours), physics (3 hours), French or German (2 hours), mechanics (4 hours), steam engine, Holmes's book on (3 hours), English essays and declamations (1 hour), gymnasium (2 hours).

JUNIOR CLASS.

First term.—Calculus and analytical mechanics (2 hours), French or German (2 hours), mechanical technology (7 hours), boilers, Welsenon (1 hour), strength of materials (4 hours), literature and history, gymnasium.
Second term.—French or German (2 hours), kinematics of machinery (3 hours), machine design (5 hours), metallurgy (4 hours), machinery of transmission, Weisbach-Herrmann (2 hours), essays and original orations, gymnasium.

SENIOR CLASS.

First term.—Thermodynamics (3 hours), graphical statics (2 hours), machine design (4 hours), kinematics (3 hours), mechanics of machinery (4 hours).
Second term.—Mechanics of machinery (4 hours), machine design (5 hours), hydraulics (2 hours), measurement of power (1 hour), lectures on American and English literature (2 hours), Christian evidences (1), preparation of thesis, gymnasium.

CURRICULUM OF THE COURSE IN MECHANICAL ENGINEERING AT THE TECHNICAL UNIVERSITY OF HANOVER, IN GERMANY.

REQUISITES FOR ADMISSION.

The Reifezeugniss of a gymnasium, a realgymnasium, or an oberrealschule. (See Page 948.)

COURSE.

FIRST YEAR.

Winter semester.—Differential and integral calculus (4½ hours of lectures, 1 of practice), analytical geometry (3 hours), algebraic analysis and trigonometry (3 hours), descriptive geometry (3 hours lectures, 5 hours practice), physics (4 hours), mechanics (3½ hours) free-hand drawing (5 hours practice), building construction for mechanical engineers (2 hours lectures, 2 hours practice), drawing of machines (3 hours practice). In all 23 hours of lectures and 16 hours of practice.
Summer semester.—Differential and integral calculus (3 hours of lectures, 1 of practice), descriptive geometry (3 hours of lectures and 5 of practice), physics (4 hours), mechanics (7 hours), principles of chemistry (6 hours), free-hand drawing (5 hours practice), building construction for meehanical engineers (3 hours lectures, 3 hours practice), machine drawing (3 hours). In all 26 hours lectures, 17 practice.

SECOND YEAR.

Winter semester.—Differential and integral calculus (4 hours), elasticity (5 hours), principles of civil engineering (Grundzüge des Ingenieurbauwesens) (3 hours lectures, 2 hours practice), general technlogy (4 hours), kinds of machines (5 hours), parts of machine (5 lectures, 7 practice), pumps (½ hour). In all 26½ hours lectures, 9 practice.

Summer semester.—Differential and integral calculus (4 hours), hydraulics (2 hours), analytical mechanics (3 hours), principles of civil engineering (3 hours lectures, 2 hours practice), general technology (4 hours), kinds of machines (5 hours), parts of a machine (4 hours lecture, 7 hours practice), pumps (2 hours). In all 27 hours lectures, 9 practice.

THIRD YEAR.

Winter semester.—Principles of practical geometry, surveying (2 hours lectures, 2 hours practice), mechanical theory of heat (2 hours), technical chemistry (3 hours), principles of mineralogy (2 hours), iron bridges (2 hours lectures, 4 practice), theory of machines (3 hours lectures, 1 hour practice), mechanical regulation of machinery and kinematics (2 hours lectures)-prime movers (6 hours lectures, 8 hours practice). In all 22 hours lectures, 15 hours practice.

Summer semester.—Principles of practical geometry (3 hours), technical chemistry (3 hours), principles of mineralogy (2 hours), iron bridges (2 hours lectures, 4 practice), theory of machines (3 hours lectures, 1 practice), mechanical regulation of machinery and kinematics (2 hours), prime movers (6 hours lectures, 8 practice). In all 18 hours lectures, 16 practice.

FOURTH YEAR.

Winter semester.—Geology (2 hours), metallurgy (2 hours), experimental hydraulics (1 hour lecture, 2 hours practice), hot air and gas machines (2 hours), special technology (3 hours), heating, ventilating, and lighting (4 hours lectures), construction of manufactories (2 hours lectures, 2 hours practice), spinning, weaving, paper making, etc. (2 hours), construction of locomotives (3 hours lectures, 3 hours practice), shipbuilding (3 hours-lectures, 4 hours practice), elements of electrical technology (2 hours), business relations, (Gewerbe-Oekonomie) (2 hours). In all 28 hours lectures, 11 hours practice.

Summer semester.—Geology (2 hours), metallurgy (2 hours), experimental hydraulics (1 hour lecture, 2 hours practice), reservoirs, pumping machines, and blowing machines (3 hours), technology of the materials of construction (3 hours lectures, 4 hours practice), construction and arrangement of manufactories (3 hours practice), spinning, weaving, etc. (2 hours), locomotive construction (3 hours lectures, 3 hours of practice), shipbuilding (3 hours lectures, 4 practice), principles of electrical technology (2 hours), business relations (2 hours). In all 23 hours lectures, 16 hours practice.

Curriculum of the Course in Mechanical Engineering in a University Endowed with the National Land Grant.

REQUISITES FOR ADMISSION.

Grammar, spelling, history of United States, geography, Latin (3 books of Cæsar), arithmetic algebra and geometry completed, trigonometry.

COURSE.

FRESHMAN YEAR.

First term.—German (3 hours), history, English literature (1 hour), derivatives of algebraic functions, properties of equations, plane analytical geometry (3 hours), physics (2 hours recitation, 2 hours experimental lectures), chemistry (2 hours recitation, laboratory practice 2 hours), elementary drawing (3 hours).

Second term.—Language, physics, and chemistry as stated above; plane analytical geometry continued (3 hours), physical geography, 8 lectures, botany (3 hours), orthographic projection, isometric drawing, projection of shadows, shading and tinting, sections, developments, and intersections of surfaces (4 hours).

JUNIOR YEAR.

First term.—Analytical geometry of three dimensions, elements of the theory of functions, differential calculus, with applications to geometry and analysis, solution of numerical equations (6 hours). Surveying—Theory and practice (3 hours until November 1), kinematics (1 hour. Shop visiting—Study of machine details and tools (3 hours, beginning when surveying ends), descriptive geometry (3 hours), German (3 hours), French (3 hours).

Second term.—Integral calculus, with applications to geometry and rational mechanics (6 hours); applied kinematics, forms of teeth of wheels, cams, parallel motions, transmission of power by belts and gearing, etc. (1 hour until spring recess, then 2 hours), shop visiting (3 hours, until spring recess); study of the steam engine (2 hours after spring recess); perspective and shadows and machine elements (3 hours), German (3 hours), French (3 hours).

SENIOR YEAR.

First term.—Friction, moment of inertia, centrifugal force, elasticity and strength of materials, theory of flexure and torsion, strains in structures, construction of roofs and bridges, equilibrium and pressure of fluids, theory of flotation, flows of fluids in pipes and channels, resistance of ships (6 hours), practical exercises in designing machine details and simple machines (12 hours), study of the steam engine (2 hours), electricity (optional, laboratory work 3 hours), visits of inspection (examination of machinery in operation and reports of visits), French (3 hours).

Second term.—Hydrodynamics and theory of water wheels and turbines (6 hours), thermodynamics (3 hours), study of the steam boiler (2 hours), electricity (optional—laboratory work 3 hours, lectures 2 hours), advanced exercises in preparing designs and working drawings for machinery and estimates of weight and cost of machinery (12 hours), French (3 hours during winter half term), thesis, visits of inspection and reports.

B.

COURSES OF MECHANICAL ENGINEERING WHOSE PUPILS WORK IN SHOPS AS WELL AS VISIT.

CURRICULUM OF A COURSE IN MATHEMATICAL ENGINEERING IN AN INDUSTRIAL UNIVERSITY IN THE WEST.

REQUISITES OF ADMISSION.

Short English composition evincing familiarity with some masterpiece of literature; arithmetic; algebra.

COURSE.

FRESHMAN YEAR.

Recitations on edges for cutting wood and adjustment of wood-working tools, shrinkage and warping of woods, and the form, adaptation, and relative strength of joints; lectures on wood-working machines and on pattern-making, moulding, and casting; mechanical drawing, exercises in wood shop, rhetoric, elocution, geometry, algebra, trigonometry.

SOPHMORE YEAR.

Lectures on management of steel in forging, hardening, tempering, and annealing; lectures on machines and machine work, mechanical drawing, iron forging, steel forging, exercises, machine work, history, English literature, physics, higher algebra, trigonometry, analytical geometry, descriptive geometry.

JUNIOR YEAR.

Principles of mechanism, mechanical drawing, metallurgy, steam engine, valves and links, experimental work, heat, chemistry, calculus.

SENIOR YEAR.

Analytical mechanics, strength of materials, steam engine, boilers, machine design, mechanical drawing and experimental work in engineering, political economy, chemistry.

CURRICULUM OF THE COURSE IN MECHANICAL ENGINEERING OF A TECHNOLOGICAL UNIVERSITY.

REQUISITES OF ADMISSION.

Short English composition and correction of ungrammatical language, geography, history of United States, arithmetic, Wentworth's elements of algebra, French or German grammar, and translation of easy prose.

COURSE.

FIRST YEAR.

First term.—Solid geometry, algebra, general chemistry, chemical laboratory, rhetoric and English composition, French (or German), mechanical drawing, freehand drawing, military drill.

Second term.—Plane and spherical trigonometry, general chemistry, chemical laboratory, political history since 1815, French (or German), mechanical drawing, freehand drawing, military drill.

SECOND YEAR.

First term.—Principles of mechanism, drawing, carpentry and woodturning (shop work), analytic geometry, descriptive geometry, physics, political economy, German.

Second term.—Construction of gear teeth, mechanism of cotton machinery, mechanism of machine tools, drawing, pattern work (shop work), differential calculus, physics, English literature, German.

THIRD YEAR.

First term.—Valve gears, thermodynamics, steam engineering, drawing, forging (shop work), integral calculus, general statics, physics (heat), physical laboratory, German.

Second term.—Steam engineering (boilers), drawing, design, and use of surveying instruments, engineering laboratory; forging, chipping, and filing (shop work); strength of materials, kinematics, and dynamics; physical laboratory, English composition, business law, German.

FOURTH YEAR.

First term.—Steam engineering, hydraulics, dynamics of machines, machine design, engineering laboratory; chipping and filing, machine-tool work (shop work); strength of materials, friction; metallurgy of iron, heating and ventilation. *Options:* Marine engineering, locomotive construction, mill engineering.

Second term.—Hydraulic motors, engineering laboratory, machine-tool work (shop work); strength and stability of structures, theory of elasticity; English, thesis work. *Options:* Marine engineering, locomotive construction, mill engineering.

CURRICULUM OF A COURSE IN MECHANICAL ENGINEERING OF A UNIVERSITY IN THE EAST.

REQUISITES FOR ADMISSION.

Short English composition upon an English classic geography, physiology and hygiene, arithmetic, plane geometry, algebra, history of United States.

COURSE.

FRESHMAN.

Fall term.—French or German, algebra, chemistry, freehand drawing, shop work, hygiene, drill.
Winter term.—French or German, algebra, chemistry, freehand drawing and machine sketching, shop work.
Spring term.—French or German, trigonometry, instrumental drawing, chemistry, shop work drill.

SOPHOMORE YEAR.

Fall term.—Analytic geometry, descriptive geometry, experimental mechanics and heat, chemical laboratory, shop work, drill.
Winter term.—Differential calculus, electricity and magnetism, chemical laboratory, descriptive geometry, shop work.
Spring term.—Integral calculus, acoustics and optics, descriptive geometry, chemical laboratory, shop work, drill.

JUNIOR YEAR.

Fall term.—Mechanics of engineering, materials of construction, designing and drawing, physical laboratory, mechanical laboratory, shop work.
Winter term.—Mechanics of engineering, machine design, mechanical laboratory, physical laboratory, designing and drawing, and drawing, shop work.
Spring term.—Mechanics of engineering, machine design, physical laboratory, mechanical laboratory, designing and drawing, shop work.

SENIOR YEAR.

Fall term.—Steam engine and other motors, physical laboratory, mechanical laboratory, mechanical engineering and machine design, shop work, electives.
Winter term.—Steam engine and motors, physical laboratory, mechanical laboratory, mechanical engineering and drawing, shop work, elective.
Spring term.—Thesis, designing and drawing, mechanical laboratory investigations, shop work, elective.

C.

CURRICULA OF MECHANICAL ENGINEERING SCHOOLS.

A SCHOOL OF THE NEW ENGLAND STATES.

REQUISITES OF ADMISSION.

English syntax and an essay on a classic English author, history of the United States, geography, arithmetic, geometry (5 books of Wentworth), algebra as far as quadratics, French.

COURSE.

APPRENTICE HALF YEAR.

English, 6 hours; French, 6 hours; free drawing, 6 hours; shop, 36½ hours.

JUNIOR.

First term.—Algebra (3 hours), geometry (3 hours), German (4 hours), general chemistry (3 hours), physics (3 hours), practice (10 hours).
Second term.—Algebra (1 hour), solid geometry (2 hours), trigonometry (2 hours), analytical geometry (1 hour), German (4 hours), general chemistry (5 hours), physics (3 hours), free drawing (4 hours), mechanical drawing (2 hours), practice (10 hours), additional summer practice (168 hours).

MIDDLE YEAR.

First term.—Analytical geometry (4 hours), descriptive geometry (3 hours), German (4 hours), qualitative analysis and mineralogy (2 hours), physics (1 hour), free drawing (2 hours), mechanical drawing (6 hours), practice (10 hours).
Second term.—Calculus (6 hours), German (4 hours), qualitative analysis and mineralogy (2 hours), metallurgy (1 hour), applied physics (1 hour), physical laboratory (2 hours), steam engineering (2 hours), free drawing (2 hours), mechanical drawing (4 hours), practice (10 hours), additional summer practice (168 hours).

JUNIOR YEAR.

First term.—Theoretical mechanics (3 hours), applied mechanics (2 hours), thermodynamics 2 hours), history and literature (5 hours), geology (2 hours), physical laboratory (2 hours), mechanical drawing (4 hours), steam engineering (2 hours), practice (10 hours).
Second term.—Applied mechanics, including hydraulics and kinematics (5 hours), steam engineering (1 hour), thermodynamics (2 hours), political science (5 hours), industrial chemistry (2 hours), thesis work, engineering, or electrical laboratory (6 hours), practice, including machine design (10 hours).

A School in the Middle States.

REQUISITES OF ADMISSION.

An essay upon a topic assigned at time of examination, arithmetic, algebra, equations of second degree, geometry, analytical and plane trigonometry, universal history, rhetoric, French reader, physics.

COURSE.

FIRST YEAR.

First term.—Logarithms and plane trigonometry reviewed, spherical trigonometry, mechanical drawing, Spanish, physics, history of the English language (lectures and essays), shop work.
Second term.—Theory of equations, analytical geometry and calculus, mechanical drawing, Spanish, light, English literature, and essays.
Third term.—Analytical geometry and calculus, exercises in mathematical laboratory, mechanical drawing, Spanish, light, English literature and essays, shop work.
Supplementary term.—Shop work.

SECOND YEAR.

First term.—Analytical geometry and calculus, machine drawing from sketches, descriptive geometry, Spanish, German, physics, English literature, essays, chemistry, analytical chemistry, shop work.
Second term.—Analytical geometry and calculus, machine drawing from sketches, descriptive geometry, German, magnetism and electricity, deductive logic and essays, general and analytical chemistry, shop work.
Third term.—Integral calculus and applications, machine drawing from sketches, descriptive geometry, German, electricity, inductive logic, essays, general and qualitative chemistry, shop work.
Supplementary term.—Shop work.

THIRD YEAR.

First term.—Analytical mechanics, kinematics, machine drawing, descriptive geometry, German, lectures on the use of instruments for making precise measures and on their application to the practical work in the physical laboratory, metallurgy, qualitative analysis, resistance of materials, the steam indicator, valve gears, link motions, and mechanism of engines, shop work.
Second term.—Analytical mechanics, kinematics, machine drawing, descriptive geometry, German, physics, metallurgy, quantitative analysis, mechanism of boilers, lectures, foundations, boilers, shop work.
Third term.—Analytical mechanics, kinematics, machine drawing, physics, metallurgy, quantitative analysis, machine design, shop work.
Supplementary term.—Experimental mechanics.

FOURTH YEAR.

First term.—Thermodynamics, vapor machines, construction, adjustment, and use of engineering instruments, graphical status, problems in applied mechanics, machine drawing and design, physics (laboratory), applied electricity, analytical chemistry (elective).
Second term.—Heat engines, refrigerating machines, hydraulic motors, theory of bridges and roofs with graphical statics applied, selected problems, machine drawing and designing, work in physical laboratory work, applied electricity, analytical chemistry, elective.
Third term.—Work on graduating theses, including experimental investigations and general research.

A School of the Southern States.

REQUISITES OF ADMISSION.

Arithmetic, including elementary principles, fractions, compound quantities, percentage and interest and proportion. Algebra, through simple operations, including factoring. English, including grammatical construction of sentences, and an essay or letter. Geography. History of United States.

COURSE.

APPRENTICE YEAR.

First term.—Algebra, geometry, freehand and mechanical drawing, English grammar and essays, shop work.
Second term.—Algebra, geometry, mechanical drawing and projection, English grammar and essays, shop work.

JUNIOR YEAR.

First term.—Solid geometry, trigonometry, leveling, topography, descriptive geometry and shades and shadows, rhetoric, essays, physics, chemistry, shop work.
Second term.—Spherical trigonometry, surveying, field practice in compass and transit surveying, descriptive geometry, machine drawing, rhetoric, essays, hydrostatics, pneumatics, acoustics, chemistry, shop work.

MIDDLE YEAR.

First term.—Analytical geometry, field practice in plane table surveying, mechanical drawing, rhetoric, essays, kinematics and mechanism, physics, metallurgy, qualitative analysis, geology, shop work.
Second term.—Calculus, field practice, map work, machine designing, political economy, science of goverument, essays, mechanism, materials of construction, machine design, physics, qualitative analysis, geology, shop work.

SENIOR YEAR.

First term.—Calculus, special problems in designing machinery, English literature, criticisms, original speeches, analytical mechanics, machine design, physical laboratory work, organic chemistry, geology, shop work.
Second term.—Calculus, graduate work in machine design, criticism, original speeches, analytic mechanics, applied mechanics, steam engineering and prime movers, laboratory experiments, technical industries, geology, shop work.

National Schools of Arts and Trades at Aix, Angers, and Chalons, France, (for the Higher Grade of Mechanicians).

Admission is obtained through competitive examination, which is upon the following subjects:
Writing, spelling, grammar, "theoretical and practical" arithmetic, elementary geometry, algebra to equations of the second degree. Elementary history of France and geography.

A.—Theory.

The theoretical instruction, always given with a view to its applications, consists of the following subjects, which occupy three years:
1. Algebra to Newton's binomial theorem, its applications and the principles which result from it.
2. Right-line trigonometry, elementary notions of cosmography, surveying.
3. Elements of analytical geometry.
4. Descriptive geometry, shades and shadows, and perspective, stone-cutting and carpentry.
5. Theoretical and applied kinematics.
6. Pure and applied mechanics, including dynamics, statics, resistance, hydraulics, and the steam engine.
7. Physics and its industrial application.
8. Chemistry and its principal industrial applications, especially metallurgy.
9. Drawing, principally industrial drawing.
10. Technology, with special reference to the construction of machines.
11. The study of the mother tongue.
12. History.
13. Geography.
14. Industrial accounts and elements of industrial economy.
15. Industrial hygiene.

B.—Practice.

The practical instruction is given in special workshops, to wit;
1. Joinery and model working.
2. Foundry work.
3. Forging and the making of small metal utensils.
4. Construction (*ajustage*).

Central School of Arts and Manufactures.

The matters upon which the applicant for admission is examined are:
Analytic geometry, elementary and higher algebra, pure and descriptive geometry, physics, chemistry, machine drawing.
The school has four specialties and as the student follows one or the other of these he is called a mechanician, a constructor, a metallurgist, or a chemist.

FIRST YEAR.

A.—Theory.

Descriptive geometry, calculus, general physics, general chemistry, kinematics, construction of machines, applied hygiene, and natural history; mineralogy and geology, architecture, botany (especially the common plants of France), Zoölogy (especially the common animals of France), industrial drawing.

B.—Practice.

Chemical manipulations, physical manipulations, stereotomical manipulations, plans, graphics, and problems.

SECOND YEAR.

A.—Theory.

Applied mechanics, resistance of materials employed in machines and in construction, construction and placing of machines, analytical chemistry, industrial chemistry, mineral chemistry, metallurgy, building construction (*constructions civiles*), industrial physics, industrial legislation, ceramics, dyeing, glass-blowing.

B.—Practice.

Manipulation in industrial physics, raising embankments, measuring the flow of water, construction of machines, graphics, and projects.

THIRD YEAR.

A.—Theory.

Applied mechanics, construction and placing machines, agricultural and industrial chemistry, general metallurgy and metallurgy of iron, working mines, public works, railroads.

B.—Practice.

(Not given.)

Industrial Institute of the North of France.

This municipal school has two divisions or schools, technology and civil engineering, each of which is composed of three specialties or sections, mechanics, spinning and weaving, and chemistry. During the first year there is no difference between the sections, and it is only in the third year that the specialization is marked. The difference between the division of technology and that of civil engineering is that which separates the three national schools at Aix, Angers, and Chalons from the central school of arts and trades namely: The course of technology is a secondary technical course, while the civil engineering course is of university grade.[1]

The plan of study of the mechanical section of both the technological and civil engineering divisions prepares especially for instruction in machine-making and in the construction of public works. The students of the section are particularly practiced in drawing, construction, plan-making, levelling, and drawing up specifications (redaction des projects).

The students of the section of spinning and weaving after the first year follow a special elementary course, but during the third year they follow the higher courses relative to textile and the related industries. The practical exercises of spinning and weaving commence during the second year and are greatly developed during the final year.

The students of the chemical section commence the study of analytical and industrial chemistry after the first year. Later on they study in a very developed special course the principles of industrial chemistry. They are exercised in manipulation and during the last year devote the greater part of their time to practical work.

In Table D the time devoted by the student in the course of civil engineering is given as far as reported by the institutions having such courses. In the table which follows the same facts are given for the courses in mechanical engineering.

---

[1] Nevertheless the first year of the division of technology furnishes a preparation for entering upon the first year of the civil-engineering division.

a The course of instruction is "manual training."
b Course just established.
c During the fifth year in this institution fifteen hours are devoted to theory and six to practice.
d Two hours a week both in theory and practice.

Now, let us turn to a third class of schools which is sharply defined from the two classes that have just been noticed. Like one class it lays stress on the shop feature; like the second class it lays stress on training the faculties of observation; but unlike both it does not teach a trade, but "the underlying principles of all trades," better, perhaps, expressed by "the underlying principles of construction in wood and metal." So much attention was given to this class of schools in Chapter XV of the Bureau's report for 1887–88 and in Chapter XVI of the report of 1888–89 that consideration of them is not now necessary, further than to repeat that the admirers of these schools may be divided into two groups, one group strongly maintaining the pedagogical value of the schools as secondary institutions and the other urging their value as apprenticeship schools or as preparation for apprenticeship. The three features of the shopwork in the "manual training schools" are well illustrated by the departments of the Chicago Manual Training School.

Department.	Weeks in course.	Greatest accommodation.	Pupils.
First year:			
Woodwork	40	151	161
Second year:			
Foundry	6	90	90
Forge	34	90	90
Third year:			
Machine shop	40	52	52

These systematic exercises in wood-working, forging, and fitting, usually called the "Russian system," have been adopted by many institutions of a higher grade than that of a school having a post-grammar (or high school) course of study. Thus at Swarthmore College, and at many of the schools en

dowed with the national land grant of 1862, manual training on the Russian system has been introduced.

If the drawing that is taught in the public elementary schools of almost every important city and the clay-modeling, cardboard construction, and even carpentry that are taught in many, be excluded from consideration, inasmuch as the public schools are not apprentice schools, it will be found that the types of schools supported at public or private expense to provide the country with mechanical engineers or mechanics has been exhausted. At New York there is a school for teaching the trades of bricklaying, and at Philadelphia a weaving school, but the class of schools they represent has, as a class, no existence in America unless the trade instruction given in the schools for the deaf, blind, and delinquent be included. As we hear much talk of "industrial art," "industrial schools," etc., in Europe, what is being done there becomes of interest. The difficulty is to give a comprehensive description; for usually what is done in a single school is made to represents all the shades of meaning in which the term "industrial" school can be taken. For some years Monsieur Marius Vachon has been intrusted with an inquiry into the conditions of industrial art instruction (peculiarly near to French industrial prosperity) in Europe. In pursuance of this commission Monsieur Vachon has made extended study through Europe and has published five reports.[1] At the conclusion of his last volume he summarizes the results of his study and travel, and it is this summary that has been translated and reproduced here as the best possible way of illustrating the character of schools which do not exist as a class in America, though we have a Cooper Union, several "mechanics' institutes," and even a "Newark Technical School" for apprentices who are abnormally developed on the practical shop or side.

Résumé of an Inquiry in Regard to the Schools and Museums of Industrial Art in Europe.

By Monsieur Marius Vachon.

The mission that the minister of public instruction and fine arts intrusted me with for the purpose of studying the organization of the schools and the museums of art and industry in Europe is at length completed. I have visited 110 schools, 40 museums, and 14 great associations, and I may now present them in their proper physiognomy by typical institutions. Every form which instruction in industrial art has taken has passed under my eyes and has rendered it possible for me to make a comparison of the methods and systems which are in vogue. I, therefore, at the conclusion of my fifth report, summarize the results of this extended personal inquiry which during five years has required a year of travel and of study.

Character of instruction.

At the base of instruction in art and industry are the apprenticeship school and the school preparatory to apprenticeship. The instruction of apprentices for the trades connected with art has taken a great variety of forms, according as the State, municipality, or association which supports a school has followed one of two systems, to wit: Apprenticeship in the shop or apprenticeship in the school. The respective values of these two systems have occasioned the discussions and disputes of pedagogues, manufacturers, and political economists.

But before entering upon the work proper it is necessary that I should indicate as exactly as possible what I understand by apprenticeship in the school. There is a tendency to mistake the true character of the instruction the term indicates when properly used; and from this error unnecessary contradictions and empty polemics result.

The manual instruction that has been introduced into the French elementary schools has no relationship with true apprenticeship, and it has been clearly defined in the Dictionnaire de Pédagogie et l'Instruction Primaire of Monsieur Buisson as "School apprenticeship (apprentissage scolaire)." By this term is understood the "workshop in the school," a part of the organization of the elementary school by which a few hours of manual work are added to the usual routine of school work. It is not an apprenticeship, but a preparation for an apprenticeship; it gives the habit of and the taste for work." Whenever, as in

[1] Upon the conditions of affairs in Germany, Austria, Belgium, Switzerland, Italy, Russia, Denmark, Sweden and Norway, and England. National Printing Office, Paris, 1885-90.

France it too frequently happens, the limit of this instruction is passed, pure apprenticeship instruction is the result, and the extremely poor work done calls forth very justly the denunciations of manufacturers. In almost all the schools of foreign countries laboratories have been organized for the application of theoretical principles, and if they are not called apprenticeship shops the manual-training school of the public-school system should not be.

APPRENTICESHIP SCHOOLS.

During my investigations I found true schools of apprenticeship both in Belgium and in Holland, and moreover they were so called. The most typical are the Iron School at Tournay, in Belgium and the Quellinus School at Amsterdam.

The Iron School at Tournay possesses shops administered as a business concern, by a lessee. The student is thus simultaneously taught theory and practice while receiving a real professional education and learning a trade. Nevertheless, the very unique and remarkable organization of this school does not give good results. The number of students is small, 75 in all, and very few finish the term of apprenticeship. The working class is not interested in the school, and the municipality and the General Government are very much concerned about its decay. Undoubtedly this type will soon be abandoned.

The Quellinus School also has a peculiar organization. When the eminent architect, Cuyppers, began the construction of the National Museum at Amsterdam, he was embarrassed by the difficulty of obtaining competent persons to execute his designs for its decoration and furnishing. Masters and workmen of ability were utterly wanting.

To train such, a school was necessary. The architect called together some friends, a society was formed, and with the concurrence of the city a school was established. The object of the school is the theoretical and practical application of drawing to carving in wood and stone. The practical work is done in a shop attached to the school, which thus is divided into two very distinct parts. The shop is the enterprise of a society which, however, realizes nothing from the work, the proceeds being distributed pro rata among the students and professors who have executed and superintended each piece of work. The students are taught drawing, but the instruction is confined to making correct designs, and is especially directed to the reading and reproduction of the designs of professional architects and designers. The management of the school, however, desires to give a more artistic character to the school and to make it a finishing institution so far as the industries taught in the school are concerned. Such as it is the organization is not sufficiently powerful to struggle successfully against the many obstacles which the journeymen carvers in stone and wood place in the way of the school's success. Moreover, the school is very expensive. Each student costs annually $113, exclusive of the interest on the building and apparatus. I am certain that a reorganization must be effected soon or the school will go under.

In Russia, where a national industry has only lately come into existence, apprenticeship schools are very numerous. At the time of my visit there were more than fifty having more than 2,000 pupils. They are mostly the creations of the state or of cities aided by the state; but a number have been founded by societies or by private individuals. By the side of the great schools there are about 1,200 small schools which teach the industry that is peculiar to the village or city in which they are situated—carpentry, turning, forging, locksmithing, tanning, bookbinding, etc.

SCHOOLS PREPARATORY TO APPRENTICESHIP.

On the other hand, the schools preparatory to apprenticeship are very numerous in Europe. Of these the schools that I have studied as types are the Ambats School of Amsterdam, the Technical School of Birmingham, Heriot's Hospital School at Edinburgh, and Les Écoles St. Luc in Belgium.

Though deeming that real and industrial instruction is only capable of being given in a shop located in an industrial center, the founders of the Ambats School have recognized the necessity of a special institution where intelligent masters, free from the preoccupation of business, shall introduce children into the principal trades through the theoretical and practical demonstration of their elements and instruction in drawing. In the shops of Holland, as almost everywhere, apprenticeship is an unscientific process, and moves so slowly that the apprentice loses heart. This is due to the selfishness and the negligence of superintendents and masters.

The Ambats school is fed exclusively by the working class. In the general course the students receive a good elementary education. In drawing the instruction is confined to the indispensable elements for the intelligent exercise of manual work. Those who desire to perfect themselves remain a long time at the school, during which they receive supplementary instruction in drawing and mathematics. Practical and manual instruction enters largely into the course. The shops are for carpentry, wood-carving, mechanical work, and locksmithing.

In this as in all schools of the same kind the management is confronted with the difficulty of holding its students. As soon as the children can use the graver and the plane a little they desert. The institution appears to prosper because it insists vigorously that the child shall be given a real manual education for apprenticeship. The society that founded the school has opened an annex in another part of the city. The cost per capita is $37 a year.

The Technical School of Birmingham and the Heriot Hospital School of Edinburg have been organized in the same spirit as the school at Amsterdam, to wit, to furnish industry with young people practically prepared for apprenticeship. But the English schools are of a higher grade than the Amsterdam school, for they will only receive students who have already finished their elementary education—who have already acquired the elementary principles of art, of science, and of literature. To the shops for manual work have been added very complete laboratories of chemistry and of physics, where the students are introduced to real scientific problems and to a certain amount of practice in industrial art. Before finishing their studies the students are engaged as future apprentices, as a rule, by the chiefs of industrial establishments. These schools are very prosperous and render great service to local industries. Day by day they grow and are constantly serving as models to new schools of the same nature that are being created in different parts of the three kingdoms.

The great institution known as the Schools of St. Luc, Belgium, follows the same course of preparing for apprenticeship to the trades which are directly concerned with art. On leaving the school the management places the young people in shops directed by former pupils, imposing on the superintendent the duty of sending the apprentice to school every evening and of admitting into the shops the professors who are charged with the duty of giving account of the conditions under which the apprenticeship is taking place and the professional progress of the apprentice. This system is rendered very practical and very valuable in results by the interest that the directors of the shops have in the St. Luc establishment, their own alma mater.

Moved by the same ideas, the work of the professional schools of Belgium has, in every important industrial center, created syndicates of the superintendents of industrial establishments, who have organized shops in their manufacturing establishments, to which the students of the industrial and professional schools are admitted. These schools give theoretical and artistic instruction; the shops the practical exercises.

Another type of schools preparatory to apprenticeship is that furnished by the numerous industrial schools of Ireland, of which the most remarkable is the school of Artane at Dublin. Only wholly orphan children are admitted, who are to devote themselves to domestic or rural work. They receive an elementary instruction, elementary ideas of science and art, and a rather complete manual education. Some thousands of children are raised in these institutions, which have the double character of a school and an asylum.

ELEMENTARY SCIENCE AND ART SCHOOLS FOR APPRENTICES AND JOURNEYMEN. (ECOLES COMPLEMENTAIRES DE L'APPRENTISSAGE.)

Of a higher grade than the schools of which I have just spoken are the industrial and the technical schools.[1] These schools aim to give the apprentice and journeyman elementary notions of science and art after his work for the day ceases. Thus the economic value of the work produced by the laborer is enhanced because it is done more rapidly and perfectly. The school completes by theory the practice of the shop.

These schools are the best type of institutions for the development of artistic and technical instruction. They answer exactly to the new conditions of the organization of skilled labor and place in the possession of the mechanic an out-

[1] What we would call industrial or technical the author calls "special professional school," which are treated of further on.

fit that is of marvelous power and yet of great simplicity. It does not interfere with apprenticeship in the shop, the basis of industrial life, and gives the apprentice, without causing social disturbance, without loss of time, and without great expense to the workingman a solid scientific and artistic instruction. The moral discipline of the school and the essentially professional character of its instruction does not disgust the student with his daily work, but rather tends to lend it new attractions and render it more elevated and productive. Thus these institutions are innumerable.

Belgium has created 36 industrial schools, properly so called, which are destined exclusively to instruct journeymen and apprentices in the elements of the science or art which is demanded by their profession. The number of students in these schools is 10,597. If to these be added the students in other and higher professional schools the total number of persons annually instructed in Belgium in the industrial way is over 25,000. The population of Belgium being 5,853,278, the proportion of the population in professional schools is 4.2 per thousand. At Brussels, Ghent, and Charleroi the proportion is 1 in 100 of population.

England is in the same category with Belgium. At London the People's Palace has 7,000 students, the Polytechnic Institute 9,000, at Birmingham the Midland Institute has 10,000. In Holland the number of industrial schools is 32, that of professional schools 25, and the attendance 7,000, in other words, 2 persons in every thousand are in attendance. Switzerland has 87 schools with 8,000 pupils, not counting in the realschulen and others. Attendance on these schools is, in many cases, made obligatory. In Denmark there are 77 schools with 6,000 students, the proportion to the population being 3 in 1,000. In Sweden there are 28 schools, that of Stockholm has 800 students, more than 5 in every 1,000 of the city's population. In Italy there are 136 industrial or art schools with 16,274 students. At Hamburg the industrial school contained 3,200 pupils, or 8 per cent of the city's population.

The types of this class of schools are numerous and vary with their environment. In Germany it seems to me that the programmes give art a preponderating place even in the centers of great metallurgic or textile industries, and that the sciences are taught only in their elements. The same is true according to my observation in Belgium, Holland, Switzerland, and Austria. In England, on the contrary, the organization of the course tends in the direction of the pure and applied sciences rather than in that of art. The technical schools with well organized laboratories of chemistry, physics, and electricity, with shops for work in iron and wood, are in greatest number. According to the most recent figures there were 112,808 pupils in technical classes, and 77,364 in art classes.

The Hamburg school is, in my opinion, the most perfect institution of its kind existing in Germany, as well from the point of view of the principles which caused its establishment, as from those of administration and instruction. It has served as a model for the majority of the German schools. Upon entering the school every pupil, if he is not yet a mechanic as sometimes happens, must choose a trade. Many corporations of mechanics have inserted in their constitution that the director of an establishment must send the apprentice to school for at least eight hours a week. Moreover, a law of the Hamburg Senate, passed in 1864, imposes the duty upon every director of an industrial establishment to send his apprentices to school during six hours a week.

The duration of the studies is not fixed by rule, the students must remain in the school for six months, but after that they may remain for two, three, four, or five years even, according to their tastes and their aptitudes; in brief, they leave only when they think they know enough to work at their trade with advantage. The session is from 6 to 10 p. m. The first half of the first year is given up exclusively to the study of the elementary principles of drawing. Copying is rigorously forbidden; all drawing must be from nature. The second half of the first year is partly devoted to professional drawing. As soon as the student has acquired the ability to draw he is put to work upon drawing objects which belong to his profession. The following years the professional drawing proceeds pari passu with general artistic instruction. With the exception of the theoretical courses, collective class instruction is not permitted. Each student receives a personal, intimate, and varied instruction according to his temperament and his aptitudes. The master is constantly in the study rooms, and constantly inspects the work of the student, advising and criticising him freely. Punishment and prizes are unknown. The discipline is severe, but it is not by general orders. Each student is habituated to conduct himself in a serious manner and to consider the work as a social duty and not as an instrument of puerile ambition. The idea of giving the tuition without charge has been pushed aside with dis-

dain as antidemocratic and as calculated to hurt the organization of the school. It is thought, very justly, that the tuition fee is an excellent, even infallible, means of interesting the children and parents in the attendance on the course.

The most typical and complete institution of this kind in Belgium, where industrial instruction has had an immense development, is that at Charleroi. It is not only an elementary industrial school, but a sort of higher institution for journeymen and apprentices. The course of instruction touches upon all the industries of the region. In view of its double object the school of Charleroi has two kinds of courses, to wit, the evening course, which has a session every evening of the week from 7 to 9 during the whole year, and the Sunday course, from 9:30 a. m. to 12:30 p. m. The evening course is elementary, the Sunday course in a certain way a higher course, since it is intended to supplement the instruction received during the week in the evening school, or the local day schools of Charleroi.

The curriculum of the evening course consists of French, commerce, physics, arithmetic, geometry, chemistry, linear drawing (figures and ornament), and to draw from plaster casts. The curriculum of the Sunday course comprises commerce and bookkeeping, arithmetic, geometry, physics, chemistry, topography (land and mining surveying), steam engine, electricity, building and architecture, forging, coal mining and engineering, linear, figure and ornamental, drawing from casts and modeling. The student may choose the course which suits him, provided he has the ability to follow it with profit. A certificate, however, is only delivered to those students who have followed the course for two years at least, and have passed a thorough examination upon all the studies that they have pursued. I visited this school one Sunday when the ground was covered with snow and witnessed a scene that touched me deeply. Eight hundred pupils, young and old, employers and employés, were assembled, and were listening to the discourse of the master, or were engaged in study, as stoically indifferent to the chilly temperature as they had been to the seductions of the saloon. Many of them had risen before daylight, had traveled for hours through the snow to attend the lesson of their professors—engineers or directors of mines, doctors of science, or other distinguished university people—to learn arithmetic, geometry, physics, chemistry, and to pay for the instruction they receive.

In England these complementary schools for the education of the apprentice form the type most in vogue. There is not an industrial center, however small, which does not possess one, and the great centers have many. I will add even that in reality these are the only industrial schools that really exist and that render real service to the national industries (J'ajouterai même qu'en realité ce sont les seules écoles qui existent sérieusement et qui rendent de réels services aux industries nationales). The day schools, with few exceptions, are luxuries (écoles de pur luxe), which are especially for young people who desire to enter upon a liberal career, for amateurs, and for persons whose time hangs heavy on their hands (oisifs). The attendance at the day schools is scarcely a twentieth of that of the evening schools.

The great schools of the kind now under consideration that I have studied with care are the school of the People's Palace at London, which contained in 1889, 5,500 students; the school of the Polytechnic Institute at London, with 7,000 students; the Technical School at Finsbury, with 1,000 students; the school of the Birmingham and Midland Institute, with 3,527 students; the Heriot-Watt College at Edinburgh, with 2,000 students; the Technical School of Manchester, with 500 students; the Technical School of Bradford, with 352 students. The instruction given in these schools is very thorough and of a higher order. To follow the course profitably it is thought that the student should be versed in the elements of art and science. But this requirement is not enforced and those who can not follow the regular course are taught in preparatory classes. Industrial science figures largely in the programmes, and to complete the theoretical instruction laboratories and shops have been fitted up with extraordinary completeness. In the case of great industrial centers having a predominating industry care has been taken to specialize the instruction. Thus I have found at the Birmingham and Midland Institute a real school of metallurgy, with laboratories, forges, etc.; at Bradford there is an evening technical school for the drapery industry; at Manchester, a school for spinning and weaving; at Glasgow, a veritable school of marine engineering.

Beside these schools where technical and industrial instruction preponderates or almost excludes any other, there exists a class of evening schools where the pupil learns drawing, painting, sculpture, modeling, etc. These are intended particularly for journeymen and apprentices in trades in which art plays a great rôle. These schools are numerous and flourishing. Each city possesses one.

The organization of these English technical and art schools presents the interesting peculiarity that I noted at Charleroi, to wit, the use of the same building by the day and evening schools, the teaching corps being common to both. This is very economical. The social results are immense. The evening schools that are attended exclusively by apprentices and journeymen come out in strong relief by their fusion with the day schools of high and low degree. The evening school is no more a philanthropic enterprise which brings the young and old together whose intellectual developement would otherwise cease, but it is an institution of a high order in which the student must pay for what he receives. The journeymen, the apprentices, the son of the owner and the children of the bourgeoisie are brought together in public and both are honored by having been students in the same institution, and the social harmony increases.

SPECIAL PROFESSIONAL SCHOOLS.

Above the schools for journeymen and apprentices, are the special-profession schools which have the object of educating foremen and other higher employés. They are true higher schools of industry. The great schools of this class that I have studied are:

In Germany: The weaving school of Crefeld (founded in 1855, thoroughly reorganized in 1881); the metal-working school at Iserlohn (1879); the mining school of Bochum (founded in 1844 and afterwards reorganized); the school of iron and steel industries at Remsheid (1880), and the woolen-industry school at Aix la Chapelle.

In Switzerland: The weaving school at Zurich, and the school of embroidery and lace at St. Gallien.

In England: The Bradford technical college, the weaving and spinning school at Manchester, and the technical school of the City and Guilds of London Institute.

In this type of institutions general and artistic instruction holds a great place, which is not the case, as we have seen, in the industrial and technical night schools. Those who attend these schools are neither journeymen nor apprentices, but young people who desire to occupy a higher rank in the industrial hierarchy, as foremen or superintendents. They study what I will call the industrial humanities.

The most complete school and the best in its organization as to matters of instruction and equipment is the Crefeld Weaving School. The school, in the first place, is something more than its name indicates. Its real mission is to train, by a professional, theoretic, and practical instruction and by a solid artistic education, weavers, foremen, silk dealers, and industrial designers for the textile industry. The programme includes the study of drawing and painting; the examination and separation of all the tissues—silk, cotton, linen, etc.; the practice and analysis of all the manipulations and transformations that they undergo before and after weaving; the theoretical and practical study of all the systems of mechanical and other trades; all the modes of fabrication; all the motors employed in the weaving industry; the appearance and the color of goods; industrial bookkeeping and commercial geography. The course, which covers two years, is conducted by fourteen teachers. Practical work alternates with theoretical and artistic instruction. The school contains for these purposes weaving shops with eighty mechanical or hand looms (metiers) with all the accessories, laboratories of chemistry, of dyeing, and printing, and a complete museum of ancient and modern cloths. After spending two years in the school the studious and intelligent student has received a complete professional instruction in weaving, and is able to become an overseer in a shop, a designer, or a commercial agent of the first order. In addition an artistic education has given him the love of the beautiful, of the works of the masters, and a desire for new ideas (la curiosité d' dées nouvelles).

The schools of Iserlohn, Remscheid, and Aix la Chapelle, were founded on the same principles, and present an organization but slightly different. They are, as is the Crefeld school, true special schools for the officers of industry.

The Technical School of Bradford and the Weaving School of Manchester have not the same general character of technical and artistic instruction. Their course is less complete and less elevated. I think that I may justly denominate them as preparing the under officers of industry. In England the dogma in matters of technical instruction, "theory in the school, practice in the shop," is applied to directors as well as to the journeyman. I am not inclined to blame the English in this, though I admire so much and recommend the Crefeld school.

SCHOOLS OF DECORATIVE ART.[1]

[SCHOOLS OF INDUSTRIAL ART, SCHOOLS OF DRAWING, SCHOOLS OF ART.]

In the third class come the schools of drawing and art, schools of decorative art, or schools of industrial art. These constitute, so to speak, the higher instruction of art applied to industry. They may be placed in three divisions which have no definite line of demarcation.

England, Germany, Russia, Austria, Sweden, and Denmark unite in distinguishing between high art and industrial art, between academic art and factory art, but Belgium is more advanced, and the old academies of Anvers and of Brussels are radically transforming their instruction. During the first year of the course the students receive instruction in drawing and geometry, the course being preparatory. In the following year the students find themselves called upon to choose the profession of an artist, sculptor or architect. To aid them a synoptic table has been gotten up which indicates the industrial branches "which are derived from each of these general divisions." It was thought that a specialization should be made at the beginning of the second year as giving point to the study of art. Experience had shown that two-thirds of the students formerly abandoned the academies before accomplishing anything because they were impressed with the inutility of the long course in art for their profession. The old system of generalization of the studies had the defect of sending off the student in quest of pure art without application to industry, and thus made very bad painters, sculptors, and architects of them.

II. *Organization and administration.*

SUPPORT.

In Germany the interlocution of the state in the support of these schools is manifested in many ways. When it is a cofounder it furnishes collections, tools, and furniture. When it is simply a participant it gives a fixed sum for a determined period. Finally the schools whose foundation it has caused (provoqué), therefore called royal, are inscribed as beneficiaries on the state budget. The municipalities make an annual appropriation and sometimes provide the building. The workingmen's and the professional schools generally receive no support from the state and are generally supported by the communities in which they are located, with the aid of societies and individual benefactors.

In Belgium the municipality is at the head of the school movement. It either takes the initiative or adopts a school founded by private societies as soon as their public utility has been shown. The state appears in the affairs of the school only as it makes appropriations, which, however, are always liberally accorded. The schools preserve their own autonomy, the state is only concerned with results, and if they are satisfactory the appropriation is continued. The municipality in giving recognition to schools founded by societies leaves to the society the management of the school, the appointment of the professors, the budgets, and the course. The municipality only administers directly the communal schools, but even in them a great deal of independence is given to the directors.

In Holland, with four or five exceptions, every industrial, art, or professional school has been founded by societies which direct them in a perfectly independent manner. The state, province, or municipality grants them aid.

In Denmark, Sweden, and Norway the most active rôle is played by private enterprise in the creation of institutions for the development of technical and art instruction. The state and municipality grants aid, but does not absorb their individuality.

In Russia almost all the schools have been founded and are supported by societies. The activity of the state is almost nil.

In Austria-Hungary every school is under the minister of public instruction or of commerce, according as they are technical or art schools.

In Switzerland the schools are generally founded and administered by the municipality. The Federal Government grants aid, which varies according to the more or less national or local character of the institution.

---

[1] The remaining part of M. Vachon's report is given in abstract.

In Italy all the schools are the creations of societies of artists and of mechanics. So far from being supported, the schools have been opposed by the state and municipality. Now the state has laid its hand upon them all and leaves them but comparatively little independence. The municipalities make them liberal grants and intervene in their administration.

In England the state has up to the present left the matter entirely to the municipalities, societies, and individuals, the National Normal School of the South Kensington Museum being the only exception. For the most part the schools are the creations of societies who manage them and endeavor to make them self-supporting with the aid of contributions from private and public purses. Every municipal school should have a governing board at its head of five members chosen from the inhabitants of the town. The state never interferes in the administration of the municipal or private schools, except so far as to require from all schools that desire to share in the public appropriation, to recruit its teaching corps from among the professors holding the diploma of the South Kensington School. This public appropriation to the schools of science and art of the Kingdom by means of an annual competition is large but variable.

TUITION.

In England the system of gratuitous instruction is resolutely excluded as injurious. Scholarships are given after a very severe examination. In Germany it is the same, though scholarships are given to poor students. In Denmark, Sweden, and Norway even scholarships are not given. In Holland nearly every school is a pay school.

In Belgium there is a mixed system and there are as many gratuitous as pay schools. Some schools require some pupils to pay while other pupils are educated free. At Charleroi the tuition is repaid at the end of three or four years to students who have obtained a diploma.

COST.

Country.	Schools.	No. of students.	Per capita cost.
Germany	Weaving School of Crefeld (shops, laboratories, etc.)	250	$74
	Industrial School of Hamburg	3,200	10
	School of Decorative Arts, Berlin	500	20
Switzerland	School of Industrial Arts, Geneva	200	10
	Municipal School of Art and Industry, Geneva	58	30
	Watchmakers' School, Geneva	112	9
	Industrial school of Zurich	350	9
Belgium	Industrial School at—		
	Charleroi	860	7

	Technical School, People's Palace, London	5,500	28
	Technical School, Birmingham (shops)	308	28
	Technical School, Manchester (shops, laboratories)	600	75
	Bradford Technical College (shops and laboratories)	1,500	20
	Artane Industrial School, Dublin (board and lodging)	800	105

III.

COURSE IN MINING ENGINEERING.

The features which distinguish the course in mining engineering from that of civil engineering become apparent on comparing the course of the Massachusetts Institute of Technology given below with the civil-engineering course given at page 952. Laboratory work is especially prominent. In brief, the mining engineer is a civil engineer who operates beneath the surface of the earth and a chemist whose specialty is metallurgy. The Massachusetts Institute of Technology has a special laboratory for the students of this course, called the Cummings Mining and Metallurgical Laboratories. The institute is careful to anticipate the common criticism that work in such a laboratory is no substitute for the experience gained in larger works; for the object of its laboratory is to prepare students for such experience, to instil the spirit of investigation, and to emphasize the process given in the text-book. The mining laboratory consists of three parts—milling, furnace, and assay rooms. To bring the student into still more intimate connection with their specialty, summer schools of mining and metallurgy are organized for the study of mines, mills, smelting works, and geological fields. In 1890 the school, consisting of twelve students, spent a month at work—mining, setting timbers, and surveying underground—in the iron mines at Ishpeming, Mich. Next year instead of a mining a metallurgical school will be organized.

Mining engineering at the Massachusetts Institute of Technology.

Subject.	Lect., Rec., Lab., Draw., or Field.	Instructor.	Year.	Term.	Number of weeks.	Hours per week.

Drawing	Draw	Richards	3	1	15	2
			4	1	15	1
Memoirs	Read	Richards, Hoffman	4	1,2	30	2

As at the Massachusetts Institute the civil-engineering course is the starting point for the other technological courses, and at the Rose Polytechnic the mechanical engineering course is the basis of the other courses; so has the school of mines of Columbia College been developed into a general school of technology. Owing to lack of information, however, it is necessary to pass by this very important school and to let the Michigan Mining School represent the class now under consideration. It is hardly necessary to remark that the school is situated in the northern or mineral-yielding portion of that State. The school has been in existence only a few years, having been established in 1886.

Curriculum of the State Mining School of Michigan.

Study.	Fall term.	Winter term.	Spring term.	Summer term.	Total hours.
First year					1,575
Higher algebra, trigonometry, and analytical geometry	70	70	30	0	170

One of the oldest and certainly one of the most renowned mining schools of Europe is the Bergakademie at Freiburg, in Saxony. In this institution there are four courses, to wit, for mining engineers, mining surveyors (markscheider), metallurgical engineers, iron-smelting engineers. To show how this specialization is made the curricula of the four courses are given side by side:

FOR MINING ENGINEERS.		
Studies.	Hours a week.	
	Lecture.	Exercises.
First year:		
Higher mathematics (part 1)	6	0
Descriptive geometry	3	2
Spherical trigonometry	a 2	0
Physics	6	1
Inorganic chemistry	4	0
Mineralogy	5	0
Crystallographic practicum	------	a 1
Topographical drawing and sketching.	0	2
Second year:		
Higher mathematics	2	0
Mechanics	6	1
Mining (1 part)	5	0
Geology	5	0
Palæontology	2	0
Study of strata and fossils	0	a 2
Mineralogical practicum	0	2
Physics (practicum)	0	2
Blowpipe assaying	2	2
Computative and graphical exercises in mechanics.	0	4
Third year:		
Geodesy and mine surveying (part 1).	3	0
Geodetic practicum	0	b 2 / a 6
Mining (part 2)	5	0
Machines	4	0
Strata	3	0
Metallurgy	4	0
Building construction	3	0
Computative and graphical exercises in machine construction, etc.	0	4
Fourth year:		
Geodesy and mine surveying (part 2).	3	0
Surveying practicum	0	6
General law	b	0
Mining law	a 4	0
Sketches of mining and smelting works.	4	0
Mining and metallurgical book-keeping.	1	0
Mining and metallurgical statistics.	b 1	0
Political economy	b 3 / a 2	------
Mining and smelting hygiene	2	------
Electricity	2	a 2

FOR MINING SURVEYORS.		
Studies.	Hours a week.	
	Lecture.	Exercises.
First year:		
Higher mathematics (part 1)	6	0
Descriptive geometry	3	2
Spherical trigonometry	2	0
Physics	6	1
Mineralogy	5	0
Mining (1 part)	5	0
Topographical drawing and sketching.	0	2
Second year:		
Geodesy and mine surveying (part 1).	3	0
Geodetical practicum	0	b 2 / a 6
Higher mathematics (part 2)	2	0
Mining (part 2)	5	0
Geology	5	0
Mechanics	6	1
Third year:		
Geodesy and mine surveying (part 2).	3	0
Mine-surveying practicum	0	6
Strata	3	0
General law	b 4	0
Mining law	a 4	0
Political economy	b 3 / a 2	0

a In summer. b In winter.

FOR METALLURGISTS.

Studies.	Hours a week. Lecture.	Exercises.
First year:		
Higher mathematics (part 1)	6	0
Descriptive geometry	3	2
Physics	6	1
Inorganic chemistry	4	0
Mineralogy	5	0
Mining (part 1)	5	0
Topographical drawing and sketching.	0	2
Second year:		
Higher mathematics (part 2)	2	0
Mechanics	6	1
Mining (part 2)	5	0
Geology	5	0
Mineralogical practicum	0	2
Physics (practicum)	0	2
Blowpipe assaying	2	2
Qualitative chemical analysis.	1	(*d*)
Chemical technology	2	0
Computative and graphical exercises in mechanics.	0	4
Third year:		
General metallurgy	4	0
Machines	4	0
General law	*b* 4	0
Mining and metallurgical bookkeeping.	1	0
Mining and metallurgical statistics.	*b* 1	0
Qualitative chemical analysis.	1	(*d*)
Geodesy and mining surveying (part 1).	3	0
Building construction	3	0
Computative and graphical exercises in machine construction.	0	4
Production of salt	*a* 1	0
Fourth year:		
Shot, pen, and typemaking, etc.	*a* 1	0
Foundry work and smithing, etc.	2	0
Assaying	0	1
Mass analysis	0	*b* 2
Gas analysis	0	*a* 2
Iron smelting	4	0
Firing	1	0
Electricity	2	*a* 2
Sketches of mining and smelting works.	0	4
Hygiene of mining and smelting work.	2	0
Political economy	*b* 3 / *a* 2	0

FOR METALLURGISTS IN IRON.

Studies.	Hours a week. Lecture.	Exercises.
First year:		
Higher mathematics	6	0
Descriptive geometry	3	2
Physics	6	1
Inorganic chemistry	4	0
Mineralogy	5	0
Mining (part 1)	5	0
Topographical drawing and sketching.	0	2
Second year:		
Higher mathematics (part 2)	2	0
Mechanics	6	1
Mining (2 part)	5	0
Geology	5	0
Physics (practicum)	0	2
Blowpipe assaying	2	2
Qualitative chemical analysis.	1	(*d*)
Computative and graphical exercises in mechanics.	0	4
Third year:		
Iron smelting	4	0
General smelting	4	0
Machines	4	0
Qualitative chemical analysis.	1	(*d*)
Geodesy and mine surveying (part 1).	3	0
Building construction	3	0
Computative and graphical exercises in machine construction.	0	4
Firing	1	0
Political economy	*b* 3 / *a* 2	0
Fourth year:		
Shot, pen, and typemaking, etc	*a* 1	0
Foundry work and smithing	2	0
Assay of iron	*b* 1	(*c*)
Gas analysis	0	*a* 2
Location of iron smelting works.	1	0
Sketches of mine and smelting works.	0	4
General law	*b* 4	0
Mining and metallurgical book-keeping.	1	0
Mining and metallurgical statistics.	*b* 1	------

c One afternoon. *d* Daily.

IV.

ELECTRICAL ENGINEERING.

Just as mining engineering is a specialty of civil engineering, so electrical engineering may be considered as a specialty of mechanical engineering; for "generation of steam" write "generation or collection of electricity," for "boiler" write dynamo, and the difference is reduced to a minimum. The main feature of difference, then, is not in the study of the art of applying the energy when generated, but in the theoretical and scientific study of the energy itself. However, there is another feature connected with electricity that is not in anyway connected with mechanical engineering unless the setting up of apparatus and construction of lines be also called such, and that is electric lighting.

During the ten or twenty years last past the development of the study of electricity and the application of it as an illuminating and motive agent has shared with the discoveries in organic chemistry the honor of public attention and applause. So responsive have our schools of higher education become to the growth of science, that already many courses of biology have been instituted and several courses in electrical engineering.

In the Massachusetts Institute the course of electrical engineering is made up in its technical features from the subjects composing the physics or mechanical engineering departments. On pages 968, 969 is given in parallel columns the course of mechanical engineering at the Rose Polytechnic Institute and the following scheme is for the students of that school who elect electrical engineering instead of the usual course.

ELECTRICAL ENGINEERING.

This course can be elected only by students in mechanical engineering.

	First term.	Second term.	Third term.
Sophomore year.		Electrostatics. Magnetism; elementary laws of magnetism and properties of magnetic substances. Electric currents; their measurements, use of galvanometers. Text-books and laboratory. (3 hours a week.)	Electric units: derivation and definition of quantity, resistance and potential; relations of. Resistance measurements, Wheatstone's bridge, Kirchoff's laws, etc. Text-book and laboratory. (3 hours a week.)
Junior year	Current generators; study of various forms of batteries; polarization and electrolytic resistance. Construction of batteries; care and management of same. Text-book and laboratory. (2 hours a week.)	Electro-magnetism; laws of electro-magnets and their construction, induction; electro-magnetic induction. Text-book and laboratory. (2 hours a week.)	Application of electro-magnetic induction in various operations, and for purposes of measurement, use of condenser in measurement, of insulation and insulation tests. Text-book and laboratory. (2 hours a week.)
Senior year.	Accurate determination of magnetic elements; absolute measurements in magnetism and electricity. The calibration of commercial instruments, and the study of their errors. (3 hours a week.)	Measurement of commercial currents by various instruments and methods, insulation of lines for electric light, telegraph and telephone purposes, arc and glow lamps, photometry, telegraph, telephone, and submarine cable appliances and systems. (3 hours a week.)	Electric lighting and power transmission; study of dynamos and motors as to efficiency, characteristics, etc., using various dynamometers. Design and construction of electrical apparatus and machinery. (6 hours a week.)

Recent arrangements at Purdue University have put that institution among the first in the country as a school of electrical engineering. A laboratory has been erected that is in itself an institution. The work has been developed from the mechanical engineering course and is identical with it during the freshman and sophomore years. During the junior and senior years the course is as follows:

JUNIOR YEAR.

Technical instruction.

(*a*) *Lectures and recitations, electricity and magnetism.*—Thirty-eight weeks, twice a week. This work thoroughly covers the elementary theory of the subject, and forms the necessary groundwork for the more advanced and technical instruction of the succeeding year. The elements of electrical and magnetic potential receives particular attention. The instruction is by textbook, supplemented by notes.

(*b*) *Laboratory work.*—Thirty-eight weeks, 6 hours a week, consisting during the first term of instruction in the art of physical measurement, and during the remainder of the year in the elements of electrical testing.

SENIOR YEAR.

(*a*) *Dynamo-electric machinery.*—Thirty-five weeks, twice a week. This course consists of the fundamental theory of such machines, of their various forms, and the applications of the same to electric lighting and power. The mathematical theory of electricity is drawn upon so far as found advantageous to the discussion of these machines. Systems of electrical distribution will be investigated, and tests on the continuous and alternating circuits of the department discussed. Each student is expected to produce from time to time a paper giving the results of reading or investigation of some electrical subject.

(*b*) *Laboratory work.*—Thirty-five weeks, 8 hours a week. During the first term the subjects considered will be advanced electrical testing and the standardization of testing apparatus, while the remainder of the year will be occupied with testing dynamos and motors, photometry and electric lighting, together with a practical study of the problems of electric lighting and power, and, finally, practice in electrical designing. Inspections of electric light factories and plants and reports on the same are considered part of this work.

(*c*) *Thesis.*—A thesis giving an original design of some electrical machinery, or an original investigation and discussion of some electrical installation, is required at the end of the course.

This electrical laboratory is a two-story structure of brick and stone, with a tower and ample rooms in the roof. The lower floor is given up almost entirely to electrical work. The second story contains the physical lecture room, offices, drafting rooms, and the like. The institution had a comparatively small electrical equipment at the start, but as soon as the new building was under way extensive importations were made, so that there are now available a rather full set of the best modern testing instruments, and a well appointed dynamo room with all the paraphernalia of commercial measurement.

The main part of the electrical building contains a general laboratory, lecture room, two laboratories for special work in electrical testing, a small laboratory for magnetic and other extremely delicate measurements, a battery room, and a director's office. The dynamo room is in an accessible and well-lighted extension, as far as possible from the laboratories where delicate instruments are in use.

This dynamo room is 27 by 42 feet, and is supplied with half a dozen typical modern dynamos of small size, conveniently arranged for experimentation. Power is furnished by a 22 high-pressure straight-line engine. This is placed at the extreme end of the dynamo room, farthest from the main building, and is coupled directly to a line shaft running nearly the length of the room, and is supported at short intervals by substantial piers. This shaft is very carefully lined up, and carries the driving pulleys for the various machines.

The equipment of dynamos consists of one of the original workshop type of gramme machines, brought to this country at the time of the Centennial Exhibition at Philadelphia, a Thomson-Houston 3-light arc machine, a Brush 4-light arc machine, an Edison 40-light incandescent machine, to which supplementary series coils for compounding have been added, and a Slattery alternator specially designed for experimental work and giving an output of about 10,000 watts. In addition, a compound wound incandescent machine is under construction from designs by the director of the laboratory. This last is a Manchester type machine, with field magnets seated on a gun-metal base. In connection with the alternating dynamo there are converters of Westinghouse, Slattery, Thomson-Houston, and national make. A bank of lamps and a Julien storage battery of 25 or 30 cells are also located in the dynamo room. A Sprague constant-potential motor and a Baxter constant-current motor serve as types of those classes of machines. The testing rooms are fitted with substantial masonry piers independent of the flooring or foundations of the building, and are

quite free from vibration. The set of testing apparatus was designed to give opportunities for the absolute measurement of resistances and of both alternating and direct currents at all potentials. To this end the equipment includes a well-selected series of standard resistances, two of Sir William Thomson's balance dynamometers and a Weber and a Siemens dynamometer, and two Thomson electrostatic voltmeters, aside from the ordinary apparatus of testing and commercial measurement. The physical lecture room is located over the dynamo room, so that any kind or quantity of current and direct mechanical power are both easily available.

The city of Lafayette, in which the institution is located, has an electrical railroad and two electric light stations, which through the courtesy of the managers are often available for additional instruction and illustration.

V.

ARCHITECTURE.

The readers of one of those romances of Violet le Duc which have an engineering "motif" will remember the answer given by the engineer to the architectural student who asked for the difference between an architect and an engineer. "You ask me a difficult question to answer," was the response; "art has been separated from science and calculation because it is thought that both can not be held in the same brain." However this may be, we have in America but few courses of architecture, those known to the Bureau being at the Massachusetts Institute of Technology, the Lehigh and Cornell Universities, Columbia College, and the University of Illinois. The courses of the two universities last named are given, together with that of the technological university at Hanover.

Course in Architecture at Cornell University.

FIRST YEAR.

Instrumental drawing and projection, six hours during winter term; building, surveying, and levelling, spring term; lectures and field work, two afternoons per week.

SECOND YEAR.

Building materials and construction, winter term; lectures three times a week; drawing, six hours a week. Spring term: Lectures and drawing, six hours a week, and each week four hours additional drawing; shades, shadows, and perspective. Spring term: Lectures; drawing, six hours a week.

THIRD YEAR.

History of architecture; lectures, fall and spring terms, three times a week; winter, daily. Drawing, six hours a week. Designing, nine hours a week. Additional drawing and library work in each term, ten hours. First half of spring term: Mechanics applied to architectural construction; lectures three times a week, with drawing as above. Ornament, spring term, twice a week.

FOURTH YEAR.

History of architecture, lectures, fall term, three times a week; winter, twice. Designing, fall and winter terms; lectures, twice a week; lectures and drawing, seven and a half hours a week. Spring term, lectures, twice a week; drawing, four hours additional; drawing and library work, each term, twelve hours per week. Heating, etc., lectures, fall term, three times a week. Stereotomy, lectures, winter term, twice a week, and six hours a week drawing and modelling. Professional practice, spring term, lectures.

ARCHITECTURAL COURSE AT THE TECHNICAL UNIVERSITY OF HANOVER.

	Hours a week.	
	Lectures.	Exercises.
FIRST YEAR.		
First semester:		
Differential and integral calculus (1 part)	5	1
Analytical geometry (plane and solid)	3	0
Descriptive geometry	3	6
Elements of physics	3	0
Mechanics	3½	½
Elements of mineralogy	2	0
Architectural drawing	0	5
Building construction (1 part)	3	6
Second semester:		
Differential and integral calculus, Part II	3	1
Descriptive geometry	3	6
Elements of chemistry	6	0
Mechanics	7	1
Elements of mineralogy	2	0
Architectural drawing	0	6
Building construction (1 part)	3	6
SECOND YEAR.		
First semester:		
Elements of practical geometry	2	2
Elasticity	5	1
Graphical statics	1	0
Geology	2	0
Landscape drawing	0	2
Figure drawing	0	6
Modelling (1 part)	0	4
Ornament (1 part)	1	2
Agricultural structures	1	3
Development of the styles of antiquity	3	6
Elements of building construction	3	0
Building technology (preparation of materials)	3	0
Second semester:		
Elements of practical geometry	0	3
Graphical statics	0	2
Geology	2	0
Landscape drawing	0	2
Figure drawing	0	6
Modelling (Part I)	0	4
Ornament (Part I)	1	2
Building construction (Part II)	3	3
Agricultural structures	1	3
Styles of antiquity	0	6
Roman style	3	0
Elements of building construction	3	0
Technology of art industries	2	0
THIRD YEAR.		
First semester:		
Water-color sketching	0	2
Drawing from life	0	6
Ornamentation (Part II)	1	2
Arrangement of buildings for private and commercial purposes	2	0
Arrangement of public buildings (palaces, halls, etc.)	2	0
Styles of the renaissances	2	0
Styles of Gothic building construction	3	0
History of architecture	6	0

	Hours a week.	
	Lectures.	Exercises.
THIRD YEAR—continued.		
First semester—Continued.		
General history of art	4	0
Early Christian style	0	3
Sketches and details of dwelling houses	1	5
Statistical computations regarding iron, stone, and wood construction	2	2
German renaissance (optional)	2	----
Æsthetics (optional)	2	----
Second semester:		
Water-color sketching	0	2
Drawing from life (until end May)	0	6
Ornament (Part II)	1	2
Arrangement of private and commercial buildings	2	0
Arrangement of public buildings	2	0
Styles of the renaissance	2	0
Styles of Gothic building construction	3	0
History of architecture	6	0
General history of art	4	0
Exercises in the history of art (Italian renaissance)	0	2
Styles of the early Christians	0	2
Sketches and details of dwelling houses	1	5
Statistical calculations of iron, stone, and wood construction	2	2
Elements of machinery	2	0
German renaissance	2	0
Lightning rods	1	0
Æsthetics	2	0
FOURTH YEAR.		
First semester:		
Modelling	6	0
Plans and estimates	1	0
Sketches in the renaissance style	0	6
Monumental buildings and city parks, with exercises in sketching	1	4
Sketching public buildings	1	10
General history of art	2	0
Special lectures on the history of art	2	0
History of industrial art	2	0
Interior architecture with color decoration	0	7
Elements of machinery	3	0
Heating, ventilating, and lighting	4	0
Second semester:		
Modelling (Part II)	0	6
Plans and estimates	1	0
Sketches in the style of the renaissance	0	6
Monumental buildings and city parks, etc	1	5
Sketches of public buildings	1	10
General history of art	4	0
Special lectures on the history of art	2	0
History of industrial art	2	0
Interior architecture with color decoration	0	7

Course in Architecture (leading to the Degree of B. S.) at the University of Illinois.

FIRST YEAR.

1. Advanced algebra, projection drawing, French or German, shop practice.
2. Trigonmetry, descriptive geometry and lettering, French or German, shop practice.
3. Analytical geometry, advanced descriptive geometry, French or German, shop practice.

SECOND YEAR.

1. Differential calculus, physics, French (optional), wood construction.
2. Advanced analytical geometry, physics, French or German (optional), stone, brick, or metal construction.
3. Integral calculus, physics, French or German (optional), sanitary construction.

THIRD YEAR.

1. Analytical mechanics, chemistry, architectural drawing.
2. Resistance of materials, chemistry, history of architecture, architectural drawing.
3. Graphic statics, history of architecture, astronomy or geology, or drawing or modeling.

FOURTH YEAR.

1. Mental science, æsthetics of architecture, architectural perspective.
2. Constitutional history, designing, heating and ventilation.
3. Political economy, designing, estimates and specifications.

BUILDERS' COURSE (1 YEAR).

1. Wood construction, projection drawing, shop practice (carpentry and joinery).
2. Stone, brick, and metal construction, architectural drawing, shop practice (stair-building)
3. Graphical statics, architectural designing, shop practice (cabinet-making).

VI.

CHEMISTRY.

Until now the subject of engineering has occupied attention, but we have arrived at a subject which being neither engineering nor agriculture, but being common to both will serve as an excellent transition from the one to the other. Before illustrating what a course of professional chemistry is, let us make a distinction for the sake of convenience, though the distinction perhaps is obvious enough. The assayist is a chemist with a specialty, the dyer is also a chemist with a specialty; but their methods, places of activity, and materials are very different. But beyond these specialties there is the chemist whose sphere is general consultation and analysis, the professional chemist. The practical or rather laboratory character of the course in applied chemistry is well shown by the chart representing the programme of the course for "technical chemists" at the Hanover University, whose excellent catalogue we now draw from for the last time.

	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
8-9	Laboratory.	Laboratory.	Laboratory.	Laboratory.	Laboratory	
9-10						Mechanical.
10-11						Physical laboratory.
11-12				Building construction.		
12-1	General technology.	General technology.	Building construction.	General technology.	General technology.	
3-4	Laboratory.	Laboratory.	Laboratory.	Laboratory.	Laboratory.	
4-5						
5-6			Political economy of industry.		Political economy of industry.	
6-7			Element of electricity.	Element of electricity.		

Returning to the consideration of American schools we find that the chemically technical part of the course of chemical engineering at the Massachusetts Institute is given during the third and fourth years. Here again laboratory work predominates.

Chemistry.

Subject.	Lect., Rec., Lab., Draw., or Field.	Instructors.	Year.	Term.	Number of weeks.	Hours per week.
Industrial chemistry	Lect	Norton	3	1,2	30	2
Organic chemistry	Lect	do	4	1,2	30	2
Do	Lect	do	3	1	15	1
Industrial chemistry	Lab	Norton, Smith	4	1	15	12, 4
Do	Lab	do	3	2	15	5
Textile coloring	Lab	do	4	1	15	6
Applied chemistry	Lect	Norton	4	1,2	30	1
Gas analysis	Lab	Drown, Gill	4	1 or 2	15	1

More specific in its indications, the course of applied chemistry of the School of Mines of Columbia College shows the same concentration of the technical work during the third and fourth years, and places the work under four heads, to wit, chemical manufactures, food and drink, clothing, and fertilizers The course is as follows:

In the second year.

(For all students.)

1. Air: nature, sources of contamination, sewer gas, plumbing, draining, disinfection, ventilation.
2. Water: composition of natural waters, pollution, disposal of sewage and house refuse.
3. Artificial illumination: candles, oils, and lamps, petroleum, gas and its products, electric light.
4. Photography.
5. Limes, mortars, and cements.
6. Building stones: decay and preservation.
7. Timber and its preservation: pigments, paints, essential oils, varnishes, preserving processes.
8. Glass and ceramics.
9. Explosives: gunpowder, gun-cotton, nitroglycerine, etc.
10. Electro-metallurgy.

In the third and fourth years.

(For students in the course of analytical and applied chemistry.)

1. Chemical manufactures: acids, alkalies, and salts.
   (*a*) Sulphur, sulphurous acid, hyposulphites, sulphuric acid, bisulphide of carbon, etc.
   (*b*) Common salt, soda ash, hydrochloric acid, chlorine, binoxide of manganese, bleaching powder, chlorates, chlorimetry, etc.
   (*c*) Carbonate of potash, caustic potash.
   (*d*) Nitric acid and nitrates.
   (*e*) Iodine, bromine, etc.
   (*f*) Sodium, aluminum, magnesium.
   (*g*) Phosphorus, matches, etc.
   (*h*) Ammonia salts.
   (*i*) Cyanides.
   (*j*) Alum, copperas, blue vitrol, salts of magnesia, baryta, strontia, etc.
   (*k*) Borates, stannates, tungstates, chromates, etc.
   (*l*) Salts of mercury and silver.
   (*m*) Oils, fats, soaps, glycerine.
2. Food and drink: milk, cereals, starch, bread, meat, tea, coffee, sugar, fermentation, wine, beer, spirits, vinegar, preservation of food, etc.
3. Clothing: textile fabrics, bleaching, dyeing, calico printing, paper, tanning, glue, india-rubber, gutta-percha, etc.
4. Fertilizers: guano, superphosphates, etc,

But specialized as these courses are they are of a less special nature than the course which follows:

Curriculum of the Royal (Saxon) Professional School for Soap-Makers at Chemnitz.

First course (winter half year).

[Note.—The instruction of this course is common to the students of the dyeing school and of the soap-makers school.]

1. General chemistry (12 hours). Dr. Bornemann. Fundamental principles, the more important elements and their compounds. Introduction to organic chemistry, especially the carbon compounds.
2. Physics (4 hours). Dr. Kollert. General properties of bodies; the different forms of structure and the more important principles of equilibrium and the movement of solid, liquid, and gaseous bodies.
3. Arithmetic (6 hours). Dr. Wend. Fundamental principles, common and decimal fractions, proportion, powers and roots, and equations having one or more unknown quantities.
4. Geometry (2 hours). Dr. Vetters. The essentials (Hauptsätze) of planimetry. Computation of areas and contents.
5. Free-hand drawing (4 hours). Mr. Schneider. Cultivation of the eye and hand to correctly represent simple forms and ornaments in clear outlines after copies or plaster paris models.
6. German (4 hours). Mr. Loereusen. Exercises in oral and written, expression of thought through composition and impromptu remarks. The more important points of grammar based on the reading book.

SECOND COURSE (SUMMER HALF YEAR).

7. Chemical technology (4 hours). Prof. Dr. von Cochenhausen. Water (rain, spring, river), hard and soft, cleansing for use in industry, etc. The important materials used by the soap-maker, common salt, soda, potash, and caustic alkalies, acids, etc. Heating materials, fire places.

8. Technical chemistry, 1 part (2 hours). Dr. Bernemann. The important organic elements and compounds for soap-making, especially the fats and their constituent parts. Coloring matter and perfumery used in soap-making.

9. Practical chemical work in the laboratory (16 hours). Prof. Dr. von Cochenhausen. Exercises in qualitative analysis. Exhibit of preparations. Exercises in easy quantitative determinations. Ascertaining value of the soda, etc. in soap.

10. Physics (2 hours). Dr. Kollert. Theory of heat.

11. Free-hand drawing (2 hours). Mr. Kühn.

12. German (4 hours). Mr. Walther. Exercises in style in relation to business composition and technological description, etc. Exercises in making impromptu remarks, the drawing up of minutes of a conversation, etc., and the more important period of German literary history.

13. Bookkeeping (2 hours). Mr. Meyersieck. Exercises in keeping the important account books. Peculiarities of business affairs under the influence of the laws governing trade, etc.

THIRD COURSE (WINTER HALF YEAR).

14. Technical chemistry, second part (6 hours). Dr. Bornemann. Extracting and cleansing fat, its qualities, the indispensable apparatus and machines for house and toilet soap making, different kinds of soaps, perfumery, candle-making, examination of fats and soap.

15. Practical chemical work in laboratory (20 hours.) Prof. von Cochenhausen. Qualitative and quantitative analysis. Testing and valuing soap, fat, etc. Exercises familiarizing the student with the character of the important fats and soaps, etc.

16. Free-hand drawing (2 hours). Mr. Schneider.

17. German (2 hours). Mr. Walther.

In addition the students of the second and third classes may take the following subjects in the foreman's school.

18. Management and conduction of water (2 hours, summer).

19. Electricity (2 hours, summer).

20. Electrical technology (3 hours, winter).

21. Extinguishing fires (2 hours).

22. Selected discussions on political economy.

VII.

AGRICULTURE.

Two ideas, not mutually exclusive, though in a measure antagonistic, have dominated in the formation of the curricula of the colleges endowed with the national land grant of 1862—the education of the farmer's son; the education of the boy for a farmer. The intent of Congress is sufficiently clearly expressed to leave no doubt as to what was meant by the caption of the act when it recites that it is "for the benefit of agriculture and the mechanic arts." But an act of Congress can not create a professional corps such as have the American classic colleges, or even some schools of engineering, and schools of analytical chemistry had at the date of 1862. Liebig's theories had not yielded to those of a new luminary in biological chemistry just then appearing in France. Biology as now understood was unborn, and the theoretical instruction of the German polytechnicum or the mathmatical instruction of the École Polytechnique of Paris were the models for American schools whose object was to teach industry. Besides this there was the heaviest handicap of all—the meager mental training in literary matters possessed by those who were to attend these schools. Under such circumstances the makers of their programmes were swayed to adopt methods and studies familiar to them, and in view of the limited education of those who applied for admission to adapt their programme to the purpose of educating the country boy, and also to educate him as much as possible for the farm. To the complaint that in doing this the school educated the boy away from the farm, Prof. Clute, president of the Michigan Agricultural College, answers that 36 per cent of the graduates are engaged in farming, to say nothing of the 11 per cent engaged in industrial pursuits or teaching in agricultural colleges, nor of the number who do not graduate.

The curriculum of the American agriculture school is therefore not a university course of study, but by the necessities of its situation has been compelled to take refuge in that scheme of instruction which, in its extremest classical form, was worked out by John Sturm, in Germany, in the sixteenth century; by the Jesuits, in France, during the seventeenth, and was modified by the ideas of Hecker, the founder of the German scientific school (Realschule), and the pedagogics of the French revolution in the eighteenth. It might be shown how this ideal of an education based on science found expression in the university of Thomas Jefferson as the education founded on the classics found an expression in the university of the Puritans and an education based on research found expression in that of Johns Hopkins.

The course of agriculture naturally follows the composite character of the science. It is broken up into schools of chemistry, horticulture, entomology, forestry, veterinary science, etc. Agriculture proper is usually considered under

the heads of agricultural soils, vegetable life, and animal life. As the requirements for admission and the ideals of the school vary so much, the time devoted to the agricultural topics is not uniform. The course of two institutions challenge attention. Both schools have been founded by private endowment, are situated in New England, and are well calculated to illustrate agricultural instruction as it obtains in the United States, in its higher and in its secondary form.

It is impossible as yet to say what the endowment of the Bussey Institution of Harvard University will be, further than that it is very large. It is a school of agriculture and horticulture, giving systematic instruction in agriculture, useful and ornamental gardening and stock raising, and is especially adapted for the instruction of young men who have been brought up as practical farmers or gardeners, as well as for those who wish to qualify themselves to be farmers or superintendents of farms, country seats, or public institutions or wish to pursue some special branch of agriculture, horticulture, botany, or entomology. The literary courses of the university are open to the student; and surrounding the school, and belonging to it, are 200 acres of excellent land. The school is an agricultural school; its faculty consists of six professors and instructors called, respectively, professor of applied zoölogy, professor of agricultural chemistry, instructor in horticulture, instructor in botany, instructor in entomology, and the director of the Arnold Arboretum. Instruction is given by lectures and recitations and by practical exercises in the laboratories, greenhouses, and fields. The aim is to give the student a just idea of the principles upon which the arts of agriculture and horticulture depend, to teach him how to make intelligent use of the scientific literature which relates to those arts, and to enable him to put a proper estimate upon those kinds of evidence which are obtained by experiments and by the observation of natural objects. The course is of one year, its professional character is indicated by the titles of the teachers.

The Storrs Agriculture School at Mansfield, Conn., derives its name from the donors of the original property, the brothers Augustus and Charles Storrs, of Brooklyn, N. Y. It has been established for the education of boys whose parents are citizens of Connecticut, in such branches of scientific knowledge as shall tend to increase their proficiency in the business of agriculture. Thus the object of the school is to teach practical and scientific agriculture and horticulture, "yet as subservient and necessary to this purpose various other branches are taught, especial prominence being given to those most necessary for the successful prosecution of agriculture."

In the class room the students study those branches of natural science, and only those, which have a directly useful bearing upon New England farming; and the indoor work is made to harmonize with that upon the farm and garden. These branches are general and agricultural chemistry, natural philosophy, farm mechanics, elementary geometry, land surveying, botany, zoölogy (which includes especially domestic animals and insects injurious to the crops of the farm and garden), geology, human and animal physiology, agriculture, farm accounts, stock breeding, milk production, arithmetic and English, taking up the general principles of scientific subjects and afterwards their special application to practical agriculture.

During the fall and winter term, when the necessities of the farm (of 170 acres) demand it and the weather permits, the students are required to spend three hours daily upon the farm, and six or more upon study, laboratory work, and recitations, a part going upon the farm in the forenoon and the others in the afternoon; and during the spring term, five hours a day may be required upon the farm, when there is special need of that amount of work, and five or more in school work. Extra labor, as far as practicable, is furnished to all who desire it as an aid towards self-support, when it can be performed without interference with regular duties. The aid received from the State permits the school to reduce its tuition fee to a minimum.

In brief the general plan of the course is to begin with a brief history of agriculture, ancient and modern; secondly, to enter into a study of soils, manures, and fertilizers, and the relation of these to plant-life and plant growth; and, lastly, a study of the higher forms of life, as represented in our domestic animals. Stock breeding, breeds of live stock, and cattle feeding occupy a large part of the time of the senior year. The agricultural experiment station is operated in connection with the school.

As an appendix to the remarks on the schools of agriculture in the United States, an account of the system of agricultural instruction in Prussia and in France has been translated and inserted after the curricula which follow.

Curriculum of the Institut Agromique (École Supérieure de l'Agriculture), Paris.

REQUISITES FOR ADMISSION.

The possession of the degree of bachelor of science, or in lieu thereof:
Written examination.—Arithmetic, algebra, geometry, logarithms, trigonometry, French composition, natural history sciences, physics, chemistry, descriptive geometry, English, German.
Oral examination.—Arithmetic, geometry, descriptive geometry, algebra, trigonometry, mechanics and cosmography, physics, chemistry, geography, English, German.

COURSE.

FIRST YEAR.

First semester.—Mechanics, general physiology, general chemistry, zoölogy, physics and meteorology, mineralogy and geology, botany, mathematics.
Second semester.—General chemistry, mineralogy and geology, mechanics, zoötechnics, physics and meteorology, general agriculture, agriculture (genie rural), zoölogy, political economy, botany.

SECOND YEAR.

First semester.—Agricultural technology, rural economy, agricultural chemistry, agriculture, engineering (genie rural), zoötechnics, special agricultural, arboriculture, comparative agriculture.
Second semester.—Viticulture and agriculture in the south [of France], comparative agriculture, administration of law and rural legislation, vegetable physiology, forestry, viticulture, hippology, agriculture, hygiene, and book-keeping.
The course is completed by conferences and practical exercises and demonstrations in chemistry, micrography, agriculture, physiology, zoölogy, zoötechnics, mineralogy, agricultural, arboriculture, and viticulture. Several times during the week there are exercises in tinting and topography, rural architecture and agricultural machines. Every Tuesday there is an excursion, industrial, botanical, or geologic, and in addition visits are made to farms, cattle markets, etc. A library which is supplied with all the important works on agriculture published in France and in foreign parts is open to the students.
There is a laboratory of vegetable pathology, a station for testing grains (essai de graines), a special laboratory for the study of fermentations in relation to brewing, distillation, wine-making, milk, and finally a laboratory of agricultural entomology.

Curriculum of a Typical American School.

REQUISITES FOR ADMISSION.

English composition and grammar, history of United States, geography, six books of Cæsar, arithmetic, algebra, geometry, trigonometry.

COURSE.

FRESHMAN YEAR.

First term.—German reader, history, English language, derivatives of algebraic functions, fundamental properties of equations, plane analytical geometry, physics with experimental lectures, chemistry, including laboratory practice, practical lessons in the art school.
Second term.—Plane analytical geometry, physical geography, botany, principles of orthographic projection, isometric drawing, etc.

SECOND YEAR.

First term.—Organic chemistry, qualitative analysis, mineralogy and botany, German, French.
Second term.—Organic chemistry, quantitative analysis, mineralogy, German, French.

THIRD YEAR.

First term.—Agriculture, agricultural chemistry, geology, zoölogy, meteorology, botany, French.
Second term.—Agriculture, agricultural chemistry, physiology, geology, zoölogy, heredity and stock-breeding, sanitary science and public health, French.

Curriculum of the Landwirthschaftliche Hochschule, Berlin, for the Winter Semester 1890-91.

REQUISITES FOR ADMISSION.

Reifezeugniss of a Gymnasium or Realgymnasium. (See p. 948.)

LECTURES.

1. Agronomy, forestry, and gardening.

(*a*) Prof. Dr. Orth: General agronomy (tilling, irrigating, manuring) Monday until Friday, 10–11. Exercises in agronomical seminary: Field and plant cultivation division, Monday 6–8. Chemistry of the soil and plants, work, Monday to Friday, 9–4.
(*b*) Prof. Dr. Werner: Agricultural operations, Monday and Tuesday, 4–6. Breeding animals, Thursday, 4–6; Friday, 4–5. Bookkeeping, Friday, 3–4. Sketch of the science of agricultural production. Wednesday, 4–6.
(*c*) Prof. Dr. Lehmann: General breeding of animals, Tuesday, Wednesday, and Thursday, 9–10. Sheep-raising and wool-growing, Monday and Friday, 9–10; Saturday, 10–12. Fodder-raising, Monday and Wednesday, 12–1.
(*d*) Privy counsellor, Engineer Schotte: Agricultural machines, Saturday, 3–5. Principles of mechanics and of machinery, Friday, 1–3. Drawing, Tuesday and Thursday, 1–3.
(*e*) Forestmaster Krieger: Timber-growing, Monday, 5–7. Management and use of forests, Friday, 5–7.
(*f*) Garden Inspector Lindemuth: Fruit-growing, Monday and Thursday, 2–3.

2. Natural science.

I. Chemistry and technology:
(*a*) Privy counsellor, Prof. Dr. Landolt: Inorganic experimental chemistry, Monday until Friday, 11–12. Practikum in large chemical operations on the first five days of the week, 9–5; Saturday, from 9–1. Practicum in small chemical operations on the first five days of the week, as the student may select, 9–1 or from 1–5.
(*b*) Prof. Dr. Delbrück: The production of spirits, yeast, and starch, Wednesday, 12–2; Saturday, 8–10.
(*c*) Privat docent, Dr. Kayduck: Chemistry of fermentation, Friday 4–5.
(*d*) Privat docent, Dr. Marckwald: Chemical investigations in relation to agricultural processes, Saturday, 9–10.
II. Physics and meteorology:
(*a*) Prof. Dr. Börnstein: Experimental physics. 1 Part, Tuesday and Wednesday, 3–4.
(*b*) Selected chapters on mathematical physics, Wednesday, 11–12. Exercises in physics, Saturday, 11–1. Meteorology, Monday, 3–4.
III. Mineralogy, geology, geognosy: Prof. Dr. Gruner: Geognosy and geology. Tuesday, 12–1; Saturday, 9–10. Qualities of soil and their valuation, Monday, Wednesday, and Thursday, 12–1. Exercise in examining soils, Tuesday and Saturday, 4–6.
IV. Botany and vegetable physiology:
(*a*) Prof. Dr. Kny: Anatomy and history of the development of plants, Monday, Friday, and Saturday, 9–10. Use of the microscope, Monday and Thursday, 12–2. Work for tree cutters (woodsmen) in the botanical institute, daily, 9–4.
(*b*) Prof. Dr. Frank: Plant food, Tuesday, 12–1. Diseases of plants, Friday and Saturday, 12–1. Vegetable pathology (Practicum), Wednesday, 12–3. Work for forest cutters in Vegetable Physiological Institute, daily, 9–4.
(*c*) Prof. Dr. Wittmack: Seeds, Thursday, 12–1. Falsification of food and fodders, Friday, 1–3. Appropriate work in the botanical division of the museum, Saturday, 1–3.
V. Zoölogy and animal physiology:
(*a*) Prof. Dr. Nehring: Zoölogy and comparative anatomy with special reference to the vertebrata, Monday, Thursday, 11–12. The game of Germany, Friday, 11–12. Zoölogical colloquium, Friday, 5–7.
(*b*) Dr. Karsch:
Insects useful or injurious to agriculture, with special reference to bee-keeping and silk-worm raising, Wednesday and Friday, 8–9.
(*c*) Prof. Dr. Zuntz:
Physiology of the change of food into flesh, Monday, Tuesday, Thursday, and Friday, 10–11.
Hygiene of the domestic animal, Monday, 3–5.
Work in physiological laboratory, Friday and Saturday, 2–4.

3. Veterinary science.

(*a*) Prof. Dr. Dieckerhoff: Epidemic disease and parasites of the domestic animals, Monday, and Thursday, 2–3.
(*b*) Privy counsellor, Dr. Müller:
Anatomy of the stomach of the domestic animals with demonstrations, Tuesday, Wednesday, and Saturday, 2–3.
(*c*) Chief veterinarian for horse diseases (oberrossartz) Küttner: Horseshoeing, Tuesday, 8–9.
(*d*) Privat docent, Dr. Hagemann: Brief review of the physiology of feeding, Thursday, 4–5. Practical course of physiological chemistry, Saturday, 4–6.

4. Law and administration.

(*a*) Prof. Sering: Agrarian laws of Germany. Economical exercises in seminary of administrative law, with visits. Imperial and Prussian law with special reference to the farmer, surveying, and the technicalities of culture, Wednesday, 4–6.

5. Agricultural engineering and building.

(*a*) Amelioration inspector, Gerhardt: Agricultural engineering (Kulturtechnik), Saturday, 10–12. Plans of improvements, Friday, 11–1; Saturday, 12–2. Engineering seminary, Friday, 9–11.
(*b*) Prof. Schlichting: Management of water, Monday, 9–10. Construction of bridges and roads, Monday, 4–6. Plans of water management, Monday and Tuesday, 10–12.

6. Geodesy and mathematics.

(*a*) Prof. Dr. Vogler: Settlement of accounts, Monday and Saturday, 9–10; surveying, Tuesday and Thursday, 9–10; practical geometry, Tuesday and Thursday, 11–12; exercises in measurements, in two groups, Monday, Tuesday, and Saturday, 10–12; Friday, 11–1; geodetic seminarium, Friday, 3–5; drawing, Friday, 9–11; exercises in surveying, Monday and Thursday, 3–5; geodetic calculation, in two groups, with assistant Prof. Friebe, Monday, 10–12; Friday, 11–1.

(*b*) Prof. Dr. Reichel: Analytical geometry and analysis, Tuesday and Thursday, 9–10; Wednesday, 9–11; mathematical exercises, in two groups, Monday and Thursday, 4–6; Friday, 3–5; descriptive geometry, Tuesday and Thursday, 10–11; exercises upon descriptive geometry, Tuesday, 12–1, and (with assistant Seiffert) Tuesday, 12–1.

Curriculum of a Southern Agricultural College.

PREPARATORY DEPARTMENT.

English grammar and composition, penmanship, declamation, arithmetic, elements of bookkeeping, algebra to equations of the first degree, geography, United States history, and agriculture.

COLLEGIATE DEPARTMENT.

FRESHMAN.

First term.—Drawing, algebra, English, natural philosophy.
Second term.—Algebra, English, agriculture, horticulture.
Third term.—Etymology, algebra, bookkeeping, English, history.
Declamations and compositions through the entire session.

SOPHOMORE.

First term.—Chemistry, drawing, geometry, rhetoric.
Second term.—Rhetoric, geometry, chemistry, geology, preparation of addresses on scientific and industrial subjects.
Third term.—Trigonometry, agriculture, botany, chemistry, delivery of addresses contesting for places at commencement.

JUNIOR.

First term.—Surveying, anatomy and physiology, horticulture, Constitution of United States (6 weeks), criticism (6 weeks), preparation and delivery of addresses on scientific and industrial subjects.
Second term.—Mechanics, chemistry, veterinary science, political economy, preparation and delivery of addresses on scientific and industrial subjects.
Third term.—General history, military science and tactics, entomology, mechanics, preparation and delivery of addresses, contesting for places at commencement, afternoon work in chemical laboratory, and with steam engine, 10 hours per week, November 15 to February 15.

SENIOR.

First term.—Literature, zoölogy, drawing, chemistry, preparation and delivery of addresses on scientific and industrial subjects.
Second term.—Botany, civil engineering, literature, chemistry, preparation and delivery of addresses on scientific and industrial subjects.
Third term.—Agriculture, chemistry, astronomy, moral science (6 weeks), meteorology (6 weeks), preparation and delivery of addresses, contesting for places at commencement.

POST-GRADUATE.

Biology.—Mycology, fertilization and cross fertilization, relation of insects and plants, histology, zoölogy, including embryology, with monthly written discussions, under direction of professor of biology.
Agriculture.—Principles of stock-breeding and feeding, theory of drainage, cultivation, curing and marketing crops, improvement of soil and manure supply. The student will be required to take charge of field and feeding experiments, dairy and general farm work under direction of the professor of agriculture.
Horticulture.—Pomology, floriculture, landscape gardening, forestry, geographic botany, economic botany, management of greenhouses, under the direction of professor of horticulture.
Chemistry.—Chemistry applied in the analysis of soils, plants, foods, animal tissues and products, feeding, water and other drinks, under the direction of the professor of chemistry.
English.—A course of reading in English prose and poetry, embracing entire works, logic, and mental science, with monthly written essays, under the direction of the professor of English.
Mathematics.—Analytical geometry, differential and integral calculus, applied mechanics, and civil engineering.

Curriculum of an Eastern Agricultural College.

REQUISITES FOR ADMISSION.

English grammar, geography, arithmetic, algebra to quadratics, the metric system, history of United States.

COURSE.

FRESHMAN YEAR.

Fall term.—Climatology or relations of weather and farming (2 hours), structural botany (5 hours), chemistry, principles and metaloids (5 hours), algebra (5 hours), Latin (3 hours), composition (1 hour), military exercises (3 hours in afternoon).
Winter term.—Farm accounts, history of agriculture (2 hours), metals (4 hours), algebra and geometry (5 hours), Latin (4 hours), free-hand drawing (6 hours), tactics (1 hour half term), military exercise (3 hours).
Spring term.—Breeds of live stock and hand tools (5 hours), analytic botany (5 hours), mineralogy (4 hours), geometry (3 hours), Latin (5 hours), composition (1 hour), military exercises (3 hours).

SOPHMORE YEAR.

Fall term.—Soils, tillage, and drainage (5 hours), economic botany (5 hours), geology (4 hours), trigonometry (4 hours), French (5 hours), composition (1 hour), tactics (half term 1 hour), military exercises (3 hours).
Winter term.—Mixed farming, rotation of crops (2 hours), laboratory work (4 hours), anatomy and physiology (5 hours), mensuration (3 hours), French (5 hours), mechanical drawing (5 hours), military exercises (3 hours).
Spring term.—Manures, grains, and forage crops (5 hours), horticulture (8 hours), surveying (7 hours), French (5 hours), composition (1 hour), military exercises (3 hours).

JUNIOR YEAR.

Falt term.—Farm implements, harvesting and storing crops (2 hours), market gardening (6 hours), zoölogy and laboratory work (8 hours), mechanics, draft, friction, etc. (3 hours), rhetoric and composition (5 hours), military exercises (3 hours).
Winter term.—Preparation and transportation of crops, markets (2 hours), laboratory work (10 hours), zoölogy (3 hours), physics, sound, and heat (4 hours); English literature (5 hours), composition (1 hour), military exercises (3 hours).
Spring term.—Special crops, farm roads (1 hour), forestry and landscape gardening (— hours), laboratory work (5 hours), entomology (7 hours), physics, light, and electricity (3 hours), English literature (4 hours), composition (1 hour), military exercises (3 hours).

SENIOR YEAR.

Fall term.—Breeding and care of live stock (4 hours), lectures on law, etc., laboratory work, chemistry of fertilizers (8 hours), comparative anatomy of domestic animals (3 hours), veterinary science (5 hours), mental science (4 hours), composition and debate (1 hour), military science (1 hour).
Winter term.—Dairy farming (3 hours), lectures on law, etc., organic chemistry (3 hours), veterinary science (5 hours), meteorology (2 hours), political economy (5 hours), composition and debate (1 hour), military science (1 hour), military exercises (3 hours).
Spring term.—Agricultural review (3 hours), lectures on law, etc., chemical industries (3 hours), geology (3 hours), veterinary science (5 hours), constitutional history (5 hours), composition (1 hour), military science (1 hour), military exercises (3 hours).

CURRICULUM OF A WESTERN AGRICULTURAL COLLEGE.

REQUISITES FOR ADMISSION.

Arithmetic, geography, grammar, reading, spelling, penmanship, and history of the United States, a knowledge of elementary algebra to equations of second degree.

COURSE.

FRESHMAN YEAR.

Autumn term.—Algebra, ancient history, English grammar, elocution,
Spring term.—Geometry, free-hand drawing, lectures, lectures on agriculture, declamations.
Summer term.—Geometry completed. Botany, rhetoric. essays.

SOPHOMORE YEAR.

Autumn term.—Algebra completed, trigonometry (half term), military tactics (half term), botany (half term), agriculture (half term), lectures, declamations and essays (based on readings from Longfellow).
Spring term.—Trigonometry completed (half term), surveying and field work (half term), botany (laboratory work, 2 hours daily), rhetoric, essays, reading of American orations.
Summer term.—Mechanics, elementary chemistry (lectures), chemical manipulation (2 hours per week, optional), English literature (half term), lectures on landscape gardening (half term), botany (one day in the week), original speeches.

JUNIOR YEAR.

Autumn term.—Mechanics completed (half term), lectures on and laboratory practice anatomy (half term), lectures and laboratory on horticulture, lectures on organic chemistry, blowpipe and volumetric analysis, essays and public speeches, Shakespeare once a week

Spring term.—Human and comparative physiology (laboratory work 3 hours daily for 2 weeks), analytical chemistry (laboratory work 2 hours daily), logic, essays and public speeches, Shakespeare once a week.
Summer term.—Entomology (laboratory practice 3 hours a week), agriculture, agricultural chemistry, essays, Shakespeare once a week.

SENIOR YEAR.

[All studies elective in this year, except moral philosophy.]
Autumn term.—Psychology, chemical physics, lectures and laboratory work, lectures on agricultural engineering, lectures and practical dissections in veterinary work, critical essays.
Spring term.—Moral philosophy (half term), lectures on meteorology, lectures on civil engineering, lectures on Constitution of United States (half term), political economy (half term), lectures and clinical instruction in veterinary science, lectures on geology (half term), lectures and laboratory practice in horticulture (half term), military science, essays and public speeches.
Summer term.—Quantitative analysis, lectures and laboratory practice in botany or forestry, lectures and clinical instructions in veterinary science, English literature, philosophy of history (half term), astronomy, Milton (once a week), public speeches.

THE SYSTEM OF AGRICULTURAL SCHOOLS OF THE KINGDOM OF PRUSSIA.

Division A: University Grade.

At the head of the system come the so-called institutes, which form a part of the universities. As the chemical and other laboratory instruction are adjuncts to the lecture system of the university so these agricultural institutes are places for demonstration, exercises, and investigation, and of course with special reference to the business of agriculture. The titles of these institutions are as follows:

1. The Agricultural Institute and Agricultural Chemical Laboratory in the University of Königsberg, with which is also connected the milk chemical laboratory, the agricultural physical laboratory, and the agricultural botanical garden and the veterinary clinic. Founded 1869–76. Length of study, 4 to 6 semesters. Conditions of admission, the Reifezeugniss of a gymnasium.[1] Four professors of agriculture and 7 university professors. Appropriation, $4,293 for the institute (excluding salaries) and laboratories, $1,083 for the veterinary clinic. At the close of 1890 there were 11 students. The agricultural chemistry laboratory has places for 20 students.

2. The Agricultural Institute in the University at Breslau, with which is joined a veterinary clinic. Founded in 1881. Length of course, 4 to 6 semesters. Eight professors proper, 14 university professors. Students, 27 farmers and 9 others. Appropriation for 1890–91, $7,794, excluding the salaries of professors.

3. The Agricultural Institute in the University at Halle. Founded 1862. Duration of course, 4 to 6 semesters. Professors of agriculture, 7; of science, 14; of law and political economy, 7; 8 assistants; students, 281, farmers by calling, of whom 71 were foreigners. The institute consists of the agricultural physiological laboratory, the agricultural collection, the botanical garden, the experimental field, the agricultural domestic animal farm (landwirthschaftliche Hausthiergarten), the dairy, the machine hall, the veterinary clinic. Cost, $20,560.

4. The Agricultural Institute in the University at Kiel. Founded in 1873. Duration of study, 4 to 6 semesters. Professors of agriculture, 2; of veterinary science, 1; of science, 10; of national economy and agrarian politics 2. One student, farmer by calling. Cost during 1890–91, $1,185, excluding salary of director.

5. The Agricultural Institute in the University at Göttingen, with which is connected the "animal chemistry experiment station," the agricultural chemistry laboratory, and the veterinary clinic. Founded in 1770 as a chair in the University, from which was developed a course of study in 1851, an academy in 1857, and finally the institute in 1872. Duration of study, 4 to 6 semesters. Professors of agriculture and fruit raising, 4; of building, 1; of veterinary science, 1; of science, 10; of national economy, 2; of agricultural law, 1. Students, 22. Cost, excluding the salaries of the director and the regular assistants, $2,198.

INDEPENDENT SCHOOLS OF AGRICULTURE OF UNIVERSITY GRADE.

1. The Royal Agricultural High School at Berlin. Founded in 1859–1881. (Program given on page 998.) Duration of study at least 4 semesters; for teachers in agricultural schools at least 6 semesters. There is, however, a two-semesters course, for land surveyors, and for "proved" surveyors another two-semesters course, called the Kulturtechniker (agricultural engineer) course.

[1] This will be understood though not mentioned in the case of each university that follows

There is also a course for practical farmers. Requisites for admission, about that of an American classical high school with four years course. Those who desire to become teachers of agriculture must have the Reifezeugniss of a gymnasium or of a Realgymnasium, and have had two years of practical experience in agriculture. For surveyors the requirements are a little lower than for the prospective teachers. Thirteen professors, 13 assistant teachers, 2 privat docents, 15 assistants (surveyors, veterinary surgeons, and doctors of philosophy in the laboratories). Students 406, of whom 178 were agricultural engineers and surveyors. In addition the following students took part in the exercises: From the University of Berlin, 53; from the Veterinary College and Military Horse School, 113. Cost, 1890-91, $95,788, of which the State paid $81,228, the rest being income from all sources.

The school has a chemical laboratory, a botanical institute, a vegetable physiological institute, a zoölogical institute, a zoötechnical institute, an animal physiological institute, a mineralogical institute, an agronomico-pedological institute, a physical cabinet and meteorological station, a geodetico-agricultural engineering professional division, a museum with a permanent exhibition of machines, etc. The course for practical farmers lasts for a week and is given during February. Attendance in 1890, 37.

2. The Royal Agricultural Academy at Poppelsdorf, near Bonn. (In connection with the University at Bonn). Founded in 1847-1877. The course for farmers and agricultural engineers covers four semesters, and for surveyors two semesters. Professors 9, assistant teachers 11: cost for 1890-'91, $31,331, of which the state paid $25,426, the balance being income from various sources. There were 133 students, of whom 92 were taking the surveyor's course of two semesters, and 5 the agricultural engineer course of four semesters. The requirements for admission are that the candidate have the mental training possessed by a student of the third below the highest class in a Prussian gymnasium, or of the final class of a scientific school (Realschule).

SUMMARY OF THE FOREGOING.

Institutions	7
Requirements for admission, about the completion of a collegiate course of study, and under very thorough methods.	
Duration of course from 2 to 3 years.	
Teaching corps:	
Professors teaching agronomical studies	a 51
Assistant teachers teaching agronomical studies	26
Scientific attachés	23
Students	227
Appropriation (or cost)	$164,231

HIGHER FORESTRY ACADEMIES.

The object of these institutions is to ground the student in the art of caring for and propagating forests and in related arts, but especially for service in the state forest service and the advancement of forestry in general. They are of university grade.

1. Royal Forest Academy at Eberswalde. Founded 1830; from 1821 to 1830 was connected with the University of Berlin. Length of study, four semesters at the academy and two at the university. Professors, 13, 1 assistant to the director, and 2 docents: students, 128 winter semester: appropriation 1890-91, $22,803. Several "forest gardens" and the institution for artificial fish raising are visited by the students, and with the school is connected the principal station of experimental forestry, which is composed of the following divisions: Technical forestry, meteorology, vegetable physiology, zoölogy, agricultural, chemistry.

2. Royal Forest Academy at Münden. Founded in 1868. Duration of study same as above. Professors, 10; docent, 1; assistants, 2; students, 31; appropriation, $15,865. With this academy are connected several gardens and "forest chemical experimental laboratories" and a fish-hatching establishment.

SUMMARY OF THE FOREGOING.

Number of schools	2
Requirements for admission, collegiate education, not over 25 years of age, good character, at least one year of practical work.	
Duration of course two years at the academy and one at a university.	
Teaching corps:	
Professors	23
Docents	3
Assistants of scientific attainments	3
Students	159
Appropriation	$38,668

a Does not include natural science nor national economy professors.

VETERINARY UNIVERSITIES (THIERÄRZTLICHE HOCHSCHULEN).

1. Royal Veterinary University at Berlin. Founded in 1790, but raised to university grade in 1887. Duration of study, 7 semesters. Requisite for admission, Reifezeugniss of a gymnasium or of a Realgymnasium. Professors, 12; assistants, 3; students, 453; appropriation, $56,312, of which the state furnished $25,000. The school has an anatomical, a pathological, a physiological, and a histological institute. There is a clinic for internal diseases, etc., another for external disorders, for small animals, a pharmacological institute, an "ambulatory clinic," and a chemical institute.

During the year 1890 2,315 horses, 2 horned cattle, 1 hog, 1,127 dogs, 16 cats, 1 deer, 1 goat, 1 sheep, 1 squirrel, and 38 birds were in the hospital.

In the polyclinic were treated 5,900 horses, 1 horned beast, 5 goats, 22 hogs, 7,465 dogs, 265 birds, 96 cats, 5 rabbits, 7 squirrels, 2 porpoises, 2 hedgehogs, 5 apes.

In their stalls were treated about 600 animals and several herds. Over 100 cadavers of animals were used in dissection.

2. The Royal Veterinary University in Hanover. Founded 1778; raised to present grade in 1887. Duration of study and requisites for admission as above. Professors, 6; teacher, 1; assistant teachers, 6; students, 221; appropriation, $23,660, of which the state supplied nearly $12,000; 4,800 animals of various kinds were treated during the year; 266 visits were made by students with a teacher and 485 without.

SUMMARY OF THE FOREGOING.

Number of schools	2
Requisites for admission Reifezeugniss of a gymnasium or realgymnasium.	
Duration of course, 3 years and a half.	
Teaching corps:	
Professors	18
Assistant teachers	10
Students	674
Appropriation	$79,972

DIVISION B—AGRICULTURAL COLLEGES.

As a rule the agricultural schools (Landwirthschaft-Schulen) are not state institutions, although regulated by it, but are institutions subventioned by the state, a city, or a society. They have the object of preparing their students for farmers by teaching them as far as possible the science and art of agriculture, and by giving them a general education. The completion of the Tertia of a gymnasium absolves the student from two years of the compulsory military service, and the completion of the course of these agricultural schools is accepted as equivalent to the completion of the Tertia of the gymnasium course. In Germany the standard of reference for mental training is ever the gymnasium course.

In Prussia there are 16 of these colleges. They were established as furnishing a grade of instruction higher than the Ackerbau schools (see Division C), and were regulated by a Royal decree of 1875, which furnished them with a code, and, of course, a programme. As might be expected, they have all been established between 1875 and 1880. Some were formerly Ackerbauschulen, but the majority are new institutions.

The cities, provinces, or districts, and the agricultural societies have been about equally interested in starting though not in supporting these schools, but the Government exercises an oversight through the minister of agriculture, domains, and forests. In order to obtain absolution from two of the three years of army service the schools must strictly follow the curriculum provided, must have the necessary apparatus for teaching, and at least four professors, including the director, who must have passed through the course of an agricultural school of university grade. The subjects of the course provided by the Government are as follows:

1. Religion.
2. Language.

(*a*) German. Correct use of the mother tongue and acquaintance with the classics of the language.

(*b*) Latin (optional). Ability to read a selection from an easy prose writer, a piece of easy poetry, with assistance in the case of unusual words, but otherwise with ease and purity.

(c) English or French. Correct pronunciation and knowledge of the more important rules of grammar. Facility in reading medium difficult prose (Voltaire's Charles XII or Irving s Sketch Book) and ability to translate an easy theme in the mother tongue into English or French without any serious errors of orthography, grammar, or idiom.

3. Geography: Principal points of mathematical geography [astronomy]. Knowledge of the different parts of the world. seas, mountains, rivers, etc. For Europe, and especially Germany, special knowledge of the natural and political features and ways of communication. History: Acquaintance with the principal facts relating to the Greeks and Romans. More special knowledge of the growth of the German Empire and the development of the states of which it is composed, especially Prussia, the intellectual advancement being regarded as well as the political.

4. Commercial arithmetic and the application of the same to agricultural affairs. Computation of surfaces and solids. The four fundamental algebraic operations, powers, roots, and logarithms, equations of the first degree of one and two unknown quantities, planimetry, knowledge of the simple trigonometrical functions and their application to goniometry, surveying with simple instruments, leveling, and mapping.

5. Natural science.

(a) Zoölogy: Knowledge of the different classes of animals with the principles of anatomy and physiology, with especial reference to animals important to agriculture.

(b) Botany: Knowledge of the vegetable families and the elements of vegetable anatomy, physiology, and pathology.

(c) Mineralogy and soils (Bodenkunde). Knowledge of the important minerals, their qualities, and usefulness of the different kinds of soils, the formation and agricultural value.

(d) Physics. Experimental familiarity with the great laws of physics (qualities of bodies, heat, etc.), and with meteorology.

(e) Chemistry. Knowledge of the most important elements and their compounds, as well as of the processes in their manipulation, with especial reference to physiology and technical agricultural affairs.

6. Agriculture.

(a) Production of vegetation. Knowledge of principles that govern the tilling and the amelioration of the soil and the growing of crops; acquaintance with the culture of the important plants.

(b) Breeding of animals. Knowledge of the principles of rearing, feeding, and care of domestic animals.

(c) Management. Knowledge of the factors of good management and their connection with the management of a farm; bookkeeping.

7. Drawing.

8. Gymnastics and singing.

Time table of the Prussian agricultural colleges.

Subject.	First year.	Second year.	Third year.
1. Religion, obligatory for unconfirmed students	1	1	1
2. Language, German and two foreign languages, Latin, English, or French	9	9	9
3. Geography and history	4	4	4
4. Mathematics	5	4	4
5. Natural history:			
(a) Zoölogy and botany	4	4	2
(b) Physics	2	2	2
(c) Chemistry (and meteorology)	2	4	4
6. Agriculture:			
(a) Production of vegetation	4	4	2
(b) Breeding animals			
(c) Management			2
7. Drawing	2	2	2
8. Gymnastics and singing	3	3	3
Total	36	37	37

The statistical facts connected with the school of Division B are these:

Number of schools	16
Number of—	
Full teachers	107
Assistant teachers	56
Students in college proper	a 1,090
Appropriation from—	
State (usually $3,750 and sometimes $4,500 to each)	$63,900
Provinces (in the case of 10 schools)	8,100
Districts (in case of 11 schools)	3,076
Cities (in case of 8 schools)	7,159
Societies (in case of 3 schools)	1,013
Total	83,248

A garden is always attached to these schools, and frequently more extensive grounds, such as experimental fields, fruit gardens, and the like. There is almost always a preparatory school, which should be taken into account in considering the number of teachers, but the 1,090 students given above are professional students and are not in the preparatory course.

Division C.—Elementary Agricultural Schools.

The elementary agricultural schools, or Ackerbauschulen, are lower agricultural schools in which the pupil of the country school may continue his studies while learning something of the theory and practice of agriculture. There are 28 of these schools in Prussia, and although 7 of them were opened 1840 to 1860, the great majority have come into existence during the last twenty years, during which there seems to have been a desire on the part of the Government to promote agricultural education.

There is no common programme for these schools, and it is thus very difficult to discuss their curriculum. Perhaps they may with sufficient accuracy be divided into three classes: Those having one or more teachers of the grammar-school studies, and a teacher of agriculture, those having a teacher of the grammar-school studies and teachers of agriculture, surveying, and the elements of veterinary art, and those (the largest class) having several teachers of a course which resembles the scientific course of an American high school and also instructors in agriculture and related arts. How far this instruction is carried it is impossible to say. As the completion of the course does not absolve the student from two-thirds of his army service, the state has no indirect way of stimulating a high or even a uniform curriculum, which thus being left to the locality is, it may be presumed, in some places high, in others low. The schools are excellently well supplied with experimental fields, etc. Smithing and other trades are taught. The course is, as a rule, 1½ or 2 years in length; occasionally it is only 1 year, and in two instances it is 3 years. The summary of the statistics of this class is as follows:

Number of schools	28
Teachers	66
Pupils	1,073
Pupils from farm in every 100	87
Appropriation by—	
Provinces (21 cases)	$29,403
Districts (6 cases)	2,013
Cities (1 case)	250
Societies (2 cases)	963

Division D.—Agricultural Winter Schools.

The object of these schools is to continue the general education of the common country school. They offer to the farmer's boy, at the time when his services are not required on the farm, or to the young farmer who is not in the situation to avail himself of the instruction of the Ackerbauschulen, a certain amount of practical instruction which such persons require to carry on advantageously their vocation. Of these schools there are 73. They are in the main supported

a Does not include preparatory school pupils, nor 66 Ackerbauschulen pupils, nor 17 winter school pupils, nor 23 pupils in a very mixed school which is joined with one of these agricultural colleges.

by the provinces, which appropriate from $250 to $1,000 annually; but the sources of support are various, the state, the district, the city, and very frequently a society, make grants. In 69 of them there were, in 1890, 2,235 pupils.

DIVISION E.—MEADOW SCHOOLS.

These have the object to instruct the sons of peasants in the management of meadows and in draining. There are 3 schools with an attendance of 195 pupils. They seem to be specialized winter schools, and are supported by the province in which they are located.

DIVISION F.—POMOLOGICAL AND GARDENING INSTITUTES.

Of these there are 4. The course is of two or three years.

The conditions of admission are, on the intellectual side, the completion of the upper or lower class of the gymnasium grade, called Tertia, and, on the practical side, 2 years' experience in gardening. Pupils in attendance, 137;[1] appropriation for 3 schools, $36,037, mostly from the state.

The full course of the Royal Institution for Teaching the Cultivation of Fruit and Wine-making at Gersenheim is as follows:

(*a*) Fundamental subjects: Botany, chemistry, physics, zoölogy, mineralogy, and mathematics.
(*b*) Professional subjects: Cultivation of plants in general, fruit-culture, tree trimming and growing, pot culture, pomology, utilizing fruit, grape-culture and the enemies of the vine and fruit tree, vegetable-growing, landscape gardening, flower-growing, drawing plants, painting fruits, and surveying and levelling.
(*c*) Horticultural bookkeeping, bee-keeping, singing, and gymnastics.

It will suffice to show the condition of agricultural education in Prussia to give the titles and attendance at the other classes of schools. For convenience the classes previously spoken of are again given.

General statement of the attendance at the schools for agricultural and the related arts at the close of the year 1890.

	Number of schools.	Attendance.
A. (*a*) Agricultural schools of university grade	7	927
(*b*) Forestry academies	2	159
(*c*) Veterinary institutions	2	674
B. Agricultural colleges (Landwirthschafts Schulen)	16	1,815
C. Elementary agricultural schools	28	1,061
D. Agricultural winter schools	73	2,235

COURSE IN AGRICULTURE IN THE HIGHER ELEMENTARY SCHOOLS OF FRANCE.

Occasionally it has happened in the history of the public-school systems of Europe that public economic distress or social disorder has been the cause of an addition to the curriculum of the public schools, and in order that the new subject may be properly and thoroughly presented in the elementary schools the

[1] Does not include 215 persons in short courses in one school.

curriculum of the schools for training teachers has first been similarly enlarged. No sooner does the German Emperor complain, for instance, that he finds that the curriculum of the German public schools in the past has given him no aid in combatting the socialistic theories so prevalent in his Kingdom of Prussia, and straightway the subject of political economy is introduced into the Prussian schools for training teachers; and so has it been with the subject of agriculture in France. Though the French revolution decided that agriculture should be placed upon the programmes, it was not until 1851, however, that instruction in agriculture was introduced as a part of the programme of the last year of the course of the schools for training teachers.

In 1860 the majority of 6,000 teachers to whom the French minister of public instruction had applied for suggestions as to the ameliorations to be made in elementary instruction responded that agriculture should be added to the course of the public schools. Shortly afterwards the symptoms of an agricultural crisis began to appear, and an investigation was made into the matter for the purpose of remedying the evil. The commission were unanimous in calling attention to the powerful influence that elementary instruction would exert in favor of agriculture, the greatest national industry of France, if introduced as a subject of study in the public schools. The manner in which this instruction should be introduced was given under three heads: First, the instruction that should be given in the schools for training elementary-school teachers; second, the instruction that should be given to the children in the district schools; third, the instruction that should be given to the adults in special courses which were appropriate to the needs of agriculture. By the law of 1879 it was enacted that every department that had not yet established a departmental professor of agriculture should be obliged to provide for one within three years. At the close of 1888 instruction in agriculture was completely organized in almost all the schools for training elementary-school teachers. But in the elementary schools instruction in agriculture has been unsatisfactory. "It is to the teacher that a good book on agriculture is indispensable; in the hands of the child it is more hurtful than helpful," says the report of the professor of agriculture of the Department of the Gironde.

But above the district school, and frequently in connection with it, there are higher elementary schools, which are of two kinds—professional and nonprofessional. In the city of Paris the course of these schools is as follows

Theoretical branches.

The subjects of this programme are apportioned over the three years' course, so as to apply in the best way to the requirements of professional instruction.

MORALS.—The principles of morals, duties, and rights of the citizen; elementary principles of political economy.

FRENCH LANGUAGE.—Methodical study of grammar and orthography, etymology, and derivation of words, exercises in style and composition, elements of the history of literature.

WRITING.—Principles and practice of running-hand, round-hand, and commercial handwriting.

HISTORY.—Principal characters of antiquity, history of France up to the present day, development of national institutions, chief epochs of general history (ancient, middle ages, and modern).

GEOGRAPHY.—Physical and political geography of the world, special geography of France (comprising the divisions for administrative purposes), economic geography, map drawing.

MODERN LANGUAGES.—One modern language at least.

MATHEMATICS.—First year: Theoretical and practical arithmetic, first elements of ordinary geometry. Second year: Advanced arithmetic, elements of algebra, plane geometry and its applications. Third year: Principles of algebra as applied to the solution of simple equations, the elementary principles of rectilinear trigonometry as applied to the estimation of triangles, elementary principles of solid geometry and their application, the common curves.

ACCOUNTS.—First principles of commerce and account keeping, book-keeping, current accounts bearing interest.

PHYSICS.—The most important phenomena and the principal theories of physics, modern discoveries, and the application of science to daily life.

CHEMISTRY.—Exercises involving the observation and examination of some of the familiar facts introductory to the study of chemistry, the metalloids and the most useful metals, the laws of chemistry, the elements of organic chemistry.

NATURAL HISTORY.—Organs and functions of men and animals, practical study of the principal groups of animals and vegetables, application of hygiene to the local industries, principal facts of geology, and examination of the best-known minerals.

SINGING.—Choir, with three parts.

GYMNASTICS.—Exercises with apparatus and military drill.

Professional Instruction.

The programme of professional instruction in the workshops is apportioned to the three years as follows, and is in practical operation in a number of schools:

First Year.

[Two hours per day.]

DRAWING AND MODELING.—Execution of the regular geometric solids of given dimensions from figured sketches.

WORKSHOP TEACHING.—(First period)—Working in wood: A box, a drawing board, a mortise-and-tenon joint, a slit-and-tongue joint, a joint halved together obliquely, a St. Andrew's cross, various kinds of scarfed joints.

(Second period)—Working in iron: Exercises with the file on an uneven piece of iron. Make rectangular parallelopiped, with a square base of given dimensions; this to be converted into an octagonal prism, then into one with sixteen sides; this is to be filed round; then, in the lathe, to turn this into a cylinder of specified diameter, and finally convert it into a hexagonal prism.

(Third period)—Working in wood: Various kinds of dovetail joints, splices, skew splices, halved together, scarf-halved with dovetail pieces.

(Fourth period)—Working in iron: Toolmaking, two rules in iron of given dimensions, two plain squares, a pair of calipers, exercises with the lathe and cutting chisel.

Second Year.

[Three hours per day.]

DRAWING AND MODELING.—Execution in graduated series of ornamental casts composed of elements of solid geometry arranged systematically, rosettes, etc.

WORK IN THE SHOPS.—(First period)—Working in wood: Mortise and tenon to moulded work, tenon for miter joint, mortise and tenon with champfered dovetail, tongued joint with cross-ties, mortise and tenon for quoins.

(Second period)—Working in iron: An angle out of square, a pair of pointed compasses, a hand vise.

(Third period)—Working in wood: Angle open-mortise joint, slit-and-tongue joint in two thicknesses of stuff, stepped in mortise and tenon, square joint of two cylinders, oblique joint of two cylinders, a pair of screw clamps.

(Fourth period)—Working in iron: Bit pincers, screw-wrench, exercise with the lathe, exercise with the cold chisel.

Second Year—Continued.

Third Year.

[Five hours daily the first six months, seven hours the last six.]

DRAWING AND MODELING.—Elements of architecture, orders and styles, ornaments of the different orders and styles.

Industrial drawing: Theoretical principles of composition and of the arrangement of colors.

General principles of the application of drawing to pottery, to fret-cutting in wood and metal, to artistic locksmith's work, and to the ornamental stamping of paper and fabrics.

CHEMISTRY.—Experiments in the laboratory, manipulation, analyses, mode of fixing colors (applied to pottery, stuffs, etc.).

ACCOUNTS.—Industrial account keeping, fixing of a scale of profits, applying the same to the work of tools and machines.

WORK IN THE SHOPS.—(First period)—Working in wood: The making of tools, moulding-block, miter block, wood bench-clamp, tenon saw, small hand saw, inlaying saw, a plane, use of the wood lathe.

(Second period)—Working in iron: The making of tools, a pair of steel squares, (one of them to be a rim square), a tap wrench, working with the cutting chisel.

(Third period)—Working in wood: The making of tools, a plane, jack plane, square, marking gauge, grooving plane, work with the lathe, model-making.

(Fourth period)—Working in iron: Making a shifting gauge, working at the forge, elementary work; making of tools, chisels, cross-cut chisels, boring bits, etc.; working at the lathe and with the cutting chisel.

In the schools of this class which have instruction in agriculture instead of in the mechanic arts, the course of agriculture covers two years, although the school has a course of three years, the first year of the course being entirely devoted to general culture. The applications of physics, chemistry, natural history, geometry, etc., however, should be pointed out to the students to prepare them for the professional instruction of the last two years of the course. During the week there are two lessons in agriculture, each of one and a half hours. The first year of the course proper is devoted to the study of vegetable life, general and special agriculture, horticulture, and arboriculture. The second year is devoted to the study of animal life, rural economy, and accounts. The syllabus which follows is modified at the discretion of the teacher. The lessons upon general agriculture and zoötechnics should be made as general as possible, and only the plants and animals which are raised in the surrounding country should be treated in detail. No lesson on grape-culture should be given in a country where the grape is not cultivated, nor should a lesson upon tobacco-culture be given when none is grown in the neighborhood, and so on. The theoretical instruction is illustrated and fixed by demonstration, practical exercises in the school garden, and excursions. The teacher should avoid with care the use of technical words, which very frequently obscure his meaning and in any case load the memory of the pupil with terms which later on he will never use. The instruction should be as far as possible clear, precise, interesting, and practical.

Lately a course of agriculture for the country elementary schools of France has been printed; how far it is in operation is not known to this Bureau, but what it is is shown by the syllabus which follows:

SYLLABUS OF THE AGRICULTURAL COURSE IN THE ECOLES PRIMAIRES SUPÉRIEURES FOR BOYS.

First Year—Agriculture.

1.—Introduction.

Definition and object of agriculture.—As one of the branches of human knowledge. The object of the science is to find the most advantageous way of producing vegetables and animals. Is one of the most important industries. Résumé of its results. Capital that it employs. Number of persons that it employs. Its primary conditions, tools, and forces. The rôle of water, heat, and light. The farmer should be familiar with the physical and natural sciences. Illustrations of this fact by examples taken from botany, geology, zoölogy, physics, etc. Agriculture as a science, as an art, as a trade. What meaning the words practice and routine should convey. The object of the course is not to teach the trade of agriculture, but to study the phenomena of the life of cultivated plants and domestic animals and to give information that will aid in its development and multiplication. The course should be filled with practical and healthy ideas, so that the pupil when he becomes a man will better understand his trade by reasoning upon what he is doing and strive to improve his methods, to wit:

Utility and advantage of instruction never more necessary than now to the farmer; competition; rapidity of the change in procedure; conditions under which plants and animals may be improved; advantages of this improvement; good and bad seedings; fertility of the soil; law of restitution; necessity of neglecting nothing; influence of good and poor food on domestic animals; difference between a well-made and a poorly constructed plow as an instrument of work.

Importance of the slightest progress in agriculture. Choice and improvement of the French varieties of seed so as to obtain a great yield, as for instance, if 50 more liters of grain can be raised to a hectare, it would be a gain of 100,000,000 francs a year, and if a centime can be saved daily in the feeding of domestic animals by improving the manner of preparing the food or ameliorating the animal machine in a manner to enable it to employ the food consumed to a better advantage to the farmer, it would be a gain of a 215,000,000 francs.

Instruction increases the charms of rural life. The attractions of the study of natural objects. Observation and interpretation of natural phenomena. Rôle of the enlightened farmer as the director of operations or as a broker. Mechanical work nourishes (asservit) both mind and body. Work done intelligently and willingly elevates man and increases his dignity. Work of cities and shops. Work of the country. Economy, health, strength, and vigor. Thanks to the healthfulness of her occupations agriculture is able to furnish the most numerous, spirited, and enduring part of the army. To cultivate and improve the soil is, then, doubly to serve one's country.

2. General Agriculture.

Agrology (*i. e.*, study of the soil with relation to agriculture).

I.—*Soil and subsoil.*

Origin and formation of the arable bed. Meteorological, physical, and chemical action. Circumstances which influence the quality of the land, such as geographic situation, altitude. Inclination and exposure of the land. Rainfall.

II.—*Classification of lands according to their physical and chemical composition.*

Physical properties and chemical composition of the land. Wheat, rye, oats, vine, and fruit lands, natural and artificial meadows, pastures, woods, and forest land.

III.—*Study of the best way of modifying the composition of the soil and the physical properties.*

1. Definition and classification of measures. Animal, vegetable, and mineral manure. Composts.

2. Stable manure, solid and liquid. Relation between and food consumed. Influence of food upon. Importance of liquid portion. Use of litters and of

what made. Preparation of litters of straw, rushes, ferns, leaves, dry grass, sawdust, marl (marne), dry earth. Care that should be given stable manure as to fermentation so as to prevent loss of valuable ingredients. Calculation of the production in relation to the consumption of forage and grain. Means at hand for increasing the supply of manure and improve its quality. Value of manure lost by negligence, in money. Fertilizing matter of cities and villages; its value and utilization. Manner of employing liquid manures. Poudrette. Wool-waste, hair, horn, skin, etc. Guano.

Vegetable manure.—Green manure; fiber (such as cotton-seed meal, for instance); sediments and waste from distilleries and sugar refineries, tanneries, etc.; sea plants, muck, paring and burning (as it is called in English agriculture).

Mineral manure.—Phosphates of chalk; salts of ammonia, of potash; ashes; nitrate of soda, salt, plaster, chalk, shells, etc. Practical experiments with these manures. Valuing the quantity of carbonate of lime in a marl. Theory of chemical manures and estimation of the relative value of manures. Precautions that the farmer should take to prevent his being imposed upon when buying commercial manures. Law touching the subject. Laboratories and stations of experimental research.

Irrigation.—Object is to supply water to enable the plants to grow, and also to carry in fertilizing matter. Kind of water required; its collection and distribution. Reservoirs, machines, canals, systems of irrigation, and preparation of the land. Increased value of the land. Lands adapted to the purpose. Quantity of water required. Time of distribution, precautions, cost, sediment. Means of using the local advantages for irrigation in the country in which the school is located.

Reclaiming land.—Difficulty of working wet soils and bad effects of water, especially in the early spring, when in the furrows. Means employed to remove the surface water. Open ditches. Influence of draining on clay lands as to temperature. Aereation of the soil. Absorption of atmospheric gases. Manure. Partial and complete drainage. Expense. Enhanced value of land. Loans by the state to enable the farmer to drain his land; law of May 28, 1858. Servitudes of draining; law of June 10, 1854. How valueless lands of the locality of the school which might be reclaimed.

Mechanical means of modifying the physical properties of the soil.—Conditions under which good tillage is possible. Proper time. The effects. Subsoiling. Clearing and breaking up land. Nonlifting subsoiling. Plowing. Various kinds of plows, and the qualities of an ideal instrument. The use of steam and animals as power. Cost. Harrowing, rolling, etc. Indications of the improvements which might be introduced in the vicinity of the school in these respects.

3.—Special Culture.

1. Study of the plant considered as an instrument (outil) by the aid of which the cultivator produces vegetable matter by using the nutriment contained in the atmosphere and in the soil.—Composition of plants. How they grow and feed. Influence of latitude and altitude. The farmer should accommodate his crops to these conditions. Qualities of the various kinds of plants cultivated. (Syllabus abridged.)

2. Study of the principal vegetables cultivated in the locality of the school or which may be introduced there with profit.—Cereals, legumens, forage and pastures, plants of industry (sugar beet, tobacco, etc.). Rotation of crops, viticulture, sylviculture. (Syllabus abridged.)

Horticulture (including the kitchen garden):

1. General ideas.—Situation of the garden. Proper soil. Preparation of the soil. Grafting. Improvements possible in the environment of the school.

2. Arboriculture.—Table grapes, peaches, apricots, cherries, plums, pears, and apples; the soil in which they should be grown, the manner in which the trees should be trimmed, etc. Conservation of fruit. Flower garden. Improvement possible in these respects in the vicinity of the school.

3. Kitchen garden.—1. General remarks. The usual kinds grown. Seed beds and resetting. 2. Cultivation of the usual vegetables. Cultivation of ornamental plants by slipping, etc. Possible improvements to be made in these respects in the locality of the school.

Zoötechnics.

Study of the use of animals in agriculture. The animal a machine which transforms the food it receives into power, flesh, milk, wool, etc. The course is divided into three parts—general, hygienic, and special zoötechnics.

1. General zoötechnics.—Food, importance of knowledge of. Animal physiology. Comparison of the chemical structure of the organs of animals with that of the food they eat. Organic and mineral matters. Different methods of determining nutritive equivalents. Cured and green food. leaves, branches, roots, straw, grain. Influence of the time of year (l'époque) upon the harvest, and of the method of culture upon its nutritive value. Good cultivation and good manuring, poor cultivation and careless cultivation. Vegetable husk and pulp and other industrial refuse as food. Salt, its physiologic action, and the manner of feeding it.

Watering. Necessity. Quantity necessary. Temperature. Precautions to be taken in winter, especially for cows. Qualities that the water should have. Ponds and drinking places.

Feeding. Regularity. Changing from green to cured food and the precautions that should be taken; preparing hay, cutting hay, grinding grain, warming roots and grain. Fermentation. Effect of these preparations upon the assimilation of the food. Importance of the matter. Study of the instruments and machines employed. Feeding during the different seasons, pasture, and stable. Amount to be fed daily and the influence which race and individual peculiarities should exercise upon it.

2. Products.—Milk, its composition, secretion, food proper to produce. Type of a milch cow, general and special characteristics, and Guénon's system. Sale of milk and utilization of that unsold. Butter and cheese making. Dairy-keeping. Reforms that should be introduced. Production of flesh, strength, and manure.

3. Reproduction.—Selection of stock for breeding, heredity, and atavism. Rearing. Castration.

4. Hygiene.—General principles. Currying and rubbing down. Construction of stables, etc. Care and treatment of disease.

5. *Zoötechnie Spéciale.*—Species and races and the improvement of the latter. Special study upon the horse and other domestic animals. General study of the animals useful to the farmer. Pisciculture in fresh, brackish, and salt waters. Culture of oysters and salt-water mussels (moules). Useful insects. Apiculture. Sericulture. Acclimatization.

RURAL ECONOMY.

Property in land and methods of cultivation. Leases. Salaries. Means of stopping the depopulation of the country. Agricultural loans (crédit agricole). Agricultural societies. Syndicates. Instruction in agriculture. The "Institut Agronomique" (Agricultural University of France). The "national schools of agriculture." The "practical schools of agriculture." The "farm schools." The "departmental professors of agriculture." Agricultural statistics of France. Production and consumption. Importation and exportation. Importing countries. Countries to which France exports food stuffs. Agricultural statistics of the department in which the school is situated and a general review of its situation from an economic standpoint.

BOOKKEEPING FOR FARMERS.

Necessity of keeping a record of the details and results of cultivation. The necessity of reducing the writing to the smallest amount possible; for the cultivator from the nature of his occupation is not fond of office work. By order and method it is possible to accomplishing this by noting in a pocket notebook the facts as they occur, and giving an hour or two on Sunday to their study. Above all the farmer should know the capital that has been sunk in his enterprise. His inventory should consist of the value of the property and buildings, the capital used in carrying on farming (animals, instruments, manure, etc.), and cash on hand. A farmer should study in advance his plan of action and regulate his expenditure thereby. In addition the farmer should keep a cash book.

PRACTICAL WORK.

Within doors.—Study of seeds—determination of the nature of the seeds of cultivated plants and of weeds. Dodder seeds—determination of the purity of the sowing and its germinating power. Study of soils, their composition and analysis. Rocks found in the locality. Soil formed by the disintegration of rocks, and alluvial soils. Soil and subsoil. Study of manures. Appearance of

commercial fertilizers, their preparation and distribution. Analysis of specimens of commercial fertilizer. Study of agricultural instruments, the work they do, the care they should receive, and their repair. Study of plants, of milk, of the teething and age of animals, the foot of the horse, ox, and ass, and shoeing. Beehives, trellises, etc. Insectides, etc. Buildings and materials. Collecting insects.

Outside work.—Spading, raking, rolling, clipping, grafting, pruning, sowing, replanting, growing, cuttings, weeding, making composts, etc.; applying sulphur, etc., to destroy the fungus on vines and vegetables; gathering and preservation of the crops. Special plates for comparative study of the value of the different kinds of manures and cultivated plants. Visits to hothouses, gardens, etc.

BIOLOGY.

The study of biology has been given the attention its importance deserves in a special study issued by this Bureau as Circular of Information No. 9, 1891. By an inadvertency, however, a notice of the biological departments of the University of Illinois was omitted from the circular, and the occasion is here taken to insert an account of the biological work of that institution, which has been kindly furnished by Prof. S. A. Forbes, of the State laboratory of natural history of Illinois.

The erection, in 1892, at a cost of $60,000, of a new building for the biological departments of the University of Illinois affords a suitable occasion for a description of their organization and work—in some respects typical for the State universities, and in others unique. These departments are thrown together, by the plan of university organization, forming what is known as the school of natural science, which comprises the departments of botany, zoölogy, entomology, human physiology, and geology.

The courses in this school are especially intended:

(1) To afford a thorough and liberal education with a basis in science and the modern languages.

(2) To prepare for the pursuit of specialties in zoölogy, entomology, botany, general biology, and geology, as a scientific career.

(3) To lay a liberal foundation in biological work and study for a course of medicine.

(4) To prepare for the teaching of the natural and physical sciences either in the higher schools or as a professional specialty.

The sciences required for admission to the studies of the school are botany, physiology, and physics, with algebra through radicals, and plane and solid geometry. The scheme of requirements for graduation is so constructed as to permit the student either to specialize at the beginning of his sophomore year by the selection of a major subject, to be pursued, if desired, for three years continuously, or to distribute his principal effort within certain limits over a small group of related subjects. To this end the studies of this school are divided into three groups: (1) required studies, (2) restricted electives, and (3) open electives. Under the head of restricted electives both major and minor courses are given, the former the maximum offering and the latter the minimum requirement in their respective subjects.

No student may graduate from the school of natural science until he has completed all required courses, and has done at least nine terms' work on one major subject, or twelve terms' work on more than one from the group of restricted electives; and taken at least minor courses in all the other subjects of this group in which such courses are offered. The major courses must be chosen for a year at a time, and may not be changed without special permission.

The required subjects are, on the other hand, general culture studies (mathematics, history, and philosophy) and, on the other, modern languages and drawing, required because necessary to any extensive pursuit of the biological sciences. The minor courses of the "restricted elective" group are all one term courses offered in botany, zoölogy, physiology, geology, physics, and chemistry respectively.

Major courses of three years are offered at present in botany and zoölogy only. In geology five terms' work may be had, in entomology two terms, and in general biology a single term, coming as a sequel to the courses in zoölogy and botany.

In botany six courses of instruction are offered—five primarily intended to meet the wants of students making botanical work more or less a specialty, and

the sixth occupying a single term, complete in itself, for students whose chief attention is given to other branches. Three to eight terms' work constitute a major course; that of the single term a minor course. To a very large extent natural objects are studied rather than books; but constant endeavor is made to introduce students to pertinent existing literature. In the laboratory much use is made of the compound microscope and special attention is given to its manipulation for best results, and to the preparation of objects.

The courses offered as major work (ten hours a week) are: (1) the histology, morphology, and physiology of plants; (2) bacteriology; (3) advanced determinative and biological work on fungi; (4) the reproduction and development of plants; and (5) research work for two terms of the senior year for such as are to present a botanical thesis for graduation.

The zoölogy is taught in five courses: (1) a major course (restricted elective) of a full year, ten hours a week; (2) a term of embryology, likewise ten hours a week, for those who have taken course 1; (3) two terms of research work (senior) for those who have taken courses 1 and 2, and who select a zoölogical subject for the graduating thesis; (4) a year's work, open elective, in systematic zoölogy for advanced students only; and (5) a general course of a single term, offered as a minor course in the school of natural science and as an elective to the students of the university at large.

A course in practical and general embryology and in the theory of evolution is given in the fall term as a sequel to course 1. It is required of all students intending to present a zoölogical thesis, except such as take course 4.

A single course of two terms, ten hours a week, is offered in entomology. It is designed mainly as a preparation for economic work and investigation as a specialty; but students whose principal interest is in structural or systematic entomology are permitted to take a special line of such work in the second term.

Palæontology is taught at present as a term's work in geology, and requires a major or a minor course in zoölogy as a precedent.

The department of human physiology is as yet in embryo, but ample provision for the development of the subject as an experimental science has been made in the new building. At present but a single term is given to it. Comparative physiology is taught extensively, however, as a part of zoölogy, with assigned experiments by students on the lower animals from the protozoa upwards.

For those who have taken a major course in either botany or zoölogy a single term (ten hours a week) of general biology is arranged and especially commended. It is intended to review, extend, systematize, and unify the student's knowledge of the phenomena, the history, and the laws of life, of the relations of plant and animal, of living and not living matter, and of biology to other sciences and to philosophy. It is properly a senior study for students of the school of natural science.

The studies of animal life are brought to a conclusion by a single term's work (three hours a week) in anthropology, the objects of which are to summarize the facts and theories relating to the origin of man, to introduce the comparative study of races with a view to ascertaining their relations to each other and to primitive man, and to study the steps by which races change from the savage to the enlightened stage.

The subject of physiological psychology in the department of philosophy is so correlated with these biological courses as to amount to a practical continuation of their methods and spirit into the field of psychological investigation.

Intimately associated with the zoölogical department of the university, and practically merged with it since 1884, is the work of the Illinois State laboratory of natural history and that of the State entomologist of Illinois, the former consisting essentially of a systematic and thorough-going investigation of the zoölogy and cryptogamic botany of the State, the results of which are in course of publication by the State, and the latter of entomological investigations whose main end is economic, but whose product is largely scientific and educational. Both these departments of work, although supported by appropriations independent of those granted to the university, are directed by the head of the zoölogical department of university instruction, and provided with quarters and facilities in the new natural science hall. The State laboratory is also the headquarters of an extensive work on the zoölogy of the fresh waters of the United States, conducted under the auspices of the U. S. Fish Commissioner.

The natural science building is 134 feet in length by 94 in width, and three stories in height above the basement. There is a spacious, well-lighted central hall, around which on all sides are situated laboratories, lecture rooms, closets, storerooms, and dark rooms, a full series for each department.

As an example of the arrangement and equipment of this building a general description may be given of the provision for zoölogy. The students' laboratories in this department are three in number, on the first floor, for elementary, advanced, and post-graduate work, respectively. In the first, table room is given for 30 students; in the second, for 16; and in the last, for 10. Adjoining the first is the private laboratory of the assistant in zoölogy and next this is the lecture room. Directly over the assistant's laboratory is that of the professor of zoölogy, and over the post-graduate laboratory is his private office. On this second floor are also the rooms of the State laboratory of natural history, consisting of an assistant's laboratory, 36 feet by 21; a collection room of the same dimensions; a library, 32 feet by 23; and a room for the artist of the establishment. In the basement of the building is a very large storeroom for the department, and an animal room to be fitted with aquaria, animal cages, and the like. On the third floor are the zoölogical collection rooms, containing the material required to illustrate the work of the department. The zoölogical laboratories are furnished with microscopes and with an abundance of microscope apparatus, including several first-class microtomes, an imbedding apparatus, and an incubator. A full equipment for field work in the various departments is at the service of the students, and the library and collections of the State entomologist and the State laboratory of natural history are also made accessible to them under suitable restrictions.

The general museum of zoölogy and geology is in another building. It occupies a hall 79 by 61 feet, with a gallery on three sides, and it is completely furnished with wall, table, and alcove cases, full to overflowing with prepared material.

HIGHER INSTRUCTION IN THE SCIENCE AND ART OF TEACHING.

I.

If the boast of autobiographies and the complaints of State superintendents go for aught it would seem that in many cases in the early days of the public school systems of the New England States the common schools were taught by college undergraduates, who thus "worked their way through college." Even now it has been stated that "of the more than 6,000 public school teachers in Tennessee at least two-thirds are working earnestly to obtain a good education either by private study or by teaching school and attending college alternately." In this way it is possible to explain the fact that in Massachusetts fifteen years elapsed between the founding of her first normal school and the establishment of public scholarships at Harvard and other colleges for the purpose of providing competent instructors for her one hundred public high schools in existence at the date of 1853.

But by the act of that year Massachusetts did not establish a higher normal training; for forty-eight scholarships of $400 each were created and distributed among her colleges, twelve of which were annually given to as many person selected from among the forty scholarship districts into which her territory had been for this purpose divided,—"The scholarships were filled, the holders graduated, but they failed to become teachers."[1] The colleges turned out what is usually called educated men but not teachers. In 1866 these scholarships were abolished.

There is still another early attempt in this line to chronicle. In 1851 Brown University established a department of didactics in which a course of lectures was given "On the habits of mind necessary to eminent success in teaching, the relation of the teacher to the pupil, etc., and on the elements of the art of teaching or the best methods of imparting instruction in reading, grammar, geography, history, mathematics, language, and the various other branches taught in our higher seminaries." The school, however, soon closed its doors.

This movement, however, was not confined to New England. At the instance of the State superintendent of Michigan the board of regents of the university of that State in 1860 permitted a course of lectures to be given on the principles and philosophy of education and the organization and mangement of schools. But it appears that the University of Iowa was the first to reward the student of pedagogy with a distinctive degree.

---

[1] 31st Annual Rept. Mass. Bd. Ed. (1867), p. 71.

After the repeal of the act of 1853 creating forty-eight scholarships the educational authorities of Massachusetts urged the necessity of an additional and higher course of instruction in the four normal schools of that State. At the date of 1870 those schools had a "voluntary" course of two years, chiefly attended by former graduates, "who had learned from their experience in teaching the value of a more advanced scholarship."

It was not until 1879 that a definite step was taken in the way of recognizing pedagogy as a science and also of recognizing the necessity of training teachers for schools above the elementary grade. In that year the University of Michigan established a chair which took the expressive name of the "Science and art of teaching." In considering the instruction given from this chair, the inquirer is struck with three facts, to wit, the announcement that the science of education, being one of the latest of the sciences, had not yet been cast into articulate form, in fact was in process of formation; the scholastic character of the attendance on the course, two-thirds of whom were college graduates; and most important of all, the double requirements to be fulfilled before the "teacher's diploma" was given to the candidate, the requirements being (1) marked ability in either Greek, Latin, French, or physics as shown by special examinations, and (2) one of the courses offered by the professor of the science and art of teaching. The course of this chair was not long, only occupying, indeed, an academic year, and even this time was halved, one-half being devoted to the study of supervision, grading, courses of study, examinations, the art of instruction and governing (no practice or model school), school architecture, school law, in a word, superintendency, and therefore called practical; and the other half to the history and science of education and comparative pedagogy, if that term may be coined.

The difference between this course and those of either the French École Normale, or the Prussian training colleges for Gymnasialpädagogik is marked. To illustrate this it may be profitable to compare the work at the University of Michigan with that of two typical Prussian training colleges for candidates for teachers' positions in the classical schools called gymnasiums.

BERLIN (1885-86).—ESSAYS BY THE MEMBERS OF THE SEMINARY.

The great Homeric hymn on Mercury.

De Nemæorum Pindari carminum locis quibusdam controversis.

Platonica (critical essay on some points in the Symposium).

Remarks on the names of Greek priests.

Quæstiones Tullianæ ad libros de inventione spectantes.

Æschylus's De Aristophanis Thesmophoriazusis quæstiones duæ. (Question 1. Was the work published in 411 B. C.? Question 2. A critical examination of verses 1001-1033.)

The tax levy of Nausinikos and the Trierarch law of Periander and Demosthenes.

Current work (1 instance): Criticism of a member upon Bindseil's recent book on composition (in German) in the highest class of a gymnasium (college).

The critic was praised for the accuracy and intelligence displayed in his work; but was criticised for withholding his own judgments and for agreeing with many doubtful statements. In conclusion the director seized the occasion to speak from his own experience on the matter contained in the essay and to connect the whole discussion with the object of the seminarium, that is to say, the training for teaching in a gymnasium.

ANN ARBOR (1880-81).—ANNOUNCEMENT.

Course I (one semester).

The general purpose will be not as much to teach specific methods as to put pupils in firm possession of a body of doctrine out of which they may draw their own methods. Recitations and lectures four times a week.

The varieties, true, and common conception of labor and a basis for estimating its value. Qualities needed for superintendence, the supervision of schools and its value.

Delegated power, its rights and privileges; relation of the board to the people, of superintendent to board and to teachers, and his duties.

The purpose and methods of the teachers' meeting.

The nature, advantages, and disadvantages of a graded school.

The course of study.

Course II (one semester).

Historical, philosophical, and critical, embracing the history of education, the comparison and criticism of the systems of different countries, the outlines of educational science, the science of teaching, a critical discussion of theories and methods. A translation of Paroz's Histoire Universelle de la Pédagogie is in progress and this will be the basis in this portion of this course. Special studies on the reformers in education will be made.

The general purpose of the second course will be to teach general principles and doctrines rather than specific methods. Pupils will be taught in the assumption that they can form for themselves their own art out of the principles they have learned and that have sufficient versatility to adopt their methods to the requirements of circumstances.

Private reading required and a course in philosophy or on lectures XXXI-XXXVI, of Hamilton's Metaphysics.

MAGDEBURG (1883-84).—ESSAYS BY THE MEMBERS OF THE SEMINARY.

Criticism of Jean Paul Richter's Lavana:
1. The Importance of Education.
2. Spirit and Principle of Education.
3. Culture through Religion.
4. Origin of Man and Instruction.
5. Bidding and Forbidding.

Proof of the last antinomy in Plato's Parmenides.
The justification and purpose of classical instruction.
Indirect questions in Greek.
What is Herbart's idea of instruction in a foreign language, and upon what has he founded it?
How far is Xenophon's prejudice for Laconia shown in his Hellenica?
Perthes's proposition to reform instruction in Latin.
Three hours of Virgil in a Gymnasium.
Montaingne as a Pedagogue.
Montaigne and Rousseau.
Locke's position in pedagogy.
Literary and historical study of Jodelle's Plays.

Criticism of an essay entitled "The character and purpose of classical instruction," by the Director, as follows:

"The paper shows a certain amount of industry; but the theme is not worked out, nor does the author go very deeply into his subject. The essay is more a reproduction of stale thoughts than the independent expressions of opinions of a mind filled with enthusiasm for the dead languages."

Having thus briefly reviewed the efforts to provide for the professional training of teachers at our higher institutions of learning, we now turn to consider the condition of the study of pedagogy in those institutions at the present day. Those interested in the work of the normal schools usually so called are referred to chapters xi–xiv of the Bureau's Report for 1888–89.

II.

It would be difficult to generalize on the pedagogical courses of the more important universities of this country, as they have few elements that are common. Two of these elements, however, are of considerable interest. One is that some universities have complete courses in pedagogy, whether graduate or undergraduate, while others make it an elective study for juniors and seniors in the regular college course. The other common element is that by establishing such a course or study these institutions recognize that the person who intends to teach should have instruction in matters and in methods that the candidate for the degree in arts or science does not receive. This may not be an attempt to recognize education or pedagogy as a science, as political economy or politics under the name of sociology has been recognized, but it is certainly placing pedagogy on the same footing as those subjects.

The only classification of the university courses in the science and art of education that is attempted here is the division into courses in which special pedagogy (methods in Latin, mathematics, etc.) receives the emphasis and those in which the emphasis is placed upon the science of education. To illustrate the first the recently established course at Harvard is used; to illustrate the second the course at Clarke University is given.

From its age, standing, and its conservative attitude in the matter of according to pedagogy a place among the sciences, Harvard University caused more than a passing interest when it announced that in its faculty of arts and sciences "courses for teachers on methods of instruction" had been established. These courses are of university grade; that is to say, they are only open to those who have graduated from a college of arts or of science. As was the case at the University of Michigan in 1879, there is a department or course of pedagogy proper, which is called "The history, theory, and art of teaching," and many courses, each concerned with the best methods of teaching the several studies of the college curriculum. The history, theory, and art of teaching course is divided into three departments, to wit: History of teaching and of educational theories, theory of teaching, and the art of teaching. The first and third are considered, either in the form of a lecture or discussion, twice a week during the year; the second, only once a week. In the first and second subjects two essays are required from the student, in the third the student is expected to observe the teaching in some designated school or schools in the vicinity of the university and, during the second half year, to present reports on what he has seen. In addition to this instruction given or directed by an assistant professor of the university, twelve lectures on "Topics in psychology of interest to teachers" are delivered by the professor filling the chair of philosophy at the university.

In special pedagogy there are thirteen subjects of study, Greek, Latin, English, German, French, history. mathematics, physics, chemistry, botany, zoöl-

ogy, geology, and geography. The syllabus for Greek and chemistry will very well illustrate the method of conducting courses in language and in science.

GREEK.

(1) *Lectures* (once a week during the second half year). Topics: Discussion of existing methods of acquiring the elements. Outline of method recommended in teaching forms and syntax. Method of securing practical application of the knowledge acquired. The art of reading. Acquisition of a vocabulary. Translation and retranslation. Review of grammar during the second year's work in school. Wider application of the principles of "reading at sight" and of the "group system" in the acquisition of a vocabulary. Method of teaching the facts of geography, history, and antiquities. Greek prose composition.—Method of teaching the dialectical and syntactical peculiarities of Herodotus and Homer. Amounts to be read. Homeric verse. Geography, history, and antiquities. Literary treatment.—List of books to be used or consulted.

(2) *Practical exercises:* Discussion of topics suggested by members of the course.—Practice in outlining lessons, in construction of exercises, in formation of word groups, in selection of passages for translation at sight, in composing English passages to be translated into Greek, and in arranging facts of geography, history, and antiquities for presentation to a class.

CHEMISTRY.

(1) *Lectures* (five). Topics: Methods of teaching chemical science. The history of the development of the modern methods. Fit adjustment of theoretical and experimental teaching and the value of each as modes of mental discipline. How far chemistry can profitably be taught in the secondary and primary schools. Best means of securing enduring results. The best and most economical ways of installing and of furnishing a school laboratory, and the precautions required to insure profitable and safe work from immature students. Suggestions on the preparation and delivery of experimental lectures. The best system of teaching the three main branches of elementary chemistry, viz: General descriptive chemistry, mineralogy, or the natural history aspect of chemistry, and qualitative chemical analysis.

(2) *Additional exercises:* In order to gain a competent knowledge of class-room and laboratory methods of teaching chemistry, the student will find it essential to take such of the following courses as he has not already studied: Chemistry, A, B, C, 1 and 3. (See the general announcement of the courses of instruction provided by the faculty for 1891-92.)

The courses at Harvard are "adapted to the purposes of teachers and of persons intending to become teachers," not so with the curriculum of the department of education of Clarke University. At the latter institution the work in pedagogy is "primarily shaped to meet the special needs of two classes, one composed of those desiring to qualify themselves for professorships of pedagogy in universities, colleges, or normal schools, the other class composed of those who intend to become superintendents of State or city systems of education or wish to fit for other administrative positions." In following out this programme President Hall has constructed a curriculum that is quite an innovation. This curriculum falls, it would seem, under four heads—comparative pedagogy (if that term may be used to connotate the description and comparison of foreign systems of education), the social effects of higher education, the effect of the artificial or intellectual development of the child upon his natural or physical development, and special pedagogy, beginning with the three R's. The courses in neurology, experimental psychology, anthropology, and practical ethics (criminalogy, pauperism, and defectives) are open to the students.

Certificates of proficiency are given on completion of the course at both universities, whose course has been described, but at the University of Iowa something more than a testimonial of proficiency is conferred. After two years of successful teaching graduates of the university who have taken a full course in pedagogy may obtain the degree of Bachelor of Didactics. The course in pedagogy of this university—fully described in Circular of Information No. 8, 1891—is composed of three sections, known as history of education (fall term), educational science and systems (winter term), and school management and exemplification of methods of instruction (spring term). During the week preceding annual commencement the State board of education holds an examination at the university for the State certificate.

The teachers' department of the University of Tennessee has been organized to aid in educating teachers for the public and private schools of the State, but especially to give this class of public-school teachers an opportunity to secure a better education. "The course is in no sense a normal department. Our (Tennessee) teachers have already, in the various normal schools, college, and institutes, sufficient opportunty for that kind of training if they want it. The purpose of the university is to advance knowledge, and the object of this course is to stimulate its students to seek a complete, liberal education, and it is hoped that many of them will take a full college and university course. A due proportion of professional training is provided as a part of their education, but in every thing the thorough development of the man in all his powers will be the object aimed at, and not merely his training to perform a few professional pro-

cesses. Even the work in the common-school branches has for its object the perfection of the teacher-student in these subjects."

A course practically of the same nature as that just spoken of is offered by the University of Wisconsin to graduates of the State normal schools who desire to improve their scholarship.

At Cornell, Columbia, and Princeton, under various titles, there are courses or quasi courses in pedagogy which juniors or seniors of the regular college course may elect. Of these the course at Cornell has the name of "The science and art of teaching."

Two schools of pedagogy which are connected with universities have peculiarities that require mention. The comparatively elaborate system of pedagogical degrees conferred by the University of the City of New York is based upon the idea inaugurated at Iowa, that a degree should follow successful teaching and not precede the efforts of the holder in the school room, and further that the course in the science and art of teaching is a professional course to be pursued by persons whose general education has been finished at a college or at a normal school. The conditions under which the degrees are conferred are as follows:

DOCTOR OF PEDAGOGY.

Each student of the school who has been a member of the senior class for two or more years and a resident student at least one year, will be entitled to the degree of doctor of pedagogy upon the following conditions:

(1) He must have been credited with attendance upon the required lectures.
(2) He must have been credited with attendance upon the required seminaria.
(3) He must have passed an examination upon each of the five courses.
(4) He must have presented the prescribed final thesis as defined below and have received approval of the same.
(5) He must have presented, upon entering the school, a certificate showing seven years' successful experience in school-room work.

MASTER OF PEDAGOGY.

Each student of the school who has been a member of the junior class for one or more years, and a resident student at least one year, will be entitled to the degree of master of pedagogy upon the following conditions:

(1) He must have been credited with attendance upon the required lectures.
(2) He must have passed the examination upon each of the four courses first named.
(3) He must present a certificate showing three years' successful experience in school-room work.

The features of the department of pedagogy of the University of South Carolina that call for special mention are (1) the establishment of an undergraduate and graduate course and (2) the introduction of modeling and blackboard drawing as a part of the undergraduate course.

Turning now to the schools of pedagogy which are unconnected with a university, it seems advisable to take up the recently established State Normal College at Albany, N. Y., since the American prototype of this class of schools, the New York College for the Training of Teachers, has been fully discussed in chapter VIII of Circular No. 8, 1891, of this Bureau, and in the Bureau's annual reports.

Of the several schools which constitute the normal-school system of New York the school at Albany was the first to be established, owing its existence to the incompetency of the normal classes of the academies to fill their proper functions. In Michigan, and in other States, the State university was called upon to give the higher education in the science and art of teaching required by the times, but in the States of which the Union was originally composed, with the exception of New York, higher education is not under State influences, much less under State control, and in creating a school of pedagogy even, New York selected one of her own schools for the purpose, and her first State Normal School became the first State Normal College.

This college has been established to give instruction in the science and art of teaching. It is a purely professional institution, consequently nothing will be studied or taught in it which does not bear directly upon the business of teaching. Advanced courses in mathematics, the natural sciences, rhetoric, and such studies can not be pursued in the college, inasmuch as only methods of teaching those subjects are taught, a knowledge of them being a prerequisite. Without dwelling on the particulars of the administration of the college which is just entering upon its work, it suffices to say that there are three courses of study,

namely, the English, the classical, and the kindergarten. The minimum age for admission to the first and second courses is seventeen years, while for the kindergarten course the minimum age is fixed at eighteen. The only course which leads to a degree (B. Ped.) is the classical course, which is of two years. Its subjects are as follows:

COURSE OF STUDY.

First term.—Philosophy of education, school economy, drawing.
Methods of teaching the following subjects, viz: Number, place, language, reading, arithmetic, geography, grammar, penmanship, botany, physiology, zoölogy, composition, color, object lessons. A course of reading connected with professional work.
Second term.—Methods of teaching the following subjects: Algebra, physics, Latin, mineralogy and geology, geometry, chemistry, rhetoric, astronomy, preparation of specimens and apparatus, discussion of educational themes.
Third term.—Methods of teaching the following subjects: Latin, Greek or French or German, history, physical geography, solid geometry and mensuration, civil government, trigonometry, bookkeeping, English literature, sanitary science, school architecture, preparation of specimens and apparatus, discussion of educational themes.
Fourth term.—History of education, school law, kindergarten methods.
Methods of teaching the following subjects, viz: Music, drawing, physical culture, elocution, familiar science, teaching in model school, a course of reading connected with professional work, discussion of educational themes, school supervision.

Among four hundred institutions carried on the lists of this Bureau as universities or colleges one hundred and fourteen report students in teachers' courses to the number of 3,414. In other words, nearly 8 per cent of the enrollment of the four hundred institutions were studying in the teachers' course or department of one hundred and fourteen colleges. Of these one hundred and fourteen colleges the great majority are situated in the Mississippi Valley; scarcely any of them are located in the New England or Middle States. With few exceptions these departments, or courses, are nothing more than normal schools, which are usually classed among institutions of secondary grade. In many of these departments Latin is introduced as a required or as an optional study; in most cases, however, the course is concerned with the studies of the grammar grade of the public schools, with high-school mathematics and science. Bible instruction and surveying appear occasionally. In some cases it is very evident that the teachers' course is constructed on the interchangeable parts plan. Thus if history of education, school management, etc., be omitted and less technical subjects be introduced the preparatory course of the college or university is formed. At the completion of the course, which is intended, it would seem, to prepare for teaching in the district schools of the State, a certificate of proficiency is given. The length of the course of the schools of the class now under consideration is generally of three or four years, frequently it is of two, sometimes of one. In the case of a one or two years' course, however, the course may be looked upon as special or irregular. In conclusion it may be said that an intelligent graduate of a thoroughly taught high school who had attentively read Compayré's History of Pedagogical Ideas, a book on methods and management, and Sully's Psychology, for example, might graduate immediately and with honor from the great majority of the normal departments or teachers' courses of our colleges and universities.

The Normal Department of the National College for the Deaf at Washington presents several unique features. To supply a limited demand for specially trained hearing-and-speaking teachers in schools for deaf-mutes, a few modestly endowed fellowships are available annually. The candidates for fellowships are graduates of approved colleges and universities specially certified by instructors in these institutions, and nominated by heads of schools for the deaf. The degree of Master of Arts is conferred upon fellows satisfactorily completing the course of study and practice. Harvard, Williams, Amherst, Yale, University of Mississippi, De Pauw, etc., have been represented in this department. The course of study includes lectures and assigned readings with required essays upon general or "comparative" pedagogics; class-room and "seminary" investigation of the literature of deaf-mute instruction; the dispassionate consideration of rival methods; the mastery of means of communication with deaf-mutes; lectures upon anatomy and physiology of the vocal organs, and laryngoscopy; the study of English phonetics, mechanism of elements of speech, Bell's Visible Speech, and observation and practice classes in speech and "lip-reading," with detailed weekly reports of work done, occasional examinations, and a thesis. In the course of the year each member of the class is expected to teach at least one deaf-mute pupil to speak. The same course of study has been pursued by candidates for certificates only.[1]

[1] As the pages go through the press Prof. Gordon, in charge of the Articulation Department of the National College for the Deaf, kindly furnishes the foregoing sketch of the work of one of his departments.

CHAPTER XI.

STATISTICS OF PROFESSIONAL INSTRUCTION, 1889–90.

The diagrams and maps on pages 838 *et seq.*, the consolidated statistics given on pages 3 and 4, and the general discussion of the curricula of the several classes of professional schools leave no occasion to discuss the statistics of the year. Indeed, to do so would be but to repeat what is said far more concisely in the summaries which follow. These summaries have not been drawn with the intent of showing statistically the entire life of the various institutions during the year under review, but with the view of presenting a few primary facts, to wit, the number of schools, the number of instructors and students in them, of graduates from them, and, as far as the replies of the Bureau's correspondents will allow, the proportion of the students having a degree in letters or science. If the secondary statistics, such as the financial particulars, are missed, they may readily be found by examining the report preceding, where they have been given with as much accuracy as the character of the institutions concerned (university departments, independent schools occupying rented buildings, etc.) will admit. Matters of this subordinate kind do not vary sufficiently within a twelvemonth to require annual insertion. Even in the case of the colleges endowed by the acts of Congress of 1862 and August 30, 1890, it is preferable to wait and use the more reliable figures which the act of the latter date exacts than those furnished to the Bureau under the provisions of the law of 1862. Table 6, therefore may be regarded as a compilation that falls short in its totals of the true amounts.

In the case of the normal schools, the amount received from public funds shows a great increase over that reported for the preceding year. It is evident that this is due in some measure to the separation of the question usually asked in the Bureau's form of inquiry into two items, namely, appropriation for support and appropriation for building. In former years it would appear that, as a rule, only the amount for support was reported. Assuming this hypothesis for a moment as true, an increase of only $28,000 is shown between the appropriation for the support of public normal schools for the years 1888–89 and 1889–90. This amount is too small, as appropriations for building were undoubtedly included in 1888–89 which have been rigorously excluded in 1889–90.

[a] One school not answering.
[b] At least 1 school occupies a rented building, the value of which has not been included.
[c] No answer from 1 school.
[d] Of this $16,500 was interest on endowment.
[e] No answer.
[f] Not including new buildings in course of erection.
[g] Twelve thousand acres of land, some of which is sold.
[h] The $10,000 in column 3 is "from bonds of endowment lands," but the answer to the question as to productive funds is "none."
[i] At page 404 of the Bureau's report for 1887–88 the peculiar system of giving free tuition in Pennsylvania normal schools is described. The appropriation directly made by the legislature is $7,500 to each school. Some schools include the amount indirectly appropriated by the State with that directly appropriated; others return the indirect appropriation as the amount of the legislative grant and the direct appropriation as a benefaction, etc. The amount given in column 1 is estimated. The aid from other sources can not always be given accurately by the schools, as their system of bookkeeping includes board, etc.
[j] $12,000 of this was for building.
[k] Includes statistics of 1887–88 for 1 school that has failed to report for two years.
[l] Each of the 5 schools of Wisconsin gets $10,000 by appropriation and a pro rata of $105,000, the income from the normal-school endowment fund. This interest has been included, of course, in column 3.

TABLE 10.—*Statistics of private normal schools for 1889-90.*

	Number of schools.	Instructors.		Pupils.					Normal graduates, 1889-90.
		In professional department.	Not in professional department.	In professional department.		Not in professional department.		Model or practice school pupils included in columns 6 and 7.

CHAPTER XII.

METHODS EMPLOYED IN THE REFORMATION OF JUVENILE OFFENDERS.[1]

In all active measures for the reformation of the disreputable portion of society there is noticeable an element which, for want of a better term, may be called faith in human nature. Yet it is not mere faith in human nature that is to be so much noticed as the faith in the power of reason to sway and of habit to mould a human being into the course of conduct that society finds necessary for its preservation and approves. It is quite natural that in a Christian community this belief in the permanent possibility of redemption of the vicious should find its strongest support. It is not improbable that the very origin of the belief was due to Christianity. The stages of the growth of the effort to prevent crime seem to be these: To prevent the orphan or the child abandoned by its parents from coming in contact with vice; then to reform those contaminated by such contact; and finally the reformation of grown criminals.

At first the efforts made in this direction were a matter of charity, though conducted under church, or at least clerical auspices. But finally the State, solicited to lend pecuniary aid, has assumed or is assuming complete or partial charge of the work. In the early efforts of the church, enthusiasm supplied the place of method which was gradually developed as experience showed the way. State control was particularly favorable to this development of the art, so to speak, of reformation, as the expense of giving form to new ideas is more readily borne, generally speaking, by the public purse than by the purses of many charitably disposed persons.

But with the growth of the conception of the interdependence of the physiological and psychological phenomena in man as shown by the removal or mutilation of the sense organs of other animals, an attempt has been made to ascertain the laws which govern criminality. To scientists, therefore, the reformatory is a laboratory of investigations; to the public, on the other hand, it is a place for obtaining certain results. In this chapter we are wholly concerned with the latter view.

From a practical, that is to say, administrative, standpoint the key to the conundrum "What shall be done with these children that they may be saved" seems to be in providing them with a good home, which is universally allowed to be the best possible place of discipline for them. To this end two methods have been employed, one old and requiring the services of an agent to visit the boys at the farmsteads where they have been received, the other, of comparatively recent origin, which consists in furnishing a similitude of a home to a few boys selected from a moral point of view for their fitness to consort with one another.

I.

The first of several general questions asked on the form of inquiry annually sent out by this Bureau was conceived in the following terms:

Briefly and in general terms please favor us with any opinion or other information you may have to impart in answer to the following questions:

1. Assuming, merely for convenience in putting the inquiry, that it is highly desirable to separate those more deeply tainted with vice and crime from the other inmates of the institution:

(*a*) Do you consider that the cottage system answers this purpose, and does the segregation of the more vicious amount to very much the same thing as a classification of all the pupils by age?

(*b*) What changes at your school in respect to the classification of pupils and the adoption of the "cottage system" during the last decade?

[1] Prepared by Mr. Wellford Addis of the Bureau, specialist in professional education.

To these questions the superintendents of the several institutions have replied as follows:

Superintendent Hatch, of Colorado: (*a*) No data. (*b*) No changes.

Superintendent Howe, of Connecticut: (*a*) The cottage stystem admits of any desirable classification. The natural classification is not by age. The natural family is composed of children of all ages. One or two boys or girls ("deeply tainted with vice and crime") can safely be placed in a family of good boys or girls and thereby be cured by the contact. Nothing is so efficacious in converting the wayward as to make them feel that they are a part of good society. (*b*) The cottage system has been adopted and carried into effect in Connecticut within the last twelve years.

Superintendent Haines, of Delaware: (*a*) I consider it very desirable to separate those more deeply tainted with crime from the other inmates and think that the cottage system answers the purpose to a certain degree. (*b*) No change.

Superintendent Shallenberger, of the District of Columbia: Ours is the cottage or family system and consists of three separate divisions. The separation consists in a division of the older from the younger boys. In each family there are two school grades. Out of school session the family is a unit for both work and play. Each family has two dormitories, one for the older and one for the younger boys. Classification other than this, in my judgment, is not important enough to justify the additional expense attending further or special separation. (*b*) Several years since another, the third, family was organized and placed in our new building. This made it possible to secure a separtion of our older from the younger boys—as indicated under (*a*) above. This has been a decided improvement, although our families are still too large. With another building we could make the association in each still more satisfactory.

Superintendent J. D. Scouller, of Illinois: (*a*) We have both the cottage and the congregate system. There should be no mixing of good and bad, vicious and virtuous in an institution when you can draw the line from personal knowledge. The cottage system is perhaps the best for the separation of pupils by age and character. There should be a central cottage or building where all pupils newly committed (or a large per cent of them) should be on probation before being classified according to the commitment, as information given by interested parties generally furnishes a reliable clue to the true character of the boy committed.

(*b*) We have added one family building or cottage.

Superintendent Mary Lyons, of Illinois: There is no doubt that the cottage system has many advantages over any other, but for various reasons we have not been able to adopt it.

Superintendent Sarah F. Keeley: I think that the cottage system is the better. However, we have not introduced this system, but classify our children by age, keeping the younger ones separate from the older.

Superintendent T. J. Charlton, of Indiana: (*a*) I do consider the cottage system entirely adequate to secure the separation of the more "deeply tainted" from those inmates who are less vicious. I do not consider the classification by age as nearly so good as the method in use here of classifying them upon the basis of character. We have four families of large boys. Two of these families are all criminals; the other two, however, are boys of a much higher moral grade.

(*b*) None, except that we are more particular to classify boys as to character.

Superintendent C. C. Cory, of Iowa: (*a*) We have two families; one in general dormitories in one building, one in single dormitories in another building, and much favor the latter. We have no girls that are what would be termed extremely "vicious," and have as yet no necessity for segregation. Only for brief periods is anyone subject to unusual restraint. The more intractable are more benefited by associating with the good than the latter are injured by the contact, contamination being prevented simply by family oversight.

(*b*) None. Next year we expect to erect another family building with single dormitories, making three families.

Superintendent Buck, of Kansas: (*a*) If properly classified the cottage is preferable.

(*b*) Formed a family of small boys.

Mother Matron of St. Scholastica, Newport, Ky.: According to our rule it is absolutely necessary to have these classes separate; but as we have as yet received none of the vicious class there has been no need of segregation.

Superintendent Farrington, of Maine: (*a*) I think the cottage system partially answers the purpose mentioned above. I do not believe that the segregation of the more vicious amounts to very much the same thing as the classification of all the pupils by age.

(*b*) No change in the general system of classification. Our first cottage is nearly completed and will soon be ready for occupancy.

Brother Dominic, Carroll Station, Md.: (*a*) We have not tried the cottage system yet and hence can not say much for or against it. But from my experience it is of vital importance in the reformation of those children who are not so deeply tainted to separate them from those more vicious; and in this case the cottage system is preferable, and certainly preferable to classification by age.

(*b*) None. We have always endeavored to keep the younger boys separated as much as is practicable from the older. This we do in the dormitories, in the playgrounds, and to a great extent in the shops and class rooms.

Superintendent Mrs. Brackett, of Massachusetts: (*a*) We have the cottage system, and believe that all inmates should be classified according to the past record of the inmate and not according to age. I do not think the segregation of the more vicious amounts to the same thing as classification by age. Some of our younger pupils are more vicious than some of the older ones.

(*b*) No data.

Superintendent Risk, of Massachusetts: I think the cottage system is the best as far as my experience goes, and it is upon this system that our school is conducted.

Superintendent Eldridge, of Massachusetts: (*a*) Think favorably of the cottage system and more of separation on the basis of character than classification by age. Think truant schools should not be maintained in alms houses.

(*b*) None.

Superintendent Johnson, of Massachusetts: (*a*) The cottage system answers the purpose better than any other system. The segregation of the more vicious answers a much better classification than can be done by age.

(*b*) No changes, as we have had but one family of 30 boys.

Superintendent Chapin, of Massachusetts: (*a*) There should be, I think, more care in the separation of the two classes named; but in general classification by age and by school attainment serves the purpose with the cottage system to help.

(*b*) In 1885 the school was remodelled on the cottage plan. It started with an administration building, where the superintendent and the most unmanageable boys were to be located, and three cottages to accommodate 30 boys each. Two years ago the large building was remodelled for two groups and at present the school consists of six cottages as nearly independent as it is possible to make them and have them supervised by one superintendent. The main mode of arriving at a classification is to grade them according to proficiency in knowledge.

Superintendent Margaret Scott, of Michigan: (*a*) I think it does.

(*b*) This institution was organized under the cottage system and no change seems desirable.

Superintendent Gower, of Michigan: We have the cottage system.

Superintendent Brown, of Minnesota: (*a*) I believe that division of the children into families of 40 to 50 each, according to age, answers all purposes and with proper supervision the danger of contamination by the more vicious will be reduced to the minimum.

(*b*) Have always been working on the cottage plan, but when we occupy our new buildings the classification will be more perfect, as the families will not be so large.

Superintendent Shaffer, of Missouri: (*a*) Separation is good, say into three classes: (1) Those entirely good, (2) the large vicious, (3) the small vicious; the latter divisions being, of course, by age.

(*b*) Separation into two classes, to wit, good and bad, on the congregate system.

Superintendent Otterson, of New Jersey: Classification by age is not the proper way to classify. Classification should be made according to the moral condition of the inmates; that is to say, the separation of the more vicious from the less, irrespective of age. The cottage or family plan presents an opportunity to accomplish this as no other plan can.

(*b*) Our institution was founded on the cottage system in 1865. Of late years a more rigid separation has been tried.

Superintendent Mrs. McFadden, of New Jersey: (*a*) I do think it answers the purpose in a great measure. I think the classification should be made with regard to crimes committed rather than age, as many young in age are old in vice.

(*b*) None; as our school only numbers about one family.

Superintendent Corrigan (Brooklyn Truant Home), of New York: For our institution, no. The boys confined in this institution are not vicious, only mischievious, and I consider that the dormitory system is the best.

Superintendent Carpenter, of New York: (*a*) I consider it highly desirable to separate those more deeply tainted with vice and crime from the other inmates of the institution. The segregation of the more vicious amounts to very much the same thing as a classification of all the inmates by age.

(*b*) The school has been classified as follows: (1) Senior department, oldest boys and two other subdivisions, according to age. (2) Primary department, boys from 7 to 10. (3) Girls' department. Each department is complete in itself and is entirely separated from the other departments.

Superintendent Jones, of New York: (*a*) There appears to be no appreciable difference in the results of the two systems.

(*b*) None.

Superintendent Brother Leontine, New York Catholic Protectory: (*a*) I admit that the cottage system—that is, separating the really vicious from the others—certainly has good moral results, but without strict supervision on the part of the prefect or master the cottage system is a failure.

(*b*) None.

Superintendent Crawford, of Ohio: (*a*) The cottage system does fairly well. The segregation of the more vicious is much the same as classification by age.

(*b*) None.

Superintendent Hite, of Ohio: (*a*) Yes; the cottage system is the only system that is in any sense reformatory, and its plans of separating the smaller inmates particularly from the larger ones is specially beneficial to both small and large pupils. We do not think the separation of the more vicious from the same ages of the vicious is beneficial to the vicious; but, on the other hand, have experienced that the contact of this vicious class with a better class, who are in the ascendency as to number, is helpful to the vicious and but very little harmful to the better class, if harmful at all.

(*b*) In 1878 all the smaller boys were classed by themselves and completely isolated from the larger boys. There has been much improvement in the housekeeping at the cottages during the decade.

Superintendent Laverty, of Pennsylvania: (*a*) We regard the cottage system as manifestly to the advantage of the pupils by separating and classifying them according to age and moral condition, with a more critical supervision and more intimate influence exerted by their care-takers.

(*b*) None. A new institution is now being erected at Glen Mills, Delaware County, Pa., for the transfer of the departments of boys, to be reëstablished on the most approved methods of the cottage or family system.

Superintendent F. H. Nibecker, of Rhode Island: (*a*) I consider the family system, when fully carried out—each family having its own dining room, play grounds, and school, the pupils of the different families coming in contact with one another only during hours of actual labor and when they are under constant supervision and instruction—as of vital importance to reform school work. In a small school classification by age is the nearest to moral grading possible. In a school of sufficient size to allow more than one family of same age a closer and truer moral gradation may be had.

(*b*) During the decade this school has been changed from a refuge or close school to a family school with congregate dining room and families, not classified by age. Within the last four years the school has been closely graded into four families, those of like age being in same family, etc., as noted above.

Superintendent Ainsworth, of South Dakota: (*a*) As a rule the cottage system will do the work, provided the cottages are under the charge of suitable persons. Our boys, good and bad, are kept together; but there are always one or more persons with them of good character.

(*b*) When more buildings are needed cottages will be erected with a capacity of from 30 to 35 children and the proper number of attendants, etc.

Superintendent McCulloch, of Texas: I think that the cottage system answers the purpose.

Superintendent Andrews, of Vermont: (*a*) I think the cottage system is better than the congregate.

(*b*) None.

Superintendent Sarah E. Pierce, of Wisconsin: Yes. Have adopted the cottage system, classified older pupils according to morals; younger pupils according to age and sex, the boys being under 10 and composing one family.

Superintendent Sleep, of Wisconsin: (*a*) We have what is termed the cottage system, but do not classify with respect to vice and crime to any extent. We class with some respect to age and size. I am of the opinion that a classification with respect to vice and crime properly done would work for good.

(*b*) None.

II.

Without discussing the case in which a reformatory is a mere temporary place of detention until the boy can be properly located in a home, it is interesting to inquire what efforts are made for his future welfare when the time has come for his being dismissed from an institution or otherwise discharged. Invariably places are secured for the boys by the school authorities. Sometimes these are in the country, at others in the city. One institution of the East has an agency in Illinois to care for the boys. The usual mode of obtaining information as to the manner in which the student is deporting himself is by periodical reports in writing, but in several States a more vigorous and reliable method is employed. Thus the Lyman School for Boys at Westboro, Mass., reports that in 1889 a special agent was appointed whose sole business is to visit the "probationers," to encourage them, right their wrongs, adjust their disputes with employers, find more suitable homes if they are not doing well, and in general make them feel a sense of continued responsibility to the State to do well. The result of every visit is reported to the central bureau and to the superintendent of the school. At another reformatory institution, the State Primary School of Massachusetts, the boys are frequently visited by agents in the employ of the State. For the care of the girls placed out in families from the Massachusetts school for girls, ninety ladies are employed by the State board. In New Jersey a regularly employed "visiting agent" visits the boys three or four times a year, with power to recall to the school any who are relapsing. In the New York Juvenile Asylum there is a visiting agent for such pupils as are returned to friends, and the school has ever exercised as close a supervision as means would allow. The House of Refuge at Philadelphia has a competent officer visit the paroled pupils every six months.

At the New York Catholic Protectory the visitation is annual, but the organization of the church carries aid in this business of supervision. The pastor of the parish in which the boy resides is corresponded with and presumably is interested in the welfare of the boy. In Ohio, on the other hand, the State organization becomes the organ of supervision, for the judges of the courts are required to appoint supervisory committees in every county, who are to oversee the boys that are sent from the school. In Kansas the county superintendent of public instruction is the visiting agent.

III.

Two other questions of considerable importance remain. These are so connected that they may be discussed together. They relate to the time the pupil may be detained in the school and the trade taught him while so detained. The following discussion is based on the replies to these questions:

Assuming for convenience that certain disadvantages of the contract system tend to neutralize its undoubted advantages as a substitute for the manual work essential to teaching habits of industry and a trade, what effort, if any, have your trustees made during the decade 1880-90 to supplant the substitute by real technological instruction, and do you think such purely technical instruction feasible in view of its nonremunerative character?

Assuming further that the instruction of the delinquent at the institution is of no avail unless he is under its instruction for a sufficient time, what change, if any, in the way of lengthening the time the pupil is consigned to your care has been inaugurated by the courts or instituted by law?

Superintendent Hatch, of Colorado: No effort made by trustees. Theoretically, I believe purely technical instruction feasible. Have had no experience. Possible term of detention has been shortened from minority to three years. Bad change.

Superintendent Howe, of Connecticut: In my opinion it is not practical to give technological instruction to an entire institution. A few of the older boys may be so taught, but it is necessarily expensive. We have not introduced technological training, but hope to soon to a limited extent. We teach habits of industry, but our industry is remunerative, which is always an incentive to labor. The law of definite sentences has been changed to indefinite or during minority. A boy can grade out of the institution by uniform good conduct in twelve months; but he goes on probation and may be returned to the institution at any time his conduct may not be good.

Superintendent Haines, of Delaware: We have no technological instruction in this institution as yet. I do think such instruction very valuable, and ought to be in every institution of this kind, without regard to its remunerative character.

Superintendent Shallenberger, of the District of Columbia: We have never contracted the labor of our boys, much preferring piecework at a fixed rate. This gives the school authorities entire control of both the work and the discipline. The trustees have repeatedly urged the propriety of establishing workshops under skilled foremen in order to teach useful trades and thus fit the boys to take their places when discharged as first-class mechanics. Every reformatory institution or industrial school should be provided with means to such an end, whether remunerative or not. Our boys are all committed during minority, unless sooner discharged by the board of trustees; hence they could regulate the time required for any boy to remain at his trade. No boy should be forced to learn any special trade, and there would be no necessity for so forcing him, as a large number are always anxious to acquire some handicrafts and would undergo any ordinary discipline to secure the means of becoming first-class mechanics.

Superintendent Scoulter, of Illinois: The contract system is supplanted here by State-account plan. Have made no effort until recently to introduce technological instruction. It may not be feasible with State legislatures, in view of its nonremunerative character, but we believe that it is a move in the right direction, though it must be borne in mind that such training will never make a mechanic; it can only develop a taste for some industry. Sentences are fixed by law.

Superintendent Sarah F. Keely, of Indiana: Our manual labor is simply to teach the girls the common industries of life, thus fitting them for lives of usefulness. We do not aim to make money, but work for the reformatory power there is in work. Under our old law girls were committed until 18, while under the new law of 1888 they are committed until 21.

Superintendent Charlton, of Indiana: Our trustees ten years ago abandoned the idea of making money out of the labor of the boys. They are now working to instruct boys and not to make them a source of revenue. I most certainly regard technical instruction as feasible. We have detained boys on an average about twenty months. I think that two years would be better.

Superintendent Cory, of Iowa: As yet we have no productive industry. Only domestic economy and common school work receives attention in the instruction of the girls.

Superintendent Buck, of Kansas: We have never had the contract system. All are committed during minority.

Superintendent Farrington, of Maine: I think such technical instruction is feasible, notwithstanding its nonremunerative character. We have established a mechanical school, where the elements of carpentry are taught. Boys are sentenced during minority, and trustees may discharge boys whenever they believe them to be reformed.

Brother Dominic, Carroll Station, Md.: Though we have eight or nine industries or trades—printing, shoemaking, tailoring, floriculture—we find that our boys do not and can not remain long enough in the institution to teach them the trades thoroughly. One advantage, however, is that they learn habits of industry and how to work. I think, so far as remuneration in shops in reformatory institutions is concerned, it is a failure. Nothing of the kind ever undertaken by us has paid. The board, or rather the committee having the matter of supervision of the shops, have established this rule within the last year, that any boy entering a shop for the purpose of learning a trade must remain there four years. This supposes him to enter at 13 and upwards.

Superintendent Johnson, of Massachusetts: No effort has been made except to give instruction in carpentry. I think boys should be placed out to get special instruction and should not remain in an institution more than two years. Truant boys are now committed for two years instead of one year as formerly.

Superintendent Chapin, of Massachusetts: Last year the Swedish system (Sloyd) was introduced, and during the last year all pupils have been instructed in it. Growing boys can not be used to carry on a profitable contract system without defeating the ends for which a reform school is established. Boys are sent here during their minority. Formerly the practice was to release boys after fifteen months' stay on good behavior, *i. e.*, as long as good conduct continued. This time has been found insufficient, and the shortest period will probably be hereafter two years.

Superintendent Margaret Scott, of Michigan: We have no contract labor that interferes or retards in any way the plan of the institution, which is to teach every girl domestic work, including sewing, and the half-day's training in day school. No change in the way of lengthening the time the pupil is consigned to the school is required.

Superintendent Brown, of Minnesota: Have always managed our manufacturing on the State-account plan and with special reference to the benefit of the children. I believe purely technical instruction to be feasible. We have not been able to lengthen the time, because of limited accommodations, but believe the time of detention should be increased when accommodations will permit.

Superintendent Shaffer, of Missouri: No change during the last ten years. Teaching habits of industry simply is not of so much importance as teaching them a trade by which they can earn their living after leaving institutions.

Superintendent Otterson, of New Jersey: A printing office has been established, where 8 to 12 boys are taught all parts of the work. We issue a paper to enable them to have regular work. We also printed our last annual report and do all our job printing. Boys are taught in all trades that can be made useful to the institution, though none are purely technological. To be of value there should always be a purpose. All boys committed were committed during minority, but by good conduct could earn their release in 14 months. The trustees have just had an act passed which requires that all boys should remain not less than three years. This to the end that we may do more trade-teaching as well as school work.

Superintendent Mrs. McFadden, of New Jersey: Shirt work was carried on to some extent, but we give our girls instruction in all branches of housework. They are also advantageously employed on the farm in weeding, harvesting, etc. The time of maximum detention has been changed from 18 years of age to 21.

Director Round, of New York: We pay each boy 1 cent each day, providing he earns his 3 mills for education work, 3 mills for morals, 2 for deportment, 1 for care of person, and 1 for care of clothing. His failure to earn 70 per cent of his mills for any month puts him down one month. He is compelled to go through three grades of six months each before being released. The boy really controls the time that he remains at the institution after eighteen months.

Superintendent Carpenter, of New York: Our older children make all the shoes and clothing of the inmates and do all house and farm work. Nothing is sold. Much like a boarding school, where the children work for their board and clothing and go to school. Thirty years' experience has taught us that children should seldom be discharged in less than one year or be retained longer than about two years; hence children are retained here from one to two years.

Superintendent Jones, of New York: They have established all the industries on State account. The object of labor in the institution is regarded for its disciplinary power rather than for profit in money values. No change in length of commitment. All commitments are during minority, though at the discretion of the managers the pupil may be discharged before he has reached his majority.

Brother Leontine, of New York: We have no contract system here. We manufacture the material for the employés, and are the sole masters of the labor of our inmates, which labor is more for the benefit accruing to them than for the gain to the institution. Rather than deprive a girl or boy of learning a trade or business that will be of use to him after leaving the institution, we make it a rule to retain such inmates at our own cost. In addition, we pay or put by for them a sum each month, so that on leaving they will have something to rely on for support. Within the last five years many have had as much as $50, $75, or $100 to their credit on leaving.

Superintendent Hite, of Ohio: Since 1884 a polytechnic building has been erected and has shown that it would be better to discontinue such industries as brush-making, knitting by machinery, cane-seating chairs, etc., and adopt manual training instead, even in view of its unproductiveness. There has been no law compelling an inmate to remain a definite length of time. The rule adopted at this institution is that no inmate will be sent home under one year from the time he enters. All the courts commit during minority or until reformed.

Superintendent Laverty, of Pennsylvania: Technological instruction has not been adopted to any extent. When we have reëstablished ourselves at the new location in Delaware County rudimentary instruction in standard trades will be introduced. We believe a more lengthened period of detention is important. The managers have been unable to adopt it, owing to the overcrowded condition of the boys' departments.

Superintendent Nibecker, of Rhode Island: In 1885 printing was introduced and has been successfully prosecuted. Many competent printers have been turned out, who have always found good places. In May, 1890, $25,000 was appropriated for the introduction of other trades in the school. Technological instruction is feasible. It is improper to consider that children should be made a source of revenue.

Superintendent C. W. Ainsworth, of South Dakota: The contract system is a political move more than anything else. Our time is mostly spent on the farm and in the garden, aside from the three and one-half hours a day in the schoolroom. We have a small printing office, in which are nine boys. Boys take care of stock and assist in the household duties, etc. No child should be released until the rudiments of a good education have been obtained and a knowledge of some kind of industry that will enable him to obtain an honest livelihood.

Superintendent McCulloch, of Texas: Only have the farm.

Superintendent Andrews, of Vermont: Yes; I do consider purely technical instruction feasible.

Superintendent Sleep, of Wisconsin: I think that we never have had the contract system. Ten years ago this winter the law changed the system of releasing from 21 to 18 years of age, but after 6 years it was restored to 21 years. Supervisors have authority to remove at any time.

CHAPTER XIII.

EDUCATION OF THE COLORED RACE.

I.—THE COMMON SCHOOLS.

The former slave States have a white population of 15,493,323, and a white school enrollment of 3,422,785, or 22.1 per cent of the white population.

The same States have a colored population of 6,954,840, and a colored school enrollment of 1,289,944, or 18.5 per cent of the colored population.

The colored form 30.98 per cent of the total population, but colored pupils form only 27.37 per cent of the total school enrollment.

These figures show that the colored school enrollment is not relatively equal to the white. It exceeds the white, as compared with the population, in the District of Columbia, North Carolina, and Texas; in the remaining States it falls behind the white—in Alabama, Georgia, Louisiana, and West Virginia far behind.

The ratio of average attendance to enrollment is 63.3 for white and 62.4 for colored in twelve States.

TABLE 1.—*White and colored schools compared—1889-90.*

ALABAMA.

Apportionment of funds between the races in Alabama.—The Alabama State distributable school fund has heretofore been apportioned among the townships and districts according to the number of children of school age, the fund of each race being kept separate. This has caused much dissatisfaction. "It is alleged that in portions of the State the colored race gets well-nigh all the school fund, whilst that race pays a very small per cent of the taxes that make up that fund; also that the colored race is as yet, in general, only capable of receiving and profiting by an elementary education, which costs comparatively much less than that suitable for the white race in its more advanced stages of civilization." The State superintendent, without discussing whether these complaints are well grounded or not, says that there are individual cases of peculiar hardship, and suggests the following plan: "Let the school fund be apportioned by this office to the different counties and townships in proportion to the number of children without regard to race, and let the township officers apportion the fund to the schools of the township in proportion to the number of children who will probably attend each school. They, being on the ground and acquainted with the wants of the different neighborhoods, can do this to better advantage than it can be done by this office. In addition to this, there should be fixed by statute a gradation of teachers' licenses, so that well-qualified and successful teachers should receive greater compensation than the teacher who can barely stand an examination for a third-grade certificate. In all other departments persons are paid in proportion to the quality as well as the quantity of work done by them, and why should not this rule apply in the payment of teachers? Under our present apportionment of funds such is frequently the case—that the poor teacher of the colored race gets much better salary than the well-qualified white teacher. If this were left to the local school authorities such injustice and inequality would not be allowed."

This is practically what is done at present in the larger Southern cities with the local school funds (city appropriation); the municipal school boards apply the local funds to the various schools, white and colored, in their discretion. It is believed that the city colored schools are amply provided for under this system. Whether it would work as well throughout the country districts, administered often by trustees prejudiced against negro education, and especially against negro education at the white man's expense, is problematical. That Superintendent Palmer does not think it would work injustice is evident, when he declares:

"Allow me here to say that I have no sympathy with those who would deprive the colored race of an equal participation in the benefits of the public-school

fund. I believe that it is not only our solemn duty but best interest to see that the colored race is educated and elevated so as to fit him for good citizenship, of which, in my opinion, there is not the slightest probability that he will be deprived. Nor am I in sympathy with those who would apply only the tax raised from our race for the education of that race. Such a law or provision of a State constitution would be declared by the courts unconstitutional as being against public policy and as contravening the letter and spirit of the Fourteenth Amendment of the Constitution of the United States. The plan herein suggested will go far towards remedying the evils complained of, and that, too, upon sound principles—that teachers should be paid in proportion to the quality of the work performed by them."

Superintendent Palmer's suggestion adopted—The law amended.—The legislature in 1891 changed the law so as to provide for three township trustees (instead of one) who are to dispose of the school funds derived from the State virtually as Superintendent Palmer has suggested. Mr. J. N. Hutchinson, himself a township trustee, explains their duties relating to the disposition of funds under the new law, as follows: They are required to "establish and apportion to each school just such an amount of the public funds as they deem just and equitable to carry on the schools in their township, not according to number of scholars pro rata as heretofore, but apportioning and giving unto schools as they deem best to promote free education in their township with due regard to all neighborhoods. For as the law was, where one school could get only ten pupils, in pro rating it was not sufficient to employ a suitable teacher to teach those children, and other schools had the advantage, especially the colored, which generally outnumbered the whites, receiving the most money, and the colored people paying less taxes. Hence some neighborhoods were deprived to a great extent of the benefit of schools, not being able to procure a suitable teacher on account of insufficiency of funds.

"I take the position that one teacher's time is worth as much to them as another teacher, without regard to the number of scholars they teach in the public schools, and the trustees should see that all children are offered the benefit of schooling, and that this is the intention of the law, which was wise in our legislature in so changing it, and now it becomes the duty of the trustees to carry out the law without regard to the whims and complaint of some."

The new State superintendent, Hon. John G. Harris, further explains the situation as follows:

"It is the duty of the township trustees to establish a sufficient number of schools in their township to meet the necessities of school children according to justice and equity, having reference to the amount of money apportioned to such township, paying to the teacher of each school an amount which will secure continuation of all the schools of both races, the *same length of time.*

"This law confers upon the township trustees the power to contract with teachers at an agreed amount per month for three months or more. The entire amount belonging to each township must be divided among the white schools and colored schools by the trustees according to 'justice and equity,' not per capita. One teacher may be secured to teach a certain school at one price, while another teacher may be employed to teach a different school at a greater or less sum. Trustees must use their very best judgment, looking to the highest interest of all the children to be taught. The greatest good to the greatest number must govern. Such, in my judgment, is the spirit of the law. 'Equal rights to all, special favors to none.'"

The words italicized, "same length of time," are evidently designed to be the watchword under the new order of things.

The law only covers the State school fund proper. The apportionment of the State poll tax remains as before—poll tax collected from the whites goes to white schools exclusively, ditto colored.

Colored education in Alabama.—W. B. Paterson, conductor of colored teachers institutes in Alabama, says in his report to the State superintendent: "The county superintendents and other white citizens attended the sessions of the institute, and showed much interest in the education of the colored race. I find that where a colored teacher is competent and devotes himself strictly to the work of teaching, that he can depend upon the support of the best people of the community. The county superintendents, too, discharge their duty regardless of race, and everywhere they expressed a desire to get the very best teachers possible for the colored schools.

"The colored people are being encouraged to build school-houses, and their white neighbors are contributing liberally towards this object.

"These facts are given to make more forcible the following statement: The schools are retarded in their progress by a want of unity and harmony among the colored people themselves. Desiring to get control of the schools, they are imposed upon by incompetent teachers, who establish a denominational or a high school, with an absurdly long and very illogical course of study, and the means of the people, which might be used very profitably to double the public-school term, are wasted. I have reference here only to the efforts made in small towns to build up a college on local patronage at a tuition of $1 per month. It would be good policy for the present to let Talladega College, Selma University, Payne Institute at Selma, and the State normals at Huntsville, Tuskegee, and Montgomery attend to the higher education and let the efforts of the people be directed to improving the public schools. Not one-tenth of the pupils entering the above institutions from the public schools are prepared to take up a normal course of study."

ARKANSAS.

Apportionment of funds between the races in Arkansas.—A statement in the Annual Report of this Office for 1888–89 was calculated to create an erroneous impression as to the distribution of the State school moneys. With reference to this subject State Superintendent Josiah H. Shinn writes to the Office:

"The law apportions to all children irrespective of color. Each child in Arkansas, black and white, of school age receives the same amount of money by State apportionment. Each county in the State, irrespective of color, gets an amount of money equal to the sum of the amounts given to its children of school age: or the multiple of the equal pro rata per child into the number of children of school age in the county. The county judge then apportions the fund received from the State in the same way to the districts. Each district gets from the State a sum of money in every case equal to the multiple formed by the pro rata into the number of children in the district.

"So far the money has been apportioned as though no color line existed.

"The money is now in the hands of the county treasurer, subject to the order of the [district] directors. Each district may have three funds, and must have two: (1) The State apportionment made by the State superintendent; (2) the poll-tax apportionment made by the county judge; (3) the local tax voted upon the property of the district and paid by the collector to the treasurer of the county for the use of that district alone.

"I desire to emphasize this point again. Up to this point in our financial management—the point when the directors are to open the schools—no distinction whatever has been made. It has been a question of cold calculation without one drop of blood. If any discrimination is made now, the fault will lie with the directors. The law requires them to hold separate schools for the races. There is no restriction upon the black man's right to hold the office of school director. In eastern Arkansas in a large majority of the districts the directory is black. Two plans have been adopted by directors, irrespective of color.

"1. To hold a three months' school for each color, and as much longer as their proportionate share of the district funds will continue it. This share is determined by taking the ratio of the black and white children of school age, respectively, to the whole number of children.

"2. To hold two schools of equal length, irrespective of these proportions.

"(*a*) As to the first proposition, the division is always more favorable to the colored race than to the white. Where but eight or ten children of either color were to be found in any district a trouble followed in nearly every case. Black directors saw little use in running a school for less than ten white children; so did the white ones. The legislature cured this last winter by permitting any number less than ten to transfer to the adjoining district.

"(*b*) The second proposition is on the broadest basis of fairness, and reaches the widest stretch of justice. No more can be claimed. It would be unjust to my fellow-citizens not to say further that the great majority of our school directors follow the second plan.

"In the following cities and towns the terms and all the other arrangements are equal: Little Rock, Helena, Marianna, Pine Bluff, Monticello, Lonoke, Camden, Texarkana, Hope, Nashville, Washington, Prescott, Malvern, Conway, Moulton, Newport, Augusta, Russellville, Fort Smith, Van Buren, and Hot Springs."

DELAWARE.

The colored schools of Delaware.—"There are only 46 [colored] schoolhouses in the State and 79 schools. Thirty-three of the schools are held either in private houses or churches, mostly the latter. All the schoolhouses occupied have been built by the colored people themselves, and some of the buildings are in the last stages of dilapidation. Some of the schools find it necessary to charge a tuition fee and others raise funds by subscription in order to secure sufficient money to pay the teacher's salary."

The State superintendent suggests "that it would be wise to increase the State appropriation to these schools in order that they may be made free schools in fact. If education is a safeguard it would seem to need no argument that the colored schools should be made as efficient as possible."

The sum of $6,000 was appropriated for these schools in 1889-'90, or a little over $1 for each colored child of school age in the State.

FLORIDA.

Capacity of colored students—Appreciation of school advantages.—The principal of the Florida State Normal College for Colored Persons reports: "The students are specially drilled in the abstract sciences in which they are the weakest, while their strong linguistic powers are given the fullest exercise. The imperfect attainments in the common studies which they bring to the institution are displaced by a severe training in the same studies, when they are carried through algebra to quadratics and through several books of geometry. In all these studies they can compete favorably with scholars of similar grade anywhere. In the Latin, the only classic thus far taught, they are carried through several books of Cæsar's Commentaries, just enough to give them a proper foundation to continue the study of the thoughts of the iron-hearted masters of the ancient world after graduation. Although it is less than two years since the senior class began the study of Latin, several of them can now read Cæsar with an ease and elegance that would do credit to scholars who have been engaged twice the length of time in studying this language.

"The surest test for the appreciation of the race for the school is in the sacrifices made by patrons in sending and maintaining scholars here, and the eagerness of the latter to avail themselves of the opportunity offered them for instruction. With limited means or from daily earnings parents send their children to this school from distant parts of the State and meet all the financial engagements incident to the education of a young person during the entire session of nine months. Although this is the second year since the school has had dormitory halls, not only has every patron met all his obligations, but the demand for more room in the dormitories is restricted by our inability to provide for any more new-comers.

"The promptness and regularity of attendance at the daily sessions of the school is another proof of high appreciation. No severer punishment for breach of discipline can be inflicted on any of them than to be ordered to leave school for even part of a day. They seem to feel that every day and hour are too precious to be lost from the prosecution of the purpose for which they have come hither from their homes. This strong regard and attachment for a school but lately established is one of the most pleasing features which promise for it, let it be hoped, a long career of usefulness."

GEORGIA.

State School Commissioner James S. Hook: "It is due the colored people to say that everywhere in Georgia, as far as they have come within my observation, they are anxious for improvement, and in proportion as they become interested in the schools I note growth in moral sentiment, less interest in partisan politics, and more anxiety to make themselves useful and respected citizens."

The University of Atlanta, as is well known, has, under the provision of the State constitution forbidding the coeducation of whites and colored, forfeited its State grant. Some of the prominent colored educators of the State are setting on foot a movement to obtain this suspended grant in order to establish a normal school for training colored teachers.

What the county superintendents say.

Crawford County.—Colored schools were well attended, but a decrease in number of schools, on account of not being able to get teachers that could make the required percentage in examination.

Houston County.—The colored people manifest a great desire to have their children educated; their schools were kept full and the average attendance was good. The colored children of our county outnumber the whites almost 4 to 1, and all their schools are full to overflowing whenever opened. In some parts of the county the white people are so sparsely settled that it is impossible for them to have schools.

Jasper County.—There is not a child of school age in the county, white or black, but what has a schoolhouse conveniently located and can attend school most any kind of weather.

Mitchell County.—The colored people of our county are very manifest in their interest of education. Many of our colored schools, if allowed, are crowded beyond accommodations.

Oconee County.—By no means tax the whites to educate the blacks. This has made a "skeleton" of what otherwise would have been a corpulent and muscular man—a giant [referring to the school system].

Putnam County.—We should have more money, negro or no negro. Something is necessarily obliged to be done or the whites will not keep up with the darkey.

MARYLAND.

The colored schools of Maryland.—Dr. James L. Bryan, school examiner of Dorchester County, Md., reports as follows: "There is great pleasure and just pride in stating that our colored schools are a credit to our system. When I began my work in this county in 1867 there were no colored schools connected with the public-school system. There were two or three run by friends outside of the State. The school board of that day made a small appropriation to two of those schools, and gradually increased the amount until the new school law of 1872 placed such schools directly under the control of the school board. Since that day these schools have increased from two or three to forty, and the teachers compare favorably with the white teachers, considering the poor advantages they have had to make themselves expert teachers. With two or three exceptions these schools occupy houses belonging to the school authorities, built generally for school purposes, and with comfortable furniture, blackboards, etc. One house, in Cambridge, used by colored pupils, cost nearly $2,500; another, in East Newmarket, cost over $1,000.

"There is small but a steady increase in the numbers attending the schools, and the results are quite gratifying.

"It is a great credit to the powers that be that this work has been done so well. It is honorable to the authorities, and should dispel all doubts of fairness in the matter of educating this class of our people."

And the examiner of Harford County says: "In a number of cases we lack suitable houses and furniture for the colored schools; but our greatest drawback in this line is an efficient corps of teachers. I do not hesitate to say that I have more difficulty in securing twenty-two suitable colored teachers than one hundred and fourteen white ones. I anxiously look forward to the day when we may rely upon the colored normal school of this State for our colored teachers.

"In many cases, too, it is difficult to secure prompt and regular attendance of colored children. Having satisfied their ambition by enrolling their names at school, the very ones most in need of its benefits are the ones most apt to be absent. Recognizing the large factor they have become in some sections, I see no higher duty the State has to perform than to do what she can to educate this large class of her citizens."

NORTH CAROLINA.

Causes of opposition to negro education.—State Superintendent S. M. Finger, of North Carolina, says: "There is much opposition to public schools in the State, and in the South generally, because of the small amount of the taxes paid by the negroes. The opposition is intensified by the belief, that is more or less prevalent, that education spoils the colored people as laborers, to their own damage and the damage of the white people. It is said that when you 'educate a negro you spoil a field hand.'

"On this point it may be said with truth that the negro's sudden freedom and citizenship, for which he was unprepared, the privileges of education, and all the new experiences he had at and soon after the war, including much bad leadership, completely turned his head, so to speak. Forced labor to him had, during slavery, been his peculiar hardship. In his ignorance he thought the new conditions, and especially the privilege of education, were to relieve him from this curse of labor. The old negroes went earnestly to work to learn to read. They failed, but attributed their failure to lack of early opportunities. But they resolved that they would secure education for their children, and, with this special end in view, the escape from manual labor. The present generation of younger negroes has been educated too much with this purpose in view, and, because of this wrong idea, it is true that a smattering of education to many of them has caused idleness and laziness. If education is to be given them in any liberal sense by the State they must show a much higher appreciation of it. They must recognize it not as a means of relief from labor, but as a help to successful labor.

"Many of their best teachers are striving now, by precept and example, to correct these wrong ideas as to what education is to do for them, and my earnest advice to school committeemen is that they do not employ teachers who are above manual labor. A man or a woman who depends upon the money he can make by teaching a three or four months school per annum and will not apply himself to some useful labor during the balance of the time is not fit to direct the education of children and should not be employed to teach.

"The colored people must not lose sight of the fact that manual labor is the lot of almost all people, white and colored, and that this is now and will be their lot to a larger degree than that of the white people, because of the peculiar conditions and circumstances that surround them. The destiny of the negroes of the United States is in their hands, with the powerful help of the white people as they may show themselves worthy of it. Let them pay their taxes and show that education does not spoil them as laborers, at least to any greater degree than it does the whites, but that it does add to their efficiency as laborers and to their usefulness as moral and upright citizens, and all the help they need that the State can, in her financial condition, reasonably afford will be extended them.

"The white people must not lose sight of the fact that it is the labor of a country that makes its wealth, and that, therefore, the education and elevation of the children of the laborers is a proper charge upon the property of any country. If we did not have the negroes we would have some other poor people, whose children would have to be educated in the public schools. But, whatever may be said about educating the negroes, we can not afford not to improve our educational facilities, whether we consider our financial condition and progress or the perpetuation of our civil and religious liberties.

"If it is said that we are too poor, then I reply that the way to get rich is to educate our people intellectually and industrially, so that they may be able successfully to apply labor to the development of our many resources. The history of the world points out this way, and we can not fail if we walk in it. With good schools in the country districts there will be less incentive for the country people to crowd into the cities and towns to educate their children, much of the discontent and restlessness will disappear, and better success will attend their labors."

TENNESSEE.

Reports of Tennessee county superintendents.

Marshall County: Our colored schools are improving very fast. At their institute this year there was an increase of teachers and an increase in interest. All of them seem to be striving for an education, and we have some very bright minds in the colored race.

McNairy County: I have held four institutes—three for the whites and one for the colored. They were all well attended. We had some excellent workers at the normal institute at Purdy in June. I have the colored teachers better organized than the whites.

Morgan County: There are only forty-seven colored population, and they are promiscuously scattered along the railroads; hence no colored schools.

Tipton County: There seems nothing at present that promises to discourage the advancement of the public schools in this county further than that there is a growing disposition on the part of the white people of the county, who pay

ninety-five one-hundredths of the taxes, to discontinue the public education of the "brother in black," who, notwithstanding the fact that he pays less than five one-hundredths of the taxes of our county, receives more than 50 per cent of the public-school moneys. This, the white people argue, is wrong, and should be remedied; and I heartily agree with them, and join them also, in the further opinion that the negro should bear the burden of his own education.

Wayne County: Our colored schools are progressing very well. We have some very good teachers among the colored population of our county. They are creating quite an enthusiasm among their race of people for education.

"*We can build our own schoolhouses.*"—The New York Age (edited by a colored man): Vast sums have been given by philanthropists to sustain such moral, religious, and intellectual work in the Southern States as are usually supplied from the general tax funds of the State affected and by the charity of the benevolently disposed citizens of such State. The past and the present generations of Afro-Americans have, therefore, been educated to look to the Federal Government for the protection usually afforded to the citizen by the State in which he resides and which does not inhere at all in the Federal authority as one of its conceded rights; and, worse yet, they have been educated to look to others to think and do for them to such an extent that self-reliance has been hampered in its development, so that if we want money for educational, religious, or other laudable purposes, we appeal too often to white men or to the Federal Government, instead of relying upon ourselves for it and working in combination and coöperation to secure it as others do. We can build our own churches and colleges and schoolhouses, and support them, if we would do so, out of the money wasted by us upon unnecessary pleasures and upon downright humbug; and we have got to do it in the not remote future, because the opinion is steadily gaining vantage that we are getting old enough to stand upon our own heels in this matter of self-help.

II.—SECONDARY AND HIGHER EDUCATION.

OCCUPATIONS OF GRADUATES.

The question is sometimes asked, What does the colored man do after completing a regular course in one of the universities or colleges? In order to answer this question somewhat definitely, a table has been prepared showing upon what lines of business the graduates of 17 institutions reporting this item had entered. These 17 institutions represent very fairly the work of the colored schools. Howard University is not included in this statement, as a considerable portion of its graduates are white.

The first thing to attract attention is the large number engaged in teaching, more than one-half being thus employed. As these institutions were mainly founded to supply the demand for competent colored teachers and preachers, they seem to have well accomplished their purpose. The whole number of graduates of these 17 institutions is 1,542. If from this number we subtract 82 deceased, 46 engaged in post-graduate studies, 97 married women, and 74 not reported, of the remaining 1,243 there are 720, or 58 per cent, engaged in teaching, 27 of these being professors in colleges and universities. Of preachers there are 117, or 9 per cent; of lawyers, 116; doctors, 163. Five have their whole time employed as editors of papers, while others are partly engaged in editing. There are 36 in the United States Government service, employed as clerks in the departments at Washington, as postmasters, as custom-house inspectors, as mail-carriers, etc.

Although in all of the institutions given in the list, without exception, instruction was given in different kinds of industrial work, such as carpentry, tinning, painting, brickmaking, plastering, shoemaking, tailoring, blacksmithing, farming, gardening, etc., and in many of them special attention was given to such instruction; still out of the 1,243 graduates only 12 are farmers, only 1 a carpenter, and 2 mechanics. The painters, tinners, brick-makers, shoemakers, plasterers, tailors, and blacksmiths seem to have graduated from their trades when they left their *alma mater*. It should not be inferred, however, that their handicraft availed them nothing, for it is frequently stated in the catalogues that those graduates who are engaged in teaching so long as the school term continues immediately enter upon their trades at the close of the term. The evidence of the table, however, is that a full collegiate education tends to draw away the colored student from the class of pursuits mentioned and to lead him into professional work; and as greater opportunities are annually being offered him for medical and legal education the number in these professions is yearly increasing.

a Number of graduates of the normal department.

COLLEGIATE STUDENTS.

The number of universities and colleges for the education of the colored race given in the tables of 1889-90 is 22, with an attendance of 811 students. The number of institutions is the same as reported in 1888-89, but in the number of students there is quite a reduction. This reduction is owing to the fact that students in the preparatory departments have been classed under the list of institutions for secondary instruction. It is well known that in many of the colored universities and colleges there are only a dozen or so of students in the college grade, while there are, perhaps, several hundred in the preparatory and primary grades. To include the latter among university and college students would be misleading.

On this point President Horace Bumstead, of Atlanta University, says: "It is a mistake to suppose that the higher education of the colored people is being overdone. There is a very grave misapprehension on that point among the good people of our land. We have so many institutions in the South that are named universities and colleges that the idea prevails that all the students in these institutions are learning Latin and Greek and the higher mathematics and getting in general the higher education. This is not so. Dr. Haygood a few years ago investigated this matter with some care and arrived at the conclusion that in these institutions with the high-sounding names not over 5 per cent of the pupils are really getting a strictly 'higher education.' Commissioner Harris thinks there may be as many as 10 per cent, but even that is a very small proportion.

"Take Atlanta University, for instance. We have had this last year about 600 students enrolled, whose names are printed in our catalogue. How many of these are getting the higher education? Just 20 of them are in the college course; 51 more are in the college preparatory course; 71 out of 600 are getting the higher education, and this is probably a larger proportion than can be found in almost any other institution in the South. When one remembers the comparatively small number of the colored people who are in these schools and then considers the small proportion of those in them who are getting the higher education it does not seem as though the thing were being overdone."

In 1888-89 the number of institutions for secondary instruction was 53 and the number of students 11,480; in 1889-90 the number of institutions was 71 and of students 12,420, an increase of about 1,000. This increase is to be accounted for, to some extent, in the same way as the decrease in the number of university and college students, viz, the including college preparatory students in the tables of secondary institutions.

Hence, although there was apparently a decrease in the number of collegiate students, it was only an apparent one; but at the same time the actual number given is so small that it may well serve to stimulate the friends of colored education to renewed efforts in their behalf.

In the number of theological students there was apparently a decrease, but there was an increase of about one-third in the number of both law and medical students.

The value of the grounds and buildings of the 22 universities and colleges, as reported, was over $2,700,000, but only a few of them had any endowment fund, the endowment funds of all of them only aggregating $807,425. Benefactions to the amount of $167,591 were received during the year. Only three of them received any State aid—Southern University, New Orleans, $7,500; Wilberforce University, Ohio, $6,000; and Claflin University, South Carolina, $10,800. The tuition fees received by all of them only aggregated $47,216. Without the aid extended by missionary societies and other benevolent funds they would have labored under great difficulties. The American Missionary Association was one of the largest contributors towards the support of these schools. It gave help to six chartered institutions—Fisk University, Atlanta University, Talladega College, Tougaloo University, Straight University, Tillotson Normal Institute—with 2,871 students in all the departments; also to 21 normal and graded schools, with 5,797 students, and to 53 common schools, with 4,727 pupils. The Freedmen's Aid and Southern Education Society of the Methodist Episcopal Church also contributed a large amount towards the education of the colored race, but it is impossible to determine the amount accurately, as the expenditures for institutions of the white race and for ministers' salaries are included in the same accounts with those for colored schools. The whole amount disbursed from the Slater fund from 1883 to 1891, inclusive, was $321,991.

The apportionment among the institutions receiving aid from the John F. Slater fund in 1889-90 was as follows:

Atlanta University, Atlanta, Ga	$1,600
Ballard Normal School, Macon, Ga	500
Benedict Institute, Columbia, S. C	1,000
Biddle University, Charlotte, N. C	1,000
Brainerd Institute, Chester, S. C	700
Central Tennessee College, Nashville, Tenn	1,100
Claflin University, Orangeburg, S. C	1,800
Clark University, Atlanta, Ga. (general appropriation)	1,800
Clark University, Atlanta, Ga. (special appropriation)	3,200
Fisk University, Nashville, Tenn	1,800
Gilbert Seminary, Winsted, La	800
Hampton Institute, Hampton, Va. (general appropriation)	1,500
Hampton Institute, Hampton, Va. (special appropriation)	1,000
Hartshorn Memorial Institute, Richmond, Va	650
Jackson College, Jackson, Miss	800
Jacksonville Graded School, Jacksonville, Fla	800
Leonard Medical School, Raleigh, N. C	500
Le Moyne Institute, Memphis, Tenn	1,300
Livingstone College, Salisbury, N. C	700
Meharry Medical College, Nashville, Tenn	1,000
Mount Hermon Female Institute, Clinton, Miss	$1,000
New Orleans University, New Orleans, La	1,000
Paul Quinn College, Waco, Tex	460
Payne Institute, Augusta, Ga	600
Philander Smith College, Little Rock, Ark	800
Roger Williams University, Nashville, Tenn	1,000
Rust University, Holly Springs, Miss	1,100
Schofield Normal Institute, Aiken, S. C	500
Scotia Female Seminary, Concord, N. C	700
Shaw University, Raleigh, N. C	1,800
Spelman Female Seminary, Atlanta, Ga	2,000
State Normal School, Montgomery, Ala	1,200
State Normal School, Tuskegee, Ala	1,000
Straight University, New Orleans, La	1,300
Talladega College, Talladega, Ala	1,400
Tillotson Institute, Austin, Tex	900
Tougaloo University, Tougaloo, Miss	1,500
Training School, Knoxville, Tenn	600
To special objects	500
Total	42,910

The sum of $47,428.27 was received from the income of the Daniel Hand fund, and was used in extending aid to deserving and promising students, in providing good school buildings at different places, and in securing teachers for places where they could not otherwise be obtained.

The Daniel Hand fund at the time it was granted consisted of interest-bearing securities to the amount of $1,000,894.25. It was placed in charge of the American Missionary Association, and only the income of it is to be used. The bonds and property are "to be received and held by said American Missionary Association *upon trust*, and for the following purposes, viz: To safely manage the said trust fund, to change investments whenever said association may deem it necessary or advisable, to reinvest the principal of said trust fund in such securities, property, and investments as said association may deem best, and to use the income thereof only for the education of colored people of African descent residing in the recent slave States of the United States of America hereinbefore specified.

"Such income to be applied for the education of such colored people as are needy and indigent, and such as by their health, strength, and vigor of body and mind give indications of efficiency and usefulness in after life."

In December, 1891, at his home in Guilford, Conn., occurred the death of Mr. Daniel Hand, the donator of the above fund, who with intelligent foresight gave from the living hand that which probably for years to come will confer its benefits upon deserving youth.[1]

[1] "Daniel Hand was born in Madison, Conn., July 16, 1801, and was therefore in the eighty-eighth year of his age when he made his gift for the education of the colored people at the South. His ancestors resided in that town for several generations, and were always landholders, industrious, quiet, and respectable. To this ancestry Mr. Hand is probably indebted under God for his physical vigor, long life, strength of character, and success in business. He was the fourth son of seven, and was on the farm under his father's direction until he was 16 years of age, when he was put in charge of his second brother, Augustus F. Hand, who was then a merchant at Augusta, Ga., and whom he succeeded in business. In 1854 Mr. Hand went to New York in connection with his Southern business, and remained there in that capacity until the beginning of the war in 1861. He resided in some portion of the Southern Confederacy during the entire war, and was never treated with violence in any way, and no Confederate officer ever offered him indignity or even an unkind word.

"Mr. George W. Williams, a native Georgian, was, at about the age of 16, employed by Mr. Hand as a clerk in Augusta, and in a few years was taken in as partner. Mr. Williams suggested a branch of the business in Charleston, and conducted it successfully. When the war came on Mr. Hand's capital was largely engaged in the Charleston business, which Mr. Williams, as a Southern man, continued, having the use of Mr. Hand's capital, which the Confederate government vainly endeavored to confiscate by legal proceedings against Mr. Hand as a Northern man of pronounced antislavery sentiments. After the war Mr. Hand came North and left it to his old partner, Mr. Williams, to adjust the business and make up the accounts, allowing him almost unlimited time for so doing. When this was accomplished Mr. Williams came North and paid over to Mr. Hand his portion of the long-invested capital and its accumulations.

"Mr. Hand, having been early deprived by death of wife and children, decided to devote a share of his large fortune to benevolent purposes. At one time he intended to make bequests to some Northern colleges, but at length, recalling the fact that his property was accumulated in the South, and knowing so well the needs of the ignorant negroes, he turned his attention to them.

"The well-known and magnificent gift of $1,000,894.25, October 24, 1888, to the American Missionary Association, for the benefit of the colored people of the Southern States, was the result."

George R. Smith College, Sedalia, Mo.—On March 27, 1888, two daughters of Gen. George R. Smith, Madams Smith and Cotton, donated 25 acres of land, valued at $25,000, in Sedalia, Mo., for the establishment of an institution of learning for the colored race, on condition that a $25,000 building should be erected on it by January 1, 1892. The building was partially erected within the required time, but the donors kindly extended the time to January 1, 1894. As the institution is to be in charge of the Freedmen's Aid and Southern Education Society of the M. E. Church, it will very probably be completed within the required time. It will be the first institution of higher grade in Missouri for colored people.

INDUSTRIAL TRAINING.

In nearly all, if not all, of the institutions for the secondary and higher education of the colored race of the South industrial training forms a very important part. It is one of the conditions required before aid can be received from the John F. Slater fund. The cost of its introduction was very considerable, in the purchase of sufficient grounds, in the erection of suitable buildings, and securing the necessary machinery and apparatus for the different kinds of work. And not only was its introduction expensive, but its maintenance as well, for it has not been the purpose to make profits, or even in many cases to meet expenses, but to impart the largest amount of useful and practical knowledge and to train in habits of carefulness, diligence, and order. But at the same time many indigent students were instructed in branches of industry by which they were soon able to contribute largely towards defraying their expenses, and afterwards to earn a good livelihood. It was found, too, that the physical exercise and the temporary mental diversion from studies was very conducive to health and vigor and was a source of enjoyment to students, while it in no way hindered progress in their studies. It also indicated that hard labor on the farm or in the workshop was not to be confined to the ignorant, poverty-stricken wretch, but that there was nothing in it inconsistent with an educated, progressive, Christian character.

As to industrial training, Dr. A. G. Haygood, general agent of the Slater fund, says: "The essential goodness of industrial training in connection with the ordinary school training is now universally admitted by experienced and practical people. In the schools aided by the Slater fund during the school year 1889–90 as many as ten thousand young people were taught in books and in some branch of useful industries. This sort of training is vital now. Mere book schooling with poor and illiterate people breeds wants faster than it develops the ability to provide for them. The outcome is misery. Tool-craft helps to realize the aspirations that book learning inspires."

TABLE 4.—*Amount and distribution of the sums disbursed from the Slater fund, from 1883 to 1891, inclusive.*

NEED OF GREATER ACCOMMODATIONS.

The number of students in the colleges and schools for secondary instruction of the colored race does not show the rapid increase from year to year which would naturally be expected, when we consider the large number of children that have been attending the common schools, many of whom should now be qualified for entering higher institutions. But an examination of the reports of colored schools and of journals devoted to colored education soon discloses one reason why there is not the increase expected, viz, the want of accommodations for more students. Many of the colored schools of higher grade are already badly overcrowded; some of them are so crowded as to seriously endanger the health of the students and hundreds of others have been refused admission on account of want of room, while others still have not applied because they already knew there was no place for them. Very few new schools of the higher grades are established for colored students, as the colored people themselves have not the means for doing so, and the missionary societies generally content themselves with sustaining or at least strengthening the institutions they have already established. Many of the schools adopt all sorts of expedients to make room for applicants begging for admission, allowing them to sleep on cots in the halls, making use of old buildings which had been discarded as no longer fit for occupancy, and very generally crowding the students in excessive numbers in the buildings designed for them. Judging from the accounts given it would seem reasonable to suppose that the number of colored students would be largely increased immediately if there were accommodations for them. A want of accommodations is especially to be regretted when it is considered how anxious the young men and women are to receive an education and what sacrifices both students and parents willingly make in order that they may receive one.

A few quotations on this subject are given from various sources. Dr. C. H. Parkhurst, editor of Zion's Herald, says: "We should have ten schools where

we now have one. Every institution is crowded to overflowing. If God is saying anything in this jubilee hour to the church it is, *enlarge, enlarge, enlarge* your beneficence; enlarge the scope of operation; enlarge the teaching and boarding capability. We rejoice over the achievements of these twenty-five years; but at the same time we are humbled that the church has done so little."

Morristown Normal Academy, Tennessee; number of students, 306.—"This institution is situated in the midst of a colored population of not less than 250,000. To meet the educational requirements of this vast number of people, there is only one other school of a similar grade within a radius of 300 miles. The people are realizing, as never before, their great need of an education, and are crowding every room to its utmost capacity. Last year scores of bright, earnest, and self-sacrificing young people were sent away for want of room."

"The present dormitory is entirely too small for the number of students crowded into it. For the last two years we have been compelled to put three students in each bed, and to place cots in the halls. Even then it was difficult to satisfy applicants that we were crowded and could not accommodate them."

Grand View, Tenn.—"The classes are full and the accommodations inadequate. The school numbers one hundred and eleven. It is necessary to crowd four boys into each room of the boys' hall. Four boys are boarding themselves in a shackly log building at the foot of the hill. Their grit is admirable."

Tougaloo, Miss.—"Both the dormitories are crowded. The ladies' hall is supposed to accommodate 75 girls. One hundred and six are crowded into it to-day. We have turned away nearly one hundred more because we had not room for them. Every indication is that the crowd of applicants will be greater next year than ever. Already applications are coming in."

Meridian, Miss.—"The work of the school is hindered by lack of room. We have enrolled this year 232 pupils, and many have been turned off because we could not seat them. We opened in December of 1888 with 28 pupils. A school for more advanced pupils is needed in this part of Mississippi. We have 30 young people in school who come from the five adjoining counties."

Straight University,[1] *New Orleans.*—"It has been a golden year for Straight University. Financially it has been our best year. A larger proportion of students able to pay came to us. We want to grow, and have every opportunity to do so save that our quarters are too small. We have turned away during the year probably 200 applicants, many of them for the boarding department. We have had to put cots in nearly all the rooms, packing them too full for comfort, as it was very hard to say No to young people who came hundreds of miles and begged tearfully for admission. The school has grown during the last eight years from 200 to 600 and is not 1,000 only because we had no room for them. Our graduates are filling important positions all over the South. Several are superintendents in Texas, Kansas, Mississippi, and Louisiana. One holds an important office in Honduras; others are doing good work in Cuba and Mexico. Eight are filling important positions in this city. We have no trouble in getting positions for our young people. Indeed, we can not supply as fast as demanded. Often as many as twenty are called for when we have none to send."

Bennett College, Greensboro, N. C.—"Our chief need is a new dormitory building. The present building, though large, is far too small for the increasing demands upon us for more commodious quarters. Students are pouring in upon us every day, and still we hear of others coming."

Wiley University, Marshall, Tex.—"There should be at once erected a large central building, which would be at once filled with students."

Gilbert Academy, Winsted, La.—"We could have an attendance of a thousand students within a year if we had buildings to accommodate them."

Central Tennessee College.—"The attendance during the past year (1889-90) is such as to encourage the thought that the desire for education, and that more advanced, is growing rather than diminishing among the colored people. The number in attendance during the past year has tested our buildings to their utmost capacity. We need additional accommodations. This educational work has really just begun, and the outlook is that all our schools will be crowded more and more. We need a new chapel. Our present one is not sufficiently large to seat our students. We have been compelled to fill up the platform and crowd every seat, and yet have not room for all our students. We need a larger chapel for our ordinary purposes, and a much larger one for our public occasions."

[1] In January, 1892, the main building of Straight University, New Orleans, La., was consumed by fire. Fortunately, however, the property was adequately insured, and a larger structure is now being erected in its stead.

"For our young women we need dormitories; and for the purpose of teaching, cooking, nursing, domestic economy, we need enlarged facilities. We need these, not for our necessary school purposes only, but to create a desire for neatness and pleasant surroundings in the homes that these young women are to make in the future. The need of additional buildings is more especially evident when it is understood that every room on the grounds is occupied by students or teachers."

From the Daniel Hand School, New Orleans.—It is the old story—200 turned away for lack of room. A few have come from the country without ever thinking that they might not find a place, and stand hopelessly on the street corner talking it over.

Another teacher says: "We are crowded to overflowing in every grade of the school but one, in which we have three unoccupied seats. In the normal department twenty pupils are without desks. Yesterday one of the ministers of the city applied for admission of his two daughters, who had completed the course in the public schools—just the class of pupils we like to have come—but I could not admit them for want of room."

From report of President T. D. Tucker, of Florida State Normal College for Colored Students.—"The surest test of the appreciation of the race for the school is in the sacrifices made by patrons in sending and maintaining scholars here and the eagerness of the latter to avail themselves of the opportunity offered them for instruction. With limited means or from daily earnings parents send their children to this school from distant parts of the State, and meet all the financial engagements incident to the education of a young person during the entire session of nine months. Although this is the second year since the school has had dormitory halls, not only has every patron met all his obligations, but the demand for more room in the dormitories is restricted by our inability to provide for any more newcomers.

"The promptness and regularity of attendance at the daily sessions of the school is another proof of high appreciation. No severer punishment for breach of discipline can be inflicted on any of them than to be ordered to leave school for even part of a day. They seem to feel that every day and hour are too precious to be lost from the prosecution of the purpose for which they have come hither from their homes. This strong regard and attachment for a school but lately established is one of the most pleasing features, which promise for it, let it be hoped, a long career of usefulness. * * * Wherever the services of our undergraduates have been once had, there they are held most in demand—a testimonial to their efficiency and the need of them as workers in the common schools."

From report of the American Missionary Association committee in 1891.—"The total number under instruction during the year has increased by several hundred, and almost every school is crowded to overflowing, compelling in many cases the sad necessity of sending away great numbers of applicants from lack of room for their accommodation. It is evident that the thirst of the colored people for knowledge, shown so remarkably from the moment of their emancipation, has not diminished, but is constantly increasing."

INDUSTRIAL TRAINING.

At *Claflin University, South Carolina*, a large number of students were instructed in trades and industries; in agriculture, including gardening and horticulture, 40 students; in architectural drawing, 13; in art needlework, 20; in blacksmithing, 98; in brickmaking, bricklaying, plastering, and frescoing, 92; in carpentry and cabinetmaking, 185; in cooking, 35; crocheting and lacemaking, 120; domestic economy, 13; dressmaking, 35; mechanical engineering, 15; merchandising, 1; nurse-training, 14; painting, graining, and glazing, 81; printing, 69; steam laundrying, 50; steam planing, sawing, turning, 26; steam milling, grinding cereals, 4; shoemaking, 21; plain sewing, 190.

President L. M. Dunton, of Claflin University, says: "In the past the negro has been a laborer. For years to come he must be a laborer. A few of course will be educated and will enter the ministry, the law, the medical profession; but the vast majority must labor with their hands. It is therefore very important to give them this manual training. We are very enthusiastic about this, and we do not allow any young woman to graduate until she can measure, cut, fit, and make a dress, and make it in style. They also learn cooking and artistic needlework. The young men are required to learn the principles of different trades, and to learn one trade thoroughly. We require a certificate from some

one of the industrial departments that they have accomplished the required work before they can graduate from the institution. During the vacations these young men and women work at these trades that they have learned at the institution. We have boys now earning a dollar and a half a day at house painting, others earning $2 a day laying brick or at carpentry. In our blacksmith department they make all the tools they use; they even make their own razors. This industrial feature has been an inspiration to the literary department."

At *Gilbert Academy, Winsted, La.*, there are 12 students in the printing office, 14 in the carpenter shop, 16 on the farm, 53 girls in the sewing room, 3 in the bakery, besides a large number in the laundry.

Philander Smith College, Little Rock, Ark.—"The industrial department is carried on in a two-story frame building erected by the students. In this department there are 114. The citizens of Little Rock have given over $800 towards paying for the building. A large number of young men have been taught the use of tools. In the printing department several young men and young ladies have been taught."

Rust University, Mississippi.—In the carpenter shop 35 young men were instructed in the use of tools and methods of construction, from the most common articles in use in home and on farm to fine cabinet work. Twenty-seven were taught shoemaking, from the making of cheap shoes to the finest French kid boot. Eleven were instructed in the printing office, and a monthly paper was published. The young men below the college course, who were not assigned to some trade, were put in the department of agriculture. In the sewing department 102 girls received useful instruction in that line.

Clark University, Atlanta, Ga.—"At Clark University we have one of the best located as well as one of the best equipped industrial schools south of the Ohio. We have one large brick building, Ballard Hall, 100 by 40 feet. The first floor is divided into two parts: one-half is occupied by the wheelwright shop. The second floor is divided into four rooms, one occupied by the printing office, one by the varnish and finishing department, another by the harness and trimming shop, while the remaining one is devoted to an office and mechanical drafting. The machinery is driven by a 30 horse-power engine. We have a blacksmith shop 40 by 30 feet, brick, three forges, drills, benches, etc. We have a foundry, 60 by 40 feet, supplied with the latest improved cupola.

"The Woman's Home Missionary Society has a building worth $6,000, built after the best models and thoroughly equipped with appliances for teaching in the culinary department, needlework, dressmaking, and all that a wife in a well-regulated home ought to know. The university physician has a class in nurse-training in this home also. A shoe shop and a machine shop are among the things now under contemplation."

Central Tennessee College.—"On October 15, 1890, the mechanic arts shop was dedicated to the training of young men for useful work in wood, iron, brass, and steel; in the manufacture of steam engines, scientific, and philosophical apparatus. Rev. H. G. Sedgwick, M. S., who is a genius himself in mechanics and can readily impart instruction to others, has during the year had excellent work done by students in wood-turning, shaping and planing, castings, steel, and brass. One engine has been built and considerable repair work done. This is the best shop, and the only one of the kind, open to colored youth in this country."

Dr. Atticus G. Haygood, general agent of the Slater fund, says: "It has been demonstrated that an hour or two a day in the workshop or the sewing room does not hinder in the least education in books. It has been found, as a rule, that the best men in the shop are the leaders in the class room. Experienced teachers say that industrial training fosters good discipline and the upbuilding of strong and reliable personal character. Outside the important fact that a great number have learned enough of the trades to pursue them profitably, it is certain that thousands have learned enough to be independent as citizens and far more capable as heads of families. That 'head, heart, and hand training' should go on together in these institutions is now the accepted doctrine in all quarters.

"It can not be doubted that the success of industrial training in the negro schools has had much to do with the development of opinion throughout the Southern States of the importance of this part of education in the white schools of the country."

Gen. S. C. Armstrong on industrial training.—"Labor is a great moral and educational force. Next to the grace of God, hard work, in its largest sense, is the most vital thing in Christian civilization. Subtract from any neighborhood,

within a radius of ten miles, all industry, and in six months, in spite of churches and schools, what would become of order and decency? Look at the fairest civilization, and you will see that the worst lives are at the top and at the bottom—those who are too rich and those who are too worthless to work. Wherever you find industry you find character and morality.

"The main thing, then, in the industrial system is to open as widely and broadly as possible opportunities for agricultural, mechanical, and household industries, which shall provide negro students means to support themselves and to develop character. Character is the foundation. The training that our pupils get is an endowment. An able-bodied student represents a capital of perhaps a thousand dollars. We propose to treble that. When they learn a trade they are worth threefold more in the labor market. Last Saturday I gave my final words to our graduating class. I said to those 45 scholars, 'How many of you can go out into the world, and, if you can not get a school, how many can work in some line of industry and so support yourselves?' There was a roar. Every one said, 'I can,' and every one laughed. They go out into the world smiling at difficulties, happy in their pluck and purpose and skill.

"We are convinced that the negro needs physical as well as mental and Christian training. He needs the ten hours' drudgery which he gets in the shops to put him in shape for the struggle of life. He must go to his work with an appetite."

Rev. R. H. Allen, Concord, N. C.—"We have now a large boarding school for colored girls. If you ever save the negroes you must save the girls and women. You will not elevate any race until wives and mothers can teach the gospel in their families. You must save the daughters of the freedmen. They are to be the wives and mothers and home-makers of the future. At Concord you will see 234 girls in a seminary, with all the appliances for education and the industrial arts. They do the whole work of the school—all the washing, ironing, cooking, scrubbing, and dressmaking. We take a girl for $45 a year. We say to her, Go to work during the vacation and make $15 or $20 and we will help you to the balance of the $45. In such schools, by a practical education of the head, hand, and heart, the girls are all well prepared to take their part in life. We help them to make character."

Rev. Frank G. Woodworth, president Tougaloo University, Mississippi.—"The ordinary laborers on plantations do not often receive more than from 75 to 90 cents per day. I want to speak of the value of industrial education. Boys who come to us untrained, often able to earn only 75 cents a day, are sent out as carpenters, blacksmiths, or tinsmiths, able to earn from $1.25 to $2.50 a day. We are having that repeated constantly. That is the bread-and-butter view of industrial education, and it is worthy of mention. The mechanics who receive $2 a day do not live in a one-room cabin. They are getting to have good little homes of their own."

The higher education helps the elementary.—President Horace Bumstead, of Atlanta University: "It is a mistake to forget that the higher education of the few is contributing most efficiently to the elementary education of the many. What are the graduates of these higher institutions doing? Are they going out and enjoying their culture, and making a selfish use of it? Take Atlanta University. We have sent out, in the last 16 or 18 years, over 200 graduates from our collegiate and normal courses, two-thirds of whom are to-day engaged in teaching. They are doing this very work that we are reminded is the most important work to do—helping up the masses, educating the people. One must remember the relationship between the higher and the more elementary work. Where would these Southern States get their teachers for the colored public schools if it were not for these higher institutions?"

Colored teachers wanted.—President E. C. Mitchell, of Leland University, New Orleans: "More colored teachers must be educated. The appeals made to our institution to furnish teachers qualified for the higher work, or even the common work, are far beyond the power we have to meet. If we had four times as many graduates, we should not be able to meet the demand made upon us for teachers of the higher grade. All the institutions of the South must be carried on by colored teachers."

What kind of education the negro needs.—Dr. A. G. Haygood: "That many half-taught and unwisely-taught negroes 'go to the bad' and seek money by 'short cuts' is not surprising. In these matters the negro's weakness illustrates his brotherhood to his white neighbors. The prisons show enough half-educated white people to prove that merely learning the rudiments does not secure virtue.

In all races it is true that with new knowledge new temptations come; strength to resist comes after, if at all. In all this a man of sense finds no argument against the education of the negro, but a demonstration of the need, for him and for the white race, of more and better education.

"'Better' is not the same as 'more;' the imminent need for the negro is to find out what education is now fittest for him. Nothing in these statements means the exclusion of the negro from the highest and widest studies of which some of them are capable; it does mean, as I see it, that the 'regulation college curriculum' is not what most negro students need. I would exclude, by arbitrary and prescriptive rules, no negro from whatever he can achieve, but I am persuaded that, in overlooking the hard facts of this case and in pressing the 'college' idea overmuch, there has been much waste of money, labor, time, opportunity.

"The educated negro man gravitates to the pulpit or the schoolroom. To the pulpit first, because here he may gratify, without hindrance, his inborn love of speaking. He is oratorical by instinct, and this race will more and more develop great orators. The educated negro woman goes to the schoolroom by preference, but she would rather be wife to the preacher. Along here are perils that wise negroes understand.

"Why should such indications and tendencies surprise us? No man lives by the labor of his hands who can live by his wits, least of all American white men. The negro's dangers are greater because his opportunities outside the labor of his hands are few. No arguments, nor frettings, nor denunciations, nor laws, nor force can multiply them; time and new conditions, possible only to the 'time element,' can increase them.

"The educated negro finds it difficult to succeed in the practice of law. White people employ attorneys of their own race, and a negro will have none but a white man for lawyer when large sums are at stake, or life or liberty are imperiled. But he has 'made a beginning' in the law.

"Next to teaching and preaching, medicine among professional pursuits offers the best field and the best opportunity for the capable negro. The reason is, there is a generally recognized and felt need of negro doctors. Two of the institutions in connection with the Slater fund—Meharry Medical College, Nashville, Tenn., and Leonard Medical School, Raleigh, N. C.—are thoroughgoing schools of medicine and command the respect of the medical profession. The large majority of the graduates of the schools are doing admirably in the practice of medicine. They are a blessing to their race and are successful and useful citizens."

The following, from the *Charleston (S. C.) News and Courier*, gives some idea of how the negro appreciates an education at Claflin University, South Carolina: "The students come from all parts of the State, and a better class of colored families are represented than usual. From the number of students (902), their condition and their work, it would seem as if the colored people are taking more than ordinary interest in the cause of education. Many parents are making great sacrifices to send their children to Claflin, and many of the students are in much better circumstances than their parents at home. The students lack early home training. They do not have access to daily papers, magazines, or books like most white children. As a rule subjects of importance and interest are not discussed in the family circle, and on account of these drawbacks the colored student labors under disadvantages. A lack of general information is noted by the professor. Their behavior is, as a rule, very good. There is not, in the knowledge of the officials of the institution, a single student who visits a barroom, smokes in the campus or in the streets.

"A student probably has less expense at Claflin than at any other educational institution in the country. Think of it—all actual expenses for a session covered by $52! What can be cheaper? This is popular education. The figures seem to be hardly credible. Here is the itemized bill for a month: Rent, $1; incidentals, 50 cents; tuition, 50 cents; board, $3.50; washing, $1; total, $6.50 per month and $52 per session. You may think that dormitory rent at $1 and washing at $1 are reasonable. But you, as many others, will ask how can a living working being be fed for $3.50? Well, it is done at Claflin, and here is how it is accomplished. Fifty students club together and get a table at the dining hall for which they pay no rent. They are not afraid of work and agree to do all the washing, waiting, and setting of tables in turn. A purchasing committee is appointed, and they have potatoes, meat, corn, and rice at the cheapest market price. The only expense besides the food is that of a cook. It seems almost incredible, but the students eat substantial meals and the bill of fare shows what they eat."

From the report of the American Missionary Association committee in 1891.—"One of the greatest needs of the colored people is coming to be that of competent, educated, Christian leaders of their own race, preachers, teachers, and other professional men, a need not likely to be adequately supplied except by the colleges and higher schools sustained by this and other Christian bodies. It may be safely assumed from the history of other races that no leadership will be permanently accepted by the colored people except such as shall come from their own ranks. In furnishing through its higher institutions such a thoroughly equipped leadership to take the place of its own at the earliest moment, this association will make one of its best contributions to the welfare of the colored race. Another encouraging fact in the same direction is the growing interest in the theological department. As an ignorant ministry has been and still is the curse of the colored people, a thoroughly educated ministry is the highest boon we can possibly confer upon them."

"*Straight University* has numbered 582 students, who come from a wide area. It is not uncommon for students who can speak no English to seek this institution from Cuba, Central America, Mexico, or some parts of Louisiana. It is an inspiring thought that they will return to their homes, as some have returned, with Christ in their hearts and thrifty thoughts in their heads to radiate good influences in those revolutionary states. This institution has been more than filled. Hundreds have been refused admission. Every year shows marked improvement in the quality of student life in this, as in all our schools. Pupils come better prepared. They are more earnest and more energetic. The demand for teachers from this institution is greater than the supply. Seventeen of its former students are now teaching in the city schools of New Orleans. Many others are filling important places as teachers, superintendents, and preachers in neighboring States. Various industries for men and all kinds of needlework and housework for women are well taught."

Temperance is taught in all the higher colored schools.—Rev. J. C. Roy: "In all of these schools the principle of temperance is taught and the students go out and propagate these sentiments among their people. In this way they produce an immense amount of temperance sentiment among the colored folks."

The Negro Conference at Tuskegee, Ala.—A negro conference made up of representatives from that district of the South known as the "Black Belt" was held at Tuskegee, Ala., on February 23, 1892. About 450 colored farmers, ministers, and teachers were present, and a full and candid discussion was had of questions affecting the industrial, moral, educational and religious future of the negro population.

In dealing with the question of the proper means to be adopted for the correction of the existing unsatisfactory order of things, the conference suggested various remedies, which may be summarized, in the language of those assembled, as follows:

"(1) That, as far as possible, we aim to raise at home our own meat and bread. (2) That as fast as possible we buy land, even though a very few acres at a time. (3) That a large number of our young people be taught trades and that they be urged to prepare themselves to enter as largely as possible all the various avocations of life. (4) That we especially try to broaden the field of labor for our women. (5) That we make every sacrifice and practise every form of economy that we may purchase land and free ourselves from our burdensome habit of living in debt. (6) That we urge our ministers and teachers to give more attention to the material condition and home life of the people. (7) We urge that our people do not depend entirely upon the State to provide schoolhouses and lengthen the time of the schools, but that they take hold of the matter themselves where the State leaves off, and by supplementing the public funds from their own pockets and by building schoolhouses bring about the desired results. (8) We urge patrons to give earnest attention to the mental and moral fitness of those who teach their schools. (9) That we urge the doing away with all sectarian prejudice in the management of schools."

The Lake Mohonk Conference.—In June, 1891, there was held at Lake Mohonk, N. Y., a conference of distinguished editors and educators on the negro question. It was presided over by ex-President Hayes, and among those present were Dr. Lyman Abbott, of the Christian Union; Dr. W. H. Ward, of the Independent; Dr. W. T. Harris, United States Commissioner of Education; Gen. O. O. Howard, Dr. Charles H. Hall, Mr. Morris K. Jessup, and Rev. R. T. Middleditch, of the Christian Enquirer. At the conclusion of the conference the following platform was adopted.

1. The accomplishing of the primary education of the negro by the States themselves, and the further development of means and methods to this end, till all negroes are creditably trained in primary schools.
2. The largely increased support of schools aided by private benevolence, which shall supply teachers and preachers for the negro race.
3. The grounding of the vast majority of these teachers and preachers in common English studies and in the English Bible, with the further opportunity for any of them to carry on their studies as far as they may desire.
4. The great extension of industrial education for both men and women.
5. The encouragement of secondary schools established, maintained, and conducted by negroes.
6. The purchase of homesteads by as many negro households as possible, with an increased number of decent houses to replace the old one-room cabin.
7. The establishment by the Government of postal savings-banks, in which negroes can be encouraged to save their earnings until they can purchase homes.
8. The aid of public education by the National Government for the special benefit of those sections in which illiteracy most prevails.
9. The removal of all disabilities under which negroes labor by the sure forces of education, thrift, and religion.

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE.

A pamphlet has been published giving a sketch of the twenty-two years' work of the Hampton Normal and Agricultural Institute, Hampton, Va., a full and extended account of which is soon to be issued. As this institution has a very important part in the work of educating the colored race, having been one of the pioneer colored schools, and having at the present time nearly 1,000 students in attendance, 650 of whom are boarding pupils, it may be well to learn from this pamphlet something of the character which was so active in its establishment and also of the early history of the enterprise.

Dr. S. C. Armstrong, who has had charge of the institute from its foundation, was born in the Hawaiian Islands in 1839. His parents had been missionaries there for eight years at the time of his birth, and his father was the minister of public instruction from 1847 till the time of his death, in 1860. Dr. S. C. Armstrong, then a young man, left the islands and went to Williams College, Massachusetts, to complete his education, and he attributes whatever measure of success he has attained to the instruction there received from Dr. Mark Hopkins. When he undertook the work at Hampton his purpose was to put in operation there the same plan and system of education that he had become acquainted with in the Hawaiian Islands under his father's superintendence. His statement of the disordered condition of the country at that time shows that he had many serious difficulties to contend with.

"In March, 1866, I was placed by Gen. O. O. Howard, Commissioner of the Freedmen's Bureau, in charge of ten counties in eastern Virginia, with headquarters at Hampton, the great contraband camp, to manage negro affairs and to adjust, if possible, the relations of the races.

"Colored squatters by thousands and Gen. Lee's disbanded soldiers returning to their families, came together in my district on hundreds of abandoned farms which Government had seized and allowed the freedmen to occupy. There was irritation, but both classes were ready to do the fair thing. It was about a two years' task to settle matters by making terms with the landowners, who employed many laborers on their restored homes. Swarms went back on passes to the 'old plantation' with thirty days' rations, and nearly a thousand were placed in families in Massachusetts as servants through the agency of a 'home' in Cambridgeport, under charge of a committee of Boston ladies.

"Hardest of all was to settle the ration question; about 2,000, having been fed for years, were demoralized and seemed hopeless. Notice was given that in three months, on October 1, 1866, all rations would be stopped, except to those in hospital, for whom full provision was made. Trouble was expected, but there was not a ripple of it or a complaint that day. Their resource was surprising. The negro in a tight place is a genius.

"It was my duty every three months to personally visit and report on the condition of the ten counties; to inspect the bureau office in each in charge of an army officer; to investigate troubles and to study the relations of the races. The better class of whites were well disposed, but inactive in suppressing any misconduct of the lower class. Friendliness between the races was general, broken

only by political excitement, and was due, I think, to the fact that they had been brought up together, often in the most intimate way, from childhood; a surprise to me, for on missionary ground parents, with the spirit of martyrs, take every pains to prevent contact of their children with the natives around them.

"Martial law prevailed; there were no civil courts, and for many months the bureau officer in each county acted on all kinds of cases, gaining generally the confidence of both races. When martial law was over and the rest were everywhere discontinued, the military court at Hampton was kept up by common consent for about six months.

"Scattered families were reunited. From even Louisiana—for the whole South was mapped out, each county officered, and as a rule wisely administered—would come inquiries about the relatives and friends of one who had been sold to traders years before; and great justice and humanity were done in bringing together broken households.

"Gen. Howard and the Freedmen's Bureau did for the ex-slaves from 1865 to 1870 a marvelous work, for which due credit has not been given; among other things, giving to their education an impulse and a foundation, by granting three and a half millions of dollars for schoolhouses, salaries, etc., promoting the education of about a million colored children. The principal negro educational institutions of to-day, then starting, were liberally aided at a time of vital need. Hampton received over $50,000 through Gen. Howard for building and improvements.

"On relieving my predecessor, Capt. C. B. Wilder, of Boston, at the Hampton headquarters, I found an active, excellent educational work going on under the American Missionary Association of New York, which, in 1862, had opened, in the vicinity the first school for freedmen in the South, in charge of an ex-slave, Mrs. Mary Peake. Over 1,500 children were gathering daily: some in old hospital barracks—for here was Camp Hamilton, the base hospital of the Army of the James, where, during the war, thousands of sick and wounded soldiers had been cared for, and where now over 6,000 lie buried in a beautiful national cemetery. The largest class was in the Butler School Building, since replaced by the fine John G. Whittier Schoolhouse.

"Close at hand, the pioneer settlers of America and the first slaves landed on this continent; here Powhatan reigned; here the Indian was first met; here the first Indian child was baptized; here freedom was first given the slave by Gen. Butler's famous 'contraband' order; in sight of this shore the battle of the *Monitor* and *Merrimac* saved the Union and revolutionized naval warfare; here Gen. Grant based the operations of his final campaign. The place was easily accessible by railroad and water routes to the north, and to a population of 2,000,000 of negroes; the center of prospective great commercial and maritime development—of which Newport News, soon to have the largest and finest shipyard in the world, is beginning the grand fulfilment—and, withal, a place most healthful and beautiful for situation.

"I soon felt the fitness of this historic and strategic spot for a permanent and great educational work.

"The suggestion was cordially received by the American Missionary Association, which authorized the purchase, in June, 1867, of Little Scotland, an estate of 125 acres (since increased to 190), on Hampton River, looking out over Hampton Roads.

"Not expecting to have charge, but only to help, I was surprised one day by a letter from Secretary E. P. Smith, of the American Missionary Association, stating that the man selected for the place had declined, and asking me if I could take it. I replied, 'Yes.'

"Till then my own future had been blind; it had only been clear that there was a work to do for the ex-slaves, and where and how it should be done.

"The thing to be done was clear; to train selected negro youth who should go out and teach and lead their people, first by example by getting land and homes; to give them not a dollar that they could earn for themselves; to teach respect for labor, to replace stupid drudgery with skilled hands; and to these ends, to build up an industrial system for the sake not only of self-support and intelligent labor, but also for the sake of character. And it seemed equally clear that the people of the country would support a wise work for the freedmen. I think so still.

"The missionary plan in Hawaii had not, I thought, considered enough the real need and weaknesses of the people, whose ignorance alone was not half the trouble. The chief difficulty was, with them, deficient character, as it is with

the negro. He is what his past has made him; the true basis of work for him and all men is the scientific one—the facts of heredity and surrounding: all the facts of the case.

"There was no enthusiasm for the manual-labor plan. People said, 'It has been tried at Oberlin and elsewhere, and given up; it don't pay.'

"'Of course,' said I, 'it can not pay in a money way, but it will pay in a moral way, especially with the freedmen. It will make them men and women as nothing else will. It is the only way to make them good Christians.'

"The school has had from the first the good fortune of liberal-minded trustees, who accepted its unformulated, practical plan when it opened, in April, 1868, with 2 teachers and 15 pupils, and adopted my formal report of 1870, the year of its incorporation under a special act of the assembly of Virginia.

"By the act of incorporation the school became independent of any association or sect and of Government. It does work for the State and General Government, for which it receives aid, but is not controlled or supported by them.

"From the first it has been true to the idea of education by self help, and I hope it will remain so. Nothing is asked for the student that he can provide by his own labor, but the system that gives him this chance is costly. The school depends on charity for $60,000 a year; the student gets nothing but an opportunity to work his way. While the workshops must be made to pay as far as possible, instruction is as important as production.

"Steadily increasing, its full growth, just reached, is 650 boarding students, from twenty-four States and Territories, averaging 18 years of age, 136 of them Indians; 80 officers, teachers, and assistants, of whom half are in the eighteen industrial departments and shops; 300 children in the Whittier (primary) department.

"The school is maintained at a total annual cost of about $155,000. Deducting the labor payments of negro students (say $55,000), $100,000, which is $154 apiece, is the net annual cost to the public. This is provided, first, by annual appropriation from Virginia of $10,000, interest on the State Agricultural College land fund (act of Congress, 1862); second, by an appropriation of $20,000 by Congress for the maintenance of 120 out of our 136 Indians at $167 apiece; third, by an income of about $10,000 from our endowment fund (of $194,000) and from rents; fourth, by about $60,000 contributed by the people, in the form of $70 scholarships, donations for general purposes and occasional unrestricted legacies. The school is never closed, but reduced nearly one-half in the summer; many colored students go out to find work, and 60 or more Indian students have 'outings' among Massachusetts farmers.

"A great stimulus to this institute and to all like work has been the 16,000 negro free schools of the South—nearly 2,000 in Virginia alone—costing the ex-slave States nearly $4,000,000 a year in taxation.

"Northern charity, at the rate of about $1,000,000 a year, with liberal Southern State aid in some cases, is supplying over twenty strong normal and collegiate institutes, mostly under church auspices, where not far from 5,000 adult select negro youth of both sexes are being fitted to teach and lead their people—industrial education being more and more appreciated and introduced. The Slater fund has been a great stimulus to their technical training. The negro girl has proved a great success as a teacher. The women of the race deserve as good a chance as the men.

"So far it has been impossible to supply the demand for negro teachers. Schoolhouses and salaries, such as they are, are ready; but competent teachers are the great and pressing need, and there is no better work for the country than to supply them.

"But the short public school sessions, of from three to seven months, do not give full support, and skilled labor is the only resource of many teachers for over half the year. As farmers and mechanics they are nearly as useful as in the schoolroom. Hence the importance of industrial training.

"Hampton's 720 graduates, discounting 10 per cent as disappointing, with half that number of undergraduates, are a working force for negro and Indian civilization. To fit them for this field has cost, since April, 1868, the round sum of $1,350,000, not including endowments, of which over $590,000 is represented by the school's 'plant,' which is good for generations to come.

"Every year an account of funds received has been rendered in detail.

"It was not in the original plan of the school that any but negroes should be received, though the liberal State charter made no limit as to color; but when, in 1878, a 'Macedonian cry' came from some Indian ex-prisoners of war in Flor-

ida—once the worst of savages—through Capt. R. H. Pratt, whose three years' wise management of them in Fort Marion had resulted in a wonderful change, seventeen were accepted at private expense, Bishop Whipple providing for five of them. The Hon. Carl Schurz, then Secretary of the Interior, was quick to appreciate the success of their first few months at Hampton, and sent us more Indians from the West; then Congress, on the strength of the results at Hampton, and of Capt. Pratt's proved capacity, appropriated funds to start the great work at Carlisle, where over five hundred Indian youth, under Capt. Pratt, are being taught the 'white man's way.'

"The annual Indian attendance at Hampton is now 136, of whom 120 are aided by Government, the rest by charity. The death rate, once alarming, has, for six years, been not quite one a year. Of the 345 returned Indians, but 25 are reported as unsatisfactory, but 4 of them bad; the rest are employed as farmers, catechists, preachers, teachers, mechanics, clerks, etc.; 35 seeking further education, 6 of them in Eastern normal schools and colleges, and 42 of the girls are married, in good homes.

"The old homesickness of Indians at eastern schools is nearly over. The three years' period at school, which was formerly too much like a prison term, is more and more ignored, and the idea of fitting for life, whatever time it takes, gains strength. Indians are no longer coaxed to come. Twice as many as we can take wish to come; yet the really desirable ones are not very many, and we do not care to increase our numbers. Our Indian work is illustrative rather than exhaustive.

"In the twenty classes—of 1871 to 1890, inclusive—723 graduates have received diplomas, 280 young women and 443 young men. Of these, 25 are Indians—8 young women and 17 young men—the first Indians graduating in 1882.

"Of the 723 graduates, 604 report as teachers; 80, a trifle over 11 per cent, report failure to teach. Of these 80, 9 are Indians, which brings down the per cent of colored graduates failing to teach to almost exactly 10 per cent. That 16 out of the 25 Indian graduates have taught is a very good showing for them, considering the fewer opportunities to teach which have been open to them.

"Of 39 graduates (colored) we have been unable to obtain any report.

"The total number of those who report having other regular occupation than teaching is 271. Of these, 191 have taught as well. While the balance—413—do not report other regular occupation than teaching, the great majority find employment as they can—at farming, trades, or service—between school terms, or cultivate their own land and keep house.

"The principal regular occupations reported besides teaching and the number reporting in each are as follows:

Of the young men:	
Professions: Ministry, 16; law, 17; medicine, 6; total	39
Missionaries in Africa	2
Mechanical trades	42
Agriculture (as an exclusive occupation)	36
In business for selves (merchants, etc., other than above)	23
In Government or civil service (U. S. Army, United States Department clerks, custom-house clerks, postal clerks and carriers, policemen, light-house keeper, county surveyor, superintendent of schools)	35
Bookkeepers and clerks, 13; treasurers, 3	16
Music	4
Of the young women:	
Physician (an Omaha Indian)	1
Missionary in Africa	1
Trained nurse (2 colored, 1 Indian)	3
In business for selves (store, millinery, laundry, gardening)	6
Dressmaking and sewing	9
Printing	1
Music (organist and singing)	5
Housekeeper (exclusively), but many more are keeping house for themselves	19
Matron	3
At service (exclusively)	8

"The total number of children reported as having been taught by our graduates is 129,475. This number is, of course, approximate.

"Some light on the frequent question as to the comparative mental endowment of black and 'colored' in the negro race is perhaps to be gathered from the unforeseen and rather striking result of an investigation of the distribution of the highest class honors since 1874, when they were first awarded.

"At Hampton, salutatory and valedictory are equal honors, the one for the young women, the other for the young men.

"Leaving out the Indian salutatorian of '86 and valedictorian of '89, and one year when the programme was made up from graduates of previous years, we find that, of the fifteen colored girl salutatorians, four were black, three dark, seven light, and one 'apparently white.' Of the fifteen young men valedictorians, seven were black and one dark, and seven were light. In other words, of young women, seven were dark and eight light; of young men, eight were dark and seven light; which divides the honors as nearly equally as possible; fifteen to the dark and fifteen to the light. After the first decade of the school, investigation was made with a precisely similar result. That it should again appear over the whole period of seventeen years is surprising and seems significant."

CHAPTER XIV.

THE SWEDISH OR LING GYMNASTICS.

By G. B. PUTNAM, *Principal of Franklin School, Boston, Mass.*

The third wave of popular interest in physical culture has been rising rapidly of late in this country, and it is to be hoped that it may reach and effect for good all our public schools.

It is said: "We grant that gymnastics should be introduced at once, but what system shall be employed?" There is no American system. This is confirmed by Dr. Edward Hitchcock, of Amherst College, who says: "I have been working at physical culture for a quarter of a century. I do not, however, think that we have a system," and by Prof. E. M. Hartwell, of Johns Hopkins University, who says: "It is not calling a thing by a name that makes a system, and that is the point I wish to urge in regard to the so-called American system. We have none."

The Germans have a system developed by "Father Jahn," who from love of Fatherland introduced turning throughout Germany, producing wonderful results among its youth in the early part of the present century.

His system was imported into this country, as early as 1826, by Dr. Charles Beck, at the Round Hill School, Northampton; by Dr. Follen, at Harvard University, and by Dr. Francis Lieber, at the Gymnasium in Boston. These were able, enthusiastic men and good teachers. All three were pupils of the illustrious Jahn, who said of the latter that he "possessed good moral behavior, was ingenious and clever, as well as a good leader and teacher of gymnastics," and yet their efforts failed of lasting success.

Many of the good features of Jahn's system have been appropriated by numerous teachers in our higher schools and colleges, as well as by those in charge of our city gymnasia. They have introduced them at random, with others from England, France, or Sweden, or among devices of their own invention, in order to establish a so-called American system. Some good results have followed, but there remains a crying demand for a system which is adapted to the felt necessities of public schools from primary to high-school grades.

I am persuaded that the Ling system of Sweden, as it stands to-day, is just what we need.

It has stood the test of seventy or eighty years, and its effects have long been visible.

A correspondent of the New York Tribune, traveling in Sweden thirty years ago, wrote as follows: "I attribute the superior physique of the inhabitants of this country, in a great measure, to the gymnastic exercises which they receive in the public schools. This kind of training is universal. Every school building has its large high room with earthen or matted floor, with all sorts of gymnastic implements. The scholars are not allowed to exercise on what they wish, but there is a regular scientifically arranged system. They are trained in squads and move and march at the word of command. The smaller or weaker boys begin with the lowest grade of exercises and follow up according to a scientific system arranged to promote health. They all seem to go into it with the greatest relish and show well-trained muscular power."

A lady from Finland recently remarked that at her home they could always distinguish a lady from Sweden, for she walked a queen. Thirty years ago John D. Philbrick, the sagacious superintendent of Boston schools, saw clearly the needs of the pupils in the way of physical culture, and in his report of September, 1860, dwelt at length on these needs, and made suggestions for meeting them, saying, among other things, "The principal remedy I would suggest is

the introduction into all grades of schools of a thorough system of physical training as a part of school culture, in which every pupil shall be required to participate. I fully agree with an able author, that a universal course of training of this kind, scientifically arranged and applied, in connection with obedience to other laws of health, might, in one generation, transform the inhabitants of this land from the low development now so extensive to the beautiful model of the highest form of humanity."

The report was referred to a subcommittee of five of the ablest men in the school board, and they, largely through his influence, recommended the appointment of a competent teacher and the daily practice of gymnastics, and they say, after speaking of the injurious effects of certain violent exercises: "The system invented by Prof. Ling, of Sweden, which is called free gymnastics, is not liable to this objection. It consists of a variety of motions of the head, chest, trunk, and limbs, performed with energy and vigor, without the use of fixed apparatus. Indeed, most of the exercises, and perhaps sufficient for the purpose of our public schools, require no apparatus whatever, and no special room set apart for its practice. This system, in a modified form, it is deemed both desirable and practicable to introduce into all our schools, and it is recommended that it be made an obligatory branch of education."

But the school board was not then ready to follow the advice of their subcommittee, and a golden opportunity was lost.

Nearly thirty years have passed and Mrs. Mary Hemenway, who, in the establishment of cooking schools and the introduction of sewing, has been a real benefactor to the children of Boston, has turned her attention to the introduction of a system of physical culture that she may thereby benefit the schools of the city.

In the autumn of 1888 she secured a hall and employed as instructor a graduate of the Royal Central Gymnastic Institute of Sweden, which Prof. Hartwell pronounces the best school for training teachers of gymnastics in the world.

Classes were formed from among the teachers of the public schools, and they entered earnestly upon the task of fitting themselves to teach the Ling system.

The first public exhibition of it was given by a dozen ladies of the normal class at the conference on physicial training, in Huntington Hall, Boston, in November, 1889. Again its peculiar features were exhibited at Mechanics' Hall before some four thousand people on the afternoon of April 5, 1890, by a normal class and also by pupils of the first and fifth classes of the Franklin Grammar School. This exhibition was under the auspices of the American Association for the Advancement of Physical Education, which was holding its annual meeting in the city.

"But who was Ling?" I am often asked. Peter Henrik Ling was born in Ljunga, province of Smaland, Sweden, November 15, 1776.

His father was a clergyman, but young Peter was soon left an orphan, and in early manhood, prompted by a love of adventure, traveled over Europe. His journeys were apparently aimless and he was often reduced to extreme want.

He succeeded, however, in mastering several modern languages and finally returned to Sweden.

Soon after, while suffering from an attack of the gout in the elbow, he thought to cure it by exercise, and to this end he learned the art of fencing.

The remedy proved effective, and his success led to the idea that other diseases might yield to proper exercise. Hence the origin of the Swedish movement cure, as the author of which his fame has become world wide. It has been practiced not only in the leading countries of Europe, but in the United States as well. That he might be able the better to apply his theories he became proficient in anatomy and physiology, and not content with healing the sick he devoted himself to inventing and arranging a system of exercises adapted to the harmonious development of the bodies of children and also the physical perfection of those destined to the life of a soldier.

In 1805 he became professor of fencing in the university at Lund and later was appointed master of fencing in the Military Academy at Carlberg.

In 1813 the Royal Central Institute of Gymnastics was established at Stockholm for the purpose of extending the application of his theories, and he became its director. Here he remained until his death, which occurred in 1839.

He received the rare honor of being made a member of the Swedish Academy, and the king conferred upon him the title of Knight of the Order of the North Star. The work which he laid down has been perfected by his pupils and successors, and, during these many years, patients have flocked thither for healing, and students for normal training in the three departments of gymastics.

Again, it is asked, "What is the Swedish system?" Let us first ask, "What is its aim?" It is based on the following proposition: "The object of educational gymnastics is to train the pupil to make his body subservient to his own will." This can only be accomplished by practice, regular and systematic. If the proper practice is secured, then activity, dexterity, strength, and health are quite sure to follow.

The Ling system has three departments, medical, military, and educational, and of the latter only do I write.

The exercises are classified as follows:

1. *Introductions*, or orders to gain attention and good position.
2. *Arch flexions*, or movements for the back and chest.
3. *Heaving movements*, or exercises in lifting the body by the arms or in extending them.
4. *Balance movements*, to give a correct carriage and general equilibrium.
5. *Shoulder-blade movements*, to flatten the back and pull the shoulders backward in their proper place.
6. *Abdominal exercises*, to strengthen the muscles of the abdomen and to aid digestion.
7. *Lateral trunk movements*, to strengthen the lateral parts of the trunk.
8. *Slow leg movements*, to increase the circulation in the lower limbs, to quiet the action of the heart, and to counteract palpitation.
9. *Jumping and vaulting*, to cultivate speed of motion and to effect the coördination of movements.
10. *Respiratory movements*, to increase the capacity of the lungs, to restore breathing to its normal rhythm, and to help counteract the evil effects of precipitate movements.

In each of these classes there may be scores, if not hundreds, of exercises of varying strength. From these a selection is made for a "day's order" or programme for the day. This provides exercise for the whole body. Nerves, muscles, and internal organs, as well as the blood vessels, have all received due attention.

Teachers do not usually take the exercises in their exact order, but make such selections as the special needs of particular classes seem to require.

Suitable exercises are available from these classes for years of work in free gymnastics, but as pupils become more advanced fixed apparatus may be desired even in our schools, and no objection would be made to a well-equipped gymnasium in connection with each, but this is not essential.

One of the features of special value in this system is that a "fundamental position" is first assumed, and whatever may be the subsequent positions taken or movements executed there is an immediate return to this. Hence there is constant practice in taking and holding that position which presents the best pose and carriage that can be secured.

Another marked feature is its progression. It begins with the simplest movements which could not harm an invalid or the feeblest pupil, and by years of practice it leads on gradually, by movements stronger and stronger and of longer duration, to feats before which an athlete might stand appalled. Of course these would never find a place in the school room.

As has been shown, each "Day's Order" has its progression also. One cardinal principle is that not every possible motion or position is of value or to be permitted. Only such are selected as are adapted to accomplish some specific end. That end is clearly seen and its attainment provided for. No exercise is performed simply because it is "pretty."

Another is that movements are made in response to words of command, no music being employed. Ling's belief was that "there is a rhythm of movement as well as of music, but there is an essential difference between them, and often no adjustment is possible. The rhythm of the movement must be sacrificed to that of the music if the latter is introduced, and for a large part of the movements music is an impossibility, since no musician could ever adapt it to them.

The use of words of command is to me one of the marked excellencies of this system, for if there is any one thing which our American children need it is the habit of obedience, and obedience so prompt that they are hardly aware that they are obeying.

I have read of a stalwart band of rebellious slaves, who once attacked their master, who was sick, alone, and unarmed. In tones of command he exclaimed: "Lay down your arms, you rascals, go instantly to your work or I will have every one of you flogged within an inch of his life." He was completely in their power, and yet, so confirmed was their habit of prompt obedience, that, to a man, they threw down their arms and fled from his presence.

Our pupils are not our slaves, but it is for their good and ours that they render instant and cheerful obedience.

The habit early formed in their physical exercises will have its effect all along the line of school work.

A former major of a school battalion, recently informed me that he considered this habit of prompt obedience the best part of the military drill in which he had had so conspicuous a part. Because "dictation is contrary to the American spirit," is an argument in favor of "commands" rather than a valid objection against them.

In my student days muscle was the end and aim, and a powerful biceps flexor was the pride of its possessor and the envy of all who failed to secure it. Not so in the Swedish system. The nerves, respiratory organs, etc., receive even more consideration. The aim is not to acquire the strength of a giant, but that symmetry of proportion and harmony of development which shall best fit for a life work.

A distinguished physician recently said, "Show me one who has been an athlete, who is now more than 42 years old, and I will show you a prematurely old man." There is some justice in the remark, for of those of my associates who were excessively trained for the development of muscle not one is alive to day. From the Swedish system no such results need be expected.

To the best of my knowledge, the teachers, both male and female, who have received drill in this system are unanimous in praise of it, both for its good effects upon them, personally, and for its adaptability to the needs of the schools.

At a recent meeting of the masters, where for the third evening this subject had been under consideration, Mr. Waterhouse, head master of the English high school, said that in his opinion a system of exercises for our public schools should be, 1, simple; 2, light; 3, safe; 4, comprehensive; 5, progressive; 6, varied; 7, lively, and that, after a careful investigation, he was satisfied that the Ling system furnished all of these requisites, and was therefore what should be introduced. That the system will soon be authorized by the school committee of Boston I have no doubt.

Several cities in the vicinity have already adopted it.

ADDENDUM.

[Extracts from the report of the director of physical training in the Boston, Mass., public schools (Dr. E. M. Hartwell), December, 1891.]

Boston has earned the right to be considered the most influential center in America of the movement for promoting Swedish educational gymnastics. This result, which has been brought about within the last three years, is primarily due to the wisdom, generosity, and public spirit of Mrs. Mary Hemenway, and secondarily to the discussions, reports, and votes of your honorable board precedent to its adoption of the Ling gymnastics for the public schools on June 24, 1890. The establishment by Mrs. Hemenway of the Boston Normal School of Gymnastics, which already has no equals and few rivals in the country as regards the genuine and thoroughgoing character of its training, is an event of capital importance in the history of physical training in America, and may well be ranked beside the gift to Harvard University of the Hemenway gymnasium, by Mr. Augustus Hemenway, her son.

The Boston Normal School of Gymnastics had its beginning in October, 1888, when, at Mrs. Hemenway's invitation, a woman's class, composed of twenty-five public-school teachers, was formed for the purpose of testing, under the instruction of a trained Swede, the adaptability of the Ling gymnastics to use in the Boston schools. The experiment proved so satisfactory that on April 25, 1889, Mrs. Hemenway offered to provide similar instruction for one year, without expense to the city, for one hundred teachers of the public schools who should be permitted to use the Ling gymnastics in their several schools. June 25 the school board voted to accept this offer, and in the ensuing September the class was formed. On September, 1889, the board accepted "with grateful appreciation the generous offer of Mrs. Mary Hemenway to provide a teacher of the Ling system of gymnastics, for service in the normal school, free of expense to the city." Mrs. Hemenway's further offer to provide free instruction "for those masters and submasters who may desire to make a thorough study of the Ling system for the benefit of the Boston public schools," was accepted by the board

on October 22. Mrs. Hemenway continued to maintain the "masters' class" and to provide the normal school with a special teacher of Ling gymnastics throughout the school year 1890–91. The "masters' class" numbered 50 in 1889–90 and 57 in 1890–91. In 1889–90 there were 190 women engaged in teaching in the public schools who received instruction in the Boston Normal School of Gymnastics. In 1890–91 the number was 140. Its first class of graduates, numbering 33, was graduated June 6, 1891. The demand for the services of graduates and pupils of this school, as special teachers of Ling gymnastics, greatly exceeds the supply.

October 8, 1889, the committee on hygiene, which had been given full powers in the department of physical exercises (on March 12), presented a well-considered "report of the board of supervisors on physical training in the public schools." (School Doc. No. 10, 1889.) The concluding recommendations of the supervisors were as follows:

"1. That the Ling system of gymnastics be the authorized system of physical training in the public schools and that it be introduced into them as soon as teachers are prepared to conduct the exercises.

"2. That a competent teacher of this system be employed to train the pupils in the normal school and the teachers in the public schools.

"3. That for the coming year provision be made for training at least the pupils in the normal school, and the teachers of the first and second classes of the primary schools, and the fifth and sixth classes of the grammar schools."

These recommendations were approved by the majority of the committee on hygiene and a minority report was made by Miss Hastings. Both reports were tabled. December 10, "the whole subject of physical training in the public schools was referred to the next school board."

Meanwhile on November 29 and 30, 1889, Boston was the scene of the largest and most notable conference on physical training ever held in the United States. Dr. W. T. Harris, the United States Commissioner of Education, presided over its deliberations. The call for it was signed by John W. Dickinson, secretary of the Massachusetts board of education; E. P. Seaver, superintendent of the Boston public schools; Francis A. Walker, president of the Massachusetts Institute of Technology; and by the presidents of Boston University, Colby University, Maine, and Wellesley College, as well as by many members of the Boston school committee and a large number of physicians and others prominent in educational circles. The audience at each of the four sessions of the conference numbered from fifteen hundred to two thousand persons. * * *

The programme, which embraced papers, discussions, and illustrative class exercises in gymnastics, was a varied and interesting one, and served not only to set forth the general nature and effects of muscular exercise, but also the salient principles and characteristic methods of the German and Swedish and so-called "American" systems of school gymnastics. Similar discussions and illustrative gymnastics on a large scale signalized the fifth annual meeting of the A. A. A. P. E., held in Boston in April, 1890. The public and educational mind was much awakened and not a little enlightened by reason of so much discussion and exposition.

January 16, 1890, a standing committee on physical training was appointed. Dr. W. A. Mowry, its chairman, made an exhaustive report on June 24, embodying the results of a wide tour in the West and South to observe the peculiarities and workings of various systems of physical training in public schools. The committee, without a dissenting vote, recommended the following:

Ordered, That the Ling or Swedish system of educational gymnastics be introduced into all the public schools of this city.

Ordered, That the appointment of one director of physical training and four assistants be authorized.

Ordered, That the salary of the director of physical training be $2,640 a year and that the salary of each assistant be $1,080 a year.

The following order was substituted for the second and third orders appended to the report:

Ordered, That a director of physical training and one or more assistants be employed, the total salaries for the same not to exceed the sum of five thousand dollars ($5,000) per annum and that the committee on physical training be authorized to nominate suitable persons for these positions, to commence at the beginning of the next school term.

In accordance with the above orders, the present director of physical training was elected on November 25, 1890, at a salary of $3,000 per annum, and the present assistant instructor was elected March 10, 1891, at a salary of $1,680. * * *

I reëntered the service of the city of Boston on January 1, 1891, after an inter-

val of 13½ years, and at once began visiting schools of all grades, from the kindergarten to the high school, having a twofold purpose in view. In the first place, I was desirous to familiarize myself with the main features of the organization and administration of the schools and, secondly, I wished to obtain an idea of the character and extent of the physical training which had been introduced into the schools, in accordance with the vote of the school committee, on June 24, 1890.

Toward the end of February I addressed a circular letter to the principals of schools, in response to which I received a statistical return, covering the month of January, 1891, regarding all high, grammar, and primary schools.

The returns showed that upwards of 1,100 teachers were giving gymnastic instruction, for some 17 minutes daily, to their classes. In some schools the old memorized gymnastic drill had been continued, pending the appointment of a director of physical training; but the greater number of teachers, in the grammar and primary schools, were engaged in an honest attempt to teach the Ling free standing movements. Counting the masters of the 55 grammar schools, 1,120 teachers, in the grammar districts, were returned as teaching gymnastics, of which number, below the grade of master, 844 were teaching Ling gymnastics and 221 teaching what may be termed not inaptly "mixed gymnastics." The best results were observed in those schools whose masters had attended the teachers' classes of the Boston Normal School of Gymnastics and had taken particular pains, besides, to lead, assist, and criticise their teachers in the work of class instruction in gymnastics. In certain schools extremely creditable results had been attained, especially in those where the teachers had formed themselves into classes and hired special instructors in the Ling system to give them normal lessons.

It gives me pleasure to say that I have been much surprised and gratified by the interest, zeal, and intelligence shown by the teachers of the grammar and primary schools, as a body, in the subject of physical training.

Since April 1, 1891, I have availed myself of the invaluable services of Mr. Hartvig Nissen, who was elected assitant instructor in physical training, March 10, 1891. Mr. Nissen has assisted me in visiting and inspecting schools and has conducted normal classes in the Ling gymnastics for the teachers of the grammar and primary schools. Two inspections of the grammar schools have been made since they opened on September 9. On the basis afforded by the first inspection, 8 were rated "excellent," 18 "good," 17 "passable," and 12 "poor." The result of the second inspection is as follows: 8 were marked "excellent," 20 "good," 20 "passable," and 7 "poor."

I propose to continue such classes until the class work in the schools shall show that the average teacher has grasped the main principles of the Ling school gymnastics and is able to carry them into effect.

Early in 1890 I was engaged by Mrs. Mary Hemenway to deliver a course of lectures on physical training before the students of the Boston Normal School of Gymnastics. These lectures were given in the Old South Meeting-House, at noon, on six Saturdays, viz, March 21 and 28, April 18 and 25, and May 2 and 9. Through the kindness of Mrs. Hemenway the lectures in question were thrown open to all teachers of the Boston public schools. I was thus enabled to meet so many of the teachers as cared to consider the salient facts regarding the origin, development, and characteristic features of the principal types and systems of physical training.

I also addressed the masters of the grammar schools upon "Physical training in the Boston schools" at the May meeting of the Masters' Association.

In accordance with an order of the school committee, which was passed May 12, Mr. Nissen gave special normal instruction to the teachers of the primary and grammar schools of some forty districts during May and June. This form of instruction has been continued, though in a less formal way in all grammar districts, from the opening of the schools in September last until now. In accordance with an order passed by the school committee on December 8, arrangements have been made to provide for the normal instruction, twice a month, in the Ling free standing movements, of all teachers of the primary and grammar schools, not especially excused by the committee on physical training, during the remainder of the present school year.

CHAPTER XV.

DISCUSSIONS OF EDUCATIONAL QUESTIONS.

I.—*Civic instruction.* II.—*Compulsory attendance.* III.—*Courses of study—Adjustment of school programmes.* IV.—*Education.* V.—*Higher education.* VI.—*Kindergartens.* VII.—*Manual and industrial training.* VIII.—*Methods of instruction.* IX.—*Physical training.* X.—*Private and parochial schools.* XI.—*Public schools.* XII.—*Reading and literature.* XIII.—*Religious and moral training.* XIV.—*School management and discipline.* XV.—*Secondary education.* XVI.—*Teachers.* XVII.—*Text-books.*

I.—Civic Instruction.

The truer meaning of patriotism.—Hon. William A. Poste, New York civil-service commissioner: Patriotism, as an impulse, like all the enthusiasms, counts for nothing in the every-day life unless its deep and truer meaning is fully perceived. The ideal of citizenship can not rise higher than the moral nature. The flag may wave from every school-house, and the boy may know on how many battle fields it led the way to glory, but unless behind all is the thought that a man is as much bounden to his country to vote thoughtfully as to fight for the flag if the country calls, that flag to him is indeed but striped bunting. Unless he can understand that for a man to sell his vote * * * is moral treason, what boots it to him that in every age men have gone to their deaths for truth, for fatherland, and that their babes might breathe free air.

Beliefs that are individual and inherent.—Hon. William A. Poste: The beliefs that men live by and die for are not to be drilled into the boy like the rule for long division. The genesis and growth and persistence of political opinions are often beyond analysis and, to the theorist, unscientific, illogical. It is well that this is so. These convictions are matters very largely of personal dispositions, intangible but persistent as the traits of race. If they are individual and inherent, they are of more positive personal force throughout the multitude than any dogma nurtured in the schools. Let the boy come to his political faith as Thomas Jefferson, Andrew Jackson, and Abraham Lincoln came to the principles that made and saved the State. It is out of the clashing of such individualisms, spear against shield, that the will of the people works. Its voice is heard above them. The voice is not always the voice of God, but in times of trial, in hours when great and solemn questions are asked and answered, the thunder of Sinai is in it.

"Patriots' Day" proposed.—Superintendent J. R. Preston, Mississippi: One school day should be set apart every year as Patriots' Day. Planting trees and flowers to adorn school premises—an engaging practice now in vogue in most of the States—is undoubtedly a potent means of establishing attractive associations and of endearing the school, and through it the State, to the hearts of future citizens. If this be a laudable practice, how much more worthy and significant to utilize a day to implant in their natures the seeds of genuine patriotism. Just as ground is prepared to nourish tree and flower, so may hearts and intellects be quickened to cherish high resolve.

So let us have Patriots' Day dedicated as a national holiday, on which to focalize the light and grandeur of our country and photograph its glory upon the hearts of the children. Let parents and the community at large congregate at the school, and in song and recitation and patriotic speeches revive their love of country and deepen their spirit of fidelity to its principles.

The highest patriotism.—W. D. Atkinson: True patriotism is the endeavor to elevate my country's standard of honor up to that which is right and true, and I should love my country for that in her which is devoted to righteousness. I should love the truth and righteousness which God has given us, and seek to bring my country up to it. I am not to make patriotism, therefore, the end, but rather the means by which I may hope to bring the nation to a love of righteousness. I do not think the observance of any patriots' day will ever attain that result. The time wasted or spent in that could be better spent in educating the young men in these moral truths and principles which will make the citizens seek that which will be for his country's highest good; hence it is not patriotism itself we are striving to attain, but it is love of truth, of right, and righteousness. Patriotism is nothing more than this; that is the highest patriotism.

A great difference.—Principal George M. Grant, Queen's University (Ontario): The school should teach patriotism, and let us not forget that there is as great a difference between patriotism and the blatant, arrogant spread-eagleism—which in Europe is called Chauvinism—as there is between enthusiasm and fanaticism. The one is healthy and full of generous inspirations and the other unhealthy and the destroyer of true patriotism and morality. The one teaches us to love our own land and race first, because it is ours, and we believe that it has done and that it promises to do most for man and for that which is best in man, especially for the good old cause of liberty, peace, and righteousness. The other teaches us to hate men for the love of God or the love of country.

II.—Compulsory Attendance.

Compulsory education in Ontario.—Hon. George W. Ross, minister of education: By an act of last session the police commissioners of every city, town, and incorporated village are required to appoint truant officers. This act came into effect on the 1st of this month [July, 1891]. It may take a year or two to acquaint the people of the province with its requirements. It may also take some time to train the truant officers to the proper discharge of their duties. As the schools of Ontario have been free for over twenty years, there is no doubt the people will gladly accept their natural complement, compulsory education, as indispensable.

The most effective agency for securing school attendance.—Report of Committee of National Council of Education, D. L. Kiehle, chairman: Everyone, and very certainly every educator, will place the first stress upon the natural, self-commanding, and assimilating power of a public free-school system, and will agree that this should be perfected to meet every demand of the highest standard of physical, intellectual, and moral training; that it should be protected from every corrupting influence and every political or religious entanglement, and that its true value by every means should be impressed upon the public mind.

Next, as to the necessity and practicability of applying the compulsory feature for the general enforcement of attendance, there will be various opinions, according to points and circumstances of observation.

In some large cities, and especially in manufacturing districts where children are at the mercy of soulless corporations, the State has successfully enforced a compulsory law; but in the State at large, and especially in agricultural districts, your committee are not aware of any enforcement of a compulsory law, which proves that it can be made an effective part of our educational system.

Our system ought to be extended by educational methods.—Superintendent D. L. Kiehle (Minnesota): The Government ought to look to the limitation and improvement of its citizenship, and we as educators ought to put more stress upon the improvement and extension of our educational system by educational methods. Our system ought to be perfected. We ought to do more for our young people. We ought to make our system less objectionable. We ought to introduce the moral element as perfectly as possible, to meet the demands of that class of people who have been accustomed to associate religious instruction with secular instruction. Now, coming to the legislative part, theoretically your committee has no doubt that it is perfectly legitimate that men be required to do these things; but practically it questions whether it is not better to enforce the compulsory law in our towns and cities moderately, watching the development of circumstances, and not relying on the law to effect very much at present in agricultural districts or over the country at large, but at all times holding it as a subordinate feature of our educational system.

The labor unions approve it.—Hon. B. G. Northrop (Clinton, Conn.): It is a significant fact that the labor unions in this country and in Europe approve obligatory education. Both political parties favor it. So far as I know, no suggestion for the repeal of our rigid law has been made in the legislature, nor in any caucus or public meeting in the State (Connecticut).

III.—Courses of Study—Adjustment of School Programmes.

On the necessity of colleges to supplement high schools.—W. T. Harris (from an address delivered before the Ohio Teachers' Association, June, 1888): The course of study preparatory for college omits for the most part those branches of study which bear the name of "moderns." Modern civilization has developed three great increments and added them to the inherited wisdom of the race. These increments are modern natural science, modern literature, modern history. These three moderns had no well-recognized existence in schools of higher education a century ago. A knowledge of them was not demanded or expected from the educated man, unless he was a specialist. The condition of things has changed so materially through the influence of the newspaper and periodical within the past fifty years that no man can pass for educated without more or less minute acquaintance with these three phases of modern activity. They have become recognized as conventionalities of intelligence. This is the all-sufficient reason for introducing the rudiments of these things into the most elementary schools and for continuing their study in all grades of higher schools. Nothing can make up for the student, who shall receive a higher education, the deficit in his culture caused by a neglect of the study of the three "moderns" in early life. They ought to exist in his mind through the period of his primary education as well as in his secondary and higher education. Without these the disciplinary effect of classical study must necessarily be weakened through the want of modern facts to explain, for the classic lore is related to these moderns as embryonic presupposition, and this is why it helps to understand ourselves.

If this be true, the modifications that have been made in the course of study pursued in college in recent times (say in the last twenty years) are not for the most part based upon a correct insight into the difficulty to be met. The management of college education in this country has answered the objection which charges it with neglect of the three "modern" branches until the last two years of the college course, by raising the standard of admission sufficiently to cover the work of the first two years of the former college course, and thereupon it exhibits a programme in which the three moderns are represented throughout the course either as "required" or "elective" studies.

The question in dispute did not concern the length of time devoted to higher education, but the early introduction of the moderns into the course of study, so that these moderns stand side by side with the disciplinary studies through the whole course. If four years of preparation and two years of college work, or six years in all, were devoted to the exclusive study of the classics and mathematics, with an almost entire neglect of moderns, the case would not be altered if these six years should be relegated entirely to the preparatory school. In order to meet the difficulty discussed here, the college should have changed the conditions required for admission, and thus have compelled the preparatory school to introduce the moderns in a proper manner side by side with the classical studies. Of course the elevation of the standard of the collage can be justified on its own grounds. It obliterates the mischievous distinction that existed between the standards of American and English colleges. But this is not so important as the readjustment demanded of the college in order to bring it into harmony with primary education, founded on a true appreciation of the demand of modern studies in education. As is usual in the discussion of political and social reforms, the parties to the dispute are busied, each, with bringing forward his own partisan view of the case. There is little that is judicial and impartial, going to the root of the question and confirming and establishing what is of permanent worth on either side. The advocates of the "moderns" wish to dispense entirely with classical study while the defenders of the college system refuse to yield place for the "moderns."

In the colleges of the Northwestern States, led by the State universities, there has been some substantial progress made towards a modification that will recognize the received high-school course of study as a preparation. But such modification only makes these colleges a separate phase of education, differing more and more widely from the standard college of the Atlantic States. To reach the high standard of admission required by the Eastern colleges the

public high school ought to add two years to its course. This would make the course of study in the common-school system fourteen years instead of twelve, as at present, and is impracticable. The average age of the high-school graduate at present being eighteen and a half years, it would manifestly be unwise to demand six years instead of four years to complete his college course. The colleges that have raised their standards of admission, therefore, have done much to widen the breach between high-school and college education.

In the signs of the times I do not discover any promise of the reform of this state of things on the part of the management of colleges. Even the cloud "no bigger than a man's hand" in the Northwest does not indicate so much true appreciation of the necessity of moderns in primary and secondary education as it indicates a wise insight into the desirability of connecting the college with the public school as it is. It surrenders its convictions in behalf of the old régime, and lowers its standard in order to adapt itself to unpropitious circumstances. In better times it hopes a reform in the public school that will devote more attention to the classics and mathematics at the expense of the "moderns." Meanwhile, the influence of the college is felt in the building up of preparatory courses within the high school, fastening upon the public-school system a recognition of the necessity of private, separate, and distinct secondary education in order to fit for a college education.

What is the remedy?

One must turn to the teachers of public high schools and to superintendents of public instruction for the adoption of the only means of relief. Unusual efforts must be made on the part of public high schools to induce their pupils to complete their education in colleges. The personal influence of the teachers, in one year's time, will avail to double the number of high-school graduates who seek a college training. The greater maturity of mind which comes from a well-balanced preparatory course will furnish a prevailing argument in favor of a more symmetrical system. Within a few years, when the colleges have come to derive a large majority of their pupils from public high schools, this question will receive its due consideration for reasons of private interest, if for no other. The numerical strength of high-school graduates who have subsequently received a college education will assist in the solution of this question.

But no solution will be more than a makeshift if it does not secure the recognition of "moderns" as an essential portion of the course of study in all elementary and preparatory schools and a like recognition of the necessity of classic study in all secondary and higher education.

In the "moderns" one finds the expression of his present civilization; in the classics, its embryonic forms and evolution.

After the presentation of these special discussions of the elements of our problem we may draw the following conclusions:

1. If the universities and colleges of the country shall more and more depend on special preparatory schools for their students, then it will follow that college graduates are less likely to be in sympathy with the system of common schools.

2. If the high-school teachers, on the other hand, continue to be lukewarm toward college education, and perhaps go so far as to discourage their pupils from completing their education in colleges after graduating from the high school, it will follow that the men of amplest directive power, the leaders in literature and the molders of public opinion, especially on the subject of education, will not be furnished by the common-school system.

It will follow, too, that the numbers who resort to college will not increase in proportion to our population. These dangers, in brief, I hold in this paper, may be averted by earnest personal endeavor on the part of high-school teachers and the superintendents of city schools to influence high-school pupils to present themselves in large numbers for admission to college. Extra efforts will double and treble the high-school quota in college, even under the present disadvantages of course of study.

This first step being taken, it will become possible, then, to secure the desirable changes in the higher course of study.

The gap between the elementary schools and colleges.—President Eliot, of Harvard University: Only nine Massachusetts high schools send pupils to Harvard College every year. In 1889, out of 352 persons who were admitted to Harvard College as candidates for the degree of bachelor of arts, 97, or 27½ per cent, were prepared at free public schools; but these schools were only 30 in number from the whole country, 23 of them being New England schools. The plain fact is that not one-tenth of the schools called high in Massachusetts habitually maintain a course of study which enables the pupil to prepare himself for admission

to Harvard College, or to any other college in the State which enforces its requirements for admission as stated in its catalogue.

If this is the condition of things in what may be called an urban State, what must it be in a rural? If a patriot were compelled to choose between two alternatives, one that the less intelligent half of his countrymen should be completelly illiterate, the other that half of the select children capable of receiving the highest instruction should be cut off from that instruction, which would he choose? He would find the decision a dreadful one to make; for either alternative would entail an incalculable loss upon his country. Yet in the present condition of secondary education one-half of the most capable children in the United States, at a moderate estimate, have really no open road to colleges and universities. I rehearse these well-known facts that we may appreciate the gravity of the problems presented by the subject. * * * Recognizing the plain fact of to-day that secondary schools are sufficient in number and defective in quality, what can colleges do, under these adverse circumstances, to make themselves as useful as possible to the population while awaiting a better organization of secondary education? Is it not their plain duty to maintain two schedules of requirements, one for the degree of bachelor of arts, the other for the degree of bachelor of science (or some equivalent), the latter demanding much less preparatory study than the former? The American colleges have been severely criticized for offering to receive students of confessedly inferior preparation to that required of candidates for the degree of bachelor of arts; but even the oldest and strongest of them have done this, and from a genuine desire, as I believe, to be serviceable to as large a proportion as possible of American youth. One lower grade of admission examination, leading to a distinct degree, is an expedient concession to the feeble condition of secondary education throughout the country. That grade of secondary schools which can not prepare pupils for the bachelor of arts course, but can prepare them for the bachelor of science course, will so be brought into serviceable connection with the colleges. * * *

I venture to think that some colleges have gone unnecessarily far in offering different courses with descending requirements for admission and different degrees. They seem to say if a candidate can not get into our classical course, perhaps he can enter the literary course; if not the literary, then the scientific; if not the scientific, at any rate the agricultural. The value of all degrees seems to me to be diminished by this unnecessary multiplicity of titles and conditions, and the standards of good secondary schools must needs be unfavorably affected by a long sliding scale of admission requirements to the several courses offered by a single institution.

Turning now from the consideration of the palliatives which colleges may resort to in the present feeble and distracted condition of secondary education, I pass to the more attractive study of the remedies for existing evils and defects.

To improve secondary education in the United States two things are necessary: (1) More schools are needed, and (2) the existing schools need to be brought to common and higher standards, so that the colleges may find in the school courses a firm, broad, and reasonably homogeneous foundation for their higher work.

1. More schools.—Secondary schools are either day schools or boarding schools, the urban school being primarily a day school and the rural a boarding school. The public secondary school is now urban almost exclusively, and it must be admitted that it is likely to continue so, for no promising suggestion has as yet been made of a rural area of support for a highly organized secondary school. It is admitted that neither a rural township nor a union of contiguous rural districts can support such a school. The county has been suggested as a possible area of support, but there is no sufficient evidence that a rural county, apart from its town or towns of dense population, could support a good high school. To increase the present number of secondary schools which can really fit pupils for college, what are the most hopeful lines of action? In the first place every effort should be made by school authorities, the press, and all leaders of public opinion to promote the establishment of secondary urban day schools, both public and private, and to adapt the programmes of existing schools to the admission requirements of some college course which leads to a degree. It is noticeable that in the older cities, and to some extent in the younger also, the best private schools exist right beside the best public schools. The causes which produce one class of schools simultaneously produce the other. Secondly, rural communities ought to be authorized by suitable legislation to contribute to the establishment (including in that term the provision of building) and annual support of urban secondary schools which are conveniently situated for their use.

Thirdly, there should be created by law special secondary school districts much larger than the areas which support primary and grammar schools and taking account of railroad communications. It is much easier for a boy or girl to go to school 15 miles by rail than to walk to school in all weather 2 miles by country lanes. The rural population has something to hope from legislative recognition of railroads as chief features in secondary school districts. The Massachusetts normal schools illustrate this principle, for they are really high schools, partly boarding schools, and partly local and railroad day schools. Fourthly, every effort should be made to stimulate private benevolence to endow rural secondary boarding schools or academies under corporate management. A boarding school ought always to be in the country and a rural secondary school would almost necessarily be, in part at least, a boarding school.

2. *Common schools.*—The existing means of elevating and regulating secondary school instruction may be conveniently considered under two heads: (*a*) State aid and supervision, and (*b*) college admission requirements. Both agencies are already useful, but both may be greatly improved and extended.

(*a*) *State aid and supervision.*—It seems to have been the object of high-school legislation in some States, as, for example, in Massachusetts and in Maine, to encourage the creation of a large number of low-grade high schools without really expecting them to effect any junction with colleges. Such at any rate has been the effect of the mandatory legislation of Massachusetts, and such must be the general result of the aid offered to free high schools by Maine. This unprosperous State now offers to give any free high school as much money per year as its supporting area annually appropriates for instruction in the school, provided the State grant shall not exceed $250 in any case. No inspection or examination of aided schools is provided for. Such legislation encourages the establishment of numerous weak schools, without helping appreciably the schools already strong.

Much wiser is the legislation of Minnesota, which established twelve years ago a State high-school board, and offered $400 a year to any high school which was found by the board after competent inspection to fulfill the following conditions: The aided school must receive both sexes free, and nonresident pupils also without fees, provided such pupils can pass examinations in all common-school subjects below algebra and geometry, and must maintain "regular and orderly courses of study, embracing all the branches prescribed as prerequisite for admission to the collegiate department of the University of Minnesota not lower than the subfreshman class." * * * This high-school legislation seems to me the wisest which has been adopted in the United States. It encourages only schools which are already well organized; insists that aided schools shall connect directly with the university; avoids expensive examinations, provides any needed amount of inspection; grades schools by their programme and general efficiency, not by individual examination results; gives no pecuniary advantage to a large school over one equally well conducted but smaller; requires aided schools to take nonresident pupils without charge; and applies almost the whole of the State's grant to the direct development of instruction, which is by far the most productive application of any money intended to benefit schools. * * *

It is unquestionable that the New York State regents' examinations have tended to raise the average standard of instruction in the academies and high schools, to extend and improve school programmes, to bring schools and colleges together by doing away with useless diversities of programmes in secondary schools and useless diversities of admission requirements in colleges, and to stimulate some of the communities which maintain these schools to give them better support and to take pride in their standing. These are great services which deserve the respectful attention of the other States of the Union and of all persons interested in the creation of an American system of secondary education. The regents have proved that a State examining board can exercise a stimulating, elevating, and unifying influence upon hundreds of institutions of secondary education scattered over a large State, and can wield that power with machinery which, considering the scale of operations, may fairly be called simple and inexpensive. * * *

(*b*) Let us turn now to the consideration of college admission requirements as means of raising and controlling secondary school instruction.

College requirements for admission act effectively only on those secondary schools which prepare some of their pupils for college; upon that large proportion of high schools and academies which do not they have only an indirect although sensible effect. For the broad purposes of the State the influence of

colleges, even if they were associated together, could not be so immediate and potent as the influence of the State, whether the latter were exerted by inspection or by examination. It is in a narrower field, therefore, that the higher institutions of education can act on the lower. At present they act in three ways.

The feeblest way is by prescribing for admission a knowledge of certain books or of certain well-defined subjects, and then admitting candidates on the certificate of any schoolmaster that they have gone over all the prescribed books or subjects. If the prescriptions of the college are judicious, they are not without some favorable effect on the curricula of the certifying schools; but it may be reasonably objected to this method that it gives the college very inadequate protection against incompetent students and the public no means of forming a just estimate of different schools. Certificates are apt to be accepted from good and bad schools alike, the anxiety to secure students in a struggling college overriding every other consideration. Particularly is this apt to be the case in a small college in which the president has succeeded in getting the subject of admission out of the hands of the faculty and into his own. Under this system a really good school has no means of proving itself good, and a bad school is not promptly exposed. Within a few years the feeblest of all methods has come into use, without any safeguards whatever, in the large majority of New England colleges, no system of State inspection or examination existing there, and no pretense being made that the certifying schools are examined, or even occasionally visited, by the colleges. A more demoralizing method of establishing a close connection between secondary schools and colleges it would be hard to imagine. Nevertheless, even under this loose and unguarded method, which only the two largest New England colleges have completely resisted, some good has resulted from coöperative action between preparatory schools and colleges to make admission requirements, on paper at least, uniform for the same subjects. The uniform requirements in English, which prevail all over New England except at Yale University, and have lately been adopted by some institutions in the Middle States, supply a noteworthy case in point.

The method just described is a corruption or degradation of a somewhat safer method of securing close connection between secondary schools and colleges which was first adopted twenty years ago by the University of Michigan. This safer method, as developed by that university, amounts to this: The university admits candidates on the diplomas given by any schools, near or remote, within the State or without, which are visited once in three years by a committee of the faculty, or by other persons designated by the university. The visit may be repeated if any important changes take place in a school within the three years. The diplomas must specify that the candidates have sustained examinations at school in all the studies prescribed for admission to one or other of the university courses leading to a degree. There were in 1889 seventy schools holding this "diploma relation" to the University of Michigan. It can not be doubted that this method is well adapted for recruiting rapidly a single dominant State university; but its value as a method for general adoption obviously depends on the thoroughness, impartiality, and publicity of the inspection which it provides. To me the inspection seems to fail on all three points. Considering the rapidity with which teachers are changed in American schools, an inspection once in three years seems too infrequent. I am wholly at a loss to understand how a busy college faculty can get time to inspect properly any considerable number of secondary schools, or how it can furnish a sufficient number of inspectors competent in all secondary-school subjects. * * * It is also obvious that the method is not public enough in its processes to demonstrate its fairness and sufficiency, and therefore to command general confidence. The single acting authority obviously has interests of its own to serve. I am not maintaining that this diploma method, as conducted in Michigan, has not worked well, or even that it has not worked so well as the method of admission by examination, as conducted in Michigan. It is some gain to establish friendly relations between seventy secondary schools and any university. I am urging that it lacks adequate securities, and is therefore not fit for general adoption. The Minnesota method, which provides in the State high-school board an independent inspecting authority, is in my opinion greatly to be preferred.

There remains the most effective mode in which colleges act on the superior sort of secondary schools, namely, the method of conducting careful examination in all the subjects acceptable for admission. These examinations have a fair degree of publicity; for the most colleges circulate freely their question papers. Harvard College also publishes in detail the results of its examinations for admission. Such examinations are no longer, as formerly, held only at the seat of

the college conducting them, but may be held simultaneously at as many places as the convenience of candidates may require. Several Eastern colleges now conduct examinations at numerous places widely distributed over the country. Yale University distinctly announces that it will hold an admission examination "in any city or at any school where the number of candidates and the distance from other places of examination may warrant it." The method can easily be given a national application by any institution which has prestige and a numerous staff. In the long run it grades schools fairly, and it is very stimulating to the older classes of secondary schools. Like all examinations conducted by an authority independent of the schools, it also protects the masters of schools, both public and private, against the unwarrantable importunities of parents, trustees, and committeemen. Nevertheless it is open to some serious objections. In the first place it is not sufficiently public. The question papers may look well; but the standard for passing may be unreasonably low, the public having no means of estimating the degree of strictness with which the answer papers are marked. Secondly, the colleges have, until lately, acted singly, each for itself, without consultation or concert. Each college or university is, therefore, naturally supposed to be seeking its own interest rather than the common welfare. Thirdly, in a small college a few men, who perhaps have peculiarities or whims, may control all the admission examinations for many years to the disadvantage of the college and the annoyance of schools. All these evils would be removed or reduced by a system of coöperation among several colleges.

At the conclusion of this rapid survey I venture to suggest that there are three directions in which patriots who desire to see American secondary schools improved and connected more closely with colleges may look for progress:

1. I may expect State examining and inspecting systems to improve and extend, for they have demonstrated their utility; and remembering the extremes to which examination methods have been carried in England, we may reasonably hope that State boards will inspect institutions more and more thoroughly, as well as examine individuals. In this connection we expect that the profession of school inspector will become well recognized as a separate and honorable calling.

2. We may hope to see formed a combination of four or six of the universities which have large departments of arts and sciences to conduct simultaneously, at well-selected points all over the country, examinations in all the subjects anywhere acceptable for admission to colleges or professional schools, the answer papers to be marked by persons annually selected by the combined universities and announced to the public, all results to be published, but without the names of candidates, and certificates to be good anywhere for the subjects mentioned in them. We see reason to believe that such a coöperative system would be simple, though extensive; that it would present no serious difficulties, mechanical or other; that it would be very convenient and economical for candidates, and self-supporting at a moderate fee; and finally that it would be authoritative, flexible, stimulating, unifying, and just.

3. We may expect to see a great extension of the scholarship system, whereby promising youth are helped through secondary schools and colleges. States, cities, towns, and endowments provided by private benevolence will all contribute to the development of this well-proved system.

Principles which may govern an attempt to bring about uniformity of college admission.—From a report to the National Council of Education, James H. Baker, chairman of committee (1891):

(1) By comparison of the requirements of leading colleges a standard classical course may be selected which could at once be adopted without essential modification by those colleges.

(2) A preparatory course omitting Greek may also be recommended in which the substitution for Greek shall fall within regular high-school work. Such a course may be made up from the catalogues of those colleges which do not require Greek. It may here be noted that in this country, in Germany, and in England there are indications that Greek is no longer to be compulsory for college and university degrees. But at the same time the advantage of taking at least one classical language, especially the Latin, is strongly urged. The head master of Harrow, while he would not make Greek a compulsory study, urges the desirability of retaining Latin about as follows: "For scientific study a dead language possesses an advantage in that it does not invite the sacrifice of accuracy to utility. Latin is the language of law, of liberty, of religion. It is the parent of half the languages in Europe. It is strong and precise in grammatical idioms. It is furnished with the necessary means and appliances for

teaching. I can not help thinking it would be an educational mistake of serious magnitude to lose the universality if the Latin language as an element of the higher education." We may add that Latin is required or advocated by most scientific schools and that its retention is generally desired,

(3) Colleges and preparatory schools not at present able to adopt standard preparation in full should pursue standard lines so that the work would all count toward the desired end, if the pupil wished to supplement it for an institution of the best class.

(4) A complete adjustment of the relation between high schools and colleges should be sought on the basis of a general high-school course. This idea will be subject to special consideration.

The committee will venture to suggest a classical preparatory course made up from the catalogues of several of the best colleges. In this course a little is taken from the Latin required by some colleges, and a concession is made to those which demand a modern language and some science and literature. Physics is selected because it includes more generic principles than any other science. The committee believes that this course thus made up is not a jumble of fragments, but that it has a natural coherence in plan and purpose, as much as any one of the courses upon which it is based. It should be especially noted that this course is suggested, not as the best possible one, but rather as an example of a course that might be established. It is also intended to show the folly of the present variations.

CLASSICAL COURSE.

Mathematics.—Algebra (elementary, complete); Plane geometry (with exercises).

Greek.—Four books of Anabasis; 3 books of Iliad; limited amount of sight reading; composition.

Latin.—Four books of Cæsar; 7 orations of Cicero; 6 books of Æneid; limited amount of sight reading; composition.

French.—Easy translation.

Science.—Physics, with experiments and notes.

History.—Greece and Rome (geography incidental).

English.—As recommended by the New England Association.

The colleges admitting without Greek substitute increased amounts of mathematics, of science, or of the modern languages. Therefore the following substitutes for Greek may be suggested, the rest of the course remaining the same as the regular classical course. The additional sciences selected have the prestige of influential recommendation.

COURSE-OMITTING GREEK.

[Substitutions for Greek.]

Solid geometry and plane trigonometry.

Additional year of French.

Chemistry (with experiments and notes) and botany.

Remainder of course same as classical.

A careful comparison of the courses above suggested as a provisional basis for uniformity with the courses of standard colleges will show that most colleges, high and preparatory schools could at once afford to agree to some such uniform requirements, and that the changes necessary for an adjustment would in no instance be vital or even important. Could uniform courses once be recommended by an influential convention of colleges and schools, every fitting school could adopt the one standard and say to the colleges, "Take our students if you wish them." Most colleges would be compelled to adopt the courses recommended.

But by far the most important and most troublesome problem is the complete adjustment of higher to secondary education. In the opinion of the committee the connection must be made by adjusting the colleges to the secondary schools and not the secondary schools to the colleges. President Eliot some years since pointed out that a good high-school finishing course must become more and more a good preparatory course. Mr. Harris is understood to maintain that the studies adapted to the age of secondary education should also furnish a good college preparation. This is in accord also with Mr. Hill's principles in the "True order of studies." It would be unsafe to deny that secondary education, which is adapted to the development of the mental powers and the enlargement

of knowledge in the given period, is a good preparation for higher education. If elementary science and history and literature and art, as well as mathematics and classical languages, are adapted to the period of secondary education, then they are excellent as a basis for college work.

From the tendency of our institutions we must believe that more and more will the high schools become feeders of the colleges. The interests of colleges and high schools will be greatly enhanced by the closest union, and one important result will be an increase in the number who will seek higher education. There is one great advantage in postponing to as late a day as possible the necessity of decision regarding a college course. Whenever a boy decides to go to college he should find himself on the road thither.

Already Michigan University and the University of California admit to a four years' general course without any foreign language, while Northwestern University admits students with only one foreign language, ancient or modern. The State universities, we think, can afford to meet the regular work of the high schools. It is understood that there are some troublesome adjustments arising from the union of classical and English students in college classes. In large colleges the problem is not serious, because classes are divided. In smaller institutions a list of electives will make the necessary adjustment possible. Even in an inflexible course some substitutions are possible, as solid geometry and plane trigonometry for freshman mathematics. This phase of the problem, however, is not the most serious one.

We will proceed to suggest a high-school course that might be generally adopted. We include it in the five "fundamental disciplines" pointed out by Mr. Harris—a selection in general harmony with Mr. Hill's analysis. Since this theory of studies is now widely adopted we expect no opposition to our basic principles. In choice of specific studies, in arrangement, and amounts we are governed in part by comparison of many courses of study, as well as by thought upon relative values. The committee indorses the custom of requiring a foreign language in a high-school course, and for reasons previously cited would give the preference to Latin. The committee does not advance a definite opinion that more than one course is necessary for a high school or that the preparatory and the finishing courses might be identical. We simply suggest a basis for present uniformity and adjustment under existing conditions.

GENERAL HIGH-SCHOOL COURSE.

Mathematics.—Algebra, plane and solid geometry, plane trigonometry.

Foreign Languages.—At least three years of some foreign language, Greek or Latin or French or German, but preferably Latin.

Science.—Physiology, physics, chemistry, and at least botany or zoölogy, and geology or astronomy, and mental science.

History.—Greek, Roman, English, and epochs of modern civil government; political economy.

English.—History of literature, study of selections, rhetoric, compositions.

Art.—Drawing and music.

WHAT HAS BEEN DONE TOWARD UNIFORMITY.

In the interest of uniformity the "Association of Colleges and Preparatory Schools" and the "Commission of Colleges" in New England have been formed, and progress has been made in recommending and securing the adoption of uniform requirements in English, in Greek and Latin, and in modern languages. The State of Ohio has secured an agreement between the colleges and high schools through the mediation of the State Teachers' Association. The plan there adopted tends to make a perfect connection between high schools and colleges. The report of Prof. King and that of Mr. White, made during the consideration of the problem, contain many valuable suggestions. Many other States through their associations or their State universities are aiming at uniformity and at a closer relation between the colleges and the high schools. But it should be noted that State uniformity may hinder rather than aid national uniformity. State boundaries have nothing whatever to do with the choice of a college. As soon as possible educators should make the question a national one, instead of wasting energy in creating organized differences.

Plans of adjusting high-school and college courses of study in Ohio.—From report prepared by Superintendent E. E. White, of Cincinnati, and adopted by Ohio State Teachers' Association and Association of Ohio Colleges:

LIMITATIONS OF THE HIGH SCHOOL.

Before submitting plans for full adjustment, your committee desires to state as clearly as possible the limitations of the high school as a preparatory school. These limitations are both economic and pedagogic. The fact that more than three-fourths of the pupils in our high schools will never enter higher institutions establishes the necessity of making the training therein the best possible as a final school course, whatever this may be. If this best possible high-school course is an adequate preparation for college, the proper articulation of the high school and college is secured. If, however, an additional course must be provided for the few who may wish to prepare for college, an additional demand is made on the resources of the high school—a demand which a large number of high schools may not be able to meet.

Besides, it is not possible for pupils, with few exceptions, to determine, on entering the high school, whether the way will be clear for them to go to college. Many who start with such a hope fall out by the way, and others, as they proceed in their studies, awaken to the desire for a higher education and see an opportunity to acquire it.

These facts show the impossibility of wisely classifying high-school pupils with respect to their future participation in college advantages. Whenever the desire to go to college takes possession of a pupil—and every high school should be a most potent awakener of such a desire—he should find himself in a direct road to the college gate.

But it is not enough that the high-school course looks directly to the college. It should also furnish the great body of its pupils with the best possible training, and, to this end, its course of study must be based on sound pedagogical principles. These principles clearly teach, as Dr. W. T. Harris has ably shown, that a true course of study must include all of the five great divisions of human knowledge, to wit, mathematics, language and philosophy, natural and physical science, history and government, and literature and art. It must also recognize the fact that each of these great divisions of knowledge has its natural sequence or development, corresponding to the mind's development, and this sequence or order must be observed, not only in the course of study, but in school instruction. To adopt Dr. Thomas Hill's famous simile, in his "True order of studies," a true course of study is like a spiral stairway surrounding the five great columns of human knowledge and cutting off a section of each at each round of its ascent. The special weakness of too many high-school courses is that they attempt to cut off sections of these columns that belong to a higher phase of mental development—that fall in the period of college training.

In harmony with these principles, a high-school course of study may properly include (1) algebra, geometry, trigonometry, and arithmetic (review); (2) language, including English and Latin or German or French; (3) science, including physical geography, physiology, and the elements of botany or zoölogy, physics, and chemistry; (4) history, including United States history and general history, and civil government; and (5) English literature and art, the latter including at least drawing, music, and vocal culture.

The experience of the high-schools of the country shows that it is not possible to give these several branches of study due proportionate attention if one-half of the time of the pupils is devoted to language, and this must be the case when the course includes both Latin and Greek in addition to English. The daily programme of a high school may wisely provide four daily class exercises for each pupil, provided these exercises do not exceed forty minutes each, and this is sufficient time for the best class work in high schools. When only one daily period is devoted to, say, Latin, in addition to English, it is not difficult to arrange a programme that will give due attention to the other four great branches of knowledge.

Your committee desires to emphasize the importance of making Latin one of the daily studies of the high school. A wide experience has shown that this is not only the best possible way of meeting the demand for language training, the best ideal training in language as logic, but it is the most fruitful element in the best possible preparation for higher courses, whether classical, scientific, philosophic or technological. It is regretted that there is not time to cite some of the conclusive evidence on which this claim for Latin as a high-school study is based. When Latin is omitted, either German or French should be taken. A true course of high-school training requires that the pupil take at least one language in addition to English.

When we have found the best possible course of study for high schools we have found, as a consequence, what ought to be an adequate preparation for college, whatever the course to be pursued therein. A true college course ought to rest upon a true high-school course. In a philosophic scheme of education there is no occasion to adjust higher and secondary courses of study. The former rests upon and articulates with the latter. * * *

PLANS OF ADJUSTMENT.

I.—*On the side of the high school.*

The general or regular course of study in the high schools of Ohio should include:

1. *Latin*, its study beginning with and extending through the entire course—certainly not less than three years. It is not meant that all pupils in the high school should be required to take Latin, but efficient instruction in Latin should be provided, and as many pupils as possible be induced to take it. A conscientious effort should be made by all high-school teachers to induce at least all pupils who enter with the intention of completing the course to take Latin as the best possible course for them, whatever may be their future education or occupation. What is needed is an enthusiastic appreciation of Latin on the part of high-school teachers. When Latin is not taken, German or (for temporary pupils) a wider and more practical course in English may take its place.

2. *Mathematics;* elementary algebra being taken the first year; geometry, plane and solid, the second year; and spherical geometry, higher algebra (at least one-half year) and trigonometry and arithmetic (reviewed) in the third and fourth years. The putting of so-called "higher" arithmetic at the beginning of the high-school course is a serious mistake—a clear violation of sound principles of teaching, and a consequent waste of effort and opportunity. Eight years of training in arithmetic certainly ought to prepare the pupil for the successful study of the elements of algebra. It is also a mistake to put the study of higher algebra before geometry. The mathematics of form, as Dr. Hill has clearly shown, is easier and more elementary than the mathematics of abstract relations.

It will be observed that the mathematics here assigned to the third and fourth years (arithmetic excepted) belong properly to the college course; but high-school pupils, if well taught and not hurried, can master these branches in the last two years, and this, as will be hereafter seen, will make feasible a needed change and adjustment in the college course. When instruction in Greek is provided in the high school it can take the place of these higher mathematical branches in the third and fourth year, the mathematics of the first two years, with arithmetic, being sufficient for admission to college.

3. *Physical science*, including physical geography, physiology, and the elements of at least two of these four sciences, viz, zoölogy, botany, physics, and chemistry. When physiology is taught in the grammar grades, zoölogy or botany and the elements of physics and chemistry may be readily taught in the high school. This instruction in science should begin with and extend through the entire course, with three or four exercises each week. The aim of the course should be to make the pupils familiar with those concepts and facts that constitute the elements of these sciences, and to this end the pupils should study, as far as practicable, things and phenomena and not text-book language about these things. In science the study of things is a necessary preparation for the study of books, and hence science instruction in the high school should be largely objective. This is the significance of the modern laboratory and museum, appliances greatly needed in all high schools.

4. *History and civil government*, the former including United States history (if not taught in grammar grades) and general history. Fully one year, three to four lessons each week, should be devoted to general history, and not less than half a year to civil government.

5. *English literature and art*, the former including composition and rhetoric and literature proper and the latter at least drawing, music, and vocal culture. It is the general testimony of college teachers that college matriculates are deficient in English, and especially in the power to express their knowledge clearly and accurately. To remove this defect pupils should not only study the great masters of expression, but synthetic training in the art of language should receive more attention.

It is believed that the general course of study outlined above is within the resources and reach of the high schools of the State, and especially of those schools which employ two or more teachers. It is based on the actual experience of the best schools. The changes made for the purpose of adjustment relate chiefly to mathematics and Latin, and these features have already been tested by school experience.

Your committee desires, in this connection, to emphasize the importance of a wiser concentration of energy in high-school instruction. The undue multiplication of branches of study and text-books is a serious dissipation of power. The principal aim of the high school is to give its pupils efficient training in the fundamental studies—what Dr. Harris calls the "fundamental disciplines."

II.—*On the side of the college.*

The course of study outlined above is an adequate preparation for all bachelor courses in college, the A. B. course alone excepted, and here the difficulty relates exclusively to the Greek. The colleges are at liberty to require for admission to all bachelor courses (1) requisite knowledge and skill in the common branches; (2) Latin, at least three years, and for technical courses either Latin or German; (3) the elements of algebra and plane and solid geometry; (4) English and English literature (character and amount to be announced at least one year in advance); (5) United States history and general history (limited); (6) physiology, physical geography, and the elements of at least two of these four sciences—botany, zoölogy, physics, and chemistry; and (7) drawing, music, and vocal culture.

In place of the Greek now required for admission to the A. B. course, they may call for spherical geometry, higher algebra (full one-half year), and trigonometry, at least plane—in other words, for present freshman mathematics—and also for some extra Latin, if necessary, and for one year of present college instruction in botany and zoölogy and physics and chemistry, now provided for in the high-school course.

Your committee suggests the following plans for meeting the absence of Greek preparation:

1. An acceptance of preparation in freshman mathematics (outlined above for third and fourth years of high school course) as a full substitute for one year of Greek. This change can be met in the college in two ways. Students who enter without Greek but with freshman mathematics can be permitted (1) to devote in the first year two recitation periods daily to Greek, omitting mathematics, or (2) what may be better, one period daily in freshman year to Greek and one to sophomore mathematics, and in the second year two periods daily to Greek, omitting mathematics.

It is believed that either of these plans will bring the student who matriculates without Greek, but with extra mathematics, to the junior year regular in all his studies, and this, too, without serious loss or inconvenience. To the college it involves the expense of two extra daily exercises in Greek for one year or one extra daily exercise for two years; and every fairly endowed college ought to be able to furnish this extra instruction.

2. A more radical plan of adjustment and a better one in the bringing of Greek wholly within the college course, as has been done successfully by several State universities. This change brings all the college courses into harmony with the high-school course outlined above. The adjustment of the courses is complete. Students who enter with two full years of Greek preparation can enter the junior class in Greek, and those with one year of Greek the sophomore class in Greek, the only changes required being in the recitation scheme or programme. No extra instruction in Greek is required.

Four years ought to be sufficient for the thorough mastery of the present Greek course, now requiring as a rule five years. It is believed that a year can easily be saved by making the Greek instruction continuous and more enthusiastic, and, as John Stuart Mill once clearly pointed out, time can also be saved by the use of better methods of teaching. (Besides, extra Greek as an elective can easily be provided in the senior year.)

AGENCY FOR EFFECTING PROPOSED ADJUSTMENTS.

It is clearly not sufficient to devise and adopt plans for adjusting high-school and college courses of study. What is also needed is the providing of an efficient agency for carrying these plans into effect; and here the experience of

several of the States is suggestive—notably of New York, Michigan, and Minnesota.

The following plan for Ohio is recommended:

1. Let the association of Ohio colleges, or, if preferred a league of those Ohio colleges that may be willing thus to coöperate, formulate and prescribe the minimum requirements for admission to the several courses in each of the colleges associated, the same to be announced at least one year in advance. These requirements should be made definite, and they should fall within the general course of study above outlined for the high schools of the State.

2. Let committees be appointed by the college association, each representing at least two colleges, to visit the high schools within easy reach, and by personal inquiry and inspection determine whether such high schools are able to furnish the necessary preparatory training for one or all of the college courses, as indicated in the prescribed requirements for admission, the results and conclusions to be reported to a general committee of the association.

3. Let the high schools found worthy of such indorsement be put on a list of approved high schools and to give increased interest and weight to such approval let the graduates of these schools be admitted on application to any of the associated colleges without examination, save it may be in one of the more disciplinary branches, as Latin or algebra and geometry. These examinations might be helpful in securing greater attention to these studies and also in establishing a higher standard of attainment in them.

The visits of these examining committees should be improved to interest teachers and pupils in higher education and also to create a livelier interest in the community in the character of its high schools. It is easy to see how such visits could be made important occasions for strengthening the high schools as well as increasing interest in college education. The fact that these committees represent the colleges of the State and no particular institution would largely remove embarrassment on the part of the examining visitors. Of course no school should be visited without prior permission.

The faculty of the University of Michigan has for many years carried out a plan similar to the one commended above, and it is the testimony of all concerned that it has brought the high schools into closer relations with the university and headed many young people toward its halls. It has also greatly improved and strengthened the high schools of the State in public interest. Citizens take a special pride in seeing the high school of their city or town on the approved list and the visits of the university committees are made occasions of special interest.

The demands of the colleges on the secondary schools.—School and College: The problem of earlier graduation from college has in New England led to a somewhat odd result, a positive demand for a reform in the curriculum of the elementary schools. The colleges having in recent years appreciably increased their demands upon the secondary schools, are not now so inconsistent as to call for the accomplishment of the greater rate of labor in a shorter period, but are joining in a claim that more of the preparation for college should be done before the fifteenth year of the pupil's life. Two methods of accomplishing this are suggested—the "clipping-down process," by which the pupils who are to go to college shall be taken out of the elementary schools at the age of 11 or 12 and transferred to schools which shall specially prepare them for college; and the "enrichment" method, by which certain subjects essential in preparation for college may be begun three or four years earlier than they now are, and may be taken in the elementary schools. There are difficulties in both the proposed methods.

The relation of grammar and high school education to collegiate.—Frank A. Hill, head master Cambridge English High School: The great majority of pupils in the two hundred and fifty high schools of Massachusetts are pursuing a course of study that does not connect with the college. For such pupils the high school is a cul-de-sac, leading nowhere. Harvard College welcomes connection with all good high schools. It has provided avenues by which they may hope, one of these days, to prepare pupils without Greek. Unfortunately, it is harder to fit pupils for Harvard without Greek than with it. The greater demand is made on those less able to meet it.

It stands to reason that a training suited to a person whose course must cease after four years in the high school ought to be worth following up in college should the high school graduate desire to go higher. I urge most strongly the connection of the college with the public-school system all along the upper line,

not simply at those favored points where the classically trained touch the college. This connection would reduce the age of admission of many a belated pupil. This connection once established, a certain absurdity would disappear. Who would have dreamed, in advance of knowledge of this absurdity, that sensible men were capable, first, of raising barriers between the high school and the college; secondly, of removing them between the high school and the professional school, and then, thirdly, of wondering why our youth so numerously skip the college to enter the professional school. Such inconsistencies are due to independent groups of men working at cross purposes, consequences natural enough under the intense localism of our educational systems, but impossible under the strong central authority of France or Germany. If both routes to the professional school are to be kept open, it is more pressing duty to lengthen and stiffen the secondary courses for the benefit of those who take the short route than to shorten and probably weaken them for the benefit of those who take the long route.

The pupil who begins at 6 and moves along normally may enter college at 19. This is young enough for average minds. Quick, strong minds may profitably enter a year or two earlier. For such the way should be shortened, but not by contracting the whole system. It should be shortened, not solely for the purpose of keeping active minds sufficiently busy. The Harvard Grammar School, of Cambridge, is trying an interesting experiment in this direction.

The time has come to consider the wisdom of increasing the range and the grade of scholarship within the pursuit limits of the grammar school. When we note how much the boys of the gymnasium and the lycée have accomplished by the time they reach 15, the question comes home whether our grammar-school pupils are working on a basis sufficiently liberal and with a spirit sufficiently serious. There are strong reasons, however, why they can not do as much as the pupils abroad. We should be temperate in our suggestions of possible improvement. * * *

The arithmetic course should be reduced to make room for algebra and geometry, algebra through equations of the first degree, and geometry in a way to test the observing, inventive, and reasoning faculties, but with recognition of the fact that its principles can be grasped for practical purposes long before it is possible for the average pupil to give the formal and rigorous demonstrations of Euclid.

Elementary science should have a place. There is something seriously defective in our teaching if under it pupils do not gain in power to see and to think. Geography should be made an observational study to an increased extent. This can be effected with the aid of the *porte-lumiere*, a darkened room, and stereopticon views.

I hesitate to recommend an additional language for the grammar schools. Latin would hardly be tolerated. I fear it would be difficult, except in highly intelligent communities, to convince the public that French or German ought to be taken up in our grammar schools, although it is the practice abroad to begin a modern language very early. The additions proposed—they would be largely substitutions—should be worked out in a tentative way, some single school in an advanced community being selected for the experiment.

The changes proposed would require more teachers of a high range of attainments. This is the coming opportunity for the young women of the colleges as well as for the grammar schools. The proportion of liberally educated young women is increasing: the supply of such women for high schools promises before long to exceed the demand. It will be a glad day when the public shall demand as generous preparation for the teachers of the lower schools as for those of the upper.

The difficulty is with the preparatory schools.—H. L. Stetson, president Des Moines (Iowa) College: If the proper preparatory work could be accomplished I think there would be no complaint with reference to the length of our present college courses. If the student could be started at 13 or 14 years in his preparatory work, and if it could be made to cover the subjects most essential for him to enter his college course, he would be able to graduate at the end of the four years at about the age of those young men who enter the various professions without the college training; and the result of my investigation has led me to this conclusion, that the whole difficulty is not in the college course, but is in what leads to it. Our preparatory work is in such chaotic condition; we have so few thoroughly good preparatory schools. Some of them are engaged in teaching the classics and others entirely in teaching the sciences. Their pupils come to us without any regular preparation, and they are compelled to spend more time in

preparing themselves for the four years than frequently is necessary to accomplish the entire course in college. In answer to these demands which have been made for increased scientific instruction the high schools—of the West particularly—and very many of the academies are devoting more and more time to the sciences and to English literature; and it may be, if this instruction is increased and made what it might be, our colleges may have to readjust their courses of study to this fact, requiring less of the classics for entrance and giving more attention to them and more attention to advanced work in the sciences, and in this way possibly we may be able to meet all the demand that is made for less time to secure an education.

Suggestions.—D. C. Gilman, president Johns Hopkins University: (*a*) The authorities in our educational system should really, as well as nominally, distinguish between the requirements of three scholastic periods, namely, the school, the college, and the university; or, in other words, between what is essential, what is liberal, and what is special in a prolonged education.

(*b*) The period of college life, which of late years has been carried forward so that it extends on the average from 18.5 years to 22.5 years (in many, perhaps in most of the older colleges) may be brought back to an earlier age, say from 16 to 20 years.

(*c*) The significance of the baccalaureate-degree school should be restored, so that it may be at least a trustworthy certificate, an approximate measure, both of the capacity and of the acquisitions of the possessor. In one way or another a consensus should be reached as to the "dignities, rights, and privileges to that degree appertaining."

(*d*) The rigidity of the class system should be relaxed, so that those who are exceptionally favored or exceptionally strong may, if they choose, run the course in less than the average time; and likewise so that any who are embarrassed by ill health, the necessity of earning a support, or the inadequacy of their early opportunities may spend more than the usual time without any implied discredit; indeed, without attracting any attention. The exaggerated emphasis given to the class system in our colleges seems to me most unfortunate.

(*e*) The enormous waste of time and energy at the school period, the time of preparation for college, must be arrested. * * *

If these remedies could be adopted, what would be the result? School life would usually end at 16 years of age, when "matriculation" in a college would indicate that the scholar was ready for higher studies. College life would usually end at 20 years of age, when a bachelor's degree would denote the attainment of a liberal education. Those who are fleet would go over the course in less time, and those who are handicapped would proceed at a slower rate. The hare would generally win; but, sometimes, the turtle. Professional or special education would then continue as long as the scholar might wish, three years being probably the usual period in schools of law, medicine, and theology. The young man would thus receive at 23 years or upwards his professional certificate or his diploma as a doctor of philosophy. He would have finished his university pupilage. An education like this would usually extend over eleven years—four in the preparatory school (from 12 to 16), four in college (from 16 to 20), and three in a professional school (from 20 to 23); but the period might be shortened or lengthened according to individual abilities or disabilities. If, then, the stronger universities would take the ground that, as a rule, none should be admitted to the professional courses, or to the freedom of university instruction, until they had attained a bachelor's degree, or in some other way acquired a corresponding preparation for advanced work, the reproaches of which we are conscious would soon disappear, and higher education would be more generally diffused, more wisely ordered, more serviceable to the public.

Changes in the grammar-school programme.—The Association of Colleges in New England, at its annual meeting, November 5 and 6, 1891, resolved to recommend for gradual adoption the following changes in the programme of New England grammar schools: (1) The introduction of elementary natural history into the earlier years of the programme as a substantial subject, to be taught by demonstrations and practical exercises rather than from books; (2) the introduction of elementary physics into the later years of the programme as a substantial subject, to be taught by the experimental or laboratory method, and to include exact weighing and measuring by the pupils themselves; (3) the introduction of elementary algebra at an age not later than 12 years; (4) the introduction of elementary plane geometry at an age not later than 13 years; (5) the offering of

opportunity to study French or German or Latin, or any two of these languages from and after the age of 10 years. In order to make room in the programme for these new subjects the association recommends that the time allotted to arithmetic, geography, and English grammar be reduced to whatever extent may be necessary. The association makes these recommendations in the interest of the public-school system as a whole; but most of them are offered more particularly in the interest of those children whose education is not to be continued beyond the grammar school.

Discussion of the changes recommended in the foregoing paragraph.—George H. Martin, agent of the Massachusetts board of education, in an address before the Massachusetts Schoolmasters' Club: In discussing the proposed reforms I shall certainly limit myself to the class of pupils referred to in the memorandum issued by the college association, viz, pupils who are to leave school at 14. Concerning the first proposition to introduce elementary natural history in the earlier years there is practical unanimity among all public-school men. It was discussed by this club six years ago, and then the club was wholly in its favor. It is already a "substantial subject" in the best schools, and no school curriculum of recent construction would be considered complete without it, and it is taught everywhere objectively and not from books. It is true there is much crude and desultory work, but this is growing less as the limitations are removed. The subject is everywhere recognized as a most efficient instrument of training and is being used for that purpose. To say that it is in all schools in all communities would be to err, but the work is rapidly gaining, and its momentum will not be sensibly increased by the belated impulse from the colleges.

I am prepared to indorse heartily the proposition to introduce elementary physics into the later years. It should be taught by experiment, and is already so taught in some grammar schools, but the "laboratory method" is not practical for grammar schools, nor is "exact weighing and measuring by the pupils themselves." This requires individual opportunity and time, neither of which the pupils in the grammar schools can have, and a degree of self-control which children under 14 have not acquired. Nor is this work desirable. What these children do need is some knowledge of the simple principles of natural philosophy which will enable them to understand the natural phenomena about them and the varied applications in modern industrial life—the pump, the steam engine, and the telegraph.

The third proposition is to introduce elementary algebra at 12 or earlier. From this I dissent. Elementary algebra has neither practical nor disciplinary value for pupils not going into the higher mathematics. Its relations are purely numerical, and with most pupils in the high schools its operations are chiefly mechanical. As a discipline it has no advantage over arithmetic. In fact, it has infinitely less value than the analytical processes of Warren Colburn's first book. It is true children may learn early to juggle with x, and they may be pleased to see how nicely the "sum comes out," but this is not algebra in any true sense. I have found by experience that real algebra is severe discipline for students from 16 to 20 who have had full high-school training. To learn to solve numerical problems in the easiest way is neither *the* end nor *an* end to be sought with much solicitude.

The next proposition is to introduce elementary plane geometry at an age not later than 13 years. By this the association doubtless meant demonstrative geometry of the Euclidian type. The mental discipline derived from this study is of great value, but such discipline can not be acquired by classes of children 13 or younger. They can, as so many older students have done, memorize theorems and demonstrations, and recite them glibly. But this is not geometry; it is only words. The question is not whether children can be put into geometry, but whether geometry can be put into them. But there is a kind of geometry which is already everywhere in use in the well-organized public schools, and which is being developed as far as the capacities of the pupils will admit. It is not called geometry, but industrial drawing. It is throughout a study of form, its properties and relations. It is form in the concrete; it deals with geometrical relations experimentally and constructively. Its logic is inductive rather than deductive, and it looks directly toward the practical necessities of handicraft as well as to the broader culture which is a universal need.

Coming to the proposed study of Latin and the modern languages at the age of 10, time will allow but brief consideration. I can not see that Latin for children from 10 to 14 would have advantages either for discipline or use sufficient to justify its introduction. All that part which exercises chiefly the memory, and which constitutes the drudgery of the study, could doubtless be done earlier

than 14, but only by dint of severe labor and by much displacement of other studies. I can not see how the children would get beyond the drudgery and receive any impulse from Latin as literature, nor would that nice linguistic work be possible on which the value of the study as mental discipline chiefly depends. This has some maturity as its necessary condition. Of modern languages, it is doubtless true that they can be learned colloquially more easily at 10 than at 14. But this argument proves too much, for they can be learned better at 6 than at 10, and better at 2 than at 6. If ease of learning is the end sought they should be put into the kindergarten. To this I should assent if there were teachers all along the line who could continue the work; but for children who are going to work at 14 it seems of doubtful utility to require or to allow them to occupy themselves for four years with either French or German.

In place of these that more extended work in the literature of their own language which is becoming so general in the best grammar schools, of which the association of colleges has evidently never heard, is infinitely more valuable. It has all the elements of culture for immediate purposes. It will be more likely to develop into a continuation study than any other subject, and to project itself into the post-school life and to influence it for good. Speaking for myself, I have no hesitation in saying that the present movement in grammar-school work in nature study, in drawing, in literature, and in music is sufficiently enriching, is more philosophical educationally, and will prove more practically and generally beneficial under the direction of the public-school men who have originated it than the lines of work proposed by the association of colleges.

Foreign languages in the grammar schools.—William C. Collar, Roxbury Latin School: That the presidents of a dozen New England colleges should unite, as they have lately done, in a recommendation that one or two foreign languages should be made a part of a regular grammar-school course, strikes me with astonishment. One would like to know whether the prodigious success that we have attained in the pursuit of foreign languages in our high schools prompted this sapient suggestion. Did they consider well the general competency of grammar-school teachers to give such instruction? Have they weighed the intellectual profit to be derived from pottering a year or two with the elements of another tongue?

Shortening and enriching the grammar-school course.—Charles W. Eliot, president Harvard University.[1]—I. We may properly use the term shortening in either of two senses. In the first place, the number of grades may be reduced from 10 to 9 or from 9 to 8, so that the combined primary and grammar-school periods shall end at 14 or 13; or secondly, the studies of the present course may be reduced in volume or in variety, or in both, so that there shall be room for the introduction of new subjects. I observe that both kinds of shortening have actually been begun in various towns and cities, and I believe that both are desirable, if not universally, at least in most localities. The argument for the first kind of shortening is a compact and convincing one—averaging the rates of progress of bright children with those of dull children being the great curse of a graded school. It is safer to make the regular programme for 8 grades and lengthen it for the exceptionally slow pupils than to make it 10 grades and shorten it for the exceptionally quick. In other words, since holding back the capable children is a much greater educational injustice than hurrying the incapable, the programme should be so construed as to give all possible chances of avoiding the greater evil. Without altering the nominal length of the programme in years, a great shortening of the course can be effected for part of the children simply by permitting the capable ones to do two years' work in one. I heard a grammar-school master testifying a few days ago in a teachers' meeting that nearly one-quarter of the pupils in his school (which numbers about 650 children) were successfully accomplishing this double task. Such a statement opens a cheerful vista for one who desires to see the grammar-school course both shortened and enriched.

With no more words about the first kind of shortening, I turn to the second kind, namely, the desirable reductions in the volume and variety of the present studies. The first great reduction should, I believe, be made in arithmetic. I find that it is very common in programmes of the grades to allot to arithmetic from one-eighth to one-sixth of the whole school time for nine or ten years. In many towns and cities two arithmetics are used during these years—a small one of perhaps 100 pages, followed by a larger one of 200 or 300 pages. Now, the small book ordinarily contains all the arithmetic that anybody needs to know; indeed,

[1] Read before the department of superintendence (Nat. Ed. Ass.) at Brooklyn, February 16, 1892.

much more than most of us ever use. Before a body of experts like this it were superfluous to enlarge on this proposition. On grounds of utility geometry and physics have stronger claims than any part of arithmetic beyond the elements; and for mental training they are also to be preferred. By the contraction of arithmetic, room is made for algebra and geometry. In a few schools these subjects have already been introduced, with or without mention in the official programmes, and they have proved to be interesting and intelligible to American children of from 11 to 13 years of age, just as they are to European children. Moreover, the attainments of the pupils in arithmetic are not diminished by the introduction of the new studies, but rather increased. The algebraic way of solving a problem is often more intelligible than the arithmetical, and mensuration is easier when founded on a good knowledge of elementary geometry than it is in the lack of that foundation. The three subjects together are vastly more interesting than arithmetic alone pursued through nine consecutive years. Secondly, language studies, including reading, writing, spelling, grammar, and literature, occupy from one-third to two-fifths of most grade programmes. There is ample room here for the introduction of the optional study of a foreign language, ancient or modern, at the fourth or fifth grade. Here it is to be observed that nothing will be lost to English by the introduction of a foreign language.

In many schools the subject of grammar still fills too large a place on the programme, although great improvement has taken place in the treatment of this abstruse subject which is so unsuitable for children. In the Beginner's Latin Book, by Messrs. Collar and Daniell, I noticed five years ago an excellent description of the amount of knowledge of English grammar needed by a pupil of 10 or 12 years of age about to begin Latin. Of course, the pupil who is not to begin Latin needs no more. All the grammar which the learner needed to know before beginning Latin was "the names and functions of the parts of speech in English and the meanings of the common grammatical terms, such as subject and predicate, case, tense, voice, declension, conjunction," etc. Manuals have now been prepared in considerable variety for imparting this limited amount of grammatical information by examples and practice rather than by rules and precepts; so that the greater part of the time formerly spent on English grammar can now be saved for more profitable uses. Thirdly, geography is now taught from books and flat atlases chiefly as a memory study, and much time is given to committing to memory masses of facts which can not be retained and which are of little value if retained. By grouping physical geography with natural history, and political geography with history, and by providing proper apparatus for teaching geography, time can be saved, and yet a place made for much new and interesting geographical instruction. Fourthly, a small saving of time can be made for useful subjects by striking out the bookkeeping which in many towns and cities is found in the last grade. This subject is doubtless included in the grammar-school programme, because it is supposed to be of practical value; but I believe it to be the most useless subject in the entire programme, for the reason that the bookkeeping taught is a kind of bookkeeping never found in any real business establishment. Every large business has in these days its own forms of accounting and bookkeeping, which are, for the most part, peculiar to itself. Almost every large firm or corporation has its own method, with printed headings, schedules, bill-heads, invoices, and duplicating order-books, adapted to its own business and intended to simplify its accounts and reduce to lowest terms the amount of writing necessary to keep them. What a boy or girl can learn at school which will be useful in after-life in keeping books or accounts for any real business is a good handwriting, and accuracy in adding, subtracting, multiplying, and dividing small numbers. It is a positive injury to a boy to give him the impression that he knows something about bookkeeping when he has only learned an unreal system which he will never find used in any actual business. At best, bookkeeping is not a science, but only an art based on conventions. As trade and industry have been differentiated in the modern world, bookkeeping has been differentiated also, and it is, of course, impossible to teach in school the infinite diversities of practice.

II. I have thus indicated in the briefest manner the reductions which may be conveniently made in some of the present subjects in order to effect a shortening of the present grammar-school programme. My next topic is diversifying and enriching it. The most complete statement of the new subjects proposed for the grammar-school programme is that made by the Association of Colleges in New England at their meeting at Brown University last November. That association then invited the attention of the public to certain changes in the grammar-school

programme which it recommended for gradual adoption. These changes are five in number.

The first is the introduction of elementary natural history into the earlier years of the programme, to be taught by demonstrations and practical exercises rather than from books. The term natural history was doubtless intended to include botany, zoölogy, geology, and physical geography. Some room for these subjects is already made in most grammar-school programmes, and the recommendation of the association refers as much to methods of teaching as to time allotted to the subject. The association recommends that the teaching be demonstrative, and that adequate apparatus be provided for teaching these subjects. There is a lamentable lack of the proper apparatus for teaching geography in the public schools. Indeed, in many schools there is no proper apparatus for teaching geography or any other natural-history subject to young children. Natural-science apparatus has been provided in some exceptional high schools, but as a rule grammar schools are still destitute in this important respect.

The second recommendation is the introduction of elementary physics into the later years of the programme, to be taught by the laboratory method and to include exact weighing and measuring by the pupils themselves.

The third and fourth recommendations cover the introduction of algebra and geometry at the age of 12 or 13.

The fifth is the offering of opportunity to study French or German or Latin or any two of these languages from and after the age of 10.

III. Such are, in brief, the proposals for shortening and enriching the grammar-school course. I want to use the rest of the time allotted to me in discussing the objections to these various changes.

The first objection I take up is the objection to a reduction in the time devoted to arithmetic. Many teachers are shocked at the bare idea of reducing the time given to arithmetic, because they believe that arithmetic affords a peculiarly valuable training, first, in reasoning, and secondly, in precision of thought and accuracy of work. They perceive that the greater part of the school progamme calls only for memorizing power and they think that arithmetic develops reasoning power. The fact is, however, that mathematical reasoning is a peculiar form of logic which has very little application to common life and no application at all in those great fields of human activity where perfect demonstration is not to be obtained. As a rule, neither the biological nor the moral sciences can make use of mathematical reasoning. Moreover, so far as mathematical reasoning is itself concerned, variety of subject is very useful to the pupils. The substitution of algebra and geometry for part of the arithmetic is a clear gain to the pupil so far as acquaintance with the logic of mathematics goes. Again, practice in thinking with accuracy and working with demonstrable precision can be obtained in algebra, geometry, and physics just as well as in arithmetic. It is quite unnecessary to adhere to the lowest and least interesting of these exact subjects in order to secure adequate practice in precision of thought and work.

The second objection is that there are children in the grammar schools who are incapable of pursuing these new subjects. Assuming that this allegation is true of some children, I have to remark, first, that we shall not know till we have tried what proportion of children are incapable of pursuing algebra, geometry, physics, and some foreign language by the time they are 14 years of age. It is a curious fact that we Americans habitually underestimate the capacity of pupils at almost every stage of education, from the primary school through the university. The expectation of attainment for the American child or for the American college student is much lower than the expectation of attainment for the European. This error has been very grave in its effects on American education all along the line, from the primary school through the university, and till within twenty years the effects were nowhere worse than at the college grade. It seems to me probable that the proportion of grammar-school children incapable of pursuing geometry, algebra, and a foreign language would turn out to be much smaller than we now imagine, but though this proportion should be large it would not justify the exclusion of all the capable children from opportunities which they could profit by. At the worst this objection can only go to show that it will be necessary to adopt in the grammar schools a flexible instead of a rigid system—some selection or choice of studies instead of a uniform requirement. Those children who are competent to study a foreign language should certainly have the opportunity of doing so at the proper age, that is, not later than 10 or 11 years; and those who are competent to begin geometry at 12 and algebra at 13 should have the chance. If experience shall prove that

a considerable proportion of grammar-school children are incapable of pursuing the higher studies that fact will only show that the selection of appropriate studies for children by their teachers should be adopted as a policy by the public grammar school. To discriminate between pupils of different capacity, to select the competent for suitable instruction, and to advance each pupil with appropriate rapidity will ultimately become, I believe, the most important functions of the public-school administrator—those functions in which he or she will be most serviceable to families and to the state.

Another objection to the changes proposed often takes this form—they are said to be aristocratic in tendency. The democratic theory, it is said, implies equality among the children, uniformity of programme, uniform tests for promotion, and no divisions in the same schoolroom according to capacity or merit. I need not say to this audience that these conceptions of true democracy in schools are fallacious and ruinous. Democratic society does not undertake to fly in the face of nature by asserting that all children are equal in capacity or that all children are alike and should be treated alike. Everybody knows that children are infinitely diverse; that children in the same family even are apt to be very different in disposition, temperament, and mental power. Every child is a unique personality. It follows, of course, that uniform programmes and uniform methods of instruction, applied simultaneously to large numbers of children, must be unwise and injurious—an evil always to be struggled against and reformed, so far as the material resources of democratic society will permit. It is for the interest of society, as well as of the individual, that every individual child's peculiar gifts and powers should be developed and trained to the highest degree. Hence in the public schools of a democracy the aim should be to give the utmost possible amount of individual instruction, to grade according to capacity just as far as the number of teachers and their strength and skill will permit, and to promote pupils not by battalions, but in the most irregular and individual way possible. A few days ago I heard an assistant superintendent in an important city declare that many grammar-school teachers in his city objected to any division among the fifty or more pupils in each room; any division, that is, according to the attainments and powers of the individual pupils. They wanted all the pupils in a given room to be in one grade, to move together like soldiers on parade, and to arrive at examination day having all performed precisely the same tasks and made the same progress in the same subjects. If that were a true portrait of the city graded school it would be safe to predict that the urban public school would before long become nothing but a charity school for the children of the dependent classes. Intelligent Americans will not subject their children to such discipline when they once understand what it means. The country district school, in which among forty or fifty pupils there are always ten or a dozen distinct classes at different stages and advancing at different rates of progress, would remain as the only promising type of the free school. Not only is it no serious objection to the new proposals that they must diminish uniformity in schools—it is their strongest recommendation.

So far from the changes proposed being of aristocratic tendency, they are really essential to a truly democratic school system; for they must be adopted and carried into effect before the children of the poor can obtain equal access with the children of the rich to the best education they are capable of, whatever the grade of that education may be. Accessibility of appropriate opportunity is the essence of democratic society; not equality of gifts, attainments, or powers, for that equality is unnatural and impossible; not abundance of inappropriate opportunities, for such abundance is of no avail; but accessibility of such appropriate opportunities as the individual can utilize for his own benefit and that of society. The American grammar-school programme now actually prevents an intelligent child from beginning the study of a foreign tongue at the right age. We all know that that age is very early, long before the high-school period. It prevents him from beginning the study of algebra and geometry at the right age. It makes it impossible for him to get a chance at the right kind of study of natural science. If a boy is not to go to the high school, he loses that chance forever under our present system. If he is going to the high school he does not get the chance till much too late. The poor boy in the United States should have as good a chance as the child of a rich man to obtain the best school training which his character and powers fit him to receive.

Is not that a fair statement of what democratic society may reasonably aim at and seek to effect through its own grammar schools? Yet the existing grammar-school programme actually prevents the poor boy from getting that chance. The rich man can obtain for his children a suitably varied course of instruction,

with much individual teaching in a private or endowed school; but the immense majority of American children are confined to the limited, uniform, machine programme of the graded grammar school. A democratic society was never more misled as to its own interest than in supposing such a programme to be for the interest of the masses. The grades for pupils from 6 to 15 years of of age are an obstruction to the rise through democratic society of the children who ought to rise. Uniformity is the curse of American schools. That any school or college has a uniform product should be regarded as a demonstration of inferiority—of incapacity to meet the legitimate demands of a social order whose fundamental principle is that every career should be open to talent. Selection of studies for the individual, instruction addressed to the individual, irregular promotion, grading by natural capacity and rapidity of attainment, and diversity of product as regards age and acquisitions must come to characterize the American public school if it is to answer the purposes of a democratic society.

Fourth. It is further alleged that the changes proposed are chiefly for the advantage of the well-to-do children whose education is to be carried beyond the grammar school to the high school, and possibly to the college above the high school. They are indeed for the interest of this class of children; but they are more for the interest of the children who are not going to the high school, and for whom therefore the grammar school is to provide all the systematic education they will ever receive. The Association of Colleges in New England distinctly says that it makes its recommendations in the interest of the public-school system as a whole; "but most of them are offered more particularly in the interest of those children whose education is not to be continued beyond the grammar school." Take, for example, the subject of geometry. It has many and very important applications in the arts and trades. Every mechanic needs some knowledge of it. Its applications are as important as those of arithmetic, if we except the very simplest and commonest arithmetical operations. That the great mass of American children should leave school without ever having touched this subject, except perhaps in arithmetic under the head of mensuration, is a grave misfortune. To introduce variety into the grammar-school programme is in itself likely to profit the children who are never to go to school after they are 14 years of age even more than the children who are. A child who is dull in one subject may be bright in a different subject. Thus a child who has no gift in language may be keen and quick in natural-history studies. A child who has no taste for arithmetic may prove unusually strong in geometry. One whose mind is not easily moved through purely mental exercises may be intellectually developed through drawing and manual training. In college we are extremely familiar with these diversities, and the elective system is now giving in most American colleges free play for the profitable exhibition and cultivation of these diverse gifts. In a similar manner the grammar school will be better for even the dull and slow children if its studies are made more various and its whole system more flexible.

A fifth objection to the introduction of new subjects is that children are already overworked in school. In an address which I gave rather more than a year ago I pointed out that there are two effective mechanical precautions against the ill effects attributed to overwork at school, precautions which it is delightful to see are more and more adopted. They are good ventilation and the systematic use of light gymnastics at regular intervals during school-hours. School time ought to be the best managed of all the day from a sanitary point of view, excepting those hours which the children pass out of doors. If the schoolroom were invariably healthier in every respect than the average home we should hear less about overwork at school. There is, however, a third precaution against overwork which is quite as important as either of those already mentioned: it is making the school work interesting to the children. Four years ago I asked the attention of this department of the National Educational Association to the depressing effect which lack of interest and conscious progress in school work has upon children. To introduce new and higher subjects into the school programme is not necessarily to increase the strain upon the child. If this measure increases the interest and attractiveness of the work and the sense of achievement it will diminish weariness and the risk of hurtful strain.

Lastly, there is an apprehension lest the introduction of the new subjects recommended should increase existing difficulties with regard to promotion. Parents are sensitive about the promotion of their children. They want the dull ones and the bright to be promoted at the same rate. Their sympathies are quite as apt to be with the slow children as with the quick. I believe that this practical

difficulty should be met in part by the abandonment of uniform attainment or of a standard of required knowledge as ground of promotion. In Harvard College, where there is no such thing as a uniform programme of study for all students, and where, indeed, there is small chance that any 2 students out of 1,450 will pursue the same course of studies during their four years of residence, we have long since abandoned uniform attainment as ground of promotion from one class to another. The sole ground of promotion is reasonable fidelity. I venture to believe that this is the true ground of promotion in grammar schools as well, and that by the sole use of this principle in promoting the difficulty now under consideration would be much alleviated, if not done away with. The right time for advancing a child to the study of a new subject is the first moment he is capable of comprehending it. All our divisions of the total school period into years, and into primary, grammar, and high schools, are artificial and in most cases hurtful or hindering to the individual. The whole school life should be one unbroken flow from one fresh interest and one new delight to another, and the rate of that flow ought to be different for each different child. Economical school administration inevitably interferes somewhat with the desirable continuity and variety of motion, but the most skilful and wisest administration is that which interferes least.

On reviewing the progress of this reform since I had the honor of discussing the question, "Can school programmes be shortened and enriched?" before this department of superintendence four years ago, I see many evidences that a great and beneficent change in public-school programmes is rapidly advancing. The best evidence is to be found in the keen interest which superintendents and teachers take in the discussion of the subject. Through them the proposed improvements will be wrought out in detail, their influence will be successfully exerted on parents, committees, and the public press; and their reward will be, first, the daily sight of happier and better-trained children, and secondly, the elevation of their own profession.

Algebra and geometry in grammar schools—President Eliot criticised.—Edward Brooks, LL. D., superintendent of schools, Philadelphia[1]: The programme for "eight grades," as recommended by President Eliot, is almost universally adopted in our graded schools. In Philadelphia pupils enter the primary schools at 6 years of age, and have an eight years' course to complete the grammar schools. Very bright pupils are allowed to do it in less time. The same thing is generally true of the cities of the country; very few have a nine years' course; almost none a ten years' course. His suggestion of combining studies has also been adopted in many of our public schools. With primary grades it is a very common practice to unite geography and history, and with more advanced grades political and physical geography have usually been taught together for many years.

I doubt very much whether there is any advantage to be derived from the introduction of algebra into the grammar-school course. To the ordinary citizen in practical life a knowledge of algebra will be found of little value. No one buys or sells by algebra; and a knowledge of polynomials or the quadratic equation would be of little use to the housewife in the discharge of her duties. Indeed, no one of the mathematical branches would be of so little value in the ordinary practical affairs of life as algebra. Besides, we can not advocate the study of algebra on account of its disciplinary value, for no mathematical branch gives so little mental discipline that the ordinary business or professional man would find of use. As a disciplinary study the elements of algebra will be found to be far inferior to either arithmetic or geometry. Much of algebra is a mere calculus, and the aim of the student is to become expert with the manipulation of symbols, a form of mental operation entirely removed from that of ordinary life. In place of algebra I would urge a more general introduction of arithmetical analysis, usually known as mental arithmetic. This form of reasoning, originating with Warren Colburn, is better adapted to sharpen and strengthen the analytical powers of young students than any other branch of the grammar-school curriculum. It is far superior to algebra in developing the thought power of the student. It is also generally simpler and shorter in its methods of reasoning and operation than algebra. Take the problem that President Eliot gives, "The sum of 2 numbers is 24, and one is twice the other." I can obtain the results by the simple process of arithmetical analysis before the algebraist could write his equations. A problem like the following: "If A can do a piece of work in four days and B in six days, in what time can both do it?" is much more simply

[1] Reported in the Journal of Education.

worked by arithmetical analysis than by algebra. And the same is true of a large number of problems. I urge, therefore, in place of algebra, that the beautiful system of arithmetical thought known as mental arithmetic be more fully introduced into our grammar schools than it is to-day.

The study of geometry as a science should not be introduced into our grammar schools. Concrete and practical geometry is already taught in most of our grammar schools under the head of drawing and mensuration. In most of these schools the pupils are made familiar with all the ordinary geometrical figures and their properties or principles. These principles include the methods of obtaining the areas of plane surfaces, the area and circumference of the circle, and the surface and volume of the parallelopiped, pyramid, cylinder, cone, and sphere. These principles are obtained, not by demonstration, but by concrete illustration, and they are applied by the children until they are familiar with them. This is all that it is practicable to do with geometry in the grammar schools. The pupils are not prepared for the logical processes of abstract geometry and can not understand them. The method of reasoning from axioms and established principles by the logical methods of geometry is too difficult for the ordinary student of the grammar schools. It is said that abstract geometry, with its demonstrations, is taught in the public schools of Germany and France; but in my examination last summer of the elementary schools of Paris corresponding to our grammar schools I did not find a single pupil studying the science of geometry. They apply the principles reached concretely, as we do in our grammar schools.

That the work of the grammar schools can be improved by shortening the course of study is a proposition that needs demonstration. That it may be enriched is a most desirable object, though it is a question whether this enrichment may not be attained by other means than the addition to or subtraction from the present course of studies. The broader question is, how shall the best results of culture and knowledge be attained in our grammar schools? The object can be attained by having a correct course of study, as rich in materials for intellectual, moral, and spiritual culture as is possible, and by having well-trained and skillful teachers to use this course of instruction to the best advantage.

Those German and French schools.—John T. Prince, agent Massachusetts board of education: President Eliot is clearly wrong in his impression of what is done in the elementary schools of France and Germany. Algebra and geometry are not in the schools that compare in any regard with our grammar grades. Algebra nowhere precedes geometry. The geometry taught is not demonstrative, but is more like that taught in the grammar and even in the primary grades here. The colloquial speaking of the Romance languages has no such value as these later reformers would place upon it. The whole difficulty lies in the fact that the grammar schools of Europe and America are compared by men who have not studied either.

The two ideals of the course of study.—W. T. Harris, commissioner: In the schools of the United States there prevail two different ideals of the course of study; the one originating with the directors of higher education and the other a growth from the common elementary school. These two ideals clash in quite important particulars. The common-school course of study, as it appears in the elementary school and in the public high school which gives secondary instruction, does not shape itself so as to fit its pupils for entrance to the colleges. At least, if we admit that as an actual fact many high-school pupils do enter college, we must also admit that there is a constant tendency in the public high school to diverge in its course of study and follow a path that does not lead to the college.

The older colleges of the States, following the traditions brought over from Europe, built their course of study on mathematics and the classical languages, Latin and Greek. They accordingly demanded of the preparatory schools a preliminary training or preparation along these lines and neglected all else.

Human learning at one period did not include much that was not conceived and expressed in Latin or Greek words. But within the past 300 years there has arisen a modern tributary stream of human learning, and it has some time since begun its demand for recognition in the course of study. This modern side of human learning includes the natural sciences and modern literature. These two contingents are almost wholly the products of the past 300 years.

The demands of the sciences and the demands of the literature of the modern languages to a share in the course of study were met in one way by the college

and in another way by the common school. The directors of higher education affirmed that Latin, Greek, and mathematics furnished the truly disciplinary studies fit for the foundation of all literal education. Modern literature and the sciences on the other hand were not and could not become culture studies, although they might be useful in the way of accomplishments in practical life.

Accordingly, the colleges proceeded to recognize the moderns by admitting them into the course of study at the end. During the fourth or senior year of college the student was given a rapid survey of the sciences and of some of the great works of modern literary art. But the college did not encourage the introduction of modern literature and natural science into the preparatory school. Consequently the pupil who left school during his preparatory course or before the senior year of college found himself ignorant of these two great and rapidly growing provinces of human learning.

But the public-school system has taken a different direction in the matter. It has been under the supervision and management of less highly educated men—that is to say, of men less thoroughly instructed in the forms of the past, and as a result less conservative. When the moderns appealed for a place in the course of study some concession was at once made to the demand. A tendency has been established to recognize the moderns throughout the course of study. First, modern literature was admitted in the shape of a graded series of school readers containing many of the gems of English and American literature, and much, too, that was written in mere colloquial English, and much that was trashy in its style and thought.

In the geographical text-book there was an attempt at a survey of the physical world in its relations to man, the world in its mathematical features of size, shape, and motions, in its physical aspects of interacting forces of light, heat, moisture, and gravitation, and finally, in its biological aspects of plant life, animal life, and the races of men.

This geographical text-book also drew on the social sciences and introduced scraps of information regarding political economy, the occupations of men, and also the political institutions, the laws and customs and religion. Geography has therefore developed from the beginning into a sort of compend of natural sciences, affording the pupil a survey of the results of the modern sciences, both in the physical and social world.

Having conceded to the demands of the moderns in the elementary school in these respects and in the introduction of a history of the fatherland, it remained next to emphasize this tendency still more in the secondary public school, and to make the high-school course of study include more thorough work in English literature, universal history, three or four selected sciences like geology, astronomy, physiology, and chemistry, in addition to the mathematics and some modern or ancient language.

It might be claimed that the graduates of the high school had a broader education: his education, under good teachers, might even be thorough, but certainly in his preparation in Latin and Greek the amount was not sufficient to give the high-school pupil a fair chance by the side of the graduate of the special preparatory school.

The directors of the common schools have therefore been compelled to establish a double course, a classical and an English course, in the public high school, a procedure so foreign to the spirit of the entire common-school course of study that it has only partially succeeded.

Adapt the high schools to the colleges.—Superintendent N. C. Dougherty, of Peoria, Ill.: What could be more natural than that the higher should reach down and adapt the lower to itself? The high schools are here to stay. If the education given by them in the past is not in all respects just what is needed, let us improve upon it. Let us make it better and better, as the years go by, until it shall supply just what is needed. Let us remember that we do the best for the boy who stops with a high-school education when we do nothing to impede the progress of the other boy who goes on to a college graduation.

The specific problem at the present time.—Nicholas Murray Butler: The marked difference at the present time between the general educational organization in this country and in Europe is to be found in the fact that in Europe the elementary school is not as a rule in complete coördination with the secondary school and the university; while in the United States the connection between the elementary and the secondary school is complete, but that between the secondary school and the university is wanting. Therefore the specific problem in educational organization that the American people have to deal with at the present

time is the coördinating of the secondary and the superior instruction. This will be done by the high schools, the academies, and the colleges. In this organization the American college will always continue to occupy a prominent place. * * * The college should rest upon the high school, and should not raise its requirements for admission to such an extent that high school graduates may not pass easily and naturally into it. The contemporary demand for a shortening of the time devoted to obtaining both a college and a professional education is a sound one, and must be heeded. The shortening, however, should not take place at the expense of residence in college. That is in many ways the most valuable feature of American higher education. It can not be sacrificed without gravest loss. The problem can best be met by welding the college and the professional school together, and admitting certain preliminary professional studies, as electives, into the course leading to the degree of bachelor of arts.

Shortening the preparatory course.—President H. E. Webster, of Union College (N. Y.): Nothing can be better established than that the colleges are entirely dependent on the secondary schools for their support and success. If the schools are weak, inefficient, the college that draws from them can not have a high standard. The eastern colleges have been for many years demanding more and more of the preparatory schools. The requirements for admission to college have been increased; the age of graduation for the average student is much greater than it was in the past. Meantime, competition for places in life has become sharper than ever. And now the cry goes out, college graduates are too old; the course must be shortened; men must get into life earlier. And so they ought. But if a change is to be made, let it be in the requirements for admission to college, not in the length of the college course. Any college man will maintain that college life is worth more to a young man than life in a preparatory school, no matter how well conducted. As it seems to me, no greater mistake can be made than to shorten the college course. This, of course, for the average man. Every college course is arranged for the average man. The exceptional man—let him graduate whenever he has done his work.

There is one great trouble with the high schools. They are doing much of the work that ought to be done in colleges, and for this they have good grounds. Only a small number of students in high schools expect or intend to enter college. It is well that those who can not enter any higher institution of learning should receive instruction in many branches which properly belong in the college course. But in every such school there ought to be a course arranged for young men and women who do intend to "go up higher." The time of preparation would then be much shortened, because many subjects would be omitted. This would encourage students to go on with their education. For many years I was a teacher of natural science in various colleges. I say without hesitation that better work can be done (in colleges) with a student who comes fresh to the subject than with one who through his high-school training thinks that he understands the subject. I conclude in this wise:

In our high schools the teaching is excellent. All honor to those who give their lives to it. But there ought to be preparatory courses for colleges, including only such subjects as are required for admission in colleges.

That if any change is to be made so as to shorten the time for college students, it should be made in the preparatory course.

There comes a "moment of instinctive readiness" for every subject of study.—William James, professor, Harvard University: In all pedagogy the great thing is to strike the iron while hot and to seize the wave of the pupil's interest in each successive subject before its ebb has come, so that knowedge may be got and a habit of skill acquired—a headway of interest, in short, secured on which afterward the individual may float. There is a happy moment for fixing skill in drawing, for making boys collectors in natural history, and presently dissectors and botanists; then for initiating them into the harmonies of mechanics and the wonders of physical and chemical law. Later, introspective psychology and the metaphysical and religious mysteries take their turn; and, last of all, the drama of human affairs and worldly wisdom in the widest sense of the term. In each of us a saturation point is soon reached in all these things; the impetus of our purely intellectual zeal expires, and unless the topic be one associated with some urgent personal need that keeps our wits constantly whetted about it, we settle into an equilibrium, and live on what we learned when our interest was fresh and instinctive without adding to the store. Outside of their own business the ideas gained by men before they are twenty-five are practically the only ideas they shall have in their lives. They can not get anything new. Disinterested curiosity is past, the mental grooves and channels set, the power of assimilation

gone. If by chance we ever do learn anything about some entirely new topic we are afflicted with a strange sense of insecurity and we fear to advance a resolute opinion. But with things learned in the plastic days of instructive curiosity we never lose entirely our sense of being at home. There remains a kinship, a sentiment of intimate acquaintance, which, even when we know we have failed to keep abreast of the subject, flatters us with a sense of power over it and makes us feel not altogether out of the pale. Whatever individual exceptions to this might be cited are of the sort that "prove the rule."

To detect the moment of the instinctive readiness for the subject is, then, the first duty of every educator. As for the pupils, it would probably lead to a more earnest temper on the part of college students if they had less belief in their unlimited future intellectual potentialities, and could be brought to realize that whatever physics and political economy and philosophy they are now acquiring are, for better or worse, the physics and political economy and philosophy that will have to serve them to the end.

Modern studies may furnish a liberal education.—J. E. C. Welldon, head master Harrow School, England (in the Academy): Speaking generally, with the experience of a school in which a modern education has been tried on a large scale, I may give it as my clear opinion that the boys who have been educated in modern subjects deserve to be accredited with a liberal education in the same sense and to the same extent as other boys. In their intellectual characteristics, so far as I can estimate them, they are not altogether like the classical boys; but they are not inferior. * * * They are, in many instances, boys of keen and active intelligence. In the range of their culture and the discipline of their mental powers they are the equals of boys who have received a classical education; in the intellectual interest which they feel in their studies they are not infrequently superior. They win their share of the prizes and distinctions which are accorded to intellectual merit in public schools. If it is necessary to mention one particular point in which they sometimes fall below their classical rivals it may be said to be the habit of accuracy, of perseverance, and of sustained and concentrated attention to a subject which is not at once interesting and attractive and demands a large amount of patient, painstaking effort if it is to be effectively pursued.

Flexibility in courses of study—F. W. Parker, Cook County Normal School: A course of study is an arrangement of topics and subjects in the line of development. It shows the teachers the direction of work and is a general guide in the preparation of lessons. A course of study should be adapted to the abilities of teachers. An ironclad course of study that demands compliances in every detail is a dire means of compelling uniformity. The differing circumstances of pupils demand flexibility in the adaptation of a course of study. A class badly taught through several grades can not be made to follow a course of study without disastrous results. A course of study should be under constant discussion and should be changed when necessary. It should aid teachers in doing their best work.

IV.—Education.

Education should be adapted to individual requirements—Influence of heredity and environment.—President D. C. Gilman (Johns Hopkins), in the Cosmopolitan Magazine: Every boy differs from every other boy in character as he does in appearance. Even twins, while they closely resemble one another in many respects, may differ essentially in fundamental tastes and talents. Mr. Grafton says that extreme similarity and extreme dissimilarity are nearly as common between twins of the same sex as moderate resemblance. If this is confirmed, what becomes of heredity?

The corollary is obvious that plans of education should as far as possible be adapted to individual requirements; but as every boy is preparing for life among his fellows, and as Providence has so ordered it that he is strongly influenced by other boys, it follows that to treat him alone, away from comrades, in the backwoods, in a cell, under exclusive instruction, is only justifiable under extraordinary circumstances. He comes into the world not only as an individual with his own responsibilities and possibilities, but as one of a family, a neighborhood, a race, from which he can not be extricated except by death. Isolation is therefore as unnatural as it is undesirable and difficult.

Every boy is influenced both by his inheritance and his environment; yet the laws of heredity in the human species are not well enough known to give

us any certain indications of what the child of any parents will become, while the conditions in which a person lives are as complex as the elements that nourish his body, the air he breathes, the water he drinks; as subtle and insinuating as the tones of the voice, the glance of the eye, the nod of the head, the pressure of the hand; as influential as religious faith, the forms of civil government, the habits of society, the lessons of antiquity, the examples of good men; and as trifling as a careless word, a thoughtless joke, a timely hint, a friendly warning, or a loving smile.

Seeking wisdom rather than knowledge.—Prof. C. A. Collin (in the University Magazine): The student undergoing the process of liberal education ought to pursue some studies in which he can not see any practical utility. His soul should grow and expand under the influence of quiet and unforced reflection and meditation which has no reference and in which he can see no reference to bread and butter. In this overpractical age the student's mind sometimes needs to be forcibly turned away from the pursuit of the practically useful to the cultivation of higher wisdom of greater value than is included within the range of what is ordinarily denominated practical. There is a certain influence from the study of Greek for which there is no equivalent. In every college or university there should be at least a small body of teachers and disciples to whom the life is more than meat, who are seeking wisdom rather than knowledge, and who, from the pursuits of philosophy, the reverence of the Lord, and the culture of the soul, gain the breadth of view, the clearness of vision, the warmth of heart, and the soundness of judgment which make the strong man; and who despise the mere keenness and agility of intellect which makes men shrewd and smart. There is no danger that men taking such courses of liberal education will be too numerous. By all means encourage every man who can take such a course and has the soul capable of receiving it to do so, whether afterwards he is to pursue a professional or a business career.

The bearing of heredity upon education.—Philadelphia Ledger: One of the most important truths which science has disclosed to us, and one which is replete with suggestions as to the conduct of life, is that of heredity. Instead of conceiving, as some have done, that each child came into the world like a blank sheet of paper, on which could be inscribed at will whatever characters we chose to imprint, we now know that he is a reproduction of past generations—the result of many combinations of character, with certain aptitudes, tastes, powers, faculties, and tendencies derived from his various ancestors. Just as some of his features are said to resemble father or mother, or more distant relatives, and some are combinations of several, so in his character will be represented certain qualities of one or of another, and often a mingling of many, which together produce an individuality all his own, yet gathered from past sources. It may be thought that if this be so there can not be much left for us to do. If each child is to reproduce the past in various forms, and under laws over which we can have no control, how can we hope to alter, by our interference, what is so irrevocably settled? How can we trace fresh characters on tablets already so full of permanent inscriptions? If heredity were the only element in the building of humanity, there might be force in such an inquiry; but this is not the case. Prof. Bradford, in the last number of the Educational Review, says: "Evolution works by two factors, namely, heredity, or that which tends to permanency, and environment, or that which tends to variation. The characteristic of the first is that it reproduces the past; of the second, that it adapts to new conditions that which has come from the past." This nature, so wonderfully complex, and so faithfully bearing within it the records of the past, is yet responsive to every touch from without. The environment or surroundings of the child or man always exert a potent sway over him. The influence of the air and the sunshine, of the climate, of town or country, of wealth or poverty, of civilization or barbarism, of care or neglect, of affection or indifference, of everything external, in fact, with which he comes in contact, is momentarily molding him into new forms, and modifying in various ways the nature which he has derived from the past.

Some of these influences are beyond our control, but many of them are within our power, and it is on this well-grounded truth that all our efforts at training, education, and self-culture should be based. Many of our failures in these attempts come from not bearing constantly in mind these two elements in every life. Every intelligent workman must have some appreciation of the materials with which he works. He must know what can and what can not be done with them if his skill is to be effective. To deal with them all alike and to expect

that the same treatment will produce the same results would appeal even to the most ordinary laborer as an utter absurdity. Yet in the infinitely more intricate and complex nature of man, where no two minds or hearts or dispositions are exactly similar, how common it is to apply the same methods, to urge the same motives, to exert the same influences, to use the same drill, and then to be utterly astonished that the same results do not supervene. If the builder gave no more attention to the different varieties of wood than we give to the varieties in human nature we should justly deem him incompetent and untrustworthy. It is for this reason, far more than for any curious research, that the great principle of heredity should be studied in its manifold bearings by those who aim to train children, to influence men, or to improve themselves. If it is true, it is full of meaning to us all. It suggests that if we would make impressions, or form habits, or instill virtues, or correct faults, we must know something of the nature we thus attempt to influence. What may be effectual in one instance may be powerless in another and ruinous in a third, for the needs are as varied as the natures. It is because that which the individual inherits from past ages, while ineradicable, is yet being constantly modified by what comes to him from without, and because these two forces are always coöperative that he who would direct the one must understand the other. If it be said that this view fills the whole subject of education with difficulty, it can not be denied. But if it is a real and honest difficulty, who would bury it out of sight? Must it not be faced courageously and grappled with earnestly? The possible has always sprung out of what seemed at first impossible, and this is no exception. So far from producing discouragement, it opens up new fields for thought and for work, which afford the richest promises for future harvests.

The true ideal of education.—President O. D. Smith, of the Alabama Educational Association: The highest end of education is not the advantage of the power it gives a man for his own selfish uses or gratification, but it is to enable him to discharge the immutable obligations laid on him by his position in the world, by his relation to God and his fellow-man in all complex relations and activities of life. He who pursues knowledge solely for the sake of knowledge is little better than he who pursues money for the sake of money.

In our ideal of education and in our processes of working to that ideal we must not ignore the individuality of the pupil, his special talents and aptitudes. For his success and usefulness in life will be in working in fields of labor indicated by these special endowments. Therefore in his education those subjects should be selected as instruments of discipline and drill which will best develop them. Why waste time and effort to make a musician of one who has little musical talent or a mathematician of one who has no aptitude for mathematics? There is no Procrustean mold by which mind may be fashioned like castings in a foundry. It is not to be beaten, like iron, into a desired form by sledge-hammer blows of drill. Let the teacher also remember he can not create a faculty, or a power, or an aptitude that does not exist. Rather let the teacher direct his efforts to the development of those powers and faculties that respond most readily to discipline and drill in a vigorous growth and give promise of most fruitful results. This principle is being recognized in our educational institutions by wider latitude of selection in elective studies and in the differentiation of courses.

But in the selection of courses of study we should always be guided and limited by the true ideal of growth and development, and not sacrifice it to the mere acquisition of knowledge, however desirable. Let the teacher never forget that in real education we seek for results in the man himself. The object of disciplinary mental training is not to amass knowledge, but to enlarge, strengthen, and sharpen the mental powers.

While education and the acquisition of knowledge are generally coincident, they are by no means necessarily identical. It is a fact of common experience that a man may be educated in the true sense of the term without having acquired much knowledge. In fact, the amount of knowledge of any subject one can acquire at school is necessarily limited. So on the other hand a man may be a walking encyclopedia and yet have but little education, because such a man can not transmute his knowledge into power, into dynamic intellectual and moral force.

The question the busy, bustling, rustling world asks is not, How much does a man know? but, What is he? Every avocation and profession has a place for the man that is most, not the man that knows most. It is a matter of comparatively little importance whether he was educated at this or that school, or any school, whether he graduated from this or that college, or any college. The plain

blunt question the world asks and has a right to ask is, How much is there of the man, how much to him, and in him? What can he do? Do in fields of labor, in the pulpit, at the bar, in the shop, on the farm, do in all the multiplied activities of life? This popular demand is playing havoc with certificates and diplomas.

The questions that confront the young men of to-day on the threshold of active life are not, Have you studied this, that, or the other brand of knowledge? but, What have they done for you? not, Have you been to school, the college, or university? but, What have these institutions accomplished for and in you? Have they made you men of thought, of persistent purpose, of executive ability, of moral and intellectual force, men whose capacities are so developed, so disciplined, under such command that you can put them to the best service in doing the world's work?

The world needs such men and will find a place for them. It is quick to recognize genuine education; as quick to reject the counterfeit, by applying the crucial test of power, the ability to do.

It seems to me, then, that the true ideal of education is the training, discipline, and development of the germ faculties of man existing in embryo in the child. It has been comprehensively defined, "the harmonious and equable evolution of the human powers." In a broader and deeper sense than we generally understand, "the child is father to the man."

A true ideal of education will correct the prevailing misapprehension as to what constitutes a "practical education." There is no gainsaying that our marvelous material development, the rapid increase of wealth, the abnormal thirst for accumulation, are seriously and dangerously affecting our ideals and methods of education. *Cui bono?* is the question on the ready tongues of pupils and parents. This question expresses a prevailing theory of education. It is the more dangerous because there is a modicum of truth in it, an apt illustration of the aphorism that "half truths are the most dangerous errors."

That the chief end of education is not to qualify a man to get a living is obvious, because life was given for a higher purpose than to toil for its own prolongation. It is, then, a grievious mistake to throw away life in the effort merely to get a living, or to throw away the preparation for life in the preparation to get a living. Real education sends one into the world tenfold better equipped to attain the very objects deemed so desirable by the advocates of the so-called practical education.

It is claimed to be especially adapted to the "industrial classes," a vague, illusive, and misleading expression, based upon the pernicious idea of class distinctions. So far as it has any meaning it includes all who do not belong to the "professions," *i. e.*, law, medicine, and the ministry. But I insist if there is any form of education that makes men stronger, wiser, nobler, the farmer, the artisan, the merchant, he who in any capacity is to be the director of labor, the controller of men, needs that education to its fullest extent. What the world needs and is asking for is not technical training and manual skill alone, valuable as these are, but, in the various industries, men of good brain, well-trained intellect, of stalwart vigor, men of conscience, of fair culture, of sound judgment, ready in business, in the market, in the forum, in the workshop, on the farm, to meet the obligations and discharge the duties pertaining to family and society, state and church. The true ideal of education recognizes and emphasizes the truth that behind the merchant, the mechanic, the farmer towers the man, and the man is more than his business or profession.

The distinction between practical and any other kind of education is unphilosophical. All real education from beginning to end is practical. Is not that education practical that develops a man's capabilities, that reduplicates him? Is it not of practical benefit to subject the intellect to those forms of study and training which will evoke its latent resources? Just so long as manhood is a force of practical value in whatever his business or profession, just so long must we account that education practical which augments and enriches it.

Let mere information take a secondary place.—James P. Munroe, in the Educational Review: It is not what we teach, it is how we teach, that is essential. In attempting to improve the public schools the mistake has been made of increasing the curriculum instead of the teaching force. Given the tools of reading, writing, and figuring, the good teacher will make one further study, if need be, serve every purpose of primary education. The mental vice of these newspaper days is superficiality. This vice the schools are doing much to encourage. Make the child accurate, thorough, persistent, logical, and let mere information take a secondary place. If he has acquired these qualities he has

learned how to study; in teaching him how to study the school has done its work. Beyond giving him the tools of knowledge the primary teaching can do little toward increasing the child's stock of information. That will come to him outside the schoolroom. As said above, and as can not be too often said, the school is a gymnasium for making the child's mind acquisitive and receptive. The teaching of many subjects does not conduce to this. The immature brain is naturally restless and roving; it is for the school to give it the power of concentration. A child's mind is impatient and easily diverted; it is for the school to teach it patience and perseverance. A hasty clutching at many things is easier and pleasanter to both teacher and pupil than thorough mastery of one thing; but the child who has really conquered one subject is he who, in manhood, will win the knowledge of a thousand.

The constituents of a sound education.—President E. B. Andrews, of Brown University: Speaking succinctly, the constituents of a sound education are, first, character; second, culture; third, critical power, including accuracy and also sympathy with all the various ages, nationalities, and moods of men; and fourth, power to work hard under rule and under pressure.

We see that here mere knowledge is left out of the account. It is quite incidental and relatively insignificant. Yet, this is what most people have been wont to regard as the sum and substance of education. We see, too, that the question what studies are to be pursued is not mentioned, although many continually place it first. It is not unimportant. It would be pleasant to go into it deeply. Were we to do this, however, we should not enter the lists for the classics on the one hand, or for the sciences of nature on the other, but should urge rather the propriety of giving a much larger place in the curriculum than has ever been given hitherto to the political sciences. But the structure and material of the curriculum is not to-day the most pressing educational question.

The definition makes character part of education, and even gives it the first place. All reflecting persons are coming to feel that unless schooling makes pupils morally better, purer within, and sweeter, kinder, stronger in outward conduct, it is unworthy the name.

Culture comes next, by which is meant the power to apprehend and relish the beautiful in conduct, in act and literature, and in nature. Education must enrich life, not enlighten it merely. Culture stands in importance close to character, to which it is also very intimately related in essential nature, and it is far more to be sought than mere mental ability.

Third comes critical power, and mainly in the two great elements of accuracy and sympathy. Memorable ever is the thought of Cardinal Newman, that the principal part of a good education is accuracy. That one's mind is full signifies nothing unless the contents are definite and analyzed. A little knowledge well grouped and ordered comes much nearer the ideal education than infinite funds lying unassorted in the mind like so much raw ore.

To be accurate requires that of many things a finite mind should deliberately remain in ignorance. To read all the books relating even to a subject in which one is especially interested would be a positive disadvantage. Too much information in detail confuses the mind, confronting it with a blurred, indefinite picture that can be of no service to it, instead of those clear, crisp, comprehensible outlines which are so valuable. Large newspaper reading is deleterious to clear thinking beyond perhaps any other of the numerous causes operative in that direction at the present day.

Accuracy must be accompanied by sympathy, the power to draw near to men of all the different ages, civilizations, and temperaments, knowledge of the race, of the world, and of God. Here is where the importance of historical study comes in. "There is one mind," says Emerson, "common to all individual men. Every man is an inlet to the same and to all of the same. He that is once admitted to the right of reason is made a freeman of the whole estate. What Plato has thought, he may think; what a saint has felt, he may feel; what at any time has befallen any man, he can understand. Who hath access to this universal mind is a party to all that is or can be done, for this is the only and sovereign agent." The true scholar must enter into this mind; the door to it is sympathy; the latch, history.

An important element of sympathy is freedom from prejudice; the power not to dismiss unstudied or contemned a view which at first sight strikes you as strange or even as false. This power is one of the very best tests of a truly educated man. If you can not to a good extent feel with your opponent, you duly weigh his argument; and without this your disputing with him will but saw the air.

With all these qualities must go self-mastery for each important purpose of life, the power to put and hold oneself to work, and to turn off large relays of intellectual or other work in a short time. This, too, is an essential ingredient in education.

We ask too much from [school] education.—Frederic Harrison, in the Forum: Many things work delightfully for good while they are spontaneous and unorganized, but when they are stereotyped into an elaborate art and evolve a special profession or trade of experts they produce unexpected failures and end in more harm than good. We ask too much from education, we make too much of it, we monstrously overorganize it, and we cruelly overload it. Education can do for us infinitely less than we have come to expect, and what little it can do is on the condition that it be left simple, natural, and free. I have known very few men who were made into anything great entirely by their education; and I have known a good many who were entirely ruined by it and were finally turned out as pedants, prigs, or idiots. Struggling to win prizes in examinations, thinking always about the style current to-day, being put through the regulation mill, and poring over some little corner of knowledge for some material object, may give a one-sided appearance of learning, with nothing behind it; will turn out mechanical eccentricitics like calculating machines; may change an honest fellow into a selfish, dull brute, or leave a weak brain softened and atrophied for life. And the more we organize education the greater is the risk of our finding this result.

The school reverses the plan of nature.—James L. Hughes, inspector of Toronto public schools (Canada): In the school of the future the pupil will originate most of the problems. The solution of problems is not so difficult as their conception. The power to recognize problems definitely is infinitely more important than the power to solve them. The most marked characteristic of childhood is its power to recognize the multitudes of new problems by which it is surrounded, and because this power is so strong it is therefore possible to develop it rapidly and definitely, and it was intended that it should so develop through the recognition of our material environment to the power of clear conception of all the problems connected with our intellectual and spiritual life.

Yet this power grows weaker instead of stronger as we grow older. The schools absolutely reverse the plan of nature. Before the child goes to school he discovers his own problems and solves most of them unaided. The few that he can not comprehend he brings to his seniors. When he goes to school his teacher brings the problems to him. Nature made a questioner, a seeker after truth; the school makes him an answer. Nature made his mind to think; the school makes it a receptacle for other people's thoughts. Nature gave him power to see the relationships between himself, and his environments, and his fellow-men, and his Creator; the school dwarfs this power by preventing its activity. We are often startled at the simplicity of new discoveries and inventions, and we wonder why we did not make them ourselves. Every new discovery or invention is merely the solution of a new problem in the relationship of natural forces. The power of solution depends on the power of recognition. We could have solved the problems if we had been definitely conscious of them. They were near us but we did not see them. If we had the power to see clearly the thousands of physical, intellectual, and spiritual problems that are ever near us, how swiftly the world would move onward; how definite would be our conscious growth towards God. But the schools train men to solve, not to find problems; to answer questions, not to recognize the mighty questions that need answering, and so there is not so much power of original investigation and independent growth in the world as there should be. The school of the future will preserve and develop the child's conceptive relationship to nature and God, intellectually and spiritually.

Fear has its place in the training of the will.—Report of committee of National Council of Education, George P. Brown, chairman: There is a prevailing sentiment that incentives suggestive of pain are to be abolished from our curriculum of will-training. The anticipated pleasures of right doing are to be substituted everywhere for the anticipated pains of wrongdoing. This finds expression in some large cities in the abolition, by order of the school authorities, of all punishment. The pulpit is influenced by this sentiment oftentimes to the extent of ignoring punishment for sin. The family is often dominated by the child's impulses for the reason that it is unable to make desire, reverence, or interest effective in giving dominance to ideas of obedience, and it rejects the incentive of pain as brutal. It is the conviction of the writer of this paper that fear has its place among the incentives in the early training of the will.

Original thinking wanted.—G. Stanley Hall: I would rather have a boy who has but little training in college attempt to add something to the world's knowledge than to attempt to attain a high state of learning.

What the young should know in advance and realize.—William James, professor Harvard University: Attention and effort are, as we shall see later, but two names for the same psychic fact. To what brain processes they correspond we do not know. The strongest reason for believing that they do depend on brain processes at all and are not pure acts of the spirit is just this fact, that they seem in some degree subject to the law of habit, which is a material law. As a final practical maxim relative to these habits of the law we may then offer something like this: Keep the faculty of effort alive in you by a little gratuitous exercise every day. That is, be systematically ascetic or heroic in little unnecessary points, do every day or two something for no other reason than that you would rather not do it, so that when the hour of dire need draws nigh it may find you not unnerved and untrained to stand the test. Asceticism of this sort is like the insurance which a man pays on his house and goods. The tax does him no good at the time and possibly may never bring him a return. But if the fire does come his having paid it will be his salvation from ruin. So with the man who has daily inured himself to habits of concentrated attention, energetic volition, and self-denial in unnecessary things. He will stand like a tower when everything rocks around him and when his softer fellow-mortals are winnowed like chaff in the blast.

The physiological study of mental conditions is thus the most powerful ally of hortatory ethics. The hell to be endured hereafter, of which theology tells, is no worse than the hell we make for ourselves in this world by habitually fashioning our characters in the wrong way. Could the young but realize how soon they will become mere walking bundles of habits, they would give more heed to their conduct while in the plastic state. We are spinning our own fates, good or evil, and never to be undone. Every smallest stroke of virtue or of vice leaves its never so little scar. The drunken Rip Van Winkle, in Jefferson's play, excuses himself for every fresh dereliction by saying, "I won't count this time." Well! he may not count it, and a kind Heaven may not count it; but it is being counted none the less. Down among his nerve cells and fibers the molecules are counting it, registering and storing it up to be used against him when the next temptation comes. Nothing we ever do so is, in strict scientific literalness, wiped out. Of course this has its good side as well as its bad one. As we become permanent drunkards by so many separate drinks, so we become saints in the moral, and authorities and experts in the practical and scientific spheres, by so many separate acts and hours of work. Let no youth have any anxiety about the upshot of his education, whatever the line of it may be. If he keeps faithfully busy each hour of the working day, he may safely leave the final result to itself. He can with perfect certainty count on waking up some fine morning to find himself one of the competent ones of his generation in whatever pursuit he may have singled out. Silently, between all the details of his business, the power of judging in all that class of matter will have built itself up within him as a possession that will never pass away. Young people should know this truth in advance. The ignorance of it has probably engendered more discouragement and faint-heartedness in youths embarking on arduous careers than all other causes put together.

What every boy is entitled to know.—President D. C. Gilman in the Cosmopolitan: Until he reaches maturity every boy requires positive guidance from those who have had a longer experience in the ways of the world. It is always cruel, and it may be criminal, to allow a youth to experiment for himself upon conduct—to say that he must sow his own wild oats, that experience is the best teacher, that he must choose his own course. Every boy is entitled to know what older persons have discovered of the laws of conduct, and to receive restraint, caution, and warning until his eyes have been opened and his power of judgment developed. Nobody questions that he ought to be taught the laws of health, of diet, of poisons, of climate, or the laws that protect his person and his property; and it is surprising that anybody should question his right to initiation, by stringent discipline, into the laws of intellectual and moral well being. Every boy, whether he wishes it or not, should be trained. Yet the contrary doctrine is covertly held, if not openly avowed, by many a tender mother and by many a generous father. Note the autobiography of John Stuart Mill.

Too intense introspection not wanted.—President Gilman (*Ib.*): The influence of modern psycho-physiological inquiries upon the coming generations is still undetermined. The good that is aimed at may perhaps surpass the evil that is

done. Certainly, in these days when morbid self-consciousness, extreme sensitiveness, bashfulness, shyness, and timidity are so frequently apparent, the wise parent, the wise teacher will hesitate before encouraging in his own family or his own school too intense and too prolonged introspection. Give the boys plenty of open air, and when they can not have this, encourage within-doors exercise in handcraft, the use of tools, and knowledge of the book of sports, not to the exclusion of other studies, but as collateral security that the mind and the body shall be simultaneously developed. * * *

Healthy, out-of-door lives, directed toward objects of enjoyment, of observation, of sport, of acquisition, are better for boys than exclusive devotion to books, and especially than habits of introspection, self-examination, casuistry, journal writing.

Home and school training contrasted.—James P. Munroe, in the Educational Review: The home and the school are two wholly different forces brought to bear upon the growing child. Each has its proper sphere, and the methods of the one have no place in the system of the other. Judiciously exerted, one supplementing the other, these two influences should produce patriotic, moral, well-balanced citizens. No argument is needed to prove the unfitness of school methods to home training; there should be no need of proof that home methods have little or no place in the school. The child whose parents treat him from the standpoint of the pedagogue is a pitiful creature, starved morally, surfeited mentally. A child who has been trained in a "home" school, by methods which have no right beyond the walls of a house, is even less well fitted for good citizenship. Home training should be always indirect, persuasive; school training direct, authoritative. Home must be suggestive; school training, mandatory. Home training should be mainly by example; school training by fact and precept. Home training must leave free play to the child's mental growth; school training must prune and control that growth. The home fits the child to be a man, the school prepares him to be citizen; one is natural, common to humanity, the other artificial, peculiar to the state. It is seldom that the proper combination of these two elements is reached. * * * The right moral training tempers love with duty and duty with love. This moral training can be perfected only within the home. School life is but a mental gymnasium in which to make the child receptive and acquisitive.

To be preferred to any sort of learning.—Locke: Under whose care soever a child is put to be taught during the tender and flexible years of his life, this is certain, it should be one who thinks Latin and languages the least part of education; one who, knowing how much virtue and a well-tempered soul is to be preferred to any sort of learning or language, makes it his chief business to form the mind of his scholars and give that a right disposition, which if once got, though all the rest should be neglected, would in due time produce all the rest; and which, if it be not got and settled so as to keep out ill and vicious habits, languages and sciences and all the other accomplishments of education will be to no purpose but to make the worse and more dangerous man.

The great end of all teaching.—Tate's Philosophy of Education: Without losing sight of the importance of practical knowledge, especially at the later stages of elementary instruction, the truly enlightened educator will ever regard the development of the faculties as the great end of all his teaching; but from the various useful matters of instruction he will always select that which is best calculated to secure this end, and his mode or system of teaching will always have a reference to the same great end. The question with him will not be, Have I conveyed the greatest amount of technical knowledge in the least time? Have I engrafted the ideas of the man upon the mind of the boy? but it will rather be, Have I awakened any element of intellectual or moral vitality which had hitherto lain dormant? Have I invigorated or purified any faculty which had hitherto existed in a feeble or in an imperfect state of development? And has all this been attained with a due regard to the future pursuits and destiny of the pupil?

As to self-education.—Charles A. Dana: The worst school that a man can be sent to (and the worst of all it is for a man of genius) is what is called a self-education. There is no greater misfortune for a man of extraordinary talent than to be educated by himself, because he has of necessity a very poor schoolmaster. There is nothing more advantageous to an able youth than to be thrown into contact with other youths in the conflict of study and in the struggle for superiority in the school and in the college.

V.—Higher Education.

College-bred men in the business world.—Andrew Carnegie: The total absence of the college graduate in every department of affairs should be deeply weighed. I have inquired and searched everywhere in all quarters, but find scarcely a trace of him. Nor is this surprising. The prize-takers have too many years the start of the graduate; they have entered for the race invariably in their teens—in the most valuable of all the years for learning anything—from 14 to 20. While the college student has been learning a little about the barbarous and petty squabbles of a far-distant past, or trying to master languages which are dead, such knowledge as seems adapted for life upon another planet than this as far as business affairs are concerned, the future captain of industry is hotly engaged in the school of experience, obtaining the very knowledge required for his future triumphs. I do not speak of the effect of college education upon young men training for the learned professions; but the almost total absence of the graduate from high position in the business world seems to justify the conclusion that college education as it exists is fatal to success in that domain. The graduate has not the slightest chance, entering at 20, against the boy who swept the office, or who begins as shipping clerk at 14. The facts prove this.

Henry Clews: I have given it some thought, and my conclusions are the result of experience. I might say in beginning that I do not employ college men in my banking office. None need apply. I don't want them, for I think they have been spoiled for business life.

After spending several of the best years, the years when the mind is most active and most open to impression, in learning a lot of things which are utterly useless for business, they come to the cities to make their way in the world. They are perfectly ignorant of business methods. Their whole education has tended to shut their minds to knowledge of this kind. While they have been at college other men have been in the business offices, have begun at the bottom and have worked up, learning all the details, getting that knowledge which can not be set down in books.

Now, the college graduate is not willing to begin at the bottom. He looks down on the humble place which he is fitted to fill. And, indeed, he looks down on all business as dull and unattractive. He wants a place such as his education and his years seem to command. This place he can not get, for he has as yet the A, B, C's of business to acquire.

And even if he does bring himself to accept the place, which he must accept if he would have any measure of success, he does not utilize it in a way to advance. His thoughts are not with his business, but with his books, literature, philosophy, Latin. Now, no man can approach the exacting business life in this half-hearted way. Business requires the undivided mind.

Winthrop D. Sheldon, in the New Englander and Yale Review:[1] It is not less education, but more and better, that is needed in business life, an education that is so all-around as to give a larger success than the mere accumulation of a fortune. Hitherto such have been the unexampled opportunities for fortune-making, always to be found in a new and undeveloped country, that multitudes of men have "stumbled" into wealth, not because of any special capacity of their own superior to that of their neighbors, but by some happy accident. The attainment of riches by no means proves that a man possesses superior ability in any large sense of the term. Indeed, it has been well said that very often the rich man in a community is conspicuously stupid, ignorant, and narrow-minded outside of his special sphere. This is the natural result of a lifetime's "money-grubbing," when all of a man's thoughts and energies are concentrated upon the one object of making money for money's sake. If it be true that comparatively few of the college-educated win a great fortune, it is doubtless due in great measure to the fact, which is much to their credit, that such men have too many and diversified intellectual interests to be able or willing to turn themselves into mere money-making machines. Thereby the community at large is greatly the gainer and its common life is preserved from becoming mercenary and sordid. * * *

Does it not involve a serious impeachment of the standards of business capacity to maintain that a youth of 14, who goes at once into a store, his mental powers as yet comparatively undisciplined, and spends the next few years in

[1] The other extracts upon this subject given in this connection were compiled by Mr. Sheldon in illustration of his argument in the New Englander. Most of them appeared originally in the New York Tribune in reply to Mr. Carnegie's assertion.

sweeping it out, running of errands, and tying up bundles, is more likely to achieve a pronounced business success than the college graduate, who meanwhile has been schooling himself to accurate thinking, cultivating his powers of observation and reflection, storing his mind with a wide range of knowledge and bringing it into permanent relation with those things which adorn and dignify our lives and make them really worth the living? The education of the store and the counting room or the shop, exceedingly valuable in its way, is in the comparison essentially narrow in its scope; and, narrow and narrowing, it is going on during the very years when the question is being determined in the case of most persons whether their future life is to be of a narrow or of a broad gauge pattern. The great mass of business men are men of mere routine; they are made such by their lack of a thorough general education and by the narrow lines of their early training, and the trend of their lives is to confine them in this mental bias. The man who brings to the routine of his work a broadly trained intelligence will be worth in the long run a great deal more than he who for lack of such intelligence is a slave to routine.

President Seth Low, of Columbia College (who has been himself a business man): While it is harder for a college graduate to get started in business than for one who enters it as a boy, in five years from the time he does start, other things being equal, the college graduate will be the peer in business of his friend who began as a boy, and while equally successful in business he will fill a much larger place in the community than the one-sided man can ever hope to fill.

James W. Alexander, a Princeton graduate and vice-president of the Equitable Life Assurance Society of New York: However it may be with the boy whose talents, temperament, and environments are such as to limit his prospects and ambition to a life of physical labor in a subordinate capacity, who can doubt that the boy who has within him the germ of some future master in affairs will be all the more of a leader by reason of a thorough college education and even that he will outstrip in the mere matter of time the boy whose only training was sweeping the shop or adding up columns of figures at a desk? It is the successful men we are talking about. And when the shop-bred boy reaches the high station to which his abstention from college education has assisted him, does it require argument to prove that he would be a more useful, a more influential, a more attractive man if he could have added to and combined with his industrial training that knowledge, science, literature, and philosophy to the mastering of which the college is the open door?

Mr. Charles L. Colby, a graduate of Brown University and president of the Wisconsin Central Railroad: I admit a man may succeed in banking or business without an education, but I earnestly believe that if two men of equal ability start together in the race, one an educated man and the other without college training, the college man will win every time in the long run. Machinery and methods are constantly changing. The uneducated do not readily comprehend them and must be instructed step by step. The more a man is educated, the more readily he adapts himself to these sudden changes in business methods. When it comes to the scientific, technical, brain requirements of a calling, the college man moves easily ahead.

Mr. Daniel Heald, a Yale graduate and president of the Home Insurance Company of New York: I believe the success I may have attained in the world is directly due to my college training. I there acquired system, analysis, and methods of thought that have been of inestimable value in life. If nature has given a man fair talent education will make better a man of him and positively aid him in his daily work. Suppose a boy is going into any manufacturing business—making pumps, for example. Give him an education. He will make better pumps because of it. Strip the rich, uneducated man of his wealth and what is left? What we want in American life is the ripe, well-rounded man of affairs.

Gen. Brayton Ives, a Yale graduate: Given a boy with a natural aptitude for business, his college training, particularly in methods of thought, will afterward be of such practical aid as more than to offset the loss of those years in business. Observe that learning how to learn is the summarized advantage of a college training; that is, it is the discipline which the boy obtains at college that enables him to learn after he leaves college and learn more rapidly, readily, and intelligently than his uneducated competitors. I can trace every step in my own career to the influence of my college course, and as every man can, of course, speak best of his own life, it is not egotistical to be personal. I was graduated from Yale in 1861, entered the Army, and instantly found my training of the utmost benefit. Being accustomed to study, I mastered the tactics more easily and in less time than was required by men whose minds had not been trained.

This enabled me to compete with men who had been there much longer than I and was the cause of much more rapid promotion than I could have gained otherwise. All the progress I have since made in civil life, including that of my present occupation—banking—is directly traceable to the special advantages afforded by my education. A man of ability educated is better, no matter where he may be placed, than a man of ability uneducated.

Chauncey M. Depew, a Yale graduate: Have the eight years passed in the preparatory school and the university, acquiring many things which would be useless in the factory or store, been thrown away? My observation leads me to directly the contrary opinion. The college-bred man, under equal conditions of capacity and health, has a trained intellect, a disciplined mind, a store of information, and a breadth of grasp, with the fearlessness which it entails, that enable him to catch up with and pass his rival. Hundreds of college graduates within the last five years have begun in the various departments of railway work at the bottom. They were firing on the locomotives, working in the machine shops, switching in the yards, keeping books in the treasurer's office, serving in the freight and passenger departments, and my observation of them for this period has demonstrated the value of a college education. It used to be a popular theory that strong men who had won great places in the business world would have been ruined if they had been educated. The better belief is that on account of genius and special capacity they succeeded in spite of their disadvantages. It is the old question of the trained boxer, runner, athlete, debater, soldier, as against unskilled strength and courage. Whatever the popular delusions, in the trials there never has been but one result.

Winthrop D. Sheldon: Mr. Carnegie must have been gazing at the mountains and craters of the moon, inquiring and searching there, when he asserted the "total absence of the college graduate in every department of affairs." Had he taken pains to look about him he would have found successful college-bred men of business almost under the eaves of his factory in Pittsburg itself. If inquiry were to be made every important commercial or manufacturing center would furnish some conspicuous examples of the college man of affairs. Mr. James W. Alexander, from whom we have already quoted, reënforced his views with a list of 65 college graduates prominent in business circles and selected at random, mostly from New York and vicinity, and other names almost if not equally as significant will occur to every observant person. From an analysis of the list we notice that there are 15 railroad officials, including, besides vice-presidents and general managers, 6 presidents, among them Chauncey M. Depew, of the New York Central system; Charles Francis Adams, of the Union Pacific; Austin Corbin, of the Philadelphia and Reading, recently chosen president of the New York and New England; and to these we may add the late Frederick Billings, at one time president of the Northern Pacific; the late Levi C. Wade, of the Mexican Central, and Presidents Bishop and Watrous, of the New York and New Haven Railroad. There are also 18 bankers, including a number of bank presidents, 10 manufacturers, 10 merchants, 7 heads of prominent trust and insurance companies, and 5 heads of leading publishing houses. Certainly neither the late Alexander T. Stewart, the prince among dry-goods merchants, nor the late John Jacob Astor, who had the reputation of being an excellent business man, found the education which they obtained, respectively at Dublin University and Columbia College, any impediment whatever in the way of their success. It is said of the former that he retained his interest in his college studies to the latest years of his life.

Mr. Sheldon sums up as follows: The great mass of those who enter the various occupations of the business world could not, if they would, receive a college education. Most of them would not improve the opportunity if they had it, and it would be of no advantage to most, because they are not fitted to profit by it. But the youth who can have such an education, and is fitted to profit by it, is on no account justified in rejecting the opportunity for fear it will incapacitate him for a successful business career. Let him get all the education he can, in the full assurance that he will be more of a man, and therefore, more of a business man; not a man of an affair, but a man of affairs. For what men are in any one phase or province of their lives is largely determined by what they are in every other. No part of the individual life can escape the uplift which a thorough education gives to the entire being. And the young graduate who decides to set his face towards a business career has no occasion to look upon the four years of his college life as thrown away or to feel that he is handicapped in the race for success. It is not necessary for him to begin where the boy of fourteen begins, whose age and lack of training unfit him for anything higher than plying the broom and

running of errands. His age, mental training, and general maturity enable him to apply himself at once to the study of business methods themselves. Nor can any fixed rule be laid down as to the length of his novitiate. That will vary according to his ability, industry, and power of adaptation, and also according to the nature of the business which he has undertaken to learn. It may, in some instances, be only months; it may require years to master all the details. But as he proceeds the practical value of his education will become more and more apparent. The success of college-bred men who have adopted a business career will compare favorably with that of business men in general. They have been successful, not in spite of their education, but in part because of it. Education is no magic key that of itself unlocks the doors of success in any department of life; but in business, as in other occupations, if joined to health, industry, energy, and common sense it will win a success of finer mold and more enduring, more satisfying quality; it will be its own justification.

Old vs. *new institutions of learning.*—President G. Stanley Hall, of Clark University: Age which brings wisdom may bring infirmities. In a time and land where change is so rapid trustees, alumni, and even faculties sometimes fall behind. Time is lost in administrative details better left to one. Young men are held back, and talent not held to its best thing, but kept doing the work of cheaper men, and the question may become pertinent why, with vast resources, so little is done for culture and for the advancement of knowledge by old institutions or comparatively so much by new ones. There is much to foster complacency and an unfortunate absence of competent criticism from without, whence all university reforms in history have really come. Prejudices may accumulate from without, and student custom and ideals grow up within that are as inveterate and ineradicable as they are vicious and absurd, but which make progress slow and hard. There is sometimes an excess of conservations, routine, and machinery. Saddest of all, perhaps, departments of endowed knowledge, like professors, sometimes cease to be productive and grow dry, formal, sterile, but they can not be displaced. It may be harder to regard an old institution as a means, precious only as it broadly serves the highest culture-interests of the whole nation, and not as an end precious in and for itself. We know how wasteful and unproductive the vast resources of Oxford and Cambridge had become in 1854, and what old abuses had to be corrected in Italy and Holland by such and other somewhat drastic outside means. In this new country we need new men, new measures, and occasionally new universities: and we, like England, have in later years experienced their amazing good. In the field of experimental science, unlike some other departments, what is there of importance, that a few centuries can afford, that can not be at least as well provided in a few years?

The differentiation of higher educational institutions urged.—G. Stanley Hall: We [at Clark University] duplicate almost nothing in other universities in this country. A full department of physics, chemistry, or mathematics even, to say nothing of biology, the complexity of which is more obvious, as sketched for us by several European leaders in their field, would each require several professors, each with one or more assistant professors to represent its several sections or departments of the subject. Thus, to say nothing of difference of grade or standard, it does not follow, because we have physics, chemistry, and other departments found in other institutions, there is duplication. The contrary is, in fact, the case. The best professors in their fields, however authoritative they may be in the entire department, excel in and contribute chiefly to but a few chapters of it, leaving ample space for other directions of excellence elsewhere.

In the new era of university development, upon which this country is now entering, it is of fundamental importance for economy and for the success of a great movement that, in place of the monotonous uniformity, duplication, and servile imitation that has prevailed, institutions should freely differentiate and should be known to do so; that above the commendable loyalty to local institutions by their graduates, there should arise the same comparative and critical discrimination of institutions as of courses in the same institutions under the elective system. Perhaps the chief benefit of the latter has been the stimulus it gave to every professor to make his course so profitable that it should prove attractive to the most of the best students. The same stimulus could be given to institutions by the extension of the elective system to them.

What a real university is.—Nicholas Murray Butler: The university is a wholly different institution from the college, and while in this country we have scores

of nominal universities, the real ones may be counted on the fingers of a single hand. A college in which the course of study is elective wholly or in part is not a university. A group of professional or technical schools is not a university. A college and a group of professional and technical schools taken together is not a university. A university must have for its heart and soul the great philosophical faculty of the Germans; the faculty which finds its reason for existence in the preservation of the humanities and in a careful and loving study of philosophy, philology, and letters. A university is marked by the time-honored freedom in teaching and freedom in study; it knows no trammels, no compulsion. It is not a disciplinary institution, but rather a field for research and investigation. At the university the bounds of knowledge will be continually widened and the leaders of the future generation in science and literature trained to their work. Professional schools or faculties, apart from the philosophical faculty, have always become technical and narrow—it is the philosophical faculty that is the real university center. Its spirit and insight must regulate and inspire all of the associated faculties.

VI.—KINDERGARTENS.

The kindergarten the great remedy for formalism in the primary school.—W. T. Harris: The school teaches the conventionalities of life; it gives the child access to the wisdom of the race, but it often errs in making its experiences to the child too formal. It is too rigid and unsympathetic, and the child is expected to throw off the freedom of the family at once, and all too soon assume the formalities of the world. Thus did the great need of a connecting link between the two call for some noble-hearted lover of his kind to suggest a change, and Froebel, whose memory all kindergartens, all true educationalists reverence, came to the rescue and supplied the need. The kindergarten takes the little one in his tenderest years, and by placing within his reach symbols and games suited to his comprehension, enables him to naturally, and without undue or forced effort, grasp and assimilate the ideas and teachings desired. It makes him notice what is going on in the great world around him, and seeing begets the desire to imitate. It leads him up from the initial stage of feeling to thinking, and from thought to action. But the games and plays are only a portion of the work; there are gifts and occupations. These are less symbolical and more logical, and train the quantitative faculties. A child does not readily realize what it means to think quantity; it is a hard and awkward step for him to take, and the idea of number, for instance, must be learned not by starting at a unit and adding, but by taking a divisible unit and dividing it; and thus Froebel, who perceived this point, introduced the divisible block. The kindergarten is the great remedy of this century for the formalism of the primary school, and it had been badly needed before it came to the rescue.

What children have a right to expect from the kindergartner.—W. E. Sheldon: Children have a right to expect that their individuality shall be recognized and respected; that their natural and hereditary traits shall be taken into account in their training; that all manifestations of interest in their development and culture shall be genuine; that an active and progressive intelligence shall be supplemented by a well-balanced self-poise of the trained kindergartner which the child will soon discover to be an element of true manhood or womanhood worthy of imitation; that their many questions shall be regarded as of importance and that the replies shall stimulate further respectful inquiries. Questions are the natural openings of the child's mind, which natural inclination prompts, and aid the teacher in the work of instruction. You should convince the learner that all proper inquiries are in order at suitable times and that it is a pleasure for you to answer them. If the inquisitiveness becomes unprofitable in character or in frequency use your best tact as the means of restraining it. Let the child appear to exercise the right of personal liberty and yet not gratify what may be really an unworthy curiosity.

Some straws.—The report of Superintendent Cassidy (Lexington, Ky.) declares the greatest need of the schools to be kindergartens.

Dr. James Mac Alister: To my mind to-day no problem is so important as the kindergarten universal.

Superintendent W. H. Love (Buffalo, N. Y.): The first change to be attempted in our school reform is to bring in the kindergarten or subprimary work.

VII.—Manual and Industrial Training.

Effect of industrial education upon general education.—Prof. Felix Adler: During an experience of 12 years in the application of manual training in the teaching of children between 6 and 14 years of age, I have observed that manual training in the ordinary school is the means of saving those children who are plainly and obviously deficient in what may be called literary quality. There are many children who are very slow in reading, in arithmetic, and in history, and it has been my observation that these children, especially numerous among the poorer classes, are at once stimulated intellectually by the opportunities of the school workshop. It has been my invariable experience that children who are slow in their progress in reading and history and mathematics are very quick in natural history and in drawing and in the workshop. Especially has the conjunction of a talent for natural history and for manual training frequently impressed itself upon me. The effect has been to stimulate these children not only in manual training and in natural history, but, awakening their self-confidence and self-respect, to stimulate them generally. Those boys who, in an ordinary public school, would be set down as dunces because they make no progress, and who would begin to consider themselves dunces after a while, find themselves *facile princeps* in the shop and in natural history, and gain the respect of others and take a new start. The best work in modeling and manual training in the school of which I have charge has been done by such pupils. Surely, therefore, this is an argument in favor of introducing manual training from the point of view of general education. If manual training can promote the intellectual training of a very large number of children defective on the intellectual side, that is a sufficient reason why it should be introduced.

Another result of my observation has been that the school-workshop is a means of strengthening the mathematics, the drawing and the elementary physics teaching. Although the main object, as the president has said, should be to educate the eye and the hand, nevertheless this education should not be unassociated with the other studies of the curriculum. The object should be to connect the manual training with the work of the class-room, and this can be accomplished by close connection between the work of the shop and the drawing, mathematics, elementary physics, etc. The pupils are asked to make their own physical apparatus, and geometrical figures are of course constantly brought before them, and many opportunities are offered for making their space perceptions more definite and clear. Another advantage in such a school brings me to what Professor Patten has said as to the function of the teacher taking the place of the military officer. It is very difficult for the teacher in the ordinary school room to discharge that function, but the teacher in the shop can do it. The pupils must present themselves before him before they go to work. He inspects their clothing and sees that they are neat, that they are neat in their work, that they put away their tools and keep them properly; he gives that personal supervision to the habits of his little workmen which should be given, but which the other teacher can not give.

In all respects I can say that we have found after 12 years of observation that the regular work of the school has been strengthened by the introduction of manual training, and especially the English work and the compositions. The great difficulty lies in controlling the expression of the pupil's thoughts, of knowing what is in the pupil's mind. The teacher must know this in order to be able to control the pupil's thought. By introducing shop teaching and requiring the pupil to describe the operations which he has performed in the shop, and to describe the work in the factories he visits, the master of the shop is enabled to know approximately the content of the pupil's mind and to control his manner of expression.

VIII.—Methods of Instruction.

The best methods of teaching modern languages.—Ex-President E. H. Magill, of Swarthmore College: What then do I recommend to the students of the modern foreign languages in our colleges? First, that they should rid themselves, once for all, of the idea that a little smoothly flowing, trivial conversation, upon topics of daily interest, in another tongue, is the *sine qua non*, and that they should not spend, not to say waste, their valuable and overcrowded time in acquiring this fluent speech. The "natural method" (so called) of teaching the modern languages, in its unadulterated state, I consider to be one of the greatest popular fallacies of modern times. The very expression, "natural

method," is in itself misleading and a misnomer. If it really were the natural method, it would surely commend itself to all educators. But it should be remembered that what may be natural for young children, in acquiring their own tongue, is by no means natural for more mature minds. Children acquire their language by simple imitation, often repeated, with little or no exercise of the reasoning powers. No such method is possible with older persons in acquiring a foreign tongue. I say that no such method is really possible, after the reasoning powers have made any degree of development; and I will add that, if it were so, there is not time in this short life for its successful application. How much of written and spoken language does a young child learn in two months? I need scarcely say that it learns nothing in this time except how to utter a few common words and phrases, and, of course, nothing whatever of written or printed speech. And yet, in two months a mature mind may acquire enough knowledge of a foreign tongue to enable him to begin to read it with pleasure, and in two more months to read with considerable rapidity, and begin to make the acquaintance of authors whom it is a privilege to know. The "natural method," I say then, for mature minds, is wholly unnatural and irrational.

Observe that I do not say that the ability to converse intelligently in a foreign tongue is a knowledge to be undervalued and despised; but I do say most emphatically that this knowledge can never be acquired except by daily association with those to whom the language is their mother tongue, without the expenditure of an amount of time entirely incommensurate with its real value. Those who are never to mingle with foreigners can have no practical use for the language as a medium of conversation, and for those who are to do this there is no more valuable preparation than that obtained from reading and hearing read by a competent linguist the language to be learned. That this reading may be extensive, even in the short courses which our colleges can afford, there must be a thorough ground work laid by becoming rapidly familiar with the forms and constructions of the language and the principal common idioms and a vocabulary should be acquired as fast as possible, after the forms become somewhat familiar, by reading the language even superficially at first; and reading not in the ordinary readers of mere fragments from various authors, but reading some complete selections from authors of unquestioned reputation.

Hence, I say, make the grammatical drill short, sharp, incisive; reduce the amount of grammar needed for reading to a minimum; and by all means never waste time in the bootless and wearisome task of turning good English into poor French in the early stages of the course. It is quite early enough for a student to begin writing original French when he becomes familiar, after a great amount of reading (partly superficial, for rapidity, and partly critical, for thoroughness of knowledge) with the manner in which other persons write it! But this is by no means to be understood as ruling out dictée exercises, which should be practiced almost daily from the beginning. It is excellent practice for a student to write out translations in English of the language studied, and then restore it to the language from which it was taken. Many points, which would escape notice entirely if merely translation into English were followed, would thus receive attention and be rapidly and firmly impressed upon the memory.

The one panacea in teaching Greek.—Thomas D. Seymour, professor of Greek at Yale: The most foolish thing in education is the suffering of words to be forgotten as soon as they are learned. For this evil but one cure can be found—review. If I am ever pronounced a monomaniac this is the subject which will be found uppermost in my mind. This is the one panacea which I offer for all ordinary ills and troubles in learning Greek: If the student learns with difficulty or forgets easily, if he has weak eyes or an aching head, if he has but little time for study or is behind his class, whether he wants to excel in Greek or wishes to take as little pains as possible with the language, let him review!

The principle of reviewing, of course, is this: If I am introduced to a man on the train and have a casual half-hour's conversation with him to-day I may be able to identify that man at once a year hence, or, having near-sighted eyes and thus a dull memory for faces, I may be compelled to say: "I remember your face very well, but I confess I can not say where I have met you before." But if I have a ten-minutes' talk with that man to-day, meet him on the street and exchange greetings with him next week, talk with him again for five minutes a month hence, see him and some of his relatives for a few moments in the spring, I could identify that man with certainty a year or ten years hence, although I had never spent in all more than half an hour with him. So with words. If a student meets a word to-day and is introduced to it, has a little

chat with it, as we may say, but does not meet that word again for two months, he is obliged to say: "Your face is familiar, but I can not call you by name. I must apply to my nomenclator for information about you."

The plan of reviewing which students should be urged to adopt, and which they must be stimulated constantly to follow, is to review the day's lesson as soon as possible after the exercise in the classroom. Only thus can the corrections which have been inculcated be fixed firmly in the mind. Otherwise when the student takes up that work after an intermission of one, two, or three days he is apt to remember only that something has been said on this or that point. Often he is not quite sure whether a member of the class gave one rendering and the teacher strongly preferred the other, or whether the case was just reversed. But if he reviews the work soon after the lesson is read he can not fail to remember the circumstances and the exact point that was made. Now, if once a week the student takes time (perhaps half an hour) to review all the Greek he has read during the week no special effort is required; he remembers the meaning of the words and phrases and the whole situation. Again, if once a month the student takes the time (perhaps an hour or an hour and a half) to review all the Greek he has read during the preceding month, no great effort is required; the words and constructions are familiar. Then the general review at the close of the term becomes what it should be, a look from a superior position over the whole field which has been traversed. Most of the details of that work are fixed in the memory for life, and even if they should become dimmed they may be easily brightened.

The only objection that can be raised to such a system of reviews is that it takes time. And so it does at first; but the time which is invested in that way bears the heaviest interest from the very outset. The advantage gained from the thorough appreciation of the situation, through the familiarity with the earlier portions of the work will be felt at once. The same words and constructions are constantly recurring, as the student will remember in his vexation when he is obliged to look up a word for the fifth or tenth time.

How to learn to read Greek as a living language.—Prof. Thomas D. Seymour, of Yale University (in school and college): If the teacher has not time to have the Greek both read aloud and translated, he should omit part of the translation and have all read aloud. * * *

This practice in pronouncing Greek words until they are as familiar to the ear as they are to the eye, should begin with the very beginning of the study of Greek. If this is neglected then the loss can never be made good.

Probably many of you are familiar with what the well-known archæologist, our countryman by adoption, who died less than a year ago, Dr. Heinrich Schliemann, has written with regard to his experience in learning foreign languages, in which he had unusual success. When he, as an errand boy in Hamburg, saw that his promotion in business could be gained only by a knowledge of the Russian language, he could find no teacher, but set to work with an old Russian grammar and a copy of a Russian translation of *Télémaque*, which he found at an old book stall. He read this Russian *Telemachus* aloud, and in order to force himself to persist in this, he hired, for a few cents a night, an old man who knew not a word of Russian to hear him read this work aloud for three hours every evening! Schliemann afterwards learned about a dozen other languages in a similar way, and believed with all his heart that his success in this matter was due solely to his patience and persistence in reading aloud.

If from the first the Greek is made thoroughly familiar to ear and tongue, the easy, oft-recurring words like those for *house*, *boy*, *man*, *woman*, *horse*, etc., would demand no more effort of mind for their apprehension than many English words, like *mansion*, *steed*, etc., which the school boy does not himself ordinarily use. And if the most frequent words require no effort of the memory the more time and strength are reserved for the rarer and more difficult words.

But the reading of the Greek aloud not only aids materially in fixing the meanings of words in the memory; it also renders important service in assisting the mind to grasp a clause or a whole sentence as a complex, and to receive the thought of the whole as a unit, rather than in separate details, each of which has to be disentangled from the rest. Thus, and thus only, does the beginner learn to read Greek as a living language, and he will find true literary enjoyment as he gains increased facility in reading without conscious translation.

The home-study of pupils.—Margaret W. Sutherland, in the Ohio Educational Monthly: The giving of work to pupils simply to give them home-work seemed a strange thing to me. In 22 years of teaching, that phase of my duty had never

presented itself. I had always determined what I thought a proper amount of work to require from my pupils and then allowed it to be done at any time they could do it. I believe very thoroughly in giving them work to do and then holding them responsible for the doing of it. * * * But I do not like the teacher to assume that she has the control of an hour, an hour and a half, or two hours, out of school time. Indeed, when one is among teachers, the question sometimes seems not to be "Have teachers any rights that parents are bound to respect?" but "Have parents any rights at all in their children?"

In the earlier years of school life, I can scarcely see the two sides to the question, "Shall a child study out of school hours?" It may be that my range of vision is narrow. I am ready to have it widened by any one who will give me more light. But these early years are so evidently a period for physical growth; nature so plainly points out the necessity for play; there is so much to be learned through childish investigation of the world lying about, that more than five hours of the day that ought to be much shorter than the grown person's day on account of the amount of sleep so necessary for proper growth, to be spent on school-work is eminently unwise. Psychologists and physiologists both warn us against the danger of overstimulation of the brain, which leads to "an increased activity of the organ due to an unfair distribution of the physical energy, the organ of the mind being enriched at the expense of the vital organs." I deprecate the requiring little children to do school-work at home, not only on account of the possibility of injury to the body, but because it does not seem to me best for the mind. There is danger of the mind's becoming jaded from continuing too long at the same kind of work. It loses its interest in a subject; and the strength of will is not sufficient to hold the attention firmly and habits are formed detrimental to concentration, that secret of success in all mental labor in later life.

There seem to me still other reasons why the teacher should not claim too much of the child's time out of school hours. I recognize the fact that our children come from a great variety of homes. Surely, many of them have work to do at home. This is particularly true of our girls in the cities and of both our boys and girls in the country. This work is often manual training of a valuable kind; and when there is not too much of it, it affords a healthful variety to the child.

There are parents—and I do not want to think their number pitiably small—(if it be, our schools must have done lamentable work in the past and are responsible for miserable failure) who can advise good reading for their children, and who wish them to have some time for acquiring that taste for good books that is rarely acquired if not in childhood or youth. Some one suggested that our schools were doing this work in literature as part of the regular school work. The amount done in this line in even our best schools is pitiably small. What cultivated parents would be at all satisfied with it? We shall do well if we teach the children in our schools how to read a good book and then direct them to some good books. It is a noble thing to inspire a love for good books in the child who has no one at home to be to him an inspiration. To guide and inspire is the design of the "Reading Circle for Children." Shall we interfere with its good work by sending home so much spelling to be studied or so many problems to be solved?

The girls in our higher grammar grades must receive our special thought when we are considering this question of home study. We are either criminally ignorant or cruelly thoughtless if we do not give our girls special care at the transitional period of their lives. They so especially need plenty of fresh air, sleep, and all attention of those interested in their well being to keeping them free from anxiety and nervous feeling. Let them pass this period in safety, and they develop into strong women, capable of a great amount of mental labor, and of wonderful endurance where love demands it. Of a bright and sunshiny disposition, they scatter blessings wherever they go. On the other hand, if they are given work that curtails the time that ought to be spent out of doors, work that prevents their being sound asleep before the grown members of the household, or worse than all, if they are worried about class standing or high per cents, they are apt to carry through life seeds of suffering that will render impossible prolonged mental effort without serious danger, seeds of suffering that will make them break down under any severe trial or make them peevish and fretful or selfish and despondent.

A grievous defect of our system.—President O. D. Smith, of the Alabama Educational Association: I am satisfied that too much stress is laid on results achieved by pupils and far too little on the effort and labor bestowed. One of the griev-

ous defects of our sytems of marking, rewards, and distinctions, is that it takes no account of earnest, conscientious effort, of severe, persistent labor, unless they have been successful. The dull pupils, those hampered by an adverse environment, by want of preparation for work required, feel the injustice of such systems; to their other obstacles is added the discouragement of unappreciated effort. I insist that honest, hard work rank highest in all estimate of school work. Let the student feel that work is the valuable thing to him in its results in achieving a real education.

There is danger also that our improved methods, superior appliances, the processes of the new education will insensibly infuse into the minds of teacher and pupil the fatal notion that there is an easy road to education, over level plains, by the still waters, through rosy bowers; that the old, rugged road, up the hill Difficulty, with its briars and brambles, rocks and rough places, traveled with toil and sweat, has been abandoned.

The schoolmaster of the olden time had one qualification worthy of imitation, he believed in and exacted work.

Just so far as the improvement in processes, methods, and appliances have stimulated and facilitated work, so far as they have made a given amount of work effective, they are a positive good; so far as they supersede the necessity of work they are an evil. One must work out his education as well as work out his salvation.

Vicious modes of recitation.—President E. B. Andrews, of Brown University: A vicious mode of handling your class will do very much to develop inaccuracy, more perhaps than a perfect curriculum can overcome. A recitation which is merely that, only a text to the pupil, embodying no instruction, is sure to promote superficiality. There is a knack of reciting which many will acquire: a habit of mere glibness and parroting will follow, and the mind be turned away from real attainments. Here lies one of the teacher's chief temptations. We are forced to cherish rapid and fluent class exercises, because they save us time, which is so precious. We are thus beguiled into treating, if not considering, those as the best scholars whose tongues wag the fastest in the class. Next, our own ideas as to what a recitation should be become confused and faulty, the final result being that the appearance of attainments is substituted for attainments themselves, and that the pupil is actually aided by us to lose sight of his own real growth, only to be awakened, perhaps too late, when out in active life he is called to match himself with those trained upon a more thorough plan.

Every day's lesson an examination.—William A. Mowry, in Education: In primary and secondary schools almost every day's lesson is an examination, not merely of what has been prescribed to be learned for that special occasion, but indirectly and incidentally of all that has been taught before on the subject. It is, in truth, the mark of a good teacher to keep a perpetual informal review on foot, and to cause his classes to feel that any past acquisitions are always liable to come up in new connections.

College entrance examinations.—President D. C. Gilman, in the Cosmopolitan: I believe that the day is coming when there will be a revision of our educational creed, when the colleges will not make their entrance examinations such rigid tests of memory as they are now, but will contrive to make them tests of power. Is a boy capable of carrying forward the studies of the college? That must be found out. His capacity to retain and repeat what he has learned is one sign of his qualifications, but there are many others which a nicer analysis may employ. The qualitative test is quite as important as the quantitative. Not the size of the brain, but its structure determines its worth. The possession of 10,000 facts may distinguish an idiot, but an idiot gives no proper emphasis; he does not perceive the difference between the trifling and the fundamental.

IX.—Physical Training.

A just medium can be secured.—President D. C. Gilman, in the Cosmopolitan: One of the first requisites of a good preparatory school is bodily discipline. This is partly to be secured by watchfulness in respect to posture, diet, repose, gymnastic, within the school walls: it is to be still further promoted by abundant exercise in the open air. Manly sports with the bat and the oar, running, jumping, bowling, swimming, rowing, riding, fencing, boxing, and, if possible, sailing, are all to be encouraged. Nor is military training to be underrated. The systematic exercise of every limb and every muscle is desirable, not under rules too rigidly laid down by the higher authorities, but under regulations

spontaneously developed by the youth. It is generally conceded that just now, in England and this country, there is danger of intemperance in sport. This may be less disastrous than intemperance in drink or meat; nevertheless there is such a thing as inebriety in athletic games. I do not refer to the danger of broken limbs and bruised faces, for they are rarely enduring injuries, but to the danger of unfair rivalries, of bad associations, of peculiar temptations in the anticipations and enjoyment of victory or in the depression of defeat, in the neglect of other and higher scholastic duties, in the waste of time and money upon costly journeys, perhaps in extravagant hospitality. The boys themselves must be encouraged to correct these tendencies, but they have a right to expect that we older boys will remind them of their highest obligations and encourage their fulfillment. With the reasonable control which players, teachers, parents can readily exercise, and which the young ladies and the newspapers might greatly encourage, the just medium can be secured, and athletics continue to be an essential factor in the training of American boys.

The place of games in education.—James L. Hughes, inspector of Toronto public schools (Canada): In physical development, as in all other departments of human culture, the law holds good that the informal is better than the formal, giving as it does not merely greater power, but greater spontaneity and freedom also: so the games of the yard and field will be recognized as forming one of the most important departments of physical, intellectual, and moral training. New games will be devised by the highest medical councils of the world, in consultation with the best minds in the teaching profession. Games may be improved without limiting the freedom and spontaneity of the playground. The games are really the best means provided in the schools of to-day for the exercise of the complete self-activity of the pupils; the only agencies for the full development of executive power; the only school process that completes the essential sequence of feeling, thought, decision, action, in application to the threefold nature of the child. The educators will not continue long to be mad enough to leave so potent an educational agency as games to chance.

Play, and plenty of it.—Principal George M. Grant, Queen's University (Ontario): Physical development does not demand gymnasium apparatus or a drill sergeant. As a rule children will see to this matter for themselves, in the best ways, if only opportunities are allowed. The games of children are, for the great mass, the very best means of securing good physical culture. Play, and plenty of it, is indispensable in education. Play means harmonious development of the body without fostering the self-consciousness that is apt to be induced by modern pretentious substitutes in the shape of military drill and gymnastic exercises.

There is no substitute.—Clara Conway, chairman of committee National Council of Education: Any plan or system of physical training which gives no attention to individual needs is defective. But here lies the chief danger, namely, that the lack of wisdom or skill in the use of apparatus may lead to serious results. There is no doubt that ill-chosen or ill-directed exercise in the gymnasium is a cause of deformity. The frequent and prolonged performance of unnatural movements is a fruitful source of enfeeblement and nervous disease. There is fortunately a strong reactionary movement against excessive work in the gymnasium, and the wisest are those who see that no movement they can prescribe can take the place of free voluntary out-of-door exercise, in which the activities have full play and in which the emotion of pleasure is a strong element. The law of will must be in force, hence there is doubt if physical exercise imposed upon pupils under protest of the will can be effective. On the other hand, in dealing with nervous or overtaxed students care should be taken to avoid exercise which requires sustained attention, and more still to avoid excessive exercises, the results of which are as serious as those of overwork.

The relation of mental to physical work.—Clara Conway, chairman of committee National Council of Education: The relation of mental and physical work is very close and vital, and yet in a careful study of the question how to give at the same time work to the inactive muscles of the child and repose to his over taxed brain there seems to be a kind of contradiction which makes the solution of the problem very difficult. The conditions of the work are the same for the brain which thinks and the muscle which contracts, and in both these organs greater activity of function is accompanied by greater production of heat. In the laborer and in the thinker alike there is an increased flow of blood toward the organ which works, and a greater vibration of heat within the active element.

In difficult gymnastics there is a strong exercise of the will, judgment, and other psychical faculties, and if there is economy in the expenditure of muscular force it is at the expense of the nerves and the brain. Therefore, it is impossible that the nerve centers gain repose under the influence of movements which excite the whole nervous system. The overworked student requires economy of nervous energy, perfect repose of the brain, and rest of the psychical powers. A run in the green fields will free the mind and rest the head better than any system ever invented, because the head has no part in the lively exercise of running. All thoughtful teachers with gymnasia at command have noticed the indifference and apathy of intellectual students in the matter of difficult exercise. The reason is physiological and ought to be regarded. The tired brain makes strong and instinctive protest against an exercise requiring as much effort of the brain as of the body. In every case of this kind the discriminating teacher will prescribe exercise producing muscular and not nervous fatigue. Exercises which have been long practiced and have been mastered are performed automatically and require no brain activity, while at the same time they quicken the blood current, regulate the respiration, and give tone to the digestive functions. There are conditions of mental sluggishness for which one remedy is the performance of physical exercises requiring the concentration of will power and sustained attention; no system of education is complete which ignores the fact. But for the overworked child help comes best from long walks with mother over the hills, from the old popular games, and, indeed, from anything rather than difficult gymnastics.

The general principles of physical training.—Clara Conway (from the same report as the preceding): Our first duty as the guardians of the child is to see with all possible care that the growth of childhood be not disturbed or distorted by any influences adverse to nature. But how? By such a nice adjustment of mental and physcal work that one be not made to suffer at the expense of the other; by systematic daily exercise in order to acquire the aptitude. To this end we place walking first; well-selected games, second; gymnastics, third. Walking, as a physical exercise merely, is a perfect exercise, because it taxes the whole system; every muscle, every nerve and fiber is brought into play. And when to this is added the interest awakened by the love of nature, a study of birds, a hunt for flowers, a search for insects, the temper is sweetened, the imagination brightened, the mind broadened, the spirit lifted near to God. It is something, says John Burroughs, to press the pulse of our old mother by mountain lakes and streams and knows what health and vigor are in her veins.

Games rank next. There seems to be a close relation between pleasure and high vitality or the vigor of the system, and between pain and the feebleness of the system. Hence the law of self-conservation. But the games should be carefully selected. Girls and boys left to themselves in this matter make their choice without considering the importance of quality and quantity. Gymnastics have a value, too, which we must not underestimate in the general summing up; but in this day and generation, when the world is alive to the supreme importance of a healthy body and physical culture is the latest fashionable "fad," not many words are needed here. The first derived from the practice of gymnastics, says an eminent physiologist, is the education of movements. The country boy, rough, clumsy, and uncultured, rapidly gains ease, grace, and polish. His muscles, hitherto used to slow obedience, learn to obey with rapidity and precision, and thus undergo a discipline to which they had been strangers. The gymnastic work, carefully done, gives strength, and strength gives confidence. There is a way of standing, walking, and sitting, not only easy and graceful, but requiring least expenditure of force. "Strength at the center and freedom at the surface" should be a precept of the gymnasium. "Let soul demand and body respond" should be another. Much of the work of the gymnasium is reformatory or hospital work. There is a patient uprooting of physical faults growing out of inheritance and out of environment and habits of life, and in their stead are established fine, graceful carriage, ease of manner, new and correct habits. In the hands of skill and wisdom the gymnasium is a powerful means for the freeing of the body, until it becomes not only the fit temple of God, but the expression of his best thought.

Should boys and girls engage in the same exercises? Dr. Sargent answers the question in these words: Up to 10 years of age any exercise that will be beneficial to a boy will be just as valuable to a girl. Between 10 and 14 girls should take lighter exercise, with more frequent intervals of rest. After that age it is simply a question of time, amount, and degree, rather than of quality. As a general rule, he says, girls need more muscle, making exercise than they

get, not so much for the sake of acquiring greater strength as for the influence that well-developed muscles have upon the brain, nerve centers, and other parts of the system. For this reason many of the so-called calisthenic movements do not meet the demands of the female organism. They weary and exhaust without giving anything adequate in return. These matters can safely be left to the judgment of a well-trained teacher. The corset should be taken off and kept off, or, what is better, never put on, in order that the body may be built up with the new material that will come to it as the result of the exercise, and to eliminate the old, broken-down tissue from the system.

Should the schools be furnished with the apparatus of the gymnasium?

We answer that no gift in the power of the State is too rare or precious for the child in its keeping, and no expense too great for the process of preparation for American citizenship. If the eminent specialists, who are doing so much for the causes of physical education, will demonstrate beyond question their ability and power—and we think they can—to remedy the evils of imperfect physical organizations, then the State owes it to the child, through the school, not only to provide the necessary means, but to furnish also the teacher, wise by natural fitness, and skilled by the best training of the schools.

What system?

The answer is brief. Any system that is good, or a combination of the best in every system.

Should not become a will training.—W. T. Harris: I think that physical exercise ought not to be set as a task when it is intended to serve as recreation. It seems to me that it has been one of the great defects in physical education that it has been brought into the schools and made a will training, so that the child who has been exhausting his nervous energy all the morning at his lessons in school is then called upon to exhaust it even more rapidly in set forms of exercise instead of relaxing, as he ought to. The child must stand up: he must not lean. He must pay strict attention and imitate precisely the motions prescribed. This is a strain on the will power, and calisthenics, as practiced in many cases, exhaust nervous energy faster than a class exercise in Latin or Greek. * * * Now I am a great stickler for the old-fashioned recess, the wild recess, the pupil bursting out of the schoolroom, running about, shouting, and pushing his fellows. It is this recess that recreates the pupil and restores his nervous energy. After the enjoyment of a little freedom and a run the child returns to the schoolroom and does his work better; but these set exercises which strain the attention of the child are hurtful. * * * There is great danger in this matter of physical exercise of overstraining in certain directions and producing permanent weakness. When one looks at the danger of half knowledge in this matter, one is almost frightened.

A vast problem.—G. Stanley Hall: If the object of the [physical] exercise is to increase the strength and physical development, it should always be when the body is rested and fresh. But if the object is divergence, in order to further intellectual work, it is a totally different thing. Then it should come when they are fatigued. Physical exercise is not one thing, but it is a great many things. I do not think we realize what a vast problem it is.

In case of fatigued pupils.—Clara Conway: I have frequently, in the schoolroom, seen pupils object to the physical exercise when the hour came, and upon investigation I find that the pupil is tired. In such a case I think it common sense that the pupil be allowed to rest, or sent out in the air and sunshine, where she may have the best rest. I think it would be cruel, I think it would be an outrage, to compel a girl to take physical exercise under those circumstances. On the other hand, I am not prepared to state that physical exercise should be dispensed with. I believe in physical exercise, but if it is observed that physical exercise is harmful it should be abandoned.

There are times when physical exercise should be given to tired pupils who are mentally fatigued, and in that case it should be such exercise that the attention of the student is not required, and where no concentration of the mental faculties is necessary, but in which the exercise is merely automatic.

Preservation of health a sine qua non.—G. Stanley Hall: Some of us have progressed to the point where we feel that no system of education is beneficial if the young person leaves the schoolroom in worse health than he entered it.

X.—Private and Parochial Schools.

Questions to be approached slowly.—Superintendent E. E. White, Cincinnati: The imperative need is that the people be educated, no matter where. If the private schools are imperfect they will be improved through the very necessities of the case; the parents will not continue long to send their children to inferior schools. I think this compulsory education should be an English education; that American children should be taught the language of the country; and I do not see any difficulty in securing this in all public schools. We have had such a law thirty years in Ohio. I am told that there are localities in some of the Western States where the instruction in the public school is not in English. No one can object to stopping that; but the difficulty is in demanding that instruction in private schools shall be in English. This may be right, but it brings an element into the question that gives trouble. In many private schools the teachers themselves can not speak English, and for that reason English in private schools and the State supervision of private schools are questions that I would like to see approached slowly. The people in most of the States are not yet familiar with the compulsory system.

State authority over private schools.—Governor H. W. Ladd, of Rhode Island: In a State so small and compact as ours it should be the aim to so systematize and correlate all our activities in this line as to be able, each year, to give an accurate and intelligent review of the whole field, and to show exactly what has been expended, what has been accomplished, and what are the various channels through which the work has been carried on, with such details of the plans and methods employed as may be necessary to an intelligent understanding of the whole situation. To this end the powers of the State Board should be enlarged to give them a definite connection with each and every educational institution carried on by the State; and they should also be clothed with authority to secure from each and every private school in the State such an annual return as shall show how many children are taught therein, and also what grade of instruction is given. These changes will at once place the board in a position to exercise its supervisory and directory powers with an effectiveness impossible in the present condition of affairs. Then, conclusions and recommendations will be based upon complete and accurate information from every section of the State and from all grades and forms of instruction.

How far the State may take cognizance of private schools.—Superintendent A. P. Marble, of Worcester, Mass.: A compulsory school law, then, implies that the State (which is only an organized form of public opinion) may take cognizance of private schools far enough to see that no child is deprived of that small amount of education on which the State insists; that is, ability to read and write in the English language, and a moderate knowledge of arithmetic and geography, for example.

But so much of oversight is not hostility to private schools, nor any infringement of parental control any more than the law requiring parents to clothe and feed their children. On the contrary, such an oversight is a positive help to a private school; since parents would not patronize it if the children could not receive certificates to entitle them to be employed, or if their children did not receive a fair amount of education, such as the law requires.

The public-school authorities, if wise, would not undertake to inspect private schools in any other than a friendly spirit and for the purpose of learning what is indispensable for them to know. They would be received cheerfully, since all schools are presumed to aim at good education; and they would soon be welcome in making friendly criticism. And parents would not long patronize a school which refused to allow the public-school authorities to ascertain what is so important for them to know, where the principle is acted on that all children have a right to a moderate amount of education. On any other principle than that outlined above, a compulsory school law—it would be better to call it a law for securing to each child his birthright of intelligence, since compulsion is a harsh term to American ears—on any other principle, such a law would be a dead letter; for if the school authorities can not inquire into the character of any school, then by means of a fictitious school the law might be successfully and easily evaded. Examination of each pupil applying for a certificate is only an indirect and practically very cumbersome way of inspecting the school which he has attended. This is not a merely theoretical question. In my city a private or parochial school for French children has invited with great cordiality an inspection for the purpose indicated above; and in a few instances certificates have been refused to children who had not acquired a knowledge of the English language.

What the private school should be measured by.—F. W. Parker, Cook County Normal School: The work of all private schools of any kind, whether sectarian or secular, should be measured entirely by their direct influence for good upon the common school, into which they will one day all be merged as soon as democratic growth demands that step.

Status of separate schools in Ontario.—Hon. George W. Ross, minister of education: The public schools of Ontario are undenominational. Fifty years ago the Roman Catholics were granted separate schools, and by a more recent act, in settlements where a Roman Catholic population predominated and a Roman Catholic was employed as a teacher in the public schools, Protestants were allowed to form themselves into Protestant separate schools. These classes of schools number as follows: Public schools, 5,380; Catholic separate schools, 243; and Protestant separate schools, 11. The department has not the same authority under the statute over Roman Catholic separate schools as it has over the public schools. Yet in the main features, such as the qualification of teachers, excluding those in religious orders, the selection of text-books, except those required for religious exercises, the authority of the department may be said to be the same.

Transfer of parochial schools to school boards in Minnesota.—Circular of State Superintendent D. L. Kiehle (October 20, 1891): The transfer of parochial schools to the control of a board of education has deservedly attracted much attention. It is important as an experiment in uniting all American children in the system of state schools; satisfactory to a large class of our fellow-citizens who have hitherto expressed great distrust of the influence of the public schools upon the religious character of their children; and also important in the possible danger of putting the public school administration in compromising relations with a religious body. Therefore such an experiment requires on all sides a spirit of intelligent confidence and entire frankness. It is in this interest and in answer to many questions that I call attention to such matters as may be helpful in studying and directing this experiment.

1. The State has made ample provision for the education of her youth. It is her policy to make them satisfactory to her best citizens and helpful to them in their highest ambition in training their children for the duties of life. She therefore requires all the people to share the expense and desires above all else that all the youth of the State enjoy the advantages afforded.

2. The attitude of the State is one of entire organic separation from religion as represented in denominations; and she therefore requires that the distinctive work of the churches be entirely excluded from the public schools. The language of the constitution is very explicit, and is as follows: "But in no case shall the moneys derived as aforesaid, or any portion thereof, or any public moneys or property be appropriated or used for the support of schools wherein the distinctive doctrines, creeds, or tenets of any particular Christian or other religious sect are promulgated or taught." (Article VIII, sec. 3.)

To take this as showing indifference, or still more, opposition of the state to matters and institutions religious, is farthest from the truth, for in every way possible the state expresses the greatest interest in those religious bodies whose purpose, with that of the family, is to elevate and purify the character of the people. While the state must forego the exercise of authority in matters religious, in order to protect the rights of all religious bodies, she speaks in no uncertain sound requiring that the principles of the purest type of morality be carefully inculcated in the minds and habits of youth. It is her purpose in the administration of her public schools to express the spirit of the ordinance of 1787 for the government of the territory of the Northwest: "Religion, morality and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall be forever encouraged."

So decided is this attitude of the state as the superior importance of character building that she allows to those of her teachers who fully appreciate their high calling all possible liberty in their choice of methods.

With this preface I proceed to define the limitations within which the public schools must be conducted.

LIMITATIONS BY STATUTE.

A board of education may not lawfully bind themselves to require or apply any religious test in the selection of teachers; neither may they distribute or classify pupils in departments, grades or classes, according to their religious

faith. To do so could have no other explanation than the purpose to propagate the tenets of a distinctive Christian sect. And what may not be done directly may not be done by indirection; that is, the board may not occupy the apartments of a parochial school and have control of it with an implied or unexpressed understanding that the teachers shall be selected from those of a particular religious body, or that the children of a particular sect shall be sent there. Such an understanding must be regarded as sacredly binding by all honorable persons, and in the eye of the law and its enforcement at the bar of public sentiment would be condemned as a violation of the law, and would therefore work a forfeiture of all rights to any share in the public funds. The board of education must be absolutely free in the exercise of its authority for the organization and conduct of a good public school; and if the results are not satisfactory, the board must not be able to say that they were limited by implied conditions which the public understood and approved.

QUESTIONS OF EXPEDIENCY.

Beyond limitations and duties determined by statute, there are many other questions which must be determined by the judgment of the board consistently with the purposes for which the school is maintained. Some of these have religious elements and others have not. For example:

1. The Bible is a religious book, and as such it has no place in the public schools to promulgate religious doctrines; but, having merit of great historical, moral, and literary value, it may be used for these qualities. If, however, to any class of persons this is obnoxious, the board should require the discontinuance of its use.

2. Sisters of Charity are religious persons, and as such have no place in the public school to propagate religious doctrine; but if they be women of education and teaching ability, it lies wholly within the authority of the board of education to employ them to do the legitimate work of the school. If, however, to any class of patrons their presence is obnoxious or unacceptable by reason of the significance of their religious garb, the board must either retire them or require them to wear the usual garb of teachers in the schoolroom.

3. The same principle requires that in case the color, or nationality, or personal peculiarities of a teacher, otherwise well qualified, make him so unacceptable to patrons as to interfere with the purposes of the school, his employment must be discontinued.

4. While public funds and public property may not be used to propagate religious doctrine, the interest which the state has in all voluntary organization of a benevolent and philanthropic nature, has always disposed to allow such bodies any use of its buildings that would in no wise interfere with their public use. In country districts it has been customary from time immemorial to allow the use of schoolhouses for religious worship and Sabbath schools as well as other meetings. This practice is one of expediency and propriety, to be decided by the judgment of the board.

THE FARIBAULT SCHOOLS.

In view of the public importance of the action at Faribault, I have visited the schools there, and by the courtesy of the board of education and the city superintendent, have become acquainted with the plan and purpose of the board in accepting the pupils of the parochial schools under their supervision. I feel warranted in expressing to the public my entire confidence that the board have acted intelligently and in no way comprise their authority as public officers; that they have used their independent and best judgment in the choice of teachers, in grading and promoting pupils, and that they are determined to give the children in these grades advantages equal to others of the city.

This experiment, for such it is, is being conducted in such a spirit of consideration that if at the end of the year the Catholics conclude to resume the education of their own children it will be done without disturbing the friendly relations of mutual respect that now prevail.—*St. Paul, October 20, 1891.*

XI.—PUBLIC SCHOOLS.

Relation of the State to public education.—From the message of Governor R. P. Flower to the New York legislature, January 5, 1892: Reports received by the Superintendent of Public Instruction indicate that the number of children in the State of school age (*i. e.*, between 5 and 21 years) in 1891 was 1,821,773.

The number of children attending the common schools in the same year was 1,054,044. More than 767,000 children of school age therefore were either not in school at all or received instruction elsewhere than at the public schools. The proportion of public school children in 1891 consequently was about 57 per cent of the total number between the ages of 5 and 21. The total cost of supplying this education to somewhat more than half the children of school age in the State was $20,269,118.29. The greater part of this amount was raised by State and local taxation.

Considered with other statistics these figures suggest some serious reflections. In 1851, forty years ago, 75 per cent of the entire school population attended the public schools. During these forty years the State has done much to improve and strengthen its common schools, to increase their efficiency and to compel attendance, yet during all that time there has been a steady decrease of attendance in proportion to the school population, and nearly 20 per cent fewer children, proportionately, attend the public schools now than attended them forty years ago. In the same interval the expense has increased from $1,884,826 to $20,269,118. For each pupil who attended the public schools any part of the year in 1851 the average cost was $2.26; in 1891 it was $19.22—the increase being 750 per cent.

If these figures are accurate, and they are based upon official statements and reports, they are startingly suggestive. If true, they mean retrograding influences and greatly increasing extravagance in management. Much of the increased cost per capita is undoubtedly explained by the erection of new school buildings, possessing greater facilities, better accommodations, and more attractive surroundings. But the surprising thing is that this sort of expenditure has not increased the proportion of children who avail themselves of these privileges, but has been accompanied by an actual diminution. Should the same ratio of decrease in numbers and the same ratio of increase in expense be maintained, the State in a few years will be actually taxing its citizens many millions of dollars each year—more than is needed now for all other purposes of government—to supply an education to a minority of its children.

This is neither democratic nor right. The State must, for its own protection and interests, see that the opportunities for a common-school education are offered to its children, but it will not be justified in raising large sums of money by taxation for this purpose without accomplishing a corresponding amount of good. If there is waste in the present lavish expenditure it should be discovered and checked. If the present compulsory education law is not effective, and the evidence is clear that it is not, it should be strengthened by wise amendment. Certainly the State can not afford to permit thousands of its children to grow up in ignorance, only to increase that population which crowds our jails, our reformatories, and our poor-houses, and menace the integrity of our public service and our institutions with the weapon of an unintelligent ballot.

No one believes more thoroughly in our common-school system than do I. It is the great hopper into which the untrained juvenile minds of Irish, English, Italian, German, Swedish, Bohemian, or American parentage, with their hereditary ideas and tendencies, are tumbled together and shaken up to form the substantial qualification of the American citizen. It is to the American ideas implanted in our youth in the common schools that our country owes her prosperity in the past and must look for the preservation of her institutions in the future. Every schoolhouse may be made a stronghold of defense against the spread of Socialistic and un-American ideas. No more worthy task therefore can be undertaken by the legislature than to strengthen and bulwark our common schools and make them centers of widening rather than diminishing influence. It will first be necessary, however, to ascertain the causes of the present unwelcome tendencies which statistical comparisons demonstrate. It may be found that much of the proportionate falling off in general attendance (aside from that which is explained by the increase of private schools), and certainly the increase in expenditure, arise from the modern tendency to so enlarge the curriculum of the public schools that they attempt too much and involve the State beyond its proper measure of responsibility. Certainly advocates of higher education at State expense can expect little sympathy from lawmakers, when the State, even with liberal appropriations, seems unable to compel merely rudimentary instruction, and thousands of children are growing up without any education whatsoever. Within the past two years the movement known as "University Extension" has assumed considerable importance and great popularity in this country. Its nature I understand to be the bringing of means of culture and higher education within the reach of persons who are unable to get a collegiate or university education, or, as it is more authoritatively described by one of its

prominent supporters, "The purpose of the university extension movement is to provide a means of higher education for persons of all classes and of both sexes engaged in the regular occupations of life." Its methods are by lectures, class exercises and examinations, conducted in various "centers" under the supervision of a central head.

The movement has caused great enthusiasm in England and in this country, and seems to have accomplished much good in stimulating intellectual tastes among the people. It has received the cordial support of most leading educators and the generous encouragement of press and pulpit. While those who expect it, when fully developed, to fill the place of actual training in colleges and universities are quite likely to be disappointed, there is every reason for believing that it will raise the intellectual standard of the people and diffuse more broadly the benefits of higher education. With such purposes and aims every good citizen must be in cordial sympathy.

Heretofore, however, university extension efforts have been carried on under the supervision of some established university, or of some association or society organized for the purpose. For instance, in England there have been four great movements—one under the direction of Oxford University, one under that of Cambridge University, one under that of the Victoria University, and the fourth under that of the London Society for the Extension of University Teaching. In the United States successful movements have been associated with the University of Pennsylvania, later with the American Society for Extension of University Teaching, with Brown University, with the New York and Brooklyn Society for School and University Extension, and with other educational bodies or associations.

For the first time in the history of the movement, however, direct government aid and encouragement have been given, in the statute which was enacted by the last legislature of this State, authorizing the regents of the university to act as the central head for the promotion of this work and appropriating $10,000 for their expenses.

Inasmuch as this work is quite likely to be still further brought to your attention and another appropriation asked for, I do not hesitate to express my opinion that the assumption of this duty by the State was not only unwise in principle, but that if the movement is as successful here as it has been elsewhere it will involve the State in unreasonable obligations and be a constantly increasing object of public expense.

I am aware that it has been the policy of the State to encourage higher education, and that public moneys have been appropriated for that purpose, but I respectfully submit that before the State should enlarge its field of usefulness in that direction, whatever views we may have as to the propriety of that enlargement, it should first perfect its system of common-school education. The already excessive taxation of the people for this latter purpose and the lamentably inadequate results I have pointed out above.

Reform is necessary before extension.

My fears that the State will eventually find the control and supervision of university extension an enormously expensive undertaking, wrong in principle because it taxes the majority for the benefit of the few, and indefensible as State policy except under the broadest view of public welfare, are based chiefly upon the testimony of those who have been most closely identified with the new movement and upon the tendency of the movement where it has been longest tried. Thus far our State has committed itself merely to the obligation of meeting the expense incurred by the regents under their granted authority "to coöperate with localities, organizations, and associations in this State, where such education shall be desired, and to aid therein by recommending methods therefor, designating suitable persons as instructors, conducting examinations, granting certificates thereupon, and otherwise rendering assistance in such educational work." The statute, moreover, expressly provides that no part of the appropriation shall be used in paying for the services or expenses of persons designated or appointed as lecturers or instructors, it being the intent of the act that such expenses shall be borne by the localities benefited.

Yet if the State were to stop there the annual expense must be largely in excess of the present appropriation if the movement is to be successful, the tendency of every State commission or bureau being towards an increased expenditure. But will the State stop there? Experience and testimony in England do not give much encouragement of an affirmative answer to this question. Prof. R. G. Moulton, who is a Cambridge University extension lecturer, and who has been explaining the movement to audiences in this country, says in a published address:

"We in England have tried, have ransacked every form of contrivance in order to make the movement pay itself—I mean pay itself out of the fees and tickets of the students who attend the lectures—and we have failed." So general has been this failure in England that dependence has been largely had upon private benevolence and endowment, and now the promoters of the movement are turning to the Government for financial assistance. In 1889 a national committee was appointed "for obtaining a grant in aid of university extension." In 1890 the local taxation act gave permission to English county councils to apply a certain part of the proceeds of a tax on spirits to technical education under university extension courses, and one county alone has this year appropriated £1,500 for this purpose. Even this indirect government assistance has not satisfied the friends of the movement, however, and in June last, at a meeting attended by many prominent educators and others, it was resolved to petition for a government grant to properly organized local bodies for the conduct of university extension teaching. This direct grant is desired not merely to pay supervisory expenses, but to meet part of the cost of teaching. There seems every possibility that the government in England will soon be bearing the greater part of the expense of this movement.

Is the prospect any better for abstention from seeking a larger share of government aid in this State, especially when the entering wedge has already been inserted?

Clearly it is not the intention of the promoters of university extension in this country to make it "pay itself." The American Society for the Extension of University Teaching says: "No great work in education along higher lines has ever been self-sustaining, in the ordinary sense of that term, and the society will be obliged to rely on the public spirit of all citizens, rich and poor, for funds to carry on the work." A writer in the Popular Science Monthly for November last, after discussing the cost of the movement, says: "The possibility of enlisting Goverment aid opens a larger question. University extension is a national movement which is intended to reach all classes and to promote the most vital interests of the nation. It has, then, as large a claim upon the national pocketbook as any interest which the Government can recognize." Even the regents of the university, in their extension bulletin, invite contributions to the movement, saying: "While the feeling seems to have generally prevailed that the funds of the State, raised by taxation, should not be used for the expenses of local work, however beneficent, and in that spirit the legislative appropriation in behalf of university extension was limited to general supervisory uses, still the cause of public education could be greatly advanced if it were possible to supplement and aid the work with judicious appropriations of money in the poorer and sparsely populated localities."

With such conditions prevailing further recourse to State assistance would not be unnatural, and I submit the question to your practical judgment whether it is wise for the State to continue to bear this questionable and in the future perhaps awkward responsibility.

The limit of public free education.—W. T. Harris: In America we explain our public-school system by saying that a nation of voters must be an educated nation. Where ignorance prevails, either an absolute monarchy is necessary to restrain the people, or else in case of a democratic form of government the demagogue will have the political control. We say that in a democracy each person is interested in the enlightenment of all his fellow-citizens. In a monarchy all the people are interested in the education of the monarch; their welfare depends on his goodness and wisdom. In a republic, where each is governed by all, it is the interest of each that all shall be wise and good.

Without education in literature, in science, and in history, the individual will be prone to superstition and intolerance. The selfishness of sectionalism and the selfishness of individuals will triumph over patriotism and personal integrity. It is a necessity for us to see to it that our rulers, the voters, are enlightened by schools and other civilizing influences.

This idea determines also the limit of public free education. Where the people are to obey laws made for them by an hereditary ruling class it may be necessary that the people shall be taught in the schools so much as will enable them to read and understand those laws. But where the people are to make the laws as well as obey them, what limit can there be to the school education required except the full preparation of the individual citizen to carry on his education for himself?

No person completes his education at school. For the nature of spiritual life is to be a perpetual education unfolding eternally. Man's ideal is the divine-

human Exemplar-all-knowing, all-powerful to do, and all-benevolent. The most the school can do, therefore, is to teach the individual how to carry on his education by the aid of the printed page and the proper use of his social opportunities.

Extent to which the authority of the State should be exercised.—State Superintendent A. S. Draper, of New York: The legislative power in our several States has been content to exercise very little general or decisive control over the schools. Provision has been made for schools, but little or nothing has been done by the lawmaking power to determine the character or direct the work of the schools. If you will examine the statute books of all the States of the Union with this matter in mind, you will stand amazed at the almost entire lack of enactments, directing what shall be taught in the schools, or insuring instruction by persons of sound character and established competency, and you will wonder, as I have, that voluntary associated effort, unauthorized and practically unsustained by law, should have been able to accomplish what it has in the way of systematic organization and intelligent advancement. * * *

Now, suppose we take our system of public instruction as we find it, and inquire what needs to be done to qualify it for the thorough and complete work which the developing circumstances of the country seem to require. I apprehend we shall not differ widely in our conclusions.

BUILDINGS AND APPLIANCES.

In the first place, the whole subject of school buildings and grounds, furnishings and appliances, needs attention. The people fail to appreciate the moral and educational influence which a good house has upon the school. A comfortable, wholesome, attractive building is certainly a condition precedent to the best school work. Yet our educational plan, the country over, leaves this matter wholly to the intelligence, the wealth, the generosity, the business thrift, or the poverty, the ignorance, the parsimony, the whims and caprices of local settlements. Does experience show that it may be safely left there? In some cases, yes. In more, no. In our largest and weathiest cities there is frequently lack of suitable school accommodations. Even at the popular centers buildings are found to to be out of date, badly worn and defaced, imperfectly warmed and ventilated, poorly lighted, deficient in furnishing, wanting in appliances to do with. And how is it in the country? How many towns and districts have schoolhouses and outbuildings unfit for any use, houses which are a constant menace to health and morals, because of indifference, or because to build new ones will increase the tax rate? How many lack proper seats and desks and blackboards, and globes and maps, and all the things which contribute to the efficiency of a school? Of course, this is not so in all places, but that it is so in some places is enough and too much. A chain is no stronger than its weakest link. Will any of us admit that anywhere in America a public schoolhouse should by any less comfortable and complete than the average American home? But there is another consideration. This matter does not rest upon sentiment alone. There is responsibility somewhere. When the public takes the children of the people into its keeping during six hours of each day for forty weeks of the year, it is bound to give them the best possible care. It is bound to make the environment such as will promote the normal and healthful development of their bodies, while it cultivates their minds and hearts. Again, when the public maintains any building, it is bound to make it a model—one which will attract attention and cultivate æsthetic tastes, one which will stimulate a desire for improvement and lead out in the way of progress.

Who of us does not know that the schoolhouses of the land do not in general come up to these standards? So long as they are wholly left to ward aldermen, village boards, or district school meetings, they never will. What reason exists, in law or in fact why the buildings of a public and common school system should not be subject to public and general inspection and supervision? Why should not competent general authority inspect all the schoolhouses of the commonwealth, and require that in size, manner of construction, condition and equipment, all shall conform to such regulations as modern experience and scientific knowledge have shown to be necessary to the fullest accomplishment of the purposes of the State in providing by law for a public school system? * * *

THE TEACHING SERVICE.

If the American school system is to successfully cope with the circumstances which confront it, and the still more trying circumstances which will confront it, it must be equipped with a more substantial teaching service. Perhaps one teacher in five or one in four is a professional. The force is too largely constituted of young girls or persons who are unable to prosecute any other employment successfully. Changes are frequent and constant. Two-thirds of the number who are now teaching will have ceased to teach in five years. Four-fifths of the newcomers are immature, physically and mentally, and are inadequately prepared for such a trust.

You may tell me that the law regulates this thing; that it determines who may teach in the schools. It assumes to, but it does not. A law is good for nothing that does not operate effectually. What does the law do? Ordinarily it confers upon city boards of education and county or district commissioners power to certify teachers. The members of the city board are not professional school men. How are they to intelligently determine who are qualified to teach school? But that is not all, nor is it the worst of it, for if it was they could employ a competent person to determine for them. They have the authority to employ teachers. They have aunts and cousins and daughters and nieces who want employment. And they also have personal and political friends with retinues of relatives, friends and acquaintances. They are human. They like to please. Only the strongest of them dare confront the misunderstandings and enmities in which a refusal to aid their friends will involve them. The greater number will use their opportunities to help those about them, even at the expense of the school system. And how much of a breakwater is the county commissioner against immaturity and incompetency in the schools? He is nominated at a political convention and chosen at the general election. He is under political obligations. If he does not pay them on demand, he is considered mean. The more honest and efficient he is, the more people there will be to engage in the enterprise of taking off his official head. He, too, is human, and he will ordinarily and almost necessarily be influenced by these considerations.

But that is not all in his case. What reason is there to suppose that the county commissioner is competent to examine and determine who may properly teach in the schools? He may be, but there is nothing to assure it. Everybody is eligible to the office. The qualifications which secure it are the ability to compass a nomination and gather in enough votes at the polls. These are not the qualifications requisite to the efficient administration of the commissioner's office. It would be as sensible to elect a man at a general election to manage a railway or construct a cantilever bridge.

There are no effectual statutory limitations upon the action of this commissioner. Possibly he may be required to certify teachers only upon examination. But what sort of an examination? Except through the constant and strenuous exercise of the legal authority of the state superintendent, it may be only a form; it may be conducted in the roadway. The world has no statutory guaranty of its substantial character and good faith. If experience in this connection has proved anything, it is that before an examination can be credited with any value it must be held at a stated time, in a public place, upon papers which are preserved, and by competent authority.

Indiscriminate licensing must cease. The age at which a person may begin teaching must be advanced. Professional training must be insisted upon whenever practicable, and where not, then at least a minimum standard of intellectual qualifications must be attained at a stated public examination. Examinations must be in competent professional hands. The authority to certify and the power to employ must never be lodged in the same persons. The certificate must be gained before employment is legal. Teachers must be treated better and their rights must be more thoroughly protected. They must be paid as well as equally qualified persons in other employments. Their tenure of position must be more secure. More men must be kept in the work. In short, a policy must be pursued, a plan must be devised, which will cause the teaching service to become broader, more substantial, more self-respecting, and equal to all the demands which may be made upon it no matter how exacting those demands may be.

THE WORK OF THE SCHOOLS SHOULD BE DEFINED.

Again, it seems to me, it is important that there should be an authoritative determination of what the common schools should do. The statutes are nearly silent in this connection. This matter is also left almost entirely to local author-

ties. We are living in times of marked activity, if not of feverish unrest. Experimentation seems to be the order of the day, and everybody has something new to propose. The schools do not escape these influences. Indeed, they reflect any popular disposition or caprice more quickly than any other of our public institutions. The result is indefiniteness and confusion in the public mind. This must be corrected or the end will be uncertainty and distrust.

The authority to levy and collect taxes is a high governmental power. It can not be exercised capriciously. The purpose for which it is exercised must be clearly understood and the object to be attained must be of such transcendent importance to all the people as to unmistakably justify the proceeding. One may properly gratify his fancy, he may speculate and experiment to his heart's delight, with his own money. But he has no right to do so with the money of the people. That must be put only to uses which benefit all, and then it must be used in sufficient quantity, and in such a way as to accomplish the object in view. These trite propositions relate to public educational work as to any other public undertaking.

I apprehend there are certain things which the schools must do to justify their existence, that there are other things which they need not do and yet may do with propriety, and that there are still other things which they ought not be permitted to undertake. * * *

The schools must be within reach of every home, and they must provide at least the fundamentals of an education to every child. They must put every child in possession of enough learning to enable him to act intelligently and understandingly in his social relations and as an American citizen. They must train his mind to act for itself, and they must, at least, go far enough with the work to enable that mind to stand alone and begin to walk on its own account. * * *

I entertain no doubt of the right and propriety of the support of high schools at common cost at the option of the qualified electors of each municipality. But there are evils resulting from the introduction of public secondary schools which need attention and which it will take time to correct. They attract public attention. They gratify local pride. They absorb the best teachers. Service in them is more remunerative and deemed to be more honorable than in the elementary schools. Their buildings are more magnificent, their equipment is more complete. Their curriculum rivals that of the best colleges thirty years ago, and what they do not feel justified in undertaking is not mentioned in even the Sunday newspapers. In the minds of educators, in the public esteem, they too frequently overshadow and dwarf the necessary and essential schools of the realm. The educational pyramid had better stand upon its base and not undertake to poise upon its apex. The best building and equipment, the best teacher, the best methods, should be provided for the beginners. The most generous support and the most alert attention should be given to starting the multitude rather than to decking out and polishing off the individual. The relationship should be more evenly and nicely adjusted by law, and the great mass of pupils who never get beyond the grammar grades should have most serious consideration of the law makers and of all interested in the well-being of the masses.

There are some things which have no legitimate place in our educational work yet which wedge their way into it. The educational theorist outruns all other theorists. The educational philosopher reaches after the unattainable and dives into the unfathomable even more than other philosophers. Speculation is without limits. There is no breakwater. He will suffer no layman to dispute him. He will speculate with other doctrinaires, and each will, in his own estimation, get the advantage in the contest. Then he will insist on his distillations being condensed at public expense. Commonly they refuse to materialize at all. All changes and innovations crowd along together in the name of progress and reform. The result is confusion and sometimes chaos.

The waste of educational energy and effort in consequence of the speculative mania and because of the clashing of different interests is great. The cost is greater than necessary, if not unreasonably abnormal. At least there is no reason why better and more telling work should not be performed with the money at the disposal of the system.

In my opinion this subject is one of preëminent importance. The school system must settle down and become a system in fact as well as in name. When it does it will the more effectually perform the work expected of it, and it will disarm the critics or be the better able to withstand the assaults which will be made upon it. It never will until competent general authority intervenes to define and limit the scope of its operations, to say what it must do in all places, what it may do in some places, and what it shall not undertake anywhere.

COMPULSORY ATTENDANCE.

I offer one more suggestion in support of my general proposition. After providing the means to do with, after securing a competent teaching service, after defining the work which the schools shall do in order to justify their existence at general cost, it is imperatively necessary to exact the attendance of the children for a sufficient time to accomplish the object in view.

Of course, if any parent prefers to educate his child at home or in a private school, no one can object, if this is not a mere pretext and a sham, and if the education so provided is at least equivalent to what the public requires. But the public has the right to know that it is equivalent and to exact information which will justify a public acceptance of its work. No responsible institution can have the least difficulty in establishing this fact. There is no other way of insuring general results. * * *

We have legislated upon this subject, it is true; but we have legislated in a *dilettante*, milk and water fashion, which has been practically barren of results. There is almost an entire failure to appreciate the importance of the subject, or how to meet it. Legislators fear that they may offend some one who has a vote. America is not to be the refuge and stamping ground of socialists and communists and anarchists. It may be well to hang bomb-throwers and murderers, but is is better to prevent boys from growing up into thugs and outcasts.

Troublesome social disorders can be best met by early and alert legal regulations, and by none more effectually than by such as will bring all children under the instruction and discipline of the schools. The children of the depraved and indifferent are the very ones whom it is most important we should reach, if we expect to accomplish the end we aim at, and justify the theory upon which we are proceeding. It can be done, but only through practical and stringent legislation. We have had enough compulsory attendance laws with no one to execute them, and which no one could execute; let us have some which will compel, and will provide that some one shall compel.

Now, these four matters which I have mentioned, viz, suitable buildings and appliances, a professional teaching service, a defined course of study, and compulsory attendance upon the public schools, or upon other instruction of equivalent value for a fixed time, are vital to the success of our educational plan, and the safety of a social compact based upon the principle of universal suffrage.

Where is the authority which is competent to regulate such matters and insure decisive and necessary action? It is not in the Federal Government. Our governmental plan does not cede the control of educational interests to the national organization. It is not in county, or town, or district authorities. It is wisely and fortunately so, for many and obvious considerations. They are mere creatures of statutory law without original legislative or executive powers. The only authority which can act for this people is the imperial Commonwealth of New York, through the law making power which sits at Albany.

Functions of the State in relation to education.—President Seth Low, of Columbia University: It is every way becoming that the State, not the locality, should make the standard and should see that the standard which it makes is everywhere upheld. The question becomes, in substance, the practical question, what part of the work can the State do best, and what part the locality? It would seem to be clear that the minimum standard should be fixed by the State. If any locality cares to carry its work beyond this general standard, that privilege may cheerfully be conceded. But the general standard certainly should be fixed by the State; first, because the State is likely to fix it most intelligently; second, because only in this way can there be any uniformity of result, and third, because when education is shaped with reference to the work which is to follow, a result which the State alone can secure, the best results are reached. * * *

The scholar is threatened at every stage of his school life with an uneconomic use of his time, unless the steps of his progress be timed as well as directed by the best wisdom of the Commonwealth. There is always danger that the effort will be made to teach too much, to teach a smattering of too many things, instead of laying solid foundations broad and deep, and instead, above all, of teaching the pupil himself to observe and to think. I plead for an active oversight, at least, on the part of the regents, of the curriculum of every school in the public-school system of the State. I would have it a part of their duty to maintain such an oversight of the system in every locality that the results obtained in all places should measure up to the ideal, at least as well as the results in any other State; or rather, as a citizen of New York, I prefer to say, such an over-

sight that the results obtained in this great Commonwealth should be the recognized standard in all our sister States. It is not an idle dream, this ideal that there should be practical uniformity of results in all the schools of the State of similar grade. Germany accomplishes it through the benign influence in that particular of the central government. The only question with us is, whether we will let the State, which is ourselves, do a similar work for us with similar efficiency.

There is another element in the problem besides the shaping of the curriculum and the oversight of the work, in which the voice of the State must be clear and decisive. It must define, and define adequately, the qualifications of the teachers in the various grades, and, if necessary, test these qualifications. I do not mean that the State should in any way interfere in the actual selection of teachers. That by all means belongs to the localities who are to employ them. But the State should define the training and equipment which the teacher must have before he is eligible to enter any one of the public schools. Similarly the State might well fix the minimum educational requirements for the different positions of responsibility throughout the schools.

The General Government may stimulate public education.—W. T. Harris: It is clear that education is of vital interest to our form of government. The inhabitants of Mississippi have an interest in the education of the people of Pennsylvania because the voters of the latter State help to make laws which affect Mississippi. So Pennsylvania is vitally interested in the education furnished in Mississippi for the reason that Pennsylvania's national interests are partly controlled by the votes of Mississippi cast for President and for Congressmen.

Here is a text for a sermon on national aid to education and for national compulsory educational laws. But I trust that no person will draw the conclusion that we ought to adopt the centralized educational system of France, no matter how strongly he believes in the duty of the nation to look after education. Our doctrine of local self-government tends to increase the directive power in all places outside the centers. But this does not necessitate a "let-alone" policy. For the General Government may stimulate local action by subsidizing it, or it may pass laws compelling a minimum provision for schools.

The limit of the function of the State.—Jas. P. Monroe, in the Educational Review: Once having established the machinery of free schools, once having placed proper safeguards for its maintenance and protection, the State should determine the least that it must do to preserve its integrity and provide for its healthy growth. It should then rightly exclude from the school all that belongs to the parent as well as all that, being nonessential to the life of the State, ought to be left to individual effort.

Mischievous interference with the schools.—Educational News: Unfortunately for the poor teacher, nearly everybody, from the chief officer of a city or other school district, down to the man who drives a garbage cart, believes that he knows better how to manage the children and conduct a school than do those who have made it a life work, and for this reason both individuals and organizations offer their uncalled-for criticisms and push their mischievous interference.

Oh, for something for idle hands to do! The idle child is the mischievous child in school; he is also the mischievous child at home. Keep him busy and you are safe. But what shall we do with the idle man? It is he who concocts the mischief of the neighborhood. It is he who says "they say" and destroys men's reputations. It is he who too often is the critic of our educational work, and while he lounges on the store boxes of the village can tell just how the school ought to be kept and where its greatest weakness is to be found. Is there no plan by which this man can put the energies to work in profitable channels? How much better our schools would succeed; how much better off the whole community would be if we could only keep the idler busy!

Also this from across the water, same subject.—Revue Pédagogique Belge: For ages, the progress of school education was retarded by general indifference; today, on the contrary, the most formidable obstruction it encounters is the itch, or the passion, for innovations. In all countries, monarchic and democratic, everybody, from emperor to pastry cook, has upon the subject of education ideas which in his view will regenerate humanity. Naturally, the ministers of public instruction have their ideas too, and endeavor to put them into practice. Almost every one wishes to break away from what he is pleased to call the old usages, that is to say, from the experience of centuries, and to build up the course of study on a new basis. The lack of practical experience causes people to get

astride of some of the strangest hobbies. One is wholly engrossed with gymnastics, another with chemistry; this one is inflexibly bent upon teaching anatomy and physiology to future seamstresses, that one is of the opinion that the youthful residents of the Rue du Temple will not be able to get along without some well-grounded knowledge of farming.

With the best intentions in the world, they would (in Paris) have turned the courses of study topsy turvy a score of times, and have completely ruined the public school instruction, if they had not had to moderate and guide them the learned and unpretentious Académie of Paris, with its inspectors and its active and energetic rector, M. Octave Gréard.

So, while no really useful innovations in the course of study, the methods, or the text-books, have been rejected, the literary basis upon which elementary instruction was founded, has been wisely retained.

The school of the future will not usurp the functions of the parent.—Superintendent A. P. Marble, Worcester, Mass. The school, having undertaken to train the intellect of boys and girls, is now quite generally expected to take entire charge of their education, intellectual, physical, and moral. This is beyond the original contract, and if so broad and general an end is to be attempted, then time must be given to enlarge the plant, to reorganize the system, and adapt it to such an aim.

If the school of the future is to take of the parent, and attend to the entire training of children—to be responsible for bodily health, intellectual training, and moral culture, if the duty of parents is to cease when once the child is old enough to enter the kindergarten, and the school is to turn him out fully equipped for the battle of life, and for entrance into a blissful hereafter, then we must have a good deal more time and more funds. It would seem as if so broad an aim would need to include dormitories, clothing, stores, and refectories. Such was the Spartan scheme of education. It is not likely to be repeated. It is not desirable. Nothing of a public and institutional nature can supply the place of parents. They were ordained of God; and no incubator of modern science or education should ever supplant them. The duty of rearing and disciplining their children ought to be thrown back upon them to the largest possible extent; any institution or any school which tends to beget in the parental mind a feeling of irresponsibility is evil and only evil, and that continually. The school of the future will not usurp the functions of the parent.

The aim of the school.—Principal George M. Grant, Queen's College (Ontario): We must remember that the object of the common school is not industrial. It should not regard children as the raw material of craftsmen, and aim at making infant mechanics. Children are organisms in the flower of life, and the best fruit will be had if you give the flower free play and do not expect it to be fruit. The fruit will come in due time, if you do not handle or test the flower too often. The aim of the school is to make children happy, healthy, and natural; to give them a love for their country and for one another; to open their eyes to the beauty of nature and the meaning of life; to give them a love for reading, and a taste that will enable them in some degree to discern good reading from bad; and to form in them habits that will make the end of their school days to be but the beginning of their education. It may be said that all this and more too is being done now. Possibly it is in some places. Improvement, too, there has been of late years, in the general diffusion of education and educational appliances, and, above all, in the increase of popular interest in the common school. But no one will say that the influence of teachers or society, or the influence of school on the formation of character, is what was at one time hoped for; and how, then, can we profess to be satisfied? Unless the people are becoming more intelligent and more moral, the school has failed. Unless there is a higher political life the state can not be satisfied. So great are the possibilities of the public school, however, that despair must not be thought of.

What socialism in education tends toward.—James P. Munroe, in the Educational Review: If the State, that nonentity for which each one of us and therefore none of us is responsible, is to bring up my children for me; if morality, good manners, and the domestic virtues are to be taught by some one else while I am but to provide the material things of life; then, forsooth, I will lay aside such sums as may meet these temporal wants and with the balance, large or small, will eat, drink, and be merry; for surely I have no better use in the world. The fact that in a few generations the State will fall to pieces is not for me to consider, since I am credibly informed that the sacred duty of maintaining it is taught in the schools. This wicked and absurd result of socialism is, of course, extreme.

There are, fortunately, human tendencies retarding such a mad career as this. Of these are avarice, making us save even when there is no direct motive for saving; family pride, unwilling to resign the task of chaping its heirs; and above all, parental love, refusing to deny itself to its offspring.

What the public schools can and can not do—kindergarten training.—State Superintendent A. S. Draper, of New York: The business and industrial world is in a ferment. The educational world is no less so. All manner of schemes are on foot. Everything is expected and demanded of the schools. Specialization and experimentation are the order of the day. The schools are sympathetic with this spirit. In my opinion there is danger in it. It is a tendeney which is to be resisted. The schools can not specialize. They can not undertake to fit a child for any particular field of labor for they can not cover all the fields. They can not teach him all he is ever to know. They can arouse his faculties. They can give him the elements of an education upon which he can build for himself and they can stimulate his ambition so that he will want to build for himself. If they do this they will do much. This much will not be accomplished if the schools attempt to do special things or if the work of the schools is allowed to become involved in uncertainty and confusion.

In so many cases as to be practically universal the child will remain in the school but a few years. He may be expected to withdraw at any time. Then the most scientific and painstaking work must be done in the first years. If there is unusual care or large expense it must be there. The idea that persons of little learning or who are without professional training can teach the youngest children, must be discarded. The greatest expertness must be placed where it will reach the greatest numbers and perform the best and most lasting work. We must proceed as though each year may be the last in which the child will have the benefit of the schools.

The child is to live in contact with affairs. He is to live by his hands and his eyes as well as by his ability to reason. His value as a citizen and his success as a man depend as much on his ability to do as on his ability to think and perhaps as much on his sense of right as on either.

Then he is to be educated practically. He is to be taught to put his hands and his eyes to their best uses. More than this, he must be disciplined. His moral sense must be aroused. He must be brought into sympathy and harmonious relations with nature and with affairs. We can not neglect this until we arrive at the age at which children may advantageously handle tools, and then expect to accomplish much. Something must precede the handling of tools. Half the children will have left school before that time. A carpenter shop connected with a high school is a feeble thing with which to bestow a practical education upon the children of a sizeable city. But the kindergarten will do it. It is at the right end of the course. It may reach every child. It harmonizes with the other work of the school. Children love it. It lengthens their time in school. Otherwise its results are extraordinary. It arouses an interest in natural objects, as stones and trees and animals. It cultivates social amenities and asserts mutuality of rights and obligations. It quickens the moral sense. It sharpens the observing and perceptive faculties. It forms and develops the constructive powers. It cultivates the æsthetic taste. The laying of straws, the weaving of mats, the folding of papers, the blending of colors, the molding of sand and the modeling of clay, train the eye to exactness and the hand to deftness at an age when such training is effective and influences the whole after life, If beyond this children are taught obedience, punctuality, neatness, some knowledge of themselves, if they are taught to spell correctly, to speak grammatically, to write legibly, to read understandingly, if they are taught the fundamental principles of mathematics, and if it is done in a cheerful way so that the teacher will be looked upon as a friend and helper, the public schools will have met measurably the responsibility resting upon them. If the attendance can be general and regular the schools will make the citizenship of the State industrious, well-disposed, and safe.

XII.—Reading and Literature.

Classical literature the basis for ethical training.—President Charles de Garmo, of Swarthmore College: The advantage of the classical, imaginative literature for the young is that it portrays the ethical lessons of life in a form that most powerfully appeals to the child's natural interests. To many it is a familiar thought that the stages of a child's mental development correspond to the stages of culture through which the world has passed. If this is true, as it must be in some

sense, then thoughtful experiment with classical literary forms will enable us to find that best adapted to any given stage of child development. All education is a process of attaining intellectual and moral freedom. The true fairy tale not only embodies an ethical truth, but it frees the puny child from the iron bands of time and place and circumstance. The child of penury may dwell in marble halls with princes of the blood and eat the food of the gods. Mrs. Burnett has beautifully illustrated this power of the imagination in "Sara Crew." The curly-headed lad at his father's knee may quickly become the armed hero, doing mighty deeds for the right. This emancipation from the physical limitations may soon be transformed to the moral field. I have said that it is the mission of literature to enable the individual ideally to pass through the experience of the race without the pain that the original experience cost. What a weary round of scourgings the race has gone through to arrive at its present state of material, political, and ethical freedom! All this is portrayed figuratively in literature, and literally in history. The child is born now, as ever, with all his experiences before him. Must he, for the lack of education, tread again the thorny path of his race? We do not ask it with regard to his material or intellectual welfare; why should we with the moral? Shall we not rather portray the inevitable struggle in forms that he can understand, teaching him to win the victory before the battle is fought.

The basis for ethical training in elementary education is to be found, therefore, primarily in a graduated course in classical literature, beginning with fairy tales, myths, legends, and folklore, and culminating with the higher dramatic literature; and secondarily, in the concrete biographical and narrative elements of history.

The best literature for children.—Principal George M. Grant, Queen's University (Ontario): The difficulty of teaching literature to children is very great, perhaps greater than of teaching history itself; and the usual mistake is in being too formal, too didactic, too analytic, and too ambitious. The children must be interested only through their imaginations. Mr. Gradgrind would give them "facts." I would give them stories and tales instead—books like Hans Andersen's and Grimm's tales, the Arabian Nights, Robinson Crusoe, and the Synoptic Gospels, to begin with, to be followed by Scott's poems, selections of ballad poetry and selections from Scripture. "The best literature for children from their seventh to their fourteenth years," says Rosenkranz, "consists always of that which is honored by nations and the world at large," and if the books I have mentioned are objected to, choose at any rate others that have stood the test of time and a jury that may be said to comprise universal humanity.

Should not anatomize in teaching children literature.—Miss N. Cropsey: A vast amount of time is wasted by presenting the common and the crude in reading and literature, because we fail to understand the poetic spirit in which the child interprets the world. It is not necessary to know the exact meaning of each word in a poem in order to be instructed and inspired by its general sentiment. The world comes to us first as a general impression; it may be dim and obscure; its diversity is interpreted in relation to this whole. Our primary schools ought to teach the best that literature has to offer, not the most complex or the most obscure in meaning, but some expression of other than the literal and disconnected view of things.

The analytic processes may entirely absorb the time of the child in school, and completely obscure his poetic view of the whole which he brought to us out of the land of early childhood, leaving him on a barren plain of facts, cut off from the living spring of imagination and reason. The eye of the poet integrates the parts and feels the living spirit which animates and unifies nature, though he may not be able to give a scientific classification of its forms.

He will get much more than we imagine.—Intelligence: Reading should be encouraged with the earliest ability of the child to read, and continue through all his public school career. There is slight danger of the child reading beyond his depth. What if he does not seize all the thoughts if he only begets a taste for ennobling literature? He will get much more than we imagine, and will grasp it with a firmness we little suspect.

The teaching of English literature.—The following remarks upon the methods of teaching English literature were written by a graduate of the Worcester (Mass.) Normal School and read by Hon. A. P. Marble at a meeting of the New York State Teachers' Association:

If I am to teach literature to a class of boys and girls, I must have my target, just as truly as the child with the bow and arrow in his hands must have his. I

must know at what my teaching is aiming, or I shall be as likely to fire into the ground as at the stars.

I begin with the hypothesis that literature is to be studied in our high schools as a form of culture and education beneficial to our growth, though, it may be, not directly helpful as a preparation for bread-earning. If one were to ask a class of boys and girls, after a year's study of literature, in what way they expected to use their knowledge, I imagine he would get some such answers as these: "I shall be able to make a great many pat quotations." "I shall be able to talk on literary subjects." "I shall be able to use better language." "I have got started in reading and in thinking for myself;" or, perhaps, "I don't suppose I shall ever use it at all."

These answers, with the exception of the last, are reducible to two purposes: To show off what one has accomplished, and to be able to accomplish in the future.

If one's education is to be only an end, and not a means to something further, it is a poor thing to waste fifteen years of work for, and not usually worth trying to show off. It is what one is, or is able to become as the result of the work he has done, rather than the exact measure of knowledge he has gathered together, that is of value to him. Things plastered upon the outside of a person soon wear off and show the old texture through. That which is taken in as a germinating force, fostered and helped to grow, changes the very fiber of the mind, and makes it able to be and to produce that which it could not have been or produced otherwise.

The activity of the mind is of course thought. And just in proportion as we can increase the thoughtfulness, the habit of thinking deeply and independently, just in that proportion can we give vitality and strength to the intellect of a youth.

Young people think, of course. But what about? Take a class of boys and girls 15 or 16 years old. What sort of thoughts are making themselves at home in their minds, to order their affairs? There is the last ball game, the tennis match, the new spring dresses, the next dancing school, endless novels, with many tedious school books from which to economize time for more interesting things. Here is much thinking, but little thought. Much of it a very healthful kind of thinking, but not just the kind that is going to bring them out men and women, intellectually wide-awake, serious, and clear-sighted, the kind of men and women we need.

Take this class of young people and get them deeply interested in a play of Shakespeare. The plot itself can be trusted to get their interest. Then just make those characters live to those boys and girls; and if Iago and Othello, Macbeth, Portia, and Hamlet do not teach them some lessons about themselves and their relations and duties to their fellow-men I am greatly mistaken.

Make them hear a little of the music of Milton, entertain them with some of Dickens and Scott, get them up to their ears in discussions over the philosophy of Ralph Waldo Emerson. In each case pick out the great gift, the leading characteristic of a writer, and just make that one point tell on the thoughts of the pupils. Above all things, do not discourage the pupils from making their own comments and expressing their own opinions. They will often seem ridiculous to the teacher; but youth is the time to be ridiculous, and mistakes are the surest way to correct ideas.

Would I have them learn quotations? Certainly. Things committed to memory are seen in the many different lights of after reflections, while a thing read once has but the light of a passing mood.

But committing to memory should not be the chief work of a class, and pupils should be tempted and praised, rather than driven and scolded, to quotation-learning.

It is very common, too, I think, in the study of literature, to require a pretty full biographical account of the life of each writer studied. This would do very well for a psychologist or a philosopher, or even for a man of mere general culture, provided he were 60 years old. And so with long criticisms and books about books: they are well for the writer of 40. But give these young boys and girls the works of great men, pure and simple, and let them feed on them and grow mentally and morally.

In my opinion it is better, too, not to include very many writers in a school literary course. Just as it is better to have a good talk with one intellectually great man than to have an introduction to 40, so it is better to know 1 poet than to know 40. To study literature and to study the history of literature are two different things, and they should not be exchanged for one another. But the life is in the literature, not in its history.

XIII.—Religious and Moral Training.

Religion in education.—Brother Azarias: Religion is sacred, and because it is so sacred a thing it should not be excluded from the schoolroom. It is not a garment to be donned or doffed at will. It is not something to be folded away carefully as being too precious for daily use. It is rather something to be so woven into the warp and woof of thought and conduct and character, into one's very life, that it becomes a second nature and the guiding principle of all one's actions. Can this be effected by banishing religion from the schoolroom? Make religion cease to be one with the child's thoughts and words and acts—one with his very nature—at a time when the child's inquisitiveness and intellectual activity are at their highest pitch; cause the child to dispense with all consciousness of the Divine Source of light and truth in his thinking; eliminate from your text-books in history, in literature, in philosophy, the conception of God's providence, of His ways and workings, and you place the child on the way to forget, or ignore, or mayhap deny that there is such a being as God and that His providence is a reality. The child is frequently more logical than the man. If the thought of God, the sense of God's intimate presence everywhere, the holy name of Jesus be eliminated from the child's consciousness and be forbidden his tongue to utter with reverence in prayer during school hours, why may not these things be eliminated outside of school hours? Why may they not be eliminated altogether? So may the child reason; so has the child reasoned; and therefore does the church seek to impress upon it indelibly the sacred truths of religion in order that they may be to it an ever-present reality.

Not that religion can be imparted as a knowledge of history or grammar is taught. The repetition of the catechism or the reading of the gospel is not religion. Religion is something more subtle, more intimate, more all-pervading. It speaks to head and heart. It is an ever-living presence in the schoolroom. It is reflected from the pages of one's reading books. It is nourished by the prayers with which one's daily exercises are opened and closed. It controls the affections; it keeps watch over the imagination; it permits to the mind only useful and holy and innocent thoughts; it enables the soul to resist temptation; it guides the conscience; it inspires a horror for sin and a love for virtue. The religion that could be cast off with times and seasons were no religion. True religion may be likened to the ethereal substance that occupies interstellar space. This substance permeates all bodies. There is no matter so compact that it does not enter, and between the atoms of which it does not circulate. Even so should it be with religion. It should form an essential portion of our life. It should be the very atmosphere of our breathing. It should be the soul of our very action. We should live under its influence, act out its precepts, think and speak according to its laws as unconsciously as we breathe. It should be so intimate a portion of ourselves that we could not, even if we would, ever get rid thereof. This is religion as the church understands religion. Therefore does the church foster the religious spirit in every soul confided to her, at all times, under all circumstances, without rest, without break, from the cradle to the grave. Place yourself, at this point of view, and say, if believing all this, child of yours should receive any other than a religious education.

How piety can not and can be taught.—Carlyle: Piety to God, the nobleness that inspires a human soul to struggle heavenward, can not be "taught" by the most exquisite catechisms or the most industrious preachings and drillings. No: alas, no. Only by far other methods, chiefly by silent, continual example, silently waiting for the favorable mood and moment, and aided then by a kind of miracle, well enough named "the grace of God," can that sacred contagion pass from soul into soul. How much beyond whole libraries of orthodox theology is, sometimes, the mute action, the unconscious look of a father, of a mother, who had in them "devoutness, pious nobleness!" in whom the young soul, not unobservant though not consciously observing, came at length to recognize it, to read it in this irrefragable manner—a seed planted thenceforth in the center of his holiest affections forevermore.

Can morality be taught in our public schools apart from religion and theology?—Nicholas Paine Gilman: The great facts and the main laws of the moral life are obvious to all mature men and women; certainly they are not dependent, for their clearness and their binding force, upon any notions as to the origin either of the universe, of mankind, or of the perception itself of these facts and laws. The facts of astronomy which affect men's daily life—such as the so-called rising and setting of the sun, the phases of the moon, and the phenomena of the ocean

tide, for instance—are plain to every one; the explanation of them given by the astronomer to the farmer and sailor, whether correct or not, will not essentially change the arts of agriculture and navigation. So the common practical duties of human beings have long been familiar. Each new generation must learn them afresh, indeed, but it learns every day morality as an art, not as a science. The difficulty lies in the practice, not in the theory. Philosophers may dispute as to the exact reason why a man loves or should love, his mother; but the duty of loving one's mother is not a question considered open to discussion in common life. The same may be said of the other obligations which make up the substance of their duty for the great mass of mankind, in all but exceptional times and situations.

When, then, we have in mind as a subject for public school instruction, not the science of ethics, not the speculations of moral philosophers, but the orderly presentation of the common facts and laws of the moral life which no one in his senses disputes, we perceive how the religious or theological difficulty at once disappears, to a large degree. There is possible a theistic explanation of the moral law; there is possible an atheistic explanation; but there is a third course open here to the common-school teacher—to attempt no such final explanation at all. It is not necessary for him to teach that morality rests upon religion as its ultimate foundation; it is just as unnecessary for him to teach that religion, on the contrary, reposes upon morality as its basis. Let the relation of religion and morality be as it may be; the teacher is not called upon to decide an issue of this magnitude. He can teach the duties of ordinary life, showing their reasonableness and their interdependence in a consecutive, orderly manner, without appealing to religion; he can use the plain and usual consequences of actions, good or bad, as reasons for morality, without being open to a just accusation of irreligion. These consequences, as he should teach them, are admitted by all. * * *

Such a limitation bars out all matters of theological controversy. The sectarian difficulty and the religious difficulty in moral education disappear when we keep to conduct and its common laws, and stop short of theological or philosophical explanations why right is right or wrong is wrong.

General method of moral instruction in public schools.—Nicholas Paine Gilman: The one principle to keep firmly in mind is to avoid didacticism ("preaching") as much as possible, and to hold fast to actual life as children already know it, or may be led to comprehend it. Concrete instances of right-doing or wrong-doing, happening in the schoolroom itself, or just outside, within the immediate knowledge of the boys and girls, afford the best starting point for talks about the moral points involved. It will be easy to bring the children's minds, through a consideration of actual examples, to recognize in some degree the general principles involved. The same caution needs to be urged here as in the case of other general notions, against haste and consequent disregard of the immaturity of the childish mind. But if the teacher will shun formality and generality, and keep mainly to the particular and the concrete, he will find that few subjects interest children more than these questions of right and wrong in common conduct. These men-and-women-to-be find people the most attractive matter, just as they will find them later in life. Man is not only the "proper," but also the most engaging "study of mankind," large or small. Conduct is to children, who have not yet entered upon the great activities of business, art, or science, much more than "three-fourths of life," and the lines of it on which they are beginners will continue unbroken through all their years. Elaborate casuistry, hair-splitting about imaginary situations, anything and everything in the line of pure ethical theory, should be utterly tabooed in the school room. But with these precautions observed, and under the guidance of a teacher of well developed moral sense, boys and girls between 8 and 14 years of age (in the grammar schools, where moral education has its most fruitful field) will reason about points of ethical practice with interest, and often with a freshness and an acuteness that are surprising. If this be not so, then these children in school differ very much from these same children out of school.

If the course of study is, anywhere, so full or crowded as not to allow time for the occasional talks (one or two a week) about conduct, which I should advise as the best method, then that course should be shortened by the omission of some branch of much less useful knowledge sure to be found in it. I would avoid set times for these conversations; in them, question and answer should play a large part; the more easily (if not very frequently) the teacher "drops into" one of them for a few vivacious minutes, the better. Some incident of the schoolroom life that has just occurred, or some matter in the lesson in read-

ing or history may well interrupt the routine of the ordinary recitation, as the teacher asks the opinions of the class or of the school on the moral point in question, incites them to think more carefully about it, and indicates the conclusion to which long experience has brought the world the starting point, at least, for the majority of these ethical talks, for, like every other social institution, it has its moral law which must be observed by all its members in order to attain its end. The plainly visible chief function of the public school is to impart the elements of knowledge. To this end there must be full obedience to the natural authority, the teacher; the prescribed conditions of quiet, order, and studiousness must be observed by the pupils. Punctuality in attendance and readiness for all the exercises; truthfulness in regard to absence from school, tardiness, or any other failures to comply the regular order; honorable conduct with respect to methods of passing examinations; polite treatment of the other scholars; attention and courtesy to the teacher, such are some of the moral necessities of the schoolroom to be met by the scholars.

The pupils have no duties which should not be met by an equal faithfulness to his duties on the part of the teacher, who should not be there teaching unless interested in his work, qualified for it, and industrious in improving his practice of it. He must be just and impartial in his treatment of the scholars: he must, having the authority, exhibit the virtues of a ruler. Teaching politeness and honor, the instructor should be an honorable gentleman. * * * The teacher has no direct influence over the pupil except in the school hours, and his earnest efforts may be rendered almost useless by the indifference, or the hostility even, of parents. But none the less must he strive to connect the morality of the schoolroom, which he can enforce, with the morality of life outside, as resting on the same general principles of reason. While the first rudiments of common sense will keep him from speaking of any vice, such as lying or stealing or drunkenness, in such a way as to proclaim his knowledge that it prevails in any scholar's home, he is still free to enlarge upon the manifold evil consequences of it. Thus his word may help somewhat to keep children pure in the midst of a bad home atmosphere, which he is otherwise powerless to change.

"Words"—this will usually be easy for the teacher to give in attempting moral education; but nowhere else does word amount to so little compared with example. If the word is not reënforced by the example, its influence will be small.

Practice fortified by theory.—George P. Brown, chairman committee of National Council of Education: It is probably evident to all that the writer believes in inculcating morality by practicing it rather than by theorizing about it. But the time comes in the education of the child when the doctrine that has guided the teacher in fixing dominant ideas in the mind of his pupil shall be made known to the pupil. Although, as in many other matters, the theory of morals may well be left until the pupil is well on his way, in the practice of morality this does not preclude the formulating of moral principles and laws which are exemplified in conduct whenever the child is prepared to recognize them in this form, and the organization of these into a system of ethics at a later period would be the culminating act of an ideal method of educating the will. A failure to reënforce the practice of right-doing by a rational theory of one's relations and consequent obligations would be to omit the most effective defense against the ever-recurring attacks of passion and sense.

Moral habits induced by school work.—State Superintendent Richard Edwards, of Illinois: The schools must develop moral power. In this world there is just one thing that has absolute worth, and that thing is character in men and women. These surroundings of ours which we so much value are after all only means to a loftier end. They have worth, these outward things, because they contribute to the good of man: otherwise they are without value. * * *

What is this child's aim in going through an arithmetical process? What is he seeking for, when, for example, he is attempting to cast the interest on a note or to add up a long column of numbers? He is seeking to know the truth. He is not inquiring what somebody would like. He is not seeking to find an answer that will please a sect, or a party, or advance his own pecuniary interests. What he is seeking is the absolute truth. If he is casting the interest on a note, he desires to know what absolute justice requires to be done. If he is adding up a column of figures he is yearning to ascertain the precise and actual amount which they represent. In the study of history he is striving to ascertain what events have actually occurred, not what someone would like to make someone else believe has occurred. In short, the purpose of all school investigation is

to find the truth. Is not this a good motive? Is not the habit engendered by this work a wholesome habit? Suppose the same motive should govern the actions of all adults. Suppose that every editorial in a newspaper, every speech delivered from the stump, every sermon delivered from the pulpit, should be animated by the same desire. Would it not be something of an improvement upon the existing order of things?
