PART II.

CHAPTER XXIII.

THE BELL AND LANCASTER SYSTEM—WHAT THERE IS IN IT FOR THE SCHOOLS OF THE SOUTH.

By G. B. Morrison.

The method of instruction known as the Bell and Lancaster system carries forward the work of the school, including instruction, order, and discipline, by the mutual activities of the pupils, under the supervision of one master. In this system the pupils teach one another; the more advanced of each grade are selected to teach those of the next lower. This method of instruction does not belong exclusively to Bell and Lancaster. It is as old as the human race; it has been practiced in all ages and is still in vogue. Wherever children congregate there exists a school of mutual instruction, wherein the knowledge possessed by each child is imparted to those not already in possession of it. Children in the home teach one another. The first steps of the baby are often directed by the older children, and in every well-ordered home each child is made to feel in a certain way a responsibility for the safety of the younger and more inexperienced members.

Mutual instruction is natural. Knowledge is contagious and will spread wherever artificial conditions are not set up against it; wherever the vaccine of pedagogic proscription is not thwarting it.

The mutual or monitorial method of discipline and instruction was in vogue in the schools of the Hindoos as early as 1600. It is said of John Sturm, a teacher of the sixteenth century, that he employed monitors both to perform the work of instruction and to attend to the practical details of the schoolroom.

In 1565 Trotzendorf in his school at Goldberg appointed monitors from his highest class—which he taught himself—to teach the lower and less advanced. He gave two reasons for the practice: (1) That his financial resources would not permit the employment of assistant teachers, and (2) that by teaching the pupil-teachers learned more, and more thoroughly, than they possibly could by being continually instructed.

As early as 1680 the Abbé de la Salle, in order to relieve the pressure of large numbers of pupils at Rheims, inaugurated a system of mutual instruction which rapidly spread throughout France.

But a complete history of this system is beyond the scope of this paper. I shall therefore limit my remarks to some of the leading facts in the life work of Andrew Bell, of Joseph Lancaster, and of William Bently Fowle.

Andrew Bell was born in St. Andrews, Scotland, in the year 1753. At a very early age he showed a strong inclination and ability for learning. In school he was an apt pupil. He learned his Latin well, but had a decided preference for scientific and

mathematical studies. While a pupil he manifested a dislike for the methods and practices of the schools, and sought to correct them. He managed, however, to keep in school, and had one or two favorite teachers who understood him and offered him encouragement. He maintained himself in the further pursuit of his studies by private teaching. At the age of 21 he came to America. Concerning his stay of about seven years in this country little is known except that he was engaged a part of the time in private teaching. At the time of his return to Europe he was private tutor in the family of Carter Braxton, a wealthy merchant of Virginia. Two of Mr. Braxton's sons accompanied their tutor to St. Andrews, where they pursued their studies with him, both as teacher and fellow-student, Mr. Bell attending the classes with them. This experience gave Mr. Bell the opportunity of seeing the advantage of serving at the same time as pupil and teacher. He soon afterwards took orders in the English Church and was sent to India, where he received an offer to take charge of a military male orphan asylum, situated at Madras. At the "asylum he found one master and two ushers employed in teaching less than twenty boys." These teachers knew nothing of school management, and, notwithstanding the small number, the pupils had only one lesson a day. The boys seemed dull and stupid, and the work was formal and spiritless. Dr. Bell first tried to educate the teachers, but soon found that with qualification for their work came dissatisfaction with their positions.

While endeavoring to devise some plan to overcome these difficulties, Dr. Bell chanced one day to pass some Malabar children who were writing in sand that had been strewn for them on the ground. Like Archimedes when discovering the law of floating bodies, Dr. Bell went back to his school saying, "Eureka! I have found it!" He at once directed that his ushers try the sand process. This they did against their own wills and under protest. As might be expected, they soon pronounced that method of teaching a failure.

But Dr. Bell was a man of clear head and determined purpose. He saw that the success of his plans must be reached through control of the minds of his assistants. He therefore appointed a boy of 8 years to teach the alphabet class. (This, let us remember, was before the "word method" came in vogue.) The immediate effect of this experiment filled Dr. Bell with hope and a determination. He saw before him a great principle; he saw Frisken—the boy first selected—rise suddenly from dull-eyed indifference to something like manly pride and dignified responsibility.

The little children, under their youthful teacher, at once showed an interest, seeming to see that, after all, the alphabet was not so far off if Frisken could teach it. They saw that one of their own number had been honored, and they were full of hope for their own possibilities. Being relieved from a feeling of distance which they had felt existed between them and the ushers, they wrestled with Frisken and the alphabet as they would with sticks and stones in building a dam across a stream. They soon learned their letters and were ready and anxious for more victories. The ushers became disgusted, leaving the field to Dr. Bell and the pupils.

From this time the work of appointing teachers from among the pupils became the distinctive feature of the school. The success of the plan is thus spoken of by Dr. Bell in one of his official letters: "Let me add," says he, "that having had the charge of this school almost six years, from its infancy, and feeling all that interest in its welfare which arises from my situation, from the years I have spent, and the toil I have bestowed upon this favorite object, I can not conceal my joy and satisfaction in observing that since the late dereliction of our masters the school has improved beyond what it had ever before done in the same period. A new teacher from among the boys, whom I had trained for the purpose, had been introduced, and the more the boys teach themselves and one another, the greater I have always found the improvement. Nor has their comfort, in every other point of view, been less promoted."

Dr. Bell resigned the school to other hands and returned to Europe in 1796. He published a voluminous report and several pamphlets on his system, which has ever

since been known as the Madras system—"a mode of conducting a school by the medium of the scholars themselves." His writings attracted wide attention, and the plan was taken up and tried by many leading educators of the time. All of these trials were made in connection with the education of the poor, who, on account of the expense of tuition, would not otherwise have received any educational advantages.

Another important feature of the system was the industrial element which entered into it. Dr. Bell organized a school at Swanage almost wholly on the industrial plan, the manufacture of straw plait being the medium for the exercise.

From about the year 1800 the Madras system assumed a religious significance, and was used and fostered for the promotion of political, educational, and religious ends. This new impulse was probably excited by apprehension for the work of Joseph Lancaster (of whom we are soon to speak), who was educating thousands of poor children by a similar monitorial system and under dissenting auspices.

The efforts of Dr. Bell and many other high churchmen resulted in the organization of the National Society for Promoting the Education of the Poor in the Principles of the Established Church. As a result of this, large sums of money were raised and expended in the establishing of schools on the Madras plan in various parts of Great Britain and Ireland. The system did not end with the lower but was carried to the teaching of the higher branches, and, according to the testimony of those who practiced it, with much success.

Thus wrote Dr. Russell in 1818: "It is now about five years since the Madras system was first introduced into the Charter House School. The difficulties which we encountered at first have gradually decreased, and I have no hesitation in declaring, after the experience of five years, that the system is as well adapted for the communication of classical instruction as it is for the education of the poor in the first elements, and I observe the interest and attention of the scholars increases in proportion to their advancement in learning."

Dr. Bell was a financier as well as educator and philanthropist, and the large fortune which he amassed was devoted to religious and educational institutions, the most noted of which is the Madras College of St. Andrews.

Closely allied to the work and methods of Dr. Bell was that of Joseph Lancaster, who was born in London in 1778. This unique character was the exact opposite of Dr. Bell, except in his insight into and faith in the system of mutual instruction. His parents were respectable, but not wealthy; he was possessed of an earnest, sincere, and philanthropic nature; he was a reformer by instinct, fervid in his affections, and had an abounding love for children. He saw the condition of the children of the poor and opened a school, free to those who could not pay, in his father's house.

Mr. Lancaster's school soon became so large that after several changes he had a building erected at his own expense. His pupils, both boys and girls, soon numbered over 1,000. Over the entrance to his door appeared this notice: "All that will may send their children and have them educated freely; and those that do not wish to have education for nothing may pay for it if they please."

Mr. Lancaster joined the Society of Friends and made the Bible a part of the course of study. His school attracted much attention and excited great interest. The idea of pupil-teachers did not occur to Lancaster before he opened his school. The mother of his invention, as in the case of Bell, was necessity. Bell first used it to improve the quality of the teaching in a school previously existing. Lancaster devised it to meet the demands of large numbers with small expense, and both were inspired at its results.

Lancaster soon found himself with three prominent possessions, viz, some strong friends, many bitter enemies, and numerous debts. His generous nature and lack of financial ability involved him so deeply in debt that he went to prison in default, but was soon released through the kindness and faith of his friends. He even attracted the attention of King George III, who gave him money to extend his system by travel and lectures. Mr. Lancaster's friends—those that stayed by him

in adversity—were few, but they were of the right sort. It is not always the number of a man's friends, but the character of those that he has, that speak most for his real character. Lancaster was fortunate in his. Among these were William Allen, William Corston, and Joseph Fox. They paid Lancaster's debts, amounting to £4,000, and afterwards, by the aid of others, raised £11,049 with which a new school was built, in which thousands of poor children afterwards received the elements of an education. These steadfast friends were all business men noted for their piety, integrity, and philanthropy.

Mr. Allen thus describes his first visit to Lancaster's school: "I can never," he says, "forget the impression which the scene made upon me. Here I beheld a thousand children collected from the streets where they were learning nothing but mischief, all reduced to the most perfect order, and training to habits of subordination and usefulness, while learning their lessons and the great truths from the Bible. The feelings of the spectator while contemplating the results which might take place in this country and the world in general by the extension of the system thus brought into practice by this meritorious young man were overpowering and found vent in tears of joy."

Lancaster's embarrassed financial affairs were assigned to trustees. The British and Foreign School Society was formed, and Mr. Allen became treasurer. The Borough Road School, as Lancaster's school was called, became, under the auspices of this society, "the model training school."

The society became one of the greatest educational forces the world has ever known, sometimes spending during a single year the sum of $100,000. This powerful organization to carry on the work started by Lancaster was, like those of Bell, ostensibly for the education of the poor. Both were Christian, and made Bible teaching an important factor. The Bell organization was under the Established Church. That of Lancaster was an organization of the friends of humanity in general, and was much broader and more liberal in its scope. The fundamental rule of the Bell society was that the catechism was to be taught. The fundamental rule of the Lancaster was that it should not be.

These facts are here given merely to show the great amount of good which has been accomplished through the agency of mutual instruction under earnest and intelligent leadership. It is unnecessary here to detail the weaknesses of Mr. Lancaster and the misunderstandings which sometimes existed between him and his best friends; neither is it to our purpose to discuss the validity of the respective claims of Bell and Lancaster as to the rights of possession and priority in the use of the monitorial system. In its time the controversy was tinged with bitterness, but at the present we can afford to give credit, free and unstinted, to both of these men for doing a great and good work. It was in 1818 that Mr. Lancaster came to America; he came to introduce his system into this country. His reception here was by some cordial and by others hostile. The hostility was chiefly from the teaching class, whose practices and methods Mr. Lancaster did not hesitate to denounce.

Lancaster had the faculty of enlisting the cooperation of the influential classes. As an illustration of this, I quote from De Witt Clinton, governor of New York, in a speech which he made on the opening of a free school in New York City:

"I confess," he says, "that I recognize in Lancaster the benefactor of the human race. I consider his system as creating a new era in education, as a blessing sent down from heaven to redeem the poor and distressed of this world from the power and dominion of ignorance. Although the merits of this apostle of benevolence have been generally acknowledged in his own country, and he has received the countenance and protection of the best men in Great Britain, yet calumny has lifted up her voice against him, and attempts have been made to rob him of his laurels."

Among Lancaster's many friends in America were John Adams, Cadwallader Colden, Dr. Hosack, Thomas Scattergood, President Nott, and Robert Vaux. By a class this movement in America was called a delusion. In the vivid educational parlance of our own time the same class would have called it a fad or a craze.

Monitorial schools were established in Albany, Boston, Hartford, New Haven, Baltimore, New York, Philadelphia, Montreal, Quebec, Washington, and other cities.

Mr. Lancaster was again overtaken by poverty and ill fortune and was again, as he had been in London, partially relieved by friends. He was reduced by sickness and discouragements, and was finally, in the fifty-first year of his age, run over and killed in the streets of New York City.

The monitorial system in the United States underwent changes from time to time, never being popular with the rank and file of the teaching class. It has long since lost all of its original characteristics, and may now be counted among the things of the past.

The value of the system in this country may be fairly judged by studying the work of William Bently Fowle, of Boston. A bookseller by occupation, Mr. Fowle had good opportunities for study. A self-educated man, he could look at the prevailing methods without that blinding prejudice with which love of Alma Mater usually veils the vision of the stock product of the schools.

Mr. Fowle studied Mr. Lancaster's methods, listened to his lectures, and shared with him the belief that prevailing methods were not perfect. He also shared the rocky road of all that class of heroes who sacrificed popularity and personal comfort for a principle. But, like all men of true motives and a determined purpose, he found friends and supporters. He was appointed a member of the lower school committee, whose duty it was to look after all those schools in which grammar was not taught.

There being many children in the town for whom the schools did not provide, the city council was finally induced to appropriate $1,000 to try an experiment on the monitorial plan for their benefit. After making several unsuccessful attempts to procure a master, Mr. Fowle undertook the task himself. By the personal assistance of Mayor Quincy an appropriation was made by which the Hancock schoolhouse was fitted up so as to be adapted to the application of the monitorial system.

The public teachers now opened hostilities, and by smooth maneuvers known only to the politician united to down Mr. Fowle's school. They hunted up every prejudice and worked it to its full carrying capacity. These teachers were true to their advertisement—that the Boston schools were "the best in the world." Mr. Fowle defended his school by a series of articles in the newspapers, wherein he clearly showed up the inefficiency of the grammar schools and the great waste of time and money occasioned by them. Mr. Fowle gained by the controversy. The course of study was greatly modified, and he was placed on a grammar master's salary, and allowed to go on with his experiments.

Mr. Fowle's school was composed of the worst juvenile element in the town, but notwithstanding this fact, corporal punishment was entirely abolished. Pupils of all grades were taught in the same room, and every child kept busy.

In the Boston schools at that time it was the custom to spend about a month to prepare especially for the examining committee. Mr. Fowle made no preparation, but nevertheless his pupils easily passed the ordeal and took their places in the next grade. Mr. Fowle then resigned from the public schools.

The great success of this school led to Mr. Fowle's promotion to a higher grade of work, and 100 wealthy and influential citizens raised a fund sufficiently large to equip a building with philosophical and other scientific apparatus, superior to any school then in existence in the United States. Some of this apparatus was imported, but the most of it was made under the direction of Mr. Fowle especially for his school.

The school was called the Female Monitorial School. It opened with about 100 pupils, and was conducted on the mutual plan, modified to suit the existing circumstances.

The great success of this school aroused the professional spirit of Boston's educators to such a degree that the school board was induced to build a high school for girls on the monitorial plan. The number of pupils who presented themselves in

excess of the school's capacity led to parental dissatisfaction. Rather than build other schools the pupils were scattered among the grammar schools, where high school grades were provided for them. Notwithstanding the favorable report of a special committee appointed to investigate the monitorial schools, they were soon discontinued. Their success was the cause of their defeat.

Mr. Fowle was in different ways connected with the Boston schools for seventeen years. In his later years he was chiefly known by his free scientific lectures, which were through a period of several years attended by thousands of devotees.

The foregoing facts in the personal history of Bell, Lancaster, and Fowle have been related, not to reflect glory on particular individuals, but because the true merits of the question before us can not be properly understood without the information which these lives furnish. So far as I have been able to discover in the investigation of this system, the men who succeeded with it were uniformly of that class who will sacrifice ease and comfort for a principle—men with a definite aim, a philanthropic spirit, and a persevering and fearless disposition. The chief characteristics of Pestalozzi's school were monitorial and industrial. He believed that children should be exercised in the arts of industry, and through this industry they should teach one another.

The application of the monitorial system to a school will have to be determined by the existing conditions. But certain general features may be outlined sufficient to give an idea of how several hundred children may be handled by one teacher.

The schoolhouse mainly consists of one large room. For illustration, I shall suppose it to be arranged for pupils between the ages of 6 and 13 years. The room is about 18 feet wide and of indefinite length, to suit the number of pupils attending. Along one side are arranged the seats and desks. Each seat is long enough to accommodate 8 pupils. These seats are arranged in groups of four parallel with the side wall and placed one in front of the other. This makes what is called a section. The sections are separated from one another by drop curtains which extend out from the wall far enough to conceal each section from a view of the others. This leaves nearly one-half of the entire space in front of the sections for general purposes. This space is used by the master for conducting a class in full view of the school and for easel blackboards in front of the sections. The seats of each section are graduated in size according to the size of the pupils. Each section contains all four grades, the primary ones in front and the highest the first from the wall. Each section is in charge of a pupil-teacher of the highest or teacher class. A further division into what is called "drafts" is made, and presided over by monitors appointed by the master according to merit. Every class has its separate monitor-teacher, and the class unit can of course be made of any desired number of pupils, as determined by the number of monitors. No monitor is required to teach for a longer time than two hours, there being different sets of teacher-pupils and monitors for the different hours. Appointment to monitorships are rewards of merit. At stated times the pupils are taught collectively in groups by the master. This may be done by raising the curtain between certain sections, throwing any desired number of pupils together.

Another and better form of collective teaching is done in galleries. This is done in a room at the end of the building seated in gallery style. It is here that the master does his real teaching, and where he stimulates to thought, leaving the memorizing and the parts requiring individual practice to the monitors. In the gallery the master teaches pupils of the same grade.

One hour per day, usually in the morning, the master teaches his pupil-teachers, and dwells on both methods and subject-matter. This forms the germ of a normal school, and it was thus that the modern normal school had its beginning. Two classes of monitors were appointed, one for teaching and another for keeping order, arranging materials, reporting misbehavior, and so forth.

From an educational standpoint the monitorial system has its advantages and disadvantages. Among the advantages may be considered the following:

1. In those processes which simply have to be learned and remembered, such as

the alphabet, the calling up of words at sight, spelling, and the fundamental rules of arithmetic, and so forth, pupils can teach one another as well as or better than can a teacher, because of a feeling of freedom and ease in one another's presence and from the frequent repetitions and familiar ways in which children talk to one another. This is true in the home, and the natures of children are the same in the school as in the home. Children can teach one another what they really know, i. e., facts which do not require development, as well as or better than the average teacher. There is, I believe, a current fallacy that teachers need methods more than facts and principles. Children can without methods teach what they know better than a teacher can teach what he does not know with a method. Much of our modern normal training consists in the training of teachers in how to teach what they do not know, i. e., what they have not a clear comprehension of. More time should be spent in getting an education and less in methods of imparting it. I have often noticed that an unlettered man will explain a machine he has invented better than a college professor could do it, simply because he understands it.

2. The beneficial effect of acting as pupil and teacher at the same time. All teachers know that we truly learn only when we teach. The sense of responsibility which a pupil selected from his fellows feels can scarcely be overestimated. He prepares his lessons in a way quite impossible with a pupil who has never felt this responsibility. His pride is awakened, and the whole force of his being is aroused to activity.

3. The monitor's position depends on merit, and he is training in the same process of rewards that he will be in after life. It is the natural system; it is a powerful incentive to study, to gain the distinction of teacher.

4. Its disciplinary effect. Any organization which calls for government by the members themselves is most effective. This is so chiefly because the individuals are thus brought into a position to see the side of the governor as well as the side of the governed.

5. The absoluteness of the appointing power of the master. Having a large number from which to select his assistants, he can secure the best natural talent; and if it prove unsatisfactory he can change without giving offense. This is a very important advantage. An ingenious and able master can in a short time, by making the proper appointments, simply multiply himself in the school, a thing wholly impossible where the assistants are less dependent.

6. Its moral effect. This is coordinate and coextensive with the intellectual effect. Pupils are less liable to do what appears wrong in the eyes of their equals than to raise themselves to the standard of one who is far above them. Besides, the governing units are so multiplied that the evildoers lose by the weakness of smaller numbers.

7. It is more economical. By the monitorial system it is possible to carry on a school of several hundred children by the employment of one master. This necessity led to the establishment of Lancaster's celebrated school at Borough Road. By a diminution of expense, such as is possible with the monitorial system, it places the means of an education within the reach of all.

Some of the objections which may be used against the system are—

1. The simultaneous working of many recitations in the same room is attended with more or less noise and confusion. The extent of this objection will depend largely on the master, but it must be admitted that with the best management the order will fall far below the modern normal-school standard. But while this feature must stand as a disadvantage, it is not without its compensating advantages. It would at least cultivate the habit of conversing in subdued tones. The tendency of the uncultured is to talk in a high key, and when animated to approach in boisterousness the tones of a town crier or an auctioneer. It might do something toward the amelioration of that oratorical buncombe which large-chested pedagogues sometimes inflict upon their charges; while the unavoidable confusion arising from many working within hearing distance is somewhat disturbing, it carries with it the constant reminder of the rights of others.

2. Much of the pupil's time in the school is spent in contact with immature minds. It is certainly true that while there are advantages to be derived from the freedom of children teaching one another, it is not on the whole to be counted equal in value to an equal amount of time spent with a full-grown and sympathetic teacher. It should be remembered, however, in weighing this objection, that the same amount of time is seldom realized even in schools which are not overcrowded, and that the teachers, as we find them, are not always full-grown and are not invariably sympathetic. Ideal conditions, even with teachers enough to supply all the classes, are seldom found.

3. The time occupied by pupils when teaching is lost to their studies. This objection is entirely invalid, for, as has been shown, the exercise in teaching—in the habits of thought and clearer understanding which it inculcates—more than compensates for any supposed loss of time from the lessons.

4. The monitorial system lessens the number of professional teachers needed, and would therefore diminish the number of persons who gain a livelihood by this means. While this is not the most ostensible, it is nevertheless the most formidable objection to the establishment of schools on the monitorial plan. Any argument which lessens an individual's chances for employment will not weigh heavily with him. It was this objection, though not outspoken, which rang the knell to mutual instruction in Boston and other American cities. This is strictly a class objection. It weighs not against the system as such, but against the probability of its successful establishment.

5. It would be difficult to find masters with the requisite ability to carry on the monitorial system. It is evident that the management of a monitorial school requires unusual ability. The master must possess the qualities of generalship combined with great teaching power and unbounded sympathy. Without such a master a monitorial school could not carry on its face even the semblance of success. In schools conducted on the usual plan, where the teacher does all the work, defects may be covered by superficial show. But this would be impossible on the mutual plan.

As to the number of teachers in this country possessing the requisite characteristics, it would be difficult to furnish any estimate; but I am quite certain that there would be many, were the conditions favorable for their development, if there were a positive demand for such talent.

The considerations which bring us to the answer of the main question in the subject of this paper have now been briefly and imperfectly pointed out. What is there left in the monitorial or mutual system for the schools of the South?

From the foregoing analysis of the subject we are forced to the following conditional answer: If the schools of the children of the South are supplied with all the modern means of obtaining an education; if they have sanitary school buildings, equipped with apparatus to accommodate all the pupils who ought to attend the school; if these buildings are supplied with first-class teachers with first-class salaries, then any argument that could be urged in favor of the monitorial schools would be futile. But if, on the contrary, there exists to-day in the South a large number of children who, for lack of these provisions, are not being educated, and if for these children monitorial masters could be obtained, then there is certainly something in the monitorial system for the children of the South.

CHAPTER XXIV.

AT WHAT AGE DO PUPILS WITHDRAW FROM THE PUBLIC SCHOOLS.[1]

By Prof. C. M. Woodward, *Washington University, St. Louis.*

1. Before attempting to answer this question, I desire to call attention to the obvious importance of a correct answer. The best planned course of study takes into consideration both the probable duration of a school course and the age of the pupils. The direct bearing of this question is seen in the fact that an estimated average length of the period of pupilage is frequently made the basis of arguments for or against some proposed modification of the course of study, or some other detail of school management.

2. I use the word "withdraw" in a somewhat restricted sense, and as properly excluding the effect of mortality among school children; that is to say, I exclude from the number of those who can with propriety be said to "withdraw from school," those whose school course is cut short by death. Fortunately, this allowance is small, but it is not on that account to be ignored. The propriety of omitting from my calculations those who die can not be seriously questioned. The practical inquiry is: At what age do pupils leave school to enter upon the active duties of life, or to enter private schools?

3. The data for my calculations are the reports of the superintendents of the public schools of St. Louis, Chicago, and Boston. In these reports the ages of all the children enrolled are recorded either at the beginning, or in the middle of the school year, and the number for each year of age is given without any regard to the grading of those pupils. For example, we have the number that are between 7 and 8 years old, and the number between 8 and 9, the number between 9 and 10, and so on. These numbers are given in every annual report, and I have taken them from the annual reports of twelve or thirteen consecutive years. I am bound to assume that these reports are accurate, although they exhibit certain anomalous results. By grouping these reports as exhibited in Tables I, II, and III, and then considering the figures in any vertical column, I am able to follow the same group of children through their course in the public schools. I have assumed that no pupils withdraw before the age of 8 years. By following down any vertical column we can see how the numbers increase or diminish from the combined effect of immigration, emigration, death, and withdrawals from school, till the class disappears altogether at the age of 20.

4. To extend my investigations over as much ground as possible I have entered on Tables I, II, III sufficient data to enable me to make three independent calculations from each table. I have named the columns A, B, C in each case, so that in all I have applied my analysis to nine sets of pupils—three in each city. I will add that I limited my study to the cities St. Louis, Chicago, and Boston for the reason that all the other large cities failed to furnish me with the requisite data.

[1] Read before the Academy of Science of St. Louis, April 20, 1896. Published in the Transactions of the Academy, Vol. VII, No. 8; issued May 21, 1896.

5. It is a source of regret that the data furnished by the three cities are not uniform in character. In the Boston schools the reports give the number "16 years old," "17 years old," "18 years old," "19 years old and over." In the Chicago reports all pupils "17 years old and over" are lumped together. In the St. Louis reports all pupils "16 years old and over" are lumped together. It has been necessary to distribute the pupils thus lumped together, according to their ages, as accurately as possible.

It was useless to refer to the unpublished records in St. Louis and Chicago for the exact details of such distribution, as they could give no additional information. In this emergency I adopted the following method, based upon an examination of the distribution in the Boston schools and of the ratio which the 16-year-old pupils bore to those "17 and over" in the city of Chicago. I will not give the details of my investigation, but will plainly state that I assumed in the case of St. Louis that 52 per cent of those who were reported to me as "16 years old and over" were 16 years old; 30 per cent were 17 years old; 13 per cent were 18 years old; 5 per cent were "19 years old and over." This distribution is made for each of the numbers at the bottoms of several columns in Table I.

In the case of the Chicago schools I assumed that 63 per cent of those who were enrolled as "17 years old and over" were 17 years old; 27 per cent were 18 years old; 10 per cent were "19 years old and over." This, I may say in parenthesis, corresponds to the distribution in the St. Louis schools for those three years. This method of distribution is applied to the last numbers in several columns in Table II. The fact that nearly all of these tables show the withdrawal of the 20-year-old pupils in the years 1895–96, and even later, was an inevitable consequence, but the results are not on that account to be called in question. All my results are based upon averages, and are the consequence of laws which vary very slightly from year to year in any given city.

6. Other data essential to my calculation are: First, the rate at which the population is increasing on account of the excess of the number of births over the number of deaths. Secondly, the rate at which the population is increasing, or diminishing, from all causes, whether by accession of new territory, the moving in or the moving out of children, or from births or deaths. The internal growth (by which I mean that arising from the excess of births over deaths) I calculate from data furnished by the city officials. The growth from excess of immigration over emigration and death, added to the growth from the accession of new territory (as in the case of Chicago in the year 1889) I call the "external growth." The total growth is, of course, the sum of the "internal" and "external" growths. I may here remark that the growth in school population shown by the enrollment in the public schools may differ from that shown by a general census. There may be a general movement toward private schools, or from private schools. When a pupil leaves a public school and enters a private one, he practically "emigrates;" when he enters the public schools in one of the higher grades, he practically "immigrates."

7. *The rate of internal growth.*—As the number of children of school age in a city bears a very nearly fixed ratio to the total population, the increase in the number of school children from year to year is the same as the rate at which the total population increases. This is true of both the "external" and the "internal" growth. Now the internal growth of a city is exactly measured by the increase of births over deaths. Hence I calculate the rate from the official reports of births and deaths. All cities give accurate reports of deaths; the reports of births are incomplete. In Boston they are more nearly complete than in Chicago, and in Chicago they appear to be better than in St. Louis. In Boston, as would be expected, the internal growth is least, viz, 7-1000, or 0.7 per cent. In St. Louis it is, as nearly as I can learn, 16-1000, or 1.6 per cent. In Chicago it is greatest, viz, 20-1000, or 2 per cent. While these rates are not uniform they are approximately so. In fact these results are averages of several years. In a former discussion of this problem in May, 1879, I did not distinguish the two kinds of growth, but allowed for the death rate of school children directly.

8. *The total rate of growth in school population.*—This rate is readily found by comparing the enrollment of any one year by the enrollment for the same ages for the preceding year. For example, take the two years 1889–90 and 1890–91 in the table of the Chicago schools. The attendance of children above 7 years of age in 1889–90 was 115,366. The next year the enrollment was 124,144, a growth of 7.6 per cent. This approximately represents the growth of the city. In the last column but one on Tables I, II, and III, representing the attendance in St. Louis, Chicago, and Boston, this total rate of growth of school population for each year is given. It will be seen that in some cases it is small, in others very large. Thus in Chicago schools the increase from 1882 to 1883 was 5.7 per cent; from 1883 to 1884, 4.5 per cent; from 1884 to 1885, 5.8 per cent; from 1886 to 1887, 2.5 per cent, and so on. In the year 1888 to 1889 I find the enormous increase of 41.5 per cent; this signalizes, of course, an immense accession of territory with a school population two-fifths as large as that of the former city itself. This explains the unexpected showing made by the city of Chicago in the census of 1890. The growth since 1890 has been all the while rapid, reaching in the year 1892 to 1893, 9 per cent.

It is probable that the increase in the school population as shown by the public school report was relatively greater than the increase in the population of the city, for two reasons: (*a*) The ratio of children to population was greater in surburban than in urban districts; and (*b*) the proportion of children in the public schools was greater in the suburbs than within the old city limits.

It is evident that both the rate of internal growth and the total rate of growth are affected by the mortality rate of school children, so that element needs no further consideration.

9. Now it is evident that the increase with which we are concerned when we are considering any group of pupils is that which arises from "external" growth alone. No increase in the number of births over deaths can add to the number of those who were 10 years old last year and who are 11 years old this year; though such increase does help to explain why the number who were 10 years old this year is greater than the number who were 10 years old last year. Consequently, in order to find the possible increase (which may be shown as we read down any vertical column) we must, from the total rate at which the school population increases, subtract the rate of internal growth, and then apply the remaining rate to the number enrolled the previous year. For example: I found that in 1890–91 the rate of increase of school attendance in Chicago was 7.6 per cent. I had already found that the internal rate of growth was 2 per cent; the difference is 5.6 per cent. This is the rate at which the number of pupils of certain ages in 1889–90 would have been increased during the next twelve months had there been no withdrawals. In the year 1889–90 there were 7,029 pupils in the Chicago schools who were between 14 and 15 years old. Five and six-tenths per cent of that number is 394; hence the "possible number" of pupils between 15 and 16 years old at the registration in 1890–91 was 7,423, as given in Table VII. By means of the final rates, which I have in the same way calculated for each and every year in the series, I have calculated the possible attendance for each year.

10. Now turn to Tables IV–XII. I have here in every case in the third column one of the columns from Tables I, II, and III. In the fourth column I have the rates of external increase already obtained. The next column gives the theoretical "external" increase in numbers, and in the sixth column the "possible" or ideal number for each age, obtained by adding the increase to the enrollment of the previous year. Now subtract the actual attendance from the "possible" attendance and we have, of course, the number who during the year withdrew.

11. It is evident that the average age of those withdrawing during any one year is one year greater than their age when they were last enrolled. For example: At enrollment the pupils in their fifteenth year are enrolled as 14, and it is evident that their average age is 14½. Then those who withdraw before the next enrollment are on the average half a year older, so that those 14-year-old pupils who do not reappear withdraw on the average when just 15 years old. Hence it makes no

difference at what date during the year the ages are registered, provided the date is always the same.

12. The average age of withdrawal is of course found by adding all the products found by multiplying the number of pupils withdrawing each year by their age, and dividing the sum by the total number of withdrawals.

13. It will be noticed in certain tables that not only is the rate of external gain minus, showing loss of school population, but in some cases they show a negative withdrawal, or an abnormal entrance of new pupils. This involves, of course, an unusual withdrawal during the same year from other groups or columns, as the rate of increase is calculated from all ages. I have carried out all such negative results, subtracting such amounts as have prefixed a minus sign.

14. *Results.*—Table XIII gives the results of the nine calculations. I submit them without comment.

15. *The average age of withdrawal v. The average age of children in school.*—I was originally led to this discussion by what I regard as erroneous statements in regard to the average length of time that the children attend school; and I am convinced that a great deal of confusion exists on this point in the minds of both teachers and school superintendents.

For the purpose of clearing up this matter, I desire to state, first, the average age at which pupils withdraw from the public schools is a very different thing from the average age of pupils in the public schools. For example: I have shown by the results in Table XIII that the average age at which pupils withdraw from the St. Louis schools is approximately 13.3 years. Now the average age of the pupils in the St. Louis schools at the time of their enrollment in the year 1894–95 was 10.2 years, which is evidently a very different thing. In the same way the average age at which pupils withdraw from the Chicago schools I have found to be approximately 15.5 years. The average age of pupils in the Chicago schools at the time of their enrollment in the year 1894–95 was 10.1 years. So in the Boston schools the average age of withdrawal is approximately 15.9 years; while the average of those in the Boston schools at the time of their registration in 1894–95 was 10.52 years. However, this result must not be compared with the averages in St. Louis and Chicago for the reason that in the Boston schools pupils are admitted under 4 years of age, while in St. Louis no pupils are admitted until they are 6 years old. In Chicago all those under 7 years old are grouped together without specifying how old they are, whether 4, 5, or 6; consequently no comparison can be made except for those who are 7 years old and over.

Using the figures given in Tables I, II, and III for the year 1894–95, for the three cities, I find the average age of all those children who were above 7 years of age at the date of registration in the public schools in 1894–95 to be as follows: St. Louis, 10.83; Chicago, 10.87; Boston, 11.56.

I wish now to show how entirely reasonable it is that the average age of those in school should be very different from the average age at the time of withdrawal. Let us suppose that in an ideal city 1,000 pupils enter the schools every year at exactly the age of 6 years. Let us also suppose that this number of pupils remains without change—that is, there are no deaths, no removals, no additions, no withdrawals, but every pupil remains in school until the age of 20, and then withdraws. Under such an ideal condition of things it is evident that the average age at the time of withdrawal would be exactly 20 years; and yet the average age at the time of registration at the beginning of any one year would be exactly 12½ years, which is clearly seen to be a very different thing. This, of course, is an ideal and an extreme or limiting case toward which results may approximate more and more as the attendance is extended more and more generally throughout the course of the public schools.

TABLE I.—*St. Louis public schools.*

Year.													A.	B.	C.									Actual rate of gain.	Rate of external gain.

CHAPTER XXV.

ADMISSION TO COLLEGE BY CERTIFICATE.

The question of requirements for admission to college is receiving considerable attention at the present time from educators and educational journals and magazines. This is evidenced by the large number of articles on the subject published in the periodicals and by the formation of associations of colleges and secondary schools, the leading objects of such associations being to secure uniformity in admission requirements and to improve the standard of collegiate as well as secondary education. One of the most important educational publications bearing upon the subject is the report of the Committee of Ten on secondary school studies. The intention of the Committee of Ten, in formulating the four different courses of study recommended in the report, was to provide courses of study for pupils who can not take a college course, and to provide courses, the completion of which could and should be accepted by the universities and colleges for admission to corresponding courses in such institutions, believing "that this close articulation between the secondary schools and the higher institutions would be advantageous alike for the schools, the colleges, and the country." That this report has borne fruit is shown by the fact that the courses of study recommended therein have been adopted with modifications by some of the secondary schools and by preparatory departments of colleges. There is, however, still a wide divergence in the courses of study of secondary schools as well as in the requirements for admission to the freshman classes of the various universities and colleges of the country. These facts have thus far rendered it impossible for all of the institutions to agree upon uniform entrance requirements or upon uniform lists of accredited or approved schools, but it can not be doubted that the tendency is in this direction. This may be seen by examining the lists of schools accredited or approved by the several institutions given on the following pages.

The two general methods of admission to the freshman class of colleges at the present time are by examination and by certificate. To these may be added another method which is in use only by institutions maintaining preparatory departments. Such institutions admit students to the freshman class who have completed a course of study in their respective preparatory departments.

Prior to the year 1871 the plan of special examination by college authorities was in almost universal use by the better class of colleges, but since that date the plan of admitting students upon certificates of public, high, and private preparatory schools has been inaugurated, and received a remarkable impetus. This movement was started by the University of Michigan, and has now been adopted by all of the State universities of the North Central and Western Divisions, as well as by some of the State institutions of the other divisions, and by a large number of the denominational and other private institutions of the country. The adoption of the certificate system by State institutions has generally been followed by the adoption of the same or a similar plan by other institutions in those States. The Michigan plan, adopted in 1871 and given in detail in the following pages, provides for an examination of the courses of study and methods of instruction of the schools, to be approved by a committee of the faculty of the university. In Indiana the high schools of

certain grades are commissioned by the State board of education, and their graduates are admitted to the State institutions.

The purpose of the system of admission by certificate, when inaugurated by the University of Michigan, and its advantages, as stated by Dr. Charles Kendall Adams, president of the University of Wisconsin, in the Educational Review for June, 1893, are as follows:

At the time the system of admitting students on certificate was adopted at the University of Michigan, now more than twenty years ago, the purpose was to bind the university and the preparatory schools of the State into a closer alliance for the purpose of mutual helpfulness. A somewhat thorough study of the systems of admitting students in other countries to the higher institutions of learning led to the belief that a carefully guarded method by which pupils of approved schools should be admitted without examination would prove beneficial to the schools as well as to the university. The system was constructed in such a way as to throw upon the university the responsibility of examining the school, and also to throw upon the individual school the responsibility for the preparation of the students admitted. * * * After five years of trial an examination of the records showed that the standing of students admitted by certificate was considerably higher than the standing of those admitted by examination. There seemed, moreover, to be conclusive evidence that the schools were greatly benefited by the arrangement. After the examination of a school its weak places were pointed out to the school board, and it was generally found that the boards were very willing to make any changes suggested. * * * I have been from the first an earnest believer in the system, and I believe that history has fully justified the predictions of those who had to do with its first introduction in Michigan. The advantages of it are threefold:

In the first place, it relieves the officers of the university of the labor of the preliminary examinations. This point should not receive serious consideration, if it is certain that the examinations so conducted are likely to secure a better grade of scholarship. But to suppose that that is the case would be to ignore or defy the experience of more than twenty years.

In the second place, a very great advantage is experienced by the preparatory school. The visit of the committee from the university is an event looked forward to as an affair of great importance to the teachers and pupils. The examination, when properly conducted, includes an inspection of the class work of every teacher and a careful report upon the nature of the work done. Such a visit is, and must be, of the very greatest importance to the school in question.

The third advantage is in the fact that all the pupils become accustomed to thinking that the academy or high school is not the end of a good education. A large number who would otherwise complete their school days at the end of the high school course are fired with a desire to go forward to a further term of study in a college or university.

These considerations, especially the second and third, are advantages of great importance, and I know of no disadvantages from the system that can, in any true sense, be regarded as of counterbalancing significance.

President Northrop, of the University of Minnesota, states that the advantages of the system are: "(1) It raises the grade of the preparatory schools; (2) it gives us students better prepared for university work; (3) it does away with an immense amount of work and worry incident to examinations; (4) it gives us better results from the student when he is once in the university."[1]

No attempt has been made to obtain expressions of opinion concerning the certificate system from the various institutions of the country, but the few State institutions which publish annual reports commend the system for the close relation which is established between the universities and the common school systems of the States, as well as for the well-prepared students furnished thereby. The annual catalogues show that the system has now been adopted, in some form or other, by 42 State universities and agricultural and mechanical colleges, and by about 150 other institutions. This shows that, while some of the more conservative institutions of the country, especially in the East, still adhere strictly to the method of examination by college authorities, the certificate system is continually gaining ground. Some of the institutions surround the system with various safeguards to insure against its abuse. In nearly all of them admission by certificate is probationary—that is, the

[1] Educational Review, February, 1893.

student is admitted to the freshman class on the condition that he is able to maintain a satisfactory standing in his class during a term, or, in some cases, the entire freshman year. Some provide that if a school sends several ill-prepared students the privilege of sending students on certificate is taken from such school, and in nearly all cases the privilege is limited to three years, when a school may be reexamined in order to ascertain whether it shall continue to be considered as an approved or accredited school. The certificates of the principals must generally show the nature of the course of study completed, with a statement that in the principal's opinion the student is able to maintain the studies of the course for which he is an applicant. Some of the institutions require the certificate to show each branch of study pursued, the text-books studied, the time spent thereon, as well as the standing attained by the student. Only a few of the colleges admit students on diplomas unaccompanied by certificates.

In the following pages will be found statements, gleaned from annual catalogues, concerning the conditions under which schools are accredited or approved and students therefrom admitted to the several universities and colleges. The list of schools approved by each institution is given, so far as possible, in connection with such institution. The material collected is presented under several different heads, as follows:

I. State institutions.

II. Private and denominational institutions.

III. List of additional institutions admitting students upon presentation of certificates from approved high schools and academies, and which do not publish a list of such schools.

IV. Institutions accepting certificates or diplomas of the regents of the University of the State of New York.

V. Institutions admitting students upon presentation of diploma or certificate from approved high schools or academies, and which do not publish a list of such schools.

I. STATE INSTITUTIONS.

University of Alabama, University, Ala.—Any school of the State of Alabama for boys and young men whose course of study comprises the requirements for admission into the freshman class in any course of the university may, upon written application of the principal, submitting curriculum of study, be declared by the president and faculty of the university a university auxiliary school, and be awarded a certificate to that effect. Any young man, of the age required for admission shall, upon presentation of a certificate signed by the principal of a university auxiliary school, be admitted into the freshman class. The auxiliary schools are: State normal college, Florence; University high school, Tuscaloosa; Marengo Military Academy, Demopolis; Livingston Military Academy, Livingston; University school, Montgomery; Greenville public school; Brundidge high school; Millwood school, Anniston; University Military School, Mobile; University Military School, Clanton; South Highland Academy, Birmingham; Butler high school; Huntsville Male Academy; Prattville Academy; Birmingham high school; Lafayette College; Mount Willing high school; Talladega Military Academy.

Arkansas Industrial University, Fayetteville, Ark.—Any high school or academy whose course of instruction covers all the branches requisite for admission to the university may be placed upon the accredited list of preparatory schools, after examination and approval by an officer of the university. Graduates of such schools are admitted without examination, and students who are not graduates are admitted upon certificates of proficiency. The accredited schools are: Fort Smith high school, Rogers Academy, Little Rock high school, Marianna Institute, Lonoke high school, Jonesboro State normal school.

University of California, Berkeley, Cal.—Students are admitted on examination and on certificates from accredited schools. The regulations concerning accredited schools are as follows:

"Upon the request of the principal of any public or private school in California whose course of study embraces in kind and extent the subjects required for admission to any college of the university at Berkeley, a committee from the academic senate will visit such school and report upon the quality of the instruction there given. If the report of such committee be favorable, a graduate of the school,

upon the personal recommendation of the principal, accompanied by his certificate that the graduate has satisfactorily completed the studies of the course preparatory to the college he wishes to enter, may, at the discretion of the faculty of such college, be admitted without examination."

There are now 48 accredited schools, as follows: High schools of Alameda, Berkeley, Coronado, Fresño, Grass Valley, Healdsburg, Kern County, Los Angeles, Marysville, Nevada City, Oakland, Pasadena, Petaluma, Pomona, Riverside, Sacramento, Salinas, San Diego, San Francisco (boys', girls'), San Jose, San Rafael, Santa Ana, Santa Barbara, Santa Cruz, Santa Monica, Santa Rosa, Stockton, Vallejo, Ventura, Visalia, Watsonville; Alameda County union high schools (No. 1, Livermore, No. 2, Centerville, No. 3, Haywards); Armijo union high school, Suisun; Belmont school; Boone's University school, Berkeley; Hoitt's Oak Grove school, Millbrae; Lompoc union high school; Mount Tamalpais Military Academy, San Rafael; Oak Mound School, Napa; Redlands union high school; San Bernardino Academy; Santa Barbara Collegiate school; Sonoma Valley union high school; St. Matthew's school, San Mateo; Trinity School, San Francisco.

University of Colorado, Boulder, Colo.—Students are admitted upon certificate of graduation from the following accredited schools: High schools of Denver (District No. 1, District No. 2), Colorado Springs, Greeley, Pueblo (District No. 1, District No. 20), North Denver, Georgetown, Cañon City, Durango, Aspen, Fort Collins, Golden, Grand Junction, Jarvis Hall Military Academy.

Colorado State School of Mines, Golden, Colo.—Certificates of proficiency from approved high schools will be received in lieu of examination.

University of Georgia, Athens, Ga.—Certificates from branch colleges are accepted in lieu of examination only when they show that the student presenting them has completed a course of study identical with that pursued by classes below the one which he wishes to enter.

University of Idaho, Moscow, Idaho.—High schools will be accredited only after visitation and recommendation by the president. So far no schools have been accredited. Certificates from the superintendents of the Boise, Lewiston, Moscow, and Pocatello schools, setting forth the industry and proficiency of the applicant, will be accepted for all requirements for admission covered by such certificate. Clear and definite statements from the teacher who has prepared the applicant for the university, explaining the ground covered and the quality of the work done, will be given due consideration.

University of Illinois, Champaign, Ill.—The faculty, after personal examination, appoints accredited high schools, whose graduates may be admitted to the university without examination. These must be schools of first-rate character, whose course of instruction includes all the studies required for admission to some one of the colleges of the university. If so requested, a member of the faculty will examine a school as to its facilities for teaching, its course and methods of instruction, and the general proficiency shown. The university bears the expense of this examination. If the report is favorable, a certificate of that fact is forwarded, and the name of the school is entered in the published list of high schools accredited by the university. The graduates of these schools are admitted to any course for which their high school studies, as certified by the principal, have prepared them. Annual reports are asked from these schools. A reexamination will be made whenever it may be deemed necessary. The list of accredited schools now embraces 120 high schools and 6 other institutions, as follows:

High schools of Alton, Arcola, Atlanta, Aurora (east, west), Austin, Beardstown, Belvidere (north), Bement, Bloomington, Cairo, Camp Point, Carthage, Canton, Carrollton, Charleston, Chicago (Auburn Park, Englewood, Hyde Park, Lake, Lake View, north division, northwest division, south division, South Chicago, west division), Clinton (Iowa), Danville, Davenport (Iowa), Decatur, Delavan, Dundee, Elgin, Elmwood, Evanston (township high school), Farmer City, Freeport, Galena, Galesburg, Galva, Geneseo, Griggsville, Jacksonville, Jerseyville, Joliet, Kankakee, Keokuk (Iowa), Kewanee, La Grange (township high school), Macomb, Mattoon, Maywood, Mendota (west), Moline, Monmouth, Morrison, Nashville, Oak Park, Ottawa (township), Paris, Pekin, Peoria, Pittsfield, Pontiac (township), Princeton (township), Quincy, Rockford, Rock Island, Roodhouse, Shelbyville, Springfield, Sterling (third district), Streator (township), Taylorville (township), Tuscola, Virden, Wilmington, Waukegan, Yorkville, Aledo, Augusta, Batavia (west), Belleville, Cambridge, Champaign, De Kalb, Dixon, East St. Louis, Effingham, Harvard, Hillsboro, Keithsburg, La Salle, Lewistown, Lexington, Le Roy, Lyons (Iowa), Marengo, Mason City, Milford, Monticello, Mound City, Oregon, Paw Paw, Paxton, Peru, Polo, Ridge Farm, Rochelle, Rossville, Savanna, Sparta, Sterling (Wallace), Sullivan, Sycamore, Tolono, Virginia, Warsaw, Washington, Winchester; Chicago manual training school; Chicago English high and manual training school; Western Military Academy, Upper Alton; Jennings Seminary, Aurora; Southern Illinois Normal University, Carbondale; Illinois Normal University, Normal.

Indiana University, Bloomington, Ind.—The State board of education examines the high schools of the State from time to time, and to those that reach a satisfactory standard is granted a commission which recognizes them as preparatory schools to the university. A certificate of graduation from any one of these commissioned high schools admits the student without examination to the university, except that it does not exempt him from the test in English composition. There are now 118 commissioned high schools in Indiana, as follows: Albion, Alexandria, Amboy, Anderson, Andrews, Attica, Auburn, Aurora, Bedford, Brookville, Butler, Bloomfield, Bloomington, Bluffton, Boonville, Bourbon, Brazil, Cambridge City, Carthage, Clinton, Converse, Columbia City, Columbus, Connersville, Crawfordsville, Crown Point, Danville, Decatur, Delphi, Dublin, Edinburg, Elkhart, Elwood, Evansville, Fort Wayne, Frankfort, Franklin, Garrett, Goodland, Goshen, Gosport, Greencastle, Greenfield, Greensburg, Hammond, Hagerstown, Huntingburg, Huntington, Indianapolis, Jeffersonville, Kendallville, Knightstown, Kokomo, Lafayette, La Grange, La Gro, La Porte, Lawrenceburg, Lebanon, Liberty, Ligonier, Lima, Logansport, Madison, Marion, Martinsville, Michigan City, Middletown, Mishowaka, Mitchell, Monticello, Mt. Vernon, Muncie, New Albany, New Castle, New Harmony, North Manchester, Noblesville, North Vernon, Orleans, Oxford, Pendleton, Peru, Petersburg, Plymouth, Portland, Princeton, Remington, Rensselaer, Richmond, Rising Sun, Roann, Rochester, Rockport, Rockville, Rushville, Salem, Seymour, Shelbyville, South Bend, Spencer, Sullivan, Terre Haute, Thorntown, Tipton, Union City, Valparaiso, Vevay, Vincennes, Wabash, Warsaw, Washington, Waterloo, Williamsport, Winamac, Winchester, Worthington, Zionsville.

Purdue University, La Fayette, Ind.—Applicants who have completed their course of preparation in high schools which have been commissioned by the State board of education will be admitted without examination. For list of commissioned high schools see under Indiana University. An arrangement has been made with the directors of the Chicago Manual Training School, Toledo Manual Training School, Rugby School, of Louisville, Ky., Classical School, of Evansville, Ferris Industrial School, Big Rapids, Mich., and the manual training high school, Louisville, Ky., by which graduates of these institutions are received and will be given credit for all work previously accomplished.

State University of Iowa, Iowa City, Iowa.—At a meeting of the board of regents in June, 1891, the following scheme was adopted for the inspection of high schools and for examinations to be held thereat:

(1) Any school may be placed upon the accepted list upon application of its principal or board of directors, provided the collegiate faculty of the university is satisfied as to its course of study, methods of teaching, facilities for instruction.

(2) The course of study of such school must be adapted for fitting its graduates for some of the collegiate courses of the university, or it must be in the direct line of such preparation.

(3) Whenever any accepted school in any of the classes requests it, its pupils may be examined by the university at a convenient time in any subject or subjects selected by the school authorities from the schedules of studies required for admission to the university, and each pupil will receive from the university a credit card for each subject passed.

(4) The university shall provide, for schools desiring the same, a syllabus of each of the subjects in which examination is to be taken.

(5) All schools in accepted relation shall be inspected at the pleasure of the university, the expense of the inspection to be borne by the university.

(6) The authorities of accepted schools shall report annually to the university all changes made in the course of study and submit a list of names of the instructors employed in the high school, with subjects taught by each. The list of accepted schools has not yet been published.

Iowa State Agricultural College.—Certificates from the following schools will be received: High schools of Adel, Albia, Algona, Ames, Anamosa, Atlantic, Battle Creek, Belle Plaine, Belmond, Bancroft, Boone, Brooklyn, Burlington, Carroll, Cedar Falls, Cedar Rapids, Chariton, Charles City, Cherokee, Clarinda, Clarion, Clinton, Colfax, Columbus City, Corydon, Corning, Council Bluffs, Cresco, Creston, Davenport, Denison, Des Moines, De Witt, Dunlap, Eldora, Emmetsburg, Estherville, Fairfield, Forest City, Fort Dodge, Greene, Guthrie Center, Hamburg, Hampton, Harlan, Humboldt, Ida Grove, Independence, Iowa City, Iowa Falls, Jefferson, Keokuk, La Porte, Le Mars, Leon, Logan, Maquoketa, Manchester, Marengo, Marion, Marshalltown, Mason City, Monroe, Monticello, Montour, Missouri Valley, Mount Pleasant, Muscatine, Nashua, Nevada, Newton, Odebolt, Onawa, Orange City, Osage, Osceola, Oskaloosa, Ottumwa, Oxford, Red Oak, Reinbeck, Rock Rapids, Rockwell City, Sac City, Scranton, Sheldon, Sioux City, Steamboat Rock, Storm Lake, Stuart, Sumner, Tama City, Tipton, Toledo, Traer, Vinton, Villisca, Washington, Waterloo, Webster City, West Union, Wilton, and Winterset; Albion Seminary, Algona Academy, Burlington Collegiate Institute, Decorah Institute, Denmark Academy, Epworth Seminary, Howe's

Academy, Iowa City Academy, Northern Iowa Academy, Northwestern Classical Academy of Orange City, Springdale Seminary, and Washington Academy.

Kansas State Agricultural College, Manhattan, Kans.—The following diplomas and certificates will be received in lieu of entrance examinations: (1) Diplomas received on the completion of a county course of study which has been approved by the faculty, when properly signed by the county superintendent. (2) Certificates of passing the grammar grade in any city school with a course of study approved by the faculty, when properly signed by the city superintendent. (3) Kansas teachers' certificates issued by the county board of examiners, showing that the above-named studies have been passed with a grade of at least 70 per cent.

The faculty have approved the courses of study adopted by the following counties and cities; others may be submitted for approval at any time:

Counties.—Allen, Anderson, Barber, Brown, Bourbon, Butler, Chase, Cherokee, Clay, Cloud, Cowley, Dickinson, Doniphan, Douglas, Elk, Ellis, Ford, Franklin, Geary, Greenwood, Harper, Harvey, Jackson, Jefferson, Jewell, Johnson, Kingman, Labette, Leavenworth, Linn, Lyon, Marshall, Marion, McPherson, Miami, Mitchell, Montgomery, Morris, Nemaha, Neosho, Ness, Osage, Osborne, Ottawa, Pottawatomie, Republic, Reno, Rice, Riley, Rooks, Rush, Russell, Saline, Sedgwick, Shawnee, Sumner, Wabaunsee, Washington, Wilson, Woodson, Wyandotte.

Cities.—Abilene, Alma, Anthony, Argentine, Arkansas City, Atchison, Augusta, Baldwin, Belleville, Beloit, Burlingame, Burlington, Caldwell, Chanute, Cherry Vale, Chetopa, Clay Center, Clifton, Coffeyville, Columbus, Concordia, Council Grove, Dodge City, Eldorado, Ellsworth, Emporia, Eureka, Fort Scott, Fredonia, Garden City, Garnett, Gaylord, Girard, Great Bend, Hiawatha, Holton, Horton, Humboldt, Hutchison, Independence, Iola, Junction City, Kanopolis, Kansas City, Kingman, Larned, Lawrence, Leavenworth, Lincoln, Lyons, Manhattan, Mankato, Marion, McPherson, Minneapolis, Neodesha, Newton, Olathe, Osage City, Osborne, Oswego, Ottawa, Paola, Parsons, Pittsburg, Pomona, Pratt, Russell, Salina, Scranton, Seneca, Solomon City, St. Marys, Topeka, Valley Falls, Wamego, Washington, Waverly, Wellington, Winfield, Wichita.

University of Kansas, Lawrence, Kans.—Students will be admitted upon the certificate of the president, superintendent, or principal of any college, academy, or other incorporated institution of learning, or of any public high school of the State, showing that such students have completed all the preparatory prescribed studies as laid down in the catalogue. Students who present certificates showing that they have completed all the required studies except three terms' work will be admitted with conditions. The following schools fully prepare for the freshman class: High schools of Abilene, Alton, Ill., Atchison, Atchison County, Belleville, Beloit, Blue Rapids, Burlington, Burrton, Caldwell, Carbondale, Cawker City, Chanute, Cherokee, Coffeyville, Concordia, Cottonwood Falls, Dickinson County, Dodge City, Downs, Ellsworth, Emporia, Eureka, Fort Scott, Frankfort, Fredonia, Garden City, Great Bend, Hartford, Hays City, Hiawatha, Holton, Horton, Howard, Hutchinson, Independence, Iola, Junction City, Kansas City, Kansas City, Mo., Labette County, Lawrence, Leavenworth, Lincoln, Marion, Marysville, Minneapolis, McPherson, Neodesha, Newton, Norton, Oklahoma City, Okla., Olathe, Osborne, Ottawa, Paola, Parsons, Peabody, Phillipsburg, Pittsburg, Pleasanton, Pratt, Sabetha, Salina, Sedgwick, Seneca, Topeka, Troy, Valley Falls, Wamego, Washington, Wellington, Wichita, and Winfield; also, Arkansas City (Kans.) Academy, Fairmount Institute, Wichita, Kans.; Friends' Academy, Tonganoxie, Kans.; Hesper (Kans.) Academy, Hiawatha (Kans.) Academy, Lowell (Kans.) Polytechnic Institute, and Wentworth Military Academy, Lexington, Mo.

The following schools report courses which fall short of preparing for the freshman class by not more than three terms work: High schools of Alma, Anthony, Argentine, Burlingame, Centralia, Cherry Vale, Enterprise, Clyde, Council Grove, Garnett, Girard, Goodland, Halstead, Herington, Hill City, Humboldt, Jetmore, Lakin, Lyndon, Lyons, Moran, Mound Valley, Osawatomie, Oskaloosa, Smith Center, Solomon, Sedan, Sterling, Wathena, Waverly, and White Cloud; also Friends' Academy, Washington, Kans.; Grellett Academy, Glen Elder, Kans.; Lewis Academy, Wichita, Kans.; Southern Kansas Academy, Eureka, Kans., and Stockton (Kans.) Academy.

Maine State College, Orono, Me.—Any preparatory school whose course of instruction covers the requirements for admission may be admitted to the list of approved schools after visitation and examination by the faculty. The list of approved schools is as follows: Bangor high school; Bar Harbor high school; Bath high school, Boynton high school of Eastport; Brewer high school; Bridgton Academy, North Bridgton; Coburn Classical Institute, Waterville; Cony high school, Augusta; Corinth Academy, East Corinth; Deering high school; Dover high school; East Maine Conference Seminary, Bucksport; Ellsworth high school; English high school; Foxcraft Academy; Framingham (Mass.) high school; Gardiner high school; Greeley Institute, Cumberland Center; Hampden Academy; Lincoln Academy, West Poland;

Maine Wesleyan Seminary, Kent's Hill; Milo high school; Monson Academy; North Yarmouth Academy, Yarmouth; Norway high school; Orono high school; Portland high school; Ricker Classical Institute, Houlton; Rockland high school; Skowhegan high school; Thornton Academy, Saco; Waterville high school; Washington Academy, East Machias; Westbrook high school; Yarmouth high school, Yarmouthville.

University of Michigan, Ann Arbor.—The privilege of sending pupils for admission on diploma, originally limited to approved schools in Michigan, has been extended to include schools in other States. On request of the school board in charge of any school the faculty will designate a committee to visit the school and report upon its condition.

If the faculty are satisfied from the report of the committee that the school is taught by competent instructors and is furnishing a good preparation to meet the requirements for admission to any one or more of the courses of study, then the graduates from the approved preparatory course or courses will be admitted without examination. The diplomas of their school board must be presented within one year and three months after graduation. They must also present certificates stating that they have sustained examinations in all the studies prescribed for admission and are recommended for admission to the university. The schools which shall be approved shall be entitled to send their graduates on diploma for a period of three years without further inspection, provided that no important changes affecting the course of study and the efficiency of the instruction are made. Each approved school is expected to send annually a copy of its catalogue to the university. There are now 144 approved schools, as follows: High schools of Adrian, Albion, Allegan, Alpena, Ann Arbor, Aurora, Ill. (east side and west side), Austin, Ill., Battle Creek, Bay City, Belding, Benton Harbor, Big Rapids, Birmingham, Buchanan, Cadillac, Caro, Cassopolis, Cedar Rapids, Iowa, Champion, Charlotte, Chicago, Ill. (north division, northwest division, south division, west division, Calumet, Englewood, English high and manual training school, Hyde Park, Jefferson high school, Lake, Lake View, South Chicago), Cincinnati, Ohio (Hughes School, Woodward School), Cleveland, Ohio (central, west), Clinton, Iowa, Coldwater, Constantine, Corunna, Decatur, Ill., Denver, Colo., Detroit, Dowagiac, Duluth, Minn., Eaton Rapids, Elgin, Ill., Escanaba, Fenton, Flint, Geneseo, Ill., Grand Haven, Grand Rapids, Greenville, Hancock, Hastings, Hillsdale, Holly, Houghton, Howell, Hudson (west side), Ionia, Iron Mountain, Ironwood, Ishpeming, Ithaca, Jackson (east side, west side), Joliet, Ill., Jonesville, Kalamazoo, Kansas City, Mo., La Grange, Ill., Lake Linden, Lansing, Lapeer, La Porte, Ind., Ludington, Manistee, Marine City, Marquette, Marshall, Mason, Maywood, Ill., Michigan City, Ind., Milwaukee, Wis., Minneapolis, Minn., Monroe, Mount Clemens, Muskegon, Negaunee, Niles, Oak Park, Ill., Omaha, Nebr., Ottawa, Ill., Owosso, Paw Paw, Peoria, Ill., Petoskey, Pontiac, Port Huron, Portland, Princeton, Ill., Rockford, Ill., Romeo, Saginaw (east side, west side), St. Clair, St. Joseph, St. Paul, Minn., Sault Ste. Marie, Schoolcraft, South Bend, Ind., Springfield, Ill., Tecumseh, Three Rivers, Toledo, Ohio, Traverse City, Union City, Vassar, Vicksburg, Washington, D. C. (Eastern High School), West Bay City, West Des Moines, Iowa, Ypsilanti; also, Normal and Collegiate Institute, Benton Harbor, Mich.; Granger Place School, Canandaigna, N. Y.; Harvard School, Kenwood Institute, Manual Training School, and University School, Chicago, Ill.; Detroit School for Boys, Home and Day School, Detroit, Mich.; Michigan Female Seminary, Kalamazoo, Mich.; Peabody Normal College, Nashville, Tenn.; Normal University, Normal, Ill.; Scoville Place School, Oak Park, Ill,; Michigan Military Academy, Orchard Lake, Mich.; Oxford College, Oxford, Ohio; Northeast Manual Training School, Philadelphia, Pa.; Raisin Valley Seminary, Vermont Academy, Saxtons River, Vt.

Michigan Agricultural College, Agricultural College, Mich.—Graduates of graded schools having a regular course of study approved by the faculty and persons presenting teachers' certificates are admitted without examination.

Michigan Mining School, Houghton, Mich.—Candidates who desire to enter by certificate are divided into two divisions—first, those 18 years of age and upward, and second, those under 18 years of age. A candidate 18 years of age or over may present a certificate from the superintendent or principal of any high school, academy, or seminary in good standing, certifying that the candidate has studied not less than one year in that institution; has been examined under the direction of the superintendent or principal who has signed the certificate, and that the candidate has passed in arithmetic; metric system; algebra through quadratic equations; plane, solid, and spherical geometry; bookkeeping; elementary physics and elements of astronomy, with a rank of not less than 85 on a scale of 100 in each and every study required for admission. Conditions in bookkeeping and astronomy are allowed when necessary. Candidates who are under 18 years of age must present a certificate from the superintendent or principal of some reputable high school, academy, or seminary that they have completed one of the regular courses of study in that school, and have graduated, obtaining a rank of not less than 85 in a scale of 100 in each

and every subject required for admission, and that the candidate's rank in all other studies in the school's prescribed course is not less than 75 for each and every one.

University of Minnesota, Minneapolis, Minn.—By a resolution of the board of regents, graduates of St. Paul and Minneapolis high schools are admitted to the freshman class upon presentation of their diplomas. The State high school board has inspected and classified the schools under its supervision, and the graduates of the schools of the first rank are admitted to the freshman class upon presentation of their diplomas. At present the following schools are in this rank: Albert Lea, Alexandria, Anoka, Austin, Crookston, Duluth, Faribault, Fergus Falls, Hastings, Henderson, Lake City, Litchfield, Mankato, Northfield, Owatonna, Red Wing, Rochester, Sauk Center, Spring Valley, Stillwater, and Worthington. The diplomas of these schools should be accompanied by a certificate from the principals, giving a list of the studies actually covered by the diplomas. The diploma will be accepted for all that it really represents of work done. As a rule, the records of graduates of normal schools, or schools which admit to the freshman class of other reputable universities without examination, will be accepted for entrance to the university.

University of Mississippi, University, Miss.—Students coming from approved high schools are admitted without examination to the classes of the university for which they may be prepared, provided they have reached the required age and present themselves within one year after leaving the high school. The following schools are recognized as affiliated high schools as long as their efficiency is approved by the faculty: Warren Institute, Oxford; Crystal Springs high school; private school of T. G. Smith-Vaniz, Canton; Winona high school; West Point high school; Union Church Academy; private school of B. M. Lovejoy, Aberdeen; private school of C. F. Kemper, Vicksburg; P. H. Saunder's summer school, University; Waverly Institute, Byhalia; city school, Jackson; city high school, Helena, Ark.; Carrollton Male Academy, Carrollton; city school, Senatobia; New Albany high school. High schools are affiliated after visitation and inspection by the faculty.

University of the State of Missouri, Columbia, Mo.—It is proposed that schools be articulated upon the adoption of a course of study outlined by the university, and that the sign that this course has been adopted be an agreement between the university and the school authorities. This agreement is to be signed on the one hand by the president of the university, and on the other hand by the principal of the high school, the president of the school board, and the superintendent of public schools of the town in which the high school is situated. In the case of private schools or colleges it should be signed by the principal or president and by the president of the trustees or curators. The agreement shall specify—

(1) That the school authorities have made their course of study meet fully the requirements proposed by the university.

(2) That the first diploma issued under the new course of study will bear a specified date.

(3) That the employment of inefficient teachers in the school will at any time justify the university in severing the relation.

(4) That the university on its part will, after the date prescribed, admit without examination to the freshman class, in any course for which they have been duly prepared, such graduates of the school as bring proper credentials of the fact that they are recommended for that class by the school authorities; and it will admit free of tuition for the first year the student graduating from the school with the highest honors.

(5) That the university will send from time to time a representative to visit the school, and will use its best efforts to promote in whatever way it can its welfare.

The following schools are on the approved list: High schools of Bethany, Bollivar, Carthage, Carrollton, Clinton, Fort Smith, Ark.; Harrisonville, Higginsville, Independence, Jefferson City, Joplin, Lamar, Lancaster, La.; Marshall, Maryville, Miami, Mexico, Moberly, Monroe City, Mound City, Montgomery City, Nevada, Paris, Richmond, Rockport, Sedalia, Shelbina, Slater, Springfield, Trenton, Westport, Cameron, Chillicothe, Hannibal, Kansas City, St. Joseph, St. Louis; Mountain Grove (Mo.) Academy; Brookfield (Mo.) College; Mount Vernon (Mo.) Academy; Appleton City (Mo.) Academy; Cooper Institute, Boonville, Mo.; Marionville (Mo.) Collegiate Institute; Buchanan College, Troy, Mo.; Kemper Family School, Boonville, Mo.; Marmaduke Military Academy, Sweet Springs, Mo.; Michigan Military Academy, Orchard Lake, Mich.; Missouri Military Academy, Mexico, Mo.; St. James Military Academy, Macon City, Mo.; University Academy, Columbia, Mo.; Wentworth Military Academy, Lexington, Mo.

University of Nebraska, Lincoln, Nebr.—There are about 75 public schools in Nebraska upon the accredited list of the university, but of these not more than half a dozen fully prepare for entrance to the university proper.

New Hampshire College of Agriculture and the Mechanic Arts, Durham, N. H.—A certificate from any academy or high school will be accepted upon any subject required for admission.

New Mexico College of Agriculture and Mechanic Arts, Mesilla Park, N. Mex.—The principals and superintendents of the following high schools are authorized to prepare students for admission: Raton, Las Vegas, Albuquerque, Deming, Eddy, and El Paso. Graduates of these schools will be admitted without examination.

University of North Carolina, Chapel Hill, N. C.—The university admits, without examination, students with certificates from certain schools in the State whose courses of study and methods of instruction are approved by the faculty.

Ohio State University, Columbus, Ohio.—Certificates of high schools and normal schools in Ohio are accepted, if found satisfactory, in lieu of examination for preparatory studies under the following conditions:

(1) Each certificate must show that the candidate has completed the course of study in the school from which he comes and must, further, contain a detailed statement of the studies pursued, the text-books used, the amount of work done in each study, the amount of time devoted to it, the date of the examination, and the rank of standing of the candidate in it. A copy of the course of study should accompany the certificate.

(2) From time to time the faculty has approved the course of study in certain high schools of the State, and the graduates of these schools are admitted to freshman work on presentation of their diplomas, subject, however, to conditions in all required studies not included in their high school course.

The list of high schools to whose graduates a definite standing has been assigned is as follows: Akron, Alliance, Barnesville, Batavia, Bellaire, Bement (Ill.), Canton, Carey, Chardon, Chillicothe, Cincinnati, Cincinnati Technical School, Circleville, Cleveland, Columbus, Coshocton, Dayton, Defiance, Delaware, East Liverpool, Elyria, Fremont, Galion, Gallipolis, Grand River Institute, Hamilton, Hillsboro, Ironton, Jefferson Educational Institute, Lancaster, Lima, Lorain, Mansfield, Marietta, Massillon, Marion, Martins Ferry, Miamisburg, Middletown, Mount Sterling, Mount Vernon, Newark, New South Lyme, New Vienna, Norwalk, Piqua, Pomeroy, Portsmouth, Richwood, Sandusky, Salem, Sidney, Springfield, Steubenville, Tiffin, Toledo, Troy, Urbana, Van Wirt, Warren, Wooster, Xenia, Youngstown, and Zanesville.

Oregon State Agricultural College, Corvallis, Oreg.—Those applicants who have completed a high school course will be admitted upon presentation of their diplomas.

University of Oregon, Eugene, Oreg.—Students presenting credits from reputable schools will be allowed their equivalents in the university.

Pennsylvania State College, State College, Pa.—Graduates of State normal schools and of a select list of high schools and academies in Pennsylvania, whose standard of requirements has been ascertained to be satisfactory, will be admitted without examination in studies which as shown by their diploma or certificate they have successfully completed in such institution. Diplomas must be accompanied by a certificate.

South Carolina College, Columbia, S. C.—The faculty are authorized to admit applicants who shall present from superintendents or principals of graded schools and other approved schools where they have been pupils, certificates that they have passed satisfactory examinations on the subjects required for admission.

South Dakota Agricultural College, Brookings, S. Dak.—Certificates from schools or teachers, approved by the faculty, will be accepted.

University of South Dakota, Vermilion, S. Dak.—High schools and public or private academies whose methods and courses of instruction are approved by the faculty may, upon application to the president, enter the list of university fitting schools, this relation to continue as long as the approved grade of work is maintained in the accredited school, or until the university requirements are modified. Pupils from such schools receive credit, without examination, for subfreshman or preparatory work only, upon presenting certificates definitely setting forth the amount of work done and the time spent on each subject. At present the accredited schools are those of Aberdeen, Deadwood, Elk Point, Flandreau, Hot Springs, Huron, Millbank, Mitchell, Parker, Pierre, Rapid City, Sioux City, Iowa, Sioux Falls, Watertown, Yankton, Scotland Academy, Wessington Springs Seminary.

University of Tennessee, Knoxville, Tenn.—All approved State secondary schools are accredited schools. They were established by an act approved March 25, 1891. This law says: "In every secondary school shall be taught the following branches: Orthography, reading, writing, arithmetic, grammar, geography, history of Tennessee, history of the United States, elementary geology in Tennessee, elementary principles of agriculture, elements of algebra, elements of plane geometry, elements of natural philosophy, bookkeeping, elementary physiology and hygiene, elements of civil government, and rhetoric, or higher English. Practice shall be given in elocution, or the art of speaking. Vocal music may be taught, and no other branches shall be introduced." Any high school, academy, or other institution whose course of study covers the branches required for admission to the freshman class may be put on an accredited list, after application, examination by some officer of the

university, and approval by the faculty. In lieu of the sciences provided in the secondary school course, these schools may offer Latin, Greek, and other good equivalents. Graduates or proficients duly recommended by the principals of such accredited schools will be received into the collegiate department without examination. The following institutions are on the list of accredited schools: In Tennessee: Training school, Brownsville; high school, Chattanooga; University school, Chattanooga; high school, Columbia; training school, Cumberland; high schools of Dyersburg, Johnson City, Jonesboro, Knoxville; university school, Knoxville; classical school, Knoxville; Haynes-McLean school, Lewisburg; high schools of McMinnville, Memphis, Milan, Morristown, Greeneville, Nashville, North Knoxville, Pulaski, West Knoxville; Memphis Institute; University school, Memphis; Howard Institute, Mt. Pleasant; University school, Academic School, Montgomery Bell Academy, and Garrett Military Academy, Nashville; training school, Paris; McMinn Academy, Rogersville; Rugby School, Rugby; Southside Preparatory School, Southside; Bolton College, Stewartsville, and Peabody high school, Trenton. In other States: Asheville (N. C.) high school; Bingham School, Asheville, N. C.; South Highlands Academy, Birmingham, Ala.; training school, Bridgeport, Ala.; Donald Fraser School, Decatur, Ga.; Male Academy, Huntsville, Ala.; School for Boys, Little Rock, Ark.; Peabody high school, Little Rock, Ark.; university school, Monticello, Ark.; Yerkes School, Paris, Ky.; Male Academy, Raleigh, N. C.

University of Texas, Austin, Tex.—Graduates of approved high schools will be admitted without examination provided they present themselves for admission within a year after their graduation. The following have been approved and are now affiliated with the university: High schools of Abilene, Austin, Beaumont, Belton, Blanco, Brackett, Brenham, Bryan, Calvert, Cameron, Cleburne, Corpus Christi, Corsicana, Dallas, Denton, Dublin, El Paso, Ennis, Flatonia, Fort Smith (Ark.), Fort Worth, Gainesville, Galveston, Gonzales, Hempstead, Houston, Lagrange, Mexia, Mineola, Navasota, Orange, Palestine, Paris, Rockdale, San Antonio, Taylor, Temple, Terrell, Tyler, Vernon, Waco, Waxahachie, Weatherford; also Belton (Tex.) Male Academy; Cole's Select School, Dallas; Columbia College, Van Alstyne; Coronal Institute, San Marcos; Franklin College, Pilot Point; Grayson College, Whitewright; Institute for the Blind, Austin; Marmaduke Military Academy, Sweet Springs, Mo.; San Antonio Academy; Staunton (Va.) Military Academy; Summer Hill School, Owen; Thomas Arnold High School, Salado; University Academy, Columbia, Mo.

Agricultural College of Utah, Logan, Utah.—Students may be admitted on certificate from an accredited high school, academy, or other institution.

University of Utah, Salt Lake City, Utah.—Graduates of accredited high schools or academies may be admitted without examination. Their applications must be accompanied by certificates from the principal stating the subjects completed, the extent of each subject, and the percentages obtained. The following schools are on the accredited list: High school, Salt Lake City; Rowland Hall, Salt Lake City; Hammond Hall, Salt Lake City; Brigham Young College, Logan; Brigham Young Academy, Provo; high school, Ogden; Latter-Day Saints' College, Salt Lake City. Schools will be accredited after application to and examination by the faculty of the university.

University of Vermont, Burlington, Vt.—Candidates will be admitted without examination in case they bring certificates of graduation from preparatory schools whose courses of study fully meet the admission requirements.

Washington Agricultural College and School of Science, Pullman, Wash.—Graduates of high schools whose course of study has been examined and approved by the faculty will be admitted on the presentation of the certificate of the principal or superintendent. Teachers holding a first grade certificate will also be admitted without examination.

University of Washington, Seattle, Wash.—Students shall be admitted without examination upon presentation of certificates from those public high schools and other educational institutions in the State whose courses of study shall have been approved by the faculty, such certificates to show the completion of a course of study on the part of applicants which the faculty shall deem equivalent to the course of study necessary for admission under examination.

West Virginia University, Morgantown, W. Va.—Graduates of the academic department of the normal school or any of its branches, or from approved high schools and academies, are admitted upon presentation of a proper certificate of such graduation.

University of Wisconsin, Madison, Wis.—Any high school or academy whose course of instruction covers the branches for admission to one or more of the courses of the university may be admitted to its list of accredited schools after a satisfactory examination by a committee of the faculty. Application for such an examination may be made by an officer of the school to the president of the university, on the basis of which a committee of the faculty will examine the course of study and the methods of instruction in the school, and on their favorable recommendation and the concurrence of the faculty it will be entered upon the accredited list. No school will be

placed upon the list whose course of study is not fully equal to the four-year course of high schools recommended by the State superintendent. The graduates of such an approved school will be received on presentation of a proper certificate into any of the courses for which they have been fitted. The accredited schools are: High schools of Ashland, Austin (Ill.), Beloit, Chicago (Ill.), Fond du Lac, La Crosse, Madison, Marinette, Milwaukee (east side, south side), Oshkosh, Rockford (Ill.), Appleton (Ryan), Baraboo, Beaver Dam, Brodhead, Burlington, Chippewa Falls, Columbus, Darlington, Decorah (Iowa), Delavan, De Pere, Eau Claire, Elkhorn, Fort Atkinson, Freeport (Ill.), Green Bay, Janesville, Lake Geneva, Lancaster, Manitowoc (north side), Menomonee, Monroe, Neenah, Racine, River Falls, Sheboygan, Stevens Point, Superior (west end), Waupaca, Wauwatosa, West De Pere, Whitewater, Evansville, Prescott, Sparta, Tomah, Viroqua, Watertown, Waukesha, Appleton (Third Ward), Black River Falls, Boscobel, Centralia, Cumberland, Dodgeville, Edgerton, Fort Howard, Fox Lake, Grand Rapids, Hudson, Kenosha, Lodi, Mayville, Mazomanie, Menasha, Neillsville, New London, Oconomowoc, Prairie du Chien, Prairie du Sac, Ripon, Sauk City, Stoughton Academy, Wausau, West Bend, Mauston, Medford, Mineral Point, Portage, Sheboygan Falls, Arcadia, Durand, Elroy, Hartford, Horicon, Jefferson, Kewaunee, Lake Mills, Merrill, Necedah, New Lisbon, New Richmond, Oregon, Reedsburg, Richland Center, Sharon, Shawano, Spring Green, Stoughton, Sturgeon Bay, Sun Prairie, Washburn, Waupun (South Ward), Wayland Academy, Beaver Dam; Harvard School, Chicago, Ill.; School for Boys, Detroit, Mich.; Shattuck School, Faribault, Minn.; Downer College, Fox Lake; Wisconsin Academy, Madison; Milwaukee Academy; Racine (Wis.) College; Carroll College, Waukesha; Kenwood Institute, Chicago, Ill.; Evansville (Wis.) Seminary; Grafton Hall, Fond du Lac; Hillside (Wis.) Home School; Notre Dame School, Chippewa Falls; St. Clara's Academy, Sinsinawa. The certified standing of any student in the regular courses of the normal schools of the State will be accepted in the studies which it covers.

University of Wyoming, Laramie, Wyo.—High schools in the various counties which adopt the university's preparatory course of study, and give competent instruction in the same, will be enrolled as "accredited high schools" of the university, and work done in such schools will be accepted on presentation of grades. The accredited high schools are: Cheyenne, Evanston, Lander, Laramie, Rawlins, Rock Springs, and Sheridan.

II. PRIVATE AND DENOMINATIONAL INSTITUTIONS.

Southern University, Greensboro, Ala.—Certificates from A. B. or A. M. preceptors will be sufficient to waive examination on any branch required for the freshmen class.

Leland Stanford Junior University, Stanford University, Cal.—The university does not agree, in advance, to exempt the graduates of any school from all entrance examinations. Recommendations from the principal of any reputable preparatory school will be considered, and examinations waived in all entrance subjects fairly covered in the applicant's course of study, subject to the following conditions:

(1) The applicant must have completed a full course in the school, and have been duly graduated.

(2) The applicant must be specifically recommended by the principal in the subjects in which exemption is granted.

(3) The faculty reserve the right to require an examination in any recommended subject, if for any reason the work is deemed insufficient or unsatisfactory.

(4) For the present, certificates will not be accepted in English composition, Latin prose composition (except by special arrangement), physiology, botany, zoology, and drawing.

(5) In physics and chemistry recommendations must be accompanied by the laboratory notebooks of the applicant. These notebooks should contain the actual notes taken in the laboratory, not copies, and must be certified by the teacher.

(6) Recommended graduates of the San Jose, Los Angeles, and Chico State normal schools may be admitted, without examination, except in English, to provisional undergraduate standing, such standing subject to revision after one year's attendance.

Colorado College, Colorado Springs, Colo.—Candidates who offer satisfactory evidence of having completed the subjects required for admission will be admitted without condition into the freshman class.

University of Denver, University Park, Colo.—Certificates from high schools and other secondary schools will greatly aid the student in securing admission. Whenever it is possible to accept a certificate instead of requiring an examination it will cheerfully be done. Students who present themselves with certificates from a Colorado high school, showing that they have completed any one of the courses of study adopted by the State Teachers' Association, will be admitted without condition to the freshman class.

Wesleyan University, Middletown, Conn.—Certificates covering the major part of the requirements for admission to college are received from certain schools of good standing, which have been approved by the faculty, but no certificates are received

covering the entrance requirements in Latin prose composition, sight reading of Latin (both prose and poetry) Greek prose composition, sight reading of Greek, French, German, English (study and practice) natural science.

Columbian University, Washington, D. C.—Candidates may be excused from examination in some or all of the required subjects by presenting certificates from the Washington high school or from other schools of good standing.

Howard University, Washington, D. C.—Graduates of the Washington high schools are admitted to the scientific course without examination if they satisfy the instructors concerned that they will make up any deficiency in chemistry and physical geography. Others may be admitted by vote of the faculty on showing that they have passed a preparatory course embracing as broad a scope as that indicated in the admission requirements, and that they are qualified to pursue all studies in course successfully.

Illinois Wesleyan University, Bloomington, Ill.—Graduates from accredited seminaries and high schools may be admitted on certificate without examination. The accredited schools are: Grand Prairie Seminary, Waynesville Academy and high schools of Bloomington, Decatur, Edinburg Township, Farmer City, Geneseo, Gibson City, Joliet, Elpaso (west side), Lexington, Macomb, Peoria, Pontiac, Sheldon, Springfield, Tuscola, Watseka, and Kewanee.

Northwestern University, Evanston, Ill.—Students who come from an accredited academy or high school may be admitted on certificate upon the condition that if the work of a student in his first term shall prove unsatisfactory he may be required to enter a fitting school and review his preparation in the study in which the failure has occurred. School boards desiring to have their schools placed on the accredited list should make application to the president of the university, who will provide, if practicable, for a proper inspection by committee. The following information is expected in the letter of application:

(*a*) The names of all the teachers, with a statement both of their preparation for teaching and of their experience in that work.

(*b*) The latest printed catalogue or annual report of the school, containing an outline of the course of study and text-books used.

(*c*) A careful statement of the methods pursued in teaching mathematics, language, and the sciences.

(*d*) The amount and kind of scientific apparatus and the extent of library facilities accessible to students.

The schools which are approved by the faculty after inspection are placed on the accredited list, and the relation thus established will continue for three years unless the faculty becomes satisfied that such changes have occurred as make further inspection desirable. There are now on the accredited list the following: High schools of Aurora (east side, west side), Austin, Chicago (Englewood, Hyde Park, Jefferson, Lake View, north division, northwest division, Oak Park, west division, south division), Decatur, Evanston, Geneseo, Joliet, Kansas City (Mo.), Keokuk (Iowa), Milwaukee (Wis.), Minneapolis (Minn.), Ottawa, Peoria, Rockford, Sioux City (Iowa), Springfield, St. Paul (Minn.), Wichita (Kans.); Jennings Seminary, Aurora; Allen Academy, Chicago; Chicago Academy; Harvard School, Chicago; University Academy, Chicago; Academy of Northwestern University, Evanston; Milwaukee (Wis.) Academy; Michigan Military Academy, Orchard Lake, Mich. Also schools in California, Iowa, Indiana, Kansas, Michigan, Minnesota, and Wisconsin, that are on the accredited list of the State universities of their respective States, will be recognized as if accredited by this university.

Lake Forest University, Lake Forest, Ill.—Schools are accredited by vote of the college faculty only after visitation and recommendation by a committee of the same. A certificate of graduation from such school will be accepted in place of entrance examinations in so far as the course pursued by the student has conformed to the requirements for admission. There are now on the accredited list Carroll College, Waukesha, Wis.; Elgin Academy; Geneseo Collegiate Institute; Racine (Wis.) Academy; high schools: Aurora (west), Bloomington, Chicago (north division, south division, west division), Elgin, Englewood, Evanston, Highland Park, Hyde Park, Jefferson, Joliet, Kewanee, Lagrange, Lake, Lake View, Normal, Oak Park, Ottawa, Peoria, Rockford, Rock Island, Springfield, Waukegan, Clinton (Iowa), Milwaukee (Wis.).

Monmouth College, Monmouth, Ill.—Candidates, on furnishing proper certificates of their standing, shall be admitted from any one of the following schools to the freshman class, in so far as these completed studies correspond with the studies below the freshman class: Albany (Oreg.) Collegiate Institute, Marissa Academy, Geneseo Collegiate Institute, Waitsburg (Wash.) Academy, Pawnee (Nebr.) Academy; high schools of Monmouth, Xenia (Ohio), Burlington (Iowa), Kewanee, Davenport (Iowa), Rock Island, and on regents' pass cards, New York.

Shurtleff College, Upper Alton, Ill.—Certificates from the following schools will be recognized: Pillsbury Academy, Minnesota; Wayland Academy, Wisconsin, and the

high schools of Alton, Jerseyville, Springfield, Lexington, Decatur, Cairo, Williamsville, and East St. Louis, all in Illinois.

Wheaton College, Wheaton, Ill.—Graduates of the following academies and high schools are admitted without examination: In Illinois: Cairo, Charleston, Decatur, Dwight, Elgin, Freeport, Geneseo, Highland Park (Northwestern Military Academy), Jacksonville, Kewanee, Ottawa, Paxton (Rice Collegiate Institute), Princeton, Rock Falls, Rockford, Springfield, Sterling, Wheaton, Anamosa, Brighton, Greenville, Lena, Mason, Naperville, Nauvoo, Mount Pulaski, Paxton. In Indiana: Aurora, Bristol, Decatur, Delphi, Garrett, Frankfort, Kokomo, Michigan City, Greencastle, Rensselaer. In Iowa: Decorah, Oskaloosa, Waverly, Wilton. In Kansas: Wichita. In Kentucky: Ashland. In Michigan: Adrian, Caro, Cassopolis, Constantine, Howell, Jackson, Muskegon, Niles, East Saginaw, St. Joseph. In Washington: Tacoma. In Wisconsin: Appleton, Monroe, Racine, Richland Center, Sheboygan.

Wabash College, Crawfordsville, Ind.—Graduates from commissioned high schools of Indiana, who present a full statement of work done in these institutions, signed by the principals of the schools, will receive credit for the same without examination. Spiceland Academy, Bloomingdale Academy, Union high school (Westfield), and Fairmount Academy, together with certain other schools of high standard, both within and without the State of Indiana, which have been approved by a special vote of the faculty, are entitled to the privileges of commissioned high schools.

De Pauw University, Greencastle, Ind.—Graduates of the commissioned high schools of Indiana are admitted without examination, except that they are required to give, by a practical test in composition, satisfactory evidence of ability to write the English language correctly. Candidates must in all cases present evidence of their graduation and a certified copy of the high school course as pursued by them. Certificates from high schools of known reputation in other States, and those of all approved fitting schools will be accepted.

Butler College, Irvington, Ind.—Certificates of work done in public or private schools of approved standing are accepted in lieu of examinations, subject to the following conditions: (1) The student's application must be accompanied by a certificate from the principal of the school from which he comes. (2) This certificate must furnish full and specific information concerning the applicant's studies, the time devoted to them, and should indicate his proficiency therein. (3) The candidate not to be exempted from the examination in any particular subject unless his certificate shows that he has satisfactorily accomplished the full amount of work in that subject. Every candidate, whether from a commissioned high school or other, shall be subject to examination in English for the purpose of determining his ability to use the English language correctly. (4) Admission on certificate will, in every case, for the first term, be regarded merely as provisional.

Union Christian College, Merom, Ind.—Students who come from commissioned high schools and other reputable institutions will be given credit for all work done elsewhere, provided such work is properly accredited.

Earlham College, Richmond, Ind.—A certificate of scholarship, signed by the principal of any one of the following schools, is accepted in place of examination on any of the branches required for admission to the college: Fairmount Academy; Spiceland Academy; Bloomingdale Academy; Union high school, Westfield; Central Academy, Plainfield; Raisin Valley Seminary, Adrian, Mich.; Damascus (Ohio) Academy; Friends' Academy, Union Springs, N. Y.; Vermilion Academy, Vermilion Grove, Ill.; Friends' Academy, Tonganoxie, Kans.; North Branch (Kans.) Academy; Hesper (Kans.) Academy; Washington (Kans.) Academy; Lowell (Kans.) Institute; and all high schools commissioned by the Indiana State board of education.

Taylor University, Upland, Ind.—Students bearing the personal certificates of a former teacher, concerning studies satisfactorily completed, will be given credit for the work they have done.

Tabor College, Tabor, Iowa.—First-class teachers' certificates or satisfactory marks from schools whose standing is known will be accepted in place of examinations in the studies so provided for.

Western College, Toledo, Iowa.—The graduates of high schools and academies accepted by the Iowa State University, and such other schools as the faculty may approve, will be received on proper certificate.

Baker University, Baldwin, Kans.—Graduates of the following schools are admitted to the freshmen class: High schools of Abilene, Atchison, Atchison County, Burlington, Burlingame, Dickinson County, Hiawatha, Iola, Labette County, Lawrence, Kansas City, Paola, Pleasanton, Seneca, Wichita, and Wamego in the State of Kansas; Hesper (Kans.) Academy, Olathe (Kans.) Academy, and Kansas City (Mo.) high school. In addition to the above there are a number of schools whose work falls but little short of fully preparing students.

Washburn College, Topeka, Kans.—Certificates from teachers and schools of recognized standing will be received, except for the work in French, chemistry, and part of the work in German and mathematics.

Central University, Richmond, Ky.—Students from high schools of recognized good standing, if certified to have completed a course of study which can be fairly accepted as an equivalent, and to have passed satisfactory examinations on the same, will be received on trial into the freshman class. This privilege has been granted to the following: Alleghany Academy, near Lexington; Shelbyville high school; Hogsett's Academy, Danville; Rugby high school, Louisville; Almond's University School, Louisville; Training School for Boys, Louisville; Waddell's high school, Louisville; Cynthiana high school; Henry County high school, New Castle; Henry Academy, Versailles; Jordan's high school, Pine Bluff, Ark.; Versailles high school; Wentworth Military Academy, Lexington, Mo.; Presbyterian high school, Campbellsville.

Tulane University, New Orleans, La.—The following regulation has been adopted by the board of administrators: That if any public or private high school or academy in the State shall furnish to the president of the university satisfactory proof (1) that it has adopted the curriculum of studies recommended by him, or its equivalent, (2) that it has a corps of teachers competent for instruction therein, and (3) that it has enforced an adequate standard of examinations, the president is hereby authorized to accept the certificate of the principal of such school that the student has followed the course and passed successfully the required examinations as entitling such student to admission to the appropriate college course without further preliminary examination, provided that this shall not take effect until after said school shall have furnished one or more students who have successfully passed the ordinary entrance examination; and provided further, that if on trial the students from such school shall prove to be insufficiently prepared, this privilege shall be promptly withdrawn from such school. The following schools have met the above requirements: New Orleans City high school; T. W. Dyer's University School; L. C. Ferrell's Select School for Boys; Thatcher Institute, Shreveport, La., and New Iberia high school; also Soulé's Commercial College, in English and mathematics.

Colby University, Waterville, Me.—Graduates of the four academies, Coburn Classical Institute, Waterville, Me.; Hebron (Me.) Academy, Ricker Classical Institute, Houlton, Me., and Higgins Classical Institute, Charleston, Me., constituting the preparatory department of the university, will be admitted on the certificate of the principal that they have completed the course and attained an average scholarship of at least 70 per cent in each study, provided that the said certificate shall be granted with approval of the faculty of the college. A similar arrangement has been made with other approved fitting schools.

Johns Hopkins University, Baltimore, Md.—When a school approved by the academic council shall certify that a candidate has satisfactorily completed all the studies requisite for matriculation, such candidate will be exempted from examination in all except the following subjects: Trigonometry, analytic geometry, Cicero or Virgil, Latin prose composition, Homer or Herodotus, Greek prose composition, and the minor courses in French, German, English, and science.

New Windsor College, New Windsor, Md.—Students who come recommended from approved schools or by persons able to attest their proper preparation are admitted to any of the courses without examination.

Amherst College, Amherst, Mass.—From certain preparatory schools of approved standing certificates of fitness to enter college are received in place of entrance examinations; but such certificates must be filled out in detail in accordance with forms printed and furnished by the college. The pass cards, certificates, and diplomas given by the regents of the University of the State of New York are accepted in the subjects which they cover. These are not accepted in English, and only partly satisfy the requirements in Greek.

Williams College, Williamstown, Mass.—The privilege of sending students to this college by certificate is granted to schools which ask for it and which comply with the conditions on which this privilege is given, but it is not granted to private tutors and is revokable in all cases when it is not properly exercised. No certificate will be accepted for the French and German required for admission to the course without Greek, nor for an optional examination in science.

Albion College, Albion, Mich.—Certificates are accepted from all schools which (*a*) have been approved by the faculty of Albion College; (*b*) have been approved by the University of Michigan; (*c*) have supplied evidence that in extent, quality, and completeness of work the pupil has gained the scholarship and culture required for admission.

Hillsdale College, Hillsdale, Mich.—Students who bring certificates of work done in other institutions will be admitted to classes in Hillsdale College without examination as follows: (1) In accordance with arrangements already made, and until further notice, students will be admitted to the freshman class who have completed the three preparatory years in Rio Grande and Parker colleges. (2) Certificates of preparatory instruction under Hillsdale graduates will be accepted for what they will cover. (3) Students will be admitted without examination in studies covered by the regents' certificates of New York and Minnesota. (4) Certificates of standing

will be accepted from those high schools in Michigan whose courses of study and the instruction are satisfactory to the faculty. (5) Certificates will be accepted from such other schools as a committee from the faculty may recommend.

Olivet College, Olivet, Mich.—Candidates from schools on the university list and from other schools approved by the faculty are admitted on certificate.

Northwestern Christian College, Excelsior, Minn.—State certificates of work done in any of the high schools of Minnesota will be accepted in lieu of examinations in the studies for which certificates are presented. Certificates from other schools will also be accepted upon the faculty becoming satisfied of the scholarly standing of the school from which the certificates come.

Carleton College, Northfield, Minn.—Certificates from the State high school board or from approved high schools and academies will be accepted. Students holding diplomas of high schools which are ranked by the State board as of the "First class" will be admitted to the freshman class without examination in all subjects represented by the diplomas.

Tarkio College, Tarkio, Mo.—Certificates from the following schools are accepted: High schools in Tarkio, Villisca (Iowa), Clarinda (Iowa), and the Pawnee (Nebr.) Academy.

University of Omaha, Bellevue, Nebr.—Any academy or high school which furnishes satisfactory instruction will be placed on the list of schools accredited as preparing for this college. Any school asking to be accredited will be examined by a representative of the college faculty.

Gates College, Neligh, Nebr.—Certificates from high schools on the university list and from academies of good standing will be accepted for such parts of the admission requirements as their work covers.

Cornell University, Ithaca, N. Y.—Diplomas issued by the regents of the University of the State of New York are accepted in place of examinations in all the subjects required for entrance which are covered by such diplomas, including, upon the recommendation of the university departments concerned, the subjects of French and German. A statement from the teacher of the work done in these two subjects must be submitted by the holder of the diploma. Certificates and pass cards issued by the regents are not accepted unless they are presented by a holder of a regent's diploma.

The following rules and regulations have been adopted by the faculty on the subject of admission by certificate:

(1) Certificates of work done in public or private schools, in or out of the State, will not be accepted in lieu of examinations unless the applicant has completed a full course in the school and has been duly graduated, and the university authorities are satisfied regarding the standing of the school.

(2) The application for the admission of a student by certificate must be made by the principal and not by the candidate himself.

(3) The application from the principal must be accompanied by full and specific information with regard to the completeness and thoroughness of the studies and course in which instruction is given. In case a catalogue or circular is published, a copy thereof should also be furnished.

(4) Certificates from schools whose students prove to be imperfectly fitted will ultimately not be considered.

(5) Subjects in which an examination has been passed for admission to the school may be included in the certificate, but in all cases the full information called for by the blank should be given.

(6) No school certificate will be accepted in place of entrance examination in English.

(7) The committee having charge of the acceptance of certificates may meet at any time during the collegiate year, but the certificate should be forwarded as soon after the graduation of the student as is possible, and at least as early as the 1st of September.

(8) The university does not engage in advance to accept the certificates of any school, and the previous acceptance of such certificates merely raises the presumption that similar certificates may be accepted again, but does not establish a permanent right to such acceptance.

Vassar College, Poughkeepsie, N. Y.—Students are admitted without examination in the following cases: (1) When they bring certificates from schools from which pupils have previously been admitted without condition. (2) When they have been prepared by a graduate of the college engaged in the work of private instruction, one of whose pupils has before been admitted without condition. (3) When they bring certificates from schools which have been visited by a committee of the faculty and approved by them, or in regard to which the faculty have other sufficient means of information. (4) The certificate of the regents of the State of New York are accepted. (5) The certificate of the president of Harvard College offered by

persons who have successfully passed the examinations for women will be accepted. The final examination in any subject covered by a certificate must have been taken within two years of the time of the candidate's entrance to college.

Union College, Schenectady, N. Y.—As a means of raising the school standards in preparatory English, all candidates will be examined in English, but in other subjects pass cards and certificates of the regents of the University of the State of New York and diplomas of schools approved by the faculty will be accepted.

Trinity College, Durham, N. C.—Students bringing certificates of proficiency in subjects required for admission to the freshman class only from preparatory schools on the "scholarship list" will be admitted without examination. The affiliated schools are: Trinity (N. C.) High School, Jonesboro (N. C.) High School, Burlington (N. C.) Academy, Bellwood (N. C.) Academy, Trinity Academy, Pilot Mountain, N. C.; Morven (N. C.) Academy, Hartland (N. C.) Academy.

Muskingum College, New Concord, Ohio.—Applicants from the Barnesville, Cambridge, New Concord, Zanesville, and Dresden high schools and Fultonham Academy, and from other high schools and academies whose work the faculty may accept, will be given credit for the work they have done.

Oberlin College, Oberlin, Ohio.—The following regulations have been adopted by the faculty in regard to admission by certificate:

(1) Diplomas issued by high schools and academics whose work has been examined and approved are accepted in all subjects in which the requirements are fully covered by the diploma. The list of schools examined and approved is as follows: Akron, Ashtabula, Austinburg, Bellevue, Bucyrus, Canton, Chardon, Hughes High School of Cincinnati, Cleveland Central, Cleveland West, Columbus, Dayton, Elyria, Geneva, Jefferson, Kinsman, Lima, Mansfield, Massillon, Monroeville, Mount Vernon, Newark, Norwalk, Oberlin, Painesville, Salem, Sandusky, South New Lyme, Tiffin, Toledo, Troy, Warren, Wellington, and Zanesville, in Ohio; Buffalo and Warsaw, in New York; Perkiomen Seminary, Pennsburg, Pa.; Lansing High School, Michigan; Ottawa and Princeton, in Illinois; Sioux City, in Iowa, and Denver, in Colorado.

(2) Applications for such approval of the work of a school must be made by the principal and accompanied by full and explicit information concerning the studies and courses.

(3) Conditional permission may be granted to the principal of a school to send students for admission upon certificate for a limited period. When three or more students so received have shown by their subsequent standing that their preparation was satisfactory, the permission may be extended to a longer period.

(4) All students entering in whole or in part upon certificate must send a full statement by their teachers of the work done in each study.

Wilmington College, Wilmington, Ohio.—Certificates of work done in Friends' academies and in public high schools whose principals are known to the faculty will be accepted in lieu of examination.

Willamette University, Salem, Oreg.—Students bearing certificates from the following correlated academies will be admitted: Wasco Independent Academy, The Dalles, Oreg.; Santiam Academy, Lebanon, Oreg.; Pendleton Academy, Pendleton, Oreg.

Dickinson College, Carlisle, Pa.—Certain preparatory schools of approved standing are allowed to examine their own students, who will be admitted on the certificate of the principals. Diplomas or certificates of graduation from schools and seminaries are not accepted unless accompanied by statements from the principal or faculties that the applicants have completed in a satisfactory manner the work required for admission to college.

University of Pennsylvania, Philadelphia, Pa.—Candidates are admitted, in certain cases, either wholly or in part upon diplomas of public high schools. Candidates who present such diplomas will be referred to a committee, who will examine each case and decide whether the diplomas shall be accepted in lieu of examinations, and what subjects they properly cover.

Swarthmore College, Swarthmore, Pa.—Graduates of the following schools are admitted upon presenting regular certificates, properly filled up by the principals: Friends' Central School, Philadelphia, Pa.; Friends' Seminary, New York City; Friends' High School, Baltimore, Md.; Woodstown Academy, Woodstown, N. J.; Friends' School, Wilmington, Del.; Friends' High School, Westchester, Pa.; Friends' High School, Moorestown, N. J.; Buckingham Friends' School, Lahaska, Pa.; Friends' Academy, Locust Valley, Long Island; Friends' Select School, Washington, D. C.; Sherwood School, Sandy Spring, Md.; Friends' School, Kennett Square, Pa.; Providence Preparative Meeting School, Media, Pa.; Oakland Boarding School, Fallston, Md.; Friends' Normal Institute, Risingsun, Md.; Abington Friends' School, Jenkintown, Pa.; Swarthmore Grammar School, Swarthmore, Pa.; George School, Newtown, Pa.; Friends' School, Christiana, Pa. Blank certificates are furnished each year to the principals of these preparatory schools and to such private teachers as may be named for the privilege.

U. S. Grant University, Athens and Chattanooga, Tenn.—Realizing the importance of thorough and systematic preparation for higher studies and extended courses, the trustees have arranged for concerted and harmonious action among the principal seminaries and academies that are tributary to the university by the adoption of a uniform course of study leading to the regular college and technical classes. The following schools are comprised in the association: Powell's Valley Academy, Well Springs, Tenn.; Fuller Institute, Chucky City, Tenn.; Roanoke Academy, Roanoke, Va.; Leicester Academy, Leicester, N. C.; Mount Zion (Ga.) Academy; Oakland Academy, Laurel Gap, Tenn.; Parrottsville (Tenn.) Academy; McLemoresville (Tenn.) Academy; Bloomington (Tenn.) College; Kingsley Academy, Bloomingdale, Tenn.; Mountain City (Tenn.) Academy; Mallalieu Academy, Kinsey, Ala.; Ellijay (Ga.) Academy; Graham Academy, Smyrna, N. C.; Murphy Collegiate Institute, Sevierville, Tenn.; Fair View College, Trap Hill, N. C.; Sunbright (Tenn.) Academy.

Carson and Newman College, Mossy Creek, Tenn.—Graduates of Jonesboro high school, Harrison and Chilhowee Normal Academy, and other preparatory schools of acknowledged standing will be admitted on the certificates from such schools.

Washington College, Tenn.—Graduates from the incorporated high schools of the State are admitted without examination.

Austin College, Sherman, Tex.—Students completing the course through any school recognized by the University of Texas will be admitted to the freshman class without examination. In addition, the high schools of Sherman and Summer Hill are also recognized.

Lawrence University, Appleton, Wis.—Graduates of any school which has been approved by the faculty may be admitted on the presentation of a certificate giving their standing. Graduates of the high schools accredited by the State University may be admitted for courses corresponding to the courses they have taken, excepting those accredited in the English courses. Graduates of normal schools of Wisconsin are accepted upon their record at these schools. Certificates of standing from high schools not accredited are received in some studies.

Beloit College, Beloit, Wis.—Graduates of any school which has been approved by the faculty after personal visitation will, when recommended by the principal of the school, be admitted without examination. Applicants for admission to the science course from accredited schools will be admitted without Latin provided the applicant is a graduate from a four-years course of study, which is the equivalent of the general science course issued for Wisconsin high schools. Graduates of the normal schools of Wisconsin are accepted upon their record at those schools. Certificates are received from more distant schools of established reputation. The following schools are on the accredited list: Beloit College Academy; Carroll College, Waukesha; Rochester Academy; Warren (Ill.) Academy; Smith Academy, St. Louis, Mo. In Wisconsin: High schools of Beloit, Delaware, Eau Claire, Elkhorn, Fort Atkinson, Janesville, La Crosse, Milwaukee (East Side and South Side), Monroe, Racine, Sparta, Whitewater. In Illinois: High schools of Chicago (north division, south division, west division, northwest division, Lake View, Lake, Englewood, and Hyde Park), Aurora (east), Austin, Elgin, Lagrange, Oak Park, Ottawa, Rockford; Sioux City, Iowa; Duluth, Minn.

III. INSTITUTIONS ADMITTING STUDENTS UPON PRESENTATION OF CERTIFICATES FROM APPROVED OR ACCREDITED HIGH SCHOOLS AND ACADEMIES, AND WHICH DO NOT PUBLISH LISTS OF SUCH SCHOOLS IN THEIR ANNUAL CATALOGUES.

Hendrix College, Conway, Ark.
Pomona College, Claremont, Cal.
Throop Polytechnic Institute, Pasadena, Cal.
University of Southern California, University, Cal.
San Joaquin Valley College, Woodbridge, Cal.
Trinity College, Hartford, Conn.
Georgetown University, Washington, D. C.
Seminary West of the Suwanee River, Tallahassee, Fla.
Rollins College, Winter Park, Fla.
Hedding College, Abingdon, Ill.
Eureka College, Eureka, Ill.
Knox College, Galesburg, Ill.
Lombard University, Galesburg, Ill.
Franklin College, Franklin, Ind.
Hanover College, Hanover, Ind.
Ridgeville College, Ridgeville, Ind.
Coe College, Cedar Rapids, Iowa.
Amity College, College Springs, Iowa.
Drake University, Des Moines, Iowa.
Parsons College, Fairfield, Iowa.
Upper Iowa University, Fayette, Iowa.
Iowa College, Grinnell, Iowa.
Simpson College, Indianola, Iowa.
Iowa Wesleyan University, Mount Pleasant, Iowa.
Cornell College; Mount Vernon, Iowa.
Penn College, Oskaloosa, Iowa.
Central University, Pella, Iowa.
College of Emporia, Emporia, Kans.
Central College, Enterprise, Kans.
Kansas Wesleyan University, Salina, Kans.
Cooper Memorial College, Sterling, Kans.
Southwest Kansas College, Winfield, Kans.

Kentucky Wesleyan College, Winchester, Ky.
Bates College, Lewiston, Me.
Woman's College of Baltimore, Md.
Boston University, Boston, Mass.
Tufts College, Mass.
Smith College, Northampton, Mass.
Mount Holyoke College, South Hadley, Mass.
Wellesley College, Wellesley, Mass.
Adrian College, Adrian, Mich.
Alma College, Alma, Mich.
Battle Creek College, Battle Creek, Mich.
Benzonia College, Benzonia, Mich.
Kalamazoo College, Kalamazoo, Mich.
Hamline University, Hamline, Minn.
Macalester College, St. Paul, Minn.
Drury College, Springfield, Mo.
Missouri Wesleyan College, Cameron, Mo.
Central Wesleyan College, Warrenton, Mo.
Union College, College View, Nebr.
Nebraska Wesleyan University, University Place, Nebr.
York College, York, Nebr.
Dartmouth College, Hanover, N. H.
Rutgers College, New Brunswick, N. J.
Wells College, Aurora, N.Y.
St. Lawrence University, Canton, N.Y.
Hamilton College, Clinton, N. Y.
Elmira College, Elmira, N. Y.
Hobart College, Geneva, N. Y.
Colgate University, Hamilton, N. Y.
University of Rochester, Rochester, N.Y.

IV. INSTITUTIONS[1] ACCEPTING CERTIFICATES AND DIPLOMAS OF THE REGENTS OF THE UNIVERSITY OF THE STATE OF NEW YORK.

Monmouth College, Monmouth, Ill.
Amherst College, Amherst, Mass.
Hillsdale College, Hillsdale, Mich.
St. Stephen's College, Annandale, N. Y.
Wells College, Aurora, N. Y.
Polytechnic Institute, Brooklyn, N. Y.
St. Lawrence University, Canton, N. Y.
Hamilton College, Clinton, N. Y.
Elmira College, Elmira, N. Y.
Hobart College, Geneva, N. Y.
Colgate University, Hamilton, N. Y.
Cornell University, Ithaca, N. Y.
Manhattan College, New York City.
Vassar College, Poughkeepsie, N. Y.
University of Rochester, Rochester, N. Y.
Syracuse University, Syracuse, N. Y.
Lafayette College, Easton, Pa.
Allegheny College, Meadville, Pa.

V. INSTITUTIONS ADMITTING STUDENTS ON DIPLOMAS OR CERTIFICATES FROM APPROVED HIGH SCHOOLS AND ACADEMIES AND WHICH DO NOT PUBLISH A LIST OF SUCH SCHOOLS.

Northwestern College, Naperville, Ill.
Midland College, Atchison, Kans.
Highland University, Highland, Kans.
Lane University, Lecompton, Kans.
Cotner University, Bethany, Nebr.
Lebanon Valley College, Annville, Pa.

[1] Does not include State institutions accepting such certificates and diplomas.

CHAPTER XXVI.

TECHNOLOGICAL INSTRUCTION IN THE LAND-GRANT COLLEGES.[1]

Probably the earliest chair explicitly though partly concerned with instruction in science was created by an American college. In 1727 Thomas Hollis, a merchant of London, "though jeered at and sneered at by many" (in England), persisted in his design to endow Harvard College with a "professorship of mathematics and physical science." It was not until 1730 that the "Principia" were firmly established even at Newton's own university of Cambridge, while at Oxford it is said that the "majority of the residents regarded mathematics and Puritanism as allied and equally unholy subjects."

I.

In America the first institution of higher education that was induced by the liberality of an individual to recognize industrialism was Harvard College, which in 1816 established "a new institution and professorship in order to teach by regular courses of academical and public lectures, accompanied with proper experiments, the utility of the physical and mathematical sciences, and for the extension of the industry, prosperity, happiness, and the well-being of society." The founder of this chair was the celebrated experimental scientist, Count Rumford, a native of Woburn, Mass., where he had been known as Benjamin Thompson. How unprepared for the introduction of this subject the pedagogical world was at that date may be inferred from the fact that the college authorities, in view of the "novelty of the institution," required only four annual lectures to be given by the first professor while he prepared himself for the duties of his chair. In 1827 the professor resigned, and for seven years the vacancy remained unfilled.

At Yale and Princeton a chair of chemistry had been more fortunate. The study of general chemistry since the days of the alchemists has been found well adapted to inspire interest. Besides, the early chairs for this science were created at an epoch in European history when the discoveries of Cavendish and Priestly and the system of Lavoisier had made chemistry the order of the day; though even at Harvard chemistry was for years joined at first with materia medica and then with mineralogy.

During the decade 1820–1830 a strong protest was made against the college curriculum in America. Efforts were made at Harvard, Amherst, and Yale to modify the course, and Union had alternatives as early as 1824. It is rather hazardous to attempt to account for this. After the close of the Revolutionary war Washington had deeply lamented that so many of the youth of this country studied in Europe, and after the close of the Napoleonic wars it again became quite fashionable for American students to continue their education in European universities. A constantly accelerated impetus may thus have been given to higher education in the United States by these students as they returned to their native land. Yet it seems

[1] By Mr. Wellford Addis, specialist in the Bureau for obtaining and collating information relating to colleges of agriculture and the mechanic arts.

more probable that a new conception of a college curriculum was due to the example afforded by the University of Virginia, which was established 1818–1825, rather than to the slow process of organic development brought about by the efforts of individual professors.

It is not difficult to say where Mr. Jefferson got his idea of a university curriculum that bears a pretty close resemblance to the several bills (or projets, as they are called in France) introduced into the National Assembly by Mirabeau, Talleyrand, and Condercet (1789–1793), the representatives of a party with which Mr. Jefferson had very intimate relations during his residence at Paris from 1785 to 1789. But irrespective of the mere question as to the origin of the idea, the first comprehensive attempt in America to change the college curriculum was the founding of the University of Virginia. Gradually the practice of having parallel classical and scientific courses came to be a feature of our higher education. But there was room for another type, and as the idea of a Harvard came from England, and as the idea of a University of Virginia came directly or indirectly from France, so the idea of a Johns Hopkins came from Germany.

Such are the three university types of North America;[1] but beside them there has arisen another type, which at first had the character which Count Rumford desired to give to his chair at Harvard, but is now developing a strong tendency to claim for itself the disciplinary power that, in the sphere of literary research, the individual effort in the seminaria of Johns Hopkins is known to give, and for similar reasons. In this type the laboratory or shop takes the place of the library and quasi original manuscripts, and activity and concentration of thought are sought to be developed by the study of industrial operations and appliances rather than the power of philosophic generalization and the delicate sensibilities and discernment of the literary man through the study of the classics or other literature exclusively.

II.

In 1824 Stephen Van Rensselaer made an effort to do for the people directly through lectures what Count Rumford had desired to do for them through the medium of a college. Mr. Van Rensselaer had satisfied himself that great defects existed in the ordinary and prevailing systems of education; he "saw that some of the most useful subjects of human knowledge were scarcely communicated at all in quarters where they seemed most needed for the practical purposes of life." His first movement was to send a scientific person, with competent assistants and adequate apparatus, to deliver familiar lectures on chemistry, natural philosophy, and natural history. Having difficulty in finding competent lecturers, his next effort was to found a normal school of science, such perhaps as he may have heard that the first French Republic had established under the name L'École Normale. The principal object of the American school, as indeed the object of the French school, was to qualify persons to instruct the sons and daughters of tradesmen and farmers in the application of experimental chemistry, physics, and natural history to agriculture, domestic economy, arts, and manufactures. Such was the origin of the Rensselaer Institute. In 1839 "it was stated as a fact from calculations actually made, that the institute had itself furnished more experimental teachers and professors, engineers, geologists, etc., than had been furnished in the same time by all the colleges in the Union." Ten years later, however, it was found that "there were certain radical defects in the fundamental features of its organization, and that the course of study was undeniably somewhat vague, unsystematic, and incomplete." The course was altered to conform to the character of the instruction given in the polytechnic schools of Europe, and the word polytechnic added to the title of the school.

The munificence of Count Rumford began to tell at Harvard about 1847 in an unexpected way. Mr. Abbot Lawrence desired to found a school of practical science at Boston, and to encourage him Harvard appointed a chemist to fill the Rumford

[1] Only one of which can be said to be in a European sense of university grade.

professorship, chemistry then being the practical science of the day, with headquarters at Liebig's laboratory in Hesse-Darmstadt and Boussingault's farm in Alsace. Mr. Lawrence, in establishing the school now known by his name, considered that elementary and classical education had been amply provided for in Massachusetts. The classical schools would supply the professions with educated men, while the counting-house or the ocean was the proper school for the votaries of commerce; but, he asked, where could industry educate her far more numerous votaries? As established, the Lawrence Scientific School was composed of three departments, with the Rumford professor as dean and the Rumford endowment as the financial foundation. These departments were practical chemistry, zoology, and civil engineering. The professor of chemistry had studied in Liebig's laboratory; Professor Agassiz organized the departments of geology and zoology, but what the department of engineering was to be no one knew. After considerable delay the ex-president of the college, Mr. Edward Everett, was appealed to to say what form this new department of higher education should take, and he is reported to have replied: "Well, my idea would be that you, the professor of engineering, should come to Cambridge and put up a sign as a surveyor and receive young men into your office." At first the school seems to have been a university all to itself, but in 1871 it was brought into close connection with the college, and the Rumford professorship "made to follow its particular objects, light and heat and the higher physics."

The influence of the researches of Liebig, Boussingault, and others in animal and vegetable chemistry and physiology has been already spoken of as sufficiently powerful to cause the Rumford professorship to be given to a chemist, and it may be inferred that the same influence was the efficient cause in the establishment of the Sheffield Scientific School of Yale. As early as 1846 the corporation of Yale College established two professorships of a scientific character. One of these was to give instruction in agricultural chemistry and animal and vegetable physiology, the other in practical chemistry. Like the Harvard venture in the same direction, "this department was left very much to take care of itself. No one in particular either helped or hindered its growth. Indeed, outside of those immediately and specially interested in it, no one troubled himself about it at all; and its position from the first was anomalous." About 1852 a third professorship or department was added to the other two, and to organize it the professor of civil engineering in Brown University came to Yale, bringing a class of 26 students with him. These professorships—disjecta membra of a school of science—were in the course of a year or two united into a "hypothetical institution called the Yale Scientific School," but there was no real connection between them until Mr. Sheffield, emulating Mr. Lawrence, gave $50,000 to support the Sheffield Scientific School, after purchasing a building in which to house it. The income derived from the fund given by Congress to the State of Connecticut, and then by the State to the Sheffield School, made its future doubly secure.

III.

In Vermont and in Virginia scientific schools of a peculiar character were founded during the fourth decade of the present century. This characteristic was the military feature. As the founder of the northern school resigned the superintendency of the Military Academy at West Point to establish the institution that in 1834 became the Norwich University, and as Virginia Military Institute was confessedly established upon the basis of the West Point institution, it may be assumed that the military features were copied from the national school rather than adopted for the pedagogical or humanitarian reasons that the classicists assign for the retention of Latin and Greek. Both of these institutions have been eminently successful in their way. A president of the northern school was killed while leading his regiment, the Ninth New England, up the heights of Chepultepec, and his son, another alumnus and a major-general, was killed in the late war, while five of the professors of

the southern school lost their lives as general or regimental officers; and it is related with melancholy generality that 200 of its alumni were slain in battle and 350 maimed for life.

IV.

Let us pause for a moment to summarize what has been said. It has been found that shortly after the close of the war of 1812, and the beginning of a manufacturing era in the United States, a series of attempts was made to teach the people, or a portion of them, the scientific facts which underlie the mechanic arts. Indeed, in 1830 this connection of the practical or useful with an institution of learning took a very singular turn, for at perhaps a dozen institutions, notably at the Oneida Institute of Science and Industry, a system of exercises was adopted on the farm or in a mechanic shop that was not only to serve as a means of physical exercise, but also to afford support to the student. Perhaps it is not just to charge this eccentricity to the account of the effort to supply American superintendents and foremen to American industry; yet in our polytechnic institutions established before the civil war we find no effort to impart skill as well as directive power. Civil engineers were called surveyors, and the other great branch of technical instruction, chemistry, was also of a character which may be denominated genteel.

In the "fifties," and therefore coincident with the influx of first great foreign immigration, a demand sprang up for instruction in agriculture. Agricultural schools were established in Pennsylvania, in Iowa, and in other States, and in Michigan and Illinois the State normal schools, established about the same time, were to give instruction in husbandry, agricultural chemistry, and animal and vegetable physiology. But these schools and departments never flourished.

Attention was drawn from the genteel trades of chemistry and surveying, and the management of that very crude factory called a farm, to the business of making machines and industrial apparatus by the revival of industry that followed the civil war. Thus a class of institutions was called into life that had as their cardinal features—theretofore unknown—the performance of manual labor in a shop, and in a systematic manner.

Practical schools of mechanical engineering appeared almost simultaneously at Worcester, Mass., at Hoboken, N. J., and at Champaign, Ill. As the founders of the Worcester Free Institute were undoubtedly the first to provide for the practical laboratories or shops adapted to this mechanical instruction, it will be considered here as the type of the others. This school was founded by John Boynton, esq., of Templeton, in 1865, for the purpose of giving instruction in those branches of study which were not taught in the public schools, but which are essential and best adapted to train the young for practical life, especially as mechanics, manufacturers, or farmers. These rather vague instructions would, in all probability, have entailed the usual literary course in books on mechanics, steam engines, boiler making, and the like, with the usual work in the chemical and physical laboratories. The school was rescued from this fate by the generosity of Ichabod Washburn, of Worcester, who, in 1866, added to its outfit a new feature which he described as follows:

"There shall be a machine shop of sufficient capacity to employ twenty or more apprentices, with a suitable number of practical teachers and workmen in the shop to instruct such apprentices, and provided with all necessary steam power, engines, tools, apparatus, and machinery of the most approved models and styles in use, to carry on the business of such machine shop in all its parts as a practical working establishment."

It will be observed that this indicates a museum and laboratory rolled up into one, and such an innovation can not be too greatly emphasized; for the study of books in which scientific facts are recorded can never compete successfully with the literatures of Greece or Rome as a means of mental training, unless the principles accepted by a society which those literatures have made are fundamentally changed. The ruling oligarchy which produced and supported those literatures left industry to

slaves and applied itself to war, literature, and art, and, to a moderate degree, to the most elevating business in which a people can engage—that is to say, commerce upon the high seas.

V.

Other than as given in schools for the defective or delinquent classes, it has been shown how technical instruction in the United States has been broadening down from the education of a few chemists and surveyors toward the instruction of a number of young men who are taught by manual and visual familiarity the business at which they are to earn their daily bread in future life. It would be but to repeat what is already well known to attempt to show how such instruction for boys of 14 or 15 years was systematized by the introduction of the Russian system as in operation at the Strogonoff School at Moscow, and the effect of the kindergarten and industrial drawing propaganda awakened by the experiments of Massachusetts and several of our great cities, but there is one feature connected with the growth of technical instruction in the United States which is of special interest. In Europe trade schools have long existed, and are mainly supported by the community in which they are located, for they have been established in order to teach the industries peculiar to their environment. Indeed, many of the so-called industrial schools of Europe are only complementary to an apprenticeship. They are merely drawing schools for apprentices in decorative or industrial fine art, or are courses of elementary lectures on the scientific facts underlying industrial operations of a far more substantial kind. At these complementary schools the apprentice, after the completion of his day's work, or on Sunday, is taught to design or is told in an entertaining way of the principles which guide the work at which he has spent the day or week. It thus appears that the instruction given by the American "manual training school" is very much more generalized than that given in Europe. Yet this is not the special point adverted to above. That point is that only in the United States has any wide attempt been made to inaugurate a comprehensive system of instruction which would be for the benefit of agriculture and the mechanic arts; and the basis of this provision is even more material than the history of the motives and the course of legislation which allowed the provision to be made. This basis was the possession of large bodies of land by the Federal Government given to it by the States or purchased by it to consolidate its territory.

The people inhabiting this country when it was discovered were regarded by the European Governments as feræ naturæ, and the title of the land upon which they ranged being in European law vacant, they granted it, not by local metes and bounds as in Europe, but by parallels of latitude which they suspected ran from the Atlantic to another ocean. Some acquaintance with the eastern coast, indeed, made it possible to be less lavish in granting the continent away; but the inexhaustible supply of territory perpetuated the liberal spirit that had from the very beginning prevailed. It was therefore natural that communities, poor in purse but rich in good will and land, should use their surplus for fostering education. The first public school of Boston was endowed with public land, the college at Cambridge during the first century and a half of its existence received nearly 100 square miles, and one year before the Puritans landed upon the New England coast 10,000 acres had been granted by the Virginia Company to found an English university in America. Nor did this munificence stop with the endowment of the schools; the Boston schoolmaster, the Cambridge president, and the university superintendent were also endowed, the first with 30, the second with 500, and the third with 300 acres.

But of all the grants of public land for education two stand preeminent. One of these is thought to have laid the foundation of the school systems of the States which were formed from the Northwest Territory and settled by a people bred to believe in public schools, and the other, though granted for the purpose of benefiting agriculture and the mechanic arts, is considered with the same show of reason to have promoted the study of science, for their "leading object shall be * * * to

teach such branches of learning as are related to agriculture and the mechanic arts." Various interpretations have been put upon this act. In some cases State universities have been founded, in other cases old State universities have been endowed; sometimes the school which has been established is almost entirely an agricultural school, in other cases it is almost entirely an institution for technical instruction. In Missouri an institution already in existence was charged with the agricultural branch of the work and an institute of technology established in another part of the State, while in Massachusetts an institute of technology already in being was intrusted with work of giving technical instruction and an agricultural college established at a distance. But whatever differences in organization may appear, owing to the generality of the terms of the act or inadvertency, this much remains—that these schools have never been anything but schools of agricultural and mechanical engineering. The trade school of Europe—the school for the common people, the caste school, the school for the "industrial classes"—has no or next to no following in America.

VI.

The first attempt to investigate and in a measure, probably, to coordinate the work of the schools established for the benefit of agriculture and the mechanic arts was made by this Bureau. Commissioner Eaton had the fortune to secure the services of an agent in the person of Prof. D. C. Gilman,[1] who reported at some length upon their condition, advising that a report such as his own be made at least once in ten years.

At the date of his report, November 1, 1871, 28 States of the 34 having received the land grant were known to have taken definite steps toward the establishment of such colleges as the act of Congress in 1862 contemplated. Those efforts had been usually put forth in good faith, but in some States the unsettled condition of affairs, and in others vague notions respecting the possibility of securing the end in view had been a disturbing factor. A great difficulty had been experienced in securing the services of accomplished and able men as professors in the departments of science of the institutions, which to Professor Gilman appeared to be one of the greatest obstacles which impede the success of the new movement. In almost every State the national grant had been added to the funds of some existing institution, in order that by the concentration of resources greater power may be acquired; but almost invariably, in cases, the Congressional funds, with others, expressly given for scientific purposes, have been separately invested and employed, so that they may not be diverted to classical or literary studies. The reporter deprecates the use of the term agricultural colleges, and hopes that something more proper as well as generic will be adopted, such as "national," "governmental," or "United States," as a prefix for a class of colleges so largely indebted to the Congressional endowment.

The first want felt in the establishment of this class of schools was the education of men of science to man them, but the first purpose for which they were established was the instruction of able, educated, trustworthy technologists, such as well-informed engineers, architects, mechanicians, manufacturers, miners, agriculturists, and the like for which the country was at that time loudly calling. The third need was the education of skillful laborers, men who add to dexterity and muscular ability an appreciation of their work, an acquaintance more or less profound with the nature of the materials, the natural laws underlying the manufacturers' processes, etc. It was safe to say that at the date of 1871 in all the institutions enjoying the benefit of the act of 1862, the second or technological need was being met. Some of the institutions also appear to have had closely in mind the wants of those who are to labor with their hands upon the farm and in the workshop, and there was one or more in which the presence of a post-graduate

[1] Now president of the Johns Hopkins University, but then a professor in the Sheffield Scientific School of Yale University, his report for the Bureau being "vacation work."

course indicated a desire to supply men of science. In other institutions agriculture predominated over the mechanic arts, and this variation seemed to Professor Gilman to be about to be made more manifest in the future, and he regarded it on the whole, as desirable that each national college should have an office and aim of its own based upon a careful study of the want of the State in which it is located.

In regard to agriculture, Professor Gilman observes: "There is no doubt that many of those who urged upon Congress the bestowal of a grant of land to the several States were deeply interested in the culture of the soil. There is also no doubt that in many cases the end to be gained was better understood than the means which should be employed, or, in other words, that the theory of agriculture was vaguely worked out."

As to the military feature of the law of 1862, Professor Gilman found that it had given a great deal of trouble, and, as far as his observation had gone, in most of the States the repeal would be welcome.

VII.

Professor Gilman was perfectly correct in prognosticating that as time elapsed the institutions he had reported upon would tend to direct their energies along one certain line rather than another. The absolute necessity of making a good secondary education the base of a good technological education, everywhere recognized—in Germany, England, and France—the inability of the country boy to get such an education at home, the literary character of the corps of the instructors, all tended to make secondary instructions, properly so called, play a very important part in this class of institutions, especially in those which had been connected with a higher institution of learning. Technology was rescued from the fate of agriculture by the wave of enthusiasm for manual training and the happy exhibition at the Centennial Exposition of the Stroganoff School of Della Vos's scheme of manual instruction without a view to remuneration. But agriculture lagged behind until Congress again came to its aid by passing two laws, one known as the Hatch Act and the other as the Morrill Act. These and the law of 1862, to which they are supplementary, are the financial foundation of the schools created for the "liberal and practical education of the industrial classes" and thereby "for the benefit of agriculture and the mechanic arts." A conspectus of these laws is given for convenience of reference.

SYNOPSIS OF THE LAW OF JULY 2, 1862.

To establish colleges for the benefit of agriculture and the mechanic arts.

1. The grant.

Each State now existing and each new State admitted into the Union shall be entitled to as many times 30,000 acres of public land (not mineral bearing) as it had in 1860 or has, at the time of its admission, representatives in both Houses of Congress. When there is not enough (or no) public land within a State, scrip shall be issued; but no State shall locate land in another State save through assignees, nor shall any portion of land be located smaller than a quarter section.

2. The object of the grant.

Ten per cent or less of the entire gross proceeds of the grant may be used, if authorized by the legislature, in the purchase of land for sites or experimental farms.

The interest of the entire remaining gross proceeds of the grant shall be used for the endowment, support, and maintenance of at least one college where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts in such manner as the legislatures of the States may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life.

An annual report shall be made regarding the progress of each college, regarding improvements and experiments made, with their cost and results, and such other matters, including State, industrial, and economical statistics, as may be useful, one copy of which shall be transmitted by mail free by each to all the other colleges of the same class, and one copy to the Secretary of the Interior.

SYNOPSIS OF THE LAW OF MARCH 2, 1887.

To establish experimental stations in connection with colleges established by the law of July 2, 1862. [Wherever the word State is used the word Territory is implied.]

1. The annual subsidy.

There shall be appropriated annually, until the provision is amended, suspended, or repealed, the sum of $15,000 to each State, to be paid quarterly out of any money in the United States Treasury arising from the sale of public lands, to the treasurer or other officer duly appointed by the governing boards of the colleges that have been or may be established in virtue of the act of July 2, 1862. The sum so granted is to be used for the following purposes:

2. The object of the subsidy.

There may be expended out of the first annual appropriation the sum of $3,000 or less, in the erection, enlargement, or repair of necessary building or buildings, and $750 or less of subsequent appropriations may be so expended.

There shall be established under the direction of the college or colleges, or agricultural departments of colleges, created by the law of 1862, in each State a department to be known as an "agricultural experiment station." Such experiment station shall conduct original researches or verify experiments, to wit: (1) On the physiology of plants and animals and the diseases to which they are severally subject, with remedies for the same; (2) on the chemical composition of useful plants at their different stages of growth; (3) on the comparative advantages of rotative cropping as pursued under a varying series of crops; (4) on the capacity of new plants or trees for acclimation; (5) in the analysis of soils and of water; (6) on the chemical composition of manures, natural or artificial, with experiments designed to test their comparative effects on crops of different kinds; (7) on the adaptation and value of grasses and forage plants; (8) on the composition and digestibility of the different kinds of food for domestic animals; (9) on the scientific and economic questions involved in the production of butter and cheese; and such other researches and experiments bearing directly upon the agricultural industry of the United States as may in each case be deemed advisable, having due regard to the climate of the State.

SYNOPSIS OF THE LAW OF AUGUST 30, 1890.

To more completely endow the colleges established under the law of July 2, 1862. [Wherever the word State is used the word Territory is implied.]

1. The annual subsidy.

There shall be annually appropriated until the provision is amended, suspended, or repealed, out of any money arising from the sale of public lands not otherwise appropriated, for the more complete endowment and maintenance of colleges for the benefit of agriculture and the mechanic arts, the sum of $15,000, and an annual increase of $1,000 until the appropriation shall be $25,000. [Territories not yet States may be beneficiaries of this law though not of the law of 1862.]

2. The object of the subsidy.

The amounts annually received by each designated school or college shall be applied only to instruction in agriculture, the mechanic arts, the English language, and the various branches of mathematical, physical, natural, and economic science, with special reference to their applications in the industries of life and to the facilities for such instruction.

An annual report shall be made by the president of each college to the Secretary of Agriculture, as well as to the Secretary of the Interior, regarding the condition and progress of the college, including statistical information in relation to its receipts and expenditures, its library, the number of its students and professors, and also as to any improvements and experiments made under the direction of any experiment stations attached to the college, with their cost and results, and such other industrial and economical statistics as may be regarded as useful, one copy of which shall be transmitted by mail free to other colleges of the same class.

3. The conditions attached to the grant.

The State legislature must formally accept the grant within three years, establish at least one school of the character set forth above within five years, must replace all losses to the fund, must invest the entire gross proceeds, after a permitted expenditure of not more than 10 per cent thereof for sites or experimental farms in safe stocks yielding not less than 5 per cent on their par value, and must use the interest wholly—excluding the purchase, erection, preservation, or repair of any building or buildings—in support of the school or schools established by this act.

3. Conditions attached to the subsidy.

The legislature of each State must formally accept the grants, must apply the appropriation to paying the necessary expenses of conducting investigations and experiments and printing and distributing the results, must connect the station with the institution endowed by virtue of the act of July 2, 1862, unless the State has an experimental station separate from the college, or the college is not distinctively an agricultural college or school though having connected with it an experimental farm or station, in either of which cases the legislature may apply the whole or in the case of the nondistinctively agricultural college or school the whole or a part to a distinctively agricultural school having a station, and no State shall disable itself from so doing by contract express or implied.

Each station shall annually, on or before February 1, make to the governor of the State a full and detailed report of its operations, including a statement of receipts and expenditures, a copy of which shall be mutually interchanged among the stations, and one sent, respectively, to the Secretary of Agriculture and the Secretary of the Treasury.

Bulletins shall be published by each station at least once in three months, which shall be sent by Government frank to each newspaper in the State and to such persons who are actually engaged in agriculture who shall request the same, as far as the means of the station permit.

4. Federal jurisdiction.

The Secretary of Agriculture shall furnish forms, as far as practicable, for the tabulation of results of investigation, shall indicate from time to time such lines of inquiry as shall seem to him important, and in general shall furnish such advice and assistance as will best promote the purpose of this law.

Whenever there is unexpended a portion of an annual appropriation, the Secretary of the Treasury shall deduct it from the next, so that each station shall receive no more than is necessary to maintain it.

3. The conditions attached to the subsidy.

The State legislature must formally accept the grants, may in certain States propose an equitable division of the fund between one school for white and one school for colored students, shall designate the officer to whom the annual appropriation shall be paid, who shall immediately pay it to the treasurer of the respective institution or institutions, who shall be required to report to the Secretary of Agriculture and to the Secretary of the Interior by detailed statement the amount received and disbursed, and shall replace all sums lost by any action or contingency, and no portion of the amount annually received shall be applied directly or indirectly to the purchase, erection, preservation, or repair of any building or buildings.

4. Federal jurisdiction.

The Secretary of the Interior is charged with the proper administration of this law, and the treasurer of each college shall report to him (and the Secretary of Agriculture), on or before the 1st day of September of each year, a detailed statement of the amount received in virtue of this law and its disbursement, and if any State misapplies or loses any portion of the appropriation and does not replace the same the Secretary of the Interior shall withhold all subsequent appropriations, and notify the President of the United States of his reasons therefor; but the State may appeal to Congress, and if Congress uphold the Secretary the amount withheld shall be covered into the Treasury.

VIII.

The tendency at present manifested by the institutions founded on the sale of public lands is one of separation from the literary institutions with which, in England at least, at the present day, it is thought advisable that they should be conjoined. We have seen how slowly in the past our large existing institutions absorbed the conception that the empirical laws of nature should have a footing on the platform occupied by the subjects occupied more particularly with the ideal conception of what a man ought to be as distinguished from what, under the given conditions of his age, he is, and it seems evident that as the German, Hecker, in establishing his realschulen, about the middle of the last century, was obliged to place them in opposition as it were against the classical colleges of his native land, and as Jefferson was obliged to found a new university, so the endowments given by Congress have endeavored to divorce themselves from a connection with institutions more particularly based on the pedagogical conceptions of the Renaissance or Reformation.

In no other countries of the world has education been left more to local initiative than in the United States and England. In neither is there a minister of public instruction, as in continental countries, and in neither is anything more obnoxious and irritating than a fussy interference by the General Government with local concerns. But in both the General Government has been appealed to for aid in establishing technical education. One country has given "public lands," the other its "whisky money,"[1] for the "practical and liberal education of the industrial classes."[2] But here the similitude ceases. In America the technical departments are "overshadowed by the literary departments of the institutions with which they are connected;" in England the universal complaint before the late secondary education commission was that by exacting fifteen hours a week for instruction in science literary instruction was being pushed to the wall. This difference is to be attributed to one of two things, or rather to both, more or less, in combination. The English grant is a capitation payment given on results obtained and witnessed to by the inspectors and passed on by the examiners of the science and art department at London; the original American grant was outright; the other cause is the difference in grade of the English and American literary instruction conjoined with technical instruction as here considered, the American literary instruction being higher.

At home we have the president of one of our most promising technological institutions observing in a report to this Bureau that if agricultural and mechanical colleges could receive like recognition from the State that the State classical institutions do it would be far better that such institutions as his own should be separated, but if the State classical college is permitted to do technical work, and thus compete with the technological college, it might be better to have them united. By an answer of this kind we are landed in the domain of educational economics. It is asserted by two of our correspondents that the answer to the question of separation depends upon the financial conditions in each State, and that the best interest of the technical school as a machine of instruction may be subserved by independence, but its existence would be precarious without affiliation with the treasury of the State university. But the conflicting claims are in general these:

Elevated atmosphere of the humanities.	Frigidity of that atmosphere.
Economy of staff.	Predilections of staff for literary work.
Economy of general expenses.	Temptation to divert land-grant money to literary department necessities.

The direct solution of questions of this kind is not within the power of legislation or of any other form of exterior control. Our old colleges not only were not specifically for the educatiou of the "industrial classes" (whatever that may mean in

[1] So called from its being the "excise revenue," £750,000 annually.

[2] Meaning in England parents receiving from any source less than £400 annually ($2,000).

America), but were intended for all classes who were desirous of opening and enlarging their intellects, irrespective of the emoluments legitimately flowing from the capital of time and money spent in the effort, and when an institution having traditions of that kind has affiliated itself to one "for the industrial classes" it is but the exhibition of a familiar tendency of the human mind, unless carefully guarded against, that the newcomers en bloc should be regarded as something of an inferior order. At Cornell or California University (new universities), where both classes were familiarized with each other and placed upon an equal footing from the beginning, this difficulty may be supposed to be unfelt. It is probable that the term "industrial classes" used in the act of 1862 was borrowed from England, where a science and art department for the industrial classes had been established, just before the first attempt to pass the bill in 1858, which was vetoed by President Buchanan.[1]

The suggestion that the resources of the State have something to do with the question of keeping conjoined the two classes of institutions invites an inquiry as to the sum obtained by the institutions endowed by the acts of Congress.

In ten States there is no income from State endowment or from appropriation, and from three no reports.[2] In twenty-three States there are received specifically for agricultural and mechanical departments[2] $338,282. In twelve States there were received all told by State universities having land-grant colleges connected with them $751,633.[2] Nearly all of which was contributed by Wisconsin, Minnesota, Ohio, and California.

Let us take the cases of Wisconsin, Minnesota, and California. The three universities of those States received in 1894–95 collectively $706,726 from the State for the purpose of support and building. Of this, $152,050 were devoted to the purposes contemplated by the act of August, 1890—that is to say, over $21 in every $100 appropriated by the State, either originally as endowment or by annual law. In these same institutions, however, there were 27 students in land-grant departments in every 100 students in attendance at the three universities, including the preparatory department of one. At an Eastern institution, not aided by the State, but having land-grant departments among its colleges, in every $100 spent from all receipts except from the Federal Government subsidy, but for all purposes, $25 was spent for matters contemplated by the act of August 30, 1890 ("Morrill Act"), and that, too, upon a very narrow, not to say too rigorous, interpretation of the meaning of the words of that act. But in that institution, which has no preparatory department, 35 in every 100 students were in technical (including, of course, agricultural) departments. These grants by these States or universities just mentioned have been made in face of the fact that the land-grant endowed departments received $20,000 additional from the Federal Government to be wholly used for persons actually teaching, for actual instruction as specified by the law, and for actually necessary apparatus required by such instruction, and it can not be regarded as but liberal. It certainly can not be assumed that there is any general desire on the part of those charged with the administration of literary institutions at the present date to be niggardly to departments endowed with the national land grants.

The value placed by the land-grant colleges upon their instruction, as compared with the literary degree of A. B. on one hand and the scientific degree on the other, is capable of being illustrated by replies they have made to special inquiries from this office. The opinion is about equally divided for and against the proposition that the training furnished by the land-grant college making the answer is equal in value to the degree of A. B., and in two or three instances it is thought that such training is not equal to the degree of B. S. given in our larger colleges. For instance, on one side President Francis A. Walker says, in regard to the value of the training furnished by the technical courses of the Massachusetts Institute of Technology as

[1] The ideas of the English on this question are given in the extracts from the testimony of the Bishop of London and the Rev. Mr. MacCarthy, pp. 610, 615.

[2] Excluding colored schools.

compared with the mental-developing power of the ordinary A. B. or B. S. course: "Yes; without any qualification. But this is only so (1) because in all our courses a modicum of philosophical theory (political economy, history, etc.) and of language studies is required, and (2) because in every course the mastery of principles is held to be more important than the acquisition of technical knowledge or skill, the technical applications of science being chiefly valued (1) because they serve to interest the student in the principles made use of and (2) because by such applications the student acquires the principles, not only in a higher degree, but in a different way than where he studies them in the lecture and recitation room only." President Schurman, of Cornell, replies: "Yes; but I think the comparison should be made, not between the technical courses and the A. B. or B. S. course, but between A. B. and B. S. or the technical courses, i. e., that humanistic studies (which appeal to something more than the intellect) should be contrasted with rationalistic or scientific (including pure science and applied science courses). I regard the technical courses as the equivalent of the courses for B. S." A somewhat different way of saying the same thing is the response of President Cyrus Northrop, of the University of Minnesota, to this effect: "No; technical knowledge is valuable, but it is gained at the sacrifice of culture and mental training if it occupies a large part of the undergraduate course. It may be more important to the student, however, than culture and training (along literary lines) would be; I mean more important to some students." Probably one or other of these answers would be acceptable to all other presidents who have favored the Bureau with replies. In several cases the educational value of laboratory work is considered as fully equal to literary training, and in several others it is intimated that were the students more thoroughly grounded in secondary studies before entering the college an affirmative answer might be given, though it is testified by a president of a transmississippi college that most students can not be made to believe they ought to take a general course of literary and scientific study before entering upon technical studies.

As admission requirements now are, there is a heavy preponderence of opinion that technical degrees (bachelor of engineering, agriculture, etc.) should follow a post-graduate course; in other words, should be preceded by the degree of B. S. or A. B. President Alston Ellis, of the Colorado Agricultural College, remarks upon this point, "Both plans have advantages. If the scientific and literary course did not beget a distaste for any work outside of the so-called learned professions, its train ing would form a good foundation upon which to build special technical work. Were proper conditions in existence I would favor technical work by post-graduates; as things exist, I believe that the degrees named can be best given for under-graduate work that unites some degree of general culture with special technical training." President Charles S. Murkland, of the New Hampshire College of Agriculture and the Mechanic Arts: "My reason for preferring a general A. B. degree of four years as preliminary for all post-graduate work is that the technical degree should mean something in addition to the general degree. It commonly means something less than the general degree." On the other hand, the opposite opinion is succinctly stated by President J. S. Smart, of Purdue University, as follows: "I think the training in our technical schools can be and should be upon a plane comparable with that of the classical institutions; therefore engineering degrees should be given for undergraduate work. But very few technical degrees would be given, if given only for post-graduate work." General Walker, in advocating "an ordinary college course of four years, to be followed by three years, or, in cases of exceptional ability, by two years, in a technological school," favors us with the following judgment: "I do not think that the degree mechanical engineer, civil engineer, etc., should ever be given for academic work, whether undergraduate or post-graduate. The engineer becomes such only by practice. It is his characteristic work to make choice between different methods of accomplishing a certain result, and the judgment required for this can not be taught in schools. So much for the word 'engineer' in a college degree."

The foregoing almost answers the question, "At what age shall specialization be begun?" because it is quite apparent that the question is, in a large measure, dependent upon the mental condition rather than upon the completion of a year of life usually varying from the fourteenth to the nineteenth year. In general, it may be said that a synopsis of the definite replies to the question as to the age at which technical specialization should be begun is well represented in the reply of President Patterson, of the State College of Kentucky: "I would prefer to receive students in the mechanical engineering course of about the age of 18, and would expect them to be well grounded in algebra, geometry, English, chemistry, and physics." Another president observes: "Chemistry, physics, and mathematics can not be begun too early for the purpose of mental development and training. Their special applications to scientific-economic problems should not be entered upon before 17 or 18, but a year later will not find the pupil at a disadvantage."

The number of students pursuing courses of a technical nature in the institutions endowed by the national land grant are given below. It necessarily follows that there should be some duplication not only from there being practically related subjects such as agriculture and veterinary science, but also from the combinations in study offered by the institutions as leading to a degree. All due allowance being made for this difficulty, however, attention may be called to the close equality of the totals given for students in the mechanic arts and those in agriculture. On the other hand, however, the students in agriculture and veterinary science are together only little more than 50 per cent of the whole body of engineering students.

Students pursuing courses in—

Agriculture	2,712
Mechanical engineering	2,413
Civil engineering	1,107
Electrical engineering	1,349
Mining engineering	163
Architecture	264
Household economy	321
Veterinary science	395
Chemical engineering	21
Biology	13
Military tactics	7,741

Proportion of time (answered for the most part as though the question had been "Number of hours during the week") which should be allotted to the following subjects in a technical course on a basis of twenty recitation hours a week, one recitation hour equaling two hours in a shop or laboratory.

[NOTE.—In justice to the institutions concerned it is to be remarked that for the most part they seemed to suppose that it was not an expression of opinion but the actual facts as existing in each institution that was asked for. Again, the multifarious details of an actual existing course of study can not be represented in questions so general as those that were asked in the form of inquiry.]

[a] For all departments; but it is to be remarked that the school is founded on the idea of self-help.

The degrees given by the institutions treated of in this chapter are indicated in the following tabulation. It is a question how far these degrees may be depended upon as showing the ultimate professional aim of the students who have received them. Wherever the information received has warranted it, such, for instance, as the expression 10 B. S. in engineering, the degrees have been considered engineering degrees.

CHAPTER XXVII.

INSTRUCTION IN SOCIOLOGY IN INSTITUTIONS OF LEARNING.[1]

By Daniel Fulcomer,

Acting Chairman, Lecturer in Social Science, University of Chicago.

About two months ago I wrote all the college presidents of the United States, intending to present my results at a different gathering from this, and on a broader subject, embracing not only "Instruction in sociology," but in all the other social sciences, such as history and economics. Upon President Finley's request to read a paper at this conference, a second circular letter was sent out, and this paper was prepared with reference only to sociology in the strict sense and to the related studies in charities and correction in which the conference is especially interested. My material naturally falls under the following heads: (1) Statistics of this year's courses and students in sociology and philanthropy; (2) the growth of these studies during the last ten years; (3) a description of the best courses thus far developed; (4) a consensus of opinion as to definition, methods of teaching, etc.; and (5) the importance of these subjects, as testified to not only by educators but by the demands shown among students for them. It is possible that we shall be led to see in sociology a rival of the classics and physical sciences for the chief place of honor in an ideal education.

NUMBER OF INSTITUTIONS TEACHING SOCIOLOGY.

From the 422 colleges and universities written to, 146 replies were received. Of this number 29 have regular courses in sociology, using the word in the looser sense to include charities and correction, while 24 have sociology proper, defining the term as the study of society. In other words, one-fifth of all the colleges reporting teach what they call sociology, while one-sixth have sociology strictly speaking. These figures do not include the institutions that give instruction in charities and corrections or the science of society incidentally to ethics, economics, etc. Of this sort there are 6 more in sociology and 20 in charities and correction, some of which give quite extended instruction in these subjects. As regards the subjects of chief importance to this conference, regular courses in charities and correction are reported by 17 institutions; that is, by 12 per cent of all the institutions reporting.

The 14 leading women's colleges, as classified by the Bureau of Education, were written to also; but their replies are used only in the synopses of opinion that follow, not in the statistics of students and courses. It must be said, in passing, that they have had some of the best sociological work of the United States, one of the strongest men in the country undoubtedly being Professor Giddings, who goes this year from Bryn Mawr to Columbia College. Five of the 8 women's colleges reporting have courses in sociology, some of them being well equipped, while 4 have courses in charities and correction.

One-half, or 11, of the colleges reporting courses in sociology give the number of students, which ranges from 8 to 250 in each course, or an average of 50. The number of students in courses in charities and correction ranges from 8 to 119, with an average of 43.

AN HISTORICAL SKETCH.

That there has been an increase of remarkable rapidity in sociological instruction within the last few years will be seen by comparing these figures with the courses of study in 101 colleges and universities printed by the United States Bureau of

---

[1] Reprinted from the Proceedings of the Twenty-first National Conference of Charities and Correction, 1895.

Education five years ago. In that year only 6 of the institutions reporting had courses in sociology; that is, one-sixteenth of the total number, as compared with one-sixth at the present time. The institutions then teaching sociology were Yale, Williams, Cornell, Trinity, Tulane, and the University of Pennsylvania. Harvard offered the same course as now, "Ethics of social reform," it being claimed that this was the earliest course in the country devoted to charities and correction.

From the fact that this was the only course in this subject in 1889 out of 101 institutions, the report that 45 courses were found three years previously in 103 institutions, as made to the American Social Science Association, seems very questionable. My second circular letter was addressed particularly to these institutions, and I failed to find more than 8 or 10 which had either now or in the past the courses in question. The University of the State of Missouri replied, "More of this work, I fear, was reported on paper than was done in actual fact;" while President Green writes, "The subjects mentioned in the inclosed circular have never been taught in Cumberland University."

The evidence is clear at least as regards sociology proper. The first course entitled to that name dates back less than ten years; the number of courses has been quadrupled in the last five years, and has been perhaps doubled in the year just passed; while, as regards the immediate future, at least seven institutions have written me that they are planning to introduce the study soon.

The rapid increase of courses in sociology which we have found is not confined to America. The continent also which produced a Comte, a Spencer, a Schäffle, and a De Greef is awakening to the supreme importance of this work in the university. The universities of Brussels, Paris, Berlin, Munich, Freiburg, Heidelberg, and many others gave courses last year in sociology proper; while anthropology, so closely related to it, has for many years held a most honorable position abroad.

CHARITIES AND CORRECTION.

As regards the history of courses in charities and correction alone, Mrs. Talbot wrote in 1886, in connection with the statistics already mentioned, as follows: "These three topics—crime, vice, and charities—receive far less attention in our colleges and universities than the other topics of our schedule (economics, etc.). The fact is due, doubtless, to the unformulated character of this department of social science. It is still in a state of empiricism, and no fundamental principles have been as yet reached, or at least generally recognized and adopted as such."

Professor Peabody sends an interesting history of his course in charities and other social questions at Harvard. He says, "The teaching of ethics applied to social questions was begun by me in this university in 1880 in the Divinity School." The figures given for each year show an increase from 2 students in 1881-82 to 48 in 1885-86, 100 in 1888-89, and 133 in 1892-93. This year's attendance is 119. The number of hours per week has increased from one to three. He continues, "The present constitution of this course under our elective system is as follows:

Graduate students	7
Divinity students	20
Senior students	55
Junior students	24
Sophomore students	2
Special students	8
Scientific students	3
	119

"There is a students' department library of about 450 volumes to which each member of the class has a key. A Paine fellowship of $500 is designed for students of these subjects. Two Paine prizes are offered at $100 each, one for a special research in some problem of charity, and one for a practical study of some aspect of the labor question."

SOME COURSES DESCRIBED.

No adequate conception will be had of the importance sociology has reached in this country or its probable future without describing in some detail the vast variety of work going on in the department of social science and anthropology at the University of Chicago. There are already several times as many courses given there as at any other university in the world. There are in this department 10 professors and instructors who teach in no other, namely, Small, Henderson, Bemis, Talbot, Starr, West, Thomas, Zeublin, Gentles, and Fulcomer. Of these, two give mainly university extension lectures, one spending nearly his entire time outside of the city

of Chicago. There are 31 courses of study given by these professors. Those in pure sociology are:

22. The methodology and bibliography of social science.
23. Seminar. The psychology, ethics, and sociology of socialism.
24. The province of sociology, and its relation to the special social sciences.
25. Social psychology.
26. The organic functions of the state and of Government.
27. Problems of social statics.
28. Problems of social dynamics.
29. The sociology of the New Testament.
30. The historical sociologies.
31. The elements of sociology.

The courses of most importance to this conference are, among others given by Professor Henderson, the following:

16. Social treatment of dependents and defectives: Lectures, discussions, visits to institutions, reports. Second term, autumn quarter.

17. Criminology: Criminal anthropology and social treatment of crime. Lectures, visits of inspection, study of living cases, reports. Winter quarter.

18. Seminar: This will continue throughout the year, and will cover topics relating to all organization for promoting social welfare. Individual needs and tastes of students will be considered, but a system of research and analysis will control the work for the year.

The seminar methods of work are of most value to specialists. There are no lectures or text-books, but each student puts the entire year on some subject worthy of publication, such as an investigation of the charities or the missions of the city. Much practical work is required in all these courses. This year, for instance, the most of the students have been visitors in charity work, have assisted Mr. Wines, and have taken censuses of the unemployed sleeping in the City Hall and of "Randall's Army."

CONSENSUS OF VIEWS ON SOCIOLOGY.—DEFINITION.

To return to the letters on sociology sent by me, among the questions asked were the following:

"What is your definition of sociology (as used distinctively from the other social sciences)?" "How is it related to political economy, moral philosophy, etc.?"

The main reason for asking these questions was to be sure that the figures given me really referred to sociology, and that the term was not used in the inaccurate way which is very common. It was by no means supposed that the average definition would be the true one. What sociology is can not be learned from the president of a Tennessee college, who said that "Under ethics and economics, most of the substance of sociology is already taught," or from the Iowa president, who, when asked to name his text-books on charities and correction, the family, anthropology, and ethnology, answered, "The Bible." It is to the few specialists in the country that we look for definitions of any value. Among these we find at least two radically different views, the old and the new, which are intimated in President Finley's answer: "I am disposed to give 'sociology' the larger scope, considering it as the science of man in society, and not the science of dependency and delinquency, of the pauper and the criminal in 'society.'" Although the older English and American workers in charities and in other social reforms had reduced the term sociology from the broad meaning given to it by its inventor, Comte, as the science of society, to the science of abnormal society, the later specialists do not fall into this error. Professor Peabody, of Harvard, who has for many years been the most prominent instructor in social reforms, says: "Sociology is a much larger subject than the practical problems of charity and reform. If it can be taught at all, it may be taught quite apart from these. It is the philosophy of social evolution." Professor Henderson, the author of the best work on charities and correction, defines sociology in the larger sense as "the study which seeks to coordinate the processes and the results of the special social sciences. It aims to consider society as an organic unity; to study its movement as a whole, its purpose, the conditions of progress. It aims to show the legitimate place and dignity of each department of social investigation by considering it as a vital part of a vast and uniform movement of thought." One of the foremost professors of sociology, Giddings, of Columbia College, says: "Sociology is not an inclusive, it is the fundamental social science. It studies the elements that make up society * * * and the simplest forms in which they are combined or organized, (1) by composition (family, clan, tribe, nation), (2) by constitution; that is, involuntary organizations for cooperation or division of labor." The most agree in calling it "a comprehensive science, including politics, economics, etc." Others call it "a science of sciences;" "the study of the social nexus that

underlies the various phenomena that are included in the various departments of social science;" "it is the philosophy of all;" "it treats of the evolution of society in its broadest sense."

RELATION OF CHARITIES TO SOCIOLOGY.

In answer to the question how charities and correction are "related to sociology, ethics, economics, etc.," all the replies make a distinction between them. The general view is expressed by Professor Henderson, who says: "General sociology treats society in its normal light, social pathology studies morbid conditions, remedies, etc." Many regard these studies as "applications of the principles of ethics."

The general answer to the questions, "Should they be taught separately from sociology?" and "Before or after the latter?" is expressed by Professor Peabody, who says: "These social questions should be dealt with late in liberal education. They presuppose both ethics and economics. In my own course a student is advised to take both before coming to me, and must have taken one or the other." Professor Commons, of Indiana University, alone would place them before, but says: "The organic nature of society should be constantly prominent."

Of the eighteen answers to the question, "Would you put sociology before or after political economy, ethics, etc.? Year?" two-thirds say, "After," two "Before," and three make the same distinction as Professor Giddings, who says: "Logically, sociology precedes political economy; * * * yet in the educational scheme political economy should be taught first, at least for the present." Professor Henderson says: "I would have a 'sketch' course in the sophomore year of college and in the last year of normal school work, and then ethics, economics, political science. In graduate work the subject can be taught again in its deeper and wider forms."

The opinion as to the best year for teaching these subjects is best indicated by the statistics received. Of the 26 institutions teaching sociology proper in 1894, 16 designate the year. Nine of the 16 put it in the senior year. The junior year comes next, with only 2 institutions. Courses in charities and correction also are found for the most part in the senior year, both in 1886 and in 1894.

THE IMPORTANCE OF SOCIOLOGY.

Question 20 asked: "Would you advise or require sociology as a part of a general education, defining it broadly as the study of society taken as a whole? Why?" Of the 24 who answered, not one replied in the negative, more than one-half expressed themselves strongly in its favor, and 3 would require it even as a common school study. The replies of the 11 presidents in this number are of interest, they being no doubt more impartial than those in charge of special departments. Six of these earnestly advise the study of sociology. One, the president of a Catholic institution, thinks it should be reserved for the university, and not the college period. The severest denunciation is that of the president of the University of Vermont, who says: "In my judgment, the so-called 'sociology' taught in our colleges, preached in our pulpits, and disseminated in our periodicals, is crude, semi-communistic, and harmful; and, until a new race of strong thinkers take hold of the subject in a new spirit, we shall make no real progress in either social science or social life." But the edge of his criticism is taken off when it becomes known that his institution was one of the earliest (1886) to give instruction in charities and correction "as a department of sociology."

Professors who teach economics are thought in some quarters to be critical of the new science; but the nine who answered this question all favor it, although one thinks the time has not yet arrived for it, and says: "Yes, when the universities have turned out a force of educators competent to direct the work, so that it will not fritter away in worthless study." A few would go as far in the opposite direction as Professor Commons, who says: "I should like to see history, economics, and sociology given equal place with language and science from the beginning of high school through to the senior year of college." This energetic young professor is on a committee of the teachers' association of his State to investigate and promote the study of sociology and related subjects in the high schools. Professor Henderson takes the broad view that is gaining ground on the continent when he says: "I would advise that teachers be prepared to treat all the studies of the primary and secondary schools in the sociologic spirit, but that text-books on sociology should not come in till the sophomore year in college. In connection with all studies children and youth should be led gradually, as they are able, to take their place as members of the community. This begins in the kindergarten, and ends only with life."

REASONS FOR ITS STUDY.

A classification of the reasons assigned for the study discovers the following:

(1) It is a practical preparation for life. Professor Thomas, of Baltimore, says: "I advise that sociology be made a part of every student's education. * * * No

one is prepared for life who is ignorant of the laws that govern the social organism of which he is an integral part." The president of the University of Wyoming also would require it for the reason that "the rising generation will not be able to correctly solve the problems now arising in society and government without this educational training." This reason is the most common one given.

(2) "The culture possibilities of sociology, together with its immense practical importance, warrant the fullest attention to it." (Professor Powers, of Smith College.)

(3) "The problems of sociology that are now agitating our civilization must not only be mastered by the leaders of the social reform, but they must be understood by everyday, honest middle classes before any healthy and permanent solution can be obtained." (President Wagner, of Morgan College.) "Americans must soon meet anarchism, communism, and a score of wild theories of land, goods, and government." (Professor Ford, of Elmira College.)

(4) "Sociology is a help to economics and ethics." (Professor Weaver, De Pauw University.)

(5) The professor-prophet of sociology, Herron, of Iowa College, must be put in a class by himself—the ethico-religious. He answers: "Because man is a social being, because society is man, because the knowledge of how to live an associated life and how to express that life in actual human relations is the chief end of man, and, if one's creed be called in question, the only way to glorify God."

THE TIME NECESSARY FOR IT.

The question, "How much time should be given to it?" brought out answers ranging from "Very little at present" to "So much as possible." The average amount suggested is about six months. The following expresses the minimum requirement: "I think that at least three months should be given to the study of sociology in all our undergraduate institutions. Of course, much more time should be given in post-graduate work." (President Johnson, University of Wyoming.) The number of months actually given to these studies in the institutions reporting to me this year averages as follows: Sociology, five months, 22 institutions reporting; charities and correction, five months, 14 institutions reporting. The length of the courses in the latter ranges from one and one-half to nine months, and of those in sociology from one and one-half months in some institutions to a total of forty-nine and one-half in the University of Chicago.

"What other studies could best be cut down to make room for it?" The answer is, "The ancient languages," four times as frequently as any other. Among the other studies named are economics, history, and mathematics. "Any subject pursued for a longer time than two years may well have a term taken from it rather than have a student graduate with no training in sociology," says Professor Freer, of Mount Vernon, Iowa. Professor Herron would cut down mathematics, or even omit biology. He says: "We can get through life without knowing much about beasts and snakes and toads, but it is becoming quite necessary that we know something about man." Several would solve the problem, not by cutting down anything, but by making sociology elective.

IMPORTANCE OF INSTRUCTION IN CHARITIES.

The answers to the question, "What place should these subjects (charities and correction) have in education?" were all in favor of them, although some said "It depends on the institution," or "They are of changing importance;" more called them "very important," and "an essential part of a liberal education." President Mosher says: "I can think of but few subjects that I think would be of greater practical importance to our country than these would be if they could be taught by the laboratory method." Professor Commons would put them "along with the elements of political economy in high schools." Their need to specialists is admirably represented by Professor Henderson, who says: "Every man or woman who intends to engage in the work of charity should study the scientific principles and methods of charity. Those who expect to deal with criminals or to write and speak on prison reform and prevention of crime and vice should give some systematic study to this subject. We have arranged to give double time to those who wish to specialize at this point."

The answers of Professor Small, as given below, tersely cover the main points of the investigation, and may be taken as representing the high-water mark of sociological thought:

Definition.—"Sociology is the philosophy of human welfare. As such, it must be the synthesis of all the particular social sciences."

"Would you advise it * * * as part of a general education?"

Answer. "Yes, in general, in the descriptive parts, to prepare the way for history, political economy, political science, and ethics."

"How much time should be given to it?"
Answer. "Last half of sophomore year and first half of junior. I would have a half year at the end of the senior year devoted to philosophical sociology after a study of the special social sciences."
"What other studies could best be cut down?"
Answer. "Latin, Greek, and mathematics."
"What place have charities and correction in education?"
Answer. "Coordinate with political economy for general students."
"How are they related to sociology?"
Answer. "As pathology to physiology."
"Should they be taught before or after the latter?"
Answer. "After or contemporary."

STUDENTS DEMAND THESE COURSES.

We have seen the importance of sociology demonstrated both from the united testimony of educators and from the rapidity of its adoption into colleges and universities. If any further evidence is necessary, it is forthcoming from the student's side. So far as statistics can be brought to this inquiry, sociology is shown to have already reached the first rank in popularity. The only place in which a fair comparison can be made is in the graduate school of the University of Chicago, where this department is put upon an equality with all others, and where students are free to elect it. The 232 graduate students attending in the autumn quarter of 1893 would give an average of 8 or 9 to each department, while the department of social science had 20. More students have chosen it for their specialty—that is, their major work—than have gone into any other study, with the exception of English and history, each of which excel it by only 1 student. The theological students who have chosen courses outside of their specialties are almost exclusively in social science, there being 22 in this department, but only 4 in all other departments combined.

The showing for this department as to the number of professors and courses given during that quarter is much the same. Sociology had 8 courses as compared with an average of 6 in other departments, and 5 professors as compared with an average of 3½. During the year there were 30 courses in this department, while the other humanities offered only the following: Political economy, 19; political science, 16; history, 48; philosophy, 15; comparative religion, 4; and ethics, 3.

Hardly any of the courses in social science can be taken by juniors and seniors, but the fact that 66 per cent of them in this one quarter have elected the humanities, or the studies of man, of which social science is the culmination, makes the argument complete.

If we turn to courses in charities and correction alone, we find these also among the most popular courses in the institution. The attendance on them is more than twice that of the average course.

CONCLUSION.

This paper has been all of fact, none of theory. There are many questions that remain to be discussed, but they must be left to other speakers, and, indeed, in part to future years. What is the relation of charities and correction to sociology? What preparation is necessary for work in this field? Are the needs properly met by training schools and by other existing institutions? What changes, if any, will the systematic study of society make in the related fields of economics, ethics, education, or government?

In view of the difficulty and the importance of the task, he is a fool who presumes to answer with authority. Were it not that I have something more to suggest than others have said, I should not add my opinion to theirs.

But the best of my prevision for the present is this, that education will some day be considered the most important function of society, and the study of mankind the most important part of education; that the college education of the future is not to center around the ancient languages nor the physical sciences, but the humanities; that they will be the keynote of the public school as well as of the college; that all questions affecting man, as charities and correction, will be seen to depend upon a broad and scientific conception of the whole; that the evils done in the name of charity will largely disappear with increasing knowledge of that most complex of all studies, the science of mankind; that the curing of dependency and crime will be subordinated in large part to its prevention, and that the need for specialists will be seen in all divisions of social labor as well as now in industry and commerce.

Statistics of instruction in sociology, including charities and correction.

[Explanation of marks used: Course 1, punishment and reform of criminals; course 2, prevention of vice (intemperance, prostitution, vagrancy, etc.); course 3, public and private charities (care of the poor, insane, blind, idiotic, deaf-mute, foundlings, orphans, etc.); course 4, sociology (in the strict sense). Marks in college year columns: 1, 2, 3, and 4, freshman, sophomore, etc., year; 5, post-graduate; 6, law school; 7, medical school; a, preparatory department; i, taught incidentally; x, year not stated; —, not taught; blank, unknown; 1/4 (*e. g.*), freshman and senior years; 1–4 (*e. g.*), freshman to senior year; p, school of political science; 4/3, senior or junior year.]

SOCIOLOGY.

SCHEDULE No. 1.

.....State and town or city.
.....Institution.
.....Name of officer making report.

Please answer at least Columns I and II, underscoring the subjects taught. In filling out Column IV denote the preparatory department by "p," post-graduate by "g," freshman year by "1," sophomore year by "2," etc.

Give text-book in—	Number of months.		In what year?	Number of students.
	Required.	Elective.		
I.	II.	III.	IV.	V.
1. Political economy				
2. Economic movements (the labor question, socialism, etc.)				
3. Political science (theory of government, etc.)				
4. Law (international, etc.)				
5. History				
6. Education (theory, social significance, etc.)				
7. Charities and correction (defectives, crime, intemperance, etc.)				
8. The family; divorce				
9. Anthropology and ethnology				
10. Statistics				
11. The industrial and fine arts (as a social study)				
12. Any other social science				
13. Sociology, as different from each of the above (perhaps inclusive of all)				

14. What is your definition of sociology as used in question 13?
15. How is it related to political economy, moral philosophy, etc.?
16. When was it first taught in your institution? What changes since, in professors, books, etc.?
17. If you do not have it now, is its introduction proposed or decided upon?
18. What institution gave the first course in sociology to your knowledge?
19. Can you give the address of any educator favoring its introduction into the public schools?
20. Would you advise or require sociology as a part of a general education, defining it broadly as the study of society taken as a whole? Why?
21. If so, how much time should be given to it?
22. What other studies could be best cut down to make room for it?
23. Would you put it before or after political economy, ethics, etc.? Year?

To DANIEL FULCOMER, *University of Chicago.*

[Second circular letter.]

THE UNIVERSITY OF CHICAGO, *April 16, 1894.*

DEAR SIR: Your institution was reported in 1886 to be giving instruction in the subjects named below. As I am to read a paper on College and University Instruction in Charities and Correction at the May meeting of the National Conference of Charities and Correction, I should like to report just what you are doing now. Will you kindly indicate this in the following schedule? If you can also answer the appended questions, your contribution will be especially gratifying.

Underscore the subjects taught.	In what year?	Number of months.		Number of students.
		Required.	Elective.	
1. Punishment and reform of criminals				
2. Prevention of vice (intemperance, prostitution, vagrancy, etc.)				
3. Public and private charities (care of the poor, insane, blind, idiotic, deaf-mute, foundlings, orphans, etc.)				

4. What place should these subjects have in education? Why?
5. How are they related to sociology, ethics, economics, etc.?
6. Should they be taught before or after the latter?
7. Should they be taught separately from sociology?
8. When were they first taught in your institution? What changes since, in professors, books, etc.?

Very respectfully, yours,

DANIEL FULCOMER.

CHAPTER XXVIII.

PROFESSIONAL EDUCATION.[1]

Comparison of Professional Schools.

Theological schools lack but 1 of numbering 150, while medical schools number 1 more than 150. Law schools are about half as many, 72, and dental schools about one-third, 45.

There are more than twice as many students of medicine as of either law or theology—medical students, 22,887; law, 8,950; theological, 8,050. These figures show an increase in the number of medical students of 1,085, of law students 1,639, of theological 392.

According to the statistics, the number of law students has nearly doubled in the last five years. It is probable this increase is attributable to the fact that when young men now begin the study of law they are no longer content with the desultory instruction of private offices, where so frequently they can obtain only a superficial knowledge of law, but they now seek the doors of a regular law school, where instruction is given systematically to a group of young men who receive fresh inspiration from the pursuit of a common purpose; where there is an esprit de corps giving constant stimulus to delve into the labyrinths of jurisprudence.

There was an increase of about 1,200 in the number of dental students—from 4,152 to 5,347.

There were 1,413 women engaged in the study of medicine, a variation of only 6 from the number of the previous year, and 65 studying law.

Although there was an increase of about 1,100 in the number of medical students, there was a decrease of 306 in medical graduates. This decrease in the percentage of graduates is due to the lengthened course, and will probably become still more noticeable in the future when several other schools shall have lengthened their courses, a step they have already determined upon.

The whole amount of endowment funds of theological schools was $16,083,683. While theological schools probably have relatively larger endowments than any other class of institutions whatever, unless the colleges of agriculture and mechanic arts should be excepted, medical and law schools have practically no endowments. The funds of all the medical schools combined, so far as reported, do not equal that of Chicago Theological Seminary alone, or of Princeton Seminary, or of Union Theological Seminary, New York. The same is probably true of the law schools.

It is true that both medical and law schools sometimes receive benefits from the funds of the universities to which they may be attached, but these are to some extent incidental benefits, the donors of the funds bestowing them on the universities with perhaps little thought of helping the professional schools, and the university officers dispensing them a share with a grudging hand.

Probably one reason why medical and law schools receive so few benefactions is the already crowded condition of these two professions. One thinks, why should aid be given to these institutions, when there is already a superabundance of lawyers and doctors who must contend against sharp competition and who find the struggle to maintain themselves in their vocations becoming harder each year, and when the number of students is still constantly increasing. If there are so many now, the bestowment of benefactions would only increase the number. But when medical schools shall have elevated their entrance requirements, and law schools shall have adopted courses equaling those of medicine, the number of candidates will probably be smaller, or at least the number completing the courses will probably be smaller.

In respect to libraries the contrast is nearly as great. The whole number of volumes in theological libraries was 1,089,897; in medical libraries, 87,259; in law libraries, 188,645. Of the 151 medical schools, only 21 can really be said to possess libraries at all, and only 6 of these have over 5,000 volumes. The medical department of the University of Pennsylvania is the only one having 10,000 volumes;

[1] By A. Erskine Miller, M.D.

Hahnemann Medical College, of Philadelphia, has 8,000; the University of Michigan medical school, 6,000, and Johns Hopkins University medical school, Nashville Medical College, and the University of Buffalo medical school have each about 5,000 volumes. It should be remembered, however, that medical libraries are not so important, for, on account of the constant variation in medical treatment, it is more important that physicians have access to current medical periodicals rather than to antiquated volumes of a library.

Union Theological Seminary, New York, has the largest library of any seminary, viz, 65,716; Hartford Theological Seminary, Connecticut, comes second with 63,000, and Princeton Seminary third with 57,203. Fifteen other seminaries have libraries of over 20,000 volumes each. Eighteen other seminaries have between 5,000 and 20,000 volumes.

Volumes in theological libraries.

Union Theological Seminary, New York	65,716
Hartford Theological Seminary, Connecticut	63,000
Princeton Theological Seminary, New Jersey	57,203
Seminary of the Reformed Dutch Church in America, New Jersey	42,750
Divinity School of the University of Chicago	40,000
Drew Theological Seminary, New Jersey	32,138
Rochester Theological Seminary	28,034
Theological Seminary of St. Sulpice and St. Mary's University, Baltimore	27,000
Meadville Theological Seminary	27,000
Divinity School of Harvard University	26,013
General Theological Seminary of the Protestant Episcopal Church, New York	25,900
Concordia Theological Seminary, Missouri	25,400
Western Theological Seminary, Allegheny	25,000
Theological Seminary of St. Charles Borromeo, Pennsylvania	23,000
Auburn Theological Seminary	22,352
Newton Theological Institution	20,600
Southern Baptist Theological Seminary	20,000
Presbyterian Theological Seminary, South Carolina	20,000

Law schools also, with a few notable exceptions, show a great deficiency in regard to libraries. Of the 72 law schools about one-third have libraries. Harvard University law school heads the list with 33,000 volumes, and is spending about $6,000 annually in enlarging and improving its library. Columbia College law school comes second with 25,000 volumes. The law school of Cornell University has a larger number of volumes than most other schools, viz, 23,400. "The famous library of the late Nathaniel C. Moak, of Albany, N. Y., which was reputed the finest private law library in the United States, was purchased and presented to the Cornell law school by the widow of the Hon. Douglass Boardman, the former dean of that school."

But if medical colleges have no endowments and no libraries, yet when we consider the number of professors and instructors the tables are turned completely; medical colleges rank far ahead of theological schools in this particular. If an institution has no productive funds, only rented buildings, and but few students, it can fill up the catalogue with names of professors of all kinds of subjects. This is easily done with little or no cost in medicine, where there are so many young men seeking a practice and who see in a professorship a stimulus to medical study, and who hope that in trying to instruct others they themselves may acquire some knowledge (docendo discimus), and that a college professorship will give them some of that practice they stand in such need of. On the other side there are great hopes, strengthened by occasional hints, that each professor will endeavor to secure the attendance of at least two or three students. But this expectation is sometimes disappointed, for in some cases there are more professors than medical students.

Chicago Theological Seminary, with an endowment of over $1,250,000, has only 15 professors; the same number reported by a medical school with an even dozen of students. Seventeen medical schools, with less than three dozen students each, have as many professors as Princeton or Union Theological Seminary, with endowments of over $1,000,000.

Medical Education.

Of the whole number of 22,887 medical students, over one-third are to be found in the three cities, Chicago, New York, and Philadelphia. St. Louis and Baltimore also have large numbers. Chicago has a larger number of medical students than any other city in the United States, viz, 2,856, post-graduate students being included. New York comes second, with 2,726, followed by Philadelphia with 2,339; and St. Louis with 1,399, and Baltimore with 1,293. It may cause some surprise that the list is not headed by New York, the great metropolis of America, with the largest

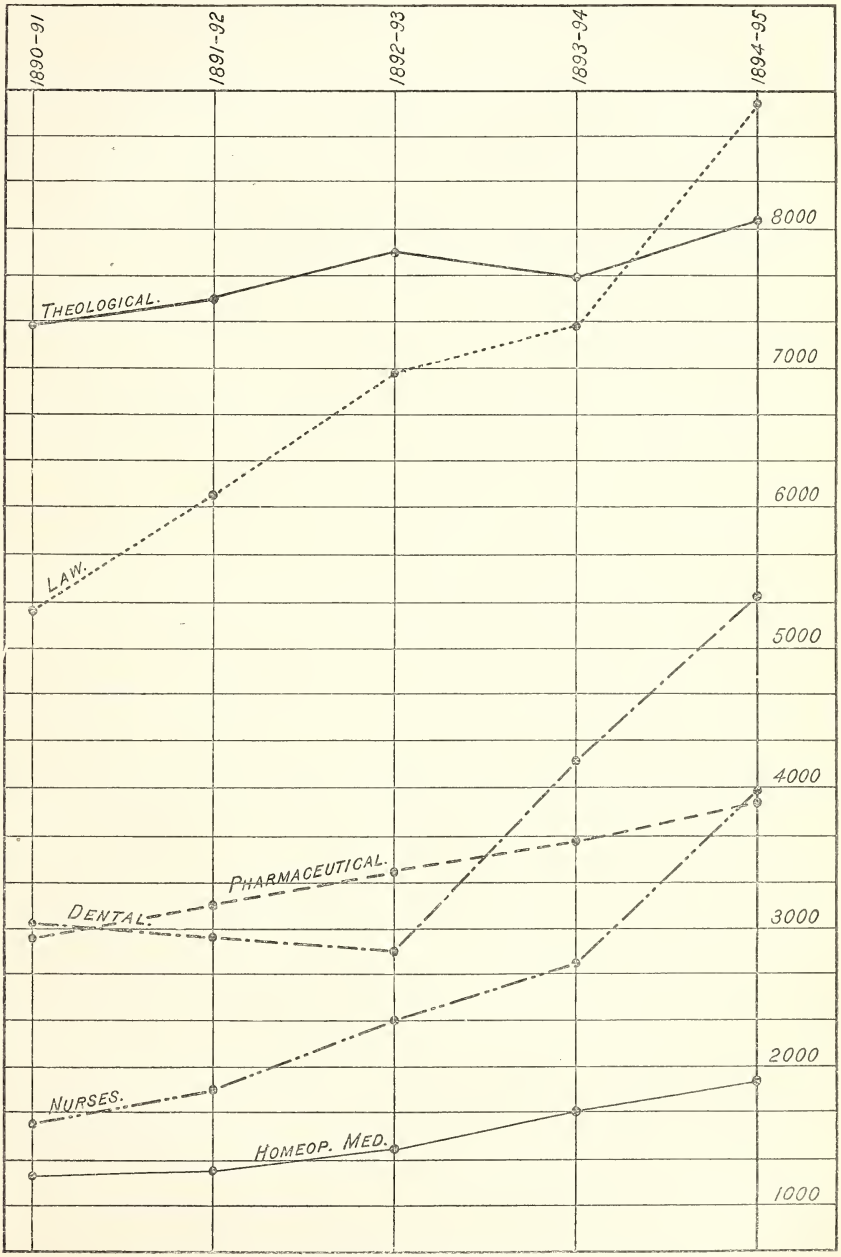

DIAGRAM 1.—Showing number of professional students for five years.

population within its narrow confines of any American city, where there is no longer room for growth except on the tops of houses, not to mention the immense population in its vicinity, all of which really make one great city, divided only by arbitrary civic lines, with numerous hospitals unsurpassed in the United States, and furnishing abundant material for clinical instruction, as well as providing many openings for resident physicians in hospitals.

It is perhaps probable that New York would have the largest number of medical students if it were not for the restrictions upon matriculation in medical colleges in the State of New York. Medical schools in other cities have restrictions by State boards upon graduation, but none of them have to contend against restrictions upon the entrance of students like we find in New York. Although the qualifications required by the State board in New York for entrance to medical colleges are not at all difficult, they no doubt keep away many young men on account of their uncer-

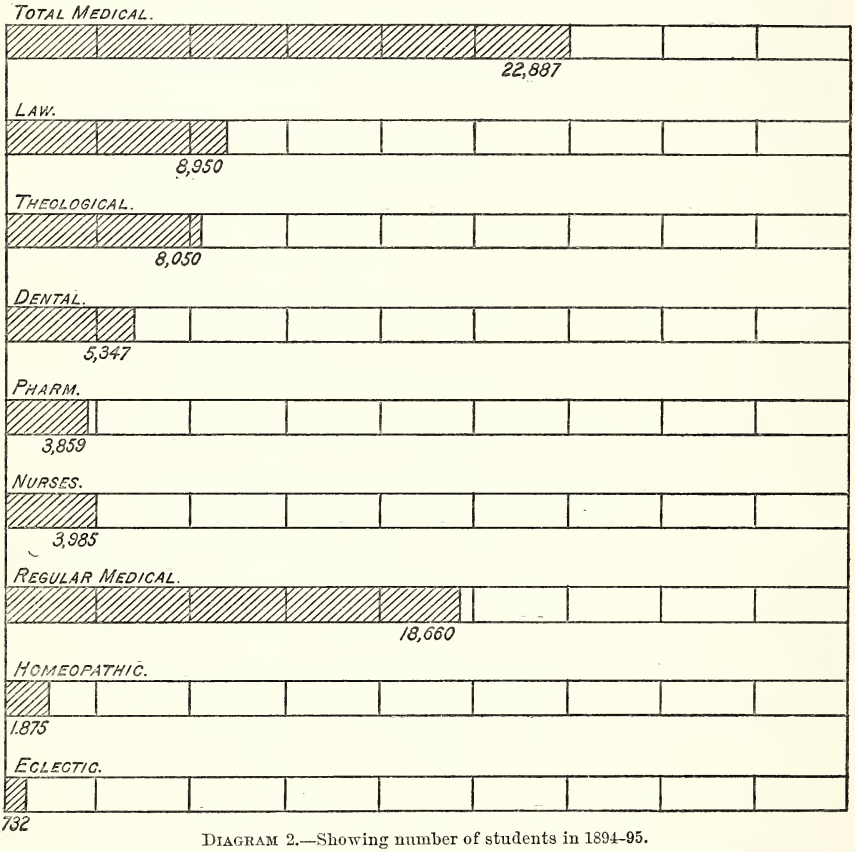

DIAGRAM 2.—Showing number of students in 1894-95.

tainty as to what is required, and also because determination to enter a medical college is frequently deferred till the last moment, when it is too late to investigate requirements.

That the matriculation requirements of the State board deter students from attendance in New York is to be inferred from comparison of the number of students in the different cities now and in 1888-89, before the requirements were made (students in post-graduate schools being omitted):

Students in 1888-89.	
New York	2,081
Philadelphia	1,515
Chicago	1,338
Louisville	990
Cincinnati	816
Baltimore	698

Students in 1894-95.	
Chicago	2,294
Philadelphia	2,201
New York	1,893
St. Louis	1,399
Baltimore	1,293
Louisville	947

In 1888-89 the medical schools in New York enrolled nearly one-seventh of the whole number of medical students in the United States (students in post-graduate schools not being included); in 1894-95 they enrolled only about one-eleventh of the whole number. If, however, the medical schools in New York shall give a better training than those in other cities they will eventually attain superior results in attendance. Moreover, if the New York schools have better student material, young men of higher preliminary attainments than other schools, they will undoubtedly be able to graduate students with better medical attainments, and especially with better qualifications for continued progress in medical knowledge. Whether these results shall be attained or not is a question which time alone can determine.

It must be remembered that it was a Chicago medical college which first took the advance step of requiring three annual courses of lectures, arranged on a graded system, and since then continued progress has been made in still further lengthening the courses and providing equipment for laboratory and clinical instruction. As there seems to be no deficiency of financial resources necessary to consummate many stupendous enterprises, its medical schools will probably fare as well in this regard as those in any other part of the country. The Illinois State medical board will furnish an effective stimulus to the highest medical instruction, for although it does not require an examination of graduates of certain recognized institutions, it has possibly accomplished more in elevating the medical standard than any other State board.

But one of the most favorable conditions to a large attendance of students at Chicago is its central location. Not only from more eastern States will it gather students, but on the western side the limit is only reached at the Pacific, while on the south extends to the Gulf of Mexico the vast territory with a larger proportion of youth than in any other section of the Union.

"No pent-up Utica contracts our powers;
The whole boundless continent is ours."

This probably explains to a larger extent than otherwise the growing number of students at Chicago, and this same condition of centrality will operate to swell the number still larger for several years to come.

Although it may be said that in these days of rapid transit, of flying vestibules and palace cars, the East and West are brought closer together, and that for a few extra dollars the medical students of a far Western State can easily reach the metropolis of the East, yet the barriers of distance are still not entirely annihilated. There is always a larger acquaintance with the conditions and opportunities, educational or other, to be found in the nearer city of nearly equal importance, besides the many ties of friendship and business intercourse.

It should occasion no surprise to see a university with its many departments grow in the number of students in attendance until it reaches one or two thousand or even three thousand; nor even to see so many students in a literary college, where a general education is being sought by young men, who go up higher, from the many thousands in the secondary schools, afterwards to branch out into every calling. But it is a matter of surprise to see the large number of students in some medical schools, all of them preparing for the same kind of work, especially when consideration is had of the numerous medical schools to be found on every side.

If the number of medical students continues to increase during the next few years as it has of late there will soon be some medical schools with more than 1,000 students. Already the medical department of the University of Pennsylvania has reached an attendance of 818 students, and the Jefferson Medical College of Philadelphia follows closely with 726. The College of Physicians and Surgeons of Baltimore, the Harvard medical school, and Bellevue Hospital Medical College have each nearly 500 students. But in medicine, as in everything else, "Westward the star of empire takes its way," and we must go to the great metropolis by the Lakes to find the largest medical concourse. Rush Medical College, of Chicago, a department of Lake Forest University, has a larger number of students than any other medical college in the United States, namely, 840. This, too, notwithstanding the fact that in Chicago there are 10 medical schools, besides several post-graduate schools.

MEDICAL STUDENTS TO POPULATION.

Much has been said about the large number of medical students to population in this country as compared with the number in other countries—England, France, Italy, Brazil, etc.—as if it were something to be greatly deprecated. It was partly on account of the large number of medical students in this country that the course in medical colleges was lengthened to three years, and when this did not diminish the number of students it was lengthened to four years, and now the matriculation requirements must be elevated for the same reason.

It is not to be denied that the proportion of medical students in this country is

much greater than in other countries. Moreover, this proportion is bound to become still more noticeable. At the time of the American Revolution, and even as late as the war of 1812, the number of physicians in this country was exceedingly small, and the medical colleges could be counted on one's fingers. During the long period of over sixty years from 1765 to 1826 only 12 medical colleges attained a permanent foothold in the United States; and the number of medical students was as small as the number of schools, in comparison with those of the present time.

The medical school of the University of Pennsylvania was the first established in the United States—opened in 1765. The Harvard medical school followed in 1782, and Dartmouth in 1796. The twelve oldest medical colleges are as follows, the date being that of opening, not the date of the charter:

1.	University of Pennsylvania, medical department	1765
2.	Harvard University medical school	1782
3.	Dartmouth Medical College	1796
4.	College of Physicians and Surgeons, Columbia College, New York	1807
5.	University of Maryland, faculty of physic	1808
6.	Yale University, medical department	1813
7.	Medical College of Ohio, Cincinnati	1820
8.	Medical school of Maine at Bowdoin College	1821
9.	University of Vermont, medical department	1823
10.	National Medical College, Columbian University, Washington, D. C.	1824
11.	University of Virginia, medical school	1825
12.	Jefferson Medical College of Philadelphia, Pa	1826

While it took sixty years in those days for the establishment of 12 medical schools, half as many were established in one year, in 1893, namely:

Council Bluffs Medical College, Iowa.
Johns Hopkins University medical school.
Tufts College medical school.
North Carolina Medical College.
University College of Medicine, Richmond, Va.
Wisconsin College of Physicians and Surgeons, Milwaukee, Wis.

The following statistics from Dr. William Pepper, of the University of Pennsylvania, show the ratio of physicians to population in various countries:

Russia	1 to 8,551
Norway	1 to 3,961
Austro-Hungarian Empire	1 to 3,857
Italy	1 to 3,536
Spain	1 to 3,375
German Empire	1 to 3,038
Belgium	1 to 2,841
France	1 to 2,666
British Islands[1]	1 to 1,164
United States	1 to 500

It is said, too, that there are twice as many medical students in the United States as in France or Germany, and it is equally true that the number is still more striking when compared with the number in Mexico, Brazil, or China. In some portions of Africa there are some entitled to be called medical students; in Brazil, a larger number; in Italy still more; and in the United States, where the enlightenment of the masses of the people is highest and material prosperity greatest, is it surprising that the number of medical students is greater than in any other country? Instead of the relative number of physicians in the United States being the same as in Brazil, or Italy, or Spain, is it not a matter of congratulation that the people of this country are so well informed that they always endeavor to obtain a cure of disease, and that they are also so generally able and willing to give proper remuneration for medical services?

Moreover, it is fortunate that in this country so many young men can secure the means necessary to obtain a full medical training, while in some other countries the conditions are so hard and exacting that it is with difficulty people can barely maintain a livelihood. Instead of deprecating the fact that there are so many more physicians in the United States than in Italy, we should point to this as evidence of greater prosperity.

The people themselves are making no complaint that there are too many physicians; they content themselves with the thought that it is the same with physicians

[1] According to British Medical Register for 1896.

as with any commodity—the greater the supply, the less the cost. The medical men themselves are the only ones who have reason to complain, and is it not probable that some of them are falling into the way of some trades unions in endeavoring to shut out accessions in order that they may enjoy exclusive possession—a monopoly?

Not only are the people in this country better able to pay for the services of physicians than in other countries, and a larger number of young men able to bear the heavy expenses of securing a medical education, but the same conditions hold in regard to any of the higher pursuits. There is a larger number of lawyers than in other countries, a larger number of dentists. In whatever country the largest number of people can elevate themselves above the condition of day laborers, there will we find the largest number of doctors, lawyers, dentists, etc.

Moreover, on account of their wide distribution the people of this country really need a much larger number of physicians than the crowded nations of Europe, just as the scattered agricultural population of a Western or Southern State will need three or more times as many physicians as the industrial population of some Eastern city, crowded together in adjoining houses. One physician can serve 2,000 people in a manufacturing town as easily as 3 physicians the same number of people in a scattered agricultural community.

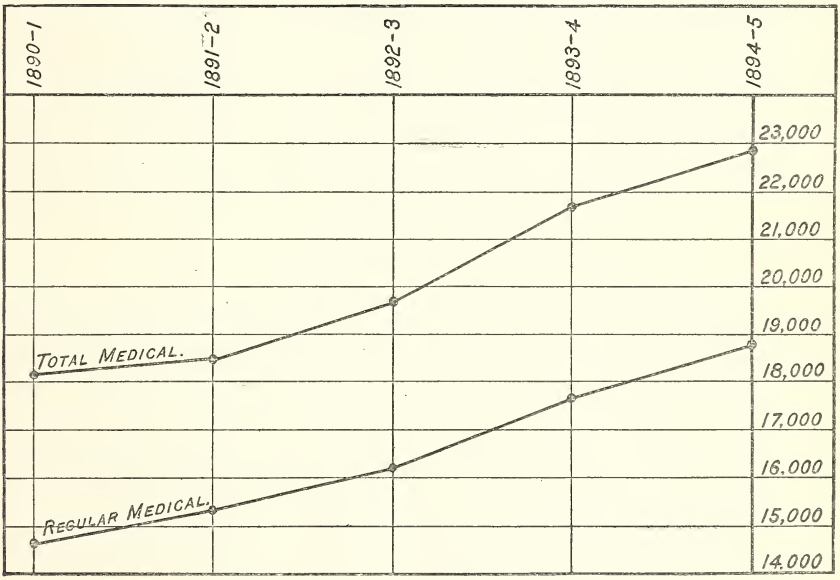

DIAGRAM 3.—Showing medical students for five years.

MEDICAL DEPARTMENTS OF STATE UNIVERSITIES.

If the 3 homeopathic schools in the universities of Iowa, Michigan, and Minnesota are considered distinct schools, there are then 17 medical schools forming part of State universities, the faculty of physic of the University of Maryland also being included, although its connection with the State is only nominal, the university having only the professional schools, law, medicine, and dentistry. The departments in State universities are as follows: California, Colorado, Georgia, Iowa (regular and homeopathic), Louisiana, Maryland, Michigan (regular and homeopathic), Minnesota (regular and homeopathic), Missouri, North Carolina (preparatory medical), Oregon, Tennessee, Texas, and Virginia.

With two or three exceptions, the annual charges for tuition are much lower than in other medical schools. The medical department of Texas University has the distinction of being the only medical school which makes no annual charge to resident students, and it has no diploma fee. Nonresident students must pay an annual fee of $50.

Heretofore Colorado had no tuition fee, but after September, 1895, an annual fee of $35 will be charged.

In Michigan University the fee is quite small, only $25 per annum; in Missouri it is only $20 the first year and $50 the second and third; in Iowa and Minnesota it is less than $50.

Notwithstanding the large endowment funds of such institutions as Harvard, Yale, Columbia College, and the University of Pennsylvania, the annual charges to medical students are higher than in other schools. The tuition fee in the medical department of Harvard University is $200, and cost of the entire course about $714; in the College of Physicians and Surgeons, Columbia College, New York, tuition $200, entire cost about $850; in University of Pennsylvania, tuition $150, entire cost $612. In the collegiate departments, which receive the main benefit from the endowment funds, the charges to students are not apparently diminished. On the contrary, as the productive funds have increased, the costs to students have seemingly endeavored to keep pace with them. If one of these schools were now to receive a legacy of an additional million of dollars, it is quite probable that the charges to students would be increased. In justification of this it is said that the receipt of a large fund enables the institution to secure additional instructors of the highest attainments, to erect buildings specially adapted to the purposes intended, and to secure all necessary apparatus. Consequently, in consideration of the quality of instruction offered to students, the charges for tuition can not be considered unnecessarily high. Moreover, the attendance of a much larger number of students would diminish the possibility of the high quality of instruction which might otherwise be bestowed.

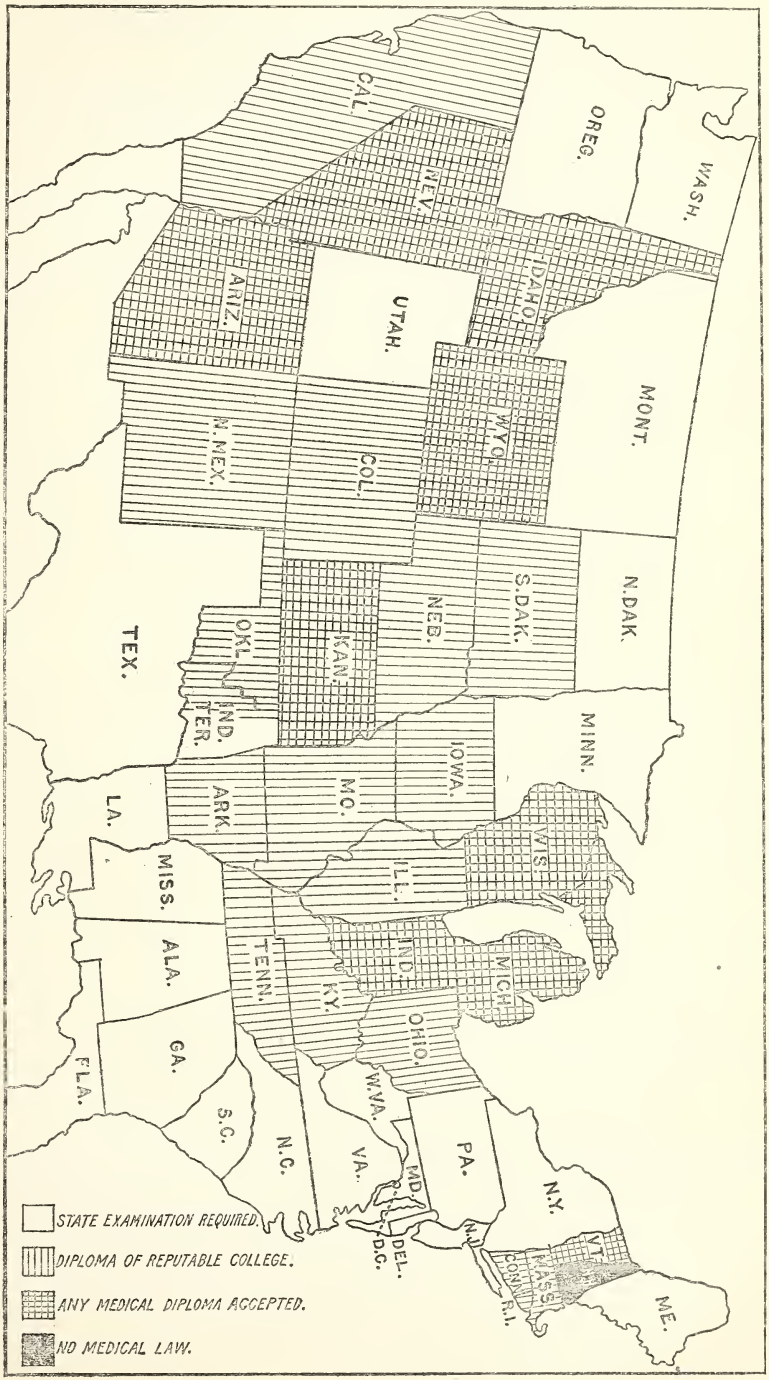
On the contrary, it seems scarcely possible that an institution with no endowment fund and no assistance from State appropriations can be able to afford full and complete facilities for acquisition of medical knowledge, unless it has a large attendance of students who pay ample fees for laboratory, clinical, and other instruction. If such instruction is not given, and students are left to gather what information they can from lectures read by young men seeking a reputation as physicians or by old physicians struggling to retain one, the institution may, of course, be conducted with little cost, but the instruction given will be correspondingly meager.

MEDICAL PRACTICE LAWS.

Besides the District of Columbia and the Cherokee Nation of the Indian Territory, there are 21 states which require an examination of every candidate for a license to practice medicine. These states are Alabama, Delaware, Florida, Georgia, Louisiana, Maine, Maryland, Minnesota, Mississippi, Montana, New Jersey, New York, North Carolina, North Dakota, Oregon, Pennsylvania, South Carolina, Utah, Virginia, Washington, and West Virginia.

It is noticeable that the South Atlantic States without a single exception require an examination, the District of Columbia also requiring an examination now according to a late law of Congress. In fact, in every Southern State east of the Mississippi, except Kentucky and Tennessee, an examination is required, and two of these states, Virginia and North Carolina, were among the first to adopt restrictive medical regulations. The District of Columbia law was approved June 3, 1896.

In Texas the medical law is interpreted differently in different parts of the State.



A new law regulating the practice of medicine in Ohio was passed February 27, 1896, requiring a diploma from a reputable college.

It is an auspicious promise of the further development and extension of restrictive measures that the two most influential States of the Union in wealth and population, New York and Pennsylvania, are among the strongest supporters of restrictive medical laws, and require of every candidate for a medical license that he shall first submit to a strict examination in order to determine whether he is qualified to take the health and lives of citizens in his hands. In the State of New York still other safeguards have been adopted in order to insure both general education and professional skill.

While examinations are not required in the populous State of Illinois, other measures have been adopted and have hitherto been enforced with such rigid adherence by the State board of health that not many quacks and impostors could can find a resting place there.

In fourteen States and Territories no one can practice medicine who is not a graduate of some medical school recognized as reputable by the State or Territorial board. Although examinations are not required in these States, in some of them the laws are so strictly enforced that only those who have received full and complete medical training are allowed to practice.

In ten States and Territories the diploma of any chartered medical college gives the right to practice, and in one other State not even a diploma is required. In Massachusetts anyone with a diploma from a medical school in that State can practice medicine; all others must undergo an examination.

Requirements for license to practice medicine.

uirements for the practice of medicine in the United States.

Stato or Territory.	Requirements.
Alabama	Examination by State or county board of medical examiners.
Arizona	Registration of diploma.
Arkansas	Diploma of college in good standing, or examination by State or county board of medical examiners.
California	Diploma of college in good standing.[1]
Colorado	Do.
Connecticut	Diploma of a college "recognized as reputable by one of the chartered medical societies of the State."
Delaware	Examination by one of the two State boards.
District of Columbia	Examination by one of the three boards.
Florida	Examination by State or district board of medical examiners.
Georgia	Examination by one of the three State boards after showing diploma of a college requiring three years of six months.
Idaho	Diploma.
Illinois	Diploma of college in good standing.
Indiana	Diploma.
Indian Territory:	
Cherokee Nation	Examination.
Choctaw Nation	Diploma of college in good standing.
Iowa	Do.
Kansas	Diploma.
Kentucky	Diploma of reputable college.
Louisiana	Examination by one of the two State boards after showing diploma of college in good standing.
Maine	Examination by State board of registration.
Maryland	Examination by one of the two State boards of examiners.
Massachusetts	Diploma of some medical college in the State, or examination by State board.
Michigan	Diploma.
Minnesota	Examination by State board of examiners.
Mississippi	Examination by State board of health.
Missouri	Diploma of college in good standing.
Montana	Examination by State board of examiners.
Nebraska	Diploma of college in good standing.
Nevada	Diploma.
New Hampshire	No requirement.
New Jersey	Examination by State board of examiners.
New Mexico	Diploma of college in good standing.
New York	Examination by one of the three State boards of examiners.
North Carolina	Examination by State board.
North Dakota	Do.
Ohio	Diploma of college in good standing.
Oklahoma	Do.
Oregon	Examination.
Pennsylvania	Examination by one of the three State boards of examiners.
Rhode Island	Diploma of college in good standing.
South Carolina	Examination by State board after showing diploma.
South Dakota	Diploma of college in good standing.
Tennessee	Do.
Texas	Examination by law; diploma sometimes accepted.[2]
Utah	Examination by State board.
Vermont	Diploma.
Virginia	Examination by State board of examiners.
Washington	Do.
West Virginia	Do.
Wisconsin	Diploma.
Wyoming	Do.

[1] The words "in good standing" denote that the regulations of the college comply with the conditions established by the State boards.

[2] The law is interpreted differently in different parts of Texas, or rather is not enforced.

MEDICAL BOARDS.

Effort has been made to ascertain what States and Territories have separate boards for different schools of medicine, what States have mixed boards, number of members in each, and how appointed. Over one-half of the States with medical boards do not mention different schools of medicine at all. Seven States have special boards appointed by the Governor without regard to schools of medicine, viz, Arkansas, Maine, Massachusetts, Minnesota, Montana, Oregon, Washington. In 8 States the boards of health constitute the medical boards, viz, Illinois, Iowa, Kentucky, Mississippi, Missouri, Rhode Island, South Dakota, West Virginia. In 6 States and the District of Columbia there are three separate medical boards, regular, homeopathic, eclectic, viz, California, Connecticut, Georgia, New York, Pennsylvania, Vermont. In 3 States there are two boards, regular and homeopathic, viz, Delaware, Louisiana, and Maryland. Seven States have mixed boards, Colorado, Nebraska, New Jersey,

New Mexico, North Dakota, Ohio, Virginia. In 9 States and Territories there are no medical boards at all, and all laws on the practice of medicine are left to enforce themselves, and consequently have little effect, as can be seen in Kansas and Wisconsin.

In New York the medical examining boards are placed under the direction of the State Board of Regents, in Pennsylvania under a Medical Council, in the District of Columbia under a Board of Medical Supervisors.

Medical examining boards.

State.	Number.	Schools represented, etc.	Members.
Alabama	1	Regular (*a*)	10
Arizona	0		
Arkansas	*b*1		5

a Board of censors of Alabama State Medical Association; also county boards under its authority.
b Appointed by governor; medical schools not mentioned.
c Each.
d 6 regular, 2 homeopathic, 1 eclectic.
e 1 for each judicial district, and 1 for the State at large for homeopaths and eclectics.
f 2 regular, 1 homeopathic, 1 eclectic, and 3 ex-officio—governor, attorney-general, superintendent of public instruction.
g 5 regular, 3 homeopathic, 1 eclectic.
h 4 regular, 2 homeopathic, 1 eclectic.
i Appointed by State medical society.
j 6 regular, 2 homeopathic, 1 lawyer.
k No one school to have a majority of the board.
l 1 board for each judicial district; appointed by the district judge.
m Must have 5 homeopathic.

A full report of the results of the examinations conducted by the different boards has not been obtained, but the following presentation was made by Dr. Perry H. Millard, of St. Paul, Minn., before the American Academy of Medicine, at Baltimore, May 6, 1895:[1]

State.	Examined.	Licensed.	Rejected.	Per cent.
Alabama	647	558	89	86.2
Maryland	150	105	25	80.6
Minnesota	641	499	142	77.8
New York	967	797	170	82.4
New Jersey	447	417	30	95.5
North Carolina	615	508	207	71
North Dakota	81	76	5	93.8
Virginia	835	613	222	73.4
Washington	207	167	40	80.6
Total	4,670	3,740	930	82.2

One of the difficulties liable to arise from having independent boards for the different schools of medicine is that the character of the examinations may vary so much as to have a serious effect on the applications of students. If one examining board allows all applicants, except 5 per cent, to pass successfully, while another board rejects 30 or 35 per cent of its applicants, it will not be long before the students will be seeking the lenient board, for after receiving a registration certificate there is nothing to hinder a candidate from practicing according to whatever system he prefers, even if he be registered by another board; and unless he choose to make known what system he follows it need not become known at all except to those who examine the records. It is useless to expect students to apply to one board when they have a far greater probability of being successful before another. The leniency of the boards will be considered by students when beginning the study of medicine. Even if the different boards had no intention whatever of influencing students in this way, the result would be the same, the student never considering the motive at all. Some variation must necessarily occur in the per cent of students rejected, just as the per cent rejected at different times by the same board will vary. In New York the results of the examinations for the year ending August 1, 1895, were as follows:

	Total.	Successful.	Rejected.	Per cent rejected.
Examined by regular board	606	445	161	26.5
Examined by homeopathic board	60	52	8	13.3
Examined by eclectic board	11	10	1	9.1

There should be as near an approach to uniformity as possible in the per cent of rejections, and in order to secure this all applicants might be required to pass the same examination in all subjects except practice and materia medica. In such subjects as anatomy, physiology, and chemistry there certainly can be no room for different schools, and the same applies equally well in obstetrics and surgery. This method is probably adopted where there are mixed boards, or else the boards avoid questions which would be answered differently by different schools.

BENEFACTIONS.

In 1894 Mr. William Deering gave to the medical school of Northwestern University, Chicago, Ill., $50,000 to endow the N. S. Davis professorship of physiology. He had given in 1890 $20,000 toward the purchase of the land on which the schools of medicine and pharmacy are located.

In 1893 Dr. Ephraim Ingals gave the medical school of Northwestern University $10,000 to aid the construction of the laboratory building.

SCHOLARSHIPS IN MEDICAL SCHOOLS.

Reference is intended to be made here to schools of medicine, for scholarships and theological schools are almost contradictory terms. The chief end of a scholarship being instruction without cost to the student, and tuition fees occurring as rare exceptions in theological schools, there is little association between the words. The benefits of scholarships in medical and law schools would be recognized at once,

[1] Some slight errors will be observed in the table, but we give it as found.

but it would be as readily recognized that they are not of frequent occurrence. From the munificence of wealthy individuals universities and colleges and theological schools have received liberal endowments and expensive buildings and apparatus, but medical and law schools have been left to depend upon their own resources. Wherever a theological seminary has not been endowed it is sustained by funds received from churches or societies, tuition fees not being considered an element in sustaining the institution. In the table of theological schools in the Commissioner's Report for 1888–89, only 8 seminaries are reported as having received tuition fees, and 4 of these were colored schools, which are usually supported by the gifts of friends, which in these instances were possibly accredited to tuition fees. Not only do theological students receive free instruction, but in a large number of cases their board and lodging are also furnished them.

In the reports received from law schools in 1894–95 40 scholarships are said to have been given to students. This does not average 1 scholarship to each school. In the 23 schools of law which form part of State universities tuition fees are charged with but three exceptions, so that the law schools are really not supported by the States.

In the medical schools 295 scholarships are said to have been bestowed, but many of these are not scholarships in a strict sense. Thirteen, carrying possibly the largest amounts in the aggregate, were in the Harvard medical school. The scholarship having the largest amount of any, $700, was in the College of Physicians and Surgeons, New York.

In the Leonard medical school of Shaw University, Raleigh, N. C., an institution for the education of colored students in medicine, there were 56 students in attendance, and 56 scholarships are reported to have been given. This probably is equivalent to saying that the medical school was supported entirely by charitable contributions, no tuition being charged.

Quite a number of medical schools, especially of those not fully established and which are anxious to secure a large attendance, make a reduction in annual charges to young men of limited means. Others make reductions to sons of ministers and physicians. Notice is intended to be taken here, however, only of those scholarships which are bestowed from the income of invested funds or which are contributed directly by friends, and not of those instances where new schools remit charges in order to obtain students.

In the medical school of Harvard University, Boston, Mass., 13 scholarships were distributed in 1894–95. There are 2 Barringer scholarships of $300 and $200, respectively, the Cheever scholarship of $200, the Isaac Sweetser scholarship of $200, 4 faculty scholarships of $200 each, the Claudius M. Jones scholarship, the Orlando W. Doe scholarship, the Charles Pratt Strong scholarship of $100, the Lewis and Harriet Hayden scholarship of $100 for colored students, and the income of the John Foster fund, amounting to about $150, payable every other year. There are also 3 fellowships in the medical school, established by Mr. William S. Bullard, amounting to $225 each.

The Boston University school of medicine (homeopathic) has 2 alumni scholarships besides the Garfield and Wade scholarships. The Fenno Tudor loan fund provides for loans, in sums not exceeding $50, to meritorious young women. The George Russell loan fund does the same for young men.

The woman's medical school of Northwestern University, Chicago, Ill., has 5 endowed scholarships for missionaries. One of these was endowed by Mrs. Chandler, of Detroit, Mich., in behalf of the Woman's Presbyterian Board of Missions of the Northwest. The Woman's Methodist Foreign Missionary Society has 2 perpetual scholarships, endowed by Mrs. Emily W. N. Schofield. Mrs. Schofield also endowed 1 scholarship for the Woman's Missionary Board of the Congregational Church.

The medical department of Columbian University, Washington, D. C., by means of a liberal endowment from the late W. W. Corcoran, is enabled to give 6 free scholarships.

In the College of Physicians and Surgeons, New York City, through the generosity of the late Alonzo Clark, for many years president of the College of Physicians and Surgeons and professor of pathology and practical medicine, a scholarship with an income of about $700 a year is bestowed for the purpose of promoting the discovery of new facts in medical science. There are also 2 alumni fellowships, open to graduates of the College of Physicians and Surgeons, which have an annual value of $500 each, besides entitling the holders to free instruction in any of the schools of Columbia College.

In the Woman's Medical College of the New York Infirmary there are 2 scholarships founded by the children of Mr. and Mrs. Robert Haydock, who were among the incorporators and first trustees of the institution. Students sent by missionary boards to prepare for missionary work get a reduction of one-half from the annual charge.

In the Woman's Medical College of Pennsylvania, at Philadelphia, the income from funds left for the purpose by Ann Preston, M. D., Robert J. Dodd, M. D., Hannah

W. Richardson, and Isaiah V. Richardson, enables the college to assist annually a limited number of women who are adapted to the profession of medicine, but are unable to secure a medical education without such aid. Four students may also be admitted at a reduction of $35 each year from the regular fees, upon presentation of a certificate from a missionary society stating definitely the intention of the applicant to prosecute medical work abroad under the direction of the society, and that she will receive from the society pecuniary assistance in obtaining a medical education.

The University of Pennsylvania gave 16 scholarships entitling to free tuition, 3 of them being obtained in competitive examination.

The Marion-Sims College of Medicine, St. Louis, Mo., through the liberality of certain friends of the institution, has 5 scholarships which entitle the holder to free instruction.

The Leonard medical school of Shaw University, Raleigh, N. C., an institution for the education of the colored race, has a fund of $5,000, received from the late Judson Wade Leonard, of Hampden, Mass., the income of which is used to furnish scholarships for young men in the medical school. It also received $1,000 from the John F. Slater fund, which was used for the same purpose.

REQUIREMENT OF ACADEMIC DEGREES FROM MEDICAL STUDENTS.

Not many years ago any young man, after spending a few months of preparatory study in a physician's office, could matriculate in probably any medical school in the United States, and, moreover, in only eighteen months he could come out of almost any medical school with his diploma. As a result young men from all sides were being graduated as doctors of medicine, although their medical knowledge was necessarily very limited. They were given diplomas certifying that they had been examined and found learned in all things pertaining to medicine and surgery. Fortunately, however, the diploma was usually in Latin, so that the truthfulness of the statement would not likely be called in question. Afterwards, with increasing numbers of students, the medical colleges demanded three years of attendance, and when this did not perceptibly diminish the number of students, another year was added, making four years in the medical courses. The graduation requirements were made higher and higher, but the qualifications for entrance remained practically unchanged.

In reply to inquiries of the Journal of the American Medical Association, January 12, 1895, we find the following from the medical department of Yale University:

"I have felt for some time that an increase in the matriculation requirement was more needed in this country than the increase of time of study—that is, that three years with well-prepared students would be better for the profession than a larger number of students kept at their professional work for a year longer. This opinion, however, does not seem to be the one which has prevailed."

With few exceptions the doors are still open to any one, the only regulations having reference to time to be spent. One important exception to this statement is in New York, where the regulations of the regents of the State University are such as to require a good secondary education before matriculation.

The medical school of Johns Hopkins University was the first to come out boldly and demand a college degree as a requisite for admission to the full course.

Harvard medical school is another to take an advance step on this question. President Eliot has already mentioned the year 1900 as an appropriate time to inaugurate the change. In the divinity school of Harvard an academic degree has been a prerequisite to entrance for some years, and in 1896 it will also be demanded of all students taking the regular course in the law school.

Since the above was written the faculty of the medical school of Harvard University, at a meeting held January 4, 1896, adopted the following resolutions:

"In and after June, 1901, candidates for admission to the medical school must present a degree in arts, literature, philosophy, science, or medicine from a recognized college or scientific school, with the exception of such persons of suitable age and attainments as may be admitted by a special vote of the faculty taken in each case.

"All candidates, whether presenting a degree or not, are and will be required to satisfy the faculty that they had a course in theoretical and descriptive (inorganic) chemistry and qualitative analysis sufficient to fit them to pursue the courses in chemistry given at the medical school."

The courses in law, theology, and medicine are naturally post-graduate studies, and if our lawyers and doctors are not to be college graduates, who shall be, besides ministers and college professors? In theological schools it has not been difficult to secure attendance of students with degrees, for there, on account of assistance of churches or societies, the expenses of students amount to but little. In the law schools heretofore the course of study has not been so extended that young men could not complete it at a reasonable age, but it is difficult to see how, under present conditions, all medical students can be required to take a full college course before

entering upon professional studies and at the same time begin their professional careers at a suitable age. They do not complete the college course until 22 or 23 years of age, and as nearly all medical schools have adopted courses of four years young men will be about 27 years of age before they can finish the medical course, and will be about 30 years old before they can be expected to support a family. If all medical students must be supported until they have completed college and professional courses at 27 years of age, it will soon be impossible for young men from the ordinary walks of life to complete a medical course at all.

It is claimed, however, by those who believe in a full, liberal education for all medical students, that if the elementary and secondary education of pupils was properly conducted, and if there was a better correlation of secondary and higher studies, young men would be prepared for entering college at an earlier age. There can be no question but that progress in elementary studies could be much more rapid, especially in rural schools, if they had efficient teachers and supervisors. With the general improvement being constantly made in the public schools it is reasonable to conclude that in a few more years there will be nothing to hinder young men from receiving a full, liberal education and also completing a course in medicine at a much earlier age than is now possible.

President Eliot has said:

"The average age of admission to Harvard College at this moment is fully 19. The student who stays there four years to get his A. B. is 23 when he graduates, He then goes to our medical school to stay there four years; so he is 27 years of age before he even has his medical degree, and we all know that some years intervene between that achievement and competency to support a family. Now, that highly educated young man ought to have been married at 25.

"The remedies for this state of things—which is really intolerable, and which particularly ought not to exist in a country so new as ours—are somewhat complex. They, in the first place, must include an improvement in the secondary schools of the country, whereby the boys may learn a great deal more and yet come out of them earlier. The proper age for secondary education in our country is between 13 and 18, not higher. Then I must frankly say that for years I have been in favor of reducing the ordinary term of residence for the degree of B. A. to three years, an out and out square reduction from four to three years."

At the medical congress in Baltimore, in 1895, Dr. Perry H. Millard, of Minnesota, stated that while it is too early for medical colleges generally to require an academic degree before admission, the standard of entrance requirements should nevertheless be raised. He suggested as a general standard that all medical students be required to show a certificate of matriculation in some college or university, or else undergo an examination to indicate an equivalent preparation. Some higher and more easily ascertainable standard of entrance requirements than the present indefinite regulations will have to be adopted before general satisfaction will be obtained.

Columbia University, New York, allows senior students of the college to elect studies in the professional schools, the purpose being, according to President Low, to shorten the time required for completion of a professional course. In the first year of the adoption of the four years' course in medicine there was a decline in the percentage of students with degrees from 40 to 36 per cent. He says students can not postpone professional studies until 22 or 23 years of age, while in England and Germany professional studies are taken up at 19 or 20 years of age, and especially since the age for completion of a professional course should be earlier in a new country than in an older one. According to President Low the trouble is that the college course has been lifted out of its proper place and away from its appropriate ages, namely, 16 to 20, and as a result young men go directly from the high school to the professional school.

One indirect advantage to be derived from the plan of Columbia, of allowing selection of professional studies in the senior year, is that students after beginning professional studies in the university will probably continue them, whereas otherwise law students especially might begin professional training in private offices of attorneys, and so be deprived of the full discipline and equipment in legal knowledge to be obtained in a law school.

Prior to the establishment of the common schools, the courses in any of the colleges could be entered upon at an earlier age than at present. This was not attributable to better instruction in the schools, for it was probably not equal to that of present times, but the boys who expected to enter upon a collegiate course had their studies shaped to meet the college requirements, even from the time of entering the grammar grades. There were many schools having as their declared purpose the preparation of boys for certain higher institutions, and all of the instruction was designed to meet this end, and the success of the school was determined in large measure by the readiness with which its pupils attained collegiate matriculation. As the result of this concentration of efforts and purpose upon the accomplishment of a particular object, the boys rarely failed to reach the standard required, even at the early age

desired by parents. We say "the boys" rarely failed, for in those days it was no indignity to term them such, even for some months after matriculation, but now college students are all "young men."

But with the advent of the common schools the ends designed to be accomplished were changed. There were no longer a few select schools with select pupils to be prepared for college, but there were many schools with many pupils, to a considerable extent children of the populace, of the *οἱ πολλοί*, and in some of the larger cities possibly of a multitudo egens et perdita. These desired not that their children should be prepared for college, but that they might keep the wolf from the door. They attached little value to Latin and Greek, but desired training in English branches and practical studies.

As the number of students preparing for collegiate training is always much smaller than the number soon to enter business in some form, the courses preparing for college become less important and academic candidates are left to qualify themselves as best they can. The courses in the high schools have gradually been broadened so as to include many other useful and practical studies, which even prospective college students are unwilling to omit. Consequently the age for completion of high school courses has been elevated, and instead of preparing pupils for entrance to college they aim rather at preparation for the practical duties of life.

But at the same time the matriculation requirements of colleges have been elevated. This caused no particular hardship a few years ago when a professional course could be completed with ease in one or two years. The courses in medicine were regarded as requiring only a few months' study, and as for law, one could study three months or a year, according to his convenience.

But times have changed, and this is soon realized by young men who conclude to study medicine with the expectation that they can complete the course as rapidly and as easily as was done by some physician they have known for years. In medicine every year now marks some advance in the requirements for graduation or for a medical license. The advances are made so rapidly as to escape the observation of all except those who are particularly interested in the subject.

The courses of law schools are also being extended somewhat, although not so noticeably as in medical schools, and the standard of preliminary education is being elevated.

In consequence of this broadening and lengthening of the courses in elementary schools, and the advanced age for completion of collegiate studies, young men who take a degree before beginning professional courses frequently can not complete the same until 28 or 30 years of age.

MISCELLANEOUS NOTES ON MEDICAL SCHOOLS.

The College of Physicians and Surgeons of Columbia College, New York, which lately received from the Vanderbilt family some important additions to its already valuable property, will soon be in possession of still other extensive improvements. The group of college buildings, given by the late William H. Vanderbilt and members of his family and by William D. Sloane, esq., stood upon thirty contiguous lots of land, bounded on the south, west, and north by Fifty-ninth street, Tenth avenue, and Sixtieth street. The college building proper consisted of a southern portion measuring 140 by 40 feet, a northern portion 96 by 43 feet, and a middle portion 96 by 55 feet. Through the recent generous gift of Messrs. Cornelius, William K., Frederick W., and George W. Vanderbilt there has been rendered possible an important enlargement of the college building. The present south wing will be extended eastward for 55 feet and to a depth of 80 feet. It will be four stories high and will be devoted to the department of anatomy.

The new Vanderbilt clinic covers an area of 180 by 60 feet, and is three stories in height. The original building having proved inadequate to accommodate the large number of patients, the sons of Mr. Vanderbilt united in an additional gift of $350,000, enabling the size of the building to be doubled.

The Sloane Maternity Hospital is a lying-in hospital given by William D. Sloane, esq., whose wife, a daughter of the late William H. Vanderbilt, has endowed the institution, making all of its beds free in perpetuity. Through the further munificence of Mr. Sloane the present hospital is to be greatly enlarged. The new building will be six stories high, but will conform to the old building in general architectural style. This will furnish 72 additional beds for patients and offer greater accommodation for the house staff and nurses.

An addition to the Barnes Medical College building, of St. Louis, four stories high, and in immediate connection with the main building, was lately erected, covering an area of 40 by 50 feet. It provides a separate entrance to the clinic for diseases of women and children, and contains a microscopical laboratory 20 by 50 feet. Upon the second floor is a chemical laboratory 40 by 50 feet, and so arranged as to enable 100 students to simultaneously engage in the practical work in this

department. Upon the third floor is an elegant museum, and the fourth contains an amphitheater with a seating capacity of nearly 500. The amphitheater is lighted from the dome, and the seats are so arranged that every student can obtain a satisfactory view.

The Missouri Medical College, of St. Louis, one of the oldest medical institutions of the country, has just completed its fifty-fourth year. It now has a new edifice in process of construction which will afford increased laboratory and clinical facilities and give place for all the didactic lecture rooms under one roof.

The Omaha Medical College completed its new building in the fall of 1893. It is of pressed brick, with stone and terra-cotta trimmings, three stories and basement. The main amphitheater is on the second floor, 31 by 41 feet, and will seat 275 students. The entire building is heated by steam and lighted by electricity.

The medical department of Buffalo University now occupies its new building on High street, near Main. It is finished with terra cotta, pressed brick, iron, and hard wood. It contains three amphitheaters, a chemical laboratory in which 96 students can work at one time, and other laboratories.

The medical department of Tulane University, of Louisiana, occupies a new site twice as large as the former one and only two squares from Charity Hospital, with 700 beds, and where over 10,000 patients are annually treated. There is a central medical building containing two large lecture rooms, one above the other, and two wings for laboratories, library, museum, and recitation rooms. The lecture rooms have a seating capacity of about 500 each and are entirely free from posts and pillars.

The medical department of Johns Hopkins University received another improvement in 1894, the Women's Fund Memorial Building. The sum of $500,000 was raised for the endowment of the medical department on condition that women would be admitted on the same terms as men. Miss Mary Elizabeth Garrett contributed $306,977 in addition to previous subscriptions. The course of instruction now covers four years of nine months each.

Baltimore Medical College has a new five-story building on Madison street and Linden, erected at a cost of $75,000. The lecture hall is 40 by 80 feet, and can seat 600 students. The anatomical room contains tables for 90 students to dissect at one time, and there is a chemical laboratory 42 by 84 feet.

Degree in Pharmacy.

At a meeting of the American Pharmaceutical Association in Asheville, N. C., September, 1894, a paper was read by Robert J. Snyder on the subject, "What objections can be urged against bestowing the degree of doctor of pharmacy upon graduates of pharmacy who take a post-graduate course."

The degree very generally given at completion of the regular course has been that of graduate in pharmacy (Ph. G.), but there is some disposition to adopt the former title as seeming more commensurate in dignity and importance with the more extended and elaborate courses which have been introduced of late years, a change which was advocated in the paper above mentioned.

Of 31 schools of pharmacy concerning whose degree information has been received, all but 5 give the degree of graduate in pharmacy. The two schools at Washington, D. C., viz, the National College of Pharmacy and the pharmaceutical school of Howard University, and the college of pharmacy of the University of Minnesota, bestow the degree of doctor of pharmacy, which is sometimes unfortunately abbreviated Ph. D., symbols which are generally interpreted differently.[1]

The University of Michigan and Vanderbilt University give the degree of pharmacentical chemist, their courses not requiring practical work in a pharmaceutical establishment, and not claiming to prepare for full commercial work. The school of pharmacy of the University of Kansas will hereafter give the degree of pharmaceutical chemist and will not require shop experience. Vanderbilt University also gives the degree of master in pharmacy upon completion of one year's satisfactory post-graduate work in the school. The Illinois College of Pharmacy and the school of pharmacy of Purdue University give the degree of graduate in pharmacy, and for a longer course the degree of pharmaceutical chemist.

Training in Drug Stores.

Not a great many years ago schools of pharmacy were almost unknown. Many physicians prepared their own medicines for administration, which quite frequently consisted of teas made from botanical plants, gathered by the physician himself from neighboring fields. Even after it became the general custom for prescriptions to be sent to a pharmacist, he received all of his training in the shop, and usually had one

[1] The College of Pharmacy of Minnesota University gives the degree of doctor of pharmacy, which it abbreviates Phm. D.

or two assistants taking lessons from him, who afterwards succeeded him in the business or else established an independent shop.

After pharmaceutical schools were opened the course of instruction usually followed was 4 years of training in a dispensing store and 2 years in a school of pharmacy. The latter would not bestow its diploma upon any student who had not received the 4 years of training in a pharmacy.

The question whether schools of pharmacy should make work in a drug store a prerequisite to graduation has received much attention from pharmacists of late. This question is of particular importance to those schools where the student is required to give his entire time to his studies, for in the schools where the students work the greater part of the day in a drug store, and attend a school of pharmacy in the evening, there is usually no occasion to insist upon practical experience. It is claimed that the school of pharmacy can have no definite assurance that a student has served any length of time in a pharmacy, or that he has had any connection with the work of dispensing drugs. He may have been employed in such a capacity that he would acquire no acquaintance with drugs whatever, for there is much work in a drug store that calls for no pharmaceutical knowledge at all. In some pharmacies the prescription department is of minor importance. Other establishments conduct mainly a wholesale business, and here it would only be necessary for the student to be able to read the labels and to weigh out the proper amounts.

On account of the difficulty, therefore, of determining whether a student has had such an actual experience in dispensing drugs, and for the proper length of time, some pharmaceutical schools relegate this question entirely to the State boards of examiners (where there are any), and content themselves with the declaration that their graduates have passed satisfactory examinations in all subjects connected with pharmacy, and that they have taken laboratory courses, giving them an intimate acquaintance with drugs. As a rule, too, these schools which require the students' full time give an extended and accurate training both by means of lectures and by abundant laboratory work with the drugs themselves.

But although such a student can illustrate accurately by chemical formulas the changes taking place in compounding drugs and can give full description of the different drugs, their properties and uses, yet if he must then enter for the first time behind the dispensing counter and take his first lessons in the various duties of a drug clerk and receive many useful and important hints from the junior clerk of only a few months' experience, and perhaps have to call for his assistance to decipher a prescription to him illegal but to others as plain as day, he will soon recognize that he has many things yet to learn. He will be astonished, too, to find that although well acquainted with the whole line of materia medica, customers constantly come in and ask for drugs by names entirely new to him, but which they evidently think he should know at once. He will have little or no knowledge of the current prices of drugs and prescriptions, to say nothing of the large assortment of other articles so frequently kept, although not properly belonging in a pharmacy. He will probably not possess the necessary tact in dealing with customers, nor dexterity in supplying their needs, and will not have that general knowledge of conducting a pharmacy which is so essential. Consequently, he can only act as junior clerk after all his years of study and training. Even after he has served several months he will constantly find himself in a quandary from which longer experience would have saved him.

The pharmaceutical schools which require no training in drug stores frankly state that no student can become a satisfactory and successful pharmacist until he has spent several months in the business. A professor in a pharmaceutical school speaks thus:

"All pharmaceutical schools unquestionably recognize the universal rule that no person can become a fully equipped and accomplished dispensing pharmacist until after years of actual practical experience in properly conducted pharmacies where a considerable amount of sufficiently varied pharmaceutical work is done."[1]

But if the diploma of a regularly established school of pharmacy can not be accepted as evidence that the holder can successfully discharge the duties of a pharmacist, but the question must be left to State boards of pharmacy, and if the State boards regularly admit to examination young men who have spent several years in pharmacies, but who have never spent a day in a pharmaceutical school, the diploma of the latter would soon be of little value to its holder in securing him employment, but instead a demand would be made for his license from the State board. If practical experience in a pharmacy is absolutely indispensable in order that one may become fully qualified, and this seems to be universally acknowledged, is it altogether unavoidable that a school of pharmacy should omit this important requisite? Is there no way by which its diploma may not only certify with truthfulness as to the holder's theoretical knowledge, but also attest his ability to enter any pharmacy and immediately undertake the duties of a full clerk? Such a diploma would be valued

[1] Oscar Oldberg, in The Apothecary, April, 1894, p. 158.

far more highly, both by employers and students. Schools of law and medicine require all students to comply with certain regularly established requisites for matriculation, in order to avoid any uncertainty as to ability to enter upon the course.

It is true that such matriculation requirements have not heretofore been rigidly enforced, but they have served a useful purpose and are now being rendered more difficult and exacting. Could not pharmaceutical schools also require applicants to produce certificates as to former employment as druggists, and to avoid possibility of deception require all applicants to pass an entrance examination? Such examinations could be made so rigid as to fully test the applicant's training even without a certificate. If the question of experience must be left to State boards of examiners, then in a State which has no board of pharmacy the graduates of pharmaceutical schools requiring no training in a store have no credentials as pharmacists. Or if they should be accepted on the strength of the diploma, their wages, if not immediately, would soon be leveled to those of half-qualified clerks. It is probable also that a student who has passed two or three years of arduous study, and who has really acquired a large amount of valuable knowledge and has at last received a certificate to that effect, would be somewhat humiliated to be under the necessity of accepting a position as an incompetent clerk, even if on account of ignorance of many minor details of store work. Although some hold a different opinion, there are many who claim that the chief object of a pharmaceutical diploma should be to certify to the holder's qualifications as a well-trained and fully competent pharmacist.

If, as it has been claimed, it is not within the province of a pharmaceutical school to inquire as to the student's training in dispensing drugs, but this must be left to the State boards of pharmacy, the question might be asked, How can the State board of pharmacy determine this matter any better than the pharmaceutical schools, or even as well, since the student must spend two or three years at the school, during which time it certainly might be able to ascertain better the student's practical knowledge than could the State board in half a day? It is claimed by some that an apprentice in pharmacy should be required to notify the State board of pharmacy as soon as he enters upon the business and whenever he changes his place of work, and in this way some record might be kept of the time in which he has been employed in a pharmacy. Others claim that it is utterly impracticable for such a record to be kept and verified for three or four years of all apprentices in pharmacy. Large numbers of young men serve in the business for two or three years and then drop out entirely. Others engage in the work temporarily, as they suppose, and afterwards make it their regular calling. Again, some States have no board of pharmacy for such work, even if it could be accomplished. Moreover, in some rural regions there is a scarcity of pharmacists even under the present lax requirements.

Not only could the school of pharmacy ascertain the student's training better than the State board, but it is within its power itself to give to a large extent this practical training. The work is not so extensive or so intricate but that it can be accomplished. As some evidence of this, notice can be taken of the business colleges, or commercial schools, some of which have elaborate methods of conducting extensive business courses requiring far more intricate and technical knowledge. Much of the information necessary to a pharmacist can be obtained with less effort than that of a full commercial course. If the diploma of a pharmaceutical school signified both theoretical and practical knowledge, it would reflect greater honor upon the school, and its holder would bear a more grateful feeling to the institution which not only gave him valuable knowledge, but saved him from ignorance of many minor but important details.

EVENING INSTRUCTION.

The great defect in some schools of pharmacy is that the instruction is confined to a few hours in the evening, the student devoting his time during the day to work in a pharmacy, where, although he receives much valuable knowledge, he is chiefly interested in the wages he receives. In some instances the time required of each student is only 5 or 6 hours each week, or about 20 or 25 hours in a month, or 100 or 125 hours in a whole course. Another school possibly exacts 5 or 6 hours each day in attendance at the school, while all the remainder of the student's time is devoted to study, the student not being engaged in any business at all. There has been much discussion as to which of these methods furnishes the more valuable training. In one case a small space of time is devoted to regular and systematic training, while most of the time is spent in a pharmacy where the student is in constant contact with the drugs which form the subject of study. In the other case the student devotes all his time to a study and examination of drugs with which he had no previous acquaintance, and he is ignorant of the other thousand and one items of information which two years of service in a pharmacy would have given him. Of what special importance is it which of these methods gives more valuable information, when neither of them can be truly said to afford all that useful and practical knowledge

which the druggist always needs? The student of pharmacy must have time in which to acquire knowledge not to be obtained while in a pharmacy. It is impossible for him to spend the entire day behind the counter and then in one or two hours in the evening get any complete and accurate instruction. He must also have time for recreation and enjoyment, or else he can not make full use of the instruction offered him.

LICENSES IN WASHINGTON STATE.

In the State of Washington graduates of the department of pharmacy of the University of Washington are allowed to register as assistant druggists without examination. After two years' experience in a drug store, either before or after graduation, they can be registered in full as qualified pharmacists without examination.

EFFECT OF LEGISLATION IN MINNESOTA.

When the law regulating the practice of pharmacy in Minnesota was passed in 1885 there were 1,046 persons enrolled on the list of pharmacists, and of this number only 38 were graduates of any college of pharmacy. There was not a college of pharmacy in the State, and all young men who wished to take a systematic course of instruction in pharmacy had to go to some other State. This is not necessary at the present time. The board of examiners has examined 1,676 persons, of whom 622 were licensed as pharmacists and 225 as assistant pharmacists. It is estimated that fully one-half of the names now on the register have passed examinations, thus showing their competency as pharmacists. That the pharmaceutical board is active in the enforcement of the law may be known from the fact that 55 cases of violation of the law have been prosecuted, and in 43 cases the offenders were fined from $50 to $100 and costs.

THEOLOGICAL SEMINARIES.

The Protestant theological schools of Germany bear an intimate relationship to the State—in fact, almost the same relationship that exists between the State and the agricultural or educational department. The theological professors in the universities, from which come the ministerial candidates, are entirely independent of the churches. They are both chosen and maintained by the State, in some instances in direct opposition to the expressed wishes of the churches. Although the church may consider one of the professors a heretic, yet he continues to be an instructor of her theological students.

Three of the theological students at the General Theological Seminary of Newark, N. J., in 1894, came direct from Germany, and the directors in their annual report mention as possibly one of the important functions of the seminary in the future that it may send back as ministers to the fatherland godly young men trained under pious influences by professors chosen for their religious and spiritual as well as intellectual qualifications. They speak of the pious men of Germany as saying, "Unconverted professors in our universities are training unconverted students for our German pulpits."

In America we are so accustomed to entire separation of church and state that we naturally reject the plan in vogue in Germany, perhaps without considering whether in some cases the churches of this country do not sustain almost similar relations to the seminaries from which come their ministerial supply. A theological seminary is established by one of the denominations of this country, a board of trustees is selected in order that property may be purchased and held by a body legally recognized; in other words, to act as agents for the denomination. Without the support and utmost confidence of that denomination their positions would be as insignificant as the trusteeship of any rural school.

So long as the institution is without endowment funds and must depend for continued existence upon the direct contributions of the members of the denomination, it is clearly recognized by the trustees and others that the institution must enjoy the absolute confidence of the denomination, and upon the least intimation that the trustees were not receiving such indorsement their resignations would be tendered at once.

But in the course of time, from contributions often involving much self-denial and from legacies bestowed by members who possessed wealth and who were anxious that the doctrines in which they believed should be maintained, the seminary accumulates funds amounting to perhaps more than a million dollars, and grounds and buildings of nearly equal value. With such an aggregation of funds and estates, the trustees, who once would have withered before even the frown of the church from which they acquired importance and power, begin to assert their independence and set up as instructors of ministerial students men pronounced heretics by the church, and then defiantly ask, What are you going to do about it? And what can be done about it? It avails nothing to say that the church expected better things

of those in whom she placed implicit confidence. She has bestowed an inheritance during life upon her chosen heirs, and they have repaid her with base ingratitude.

MISCELLANEOUS NOTES ON THEOLOGICAL SCHOOLS.

San Francisco Theological Seminary, California.—This institution is not located, as one would infer from the title, at San Francisco, but near one of the suburban towns, San Rafael, about 16 miles from San Francisco, and regarded by many as one of the most beautiful places in the world. The grounds of the seminary comprise about 14 acres on the north side of San Francisco Bay, the generous gift of Mr. A. W. Foster. The seminary is under the care of the Synod of the Pacific, subject to the act of the general assembly of 1870 relating to theological seminaries.

Montgomery Hall, the residence of the students, is a three-story building arranged to accommodate 50 students, giving each student a separate room fully furnished and with a fireplace or grate.

Scott Library is a large, well-arranged, circular building, 50 feet in internal diameter and 44 feet in height. The library contains over 18,000 volumes.

Montgomery Memorial Hall honors the name of the donor of $50,000 to be used for building and maintaining a chapel on the seminary grounds. This building will be entirely of stone, and circular in form.

McCormick Theological Seminary.—The seminary buildings are (1) Ewing Hall, erected in 1863, containing thirty-five rooms for students and a reading room; (2) the chapel, erected in 1875, containing chapel and two lecture rooms; (3) McCormick Hall, erected in 1884, containing seventy suites of rooms for students, the office, and the parlor; (4) Fowler Hall, erected in 1887, containing sixty-five suites of rooms for students and two lecture rooms; (5) five houses for professors. The student has no expense for furniture or linen, as every room is furnished with elegance and comfort, so that the candidates for the ministry may be trained amid surroundings appropriate to cultured living.

A new and entirely adequate library building, Virginia Hall, has been erected at an expense of $80,000, the gift of Mrs. Nettie F. McCormick and Mr. Cyrus H. McCormick. The reading room, with its spacious walls and comfortable appointments, is a favorite rallying place for the students and the professors. The library at present contains 18,000 volumes.

The buildings above described, including professors' houses, cost about $400,000, of which more than three-fourths was contributed by the late C. H. McCormick and his heirs. It should be noted in this connection that Mr. McCormick also contributed $30,000 to Union Theological Seminary, Virginia, for the endowment of a professorship.

Garrett Biblical Institute, Evanston, Ill.—This is one of the oldest and best endowed seminaries of the Methodist Episcopal Church. It has an annual income of about $30,000 from its resources. Evanston is the great Methodist literary center of the Northwest.

The seminary shares in the advantages of the new and splendid Orrington Hunt Library building, so named in honor of the munificent donor of $50,000.

Danville Theological Seminary, Kentucky.—This institution has taken on new vigor. A new and commodious brick building has been erected and completed, Breckinridge Hall. It is 161 feet long, and contains excellent accommodations for 42 students, two recitation rooms, lecture hall, and library.

Bangor Theological Seminary, Maine.—This institution was chartered in 1814 by the State of Massachusetts, as Maine formed a part of that State at that time. In 1820 the Province of Maine was separated from Massachusetts and became an independent State. It was larger than all the rest of New England, and contained a population of 300,000 souls. It was in order to supply this widely scattered population with ministers that Bangor Seminary was opened. "The relations between the seminary and the Maine churches have always been most intimate. To the great majority of them it has furnished ministers, and to-day more than half of the pastors of the Congregational churches in the State are graduates of the seminary, while many from the other denominations also have studied there." "During the nearly eighty years of its existence this seminary has sent out more than 700 graduates, and has educated for one or more years without graduation 200 more."

The alumni of the seminary have raised an endowment of $10,000 for the Bond lectureship, named from Rev. Elias Bond, D. D., of the Hawaiian Islands, who gave the larger part of the fund.

Cobb Divinity School, Lewiston, Me.—Founded September 1, 1840, it was the first established by the Free Baptist denomination. In 1888 it first took its present name, in recognition of the liberal contributions to its funds by Hon. J. L. H. Cobb, a resident of Lewiston.

Roger Williams Hall, now in process of erection, the gift of Deacon L. W. Anthony, of Providence, R. I., will enable the institution for the first time to occupy a building

of its own, distinctly for its own purposes. It is a three-story brick building, with basement and attic.

St. Mary's Seminary, Baltimore, Md.—This is the oldest Catholic seminary in the United States, established in 1791, and was only preceded by one seminary of any denomination, the Dutch Reformed, at New Brunswick, N. J., in 1785. It was founded by members of the Society of St. Sulpice, who upon the outbreak of the French Revolution "thought it advisable to provide for its safety by founding a community of Sulpicians in the United States." The four priests selected for this mission sailed from St. Malo in the month of March and reached Baltimore July 10, 1791. They bought a house then known as The One-Mile Tavern, and the spot is still occupied by their successors, now in the center of the city. The scholastic year 1894–95 was marked by the largest concourse of students ever in attendance, and fully justified the enlargement and improvement of the buildings which had just been completed.

Princeton Theological Seminary, New Jersey.—Although one may be well acquainted with the importance and greatness of Princeton Seminary, an institution which, with Princeton University, has made famous the rural village between New York and Philadelphia, and which for more than three-quarters of a century has been sending out many of the best ministerial scholars in the land, yet when he takes up the catalogue of 1894–95 and examines carefully its pages, where he finds nothing but names of trustees, faculty, and students, plates of buildings, courses of study, and brief notices of library, dormitories, and fellowships, he is surprised that such a wonderful institution has not attracted more of his attention.

Here are 263 students, gathered literally from the four corners of the earth. Not only do they come from Canada, Holland, Scotland, and Ireland (15 from the latter), but from Turkey, Persia, Japan, India, and Australia. In the United States we find them from 28 States, from Maine to California, and from Wisconsin and North Dakota to Alabama and Mississippi. Seventy-three universities and colleges are represented by the students, all of whom except 18 had received collegiate instruction. The graduates of Davidson and Erskine College in North and South Carolina meet for the first time their brothers in black from Biddle University on the floors of Princeton. No climate, race, or condition of men will be able to keep out the elevating and educating influence of Princeton's graduates.

The sons of the original abolitionists of New England hold friendly companionship with those who treasure the memory of Dixie heroes, while the sons of the forty-niners of California, appreciating rightly the actuating principles of either side, look on in admiration and hope as the words recur—

> Breathes there the man, with soul so dead,
> Who never to himself hath said,
> This is my own, my native land?

On the first page of the catalogue is the plate of Alexander Hall, long known as the Old Seminary, the first building erected by Presbyterians in the United States for seminary purposes. Its primeval simplicity was accompanied by solid worth, and it serves to-day as useful a purpose as Hodge Hall, a magnificent four-story structure built by money bequeathed by Mrs. Mary Stuart, widow of Robert L. Stuart, of New York. On another page is Brown Hall, the dormitory of single rooms, another four-story building, from Mrs. Isabella Brown, of Baltimore. In case of severe illness of any student, the Isabella McCosh Infirmary is ready to receive him.

On another page is shown the library building, erected by the late James Lenox, of New York, and now containing 56,000 bound volumes. There is also a fund of $38,000, the income of which is to be used for the maintenance and increase of the library.

Notwithstanding the great usefulness of this large collection of theological literature and of the massive structures adjacent to it, what is of more value and what is more effective in securing attendance from so many quarters is the group of theological scholars that compose the faculty.

And for all these advantages the students pay neither tuition nor room rent. An endowment of over $1,000,000 saves them from that.

General Theological Seminary of the Protestant Episcopal Church, New York.—Rev. Dr. W. E. Eigenbrodt, who for twenty-seven years was in active service in the seminary, died November 4, 1894. By his last will he bequeathed to the seminary property to the value of about $200,000, in addition to his valuable library.

The seminary also received from the residuary estate of Mr. George A. Jarvis, of Brooklyn, $43,492.73, the principal to be kept invested, and the interest only to be used for the benefit of the seminary.

From Trinity Church, New York, $25,000 was received for another professor's house, to be erected on the grounds, and provision was also made by other friends of the seminary, whose names are unknown, for the erection of another professor's house.

Union Biblical Seminary, Dayton, Ohio.—This is the only seminary of the Church of the United Brethren in Christ. Founded in 1871, it completes its twenty-fifth

anniversary in October, 1896. The board of directors, at its regular session in May, 1895, unanimously resolved that the quarter centennial of the seminary be appropriately observed, and that an effort be made to raise, as a special quarter-centennial fund, $60,000.

The seminary possesses a splendid brick building, with large, well-furnished rooms, heated by modern methods. The seminary first opened in October, 1871, with 11 students and 3 professors—Rev. Lewis Davis, D. D., Rev. George A. Funkhouser, and Rev. J. P. Landis. Since the opening 192 students have been graduated, and about an equal number have taken a partial course, and the assets of the institution have grown to $150,000 above all liabilities. Among those who contributed liberally toward securing the firm establishment of the seminary, special mention should be made of Rev. John Kemp, Dayton, Ohio, who contributed $10,000; Rev. H. W. and Louisa Cherry, Butler, Ind., $8,800; Robert Smith, Polo, Ill., $7,500; Miss Minerva Willey, Ross, Ohio, $6,000; John and Lydia Runkle, Caroline Bever, James Hammond, and Mary A. Herr, each giving $5,000.

The present chairman of the faculty, Rev. G. A. Funkhouser, D. D., was born at Mount Jackson, Va., June 7, 1841. He attended the schools of his neighborhood, and at the age of 18 entered Otterbein University, but in 1862 enlisted in the Union army, serving till the close of the war, when he again entered college and graduated in 1868. After a three-years course in Western Theological Seminary, Allegheny, Pa., he graduated from that institution in 1871, and the same year was elected professor in Union Biblical Seminary, where he still remains at its quarter centennial.

United Presbyterian Theological Seminary, Xenia, Ohio.—April 24, 1894, the centennial year of the seminary's existence was celebrated at Xenia with appropriate exercises. This institution, constituted by the consolidation of the Associate Reformed Seminary of the Northwest with the Associate Seminary of Xenia, disputes the claim of the Dutch Reformed Theological Seminary at New Brunswick, N. J., of being the oldest theological seminary in the United States. If it shall not be able to establish its right to the first centennial celebration it will at least prevent the statute of limitations from running against its claim. Each of these institutions for several years had only a peripatetic existence, with one professor and a few students, who followed wherever convenience called him; so the identity in either case must be traced with care. In 1794 Rev. John Anderson, D. D., was elected professor of theology by the Associate Synod, and a building was erected in Beaver County, Pa., and a library of 800 volumes collected. His instruction continued until 1819, when he resigned and Rev. John Banks was chosen professor, with headquarters at Philadelphia; but in 1821 Rev. James Ramsay, D. D., was chosen professor of the western seminary, which was moved to Canonsburg, Pa., and afterwards to Xenia, Ohio. In 1874 it was united with the Associate Reformed Seminary.

The institution is now firmly established, with 4 professors, about 30 students, over $100,000 endowment, and a library of 5,000 volumes.

Law Schools.

There are 72 schools of law in the United States, over half of them forming departments of universities. The number of law students attending them in 1894–95 was 8,950; the number of graduates was 2,717, or 30 per cent.

Although there are so many lawyers in the United States that their name is legion, yet more than one-third of the States and Territories have no law school at all. Some of these, too, are important States, and 4 of them are among the original 13. The 15 States with no law school are Maine, New Hampshire, Vermont, Rhode Island, New Jersey, Delaware, Florida, North Dakota, South Dakota, Montana, Nevada, Idaho, Utah, Wyoming, and Washington; the 3 Territories are Arizona, New Mexico, and Oklahoma. Yet students in these States need not go far to obtain instruction, for other States have an abundant supply of law schools. In the confines of the District of Columbia alone there are 4 schools; Illinois has 6, and although any one can practice law in Indiana, yet the young men so appreciate advantages of regular systematic instruction that it has 4 law schools. New York has 7, Ohio 5, and Tennessee 6.

While nearly all medical colleges have courses of at least three years, and many of four years, law schools still lag far behind. In 12 law schools it is possible to complete the whole course in one year. The other schools have courses of two years, except 11, which require three years.

Since the most ignorant can be admitted to the bar in some States, and few requirements are made in others, law schools are placed under the necessity not only of having short courses of study, but also of having low tuition fees. The cost of completing a course in law schools, as compared with medical, is quite noticeable, as is shown by taking departments in the same universities, cost of books, board, etc., not being included.

Cost of an education in law or medicine.

	Medicine.	Law.
University of California	$450	$30
University of Colorado	125	55
Yale University	420	315
Georgetown University	426	230
University of Georgia	335	75
Northwestern University	405	175
Tulane University	465	80
University of Maryland	365	134
Boston University	510	300
Harvard University	714	450
University of the City of New York	525	220
Columbia College	850	480
University of Oregon	295	130
University of Pennsylvania	612	455

An examination of the diagram showing number of law students during the five years 1890–91 to 1894–95 (see a preceding page) reveals a rapid increase in number of students in law schools, and this increase had been occurring still further back. Although the number of law students has certainly been increasing, there must be some additional explanation of such numbers as 5,258, 6,073, 6,968, 7,311, 8,950. The explanation most probable is that young men are discarding the old method of study in the office of an attorney. While theological students and students of medicine, dentistry, and pharmacy are taking courses of three or four years in regular professional schools, lawyers are still being made in as many months. Although a full preparation for the practice of law successfully will require as much time and effort as any other profession, and possibly more, fledgelings of a few months' study presume to undertake the most difficult cases, and their confiding clients must reap the consequences. Although many States require an examination of all candidates for admission to the bar, it is notorious that such examinations, as conducted, fail to accomplish the desired results. Full qualifications in the great majority of cases can only be reached certainly by regular and systematic training at a law school. It is true that many of the most successful members of the legal profession never entered a law school, but they succeeded in spite of difficulties. They had to encounter and overcome many obstacles. Some of them, too, had no opportunity to attend a law school. There were also many physicians of great reputation who never attended a medical college, and it was once contended that in a physician's office was the best place to become a physician, and a dentist's office to study dentistry. Bitter war was once made on theological seminaries as being entirely unnecessary, and in some denominations the opponents are not entirely silenced yet. But the conflict is no longer waged; the decision of the majority is recognized. In regard to the study of law, too, a decision has been reached by those who have had proper opportunities for considering the question intelligently that while good legal training can be obtained elsewhere than in law schools, and that while many have become eminent lawyers by private study, just as many of our most intelligent and wisest men have obtained their knowledge without collegiate training, yet as universities and colleges are the proper places for literary training, so law schools are the proper places for acquiring legal knowledge. Although many physicians acquired most of their skill in the practice of their profession, yet medical colleges are regarded as indispensable. While many evangelists have caused such awakenings in the masses as to astonish staid theologians, the seminaries of theology have continued their instruction as usual.

While Benjamin Franklin obtained such an education in his room at night, by a tallow candle, and in his printing office that he became both philosopher and statesman, he was unwilling for others to depend on such efforts, but labored constantly for the establishment and support of educational institutions, and the great University of Pennsylvania is to fulfill his ideas, from whose efforts it took its beginning.

While J. Marion Sims knew so little of medicine at the beginning of his professional career that he read up his cases from both beginning and end of the book, and finally became so discouraged that he threw his medical shingle into a well, a school of medicine in New York is left to honor his memory, as well as one of later date in St. Louis, Mo.

While the young surveyor on the banks of the Ohio grew up to a large extent in the frontiers, his discernment of the useful was such that he cherished a plan for a great national university.

Although such examples as the above, and others like them, are constantly cited as instances of how men can succeed without the advantages of collegiate training,

little is said about the opinions of such men as to the value of educational institutions. The most eminent lawyers of the American bar are the strongest advocates of full and thorough courses in law schools; nevertheless with strange inconsistency their examples are sometimes urged to show the uselessness of the schools they advocate.

Although the value of law-school training is forcing a recognition from many, sufficient progress has not yet been made to induce State legislatures to require a law-school course before admission to the bar. In the State of New York a near approach has been made to this requirement. Several States require medical practitioners to have diplomas from medical colleges, but they do not require diplomas from law students. One prominent cause of this heretofore has been the scarcity of law schools, some States having none at all. But there are few communities at the present time where law schools can not be reached as easily as medical schools. Moreover, if all law students were required to pursue a regular course in a law school, other schools would soon spring up wherever needed. It need not be expected that there will be much elevation of the standard of legal education until the legislatures shall have adopted more stringent regulations.

It is difficult for the laity to fully appreciate the need of an educated legal profession. As they are unable of themselves to detect the gravest mistakes in medical practice, just so in the courts they are not aware when the greatest ignorance of law is displayed. Here are some statements made at the meeting of the American Bar Association in 1894, and not a word of protest or doubt uttered by anyone present: "An inundation of incompetency, to use no harsher term, has in recent years deluged our profession and brought it as the appointed agency for the attainment of justice into common disrepute." There is at present a "deplorable state of legal attainment among the members of the bar in general." "Men with rights to maintain or with wrongs to redress hesitate and often refuse to submit to the uncertainties, the tedious delays, and the wasting expense inevitable in the ordinary court processes of the day." "And the worst feature of this condition of affairs is that this waning faith is justified by the facts." "Judged by the results of its service in actual litigation, the profession is to-day a monstrous charlatan." Another member said, in speaking of applicants for admission: "I have seen the most absolute ignorance displayed of the rules of orthography, and several men have been able to pass a good legal examination who yet were utterly unable to write a single sentence in good English." Another member said: "We are all united in the sentiment that there should be a higher degree of culture in the legal profession, but the reform must come from the lawyers themselves," because, as was suggested by Judge Dillon, the legislation of the country is largely done by lawyers. Complaint was made that the courses in law schools are too short to afford full legal training, but representatives of the law schools, while admitting this fact, stated that the fault lay not with them, but with the State legislatures which adopted no regulations requiring a full legal education for admission to the bar.

ADMISSION REQUIREMENTS OF LAW SCHOOLS.

Of 60 catalogues of law schools examined, in 43 we find that there are practically no requirements for admission to the law classes. Any young man with an ordinary English education who has not the stamp of ignorance plainly visible upon his face, if he can comply with the required financial outlay, need feel no hesitancy in entering the law-school door. And indeed he does not; and this is so well known that some of the catalogues do not even mention the subject of admission requirements, but instead dilate upon the importance of receiving instruction in a law school rather than in an attorney's office, and in such a way that it is evident no applicant will be declined. In one catalogue it is stated that an examination will be required of all students who have not completed a course in a high school or grammar school, but "the object of this examination is merely to ascertain whether his previous training has developed in him sufficient practical ability to appreciate the doctrine of the law. It will therefore be of a general rather than a technical character. An acquaintance with English and American history is desirable, but is not required for admission." Of course, if no knowledge of American history is required, one need not worry about any other requirements.

Twelve other schools require an examination when the applicant expects to apply for a degree, but not otherwise. But even in the institutions which have some regulations for admission, the requirements are so lax that few applicants, if any, are kept out. Graduates from high schools are received without examination, and in those cases where an examination is required it is usually upon the branches of an ordinary English education. The University of Michigan requires some knowledge of Blackstone, and the New York law schools some Latin and geometry from candidates for degrees.

The Harvard law school is somewhat more restrictive. It requires an examination in Latin, French, and Blackstone's Commentaries. In Latin they must be able to translate without grammar or lexicon passages from Cæsar's Gallic War and from Cicero, and in French they must translate ordinary passages without grammar or lexicon.

When a young man concludes to be a lawyer, he begins a clerkship in the office of some attorney or enters upon the short course of study in some law school, after completing which he applies for admission to the bar. He is never troubled with doubts or fears as to whether he will be able to pass successfully the examination of the law school, or whether he will find any difficulty in gaining admission to the bar. And he does not conclude at once where he will locate for practice, whether in some Eastern city, or in one of the central States, whether in the South or in the West; for why should he be perturbed with reflections on this subject, which he can decide at leisure and just to suit himself, for he knows that the door of admission to the bar hangs wide open in almost every State.

As a result of such conditions hundreds of young men hang out their shingles as attorney and counselor at law when they ought to be driving carts or holding the plow. It is true they must wait many weeks before having much to do, and many of them drop out of the legal profession into other pursuits where muscle is needed as well as brain, and where they find a more appropriate sphere.

In Pennsylvania students who expect to apply for admission to practice in the county of Philadelphia must undergo an examination in the ordinary English studies.

It is useless, however, to complain of the admission requirements of law schools when the door of admission to the practice of law itself stands wide open. This is the root of the evil. While almost every State in the Union has a law governing the practice of medicine, and many of them very stringent laws which are stringently enforced, and while many States have laws governing the practice of dentistry and pharmacy, the profession of law can usually be entered by anyone with an ordinary English education after a few months' study. It is a learned profession which requires little learning.

As a result of this lack of instruction in the legal profession, Mr. Frank C. Smith stated at the meeting of the American Bar Association, in 1894, that the courts are clogged with cases of no legal merit, or which are delayed by contention as to methods of procedure, the true merits of the controversy being made entirely subordinate.

The imperfections and shortcomings of law schools are probably recognized and appreciated by none so fully as by law-school instructors themselves. They labor under the necessity of having to adapt their instruction to the capabilities of students who, in many instances, have not received that full and extensive equipment of knowledge and that culture which members of the legal profession constantly find so helpful. They fully recognize the inconsistency of students undertaking studies in law, which should really represent post-graduate work, while they are yet incapable of meeting the requirements for even beginning a collegiate course. They know, also, the utter impossibility of students acquiring anything like full preparation in law in the short time usually claimed for law courses, and probably none are so anxious as they to remedy these evils. But they are also well aware how serious an undertaking it would be to set up barriers before the law school which it would require time and labor to overcome, and then to ask an extended course of three or four years for legal training at considerable expense when at once bound the student can pass over the law school directly into the legal profession, where at once he can begin to receive some reward, however meager, for his work. They know full well how difficult it is for human nature to turn from the reward in reach of the hand, with the hope that in future years they may gather in larger returns.

Medical schools until the last two or three years also labored under the same difficulties, and so far as entrance requirements are concerned little progress has yet been made. But they now have full time in which to impart medical knowledge. Courses of three years were at first adopted, but now four years are very generally required. American medical colleges formed an association to elevate the standard of medical education, and its efforts and aims were supported by the different State and national associations, and soon medical laws were enacted in different States which require attendance upon medical schools for a certain number of years and that an examination shall then be passed before a State medical board paid for their services, in order to see that the work of medical schools is well done. Study at home or in private offices is given but little consideration, although under some circumstances considerable medical knowledge can be thus obtained by students zealous in their work and determined to succeed. As a result, there is no longer occasion for short courses and superficial examinations in medical schools.

When State legislatures shall have been induced to enact laws requiring full preparation for admission to the bar, and especially when adequate measures shall have

been adopted to bring into full effect and operation the laws adopted (for several States have good laws on admission to the bar, but they are improperly or inefficiently executed), law schools will be able to adopt courses of three or four years, and to raise the requirements, both for entrance and graduation. If an association of American law schools were formed, its efforts conjoined with those of the section on legal education of the American Bar Association and of the State bar associations would doubtless secure the enactment of laws for higher legal education with all necessary provisions for their successful operation and enforcement. Nothing would then prevent law schools from adopting courses of three or four years, or from requiring stringent examinations for graduation. The great value of systematic instruction in a law school would then stand out in such bold relief that notwithstanding the adoption of rigid requirements the number of law students would suffer no loss.

REQUIREMENTS FOR ADMISSION TO THE BAR.

It is true that quite a number of States have some law on the subject of admission to the bar, and 24 States even mention a period of time that applicants must have studied law before admission, but from various causes these regulations have practically no effect except in a few States. Ralph Stone, esq., says: "The favorite method of examining applicants is in open court by a temporary committee appointed by the court, or theoretically by the county or supreme judges themselves. Both of these methods, according to the testimony of the attorneys-general of the several States [Mr. Stone had written to all of them on the subject] are very unsatisfactory. They are the methods in vogue, however, astonishing as it may seem, in all but eight of the States."

The time of study spent in a lawyer's office can easily be made to cover a long period, especially if the attorney has an elastic conscience. To illustrate the ineffectiveness of such laws as compared with the requirement of a certain number of years in a law school, we need only refer to medical schools, which formerly demanded one year of study under a preceptor and two or three years at a medical school. The latter was easily enforced because definite and distinct, but the requirement of a year under a preceptor was a dead letter.

A requirement for admission to the bar, common to perhaps all the States, is that the applicant be of good moral character, and certainly this is a very wise provision, and one which should be adhered to without exception, for great responsibilities and important trusts constantly rest in the hands of lawyers, and there should be some safeguard for the proper execution of these trusts. But a lawyer, writing in a recent periodical, says what is needed is that the States devise some means to maintain the good moral character which all the young lawyers seem to possess when admitted to the bar.

Ralph Stone, in the Michigan Law Journal, February, 1895, gives the number of years of law study required in the several States with such a provision as follows: North Carolina, one year; Washington, eighteen months; Colorado, Illinois, Iowa, Kansas, Maine, Maryland, Nebraska, North Dakota, Wisconsin, Wyoming, two years; Connecticut, Delaware, District of Columbia, Minnesota, New Hampshire, Ohio, Pennsylvania, Vermont, three years; New Jersey, three years if the applicant possesses an A. B. or B. S. degree, and four years if he does not; New York and Oregon, two years if a college graduate, three years if not; Rhode Island, two years if the applicant possesses a classical education, and three years if he does not.

According to the above statement Pennsylvania requires three years of study and an examination before admission to the bar, which would seem sufficient to insure well-trained applicants. The law student can give the required notice when beginning the study of law without stating whether he is devoting his whole time to law or two hours each week. After the required three years he presents himself for examination, not in Philadelphia or Pittsburg, but in one of the rural counties. Let us see what he will encounter, according to Prof. George Wharton Pepper, of the law school of the University of Pennsylvania: "Admission to the bar is usually gained throughout the Commonwealth upon passing an examination before the board of examiners, selected by the judge or judges of the local courts from among the members of the bar. The standard of attainment required of the student differs in the different counties of the State, probably the most searching examination being that required for admission to the Pittsburg bar. In some counties the examination is scarcely more than a formality."

A professor of law in one of the Eastern States says the only requirement for admission to the bar in many of the Western States is "the possession of a good moral character and an unlimited amount of assurance." The Western lawyer would doubtless reply that the requirements in the East are the same, and the character not closely examined.

Diplomas from State law schools admit without examination in 13 States: Georgia, Illinois, Louisiana, Maryland, Michigan, Minnesota, Mississippi, Missouri, South Carolina, Tennessee, Texas, West Virginia, and Wisconsin.

In 8 States, Connecticut, Delaware, District of Columbia, Maryland, Massachusetts, Minnesota, New Jersey, and New York, there are boards of examiners who insist upon a higher standard than is demanded in other States.

A standard of general education is necessary in only 4 States: Delaware, Minnesota, New York, and Pennsylvania. In Delaware, Pennsylvania, and Vermont the student must register before beginning the study of law.

As was stated above, the attorneys-general of the different States concur entirely in the statement that the examinations for admission to the bar, as at present conducted in the great majority of States, afford very inadequate tests of the applicants' knowledge of law. The examinations are sometimes conducted in open court, possibly toward the close of term, when there is little time for anything but urgent business, and perhaps each applicant is asked not more than half a dozen questions in law. Or if the examinations are conducted in private by a committee of lawyers, they are perhaps personal friends of the applicants, whose good will they desire to retain, and they have no methodic system of examination and attach little importance to it, for the result of one examination with two or three applicants would have little effect on the general standing of the profession, but if all the applicants for admission in the State were required to appear at some city in the State at one of two examinations in a year, and to undergo a full and searching written examination lasting two or three days before a State board of law examiners appointed for a term of years and given full compensation for their time and labor, the results of the examinations would be very important and would soon have a well recognized effect in elevating the standard of legal education. By the formation of an association of boards of law examiners of the different States, a uniform standard of requirements and methods might be adopted in a number of States as is being done at present by the State boards of medical examiners.

Although the young graduate in law can locate in almost any State of his choice, and find no difficulty in admission to the bar, there is one State where he may be interrogated more closely than he expected, and where not every ignoramus can assume the title of lawyer. It is eminently proper that the State of New York should lead in the reform of legal education, for its courts have sufficient legitimate work to do, without being burdened with controversies of no legal merit, and which intelligent lawyers would never institute. Other States are also sure to see the propriety of such regulations in order to shield themselves from the incompetency thrust upon them.

In New York every applicant for admission to the bar must undergo an examination before the State board of law examiners, and he is not allowed to take this examination at all until he has completed the required preliminary course of study, and he can not enter upon this preliminary course until he shall have satisfied the regents that he is qualified to begin the study of law.

Any one who has practiced law for three years in the highest court of law in another State or country may in the discretion of the supreme court, and under certain conditions, be admitted and licensed without an examination. Before an applicant is entitled to a law examination, he must furnish evidence to the board of law examiners that he is a person of good moral character, that he is 21 years of age and a resident of the State, that he has studied law according to the prescribed conditions for three years, or if a graduate of a college or university, that he has studied law for two years. Any one who has been admitted as an attorney in the highest court of original jurisdiction of another State or country, and has remained therein as a practicing attorney for at least one year, may be admitted to the law examination after one year of study of law. Before entering upon a law clerkship or attendance at a law school, an applicant must pass an examination, conducted under the authority and in accordance with the ordinances and rules of the University of the State of New York, in English composition, advanced English, first-year Latin, arithmetic, algebra, geometry, United States and English history, civics and economics, or in their substantial equivalents as defined by the rules of the university, but the regents may accept as the equivalent of the examination, first, a certificate of having successfully completed a full year's course of study in any college or university; second, a certificate of having satisfactorily completed a three years' course of study in any institution registered by the regents as maintaining a satisfactory academic standard; or, third, a regents' diploma.

In brief, it is required in New York that the applicant shall present evidence, first, that he has sufficient preliminary education to enter successfully upon the study of law; second, that he has studied law three years, or, if a graduate of a college or university, two years; and he must lastly stand an examination in law before a State board of law examiners.

INSTITUTIONS REPRESENTED AT HARVARD LAW SCHOOL.

In 1894–95 there were 404 students in attendance at the Harvard law school, and of these 305 were college graduates. Excepting one or two theological seminaries,

it is doubtful if at any other institution in the United States can be found college graduates from so many different universities and colleges, distributed over so wide a territory. No one institution has a specially predominant number, if we omit Harvard University itself, which might be presumed more ascendant than to furnish only 140 out of 404 students. The other institutions almost invariably furnish only 1, 2, or 3 students, the exceptions being Yale, which furnishes 19, Amherst 16, and Brown University 11.

Institutions in every section of the country are represented, and several in other countries. The University of California, which is about as distant as the national domain will admit of, sends 7 of its graduates; the University of Oregon has 1 for the northwest corner, and Texas University 1 for the southwestern, while Oberlin College from near the center of population of the United States is also represented. Including the representatives from Cambridge University, England, and Trinity College, England, and those from the universities in the provinces of Canada, there are in all 70 universities and colleges represented, and every section of the Union.

LAW IN UNIVERSITIES AND COLLEGES.

There can be no question as to the importance of a citizen having at least general information as to the principles of law, for in all business transactions some knowledge of law will be needed. It may not be necessary to understand legal forms and methods of procedure, but even here full knowledge in some one line may be valuable by rendering easier the acquisition of legal knowledge in other cases. Whether one be a farmer, mechanic, builder, or merchant there will be many occasions when legal knowledge will be needed. He should not have to depend, when avoidable, upon the honesty and character of men to be saved from financial loss. Upright dealing is best promoted by its being known that unfairness will be detected and intelligently resisted.

Moreover, few studies are better suited than law to develop mental acumen, to accustom to close distinctions in interpretation of words, and in reaching logical conclusions. The methods of reasoning in trained and untrained minds are so different that men of equal natural endowments arrive at entirely diverse opinions.

Notwithstanding the importance of general legal knowledge, universities and colleges include very little law in their courses of study. Constitutional and international law, it is true, receive attention in many colleges, but of the 430 universities and colleges in the United States in 1890–91 only 102 gave instruction in commercial law. It was very noticeable, too, that the large majority of those teaching commercial law were situated in the Central States—the great Mississippi Valley and adjacent States. Commercial law was not taught in a single institution of the New England States; in only 13 institutions of the great manufacturing and commercial States, New York, Pennsylvania, and New Jersey; in only 9 in the South Atlantic States, and in 7 institutions of the Pacific States. Columbia College, New York, marks quite an exception by offering instruction in contracts, elements of jurisprudence, real estate, torts, criminal law and procedure, domestic relations, common law pleading and procedure.

The committee on legal education of the American Bar Association state that "Blackstone's Commentaries contain the lectures which their distinguished author read before the undergraduates at Oxford, and that Kent's Commentaries contain the lectures which the distinguished chancellor delivered before the undergraduates of Columbia College in the early part of the present century. The introduction of technical law subjects into the academic curriculum would not, therefore, be contrary to all academic precedents. * * *

"The introduction of law studies into the academic curriculum is to be strongly commended in the interest of those who have no intention of ever practicing law, but who may well know something of the elements of the law as a suitable part of a liberal education. In that admirable lecture with which Mr. Justice Blackstone began his instruction at Oxford he declared that he thought 'it an undeniable position that a competent knowledge of the laws of that society in which we live is the proper accomplishment of every gentleman and scholar; a highly useful, I had almost said essential part of liberal and polite education. And in this I am warranted by the example of ancient Rome, where, as Cicero informs us, the very boys were obliged to learn the twelve tables by heart as a carmen necessarium or indispensable lesson, to imprint on their tender minds an early knowledge of the laws and constitution of their country.'"

PRESIDENT JORDAN ON AMERICAN LAW SCHOOLS.

In the Forum of May, 1895, President David Starr Jordan contributes an article in which he says: "The various influences, German, English, and American, which are molding our higher education are joining together to produce the American university. And the American university, as Mr. James Bryce has clearly indicated,

is becoming an institution in every way worthy of our great Republic. Its swaddling clothes of English tradition are being cast aside, and it is growing to be American in the high sense of adjustment to the American people's needs. The academic work of the best American institutions is characterized by vigor and thoroughness, and in the free air that pervades them there is every promise for their future.

"In Europe professional training is in general the culmination of university education. It is not so in America. It is here rather a 'practical short cut' by which uneducated or ineducable men are helped to the rewards of knowledge and skill with the least possible loss of time. In most of our States provision is made for a system of public education, beginning with the common schools and culminating in the university. The law schools, however, in the different States form no part of this system. They are rarely ever in real alliance with it. Their place is with the 'Independent Normal' and the 'School of Oratory.' Instead of a requirement of general intelligence and a special knowledge of economics, history, literature, and language as a preparation for the study of law our schools have been eager to admit any one who could pay the required fees and perchance read the English language.

"It is thus true, as President Eliot has said, that into an American law school any man 'can walk from the street.' But in most of the States he can do better or worse than this. From the streets he can walk directly into the profession of law, disregarding even the formulæ of matriculation or graduation. Even the existence of the law school is a concession to educational tradition. It is possible with us to enter any one of the 'learned professions' with no learning whatsoever.[1] In fact, in many of our States it requires no more preparation to be admitted to the bar than to be admitted to the sawbuck. Fortunately admission to either on these terms carries with it no prestige or social elevation whatever. But the danger in the one case is greater than in the other. The inefficient lawyer may work the ruin of interests intrusted to him. The ignorant physician is more dangerous than the plague. The incompetent wood sawyer harms only the woodpile. A large part of our criminal records is devoted to legal and medical malpractice. In other words, our bulk of crime is swollen by robbery and murder committed under the guise of professional assistance. When the professions cease to be open wide to adventurers and theives, they will rise to something of their traditional dignity. It has been said that the only 'learned profession' in America at present is that of the engineer. Men can not trifle with the forces of nature."

"Our people have always been willing to tax themselves to furnish a general education for their children. The common-school idea from the very first has included a liberal education. But in most of the States the people have at one time or another definitely refused to devote public funds to the making of lawyers and doctors. They would not, at their expense, help men into professions they believed to be overpaid as well as overcrowded. This policy has been a most short-sighted one. It has been responsible for the existence in every part of our country of hordes of pettifoggers and quacks, who rob the people instead of serving them. Incompetent professional service is always robbery. The professions are overcrowded simply because they have ceased to be professions. The remedy for incompetence is found in insisting on competence. This can be done by furnishing means by which competence can be made possible.

"Moreover, the politicians of each country are, for the most part, its lawyers. Our lawyers are our rulers. We can never hope to see our States well governed till its lawyers are well trained. There can be no political conscience except as an outcome of political knowledge. Right acting can come only as a result of right thinking. The men who think right will in the long run act in accord with their knowledge. Those who have known that there is a science of human institutions can never wholly forget that fact. There can be no right thinking in matters of public administration without a knowledge of the laws of growth of human institutions. Only in accordance with these laws is good government possible. Of these fundamental laws of being the statutes of man must be an expression. Where they are not so the people have sooner or later a fearful score to pay. The Fates charge compound interest on every human blunder, and they have their own way at the last."

INCOMPETENCY OF LAWYERS.

[Frank C. Smith, of New York, at the Bar Association in Detroit.]

The profession of the law is organized for a mission, and that mission is to aid in the administration of justice. Our patents of nobility are the commissions given us by the State to serve in this capacity, and we are proven either worthy or unworthy of the trust reposed in us according to the measure of fitness, mental and moral, and

[1] Formerly true in medicine, but now medical schools require three and four years of study.—A. E. M.

the former no less than the latter. And right here it is well to remember that law, and that includes justice, is effective and potent only as it is applied to the affairs of men; and that, as stated, our profession is justly judged not by its accumulated knowledge of legal principles but by the result of its practical applications of those principles in the course of its appointed service. Every true lawyer is, therefore, interested in the record which his profession is making as the minister of justice, and anxious that only those who are fully equipped to properly serve in this ministry shall be given its high responsibilities.

The functions of the bar are no less important than those of the bench. It is the practitioner who conceives and advises litigation. It is he who gives it shape, who determines its character, who controls its issues, who conducts it through the courts and makes up the precise question which the bench is ultimately to decide. Upon him rests the duty of preparing the pleadings, of conducting the examination of witnesses, of supervising the making up of the record, of perfecting the appeal and securing a just hearing and determination of the issues by the court of final resort. If the practitioner fails in his judgment as to the proper action to be taken in any stage of the proceedings, the course of litigation is thereby embarrassed and complicated, the rights of parties are jeopardized, and often actually impaired and lost. The courts are thereby mistrusted, and the profession derided as incompetent to do the service which it claims as its especial prerogative. In other words, it is the practitioner and not the judge who is most largely responsible for the actual results of litigation. If men fail to secure their rights through an appeal to the courts it is principally because the lawyers who are intrusted with the conduct of the litigation fail to present properly these rights to the judicial tribunals, and this failure arises from the lack of a proper understanding of the rules of legal procedure.

It is a deplorable fact, of too general cognizance to require more than a statement thereof in this presence, that year by year the failure of remedial justice to meet the needs of the people becomes more and more conspicuous and disheartening. We know that to a very considerable extent the causes of this failure lie in the imperfect methods of legal procedure prescribed by the legislatures; but I repeat with emphasis born of convincing results of an investigation into the forensic practice of our profession which went deeper than that which it was my privilege to report to you last year, that, as compared with the incompetency of the profession as a whole, upon matters of legal procedure and practice, the just objections to the systems themselves are of minor influence.

It will be recalled that an examination of all the cases reported for the year covered by the General Digest of 1894 resulted in ascertaining that over 48 per cent of the points which were therein submitted to, and determined by, the courts of appellate jurisdiction in this country were upon questions of pleading and practice, in no sense involving the actual merits of the controversies. And it was strongly urged that this great proportion of such questions was monstrously disproportionate to the true province of legal procedure, and was a reproach to our profession, through whose ignorance or indolence, it was insisted, this fact was made possible.

I was desirous of learning how far questions of legal procedure were actually determinative of litigations, deeming that such information would enable us to form an accurate judgment as to the real quality of the work of the bar in the trial of causes. For this purpose I have examined the cases reported for the year June 1, 1894, to May 31, 1895, with the following results: Total number of cases examined, 16,416. Of these, 1,052 were originally begun in the courts reported, leaving 15,364 which were heard on error or appeal. Of these 15,364 cases submitted to the appellate jurisdiction of these courts, 9,523 were affirmed and 5,841, or a little over 38 per cent, were reversed. Of these reversed cases 2,302, or almost 38 per cent, were reversed upon questions of procedure. In other words, of the reversed cases 38 out of every 100 so resulted because of the incapacity of the attorney in charge to properly present the merits of his cause for judicial determination. In 38 out of every 100 such instances, then, justice was either denied the litigant or to gain his rights he had to submit to the anxiety, delay, and expense inevitable in a new trial or in instituting a new action. And this because the certified member of the bar to whom he intrusted his cause did not know how to practice law.

Is it any wonder that men will hesitate and even refuse to submit their differences and their property interests to the precarious care of the average practitioner of the day when the records of our highest courts show that in 38 out of every 100 instances of reversal the cause is absolutely shipwrecked because of the mismanagement or stupidity of the licensed pilot? Men know these facts, if not these figures; and it is because the experience of the people for the last twenty or thirty years has proven to them the degeneracy of the bar, as the efficient servant of justice, that the masses so often regard a surrender of their rights as preferable to an attempt to secure their enforcement by a recourse to litigation.

A BETTER EDUCATION THE GREAT NEED OF THE PROFESSION.[1]

[By Justice David J. Brewer, of the United States Supreme Court.]

The lawyer is evermore the leader in society; and by society I do not mean that little coterie which lives simply to dine and wine, but that larger association of all individuals whose mingled labors have achieved the present and will work out the future of human life and destiny. In society, in this better sense of the term, the lawyer is the leader.

Temporarily, it is true, he may be displaced by the soldier. In the abnormal and chaotic movements which accompany revolution and war the lawyer is ignored. Inter arma leges silent. The man on horseback becomes the leader, and around his life there is a pyrotechnic splendor which has lifted him into undue prominence, and made him too frequently the central figure in written history. But his leadership is always temporary, and conditioned upon some disarrangement of the normal condition of human society. When life is moving on in peaceful and regular lines the soldier drops to his appropriate place, as simply the representative of force—the one ready to help the lawyer as the true leader in all efforts which make for the bettering of human life and the coming in of a higher civilization.

So, in the early days of New England, the minister, for a while, superseded him. Legislation denounced him, and society under its theocratic leadership endeavored to forbid his presence and exclude him from recognition. Washburn, in his Judicial History of Massachusetts, says:

"It was many years after the settlement of the colony before anything like a distinct class of attorneys at law was known. And it is doubtful if there were any regularly educated attorneys who practiced in the courts of the colony during its existence. Lechford, it is true, was here for a few years, but he was soon silenced, and left the country. Several of the magistrates had also been educated as lawyers at home, among whom were Winthrop, Bellingham, Humfrey, and probably Pelham and Bradstreet. But these were almost constantly in the magistracy, nor do we hear of them ever being engaged in the management of causes. If they made use of their legal acquirements it was in aid of the great object which they had so much at heart—the establishment of a religious commonwealth, in which the laws of Moses were much more regarded as precedents than the decisions of Westminster Hall, or the pages of the few elementary writers upon the common law which were then cited in the English courts."

It is curious to note some of the legislation aimed to dispossess the lawyer from his rightful position, and exclude him from even existence in society. In 1656 the following statute was enacted in that colony:

"This court, taking into consideration the great charge resting upon the colony, by reason of the many and tedious discourses and pleadings in the courts, both of plaintiff and defendant, as also the readiness of many to prosecute suits in law for small matters, it is therefore ordered by this court and the authority thereof that when any plaintiff or defendant shall plead by himself or his attorney for a longer time than *one hour*, the party that is sentenced or condemned shall pay twenty shillings for every hour so pleading more than the common fees appointed by the court for the entrance of actions, to be added to the execution for the use of the country."

There was a crafty wisdom in this statute which commends itself to anyone of much experience on the bench, and I venture to suggest that a similar act would to-day be sustained by every court. By an act passed in 1663 "usual and common attorneys" were excluded from seats in the general court, as the Massachusetts legislature was called. But notwithstanding these efforts, it soon developed that the needs of society were stronger than the wishes of the theologic advisers, and little by little the lawyer was lifted in even that theocratic society into his proper and accustomed place, and there, as elsewhere in the land, became the recognized leader.

To-day wealth is striving to dispossess him from his position of leadership, and money is used to secure position and control, but with the ordinary result that place and power acquired alone by such means simply expose the possessor to ridicule and scorn. It takes something more than a $200 silk nightshirt to make a man a leader in social forces, and whatever of prominence and notoriety money may purchase, it never purchases the power to change the currents of life.

---

[1] Address delivered at the meeting of the American Bar Association at Detroit, Mich., August, 1895. From Proceedings of the American Bar Association, 1895.

This leadership of the lawyer is not accidental nor enforced, but natural, and resulting from his relations to society. That which binds society together and makes possible its successes and its blessings, is the mystic force which we call "law." It is that which transforms humanity from a mere aggregation of individuals, each by his own strong arm asserting his rights, into an organized society, the rights of whose individual members, as against one another, are enforced by the united strength of all, and in whose consequent freedom of personal action has been wrought out all the achievements of the past and rest all the possibilities of the future. He, therefore, who voices the law, who is its interpreter, must inevitably stand in the front as the leader in the social organization, the one to direct the movement of all its uplifting forces. Sneer at it as anyone may, complain of it as anyone will, no one can look at American society as it is to-day, and has been during the century of national existence, without perceiving that the recognized, persistent, and universal leader in social and political affairs has been the gentleman of the green bag. A distinguished member of our profession said to me the other day in Nashville: "It is a curious fact that though there is no express authority therefor in any constitution or statute in the land, the lawyers have always been the rulers of this nation." We speak of our Constitution as the wise organic instrument under whose provisions the nation has moved on to strength and glory, but that Constitution was the handiwork of lawyers. They framed it, and they have interpreted it. Think how we should have drifted and what a helpless mass of people we should have been without its grants, limitations, and distributions of power. And, in a general way, the same may be said of every State constitution and of every statute. It is the brain of the lawyer which fashions them, and his brain that applies and makes them useful. As a general rule, made more conspicuous even by the few brilliant exceptions, the lawyer has been the legislator, the judge, and the executive.

The power which alone permanently controls and lifts upward is brain power, and brain power applied in such a way and to such forces as regulate life in its daily action. Leadership, however, does not attend on the mere name of lawyer. It will continue in him and become more or less potent as his capacity therefor improves or wanes, according to his increasing or lessening fitness for interpreting the rules of human conduct and directing the movements of society. There is no physical force to compel his supremacy. He has no inherited right, and he must always stand intellectually in front if he would lead. Civilization lifts all men up. The schoolroom places each man on a higher level than his father occupied. Knowledge is not only more wisely distributed, but also moving on a higher plane. And the lawyer of the future, to continue the leader must be a wiser man than the lawyer of the past or present.

The thought of some is to dispossess the lawyer by giving to each man a knowledge of the rules of law, and you will find on many bookshelves such volumes as these: Every Man His Own Lawyer, The Business Man's Guide—books aimed to place before all men the common rules for interpreting and controlling business transactions. Some fancy that with this diffusion of knowledge the need for the lawyer will cease. They who indulge in such fancy forget the fact that the many never keep pace with the few, that social and business relations become more complicated as civilization advances, and that with the complexity of those relations comes a multiplicity of rules and laws beyond the reach of the ordinary education of the many. There is as much difference between the few primitive rules that controlled society in its early stages of development and those which are now required for the management of its great and interlaced interests, as there is between the hatchet, the saw, and other ordinary tools of the carpenter, and the marvelous and intricate machinery of our great manufacturing establishments. It may require but little time and effort to learn how to use a plane or a handsaw, but to construct and keep in motion and order all the involved machinery of a great manufacturing establishment requires years of patient study and careful attention. So it may be that a little knowledge will enable one to go into a primitive society and advise as to the rules of law controlling its few transactions, but he who would stand in one of our great commercial cities as a power and a leader, advising and directing all its multiform affairs, must be a man of superior knowledge and large wisdom.

We hear many suggestions to-day as to the means necessary to make the law keep pace with the needs of advancing society. Law reform is a great cry. Simplicity in mode of procedure is thought by some to be the one thing needful. Far be it from me to belittle this demand. I do not wonder that the lawyer fell into disrepute when the highest effort seemed to be put forth in solving mere questions of pleading and practice, when the pride of the lawyer was in tripping his adversary through a mere technicality, and when the outcome of too many a lawsuit was not the determination of the relative rights of the litigants, but simply how nearly the pleadings on the one side or the other conformed to a technical and arbitrary system. Chief Justice Taney, writing of his professional experience, says: "In that day strict and nice technical pleading was the pride of the bar, and I might also say of the court.

And every disputed suit was a trial of skill in pleading between counsel, and a victory achieved in that mode was much more valued than one obtained on the merits of the case." I am glad that law reformers have swung ponderous blows against the common-law system of pleading and practice, and are striving to give the utmost simplicity to modes of procedure. Once in a while we see one of those technical devotees of ancient ways, whose delight is simply in the maneuvers of the court room. I remember one, who, employed to defend a chancery suit, wearied the court by the multitude of his dilatory, evasive, and technical pleas and motions. Finally, the judge, in his impatience, said to him, "Why do you take up my time with these frivolous and technical matters; why do you not come to the merits of the case at once?" And his reply, which illustrates so well the spirit of the old practitioners, was, "The moment I get to the merits of the case I lose all interest in it." No thoughtful man can doubt that simplicity in modes of procedure is of the utmost importance. The mere tools of the profession should be easily handled. Writing a pleading, or any other document, in a dead language is not the best evidence of the highest practical learning, or the greatest capacity. And it is to the credit of our profession that its members are rapidly coming to appreciate this truth; to realize that mere form is of trifling moment, and that substance of right and justice is the one thing to be striven for. God speed the day when a victory won by a trick shall ruin the lawyer who wins it.

Again, another demand is for more speed in the dispatch of litigation. A slow procedure, with free right of appeal from court to court and abundant license of indirect collateral attack, was barely tolerable when life itself moved slowly, when business transactions were few, when travel was by canal boat or stage coach, when the mail was weekly or at best triweekly, and when leisure was abundant. The pure gold of truth and justice was finally separated, it is said, after being sifted through many judicial sieves. "Jarndyce *v.* Jarndyce" expressed even then the contempt of thoughtful minds. The law's delay became proverbial. Now, when travel is by steam, and correspondence by electricity, when business transactions challenge the seconds in their flight, when men grow rich or poor in a fortnight, and all life moves in the hot haste of a Kansas cyclone, something must be done to bring the movements of the courts into harmony with the speed of other things. It is not strange that business men are compelling the members of their various commercial bodies to settle their controversies through committees rather than by lawsuits. Lawyers are proverbially conservative, and they do not change their habits or notions as easily or as quickly as some might wish. Precedent is an awful tyrant in our profession. What has been is to many the sacred law of what must be, and an iconoclast on the bench is a sacrilegious judicial monster. Even that tribunal of the nine black gowns glories in the past, and follows in its traditions, and the agonizing cry of the despondent dissenter, even in the income-tax case, is that *stare decisis* is being stabbed in the house of its friends. Et tu, Brute! When the court had little to do, the justices were wont to spend the morning hours of each Monday in reading at length what they had written during the prior weeks. What has been must be, and so, although the great stress of accumulating business demands every hour, the customs of the past still largely control. Someone has denounced in language too strong for me to quote the waste of time in reading to an audience of 100 or so that which is the interpretation of the law for 70,000,000 of people, who learn what has been decided not from the lips of the justices but from the pages of the press. And, I may add, the acoustic properties of the court room are so imperfect, and the voices of the justices generally so low, that scarcely half the scanty audience hear what is said. And when one speaks so that all in the room do chance to hear, the press dispatches announce to the world that the audible justice has made a stump speech from the bench. But "great is Diana of the Ephesians," and so for "about the space of two hours" every Monday morning the reading must go on.

Yet speed of itself may be more of a vice than a virtue. Important questions are not rightly decided unless fully considered, and the administration of justice would soon be pronounced a mockery if first impressions controlled every case. But greater expedition can be obtained without detracting from fullest examination and consideration. Shorten the time of process. Curtail the right of continuance. When once a case has been commenced deny to every other court the right to interfere, or take jurisdiction of any matter that can be brought by either party into the pending litigation. Limit the right of review. Terminate all review in one appellate court. Reverse the rule of decision in appellate courts, and instead of assuming that injury was done if error is shown, require the party complaining of a judgment or decree to show affirmatively not merely that some error was committed in the trial court, but also that if that error had not been committed the result must necessarily have been different. It may be said that this would make reversals difficult to obtain. They should be difficult. The end of litigation should be almost always in the trial court. Business men understand that it is best that the decisions of their committees of arbitration should be final and without any review; while some of our

profession seem to think that justice is more likely to be secured if by repeated reviews in successive courts, even to the highest in the nation, the fees of counsel can be made to equal if not exceed the amount in controversy between the clients. In criminal cases there should be no appeal. I say it with reluctance, but the truth is that you may trust a jury to do justice to the accused with more safety than you can an appellate court to secure protection to the public by the speedy punishment of a criminal. To guard against any possible wrong to an accused, a board of review and pardons might be created with power to set aside a conviction or reduce the punishment, if on the full record it appears not that a technical error has been committed, but that the defendant is not guilty, or has been excessively punished.

The truth of it is, brethren, in our desire to perfect a system of administration, one which shall finally extract from confused masses of facts and fictions the absolute and ultimate verities, we forget that tardy justice is often gross injustice. We are putting too heavy burdens on our clients, as well as exhausting the patience of the public. Better an occasional blunder on the part of a jury or a justice of the peace, than the habit of protracted litigation.

The idea of home rule and local self-government is growing in favor. Thoughtful men more and more see that the wise thing is to cast upon each community full responsibility for the management of its local affairs, and that the great danger to free government is in the centralization of power. Is it not in line with this thought that as far as possible the final settlement of all controversies which are in themselves local shall be by the immediate friends and neighbors of the litigants? Was not that the underlying thought of the jury as first established? And while we boast that the jury system is the great bulwark of our liberties, are we not in danger of undermining its strength and impairing its influence by the freedom of appeals? Is not the implication therein that the jury and the trial judge can not be trusted, and is not the sense of responsibility taken away from both when they understand that no matter what they may decide some superior and supposedly wiser tribunal is going to review all their decisions and correct whatever of mistake they may make?

We boast of the educating influence of the ballot box, and say that only as each citizen realizes that the responsibilities of government rest upon him is possible the development of a perfect system of popular government. Is it not also true that the jury room has its educating influence, and that we ought so to adjust our system of jurisprudence that each juror shall come to feel that the responsibility for the administration of justice rests largely upon him?

But whatever of help may be in these suggested reforms, they are impotent of themselves to create the leader. They are simply a matter of machinery. The power must be in the man. The lawyer must be fitted to lead. For that a thorough education is necessary. And so I come to the thought which I wish to impress upon you; and that is, if our profession is to maintain its prominence, if it is going to continue the great profession, that which leads and directs the movements of society, a longer course of preparatory study must be required. A better education is the great need and the most important reform. The door of admission to the bar must swing on reluctant hinges, and only he be permitted to pass through who has by continued and patient study fitted himself for the work of a safe counselor and the place of a leader.

I do not propose to discuss the different methods of legal education, or compare the law school with the office, the case with the text-book. These are questions which others can and doubtless will discuss with far more ability and with the benefit of a larger experience. That which I wish alone to emphasize is the need of securing in some way to everyone admitted to practice the benefit of a preparation therefor far surpassing that which most young lawyers now enjoy. I speak with the utmost freedom, for I did that which I now condemn. I hastened through my legal studies and was by the diploma of a law school and a certificate from a court declared fit to advise as to all rights and liabilities, and to carry on any litigation before I was old enough to be intrusted with the right to vote. I appreciated the mistake when I attempted to practice, and I fear some of my clients became equally aware of the fact.

But why is a higher education to-day the special need of the profession? Because, first, the law is a more intricate and difficult science than heretofore. The very complexities of our civilization and the multiform directions of human enterprise have not only increased the number, but have also given greater variety to the rules controlling business transactions. He who would become qualified to counsel and guide must therefore have a larger legal lore, and that is only obtained by a more extended study and training. While it is true that the practice of the law is becoming divided into specialties, and we have the insurance lawyer, the railroad lawyer, etc., yet no man can become a successful specialist without a general knowledge of the rules obtaining in other departments than his own.

Because, second, to preserve the confidence of the community in the profession, each member must be qualified for the higher demands now made upon it. When society perceives that the great number are but slightly educated, how soon will the lawyer fall into disrepute. He will be only the object of the sneer of the cynic and the laugh of the wit. He will be thrown from his position of leader, and no longer sought after, respected, or followed.

Because, third, his mistakes are freighted with greater possibilities of injury. When business transactions are nothing more than an occasional barter of a chattel, or a simple contract for labor, a mistake works but little injury, and only to a few. But when they involve the great railroad and commercial dealings, so common to-day, a mistake may be fruitful of large and widespread ruin. So the responsibilities which rest upon us are greater than ever before, and we must rise to the level of those responsibilities, or both we and the society we attempt to lead will suffer.

Because, fourth, society each day of its advancing civilization needs and demands a wiser leadership. The welfare of humanity rests not on what has been accomplished, but on the steps forward which it takes. If those steps are wisely advised and prudently taken, then we may confidently look for the coming in of the day of which poets have sung, and which prophets have foretold, when peace and righteousness shall fill the earth. While, on the other hand, if illy advised and rashly taken, progress ceases and society resolves itself again into the anarchy and chaos from which it has so slowly arisen. It has often been said that a community is no better than its leaders, and while there may be temporary exceptions, that is certainly the general rule. So if we would have a steady advance in social order we must have an equally constant advance in the character and accomplishments of the lawyers, its leaders.

I know that mere education is not all-sufficient. There must be a man to be educated. It is an old saying that you can not make a silk purse out of the caudal appendage of the female swine. No more will any amount of study and training pour legal lore into some craniums or give that rare and blessed gift, common sense. Still that does not prove that there is no need of education. Henry Ward Beecher once said that dress does not make the man, but when the man is made he looks a great deal better dressed up. So while mere study will not supply the lack of legal capacity, given one capable of becoming a lawyer, and a thorough education will place him in the front.

The strength of an army is not in its numbers, but in its discipline and training. Cortez, with a handful, rode through thousands of opposing Mexicans and entered the capital city in triumph. Japan's disciplined troops saw scarcely anything else than the backs of the fleeing Chinese, and the most numerous people on the face of the earth were conquered within a few weeks. So it is with our profession. Its power lies not in the mere number of its members, but in their learning and capacity. A single true and noble lawyer is strength and glory, while a thousand pettifoggers are weakness and shame. In our late war, with its millions of volunteer soldiers, who became the victorious leaders? The trained students of military science. Their education had fitted them to lead. The great movements of civilized society upward are struggles, though not wars. Who can lead in those movements? Mainly the trained lawyers, they whose long study of human rights and obligations enables them to place before each individual the limits of action, and to guide into paths of life and conduct, which are ways of pleasantness and paths of peace, and so the paths through which civilization moves on and up.

It may be objected that if the course of study is extended and the conditions of admission to the bar increased a great many will be deterred from entering the profession. A perfect answer is that a great many ought to be deterred. A growing multitude is crowding in who are not fit to be lawyers, who disgrace the profession after they are in it, who in a scramble after a livelihood are debasing the noblest of professions into the meanest of avocations, who instead of being leaders and looked up to for advice and guidance, are despised as the hangers-on of police courts and the nibblers after crumbs which a dog ought to be ashamed to touch. Even of those who would love to keep up the dignity of the profession many find no adequate compensation from the practice, and so mingle with it dealing in insurance, real estate, and kindred matters, to eke out the living the law does not furnish. It would be a blessing to the profession, and to the community as well, if some Noachian deluge would engulf half of those who have a license to practice. Webster's reply to the question whether the profession was not crowded was that the first story was full, but that there was plenty of room in the second. We should see to it that there be no first story, and that only second-story lawyers be found on our rolls.

It is said that some of the noblest of our members would be shut out from the law and turned into other pursuits. If a four-years' course of study had been required would Abraham Lincoln have become a lawyer? My reply is two-fold. First, seldom would any one capable of becoming a hero of the bar be turned away. Obstacles only stimulate the efforts of such men. They work their way up in spite of all

difficulties. They glory in their ability to overcome all opposition. Secondly, if perchance someone worthy of a place on our rolls should be kept away there will be plenty left. The general level of professional standing should not be lowered for fear some single chieftain is never found.

Finally, it is objected that the high standard should not be insisted upon, because in our hamlets and smaller villages there is room for very ordinary lawyers. This is a mistake. There is no place anywhere on the face of the earth for a cheap lawyer. It is true that in a village there may be but little business, true that many transactions are of such a simple character that a limited knowledge of the law will guide one safely through them; but it is also true that the relations between the villages and the great business cities are becoming more and more intimate, and are such that often the highest legal lore is required to properly advise the dwellers in the former as to their rights, duties, and liabilities, and so the lawyer in the village must be qualified to meet the lawyer in the city on equal terms. Further, he will represent the village in the legislature, and he should be able to make that village a power in the legislation of the State. There should be a general lifting up of the profession, so that all its members everywhere be recognized as leaders.

The final peace of the world will be wrought out through our profession. I know the poet sings of the day

> When the war drum throbs no longer and the battle flags are furled
> In the parliament of man, the federation of the world.

But the poet is mistaken. The legislator will not bring the day of universal peace. There will never be one great parliament, one federal republic embracing all races and ruling the world. The law of race individuality, with its consequent differences and antagonisms, can not be overcome. Gaul and Teuton, Slav and Saxon will never become one people. Blood is thicker than water. Because individuals of these varied races come to this new land of ours, and dwelling as neighbors are slowly moving toward one homogeneous people, it does not follow that the law of race will ever be forgotten or ignored in the native land. The vision of one great nation with a single parliament is only a poet's dream. But the lawyer will work out the final peace and bring in the glad day when the spear shall be turned into a plowshare and the sword into a pruning hook, and nations shall learn war no more. In each separate nation as it advances in civilization more and more are differences settled and rights adjusted by the lawyer and the judge, rather than by the pistol and bowie knife; so, as the world advances in civilization, will differences between nations be in like manner settled. Arbitrations are growing in favor, and international courts will soon be a part of the common life of the world. I know the time may seem far distant when any such court shall come into existence. It will be witness to a great advance in civilization, and yet within the last fortnight I have seen it stated in the papers that the French Assembly has unanimously passed a resolution looking to the establishment of some tribunal of arbitration to settle all differences that may in the future arise between that nation and this country. The world is becoming familiar with international arbitrations and the settlement of disputes thereby; and every successful arbitration is but a harbinger of the day when all disputes between nations shall be settled in courts of peace and not by the roar of cannon and waste of blood.

When in youth I studied the structure of our Government, I looked with awe and reverence upon the Supreme Court of the United States, a tribunal taking no cognizance of the minor disputes between individuals within the several States, but sitting in judgment upon the weightier controversies between States and citizens thereof, and determining the rights and liabilities of States to each other and to citizens. I thought of the solemn sense of responsibility which must rest upon each justice thereof as he came to the decision of every case. The years have brought me to a place on that bench. With a profounder reverence and a personal sense of responsibility I now look upon that court and its work, and I would that every judgment it pronounces should be wrought out with such wisdom as through the long stretch of coming years to stand the supremest test.

Does it tell of the coming on of second childhood, or is it proof of a growing confidence in man and his capacity for self-control that I now look with the full assurance of faith to the dawning of a day when some great international court shall come into being, whose judgments, touching no questions between individuals, shall determine all controversies between nations, and by such determinations bid the world's farewell to the soldier? But by whom shall such a tribunal be established, and who is to sit therein and render the judgments which shall command such confidence and respect that willing obedience thereto be yielded by all? Out of the rich brain of our profession shall be wrought the form and structure of that court, its fashion and its glory, and the lawyers shall be the judges thereof.

So believing, let us all strive to lift the standard of professional character and acquirements so that no one shall ever think of challenging our place in the front.

CHAPTER XXIX.

MEDICAL SCHOOLS OF THE UNITED STATES.[1]

The Report of the Commissioner of Education for 1892–93 (pp. 601–613) contains a summary of a report on medical education in the United States by Dr. Marcel Baudouin, delegate from the French Government to the Chicago Exposition and specially commissioned to study the system of medical instruction, conditions of professional life, etc., in our country. Dr. Baudouin visited the chief medical schools, hospitals, etc., of the country, and his report contains, in addition to the summary referred to, extended descriptions of individual institutions. To reproduce these in full would require more space than can be allowed for the subject, but it seems desirable to present at least extracts relating to typical schools and in a few instances even to give in full Dr. Baudouin's account of individual institutions.

JOHNS HOPKINS UNIVERSITY.

"Of this university for higher scientific education," says Dr. Baudouin, "it is necessary to give more than simple mention. Here, however, I can only describe its magnificent institute of physics, the largest in the United States, directed by Prof. Henry A. Rowland; its chemical laboratories, which Prof. Ira Remsen courteously showed me, and its geological collections (so important ordinarily in all the large American universities on account of the development given to studies relative to the mineral wealth of an almost virgin soil). Apparently the chief purpose of this university is the training of engineers (mining, mechanical, etc.), and specialists in chemistry, but it is also celebrated for the works of pure science which come from its laboratories. Here are to be found men of undoubted ability; here are illustrious mathematicians, savants of the highest order, whom rival universities seek as professors. This is, in fact, one of the principal centers of higher education in North America and would well repay close study. It differs essentially from our French faculties and also from the German universities.

"In 1889 the Medical Weekly stated that the medical department of Johns Hopkins University, announced prematurely, was not in actual operation, but I was informed that the medical faculty of the famous university of Baltimore would open its doors in October, 1893. This department will, without doubt, have the same importance as the other faculties of this institution, and has promise of a brilliant future. In the hospital I am about to describe this school will possess fine appointments, and since the cultivation of pure science is not neglected in this intellectual center it can not fail to draw the most distinguished professors to its circle. Those men who have already taken the course of study at the hospital and who will certainly form a part of the personnel of its future faculty are men well known in the intellectual world.

JOHNS HOPKINS HOSPITAL.

"This hospital is as well known in the medical as is the university of the same name in the scientific world, but, judging from its register, few Frenchmen have visited it. I know of only one hospital in Europe, the Urban Spital at Berlin, that can at all compare with this one founded by Johns Hopkins. Our French hospitals are built on a very different plan, which their antiquity readily explains. Those that have been recently constructed, whether at Paris or in the provinces, may be as good and as interesting as the two mentioned, but certainly they do not compare with them either in extent or in perfect hygienic resources, or in the perfect, harmonious arrangement of all the parts. One who has not seen these two hospitals (which, be it said, admit only 300 or 400 patients, while Tenon at Paris admits double

[1] From report of Dr. Marcel Baudouin, delegate from the French Government to the Chicago Exposition.

that number) can not form an idea of the results which may be attained at this age of the world in the construction of a great hospital when the resources are unlimited.

"The Johns Hopkins Hospital, like the university, was built from funds left by Johns Hopkins, a merchant of Baltimore. Many plans for this institute were submitted to the executive committee, both by physicians and architects, but that accepted is due to Dr. John S. Billings, whose name I have already had occasion to mention. In order to perfect his designs Dr. Billings spent several years in Europe, and visited the principal hospitals of France and Germany. From these studies resulted plans so admirable that they were adopted without opposition. The immense buildings intended for those attacked by acute diseases are situated on a point of land elevated above the city. They comprise numerous separate pavilions divided into three grand sections—medicine, surgery, and gynecology. There is no section of accouchement. These departments are each under a physician in chief. The hospital is free to patients resident of Baltimore and its environs, and to those victims of accidents who are natives of Maryland. There are also separate pay wards for men and for women, and common wards where all patients may be admitted who are not able to pay the usual charges of $5 a week.

"There are also laboratories of bacteriology and pathologic anatomy admirably equipped (pertaining to the school of medicine), an excellent dispensary, and a training school for nurses with a nurses' home.

"I do not intend to give here a full description of the Johns Hopkins Hospital, which was finished only in 1889, nor to enter into all the details of its work. Those who desire more particular technical information will read with greater profit the magnificent publication of Dr. Billings. I prefer to dwell only on such parts as I have seen myself, and of which my report will naturally be shorter and less minute.

"*The wards.*—My first visit was to the surgical department, which occupies a separate and finely appointed division. As I have said before, the wards are small and accommodate each only about a dozen beds. The largest ward is circular, or, rather, octagonal, a form which more than any other facilitates a constant watch on the patients.

"I noticed here portable screens of pine wood which are used to separate the beds of the patients during an operation or while a painful wound is dressed. Sometimes three of these screens are used, forming a sort of box, and thus much agony is kept from the sight of the patients. Some surgical operations which I witnessed interested me much, two in particular. A large aneurism of the aorta, and especially an operation at which, in the course of a hysterectomy, the ureter was cut, and at which Dr. Howard A. Kelly, professor of gynecology, successfully effected a suture of that conduit by means of a lateral anastomosis.

"Certain usages which I had never seen in Europe surprised me; for instance, the custom of taking the temperature in the mouth by means of a very convenient little thermometer. This instrument is placed in the buccal cavity, and the lips of the patient tightly closed for a few moments. In this way results are obtained comparable to those obtained by taking the temperature at the rectum and vagina. This method is a little less exact; as it is rapid it is employed in ordinary cases or where time presses. When the malady is serious recourse is had to the rectal temperature. Contagion is easily avoided by washing these little instruments in antiseptics. The wards for the sick deserve more than passing mention, but I can only touch upon their irreproachable cleanliness, upon the care with which all hygienic precautions are observed, upon the use of the telephone, the little libraries, the flowering plants, the aquariums, and the cages of birds. I must emphasize the importance and regularity of the services rendered by the American nurses who occupy the same position as the 'infirmières' and 'surveillants' of our own hospitals.

"*The nurses.*—There are 60 nurses at Johns Hopkins Hospital, whose shining white uniforms, delicate manners, good nature, respect for the sick, and professional knowledge aroused in me a most lively interest. If the reader will bear in mind that I am a member of the corps of instruction in a training school for nurses connected with a similar hospital in Paris he will easily comprehend how painful were the comparisons which were forced upon me.

"The comparison that I made between the uncertain remuneration of French lay nurses and the liberal salaries received by American nurses, especially those of Johns Hopkins Hospital, and also between the intellectual culture of the two, is not favorable to the French.

"The Nurses' Home of Johns Hopkins Hospital is superb, in reality a little hotel, almost a palace, whose soft carpets and white marble staircase are in strong contrast with the ragged straw matting and wooden ladders of the dormitories of the Pitié or of the Salpêtrière. This building is four stories high. The basement contains a dining room which will accommodate 40 persons, a pantry, four storerooms, a study hall, a lecture room, bathrooms, water-closets, and an elevator, besides a kitchen where the nurses have practical lessons in cookery.

"The first story opens from a large hall on a terraced walk. It contains a parlor

for the nurses, two rooms for the superintendent, a library, six rooms for the head nurses, two others for sick nurses, and water-closets and bathrooms. This story is reserved for the graduate nurses.

"The second and third stories are identical and have seventeen rooms heated by steam (a manner of heating very common in America), four rooms with fireplaces for sick nurses, a laundry, and bathrooms and water-closets. As a matter of simple information I believe it useful to describe the nurses' parlor, which is furnished with a view to comfort rather than luxury. This room is heated by hot water although one of its few luxuries is a fireplace, a rarity in modern American houses. The waxed floor is covered with soft rugs; easy wicker chairs, stuffed chairs, and the traditional rocking chair of America supply inviting seats. The clean white walls are bare of pictures and the windows are without curtains or draperies. I will add only one word more. We not only have nothing in France to be compared with institutions of this kind in the United States, but there is nothing in our country which can truly be called an autonomous and complete lay school for nurses. What has been done at Paris can not be compared with the institutions of this sort in the United States.

"The new hall for surgical operations is reserved for the practice of gynecology and surgery, and is profusely lighted by electricity.

"The surgical amphitheater, in the form of a half circle, is provided with rows of seats rising one above another. At the rear is the entrance for students. Not far from this room is a smaller room for operations on the wounded, or patients requiring antiseptics. This is lighted from the two sides, while the large hall receives its light from above.

"At the outer edge of the hall is an anesthetic room, which serves for both operating rooms, an arrangement somewhat objectionable. There is a dark room for ophthalmology, a room for the surgeon, a room for watchers, a room for those who have undergone an operation, and a small hall for the sick. Situated at the side of the office through which all the wounded must be brought who require immediate operation is a bathroom and a room for gynecological examinations. The wounded do not enter the operating room by the same passage as the hospital patients, and the students have still another entrance. I pass over the dispensary building (a description of which would greatly astonish French physicians), to say a word about the isolating ward. In the basement of this building are the usual arrangements for heating, and from the roof project the usual ventilating chimneys. So numerous are these that one could well describe the Johns Hopkins Hospital as the hospital of little chimneys and hot-water coils.

"Above the basement there is a single story a little more than 10 meters in height. It contains twenty alcoves which open on a central hall. A single bed is in each. In three of the alcoves the floor is perforated in order to insure perfect cleanliness and to admit extra heat from the coils immediately beneath. There are also two rooms for nurses, with two beds in each room, a laundry, a bathroom, and a special kitchen.

"*Heating and ventilation.*—I can not say enough in praise of the system of ventilation and heating which has been adopted by Dr. Billings. I should certainly fail in my duty if I did not make special mention of this feature, which distinguishes Johns Hopkins Hospital from all other American hospitals as well as from those of Europe.

"*Machinery.*—The basement of this establishment should also be seen in detail. Here is machinery unlike any to be seen in France and which can be equaled only in Berlin. Unfortunately it is impossible to describe it in a few lines. Therefore I shall only mention its principal points. Acoustic tubes are placed in all the halls and corridors and communicate with the different buildings. The separated buildings are connected by telephone with the office and through this with the city. Almost every room is supplied with an electric register of temperature.

"Altogether this hospital presents exquisite cleanliness and admirable organization and is constructed with that view to convenience that is met with only in a country where time is money and where in order to work well and profitably it is necessary to work quickly. It is a unique hospital which should be seen and studied."

WOMAN'S MEDICAL COLLEGE OF PENNSYLVANIA.

"As everyone knows, in America there are several colleges devoted exclusively to women. I have examined in all its details the most important of these, The Woman's Medical College of Pennsylvania, situated in Philadelphia. It was organized in 1850, and is the oldest and most celebrated of the existing woman's colleges. The first college of this class, founded in Boston in 1848, is no longer in existence.

* * * * * * *

"The school of medicine is under the direction of a board composed of men and women (the latter six in number). The president is a woman (Mrs. Mary E. Munford), as is also the dean (Mrs. Clara Marshall). There are, besides, teachers,

demonstrators, assistants, and prosectors, many of whom are women. Like most of the American universities, it has a woman librarian.

"The examination for entrance into this college is not difficult. In order to show the plane upon which medical colleges stand I add that the applicants for admission are required to know a little orthography, arithmetic, physics, and Latin (the conjugation of the verbs is sufficient); nothing more is required. The professors, evidently, are content with very little. In the United States it is necessary not to be too severe if one intends to have pupils, a fortiori if they are women."

(Here follows a synopsis of the curriculum.)

"I went through the building, even to the roof, and found that, as in almost all American colleges, the dissecting room was in the top story. The room in this case is lighted by electricity, and each table is supplied with a small light that can be moved to accommodate the operator. I wondered at the location of the operating room, but it is probably so placed to prevent the odor from getting to all the rooms of the building and for freer admission of air into the room."

(Brief descriptions are also given of a few other rooms.)

THE UNIVERSITY OF PENNSYLVANIA.

"In spite of the importance of Jefferson College, in spite of the relative éclat, at least, of the Woman's College, the place of honor among the medical schools of the metropolis of Pennsylvania must be accorded to the medical department of the University of Pennsylvania. It is situated some distance from the center of the city, on the left bank of the Schuylkill River, not far from the Drexel Institute. The campus of the university covers five squares, on which are located the immense buildings separated by grass plats. The first block inclosed by a railing is in the form of a trapezoid, on which stands the college hall of the university; that is to say, the offices of the directors and the halls of the faculty of philosophy, of the faculty of medicine, the laboratories for dental clinics, the library, the mechanical laboratories, and the machine shops. Behind these are the hospital of the university, the nurses' home, the maternity hospital, and the morgue, with a mortuary chapel. A little farther away in a triangular park are the veterinary hospital, the veterinary school, a hospital for dogs, and the school of biology (faculty of natural sciences). Finally, there is in course of construction an immense building, which will receive the name of the Wistar Institute of Anatomy and Biology.

"The school of medicine connected with this university is one of the oldest in the United States and one of the most important. Organized in 1765, it conferred its first diploma in 1768. Owing largely to the influence of Benjamin Franklin and William Smith, its early development was rapid. The course of study in this school is for three years only,[1] but most of its professors are men of great distinction, and some of them, as, for instance, J. W. White, L. A. Duhring, J. Ashhurst, J. S. Billings, and J. Marshall, have a European reputation. The corps of teachers comprises 22 professors, 4 assistant professors, 1 demonstrator, 7 teachers, and 20 prosectors and instructors in anatomy. The dean, Mr. Marshall, still quite a young man, is only an assistant professor. The total number of students for the present scholastic year (1892–93) is 847, of whom 1 is French, 1 African, 1 Haitian, 1 Japanese, 2 Germans, and 2 natives of the West Indies. It was with great interest that I went through the laboratories of this university, especially the two for chemistry, each of which accommodates more than 200 pupils. The dissecting room, like that at the Woman's College, is in the top story, and is lighted by electricity and supplied with lavatories. I saw also the old museum of anatomy, which contains one or two curious specimens, and the museum of geology.

"*School of dentistry.*—I was much struck by the location of this department. One room is in the lower story of the chemical laboratory, and is reserved for clinic exercises and for operations by the pupils. This immense hall contains a succession of dentists' chairs, in which, at the time of my visit, were seated a large number of patients, upon whom the students were operating. This department is, moreover, much appreciated. It has 8 professors, 3 assistant professors, 9 instructors, and 17 demonstrators. The course of study is for three years. In the years 1892 and 1893 there were 153 pupils, of whom 72 were in the first year, 60 in the second, 17 in the third, and 17 more taking special studies. Among them were 1 French and 2 German pupils.

"The operating room is one of the largest I visited in the United States. It measures 140 feet long by 40 feet wide. It is lighted from all sides by large bay windows. Before each of these windows, where the light is very strong, is placed a Morrison chair and all the instruments necessary in dentistry. The mechanical laboratory has been supplied with all the modern appliances and with electric lights. In 1891–92 8,536 persons were treated in the operating room. From this it will be seen that the patronage is large and the students active.

---

[1] Since this article was written this school and many others have adopted courses of four years.

"Among the diseases treated are recorded 143 cases of alveolar abscesses and 1,321 cases—an almost incredible number—of salivary calculi. If this is so, it is certainly a very characteristic pathologic fact, or else the American dentists have a special means of discovering these minute concretions. At the mechanical laboratory they made 794 artificial pieces (prothétiques) of various sorts during the year. At this school the study of dentistry costs from $100 to $120 a year, or about $400 for the three-years course."

ROOSEVELT HOSPITAL, NEW YORK.

Dr. Baudouin passes in rapid review the various medical institutions and hospitals of New York. Respecting the Roosevelt Hospital he says:

"Of all the medical institutions this is the one which a doctor ought to see on visiting America. It is a hospital comprising nearly 250 beds, not large but well arranged, although not at all according to the modern ideas for the construction of hospitals. The most interesting part to study is an annex which forms at this time certainly the most beautiful structure in the world intended for operations. I speak of the Syms Building, which was finished in 1892 and has not yet been described in Europe.

"Thanks to Dr. McBurney, the chief of service, I visited this famous operating room. It is, in fact, a marble palace erected in honor of aseptic surgery. The luxurious operating rooms of M. Poncet, in Lyons; of the Urban Spital, in Berlin; of Professor Kelly, of the Johns Hopkins Hospital, Baltimore, are nothing beside this veritable temple of shining white marble. It cost 1,750,000 francs ($350,000), which was generously donated by Mr. W. J. Syms, on the express condition that it should be spent for the especial purpose of erecting a model establishment. The plans are worthy of the greatest praise, and the execution is equal to the majestic conception of the architect, Mr. W. Wheler Smith, and the consulting surgeon, Dr. Ch. McBurney.

"The Syms Building was opened November 5, 1892. Its principal entrance is on Fifty-first street, opposite the College of Physicians, and it communicates at the left by a special passage with Roosevelt Hospital. In the center is a vast amphitheater admirably arranged. It is lighted from the sides, and has a floor, doors, and walls of marble. (Marble has been used here not for luxury, but because it can be so easily kept clean.) The building is lighted by gas and electricity. Arranged around the amphitheater are little rooms where all necessary preparations are made for operating; also a large circular lobby from which open a dozen rooms whose enumeration sufficiently indicates their uses. These are a waiting room for the sick near the operating room for septic patients; an examination room for the sick; two rooms for etherization (anesthesia); a photograph room, with dark cabinet; a laboratory of histology; a room for bandages; a room for articles used in dressing wounds; a room for the sterilizing stoves (I counted six, very complete); a room supplied with two reservoirs for sterilized water, where the instruments are cleaned; another room fitted with glass cases for the surgical instruments; finally, a large toilet room for the assistants. At the side there is still another operating room for laparotomy, and the surgeon's room.

"We were particularly interested in an arrangement the advantages of which are at once apparent. I speak of a great inclined plane which takes the place of a staircase, or rather of an elevator, by which the patients are conveyed to the operating room in the second story, with the least possible jolting. On the floor of this incline are projections, which make the descent of the litters and slides on which are placed the couches of the patients, slow and easy. I repeat, with pleasure, that I was amazed, not only at the luxurious appointments, but above all at the services rendered in this magnificent institution of surgery, which from all points of view must be regarded as a model."

At Bellevue Hospital Dr. Baudouin noted particularly the morgue, the tents in the open court for typhus cases, the old war ship at the quay fitted up as an isolating ward and more especially, as he says, "a large building reserved for inebriates, who multiply alarmingly in New York, and who are generally of Irish origin. A visit to the rooms where delirium tremens and pneumonia with pulmonary œdema are common is very interesting."

The author devotes several pages to the hygienic aspects of New York City, noting in particular the abundant provisions for securing heat, light, and ventilation in private houses and in the principal hotels. He closes this chapter in these words: "Three things are greatly appreciated in the United States, first, the dollar, then equality, and finally, material comfort. If comfort comes last, it is nevertheless an adored idol."

From New York Dr. Baudouin continued his journey eastward, stopping first at Yale and then at Clark University. After a brief account of Yale he adds: "I would like to describe in detail the organization of the American university, taking

Yale, one of the most celebrated, as a type, and also to show how and why in America they unite under the name of university what is called a high school or a college and the various faculties. This organization is extremely curious and deserves the attention of those who are occupied with questions of education, but it would lead me too far astray from the medical schools, which is my legitimate subject."

SCHOOL OF MEDICINE OF YALE UNIVERSITY.

Of this school our author says: "It dates from 1810, at least it was authorized at that time, but was not organized until 1813, and the first instructors were chosen by the professors of Yale from the members of the Connecticut Medical School. In 1879 an examination for admission was required of applicants, and at least a three years' course of study was demanded, together with practical work in the laboratories. * * * In 1884 the school passed entirely from the control of the Medical Society of Connecticut, under the authority of Yale College. It was then organized like one of our best full-course schools (écoles de plein exercise), and bears comparison with several of our provincial faculties.

(Here follows a brief outline of the course of study.)

Dispensary and hospital.—"One word on the hospital of New Haven and the dispensary annexed to the university where the students take their course in clinics. The dispensary occupies one of the buildings which form a part of the school of medicine. It has recently been enlarged and the old buildings have been remodeled. In spite of this it is not very important and furnishes only restricted means of study to the students.

The New Haven Hospital.—"This hospital is more worthy of interest on account of the numerous accidents which necessarily occur in an industrial city of nearly 100,000 inhabitants. Operations are frequently performed in the hospital, and the new amphitheater which is annexed to the surgical division is equipped after the most approved models. There are three resident physicians.

"Medical instruction at Yale approaches ours as far as regards practical work and clinic exercises, but the same can not be said with respect to its theoretic course; which system is the best remains to be decided (a difficult question to solve, since the duration of studies in the United States of America is notoriously too short). It is absolutely impossible to make a real doctor in three years—I do not say a learned physician. This is beginning to be recognized everywhere, since even in this country, where (as one said to me) 'everything goes by steam,' they realize that it is necessary to demand at least four years' study."

[As stated before, nearly all American medical colleges have now a four years' course, adopted since the above was written.—Ed.]

"The gymnasium of Yale University, the plans of which were seen by M. Perre de Coubertin during his visit in the United States, is magnificent. It is now almost finished and a few words will characterize it better than a long description. It is a palace of white marble erected for hygienic and physical exercises. The old gymnasium being totally out of keeping with the splendid edifices of the university and insufficient for the needs of the constantly increasing number of students, the alumni gave $200,000 for the construction of this temple of hygiene which was intrusted to the architect, Mr. Gaugolpho.

"I went over the monumental staircase, the reception room, the hall of trophies, the swimming pools, and the immense hall at the top of the building which M. Perre de Coubertin saw only in drawings. I visited the toilet room, the water-closets, the baths in the basement. I saw the gymnastic apparatus and the students practicing and spectators watching their work. I saw all this, and my eyes, dazzled at the sight, shed tears of regret at the remembrance of what we had in France to compare with the American gymnasium! In proportion as I admired the beautiful and luxurious appointments and arrangements, just so much was I pained to see the abuse of sports, artificial and useless, such as rowing indoors and riding wooden horses, etc. I repeat what many have said—they will abandon this system which consists in transforming the colleges into places of sport. There must be a limit to everything, even to physical exercise. Please Heaven, may I never hear from a French woman, since I value highly the universities of past times, the remark made by a young American woman, daughter of an old governor of one of the Middle States: 'It is so interesting and beautiful to see our brothers and our friends contesting in public the palm of baseball on the athletic field of the university, that I would willingly sacrifice a night at the opera at Paris to be present at a performance of this kind.' That day Paris and France will exist no more! Physical exercise in the open air without rule or torture as much as you wish; but these rowing regattas on wooden streams, these trials of strength or races on the velocipede—to what good? Everyone knows the races have not benefited the horse and I do not believe they are any more efficacious for man."

SHEFFIELD SCIENTIFIC SCHOOL.

"This institution is in reality designed to train men engaged in mechanical pursuits. It resembles a little our École Centrale, since biologists, chemists, mechanical and mining engineers, and agriculturists are graduated from its halls. There are also students who are occupied in high scientific researches as at Clark University. Altogether we have nothing in France absolutely analogous to this institution. The great American universities, such as Yale, are unique; this bringing together under one roof and classifying students of such diverse courses has truly a stamp of originality and grandeur.

CLARK UNIVERSITY.

"What a contrast with Yale! Clark has as yet only a few professors and few pupils. But let Yale take care; Clark will become great, provided the donations continue to flow to its treasury, and its future professors possess the qualities and courage of the president, Mr. G. Stanley Hall. Although Clark University has existed only a few years it is in a flourishing condition. In America universities are born and grow like cities. For instance, four of these universities, and four very important ones, have been founded within five years; Clark at Worcester, Stanford, the Catholic University at Washington, and that of Chicago, in course of construction.

"Clark University is an establishment which in its tendencies fairly represents a university as we comprehend it in France, but where we have only two faculties, that of science and that of literature, Clark in reality has five departments, as they say in America; mathematics, physics, chemistry, biology, and psychology. It has no faculty of theology, nor of law, nor of medicine, nor of pharmacy; but I ought to add that they expect to organize these several branches of education as soon as possible.

"The campus of the university is about a mile and a half from the center of the city, north of Main street. Two large buildings are completed, the most recent of which is reserved for chemistry; the other contains the offices and Prof. G. Stanley Hall's magnificent laboratory of physiological psychology. I visited this department with lively interest, as well as the laboratories of physics and biology, which are of less importance. I repeat, it is absolutely necessary when on a scientific mission to the United States to devote one day to the department of chemistry and experimental psychology of this university.

"*Laboratory of experimental psychology.*—The physician will be especially struck with the lavish appointments of Dr. Hall's laboratory, with the nature of the original work which is done there, and with the ideas which prevail. It is certainly a model of its kind, and it is to be desired that one laboratory of physiological psychology at the Sorbonne, which serves the 'École pratique des hautes études,' be as well equipped, and that the means of study be as perfect. My attention was specially directed to the specimens that were used in a delicate study in histology, i. e., the sudden transformation of the cells of the nerve centers from various causes. I could not help admiring the patience and technical skill of the young assistants who successfully conducted very complicated work. Dr. Hall has a high conception of the rôle of a professor of psychology. He is not content with teaching his pupils merely the anatomy and physiology of the nervous system; he takes them on Sundays to the insane asylums of the city, shows them the patients, and gives them living examples of the different affections of the will, the memory, etc. It is evident that the school of M. Ribot of the 'Revue Philosophique' is not the only one in which the sick are made the subjects of psychological observations."

Here follows an outline of the course in psychology, to which the writer adds: "It is evident that here we have a true institute of psychology worthy to be compared with the Paris School of Anthropology."

"Clark University publishes a review more important than the Revue de l'école d'Anthropologie, the American Journal of Psychology, much appreciated by competent judges, and of which Dr. Hall is the founder and editor in chief.

"In 1892 there were only 18 students following the course of higher studies at Clark University. Ultimately they become professors of specialties, and are much sought after by other colleges.

"I am convinced that these few remarks on Clark University, on the course of study, and the laboratories of psychology will suffice to show what impulse a professor of talent is able to give to an institution; what results a man of great energy may accomplish when supported by generous donators, if he is simply guided in his enterprise by the love of science and his own original ideas. Is it not to be regretted that in our country such men are never able to give proof of their moral vigor and their power as organizers? But what system is without faults? We must acknowledge that the American system is far from perfect."

From Worcester Dr. Baudouin proceeded to Boston. Of this city he says: "It would be supposed that at Boston, the Athens, or, better, the Edinburgh of the United States, the most cultivated city beyond the seas, the schools of medicine would be superior to those of the rival cities of New York and Philadelphia. It is not so, except, perhaps, the Harvard Medical School. But this school, which ranks first in Massachusetts, and which is situated in Boston, while the other buildings of the University are at Cambridge, a suburb of Boston, is hardly larger or more celebrated than those of the University of Pennsylvania or of Columbia College."

Dr. Baudouin's notes on Harvard University as a whole are exceedingly meager. Of the medical school he says: "This chief medical school of Boston, although a part of Harvard University, is situated in the city. The buildings occupy an entire block on Boylston street, not far from the Boston Athletic Club, one of the famous clubs of Boston, the great public library, and the Public Gardens, where the statue of carved bronze in honor of the discoverer of anæsthesia by ether is erected. The massive structure of red bricks presents an imposing but severe appearance.

"The course of study at this school has within a few years been changed from three to four years, and is extremely rigid. The course also has been recently extended; anatomy, physiology, embryology, bacteriology, and hygiene, concurrently with general and medical chemistry, form the subjects of the first year. Unfortunately the entrance examination is not very severe, not at all comparable to our baccalaureate's.[1] It is the same everywhere; the students of the learned professions in America are not, as with us, taken from the cultivated classes; and the doctors commence their special studies very poorly equipped in point of general instruction.

"The school is equipped with laboratories for bacteriology and special rooms for experimental work in histology, physiology, chemistry, etc.

"I noticed at Harvard University, as elsewhere, that medical physics is not well developed, at least not in comparison with chemistry. The courses in natural history also are very limited. They give much less time to zoology and botany than we do. Perhaps this is due to the fact that the students are supposed to be sufficiently advanced in these studies when they enter the medical school. Clinical studies are pursued in the several hospitals of the city, which afford great facilities for this work. A sort of post-graduate course has been instituted in connection with the regular school, analogous to those in New York. It comprises a very important personnel, whose members lecture in the various city hospitals to doctors wishing to perfect themselves in one or the other branches of the healing art."

M. Baudouin describes at length the Harvard school of dentistry and speaks of its wide reputation. He devotes nearly a page to the veterinary school, and in closing says: "The instruction here is very complete. Ophthalmology is taught in a special manner, and of course there are chairs of anatomy, botany, of chemistry, general and medical, of pathological anatomy, etc. The course of study is for three years and is based upon the usual curriculum of the medical schools of the country. The practical work is organized with care. The Massachusetts State board of cattle commissioners and the board of health of Boston have some official connection with the school, which is also of practical advantage to the pupils. The veterinary hospital, founded in 1883, affords the pupils opportunity for clinic exercises."

INSTITUTE OF TECHNOLOGY.

"It would be unpardonable," says our author, "if in my enumeration of the scientific institutes of Boston I should forget its famous school of technology, well known to the pupils of our schools of arts and technical professions. It has a special section of biology for sanitary engineers. This magnificent establishment which represents exactly our École Centrale, has superb laboratories of chemistry, physics, etc. I only regret that I can not describe them here."

HOSPITALS.

The numerous hospitals of Boston are enumerated in the report, and a few described in detail. Of the Massachusetts General Hospital Dr. Baudouin says: "It is old, but has yet a certain interest on account of its dimensions, and the new buildings which are contemplated. An operating room is to be added, which will be in conformity with the most modern ideas.

"The Boston City Hospital, of more recent date, does honor to the city which has founded it. I must mention particularly its tent service, that deserves detailed description; its capacity—it is one of the largest, after Bellevue Hospital, in the United States; and the nurse training school which is attached to it.

"Before leaving Boston one should visit the McLean Hospital, an annex of the Massachusetts Hospital. It is a vast hospital asylum of recent construction, built at Waverley, a few miles northwest of Boston, not far from Watertown and Waltham.

---

[1] The regulations recently adopted will require a literary degree for entrance.

It is composed of a number of buildings erected in a beautiful park in the midst of a grove of old oaks. There are six buildings reserved for the sick. In the center of this group is the administration building, which contains the offices, the library, the telephone, a dispensary, etc., in the first story, while the second and third are occupied by the personnel of the hospital. At a certain distance are found other constructions remarkable for their arrangement: Upham Memorial Building, for men; Appleton Building, for women; Belknap House, containing numerous rooms well arranged, with refectories, halls, etc. Each of these buildings is independent of the others, and all are heated by steam. A training school for nurses has been annexed to the McLean Hospital since 1882. I will here say a few words concerning it, for I have had scarcely an occasion to speak in detail of these schools which are so common in the United States:

"The training school at McLean, like others of the same character, is under the direction of a woman superintendent, subordinate to the superintendent or director of the hospital. The lectures of elementary instruction are delivered by the chief nurses and supervisors and technical lectures by the doctors and surgeons of the hospital and their assistants. From time to time the pupils pass examinations. Naturally they are instructed in all that relates to the service of the sick room, to simple dressings, and the first principles of massage and the necessary preparation for slight surgical operations. They are taught to recognize the chief symptoms of disease (delirium, coma, etc.); they learn how to restore asphyxiated patients; they are shown the necessity of thorough disinfection, and, above all, the benefits of constant and thorough cleanliness.

"In return for this instruction they give their services to the hospital. They live at the hospital in the capacity of nurses and assistant nurses, and receive only sufficient money to pay for their clothing. The women receive $12 a month the first year and $15 the second year. The men receive $23 the first year and $25 the second. The studies last for two years, and after the diplomas are granted the pupils become graduated nurses and receive appointments at $25 per month for the first year and $30 per month for the second year. The men are a little better paid; they receive $27 a month the first year and $30 a month the second year. At least these are the salaries given at the McLean Hospital. In other cities they are higher.

"It is needless to remark on the suggestiveness of the comparison of the salaries received by these nurses and those of Paris. But I ought to add at once that the personnel of the American hospitals in point of morality and intellect surpasses that of our hospitals. The nurses, in the great cities of the East especially, are for the most part women above the average. This is so true and is so well recognized that many of them, well raised, pretty, and well educated, marry the medical students. The system of marriage dowry does not exist in the true Yankee family. Apartments as luxurious and well furnished as those of the assistant doctors are reserved for these nurses. It is certainly true that women generally are better cared for in America than in Europe, and that on the American side of the Atlantic the comforts of life are met almost everywhere, as well in the family of the simple workman as in that of the millionaire."

CORNELL UNIVERSITY.

The reputation which Cornell University enjoys in Europe made it a special center of interest to Dr. Baudouin. "The wild and picturesque region of Ithaca, in the State of New York, where this magnificent institution has been erected, is reached after a fatiguing journey, especially so to one not used to American railroads. Leaving Syracuse, a great center of commerce and manufacture of all sorts, I accomplished this interesting excursion to Ithaca in one day, and visited the campus of Cornell University in company with Mr. Fr. C. Crane, professor of the literature of the romance languages, and a sincere friend of France. Besides its college, very renowned in America, this model establishment possesses a school of law, recently opened, and special schools of agriculture, of architecture, and of engineering. The school of mechanical and electrical engineering is one of the best in the United States, and its professors are much esteemed in Europe. Many of their works have been translated into French. There are laboratories for the study of machines and the resistance of materials, which are organized with a lavishness unknown to us in France. The arrangements of the testing shops and the hall for practical work are the most unique in the world.

"The laboratories of physiology and comparative anatomy, placed under the charge of Prof. Burt Green Wilder, are worth visiting. Mr. Wilder, who is a veritable specialist in the study of the brain of vertebrates, very courteously conducted me through his museum. The specimens which he has prepared do honor to this collection of the university. This expert anatomist showed us some very well preserved human brains—the brains of a twin fœtus, the brain of a young monster—and a series of preparations illustrating the development of the human brain. Almost all these specimens are truly masterpieces of fine dissection. Many other organs

have been prepared with as much skill, particularly the different parts of the heart. Almost all of this entire museum is the work of Professor Wilder.

"In twenty years he has succeeded, with rather moderate resources, in forming a zoologic collection quite sufficient for the college of the university. In this collection are some rare animals, many of them of American origin. Recently Mr. Wilder, who is an old pupil of Agassiz, has dissected an orang-outang. He showed us the brain, a preparation of which he is very proud, for it is difficult to procure this anthropoid in America. This organ is remarkable for the folds of its circumvolutions, in particular that of Broca. Mr. Wilder has established many very interesting anatomical facts with this specimen; for example, by means of this it has been possible to demonstrate the existence of the orifice of Magendie in the orang-outang.[1] Mr. Wilder has also the brains of criminals and of men distinguished for ability. We saw in this museum the brain of a celebrated philosopher, Chauncy Bright, which is remarkable for a well-developed connecting convolution, extending between the ascending frontal and the anterior parietal convolutions at the upper end of the fissure of Roland. There is also the curious brain of a lunatic, and one of a well-known assassin, Rullott.

"*Preparatory course of medicine.*—If at Cornell there is no faculty of medicine, there is nevertheless a preparatory course for those of its students who desire to pursue the study of medicine. This course, which lasts two years, is very peculiar. There is nothing analagous to it in France."

* * * * * * *

Here M. Baudouin introduces the programme of this preparatory course, with respect to which he continues: "It will be noticed that drawing and military and other physical exercises are included in the programme, and also that importance is given to the studies, which in France are called accessory sciences (i. e., chemistry, botany, physics). We remark also the mixture of courses, which in the French system belong to superior instruction (histology, anatomy, embryology, etc.), with those of the higher classes of the secondary schools in France (i. e., psychology, living languages, etc.). This mixture is very curious, and shows that in the United States there is little disposition to follow our old way, the so-called classics. In any case, it is very difficult to compare our actual organization with that of American universities. It is evident, therefore, that the question of the real equivalence between American and French diplomas is not likely to be settled at once. In America everything has been conceived in a manner so novel and unexpected to our minds, accustomed to classifications fixed, but artificial, also, in spite of their antiquity, that any comparison with what passes in Europe seems to me premature at this time. It is necessary to wait for a series of reforms which are sure to take place before many years elapse. Moreover, of what use is it to attempt the comparative study of questions set for entrance examinations or of the programmes of technical schools when the respective standards of these schools differ in different schools, and according to the patronage that each controls, the resources with which they are provided, and the number of their students? Of what use is it to compare our students in the first year of the medical course, or those possessed of the diploma of bachelor of sciences limited, with the young men who follow the preparatory course in medicine at Cornell? I am satisfied that this would be a sterile work. It is important rather to consider the attractive independence and great variety of the American programmes, the practical spirit which characterizes them. Certainly these tendencies are not indulged without great inconveniences, without some risk even to science itself. But if there are not many schools of savants in the United States, there are certainly numerous men of science, endowed with the sacred fire, and thanks to their remarkable energy and indomitable activity, America is still able to make a good figure in the world of high intellectual culture. I have already said that Johns Hopkins and Clark universities prove this. I add that at Cornell there are also a certain number of professors who belong to the phalanx of the élite."

The following extracts from the pages devoted to the institutions of the North Central and the Pacific States will suffice to indicate the extent and variety of Dr. Baudouin's studies in the department of professional instruction which was the object of his mission.

MICHIGAN.

"Ann Arbor even more than New Haven is the typical university city of America, like Montpellier in France, or Göttingen in Germany. It is nothing aside from the great number of both sexes who make the university one of the most important of the United States. Here those who wish to study the functions of high schools and colleges, the system of coeducation and the effects of common school education ought to come and remain several weeks of the school year. Life here is very quiet and

[1] Burt G. Wilder. "The metapore or foramen of Magendie, in man and in the orang-outang," in American Neurological Association. (Congress of July 25-27, 1893, at Long Branch.)

the American professors and students live together in an inexpensive way very much like the Germans.

"At first view Ann Arbor seems to offer nothing very interesting to the visitor, but on closer acquaintance he discovers that it would be a great mistake to neglect the university. It really presents a curious phenomenon, very characteristic of the country, namely, the maintenance in the same State university, of two schools of medicine, allopathic (regular) and homeopathic. The allopathic school resembles those that I have already described but by force of circumstances displays a more tolerant spirit. The professors of these two institutions often mingle amicably in official meetings as they form part of the same household. This is certainly a feature almost unique in the world (to use a favorite expression of my host). It is in any case a very rare spectacle to find thus side by side the two hostile sisters. To see on the same campus the two rival establishments and to study their reciprocal relations, have certainly been special points of interest in my medical journeyings in the United States. As I have said, there are in America a great many homeopathic schools, but this is the first instance in which I have found in the same university these professors united with those of the classic schools and living thus harmoniously.[1] Ann Arbor has also a school of pharmacy and a school of dentistry of high renown."

In describing the regular school of medicine at Ann Arbor, Dr. Baudouin notes that women are admitted, and adds: "Singular contradiction in this university where, as M. P. de Coubertin says, 'the women students have the deliberate manner, the sceptical air, and the abominable sang-froid of the Russian Nihilists,' they have not the right to dissect with the men. They also read the anatomical works in separate halls. Note, however, by the side of this a peculiarty not less interesting, they go to the hospital with the young men and attend all the clinics with them."

"At Ann Arbor, the State university, instruction is almost gratuitous. The students of the school of medicine, natives of Michigan, pay $35 for the course, including entrance fees and annual dues; the other students pay $60; there are also supplementary expenses for all (diploma, $10; dissection, $20; laboratories, $76), without counting the expense of special courses. I saw on the campus the modest buildings appropriated to this school of medicine. They are not luxurious like those of the universities founded by private individuals; so true it is that always and everywhere official assistance paralyzes the generosity of individuals. I believed myself transported into one of our little secondary schools. Nevertheless, in 1892, Ann Arbor had 344 students in the regular school of medicine, without counting 63 in the homeopathic school. Apparently the number of students in the regular school is not increasing, at least the official figures show a decrease from 1880 to 1890. In the latter year the course of study was raised from three to four years; since 1890, however, the number of students has increased slightly."

MEDICINE AT THE WORLD'S FAIR.

"One word now of the great Columbian Exposition, and also of the great hospital of the World's Fair. I have had the opportunity of examining sections least accessible to the public, especially in the Palace of Homeopathy, the Children's Building, and more particularly in the Columbian Emergency Hospital, which may certainly serve as a model for our future exposition of 1900. This description, in years to come, may have a certain historic interest when nothing of the World's Fair remains. The Columbian Emergency Hospital is situated opposite one of the principal entrances to the Fair. The building has two rooms, each containing ten beds. One room is devoted to the treatment of the sick, and the other to the victims of accidents. There is still a third room, quite large, which is reserved for obstetric cases. It contains three beds.

"The hospital is well lighted by electricity. The parts reserved for the superintendent and employees and the head nurse are furnished with luxury and taste. As in all American hospitals, flowers abound, especially in the waiting room.

"The hospital was one of the first buildings completed, and was early called into use for the workmen employed on the buildings of the Exposition. It continues to be of the greatest service, thanks to the system of ambulances stationed at each corner of Jackson Park. The surgical service, in particular, is admirably arranged. This ward is remarkable for its cleanliness, and the operating room is a veritable model of aseptic appliances. It is sufficiently large, well lighted, completely furnished, and well kept. I have witnessed here many small operations, such as in our hospitals are performed at consultations. I was told that whenever they had a serious case the patient was removed to a city hospital, but, considering the perfect appointments of the Emergency Hospital, the operation could have been as well performed there.

[1] It is the same at Minneapolis, Minn., and in Iowa.

"On days when the crowd was the greatest there were naturally many accidents, especially from fires, which were very frequent. The Fourth of July, the national holiday, the visitors numbered less than 200,000; there were nevertheless 170 persons brought to the hospital. If, as the administration confidently expected, there had been each day from 500,000 to 600,000 persons, it will be readily seen that the hospital accommodations would scarcely have sufficed.

"Every morning the patients not yet cured are taken to a city hospital and thus at the beginning of each day the 23 beds are almost always empty. It is hardly necessary to dwell on the efficiency of the assistants at the hospital. Here are to be seen strong, vigorous women, members of the worthy body of American nurses. Two doctors are in charge; they have as aids five house surgeons very expert (I have seen them at work), two sanitary inspectors, a superintendent of the ambulance corps, very efficient, a druggist, employees of the office, a superintendent of the nurses, and five graduate nurses.

"*The Homeopathic Hospital.*—Not far from the hospital of the regular school is the headquarters of homeopathy. It has two parts—a small homeopathic hospital in the second story and the homeopathic exhibit on the ground floor. The homeopaths insisted upon having their hospital at the World's Fair on the same footing as the regulars.

"The model Homeopathic Hospital comprises several rooms furnished for the sick. It has a doctor in charge and many nurses. I must add, however, that I saw no sick people there.

"In the part devoted to the exhibit there are rooms for the display of chemical and pharmaceutical products and a series of framed photographs showing the Chicago Homeopathic College and Free Dispensary, the professors of the college and their pupils. There are portraits of 74 homeopathic doctors. Elsewhere they show the plans of another homeopathic hospital which will soon be erected at the corner of York street and Hermitage avenue. Dr. Streeter also shows photographs of his private hospital on Calumet avenue, devoted exclusively to the treatment of women. It is very well arranged and has in connection with it a school for nurses."

CHILDREN'S BUILDING.

"I must note in brief the Children's Building or 'Pavillon des enfants,' situated not far from the principal entrance. It contains, first, exhibits referring to infancy; second, a model gymnasium; third, a series of class rooms; fourth, a refuge; fifth, a crèche of which I will speak later. The roof serves as a court of recreation for the children and has a toboggan slide. In the crèche they care for babies during the day while the fathers and mothers visit the Exposition, or, if they are employed there, while they attend to their work. In a large room some of the little ones play together freely; others are in cradles suspended from the ceiling like hammocks and rocked by the older girls. Others occupy dainty little beds of iron, while the youngest are in the charge of nurses. Strangers at Chicago often laugh about this crèche. They can not suppress a smile at seeing the babies 'checked' on their entrance. To each mother leaving her child, a copper tag is given bearing a number corresponding to one which is attached to the neck of the child. A 'check' is used in America in place of the 'bulletin de bagages' with us. In spite of the pleasantries to which it has given rise this crèche seems to me to fill a need and I shall be happy to see an institution of this kind at the next exposition in Paris (1900). How many poor families might pass several days at the Exposition if they knew they would find there a crèche and competent, trustworthy women to whom they might confide their children instead of taking them into the crowd to be lost."

RELIEF STATIONS AT THE WORLD'S FAIR.

"These posts, placed at different points of the Exposition, seem to me very interesting. There are three principal stations besides the one annexed to the hospital. These flying hospitals are organized like fire companies. Instead of firemen they are in charge of ambulanciers, well trained in the duties of their office. Near a little table stands the ambulance, patiently waiting the sound of an electric bell which announces an accident. The shafts are always ready for the horse with the harness suspended over them. Behind, in a box stall, stands the trained horse; at the sound of the bell the men throw themselves into the ambulance, the doors of the box open, and the horse places himself under the harness. In less than a minute the carriage is en route. Notice of accidents is given at each end of these stations in a very simple way. There are at the Exposition a large number of alarm boxes communicating with the ambulance posts, the fire engines, and the police stations. An accident occurs—immediately the policeman nearest the scene of accident goes to the nearest alarm box, and presses the electric button which notifies the central office. From this office the proper ambulance is called and sent to the scene of the accident, the wounded person is immediately conveyed to the hospital, where an assistant,

already notified of the occurrence, awaits his arrival in the operating room, which is always ready for patients.

"This brief description of this interesting and important feature of the World's Fair will show what is the outcome when private initiative has free course and when an able man is allowed to put into execution his own ideas unembarrassed by routine.

"If America has some faults she has some great qualities also. It must be confessed that often by a single stroke she goes far toward solving the most difficult questions. These brief remarks upon the hospital of the World's Fair may furnish some information to those who are charged to organize medical science at the exposition of 1900."

The following general observations introduce the reader to M. Baudouin's account of Western universities:

"The universities of the East and center of North America, it is hardly necessary to repeat, are the most interesting to visit. Those on the Atlantic border give the impression of indisputable power, and an intensity of physical and intellectual life really astonishing. It must also be admitted that their actual value is sufficient to justify to the foreigner the renown of this new country."

SCHOOLS OF THE WESTERN STATES.

"The colleges of the Central States," says Dr. Baudouin, "which have neither the age nor the distinction of the Eastern colleges, are, nevertheless, worthy to be compared with our provincial schools and faculties, and whoever has visited America has seen or, at least, heard of them. It is not so with the others, which, situated in the West or 'Far West,' have had a development as rapid as that of the cities where they have been established. It has, therefore, seemed to me important to visit these schools so young but already so prosperous, and to study their effects in the places where they are located—to see their buildings and appointments, almost as magnificent for those at the foot of the Rocky Mountains as for those on the borders of the Great Lakes, and to devote some pages to their schools of medicine in spite of their extreme youth and small renown."

It is impossible even to name here all the foundations which are described or mentioned in the remaining pages of the report. We can note only a few typical institutions.

The University of Minnesota is described somewhat in detail. As to its rapid growth the author says: "This university, situated on the left bank of the Mississippi River, in the city of Minneapolis, comprises many large buildings. It was founded in 1857, and had hardly commenced to receive students in 1860. It has at this time (1893) more than 1,000 students, male and female." The report presents views of the college of medicine and surgery and the medical laboratory, and also the course of study for each year at the homeopathic college. An official statement as to the cost of living at Minneapolis is quoted, which gives $323.54 as the expenses for a young man and $240.05 for a young woman.

University of Colorado.—"The development of the University of Colorado is still more astonishing than that of the schools of Minneapolis. The place where the city of Denver now stands was in 1858 only a vast prairie extending to the foot of the Rocky Mountains. At this time (1893) the Queen of the Prairies possesses more than 150,000 inhabitants. Its university, which, though established in 1860 can hardly be said to have developed before 1876, comprises several important buildings at Boulder, a little city situated 29 miles from the capital in the Rocky Mountains, at the entrance to the celebrated Boulder Canyon. About 300 students are here congregated.

"The school of medicine which belongs to the university is situated not at Boulder but at Denver itself, in the center of the city, at Seventeenth and Stout streets. The first year students study at Boulder, the boys living at Kent Hall with the law students and the young girls in buildings reserved especially for them. When a brother and sister attend the university at the same time they may live in the same house. All students are obliged to register at Boulder. In the second year they attend the school of medicine at Denver in order to take advantage of the hospital work. This arrangement reduces expenses, as living in Denver is much dearer than in the neighboring towns. The course of study lasts three years, nine months each year.

"The clinical instruction is given in the hospitals of the city, which accommodate more than 400 patients, and are open to the students. The Arapahoe County Hospital, where many of the professors of the school teach, contains 150 beds and is increasing in importance every year. There are four clinic lectures at this hospital each week. The dispensary of the school is also here and is open every day except Sunday. Here also clinic lessons are given every day during the scholastic year. In these lessons the student is obliged to give a diagnosis, a prognosis, and a treatment of a case.

"The school is open to all graduates of recognized colleges or high schools. Other

candidates for admission are obliged to submit to an examination in English grammar, arithmetic, geography, history of the United States, and the elements of physics. Some students come to the University of Colorado for the sake of the climate, just as certain students go to the Lycées of Pan and of Nice.

"The climate of this region is indeed highly recommended for pulmonary affections or chronic malaria. The average temperature, which is 48° F., or nearly 9° C., attracts many pupils who are invalids, but who, after a year at Boulder, are often able to continue their studies.

"From the character of the surrounding country and the frequent accidents the Americans have drawn a very legitimate conclusion and have established here a course of lectures relating especially to the treatment of the victims of railroad accidents. Those who have traveled in this section, and who remember that at Denver all the railroads of the far West meet and cross, will not be astonished at or fail to realize the importance of a special medical service of the first order."

The schools and hospitals of Portland.—"Oregon has two medical schools located at Portland. Although not the capital of the State, by reason of its situation and commerce this city, which has an English stamp, is the metropolis of the Northwest Pacific. Here is a Chinese population of more than 3,000 and a house of refuge especially for Chinese women (the Chinese Woman's Home). The Good Samaritan Hospital was founded in 1875 by an old bishop of Oregon. It accommodates 125 patients and is directed by a superintendent. Only those patients are admitted who are able to pay $7 per week in the common ward or $14 per week for special rooms. Attached to the hospital is a training school for nurses' directed by Mrs. E. Loverage.

"The Portland Methodist Episcopal and Free Dispensary, which was rebuilt in 1888 and received 100 patients, is hardly less interesting.

"St. Vincent's Hospital, which contains 200 beds, is as old and more important than the Good Samaritan. It is under the supervision of the Sisters of Charity and receives about 1,500 patients each year.

"Four medical societies, of which one is homeopathic, are established at Portland. The best known is the Oregon State Medical Society."

Medical schools of San Francisco.—"As the medical schools of San Francisco have not been visited by many physicians of Europe, I may hope that they will thank me for having pushed my university investigation into California.

"The two most important medical schools are well worthy of mention; moreover, in this distant country the French language and literature are not at all forgotten, and what is still more interesting, many of our compatriots practice here, and at this moment superintend the construction of a magnificent hospital. They certainly merit our attention.

"I may note here that in this State, quite new and still almost a desert in some parts, numbering only 1,200,000 inhabitants, there are already five schools of medicine, so that the old pioneers of San Jose Valley can scarcely lack practitioners. The oldest and certainly the most important school of medicine is the Cooper Medical College. Its organization dates back to 1858, when it constituted the medical department of the University of the Pacific. Its first diplomas were granted in 1860. The school ceased to exist from 1864 to 1869, but in 1870 was reopened under its former name. Two years later it became the medical department of the University of of San Francisco and then took the name of Medical College of the Pacific. In 1882 its former name was restored, and this is still retained. An effort is now being made to incorporate it as the school of medicine of a very rich university about to be erected at Palo Alto near the bay of San Francisco. This institution first granted diplomas in 1860.

"In 1890 the college received important donations from Mr. James M. MacDonald, and also from Professor Lane, who gave land and buildings to the value of about $100,000. Mr. Lane is the nephew of Mr. Samuel Cooper, the founder of the school, who died in 1861 at the age of 41 years, and whose ambition was to found a hospital. Professor Lane's gift was intended as a memorial of Dr. Cooper. He was a distinguished surgeon (especially known by his work on the suture of the kneepan, an operation which he was one of the first to perform on the articular resections, etc.). He should not be confounded with Astley Cooper."

In addition to a detailed description of the buildings of this college and their appointments, Dr. Baudouin notes that here, as in most of the American colleges, the dissecting room is in the top of the building. He counted, he says, 12 cadavers injected with red wax. He adds: "Mr. Gibbons told me that as they used each year only 50 cadavers, it was necessary to keep them as long as possible. One subject serves for 5 students, and costs $12. Generally a student in the course of his study dissects five bodies, making an expense of $60. The course of study is for three years, but after 1894 it will continue for four years. It is gratifying to observe that all the good schools are in favor of this change.

"In the list of books recommended I have seen only English and American authors,

with a few German, but not a single French work. This is inexcusable, at least in California where nothing French should pass unnoticed."

A somewhat extended account, historical and descriptive, is given of the Toland Medical College, which constitutes the medical department of the University of California. The author notes as a matter of special interest that in the dissecting room he saw 15 students at work. "This," he adds, "appeared strange to me considering the season of the year, as I had not before seen students working in any of the colleges I had visited. I soon learned that the course of study here is divided into a spring, a summer, and a fall term, the vacations taking place during the winter months of December, January, and February, an arrangement best suited to the climate of San Francisco, as I can state from my own experience; this has induced the doctors to depart here from the custom as old as old Europe. It is only in America that such changes can be made without objections, and it is really the study of these thousand little details, rather than the visits to so great a number of institutions which with few exceptions are not of a high order, that has made my tour in the United States interesting."

A paragraph is given to the San Francisco polyclinic or post-graduate medical department of the University of California. Brief but interesting accounts are also given of the hospitals of San Francisco, including the Chinese hospital, the German, and the new French hospital. The plans of the latter are fully described and graphically illustrated. The Home for Inebriates is also mentioned in the same chapter. "There is nothing," says the writer "analogous to this in France."

With respect to the number of practicing physicians in California, Dr. Baudouin says: "For a population of about 300,000, San Francisco has 600 physicians, or 1 for every 500 persons. At Los Angeles the proportion is still greater, i. e., 1 physician for every 250 inhabitants. This is the general average for American cities, while in Europe (even in Germany, where doctors abound) the proportion in cities is generally 1 doctor for 1,000 inhabitants. Undoubtedly the high proportion at San Francisco, as in other cities of the United States, is due to the excessive number of schools and the low standard of studies. But here another cause operates also; this is the large importation of Germans; actually there are 181 German physicians in the city. To this there could be no objection if they were really doctors, but it appears that out of the 181 only 6 have really passed the State examination required in Germany; the others are only students, who have scarcely mastered their course, and whose professional attainments leave much to be desired. A remedy for this state of things is earnestly desired here where, in truth, it is not denied that admission to the profession is far too easy. It appears, however, that the matter can not well be regulated without what would be still more difficult, the complete reorganization of American universities."

CHAPTER XXX.

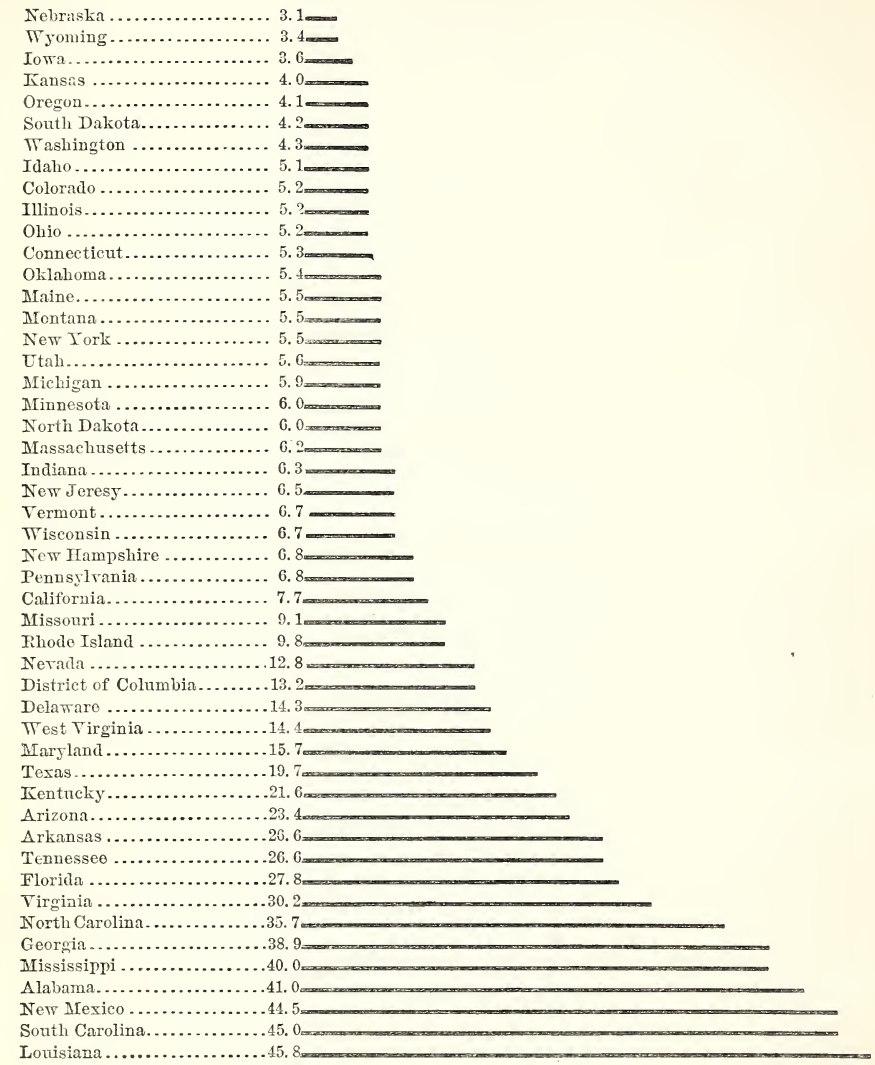
EDUCATION IN THE SEVERAL STATES.

ALABAMA.

[Letter of Dr. J. L. M. Curry to the gubernatorial candidates of Alabama.]

WASHINGTON, D. C., *May 21, 1896.*

To the Hon. Joseph F. Johnston and Hon. Albert T. Goodwyn.



DEAR SIRS: I address this open letter to you as the accredited representatives of the two great parties seeking to control the government of the State. I need make no apology for my interest in Alabama or the cause which I seek to bring before you.

With the issues which divide the parties I have no concern in this letter. The subject of this communication is higher, far more important, more paramount than all the issues, Federal and State, which divide parties, local or national. It involves vitally every county, neighborhood, family, and citizen. It is not of temporary, but of permanent interest. It affects the people individually, socially, intellectually, and materially. All patriots should combine and labor incessantly until there be permanently established and liberally sustained the best system of free schools for the whole people, for such a system would soon become the "most effective and benignant of all the forces of civilization." Such a cause should enlist the best and most practical statesmanship, and should be lifted above and out of mere party politics, which is one of the most mischievous enemies of the public school system.

Mr. Jefferson is quoted by both parties on fiscal and currency and constitutional questions. Let us hear what he says on the education of the people. In 1786 he wrote to George Wythe: "I think by far the most important bill in our whole code is that for the diffusion of knowledge among the people. No surer foundation can be devised for the preservation of their freedom and happiness." To Washington he wrote: "It is an axiom in my mind that our liberty can never be safe but in the hands of the people themselves, and that, too, of the people of a certain degree of instruction. This it is the business of the State to effect and on a general plan."

The best test of a country's civilization is the condition of public instruction, said a French statesman. Tested by that standard, what is the rank of Alabama among civilized people? The total population of Alabama over 10 years of age by the last census is 1,069,545, and of these 107,355, or 18.2 per cent of the white people are illiterate, and 331,260, or 69 per cent of the negroes are illiterate. Of 540,226 children between 5 and 18 years of age 301,615, or 55 80 per cent are enrolled in schools, leaving only two States in this particular below her. In 1891–92 the percentage of school population (5 to 18 years) in attendance was 33.78 per cent with four States below. The average school term or session was seventy-three days.

This diagram shows graphically the rank of each State and Territory according to the rates of illiteracy in 1890:

This beggarly array does not fill up the dark outlines of the picture. These short schools are in many cases inefficient and inadequate, and the graduates of high schools, even, are three years behind the German graduates in the amount of knowledge acquired and in mental development. This inferiority is largely attributable to the shorter terms of school years, to the want of professional teachers, and to the small enrollment. In Prussia, under a compulsory law, 91 per cent are instructed in the public elementary, or people's schools, or only 945 of the children subject to the law were unjustly withheld from school. It is lamentable that in many cases a teacher in primary schools need not know much more than he is required to teach, and that knowledge may be confined to the text-book. This deficiency in teacher training is, with political and sectarian influence, the most vulnerable point in our school system. The lack of proper supervision and inspection of schools is traceable to this same pestiferous influence, and hence the officers charged with this duty remain too short a time in their places to be qualified for their work. Rotation in

office, narrow partisanship, inefficiency, are the direct fruits of making school offices not places of trust, but spoils of political victory. Our system of public instruction has acquired such dimensions, ramifies so minutely into every family and neighborhood, concerns so greatly every interest of the State, that its administration should be vested in officers of the highest intelligence and patriotism, of administrative skill and ability, of thorough acquaintance with school and educational questions. The state superintendent should remain in office long enough to be thoroughly familiar with the duties of his exalted position, and should be an expert, capable of advising executive and legislature, and school officers and teachers, and in full and intelligent sympathy with the educational problems that are so important and numerous. Greatly blessed is a State and are the children who have at head of school affairs such men as Mann, Sears, Dickinson, Draper, White, Ruffner, and our peerless Harris.

The statistics of defective schools and consequent illiteracy teach their own sad lessons. The calamities which, in the inevitable order of events, must result from having so large a portion of the people in ignorance, need not be elaborated, but they should fill every patriot with alarm and impel to the adoption of early and adequate remedies as an antidote for what is so menacing to free institutions and to general prosperity. While ignorance so abounds, how can we hope for purity in elections and safety from demagogism, immorality, lawlessness, and crime? "Whatever children we suffer to grow up among us we must live with as men; and our children must be their contemporaries. They are to be our copartners in the relations of life, our equals at the polls, our rulers in legislative halls, the awarders of justice in our courts. However intolerable at home, they can not be banished to any foreign land; however worthless, they will not be sent to die in camps or to be slain in battle; however flagitious, but few of them will be sequestered from society by imprisonment, or doomed to expiate their offenses with their lives."

Perhaps the argument most likely to reach the general public is the close relation between public free schools and the increased productive power of labor and enterprise. The political economy which busies itself about capital and labor, and revenue reform and free coinage, and ignores such a factor as mental development, is supremest folly; for to increase the intelligence of the laborer is to increase largely his producing power. Education creates new wealth, develops new and untold treasures, increases the growth of intellect, gives directive power and the power of self-help; of will and of combining things and agencies. The secretary of the board of education of Massachusetts in his last report makes some valuable statements and suggestions. No other State is giving as much for education, and yet each inhabitant is receiving on an average nearly seven years of two hundred days each, while the average given each citizen in the whole nation is only four and three-tenths of such years. While the citizens of Massachusetts get nearly twice the average amount of education, her wealth-producing power as compared with other States stands almost in the same ratio. This increased wealth-producing power means that the 2,500,000 people produce $250,000,000 more than they would produce if they were only average earners. And this is twenty-five times the annual expenditure for schools. The capacity to read and write tends to the creation and distribution of wealth, and adds fully 25 per cent to the wages of the working classes. It renders an additional service in stimulating material wants and making them more numerous, complex, and refined. We hear on every hand louder calls for skilled labor and high directive ability. It is a lack of common business sagacity to flinch from the cost of such a wealth-producing agency. This question is not, How can we afford to do it? but, Can we afford not to do it?

All experience shows only one means of securing universal education. Private and parish schools educate only about 12 per cent of the children, and if they could educate all there would remain insuperable objections to them in the way of management, classification, efficiency and support. Our institutions and rights demand free schools for all the people, and they must be established and controlled by the State, and for their support combined municipal, county, and State revenues are needed. Eighty-seven per cent of the children of the Union are now in public schools. In 1890 the entire costs for school purposes were estimated at $143,110,218, toward the payment of which the local school tax contributed $97,000,000. While furnishing education is a legitimate tax on property, whether the taxpayer takes advantage of the public schools or not, the history of education in the United States shows that with State revenues should be combined local taxation. This insures immediate interest in the schools, better supervision, greater rivalry, and, on the whole, better results.

The schools in Alabama are handicapped by a clause in the constitution limiting local taxation to an extremely low figure. If by general agreement among the friends of education the removal of this restriction could be separated from party politics, and local taxation could be brought to the support of schools, there would soon be an era of educational and material prosperity. What a commentary it would be on the capacity of our people for self-government, on their catholic patriotism, on the

subordination of private wishes to the public good, if, under the advice and leadership of those selected as fittest persons for the executive chair, the whole subject of free and universal education should be elevated to the plane of organic law, and be as sacred and irremovable as any of the fundamental muniments of liberty.

Yours, truly,

J. L. M. CURRY.

CALIFORNIA.

EDUCATING GIRLS.

[Communicated to the Boston Sunday Journal by President David Starr Jordan, of the Leland Stanford Junior University.]

The subject of the higher education of young women at present usually demands answers to these three questions:

1. Shall a girl receive a college education?
2. Shall she receive the same kind of a college education as a boy?
3. Shall she be educated in the same college?

First. Shall a girl receive a college education? The answer to this must depend on the character of the girl. Precisely so with the boy. What we should do with either depends on his or her possibilities. Wise parents will not let either boy or girl enter life with any less preparations than the best they can receive. It is true that many college graduates, boys and girls alike, do not amount to much after the schools have done the best they can with them. It is true, as I have elsewhere insisted, that "you can not fasten a $2,000 education to a 50-cent boy," nor to a 50-cent girl, either. But there is also great truth in these words of Frederic Dennison Maurice: "I know that nine-tenths of those the university sends out must be hewers of wood and drawers of water. But if we train the ten-tenths to be so, then the wood will be badly cut and the water will be spilt. Aim at something noble; make your system of education such that a great man may be formed by it, and there will be manhood in your little men of which you do not dream."

It is not alone the preparation of great men for great things. Higher education may prepare even little men for greater things than they would have otherwise found possible. And so it is with the education of women. The needs of the times are imperative. The noblest result of social evolution is the growth of the civilized home. Such a home only a wise, cultivated, and high-minded woman can make. To furnish such women is one of the noblest missions of higher education. No young women capable of becoming such should be condemned to a lower destiny. Even of those seemingly too dull or too vacillating to reach any high ideal of wisdom, this may be said, that it does no harm to try. A few hundred dollars is not much to spend on an experiment of such moment. Four of the best years of one's life spent in the company of noble thoughts and high ideals can not fail to leave their impress. To be wise, and at the same time womanly, is to wield a tremendous influence, which may be felt for good in the lives of generations to come. It is not forms of government by which men are made or unmade. It is the character and influence of their mothers and wives. The higher education of women means more for the future than all conceivable legislative reforms. And its influence does not stop with the home. It means higher standards of manhood, greater thoroughness of training and the coming of better men. Therefore, let us educate our girls as well as our boys. A generous education should be the birthright of every daughter of the Republic as well as of every son.

Second. Shall we give our girls the same education as our boys? Yes and no. If we mean by the same an equal degree of breadth and thoroughness, an equal fitness for high thinking and wise acting, yes, let it be the same. If we mean to reach this end by exactly the same course of studies, then my answer must be no. For the same course of study will not yield the same results with different persons. The ordinary "college course" which has been handed down from generation to generation is purely conventional. It is a result of a series of compromises in trying to fit the traditional education of clergymen and gentlemen to the needs of men of a different social era. The old college course met the special needs of nobody, and therefore was adapted to all alike. The great educational awakening of the last twenty years in America has come from breaking the bonds of this old system. The essence of the new education is individualism. Its purpose is to give to each young man that training which will make a man of him. Not the training which a century or two ago helped to civilize the masses of boys of that time, but that which will civilize this particular boy. One reason why the college students of 1895 are ten to one in number as compared with those of 1875, is that the college training now given is valuable to ten times as many men as could be reached or helped by the narrow courses of twenty years ago.

In the university of to-day the largest liberty of choice in study is given to the

student. The professor advises, the student chooses, and the flexibility of the courses makes it possible for every form of talent to receive proper culture. Because the college, of to-day helps ten times as many men as that of yesterday could hope to reach, it is ten times as valuable. The difference lies in the development of special lines of work and in the growth of the elective system. The power of choice carries the duty of choosing rightly. The ability to choose has made a man out of the college boy, and transferred college work from an alternation of tasks and play to its proper relation to the business of life. Meanwhile, the old ideals have not risen in value. If our colleges were to go back to threshing the cut straw of mediævalism—in other words, to their work of twenty years ago—their professors would speak to empty benches. In those colleges which still cling to those traditions these benches are empty to day or filled only with idlers. This to a college is a fate worse than death.

The best education for a young woman is surely not that which has proved unfit for the young man. She is an individual as well as he, and her work gains as much as his by relating it to her life. But an institution broad enough to meet the varied needs of varied men can also meet the varied needs of the varied woman. Intellectual training is the prime function of the college. The intellectual needs of men and women are not different in many important respects. The special or professional needs so far as they are different will bring their own satisfaction. Those who have had to do with the higher training of women know that the severest demands can be met by them as well as by men. There is no demand for easy or "goody-goody" courses of study for women except as this demand has been made or encouraged by men.

There are, of course, certain average differences between men and women as students. Women have often greater sympathy, greater readiness of memory or apprehension, greater fondness for technique. In the languages and literature, often in mathematics and history, women are found to excel. They lack, on the whole, originality. They are not attracted by unsolved problems, and in the inductive or "inexact" sciences they seldom take the lead. In the traditional courses of study, traditional for men, they are often very successful. Not that these courses have a special fitness for women, but that women are more docile and less critical as to the purposes of education. And to all these statements there are many exceptions. In this, however, those who have taught both men and women must agree. The training of women is just as serious and just as important as the training of men, and no training is adequate for either which falls short of the best.

Third. Shall women be taught in the same classes as men? This is, it seems to me, not a fundamental question, but rather a matter of taste. It does no harm whatever to either men or women to meet those of the other sex in the same class rooms. But if they prefer not to do so, let them do otherwise. Considerable has been said for and against the union in one institution of technical schools and schools of liberal arts. The technical character of scientific work is emphasized by its separation from general culture. But I believe better men are made where the two are not separated. The devotees of culture studies gain from the feeling reality and utility cultivated by technical work. The technical students gain from association with men and influences whose aggregate tendency is toward greater breadth of sympathy and a higher point of view.

A woman's college is more or less distinctly a technical school. In most cases its purpose is distinctly stated to be such. It is a school for training for the profession of womanhood. It encourages womanliness of thought as something more or less different from the plain thinking which is often called manly.

The brightest work in women's colleges is often accompanied by a nervous strain as though the students or teachers were fearful of falling short of some expected standard. They are often working toward ideals set by others. The best work of men is natural and unconscious, the normal product of the contact of the mind with the problem in question. On the whole, calmness and strength in woman's work are best reached through coeducation.

At the present time the demand for the higher education of women is met in three different ways:

1. In separate colleges for women, with courses of study more or less parallel with those given in colleges for men. In some of these the teachers are all women, in some mostly men, and in others a more or less equal division obtains. In nearly all of these institutions the old traditions of education and discipline are more prevalent than in colleges for men. Nearly all of them retain some trace of religious or denominational control. In all of them the Zeitgeist is producing more or less commotion, and the changes in their evolution are running parallel with those in colleges for men.

2. In women's annexes to colleges for men. In these, part of the instruction given to the men is repeated to the women, in different classes or rooms, and there is more

or less opportunity to use the same libraries and museums. In some other institutions the relations are closer, the privileges of study being similar, the differences being mainly in the rules of conduct by which the young women are hedged in, the young men making their own regulations.

It seems to me that the annex system can not be a permanent one. The annex student does not get the best of the institution, and the best is none too good for her. Sooner or later she will demand it, or go where the best can be found. The best students will cease to go to the annex. The institution must then admit women on equal terms or not admit them at all. There is certainly no educational reason why women should prefer the annex of one institution if another institution equally good throws its doors wide open for her.

3. The third system is that of coeducation. In this relation young men and young women are admitted to the same classes, subjected to the same requirements, and governed by the same rules. This system is now fully established in the State institutions of the North and West, and in most other colleges of the same region. Its effectiveness has long since passed beyond question among those familiar with its operation. Other things being equal, the young men are more earnest, better in manners and morals, and in all ways more civilized than under monastic conditions. The women do their work in a more natural way, with better perspective and with saner incentives than when isolated from the influence and society of men. There is less of silliness and folly when a man ceases to be a novelty. There is less attraction exerted by idle and frivolous girls when young men meet also girls industrious and serious. In coeducational institutions of high standards frivolous conduct or scandals of any form are unknown. The responsibility for decorum is thrown from the school to the woman, and the woman rises to the responsibility. Many professors have entered Western colleges with strong prejudices against coeducation. These prejudices have in no case endured the test of experience. What is well done has a tonic effect on the mind and character. The college girl has long since ceased to expect any particular leniency because she is a girl. She stands or falls with the character of her work.

It is not true that the standard of college work has been in any way lowered by coeducation. The reverse is decidedly the case. It is true, however, that untimely zeal of one sort or another has filled our Western States with a host of so-called colleges. It is true that most of these are weak, and doing poor work in poor ways. It is true that most of these are coeducational. It is also true that the great majority of their students are not of college grade at all. In such schools often low standards prevail, both as to scholarships and as to manners. The student fresh from the country, with no preparatory training, will bring the manners of his home. These are not always good manners, as manners are judged in society. But none of these defects are derived from coeducation, nor are any of these conditions in any way made worse by it.

A final question: Does not coeducation lead to marriage? Most certainly it does, and this fact need not be and can not be denied. But such marriages are not usually premature. And it is certainly true that no better marriages can be made than those founded on common interests and intellectual friendships.

A college man who has known college women is not drawn to women of lower ideals and inferior training. He is likely to be strongly drawn toward the best he has known. A college woman is not led by mere propinquity to accept the attentions of inferior men. Among some thirty college professors educated in coeducational colleges, as Cornell, Wisconsin, Michigan, California, whose records are before me, two-thirds have married college friends. Most of the others have married women from other colleges, and a few chosen women from their own colleges, but not contemporary with themselves. In all cases the college man has chosen a college woman, and in all cases both man and woman are thoroughly happy with the outcome of coeducation. It is part of the legitimate function of higher education to prepare women as well as men for happy and successful lives.

CONNECTICUT.

THE TENDENCY OF MEN TO LIVE IN CITIES.

[Address of President Kingsbury, of the American Social Science Association. Read September 2, 1895.]

Two or three years since I wrote this title as a memorandum for a paper which I wished to prepare when I should find time sufficient to make some necessary investigations, statistical and otherwise. I knew of nothing, or almost nothing, written on the subject, except by way of occasional allusion. I made many inquiries in various directions, personally and by letter, of those who would, I thought, be likely to give me information; I examined libraries and catalogues—and all this with very trifling results. To-day, when I again take up the theme, so much has been written

on the subject that the question has almost passed from the stage of generalization to that of specialization and detail.

In the April number of the Atlantic Magazine of the present year an article commenting on Dr. Albert Shaw's recent work, entitled "Municipal government in Great Britain," says:

"The great fact in the social development of the white race at the close of the nineteenth century is the tendency all over the world to concentrate in great cities."

Doubtless this is true; but it is not a new, or even a modern tendency, although, as we shall see, there is much in modern civilization which tends to increase and accentuate it. Still, when the earliest dawn of authentic history sheds its pale light on the impenetrable darkness which lies beyond, it shows us cities as large, as magnificent, as luxurious, as wicked, and apparently as old as any that the world has since known. The books speak of Babylon as the largest city the world has ever seen; but it was by no means the first, and may not have been the greatest even then. Nineveh, its great rival, Memphis, Thebes, Damascus, claiming to be the oldest of them all, Rome, in a later time, with its two or three millions of inhabitants, are but representatives of other cities by the thousands, perhaps larger and older than the largest and oldest here named, and are certainly sufficient to show that a tendency in men to live congregated together in large numbers is as old as anything that we know about the human race.

In our earliest literature, too, we find, apparently well fixed, some of the same prejudices against the city as a place for men to dwell in that now exist. These prejudices must have been already existing for a long time, and their influence must have been the subject of observation before even the possibly somewhat prejudiced people who did not live in cities should have arrived at such firmly settled conclusions in regard to their deleterious influence. Curiously enough, the prejudice appears in one of our earliest writings. These is no doubt that the writer of the Book of Genesis had what might be called an unfriendly feeling toward Cain. He gives him a bad character in every respect. He holds him up to the universal contempt of mankind, and visits him with the severest judgments of God. And, after he has said about him nearly every bad thing that he can think of, he adds as a climax to his enormities, "And Cain builded a city." Now, whether he meant to be understood that cities, having been first built by such an infamous scoundrel, had turned out to be very much what you might expect, or whether, the general character of cities having been already settled in his mind, it was adding one more black mark to Cain to mention this fact, is by no means clear; but this much is certain, that the writer was no admirer of cities, and that neither Cain nor cities were intended to derive any credit from his statement. From that day to this they have had their severe critics. They have been regarded as the breeding places of vice and the refuge of crime. Our own Jefferson—that is, Thomas, not Joseph—is said to have called them "ulcers on the body politic." Dr. Andrew D. White, in his address as president of this association delivered in 1891, says, "Our cities are the rotten spots in our body politic, from which, if we are not careful, decay is to spread throughout our whole country; for cities make and spread opinions, fashions, ideals." The poet Cowley says, "God the first garden made, and the first city Cain." And other writers with the same feelings have used language of a similar import, dictated by the warmth of their temperament, the range of their vocabulary, and the power of their rhetoric.

Prof. Max Nordau, who has lately shown us in a large octavo of 650 pages how we are all hastening on to certain destruction—a conclusion which I am not disposed to combat—or perhaps I might more modestly say, as the late President Woolsey is reported to have said to Daniel A. Pratt, the great American traveler, when he laid before him some rather startling propositions, that I would rather give him a dollar than to attempt to point out the fallacy in his argument—Mr. Nordau, after quoting high authority to show how the human race is poisoning itself with alcohol, tobacco, opium, hasheesh, arsenic, and tainted food, says:

"To these noxious influences, however, one more may be added, which Morel [the authority he has just quoted] has not known or has not taken into consideration; namely, residence in large towns. The inhabitant of a large town, even the richest, who is surrounded by the greatest luxury, is continually exposed to unfavorable influences which diminish his vital powers far more than what is inevitable. He breathes an atmosphere charged with organic detritus; he eats stale, contaminated, adulterated food; he feels himself in a state of constant nervous excitement, and one can compare him without exaggeration to the inhabitant of a marshy district. The effect of a large town on the human organism offers the closest analogy to that of the Maremma, and its population falls victim to the same fatality of degeneracy and destruction as the victims of malaria. The death rate in a large town is more than a quarter greater than the average for the entire population. It is double that of the open country, though in reality it ought to be less, since in a large town the most vigorous ages predominate, during which the mortality is lower than in infancy

and old age. And the children of large towns who are not carried off at an early age suffer from the peculiar arrested development which Morel has ascertained in the population of fever districts. They develop more or less normally until they are 14 or 15 years of age, are up to that time alert, sometimes brilliantly endowed, and give the highest promise. Then suddenly there is a standstill. The mind loses its facility of comprehension; and the boy, who only yesterday was a model scholar, becomes an obtuse, clumsy dunce, who can only be steered with the greatest difficulty through his examinations. With these mental changes bodily modifications go hand in hand. The growth of the long bones is extremely slow or ceases entirely, the legs remain short, the pelvis retains a feminine form, certain other organs cease to develop, and the entire being presents a strange and repulsive mixture of uncompleteness and decay. Now, we know how in the last generation the number of inhabitants of great towns increased to an extraordinary degree. At the present time an incomparably larger portion of the whole population is subjected to the destructive influences of large towns than was the case fifty years ago. Hence the number of victims is proportionately more striking, and continually becomes more remarkable. Parallel with growth of large towns is the increase in the number of the degenerate of all kinds, criminals, lunatics, and the higher degenerates of Magnan; and it is natural that these last should play an ever more prominent part in endeavoring to introduce an ever greater element of insanity into art and literature."

Many people think Nordau like the patient in the asylum. He thinks everybody crazy except himself. But Dr. Walter B. Platt, in a paper read before this association in 1887, points out certain dangers to the constitution to which every dweller in cities is of necessity exposed from physical causes, specially mentioning disuse of the upper extremities, the exposure to incessant noise and its cumulative effect on the whole nervous system, the jarring of the brain and spinal cord by a continual treading upon unyielding pavements. And he adds that good authorities assert that there are very few families now living in London who with their predecessors have resided there continuously for three generations; but he excepts from the operations of these deleterious influences those whose circumstances are such as to enable them to spend a considerable portion of each year in the country.

Dr. Grace Peckham, in a paper read before this association in 1885, says: "However it was arrived at, the census of 1880 shows that the infant mortality of cities in this country is twice as great as that of the rural districts."

Everyone who has taken an interest in Mr. Charles Loring Brace's great work in the city of New York knows that his firm belief was that the salvation of the city poor depended on getting the surplus into country homes; and few men have been more competent to judge or more ready to look at all sides of a case than he. The literature of the slums is full of every human horror; and it would seem as if any change must be for the better.

Dr. Josiah Strong, in that vigorous presentation of the dangers of our American civilization entitled Our Country, says: "The city has become a serious menace to our civilization, because in it each of our dangers is enhanced and all are localized. It has a peculiar attraction for the immigrant. In 1880 our fifty principal cities contained 39.3 per cent of our German population and 45.8 per cent of our Irish. Not only does the proportion of the poor increase with the growth of the city, but their condition becomes more wretched. Dives and Lazarus are brought face to face." Speaking of Dives and Lazarus, has Dives had what you might call quite fair play? Even Judas has had his apologists, but I do not remember ever to have seen any speculation as to what would have become of Lazarus if he had not been fed from Dives's table. Doubtless he preferred that to the poorhouse or even to tramping; and from all accounts, he was not exactly the sort of person you would choose for a parlor boarder. This, however, is a mere passing comment, and, I trust, will not involve me in any theologic discussion; but I do like to see even the devil have his due.

The feature of cities which is perhaps at present attracting more attention than any other is their misgovernment. Dr. Strong begins a paragraph thus: "The government of the city is by a 'boss' who is skilled in the manipulation of the 'machine,' and who holds no political principles except 'for revenue only.'" If a foreigner were to read that sentence he would infer that "boss" was the English for the chief magistrate of a city, but we know so well just what it means that it scarcely attracts our attention. * * *

One would think after reading all this about the evils of cities from the time of Cain to the last New York election, or, rather, let us say, to the last but one—and especially when we must admit that we know everything that is said to be true, and that even then not the half nor the tenth part has been told, and we are almost driven to the conclusion that nothing short of the treatment applied to Sodom and Gomorrah will meet the necessities of the case—that every sane man and woman should flee without stopping for the open country; and the women especially should be careful

how they look behind them, and be sure to remember Lot's wife, and nothing should induce them to turn their faces cityward again.

Now, in spite of all this precisely the reverse is true, and, while there has always been a strong tendency in humanity cityward, this nineteenth century sees it intensified beyond all former experience. Statistics do not make interesting public reading, but from Dr. Strong's valuable work, where there are many, we take a few in support of our position:

"The population of this country as divided between city and country was, in 1790, omitting fractions, country 97 per cent, city 3 per cent; in 1840, country 91 per cent, city 9 per cent; in 1890, country 71 per cent, city 29 per cent; and the rate of increase is itself all the while increasing."

In 1856 Chicago had a population of 90,000. In 1895 it is supposed to have 1,500,000, with several outlying districts not yet heard from. In this classification, which is taken from the United States census, towns of 8,000 and over rank as cities, while the rest is country. Of course a line must be drawn somewhere for the purpose of statistics, but many think it might more properly have been drawn at 5,000, which would largely increase the city percentage. Dr. Strong also quotes this statement: That in the rural districts of Wayne County, N. Y., there are 400 unoccupied houses, and much other valuable statistical information of a similar character. Professor Nordau also has many statistics of various European countries, all to the same purport. But the general fact of the enormous increase of the city at the expense of the country is so notorious that it needs no proof. Let us consider some of its causes.

It is well to notice, and perhaps here as well as anywhere, that, while in all countries the influence of the city has been great, it has not been equally great in all. Rome was the Roman Empire. Carthage was Phœnicia. Paris to-day is France. But London, big as it is, is not England; Madrid is not Spain, and, certainly, Berlin is not Germany. In all these cases there is a power and a public opinion, a consensus of thought, a moral, political, and social influence in the country as a whole, which does not look to nor depend upon the city as its maker, leader, and guide. It is easier to see and feel this fact than to analyze and explain it. Probably the same reasons or kinds of reasons do not apply in every case, but each has its own, some of which are easy to find and others too deep and elusive to be discovered. Accidents of early history, geographical relations, the temper and idiosyncrasies of a people, and other influences, some broader and some more subtle, all combine to fix the relative position and importance of the great city and the country or the lesser town. Speaking of Constantinople, Mr. Frederic Harrison says:

"There is but one city of the world of which it can be said that for fifteen centuries and a half it has been the continuous seat of empire under all the changes of race, institutions, customs, and religions. And this may be ultimately traced to its incomparable physical and geographical capabilities."

In England more than in any other country, as it seems to me, country life is regarded as the normal condition of a fully developed man; and even then it is only those who keep themselves polished by frequent attrition with city life that accomplish much for themselves or their fellow-men. But probably the lesson to be drawn is that a life where both the city and country have a part develops the highest form of manhood and is the end to be striven for.

Ancient cities owed their existence to a variety of causes. Probably safety and convenience were, at the bottom, the reasons for aggregating the population; but any special city frequently owed its existence, so far as appears, to the mere caprice of a ruler as a passing fancy—though he may have had his reasons—sometimes, doubtless, to military considerations, and sometimes perhaps to accident, or to migration, or the results of natural causes, geographical or commercial. It was not until the Middle Ages that the industrial town was evolved. But the modern town seems wholly industrial in its raison d'être; it is therefore governed by the laws which govern industrial progress.

Buckle says: "Formerly the richest countries were those in which nature was most bountiful. Now the richest countries are those in which man is most active." (He also adds, although perhaps it has no special significance in this connection, that "it is evident that the more men congregate in great cities the more they will become accustomed to draw their material of thought from the business of human life and the less attention they will pay to those proclivities of nature which are a fatal source of superstition.")

Aside from all questions of mutual defense and protection and mutual helpfulness in various ways and industrial convenience, doubtless one of the very strongest of forces in the building of the city is the human instinct of gregariousness. This underlies ancient as well as modern, military as well as industrially founded aggregations, and the hamlet or the village as well as the city. But there is always a craving to get where there are more people. The countryman, boy or girl, longs for the village, the villager for the larger town, and the dweller in the larger town for the great city; and, having once gone, they are seldom satisfied to return to a place of less size,

In short, whatever man may have been or may be in his prognathous or troglodyte condition, ever since we have known much about him he has been highly gregarious, even under unfavorable conditions.

As long ago as 1870 Mr. Frederick Law Olmsted, in a paper read before this association, said, "There can be no doubt that in all our modern civilization, as in that of the ancients, there is a strong drift townward;" and he quotes the language of an intelligent woman whose early life had been spent in one of the most agreeable and convenient farming countries in the United States: "If I were offered a deed of the best farm I ever saw, on condition of going back to the country to live, I would not take it. I would rather face starvation in town."

The life of the great city would seem to bear hardest of all on the very poor, and the country, or at least suburban, life to present the strongest attraction, by contrast, to this class. Pure air, plenty of water, room for children to play, milk on which to feed them, room to sleep, wholesome food for adults—these things, almost impossible to the poor in the city, are nearly all of easy attainment in the country; yet the overmastering desire for a city life seems to be stronger with this class than with any other. Perhaps you are familiar with the story of the kind lady who found a widow with a great family of children living in the depths of poverty and dirt in the city, and moved them all to a comfortable country home where, with a moderate amount of exertion, they were sure of a living. At the end of six weeks her country agent reported that the family had suddenly disappeared, no one knew where. Going back to the neighborhood of their old haunts, she found them all reestablished there in the same circumstances of dirt and destitution as of old. "Why did you leave that comfortable home and come back here?" was her astonished inquiry. "Folks is more company nor sthoomps, anyhow," was the answer. Poor food, and little of it, dirt and discomfort, heat and cold—all count as nothing in competition with this passion of gregariousness and desire for human society, even where that means more or less of a constant fight as the popular form of social intercourse.

Doubtless one of the most potent factors in the modern growth of cities has been the immense improvement in the facilities for travel, which has been such a marked characteristic of the last half century. But, after all, what is this but saying that it has been made easier for people to go where they wished to be? Facilities for travel make it as easy to get from city to country as from country to city; but the tide, except for temporary purposes, all sets one way. Nevertheless, there is no question that this ease of locomotion has been availed of to a surprising extent in transporting each year in the summer season a very large portion, not of the rich alone, but of nearly every class, not only from our great cities but from our moderately large towns, to the woods and lakes and seashore for a time. The class of people who, fifty years since, lived in the same house the year round, without thought of change, now deem a six or twelve weeks' residence in the country a vital necessity; and this fact is a great alleviation and antidote to some of the unfavorable influences of city life.

All modern industrial life tends to concentration as a matter of economy. It has long been remarked that the best place to establish or carry on any kind of business is where that business is already being done. For that reason we see different kinds of manufactures grouping themselves together—textiles in one place, metals in another; and, of the textiles, cottons in one place, woollens in another; and of the metals, iron in one place, copper in another, and so on. The reason of this is obvious. In a community where a certain kind of business is carried on the whole population unconsciously become, to a certain extent, experts. They know a vast deal more of it than people who have had no such experience. Every man, woman, and child in a fishing village is much superior in his or her knowledge of fish, bait, boats, wind, and weather to the inhabitants of inland towns. This is true of all the arts, so that, besides the trained hands which may be drawn upon when needed, there is a whole population of half-trained ones ready to be drawn upon to fill their places. Then, every kind of business is partly dependent on several other kinds. There must be machine makers, blacksmiths, millwrights, and dealers in supplies of all sorts. Where there is a large business of any kind these subsidiary trades that are supported by it naturally flock around it; whereas in an isolated situation the central establishment must support all these trades itself or go a considerable distance when it needs their assistance. Fifty or sixty years ago small manufacturing establishments in isolated situations and on small streams were scattered all through the Eastern States. The condition of trade at that time rendered this possible. Now they have almost wholly disappeared, driven out by economic necessity; and their successors are in the cities and large towns.

If you will examine any city newspaper of fifty or sixty years ago, you will find frequent advertisements for boys as clerks in stores; and almost always they read "one from the country preferred." Now you never see this. Why is it? I think mainly because the class of boys which these advertisements were expected to attract from the country are no longer there. This was really a call for the

well-educated boys of the well-to-do farmers of native stock, who thought they could better themselves by going to a city. They went, and did better themselves; and those who stayed behind fell behind. The country people deteriorated, and the country boy was no longer for business purposes the equal of the boy who had been trained in city ways. Country boys still go to the city; but they are not advertised for, and have to find their own way.

Our great civil war compelled us to find out some way in which to replace the productive power of a million men sent into the field and suddenly changed from producers into consumers. Their places had to be filled in the lines of agriculture and of all the mechanic arts, in the counting room, in the pulpit, at the bar, and everywhere else where a soldier was to be found. A hundred thousand of these places, more or less, in shops, in mechanic industries, in counting rooms, in the medical profession, even at the pulpit and the bar, were filled with women; and the deficit left by the remainder of the million was supplied by newly invented machinery to do their work. The result was that when the war was over a million of men, or as many as came back, found their places filled. They were no longer needed. In all rural occupations this was especially the case; and, being driven out the country by want of work, they flocked to the city as the most likely place to find it. The disturbing influence in financial, economic, and industrial matters of this sudden change of a million men from producers to consumers and back again to producers, followed as it was soon after by the disturbing influences of the Franco-Prussian war, have never been given their due weight by students of sociology.

We must remember, too, that cities as places of human habitation have vastly improved within half a century. About fifty years ago neither New York nor Boston had public water, and very few of our cities had either water or gas, and horse railroads had not been thought of. When we stop to think what this really means in sanitary matters, it seems to me that the increase of cities is no longer a matter of surprise.

A few years since the great improvement of the lift or elevator added probably 10 per cent actually, and much more than that theoretically, to the possibilities of population on a given amount of ground; and now within a very recent period three new factors have been suddenly developed which promise to exert a powerful influence on the problems of city and country life. These are the trolley, the bicycle, and the telephone. It is impossible at present to foresee just what their influence is to be on the question of the distribution of population; but this much is certain, that it adds from 5 to 15 miles to the radius of every large town, bringing all this additional area into new relations to business centers. Places 5 or 10 miles apart and all the intervening distances are rendered accessible and communicable for all the purposes of life as if they were in the next street. Already the bicycle has done more toward directing attention and effort to the improvement of ordinary highways than all that has been done before since the days of Indian paths. It is affecting the legislation of the country on the subject of roads. When we think of what this minimizing of distance means we can not help seeing that its influence must be immense, but just what no man can foretell. It is by such apparently unimportant, trifling, and inconspicuous forces that civilization is swayed and molded in its evolutions and no man can foresee them or say whither they lead.

Cities, as desirable places of human habitation, seem to have touched low-water mark—as did almost everything else—in that miserable period of comparative cessation in human progress known to us in European history as the "Dark" or "Middle Ages." Babylon had its gardens and its perennial streams of pure water running through its streets; Damascus, its wonderful groves and gardens. Old Rome had its mighty aqueducts traversing the country like lines of pillared temples and bringing the full flow of the mountain streams into the heart of the city, where it irrigated the great gardens and pleasure grounds of the wealthy nobles, and sported in fountains for everybody, and furnished baths for the benefit of the mass of the people. And many other large cities on both shores of the Mediterranean were but a duplicate of Rome. But, when the people had in some way lost their grip, either through luxury or gluttony or the idleness which came of having no great wars on hand, or whatever it may have been, their waterworks fell out of repair, their baths went to ruin, the Goths came and finished up the job, and the last state of that people was worse, very much worse, than the first. London, which had its rise and great growth in these days of ignorance and darkness, was a great straggling village, without a vestige of sanitary appliances, without decent roads, infested by robbers, and altogether such a place as pestilence delights in and only fire can purify. Mr. Frederic Harrison is so impressed with this that he seems to think the Christianity of those days largely responsible for the increase of dirt that was contemporaneous with its early growth, and that, in its stern repression of luxurious living and care for the body, it affords a very unfavorable contrast to the cleanlier and more sanitary ways of the earlier time. Probably this is not without much truth; but there were other forces at work affecting alike both saints and sinners. Yet in these mediæval cities,

miserable places as many of them often were for human dwellings, there were certain forces at work which have done as much for humanity, and for modern civilization as any that can be named. Cities have always been nurseries of freemen.

The Rev. Dr. James W. Cooper, in a recent address, says:

"It is a significant fact that in the development of society productive industry and political liberty have always gone together. There has been no manufacturing or trading people known to history, from the ancient Tyrians to the mediæval Florentines and the modern English, which has not also been a free people. Business enterprise demands freedom and developes it. Men must have liberty if they are to combine in business ventures, and through such combinations they learn also to unite their interests in other than mere business ways for the common weal. There is a close connection between the private fortune of each and the property of all, if it can only be discerned; and practical, pushing men are ordinarily the first to discern it."

"If you go back to the fourteenth or fifteenth century, you will find the seeds of modern civilization in the little towns and free cities which were just then beginning to develop an independent life all over England and on the Continent. * * * With the introduction of manufactures came the town, and with the town there came insistence on personal rights, a self-respecting, self-governing, compact community was developed, the castle was defied, the old feudal system of the Middle Ages gave way before the new civilization, and the modern era was ushered in. This was accomplished by the towns. It is the habit just now to praise the country and decry the town. We quote Cowper, and say, 'God made the country, man made the town.' I suppose this is true. But God also made man who made the town, * * * and, while the beginning of things was a garden in the paradise of Eden, the end of things, as prophesied in the Book of Revelation, is a city, magnificent and populous, the new Jerusalem."

In a paper read before this association in 1885 on city and country schools, Mr. W. M. Beckner says: "Cities have played a noble part in the struggle for light and progress. In Europe they were the first to rebel against the feudal system. In England, London always led the fight against tyranny." Indeed there is plenty of historical proof of this fact. "The ordering of secular matters appertaineth not to the Pope," said the burghers of London in the year 1215, a time when the Pope himself and a great many other people thought that the ordering of everything that was worth ordering appertained to him. I find also the following in a book of parliamantary usages: "At the first meeting of a new Parliament the members for the city of London, in court dress or uniform, take seats on the treasury bench, which are afterwards vacated for the ministers of the day. This privilege is accorded to them in commemoration of the part taken by the city in 1642 in defense of the privilege of Parliament and the protection given to the five members who took refuge in the city when their arrest had been attempted by King Charles. This usage was observed," it says, "at the meeting of Parliament in April, 1880." London and Bristol were the sympathizers and stanch friends of America in our own Revolution.

It is remarked, too, I think, by Mr. J. R. Green, that the important part in all public matters played by the trade guilds, which were only found in cities, and their influence as a whole toward freedom, although at times despotic within themselves, is too well known to need any lengthy reference.

Prof. George Burton Adams, in his History of Mediæval Civilization, says: "It is in Italy, however, that the most revolutionary changes which mark the new age are to be seen. There Frederick found himself opposed by an entirely new and most determined energy—the cities."

And in the history of freedom the very names of Utrecht, Dort, Haarlem, Leyden, Magdeburg, Hamburg, Bruges, Wittenberg, Eisenach, and Worms, of Padua, Bologna, and Florence, of Warsaw, Prague, and Buda-Pesth, to which may be added London, Bristol, and Boston, ring with the story of popular rights and human liberty.

Frederic Harrison says: "The life that men live in the city gives the type and measure of their civilization. The word 'civilization' means the manner of life of the civilized part of the community—that is, of the city men, not of the countrymen, who are called rustics, and were once called pagans (pagani), or the heathen of the villages." And another says: "A great and beautiful city surely draws to her the observant and thoughtful souls from every district, and, if she does not keep them, sends them home refined and transmuted."

Some modern woman is quoted as saying that, if one has to run the gauntlet of two or three hundred pair of sharply scrutinizing eyes, the consciousness of a Paris dress is worth any amount of moral principle. And Sappho, who sang six or seven hundred years before the Christian era, says:

What country maiden charms thee,
However fair her face,
Who knows not how to gather
Her dress with artless grace?

If they "didn't know everything down in Judee," it is clear that in Lesbos they knew two or three.

In contrast with the statements of Nordau and of others in regard to the unfavorable sanitary conditions of city life, it must be noticed that it is always in cities that those who can afford it get the best food; and, if you are living in the country, you are largely dependent on the city for your supply. The summer seashore visitor usually finds, if he takes the trouble to investigate, that his fresh fish comes from the nearest great city, also his meat, and quite likely his butter and eggs, and nearly everything except perhaps his milk. To be sure, they came from the country first in many cases; but they seek the best market, and are to be best found at it.

It is also only in great cities, as a rule, that the best medical skill can be obtained. There we all go or send to have our most serious diseases treated and our most critical surgical operations performed. It is almost wholly owing to the unsanitary condition among the children of the very poor that the city death rate is so high.

Mr. C. F. Wingate, in a paper read here in 1885, quotes Dr. Sargent as saying that "life in towns is, on the whole, more healthful than in the country;" also Sir Charles Dilke, in speaking of recent sanitary improvements in England, as saying that "the exceptions are mostly found in the rural districts." This apparent discrepancy between these statements and some of the others is doubtless to be accounted for by the fact that the former had in mind the very poor, while the latter doubtless referred to the better conditioned.

I have been fairly familiar with the streets of New York and Boston for the last fifty years, and there is no fact in that connection with which I have been more impressed than the physical improvement which has taken place in both men and women during that period. The men are more robust and more erect, the women have greatly improved both in feature and carriage; and in the care and condition of the teeth in both sexes a surprising change has taken place. In Boston streets and street cars it seems to me that you see a hundred good-looking women where you formerly saw one. Whether this would hold good in the slums and low parts of the town may be doubted, but there of course one looks for the refuse and cast-off material of society.

A few years since I stood by the grave of a prominent man in one of our rural towns. By my side stood a man who had achieved a reputation both in literature and law. He said to me, "Who is that man opposite?" calling my attention to a tall, fine-looking man. "That," I replied, "is General H." "Ah!" said my friend, with accents of enthusiasm, "one needs to come into the rural districts to see the finest specimens of manhood." I said, "Look about, and see if you find any more." He did not find them. Then I said, "You have picked out the one man here who is in no sense a rural product. It is true this is his home, but his life is metropolitan or cosmopolitan; and those prematurely old, bowed, rheumatic, decrepid, and uninteresting people who make up most of the gathering are the true representatives of our rural population." I think I shattered an ideal, but the logic of facts was too strong to be resisted.

Perhaps this is as good a place as any to remark that when any occupation or calling in life or in a community becomes relatively less remunerative than the average, there begins at once, by natural selection, a process of personal deterioration of those engaged in it. In other words, success is the stepping stone to improvement. And in the rural districts of the Eastern States this deterioration has been going on now for fifty years.

Rev. Dr. Greer has recently said, speaking of clerical work in city and country:

"I think I should say that the difficulties in the country are greater than those in the city. There is more, I think, in common village life to lower and degrade and demoralize than in the city. Take the matter of amusements in the city. There are good ones, and we can make a choice. In the country one can not make a choice. If a theatrical company comes to a village, it is a poor company. If a concert is given, it is a poor concert. The entertainment is of a poor character. Then, again, there is a loneliness, an isolation in the country life; and this tends to lower and depreciate that life. I believe statistics show that a large contingent of the insane in our asylums come from the farms. That hard drudgery of struggle with the clod and the soil from early morning to evening twilight is a lonely and bitter struggle. There is a want of idealism."

I think it is Dr. Strong who says: "When population decreases and roads deteriorate, there is an increasing isolation, with which comes a tendency toward demoralization and degeneration. The mountain whites of the South afford an illustration of the results of such a tendency operating through several generations. Their heathenish degradation is not due to their antecedents, but primarily to their isolation." He also mentions communities in New England where like causes have produced a similar result. I think isolated rural life, where people seldom come in contact with dwellers in large towns, always tends to barbarism. I believe that

poorer people in our cities, if planted in isolated situations in the country, would deteriorate and grow barbaric in habit and thought, even though they might be physically in better condition. What very unattractive people most of our rural population are!

It is to be noted that the attrition and constant opportunity for comparison which city life makes possible, and even compulsory, tend to make all the people who are subjected to its influence alike. They do and see and hear and smell and eat the same things. They wear similar clothes, they read the same books, and their minds are occupied with the same objects of thought. In the end they even come to look alike, as married people are sometimes said to do, so that they are at once recognized when they are seen in some other place; while people who live isolated lives think their own thoughts, pursue different objects, and are compelled to depend upon their own judgments and wills for the conduct of their daily lives. The consequence is that they develop and increase peculiarities of character and conduct to the verge of eccentricity, if not beyond it, and present all that variety and freshness of type which we call originality or individuality. They are much more dramatic, picturesque, and interesting in literature, perhaps not always in real life. I mention this in passing, without any attempt to estimate fully the value of either development. Doubtless something is lost and something gained in either case, and probably much could be said in favor of each. Many persons have a great desire to get, as they say, "back to nature," while others prefer mankind in the improved state, even with some sameness.

The ideal life, time out of mind, for all who could afford it, has been the city for action, the country for repose, tranquillity, recuperation, rest. When Joab, the mighty captain of Judea, quarreled with King David, he retired to his country seat, in what was called the "Wilderness." When Cicero tired of the excitement of Rome, he found rest and quiet in Tusculum. When things went badly with Cardinal Wolsey, he sought refuge and repose in the Abbey of Leicester. Prince Bismarck retires from the frown of young Kaiser Wilhelm to Friedrichsruhe. The country is a good place to rest in, especially if one can control his surroundings. The quiet, the calm, the peace, the pleasant color, the idyllic sights and sounds, all tend to allay nervous irritation, to tranquilize the soul, to repress the intellectual, and to invigorate the animal functions in a very remarkable degree. But this is not rustic life; it is only the country life of the city resident. But the tranquil appearance of a country town, the apparent simplicity and serenity of rural life, the sweet idyllic harmony of rural surroundings are, as everyone must know who has much experience, very deceptive. I remember in one of Dickens's stories a man who lives the life of a traveling showman, one Dr. Marigold, says, in substance, that temper is bad enough anywhere, but temper in a cart is beyond all endurance. The small jealousies and rivalries, the ambitions, the bickerings and strifes of a small rural community, are greatly intensified by the circumscribed area in which they find their vent, and compared with the same human frailties in a larger sphere have all the drawbacks of temper in a cart.

Mr. (Lacon) Colton says: "If you would be known and not know, vegetate in a village. If you would know and not be known, live in a city." But to this it may be added that those who are known in a city are very much more widely known than they can be in the country. A happy fitness between the size of the person and the size of the place is doubtless productive of the most desirable results.

Mr. Shaw says:

"I am not willing to deduce any pessimistic conclusions from this general tendency, whether exhibited in England, in Germany, or in America. I do not for a moment believe that modern cities are hastening on to bankruptcy, that they are becoming dangerously socialistic in the range of their municipal activities, or that the high and even higher rates of local taxation thus far indicate anything detrimental to the general welfare. It all means simply that the great towns are remaking themselves physically, and providing themselves with the appointments of civilization, because they have made the great discovery that their new masses of population are to remain permanently. They have in practice rejected the old view that the evils of city life were inevitable, and have begun to remedy them and to prove that city life can be made not tolerable only for workingmen and their families, but positively wholesome and desirable."

It would seem then (1) that for economic reasons a large part of the work of the world must be done in cities, and the people who do that work must live in cities. (2) That almost everything that is best in life can be better had in the city than elsewhere, and that, with those who can command the means, physical comforts and favorable sanitary conditions are better obtained there. (3) That a certain amount of change from city to country is desirable, and is also very universally attainable to those who desire it, and is constantly growing more so. (4) That the city is growing a better place to live in year by year; that in regard to the degenerate portion of mankind, the very poor, the very wicked, or the very indifferent, it is a question

whether they are better off in the country; but, whether they are or not, their gregarious instincts will lead them to the city, and they must be dealt with there as part of the problem. (5) That efforts to relieve the congested conditions of the city poor by deportation of children to the country are good and praiseworthy, but only touch the surface of things, and that city degeneration must mainly be fought on its own ground.

Perhaps, too, the country needs some of our sympathy and care. It appears clear that here is a constant process of deterioration. Deserted farms and schools and churches mark the progress of ignorance and debasement, and threaten to again make the villagers pagani, as they were in the days of old. And improvement here is not the hopeless thing it might seem; but it must be on economic, and not on sentimental, lines.

The problems here discussed have but recently attracted general attention, and doubtless much is yet to be learned, but the progress already made is by no means small and all the signs are signs of promise.

GEORGIA.

[Address delivered October 31, 1893, by Hon. J. L. M. Curry, general agent of the Peabody and Slater funds, in response to an invitation of the general assembly of Georgia.]

Mr. President, Mr. Speaker, Gentlemen of the Senate and House of Representatives of the General Assembly of Georgia:

I appreciate, I trust properly, the distinguished compliment of being invited to speak to you upon what the president of the senate has well characterized as the paramount subject of your deliberations. I count myself happy in appearing, also, in this magnificent hall of this magnificent capitol, which has, I understand, the rather exceptional merit of having been completed within the original appropriation, and of having been completed without stain or smirch resting upon anyone connected with it. I have the honor of appearing before men of distinguished ability, engaged in the most responsible work of lawmaking. Lawmaking is the attribute of sovereignty, and it is of the highest human honor and responsibility to be invested with this attribute. It would be carrying coals to Newcastle for me to say in this presence that the proper fulfilment of this function demands intelligence, patriotism, integrity, general acquaintance with law, political economy, and a thorough knowledge, not so much of what people desire or clamor for, as of what may be best for the people's needs and welfare. Divine law is the expression of omniscience and omnipotence; human law is the condition of civilization. Under the provocation of atrocious crimes, communities, aroused to indignation, have sometimes violated law. Sometimes, under the experiences of the law's delay and cheated justice, and burning with a desire to take vengeance upon odious malefactors, they have summarily, and sometimes with savage ferocity, deprived a suspected or guilty person of his life under the process of what is known as "lynch law." In pioneer and frontier life, communities have sometimes been compelled, for self-protection, to organize vigilance committees and take the law into their own hands. Such an extreme exigency does not exist at the South, nor excuse the illegal proceedings with which the papers are too often too full. The race of these criminals has not the possession of the government and is not charged with any of its functions. The white people, the race wronged and outraged, are in power, and control the legislative, executive, and judicial departments. As they are the judges, jurors, and executioners there is not the remotest possibility of one of these criminals, under just operation of law, going unwhipped of justice. A mob is a sudden revolution. It is enthroned anarchy. It is passion dominant, regnant. It usurps all the functions of government. It concentrates in itself all the rights and duties of lawmaker, judge, jury, counsel, and sheriff. A mob does not reason, has no conscience, is irresponsible, and its violence is unrestrained, whether it burns down an Ursuline convent, as in Massachusetts, or tortures a ruffian in Paris, Tex. A mob of infuriated men, or of hungry, enraged women, will violate all law, human and divine, and will be guilty of torturing, of quartering, of burning, of murder—enormities hardly surpassed by the most atrocious crimes. Life, property, person, character, perish as stubble before the flame, in the presence of a conscienceless, unthinking, aroused multitude. A rape is an individual crime, affecting disastrously, incurably, the person or the family; a mob saps the very foundations of society, uproots all government, regards not God nor man, is fructiferous of evil. The progress of mankind is to be found only along the lines of the higher organization of society. Our free institutions can not survive except on the condition of the union of enlightened liberty and stable law. Lawlessness and violence are the antipodes of liberty and social order. Obedience to the constituted authorities, to law, is of the essence of true freedom, of self-control, of civilization, of happiness, of masterful development. There probably is not a neighborhood in the United States which would not have summarily arrested and executed, without

a day's waiting, the fiend of Paris. But that infliction of merited punishment, coupled with vengeance, is not defensible, but is fruitful of manifold evils. To its disregard of law may be traced whitecapism in the West and South, in which self-constituted bands mercilessly execute their unauthorized judgments as to martial rights and obligations, political economy, personal duties, etc. It is a very grave error that democracy means the right of the people anywhere and everywhere, and in any way, to execute their passionate will. Ours is a representative government. Our representatives are not chosen because the people can not assemble en masse to legislate, adjudicate, and execute; but because the people ought not to assemble en masse to execute these functions of a complex government. I can fortify myself before a Georgia audience by quoting the expression of the Chief Justice of the Supreme Court, who said before the bar association of this State: "The people have no hands for unlawful work. Justice is in the hands of the people only when it is in the hands of their organized tribunals."

I think it but a natural transition from these preliminary remarks to say that there is a wrong estimate of the power and effects of legislation. Too much is often expected of the general assemblies, as if the legislature were a sort of second-hand providence; and I suspect that not a few of you heard when you were candidates, or when you were about to leave for Atlanta, such inquiries as "What are you going to do for us? What will you do for us when you get to Atlanta?" I heard this very often when I was in public life. The world is governed too much. Some political thinker has said that the best government is that which governs the least. I would not altogether subscribe to the "let alone" theory, because it may be pushed to extremes. There are two great factors of modern, progressive, civilized life. They are wise social organizations and proper individual development. Bearing these two factors in mind, I think you will not fail to see the relativity of my introductory remarks to what will follow. In cases of commercial distress, agricultural depression, financial crisis, national bankruptcy, we are too prone to seek for legislative cures and political nostrums, but all the legislation that you could pass from now until next Christmas would not increase one iota the real returns of agriculture. There are some knaves—not in Georgia, I hope—more demagogues, and a good many fools, who are trying to find a short cut to national and individual prosperity by treating wealth as if it were a thing that could be created by statute without the intervention of labor, forgetting that the products of labor represent all that there is of wealth in a country. Now, there are some universally established truths in political and legislative economy. Great changes, new systems of finance and trade, are not to be ordered as if you were to order a new suit of clothes according to a certain pattern. History condemns South Sea bubbles, John Law schemes of finance, shin-plaster, and fiat currency. Building Chinese walls around your country and erecting barriers against foreign trade never made a nation prosperous any more than the absurd notion, revived in recent times, that what makes one nation rich impoverishes the other, what one gains another loses. Now, we have serious agricultural depression in Georgia, Alabama, Mississippi, and in all the Southern States. The abolition of slavery was a gigantic revolution. Did it ever occur to you that there is not in the annals of history anything comparable to it in its unprecedented magnitude and suddenness? This, with other effects of the war, paralyzed Southern industries and produced individual and general impoverishment.

African slavery was a great economic curse. I am not speaking of it politically, socially, or morally, but it brought upon the South the curse of ignorant, compulsory, uninventive labor, undiversified products of agriculture, and sparse population. It was an interdict effectual upon invention, thrift, development of varied resources, diversity of employments, large and profitable use of machinery, improvement of soil, construction of good country roads, establishment of free public schools. These were the results of African slavery as an economic force. Curse as it was, it suggests a remedy for its evils. What are we to do? We must increase and make more valuable and diversified our products, and we must improve our country roads. Whatever facilitates exchange of products is a blessing. It will not be worth while to produce unless we can exchange what is beyond our own consumption. What do you need in Georgia? You need intelligent, skilled labor. Many of your laborers are ignorant, stupidly so, of every element of art and science. I spoke to a negro the other day at a railway station about his future. His reply was characteristic: "I ain't got nothing, and I don't want nothing." What is the worth of a system which produces such men? What you want is an alliance of brains and hands, with habits of thrift and cleanliness, and increased capacity of production.

Now, Mr. President, I affirm that no ignorant people were ever prosperous or happy. You may measure the growth, the progress, development, and the prosperity of a people by their advance in culture, in intelligence, in skill; and you can measure the decline of a people by their decline in culture, intelligence, and skill. In the United States there are twenty millions of horsepower at work, lowering the cost of production, cheapening the necessaries of life, giving to toil a larger reward. Much

of what handiwork did has been displaced by labor-saving machinery. Guiding the plow with the hand, mowing grass with the scythe, cutting grain with the cradle—this is fast disappearing from enlightened communities. The steam harvester and thrasher have rendered the work of saving the grain crops more rapid and less arduous. Science has found practical application, and ceases to be mere theory; it has allied itself with the useful arts. Machinery has released thousands from a weary struggle for supply of mere animal wants, and has permitted them to take up other pursuits, such as mining, manufactures, mechanical arts, gardening, fruit raising, etc., but this wealth-creating industry demands intelligence, thrift, and saving. Industry has thus received great benefit; the people have gained hope, inspiration, and life from the applications of the principles of science, have gained, finally, command of all of the resources of nature and have had opened for themselves the highest rewards of intelligent industry.

It needs to be repeated and emphasized that national wealth is not the result of chance, or fraud, or legislative hocus-pocus, or stockjobbing manipulations or adroit dealing in futures. It is the result of honest, intelligent labor. The elements of wealth exist in nature in manifold forms, but must be fitted for human wants by labor. Through all transitions from natural condition to finished and useful artificial state, each successive process adds to the value. To utilize the powers of nature, the elements of property and wealth, is, in beneficent results, proportionate to the intelligence employed. The value created is almost in the direct ratio of the skill of the worker. Labor is not spontaneous nor self-willed, but must have behind it an intelligent control. Stupid labor is confined to a narrow routine, to a few, simple products. Unskilled labor is degraded necessarily to coarser employments. What makes work honorable, productive, remunerative, what elevates a man above a brute, is work directed by intelligence. The best method of applying power might be illustrated by such common processes as turning a grindstone, shoveling manure, harnessing a horse, driving a nail. Among the aristocracy of the old world and the Bourbons of the new is a current theory that it is best for the lower classes, the mudsills of society, the common laborers, to remain in ignorance. I have no patience with men who say that education for the ordinary occupations of life is a wasted investment, or who deny the utility or the feasibleness of furnishing to wage earners and breadwinners an education suited to the industries of real life. Will our impoverished people never see that ignorant labor is terribly expensive, that it is a tax, indirect but enormous, bringing injury to the material worked, to the tools or implements employed, wasting force and lessening and making less valuable what is produced?

The president has declared what was intended as the burden of my address. While there are local interests and concerns that may interest you, there is one question, overtopping all others, that goes into the very household, that concerns every individual, that is allied to every interest; and that is how to furnish cheaper and more efficient means of education for the boys and girls of the State. When I speak of this being the paramount subject of legislation, I mean to say that the duty of the legislator is not only to look after education in Clarke County, in Cobb County, but to have the means of education carried to every child, black and white, to every citizen within the limits of the State. I mean universal education; free education; the best education; without money and without price. The great mistake in legislators and people is that, while they profess to be friends of education, and satisfy themselves that they are, they are talking and thinking of the public schools as poor schools for poor children, and not as good schools, the best schools, for the education of all. Here is field and scope for the exercise of the highest powers of statesmanship. This universal education is the basis of civilization, the one vital condition of prosperity, the support of free institutions. All civilized governments support and maintain schools. In semicivilized countries there is no recognition of the right to improvement, nor of the duty of the government to support universal education. William Ewart Gladstone is the greatest statesman of this century. Financier, scholar, orator, with marvellous administrative capacity, even to the minutest details of departmental and governmental work, and shows his appreciation of education by giving to the vice-president of the council of education a seat in his cabinet, and he is the only British prime minister who has so honored education. Last year I was reading brief biographical sketches of the candidates of the Republican and Democratic parties of Massachusetts for the various State offices—governor, attorney-general, etc.—and every one of them, with one exception, had been trained in the common schools of the State, and, therefore, when in office, they would understand what people were talking about when they advocated common schools, and would feel as Emerson said, that if Massachusetts had no beautiful scenery, no mountains abounding in minerals, yet she had an inexhaustible wealth in the children of the Commonwealth. None of you, perhaps, were educated in the public schools. How many times do you visit the public schools? How many times in the last year have you gone into a public school and sat down

on the rear bench and watched the teacher teaching, in order to know what is being done in these great civilizing agencies of the State?

A few years ago the King of Prussia, through Bismarck, issued a call for an educational conference, and he took part with educators and scholars in the discussions. In my journeys through the South, pleading for the children, I have found one governor from whom I never fail to receive a sympathetic response to every demand or argument that I may present for higher or general education. In days that are to come, when you shall record what Rabun did, what Troup, what Clarke, what McDonald, what Johnson, what Gilmer, what Jenkins, what Brown, what Gordon, what Stephens, and what other governors of Georgia have done, there will be no brighter page, none more luminous with patriotism, broad-minded, honest, intelligent, beneficent patriotism, devotion to the highest interests of the State, than that which shall record the fact that the great school governor of the South was William J. Northen. [Great applause.]

The most interesting and profitable changes that have been made in the ends of modern education is the incorporation of manual training in the curriculum, so as to bring education into contact with the pursuits of every day. The three r's, reading, 'riting, and 'rithmetic, used to be the standard. We should add the three h's, and develop, pari passu with the three r's, the hand, head, and heart, so that we may develop the child intellectually, physically, and morally, and so have the completest manhood and womanhood. Oh! it is a sad spectacle to see the ordinary graduate from one of our colleges, with an armful of diplomas, standing on the platform receiving bouquets, and ready to step across the threshhold and enter the arena of active life. You congratulate him because he has acquired knowledge in the schoolroom. But what can he do? What can he produce? What wealth can he create? What aid can he render civilization? He may be a lawyer. A lawyer never yet made two blades of grass grow where only one grew before. [Laughter.] Now, you show that you agree with what I am saying. [Laughter.] I have no sympathy, however, allow me to say it, with the vulgar, ignorant, stupid prejudice that some people have against lawyers. None in the world. [Applause.] You may trace the history of free government in all the struggles for right and liberty, you may study with profoundest admiration the constitutions, the embodiments of political wisdom, and every page of that history you will find illuminated by the wisdom of lawyers. But I say of lawyers what I say of doctors. Doctors do not add one cent to the wealth of the community. Neither do preachers. They are valuable; you can not do without them. But the lawyer, the doctor, the preacher, the editor, do not add one cent to the assessed value of the property in Georgia. Wealth comes from productive labor, and wealth is in proportion to the skill of the labor. It is the mechanic, the farmer, the miner, the manufacturer, the fruit grower, who add wealth to the community and to the country. The others are indispensable in the distribution of the products of labor, in the transactions of business between man and man, and in a thousand ways, but they do not create wealth.

Let me come back to what I was saying, that the graduate of your college is educated to be a clerk, doctor, lawyer, preacher. You may turn him out of college and he will tramp the streets of your cities, of Atlanta, Augusta, Savannah, to find some place in the bank, or some place in a doctor's or lawyer's office. He has been educated away from business, from ordinary productive pursuits, and has a distaste for labor. If his natural bent had been followed, if he had been taught the application of science to business, made familiar with tools and constructive machinery, he would have turned out, in very many cases, something more useful than he will be after having entered one of the learned professions.

I wish some of you would stop over some time on your way to New York at Washington or Philadelphia and go through the public schools. You would see that from the kindergarten to the high school there is no schoolroom where the pupils can not be taught the application of scientific principles to everyday life, and from which they can not come with a knowledge of the common tools and their uses. England learned that in order to hold the markets of the world she had to teach her children in industrial schools. She discovered that her trade was slipping away from her because of the lack of industrial training on the part of her working people. France gives manual training to both sexes.

Saxony, a manufacturing country, had in 1889 115 trade or industrial schools, it being discovered that "a thorough professional education alone can aid the tradesman in his struggle for life." Statistics show a constant improvement of economic conditions. The flourishing orchards, with their world-renowned wealth of fruit, in Austria, Hungary, Bavaria, and Oldenburg, are directly traceable to the introduction of practical instruction in the school gardens. Prussia has introduced into the normal schools instruction in the culture of fruit and forest trees, and "the admirably managed forests and vast orchards of Prussia owe their existence and excellent yield in no small degree to the unostentatious influence of the country schoolmaster who teaches his pupils in school and the adult villagers in agricultural clubs."

As much as we may boast of our free institutions we are far behind the rest of the world in industrial education, in the application of scientific principles to daily life. We abuse Russia, but Russia has 1,200 technological schools; Belgium has 25,000 pupils in her trade schools; Denmark, 6,000; Italy, 16,000. Georgia has no trade school for white children. She has, fortunately, one noble technological school, which I commend to your support and your encouragement. The other day I went to Newport News, which, as you know, is at the mouth of James River, on Hampton Bay, in the State of Virginia. The largest shipbuilding works and the largest dry dock in the United States are at Newport News. They recently received contracts for the construction of United States vessels, and are prepared to do all such work in the best possible manner. I went through the works. I had an old Confederate soldier to pilot me. When I asked about the improvements in the place his heart rejoiced. I was there when the dinner hour arrived. From the shops and works men came in great numbers, until it seemed there must have been 1,000. I said to my friend, "Where do these men come from?" He replied that they came from various parts of the world. "Are there any from the South?" said I. "Oh, yes," said he. "What do you pay these men?" I asked. "From one dollar a day up to eight or ten." "Do any of these old Confederates get the eight or ten?" With a deep sigh and with a tear in his eye, he said: "No; no Confederate among them. The Confederate soldiers," he continued, "and the negroes get a dollar a day; the Northern and European laborers get the six or ten dollars a day." "Why is this?" I asked. "Because," said he, "they have had industrial training at home. They come from their shops and from their training schools, and they put intelligence into their work, and they get for it the best wages."

And yet, when I stand here and appeal to Georgians for manual-labor schools, you say that man is a theorizer; he is taking up the time of the legislature, which should be passing an act to declare Goose Creek a highway, or to build a road across Possum Swamp, or a bridge over Terrapin Hollow! [Laughter.]

Last year, Mr. President, I was in Asia Minor. If any of you have read The Prince of India you will remember some account of the town of Brusa, southeast of Constantinople. I saw there hundreds of donkeys and women with loads of mulberry leaves. A few years ago the silk trade seemed likely to become extinct, because of an insect that was destroying the mulberry trees and attacking the cocoons. Thousands of trees were cut down. The people are now replanting the mulberry trees, and trade is springing up again. It is because Pasteur, the great curer of hydrophobia, subjected the cocoons to a microscopic examination, discovered the insect and applied a remedy. He applied scientific knowledge to the work of saving the silk trade. A school of sericulture has been established, the mulberry trees are being planted, and the people are growing prosperous again.

When you came here you took the oath to support the Constitution, and it says that there shall be a thorough system of common schools, free to all children, for education in the elementary branches of an English education. This mandate requires general, or State, and local supervision, neat and healthy houses, grading and classifying of the pupils, adequate local and State revenues. A valued friend said to me last night that Georgia is spending too much money for public schools. Let us see how this is. Agricultural depression is more serious and more harmful in Mississippi than in any other State, because it is so exclusively agricultural, having few manufacturing interests, little commerce, and no big cities. And yet Mississippi pays for her public schools $7.80 on every thousand dollars of the taxable value of property; Illinois pays $14.40; Texas, $4.80; Nebraska, $18.70; Massachusetts, $3.80; New York, $4.50. Georgia's educational tax proper for the support of the public schools is $1.40 on the thousand dollars! What do you say to that? Can you expect to equal other States in school advantages unless you increase the revenues going to the public schools? Let it be borne in mind that outside the cities, the local or extra-State revenues are very meager. The Southern States raise on an average about 36 cents per capita of population.

But you need not only to increase the revenues supporting the common schools—you need promptly and properly paid teachers. The worst thing that I have ever heard about my native State, Georgia, is that she has permitted the teachers in her public schools—poorly paid as they are—to go month after month without receiving the pittance of their hard-earned salaries! [Applause.] If I were the legislature I would not let the sun go down before I wiped away this crime against the teachers of the State. I only echo what you will find in the governor's message, in the report of Captain Bradwell, and in the lamentations of the teachers.

The training of the teachers is implicitly contained in the compulsory establishment of schools. By making education an integral part of the government you are under strongest obligation to provide good schools. The teacher is the school. You can not have a thorough system of common schools without good teachers. You can not have good teachers without paying them promptly their salaries and without training them to teach. Unfortunately our normal schools are handicapped by the

unpreparedness of the pupils to be taught how to teach. Thorough general training should precede professional training, and is its best preparation for it. Take a school of medicine or of law and combine it with elementary education. It would be absurd. It is none the less absurd to combine elementary instruction with professional training for teaching. Teachers should know the history of education and of educational methods, and practical and definite application of the principles of education; and these things should not be dead rules. The teacher goes from the concrete to the abstract; from special to general; from known to unknown; from idea to the word; from thought to clear expression; and these should be applied habitually, unconsciously, and govern spontaneously every act and element in teaching. Students can become habituated to best methods by being kept in the true path, under the guidance of those familiar with the right methods and principles.

I went to Milledgeville the other day to see and inspect the Normal and Industrial College. It is a most remarkable school. It has been in existence only three years, and has 322 girls; 121 engaged in preparing themselves for teaching school. Although in its infancy, it has sent out 100 teachers to teach in Georgia. I went into the different departments. I wish you could see Professor Branson's teaching in the normal department; it would do you good. You could not do a better thing than to spend a day in going through the school and seeing what they teach there. If you do not go yourselves, send your committees and let them see how the thing is done.

Here is a map, which is an object lesson. It shows the normal schools in the United States. It is not accurate in all its details; yet the general facts are correctly stated. In the States that are most wealthy and most advanced there are the greater number of these black dots, which represent normal schools. The person who made the map did not recognize the fact that in Georgia you have an excellent normal school at Milledgeville. It is industrial and normal, and the work done is excellent. The Peabody fund gave $1,800 last year to this school. I wish I could persuade you to establish coeducation of the sexes at Milledgeville. In the name of patriotism, why do not you teach the boys as well as the girls how to teach school?

Teaching—good teaching, I ought to say—has much of the persuasive power of oratory. It is a glorious sight to see a live teacher—not one of these old moss-back teachers, who has not learned anything since the flood, but a live teacher, who appreciates his vocation—standing before his classes! How it arouses enthusiasm, fortifies the will, inspires the soul; and what a criminal waste of time and money and labor and energy it is to put an incompetent teacher before a class of boys and girls! We see sometimes a picture of Herod murdering the innocents. How we grieve over it! I went into a school the other day in the mountains. There sat the teacher, ignorant, stolid, indifferent, incapable, with the boys and girls gathered around him, studying the a-b, ab; b-a, ba, k-e-r, ker, baker; and I thought then, Mr. President, that we ought to have another painter to draw another picture of the murder of the innocents. It is not the teachers who ought to be painted in that picture; it is the legislatures who are murdering the innocents, when they refuse to establish normal schools for the proper training of teachers. How does the old hymn go? "How tedious and tasteless the hour"—some of you have sung it. How unutterably tedious are the hours spent in such schools, poring over lessons day after day. Some are mechanics when they ought to be artists, for these teachers have no plan nor method, no inspiration nor striving to teach and stimulate all the many sides of a child's nature to higher attainments, higher thoughts and more vigorous action. Time does not permit me to speak of secondary schools, of rural schools, of six-months schools. Some one in writing about me in the paper said that I was growing old. That may be true as to years, but not in thought, not in patriotism, not in loyalty to the South, not in loyalty to the Union, not in loyalty to this country of ours, and to the Stars and Stripes. I am not growing old in my interest in the cause of education. And yet when I hear that your people are about to celebrate the semicentennial of Atlanta, it recalls to mind the time when I used to pass this place and there was no city here, nothing but old Whitehall Tavern. That was in 1841-42. During that period a town was started which was called Marthasville. I used to ride through this section of the country, by Decatur and Stone Mountain, on my way from my home in Alabama to the college at Athens. It then took me five days to make the journey. Now I can go the distance in six hours. What a mighty change! From Marthasville in 1842 to Atlanta in 1893! Five days of travel cut down to six hours; five days on horseback or in stage coach to six hours in a Pullman palace car! Steam has revolutionized the business and travel of the world. We have gone from the stage coach to the steam car, and the sails of the old ships have been superseded by the ocean steamships. The telegraph and telephone and steam have brought the continents into one neighborhood and given solidarity to the business of the world. The merchant can telegraph to China or to Japan for a bill of goods; and before he goes to bed to-night word comes from the other end of the world that the goods have been delivered to the ship and they will leave in the morning. What a revolution has been wrought in our methods of business. Improved machinery of transportation

has reduced freight expenses from $2\frac{3}{4}$ cents per ton per mile to about one-half cent per ton per mile. Civilization creates new kinds of property. In Africa the inhabitants know nothing about bills of exchange, promissory notes, choses in action—nothing about the modern methods of business. Just in proportion as you grow in civilization, and advance in the scale of education and intelligence, you have more kinds of property. It is because of diffused education, because of the work of intelligence, because the forces of nature have been harnessed to the business of life. Science and religion are both evangels of democracy. Wherever these go shackles fall off, tyranny ceases, and the great masses are lifted up to the recognition of their rights and their privileges. Prerogative of mental development is no longer confined to the few, but is conceded to all who bear the image of the Son of Man.

Only one more remark. I said awhile ago that I was a Georgia boy. I am a native of Lincoln County—the dark corner of Lincoln. I graduated from the University of Georgia, growing up in my college days with such men as Tom Cobb, Linton Stephens, Ben Hill, Jud Glenn, and others. In my political life I associated on terms of intimacy with such men as Stephens, Toombs, Hill, and Cobb. I come to you as a Georgian, appealing for the interests of the children of Georgia, and appealing to the representatives of the State. How inspiring it is to deeds of noble statesmanship to read the names of the counties you represent. Some of them recall in imperishable words the names of founders of the State, of men who stood for her rights, of men who bore the brunt of the Revolutionary struggle, such as Oglethorpe, Richmond, Burke, Chatham, Wilkes, and Camden; Jefferson, Madison, Franklin, Carroll, Sumter, Putnam, Jasper, Greene, the German De Kalb, Hancock, Lincoln; to them add the names of the men of the days succeeding the Revolution, Calhoun, Webster, Clay, Lowndes, Polk, Pierce, Douglas, Randolph, Taylor, and Quitman—men from other States, but allied to you in close sympathy. Not these only, for your own great men have their names linked with the destinies of your counties. What an inspiration it must be to represent the county of Berrien, or Bartow, or Cobb, or Clayton, or Dawson, or Dooly, or Dougherty, or Forsyth, or Gilmer, or Hall, or Jackson, or Johnson, or Lumpkin, or McDuffie, or Miller, or Meriwether, or Murray, or Troup, or Walton. I think that if I were a representative from such a county, with such a name, I should be inspired with patriotism to do something high and useful, and to help the State I lived in to bear worthily the name of the "Empire State of the South." [Applause.] I appeal to you for the common schools of Georgia, for the future men and women of the State. The women of the State touch my heart very deeply. My grandmother, mother, daughter-in-law, granddaughter, Georgia born, names suggestive of holiest affection and tenderest memories, which make me, not less than my nativity, a Georgian. In all of womankind, whether or not history has recorded or romance described or poesy sung her virtues, there has been no type of female excellence, no example of purity or loveliness or heroism more exalted and noble than that furnished by Georgia mother or wife, fit representatives of the unsurpassed southern matron. In their names I plead.

Mr. President, a friend told me of a girl in the northern part of the State, not prince-begotten nor palace-cradled, growing up in glad joyousness and innocency, amid the rich, virgin growth of wild trees, who was seen plowing an ox on rolling hillside to earn subsistence for an invalid father, a bed-ridden Confederate soldier, who lay helpless in an adjacent log cabin. Touched by such heroism and filial fidelity, a gentleman sent her to school, and last year at the examination one thousand people, who had come from the mountains to show their interest in the education of the children, saw that girl, who had labored for the support of herself and her bed-ridden father, stand on the platform and take the prize offered for the best essay. Refusing to abandon her old father during vacation, she went back to her mountain home and to labor, but she is now teaching in the school which brought to light her latent powers. There are thousands of Georgia boys, in the wire-grass and middle Georgia and in the mountains, who, if educated, would, like Stephens, be patriotic and honored servants of the State. There are thousands of young maidens, who, like our heroine, require but the helping hand of the State and the warmth of generous culture to emerge from humble homes of obscurity and poverty to places of usefulness and honor. [Long applause.]

LOUISIANA.

THE ORIGIN AND DEVELOPMENT OF THE PUBLIC-SCHOOL SYSTEM IN LOUISIANA.

[Paper prepared for Louisiana Educational Association, by John R. Ficklen, professor of history in Tulane University.]

"If I had as many sons as Priam, I would send them all to the public schools."—*Daniel Webster.*

Mr. President, ladies, and gentlemen: It seems eminently wise that the Louisiana Educational Association at this period of its honored career should devote a portion of its time and attention to the origin and development of the public-school

system within the borders of this State; for we are now entering upon a new era in the history of our schools, and we need, in particular at such a time, to study both the present and the probabilities of the future in the light of the past. As student and teacher I have always laid great stress upon this study of the historical development of our institutions as one of prime importance. We do not thoroughly understand the present until we know how and why it has become what it is. Moreover, from the accumulated experience of those who have gone before us we may learn to avoid a thousand errors; where they garnered only "barren regrets," we may reap a bountiful harvest of good results.

As the individual must live over in miniature the life of the whole human race, so those who would reform institutions must investigate the history of those institutions and understand the causes that led to failure or to success. Without this knowledge their labors will be short sighted and unfruitful, and to their hands no wide powers should be intrusted.

Let us trace, then, as briefly as possible, the origin and development of our public-school system. From such a study I hope something profitable and something interesting may be gleaned together. Clearness of treatment will be promoted if we divide the whole subject into three periods.

I. From the beginning of this century to the framing of the second constitution in 1845.

II. From 1845 to the civil war.

III. From the civil war to the present time (1894).

I.

Before the opening of the nineteenth century, as you doubtless know, public free schools did not exist in Louisiana. The Ursuline Nuns, ever since they were brought over by Bienville, had devoted themselves to the education of young women, and there were some private schools in New Orleans, but the policy of the Government had provided no system of public instruction. The truth is that monarchical governments in that day were unfavorable to the education of the masses. Knowledge is power, and it was not considered desirable that the people should have much power.

In the year 1803, however, the great Territory of Louisiana, Jefferson's fine purchase, was formally transferred to the commissioners of the American Union. As you know, Louisiana then embraced a vast tract of country, from which many rich and prosperous States have since been carved. For nine years the southern portion was called the Territory of Orleans; but, finally, in 1812, much to the delight of its 60,000 inhabitants, it was erected into the State of Louisiana—one of the fairest sovereignties that go to constitute the American Union.

During the early period of its territorial government, there are to be found frequent references to the subject of public education. But many years were to elapse before educational views crystallized into any kind of system of free schools. Nor was this tardy recognition of the value of common schools peculiar to Louisiana. It was equally the case in the early history of all the Southern and most of the Northern States. It would be interesting to trace the development of public schools in the United States at large; to show how the enduring system established in Massachusetts by the old Puritans of the seventeenth century was modeled after the system of schools which they had learned to know during their sojourn in Holland—a system in which Holland at that time led the world. It would be interesting to show that the main object of the Puritans was to keep out "that old deluder, Satan," by teaching all the children to read the Bible, thus preparing them to exorcise the evil spirits that ever torment the ignorant. It would be still more interesting to show why that old royalist, Governor Berkeley, feared the rise of public (I had almost said republican) schools, and devoutly thanked God that there were none in Virginia. Such themes, however, while they would be fruitful of suggestions as to the progress of our American civilization, would occupy far more time than has been allotted to this whole paper. I can not forbear, however, mentioning one fact which may make our Louisiana teachers rejoice that they live in this day and generation rather than in the New England of the seventeenth century. In an old New England town book (date 1661) the duties of the schoolmaster are laid down as follows: (1) To act as court messenger; (2) to serve summonses; (3) to conduct certain ceremonial services of the church; (4) to lead the Sunday choir; (5) to dig the graves; (6) to take charge of the school; (7) to ring the bell for public worship; (8) to perform other occasional duties. With these manifold functions to discharge, it is easy to understand the importance attached, in early New England, to the office of schoolmaster.

But to return to Louisiana. No sooner had the United States taken possession of Louisiana than the enlightened policy of our first American governor, W. C. C.

Claiborne, spoke out in no uncertain accents on the subject of public education. I quote from his address to the territorial council in 1804, just ninety years ago: "In adverting to your primary duties," he says, "I have yet to suggest one than which none can be more important or interesting. I mean some general provision for the education of youth. If we revere science for her own sake or for the innumerable benefits she confers upon society, if we love our children and cherish the laudable ambition of being respected by posterity, let not this great duty be overlooked. Permit me to hope, then, that under your patronage, seminaries of learning will prosper, and means of acquiring information be placed within the reach of each growing family. Let exertions be made to rear up our children in the paths of science and virtue, and impress upon their tender hearts a love of civil and religious liberty. My advice, therefore, is that your system of education be extensive and liberally supported."

These were noble sentiments, but if we may judge by the words of the same governor some years later, they found as yet only a feeble echo in the hearts of the people. For in 1809 we find Claiborne lamenting the general "abandonment of education in Louisiana." It is true that in 1805 the College of Orleans was established—a college in which the honored historian of Louisiana, Charles Gayarre, was a pupil; but though it lingered on till 1826, it was never in a flourishing condition, and the legislature finally concluded to abolish it and appropriate its funds to the establishment of one central and two primary schools. In the constitution of 1812, under which Louisiana was admitted to the Union, there is no mention of a system of public education; it was perhaps intended that the whole matter should be left to legislative action. During the ensuing war of 1812–15 with England, in which Louisiana bore so glorious a part, the people were too much absorbed in the defense of their soil to make any provision for education.

According to the annual message of Governor A. B. Roman (in 1831), it was the year 1818, just one hundred years after the founding of New Orleans, that witnessed the enactment of the first law concerning a system of public schools. The governor doubtless means the first effective law; for ten years previously (1808), an act was passed to establish public schools, but it was rendered nugatory by the proviso that the school tax should be collected only from those who were willing to pay it. Beginning in 1818, however, the legislature made comparatively liberal appropriations for educational purposes, the amounts increasing from $13,000 in 1820 to $27,000 in 1824. Little attention was paid to elementary instruction, but it was proposed to establish an academy or a college in every parish in the State. Lottery schemes—not peculiar to Louisiana, but used freely for educational institutions at this period, both in the North and in the West—were set on foot to raise funds for the College of Orleans and for an academy recently established in Rapides Parish. In addition, one-fourth of the tax paid by the gaming houses of New Orleans was presumably sanctified by its appropriation to the cause of education.

In spite, however, of all these efforts the message of Governor Roman in 1831 makes patent the fact that the system of public instruction in Louisiana has been a failure. The main cause of the failure was recognized by this enlightened Creole and he sets it forth in the clearest and strongest language. It may be summed up in a few words. The schools had not been wholly free. In every academy established and in every primary school provision was made to receive without tuition fees a certain number of indigent pupils. In the two primary schools of New Orleans, for instance, gratuitous instruction was given only to children between the ages of 7 and 14, and preference was to be shown to at least 50 children from the poorer classes. Thus a certain number of poor children, marked with the badge of charity, were to be admitted to the schools and there associate with others that paid. Such a system of public schools could not be successful. The pride of the poorer classes was hurt. One of the parishes refused to take the money appropriated for public schools, while in many others the parents, though living near the schoolhouses, would not send their children because it was repugnant to their feelings to have them educated gratuitously.

In twelve years, declares Governor Roman, the expenditure for public schools had amounted to $354,000, and it was doubtful whether 354 indigent students had derived from these schools the advantages which the legislature wished to extend to that class. In conclusion the governor uttered these significant words, words which should be engraved over the portals of our legislative halls: "Louisiana will never reach the station to which she is entitled among her sister States until none of her electors shall need the aid of his neighbor to prepare his ballot."

Thus we see that the necessity of a new system was beginning to be felt—a system under which the schools should be absolutely free, under which the sons and daughters of the rich and poor should sit side by side, and know no distinction except that which is created by superior abilities. Unless the schools could be raised to a higher level in public esteem, there was no hope of their success.

There were other causes of failure which perhaps did not escape Governor Roman, but which he fails to mention. There was, first of all, the sparseness of the country population, which in Louisiana, as elsewhere in the South, made the problem of educating the people a far different matter from what it was in Massachusetts. In the South large plantations and the absence of towns tended to make the progress of public schools slow and uncertain; while in Massachusetts the fact that the whole population was grouped first in settlements around the churches and then in regular townships, made the organization of public schools a comparatively easy task. In discussing the backwardness of the South in educational facilities, this important consideration is too often omitted. If, with the increase of the population at the present day, it has less significance, it certainly had a great deal before the war.

In the second place, among the old Creoles of Louisiana, the education of young children was regarded as a matter that concerned not the State but the family. Exception must be made in favor of enlightened men like Governor Roman, but the fact remains that for many years the scheme of free public schools was looked upon as a useless innovation. As late as 1858, says De Bow's Review, every Louisiana planter had a school in his own house to educate his children.

From other sources we know that when children were ready for higher instruction their parents, if they were prosperous, most often sent them to Northern colleges or to France. This feeling against the public schools arose partly from what Mr. Lafargue has called the aristocratic and somewhat feudal social system of that day, and partly from the force of custom—a custom that dates back to the eighteenth century—when Etienne de Boré, the first successful sugar planter in Louisiana, received his education first in Canada and then in France.

Last of all it has been claimed with some justice that slavery impeded the progress of the public schools, as that institution impeded the rise of the white laboring classes from whose ranks these schools have always drawn the largest number of pupils. This was certainly true of the country parishes; but to a far less extent of New Orleans where all classes of society were duly represented.

All these causes were more or less operative to hinder the progress of the free school system until the civil war came and radically changed the conditions of Southern life.

From 1835 to 1845 Louisiana continued to make generous appropriations for the cause of education, but instead of establishing what was especially needed for the mass of the people, a good system of elementary instruction, the public funds were expended in founding a number of pretentious academies and colleges. These were required to give free instruction to a small number of indigent pupils, but how many such pupils were actually received it is impossible to say.

The student who examines the early records of the State is amazed at the number of these transitory institutions, many of which hardly survived the generous donations made for their support. As far as I know, the only ones now remaining of some twenty odd which were once scattered through the various parishes of the State are Centenary (once the College of Louisiana), now administered by the Methodists; Jefferson College, now under control of the Marist Fathers, and the Louisiana State University, which was once the Seminary of Learning in Alexandria.

To illustrate the preference in that early period for these higher institutions, none of which gave free tuition except to a few indigent pupils, it will suffice to say that in 1838 the amount appropriated for public schools was $45,633, while during the same year the subsidies to colleges and seminaries were $126,000. During the period of which we are about to speak, however, far less was given for the support of these institutions. Many of them being found superfluous had doubtless already disappeared.

II.

We now enter upon our second period, 1845–1860. During the year 1845 Louisiana received a new constitution. In it full expression was given to the democratic tendencies of the day. The Whigs had yielded to the Democrats, and the latter proceeded to grant the people many privileges which had been previously denied. The privilege of choosing the governor from the two candidates receiving the highest number of votes was taken from the legislature, and the right to vote was no longer restricted to owners of property. But best of all its democratic measures this constitution provided for a system of public schools under the care and supervision of a superintendent of education, to be appointed by the governor, and of parish superintendents, to be elected by the people. The importance of this departure can not be exaggerated. Up to this time such schools as had existed in the State had been under the care of the secretary of state, whose other official duties were too numerous for this additional burden. From this time on we are to see a superintendent of

education devoting his time and energies to the establishment of an extensive system of public free schools and making regular reports to the general assembly.[1]

The constitution of 1845, and the laws passed by the legislature to carry out its provisions, created a new era in the history of education in Louisiana. Up to 1845, although large sums in proportion to the educable population had been expended, the system had been a failure, and the secretary of state had declared it should be consigned to "an unhonored grave." Let us see what were the provisions for the organization and support of the new system. In the first place the schools were to be absolutely free to all white children. Of course, as it was one of the corollaries of the institution of slavery that it was dangerous to educate the slaves, no provision was made for the education of the negro until he had been emancipated.

For the support of the new system, the constitution declared that the proceeds of all lands granted by the United States Government for the use of public schools, and of all estates of deceased persons falling to the State, should be held by the State as a loan, and should be a perpetual fund, on which annual interest at 6 per cent should be paid for public schools, and that this appropriation should remain inviolable. The lands referred to were the public lands which the Federal Government had retained when Louisiana was made a State, and which that Government was now granting to the State for educational and other purposes. In 1847 these land grants amounted to 800,000 acres, and in many instances proved to be very valuable. Moreover, there are many references in these old acts of the legislature to the location of the sixteenth sections in townships for school purposes and to the sale of these sections. For the further support of the schools it was now provided by an act of the legislature that every free male white over 21 years of age should pay a poll tax of $1, and that a tax of 1 mill should be levied on all taxable property. As early as 1842 the police jurors[2] were authorized to levy a tax for schools not to exceed one-half the annual State tax. Provision was now made that whenever a parish raised not less than $200 the governor should authorize the State treasurer to pay over to said parish double the amount so assessed.

Certainly no happier choice for State superintendent of education could have been made throughout the extent of Louisiana than was made in 1847 by Governor Isaac Johnson. The man he chose was a ripe scholar. He had been trained in all the learning of that day. First under a private tutor and then in Georgetown College he had saturated his mind with all that was best in classical literature, and he had caught an inspiration which made him one of the great teachers of his time. A brilliant orator, he spoke and wrote with convincing eloquence whenever the sacred cause of education was at stake. Such a man was Alexander Dimitry, the first superintendent of education, whom Louisiana honors and reveres as the organizer of her system of public schools.

Both the reports of Mr. Dimitry, which are generally supposed to be lost, are to be seen in the Fisk Library of New Orleans. The first was rendered in 1848 and the second in 1850. To the student of our educational progress both are interesting and instructive.

The first describes how the 47 parishes had been divided into school districts by the police jurors, assisted by the parish superintendents. The services of these superintendents, who were elected at a salary of $300 a year, were very efficient, but the schools in the parishes were not generally welcomed, and Mr. Dimitry declared that he viewed them rather in the light of an experiment. It was only natural that he should hold this opinion; for when the free schools were first established in New Orleans, during the years 1841 and 1842, the announcement, says Mr. Dimitry, was received by some with doubt, and by others with ridicule, if not hostility. "When the schools in the second municipality were opened personal appeals and earnest exhortations were made to parents, and yet such were the prejudices to be overcome that out of a minor population of 3,000 only 13 pupils appeared upon the benches." Fortunately, public sentiment in the city gradually changed, and in 1848 Mr. Dimitry was able to declare that thousands were blessing the existence of the city schools, for in 1849, out of an educable population of 14,248, the number attending the free schools was 6,710, or nearly 50 per cent. In the country parishes his labors were soon rewarded with more than anticipated success, for out of an educable population in 37 parishes of 28,941 the number attending in 1849 was 16,217, or more than 50 per cent.

In his last report Mr. Dimitry complained of the opposition shown by many to the new system, and especially to a portion of the law which prescribed the levying of a district tax for the schools. But he had reason to congratulate himself on having

[1] Mr. R. M. Lusher, formerly State superintendent of education, and a noble worker in that office, wrote a sketch of the public school system in Louisiana. In this sketch he makes the curious error of stating that all the reports of the State superintendents from 1847 to 1860 were burned during the war. In the Fisk Library of New Orleans may be found nearly every one of the reports which he supposed to be destroyed, beginning with that of Alex. Dimitry in 1848.

[2] County officers in Louisiana.

created a sentiment in favor of the free schools and in obtaining an attendance of more than 50 per cent of the educable population—a per cent, it is to be remembered, far higher than that of the year 1894, when 70 per cent of our educable population are not receiving any instruction either in public or private schools. (Estimate made by the Times-Democrat.)

Throughout this period (1848-1850) moreover, the State was prosperous, and the sums appropriated to the public schools in 1849 amounted to nearly one-third of a million dollars, a higher ratio per educable youth than at the present day. Such was the condition of the public schools during Dimitry's able administration. By annual visits to the different parishes, he kept himself in touch with his superintendents, and inspired the State at large with much of his own zeal and enthusiasm.

In the years 1851 and 1852 important changes were made in the administration of the schools. First of all, the State superintendent was no longer to be appointed by the governor, he must be elected by the people. Then followed an act of the legislature which proved to be extremely unwise. That body in a fit of economy abolished the office of parish superintendent and substituted in each parish a board of district directors who were to receive no salary. Moreover, the salary of the State superintendent was reduced to $1,500 a year, and he was relieved from the duty of an annual visit to each parish. The effect of these changes upon the schools in the country parishes is abundantly shown in the reports of the State superintendents, Robert C. Nicholas, in 1853, Dr. Samuel Bard, in 1858, and Henry Avery, in 1861. They all declare that the system outside of New Orleans had been seriously crippled; that the district directors took no interest in their work, and that often it was impossible to find out who were directors in a parish. Loud complaints, moreover, came from many of the parishes that the teachers appointed were not only incompetent, but often drunkards and unprincipled adventurers. It is not, therefore, surprising to learn that many parents demanded and actually obtained their children's quota of the public-school funds, which they used in part payment of the salaries of private tutors and governesses. Such a method of appropriating the public money, however, not only produced general demoralization, but worked great injustice to the poorer classes.

In spite of complaints and appeals, the legislature failed to restore the parish superintendents and to reform the abuses just mentioned. Hence a pessimistic writer in De Bow's Review for 1859, taking up an annual report of the State superintendent, gives a gloomy account of education in Louisiana. He even goes so far as to conclude that the New England system of foreing education on the people was not adapted to Louisiana; that such a law was theoretical and void of practical results. He then continues in the following strain: "If a law were passed by the State of Louisiana appropriating $300,000 a year to furnish every family with a loaf of bread more than half the families would not accept it. The report of the superintendent for 1859 proves that more than half the families in Louisiana will not accept the mental food which the State offers their children. Some parishes will not receive any of it. Tensas, for example, which is taxed $16,000 for the support of public schools has not a single school. The truth is the government does more harm than good by interfering with the domestic concerns of our people."

This Jeremiah then proceeds to detract as much as possible from the merit of the public schools in New Orleans, though he admits that these schools were regarded as very successful.

I have quoted the words of this critic quite fully because, while they contain some grains of truth, I believe they also contain a great deal of error. Luckily the reports from 1856 to 1861, from which he forms his conclusions, are still in existence, and they do not justify his statement that at this period the people were opposed to the public schools because "they did not wish to accept the mental food offered them by the State." On the contrary, here is an extract from the report of 1859 which throws much light on the condition of affairs in many of the parishes: "Under the present law nearly every wealthy planter has a school at his house and draws the pro rata share out of the public treasury. The poor children have not the benefit of these schools, and in this parish, which pays about $14,000 in school tax, there is consequently not enough in the treasury to pay the expense of a single school at the parish seat, where it ought to be."

This extract shows what pernicious custom lay at the root of the failure. The money was misappropriated in favor of the private schools; so that where public schools were established, cheap and worthless teachers had to be employed, who soon brought their schools into disrepute. The ineffieiency of the school directors followed as a matter of course. Seeing that the rich planters were satisfied, the legislature simply did nothing but appropriate ample funds, which often never reached the schools for which they were destined. Under these circumstances it is even remarkable that in 1858, according to Dr. Bard's report, the number of pupils attending public schools in the country parishes was 23,000 out of an educable population in the whole State of 60,500.

Let us turn to New Orleans. During this period the city was divided into four school districts, with a board of directors and a superintendent for each district. This arrangement insured most efficient management. The attendance in 1858 was 20,000—nearly as many as in all the country parishes—and Dr. Samuel Bard, after an examination of the city schools during this year, reported to the general assembly that "the discipline was admirable, the attainments of the scholars unexpectedly extensive, and the teachers of rare ability." Hon. William O. Rogers, who did splendid work for the schools at this period, and who later became city superintendent, has often in my presence corroborated the testimony of Dr. Bard.

It was at this very time, also, that an important advance was made in educational methods. As early as 1853 Superintendent Nicholas had recommended the establishment of a normal school, declaring, however, that there was none in the United States and only one in Canada. Finally in 1858, largely through the exertions of Mr. Rogers, a normal school, the first in Louisiana, was opened in New Orleans. Unfortunately its career of usefulness was soon cut short by the rapidly approaching civil war.

Mankind has often been accused of viewing the past through a roseate haze, which, while it lends a new charm to that which was already beautiful, also clothes with its own light even that which was dark and unbeautiful. It will not be wise, therefore, in looking back over the period of fifty-six years which we have just reviewed to speak too favorably of the system of public schools in Louisiana. Certainly, however, the State in 1860 had great reason to congratulate herself on the advance that had been made over the period previous to 1845. Up to that date, as we have seen, the school system was not organized at all; for the schools were not under proper supervision and outside of New Orleans they were not free except to a small class of indigent pupils. With the new constitution and the advent of Alexander Dimitry, Louisiana entered upon a new era of educational progress, especially in New Orleans. In the country parishes down to 1860 it must be admitted that the success of the system was only partial—a result that was due to the size of the plantations, the too conservative character of the old planters, the abolition in 1852 of the office of parish superintendent, and especially to the appropriation of public funds for the benefit of private schools.

III.

PUBLIC SCHOOLS DURING AND SINCE THE WAR.

During the great civil war it was but natural that the public schools of Louisiana, especially in the country parishes, should languish, for men were engaged in a struggle which left little time for the consideration of the educational problem. In most of the parishes the schools for several years were entirely closed. One of the school directors wrote that from his parish there were no reports to make except war reports. In New Orleans, however, and in the neighboring parishes, which were in the possession of the Federal troops, many schools were kept open, and provision was made by the Freedmen's Bureau of Education to give instruction to the newly emancipated slaves. Under these new conditions there was a strong effort to open schools in which the two races should be educated together. But this policy, so repulsive to Southern sentiments, ended in failure and it was abandoned.

The history of our State after the war is too well known to need repetition here. In a few years the public debt of Louisiana was increased by the sum of $40,000,000. Moreover, in 1872, the Government sold at public auction the whole free-school fund, which had been invested in State bonds, and which had been repeatedly declared a sacred and inviolable trust for the benefit of the public school. This fund, derived from the sale of public lands, amounted to more than $1,000,000. After it had been accomplished there followed a period of "storm and stress"—a fierce struggle for supremacy, which, during the year 1877, ended in the triumph of the more conservative elements of the State, under the leadership of Francis T. Nicholls.

We can point with pride to one of the first acts of the legislature under this new administration. It was as follows:

"The education of all classes of the people being essential to the preservation of free institutions, we do declare our solemn purpose to maintain a system of public schools by an equal and uniform taxation upon property as provided in the constitution of the State, and which shall secure the education of the white and the colored citizens with equal advantages.

"LOUIS BUSH, *Speaker.*
"LOUIS A. WILTZ, *Lieut. Governor.*
"FRANCIS T. NICHOLLS, *Governor.*"

It is to be noted here that the State assumed formal charge of the education of the freedman, pledging him the same advantages as the whites. This pledge has been faithfully kept; the number of colored pupils has gradually increased until there are now enrolled in the public schools of the State more than 60,000.

In March, 1877, a few months before the act above quoted, the general assembly had established a State board of education, consisting of the governor, the lieutenant-governor, the secretary of state, the attorney-general, the State superintendent, and two citizens of the United States, residents for two years in Louisiana.

As you know, this board was reorganized some years later, so as to contain one representative from each Congressional district—a change most wisely made.[1]

The most important step, however, in the reorganization of the public school system was taken in the constitution of 1879. This is the constitution under which we are now living, but which we all hope to see radically amended in the near future. It provided for the appointment of parish boards, and declared that these boards might appoint at a fixed salary a parish superintendent of public schools.

Thus, after the lapse of twenty-seven years, Louisiana restored the office of parish superintendent—an office which under Alexander Dimitry was found to be all important, and which since 1879 has proved essential to the very existence of public schools in Louisiana. May the parish superintendent, one of the strongest pillars of public education in our State, be a perpetual institution among us, and may his office in the future receive that meed of respect and remuneration which his zeal and devotion so richly deserve.

While the constitution of 1879 is entitled to our gratitude for the reinstatement of the parish superintendents, one is forced to admit that it made no adequate provision for the support of the public schools. It is true that the free-school fund, the bonds of which were sold in 1872, was placed among the perpetual debts of the State, but the interest to be paid was reduced from 6 to 4 per cent, and it was further declared that this interest and the interest due on the seminary and the agricultural and the mechanical funds should be paid, not out of the general revenues of the State, but out of the tax collected for public education. This was a wholesale "robbing of Peter to pay Paul."

Moreover, though provision was made for a supplementary tax to be levied for public schools by the police juries of each parish, even this was not obligatory, and if it were levied it was to be kept within very narrow limits.

These unwise articles of the constitution have received such repeated and such hearty condemnation from every superintendent of education that it is not necessary for me to add my own opinion. I would only remind you that when that constitution was adopted in 1879 the State had just passed through the period of reconstruction, her finances were in a prostrate condition, and some constitutional limitation of taxation seemed absolutely necessary. Those conditions no longer exist, and it is to be hoped that the amendments recently proposed by the board of education will be unanimously adopted.

It may be added that the constitution of 1879 ended its provisions for the public schools with one article that has received universal approval and should be widely acted upon. It declares that women over 21 years of age shall be eligible to any office of control or management under the school laws of Louisiana. This is simply an act of justice to that sex which furnishes so large a proportion of our teachers throughout the State.

The history of the public schools since 1879 is so well known that I can not pretend to any knowledge which this audience does not already possess. A simple outline, therefore, will suffice to refresh your memories.

The first result of the insufficient support granted by the constitution, you will remember, seemed to be the ruin of the public school system.

In spite of the splendid efforts of Hon. R. M. Lusher, a devoted and untiring worker in the cause of public education, the school receipts for 1882 allowed only 45 cents for each educable child in the State; and the Louisiana Journal of Education for that year gloomily but forcibly declared that the public school system was as "dead as Hector." The teachers even in New Orleans were often unpaid, many schools had been closed, and the double obligation of educating both whites and blacks seemed too great a burden for the State to bear. But the exertions of Lusher, Easton, and Jack, together with the efficient aid received from the parish superintendents and the State board, were not without avail. Defeat was at last changed into victory, and the record of the past decade, illuminated by the labors of these men, is a most interesting chapter in the history of our educational progress. The school fund, especially in the country parishes, has been largely increased, and so has the attendance. Not only has public sentiment, without which laws avail naught, been brought over to the side of education, but the teachers themselves, though often receiving scanty remuneration, have shown greater ability and greater enthusiasm than ever before in the history of the State. This I attribute largely to the splendid work done in the Normal School of New Orleans under Mrs. Mary Stamps and in the State Normal of Natchitoches under President Boyd. I am sure you will believe that lack

[1] In 1870 the Republicans had established a State board of education, consisting of the State superintendent and six "division superintendents." The State was divided into six districts under these "division superintendents."

of space, and not lack of appreciation, has prevented my giving a detailed account of the valuable aid rendered to this normal work by the Peabody fund. A tribute to Dr. Curry's wise administration of this fund is certainly due from anyone who writes the history of public education in Louisiana. Lack of space must also be my plea for omitting the history of the McDonogh fund, to which New Orleans owes its array of splendid school buildings.

It may safely be declared, therefore, that the year 1894 records progress in every direction, but I can not do more than name some of the chief influences at work for the advancement of the public schools. They are the Association of Parish Superintendents; the State Teachers' Association, with its reading circle and its official journal; the State and parish institutes for teachers, the Louisiana Chautauqua; and last, but not least, the Louisiana Educational Association. Surely this is a goodly list—one that any State might be proud of.

In glancing over the incomplete sketch of public education in Louisiana, the progress of which I have traced through ninety years, I am struck with the fact that the State has followed what is called the general trend of education. This trend, as laid down by Dr. William T. Harris, is as follows: First, from private, endowed, and parochial schools there is a change to the assumption of education by the State. "When the State takes control, it first establishes colleges and universities; then elementary free schools, and then it adds supplementary institutions for the afflicted; then institutions for teachers, together with libraries and other educational aids. In the meanwhile increasing attention is paid to supervision and methods. Schools are better graded. In class work there is more assimilation and less memorizing. Corporal punishment diminishes, and the educational idea advances toward a divine charity." Such, amid a thousand difficulties and vicissitudes, has been the history of public education in Louisiana. I am persuaded that we are on the right path.

The question still remains, however, Is Louisiana abreast of the other States of the Union in her provision for the education of her youth? The highest authorities declare that she is not. Let us for a moment examine the conditions as they exist.

In 1848 the educable youth of the State numbered only 41,500; in 1894, with the addition of the colored pupils, they numbered more than 378,000. Of these only 115,000 attend any school, either public or private. What is the consequence? I answer that in seven of our prosperous parishes, out of 13,000 voters, it is stated that 6,858 white voters, more than 50 per cent of the whole number, can not read and write; and it is a well-known fact that Louisiana now leads all the Southern States in illiteracy. What shall we do to remove this lamentable condition of things?

Evidently, though we now spend nearly $1,000,000 a year for our public schools, that sum, in view of the increased population, is grossly inadequate. We need higher salaries for our teachers, better remuneration for our parish superintendents, and longer sessions for our schools. The machinery of our public school system, as far as the officials and their relations to each other are concerned, is excellent. But what we require above everything is the privilege of local taxation beyond the present constitutional limitation. We have reached a point in Louisiana where local pride has been aroused. We are beginning to feel that however grateful we may be for the beneficent work of such funds as the Peabody, we must first of all help ourselves; we must demand our independence—the most glorious privilege granted to man.

MASSACHUSETTS.

Mary Hemenway.

[At a meeting held by the Boston public school teachers at the Old South Meeting House May 2, 1894, in honor of the memory of Mrs. Mary Hemenway, warm and loving tribute was paid to her personal character and worth, her services in the cause of education were reviewed, and the reforms instituted by her recalled to remembrance by those who had been her associates and coworkers and who were specially qualified to represent the different phases of her activity. The addresses made upon this occasion were afterwards incorporated into a memorial volume, under the editorial supervision of Dr. Larkin Dunton, head master of the Boston Normal School From this volume the following extracts have been made to illustrate her life and work. They are succeeded by a more detailed account of the Old South work from another source.]

[From the introductory remarks by Dr. Dunton.]

Mrs. Hemenway was born in the city of New York December 20, 1820, and died at her home in Boston March 6, 1894. She was the daughter of Thomas Tileston, from whom she seems to have inherited her remarkable business ability. She married Mr. Augustus Hemenway, a great shipping merchant. Several years before his death his health had so failed as to throw much of the oversight of his immense business upon Mrs. Hemenway. By this means was developed that remarkable talent for the

directing of affairs which subsequently proved so useful in carrying on her great benevolent enterprises. She certainly possessed business ability of a high order.

Her insight into the causes of suffering among the people, far and near, present and future, and into the remedies for this suffering, was wonderful. Her breadth of view was only equalled by the warmth of her heart. It was the generosity of her nature that so endeared her to the teachers of Boston. They came to know her as a fellow-worker for the good of the people. Pride, haughtiness, and condescension, which too often accompany the possession and even the distribution of wealth, were so conspicuously wanting in her nature that every teacher who was brought into contact with her in her benevolent work felt only the presence of a great heart beating in sympathy with all mankind.

Her beneficent plans were never set on foot and then left to the management of others. She not only followed her work with her thought and her kindly interest, but she stimulated and cheered her coworkers with her inspiring personality. It was her clear head, her warm heart, and her cheerful presence that gained for her admiration and affection.

[Resolutions presented by Robert Swan, master of the Winthrop School, and adopted by the meeting.]

Whereas it is fitting, at the close of Mrs. Mary Hemenway's useful life, that the Boston public school teachers, assembled in the Old South Meeting House, which she loved so well and did so much to save, should place on record their profound appreciation of the noble work she has accomplished for the practical education of the children under their care, by which the pupils, and through them the homes from which many of them come, have been elevated both mentally and morally: Therefore be it

Resolved, That through her wise foresight and long perseverance in the introduction of a systematic training in sewing, by which girls in the public schools are made proficient in needlework, the first step toward manual training, now acknowledged by all to be an essential part of our school programme, she exhibited an almost intuitive sense of the needs of the community, and enabled the children to relieve their mothers of many weary hours of labor.

Resolved, That by the introduction of the kitchen garden and, later, the school kitchen—a long step in progress—she accomplished by this wise provision of her studious care an inestimable benefit to the city, the children being thus taught not only to cook intelligently and economically, but also to buy understandingly the various articles required, by which the manner of living has been changed, healthful food and proper service displacing uncomfortable and unhealthful methods.

Resolved, That by the introduction of the Ling system of gymnastics, in which Mrs. Hemenway's liberality and care for the physical development of the children were the principal factors, the city is greatly indebted for another advance in education.

Resolved, That by the establishment of the Normal School of Cooking and the Boston Normal School of Gymnastics, furnishing qualified teachers to inaugurate the work in other cities, by which the full advantage of Boston's experience is reaped, her beneficial influence has made instruction in these branches national instead of local.

Resolved, That by her contribution in money and intelligent helpfulness in promoting the Boston Teachers' Mutual Benefit Association in the days of its inception much was done to insure the success of the enterprise.

Resolved, That by the purchase of Dr. John D. Philbrick's library and its presentation to the Boston Normal School she has made easily accessible to the pupils the choicest works on educational subjects, thus making the valuable information acquired a part of their equipment for their chosen profession.

Resolved, That by her prizes for essays on subjects connected with American history, awarded to graduates of the Boston high schools on Washington's Birthday in the Old South Meeting House, she has caused a thorough research into our colonial and national life that can result only in inspiring patriotic ardor which must conduce to the best citizenship.

Resolved, That by these and many other acts which can not be enumerated at this time her name is justly entitled to rank with the names of Pratt and Drexel, who have established institutes in Brooklyn and Philadelphia that will confer incalculable benefits on the people of this country.

Resolved, That Mrs. Hemenway, in these varied interests, gave what is infinitely more important than money—her constant sympathy in and enthusiasm for the work, which is an invaluable memory to all who were blessed with her assistance.

Resolved, That in tendering these resolutions to the family of Mrs. Hemenway we desire to express our deep sympathy in their bereavement.

[Address by Edwin P. Seaver, superintendent of schools.]

How the Old South Meeting House was saved from threatened destruction is a well-known story that needs not now to be repeated. Mrs. Hemenway's interest in

that patriotic enterprise did not end with her giving a large share of the purchase money. That generous gift was but the beginning of a larger enterprise, the prelude to a nobler history.

These ancient walls had been saved. What should be done with them? They might have been allowed to stand as mute witnesses to the events of a glorious past. They might have been used merely as a shelter for curious old relics, which antiquarians love to study and passing visitors cast a glance upon. And so the old meeting house might have stood many years more—a monument to religion and freedom, not unworthy, indeed, of its purpose, but yet a silent monument.

The plans of Mrs. Hemenway were larger and more vital. The old building should be not only a relic and monument of the past, but a temple for present inspiration and instruction. The thoughts and the hopes that aforetime had thrilled the hearts of men assembled in this house should live again in the words of eloquent teachers. Here should young people gather to learn lessons of virtue and patriotism from the lives of great men whose deeds have glorified our nation's annals. What has now become known throughout the country as "the Old South work" is the outgrowth of this fruitful idea. Let us briefly review the particulars of this "Old South work," keeping in mind as we do so its main purposes, which are first to interest young people in American history, and then, through that interest, to inspire them with a love of their country, and to instruct them wisely concerning the duties and privileges of citizenship under a free government. Can any instruction more vital to the public good be thought of?

First, we may notice that Washington's Birthday has been appropriately celebrated in this house every year from 1879. Other national holidays have been celebrated likewise, or may hereafter be celebrated, for the idea is a growing one.

Next should be noticed "the Old South lectures." As early as 1879, and in the two years following, courses of lectures on topics of American history were delivered in this house by Mr. John Fiske, who has since become so well known as a brilliant writer on historical subjects. That these lectures would be intensely interesting to the adult portion of the audiences was naturally enough expected at the time, but it was hardly foreseen that the young people would be so thoroughly fascinated as they were with a lecturer who had been known chiefly as a writer on deep philosophical subjects. Mr. Fiske has been a frequent lecturer on this platform from 1879 down to the present time.

In 1883 "the Old South lectures," properly so called, were organized on a definite and permanent plan. Each year the work to be done is laid out in a systematic manner. A general topic is chosen, and particular topics under this are assigned to different speakers, who are invited because their special knowledge of the topics assigned them gives great interest or importance to what they may have to say. The great interest awakened by these lectures has led to the repetition of many of them in other cities.

"The Old South leaflets" are an interesting auxiliary to the lectures. A practice was early adopted of providing in printed form the means of further studying the matters touched upon by the lecturer of the day. The leaflets so provided contained not merely an outline of the lecture, but the texts of important historical documents not otherwise easily accessible, and references to authorities with critical notes thereupon, and other interesting special matter. These leaflets have proved to be so useful to teachers in their school work that the directors of "the Old South work" have published a general series of them, which are to be continued, and are supplied to schools at the bare cost of paper and printing.

Perhaps "the Old South essays" touch the Boston public schools more immediately than does any other part of "the Old South work." Every year, beginning with 1881, have been offered to high school pupils soon to become graduates, and also to recent graduates, four prizes, two of $40 and two of $25 each, for the best essays on assigned topics of American history. The usual objection to the plan of encouraging study by the offer of prizes, that many strive and few win, so that the joy of victory in the few is more than offset by the disappointment of failure in the many, was met in the present case with characteristic wisdom and liberality; for every writer of an essay not winning a money prize has received a present of valuable books in recognition of his worthy effort. The judges who make the awards of prizes state that crude essays, betraying a want of study and care on the part of the writers, are extremely rare. On the other hand, there are often so many essays of the highest general excellence that the task of making a just award is a difficult one.

Some of these essays have been printed in the New England Magazine and in other periodicals. Some have been published in pamphlet form, and have received the favorable notice of historical scholars. It is now the custom to invite at least one of the prize essayists each year to deliver one of "the Old South lectures."

Among the more distinguished of the essayists may be named Mr. Henry L. Southwick, a graduate of the Dorchester High School, whose prize essay of the year 1881, entitled "The policy of the early colonists of Massachusetts toward Quakers and

chers whom they regarded as intruders," attracted much attention; Mr. F. E. E. Hamilton, a graduate of the English High School, and since an alumnus of Harvard College; Mr. Robert M. Lovett, a graduate of the Boston Latin School, who led his class at Harvard College; Miss Caroline E. Stecker, who took prizes in two successive years; and Mr. Leo R. Lewis, of the English High School, now a professor in Tufts College. Others there are who may be expected hereafter to distinguish themselves in the line of work for which the writing of their essays was the beginning of a preparation.

The whole number of Old South essayists is now over 100. About 20 of these have been or still are students in colleges, some proceeding thither in regular course from the Latin schools, but others in less easy ways, being impelled to the effort undoubtedly by a desire for higher education that had grown out of their historical studies for their essays. But among the essayists who have not become college students, the interest in historical studies has been no less abiding. The Old South Historical Society, formed about two years ago, is composed of persons who have written historical essays for the Old South prizes. Quarterly meetings are held for the reading of papers and for discussion on historical subjects. This society may well be regarded with peculiar interest by our teachers, because it represents the best historical scholarship of successive years in the high schools of Boston. It may soon become, if it be not already, one of the most important learned societies in this city.

But historical study and writing are not for the many, nor are they enough to satisfy the few. A broader influence may touch the hearts of all through music. Out of this thought has grown the society known as "The Old South Young People's Chorus."

At many of "the Old South lectures" there has been singing of national patriotic hymns by large choruses of boys and girls from the public schools, three or four hundred often taking part. On the Washington's Birthday celebrations there has always been singing by the public-school children. These interesting exercises have led to a more permanent organization for the practice of patriotic music, which flourishes now under the name of "Young People's Chorus."

Finally, let us note the extension of "the Old South work" to other cities, as Providence, Brooklyn, Philadelphia, Cleveland, Indianapolis, Chicago, Madison, Milwaukee, and others. Everywhere the idea of bringing our national history home to the minds and hearts of young people through an awakened interest in monuments and memorials of the past has been enthusiastically received. Philadelphia, no less than Boston, has her shrines of freedom. There is no city or town in the land that does not possess something interesting as a memorial of past events—events which the national historian may regard as of no more than local importance, but which, by the very circumstance of being local, best show the child the stuff out of which the fabric of our national history is woven. Everywhere, therefore, the materials for "the Old South work" are at hand, and the plan of this work is so simple that it can be adopted everywhere. * * *

[From the address by James A. Page, master of the Dwight School.]

Of the public-spirited woman in whose honor we are met it may be said, in the language of Sydney Smith, that she was three women, not one woman.

Practical as a business man, she was yet tender and generous to many different sorts of people. Expecting always faithful and loyal service, she was considerate of those carrying forward her great plans. She delighted to spend money, as she was spending it, for lofty purposes. She had strength—the strength of opposite qualities, the strength that fits for public service. The city was fortunate that at such a time, or at any time, such service was to be had.

The woman who gave this service saw very surely that any institution, to be lasting, must be firmly founded; and her motto therefore in this, as in other things, was "Go slowly." We had had "systems" of gymnastics before, and they had vanished. We had had "fads" of this kind, and they had perished one by one. The thing to be done now was to secure a plan that should be workable, and yet should be based on well-ascertained physiological and psychological data.

She gave her mind to this. In 1888 the cooperation of twenty-five teachers was secured, and the work was carried on for a considerable time in rooms at Boylston Place. After much experience had been gained and circumstances had seemed to justify it, larger rooms were obtained, and in 1889 the masters of the schools were invited to interest themselves in the movement and to take part in the exercises. They responded to the call without an exception, I believe, and the work took on a wider scope. It was in this year also (1889) that the Conference on Physical Training took place under the auspices of this school, and the advocates of many different systems were invited to take part, and each to show by example and on the stage the special excellencies of his own school of work. The German pupils, those of the Christian associations, of Delsarte, of the colleges, of the Swedish, and of some private

schools took the stage successively, and had ample opportunity to demonstrate the value of their several systems. A brilliant reception was given in the evening.

It was determined, I think, at this time by a very general consensus of opinion that for the public schools of this city as a whole, and with all their limitations, the Swedish system was the best adapted.

From this time, convinced it was on the right track, the Boston Normal School of Gymnastics has continued a constantly growing power and success. Under the same firm but fostering hand as at the beginning it outgrew its quarters in Park street, and since 1890 has been located in more commodious rooms at the Paine Memorial Building. It has graduated three classes, that of 1891 consisting of 12 students, that of 1892 also of 12, and that of 1893 consisting of 43 students, and this with a constantly advancing standard as to conditions of admission. In addition to these regular graduates 30 pupils have received one-year certificates, and some of them are now doing good work as teachers.

The school has at its head Miss Amy Morris Homans and in its staff such men as Dr. Enebuske, the professor of philosophy at Harvard University, the dean of the Harvard Medical School, and the professor of biology at the Massachusetts Institute of Technology.

It is not strange, then, that the services of pupils trained in such a way should be in demand in all parts of the country. Two have gone to the Drexel Institute of Philadelphia; 2 have gone to Smith College, Northampton; 2 to Radcliffe College, Cambridge; 1 to Bryn Mawr, Pa.; 4 to different State normal schools in Massachusetts; 1 to Oshkosh, Wis.; 1 to Denver, Colo.; 1 to the Normal College, Milledgeville, Ga.; and 1 each to Gloucester, Lynn, Lawrence, Dedham, Cambridge, and Pawtucket.

The aggregate salaries paid to the young ladies of the three classes already graduated are not less than $50,000, the highest single salary reaching $1,800, and the average being slightly less than $1,000.

These statements give but a faint idea of the work of the school—its fineness, its scope, its far-reaching quality. But we can see that the bread cast on the waters is beginning to return. These centers throughout the country are already established. Imagine them, as the years go by, multiplied a thousand fold, making a better and happier, because a stronger, people, and then bring the threads back to this place and connect them with the deed of one noble, public-spirited woman.

The counterpart of this picture is the one of 60,000 children taking the Swedish exercises daily in our own city schools, under the direction of teachers acquainted with the system from actual contact with it, and under the supervision of an expert like Dr. Hartwell. Who that saw the exposition of it at the English High School on Saturday last can hesitate in his hearty Godspeed or forget the one whose initiative made it all possible?

[From the address of Dr. Larkin Dunton, head master of the Boston Normal School.]

If a man has wisdom and money, but no heart, he does nothing for his fellow-men. If his purse is full and his heart is warm, yet, if he lacks wisdom to guide his efforts, he is as likely to harm as to help. But happy is it for the world when wisdom, love, and wealth are the joint possession of one great soul. They then constitute an irresistible force. Mrs. Mary Hemenway possessed them all in largest measure. Let us note briefly the comprehensiveness of view and kindness of heart that are shown in the work of this grand woman.

She was allowed to grow up, as she said, without learning to do things; and she noticed that girls who were efficient workers were happy. She felt that she had been deprived of her birthright. This was her first inspiration for teaching girls to sew; though she saw also the effect of a knowledge of this work in their future homes as well as in helpfulness to their mothers. Through her efforts sewing was introduced into the schools of Boston. But she was too wise to allow this branch of instruction to depend upon the life of any one person. She began at once to interest the school committee and teachers in the work, to the end that it might be incorporated into the regular programme of the schools, be given to all the girls, and, more than this, be made perpetual by being put under the fostering care of the immortal city. The example of Boston has been widely copied, so that the influence of the work thus unostentatiously begun, but so wisely managed, has extended and will extend to millions of children and millions of homes.

A legitimate result of the introduction of this new branch of instruction has been the creation of a department of sewing in the Boston Normal School, so that hereafter sewing is to be taught by women as able and as well educated as those who teach arithmetic or language, and is, therefore, to take its place as an educational force in the development of our girls.

Through various experiments in vacation schools in summer Mrs. Hemenway came to see that it would be possible to raise the standard of cooking in the homes of the people by teaching the art to the children in the public schools. This, she thought,

would not only raise up a stronger race of men and women, but would make their homes happier and more attractive, and so would lesson the temptation of fathers and sons to spend their evenings at the saloon. And thus good cooking came to stand in her mind as the handmaid of temperance.

But she was wise enough to see that the realization of her ideal, namely, the universality and perpetuity of good cooking, depended upon two conditions—first, that the work must be under the care and support of an abiding power; and second, that the instruction must be given by competent teachers. Hence she set herself to work to demonstrate the feasibility of the plan to the school authorities, to the end that they would undertake it for all the girls of the city. At the same time, seeing that there were no suitable teachers for this new branch of education, she established a normal school of cooking, which she has maintained to the present time.

This normal school has not only supplied the school kitchens of Boston with competent teachers, but has supplied other cities with teachers, so that other centers of like influence could be created. This institution has also shown the authorities here the necessity of training teachers for this kind of school work, and a department of cooking has been provided for in the city normal school. So the continuation and improvement of the work are secured.

When Mrs. Hemenway's attention was called to physical training as a means of improving the health, physique, and graceful bearing of the young, she immediately began experimenting with various systems of gymnastics for the purpose of ascertaining which was best adapted to the needs of American children.

She soon became so favorably impressed with the Swedish system that she invited 25 Boston teachers to assist her in making her experiment with it. Their judgment of the result was so favorable that she made an offer to the school committee to train a hundred teachers in the system, on condition that they be allowed to use the exercises in their classes in case they chose to do so. The offer was accepted, and the result proved a success.

Mrs. Hemenway saw at the outset that what she could do personally was but a trifle compared to what ought to be done, so she decided to start the work in such a way that it would become as broad as Boston and as lasting. Hence she began at once to share the responsibility with the city and to train the teachers for the work.

She soon gained such a broad view of the possibilities of the system that she decided to make it more generally known. This led to the great Conference on Physical Training in Boston in 1889, which did so much to arouse an interest in the subject and to create a demand for teachers specially trained for the work. But it was not enough to create a demand for teachers; the demand must be met; so she established the Boston Normal School of Gymnastics for the education and training of teachers of gymnastics.

Mere imitators would not do for this work. She believed the body to be the temple of God, and that it should be guarded and adorned by those who knew it so well as to believe in its possibilities and its sacredness. This school has done much to qualify the teachers of Boston for conducting the Swedish exercises, and it has sent its graduates into many other cities, which in turn have become centers of inspiration and help along the same line. Mrs. Hemenway, through this school, will improve the physical power, health, and morality of millions of our children.

But she was not satisfied with all this. She saw that to make this work perpetual in Boston the education of teachers of gymnastics must be made perpetual: it must not depend upon one frail life; so she furnished the best equipped teacher that she could procure to give instruction in the theory and art of gymnastics in the Boston Normal School till a woman could be educated for the place. When this was done and the school committee had appointed a competent teacher, Mrs. Hemenway's influence was gradually withdrawn, so that now every graduate of our normal school goes out prepared to direct intelligently the work in gymnastics, and all is done that human foresight could devise to make instruction in this subject perpetual.

Her work in connection with the Old South had the same general aim. It was to improve the morals of the people by teaching patriotism widely and perpetually. She once said: "I have just given $100,000 to save the Old South, yet I care nothing for the church or the corner lot; but if I live, such teaching shall be done in that old building and such an influence shall go out from it as shall make the children of future generations love their country so tenderly that there can never be another civil war in this country." This sentiment accounts for her support of Old South summer lectures and Old South prize essays for the development of patriotism in the young.

Mrs. Hemenway spent $100,000 in building up the Tileston Normal School, in Wilmington, N. C. When asked why she gave money to support schools in the South, she replied: "When my country called for her sons to defend the flag, I had none to give. Mine was but a lad of 12. I gave my money as a thank offering that I was not called to suffer as other mothers who gave their sons and lost them. I gave it that the children of this generation might be taught to love the flag their fathers tore down."

THE OLD SOUTH WORK.

[By Edwin D. Mead.[1]]

* * * The extent of the obligation of Boston and of America to Mrs. Hemenway for her devotion to the historical and political education of our young people is something which we only now begin to properly appreciate, when she has left us and we view her work as a whole. I do not think it is too much to say that she has done more than any other single individual in the same time to promote popular interest in American history and to promote intelligent patriotism.

Mary Hemenway was a woman whose interests and sympathies were as broad as the world; but she was a great patriot—and she was preeminently that. She was an enthusiastic lover of freedom and of democracy, and there was not a day of her life that she did not think of the great price with which our own heritage of freedom had been purchased. Her patriotism was loyalty. She had a deep feeling of personal gratitude to the founders of New England and the fathers of the Republic. She had a reverent pride in our position of leadership in the history and movement of modern democracy, and she had a consuming zeal to keep the nation strong and pure and worthy of its best traditions, and to kindle this zeal among the young people of the nation. With all her great enthusiasms, she was an amazingly practical and definite woman. She wasted no time or strength in vague generalities, either of speech or action. Others might long for the time when the kingdom of God should cover the earth as the waters cover the sea—and she longed for it; but while others longed she devoted herself to doing what she could to bring that corner of God's world in which she was set into conformity with the laws of God—and this by every means in her power, by teaching poor girls how to make better clothes and cook better dinners and make better homes, by teaching people to value health and respect and train their bodies, by inciting people to read better books and love better music and better pictures and be interested in more important things. Others might long for the parliament of man and the federation of the world—and so did she; but while others longed she devoted herself to doing what she could to make this nation, for which she was particularly responsible, fitter for the federation when it comes. The good patriot, to her thinking, was not the worse cosmopolite. The good state for which she worked was a good Massachusetts, and her chief interest, while others talked municipal reform, was to make a better Boston.

American history, people used to say, is not interesting; and they read about Ivry and Marathon and Zama, about Pym and Pepin and Pericles, the ephors, the tribunes, and the House of Lords. American history, said Mrs. Hemenway, is to us the most interesting and the most important history in the world, if we would only open our eyes to it and look at it in the right way—and I will help people to look at it in the right way. Our very archæology, she said, is of the highest interest; and through the researches of Mr. Cushing and Dr. Fewkes and others among the Zuñis and the Moquis, sustained by her at the cost of thousands of dollars, she did an immense work to make interest in it general. Boston, the Puritan city—how proud she was of its great line of heroic men, from Winthrop and Cotton and Eliot and Harvard to Sumner and Garrison and Parker and Phillips! How proud she was that Harry Vane once trod its soil and here felt himself at home! How she loved Hancock and Otis and Warren and Revere and the great men of the Boston town meetings—above all, Samuel Adams, the very mention of whose name always thrilled her, and whose portrait was the only one save Washington's which hung on the oaken walls of her great dining room! The Boston historians, Prescott, Motley, Parkman; the Boston poets, Longfellow, Lowell, Emerson—each word of every one she treasured. She would have enjoyed and would have understood, as few others, that recent declaration of Charles Francis Adams, that the founding of Boston was fraught with consequences hardly less important than those of the founding of Rome. All other Boston men and women must see Boston as she saw it—that was her high resolve; they must know and take to heart that they were citizens of no mean city; they must be roused to the sacredness of their inheritance, that so they might be roused to the nobility of their citizenship and the greatness of their duty. It was with this aim and with this spirit, not with the spirit of the mere antiquarian, that Mrs. Hemenway inaugurated the Old South work. History with her was for use—the history of Boston, the history of New England, the history of America.

In the first place she saved the Old South Meeting House. She contributed $100,000 toward the fund necessary to prevent its destruction. It is hard for us to realize, so much deeper is the reverence for historic places which the great anniversaries of these late years have done so much to beget, that in our very centennial year, 1876, the Old South Meeting House, the most sacred and historic structure in Boston, was in danger of destruction. The old Hancock house, for which, could it be

[1] Reprinted from the Journal of Education, August 30–September 13, 1894.

restored, Boston would to-day pour out unlimited treasure, had gone, with but feeble protest, only a dozen years before; and but for Mrs. Hemenway the Old South Meeting House would have gone in 1876. She saved it, and, having saved it, she determined that it should not stand an idle monument, the tomb of the great ghosts, but a living temple of patriotism. She knew the didactic power of great associations; and everyone who in these fifteen years has been in the habit of going to the lectures and celebrations at the Old South knows with what added force many a lesson has been taught within the walls which heard the tread of Washington, and which still echo the words of Samuel Adams and James Otis and Joseph Warren.

The machinery of the Old South work has been the simplest. That is why any city, if it has public spirited people to sustain it, can easily carry on such work. That is why work like it, owing its parentage and impulse to it, has been undertaken in Providence and Brooklyn and Philadelphia and Indianapolis and Chicago and elsewhere. That is why men and women all over the country, organized in societies or not, who are really in earnest about good citizenship, can do much to promote similar work in the cities and towns in which they live. We have believed at the Old South Meeting House simply in the power of the spoken word and the printed page. We have had lectures and we have circulated historical leaflets.

What is an Old South lecture course like? That is what many of the teachers and many of the young people who read the Journal of Education, and who are not conversant with the work, will like to know. What kind of subjects do we think will attract and instruct bright young people of 15 or 16, set them to reading in American history, make them more interested in their country, and make better citizens of them? That question can not, perhaps, be better answered than by giving the Old South programme for the present summer. This course is devoted to "The Founders of New England," and the eight lectures are as follows: "William Brewster, the elder of Plymouth," by Rev. Edward Everett Hale; "William Bradford, the governor of Plymouth," by Rev. William Elliot Griffis; "John Winthrop, the governor of Massachusetts," by Hon. Frederic T. Greenhalge; "John Harvard, and the founding of Harvard College," by Mr. William R. Thayer; "John Eliot, the apostle to the Indians," by Rev. James de Normandie; "John Cotton, the minister of Boston," by Rev. John Cotton Brooks; "Roger Williams, the founder of Rhode Island," by President E. Benjamin Andrews; "Thomas Hooker, the founder of Connecticut," by Rev. Joseph H. Twichell.

It will be noticed that the several subjects in this course are presented by representative men—men especially identified in one way or another with their special themes. Thus, Edward Everett Hale, who spoke on Elder Brewster, is certainly our greatest New England "elder" to-day. Dr. Griffis, whose book on "Brave Little Holland" is being read at this time by many of our young people, is an authority in Pilgrim history, having now in preparation a work on "The Pilgrim Fathers in England, Holland, and America." It was singularly fortunate that the present governor of Massachusetts could speak upon Governor Winthrop. Mr. Thayer is the editor of the Harvard Graduates' Magazine, and a special student of John Harvard's life and times. Mr. De Normandie is John Eliot's successor as minister of the old church in Roxbury. Rev. John Cotton Brooks, Phillips Brooks's brother, is a lineal descendant of John Cotton, and has preached in his pulpit in St. Botolph's church at old Boston, in England. President Andrews, of Brown University, is the very best person to come from Rhode Island to tell of that little State's great founder. Mr. Twichell, the eminent Hartford minister, was the chosen orator at the celebration of the two hundred and fiftieth anniversary of the founding of Connecticut, in 1889. With such a list of speakers as this, this course upon "The founding of New England" could not help being a strong, brilliant, and valuable course; and so it has proved.

The Old South lectures—thanks to Mrs. Hemenway's generosity, still active by provision of her will—are entirely free to all young people. Tickets are sent to all persons under 20, applying in their own handwriting to the directors of the Old South studies, at the Old South Meeting House, and inclosing stamps. Older people can come if they wish to—and a great many do come—but these pay for their tickets; it is understood that the lectures are designed for the young people. We tell our lecturers to aim at the bright boy and girl of 15, and forget that there is anybody else in the audience. If the lecturer hits them, he is sure to interest everybody; if he does not, he is a failure as an Old South lecturer. We tell them to be graphic and picturesque—dullness, however learned, is the one thing which young people will not pardon; we tell them to speak without notes—if they do not always satisfy themselves quite so well, they please everybody else a great deal better; and we tell them never to speak over an hour—we pardon fifty-nine minutes, but we do not pardon sixty-one. Persons starting work like the Old South work in other cities would do well to remember these simple rules. Any persons looking in upon the great audience of young people which, on the Wednesday afternoons of summer, fills the Old South Meeting House, will quickly satisfy themselves whether American history taught by such lectures is interesting.

For the Old South lectures are summer lectures—vacation lectures—given at 3 o'clock on Wednesday afternoons. They begin when the graduation exercises and the Fourth of July are well behind, usually on the Wednesday nearest August 1. For one reason we find this a little late—it carries the last lecture or two beyond the opening of the schools in September; and such courses of lectures in vacation might well begin as early as the middle of July.

Our lectures are not meant for idlers; we do not aim to entertain a crowd of children for an hour in a desultory fashion; our lecturers do not talk baby talk. The Old South work is a serious educational work; its programmes are careful and sequential, making demands upon the hearers; it assumes that the young people who come are students, or want to be—and by consistently assuming it, it makes them so. Dr. Hale, who has addressed these Old South audiences oftener, perhaps, than anybody else, remarked at the opening of the present course upon the notable development in the character and carriage of the audiences in these years of the work; it is no longer safe, he said, to say 1603 at the Old South, when you ought to say 1602.

Last year, when the people of the whole country were assembling at Chicago, the capital of the great West, the lectures were devoted to the subject of "The opening of the West." The subjects of the previous ten annual courses were as follows: "Early Massachusetts history," "Representative men in Boston history," "The war for the Union," "The war for independence," "The birth of the nation," "The story of the centuries," "America and France," "The American Indians," "The new birth of the world," "The discovery of America."

* * * * * * *

The Old South Leaflets are prepared, primarily, for circulation among the young people attending the Old South lectures. The subjects of the leaflets are usually immediately related to the subjects of the lectures. They are meant to supplement the lectures and stimulate reading and inquiry among the young people. They are made up, for the most part, from original papers of the periods treated in the lectures, in the hope to make the men and the life of those periods more clear and real. Careful historical notes and references to the best books on the subjects are added, the leaflets usually consisting of 16 or 20 pages. A single instance more will suffice to show the relation of the leaflets to the lectures. The year 1889 being the centennial both of the beginning of our own Federal Government and of the French revolution, the lectures for the year, under the general title of "America and France," were devoted entirely to subjects in which the history of America is related to that of France, as follows: "Champlain, the founder of Quebec," "La Salle and the French in the Great West," "The Jesuit missionaries in America," "Wolfe and Montcalm. The struggle of England and France for the Continent," "Franklin in France," "The friendship of Washington and Lafayette," "Thomas Jefferson and the Louisiana purchase," "The year 1789." The corresponding leaflets were as follows: "Verrazzano's account of his voyage to America," "Marquette's account of his discovery of the Mississippi," "Mr. Parkman's histories," "The capture of Quebec, from Parkman's 'Conspiracy of Pontiac;'" "Selections from Franklin's letters from France," "Letters of Washington and Lafayette," "The Declaration of Independence," "The French declaration of the Rights of Man, 1789."

* * * * * * *

The virtue of the Old South Leaflets is that they bring students into first hand, instead of second hand, touch with history. That, indeed, may describe the Old South work altogether. It has been an effort to bring the young people of Boston and America into original relations with history; and it has been, we think, the foremost effort of the kind in the country. This is why it has won the attention and commendation, so gratifying to us, of the educators of the country. Our joy in the Old South work has been the joy of being pioneers, and the joy of knowing that we were pioneers in the right direction. We should have known this if others had not known it; but we do not deny that the warm words of the historical scholars and teachers of the country have been very grateful and very helpful to us. The Old South work is "in exactly the right direction," John Fiske has said. It is a pleasant thing to remember that it was at Mrs. Hemenway's instance and at her strong solicitation that Mr. Fiske first turned his efforts to the field of American history; and almost everything that has appeared in his magnificent series of historical works was first given in the form of lectures at the Old South. In his new school history of the United States, * * * the Old South Leaflets are constantly commended for use in connection. "The publication of these leaflets," he says, "is sure to have a most happy effect in awakening general interest, on the part of young students, in original documents." To the same effect writes Mr. Montgomery, whose text-books in history are so widely used in the schools. James MacAlister, the president of the Drexel Institute in Philadelphia, writes: "I regard the Old

South work as one of the most important educational movements of recent times." Mr. Herbert Welsh, of Philadelphia, wrote a special tract about the Old South work and spread it broadcast in Philadelphia. He had been deeply impressed by the Old South work when he came to lecture for us a little while before. "The secret of the success of the Old South plan," he said, "is that it teaches history from a living and most practical standpoint. It is the application of the best that our past has given to the brain and heart of the youth of the present." "Why should not this simple and effective plan be made use of in Philadelphia?" he asked; and last year Old South work was inaugurated in Philadelphia, the lectures to the young people being given in the old State house, where the Declaration of Independence was signed and the Constitution framed. President Andrews, of Brown University, Prof. Herbert Adams, of Johns Hopkins, Professor Hart, of Harvard, Prof. Woodrow Wilson, Mr. Horace E. Scudder, and others have written in the same warm way. Mr. Tetlow, the master of the Boston Girls' High School, and masters all over the country, unite in welcoming the leaflets. "To teach history by the study of original documents," writes one, "has been the dream of the best instructors, but this dream may now be realized through the inexpensive form in which these originals are presented." "The educational world," writes Miss Coman, the professor of history at Wellesley College, "is coming to recognize the value of teaching history, even to young people, from the original records, rather than from accounts at second or third hand. I rejoice that these documents have been made accessible to the children of our public schools." "We may talk about such documents all we please," says Mr. Huling, the master of the Cambridge High School, "and little good will be done; but when the pupil reads one of these for himself, he is indeed a dull fellow if he does not carry away a definite impression of its place in history." "I wish," writes Mr. Belfield, the principal of the Chicago Manual Training School, who has done more than anybody else to promote the Old South movement in the West, "that the series could be brought to the attention of every school superintendent, high-school principal, and teacher of United States history in the country." "The Old South Leaflets," says Professor Folwell, the professor of history in the University of Minnesota, "ought to be scattered by millions of copies all over our country."

It is a satisfaction to be able to quote such words from such persons, for they are surely a great reenforcement of our commendation of this missionary work in good citizenship to the attention of the country. For that is what the Old South work is—a missionary work in good citizenship—and feeling it to be that, we "commend ourselves." We wish that societies of young men and women might be organized in a thousand places for historical and political studies, and that our little Old South Leaflets might prove of as much service to these as they are proving to our Old South audiences and to the schools.

But the Old South work is not simply a means of doing something for the young people of Boston; it is also a means of getting something from them and setting them to work for themselves. Every year prizes are offered to the graduates of the Boston high schools, graduates of the current year and the preceding year, for the best essays on subjects in American history. Two subjects are proposed each year, and two prizes are awarded for each subject, the first prize being $40 and the second $25. The subjects are announced in June, just as the schools close, and the essays must be submitted in the following January. The prizes are always announced at the Washington's birthday celebration, which is one of the events of the Old South year. The subjects proposed each year for the essays are always closely related to the general subject of the lectures for the year, our aim being to make the entire work for the year unified and articulate, each part of it helping the rest. The subjects for the essays for the present year, when the lectures are devoted to "The founders of New England," are (1) "The relations of the founders of New England to the universities of Cambridge and Oxford," (2) "The fundamental orders of Connecticut and their place in the history of written constitutions."

I think that some of your readers would be surprised at the thoroughness and general excellence of many of these essays written by pupils just out of our high schools. The first-prize essay for 1881, on "The policy of the early colonists of Massachusetts toward Quakers and others whom they regarded as intruders," by Henry L. Southwick, and one of the first-prize essays for 1889, on "Washington's interest in education," by Miss Caroline C. Stecker, have been printed, and can be procured at the Old South Meeting House. Another of the prize essays, on "Washington's interest in education," by Miss Julia K. Ordway, was published in the New England Magazine for May, 1890; one of the first-prize essays for 1890, on "Philip, Pontiac, and Tecumseh," by Miss Caroline C. Stecker, appeared in the New England Magazine for September, 1891; and one of the first-prize essays for 1891, on "Marco Polo's explorations in Asia and their influence upon Columbus," by Miss Helen P. Margesson, in the New England Magazine for August, 1892. The New England Magazine, which is devoted preeminently to matters relating to American history and good citizenship, has from the time of its founding, five years ago, made itself an organ of the Old

South work, publishing many of the Old South essays and lectures, and always noticing in its editor's table everything relating to the progress of the movement.

The young people who have competed for these Old South prizes are naturally the best students of history in their successive years in the Boston high schools. They now number more than 100, and they have recently formed themselves into an Old South Historical Society. Many of the Old South essayists have, of course, gone on into college, and many are now scattered over the country; but more than half of their number, not a few of them teachers in the schools, are to-day within sound of the Old South bell, and the quarterly meetings of the little society, which by and by will be a big society, are very interesting. There is always some careful historical paper read by one of the members, and then there is a discussion. We have the beginning of a very good library in the essayists' room at the Old South, and this we hope will grow and that the society's headquarters will by and by become a real seminary. The society is rapidly becoming an efficient factor in the general Old South work. It has recently formed three active committees—a lecture committee, an essay committee, and an outlook committee—and its leading spirits are ambitious for larger service. The members of the lecture committee assist in the distribution of tickets to the schools and in enlisting the interest of young people in the lectures. The members of the essay committee similarly devote themselves to enlisting the interest of the high schools in the essays. They will also read the essays submitted each year, not for the sake of adjudging the award of prizes—that is in other hands—but that there may always be in the society scholarly members thoroughly cognizant of the character of the work being done and of the varying capacity of the new members entering the society. The office of the outlook committee is to keep itself informed and to keep the society informed of all important efforts at home and abroad for the historical and political education of young people. It will watch the newspapers; it will watch the magazines; it will watch the schools. It will report anything it finds said about the Old South work and about its extension anywhere. At the next meeting I suppose it will tell the society about Mr. Fiske's new school history and about any new text-books in civil government which have appeared. I hope it will tell how much better most of the series of historical readers published in England for the use of the schools are than the similar books which we have in America. It is sure to say something about the remarkable growth of the Lyceum Leagues among our young people lately, and it is sure to report the recent utterances of President Clark and other leaders of the Christian Endeavor movement upon the importance of rousing a more definite interest in politics and greater devotion to the duties of citizenship among the young people in that great organization. Especially will it notice at this time the Historical Pilgrimage, that interesting educational movement which suddenly appeared this summer, full grown—a movement which would have enlisted so warmly the sympathies of Mrs. Hemenway, who felt, as almost nobody else ever felt, the immense educational power of historical associations. It will tell the society what Mr. Stead has written about historical pilgrimages in England, and Mr. Powell and Dr. Shaw in America; it will speak of the recent reception of the pilgrims at the Old South; and it may venture the inquiry whether the Old South Historical Society might not profitably make itself a center for organizing such local pilgrimages for the benefit of the young people of Boston—pilgrimages, one perhaps each year, to Plymouth and Salem and Lexington and Concord and old Rutland and Newport and Deerfield and a score of places. That thought, I know, is already working in the minds of some of the more enterprising members of the society.

Many societies of young people all over the country might well take up such historical studies as those in which the Old South Historical Society interests itself. They should also interest themselves in studies more directly political and social. We have in Boston a Society for Promoting Good Citizenship. This is not a constituent part of the Old South work; but it is a society in whose efforts some of us who have the Old South work at heart are deeply interested, and its lectures are given at the Old South Meeting House. Its lectures deal with such subjects as qualifications for citizenship, municipal reform, the reform of the newspaper. Last season the lectures were upon "A more beautiful public life," the several subjects being: "The lessons of the white city," "Boards of beauty," "Municipal art," "Art in the public schools," "Art museums and the people," and "Boston, the City of God." These subjects, and such as these, young men and women might take up in their societies, with great benefit to themselves and to their communities. Our young people should train themselves also in the organization and procedure of our local and general government, as presented in the text-books on civil government, now happily becoming so common in the schools. The young men in one of our colleges have a House of Commons; in another college—a young woman's college—they have a House of Representatives. Our Old South Historical Society has talked of organizing a town meeting for the discussion of public questions and for schooling in legislative methods. Why should not such town meetings be common among our young people?

Why, too, will not our young people everywhere, as a part of their service for good citizenship, engage in a crusade in behalf of better music? Good music is a great educator. Bad music is debilitating and debasing. That was a wise man whom old Fletcher quotes as saying: "Let me make the songs of a people and I care not who makes the laws." How many of the young men and women in the high schools have read what Plato says about strong, pure music in education, in his book on The Laws? Indeed, it is to be feared that not all the teachers have read it. I wish that a hundred clubs or classes of young people would read Plato's Laws next winter, and his Republic the next, and then Aristotle's Politics. Do not think they are hard, dull books. They are fresh, fascinating books, and seem almost as modern, in all their discussions of socialism, education, and the rest, as the last magazine—only they are so much better and more fruitful than the magazine! They make us ashamed of ourselves, these great Greek thinkers, their peaching is so much better than our practice; but it is a good thing to be made ashamed of ourselves sometimes, and we need it very much here in America in the matter of music. We are suffering in our homes, in our schools, in our churches, our theaters, everywhere, from music of the trashiest and most vulgar character. Let us go to school to Plato; let us go to school to Germany and England. We aim to do something in behalf of this reform at the Old South. Our large choruses from the public schools at many of our celebrations have sung well; but we wish to do a real educational work, not only as touching patriotic music strictly, but as touching better music for the people generally. If in some future the ghosts of some of the great Greeks stroll into the Old South Meeting House we hope they may find it the center of influences in behalf of pure and inspiring music, which shall be as gratifying to them as the devotion to the State which has been inculcated there in these years would surely be.

THE OLD SOUTH LEAFLETS.

The Old South Leaflets, which have been published during the last thirteen years, in connection with these annual courses of historical lectures at the Old South Meeting House, have attracted so much attention and proved of so much service, that the directors have entered upon the publication of the leaflets for general circulation, with the needs of schools, colleges, private clubs, and classes especially in mind. The leaflets are prepared by Mr. Edwin D. Mead. They are largely reproductions of important original papers, accompanied by useful historical and bibliographical notes. They consist, on an average, of 16 pages, and are sold at the low price of 5 cents a copy, or $4 per 100. The aim is to bring them within easy reach of everybody. The Old South work, founded by Mrs. Mary Hemenway, and still sustained by provision of her will, is a work for the education of the people, and especially the education of our young people, in American history and politics; and its promoters believe that few things can contribute better to this end than the wide circulation of such leaflets as those now undertaken. It is hoped that professors in our colleges and teachers everywhere will welcome them for use in their classes, and that they may meet the needs of the societies of young men and women now happily being organized in so many places for historical and political studies. Some idea of the character of these Old South Leaflets may be gained from the following list of the subjects of the first sixty-four numbers, which are now ready. It will be noticed that many of the later numbers are the same as certain numbers in the annual series. Since 1890 they are essentially the same, and persons ordering the leaflets need simply observe the following numbers:

No. 1. The Constitution of the United States. No. 2. The Articles of Confederation. No. 3. The Declaration of Independence. No. 4. Washington's Farewell Address. No. 5. Magna Charta. No. 6. Vane's "Healing Question." No. 7. Charter of Massachusetts Bay, 1629. No. 8. Fundamental Orders of Connecticut, 1638. No. 9. Franklin's Plan of Union, 1754. No. 10. Washington's Inaugurals. No. 11. Lincoln's Inaugurals and Emancipation Proclamation. No. 12. The Federalist, Nos. 1 and 2. No. 13. The Ordinance of 1787. No. 14. The Constitution of Ohio. No. 15. Washington's Circular Letter to the Governors of the States, 1783. No. 16. Washington's Letter to Benjamin Harrison, 1784. No. 17. Verrazzano's Voyage, 1524. No. 18. The Constitution of Switzerland. No. 19. The Bill of Rights, 1689. No. 20. Coronado's Letter to Mendoza, 1540. No. 21. Eliot's Brief Narrative of the Progress of the Gospel among the Indians, 1670. No. 22. Wheelock's Narrative of the Rise of the Indian School at Lebanon, Conn., 1762. No. 23. The Petition of Rights, 1628. No. 24. The Grand Remonstrance. No. 25. The Scottish National Covenants. No. 26. The Agreement of the People. No. 27. The Instrument of Government. No. 28. Cromwell's First Speech to his Parliament. No. 29. The Discovery of America, from the Life of Columbus by his Son, Ferdinand Columbus. No. 30. Strabo's Introduction to Geography. No. 31. The Voyages to Vinland, from the Saga of Eric the Red. No. 32. Marco Polo's Account of Japan and Java. No. 33. Columbus's Letter to Gabriel Sanchez, describing the First Voyage and Discovery.

No. 34. Amerigo Vespucci's Account of his First Voyage. No. 35. Cortes's Account of the City of Mexico. No. 36. The Death of De Soto, from the "Narrative of a Gentleman of Elvas." No. 37. Early Notices of the Voyages of the Cabots. No. 38. Henry Lee's Funeral Oration on Washington. No. 39. De Vaca's Account of his Journey to New Mexico, 1535. No. 40. Manasseh Cutler's Description of Ohio, 1787. No. 41. Washington's Journal of his Tour to the Ohio, 1770. No. 42. Garfield's Address on the Northwest Territory and the Western Reserve. No. 43. George Rogers Clark's Account of the Capture of Vincennes, 1779. No. 44. Jefferson's Life of Captain Meriwether Lewis. No. 45. Fremont's Account of his Ascent of Fremont's Peak. No. 46. Father Marquette at Chicago, 1673. No. 47. Washington's Account of the Army at Cambridge, 1775. No. 48. Bradford's Memoir of Elder Brewster. No. 49. Bradford's First Dialogue. No. 50. Winthrop's "Conclusions for the Plantation in New England." No. 51. "New England's First Fruits," 1643. No. 52. John Eliot's "Indian Grammar Begun." No. 53. John Cotton's "God's Promise to his Plantation." No. 54. Letters of Roger Williams to Winthrop. No. 55. Thomas Hooker's "Way of the Churches of New England." No. 56. The Monroe Doctrine: President Monroe's Message of 1823. No. 57. The English Bible, selections from the various versions. No. 58. Hooper's Letters to Bullinger. No. 59. Sir John Eliot's "Apology for Socrates." No. 60. Ship-money Papers. No. 61. Pym's Speech against Strafford. No. 62. Cromwell's Second Speech. No. 63. Milton's "A Free Commonwealth." No. 64. Sir Henry Vane's Defence.

Title pages covering Nos. 1 to 25 (Vol. I) and 26 to 50 (Vol. II) will be furnished to any person buying the entire series and desiring to bind them in volumes. Address Directors of Old South Studies, Old South Meeting House, Boston.

WOMEN AND MEN—THE ASSAULT ON PRIVATE SCHOOLS.

[Contributed by T. W. Higginson to Harper's Bazaar.]

When Matthew Arnold, who had spent much of his life as an inspector of schools came to this country, he found with surprise that our public schools were not what he had supposed. He had thought them schools to which all classes sent their children; but he found it otherwise. In cities, he said, they seemed to be essentially class schools—that is, the more prosperous classes avoided them, sending their sons rarely to them, their daughters never. What then became of the talk of our orators in favor of these schools as the most democratic thing in the whole community? In the country it might be so, but population was tending more and more to the cities, tending away, that is, from the public schools. All the alleged danger to our system from religious interference seemed to him trivial compared with this silent social interference, which was going on all the time.

Matthew Arnold was in many ways, for a man so eminent, curiously narrow and even whimsical, but his perceptions on this one point were certainly acute. As one evidence of it we see a movement brought forward in the newspapers, from several different quarters, to crush this particular evil, by one sweeping measure, with the absolute prohibition of all private schools. Either abolish them all and force every child into the public schools, or else place all private schools under direct public supervision and allow at their head only publicly trained teachers. There is little chance that any such measure will ever be seriously brought forward. The amount already invested in private or endowed schools and colleges—and the plan, to be consistent, must include colleges—is too immense to allow of its being very strongly urged. But it presents some very interesting points and is worth considering.

To begin with, it has the merit, unlike the attacks on merely denominational schools, of being at least logical. Those attacks in some parts of our land have needed almost no probing to show a hopeless want of logic. They always turned out to be aimed, not at denominational schools in themselves, but at some particular denomination. At the East this was naturally the Roman Catholic body, and to some extent the Episcopalian. In certain Western States it was the Roman Catholics and Lutherans. But these attempts to prohibit sectarian schools invariably fell to pieces when it appeared that most of the opponents had not the slightest objection to denominational schools if they only belonged to the right denomination—that is, their own—and only objected to them in the hands of some other religious body. The crowning instance of this was when the late Rev. Dr. Miner, an excellent and leading clergyman of the Universalist order, appeared every winter before the Massachusetts legislature to urge the utter prohibition of parochial schools; and yet spent one of the last days of his life in giving out diplomas at an academy of his own sect, and, moreover, provided for several similar schools in his will.

Now no such inconsistency stands in the way of those who would prohibit, without distinction, all denominational and all private schools. Unwise they may be, but not illogical. Indeed, the step they propose is only following out consistently what the others urged inconsistently. If it is right to coerce one mother, who takes

her children from the public school through anxiety for their souls, we should certainly do the same for another, who withdraws hers for the sake of their bodies; or perhaps, after all, only out of regard for the welfare of their clothes. There are several prominent religious bodies which believe that religious education of their own stamp is absolutely needful for children. Most of the early public schools in this country were on that basis, and began instruction with the New England Primer. We may say that this motive is now outgrown; but it is certainly as laudible as when a daughter is taken from one school and sent to another, that she may be among better-dressed children or make desirable acquaintances.

Grant these reasons frivolous—and they are not wholly so—there are ample reasons why the entire prohibition of private schools would be a calamity to the educational world. The reason is that they afford what the public schools rarely can, a place where original methods may be tried and individual modes of teaching developed. Private schools are the experimental stations for public schools. A great public school system is a vast machine, and has the merits and defects of machinery. It usually surpasses private institutions in method, order, punctuality, accuracy of training. It is very desirable that every teacher and every pupil should at some time share its training. In these respects it is the regular army besides militia. But this brings imitations. The French commissioner of education once boasted that in his office in Paris he knew with perfect precision just what lesson every class in every school in the remotest provinces of France was reciting. We do not reach this, but it is of necessity the ideal of every public system. It has great merit, but it kills originality. No teacher can ever try an experiment, for that might lose 1 per cent in the proportion of the first class able to pass examination at the end of the year. The teacher is there to do a precise part; no less, no more. Under this discipline great results are often achieved, but they are the results of drill, not of inspiration.

Accordingly every educational authority admits that the epoch-making experiments in education—the improvements of Pestalozzi, Fellenberg, Froebel—were made in private, not public schools. Like all other experiments, they were tried at the risk of the inventor or his backers, and often to the impoverishment of all concerned. Mr. A. Bronson Alcott's school was starved out, in Boston, half a century ago, and he himself dismissed with pitying laughter. Yet there is no intelligent educator who does not now admit the value of his suggestions; and Dr. Harris, the national superintendent of education, is his admiring biographer. His first assistant, Miss Elizabeth Peabody—esteemed throughout her beneficent life a dreamer of the dreamers—yet forced upon American educators Froebel's kindergarten. He began it with a few peasant children in Germany, and now every city in the United States is either adopting or discussing it. In many things the private school leads, the public school follows. Every one who writes a schoolbook involving some originality of method knows that the private schools will take it up first. If it succeeds there, the public schools will follow. To abolish or impair these public schools would be a crime against the State; to prohibit private schools an almost equal crime. It would be like saying that all observatories must be sustained by the State only, and that Mr. Percival Lowell should be absolutely prohibited from further cultivating his personal intimacy with the planet Mars.

Humane Education.

The objection of the American Humane Society, as stated by its president, George T. Angell, 19 Milk street, Boston, is "to humanely educate the American people for the purpose of stopping every form of cruelty, both to human beings and the lower animals."

For the accomplishment of this worthy purpose it seeks to enlist the aid of public and private school teachers, the educational, religious, and secular press, and the clergy of all denominations, "in order to build up in our colleges, schools, and elsewhere a spirit of chivalry and humanity which shall in coming generations substitute ballots for bullets, prevent anarchy and crime, protect the defenseless, maintain the right, and hasten the coming of peace on earth and good will to every harmless living creature, both human and dumb."

This work of this society should commend itself to all well-disposed persons.

One phase of the society's activity is its pronounced opposition to the vivisection or the indiscriminate dissection of animals in the public schools. It is felt that such practices have an unfavorable effect on young and undeveloped minds—tend to blunt the edge of their finer sensibilities.

The agitation of this subject in Massachusetts led to the enactment of a law in 1894 prohibiting the vivisection of animals in the public schools, or the exhibiting of any animal upon which vivisection had been practiced; also regulating the dissection of dead animals.

The States of Maine and Washington require their teachers to spend at least ten minutes each week in teaching kindness to animals.

MISSISSIPPI.

WHY EDUCATE? WHAT IS THE PHILOSOPHY OF EDUCATION?

[An address delivered at the second annual commencement of Millsaps College, Jackson, Miss., June 12, 1894, by Hon. William H. Sims, of Mississippi.]

Gentlemen of the Faculty and Student Body of Millsaps College, Ladies, and Gentlemen:

My appreciation of the honor of occupying this place to-day, in an institution whose success is very near my heart, will not, I trust, be measured by the modest contribution of thought and learning which I am able to bring to this occasion, but rather, let me ask, by the willingness I have shown to obey the summons of this faculty in coming a thousand miles to discharge a duty which the invitation of a Mississippi college imposes upon a Mississippian.

In appearing before you in this beautiful new home, the thought very naturally arises in my mind, Why was this building built? Of course, its dedication to present uses and the fame which has gone abroad concerning its origin would seem sufficiently to answer the inquiry. And yet, it has occurred to me that it may be useful in presenting what I have to say to-day to endeavor to center your attention upon what the answer to that question involves. Why was this building built? Do you imagine that this inquiry will have more of interest to a beholder of this structure a few centuries hence, as perchance he may look upon its venerable walls, stained by the mold and decay of time, when its architectural design may have become antiquated and obscured, amid the changeful fashions of later days; when its mission, then in part fulfilled, its history or many of its chapters written, the good that it shall have accomplished then made manifest, the seed that shall have been winnowed within these walls and distributed to the sowers scattered across the face of the land, yielding a fruitage excellent and a harvest abundant? And, may I ask, is there no good to be gained from such presuppositions? Does the forecasting of the possible outcome of a great benefaction to mankind inspire thoughts less of interest and of profit than the looking back upon the good already accomplished? Is it better to seek inspiration from the things of the past than from the hopes of the future? Is it better that our eyes be turned to the setting than the rising sun; to the gold-crowned summit of Solomon's Temple; to the land of promise which has been traversed, or to the shining pinnacles of glory which gleam ahead beyond the rugged hilltops and invite to the sun-burst splendor of the New Jerusalem?

But think on this as we may, I invite you back to the question suggested: Why was this building built? Did not its founder know before the work was begun why it was to be begun? Did not an intelligent benevolence conceive the object of its erection before its foundations were laid? Would the noble benefactor of his day and generation, whose name it bears and without whose munificent generosity its existence was not possible, have parted with his great endowment and led others to emulate his example without a definite object and what seemed to him a wise end in view, carefully and deliberately considered, which lay back of the giving of the gifts? Those who know him well and those who know the manner of men from whom large charities habitually come will answer, nay—verily!

What was that purpose? Why was this building built? I answer: It was built for the noblest of human purposes; for the highest earthly object this side of heaven for which any building can be built. It was built for a schoolhouse; for a college to enlarge the opportunities of Mississippi boys for high education, for sound, broad, conservative mental training, along the lines of Christian ideals.

And was this a wise investment of a great sum of money? Let us consider this: Why educate? What is the philosophy of education?

Around these suggestive inquiries I purpose to group the facts and reflections which I have collected as my opportunities permitted to present to you to-day.

The student of nature and her wonderful methods is continually impressed by the wise adaptation of the means she employs to the ends designed. Throughout all the vast departments of creation, wherever scientific investigation has been rewarded with the discovery of what nature intended to effect in any particular case, this perfect adaptation of method to design is to be found. So certain is the intelligent mechanical inventor of the correctness of nature's plans that when he has been able to employ one of her devices in constructing his machine he looks forward to its successful operation with unwavering confidence, because he knows that no better contrivance is possible; and it may be always assumed that where this law of adaptation is not apparent it is not because of its absence but because nature's true purpose has not been discovered.

This prelude, I trust, will acquit me of seeming irreverence when I further say that no animal being on earth seems to have been less prepared for his natural environments, according to our knowledge of his introduction on this earth, than man.

From the very beginning of his existence on this mundane sphere he has commenced life the most dependent and the most helpless of all the animal kingdom. So far as we know, no other animal at birth is so poorly equipped for the life thrust upon him. The beasts of the field and the fowls of the air were furnished by nature with bodies suited to their environments, without need of artificial coverings, while man has needed bodily protection from the cradle of his being. All other animals except man were endowed at birth with natural instincts so perfectly adapted to their necessities that they correctly guided them in their selection and accumulation of food and the preparation of their several habitations with an exactness that left nothing to be desired for their well being.

Primitive man, however, we are left to suppose, was not so happily conditioned. He was at birth given no unerring inward impulse to safely guide him in the early days of his being amid the perils which surrounded him, no instinct to meet the animal necessities which soon beset him. Unlike other animals, he had no ready-made clothing for his vesture, no ready-made law for the government of his daily life, and like the Son of Man himself, when incarnated, "had not where to lay his head," though the foxes had holes and the birds of the air had nests.

It would be a shallow thinker, however, who would argue from these premises that nature's plummet slipped when man was made and placed on earth amid conditions unadjusted to his necessities. On the contrary, I maintain that all the grand philosophy of man's creation and being turns on this pivotal point. While seemingly the most helpless and most dependent of mortal beings at the start, and with the smallest provision ready-made to supply his animal wants, man was, notwithstanding, invested with such potential powers as not only marked him as nature's favorite, but as the crowning work of "Nature's God." Other animals, while they were under the special guidance of nature's law of instinct, were yet the slaves of the very laws that guided them and which fixed their conditions as mere animals in appointed grooves as long as the species should last; while man, endowed with mind and reason and soul like unto the spiritual image of God himself, possessed powers which, though feeble at first, were perforce of man's self-activity to be so developed by the friction of his environment and the free direction of his immortal personality as to make him the regnant king of all the kingdoms of nature, the Avatar of earth.

Thus armed with reason and self-determining purpose, unfettered by his Creator, man entered upon his career with capacity "to grow in knowledge and wisdom and holiness forever." His civilization is the measure of his progress toward complete development. His history is the record of his experience along the way of that progress. The lessons of that experience and the learning and wisdom he has accumulated and left to us are man's great educational capital. "As heirs of all the ages," each is entitled to share in this capital. The business of teaching is to so distribute the inheritance to the young heirs who seek it that they may be helped along their several ways of development and progress. The partiality and selfishness, however, with which this distribution has been made from remote eras by those whom power had set in authority is alike interesting and instructive, and the effort of benevolence in recent times, whether of individuals or of government, to ameliorate the condition of mankind and work out the problem of man's development has been most profitably directed to widening the avenues to learning and instruction, so that all may seek the portals of their temple with such freedom of thought and action as the good of society permits.

In contemplating the winding stream of educational development through the long years of recorded history, it is interesting to observe its tortuous course, its unequal volume, and the restricted boundaries of its channel, influenced and controlled, as it has been, by those who shaped the life and destiny of humanity. Seldom was it permitted to dash along with the impulse of nature into the cascades and waterfalls that set in motion the mills that ground the mental pabulum of the poor and lowly; rarer still to accumulate into great lakes and reservoirs of learning about which the multitude could congregate and slake their thirst for knowledge; and still rarer did it overflow the barriers made to confine it, and, like the generous Nile, spread its beneficent fertilization amid the desert about it, enriching and quickening the common mind. Its eddies were the whirlpools of fanatical ignorance maddened by wrongs. Its lakes were stagnant lagoons of brutish superstition, where darkness brooded and the vampire made its home. Its overflows were the fiery billows of religious wars consuming the youth and virtue of the nations. And yet this educational stream even in the ante-Christian period, was not without instances where it flowed through the untaught masses pure and strong and deep, like the Jordan through the body of the Dead Sea.

Glancing at educational conditions in the Orient, we find that from time immemorial they have been created and maintained by the government, or the ruling classes, for the narrowest and most selfish of purposes. It is to be noted, however, that far back in the centuries, the Chinese Government enforced general education, but of a rigid and stereotyped character. Its fundamental purpose was obedience to the

regnant authority; its ideal end, to the family. Profound reverence for parents and the aged, and a religious homage for the Emperor as the great father of all the families of the realm, were absolutely enforced. These, the precepts of their philosophers, Confucius and Mencius his follower enjoined, and the price of disobedience was death.

The Imperial Government was an aristocracy of scholars, all of its officers, from the highest to the lowest, were selected by competitive examinations from among those whose minds had been saturated with such teachings of reverence and whose memories were found best stored with the maxims and phrases, to the very letter, of the infallible philosophy of their classics. In their written examinations the betrayal of any thought of their own, or expression not based upon such authority, was fatal to the seeker of official trust. All independence of ideas was suppressed; all individuality pruned away by these procrustean methods. And thus the oldest and most populous nation of earth for centuries stood in its wooden shoes upon the same intellectual dead level, yielding the humblest obeisance to the supreme authority of the Empire and to the absolutism of prescribed thought crystallized in the maxims, laws, and standards handed down by their teachers of religion and philosophy. Is it wonderful that such education made hundreds of millions of intellectual dwarfs and automatons, who, though toilsome, sober, economical, peaceful, and skilled in many arts, have for centuries dwelt in the supreme contentment that they had nothing more to learn, and that all change was treason to state and religion?

Passing from China to ancient India, we leave popular education behind us, and high mental cultivation for the few and none for the many. Here the Brahmins, by a rigid religious tenure, monopolized all education. Impassable boundary lines divided society into the distinctive castes of Brahmin, and warrior, and merchant, or hand worker and slave. In these several castes they were born and lived and died. No interchange of the positions of the social strata was possible under the mystic dominion over mind and soul exercised by the sacred Brahmins. As priests set apart by their subtle religious philosophy, they were alone permitted to read and teach and interpret the books of the Vedas, the fountains of knowledge from which all their wisdom came. Hedged about with mystery and the profoundest reverence, their mental and moral sway was so absolute, that, although enjoying no official authority of state, their decisions of questions brought before them had the force and effect of law. They were regarded so nearly infallible that they could commit no crime worthy of corporal punishment. Their exclusive possession of all the real learning of the nation invested them with such awe and unquestioned superiority as to make it possible for them to maintain their supreme influence over all other classes. How this state of things was brought about it is difficult to trace; but undoubtedly the control of education perpetuated their power.

> For just experience tells in every soil
> That those that think must govern those that toil.

In Egypt as in ancient India, the molding of the national education was in the hands of a sacerdotal order. The children of the people were the recipients from their fathers of crude instruction in reading and writing, but the priests, who, through their religious potencies, ruled the ruling powers of state, kept within their unyielding grasp all superior instruction and dispensed it for their own ends and purposes. No development of the masses was possible under such conditions and the mysterious sphinx, the sleeping mummy in its staid cerements, and the immobile pyramids are just symbols and types of their motionless national life.

While the end of education in both ancient India and in Egypt was to subordinate the toiling millions to the absolute control and dominion of the priests, the educational purpose of the ancient Persians was to make soldiers. The State drew to itself all individual life for that object. The boy was born and trained and died not to achieve his own destiny, not to advance his own status or that of his family, but that he might efficiently serve the government in its armies. In short, no account was taken of the individuality of the citizen, his rights, his preferences, his tastes, his talents. He was a mere atom, whose existence was merged into the army of a Xerxes for the benefit of his kingdom. This we observe to be the operative principle underlying all oriental education. The tyranny of some power whether of caste among the Hindoos or of priests among the Egyptians and, we may add, among the ancient Jews or of government among the Chinese and the Persians, so proscribed the intellectual development of the people that it was everywhere more than ignored; it was repressed and molded by the ruling of the sacerdotal classes to their own ends and uses.

In striking contrast to the foregoing, Sparta excepted, was the philosophical aim of education among the Greeks, among whom "we find the most splendid types of intellectual culture the world has yet known." The education of the Spartans, as of the Persians, was the education of the State, by the State, and for the State, to make the most perfect human fighting machines which breeding and selection and

rigid discipline could accomplish with a hand of iron. Perhaps the human animal was never before or since so systematically and perfectly developed in a race. The healthy child was taken, the weakling was cast to the wild beasts of the forests. The chosen one was left in the care of the mother who gave her maternal service strictly to the purpose of this training. At 7 the boy went from her bosom to the bosom of the commonwealth, to be the mother's boy no longer. He was put in charge of a special magistrate as his trainer, by whom he was schooled in hardships and developed in strength and cunning and courage through years of assiduous attention. His sinews became as steel, his limbs practiced to fatigue and endurance, his art with arms perfect, his will obedient to the discipline of war, his eye true, his spirit daring and audacious and unconquerable. Of such were the three hundred who died with Leonidas at Thermopylæ, and these were only the types of eight thousand comrades in arms, every one of whom would have done the same thing.

In another part of Greece, however, alongside of the Spartan, there grew up at Athens a system of education of broader scope and more ennobling purpose. With equal devotion to the supremacy of the state and her need for invincible soldiers, the Athenian conception was to so educate her free-born citizens by promoting and developing rather than by restraining and cramping their individuality of character that they might not only be soldiers, but far more. The aim was to accomplish them not only for war but for the civic pursuits of peace. Not by the authority of law, as at Sparta, but by the force of public opinion. Not for the sole use and benefit of the body politic, but for the development and exaltation of the citizen first and the glory of Athens afterwards. The fruits of this conception were educational results never before equaled and perhaps never since surpassed. The harmonious training of mind and body were supplemented by an æsthetic culture. Their ideals, though not heaven sent and though not inspired by the contemplation of the Son of Righteousness, were born of a reverent love of goodness and beauty with which they had invested the most perfect of their mythological deities. Their unfettered freedom of thought shone through the marble drapery of their statues, and the soul of immortal longings inspired their canvas, while grace and lofty daring sat upon their persons and declared a character that despised all that was mean and ignoble. The result of Grecian education and culture did not end with her citizens. It was embalmed in her literature, and whispers its lessons of truth and beauty to-day through the galleries and labyrinths of the mind of every student and scholar whom its language has reached. It has clung to the very words of that language, and its airy grace has given it the wings of the thistle down and disseminated it all over the earth.

Further toward the setting sun, on shores washed by the same Mediterranean Sea that embraced the Peninsula of Hellas, arose a later civilization under the dominion and influence of Rome. This civilization, by reason of a valor, nursed by a stern spirit of independence and a patriotism born of the robust virtues of her people in the early days of the Republic had extended her empire across a populous region 3,000 miles in length by 2,000 in breadth. The genius of her people was conquest and their education was for that purpose, and to make the self-respecting freeman whose proudest boast was that he was a Roman citizen. Over his free spirit, however, the State exercised no educational coercion, but alike as at Athens, the sway of public opinion was the moulding factor of his culture, and the love of country the high incentive. His indomitable will did not expend its energies, as did the Greeks, in interpreting and subduing nature, but in conquering provinces; not in creating ideals after the gods of Olympus, but in marshaling legions on the field of Mars. War he considered the chief business of his life, and education in letters he ranked as a pastime. Even his language itself embodied this spirit of his living, since exercitus (the army) meant business, and ludus (the school) meant diversion.

Unlike the Grecian, the real and the practical, rather than the speculative and the æsthetic employed his thoughts, and while Rome was speading her eagles of conquest from the Thames to the Euphrates, her internal improvement in material prosperity, her wealth, her institutions, her laws, her public works, alike attested the greatness of her utilitarian education. And this continued her distinctive characteristic even after the cultured captives that returned with her victorious columns from Grecian conquest, introduced into Rome the refinements and subtleties of the Athenian schools of thought, and filled her Forum with the discussions of sophists and philosophers. Thus leading up to and into the Christian era, the sturdy character of Roman education in its trueness and depth and practical purpose resembled the modern Christian education. The Greeks formed intellectual and æsthetic ideals and standards. The Romans formed physical or practical ideals and standards. The Christians formed ethical or moral ideals and standards.

In this partial though somewhat tedious review of the scope and purpose of education, as illustrated in the typical civilizations of history, it is perhaps more clearly revealed to us why the ancients did not educate than why they did educate. We

have seen that the personal and individual development of the people was of small concern to the ruling powers and was seldom the end aimed at. Indeed, with the single exception of China, popular education, as we now use that term, had no national existence, nor did it prevail anywhere until modern times. We need not look far to discover a reason for this, especially when we consider that for centuries as small account was taken of the right of the people to individual liberty as to individual education. Knowledge then, as in later days, was regarded as a power, and it was truly conceived that the ignorant masses could be more easily kept in subjection to the rule of absolutism than a body of intelligent citizens. Absolute governments had no place for educated subjects except in numbers limited to the necessities of enforcing authority. The province of the subject was to toil and to obey. Even in the case of general education in China, to which we have referred, the system of education was so ingeniously guarded in its philosophical conception and application that it subserved rather than violated the principle of subjection; for, as remarked by that great scholar and philosopher, Dr. W. T. Harris, of our National Bureau of Education, concerning this Chinese system: "It is one of the most interesting devices in the history of education—a method of educating a people on such a plan that the more education the scholar gets the more conservative he becomes."

The thought occurs here, would not such a system as the Chinese be serviceable to-day in the regulation of the now world-wide disturbers of social order, the anarchists, the socialists, and their kindred brood? I answer, that only under Chinese conditions of liberty would such education be practicable, and under no conditions of liberty acceptable to modern civilized manhood could it possibly be enforced. The world, in its ideas of freedom of thought and of action, has moved far away from such tyranny in governments. The divine right of kings or of oligarchies has no footing in Western civilization. It has cost hecatombs of human lives and seas of blood to reach our present estate of human freedom. But the socalist and anarchist can not permanently harm American institutions and organized society. Those who have so apprehended have not carefully considered the basis of their fears. The nihilistic agitations in Europe will doubtless operate to sweep away some of the remains of the feudal fetters imposed on liberty of living, but this "goverment of the people, for the people, and by the people" has nothing to fear from such agitations. The social vagaries and economic delusions which are preached to the unemployed wage worker to ferment society will have local expression in sporadic violence, but the disturbances can not, in our day and generation, mount up to the proportions of revolution. The anarchists submit no propositions which can engage such general local interests as to array State against State or section against section—as in the late civil war; and as long as State autonomy remains to us, the State governments can take care of their internal disturbances, especially when backed by the power of the General Government. Until the great body of the people lose their balance and common sense, they may be safely trusted to adhere to the tradition that any government is better than no government at all.

But even the sovereign authority of the people, with which the States and General Government have been invested, will not long have to contend with anarchistic elements which have come to us from abroad under the false pretense of enjoying and upholding our established institutions of freedom, if we so legislate as to stop the crevices in our naturalization laws, through which the wild, untrained, fanatical representatives of European red republicanism find entrance into our body politic. And, again, we may hope to increase the volume of our now mighty current of popular education until every precinct in every county in every State shall have the full benefit of its quickening and enlightening influence, and until every child in all the land, native and foreign, white and black, Indian and Chinaman, shall be possessed of the modern trivium of education, "the three R's," the three keys to knowledge, with which he can gain access to the immense treasury of learning which the centuries have piled up for us, and to which they have fallen heirs. This accomplished, and the plea of the anarchist will find few sympathizers among our people. It is not too much education that makes the vicious, but the lack of it. The anarchist here with us is not too much educated; as may be supposed, he is too badly educated or too wrongly trained and educated by the factors of the environment from which he came to us to be adjusted into any niche of American freedom. We may not be able to educate and assimilate into good citizenship all the Herr Mosts and vicious cranks that Europe can empty upon us, but we can restrain their coming and so educate the children of those already here as to make them cohelpers in good government.

We are told in the Greek reader that Aristotle, when asked in what way the educated differed from the uneducated, replied, "As the living differ from the dead." Compare the lowest type of the barbarian with the highest type of the Greek in Aristotle's day (and the comparison is just as good in ours) and you can appreciate the force of this remark.

Carlyle, the great Scotchman, said: "An educated man stands as it were in the

midst of a boundless arsenal and magazine filled with all the weapons and engines which man's skill has been able to devise from the earliest time, and he works accordingly with the strength borrowed from all the ages. How different is his state who stands on the outside of the storehouse and feels that its gates must be stormed or remain forever shut against him? His means are the commonest; the work done is in no measure of his strength. A dwarf behind his steam engine may remove mountains, but no dwarf will hew them down with his pickaxe, and he must be a Titan that hurls them abroad with his arms."

These illustrations from two great thinkers, who spoke more than two thousand years apart, each standing upon the very apex of culture of his day and time, do not contrast too strongly the conditions referred to. In both the wholly uneducated is set over against the fully educated man; the savage against the scientist and the scholar. The distance between them is measureless, and we can not say that the chasm will ever be bridged. Leaving aside the consideration of racial inequalities, about which there is now little dispute, the natural mental inequalities of men must long postpone, if it ever reaches this consummation. The leveling process must encounter obstructions by this inequality which is one of natures unwritten laws. This inequality is the unescapable consequences of action—the necessary predicate of human progress. In this progression the individual speed is unequal; all can not be in the front line. Few can be abreast with Newton or Bacon or Gladstone. That education, however, under conditions seldom favorable, has raised the general average of mankind from century to century, the history of civilization attests, and this progress of civilization is but the progress of education.

A learned English scholar recently wrote concerning the history of education: "It would comprehend the transforming of crude nature of the savage man, which chiefly concerns itself with mere animal wants and desires, into the higher nature of a being who looks behind to gather the fruits of experience; who looks before to utilize them for the benefit of those who are to succeed him, who explores the remote and the distant as well as the near, who reflects and thinks with the view to the general good of the commonwealth, and this, while it is the problem of civilization, is also the problem of education."

But, let me ask, what is the modern conception of education? What is education in its true intent and meaning—not in the widest amplitude with which it may be regarded, but in the sense it is accepted in the schools? Considered in the light of its derivative Latin synonym, *Educere*, it means to lead forth, to unfold the powers of the mind. And while it means this, it is obvious that it means far more than this. The unfolding of the powers of the mind, I conceive, might be accomplished by an artificial system of mental gymnastics, without acquiring any useful knowledge and without being provided with any of the instruments of self teaching, the arts of reading and writing. Those instruments must in themselves constitute the most important part of education, and, as we are told by a philosophic writer: "The child may learn to read and write, and by it learn the experience of the race through countless ages of existence. He may by scientific books see the world through the senses of myriads of trained specialists devoting whole lives to the inventory of nature. What is immensely more than this, he can think with their brains and assist his feeble powers of observation and reflection by the gigantic aggregate of the mental labors of the race."

And so it is that education does not merely contemplate the unfolding of the mental powers, but demands moreover that such process of unfolding shall bring to the mind of the pupil the largest amount of important and useful knowledge. Just here however, let me say, that I do not rashly venture in this presence to assume the educator's task of suggesting how to educe or unfold the powers of the mind, or what material should be put before the mind in its progress toward development, to enable it to reach the full measure of education. The first should be determined by the teacher, as he looks into the face, and studies the capacity of each pupil. The latter is appointed after wise consideration in the curriculum chosen by every school of high education. As all nature is a schoolhouse for him who seeks education, and all history, with its "philosophy teaching by examples," is his text-book, so all thought is an educational factor. There are many roads to knowledge, but only one to education, and that is through the gateway of self-help, which the earnest seeker of education affords to his own mind. Indeed, it has been wisely said that there is no real education that is not self-education. Whatever of knowledge is assimilated and appropriated, becomes education. It is the exercise of man's self activity at last that sets in motion his powers of observation; the orderly classification of the things observed; the determination of the scientific principles underlying these classes, and the great philosophical unity that unites all the sciences, and links man to The Great First Cause; this, I take it, to be in its last analysis, the true philosophy of education.

The greatest teacher can do little more than lift the latch and point the way.

PENNSYLVANIA.

THE PUBLIC EDUCATION ASSOCIATION OF PHILADELPHIA.

[From a pamphlet by Lewis R. Harley, Ph. D.]

The desirability of improving the school system of Philadelphia has given rise to a number of voluntary associations, which have been actively engaged for several years in urging reforms and promoting the development of the schools in various ways. Among the most active of these organizations has been the Public Education Association of Philadelphia, founded in 1881.

This association, like some of its predecessors, grew out of charity work. Its source was the Committee on the Care and Education of Dependent Children of the Society for Organizing Charity.

It is the object of this association to promote the efficiency and to perfect the system of public education in Philadelphia, by which term is meant all education emanating from, or in any way controlled by, the State. They purpose to acquaint themselves with the best results of experience and thought in education, and to render these familiar to the community and to their official representatives, that these may be embodied in our own public-school system. They seek to become a center for work and a medium for the expression of opinion in all matters pertaining to education, as, for instance, the appointment of superintendents; the compilation of school laws; the kindergarten in connection with public education; manual instruction—how much is desirable, and what it is practicable to introduce into the public-school system; the hygiene of schools; the adequate pay and the better qualification of teachers; and, above all, to secure, as far as possible, universal education, by bringing under instruction that large class, numbering not less than 22,000 children, who are now growing up in ignorance in this city.

These objects the association hope to attain through appeals to the local authorities and to the legislature, and by such other means as may be deemed expedient.

The officers of the association in 1895 were Edmund J. James, chairman; Miss E. W. Janney, treasurer; William W. Wiltbank, recording secretary.

The Public Education Association has had a busy career of fifteen years. It has been a constructive period in educational work in Philadelphia, and the association has seen the following results accomplished:

I. The institution of the department of superintendence, with the increase of force by which the efficiency of this department has been largely augmented and thoroughly organized.

II. The selection of a superintendent.

III. The introduction of sewing into the curriculum of the Normal School, and its more recent introduction, based upon the success of the earlier experiment, into the lower grades of schools, by which 25,000 girls were, in 1887, receiving regular, systematic instruction in needlework.

IV. The universal acknowledgment that the most complete and satisfactory exhibition of this work ever made in the country was the exhibit of the sewing done in the public schools of Philadelphia made in the spring of 1886, at the Industrial Exhibition at New York.

V. The institution of the Manual Training School.

VI. The reorganization of the schools under supervising principals.

VII. The introduction of cooking classes in the Normal School.

VIII. The exhibition of school work in Horticultural Hall.

IX. The assumption by the board of education of the kindergarten schools.

X. The establishment of the chair of pedagogy in the University of Pennsylvania.

XI. The lectures in pedagogy in the Summer School of the Extension Society.

XII. The separation of the girls' high and normal schools and the material improvement of the courses in the former.

XIII. The passage of the compulsory school law.

The association encouraged and assisted all of these movements; it initiated and completed some of them. There are still other tasks for the association. The new compulsory school law will render a school census necessary. The school accommodations of the city will be inadequate to meet the requirements of the law, and the enforcement of the law itself will depend upon public sentiment. In all these matters the society can be of assistance.

The department of education should be reorganized. The association has already made strenuous efforts to have the sectional boards abolished, and it seemed at times as if the measure would pass the legislature. The agitation should be continued until the department of education is placed beyond the reach of politics. The administration of the city schools should be committed to a single body. These are some of the subjects which should receive the attention of the association. The

work of the Public Education Association is not completed. The educational welfare of so large a municipality as Philadelphia will require the continued aid of this influential organization, which in the past has accomplished so much for the advancement of the schools.

SOUTH CAROLINA.

[Address delivered December 13, 1894, by Hon. J. L. M. Curry, in response to an invitation of the general assembly of South Carolina.[1]]

SENATORS AND REPRESENTATIVES: It has been said that among the best gifts of Providence to a nation are great and good men, who act as its leaders and guides, who leave their mark upon their age, who give a new direction to affairs, who introduce a course of events which come down from generation to generation, pouring their blessings upon mankind. Public men are the character and conscience of a people. Respect for the worth of men and women is the measure of progress in civilization. On the 16th of November, 1894, passed away one of America's purest and noblest men, one of the last links which bound the present with the better days of the Republic. For South Carolina he cherished a great affection, and sought to rekindle and keep alive the memories and fraternity of the Revolutionary period, when Massachusetts and South Carolina were struggling together for the establishment of our free institutions. Deeply touched and very grateful was he that South Carolina honored him so highly, by attaching his name in perpetuity to one of her most beneficent institutions of learning. The watchward of his life was the worship of truth and devotion to the Union. He saw clearly that "whoever would work toward national unity must work on educational lines." We may well pause to drop a tear over the grave of author, orator, philanthropist, patriot, statesman, Christian gentleman. Governor Tillman said last May, at the laying of the corner stone of the college at Rock Hill: "On one thing the people of South Carolina are certainly agreed—in their love for Robert C. Winthrop and the new college that bears his name."

I have said that he was a Christian statesman. Christianity and democracy have revolutionized the ideas and institutions of the world in reference to man, his rights, privileges, and duties. The arrival of democracy, says Benjamin Kid, is the fact of our time which overshadows all other facts, and this arrival is the result of the ethical movement in which qualities and attributes find the completest expression ever reached in the history of the human race. Kings and clergy, as having superior access to God and command of the Divine prerogatives, have been relegated to the background. Man's attainment to an enjoyment of privileges and possibilities depends on the development of latent, original, God-given powers. Families, churches, and States recognize and provide for the unfolding of these capacities. "Education, a debt due from present to future generations," was the idea and motive which permeated Mr. Peabody's munificence, and the sentiment is the legend for the official seal of the Peabody Education Fund. Free schools for the whole people should be the motive and aim of every enlightened legislator. South Carolina incorporates the duty into her organic law. There can be no more legitimate tax on property than furnishing the means of universal education, for this involves self-preservation. The great mass of the people are doomed inevitably to ignorance, unless the State undertake their improvement. Our highest material, moral, and political interests need all the capabilities of all the citizens, and then there will be none too much to meet life's responsibilities and duties. As the people are sovereign, free schools are needed for all of them. We recognize no such class as an elect few. It is desirable that citizens should read the laws they are to obey. A governor once put his edicts above the heads of the people; we sometimes, practically, do the same by keeping the people in ignorance. When all must make laws as well as obey, it is essential that they should be educated. The more generally diffused the education the better the laws; the better are they understood and the better obeyed. The highest civilization demands intelligent understanding of the laws and prompt, patriotic, cheerful obedience.

---

[1] Extract from the journal of the house of representatives of the State of South Carolina, Thursday, December 13, 1894:

JOINT ASSEMBLY.

The senate attended in the house at 11 a. m. to hear the address of the Hon. J. L. M. Curry.

The president of the senate presented Senator Tillman, who introduced the Hon. J. L. M. Curry, who entertained the general assembly for some time in an eloquent and able address on education.

Mr. Manning offered the following resolution:

"*Resolved*, That the general assembly of South Carolina has heard with pleasure and the deepest interest the eloquent and instructive address of the Hon. J. L. M. Curry, and the heartfelt thanks of this body are hereby extended to him for his address, and we wish to assure him that his words on behalf of the advancement of the educational interests of the State have fallen on ears that are alive to those interests, and that we hope for the best results upon the educational institutions of the State."

Which was considered immediately and unanimously adopted.

When schools are established, what will perfect them? The first need is sufficient money, to be attained through State and local revenues. In no instance should this money be appropriated for sectarian purposes. In England, since the free education act, there has been a determined effort to quarter denominational schools upon the rates. In the United States a persistent effort is made to subsidize from general revenues certain sectarian schools in States and among the Indians. During the nine years—1886–1894—our Government gave for education of the Indians $4,277,940, and of this appropriation one church received $2,738,571. The remainder was distributed among fifteen various schools and organizations. Another requirement is efficient local and State supervision, divorced from party politics, and controlled by civil service principles. If education be of universal and vital concern, it needs for its administration the highest capacity. The system of common schools reached its preeminent usefulness in Massachusetts under the administration of such remarkable men as Mann, Sears, and Dickinson. Pupils should be graded so as to economize time, utilize teaching talent, and secure systematic progress. At last, all depends on good teaching, and children, with all their possibilities, deserve the best. There is often a criminal waste of time, talent, opportunities, and money, because of incompetent teachers. There is sometimes a distressingly small return for mony and labor expended upon schools. It is not well-organized school systems, nor excellent textbooks, nor systematic courses of study, nor wise supervision, however important, that make the good school. It is the teacher, not mechanical in method and the slave of some superficial notion of the object and the process of the work, but a thorough master of the profession, widely knowledged and cultured, able to interest the pupils, to develop the highest power and efficiency. A good teacher will make a good school in spite of a thousand hindrances. One able to awaken sluggish intellect, give a mental impulse running through after life, who understands child nature, the laws of mental acquisition and development, whose mind has been expanded and enriched by a liberal education, who has accurate scholarship and a love for sound learning, who can awaken enthusiasm, mould character, develop by healthful aspirations, inspire to do duty faithfully, will have a good school. Andrew D. White called Dr. Wayland the greatest man who ever stood in the college presidency, and such men as Mark Hopkins, M. B. Anderson, Drs. McGuffey and Broadus show the value of high qualifications in teachers. In our public schools are thousands of men and women, doing heroic work, noiselessly and without ostentation, who deserve all the praise which is lavished upon less useful laborers in other departments. As the State has undertaken the work of education, it is under highest obligations to have the best schools, which means the best teachers.

How shall South Carolina meet these imperative obligations? Your schools average four and seventh-tenths months, but no school should have a term shorter than eight months, and the teachers, well paid, should be selected impartially, after thorough and honest examination. All should have unquestioned moral character, sobriety, aptitude for the work, desire and ability to improve. It has been suggested that if only one law were written above the door of every American schoolroom, it ought to be, No man or woman shall enter here as teacher whose life is not a good model for the young to copy. The experience of most enlightened countries has shown that these teachers should be trained in normal schools; and by normal schools I do not mean an academy with deceptive name and catalogue, and the slightest infusion of pedagogic work. Teaching is an art, based on rationally determined principles. The child grows and runs up the psychic scale in a certain order. The mind has laws, and there is no true discipline except in conformity to and application of these laws. Acquaintance with and application of these laws come not by nature, not spontaneously, but by study and practice. The real teacher should be familiar with the history, the philosophy, and the methods of education. He will best acquire and accomplish the technical and professional work if he have a well-balanced mind, fine tastes, and "the faculty of judgment, strengthened by the mastery of principles, more than by the acquisition of information." We have professional schools for the lawyer, the doctor, the engineer; why not for the teacher? His ability to teach should not be picked up at haphazard, by painful experience, and with the sacrifice of the children. A signboard near my residence reads, "Horses shod according to humane principles of equine nature." It conveys a true principle and suggests that children should be instructed according to the true principles of mental science.

President Eliot, in one of his excellent papers, enunciates six essential constituents of all worthy education.

(*a*) Training the organs of sense. Through accurate observation we get all kinds of knowledge and experience. The child sees the forms of letters, hears the sound of letters and words, and discriminates between hot and cold, black and white, etc. All ordinary knowledge for practical purposes, and language as well, are derived mainly through the senses.

(*b*) Practice in comparing and grouping different sensations and drawing inferences.

(*c*) Accurate record in memory or in written form.

(*d*) Training the memory; and practice in holding in the mind the record of observations, groupings, and comparisons.

(*e*) Training in the power of expression, in clear, concise exposition; logical setting forth of a process of reasoning.

(*f*) Inculcation of the supreme ideals through which the human race is uplifted and ennobled. Before the pupil should be put the loftiest ideals of beauty, honor, patriotism, duty, obedience, love.

Teachers are greatly helped by teachers' institutes, when those who assemble get the wisdom and experience of many minds on the difficult problems of the profession. The work should be practical, systematic, logical, continuous from year to year, and a course of professional reading should be prescribed, so as to increase the intelligence and culture of the profession.

We very often lose sight of the true end of education—it is, or should be, effective power in action, doing what the uneducated can not do, putting acquisition into practice, developing and strengthening faculties for real everyday life. The only sure test is the ability to do more and better work than could be done without it. The average man or woman with it should be stronger, more successful, more useful, than the average man or woman without it. It is the human being with an increase of power which makes one more than equal to a mere man. It is not so much what is imparted, but what is inwrought; not what is put in, but what is got out. It is not so much what we know as what we are and can do for productive ends. The object of Christianity is to make good men and good women here on earth. The object of education is to make useful men and women, good citizens. And here comes in the need of manual training, which is not to fit for special trades, but to teach the rudiments of mechanics, those common principles which underlie all work. The pupil can acquire manual dexterity, familiarize himself with tools and materials, be instructed in the science without a knowledge of which good work can not be done. The object of this industrial instruction is to develop the executive side of nature, so that the pupil shall do as well as think. This introduction of manual training into schools has been found to be very helpful to intellectual progress. Gentlemen need not reject it as something chimerical and utopian; it is not an innovation; the experiment is not doubtful; it has been tried repeatedly; it is comparatively inexpensive, and has been and is now in very successful operation. It is not wise statemanship, nor even good common sense, to forego for many years what other peoples are now enjoying the advantages of. In a quarter of a century trade schools, technical schools, manual training, the kindergarten, will have nearly universal adoption. Why, during this period, should a State rob her children of these immense benefits?

As population increases the struggle to maintain wages becomes more severe, the pressure being the hardest upon the unskilled, and less severe on each higher rank of laborers. Every possible facility for education should be put within the reach of laboring men, to increase their efficiency, to raise the standard of life, and to augment the proportion between the skilled and the unskilled. Dr. Harris, our wisest and most philosophical educator, says: "Education emancipates the laborer from the deadening effects of repetition and habit, the monotony of mere mechanical toil, and opens to him a vista of new inventions and more useful combinations." Our industrial age increases the demand for educated, directive power. Business combinations, companies for trade, transportation, insurance, banking, manufacturing, and mining, demand, as essential conditions of success, intelligent directive power. Production is augmented by skill. An indispensable condition of economic prosperity is a large per capita production of wealth. Socialism, as taught by some extremists, would sacrifice production to accomplish distribution, and means annihilation of private capital, management by the State of all industries, of production and distribution, when Government would be the sole farmer, common carrier, banker, manufacturer, storekeeper, and all these would be turned into civil servants, and be under the control and in the pay of the State, or of a party.

States may have ideals as well as individuals, and embody the noblest elements of advanced civilization. Agriculture, manufactures, mining, mechanical arts, give prosperity when allied with and controlled by thrift, skill, intelligence, and honesty; but what is imperishable is the growth and product of developed mind. Greece and Rome live in their buildings, statuary, history, orators, and poems. Pliny said: "To enlarge the bounds of Roman thought is nobler than to extend the limits of Roman power." The founders of the great English universities centuries ago builded wiser than they knew, and opened perennial fountains of knowledge and truth from which have unceasingly flowed fructifying streams. All modern material improvements are the outgrowth of scientific principles applied to practical life. If you would legislate for the increased prosperity and glory of South Carolina, be sure not to forget that this is the outcome of the infinite capacities of children. Hamilton said there was nothing great in the universe but man, and nothing great in man but

mind. "No serious thinker," says Drummond, "can succeed in lessening to his own mind the infinite distance between the mind of man and everything in nature." Fisk says: "On earth there will never be a higher creation than man." Evolutionists say that the series of animals comes to an end in man, that he is at once the crown and master and the rationale of creation. What you know and admire in South Carolina is what has been done by cultivated men and women. What other country can show such a roll of immortal worthies as your Pinckneys and Rutledges, your Marion, Sumter, and Pickens, your Harper, Johnson, O'Neill, your Fuller and Thornwell, your McDuffie and Hayne, Legare and Petigru, and, towering above all contemporaries, peerless in political wisdom, metaphysical subtlety, ignited logic, the great unrivaled American Aristotle, John C. Calhoun?

CHAPTER XXXI.

EDUCATION OF THE COLORED RACE.

References to preceding reports of the United States Bureau of Education, in which this subject has been treated: In annual reports—1870, pp. 61, 337–339; 1871, pp. 6, 7, 61–70; 1872, pp. xvii, xviii; 1873, p. lxvi; 1875, p. xxiii; 1876, p. xvi; 1877, pp. xxxiii–xxxviii; 1878, pp. xxviii–xxxiv; 1879, pp. xxxix–xlv; 1880, p. lviii; 1881, p. lxxxii; 1882–83, pp. liv, xlviii–lvi, xlix, 85; 1883–84, p. liv; 1884–85, p. lxvii; 1885–86, pp. 596, 650–656; 1886–87, pp. 790, 874–881; 1887–88; pp. 20, 21, 167, 169, 988–998; 1888–89, pp. 768, 1412–1439; 1889–90, pp. 620, 621, 624, 634, 1073–1102, 1388–1392, 1395–1485; 1890–91, pp. 620, 624, 792, 808, 915, 961–980, 1469; 1891–92, pp. 8, 686, 688, 713, 861–867, 1002, 1234–1237; 1892–93, pp. 15, 442, 1551–1572, 1976; 1893–94, pp. 1019–1061. Special Report on District of Columbia for 1869, pp. 193, 300, 301–400. Special report, New Orleans Exposition, 1884–85, pp. 468–470, 775–781.

This chapter and the one which follows contain a large amount of matter relating to the advancement of the colored race in the United States. The very creditable exhibit made at the Atlanta Exposition in 1895 by the more progressive element among the negroes aroused new interest in all parts of the country in their educational advancement. In response to the general demand for information on this subject a special effort was made by this Bureau to collect statistics from all the colored schools of the South. It was no easy task on account of the indifference manifested by many of those in charge of private schools. Of the 162 schools of secondary and higher grade known to this office fewer than half the number responded to the first request for information. Even after the fifth request had been sent out a few of the schools had failed to respond. Many of the reports received contained but meager information. Such statistics as could be obtained will be given in detail in succeeding pages of this chapter.

The statistics of public common schools for the negroes are given in connection with the statistics of white schools in the beginning of the first volume of this annual report. On the next page is presented a table which contains in condensed form the more important items of information relating to the number and attendance of colored pupils in the common schools of each of the former slave States. In these sixteen States and the District of Columbia the estimated number of persons 5 to 18 years of age, the school population, was 8,297,160. Of this number 5,573,440 were white children and 2,723,720, or 32.9 per cent, colored. The total enrollment in the white schools was 3,845,414 and in the colored schools 1,441,282. The per cent of white school population enrolled was 69 and the per cent of colored school population enrolled was 52.92. The whites had an average daily attendance of 2,510,907, or 65.30 per cent of their enrollment, while the average attendance of the blacks was 856,312, or 59.41 per cent of their enrollment. There were 89,276 white teachers and 27,081 colored teachers in the public schools of the South in 1895.

An accurate statement of the amounts of money expended by each of the Southern States for the education of the colored children can not be given for the reason that in only two or three of these States are separate accounts kept of the moneys expended for colored schools. Since 1876 the Southern States have expended about $383,000,000 for public schools, and it is fair to estimate that between $75,000,000 and $80,000,000 of this sum must have been expended for the education of colored children. In 1895 the enrollment of colored pupils was a little more than 27 per cent of

the public school enrollment in the Southern States. It is not claimed that they received the benefit of 27 per cent of the school fund and perhaps no one would say they received less than 20 per cent. It is a fact well known that almost the entire burden of educating the colored children of the South falls upon the white property owners of the former slave States. Of the more than $75,000,000 expended in the past twenty years for the instruction of the colored children in Southern public schools but a small per cent was contributed by the negroes themselves in the form of taxes. This vast sum has not been given grudgingly. The white people of the South believe that the State should place a common-school education within the reach of every child, and they have done thus much to give all citizens, white and black, an even start in life.

Common-school statistics classified by race, 1894-95.

ILLITERACY OF THE COLORED POPULATION.

What have the negroes themselves accomplished to justify the generosity of the white people of the South and the benevolence of the people of the North? It may be said that in 1860 the colored race was totally illiterate. In 1870 more than 85 per cent of the colored population of the South, 10 years of age and over, could not read and write. In 1880 the per cent of illiterates had been reduced to 75, and in 1890 the illiterates comprised about 60 per cent of the colored population 10 years of age and over. In several of the Southern States the percentage is even below 50 per

cent. The comparative statistics for 1870, 1880, and 1890, showing the illiteracy of the colored race, are given for each of the Southern States in the following table:

Illiteracy of the colored population 10 years of age and over.

State.	1890.			1880.			1870.		
	Population 10 years of age and over.	Illiterates.		Population 10 years of age and over.	Illiterates.		Population 10 years of age and over.	Illiterates.	
		Number.	Per cent.		Number.	Per cent.		Number.	Per cent.

In thirty years 40 per cent of the illiteracy of the colored race had disappeared. In education and in industrial progress this race had accomplished more than it could have achieved in centuries in a different environment without the aid of the whites. The negro has needed the example as well as the aid of the white man. In sections where the colored population is massed and removed from contact with the whites the progress of the negro has been retarded. He is an imitative being, and has a constant desire to attempt whatever he sees the white man do. He believes in educating his children because he can see that an increase of knowledge will enable them to better their condition. But segregate the colored population and you take away its object lessons. The statistics exhibited in the following table in a measure confirm the truth of this position:

Colored population and illiteracy in 1890 compared.

State.	Colored population.	Per cent to total.	Per cent of colored illiteracy.	Per cent of white illiteracy.
1	2	3	4	5
West Virginia	32,717	4.3	44.4	13.0
Missouri	150,726	5.6	41.7	7.1
Kentucky	268,173	14.4	55.9	15.8
Delaware	28,427	16.9	49.5	7.4
Maryland	215,897	20.7	50.1	7.0
Texas	489,588	21.9	52.5	10.8
Tennessee	430,881	24.4	54.2	17.8
Arkansas	309,427	27.4	53.6	16.3
District of Columbia	75,697	32.9	35.0	2.7
North Carolina	562,565	34.8	60.1	17.9
Virginia	635,858	38.4	57.2	13.9
Florida	166,473	42.5	50.6	11.3
Alabama	679,299	44.9	69.1	18.2
Georgia	858,996	46.8	67.3	16.3
Louisiana	560,192	50.1	72.1	20.1
Mississippi	744,749	57.8	60.9	11.9
South Carolina	689,141	59.9	64.1	17.9

Here it is shown that in the States where the colored population is greatest in proportion to the total population, or where such colored population is massed, as in the "black belt" of South Carolina, Georgia, Alabama, Mississippi, and Louisiana, there the per cent of illiteracy is highest. In this table the Southern States are

arranged with reference to their proportion of colored population, West Virginia standing first with only 4.3 per cent, and South Carolina at the foot of the list with 59.9 per cent colored population. The per cent for each State is shown in the third column. Leaving out of the count the District of Columbia, in which there is a perfected system of city schools, the percentages of illiteracy in column 4 seem to bear a close relation to the percentages of population in column 3. The eight States having less than 30 per cent of colored population have, with a single exception, less than 55 per cent of colored illiteracy. The eight States having more than 30 per cent of colored population have, with two exceptions, more than 60 per cent of illiteracy. In the fifth column the per cent of white illiteracy is given for each State.

SECONDARY AND HIGHER EDUCATION.

There are in the United States, so far as known to this Bureau, 162 institutions for the secondary and higher education of the colored race. Six of these schools are not located within the boundaries of the former slave States. Of the 162 institutions, 32 are of the grade of colleges, 73 are classed as normal schools, and the remaining 57 are of secondary or high school grade. While all these schools teach pupils in the elementary studies, they also carry instruction beyond the common school branches. State aid is extended to 35 of the 162 institutions, and 18 of these are wholly supported by the States in which they are established. The remaining schools are supported wholly or in part by benevolent societies and from tuition fees.

Detailed statistics of the 162 institutions will be found in this chapter. In these schools were employed 1,549 teachers, 711 males and 838 females. The total number of students was 37,102; of these, 23,420 were in elementary grades, 11,724 in secondary grades, and 1,958 were pursuing collegiate studies. The following table shows for each State the number of schools and teachers and the number of students in elementary, secondary, and collegiate grades:

Summary of teachers and students in institutions for the colored race in 1894–95.

State.	No. of schools.	Teachers.			Students.									Total.

There were 4,514 colored students studying to become teachers, 1,902 males and 2,612 females. Many of these students were included among those pursuing the English and other courses noted in the foregoing table.

The number of students graduating from high school courses was 649, the number of males being 282 and the number of females 367. There were 844 graduates from normal courses, 357 males and 487 females. The number of college graduates was 186, the number of males being 151 and the number of females 35. The distribution of graduates by States, as well as the number of normal students, can be found in the following table:

Number of normal students and graduates in 1894–95.

State.	Students in normal course.			Graduates of high school course.			Graduates of normal course.			Graduates of collegiate course.

There were 1,166 colored students studying learned professions—1,028 males and 138 females. Of the professional students 585 were studying theology, 310 medicine, 55 law, 45 pharmacy, 25 dentistry, and 8 engineering. The 138 female students were receiving professional training for nurses. There were 42 graduates in theology, 67 in medicine, 21 in law, 2 in dentistry, 16 in pharmacy, and 25 in nurse training. The following table (p. 1336) gives the distribution of professional students and graduates by States.

Colored professional students and graduates in 1894–95.

State.	Students in professional courses.			Professional students and graduates.															
				Theology.		Law.		Medicine.		Dentistry.		Pharmacy.		Nurse training.		Mechanical or electrical engineering.

The importance of industrial training is almost universally recognized by teachers of the colored race, and the negroes themselves are beginning to see its value. This feature of colored education was treated at some length in the Education Report for 1893–94. More complete statistics are presented this year. For the first time the number of students in each industrial branch has been ascertained. Of the 37,102 students in the 162 colored schools nearly one-third, or 12,058, were receiving industrial training. Of these, 1,061 were learning farm and garden work, 1,786 carpentry, 235 bricklaying, 202 plastering, 259 painting, 67 tin and sheet-metal work, 314 forging, 200 machine-shop work, 147 shoemaking, 706 printing, 1,783 sewing, 5,460 cooking, and 1,017 were learning other industries. An exhibit of the industrial side of colored education is made in the following table:

Industrial training of colored students in 1894–95.

State.	Pupils receiving industrial training.			Students trained in industrial branches.												
	Male.	Female.	Total.	Farm or garden work.	Carpentry.	Bricklaying.	Plastering.	Painting.	Tin or sheet-metal work.	Forging.	Machine-shop work.	Shoemaking.	Printing.	Sewing.	Cooking.	Other trades.

Colored institutions received benefactions in 1894-95 amounting to $304,822. They received State and municipal aid amounting to $188,936; from productive funds, $98,278; from tuition fees, $101,146, and from other sources and unclassified sums amounting to $534,272. The latter figure includes the sums received by colored agricultural and mechanical colleges from the United States. The income of the colored institutions, so far as reported, amounted to $922,632. In the libraries of the 162 colored schools there were 175,788 volumes, valued at $357,549. The value of grounds, buildings, furniture, and scientific apparatus was $6,475,590, and the value of other property and endowments was $2,381,748. The following table summarizes the financial reports received from the 162 colored institutions:

Financial summary of the 162 colored schools.

State.	Value of benefactions or bequests, 1894-95.	Volumes in libraries.	Value of libraries.	Value of grounds, buildings, furniture, and scientific apparatus.	Amount of any other property or endowment.	Amount of State or municipal aid.	Amount received from tuition fees.	Amount received from productive funds.	Amount received from other sources.	Total income for the year 1894-95.

Beginning on the next page is a table giving in detail the statistics of the 162 colored schools so far as reported to this Bureau.

In the concluding pages of this chapter are printed two addresses in which are presented two views of the education of the colored race. The first was delivered at Brooklyn, N. Y., in January, 1896, at the dinner in honor of Alexander Hamilton by Booker T. Washington, principal of the Tuskegee Normal and Industrial Institute. The second was delivered before the American Baptist Home Mission Society, at Asbury Park, N. J., May 26, 1896, by Edward C. Mitchell, D. D., president of Leland University, New Orleans, La. Mr. Washington pleads for the industrial as well as the intellectual training of the negro, while Dr. Mitchell advocates the higher education.

INDUSTRIAL EDUCATION OF THE BLACKS.[1]

It hardly seems fitting for you to associate my history and thought with those of Alexander Hamilton, one of the great men not born to die. And yet it may not seem immodest in me to suggest that the great and lowly, the rich and poor, the white and black, the ex-master and the ex-slave, have this in common, that each in his own way, and in his own generation, can put forth his highest efforts to serve humanity in the way that our country most needs service; in this all of us can be equal—in this all can be great. If any of you have the faintest idea that I have come here in the capacity of an instructor along any line of education I wish you to part with such an impression at once. My history and opportunity have not fitted me to be your teacher; the most that I can do is to give you a few facts out of my humble experience and leave you to draw your own conclusions.

I was born a slave on a plantation in Virginia, in 1857 or 1858, I think. My first memory of life is that of a one-room log cabin with a dirt floor and a hole in the center that served as a winter home for sweet potatoes, and, wrapped in a few rags on this dirt floor I spent my nights, and, clad in a single garment, about the plantation I often spent my days. The morning of freedom came, and though a child, I recall vividly my appearance with that of forty or fifty slaves before the veranda of the "big house" to hear read the documents that made us men instead of property. With the long prayed for freedom in actual possession, each started out into the world to find new friends and new homes. My mother decided to locate in West Virginia, and after many days and nights of weary travel we found ourselves among the salt furnaces and coal mines of West Virginia. Soon after reaching West Virginia I began work in the coal mines for the support of my mother.

While doing this I heard in some way, I do not now remember how, of General Armstrong's school at Hampton, Va. I heard at the same time, which impressed me most, that it was a school where a poor boy could work for his education, so far as his board was concerned. As soon as I heard of Hampton I made up my mind that in some way I was going to find my way to that institution. I began at once to save every nickel I could get hold of. At length, with my own savings and a little help from my brother and mother, I started for Hampton, although at the time I hardly knew where Hampton was or how much it would cost to reach the school. After walking a portion of the distance, traveling in a stage coach and cars the remainder of the journey, I at length found myself in the city of Richmond, Va. I also found myself without money, friends, or a place to stay all night. The last cent of my money had been expended. After walking about the city till midnight, and growing almost discouraged and quite exhausted, I crept under a sidewalk and slept all that night. The next morning, as good luck would have it, I found myself near a ship that was unloading pig iron. I applied to the captain for work, and he gave it, and I worked on this ship by day and slept under the sidewalk by night, till I had earned money enough to continue my way to Hampton, where I soon arrived with a surplus of 50 cents in my pocket.

I at once found General Armstrong, and told him what I had come for, and what my condition was. In his great hearty way he said that if I was worth anything he would give me a chance to work my way through that institution. At Hampton I found buildings, instructors, industries provided by the generous; in other words, the chance to work for my education. While at Hampton I resolved, if God permitted me to finish the course of study, I would enter the far South, the black belt of the Gulf States, and give my life in providing as best I could the same kind of chance for self-help for the youth of my race that I found ready for me when I went to Hampton, and so in 1881 I left Hampton and went to Tuskegee and started the Normal and Industrial Institute in a small church and shanty, with 1 teacher and 30 students.

Since then the institution of Tuskegee has grown till we have connected with the institution 69 instructors and 800 young men and women, representing 19 States; and, if I add the families of our instructors, we have on our grounds constantly a population of about 1,000 souls. The students are about equally divided between the sexes, and their average is 18½ years. In planning the course of training at Tuskegee we have steadily tried to keep in view our condition and our needs rather than pattern our course of study directly after that of a people whose opportunities of civilization have been far different and far superior to ours. From the first, industrial or hand training has been made a special feature of our work.

This industrial training, combined with the mental and religious, to my mind has several emphatic advantages. At first few of the young men and women who came to us would be able to remain in school during the nine months and pay in cash the $8 per month charged for board. Through our industries we give them the chance

[1] An address delivered by Booker T. Washington, principal of the Tuskegee (Ala.) Normal and Industrial Institute, at the dinner in honor of Alexander Hamilton, Brooklyn, N. Y., January, 1896.

of working out a portion of their board and the remainder they pay in cash. We find by experience that this institution can furnish labor that has economic value to the institution and gives the student a chance to learn something from the labor within itself. For instance, we cultivate by the labor of our students this year about 600 acres of land. This land is not only cultivated in a way to bring in return to our boarding department, but the farm, including stock raising, dairying, fruit growing, etc., is made a constant object lesson for our students and the people in that section of the South. A three-story brick building is now going up, and the bricks for this building are manufactured at our brick yard by students, where we have made 1,500,000 brick this season. The brick masonry, plastering, sawing, sawing of lumber, carpenters' work, painting, tinsmithing, in fact everything connected with the erection of this building is for permanent use, and the students have the knowledge of the trades entering into the erection of such a building. While the young men do this, the girls to a large extent make, mend and laundry their clothing, and in that way are taught these industries.

Now, this work is not carried on in a miscellaneous or irregular manner. At the head of each industrial department we have a competent instructor, so that the student is not only learning the practical work but is taught as well the underlying principles of each industry. When the student is through with brick masonry he not only understands the trade in a practical way, but also mechanical and architectural drawing to such an extent that he can become a leader in this industry. All through the classroom work is dovetailed in the industrial—the chemistry teaching made to tell on the farm and cooking, the mathematics in the carpentry department, the physics in the blacksmishing and foundrying. Aside from the advantage mentioned, the industrial training gives to our students respect and love for labor—helps them to get rid of the idea so long prevalent in the South that labor with the hands is rather degrading, and this feeling as to labor being degrading is not, I might add, altogether original with the black man of the South. The fact that a man goes into the world conscious of the fact that he has within him the power to create a wagon or a house gives him a certain moral backbone and independence in the world that he would not possess without it.

While friends of the North and elsewhere have given us money to pay our teachers and to buy material which we could not produce, still very largely by the labor of the students, in the way I have attempted to describe, we have built up within about fourteen years a property that is now valued at $225,000; 37 buildings, counting large and small, located on our 1,400 acres of land, all except three of which are the product of student labor. The annual expense of carrying on this work is now about $70,000 a year. The whole property is deeded to an undenominational board of trustees, who have control of the institution. There is no mortgage on any of the property. Our greatest need is for money to pay for teaching.

What is the object of all this? In everything done in literary, religious, or industrial training the question kept constantly before all is that the institution exists for the purpose of training a certain number of picked leaders who will go out and reach in an effective manner masses by whom we are surrounded. It is not a practical nor desirable thing for the North to educate all the negroes in the South, but it is a perfectly practical and possible thing for the North to help the South educate the leaders, who in turn will go out and reach the masses and show them how to lift themselves up. In discussing this subject it is to be borne in mind that 85 per cent of the colored people South live practically in the country districts, where they are difficult to reach except by special effort. In some of the counties in Alabama, near Tuskegee, the colored outnumber the whites four and five to one.

In an industrial sense, what is the condition of these masses? The first year our people received their freedom they had nothing on which to live while they grew their first cotton crop; funds for the first crop were supplied by the storekeeper or former master, a debt was created; to secure the indebtedness a lien was given on the cotton crop. In this way we got started in the South what is known as the mortgage or crop lien system—a system that has proved a curse to the black and white man ever since it was instituted. By this system the farmer is charged a rate of interest that ranges from 15 to 40 per cent. By this system you will usually find three-fourths of the people mortgage their crops from year to year, as many deeply in debt and living in one-roomed cabins on rented land. By this system debts and extravagances are encouraged, and the land is impoverished and values fall.

The schools in the country districts rarely last over three and one-half months in the year, and are usually taught in a church or a wreck of a log cabin or under a brush arbor. My information is that each child entitled to attend the public schools in Massachusetts has spent on him each year between $18 and $20. In Alabama each colored child has spent on him this year about 71 cents, and the white children but a few cents more. Thus far in my remarks I have been performing a rather ungracious task in stating conditions without suggesting a remedy. What is the remedy for the state of things I have attempted to describe?

If the colored people got any good out of slavery it was the habit of work. In this respect the masses of the colored people are different from most races among whom missionary effort is made, in that the negro as a race works. You will not find anything like that high tension of activity that is maintained here; still the negro works, whether the call for labor comes from the rice swamps of the Carolinas, the cotton plantations of Alabama, or the sugar cane bottoms of Louisiana, the negro is ready to answer it—yes, toil is the badge of all his tribe, though he may do his work in the most shiftless and costly manner, still with him it is labor. I know you will find a class around railroad stations and corners of streets that loaf, just as you will find among my people, and we have got some black sheep in our flock, as there are in all flocks, but the masses in their humble way are industrious.

The trouble centers here: Through the operations of the mortgage system, high rents, the allurements of cheap jewelry and bad whisky, and the gewgaws of life, the negro is deprived of the results of his labor. Unused to self-government, unused to the responsibility of controlling our own earnings or expenditures, or even our own children, it could not be expected that we could take care of ourselves in all respects for several generations. The great need of the negro to-day is intelligent, unselfish leadership in his educational and industrial life.

Let me illustrate, and this is no fancy sketch: Ten years ago a young man born in slavery found his way to the Tuskegee school. By small cash payments and work on the farm he finished the course with a good English education and a practical and theoretical knowledge of farming. Returning to his country home where five-sixths of the citizens were black, he still found them mortgaging their crops, living on rented land from hand to mouth, and deeply in debt. School had never lasted longer than three months, and was taught in a wreck of a log cabin by an inferior teacher. Finding this condition of things, the young man to whom I have referred took the three months public school as a starting point. Soon he organized the older people into a club that came together every week. In these meetings the young man instructed as to the value of owning a home, the evils of mortgaging, and the importance of educating their children. He taught them how to save money, how to sacrifice—to live on bread and potatoes until they could get out of debt, begin buying a home, and stop mortgaging. Through the lessons and influence of these meetings, the first year of this young man's work these people built up by their contributions in money and labor a nice frame schoolhouse that replaced the wreck of a log cabin. The next year this work was continued and those people, out of their own pockets, added two months to the original three months' school term. Month by month has been added to the school term till it now lasts seven months every year. Already fourteen families within a radius of 10 miles have bought and are buying homes, a large proportion have ceased to mortgage their crops and are raising their own food supplies. In the midst of all was the young man educated at Tuskegee, with a model cottage and a model farm that served as an example and center of light for the whole community.

My friends, I wish you could have gone with me some days ago to this community and have seen the complete revolution that has been wrought in their industrial, educational, and religious life by the work of this one teacher, and I wish you could have looked with me into their faces and seen them beaming with hope and delight. I wish you could have gone with me into their cottages, containing now two and three rooms, through their farms, into their church and Sunday school. Bear in mind that not a dollar was given these people from the outside with which to make any of these changes; they all came about by reason of the fact that they had this leader, this guide, this Christian, to show them how to utilize the results of their own labor, to show them how to take the money that had hitherto been scattered to the wind in mortgaging, high rents, cheap jewelry and whisky, and to concentrate in the direction of their own uplifting. My people do not need or ask for charity to be scattered among them; it is very seldom you ever see a black hand in any part of this country reached forth for alms. It is not for alms we ask, but for leaders who will lead and guide and stimulate our people till they can get upon their own feet. Wherever they have been given a leader, something of the kind I have described, I have never yet seen a change fail to take place, even in the darkest community.

In our attempt to elevate the South one other thing must be borne in mind. I do not know how you find it here, but in Alabama we find it a pretty hard thing to make a good Christian of a hungry man. I think I have learned that we might as well settle down to the uncompromising fact that our people will grow in proportion as we teach them that the way to have the most of Jesus, and in a permanent form, is to mix in with their religion some land, cotton, and corn, a house with two or three rooms, and a little bank account; with these things interwoven with our religion there will be a foundation for growth on which we can build for all time. What I have tried to indicate are some of the lessons that we are disseminating into every corner of the black belt of the South, through the work of our graduates and

through the Tuskegee negro conference, that brings together at Tuskegee once a year 800 of the representatives of the black yeomanry of the South to lay plans, to get light and encouragement, and thus add the strength of mothers and fathers to the strength of the schoolroom and pulpit. More than anything else Tuskegee is a great college settlement dropped into the midst of a mass of ignorance that is gradually but slowly leavening the whole lump.

Of this you can be sure that it matters not what is said the black man is doing or is not doing, regardless of entanglements or discouragements, the rank and file of my race is now giving itself to the acquiring of education, character, and property in a way that it has never done since the dawn of our freedom. The chance that we ask is, by your help and encouragement, to be permitted to move on unhindered and unfettered for a few more years, and with this chance, if the Bible is right and God is true, there is no power that can permanently stay our progress. Neither here nor in any part of the world do people come into close relations with a race that is to a large extent empty handed and empty headed. One race gets close to another in proportion as they are drawn in commerce, in proportion as the one gets hold of something that the other wants or respects—commerce, we must acknowledge, in the light of history, is the great forerunner of civilization and peace.

Whatever friction exists between the black man and white man in the South will disappear in proportion as the black man, by reason of his intelligence and skill, can create something that the white man wants or respects; can make something, instead of all the dependence being on the other side. Despite all her faults, when it comes to business pure and simple, the South presents an opportunity to the negro for business that no other section of the country does. The negro can sooner conquer Southern prejudice in the civilized world than learn to compete with the North in the business world. In field, in factory, in the markets, the South presents a better opportunity for the negro to earn a living than is found in the North. A young man educated in head, hand, and heart, goes out and starts a brickyard, a blacksmith shop, a wagon shop, or an industry by which that black boy produces something in the community that makes the white man dependent on the black man for something—produces something that interlocks, knits the commercial relations of the races together, to the extent that a black man gets a mortgage on a white man's house that he can foreclose at will; well, the white man won't drive the negro away from the polls when he sees him going up to vote. There are reports to the effect that in some sections the black man has difficulty in voting and having counted the little white ballot which he has the privilege of depositing about twice in two years, but there is a little green ballot that he can vote through the teller's window three hundred and thirteen days in every year, and no one will throw it out or refuse to count it. The man that has the property, the intelligence, the character, is the one that is going to have the largest share in controlling the Government, whether he is white or black, or whether in the North or South.

It is important that all the privileges of the law be ours. It is vastly more important that we be prepared for the exercise of these privileges. Says the great teacher: "I will draw all men unto me." How? Not by force, not by law, not by superficial glitter. Following in the tracks of the lowly Nazarine, we shall continue to work and wait, till by the exercise of the higher virtues, by the products of our brain and hands, we make ourselves so valuable, so attractive to the American nation, that instead of repelling we shall draw men to us because of our intrinsic worth. It will be needless to pass a law to compel men to come into contact with a negro who is educated and has $200,000 to lend. In some respects you already acknowledge that as a race we are more powerful, have a greater power of attraction, than your race. It takes 100 per cent of Anglo-Saxon blood to make a white American. The minute that it is proved that a man possesses one one-hundredth part of negro blood in his veins it makes him a black man; he falls to our side; we claim him. The 99 per cent of white blood counts for nothing when weighed beside 1 per cent of negro blood.

None of us will deny that immediately after freedom we made serious mistakes. We began at the top. We made these mistakes, not because we were black people, but because we were ignorant and inexperienced people. We have spent time and money attempting to go to Congress and State legislatures that could have better been spent in becoming the leading real estate dealer or carpenter in our own county. We have spent time and money in making political stump speeches and in attending political conventions that could better have been spent in starting a dairy farm or truck garden and thus have laid a material foundation, on which we could have stood and demanded our rights. When a man eats another person's food, wears another's clothes, and lives in another's house, it is pretty hard to tell how he is going to vote or whether he votes at all.

Gentlemen of the club, the practical question that comes home to you, and to me as an humble member of an unfortunate race, is, how can we help you in working out the great problem that concerns 10,000,000 of my race, and 60,000,000 of yours.

We are here; you rise as we rise; you fall as we fall; we are strong when you are strong; you are weak when we are weak; no power can separate our destinies. The negro can afford to be wronged in this country; the white man can not afford to wrong him. In the South you can help us to prepare the strong, Christain, unselfish leaders that shall go among the masses of our people and show them how to take advantage of the magnificent opportunities that surround them. In the North you can encourage that education among the masses which shall result in throwing wide open the doors of your offices, stores, shops, and factories in the way that shall give our black men and women the opportunity to earn a dollar. * * * Let it be said of all parts of our country that there is no distinction of race or color in the opportunity to earn an honest living. Throw wide open the doors of industry. We are an humble, patient people; we can afford to work and wait. There is plenty of room at the top. The workers up in the atmosphere of goodness, love, patience, forbearance, forgiveness, and industry are not too many or overcrowded. If others would be little, we can be great; if others bad, we can be good; if others try to push us down, we can help to push them up.

Men ask me if measures like those enacted in South Carolina do not hurt and discourage. I answer, Nay, nay; South Carolina and no other State can make a law to harm the black man in great measure. Men may make laws to hinder and fetter the ballot, but men can not make laws that will bind or retard the growth of manhood:

Fleecy locks and black complexion
Can not forfeit Nature's claim;
Skins may differ, but affection
Dwells in white and black the same.

If ever there was a people that obeyed the scriptural injunction, "If they smite thee on one cheek, turn the other also," that people has been the American negro. To right his wrongs the Russian appeals to dynamite, Americans to rebellion, the Irishman to agitation, the Indian to his tomahawk; but the negro, the most patient, the most unresentful and law abiding, depends for the righting of his wrongs upon his songs, his groans, his midnight prayers, and an inherent faith in the justice of his cause, and if we judge the future by the past who may say that the negro is not right? We went into slavery pagans, we came out Christians. We went into slavery a piece of property, we came out American citizens. We went into slavery without a language, we came out speaking the proud Anglo-Saxon tongue. We went into slavery with the slave chains clanking about our waists, we came out with the American ballot in our hands. Progress, progress is the law of nature; under God it shall be our eternal guiding star.

HIGHER EDUCATION AND THE NEGRO.[1]

That education is the strength of our Republic, the source of its prosperity, the chief guarantee of its perpetuity, needs no discussion here. Is it necessary to defend in this presence the proposition that higher education, the work of colleges and universities, is indispensable to the existence of any education among any people? What educated nation exists or ever has existed upon the earth without colleges of higher learning? Did common schools ever make an intelligent nation? Did common schools ever exist in any nation excepting as the fruit of higher learning? Should we ever have had our common-school system but for our colleges?

To ask these questions is to answer them. The intelligence of the old world has all come down from her universities. The brighter civilization of America, with all her common-school system, has grown out of Harvard and Yale, Brown and Columbia, and William and Mary, Dartmouth and Williams, each of which was founded before the public school. The college is the fountainhead of all learning, and the only possible source of supply for all secondary and primary schools of instruction. The colleges are more. They are the only developers of complete manhood. There can be no well-rounded, thoroughly balanced minds, capable of dealing with principles, measuring forces, comprehending relations, grasping and handling the great questions of public life and human leadership, without the broad culture and thorough discipline which years of life in college alone can insure. Exceptional cases of remarkable genius or of abnormal growth do not vitiate this general rule. It has become an axiom in America, and our 500 colleges have grown out of it.

Said Dr. Shedd, fifty years ago: "The common information of society is nothing more nor less than the fine and diffusive radiance of a more substantial and profound culture. This light penetrating in all directions is like a globe of solid fire. All this general and practical information which distinguishes from a savage (or although civilized yet ignorant) state of society—which distinguishes England and the United States from Africa and South America—did not grow up spontaneously from the earth,

[1] An address delivered before the American Baptist Home Mission Society, at Asbury Park, N. J., May 26, 1895, by Edward C. Mitchell, D. D., president of Leland University, New Orleans, La.

is not the effect of a colder climate or a harder soil. It has been exhaling for centuries from colleges and universities—it has been distilling for ages from the alembic of the scholar's brain." The history of the last fifty years has been accumulating evidences of this great truth, and all nations have been furnishing illustrations of it.

A new nation has now come upon the stage. Eight millions of people have been thrust into the center of our civilization. They have been endowed with citizenship, with all its responsibilities, with all its possibilities for good or evil. They constitute about one-eighth part of our body politic. Among them is over one-third of the Baptist denomination of this country. Shall they be educated? Can we afford to leave one stone unturned, one agency unemployed, which might lead this mighty force out of the slough of ignorance and poverty and vice up into the plane of Christian manhood and useful citizenship? There can be but one answer to this question. If we have any love for our country; if we have any regard for our brethren in Christ Jesus; if we have any loyalty to our great Baptist brotherhood, we can not withhold any possible facility for that self-improvement of which, through no fault of their own, they have for centuries been deprived.

It goes without saying in this audience that education is what they need—education, moral, intellectual, physical. Providentially the moral education is not without a substantial basis. The spirit of God has not been absent from this people in their long night of bondage. With all their ignorance and even superstition at times, none can doubt the genuineness of their love to the Divine Master; and, to this day, religion among them is a very potent influence, and is very widespread in its extension. From the census of 1890 it appears that the proportion of white Baptist communicants to the whole white population of the South is about 8 per cent (or 1 in 12), while the proportion of negro Baptist communicants to the whole negro population is 20 per cent (or 1 in 5). Moreover, the moral and religious training of the negro in the days of slavery was by no means altogether neglected. They enjoyed some advantages which have now passed away from them. A large proportion of them not only received a religious training from members of white Christian families, but they were regular attendants upon white churches, and thus intelligently taught the Word of God. That they no longer enter white churches is a thing to be expected under present circumstances; nor can it be regretted if only a proper leadership, out of themselves, can be raised up for them. It is evident, however, that what they need in religious things is not so much the spiritual as the intellectual. It is a better intelligence to guide their religious proclivities which is the onething lacking in many localities.

This brings us to the question: What should be the intellectual training of this people?

If negroes are men and women, members of the human family, endowed with similar capacities and tendencies which appear in other races, then our question is already answered by what we said in the beginning. If the experience of five hundred years has taught us any wisdom in regard to the processes of human development; if we, in our American republic, have learned anything in the last two centuries as to what constitutes education, and what means and appliances are best to make it effective, then here and now we have a grand opportunity to employ this wisdom for the elevation of a new race. There is nothing for us to do but to put into operation the same agencies by which we ourselves have been educated, taking advantage of all the improvements which modern science has invented, or our past mistakes have suggested.

To imagine that the negro can safely do without any of the institutions or instrumentalities which were essential to our own mental advancement is to assume that the negro is superior to the white man in mental capacity. To deprive him of any of these advantages, which he is capable of using, would be to defraud ourselves, as a nation and a Christian church, of all the added power which his developed manhood should bring to us. It does not seem to be necessary in this audience to discuss the proposition that intelligence is power, and that the only road to intelligence is through mental discipline conducted under moral influences.

What now have we been doing for our brother in black to help him in his life struggle? The work began somewhat as in the days of our fathers. The John Harvards and the Elihu Yales of Pilgrim history found their counterparts in General Fiske, Dr. Phillips, Seymour Straight, and Holbrook Chamberlain, who founded colleges, even before it was possible for many to enter upon the college course, but with a wise forecast for the need that would eventually come and is now actually upon us.

A little later, about 1876, the people of the South organized public schools. In nearly all the Southern States the same proportionate provision is made for the negro as for the whites, and this is and must ever be the main dependence of the elevation of the negro. With all the honor which is due, and which is cheerfully rendered to Northern benevolence, for the splendid foundations of higher learning, it should not be forgotten that more than ten times as much money has been appropriated by the South for negro education.

It is true that this provision is inadequate for both races. In about one-third of the States an average of only four months per annum of instruction is given. This is not from want of will, but of means. The poverty of the South is yet very great. We of the prosperous North can not understand it. If we did, we should better appreciate the pluck and energy and uncomplaining self-sacrifice with which they adjust themselves to their new conditions and bear their heavy burdens. President Dreher, of Roanoke College, Virginia, has shown by reliable statistics that with all the apparent inferiority of the South in her appointments for education, yet in proportion to her means she is doing even more than the North for this purpose.

But what shall we teach the negro? Shall we give him anything beyond the three R's? By "we," of course, is meant, "we white folks," but Southern white folks have long ceased to teach the negro the common branches at all. This work has all been relegated to negro teachers. Let us take for example Mississippi, which, hitherto, has shared with Louisiana the unenviable distinction among States of having the greatest amount of illiteracy. The State superintendent of public instruction, Mr. J. R. Preston, wrote for the New York Independent last year, in reply to some inquiry: "There is not a white teacher in the colored schools of the State," and this is substantially true of every State of the South. Your Northern friend, who desires to teach the three R's, might travel from Mason and Dixon's line to the Gulf, and he would find every situation preempted. He would have to adopt for himself the Shakespearian lamentation, "Othello's occupation's gone." The only place where he would find primary instruction given by white teachers would be in our own so-called universities. According to the last report from Washington, the white teachers of public schools in the South are in the proportion of 1 to every 42 white pupils, and the colored teachers of 1 to every 51 colored pupils. The entire public-school system for the negro is carried on by negro teachers.

And this not only in the lower grades of instruction. Superintendent Preston informs us that in Mississippi there are over 600 colored teachers who hold first-grade certificates. Now a first-grade certificate, in most States, means that the teacher has passed an examination in algebra, physics, physiology, chemistry, geometry, Latin, civil government, psychology, pedagogy; or, in other words, with the exception of Greek, he is fitted to enter the freshman class in any Southern college. And Superintendent Preston says: "These teachers are examined by a white board. They have just the same questions that the white teachers have. I make them out and I know. And the board was just to them and gave them all they earned, but it is not likely to err on the side of mercy." It is not probable that any Southern State is behind Mississippi in the proportionate number of its colored teachers. Virginia reports 700, North Carolina 761, Arkansas 500; Texas has a different method of classification, but reports 1,900 as "higher than third grade." As regards the kind and amount of education which Mississippi's colored people have received, Superintendent Preston says: "The other day I was conducting an institute where there were 19 colored teachers in attendance, and I found that 18 of them were college graduates. I went right over into an adjoining county, and took a white institute with 37 in attendance, and found only about one-fourth were college graduates." By college graduates normal graduates are doubtless meant, and, in the case of colored teachers, the normal colleges of our missionary schools.

What, then, I again ask, shall we teach the negro? The answer seems to be as plain as the logic of common sense can make it. Let us teach what our colleges and universities were founded to teach. Let us teach the only thing left for us to teach. Let us teach the only thing that the negro can not do as well for himself. Let us teach the thing which the experience of all the ages and the matured judgment of all true educators has decided to be essential for the full development of manhood. Let us teach the negro who he is and what he is as God made him in his physical and mental structure. Let us teach him what the world is that God has made for him, with all its elements and powers and forces. Let us teach him the history of races and of civilizations, with the laws of that progress. Let us teach him to become master of his own tongue by studying its sources in the ancient world and in classic literature, and master of himself by analyzing the structure and workings of his own mind. In short, let us give him such glimpses of the whole range of science as shall tax his powers to the utmost, while it takes the conceit out of him and brings him nearer to that supreme discovery of Socrates that he "knows nothing."

As Commissioner Harris has well said: "Education, intellectual and moral, is the only means yet discovered that is always sure to help people to help themselves. * * * It produces that divine discontent which goads on the individual and will not let him rest."

But has the negro the capacity for mental training? Is that a question to-day? I am almost ashamed to discuss it in this presence, but my apology is that I have been requested to do so. It will bear examination from any and every point of view. It is vital to the whole subject before us. If anybody doubts, he should inform

himself. If color has anything to do with intellect, it should appear when the two colors or races are brought into contact and competition. The best source of information, therefore, is a study of the negro at school. We have seen, however, that the common-school teacher is now ruled out of court as an interested party. To find white teachers we must go to the colleges. I have recently asked presidents of fifteen colleges these three questions: (1) About what proportion of your pupils are full-blooded negroes? (2) What difference, if any, have you perceived in the average ability of full-blooded negroes as compared with those of mixed blood? (3) What difference, if any, is manifest between your pupils as a whole in intellectual ability and those of white schools under similar conditions? The replies to these questions are before me. The substance of them is this: Not more than one-fifth of all the pupils are full-blooded negroes. The rest are of all degrees from quadroon to blonde. In the second place, there is no difference of mental ability clearly traceable among them; if there be any, it is in favor of the full-blooded negro. Thirdly, as compared white pupils, there is no perceptible difference, when their environments are taken into account. Of course, there is some difficulty in measuring the force of environments.

This consensus of opinion among Southern educators coincides with my own observations. Having been a teacher for over thirty years, over twenty of which were spent in theological schools in the North and in Europe, I have now spent ten years in the South, and in daily contact with so-called negro pupils, and I can truly say that I find no appreciable difference in original capacity. If they have come from ignorant districts and dark surroundings, their vocabulary is limited, and their first exhibitions of intelligence are inferior to those who come from cultivated homes, though often their greater eagerness to learn counterbalances this disability. We must not, however, be misled by an assumption that the American negro is merely a transplanted savage. Two centuries of life in the midst of the foremost civilization of the world is a long way from savagery. There were intelligent Christian men and women in daily contact with the American bondsmen; they were able Christian ministers, from whose lips they received their doctrine. Though schools were forbidden, there were lovely Christian daughters, white angels, who defied the law in their loving sympathy for the lowly. Life in many a Southern family was an education inferior only to that of their master's children. Only by the intellectual brightness of Southern people, and the Christian character which illuminated Southern homes, can we account for the mental development of thousands of negroes, as they came out of the war too old to come into our schools, but constituting, nevertheless, the present influential leaders of the people.

And it must be in part the memories of those refining influences which are blossoming out all over the South in the neat, attractive homes which these people are building for themselves. The Southern negroes are not all living in one-room cabins, of which we have heard much recently. There are better homes than mine owned by negroes in New Orleans. There are plenty of ex-slaves in Louisiana who are richer than their former masters. There are over 300,000 homes and farms owned by negroes in the South without encumbrance. Six years ago Southern negroes were paying taxes on nearly $300,000,000. The white Baptists of the South had a church property worth $18,000,000, the accumulation of two hundred years. The negro Baptists at the same date (twenty-six years out of slavery) had acquired a church property of over nine millions. There must have been an ante-bellum civilization behind all this.

Said Rev. A. D. Mayo, at the Mohonk Conference in 1890: "It has never been realized by the loyal North what is evident to every intelligent Southern man, what a prodigious change had been wrought in this people during its years of bondage, and how, without the schooling of this era, the subsequent elevation of the emancipated slave to a full American citizenship would have been an impossibility. * * * In that condition he learned the three great elements of civilization more speedily than they were ever learned before. He learned to work, he acquired the language and adopted the religion of the most progressive of peoples. Gifted with a marvelous aptitude for such schooling, he was found in 1865 farther out of the woods of barbarism than any other people at the end of a thousand years."

The scholastic education of the negro began in earnest only about twenty years ago, 1876 being the date of the complete inauguration of the public school system of the South. This is too short for us to expect great results. The educated generation are not yet fairly out of school, but there have already appeared some isolated cases which show signs of promise. In the class of 1888 at Harvard University were two negroes, one of whom was selected by the faculty to represent his class on commencement day, as being the foremost scholar among his 250 classmates; the other was elected by the class for the highest honor in their gift by being made their orator on class day. The circumstance reflects honor not merely on him, but on the democratic spirit of our oldest university, which recognized merit without regard to color. Boston University has also yielded first honors to a negro. A negro professor of theology at Straight University at New Orleans is a graduate of Vermont University,

who afterwards took the prize for traveling scholarship from Yale Theological Seminary, and spent a year in Germany upon it. Professor Bowen, of the Gammon Theological Seminary, delivered at the Atlanta Exposition opening an address which in classic finish will bear comparison with the best orations of Edward Everett. The principal of one of our auxiliaries, Mr. E. N. Smith, a perfect gentleman and an excellent teacher, is a full-blooded negro, a graduate from Lincoln University and Newton Theological Institution, and pronounced by Dr. Hovey one of the best scholars that have been educated there.

Said President Merrill E. Gates, of Amherst College (The Independent, Dec. 5, 1895): "My observation leads me to believe that the proportion of truly successful men, tried by the highest standards of success, among the colored men who study in our Northern colleges, is quite as great as is the proportion of successful men among the whites who have the same, or equally good, opportunities for an education."

We might multiply examples—they are not necessary. There seems to be nothing better established than the essential manhood of the negro. Intelligent men of the South do not question it. Their recent cordial response to our proposal for cooperation is a good illustration of this.

There are two points of importance to which I wish to call your attention before leaving this subject—one relates to the continued use of our colleges in the South for giving primary instruction, the other is the relation of industrial training to the education of the negro.

We have seen that the public schools of the South are fairly equal in quality for both races, and that negro schools are taught by negro teachers. There is a truth beyond that. In the present deficiency of provision for common-school instruction, the colored people are ready and willing, with proper encouragement, to supplement these with schools supported by themselves. There are twelve such institutions already established in Louisiana. Now, if this be so—if the negro, with the help of the State, is providing his own primary education, and doing it successfully, what propriety is there in our continuing to furnish college endowments and employ college teachers to do primary work? It is a first principle of true beneficence to do nothing for any man which he can be led to do for himself. Certainly we ought not in any way by rivalry to discourage the work of self-education. It has been well said by the Hon. J. L. M. Curry: "An educational charity would sadly fail of its purpose if the least impediment were placed in the path of the free school. In so far as these institutions not under State control impair the efficiency of or divert attendance from the public schools, they are mischievous, for the great mass of children, white and black, must, more in the future than at present, depend almost exclusively upon the State schools for the common branches of education."

In the United States statistics of 1893 and 1894 it appears that in the 158 private schools designed for the secondary and higher education of colored people in the South, there were 18,595 primary pupils, while only 13,262 belong to the secondary or high-school class, and 940 were in collegiate classes. As these schools of higher education are situated for the most part in larger towns and cities, where the best provision for public schools is usually made, it is fair to presume that those 18,000 pupils are drawn from the free schools by the attractive name of "college" or "university," which veils their low grade of standing, and that these learned faculties of 1,320 professors must be largely engaged in rudimentary instruction. Would it not be far better for these pupils to set before them the prize of admission to the college, at least as far as the normal grade, as a motive for excellence in the common schools, and would it not be better for the professors to be allowed to confine their work of instruction to those higher branches for which they are specially fitted?

Of course, the change of policy here recommended would considerably diminish the show of numbers in our so-called colleges, but it would greatly improve the efficiency and thoroughness of their legitimate work, and directly help and stimulate the free schools to better attainment. Said Commissioner Harris, in his discussion of the education of the negro in the Atlantic Monthly for June, 1892: "It is clear from the above consideration that money expended for the secondary and higher education of the negro accomplishes far more for him. It is seed sown where it brings forth an hundredfold, because each one of the pupils of these higher institutions is a center of diffusion of superior methods and refining influences among an imitative and impressible race. State and national aid, as well as private bequests, should take this direction first. There should be no gift or bequest for common or elementary instruction. This should be left to the common schools, and all outside aid should be concentrated on the secondary and higher instruction."

There is an important reason for this wise counsel of Dr. Harris which now presses itself upon our attention. We have reached a crisis in the progress of negro education. The work of the common school now carried on by the people themselves has created all over the South a new generation of educated youth, wiser than their parents, wiser than their ministers, approaching manhood and womanhood, ready soon to take control of affairs and of public sentiment. They already know the

difference between learning and ignorance, between religion and superstition. They have no knowledge of slavery. They are a new generation of free-born people. Their improvement is phenomenal, but no corresponding improvement has come to the ministry. That the ministry has greatly improved during this twenty years no one who has visited their churches or attended their associations can doubt. Considering their advantages, they are a very able body of men. Some of them rank among the best preachers of the South. Many of the younger of them have had more or less training in our colleges. The Richmond, Atlanta, and Gammon theological seminaries have sent out a small quota. But as yet not a thousand in all the South have had even a college education. Nearly the whole educational machinery thus far has been occupied in supplying the great demand for teachers, and the whole force of educated talent has been drawn to the schools.

The fact mentioned a while since that less than 1,000 in the whole South are at this moment engaged in collegiate study is to be accounted for not by want of capacity for higher studies, but for want of motive. Education costs them a great deal. Nearly every one earns every dollar which he pays for his learning. With most it has been a great struggle to reach the point of normal graduation, and then the best salary for teaching at present available is open to them. Every influence urges them to stop here and reap the fruits of their hard-earned attainment. Moreover, the influences around them all tend to discourage higher attainment. Some have brothers and sisters to educate, and must stay at home to earn the money. Others have mothers and fathers who are struggling with poverty and debt, and who now claim their services to help them out. All their neighbors say, "You know enough now, since you have been teaching the whole neighborhood." To break away from all this requires higher incentive and a stronger pressure than comes to most of them. Meanwhile, the old people and their ministers go on in the ruts of ignorance and superstition. The uneducated ministers (however good and gifted with natural ability) are unable to keep pace with the young people in intelligence or to retain their influence over them. A breach is growing. A moral drift away from religion is beginning to manifest itself. There is danger ahead for which no adequate provision is in sight. What shall that provision be? Ministers' institutes? Some helpful suggestions can be doubtless made to the existing ministry by their educated white brethren. But he must have great faith in the receptive powers of the average negro who supposes that a mature man can be transformed from ignorance to erudition by a week or ten days annually of lecturing. Shall we take them into our colleges? It is too late. They are too old to begin a course of study. They are ashamed to expose their ignorance. Many have families. Gladly as we would help them in their conscious need, and deeply as our hearts are stirred by their struggle, the problem is insoluble in that direction. The only hope for a ministry which will really lead and properly teach the next generation of the colored race is through the legitimate methods of education.

How shall this be reached? How shall we bridge this chasm between an educated people and an ignorant ministry? To meet this crisis wisdom and generalship are needful. It is our duty as their friends to point out the danger and to provide the remedy. The motive which is lacking should be somehow supplied. Six hundred years ago illiteracy in England well-nigh approached that of the negro American of to-day. It is said that only five of the twenty-five barons who signed the Magna Charta could write their names. Her Christian philanthropists saw the evil, and established prizes, denominated "bursaries," "scholarships," and "fellowships," to stimulate high attainments in study. The accumulation of these prizes by the wise forecast of our English ancestors really constitutes the basis of the universities of Oxford and Cambridge.

The duty of the hour for us toward our Southern brethren is not only to endow the colleges which we have established, but to offer to those who by their own exertions have attained the rank of college students a prize sufficient to enable and stimulate them to go on to the full stature of intellectual manhood. Here is an opportunity for the use of consecrated wealth. Who will avail himself of it, as Daniel Hand has done for the American Missionary Association?

What shall we say, now, about the relation of industrial training to our problem? Industrial training is good and useful to some persons, if they can afford time to take it. But in its application to the negro several facts should be clearly understood:

1. It appears not to be generally known in the North that in the South all trades and occupations are open to the negro, and always have been. Before the war slaves were taught mechanics' arts, because they thereby became more profitable to their masters. And now every village has its negro mechanics, who are patronized both by white and colored employers, and any who wish to learn the trade can do so.

2. It is a mistake to suppose that industrial education can be wisely applied to the beginnings of school life. Said the Rev. A. D. Mayo, than whom no man in America is better acquainted with the condition and wants of the South: "There are two specious, un-American notions now masquerading under the taking phrase, "industrial

education:" First, that it is possible or desirable to train large bodies of youth to superior industrial skill without a basis of sound elementary education. You can not polish a brickbat, and you can not make a good workman of a plantation negro or a white ignoramus until you first wake up his mind, and give him the mental discipline and knowledge that comes from a good school; * * * second, that it is possible or desirable to train masses of American children on the European idea that the child will follow the calling of his father. Class education has no place in the order of society, and the American people will never accept it in any form. The industrial training needed in the South must be obtained by the establishment of special schools of improved housekeeping for girls, with mechanical trainimg for such boys as desire it. * * * And this training should be given impartially to both races, without regard to the thousand and one theories of what the colored man can not do."

3. Industrial training is expensive of time and money, as compared with its results as a civilizer. When you have trained one student you have simply fitted one man to earn an ordinary living. When you have given a college education to a man with brains you have sent forth an instrumentality that will affect hundreds or thousands.

Said Chauncey M. Depew, in his address at the tenth convention of the University of Chicago, in April, 1895: "I acknowledge the position and the usefulness of the business college, the manual training school, the technological institute, the scientific school, and the schools of mines, medicine, law, and theology. They are of infinite importance to the youth who has not the money, the time, or the opportunity to secure a liberal education. They are of equal benefit to the college graduate who has had a liberal education in training him for his selected pursuit. But the theorists, or rather the practical men who are the architects of their own fortunes, and who are proclaiming on every occasion that a liberal education is a waste of time for a business man, and that the boy who starts early and is trained only for his one pursuit is destined for a larger success, are doing infinite harm to the ambitious youth of this country.

"The college, in its four years of discipline, training, teaching, and development, makes the boy the man. His Latin and his Greek, his rhetoric and his logic, his science and his philosophy, his mathematics and his history, have little or nothing to do with law or medicine or theology, and still less to do with manufacturing, or mining, or storekeeping, or stocks, or grain, or provisions. But they have given to the youth, when he has graduated, the command of that superb intelligence with which God has endowed him, by which, for the purpose of a living or a fortune, he grasps his profession or his business and speedily overtakes the boy who, abandoning college opportunities, gave his narrow life to the narrowing pursuit of the one thing by which he expected to earn a living. The college-bred man has an equal opportunity for bread and butter, but beyond that he becomes a citizen of commanding influence and a leader in every community where he settles."

4. Industrial training is liable to divert attention from the real aim and end of education, which is manhood. The young scholar can not serve two masters. It requires all the energy there is in a boy to nerve him to the high resolve that in spite of all difficulties he will patiently discipline himself until he becomes a man. This is one reason why our northern colleges, which in many cases began as manual-labor schools, have abandoned it. Ought we to insist on "putting a yoke upon the necks" of our brethren in black "which neither we nor our fathers were able to bear?"

Finally, experience seems to show that industrial education does not educate, even in trades.

In the report of the Bureau of Education for 1889–90 is a full statistical table of the lines of business in which the graduates of 17 colored schools are employed. In all these schools industrial instruction is given, such as carpentry, tinning, painting, whip making, plastering, shoemaking, tailoring, blacksmithing, farming, gardening, etc. Out of 1,243 graduates of these schools there are found to be only 12 farmers, 2 mechanics, 1 carpenter. The names of the universities are Allen (S. C.); Atlanta (Ga.); Berea (Ky.); Central Tennessee (Tenn.); Claflin (S. C.); Fiske (Tenn.); Knoxville (Tenn.); Livingstone (N. C.); New Orleans (La.); Paul Quinn (Tex.); Philander Smith (Ark.); Roger Williams (Tenn.); Rust (Miss.); Southern, New Orleans, La.; Straight, New Orleans, La.; Tuskegee (Ala.); Wilberforce (Ohio).

The employments of the graduates were: Teachers, 693; ministers, 117; physicians, 163; lawyers, 116; college professors, 27; editors, 5; merchants, 15; farmers, 12; carpenter, 1; United States Government service, 36; druggists, 5; dentists, 14; bookkeepers, 2; printers, 2; mechanics, 2; butchers, 3; other pursuits, 30.

The money appropriated to these schools by the Slater fund from 1884 to 1894 was $439,981.78.

CHAPTER XXXII.

THE SLATER FUND AND THE EDUCATION OF THE NEGRO.

Compiled from Occasional Papers published by the trustees of the John F. Slater fund, Nos. 1 to 6.[1]

Contents.—I. Difficulties, complications, and limitations connected with the education of the negro. II. Education of the negroes since 1860. III. Occupations of the negroes. IV. A statistical sketch of the negroes in the United States. V. Memorial sketches of John F. Slater. VI. Documents relating to the origin and work of the Slater trustees: (*a*) Charter from the State of New York; (*b*) letter of the founder; (*c*) letter of the trustees accepting the gift; (*d*) the thanks of Congress; (*e*) by-laws; (*f*) members of the board; (*g*) remarks of President Hayes on the death of Mr. Slater.

I.

DIFFICULTIES, COMPLICATIONS, AND LIMITATIONS CONNECTED WITH THE EDUCATION OF THE NEGRO.

[By J. L. M. Curry, LL. D., secretary of the trustees of the John F. Slater fund.]

Civilization certainly, Christianity probably, has encountered no problem which surpasses in magnitute or complexity the negro problem. For its solution political remedies, very drastic, have been tried, but have failed utterly. Educational agencies have been very beneficial as a stimulus to self-government and are increasingly hopeful and worthy of wider application, but they do not cure social diseases, moral ills. Much has been written of evolution of man, of human society, and history shows marvelous progress in some races, in some countries, in the bettering of habits and institutions, but this progress is not found, in any equal degree, in the negro race in his native land. What has occurred in the United States has been from external causes. Usually human development has come from voluntary energy, from self-evolved organizations of higher and higher efficiency, from conditions which are principally the handiwork of man himself. With the negro, whatever progress has marked his life as a race in this country has come from without. The great ethical and political revolutions of enlightened nations, through the efforts of successive generations, have not been seen in his history.

When, on March 4, 1882, our large-hearted and broadminded founder established this trust, he had a noble end in view. For near thirteen years the trustees have kept the object steadily before them, with varying results. Expectations have not always been realized. If any want of highest success has attended our efforts, this is not an uncompanioned experience. As was to have been foreseen, in working out a novel and great problem, difficulties have arisen. Some are inherent and pertain to the education of the negro, however, and by whomsoever undertaken, and some are peculiar to the trust. Some are remedial. In this, as in all other experiments, it is better to ascertain and comprehend the difficulties so as to adopt and adjust the proper measures for displacing or overcoming them. A general needs to

---

[1] *Announcement to the series.*—The trustees of the John F. Slater fund propose to publish from time to time papers that relate to the education of the colored race. These papers are designed to furnish information to those who are concerned in the administration of schools, and also to those who by their official stations are called upon to act or to advise in respect to the care of such institutions.

The trustees believe that the experimental period in the education of the blacks is drawing to a close. Certain principles that were doubted thirty years ago now appear to be generally recognized as sound. In the next thirty years better systems will undoubtedly prevail, and the aid of the separate States is likely to be more and more freely bestowed. There will also be abundant room for continued generosity on the part of individuals and associations. It is to encourage and assist the workers and the thinkers that these papers will be published.

Each paper will be the utterance of the writer whose name is attached to it, the trustees disclaiming in advance all responsibility for the statement of facts and opinions.

know the strength and character of the opposing force. A physician can not prescribe intelligently until he knows the condition of his patient.

The income of the fund is limited in amount, and the means of accomplishing "the general object" of the trust are indicated in Mr. Slater's letter and conversations and by the repeatedly declared policy of the board—as teacher training and industrial training. He specified "the training of teachers from among the people requiring to be taught and the 'encouragement of such institutions as are most effectually useful in promoting this training of teachers.'" No one, in the least degree familiar with the subject, can deny or doubt that the essential need of the race is a higher and better qualified class of teachers. The fund does not establish nor control schools, nor appoint teachers. It cooperates with schools established by States, by religious denominations, and by individuals. Mr. Slater did not purpose "to bestow charity upon the destitute, to encourage a few exceptional individuals, to build churches, schoolhouses, or asylums." Aided schools may accept money to carry out the specific purposes of the trust, but they often have other and prescribed objects, and hence what the trustees seek is naturally, perhaps unavoidably, subordinated to what are the predetermined and unchangeable ends of some of these schools.

The most obvious hindrance in the way of the education of the negro has so often been presented and discussed—his origin, history, environments—that it seems superfluous to treat it anew. His political status, sudden and unparalleled, complicated by antecedent condition, excited false hopes and encouraged the notion of reaching per saltum, without the use of the agencies of time, labor, industry, discipline, what the dominant race had attained after centuries of toil and trial and sacrifice. Education, property, habits of thrift and self-control, higher achievements of civilization, are not extemporized nor created by magic or legislation. Behind the Caucasian lie centuries of the educating, uplifting influence of civilization, of the institutions of family, society, the churches, the state, and the salutary effects of heredity. Behind the negro are centuries of ignorance, barbarism, slavery, superstition, idolatry, fetichism, and the transmissible consequences of heredity.

Nothing valuable or permanent in human life has been secured without the substratum of moral character, of religious motive, in the individual, the family, the community. In this matter the negro should be judged charitably, for his aboriginal people were not far removed from the savage state, where they knew neither house nor home and had not enjoyed any religious training. Their condition as slaves debarred them the advantage of regular, continuous, systematic instruction. The negro began his life of freedom and citizenship with natural weaknesses uncorrected, with loose notions of piety and morality and with strong racial peculiarities and proclivities, and has not outgrown the feebleness of the moral sense which is common to all primitive races. One religious organization, which has acted with great liberality, and generally with great wisdom, in its missionary and educational work among the negroes, says: "Of the paganism in the South, Dr. Behrends has well said that the note of paganism is its separation of worship from virtue, of religion from morals. This is the characteristic fact of the religion of the negro." The Plantation Missionary, of this year, a journal edited and published for the improvement of the "black belt" of Alabama, says, "five millions of negroes are still illiterate, and multitudes of them idle, bestial, and degraded, with slight ideas of purity or thrift." The discipline of virtue, the incorporation of creed into personal life, is largely wanting, and hence physical and hysterical demonstrations, excited sensibilities, uncontrolled emotions, transient outbursts of ardor, have been confounded with the graces of the spirit and of faith based on knowledge. Contradiction, negation, paradox, and eccentricity are characteristics of the ignorant and superstitious, especially when they concern themselves with religion.

The economic condition is a most serious drawback to mental and moral progress. Want of thrift, of frugality, of foresight, of skill, of right notions of consumption and of proper habits of acquiring and holding property, has made the race the victim and prey of usurers and extortioners. The negro rarely accumulates, for he does not keep his savings, nor put them in permanent and secure investments. He seems to be under little stimulus toward social improvement, or any ambition except that of being able to live from day to day. "As to poverty, 80 per cent of the wealth of the nation is in the North and only 20 per cent in the South. Of this 20 per cent a very small share, indeed, falls to the seven millions of negroes, who constitute by far the poorest element of our American people." (American Missionary, November, 1894, p. 390.) "While it is true that a limited number of the colored people are becoming well-to-do, it is also equally true that the masses of them have made but little advance in acquiring property during their thirty years of freedom. Millions of them are yet in real poverty and can do little more than simply maintain physical existence." (Home Missionary Monthly, August, 1894, p. 318.) No trustworthy statement of the property held by negroes is possible, because but few States, in assessing property, discriminate between the races. In Occasional Papers, No. 4 (see p. 1404) Mr.

Gannett, in discussing the tendency of population toward cities, concludes that "the negro is not fitted, either by nature or education, for those vocations for the pursuit of which men collect in cities," and that as the inclinations of the race "tend to keep it wedded to the soil, the probabilities are that the great body of the negroes will continue to remain aloof from the cities and cultivate the soil as heretofore." The black farm laborers hire to white proprietors, work for wages or on shares, give a lien on future earnings for food, clothing, shelter, and the means for cultivation of the crops. The meager remainder, if it exist at all, is squandered in neighboring stores for whisky, tobacco, and worthless "goods." Thus the negro in his industrial progress is hindered by his rude and primitive methods of farming, his wastefulness and improvidence. The manner of living almost necessarily begets immorality and degradation. Mr. Washington, in his useful annual conferences, has emphasized the need of improved rural abodes and the fatal consequences of crowding a whole family into one room. The report already quoted from (Home Monthly, p. 22) says: "On the great plantations (and the statement might be much further extended) there has been but little progress in thirty years. The majority live in one-room cabins, tabernacling in them as tenants at will." The poverty, wretchedness, hopelessness of the present life are sometimes in pitiable contrast to the freedom from care and anxiety, the cheerfulness and frolicsomeness, of ante-bellum days.

The average status of the negro is much misunderstood by some persons. The incurable tendency of opinion seems to be to exaggerated optimism or pessimism, to eager expectancy of impossible results or distrust or incredulity as to future progress. It is not easy to form an accurate judgment of a country, or of its population, or to generalize logically, from a Pullman car window, or from snatches of conversation with a porter or waiter, or from the testimony of one race only, or from exceptional cases like Bruce, Price, Douglass, Washington, Revels, Payne, Simmons, etc. Individual cases do not demonstrate a general or permanent widening of range of mental possibilities. Thirty years may test and develop instances of personal success, of individual manhood, but are too short a time to bring a servile race, as a whole, up to equality with a race which is the heir of centuries of civilization, with its uplifting results and accessories. It should be cheerfully conceded that some negroes have displayed abilities of a high order and have succeeded in official and professional life, in pulpit and literature. The fewness gives conspicuousness, but does not justify an a priori assumption adverse to future capability of the race. Practically, no negro born since 1860 was ever a slave. More than a generation has passed since slavery ceased in the United States. Despite some formidable obstacles, the negroes have been favored beyond any other race known in the history of mankind. Freedom, citizenship, suffrage, civil and political rights, educational opportunities and religious privileges, every method and function of civilization, have been secured and fostered by Federal and State governments, ecclesiastical organizations, munificent individual benefactions, and yet the results have not been, on the whole, such as to inspire most sanguine expectations, or justify conclusions of rapid development or of racial equality. In some localities there has been degeneracy rather than ascent in the scale of manhood, relapse instead of progress. The unusual environments should have evolved a higher and more rapid degree of advancement. Professor Mayo-Smith, who has made an ethnological and sociological study of the diverse elements of our population, says: "No one can as yet predict what position the black race will ultimately take in the population of this country." He would be a bold speculator who ventured, from existing facts, to predict what would be the outcome of our experiment with African citizenship and African development. Mr. Bryce, the most philosophical and painstaking of all foreign students of our institutions, in the last edition of his great work, says: "There is no ground for despondency to anyone who remembers how hopeless the extinction of slavery seemed sixty or even forty years ago, and who marks the progress which the negroes have made since their sudden liberation. Still less is there reason for impatience, for questions like this have in some countries of the Old World required ages for their solution. The problem which confronts the South is one of the great secular problems of the world, presented here under a form of peculiar difficulty. And as the present differences between the African and the European are the product of thousands of years, during which one race was advancing in the temperate, and the other remaining stationary in the torrid zone, so centuries may pass before their relations as neighbors and fellow-citizens have been duly adjusted." It would be unjust and illogical to push too far the comparison and deduce inferences unfair to the negro, but it is an interesting coincidence that Japan began her entrance into the family of civilized nations almost contemporaneously with emancipation in the United States. In 1858 I witnessed the unique reception by President Buchanan, in the east room of the White House, of the commissioners from Japan. With a rapidity without a precedent, she has taken her place as an equal and independent nation, and her rulers demand acknowledgment at the highest courts, and her ministers are officially the equals of their colleagues in every diplomatic corps. By

internal development, without extraneous assistance, Japan has reached a degree of self-reliance, of self-control, of social organization, of respectable civilization, far beyond what our African citizens have attained under physical, civic, and religious conditions by no means unfavorable. It is true that Japan for a long time had a separate nationality, while the freedmen have been dependent wards, but the Oriental nation, without the great ethical and pervasive and ennobling and energizing influence of Christianity (for the propagandism of the daring Jesuit missionaries of the sixteenth century has been effaced) has recorded her ascents by monuments of social life and dramatic events in history. Her mental culture and habits and marvelous military success are witnesses of her progress and power. We have been accustomed to think of the whole Orient, that "fifty years of Europe were better than a cycle of Cathay," but within a quarter of a century Japan has transformed social usages and manners, arts and manufactures, and in 1889, when we were celebrating the centennial of our Constitution, she adopted a constitution, with a limited monarchy and parliamentary institutions.

Much of the aid lavished upon the negro has been misapplied charity and, like much other almsgiving, hurtful to the recipient. Northern philanthropy, "disastrously kind," has often responded with liberality to appeals worse than worthless. Vagabond mendicants have been pampered; schools which were established without any serious need of them have been helped; public-school systems upon which the great mass of children, white and colored, must rely for their education have been underrated and injured, and schools of real merit, and doing good work, which deserve confidence and contributions have had assistance legitimately their due diverted into improper channels. Reluctantly and by constraint of conscience this matter is mentioned, and this voice of protest and warning raised. Dr. A. D. Mayo, of Boston, an astute and thoughtful observer, a tried friend of the black man, an eloquent advocate of his elevation, who for fifteen years has traversed the South in the interests of universal education, than whom no one has a better acquaintance with the schools of that section, bears cogent and trustworty testimony to which I give my emphatic endorsement:

"It is high time that our heedless, undiscriminating, all-out-doors habit of giving money and supplies to the great invading army of Southern solicitors should come to an end. Whatever of good has come from it is of the same nature as the habit of miscellaneous almsgiving which our system of associated charities is everywhere working to break up. It is high time that we understood that the one agency on which the negroes and nine-tenths of the white people in the South must rely for elementary instruction and training is the American common school. The attempt to educate 2,000,000 colored and 3,000,000 white American children in the South by passing around the hat in the North; sending driblets of money and barrels of supplies to encourage anybody and everybody to open a little useless private school; to draw on our Protestant Sunday schools in the North to build up among these people the church parochial system of elementary schools which the clergy of these churches are denouncing—all this and a great deal more that is still going on among us, with, of course, the usual exceptions, has had its day and done its work. The only reliable method of directly helping the elementary department of Southern education is that our churches and benevolent people put themselves in touch with the common-school authorities in all the dark places, urging even their poorer people to do more, as they can do more, than at present. The thousand dollars from Boston that keeps alive a little private or denominational school in a Southern neighborhood, if properly applied, would give two additional months, better teaching and better housing to all the children, and unite their people as in no other way. Let the great Northern schools in the South established for the negroes be reasonably endowed, and worked in cooperation with the public-school system of the State, with the idea that in due time they will all pass into the hands of the Southern people, each dependent on its own constituency for its permanent support. I believe in many instances it would be the best policy to endow or aid Southern schools that have grown up at home and have established themselves in the confidence of the people. While more money should every year be given in the North for Southern education, it should not be scattered abroad, but concentrated on strategic points for the uplifting of both races."

After the facts, hard, stubborn, unimpeachable, regretable, which have been given, we may well inquire whether much hasty action has not prevailed in assigning to the negro an educational position, which ancient and modern history does not warrant. The partition of the continent of Africa by and among European nations can hardly be ascribed solely to a lust for territorial aggrandizement. The energetic races of the North begin to realize that the tropical countries—the food and the material producing regions of the earth—can not, for all time to come, be left to the unprogressive, uncivilized colored race, deficient in the qualities necessary to the development of the rich resources of the lands they possess. The strong powers seem unwilling to tolerate the wasting of the resources of the most fertile regions through the apparent impossibility, by the race in possession, of acquiring the qualities of

efficiency which exist elsewhere. The experiment of the Congo Free State, one of the richest and most valuable tracts in Africa, established and fostered under propitious circumstances by the King of Belgium, seems likely to be a barren failure and to prove that African colonization is not a practicable scheme, without State subvention, or the strong, overmastering hand of some superior race. It requires no superior insight to discover that human evolution has come from the energy, thrift, discipline, social and political efficiency of peoples whose power is not the result of varying circumstances, "of the cosmic order of things which we have no power to control."[1]

The negro occupies an incongruous position in our country. Under military necessity slaves were emancipated, and all true Americans accept the jubilant eulogium of the poet, when he declares our country

> A later Eden planted in the wilds,
> With not an inch of earth within its bounds
> But if a slave's foot press, it sets him free.

Partisanship and an altruistic sentiment led to favoritism, to civic equality, and to bringing the negroes, for the first time in their history and without any previous preparation, "into the rivalry of life on an equal footing of opportunity." The whole country has suffered in its material development from the hazardous experiment. The South, as a constituent portion of the Union, is a diseased limb on the body, is largely uncultivated, neglected, unproductive. Farming, with the low prices of products, yields little remunerative return on labor or money invested, and, except in narrow localities and where "trucking" obtains, is not improving agriculturally, or, if so, too slowly and locally to awaken any hopes of early or great recovery.[2] Crippled, disheartened by the presence of a people not much inferior in numbers, of equal civil rights, and slowly capable of equal mental development or of taking on the habits of advanced civilization, the white people of the South are deprived of any considerable increase of numbers from immigration and any large demand for small freeholds, and are largely dependent on ignorant, undisciplined, uninventive, inefficient, unambitious labor. Intercourse between the Slavs and the tribes of the Ural-Altaic stock, fusion of ethnic elements, has not resulted in deterioration, but has produced an apparently homogeneous people, possessing a common consciousness. That the two diverse races now in the South can ever perfectly harmonize while occupying the same territory no one competent to form an opinion believes. Mr. Bryce concludes that the negro will stay socially distinct, as an alien element, unabsorbed and unabsorbable. That the presence in the same country of two distinctly marked races, having the same rights and privileges, of unequal capacities of development—one long habitated to servitude, deprived of all power of initiative, of all high ideal, without patriotism beyond a mere weak attachment—is a blessing is too absurd a proposition for serious consideration. Whether the great resources of the South are not destined, under existing conditions, to remain only partially developed, and whether agriculture is not doomed to barrenness of results, are economic and political questions alien to this discussion.

As trustees of the Slater fund, we are confined to the duty of educating the lately emancipated race. In Occasional Papers, No. 3 (see p. 1374), the history of education since 1860, as derived from the most authentic sources, is presented with care and fullness. "The great work of educating the negroes is carried on mainly by the public schools of the Southern States, supported by funds raised by public taxation, and managed and controlled by public school officers. The work is too great to be attempted by any other agency, unless by the National Government; the field is too extensive, the officers too numerous, the cost too burdensome." (Bureau of Education Report, 1891–92, p. 867.) The American Congress refused aid, and upon the impoverished South the burden and the duty were devolved. Bravely and with heroic self-sacrifice have they sought to fulfill the obligation.

In the distribution of public revenues, in the building of asylums, in provision for public education, no discrimination has been made against the colored people. The law of Georgia of October, 1870, establishing a public school system, expressly states that both races shall have equal privileges. The school system of Texas, begun under its present form in 1876, provides "absolutely equal privileges to both

---

[1] Since this paper was prepared, Bishop Turner, of Georgia, a colored preacher of intelligence and respectability, in a letter from Liberia, May 11, 1895, advises the reopening of the African slave trade and says that, as a result of such enslavement for a term of years by a civilized race, "millions and millions of Africans, who are now running around in a state of nudity, fighting, necromancing, masquerading, and doing everything that God disapproves of, would be working and benefiting the world." Equally curious and absurd is the conclusion of the editor of the Globe Quarterly Review (July, 1895, New York), a Northern man, that "nothing but some sort of reenslavement can make the negro work, therefore he must be reenslaved, or driven from the land." Could anything be more surprising than these utterances by a former slave and by an abolitionist, or show more clearly "the difficulties, complications, and limitations" which environ the task and the duty of "uplifting the lately emancipated race?"

[2] The last assessment of property in Virginia, 1895, shows a decrease of $8,133,374 from last year's valuation.

white and colored children." In Florida, under the constitution of 1868 and the law of 1877, both races share equally in the school benefits. Several laws of Arkansas provide for a school system of equal privileges to both races. Under the school system of North Carolina there is no discrimination for or against either race. The school system of Louisiana was fairly started only after the adoption of the constitution of 1879, and equal privileges are granted to white and colored children. Since 1883 equal privileges are granted in Kentucky. The school system of West Virginia grants equal rights to the two races. The system in Mississippi was put in operation in 1871 and grants to both races "equal privileges and school facilities." The same exact and liberal justice obtains in Virginia, Alabama, and Tennessee.

In 1893-94 there were 2,702,410 negro children of school age—from 5 to 18 years—of whom 52.72 per cent, or 1,424,710, were enrolled as pupils. Excluding Maryland, Kentucky, and Missouri, the receipts from State and local taxation for schools in the South were $14,397,569. It should be borne in mind that there are fewer taxpayers in the South, in proportion to population generally and to school population especially, than in any other part of the United States. In the South Central States there are only 65.9 adult males to 100 children, while in the Western Division there are 156.7. In South Carolina, 37 out of every 100 are of school age; in Montana, only 18 out of 100. Consider also that in the South a large proportion of the comparatively few adults are negroes with a minimum of property. Consider, further, that the number of adult males to each 100 children in New Hampshire, Massachusetts, and Connecticut is twice as great as in North Carolina, South Carolina, Georgia, Alabama, and Mississippi. In view of such and other equally surprising facts, it is a matter of national satisfaction that free education has made such progress in the South. (Bureau of Education Report, 1890-91, pp. 5, 19, 21, 24.)

It is lamentable, after all the provision which has been made, that the schools are kept open for such a short period, that so many teachers are incompetent, and that such a small proportion of persons of school age attend the schools. This does not apply solely to the colored children or to the Southern States. For the whole country the average number of days attended is only 89 for each pupil, when the proper school year should count about 200. While the enrollment and average attendance have increased, "what the people get on an average is about one-half an elementary education, and no State is now giving an education in all its schools that is equal to seven years per inhabitant for the rising generation. Some States are giving less than three years of 200 days each." (Annual Statement of Commissioner of Education for 1894, p. 18.) It is an obligation of patriotism to support and improve these State-managed schools, because they are among the best teachers of the duties of citizenship and the most potent agency for molding and unifying and binding heterogeneous elements of nationality into compactness, unity, and homogeneity. We must keep them efficient if we wish them to retain public confidence.

In No. 3 of Occasional Papers (see page 1379) is described what has been undertaken and accomplished by different religious denominations. The information was furnished by themselves, and full credit was given for their patriotic and Christian work. These schools are of higher grades in name and general purpose and instruction than the public schools, but unfortunately most of them are handicapped by high-sounding and deceptive names and impossible courses of study. There are 25 nominal "universities" and "colleges," which embrace primary, secondary, normal, and professional grades of instruction. These report, as engaged in "collegiate" studies, about 1,000 students. The work done is in some instances excellent; in other cases it is as defective as one could well imagine it to be. This misfortune is not confined to colored schools. The last accessible report from the Bureau of Education gives 22 schools of theology and 5 each of schools of law and of medicine, and in the study of law and medicine there has in the last few years been a rapid increase of students.

A noticeable feature of the schools organized by religious associations is the provision made for industrial education. In the special colored schools established or aided by the State of higher order than the public schools, such as those in Georgia, Alabama, Mississippi, and Texas, manual training is required for both sexes. As few white schools of the South are provided with this necessary adjunct of education, it would be unjust to criticise too severely what is being done along industrial lines in colored schools. It is rather a matter for rejoicing that the schools have even been started in this most hopeful direction, and especially as the long-wished-for industrial development seems to be dawning on the South. Whatever may be our speculative opinions as to the progress and development of which the negro may be ultimately capable, there can hardly be a well-grounded opposition to the opinion that the hope for the race in the South is to be found not so much in the high courses of university instruction or in schools of technology as in handicraft instruction. This instruction, by whatever name called, encourages us in its results to continued and liberal effort. What such schools as Hampton, the Spelman, Claflin, Tuskegee, Tougaloo, and others have done is the demonstration of the feasibility and the value of

industrial and mechanical training.[1] The general instruction heretofore given in the schools, it is feared, has been too exclusively intellectual, too little of that kind which produces intelligent and skilled workmen, and therefore not thoroughly adapted to racial development nor to fitting for the practical duties of life. Perhaps it has not been philosophical nor practical, but too empirical and illusory in fitting a man for "the conditions in which he will be compelled to earn his livelihood and unfold his possibilities." The effort has been to fit an adult's clothing to a child, to take the highest courses of instruction and apply them to untutored minds. Misguided statesmanship and philanthropy have opened "high schools and universities and offered courses in Greek and Latin and Hebrew, in theology and philosophy, to those who need the rudiments of education and instruction in handicraft." This industrial training is a helpful accompaniment to mental training, and both should be based on strong moral character. It has been charged that the negroes have had too strong an inclination to become preachers or teachers, but this may be in part due to the fact that their education has been ill adjusted to their needs and surroundings, and that when the pupils leave school they do so without having been prepared for the competition which awaits them in the struggle for a higher life.

Whatever may be the discouragements and difficulties and however insufficient may be the school attendance, it is a cheering fact that the schools for the negroes do not encounter the prejudices which were too common a few years ago. In fact, there may almost be said to be coming a time when soon there will be a sustaining public opinion. The struggle of man to throw off fetters and rise into true manhood and save souls from bondage is a most instructive and thrilling spectacle, awakening sympathetic enthusiasm on the part of all who love what is noble. * * * Having gathered testimony from many of the leading colored schools of the South in answer to these direct questions, "Is there any opposition from the white race to your work in educating the negroes? If so, does that opposition imperil person or property?" I group it into a condensed statement:

1. CONGREGATIONALISTS.

Storrs School, Atlanta, says: "There is no aggressive opposition to our work among the negroes." Fisk University, Nashville: "There is no special manifestation of open opposition to our work on the part of the white people; indeed, the better citizens have a good degree of sympathy with our work and take a genuine pride in the university." Talladega College, Alabama: "I do not know of any opposition from the white race to our work. * * * We have more opposition from the very people for whom we are especially laboring than from the other race." By act of incorporation, February 28, 1880, the college may hold, purchase, dispose of, and convey property to such an amount as the business of the college requires, and so long as the property, real or personal, is used for purposes of education it is exempt from taxation of any kind. Knoxville College: "No opposition from the white race disturbs us." Beach Institute, Savannah, Ga.: "There seems to be here no active opposition to our work in educating the negroes." Straight University, New Orleans: "There is no opposition from the white race." Ballard Normal School, Macon, Ga.: "We meet now with no opposition from the whites."

2. METHODISTS.

From Philander Smith College, Little Rock, Ark.: "No opposition that amounts to anything." Cookman Institute, Jacksonville, Fla.: "There is no active opposition from the white race to our work, as far as I know." Claflin University, Orangeburg, S. C.: "There is no opposition to it on the part of the white race." Central Tennessee College, Nashville, Tenn.: "On the part of the intelligent whites there is none; on the contrary, they have nearly always spoken well of it and seem to rejoice that their former slaves and their children are being educated. Having been here over twenty-seven years, I feel quite safe." Bennett College, Greensboro, N. C., gives an emphatic negative to both questions. New Orleans University: "No opposition from white people to our work."

3. PRESBYTERIANS.

From Biddle University, Charlotte, N. C.; "No opposition from the white race; on the contrary, very pleasant neighbors."

[1] Principal Washington, of Tuskegee Institute, as the representative of his race, made an address at the opening of the great Atlanta Exposition which elicited high commendation from President Cleveland and the press of the country for its practical wisdom and its broad, catholic, and patriotic sentiments. The Negro Building, with its interesting exhibits, shows what progress has been made by the race in thirty years and excites strong hopes for the future. The special work displayed by the schools of Hampton and Tuskegee received honorable recognition from the jury of awards.

4. BAPTISTS.

Bishop College, Marshall, Tex.: "We have experienced opposition from certain classes of white people to the extent of threats and assaults, yet such have come from those who were entirely unacquainted with the real work being done, and I think that now sentiment is changing." Leland University, New Orleans, La.: "There is not to my knowledge, nor ever has been since I came in 1887, any opposition from the white race to our work." Spelman Seminary, Atlanta, Ga.: "We are not aware of any opposition from the white race to our work." Shaw University, Raleigh, N. C.: "It gives us pleasure to say the feeling for our work among the whites seems of the kindest nature and everything is helpful." Roger Williams University, Nashville, Tenn.: "No opposition meets us from any sources; on the contrary we are generally treated with entire courtesy." Selma University, Alabama: "There is no opposition to our work from the white race. So far as I know they wish us success."

5. NONDENOMINATIONAL SCHOOLS.

Tuskegee Normal and Industrial Institute, Alabama; "I am glad to state that there is practically no opposition on the part of the whites to our work; on the contrary, there are many evidences of their hearty approval." Hampton Normal and Industrial Institute, Virginia: "This school meets no opposition to the work from the white race, and, with occasional individual exceptions, has never met any, but receives for itself and its graduate teachers a great amount of practical sympathy, and is glad of this and every opportunity to acknowledge it."

CONCLUSIONS.

I. It follows that in addition to thorough and intelligent training in the discipline of character and virtue, there should be given rigid and continuous attention to domestic and social life, to the refinements and comforts and economies of home.

II. Taught in the economies of wise consumption, the race should be trained to acquire habits of thrift, of saving earnings, of avoiding waste, of accumulating property, of having a stake in good government, in progressive civilization.

III. Besides the rudiments of a good and useful education there is imperative need of manual training, of the proper cultivation of those faculties or mental qualities of observation, of aiming at and reaching a successful end, and of such facility and skill in tools, in practical industries, as will insure remunerative employment and give the power which comes from intelligent work.

IV. Clearer and juster ideas of education, moral and intellectual, obtained in cleaner home life and through respected and capable teachers in schools and churches. Ultimate and only sure reliance for the education of the race is to be found in the public schools, organized, controlled, and liberally supported by the State.

V. Between the races occupying the same territory, possessing under the law equal civil rights and privileges, speculative and unattainable standards should be avoided, and questions should be met as they arise, not by Utopian and partial solutions, but by the impartial application of the tests of justice, right, honor, humanity, and Christianity.

II.

EDUCATION OF THE NEGROES SINCE 1860.

[By J. L. M. Curry, LL. D., secretary of the trustees of the John F. Slater fund.]

INTRODUCTION.

The purpose of this paper is to put into permanent form a narrative of what has been done at the South for the education of the negro since 1860. The historical and statistical details may seem dry and uninteresting, but we can understand the significance of this unprecedented educational movement only by a study of its beginnings and of the difficulties which had to be overcome. The present generation, near as it is to the genesis of the work, can not appreciate its magnitude, nor the greatness of the victory which has been achieved, without a knowledge of the facts which this recital gives in connected order. The knowledge is needful, also, for a comprehension of the future possible scope and kind of education to be given to the Afro-American race. In the field of education we shall be unwise not to reckon with such forces as custom, physical constitution, heredity, racial characteristics and possibilities, and not to remember that these and other causes may determine the limitations under which we must act. The education of this people has a far-reaching and complicated connection with their destiny, with our institutions, and possibly with the Dark Continent, which may assume an importance akin, if not superior, to what it

had centuries ago. The partition of its territory, the international questions which are springing up, and the effect of contact with and government by a superior race, must necessarily give an enhanced importance to Africa as a factor in commerce, in relations of governments, and in civilization. England will soon have an unbroken line of territorial possessions from Egypt to the Cape of Good Hope. Germany, France, Portugal, Italy, Spain, possibly Russia, will soon have such footholds in Africa as, whatever else may occur, will tend to the development of century-paralyzed resources.

What other superior races have done, and are doing, for the government and uplifting of the inferior races, which, from treaty or conquest, have been placed under their responsible jurisdiction, may help in the solution of our problem. Italy had a grand question in its unification; Prussia a graver one in the nationalization of Germany, taxing the statesmanship of Stein, Bismarck, and their colaborers; Great Britain, in the administration of her large and widely remote colonial dependencies with their different races; but our problem has peculiar difficulties which have not confronted other governments, and therefore demands the best powers of philanthropist, sociologist, and statesman.

The emergence of a nation from barbarism to a general diffusion of intelligence and property, to health in the social and civil relations; the development of an inferior race into a high degree of enlightenment; the overthrow of customs and institutions which, however indefensible, have their seat in tradition and a course of long observance; the working out satisfactorily of political, sociological, and ethical problems—are all necessarily slow, requiring patient and intelligent study of the teachings of history and the careful application of something more than mere empirical methods. Civilization, freedom, a pure religion, are not the speedy outcome of revolutions and cataclysms any more than has been the structure of the earth. They are the slow evolution of orderly and creative causes, the result of law and preordained principles.

The educational work described in this paper has been most valuable, but it has been so far necessarily tentative and local. It has lacked broad and definite generalization, and, in all its phases, comprehensive, philosophical consideration. An auxiliary to a thorough study and ultimate better plans, the Slater fund, from time to time, will have prepared and published papers bearing on different phases of the negro question.

I. The history of the negro on this continent is full of pathetic and tragic romance, and of startling, unparalleled incident. The seizure in Africa, the forcible abduction and cruel exportation, the coercive enslavement, the subjection to environments which emasculate a race of all noble aspirations and doom inevitably to hopeless ignorance and inferiority, living in the midst of enlightenments and noblest civilization and yet forbidden to enjoy the benefits of which others were partakers, for four years amid battle and yet, for the most part, having no personal share in the conflict, by statute and organic law and law of nations held in fetters and inequality, and then, in the twinkling of an eye, lifted from bondage to freedom, from slavery to citizenship, from dependence on others and guardianship to suffrage and eligibility to office—can be predicated of no other race. Other peoples, after long and weary years of discipline and struggle against heaviest odds, have won liberty and free government. This race, almost without lifting a hand, unappreciative of the boon except in the lowest aspects of it, and unprepared for privileges and responsibilities, has been lifted to a plane of citizenship and freedom, such as is enjoyed, in an equal degree, by no people in the world outside of the United States.

Common schools in all governments have been a slow growth, reluctantly conceded, grudgingly supported, and perfected after many experiments and failures and with heavy pecuniary cost. Within a few years after emancipation, free and universal education has been provided for the negro, without cost to himself, and chiefly by the self-imposed taxes of those who, a few years before, claimed his labor and time without direct wage or pecuniary compensation.

II. Slavery, recognized by the then international law and the connivance and patronage of European sovereigns, existed in all the colonies prior to the Declaration of Independence, and was reenforced by importation of negroes from Africa. In course of time it was confined to the Southern States, and the negroes increased in numbers at a more rapid rate than did the whites, even after the slave trade was abolished and declared piracy.

For a long time there was no general exclusion by law of the slaves from the privileges of education. The first prohibitory and punitive laws were directed against unlawful assemblages of negroes, and subsequently of free negroes and mulattoes, as their influence in exciting discontent or insurrection was deprecated and guarded against. Afterwards legislation became more general in the South, prohibiting meetings for teaching reading and writing. The Nat Turner insurrection in Southampton County, Va., in 1831, awakened the Southern States to a consciousness of the perils which might environ or destroy them from combinations of excited, inflamed, and ill-advised negroes.

As documents and newspapers tending to inflame discontent and insurrection were supposed to have been the immediate provocation to this conspiracy for murder of whites and for freedom of the blacks, laws were passed against publishing and circulating such documents among the colored population, and strengthening the prohibitions and penalties against education.

Severe and general as were these laws they rarely applied, and were seldom, if ever, enforced against teaching of individuals or of groups on plantations or at the homes of the owners. It was often true that the mistress of a household or her children would teach the house servants, and on Sundays include a larger number. There were also Sunday schools in which black children were taught to read, notably the school in which Stonewall Jackson was a leader. It is pleasant to find recorded in the memoir of Dr. Boyce, a trustee of this fund from its origin until his death, that as an editor, a preacher, and a citizen he was deeply interested in the moral and religious instruction of the negroes.

After a most liberal estimate for the efforts made to teach the negroes, still the fact exists that as a people they were wholly uneducated in schools. Slavery doomed the millions to ignorance, and in this condition they were when the war began.

III. Almost synchronously with the earliest occupation of any portion of the seceding States by the Union army efforts were begun to give the negroes some schooling. In September, 1861, under the guns of Fortress Monroe, a school was opened for the "contrabands of war." In 1862 schools were extended to Washington, Portsmouth, Norfolk, and Newport News, and afterwards to the Port Royal islands on the coast of South Carolina, to Newbern and Roanoke Island in North Carolina. The proclamation of emancipation, January 1, 1863, gave freedom to all slaves reached by the armies, increased the refugees, and awakened a fervor of religious and philanthropic enthusiasm for meeting the physical, moral, and intellectual wants of those suddenly thrown upon charity. In October, 1863, General Banks, then commanding the Department of the Gulf, created commissioners of enrollment, who established the first public schools for Louisiana. Seven were soon in operation, with 23 teachers and an average attendance of 1,422 scholars. On March 22, 1864, he issued General Order No. 38, which constituted a board of education "for the rudimental instruction of the freedmen" in the department, so as to "place within their reach the elements of knowledge."

The board was ordered to establish common schools, to employ teachers, to acquire school sites, to erect school buildings where no proper or available ones for school purposes existed, to purchase and provide necessary books, stationery, apparatus, and a well-selected library, to regulate the course of studies, and "to have the authority and perform the same duties that assessors, supervisors, and trustees had in the Northern States in the matter of establishing and conducting common schools." For the performance of the duties enjoined the board was empowered to "assess and levy a school tax upon real and personal property, including crops of plantations." These taxes were to be sufficient to defray expense and cost of establishing, furnishing, and conducting the schools for the period of one year. When the tax list and schedules should be placed in the hands of the parish provost-marshal he was to collect and pay over within thirty days to the school board. Schools previously established were transferred to this board; others were opened, and in December, 1864, they reported under their supervision 95 schools, 162 teachers, and 9,571 scholars. This system continued until December, 1865, when the power to levy the tax was suspended. An official report of later date says: "In this sad juncture the freedmen expressed a willingness to endure and even petitioned for increased taxation in order that means for supporting their schools might be obtained."

On December 17, 1862, Col. John Eaton was ordered by General Grant to assume a general supervision of freedmen in the Department of Tennessee and Arkansas. In the early autumn of that year schools had been established, and they were multiplied during 1863 and 1864. In the absence of responsibility and supervision there grew up abuses and complaints. By some "parties engaged in the work" of education "exorbitant charges were made for tuition," and agents and teachers, "instead of making common cause for the good of those they came to benefit, set about detracting, perplexing, and vexing each other." "Parties and conflicts had arisen." "Frauds had appeared in not a few instances—evil-minded, irresponsible, or incompetent persons imposing upon those not prepared to defeat or check them." "Bad faith to fair promises had deprived the colored people of their just dues."[1]

On September 26, 1864, the Secretary of War, through Adjutant-General Thomas, issued Order No. 28, in which he said: "To prevent confusion and embarrassment the general superintendent of freedmen will designate officers, subject to his orders, as superintendents of colored schools, through whom he will arrange the location of all schools, teachers, occupation of houses, and other details pertaining to the education of the freedmen." In accordance with this order Colonel Eaton removed his

[1]See report of Chaplain Warren, 1864, relating to colored schools.

headquarters from Vicksburg to Memphis. On October 20, 1864, he issued sixteen rules and regulations for the guidance of superintendents and teachers of colored schools in his supervision. These instructions to subordinates were wise and provided for the opening of a sufficient number of schools, for the payment of tuition fees from 25 cents to $1.25 per month for each scholar, according to the ability of the parents; for the admission free of those who could not pay and the furnishing of clothing by the aid of industrial schools, for the government of teachers in connection with the societies needing them, etc. The "industrial schools" were schools in which sewing was taught, and in which a large quantity of the clothing and material sent from the North was made over or made up for freedmen's use, and were highly "useful in promoting industrious habits and in teaching useful arts of housewifery." The supervision under such a competent head caused great improvement in the work, but department efforts were hindered by some representatives of the benevolent societies who did not heartily welcome the more orderly military supervision. An assistant superintendent, March 31, 1865, reports, in and around Vicksburg and Natchez, 30 schools, 60 teachers, and 4,393 pupils enrolled; in Memphis, 1,590 pupils, and in the entire supervision, 7,360 in attendance.

General Eaton submitted a report of his laborious work, which is full of valuable information. Naturally, some abatement must be made from conclusions which were based on the wild statements of excited freedmen, or the false statements of interested persons. "Instinct of unlettered reason" caused a hegira of the blacks to camps of the Union army, or within protected territory. The "negro population floated or was kicked about at will." Strict supervision became urgent to secure "contraband information" and service and protect the ignorant, deluded people from unscrupulous harpies. "Mental and moral enlightenment" was to be striven for, even in those troublous times, and it was fortunate that so capable and faithful an officer as General Eaton was in authority.

All the operations of the supervisors of schools did not give satisfaction, for the inspector of schools in South Carolina and Georgia, on October 13, 1865, says: "The bureau does not receive that aid from the Government and Government officials it had a right to expect, and really from the course of the military officials in this department you might think that the only enemies to the Government are the agents of the bureau."

IV. By act of Congress, March 3, 1865, the Freedmen's Bureau was created. The scope of its jurisdiction and work extended far beyond education. It embraced abandoned lands and the supply of the negroes with food and clothing, and during 1865 as many as 148,000 were reported as receiving rations. The Quartermaster and Commissary Departments were placed at the service of the agents of the bureau, and, in addition to freedom, largesses were lavishly given to "reach the great and imperative necessities of the situation." Large and comprehensive powers and resources were placed in the hands of the bureau, and limitations of the authority of the Government were disregarded in order to meet the gravest problem of the century. Millions of recently enslaved negroes, homeless, penniless, ignorant, were to be saved from destitution or perishing, to be prepared for the sudden boon of political equality, to be made self-supporting citizens and to prevent their freedom from becoming a curse to themselves and their liberators. The commissioner was authorized "to seize, hold, use, lease, or sell all buildings and tenements and any lands appertaining to the same, or otherwise formally held, under color of title by the late Confederate States, and buildings or lands held in trust for the same, and to use the same, or appropriate the proceeds derived therefrom to the education of the freed people." He was empowered also to "cooperate with private benevolent associations in aid of the freedmen." The bureau was attached to the War Department, and was at first limited in duration to one year, but was afterwards prolonged. Gen. O. O. Howard was appointed commissioner, with assistants. He says he was invested with "almost unlimited authority," and that the act and orders gave "great scope and liberty of action." "Legislative, judicial, and executive powers were combined, reaching all the interests of the freedmen." On June 2, 1865, the President ordered all officers of the United States to turn over to the bureau "all property, funds, lands, and records in any way connected with freedmen and refugees." This bestowment of despotic power was not considered unwise because of the peculiar exigencies of the times and the condition of the freedmen, who, being suddenly emancipated by a dynamic process, were without schools, or teachers, or means to procure them. To organize the work a superintendent of schools was appointed for each State. Besides the regular appropriation by Congress the military authorities aided the bureau. Transportation was furnished to teachers, books, and school furniture, and material aid was given to all engaged in education.

General Howard used his large powers to get into his custody the funds scattered in the hands of many officers, which could be made available for the freedmen. Funds bearing different names were contributed to the work of "colored

education."[1] During the war some of the States sent money to officers serving in the South to buy substitutes from among the colored people to fill up their quota under the draft. A portion of the bounty money thus sent, by an order of General B. F. Butler, August 4, 1864, was retained in the hands of officers who had been superintendents of negro affairs, and by the President's order of June 2, 1865, was turned over to the disbursing officers of the Bureau of Freedmen. After the organization of the bureau, General Howard instructed agents to turn money held by them over to the chief disbursing officer of the bureau. This was in no sense public money, but belonged to individuals enlisted as contraband recruits to fill the State quotas. What was unclaimed of what was held in trust under General Butler's order was used for educational purposes.

In the early part of 1867 the accounting officers of the Treasury Department ascertained that numerous frauds were being perpetrated on colored claimants for bounties under acts of Congress. Advising with General Howard, the Treasury officials drew a bill which Congress enacted into a law, devolving upon the commissioner the payment of bounties to colored soldiers and sailors. This enlarged responsibility gave much labor to General Howard, in his already multifarious and difficult duties, and made more honorable the acquittal which he secured when an official investigation was subsequently ordered upon his administration of the affairs of the bureau.

The act of Congress of July 16, 1866, gave a local fund, which was expended in the district in which it accrued, and besides there were general appropriations for the support of the bureau, which were in part available for schools.

Mr. Ingle, writing of school affairs in the District in 1867 and 1868, says:

"Great aid was given at this period by the Freedmen's Bureau, which, not limiting its assistance to schools for primary instruction, did much toward establishing Howard University, in which no distinction was made on account of race, color, or sex, though it had originally been intended for the education of negro men alone."

The monograph of Edward Ingle on "The negro in the District of Columbia," one of the valuable Johns Hopkins University studies, gives such a full and easily accessible account of the education of the negroes in the District, that it is needless to enlarge the pages of this paper by a repetition of what he has so satisfactorily done.

The bureau found many schools in localities which had been within the lines of the Union armies, and these, with the others established by its agency, were placed under more systematic supervision. In some States schools were carried on entirely by aid of the funds of the bureau, but it had the cooperation and assistance of various religious and benevolent societies. On July 1, 1866, Mr. Alvord, inspector of schools and finances, reported 975 schools in 15 States and the District, 1,405 teachers, and 90,778 scholars. He mentioned as worthy of note a change of sentiment among better classes in regard to freedmen's schools, and that the schools were steadily gaining in numbers, attainments, and general influence. On January 17, 1867, General Howard reports to the Secretary of War $115,261.56 as used for schools, and the Quartermaster's Department as still rendering valuable help. Education "was carried on vigorously during the year," a bettter feeling prevailing, and 150,000 freedmen and children "occupied earnestly in the study of books." The taxes, which had been levied for schools in Louisiana, under the administration of T. W. Conway, had been discontinued, but $500,000 were asked for schools and asylums. In 1867 the Government appointed Generals Steedman and Fullerton as inspectors, and from General Howard's vehement reply to their report—which the War Department declines to permit an inspection of—it appears that their criticisms were decidedly unfavorable. Civilians in the bureau were now displaced by army officers. In July, 1869, Mr. Alvord mentions decided progress in educational returns, increasing thirst for knowledge, greater public favor, and the establishment of 39 training schools for teachers, with 3,377 pupils. Four months later General Howard says, "hostility to schools and teachers has in great measure ceased." He reported the cost of the bureau at $13,029,816, and earnestly recommended "the national legislature" to establish a general system of free schools, "furnishing to all children of a suitable age such instruction in the rudiments of learning as would fit them to discharge intelligently the duties of free American citizens." Solicitor Whiting had previously recommended that the head of the Freedmen's Bureau should be a Cabinet officer, but this was not granted, and the bureau was finally discontinued, its affairs being transferred to the War Department by act of Congress, June 10, 1872. It is apparent from the reports of Sprague, assistant commissioner in Florida, and of Alvord in 1867 and 1870, that the agents of the bureau sometimes used their official position and influence for organizing the freedmen for party politics and to control elections. A full history of the Freedmen's Bureau would furnish an interesting chapter in negro education, but a report from Inspector Shriver, on October 3, 1873, says the department has "no means of verifying the amount of retained bounty fund;" and

[1] See Spec. Ed. Rep., District of Columbia, p. 259.

on December 4, 1873, the department complains of "the incomplete and disordered condition of the records of the late bureau." (See Ex. Doc. No. 10, Forty-third Congress, first session, and House Mis. Doc. No. 87, Forty-second Congress, third session.)

That no injustice may be done to anyone, the answer of the "Record and Pension Office, War Department," May 21, 1894, to my application for statistics drawn from the records, is embodied in this paper. So far as the writer has been able to investigate, no equally full and official account has heretofore been given.

The following consolidated statement, prepared from records of superintendents of education of the Bureau of Refugees, Freedmen, and Abandoned Lands, shows the number of schools, teachers, and pupils in each State, under control of said bureau, and the amount expended for schools, asylums, construction and rental of school buildings, transportation of teachers, purchase of books, etc.:

Year.	Schools.	Teachers.	Pupils.	Expended by bureau.	Received from freedmen.	Received from benevolent associations.
1865–66	1,264	1,795	111,193	$225,722.94	$18,500.00	$83,200.00
1867	1,673	2,032	109,245	415,330.00	17,200.00	65,087.00
1868	1,739	2,104	102,562	909,210.20	42,130.00	154,736.50
1869	1,942	2,472	108,485	591,267.56	85,726.00	27,200.00
1870	1,900	2,376	108,135	480,737.82	17,187.00	4,240.00

"This statement or statistical table is made up from the reports of the superintendents of education of the several States under the control of the bureau from 1865 to 1870, when Government aid to the freedmen's schools was withdrawn. It embraces the number of schools established or maintained, the number of teachers employed, the number of pupils, and the amount expended for school purposes in each State and the District of Columbia. The expenditures also include the amounts contributed by the bureau for the construction and maintenance of asylums for the freedmen, which can not be separated from the totals given.

"The table is based upon the reports of the school superintendents, and has been prepared with great care. The results thus obtained, however, differ in some material respects from the figures given by the commissioner of the Freedmen's Bureau in his annual reports. These discrepancies, which this department is unable to reconcile or explain, will be seen by a comparison of the table with the following statement made from the reports of the commissioner:

Year.	Schools.	Teachers.	Pupils.	Disbursements for school purposes.			
				By bureau.	By benevolent associations.	By freedmen.	Total.
1866	975	1,405	90,778	$123,659.39	$82,200.00	$18,500.00	$224,359.39
1867	1,839	2,087	111,442	531,345.48	65,087,01	17,200.00	613,632.49
1868	1,831	2,295	104,327	965,896.67	700,000.00	a360,000.00	2,025,896.67
1869	2,118	2,455	114,522	924,182.16	365,000.00	a190,000.00	1,479,182.16
1870	2,677	3,300	149,581	976,853.29	360,000.00	a200,000.00	1,536,853.29

a Estimated.

"It has been found impracticable to ascertain the amounts expended by the Freedmen's Bureau for Howard and Fisk Universities, and the schools at Hampton, Atlanta, and New Orleans, the items of expenditure for these schools not being separated in the reports from the gross expenditures for school purposes."

A committee of investigation upon General Howard's use of the bureau for his pecuniary aggrandizement were divided in opinion, but a large majority exonerated him from censure and commended him for the excellent performance of difficult duties. An equally strong and unanimous verdict of approval was rendered by a court of inquiry, General Sherman presiding, which was convened under an act of Congress, February 13, 1874.

V. It has been stated that the bureau was authorized to act in cooperation with benevolent or religious societies in the education of the negroes. A number of these organizations had done good service before the establishment of the bureau and continued their work afterwards. The teachers earliest in the field were from the American Missionary Association, Western Freedmen's Aid Commission, American Baptist Home Mission Society, and the Society of Friends. After the surrender of Vicksburg and the occupation of Natchez, others were sent by the United Presbyterians, Reformed Presbyterians, United Brethren in Christ, Northwestern Freedmen's

Aid Commission, and the National Freedmen's Aid Association. The first colored school in Vicksburg was started in 1863 by the United Brethren in the basement of a Methodist church.

The American Missionary Association was the chief body, apart from the Government, in the great enterprise of meeting the needs of the negroes. It did not relinquish its philanthropic work because army officers and the Federal Government were working along the same line. Up to 1866 its receipts were swollen by "the aid of the Free Will Baptists, the Wesleyans, the Congregationalists, and friends in Great Britain." From Great Britain it is estimated that "a million of dollars in money and clothing were contributed through various channels for the freedmen." The third decade of the association, 1867–1876, was a marked era in its financial history. The Freedmen's Bureau turned over a large sum, which could be expended only in buildings. A Congressional report says that between December, 1866, and May, 1870, the association received $243,753.22. Since the association took on a more distinctive and separate denominational character, because of the withdrawal of other denominations into organizations of their own, it, along with its church work, has prosecuted, with unabated energy and marked success, its educational work among the negroes. It has now under its control or support—

Chartered institutions	6
Normal schools	29
Common schools	43
Totals:	
Schools	78
Instructors	389
Pupils	12,609
Pupils classified:	
Theological	47
Collegiate	57
College preparatory	192
Normal	1,091
Grammar	2,378
Intermediate	3,692
Primary	5,152

Some of these schools are not specially for negroes. It would be unjust not to give the association much credit for Atlanta University and for Hampton Normal and Industrial Institute, which are not included in the above recapitulation, as the latter stands easily first among all the institutions designed for negro development, both for influence and usefulness. During the war and for a time afterwards the school work of the association was necessarily primary and transitional, but it grew into larger proportions, with higher standards, and its normal and industrial work deserves special mention and commendation. From 1860 to October 1, 1893, its expenditures in the South for freedmen, directly and indirectly, including church extension as well as education, have been $11,610,000.

VI. In 1866 was organized the Freedmen's Aid and Southern Society of the Methodist Episcopal Church. Under that compact, powerful, well-disciplined, enthusiastic organization more than $6,000,000 have been expended in the work of education of negroes. Dr. Hartzell said before the World's Congress in Chicago that Wilberforce University, at Xenia, Ohio, was established in 1857 as a college for colored people, and "continues to be the chief educational center of African Methodism in the United States." He reports, as under various branches of Methodism, 65 institutions of learning for colored people, 388 teachers, 10,100 students, $1,905,150 of property, and $652,500 of endowment. Among these is Meharry Medical College, of high standard and excellent discipline, with dental and pharmaceutical departments as well as medical. Near 200 students have been graduated. The school of mechanic arts in Central Tennessee College, under the management of Professor Sedgwick, has a fine outfit, and has turned out telescopes and other instruments which command a ready and remunerative market in this and other countries.

VII. On April 16, 1862, slavery was abolished in the District of Columbia. By November 13,000 refugees had collected at Washington, Alexandria, Hampton, and Norfolk. Under an unparalleled exigency, instant action was necessary. The lack of educational privileges led Christian societies to engage in educational work—at least in the rudiments of learning—for the benefit of these people, who were eager to be instructed. Even where education had not previously been a part of the functions of certain organizations, the imperative need of the liberated left no option as to duty. With the assistance of the Baptist Free Mission Society and of the Baptist Home Mission Society, schools were established in Alexandria as early as January 1, 1862, and were multiplied through succeeding years. After Appomatox the Baptist Home Mission Society was formally and deliberately committed to the education of the blacks, giving itself largely to the training of teachers and

preachers. In May, 1892, the society had under its management 24 schools with 216 instructors, 4,861 pupils, of whom 1,756 were preparing to teach, school property worth $750,000 and endowment funds of $156,000. Probably not less than 50,000 have attended the various schools. Since 1860 $2,451,859.56 have been expended for the benefit of the negroes. The superintendent of education says: "The aggregate amount appropriated for the salaries of teachers from the time the society commenced its work until January, 1883, was: District of Columbia, $59,243.57; Virginia, $65,254.44; North Carolina, $41,788.90; South Carolina, $29,683.71; Florida, $3,164.16; Georgia, $26,963.21; Alabama, $4,960.37; Mississippi, $6,611.05; Louisiana, $39,168.25; Texas, $2,272.18; Arkansas, $150; Tennessee, $57,898.86; Kentucky, $1,092.54; Missouri, $300. The following gives the aggregate amount appropriated for teachers and for all other purposes, such as land, buildings, etc., from January, 1883, to January, 1893: District of Columbia, $103,110.01; Virginia, $193,974.08; North Carolina, $142,861.95; South Carolina, $137,157.79; Florida, $55,923.96; Georgia, $314,061.48; Alabama, $35,405.86; Mississippi, $86,019.70; Louisiana, $33,720.93; Texas, $131,225.27; Arkansas, $13,206.20; Tennessee, $164,514.05; Kentucky, $49,798.56; Missouri, $6,543.13. Until January, 1883, the appropriations for teachers and for lands, buildings, etc., were kept as separate items. I have already given the appropriations for the teachers up to that date. For grounds and buildings $421,119.50 were appropriated." In connection with the Spelman Seminary and the male school in Atlanta, there has been established, under intelligent and discriminating rules, a first-class training department for teachers. A new, commodious structure, well adapted to the purpose, costing $55,000, was opened in December. At Spelman there is an admirable training school for nurses, where the pupils have hospital practice. Shaw University, at Raleigh, has the flourishing Leonard Medical School and a well-equipped pharmacy.

VIII. The Presbyterian Church at the North in May, 1865, adopted a deliverance in favor of special efforts in behalf of the "lately enslaved African race." From the twenty-eighth annual report of the Board of Missions for Freedmen it appears that, besides building churches, special exertions have been put forth "in establishing parochial schools, in planting academies and seminaries, in equipping and supporting a large and growing university." The report mentions 15 schools—3 in North Carolina, 4 in South Carolina, 3 in Arkansas, and 1 in each of the States of Texas, Mississippi, Virginia, Georgia, and Tennessee. One million two hundred and eighty thousand dollars have been spent. "In the high schools and parochial schools we have (May, 1893) 10,520 students, who are being daily molded under Presbyterian educational influence." The United Presbyterian Church reports for May, 1893, an enrollment in schools of 2,558. The Southern Presbyterians have a theological seminary in Birmingham, Ala., which was first opened in Tuscaloosa in 1877.

IX. The Episcopal Church, through the Commission on Church Work among the Colored People, during the seven years of its existence (1887–1893) has expended $272,068, but the expenditure is fairly apportioned between ministerial and teaching purposes. The schools are parochial, "with an element of industrial training," and are located in Maryland, Virginia, North Carolina, Tennessee, and Alabama; but the "reports" do not give the number of teachers and scholars. The Friends have some well-conducted schools, notably the Schofield in Aiken, S. C. They have sustained over 100 schools and have spent $1,004,129. In the mission work of the Roman Catholic Church among the negroes school work and church work are so blended that it has been very difficult to make a clear separation. Schools exist in Baltimore, Washington, and all the Southern States, but with how many teachers and pupils and at what cost the report of the commission for 1893 does not show. A few extracts are given. "We need," says one, "all the help possible to cope with the public schools of Washington. In fact, our school facilities are poor, and unless we can do something to invite children to our Catholic schools many of them will lose their faith." Another person writes: "Next year we shall have to exert all the influence in our power to hold our school. Within two doors of our school a large public-school building is being erected; this new public-school building will draw pupils away from the Catholic school unless the latter be made equally efficient in its work."

X. On February 6, 1867, George Peabody gave to certain gentlemen $2,000,000 in trust, to be used "for the promotion and encouragement of intellectual, moral, or industrial education among the young of the more destitute portions of the Southwestern States of our Union." This gift embraced both races, and Dr. Barnas Sears was fortunately selected as the general agent, to whom was committed practically the administration of the trust. In his first report he remarked that in many of the cities aided by the fund provision was made for the children of both races, but said that as the subject of making equal provision for the education of both races was occupying public attention, he thought it the safer and wiser course not to set up schools on a precarious foundation, but to confine help to public schools and make efforts in all suitable ways to improve or have established State systems of education. Still,

in some localities aid was judiciously given, and the United States superintendent of education for the negroes in North Carolina gave testimony that but for the Peabody aid many of the colored schools would be closed. "Our superintendents have aided largely in distributing the Peabody fund in nearly all the States." "Great good has thereby been accomplished at very little added expense." The Peabody fund bent its energies and directed its policy toward securing the establishment of State systems of education which should make adequate and permanent provision for universal education. State authorities would have more power and general influence than individuals or denominational or private corporations. They represent the whole people, are held to a strict accountability, protected "from the charge of sectarianism and from the liability of being overreached by interested parties." State systems, besides, have a continuous life and are founded on the just principle that property is taxable for the maintenance of general education. The fund now acts exclusively with State systems, and continues support to the negroes more efficiently through such agencies.

XI. Congress, by land grants since 1860, has furnished to the Southern States substantial aid in the work of agricultural and mechanical education. On March 2, 1867, the Bureau of Education was established for the collection and diffusion of information. This limited sphere of work has been so interpreted and cultivated that the Bureau, under its able Commissioners, especially under the leadership of that most accomplished American educator, Dr. W. T. Harris, has become one of the most efficient and intelligent educational agencies on the continent. To the general survey of the educational field and comparative exhibits of the position of the United States and other enlightened countries have been added discussions by specialists and papers on the various phases of educational life produced by the incorporation of diverse races into our national life or citizenship. The annual reports and circulars of information contain a vast mass of facts and studies in reference to the colored people, and a digest and collaboration of them would give the most complete history that could be prepared.

The Bureau and the Peabody education fund have been most helpful allies in making suggestions in relation to legislation in school matters, and giving, in intelligible, practical form, the experiences of other States, home and foreign, in devising and perfecting educational systems. All the States of the South, as soon as they recovered their governments, put in operation systems of public schools which gave equal opportunities and privileges to both races. It would be singularly unjust not to consider the difficulties—social, political, and pecuniary—which embarrassed the South in the efforts to inaugurate free education. It required unusual heroism to adapt to the new conditions, but she was equal in fidelity and energy to what was demanded for the reconstruction of society and civil institutions. The complete enfranchisement of the negroes and their new political relations, as the result of the war and the new amendments to the Constitution, necessitated an entire reorganization of the systems of public education. To realize what has been accomplished is difficult at best—impossible, unless we estimate sufficiently the obstacles and compare the facilities of to-day with the ignorance and bondage of a generation ago, when some statutes made it an indictable offense to teach a slave or free person of color. Comparisons with densely populated sections are misleading, for in the South the sparseness and poverty of the population are almost a preventive of good schools. Still the results have been marvelous. Out of 448 cities in the United States with a population each of 8,000 and over, only 73 are in the South. Of 28 with a population from 100,000 to 1,500,000, only 2 (St. Louis being excluded) are in the South. Of 96, with a population between 25,000 and 100,000, 17 are in the South. The urban population is comparatively small, and agriculture is the chief occupation. Of 858,000 negroes in Georgia, 130,000 are in cities and towns and 728,000 in the country; in Mississippi, urban colored population 42,000, rural 700,000; in South Carolina, urban 74,000, rural 615,000; in North Carolina, urban 66,000 against 498,000 rural; in Alabama, 65,000 against 613,000; in Louisiana, 93,000 against 466,000. The schools for colored children are maintained on an average 89.2 days in a year, and for white children 98.6, but the preponderance of the white over the black race in towns and cities helps in part to explain the difference. While the colored population supplies less than its due proportion of pupils to the public schools, and the regularity of attendance is less than with the white, yet the difference in length of school term in schools for white and schools for black children is trifling. In the same grades the wages of teachers are about the same. The annual State school revenue is apportioned impartially among white and black children, so much per capita to each child. In the rural districts the colored people are dependent chiefly upon the State apportionment, which is by law devoted mainly to the payment of teachers' salaries. Hence, the schoolhouses and other conveniences in the country for the negroes are inferior, but in the cities the appropriation for schools is general and is allotted to white and colored, according to the needs of each. A small proportion of the school fund comes from colored sources. All the States do not

discriminate in assessments of taxable property, but in Georgia, where the ownership is ascertained, the negroes returned in 1892 $14,869,575 of taxable property against $448,884,959 returned by white owners. The amount of property listed for taxation in North Carolina in 1891 was, by white citizens, $234,109,568; by colored citizens, $8,018,446. To an inquiry for official data, the auditor of the State of Virginia says: "The taxes collected in 1891 from white citizens were $2,991,646.24 and from the colored $163,175.67. The amount paid for public schools for whites, $588,564.87; for negroes, $309,364.15. Add $15,000 for colored normal and $80,000 for colored lunatic asylum. Apportioning the criminal expenses between the white and the colored people in the ratio of convicts of each race received into the penitentiary in 1891, and it shows hat the criminal expenses put upon the State annually by the whites are $55,749.57 and by the negroes $204,018.99."

Of the desire of the colored people for education the proof is conclusive, and of their capacity to receive mental culture there is not the shade of a reason to support an adverse hypothesis. The Bureau of Education furnishes the following suggestive table:

Sixteen former slave States and the District of Columbia.

Year.	Common-school enrollment.		Expenditures (both races).	Year.	Common-school enrollment.		Expenditures (both races).
	White.	Colored.			White.	Colored.

* Approximately.

Total amount expended in 18 years, $353,557,559.

In 1890-91 there were 79,962 white teachers and 24,150 colored. To the enrollment in common schools should be added 30,000 colored children who are in normal or secondary schools. The amount expended for education of negroes is not stated separately, but Dr. W. T. Harris estimates that there must have been nearly $75,000,000 expended by the Southern States in addition to what has been contributed by missionary and philanthropic sources. In Virginia, North Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas, and Arkansas annual grants are made for the support of colored normal and industrial schools.

The negroes must rely very largely upon the public schools for their education, and so they should. They are and will continue to be the most efficient factors for uplifting the race. The States, at immense sacrifice, with impartial liberality, have taxed themselves for a population which contributes very little to the State revenues, and nothing could be done more prejudicial to the educational interests of the colored people than to indulge in any hostility or indifference to or neglect of these free schools. Denominations and individuals can do nothing more harmful to the race than to foster opposition to the public schools.

XII. A potential agency in enlightening public opinion and in working out the problem of the education of the negro has been the John F. Slater fund. "In view of the apprehensions felt by all thoughtful persons," when the duties and privileges of citizenship were suddenly thrust upon millions of lately emancipated slaves, Mr. Slater conceived the purpose of giving a large sum of money to their proper education. After deliberate reflection and much conference, he selected a board of trust and placed in their hands $1,000,000. This unique gift, originating wholly with himself, and elaborated in his own mind in most of its details, was for "the uplifting of the lately emancipated population of the Southern States and their posterity, by conferring on them the blessings of Christian education." "Not only for their own sake, but also for the sake of our common country," he sought to provide "the means of such education as shall tend to make them good men and good citizens," associating the instruction of the mind "with training in just notions of duty toward God and man, in the light of the Holy Scriptures." Leaving to the corporation the largest discretion and liberty in the prosecution of the general object, as described in his letter of trust, he yet indicated as "lines of operation adapted to the condition of things" the encouragement of "institutions as are most effectually useful in promoting the training of teachers." The trust was to be administered "in no partisan, sectional, or sectarian spirit, but in the interest of a generous patriotism and

an enlightened Christian spirit." Soon after organization the trustees expressed very strongly their judgment that the scholars should be "trained in some manual occupation, simultaneously with their mental and moral instruction," and aid was confined to such institutions as gave "instruction in trades and other manual occupations," that the pupils might obtain an intelligent mastery of the indispensable elements of industrial success. So repeated have been similar declarations on the part of the trustees and the general agents that manual training, or education in industries, may be regarded as an unalterable policy; but only such institutions were to be aided as were, "with good reason, believed to be on a permanent basis." Mr. Slater explained "Christian education," as used in his letter of gift, to be teaching, "leavened with a predominant and salutary Christian influence," such as was found in "the common school teaching of Massachusetts and Connecticut," and that there was "no need of limiting the gifts of the fund to denominational institutions." Since the first appropriation near fifty different institutions have been aided, in sums ranging from $500 to $5,000. As required by the founder, neither principal nor income is expended for land or buildings. For a few years aid was given in buying machinery or apparatus, but now the income is applied almost exclusively to paying the salaries of teachers engaged in the normal or industrial work. The number of aided institutions has been lessened, with the view of concentrating and making more effective the aid and of improving the instruction in normal and industrial work. The table appended presents a summary of the appropriations which have been made from year to year.

Cash disbursed by John F. Slater fund as appropriations for educational institutions.

III.

OCCUPATIONS OF THE NEGROES.

[By Henry Gannett, of the United States Geological Survey.]

The statistics of occupations used in this paper are from the census of 1890, and represent the status of the race on June 1 of that year. The census takes cognizance only of "gainful" occupations, excluding from its lists housewives, school children, men of leisure, etc. Its schedules deal only with wage earners, those directly engaged in earning their living.

GENERAL STATISTICS.

In 1890, out of a total population of 62,622,250, 22,753,884 persons, or 34.6 per cent, were engaged in gainful occupations. Of the negroes, including all of mixed negro blood, numbering 7,470,040, 3,073,123, or 41.1 per cent were engaged in gainful occupations. The proportion was much greater than with the total population, This total population, however, was composed of several diverse elements, including, besides the negroes themselves, the foreign born (of which a large proportion were adult males), and the native whites. The following table presents the proportions of each of these elements which were engaged in gainful occupations:

	Per cent.
Total population	34.6
Whites	35.5
Native whites	31.6
Foreign born	55.2
Negroes	41.1

The diagram No. 1 sets forth these figures in graphic form. The total area of the square represents the population. This is subdivided by horizontal lines into rectangles representing the various elements of the population, and the shaded part of each rectangle represents the proportions engaged in gainful occupations.

The proportion was greatest among the foreign born because of the large proportion of adults, and particularly of males, among this element. Next to that, the proportion was greatest among the negroes, being much greater than among the whites collectively, and still greater than among the native whites.

Classifying the wage earners of the country in respect to race and nativity, it appears that 64.5 per cent were native whites, 22 per cent were of foreign birth, and 13.5 per cent were negroes.

Analyzing the statistics of occupation by sex, it is discovered that the proportion of native white males who had occupations was 53.4 and of females 9.4 per cent. The corresponding proportion of male negroes was 56.3 per cent and of female negroes 26 per cent. The male negroes were slightly more fully occupied than were the native whites, while among females the proportion of wage earners was much greater. The difference between native whites and negroes in the proportion of wage earners was, therefore, due mainly to the fuller occupation of women. To put it in another form: Out of every 100 native whites who pursued gainful occupations, 85 were males and 15 were females; of every 100 negroes, 69 were males and 31 were females. Indeed, a larger proportion of women pursued gainful occupations among negroes than in any other class of the population.

CLASSIFICATION OF OCCUPATIONS.

The primary classification of occupations made by the census recognized five great groups, as follows: (1) Professions, (2) agriculture, (3) trade and transportation, (4) manufactures, (5) personal service. These titles are self explanatory, with the possible exception of the last class, which is mainly composed of domestic servants.

The following table shows the proportion of the negro wage earners engaged in each of these groups of occupations. In juxtaposition, for comparison, are placed similar figures for the native white and the foreign born:

	Native white.	Foreign born.	Negro.
	Per cent.	*Per cent.*	*Per cent.*
Professions	5.5	2.2	1.1
Agriculture	41.0	25.5	57.2
Trade and transportation	17.0	14.0	4.7
Manufactures	22.9	31.3	5.6
Personal service	13.6	27.0	31.4
Total	100.0	100.0	100.0

Similar facts are shown by diagram No. 2. In this the total area of the square represents the number of persons in the country pursuing gainful occupations. This is divided into rectangles by horizontal lines, the rectangles being proportioned respectively to the numbers of the native whites, the foreign born, and the negroes. The subdivision of these rectangles by vertical lines indicates the proportion in each group of wage earners.

The most striking facts brought out by this table and diagram are that only a trifling proportion of the negroes were in the professions, that much more than one-half were farmers, and nearly one-third were engaged in personal (mainly domestic) service. Indeed, over seven-eighths of them were either farmers or servants. The proportions engaged in trade and transportation and in manufactures were very small. In respect to the farming class, they contrasted sharply with the foreign born. In trade and transportation and in manufactures the contrast was even greater, in the contrary direction. The foreign born contained a much larger proportion of professional men.

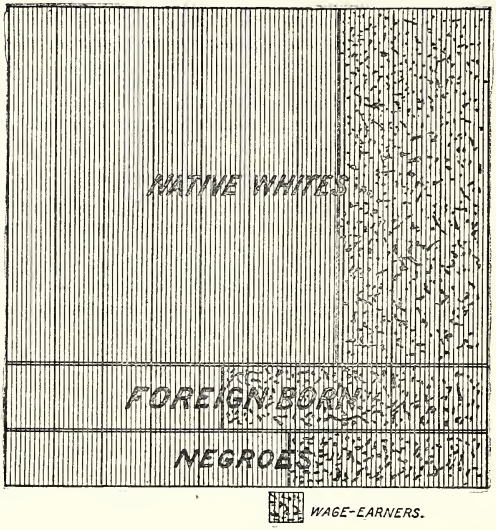
Comparing the negroes with the native whites, equally interesting contrasts appear. Professional men were much more numerous among whites than among negroes. The proportion of the farming class, although much smaller, was nearer that of the negroes than was the same class among the foreign born. In trade and transportation and in manufactures the native whites had much greater proportions, while in personal service the proportion was much less than that of the negroes.

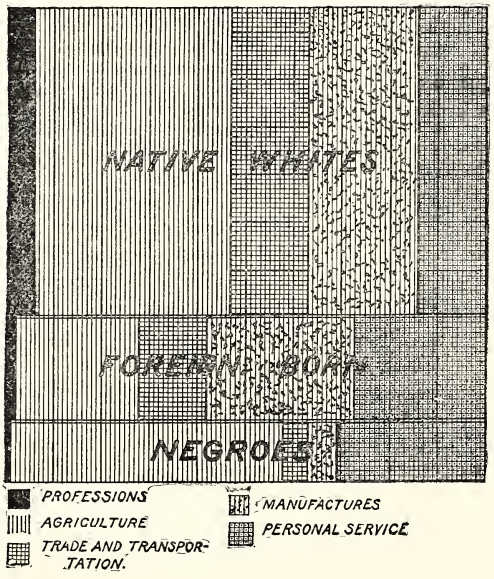
MALE AND FEMALE WAGE EARNERS.

It will be interesting to analyze these figures further. The following table classifies negro wage earners by occupation and by sex, giving for each sex the percentage engaged in each group of occupations:

	Male.	Female.
Professions	1.2	0.9
Agriculture	63.4	44.0
Trade and transportation	6.8	.2
Manufactures	7.0	2.8
Personal service	21.6	52.1

DIAGRAM No. 1.—*Proportion of the population and its elements, which were engaged in gainful occupations in 1890.*





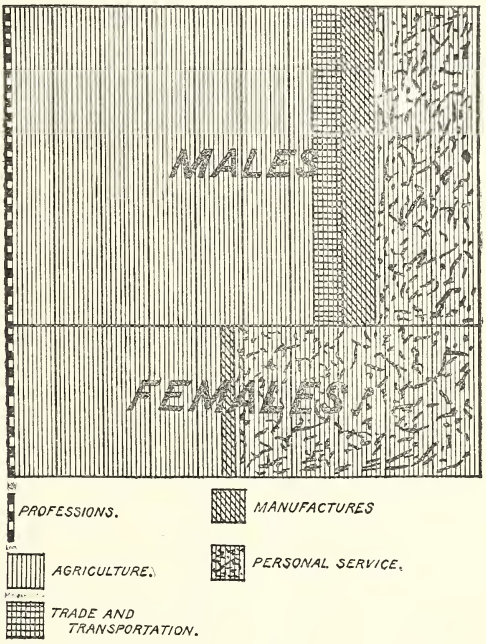


DIAGRAM No. 2.—*Classification of the wage-earners by race and nativity and by occupations.*

These figures are also illustrated by diagram No. 3, the area of which represents all negro wage earners. The two rectangles into which it is divided represent the males and females; each of these is subdivided into rectangles representing the number in each group of occupations. Of the male negro wage earners, more than three-fifths were farmers and a little less than one-fourth were servants. The two classes jointly accounted for nearly 85 per cent of all.

DIAGRAM No. 3.—*Classification of negro wage-earners by sex and occupation.*

Of the females, considerably less than one-half were farmers and more than one-half were servants—the two classes together accounting for 95 per cent of all. This large proportion of female negro farmers was doubtless made up in the main of women and female children employed in the cotton fields.

NUMBER OF WAGE EARNERS.

The following table, abstracted from the census publications, shows the number of negroes in all occupations and in each of the five great groups of occupations by sex and by States and Territories:

DIAGRAM NO. 4.—*Proportion of negro wage-earners to negro population.*

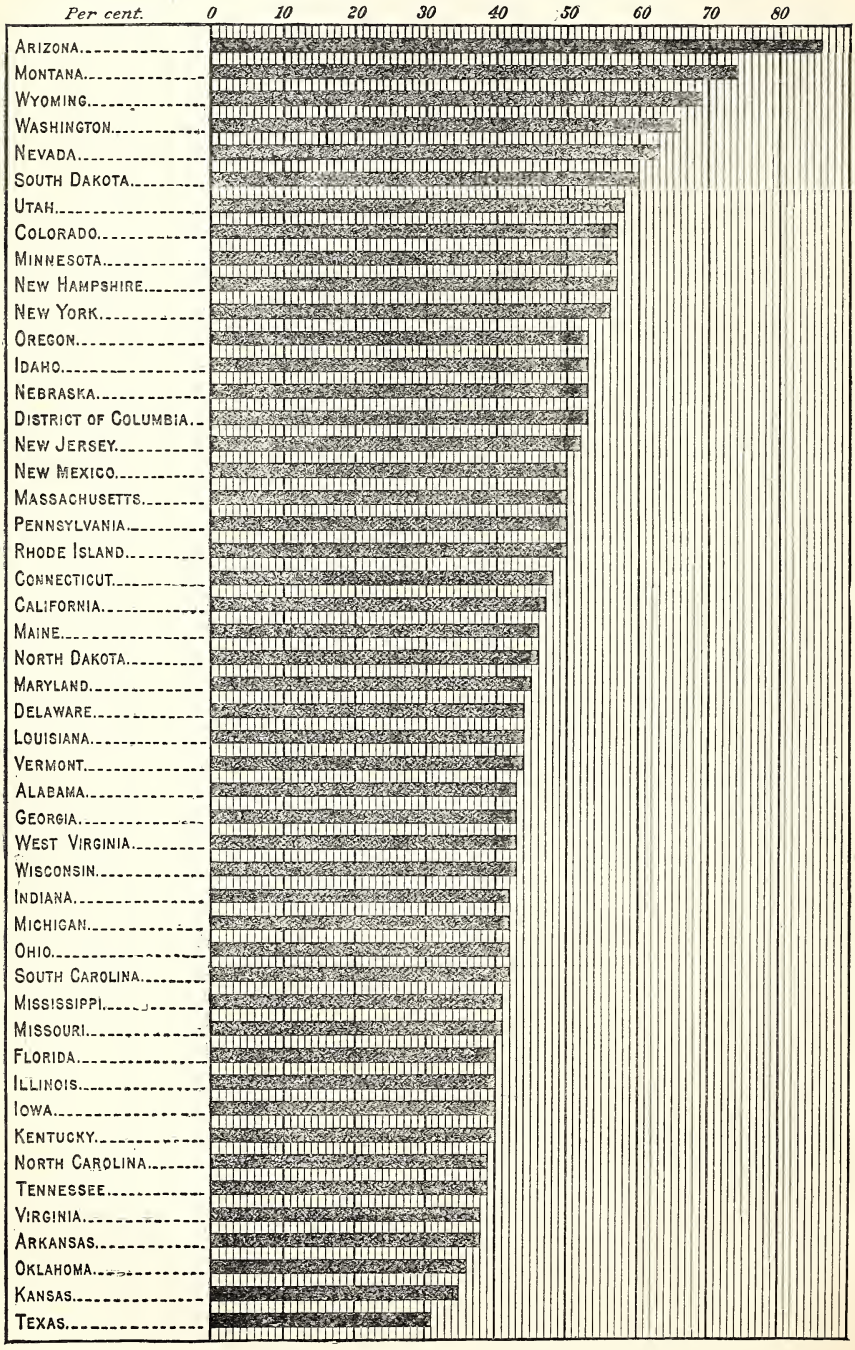

DIAGRAM NO. 5.—*Grouping of the States and Territories.*

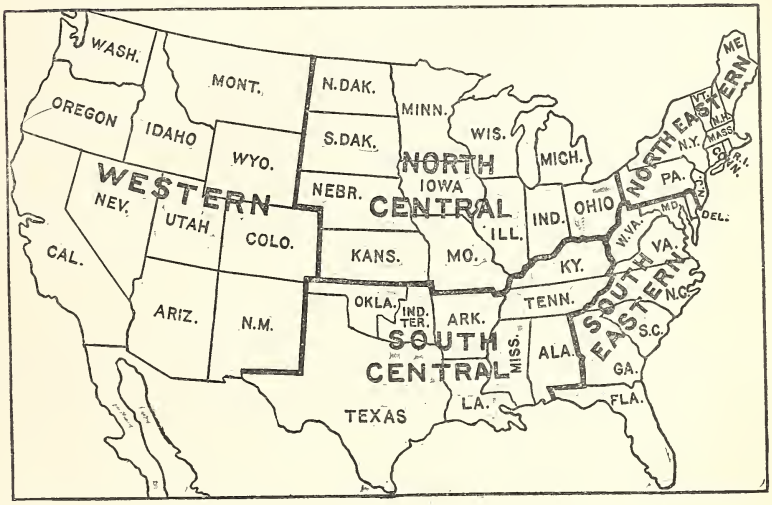

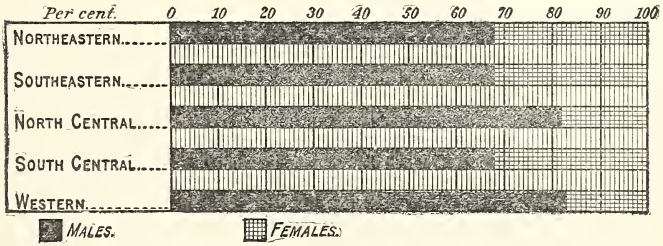

DIAGRAM NO. 6.—*Proportions of male and female wage-earners.*

PROPORTION OF WAGE EARNERS TO POPULATION.

The foregoing diagram No. 4 shows by the length of the bars the proportion which the negro wage earners bore in 1890 to the negro population of each State. This proportion was greatest in the States and the Territories of the West. Following these are the Northeastern States, while the lower part of the column is made up of the States in the Upper Mississippi Valley and those of the South.

OCCUPATIONS BY GROUPS OF STATES.

The distribution of wage earners among the five occupation groups differed widely in different parts of the country. To study it, it will be sufficient to group the States and analyze the statistics of each group.

The groups which will be used here are those which have been in use in the last two censuses, namely, the Northeastern and Southeastern, North Central and South Central, and Western groups. The States and Territories of which each group is composed are shown in map No. 5.

Examination of the States forming the above groups will show that the groups are in many respects very characteristic. The Southeastern and South Central groups contain nine-tenths of the negroes of the country. These States may be said to constitute the home of the negro, while in the Northern and Western States he is an immigrant.

OCCUPATIONS BY SEX AND STATE GROUPS.

Diagram No. 6 shows the distribution by sex and by groups of States of the negro wage earners. It appears that in the Northeastern, Southeastern, and South Central groups two-thirds of the wage earners were males and one-third were females, while in the North Central and Western groups about five-sixths were males and one-sixth only were females. This is in part due to the disproportionate number of males in these parts of the country.

Diagram No. 7 shows the distribution of the negro wage earners, classified by sex, among the five occupation groups and by groups of States. The length of each bar represents 100 per cent, and each bar is divided proportionately among the different occupation groups. Thus from it we read that in the Northeastern States 15 per cent of the male wage earners were engaged in agriculture, 56 per cent in personal service, 16 per cent in trade and transportation, 12 per cent in manufactures, and 2 per cent in the professions.

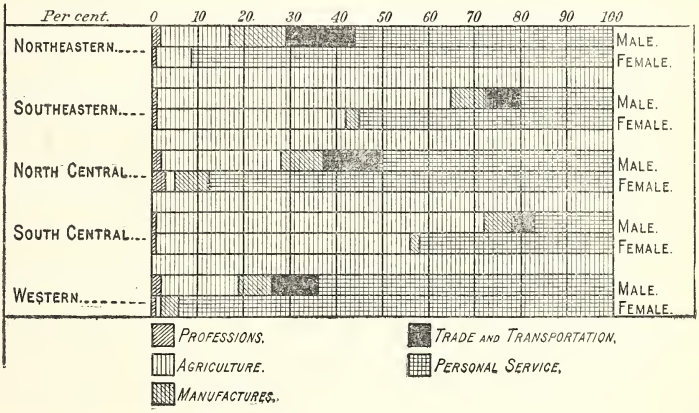
It is seen that a far larger proportion of male wage earners were engaged in agriculture in the Southern States than in the Northern and Western States, the proportion in the two groups of the former States being 64 and 71 per cent, while in the Northeastern States only 15 per cent were engaged in agriculture, in the North Central States 26 per cent, and in the Western States 17 per cent.

In trade and transportation the highest proportion was found in the Northeastern States, where it was 16 per cent; in the North Central States it was 14, and in the Western States 10 per cent, while in the Southeastern States it was 7 per cent and in the South Central States 7 per cent.

Of course, the magnitude of the proportion in the Northeastern States is due to the fact that this is the commercial and manufacturing section of the country, where a large proportion of all the population is engaged in these avocations. The same is the case, though in less degree, in the North Central States, while the Southern States are almost purely agricultural. The figures relating to manufacturing occupations show similar characteristics. It will be noted that in the Northern and Western States the occupations of the negroes were more diversified than in the Southern States. Agriculture and personal service in the Northeastern States occupied but 71 per cent of all wage earners, in the North Central States they occupied 75 per cent, and in the Western States 81 per cent, while in the Southeastern States these two occupation groups comprised 84 per cent and in the South Central 88 per cent of all.

The diagram shows in a similar manner the distribution of the female negro wage earners. There were engaged in agriculture in the Northern and Western States but a trifling proportion of negro women, while in the Southern States as a whole nearly one-half of the female negro wage earners were engaged in that avocation. On the other hand, personal service occupied fully nine-tenths of the female wage earners in the Northern and Western States, while in the Southern States less than one-half were engaged in it. Indeed, 94 per cent of the female wage earners of the West were engaged in personal service, 91 per cent in the Northeastern States, and 87 per cent in the North Central States. In trade and transportation the proportion was trifling and in manufactures it was small, although much larger in the North and West than in the South.

DIAGRAM NO. 7.—*Distribution of occupations by sex and sections of the country.*



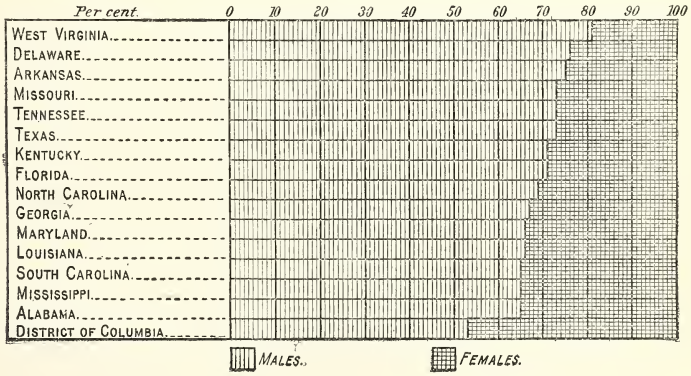


DIAGRAM NO. 8.—*Proportions of males and females among the negro wage-earner.*

Here also we see that agriculture and personal service occupied nearly all wage earners—91 per cent in the Northeastern States, 96 per cent in the Southeastern States, 89 per cent in the North Central States, 97 per cent in the South Central States, and 95 per cent in the Western States. Occupations were slightly more diversified in the North and West than in the Southern States, as was the case with the males.

OCCUPATIONS BY STATES.

It will now be of interest to extend this study in detail by States, but in doing so the study will be confined to the Southern, the former slave States, which are in a sense the home of the negro and in which more than nine-tenths of them live. In most of the Northern States the number of negroes is so small that any conclusions drawn from statistics regarding them are worthless and are likely to be misleading.

Diagram No. 8 shows the distribution by sex of the negro wage earners of these Southern States. The total length of the bar represents in each case all the wage earners, the white portion representing the males and the shaded portion the females.

This diagram shows that the greatest proportion of female wage earners is in the District of Columbia, where it is nearly one-half of all negro wage earners, and the least in West Virginia, where it is less than one-fifth of all. In most of the cotton States it ranges from one-fourth to one-third of all negro wage earners.

Diagrams Nos. 9 and 10 present the proportion of male and of female negro wage earners who are engaged in agriculture, personal service, and other occupations in the Southern States.

The first of these diagrams, representing male wage earners, shows that agriculture and personal service accounted for from 63 to 94 per cent of all male wage earners. Indeed, excluding the District of Columbia from consideration, from 73 to 93 per cent were accounted for by these two occupations.

Again, excluding the District of Columbia, which is not a farming community, the male wage earners who were farmers constituted in the different States proportions varying from 36 per cent in Missouri to 85 per cent in Mississippi. The proportion of farmers was highest in the cotton States and decidedly less in the border States. On the other hand, the proportion of males engaged in personal service was least in the cotton States and increased decidedly in those farther north.

The second diagram, illustrating the occupations of female wage earners, has certain features in common with that relating to males, but these features are more accented. In the cotton States a large proportion of the female wage earners worked in the fields and was therefore reported as engaged in agriculture, while in the border States but a small proportion was found there. On the other hand, domestic service claimed nearly all female wage earners in the border States, but in the cotton States a relatively small proportion.

Both the diagrams, and especially the first, show an important feature. In the cotton States wage earners were almost entirely either farmers or those engaged in personal service, but in the States farther north these classes were relatively smaller and occupations were somewhat more varied.

OWNERSHIP OF FARMS AND HOMES.

The statistics of farm and home ownership and of mortgage indebtedness of the Eleventh Census throw some light upon the pecuniary condition of the negro race.

The total number of farms and homes in the country in 1890 was 12,690,152, of which the negroes occupied 1,410,769, or 11.1 per cent. The proportion of negroes to the total population was at that time 12.20 per cent, showing a deficiency in the proportion occupying homes and farms when compared with the population.

The number of farms in the country was 4,767,179. Of these 549,642, or 11.5 per cent, were occupied by negroes, being a proportion greater than that of farms and homes combined.

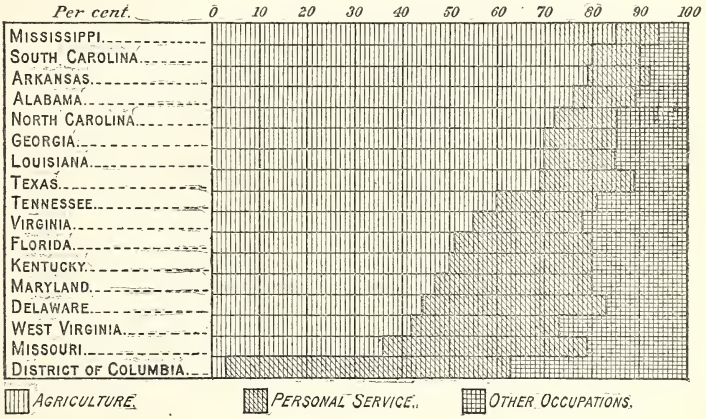
The number of homes, as distinguished from farms, in the country was 7,922,973, of which 861,137, or 10.9 per cent, were occupied by negroes, being a proportion less than that of farms and homes combined.

Of the 549,632 farms in the country occupied by negroes 120,738, or 22 per cent, were owned by their occupants. The corresponding proportion for whites was 71.7 per cent. Of course, as regards tenants, the reverse was the case, the proportions being for whites 28.3 per cent and for negroes 78 per cent. More than three-fourths of the farms occupied by negroes were rented; in other words, more than three-fourths of the negro farmers were tenants, while less than one-fourth of the white farmers were tenants.

Of the farms owned by negroes 90.4 per cent were without incumbrance. Of those owned by whites 71.3 were without incumbrance, showing a much larger proportion incumbered than among those owned by negroes.

Of 861,137 homes occupied by negroes in 1890, 143,550 were owned by their occupants and 717,587 were rented, the proportions being 19 per cent and 81 per cent.

DIAGRAM No. 9.—*Proportions of male negro wage-earners engaged in agriculture, personal service, and other occupations.*



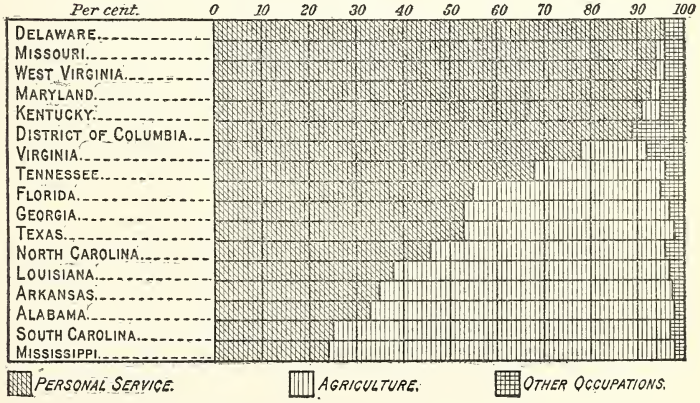


DIAGRAM No. 10.—*Proportions of female negro wage-earners engaged in personal service, agriculture, and other occupations.*

Corresponding proportions for whites were 39.4 per cent and 60.6 per cent. Of the houses owned by negro occupants 126,264, or 87.7 per cent, were free, and 12.3 incumbered. Corresponding figures for whites were 71.3 and 28.7 per cent, showing, as before, a much greater proportion of free holdings among negroes than among whites.

Diagrams Nos. 11 and 12 summarize the above facts in graphic form. The total areas of the squares represent the number of farms and homes, respectively, those occupied by whites and negroes, respectively, being represented by the rectangles into which the squares are divided by horizontal lines. The vertical lines subdivide these rectangles into others proportional to the numbers occupied by owners without and with incumbrance, and by renters.

The male negroes occupied in agriculture numbered, in 1890, 1,329,584. Of these 510,619 occupied farms, the remainder, 818,965, being presumably farm laborers. The negro farmers—i. e., occupants of farms—constituted 38.3 per cent of the male negroes engaged in agriculture, leaving 61.7 per cent of the number as laborers. The corresponding figures for whites were 60.4 per cent and 39.6 per cent. The proportion of negroes engaged in agriculture who were farmers—i. e., occupied farms—was, therefore, much smaller than that of the whites. In spite of this low comparative showing, however, it must be agreed that, considering all the attendant circumstances, the proportion of negro farm occupants—more than one-third of all negroes engaged in agriculture—is unexpectedly large.

Summing up the salient points in this paper, it is seen that in the matter of occupations the negro is mainly engaged either in agriculture or personal service. He has, in a generation, made little progress in manufactures, transportation, or trade. In these two groups of occupations males are in greater proportion engaged in agriculture and females in domestic service. They have, however, during this generation, made good progress toward acquiring property, especially in the form of homes and farms, and, in just so far as they have acquired possession of real estate, it is safe to say that they have become more valuable as citizens. The outlook for them is very favorable as agriculturists, but there is little prospect that the race will become an important factor in manufactures, transportation, or commerce.

IV.

A STATISTICAL SKETCH OF THE NEGROES IN THE UNITED STATES.

[By Henry Gannett, of the United States Geological Survey.]

From the time of the earliest settlement upon these shores the United States has contained two elements of population, the white race and the negro race. These two races have together peopled this country, increasing partly by accessions to their numbers from abroad and partly by natural increase, until to-day (1894) the white race numbers probably 61,000,000 and the negroes 8,000,000. The history of the latter race, thus brought into close association with a more civilized and stronger people for two and three-fourths centuries, is one of surpassing interest. Unfortunately, however, this history, for the earlier part of the period, is, with the exception of a few fragments, utterly lost. For the last century, however, since the year 1790, the date of the first United States census, we have, at ten-year intervals, pictures of the distribution of the race and considerable information regarding its social condition.

SLAVE TRADE.

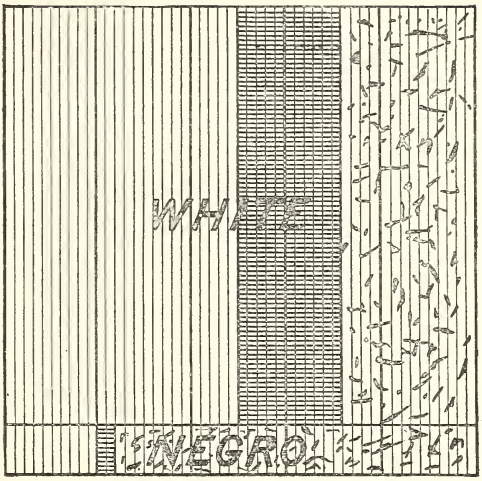
The slave trade flourished actively up to the close of the last century, and indeed it did not entirely cease until the year 1808. It was mainly in the hands of the English, including their North American colonies. It was a large and flourishing business for the shipowners of New England.

Of the number of slaves brought from Africa to this country, either directly or by way of the West India Islands, we have very little information. Prior to 1788 there are no records, and since that time the records of the slave trade do not distinguish between the slaves brought to the United States and those to other parts of America.

Of the number of slaves in this country in colonial times the information is almost equally scanty, consisting of little more than estimates by different historical writers. Of these, Bancroft's are perhaps as reliable as any. His estimates of the number of negroes at different times are as follows:

1750	220,000	1770	462,000
1754	260,000	1780	562,000
1760	310,000		

DIAGRAM No. 11.—*Farms.*



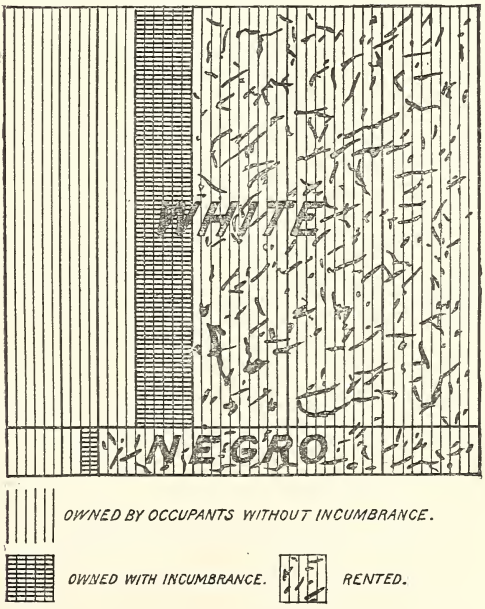


DIAGRAM No. 12.—*Homes.*

NUMBERS OF EACH RACE.

In 1790 we have the first reliable data regarding the number and distribution of the negroes. The total number of each race at this and each succeeding decennial enumeration is shown in the following table:

Census year.	White.	Negro.	Census year.	White.	Negro.
1790	3,172,006	757,208	1850	19,553,068	3,638,808
1800	4,306,446	1,002,037	1860	26,922,537	4,441,830
1810	5,862,073	1,377,808	1870	33,589,377	4,880,009
1820	7,862,166	1,771,656	1880	43,402,970	6,580,793
1830	10,537,378	2,328,642	1890	54,983,890	7,470,040
1840	14,195,805	2,873,648			

From this it appears that the whites have increased in a century from a little over 3,000,000 to nearly 55,000,000, and the negroes from three-fourths of a million to about 7,500,000. The whites were in 1890 nearly eighteen times as numerous as in 1790, the negroes nearly ten times as numerous.

The diagram constituting Plate I presents the same facts in graphic form. In each case the total length of the bar is proportional to the total population in the year indicated. The white portion of each bar represents the white population of the country, while the shaded portion represents the negro population.

The tables and diagram illustrate the rapid growth of the country in population, both of its white and its negro element.

PROPORTIONS OF EACH RACE.

The following table shows the proportions in which the total population was made up of these two elements at each census, expressed in percentages of the total population:

Census year.	White.	Negro.	Census year.	White.	Negro.
1790	80.73	19.27	1850	84.31	15.69
1800	81.12	18.88	1860	85.62	14.13
1810	80.97	19.03	1870	87.11	12.66
1820	81.61	18.39	1880	86.54	13.12
1830	81.90	18.10	1890	87.80	11.93
1840	83.16	16.84			

This table and Plate II show that on the whole the negroes have diminished decidedly in proportion to the whites. In 1790 they formed 19.27 per cent, or very nearly one-fifth of the whole population. At the end of this century they constituted only 11.93 per cent, or less than one-eighth of the population. At the end of the century their proportion was less than two-thirds as large as at the beginning. Moreover, this diminution in the proportion has been almost unbroken from the beginning to the end of the century. The proportion of the negroes has apparently increased in only two out of eleven censuses, namely, in 1810, immediately after the cessation of the slave trade, and in 1880. I say apparently, because in the latter case the increase is only apparent, due to a deficient enumeration of this race in the census preceding, namely, that of 1870.

RATES OF INCREASE.

The following table and the diagram accompanying it show the rates of increase of the negroes during each of the ten-year periods for the last century, and placed in juxtaposition therewith for comparison are the rates of increase of the whites of the entire country:

Decade.	Percentage of increase.		Decade.	Percentage of increase.	
	White.	Negro.		White.	Negro.
1790 to 1800	35.76	32.33	1840 to 1850	37.74	26.63
1800 to 1810	36.12	37.50	1850 to 1860	37.69	22.07
1810 to 1820	34.12	28.59	1860 to 1870	24.76	9.86
1820 to 1830	34.03	31.44	1870 to 1880	29.22	34.85
1830 to 1840	34.72	23.40	1880 to 1890	26.68	13.51

This table and diagram show that, with the exception of two ten-year periods, namely, those from 1800 to 1810 and 1870 to 1880, the negro element has in every case increased at a less rapid rate than the white element, and in many cases its rate of increase has been very much smaller.

Thus a comparison of the numerical progress of the negroes with that of the whites in the country, as a whole, shows that the former have not held their own, but have constantly fallen behind. They have not increased as rapidly as the whites.

It may be said that this is due to the enormous immigration which certain parts of the country have received, an immigration composed entirely of whites. This suggestion can easily be tested. White immigration on a considerable scale began about 1847. Prior to that time it was not of importance. We may then divide the century into two equal parts and contrast the relative rates of increase of the races during those half centuries. Between 1790 and 1840 the whites increased 4.5 times, the negroes 3.8 times. The latter element had diminished in relative importance in this half century from about one-fifth of the population to one-sixth.

In the succeeding fifty years the whites had increased 3.9 times, and the colored 2.6 times only. In other words, the greater increase of the whites has not been dependent upon immigration, since their rate of increase was greater than that of the negroes before immigration set in.

Rates of increase of white and negro population.

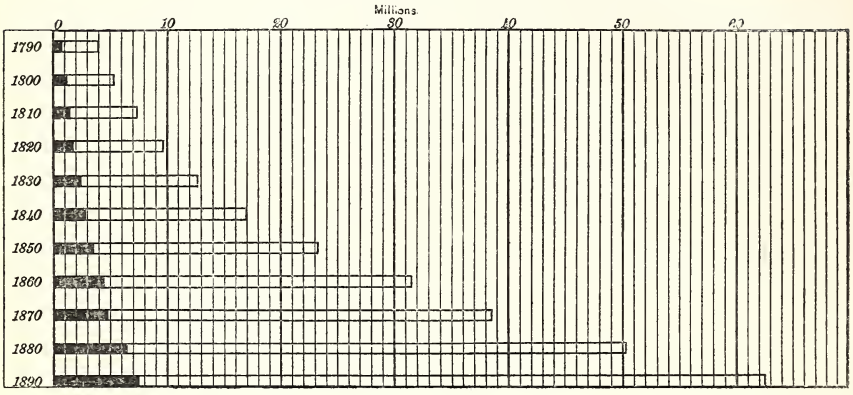
These figures, and the conclusions necessarily derived from them, should set at rest forever all fears regarding any possible conflict between the two races. We have before us the testimony of a century to show us that the negroes, while in no danger of extinction, while increasing at a rate probably more rapid than in any other part of the earth, are yet increasing less rapidly than the white people of the country, and to demonstrate that the latter will become more and more numerically the dominant race in America. Whether the negro will, through an improvement in his social condition, become of greater importance relatively to his numbers is a matter to be discussed later.

CENTER OF POPULATION.

The center of population, as it is called, may be described as the center of gravity of the inhabitants as they are distributed at the time under consideration, each inhabitant being supposed to have the same weight and to press downward with a force proportional to his distance from this center.

The center of population of all the inhabitants of the United States has been computed for each census. At the time of the first census, in 1790, the center of population was found to be in Maryland, on the eastern shore of Chesapeake Bay, nearly opposite Baltimore. The general westward movement of population has caused a corresponding westward movement of this center, such movement following very

PLATE I.—*Total population and white and negro elements.*



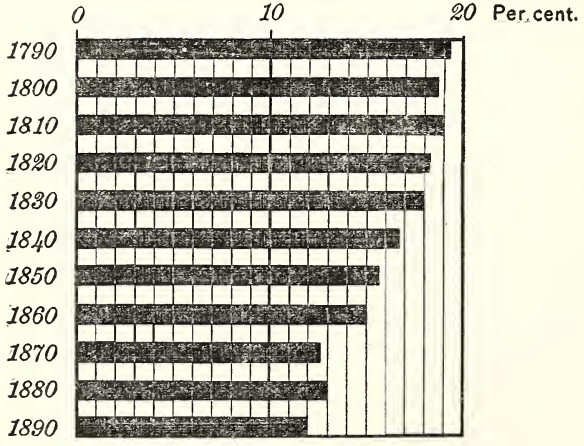


PLATE II.—*Proportion of the negro element to the total population.*

nearly the line of the thirty-ninth parallel of north latitude. In 1880 the center of the total population was found on the south bank of the Ohio River, nearly opposite Cincinnati, and in 1890 it was found in southern Indiana, 20 miles east of Columbus, in latitude 39° 12′ and in longitude 85° 33′.

The center of the negro population has been computed in 1880 and in 1890. At the first of these dates it was found in latitude 34° 42′ and in longitude 84° 58′. This position is in the northwestern corner of Georgia, not far from Dalton. In 1890 it was found to have moved southwestward into latitude 34° 26′ and longitude 85° 18′, being not far from the boundary between Alabama and Georgia and a few miles west of Rome, Ga. The longitude of the center of the negro population was very nearly the same as that of the total population, but in latitude it was nearly 5 degrees, or more than 300 miles, south of it. The positions of the center of total population and of the negro population in 1880 and in 1890 are shown upon the map which constitutes Plate VI.

The movements of the center of population are the net resultant of all the movements of population. During the past decade the negroes have moved in all directions, north, south, east, and west; but, as indicated by the movement of the center, the net resultant of their movements has been toward the southwest. As a whole this element moved in a southwesterly direction a distance of about 25 miles.

FREE NEGROES AND SLAVES.

Prior to 1870 the negro element, as returned by the successive censuses, was made up of two parts, free negroes and slaves. The proportions of these elements differed at different times, as is shown by the following table:

	1790.	1800.	1810.	1820.	1830.	1840.	1850.	1860.
Per cent which free negroes bore to all negroes	8	11	13.5	13	14	13	12	11
Per cent of all free negroes found in former slave States	55	56	58	57	57	56	55	54
Per cent of all free negroes found in free States	45	44	42	43	43	44	45	46

From this it appears that the free negroes constituted in 1790 only 8 per cent of all negroes, that the proportion increased rapidly to 1830, when they constituted not less than 14 per cent, and from that time the proportion diminished, until in 1860 they constituted 11 per cent of all negroes.

Moreover, the proportions of the free negroes found within the slave States and the free States differed at different times. More than half of the free negroes were found within the former slave States and less than one-half within the free States, and the proportion of free negroes found in the former slave States ranged from 54 per cent in 1860 to 58 per cent in 1810.

DISTRIBUTION OF THE NEGRO ELEMENT.

The negroes are distributed very unequally over the country. While they are found in every State and Territory and in almost every county of the land, the vast body of them are found in the Southern States, in those States lying south of Mason and Dixon's line, the Ohio River, the northern boundary of Missouri, and westward as far as Texas and Arkansas. The two maps on Plate III illustrate their distribution, State by State, over the country. One of these maps shows their density—that is, the average number in each square mile. It is an absolute measure of their numbers in different parts of the country. It is seen that they are the most plentiful in Maryland, Virginia, South Carolina, and Mississippi, and secondarily in North Carolina, Tennessee, Georgia, Alabama, and Louisiana. On the other hand, in nearly all the Northern and Western States they are very sparsely distributed, there being in these States, with scarcely an exception, less than four of them to a square mile, while in many of them there is less than one to a square mile.

The other map shows the proportion which the negro element bears to the total population, State by State. This is a measure of its importance relative to the whites. From this map it is seen that in three States, Louisiana, Mississippi, and South Carolina, more than half the people are negroes. Indeed, in South Carolina three out of every five of the inhabitants are of this race. It is seen further that in all the States along the Atlantic and Gulf, from Virginia to Louisiana, together with Arkansas, more than one-fourth of the people are negroes, while, on the other hand, throughout the entire North and West the proportion of negroes is less than 5 per cent, and in many of the States it is less than 1 per cent of the total population.

PROPORTION OF THE NEGROES IN THE SLAVE STATES.

The distribution of the negro race may be still more closely characterized by the statement that in 1890 there were found in the former slave States not less than 92 per cent of all negroes. This proportion has differed at different times during the last century, as is shown in the following table:

Proportion of total negro element comprised in former slave States.

Year.	Per cent.	Year.	Per cent.	Year.	Per cent.
1790	91	1830	93	1870	93
1800	91	1840	94	1880	93
1810	92	1850	95	1890	92
1820	93	1860	95		

From this table it will be seen that at the commencement of this history the former slave States contained 91 per cent of the negroes of the country. As time wore on this proportion increased, until in 1850 and 1860 they comprised 95 per cent, or nineteen-twentieths of all, while since that date, i. e., during the period of freedom of the race, it has shown a slight tendency northward, the proportion in the former slave States having become reduced, as above stated, to 92 per cent.

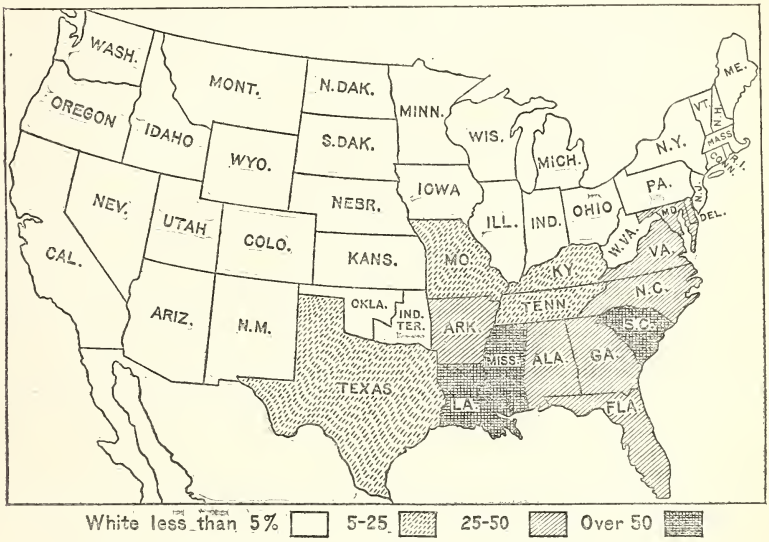
THE NEGROES OF THE SLAVE STATES.

In the above pages the history of the negroes has been traced in a broad, general way, and compared with that of the entire population and the white element of the country. The history is more or less complicated with the results of immigration, and with other disturbing factors, which have affected mainly the North and West. We may now, without serious error, confine our study of the race to the Southern States, the former slaveholding States, in which are found more than nine-tenths of the whole number of the negroes. The movement of these people from the South into the North has been inconsiderable, and there has been but little movement of the whites in either direction across the boundary line between the sections. The South has received little immigration either from the North or from Europe, and the emigration from it has been unimportant. So far as emigration and immigration are concerned, it has been throughout our history almost isolated from the rest of the world. So we may, without serious error, study the relations of the whites and blacks of this region by itself, without reference to other parts of the country.

PROPORTIONS OF THE RACES.

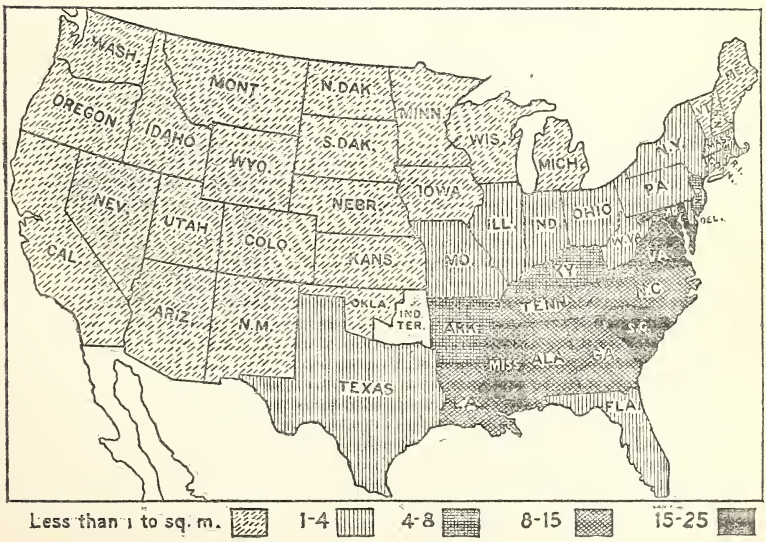
The following table and accompanying diagram (Pl. IV) show the proportions in which the population of this part of the United States was composed at each census for the past hundred years.

Proportions in which the population of former slave States was made up.



Census year.	White.	Negro.	Census year.	White.	Negro.
1790	65	35	1850	64	36
1800	65	35	1860	66	34
1810	63	37	1870	68	32
1820	63	37	1880	67	33
1830	63	37	1890	69	31
1840	63	37			

It appears from the above table that a century ago the population of the South was made up of whites and negroes in the proportions of 65 and 35 per cent, and that in 1890 the proportions were 69 and 31 per cent. The proportion of negroes increased from 1790 to 1810, when it reached 37 per cent, leaving only 63 per cent as the proportion of the whites, and remained practically stationary for three decades. Since 1840 the proportion of negroes has diminished.



RATES OF INCREASE.

The following table, showing the rates of increase of the two races for each ten-year period during the past century, leads to a similar conclusion—that is, that for a half century the negroes increased more rapidly than the whites, while during the last half century they have increased less rapidly.

PLATE III.—*Proportion of negroes to total population in 1890.*

Density of negro population in 1890.

Rates of increase of white and negro elements of former slave States.

From—	White.	Negro.	From—	White.	Negro.
1790 to 1800	34	33	1840 to 1850	34	27
1800 to 1810	30	39	1850 to 1860	30	22
1810 to 1820	28	30	1860 to 1870	17	8
1820 to 1830	29	32	1870 to 1880	33	34
1830 to 1840	27	24	1880 to 1890	24	13

THE NEGROES IN CITIES.

It is well known that as the population of a State or country increases such increase goes in constantly rising proportion into its cities; in other words, that urban population increases at a more rapid rate than the total population, especially after the population has passed a certain average density. This country presents an excellent example of this tendency of population toward the cities. At the time of the first census only 3⅓ per cent of the total population was in cities of 8,000 inhabitants or more, while in 1890, a century later, the proportion in cities had increased to over 29 per cent. The total population of the country had become very nearly 16 times as great, while its urban element had become 139 times as great. The latter had increased more than 8 times as rapidly as the former.

Having thus illustrated the general tendency of the people toward cities, it will be instructive to see how the negroes have behaved in this regard. In measuring their appetency for urban life I shall consider only the population of the former slave States, and shall contrast the negro with the white element of those States in this regard. I shall follow the practice of the Census Office also in considering as urban the inhabitants of cities of 8,000 or more.

In cities of 8,000 inhabitants or more there were found in 1860 only 4.2 per cent of the negroes of these States, while of the whites 10.9 per cent were found at that time in these cities. The violent social changes attendant upon the war produced, among other results, an extensive migration of negroes to the cities, so that in 1870 the proportion of them found in cities had more than doubled, being no less than 8.5 per cent, while of the whites there were found 13.1 per cent. In 1880 the proportion of negroes in cities had diminished to 8.4 per cent, while that of the whites had also diminished, being 12.4 per cent.

The census of 1890 shows a decided increase in the proportion of each race in the cities, that of the negroes being 12 per cent, and that of the whites being 15.7 per cent.

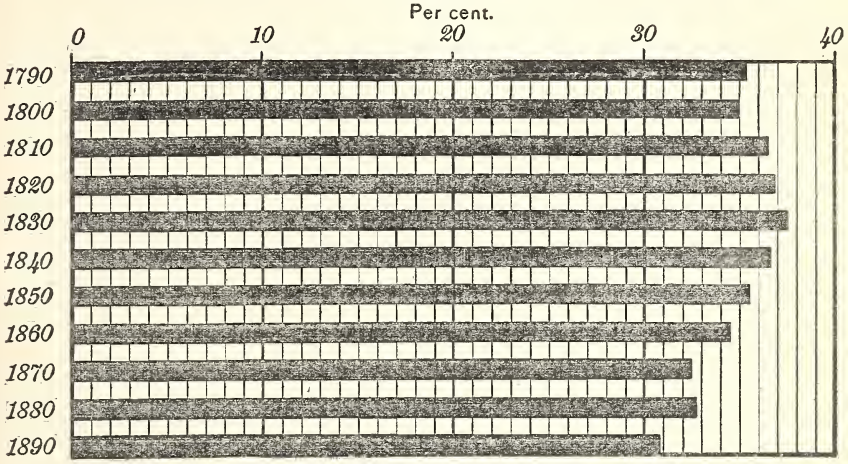
Thus it is seen that the proportion of the negroes in the cities has in every case been less than that of the whites, but that they have gained upon the whites in this regard. This gain is, however, very slight and is probably not significant. While the negro is extremely gregarious and is by that instinct drawn toward the great centers of population, on the other hand, he is not fitted either by nature or education for those vocations for the pursuit of which men collect in cities—that is, for manufactures and commerce. The inclinations of this race, drawn from its inheritance, tend to keep it wedded to the soil, and the probabilities are that as cities increase in these States in number and size, and with them manufactures and commerce develop, the great body of the negroes will continue to remain aloof from them and cultivate the soil as heretofore.

GEOGRAPHICAL DISTRIBUTION.

The geographical environment of the negro has been made a subject of careful study by the Census Office, and many interesting facts regarding its distribution with reference to topography, altitude, rainfall, and temperature have been developed.

It is found that more than 17 per cent of them live in the low, swampy regions of the Atlantic Coast and in the alluvial region in the Mississippi Valley. This proportion contrasts sharply with that of the total population, of which only 4 per cent are found in these regions. Upon the Atlantic plain the proportion of negroes is also much greater than that of the total population, and, generally speaking, it may be said that they seek low, moist regions and avoid mountainous country. This peculiarity of their distribution is brought out more forcibly in their distribution with reference to elevation above sea level. At an altitude less than 100 feet above the sea there are found nearly one-fourth of the negroes, while only about one-sixth of the total population is in these regions. Below 500 hundred feet are found seven-tenths, while nearly two-fifths of the total population are found at this altitude. Again, below 1,000 feet there are found 94.5 per cent of all the negroes of the country, while of the total population there are found only 77 per cent below that altitude.

PLATE IV.—*Proportion which negroes of former slave States bore to population of those States.*



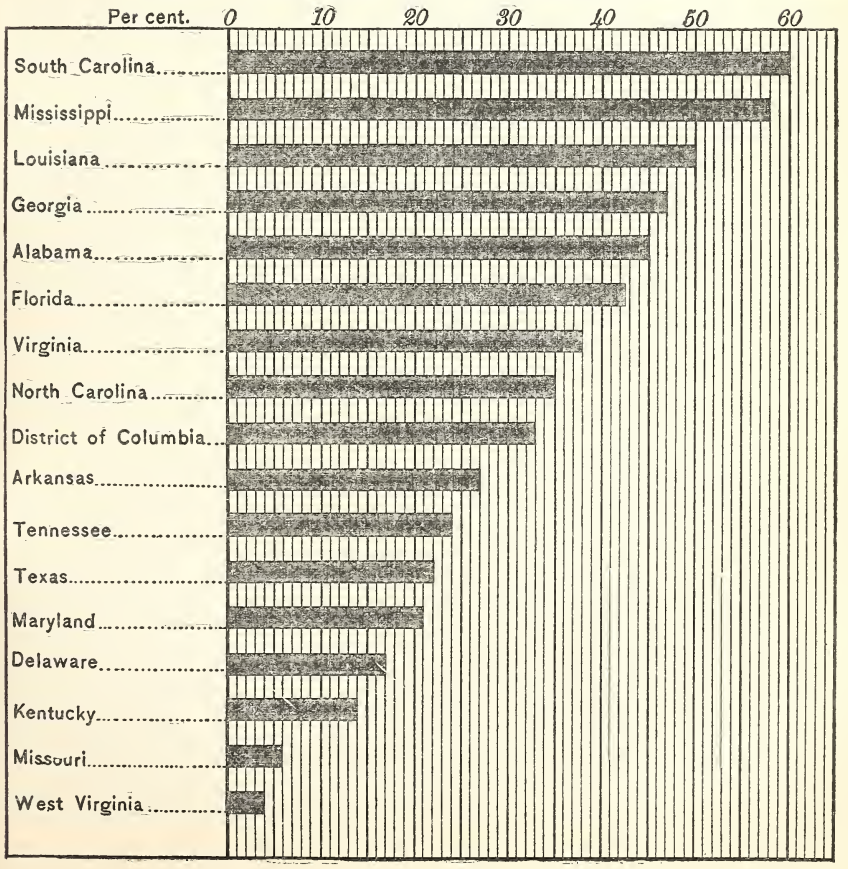


PLATE V[a].—*Proportion of negroes to total population in 1890.*

It is, of course, well known that the negroes prefer higher temperatures than the white race. A measure of this is given by the statement that while the total population lives, on an average, under a mean annual temperature of 53° F., that under which the negro lives is, on an average, 61°, or not less than 8° higher. The great body of the negroes live where the mean annual temperature ranges from 55° to 70°, very nearly 85 per cent of this element being found within the region thus defined.

Nothing perhaps more sharply characterizes the difference in the habitat of the negroes and the element of foreign birth than the difference in temperature conditions under which they are found, a difference which may be characterized by the following statement: In those regions where the annual temperature exceeds 55° are found seven-eighths of the negroes. On the other hand, in those regions where the temperature is less than 55° are found nine-tenths of the foreign born.

Those who are acquainted with the relations between the distribution of population and rainfall over the surface of the country are aware that the great body of the negroes is found in regions of heavy rainfall. Indeed, more than nine-tenths of their numbers are found where it exceeds 40 inches annually, and more than three-fifths where it exceeds 50 inches. These figures are greatly in excess of those concerning the total population.

HISTORY OF THE NEGRO IN EACH SLAVE STATE.

Thus far the distribution and history of the race have been considered broadly. It will now be of interest to take up each of the former slave States individually and trace the history of the race within its limits. This is summarized in the following table and group of diagrams (Pl. V), which present in each of the former slave States the proportion which the negro element bore to the total population at each census.

For economy of space the black bars representing the proportions in the diagrams are not extended to their full length, so the lengths of the bars do not represent the absolute percentage which the negroes bear to the total population. Since we are interested mainly in the relative lengths of the different bars of each State, and not in comparing those of one State with those of another, this is a matter of no consequence.

In Delaware the proportion of negroes in 1790 was about 22 per cent. This proportion increased gradually until 1840, when it was 25 per cent. Since then it has diminished, and in 1890 was about 17 per cent. In Maryland over one-third of the population were negroes in 1790. The proportion increased and reached a maximum in 1810, when it was 38 per cent. Since then it has diminished, and in 1890 was but 21 per cent. In the District of Columbia the proportion of negroes in 1800, the first year of record, was about 29 per cent. It reached its maximum with 33 per cent in 1810, and from that time steadily diminished until the opening of the civil war. In 1860 the proportion was 19 per cent. During the war large numbers of negroes took refuge within the capital, increasing the proportion to about one-third of the total population, which ratio has been maintained.

In Kentucky one-sixth of the population were negroes in 1790. The proportion increased until 1830, when it was about one-fourth of the population, since which time it has diminished and is at present but 14 per cent.

In Tennessee only one-tenth of the population were negroes at the time of the first census. That proportion steadily increased for 90 years, reaching its maximum in 1880, when it slightly exceeded one-fourth of the population. In the last ten years it has diminished a trifle.

The first report of population regarding Missouri was made in 1810. At that time about one-sixth of the inhabitants were negroes. In 1830 the proportion was slightly greater. Since then it has diminished rapidly, and in 1890 the negroes constituted less than 6 per cent of the population.

In the State of Virginia the negroes constituted in 1790 not less than 41 per cent of the inhabitants, and their proportion increased slightly for twenty years, reaching a maximum in 1810 of over 43 per cent. Since that time it has diminished steadily, and in 1890 constituted but 27½ per cent, taking the States of Virginia and West Virginia together.

All the above are border States, and all, with the exception of Tennessee and the District of Columbia, show a similar history. They show an increase in the proportion for two, three, or four of the earlier decades, and then a constant and great diminution in the proportion. The other States show a very different history. North Carolina, starting with 27 per cent, has increased slowly and with some slight oscillations up to 1880, when the proportion reached 38 per cent. In the last decade it has diminished. South Carolina, starting with 44 per cent, increased her proportion until 1880, when more than three-fifths of the population were negroes. Since then there has been a trifling diminution. Georgia started with 36 per cent, and with

some slight oscillations continued to increase until 1880. Within the last ten years there has been a slight reduction. In Florida the oscillations have been considerable. The history commenced with 1830, when 47 per cent of the population were negroes. It reached a maximum of 49 per cent at the next census, followed by a diminution for two decades. Then in 1870 it rose again to 49 per cent, since which time it has diminished rapidly, especially during the decade between 1880 and 1890. The history of Alabama commenced in 1820, when one-third of her people were negroes. The proportion increased up to 1870, and since then has diminished. Mississippi's history began in 1800, when 41 per cent of her people were negroes, and with some slight oscillations the proportion has increased up to the present time. The history of Louisiana commenced in 1810, when 55 per cent of her population were negroes. Her history has been a diversified one, the maximum proportion of this race being reached in 1830, with 59 per cent. Since that time it has, on the whole, diminished, and in 1890 half the people of the State were negroes. The history of Texas began in 1850, when 28 per cent of her people were negroes. The proportion increased for two decades, when it reached 31 per cent. Since that time it has diminished rapidly, owing largely to immigration to the central parts of the State. The history of Arkansas begins in 1820, when a little less than one-eighth of its people were negroes. The proportion has increased almost continuously from that time to the present, and in 1890 the negroes formed 27 per cent of the total population.

Thus it is seen that in the cotton States the proportion of the negro element has in nearly all cases increased until a very recent time. Indeed, in two or three of them it has increased up to the time of the last census, while in most of them the only diminution in the proportion has occurred during the last ten years. All this indicates in the most unmistakable terms a general southward migration of this race. As compared with the whites, the border States have lost in proportion of negroes for the past half century, while the cotton States have continued to gain until very recently.

Percentage of negroes to total population.

State.	1890.	1880.	1870.	1860.	1850.	1840.	1830.	1820.	1810.	1800.	1790.

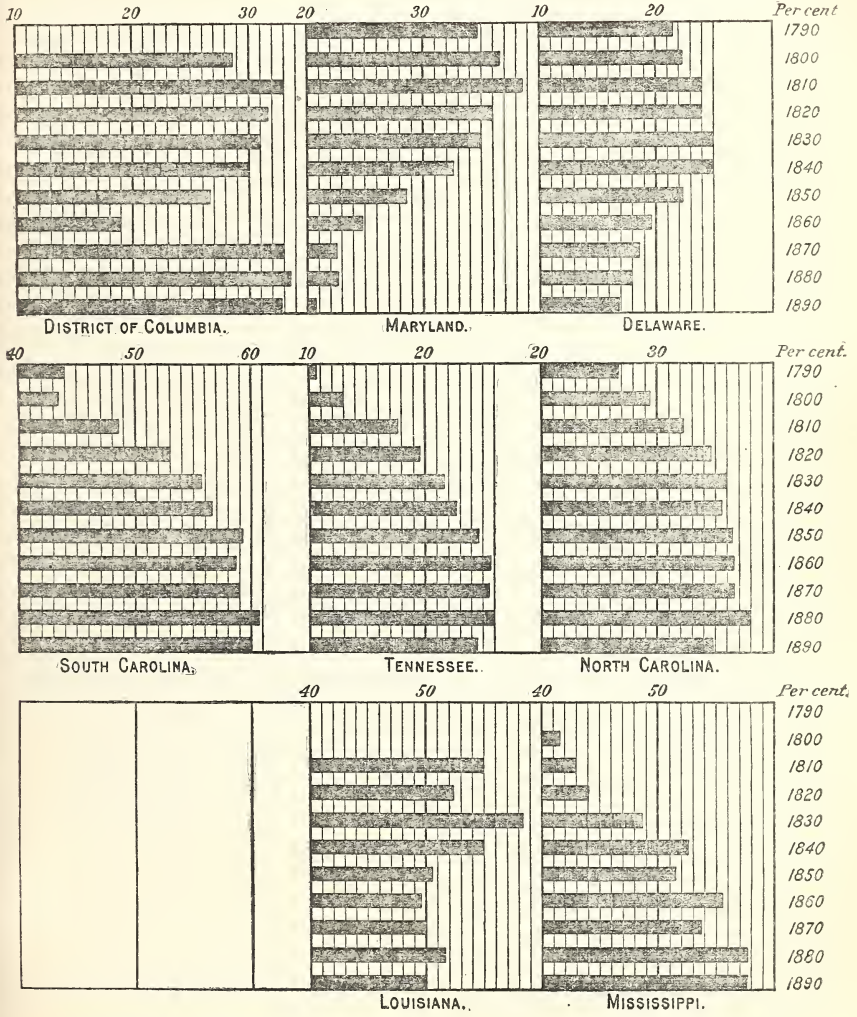
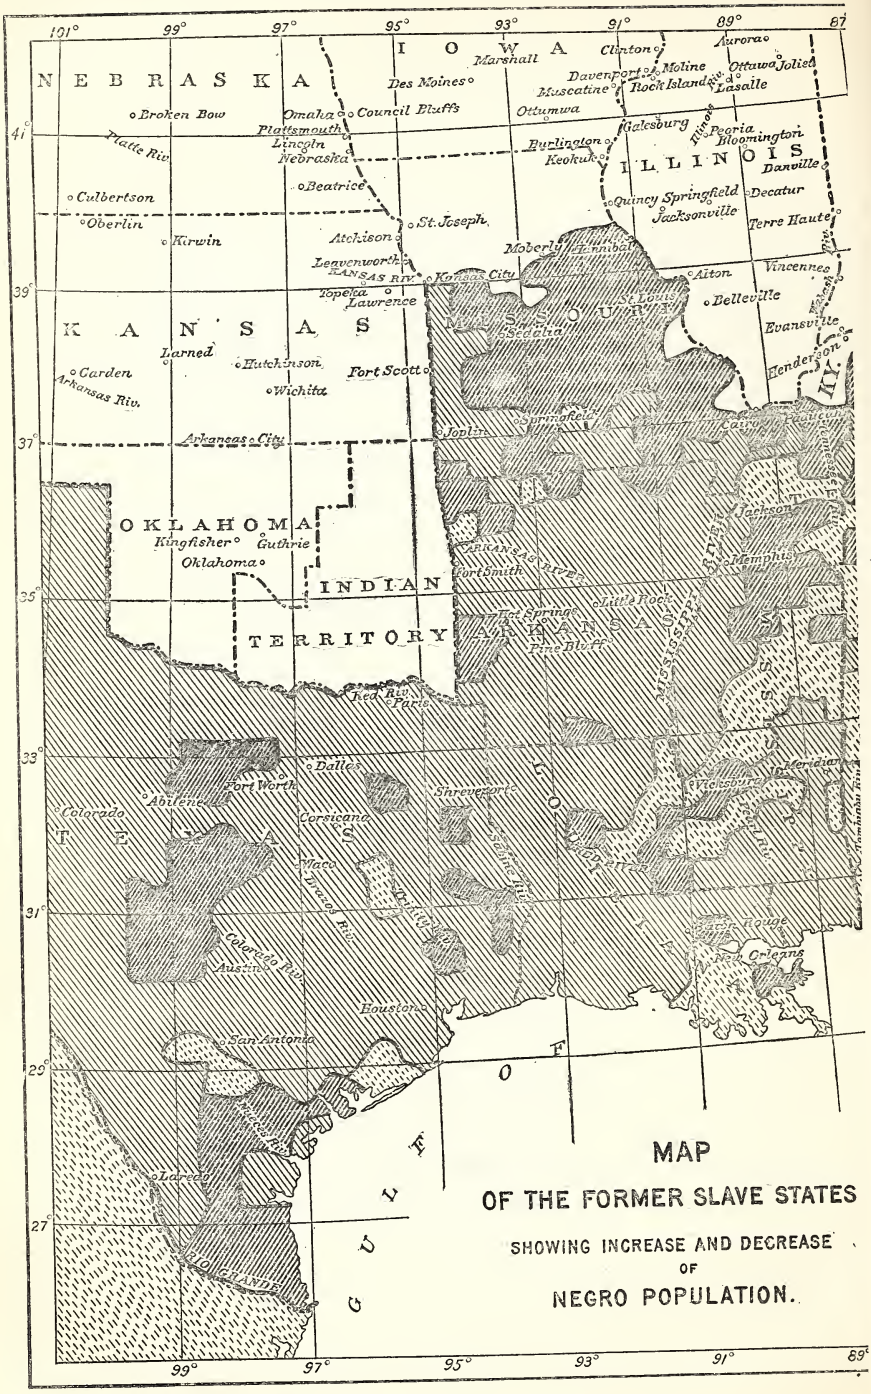
DETAILS OF MOVEMENTS OF NEGROES BETWEEN 1880 AND 1890.

The map on Pl. VI shows the movements of this race in detail during the ten years between 1880 and 1890, within the former slave States. The northern part of Missouri and western Texas are not represented upon this map, inasmuch as the number of negroes in these regions is not large.



The areas upon this map which have the darkest shade are those in which the number of negroes has absolutely diminished during the decade in question. The areas in the lightest tint are those in which the negroes have increased, but at a rate less than the increase of the same element in the country at large. The areas of medium tint are those in which the negroes have increased more rapidly than in the country at large.



It is seen at once that the areas in which the negroes have decreased are mainly comprised in the northern of these States, principally in Delaware, Maryland, Virginia, Kentucky, and Missouri, and secondarily in Tennessee and North Carolina. There are also areas of decrease in Texas and small areas in the other States, but these are of little importance in comparison with the great areas of the border States in which the number of negroes has actually diminished.

On the other hand, the areas in which the negroes have increased more rapidly than in the country at large are found mainly in the southern parts of South Carolina, Georgia, Alabama, Mississippi, and eastern Texas, with nearly all of Arkansas and Florida. In other words, the most rapid increase of the race has been in the southern and western parts of the region under consideration. There does not appear to be any decided movement into the "Black Belt," which traverses the central part of South Carolina, Georgia, Alabama, and Mississippi. Indeed, the heaviest increase is south of this region.

CONJUGAL CONDITION.

The conjugal condition of the negroes is set forth for the first time in the reports of the Eleventh Census. With the exception of the matter of divorce, it is summarized in the following diagram (Pl. VII). This shows the proportion of males and females at various ages who were single, married, or widowed. It shows that under the age of 15 there are practically no marriages among the race. Between 15 and 20 a small proportion, perhaps about 1 per cent, of males were married and 14 per cent of the females. At ages between 20 and 25 a third of the males and nearly three-fifths of the females were married, and with advancing age a constantly increasing proportion of both sexes is either married or widowed. It is evident, however, that the women marry much younger than men. The proportion of widowed first becomes appreciable between the ages of 20 and 25 years. It increases much more rapidly among females than among males, and altogether the proportion of widows is many times greater than that of widowers, showing that many more widowers remarry than widows, and that they marry largely unmarried women.

Comparison of conjugal statistics of the negroes with those of the whites develops two points of difference: First, that the negroes marry younger than the whites; second, that the proportion of widows at most ages is greater than among whites. The first of these facts is in accord with the shorter life period of the race; the second is a result of the greater death rate of the race.

Statistics of divorce show more frequent severance of conjugal relations among the negroes than among the whites. The proportion of divorced persons to married persons in the United States at large among the native whites was 0.59 of 1 per cent, while among the negroes it was 0.67 of 1 per cent.

MORTALITY.

There is no question but that the rate of mortality among the negro population is considerably greater than among the whites. It is not easy, however, to obtain an accurate measure of the relative death rates of the two races. The census statistics upon this subject are unreliable, since the returns from which they are derived are by no means complete. Were the omissions uniformly distributed between the two races we might still derive a comparison from them regarding the death rates of the two races, but unfortunately there is every probability that the omissions are much greater proportionally among the negroes than among the whites. It is only in a few large Southern cities which maintain a registration of deaths that reliable figures are to be had. In these cities the relative death rates during the census year (1890) are shown in the following table:

	Death rate per 1,000.		
	Total population.	Native whites.	Negroes.
St. Louis	19	17	35
Baltimore	25	22	36
New Orleans	28	22	37
Washington	26	19	38
Louisville	22	18	32

From these figures it appears that in the large cities the annual death rate of the negroes is very nearly if not quite double that of the native whites. It is probable that in the rural districts the disproportion among the death rates is not as great, since it is probable that a rural environment is better suited to the negroes than the environment of a large city. However this may be, there is no reasonable question, as stated above, that the death rate of the negroes is much larger than that of the whites.

CRIMINALITY.

The proportion of criminals among the negroes is much greater than among the whites. The statistics of the last census show that the white prisoners of native extraction confined in jails at the time the census was taken were in the proportion of 9 to each 10,000 of all whites of native extraction, while the negro prisoners were

in the proportion of 33 to each 10,000 of the negro population. Thus it appears that the proportion of negroes was nearly four times as great as for the whites of native extraction. It should be added, however, that the commitments of negroes are for petty offenses in much greater proportion than among the whites.

PAUPERISM.

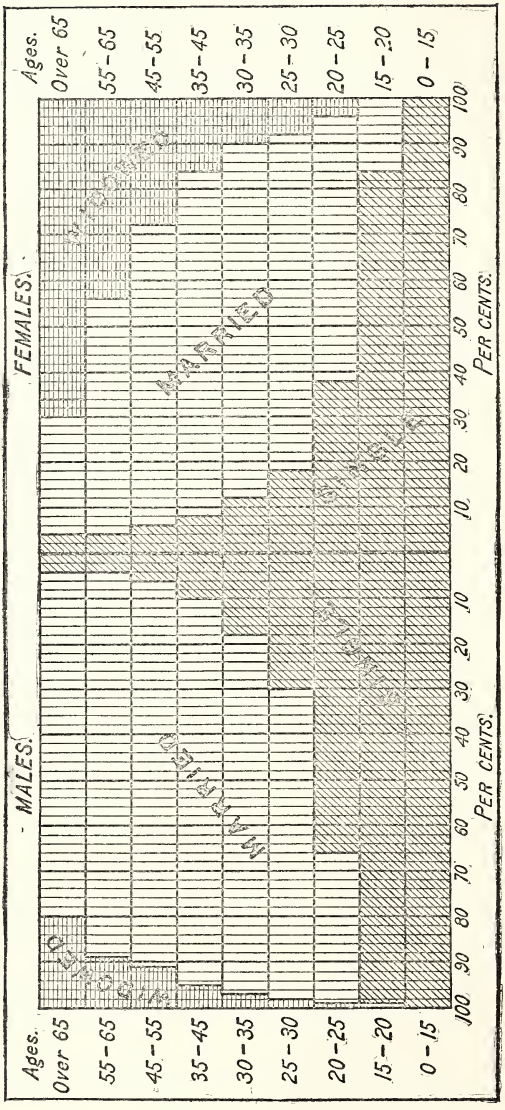
In respect to pauperism, the investigations of the census have been confined to paupers maintained in almshouses and have not been extended to those persons receiving outdoor relief, either permanent or temporary. The number of white paupers of native extraction in almshouses was found to be in the proportion of 8 to every 10,000 whites of native extraction, while the negro paupers were in the same proportion. Lest these figures should mislead, however, it must be added to this statement that in the South but little provision is made in the form of almshouses for the relief of the poor, this provision being confined almost entirely to the northern part of the country, a fact which in itself explains the small proportion of the negro paupers in almshouses. On the other hand, it is a matter of common knowledge to any resident of a Southern city that the negroes form a disproportionately large element of the recipients of outdoor charity.

ILLITERACY AND EDUCATION.

Of the progress of the negro race in education, the statistics are by no means as full and comprehensive as is desirable. Such as we possess, however, go to indicate a remarkably rapid progress of the race in the elements of education. During the prevalence of slavery this race was kept in ignorance. Indeed, generally, throughout the South it was held as a crime to teach the negroes to read and write, and naturally when they became freemen only a trifling proportion of them were acquainted with these elements of education. In 1870, five years after they became free, the records of the census show that only two-tenths of all the negroes over 10 years of age in the country could write. Ten years later the proportion had increased to three-tenths of the whole number, and in 1890, only a generation after they were emancipated, not less than 43 out of every 100 negroes, of 10 years of age and over, were able to read and write. These figures show a remarkably rapid progress in elementary education.

In 1860 the number of negroes who were enrolled in the schools of the South was absolutely trifling. Since the abolition of slavery the number has increased with the greatest rapidity. This is shown in the following table, which relates only to the inhabitants of former slave States. The first column shows the proportion which the number of white children enrolled in the public schools bore to the white population, and the second column the proportion which the number of negro children in the public schools bore to the total negro population of these States.

	White.	Negro.
1870	13.50	3.07
1880	18.33	13.07
1890	21.92	18.71



It is seen from the above table that in 1870 the white pupils constituted 13.5 per cent of the white population, and that in 20 years this proportion increased to nearly 22 per cent. On the other hand, the negro school children constituted in 1870 only 3 per cent of all negroes, but that in 20 years it has increased to nearly 19 per cent of all negroes. The proportion of negro school children increased at a far more rapid rate than that of the white school children, and in 1890 had nearly reached it.

The following table shows the proportion of such enrollment to population in 1890 in each of these states:

Per cent of school enrollment to population in 1890.

State.	White.	Negro.	State.	White.	Negro.
Delaware	19.12	16.38	Kentucky	22.27	20.40
Maryland	17.93	16.69	Tennessee	26.49	23.58
District of Columbia	15.24	17.61	Alabama	22.40	17.10
Virginia	21.59	19.20	Mississippi	27.71	24.60
West Virginia	25.58	20.04	Louisiana	13.43	8.82
North Carolina	19.79	20.80	Texas	21.06	22.21
South Carolina	19.49	16.46	Arkansas	19.98	19.22
Georgia	21.40	15.51	Missouri	23.24	21.76
Florida	24.37	21.85			

PLATE VII.—*Conjugal condition of the negro element.*

An examination of this table shows that in the District of Columbia, North Carolina, and Texas the proportional enrollment of negroes was greater than that of the whites, while in other States it was less.

The following table shows the rate of increase in the enrollment in each of these States from 1880 to 1890:

State.	White.	Negro.	State.	White.	Negro.
	Per cent.	*Per cent.*		*Per cent.*	*Per cent.*
Delaware	10.75	108.42	Kentucky	34.44	89.20
Maryland	20.07	35.78	Tennessee	53.88	65.56
District of Columbia	27.62	67.34	Alabama	66.99	53.52
Virginia	44.44	78.77	Mississippi	30.75	50.66
West Virginia	33.68	59.72	Louisiana	61.72	42.56
North Carolina	29.51	22.97	Texas	179.36	143.75
South Carolina	45.64	55.33	Arkansas	101.08	121.29
Georgia	39.09	53.81	Missouri	27.18	36.42
Florida	98.07	132.71			

From this table it appears that in all excepting four States, namely, North Carolina, Alabama, Louisiana, and Texas, the enrollment of negro children in the public schools has increased more rapidly than that of the whites.

Summing up this article in a paragraph, the following conclusions may be stated: The negroes, while increasing rapidly in this country, are diminishing in numbers relative to the whites. They are moving southward from the border States into those of the south Atlantic and the Gulf. They prefer rural life rather than urban life. The proportion of criminals among the negroes is much greater than among the whites, and that of paupers is at least as great. In the matter of education, the number of negro attendants at school is far behind the number of whites, but is gaining rapidly upon that race.

Only one generation has elapsed since the slaves were freed. To raise a people from slavery to civilization is a matter, not of years, but of many generations. The progress which the race has made in this generation in industry, morality, and education is a source of the highest gratification to all friends of the race, to all excepting those who expected a miraculous conversion.

V.

MEMORIAL SKETCH OF JOHN F. SLATER.

John Fox Slater, of Norwich, Conn., who gave a generous fund to promote the education of the freedmen, was a quiet, thoughtful, well-trained man of business, who rose by industry, sagacity, and prudence to the possession of a fortune. His chief occupation through life was the manufacturing of cotton and woolen goods in Connecticut and Rhode Island. In recent years, as his means increased, he was interested in many enterprises, some of them established in New York and others in the West. He was a close observer of the social, political, and religious progress of the country, and a frequent, unostentatious contributor to benevolent undertakings, especially such as were brought to his attention in the town where he resided and in the church which he attended. From all positions which made him conspicuous he was inclined to withdraw himself, and he probably underrated the influence which he might have exerted by the more public expression of his opinions; but whenever he did participate in public affairs he showed the same independence, sagacity, and resolution which marked the conduct of his business. Under these circumstances the story of his life is simply that of a private citizen who was faithful to the responsibilities which devolved upon him, and who gradually acquired the means to contribute liberally toward the welfare of others. Notwithstanding the well-known unwillingness of Mr. Slater to attract the attention of the public, those who are concerned in the administration of his trust desire to put on record the characteristics of his long and useful life.

For three generations the Slater family has been engaged, either in England or the United States, in the improvement of cotton manufactures. Their English home was at Belper, Derbyshire, where William Slater, a man of considerable property, the grandfather of John F. Slater, resided more than a hundred years ago, until his death in 1782. At Belper and at Milford, not far from Belper, Jedediah Strutt was engaged as a partner of Sir Richard Arkwright, in the business of cotton spinning, then just becoming one of the great branches of industry in England.

Samuel Slater, fifth son of William Slater, was apprenticed to Mr. Strutt, and near the close of his service was for some years general overseer of the mill at Milford. Having completed his engagement he came to this country in 1789, and brought with

him such an accurate knowledge of the business of cotton spinning, that without any written or printed descriptions, without diagrams or models, he was able to introduce the entire series of machines and processes of the Arkright cotton manufacture in as perfect a form as it then existed in England. He soon came into relations with Moses Brown, of Providence, and through him with his son-in-law and his kinsman, William Almy and Smith Brown. With the persons last named he formed the partnership of Almy, Brown & Slater. For this firm Samuel Slater devised machinery and established a mill for the manufacture of cotton, at Pawtucket, R. I., in the year 1790, but as this proved an inadequate enterprise, he constructed a larger mill at the same place in 1793.

A few years later, about 1804, at the invitation of his brother Samuel, John Slater, a younger son of William, came from England and joined his brother in Rhode Island. The village of Slatersville, on a branch of the river Blackstone, was projected in 1806, and here until the present time the Slaters have continued the manufacture of cotton goods.

John F. Slater, son of John and nephew of Samuel, was born in the village just named, in the town of Smithfield, R. I., March 4, 1815, and received a good education in the academies of Plainfield, in Connecticut, and of Wrentham and Wilbraham, in Massachusetts. At the age of 17 (in connection with Samuel Collier) he began to manage his father's woolen mill at Hopeville, in Griswold, Conn., and there he remained until he became of age. In 1836 he took full charge of this factory, and also of a cotton mill at Jewett City, another village of the same town, where he made his home. Six years later he removed to Norwich, with which Jewett City was then connected by railway. Here he married, May 13, 1844, a daughter of Amos H. Hubbard, and here his six children were born. Only two of them, the eldest and the youngest, a daughter and a son, survived the period of infancy, and of these the son alone is living. Norwich continued to be Mr. Slater's home until he died there, at the beginning of his seventieth year, May 7, 1884.

Before his last great gift, Mr. Slater made generous contributions to religious and educational enterprises. He was one of the original corporators of the Norwich Free Academy, to which he gave at different times more than $15,000. To the construction of the Park Congregational Church, which he attended, he gave the sum of $33,000, and subsequently a fund of $10,000, the income of which is to keep the edifice in repair. At the time of his death he was engaged in building a public library in Jewett City, which will soon be completed, at a cost of $16,000. His private benefactions and his contributions to benevolent societies were also numerous. During the war his sympathies were heartily with the Union, and he was a large purchaser of the Government bonds when others doubted their security.

Some years before his death, Mr. Slater formed the purpose of devoting a large sum of money to the education of the freedmen. It is believed that this humane project occurred to him, without suggestion from any other mind, in view of the apprehensions which all thoughtful persons felt, when, after the war, the duties of citizenship were suddenly imposed upon millions of emancipated slaves. Certainly, when he began to speak freely of his intentions, he had decided upon the amount of his gift and its scope. These were not open questions. He knew exactly what he wished to do. It was not to bestow charity upon the destitute, nor to encourage a few exceptional individuals; it was not to build churches, schoolhouses, asylums, or colleges; it was not to establish one strong institution as a personal monument; it was, on the other hand, to help the people of the South in solving the great problem which had been forced upon them, how to train, in various places and under differing circumstances, those who have long been dependent, for the duties belonging to them now that they are free. This purpose was fixed. In respect to the best mode of organizing a trust, Mr. Slater sought counsel of many experienced persons—of the managers of the Peabody educational fund in regard to their work; of lawyers and those who had been in official life, with respect to questions of law and legislation; of ministers, teachers, and others who have been familiar with charitable and educational trusts, or who were particularly well informed in respect to the condition of the freedmen at the South. The results of all these consultations, which were continued during a period of several years, were at length reduced to a satisfactory form, and were embodied in a charter granted to a board of trustees by the State of New York, in the spring of 1882, and in a carefully thought-out and carefully written letter, addressed to those who were selected to administer the trust.

The characteristics of this gift were its Christian spirit, its patriotism, its munificence, and its freedom from all secondary purposes or hampering conditions. In broad and general terms, the donor indicated the object which he had in view; the details of management he left to others, confident that their collective wisdom and the experience they must acquire would devise better modes of procedure, as the years go on, than any individual could propose in advance. * * *

On the 18th of May, 1882, Mr. Slater met the board of trustees in the city of New York and transferred to them the sum of $1,000,000, a little more than half of it

being already invested, and the remainder being cash, to be invested at the discretion of the board. On that occasion the trustees addressed him a letter acknowledging his generosity, and they invited him always to attend their meetiugs; but he never met with them again, and declined to guide in any way their subsequent action.

The gift of Mr. Slater was acknowledged by expressions of gratitude from every part of the country, and especially from those who were watching with anxiety the future of the blacks. The echoes of gratitude came also from distant lands. Henceforward, in the annals of Christian philanthropy, the name of John F. Slater will be honored among those who have given wisely, freely, and in their lifetime, to enlighten the ignorant and to lift up the depressed.

MEMOIR.

[By Rev. Dr. S. H. Howe, pastor of the Park Church, Norwich, Conn.]

Mr. John Fox Slater, founder of the fund that bears his name, was born in Rhode Island, March 4, 1815. His family came a generation before from England, and was identified with manufacturing interests in the countries both of its birth and its adoption. He who was to be associated in the public mind with industrial education among one of the races on the continent was born to the inheritance of a name which has held high eminence for its relation to industrial progress. One of his near relatives has been called the "father of American manufactures." Family tradition and family prominence along these lines early determined for him the career of a manufacturer, by which he laid the foundations of the fortune which he ultimately amassed. He early developed rare business aptitudes, as was evidenced by the intrustment to him of one of the mills of his father at the age of 17. From this early period he continued in the career of a manufacturer until his death, maintaining and enlarging the plant covered by his sole ownership not only, but also identified with other large manufacturing corporations as shareholder and director. Starting from the solid foundation of a good academical education, he found in business life a training and discipline which fitted him to grapple, with the hand of a master, with the largest questions in business and finance, and to achieve success where others failed. He had large experience in business life, and developed rare powers for the grasp of its intricate problems. His business successes were not due to the chances of trade, or the fluctuations of values, or to the daring and the ventures of speculation, but were the fruit of the sagacious and alert use of the opportunities which were in his own as in other men's reach. He possessed profound insight and exhaustive knowledge of affairs and men, with mental grasp and business training, some have believed, sufficient to have wisely controlled the financial interests of a nation. His judgment and counsel were sought by great corporations in the management of enterprises and industries which represented large investments and a vast outlay of capital. It is not strange that his ventures were so largely successful, and that his failures and losses were exceptional and rare.

Then his sagacity in business, which amounted to genius, was allied to honorable methods and to inflexible business integrity. Few men have had an aversion so severe and uncompromising to unfairness and to doubtful practices. His opportunities for speculation were many, but he carefully held himself aloof from all but the legitimate channels of trade. He gathered fortune by honorable methods—a fact of some significance to those who handle his munificent trust, and a significant fact to those who are helped to manhood and culture by it. The hands which created this noble foundation were clean hands.

Mr. Slater, as may be inferred from what has been said, was a man of wide intelligence, peculiarly receptive and hospitable to truth. To his strong Puritan sense of right and devotion to principle, he added that larger interest in the world and the age in which he lived, which gives scope and breadth to thought, and defends against mere local and provincial sympathies. And yet he was a public-spirited citizen in his adopted city, jealous of its good name, generous toward its charities. Toward his country he was patriotic and loyal, interested in its politics and its legislation.

He was a man of strong, pronounced personality; of fine fiber and of genuine manliness—a gentleman by instinct and training and habit; reserved and self-respecting, though genuinely sympathetic toward and accessible to all classes of men. He was sensitive concerning and deeply averse to that adulation which goes after great fortune for its own sake. It is the testimony of a friend who saw him most frequently through a long period of years and shared his confidence in a larger sense than others that in all his intercourse with him he had not heard a sentence that suggested the pride of fortune. He wished to be estimated for what he was and not for what he possessed. And this rule governed him in the estimate which he placed upon others. He was modest and unostentatious to the last degree. While

he was touched and gratified by the honor which came to him in connection with his great gift to benevolence, he did nothing to invoke it or to stimulate it. He remained amidst it all the same quiet, reserved, unostentatious citizen. He was to those who knew him well a most delightful and resourceful conversationalist. His breadth of view, his versatility, his familiar acquaintance with affairs and men, with questions of finance, politics, and religion, his taste for art, his knowledge of the world gained from travel, made his companionship delightful to those who shared it.

His interest in and gifts to benevolence antedated his later beneficence. Great gifts are never a bit of pure extemporization. Great things are not done on the spur of the moment. Those who develop unexpected resources on great occasions or show themselves capable of conspicuous sacrifices or services have had in advance their rehearsals. The noblest philanthropies are not extemporized or wrung forcibly from their authors by the stern importunity of death. Even legacies have generally a background of practical benevolence. Mr. Slater has given wisely and generously to objects that commended themselves to him. Many of these gifts were in the public eye, but it is the testimony of his nearest friends that he gave with larger liberality than the public could be aware of, with simplicity, and without ostentation, responding to cases of distress and suffering generously, but in such fashion as to conceal the giving hand.

But the conspicuous act of his life with which the public had most concern is of course the creation of the foundation for industrial education among the freedmen. Much that had gone before in his life had been leading up to this princely gift. He had always manifested a profound interest in education, had given largely, and had projected generous measures for educational work in the community, which, however, were yielded in the interest of his larger purpose. His interest in local education has been most worthily commemorated by the splendid memorial building erected in his honor by his son in connection with the Norwich Free Academy. Mr. Slater realized, and as his fortune grew was oppressed with, the sense of the responsibility of wealth, and planned long in advance to give in bulk to some worthy object of benevolence; and he resolved to execute this purpose in life rather than by bequest. The issues of the great civil war which unloosed the fetters of the slave, but which did not qualify him for the responsible duties of citizenship, gave Mr. Slater his great opportunity. He thought this problem through. He had been loyal, patriotic, and generous in his gifts when the struggle was upon the nation, and he rejoiced in the successful outcome; but here was a new field and an unlimited opportunity which he resolved to appropriate. His plan originated wholly and without suggestion from others with himself, and was elaborated to its minutest detail in advance of its publicity. Standing at this distance and looking through the experimental test of more than a decade of its working, it is impossible to resist the conviction that it was statesmanlike, patriotic, and Christian in its conception and spirit. Mr. Slater was wise to see what we have been learning, that the exigent want for the emancipated race was practical and industrial education. The higher education has its offices to take in exceptional instances, but for the masses of the race, so long submerged and held down to the low levels of intelligence where emancipation found it, the wisest, most practical, and resultful plan for its elevation was that devised by the founder of this educational fund. It was the instinct of patriotism and of practical statesmanship to go to the weakest spot in the body politic to strengthen it, as it was the impulse of Christian thought to place the ladder of ascent within reach of the foot of the lowest man, who was most hopeless of self-recovery. Perhaps this is occasion for surprise. Mr. Slater might have been patrician in his sympathies, exclusive and reserved in his associations. He had aptitudes and opportunities for aloofness from other than the privileged classes; he might have been exclusive in his sympathies rather than inclusive. But his sympathies swept him around to the opposite pole from that on which he stood. He crossed the whole diameter of society to find the lowest groove in our social and national life that he might do this conspicuous act of beneficence to the poorest of this nation's poor. Such examples of wise beneficence, which express the sympathy of the privileged for the unprivileged classes, do much to lighten the strain of self-government in a nation like ours. They do much to allay the antagonisms of society and to bridge the chasm which opens between those zones of enormous wealth on the one hand and a degrading poverty which are drawn across the map of our modern life. When wealth consents after this fashion to reach out helping hands toward the nation's poor and gives aid toward self-help, then many of the perplexing problems of modern socialism will be solved.

The wisdom of this foundation in its intent and aim can not easily be overstated. Not to create the conspicuous institution, that by concentration of forces focuses the public eye upon the giver, but rather and more wisely to distribute aid over a wide area, among a score or more of institutions; not to do the premature thing of providing foundations for university training for which the race has and for generations will have such scant preparation, but rather to make provision for training

along those practical and industrial lines, which is the exigent need, in order to self-help toward the creation of the home and an ordered life in the social community. The verdict of his fellow-workers in this field of philanthropic effort, after watching the experiment for a decade, is "Well done, good and faithful servant," and we may well believe that in these words we hear a higher verdict than man's.

The reflex influence of Mr. Slater's beneficence, we are persuaded, has been great. We can not estimate the good we do when we do good. The effect of this splendid beneficence in stimulating philanthropic enterprise, passing as it has into the currency of popular thought as a quickening inspiration, its impetus to the noble army of workers for the uplifting of the race, has been enormous. Its inspiration and influence upon this greatest decade of giving in all the history of the world has been immense we are confident. Other millions have gotten into the wake of this one; and we believe other men to whom God has given great wealth, and into whose hearts the passion of the cross has been poured, are to be moved by it to the breaking of their costly boxes of alabaster in the presence of the world's Christ. Such men are and are to be the saving and the enduring forces of the world. They may disappear from the eye; they cease to be seen as visible personalities, but they become immortal in the world as quickening influences. They walk in uncrowned regality through the ages. Their gifts, their lives, will be reduplicated as they spread by contagion the spirit of philanthropy among men; passing for a sort of fresh incarnation into the minds and hearts of others, who catch their spirit, and go to spread it and give it fresh forms and embodiments. Over such lives even death can have no power.

Mr. Slater only lived to see the genesis of the work he did, and of the forces he started in the world. His great gift, at that time almost an unprecedented one, awakened wide-spread interest. The news spread over the land and was borne across the sea. Hundreds of letters congratulatory and appreciative poured in upon him. His friends gave expression to their admiration. His city, to whose name his beneficence had imparted a fresh eminence and fame, made him aware of her appreciation of the honor he had bestowed upon her; but amid it all he remained the same unostentatious, quiet citizen—grateful and appreciative of the honor which had come to him, but accepting it rather as an unreckoned-upon accompaniment of his unselfish act. He remained in the routine of his accustomed business, and in the fellowship of friends and neighbors, as if he had only done a duty or accepted a privilege which lay in the path of his accustomed living. Two years later the fatal disease laid its hand upon him, when in the faith of a Christian he girded himself to go unto his Father's house. To many of us it was the summons to the presence of Him who was and is ever the Supreme Friend of the poor and the lowly, to hear His commendation: "In as much as ye have done these things unto the least of these, my brethren, ye have done them unto me. Enter into the joy of thy Lord."

VI.

DOCUMENTS RELATING TO THE ORIGIN AND WORK OF THE SLATER TRUSTEES, 1882 TO 1894.

Charter from the State of New York, approved April 28, 1882.

AN ACT to incorporate the trustees of the John F. Slater fund.

Whereas Messrs. Rutherford B. Hayes, of Ohio, Morrison R. Waite, of the District of Columbia, William E. Dodge, of New York, Phillips Brooks, of Massachusetts, Daniel C. Gilman, of Maryland, John A. Stewart, of New York, Alfred H. Colquitt, of Georgia, Morris K. Jesup, of New York, James P. Boyce, of Kentucky, and William A. Slater, of Connecticut, have, by their memorial, represented to the senate and assembly of this State that a letter has been received by them from John F. Slater, of Norwich, in the State of Connecticut, of which the following is a copy:

[Here the letter printed below is inserted.]

And whereas said memorialists have further represented that they are ready to accept said trust and receive and administer said fund, provided a charter of incorporation is granted by this State, as indicated in said letter; now, therefore, for the purpose of giving full effect to the charitable intentions declared in said letter;

The people of the State of New York, represented in senate and assembly, do enact as follows:

SEC. 1. Rutherford B. Hayes, Morrison R. Waite, William E. Dodge, Phillips Brooks, Daniel C. Gilman, John A. Stewart, Alfred H. Colquitt, Morris K. Jesup, James P. Boyce, and William A. Slater are hereby created a body politic and corporate by the name of The Trustees of the John F. Slater Fund, and by that name shall have perpetual succession; said original corporators electing their associates

and successors, from time to time, so that the whole number of corporators may be kept at not less than nine nor more than twelve.

Said corporation may hold and manage, invest and reinvest, all property which may be given or transferred to it for the charitable purposes indicated in said letter, and shall, in so doing, and in appropriating the income accruing therefrom, conform to and be governed by the directions in said letter contained; and such property and all investments and reinvestments thereof, excepting real estate, shall, while owned by said corperation and held for the purposes of said trust, be exempt from taxation of any and every nature.

SEC. 2. Rutherford B. Hayes, of Ohio, shall be the first president of the corporation, and it may elect such other officers and hold such meetings, whether within or without this State, from time to time, as its by-laws may authorize or prescribe.

SEC. 3. Said corporation shall annually file with the librarian of this State a printed report of its doings during the preceding year.

SEC. 4. This act shall take effect immediately.

Letter of the founder.

To Messrs. Rutherford B. Hayes, of Ohio; Morrison R. Waite, of the District of Columbia; William E. Dodge, of New York; Phillips Brooks, of Massachusetts; Daniel C. Gilman, of Maryland; John A. Stewart, of New York; Alfred A. Colquitt, of Georgia; Morris K. Jesup, of New York; James P. Boyce, of Kentucky, and William A. Slater, of Connecticut.

GENTLEMEN: It has pleased God to grant me prosperity in my business, and to put it into my power to apply to charitable uses a sum of money so considerable as to require the counsel of wise men for the administration of it.

It is my desire at this time to appropriate to such uses the sum of $1,000,000; and I hereby invite you to procure a charter of incorporation under which a charitable fund may be held exempt from taxation, and under which you shall organize; and I intend that the corporation, as soon as formed, shall receive this sum in trust to apply the income of it according to the instructions contained in this letter.

The general object which I desire to have exclusively pursued, is the uplifting of the lately emancipated population of the Southern States, and their posterity, by conferring on them the blessings of Christian education. The disabilities formerly suffered by these people, and their singular patience and fidelity in the great crisis of the nation, establish a just claim on the sympathy and good will of humane and patriotic men. I can not but feel the compassion that is due in view of their prevailing ignorance, which exists by no fault of their own.

But it is not only for their own sake, but also for the safety of our common country in which they have been invested with equal political rights, that I am desirous to aid in providing them with the means of such education as shall tend to make them good men and good citizens—education in which the instruction of the mind in the common branches of secular learning shall be associated with training in just notions of duty toward God and man, in the light of the Holy Scriptures.

The means to be used in the prosecution of the general object above described I leave to the discretion of the corporation, only indicating as lines of operation adapted to the present condition of things, the training of teachers from among the people requiring to be taught, if, in the opinion of the corporation, by such limited selection the purposes of the trust can be best accomplished; and the encouragement of such institutions as are most effectually useful in promoting this training of teachers.

I am well aware that the work herein proposed is nothing new or untried. And it is no small part of my satisfaction in taking this share in it that I hereby associate myself with some of the noblest enterprises of charity and humanity, and may hope to encourage the prayers and toils of faithful men and women who have labored and are still laboring in this cause.

I wish the corporation which you are invited to constitute to consist at no time of more than twelve members, nor of less than nine members for a longer time than may be required for the convenient filling of vacancies, which I desire to be filled by the corporation, and, when found practicable, at its next meeting after the vacancy may occur.

I designate as the first president of the corporation the Hon. Rutherford B. Hayes, of Ohio. I desire that it may have power to provide from the income of the fund, among other things, for expenses incurred by members in the fulfillment of this trust and for the expenses of such officers and agents as it may appoint, and, generally, to do all such acts as may be necessary for carrying out the purposes of this trust. I desire, if it may be, that the corporation may have full liberty to invest its funds according to its own best discretion, without reference to or restriction by

any laws or rules, legal or equitable, of any nature, regulating the mode of investment of trust funds; only I wish that neither principal nor income be expended in land or buildings for any other purpose than that of safe and productive investment for income. And I hereby discharge the corporation and its individual members, so far as it is in my power so to do, of all responsibility, except for the faithful administration of this trust according to their own honest understanding and best judgment. In particular, also, I wish to relieve them of any pretended claim on the part of any person, party, sect, institution, or locality, to benefactions from this fund that may be put forward on any ground whatever, as I wish every expenditure to be determined solely by the convictions of the corporation itself as to the most useful disposition of its gifts.

I desire that the doings of the corporation each year be printed and sent to each of the State libraries in the United States, and to the Library of Congress.

In case the capital of the fund should become impaired, I desire that a part of the income, not greater than one-half, be invested, from year to year, until the capital be restored to its original amount.

I purposely leave to the corporation the largest liberty of making such changes in the methods of applying the income of the fund as shall seem from time to time best adapted to accomplish the general object herein defined. But being warned by the history of such endowments that they sometimes tend to discourage rather than promote effort and self-reliance on the part of beneficiaries; or to inure to the advancement of learning instead of the dissemination of it; or to become a convenience to the rich instead of a help to those who need help, I solemnly charge my trustees to use their best wisdom in preventing any such defeat of the spirit of this trust, so that my gift may continue to future generations to be a blessing to the poor.

If at any time after the lapse of thirty-three years from the date of this foundation it shall appear to the judgment of three-fourths of the members of this corporation that, by reason of a change in social conditions, or by reason of adequate and equitable public provision for education, or by any other sufficient reason, there is no further serious need of this fund in the form in which it is at first instituted, I authorize the corporation to apply the capital of the fund to the establishment of foundations subsidiary to then already existing institutions of higher education, in such wise as to make the educational advantages of such institutions more freely accessible to poor students of the colored race.

It is my wish that this trust be administered in no partisan, sectional, or sectarian spirit, but in the interest of a generous patriotism and an enlightened Christian faith; and that the corporation about to be formed may continue to be constituted of men distinguished either by honorable success in business, or by services to literature, education, religion, or the State.

I am encouraged to the execution in this charitable foundation of a long-cherished purpose by the eminent wisdom and success that has marked the conduct of the Peabody education fund in a field of operation not remote from that contemplated by this trust. I shall commit it to your hands, deeply conscious how insufficient is our best forecast to provide for the future that is known only to God, but humbly hoping that the administration of it may be so guided by divine wisdom as to be in its turn an encouragement to philanthropic enterprise on the part of others, and an enduring means of good to our beloved country and to our fellow-men.

I have the honor to be, gentlemen, your friend and fellow-citizen,

JOHN F. SLATER.

NORWICH, CONN., *March 4, 1882.*

Letter of the trustees accepting the gift.

NEW YORK, *May 18, 1882.*

JOHN F. SLATER, Esq., *Norwich, Conn.:*

The members of the board of trustees whom you invited to take charge of the fund which you have devoted to the education of the lately emancipated people of the Southern States and their posterity, desire, at the beginning of their work, to place on record their appreciation of your purpose, and to congratulate you on having completed this wise and generous gift at a period of your life when you may hope to observe for many years its beneficent influence.

They wish especially to assure you of their gratification in being called upon to administer a work so noble and timely. If this trust is successfully managed, it may, like the gift of George Peabody, lead to many other benefactions. As it tends to remove the ignorance of large numbers of those who have a vote in public affairs, it will promote the welfare of every part of our country, and your generous action will receive, as it deserves, the thanks of good men and women in this and other lands.

Your trustees unite in wishing you long life and health, that you may have the satisfaction of seeing the result of your patriotic forecast.

The thanks of Congress.

JOINT RESOLUTION of the Senate and House of Representatives of the United States, approved February 6, 1883.

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the thanks of Congress be, and they hereby are, presented to John F. Slater, of Connecticut, for his great beneficence in giving the large sum of $1,000,000 for the purpose of "uplifting the lately emancipated population of the Southern States and their posterity by conferring on them the blessings of Christian education."

SEC. 2. That it shall be the duty of the President to cause a gold medal to be struck with suitable devices and inscriptions, which, together with a copy of this resolution, shall be presented to Mr. Slater in the name of the people of the United States.

JOINT RESOLUTION of the Senate and House of Representatives of the United States, approved April 9, 1896.

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the sum of one thousand dollars, or so much thereof as may be needed, is hereby appropriated out of any moneys in the Treasury not otherwise appropriated, to defray the cost of the medal ordered by public resolution numbered six, approved February sixth, eighteen hundred and eighty-three, to be presented to John F. Slater, of Connecticut, then living, but now deceased.

SEC. 2. That said medal and a copy of the original resolution aforesaid shall be presented to the legal representatives of said John F. Slater, deceased.

By-laws adopted May 18, 1882, and amended from time to time.

1. The officers of the board shall be a president, a vice-president, a secretary, and a treasurer, chosen from the members. These officers shall serve until death, resignation, or removal for cause, and vacancies, when they occur, shall be filled by ballot.

2. There shall be appointed at each annual meeting a finance committee and an executive committee. The finance committee shall consist of three, and the executive committee of five, the president of the board being, ex officio, one of the five.

3. There shall also be an educational committee consisting of six persons, three of whom shall be appointed by the board and three of whom shall be ex officio members, to wit, the president, the treasurer, and the secretary of the board.

4. The annual meeting of the board shall be held at such place in the city of New York as shall be designated by the board, or the president, on the second Wednesday in April in each year. Special meetings may be called by the president or the executive committee at such times and places as in their judgment may be necessary.

5. A majority of the members of the board shall be a quorum for the transaction of business.

6. In case of the absence or disability of the president, the vice-president shall perform his duties.

7. The secretary shall keep a record of the proceedings of the board, which shall be annually published for general distribution.

8. The executive committee shall be charged with the duty of carrying out the resolutions and orders of the board as the same are from time to time adopted. Three shall constitute a quorum for business.

9. The finance committee, in connection with the treasurer, shall have charge of the moneys and securities belonging to the fund, with authority to invest and reinvest the moneys and dispose of the securities at their discretion, subject, however, at all times to the instructions of the board.

All securities belonging to the trust shall stand in the name of "the trustees of the John F. Slater fund," and be transferred only by the treasurer when authorized by a resolution of the finance committee.

10. The secretary of the board shall be, ex officio, secretary of the executive committee.

11. In case of the absence or disability of the treasurer, the finance committee shall have power to fill the vacancy temporarily.

12. Vacancies in the board shall be filled by ballot, and a vote of two-thirds of all the members shall be necessary for an election.

13. These by-laws may be altered or amended at any annual or special meeting by a vote of two-thirds of all the members of the board.

Members of the board.

Name.	Year.	Resigned or died.
APPOINTED.		
Rutherford B. Hayes, of Ohio	1882	*1893
Morrison R. Waite, of the District of Columbia	1882	*1888
William E. Dodge, of New York	1882	*1883
Phillips Brooks, of Massachusetts	1882	†1889

C. B. Galloway, of Mississippi	1894	.....
Alexander E. Orr, of New York	1895	.....

*Died in office. †Resigned.

From 1882 to 1891 the general agent of the trust was Rev. A. G. Haygood, D. D., of Georgia, who resigned the office when he became a bishop of the Methodist Episcopal Church South. Since 1891 the duties of a general agent have been discharged by Dr. J. L. M. Curry, of Washington, D. C., chairman of the educational committee.

Remarks of President Hayes on the death of Mr. Slater.

Gentlemen of the Board of Trustees of the John F. Slater Fund:

Our first duty at this the fifth meeting of the trustees of the John F. Slater fund for the education of freedmen is devolved upon us by the death, since our last meeting, of the founder of this trust.

John F. Slater died early Wednesday morning, the 7th of May last, at his home in Norwich, Conn., at the age of 69. He had suffered severely from chronic complaints for several months, and his death was not a surprise to his family or intimate friends.

Two of the members of this board of trustees, Mr. Morris K. Jesup and myself, had the melancholy privilege of representing the board at the impressive funeral services of Mr. Slater at his home, at the Congregational Church, and at the cemetery in Norwich, on the Saturday following his death.

When he last met this board, his healthful appearance and general vigor gave promise of a long and active life. It was with great confidence that we then expressed to him our conviction that his wise and generous gift for the education of the emancipated people of the South and their posterity was made at a period of his life when he might reasonably hope to observe during many years its beneficent influence. But in the providence of God it has been otherwise ordered, and the life which we fondly wished would last long enough to yield to him the satisfaction of seeing the results of his patriotic forecast has been brought to a close.

He had a widely extended and well-earned reputation for ability, energy, integrity, and success as a manufacturer and as a man of affairs. He was a philanthropist, a patriot, a good citizen, and a good neighbor. He was a member of the Park Congregational Society in Norwich for many years and was warmly and strongly attached to the denomination of his choice. His church relations did not limit his sympathies, nor narrow his views of duty. In his letter establishing this trust is the following clause:

"The general object which I desire to have exclusively pursued is the uplifting of the lately emancipated population of the Southern States, and their posterity, by conferring on them the blessings of Christian education."

When asked the precise meaning of the phrase "Christian education," he replied that "the phrase Christian education is to be taken in the largest and most general sense—that, in the sense which he intended, the common-school teaching of

Massachusetts and Connecticut was Christian education. That it is leavened with a predominant and salutary Christian influence. That there was no need of limiting the gifts of the fund to denominational institutions. That, if the trustees should be satisfied that at a certain State institution their beneficiaries would be surrounded by wholesome influences such as would tend to make good Christian citizens of them, there is nothing in the use of the phrase referred to to hinder their sending pupils to it."

I forbear to attempt to give a full sketch of Mr. Slater. Enough has perhaps been said to bring to your attention the great loss which this trust has sustained in the death of its founder, and the propriety of placing on our records and giving to the public a worthy and elaborate notice of his life, character, and good deeds.

CHAPTER XXXIII.

REPORT ON EDUCATION IN ALASKA.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION, DIVISION OF ALASKA,
Washington, D. C., June 30, 1895.

SIR: I have the honor to submit the following annual report of the general agent of education in Alaska for the year ending June 30, 1895:

There is in Alaska a school population of from 8,000 to 10,000; of these, 1,030 were enrolled in the 17 day schools sustained by the Government. In addition to the Government schools, the missionary societies of the Moravian, Presbyterian, Episcopal, Methodist, Congregational, Baptist, Lutheran, and Roman Catholic churches sustained 24 schools with an enrollment of about 900 pupils. Of these latter, three-fourths were industrial pupils; these were clothed, housed, fed, and taught at the expense of the societies.

St. Lawrence Island, Bering Sea.—V. C. Gambell, teacher; enrollment of pupils, 52; population, barbarous Eskimos; mail, once a year. On the 15th of September, 1894, the revenue cutter *Bear* steamed away from St. Lawrence Island, leaving our two missionaries, Mr. and Mrs. V. C. Gambell, shut off from all communication with, or sight of, the civilized world for the next eight or ten months, as they then thought; but on October 2d a whale ship, which they vainly hoped would anchor, steamed close along the shore. When Mr. Gambell found that it would not stop, he hurried some natives into a boat, and, waving a coat to attract attention, rowed after it. The captain, seeing this, turned about and came back, taking Mr. Gambell on board. They had been in the Arctic over winter and were on their way to San Francisco, but hearing that the Gambells were on the island, had sailed near, so as to give them a chance to send letters or to afford them any help they could. After Mr. Gambell left the steamer and returned to their island home, their complete isolation began.

The school room is under the same roof and communicates with the house; but a new outside door allows the pupils entrance to it without going through the house.

The school opened the first Monday of November, 1894. The whole village was excited over this event. They are like one large family. Being separated from the main land by so much water, they rarely mingle with other Alaskans or Siberians, and, of course, intermarry constantly, so that everybody is related to everybody else, and the interests of one are the interests of all. So the opening of school would naturally be common talk. The pupils, ranging in age from 16 years down, are principally boys, the girls being too shy to go. The men were anxious to go, too, but it was thought best not to have them with the boys. Mr. Gambell had been apprised of the fact that the native language was very difficult to acquire, and this he has found to be the case. He teaches the children English, and they are as apt at learning as the average pupils in our schools. He writes, June, 1895, that the boys have learned enough English to be able to make themselves understood and to understand almost anything he wanted to tell them. They are particularly quick in arithmetic, as far as he has taken them, and specimens of their penmanship that he sent home are really remarkable. One exercise was copying on paper and reading short sentences written on the blackboard. After only a month's teaching they could read at once sentences containing words that they had learned. The men visit the school frequently, and are very much pleased to hear the sentences read. They sit breathlessly attentive until a sentence is read, and laugh heartily when it is rubbed out. When a boy hesitates, and fails to recognize a word at once, the men grow excited, and say, "oo-hook, oo-hook," an exclamation they use to their dogs when the want them to go faster. Some of the men try to write and make figures, but they do not succeed so well as the 15-year-old boys. In March, Mr. Gambell writes: "The boys are getting along well. They like number work, adding correctly and rapidly columns of five figures, some of them never making a mistake. Many of them know the multiplication table to the 'elevens.' I let them do so much of this because they like it, and I think they have more confidence in themselves and use

the English they know. They read well in the First Reader. I have used the phonetic method of teaching reading." They are fond of music, and learn the school songs readily. The whole village has learned these songs, and they can be heard at almost any hour of the day or night.

Teller Reindeer Station.—Teacher, T. L. Brevig; enrollment, 56; population, Eskimo. There are in the native village about 60 persons under 21 years of age. With but three or four exceptions, all of the children under 15 and over 6, have attended school with greater or less regularity. The discipline has been very easy to maintain. The teacher complains of lack of application and concentration with the pupils. Perhaps his difficulty is want of a common language, as the teacher does not understand the Eskimo and the Eskimos have not yet gained a sufficient knowledge of English to understand it.

Unalaska.—John A. Tuck, teacher, and Miss Mattie Short, assistant; enrollment of pupils, 39; population, Aleut. Good progress has been made during the year by the children in the practical acquisition of the English language. The greater part of those who have been under instruction for three years or more not only read, write, and speak, but do their thinking in English. In geography good work has been done, especially in drawing and interpretation of maps. The children encounter their greatest difficulty in mastering arithmetic, hence more than usual attention has been paid to their training in that subject. Many of the older pupils have fully conquered the four fundamental operations so as to be fairly rapid and remarkably accurate in their work. One girl has progressed well in mental arithmetic, and handles quite complex operations in fractions with ease and readiness. The attendance during the year has been mainly from the pupils in the Methodist Mission Home. Last spring a large and comfortable schoolhouse and teacher's residence was erected at an expense of $5,000. Before it was occupied, during the prevalence of a severe gale, it was blown from its foundations, and the school as in former years is still kept in a rented building. We trust that another season will see the Government building repaired and in good shape for use.

Unga.—O. R. McKinney, teacher; enrollment, 40; population, Aleut. This school continued from September without interruption until Christmas, when it was found necessary to close the house a few days for repairs. Through January and February the entire school population of the village was enrolled. During March an epidemic of sickness closed the school again for three weeks. Rapid advancement was made in reading, spelling, writing, and hygiene, and moral lessons. In these studies they made better progress than the same class of children in the States; they did not prove so bright, however, in aritmetic, although one class finished both decimal and common fractions during the year and reviewed the subjects in other books. The teacher has been encouraged by the special interest which the children take in the school. They never seem to tire of it, and often ask why they can not have school all the time. Over against this encouragement is the discouragement of much drunkenness in the community without any court of law to control the community. The most atrocious crimes can be committed and the perpetrator be allowed to go free.

Afognak.—Mrs. C. M. Colwell, teacher; enrollment, 38; population, Russian Creoles. During the winter a school of the Russo-Greek Church was opened in the village. Almost all of the inhabitants of Afognak are members of the Russian Church, and as the church officials insisted upon the children attending the church school half of each day the work of the public school was materially interfered with.

The natives of this region are exceedingly poor, and in order that some of the poorer children might attend school the teacher provided them with clothing.

Kadiak.—C. C. Solter, teacher; enrollment, 56; population, Creoles. The attendance during the year has been unusually good, some days the schoolroom being too small to accommodate all those wishing to attend. The teacher also reports increased regularity of attendance. There was a notable absence of the larger and older pupils, they having dropped out to go into business; one of the boys has secured a clerkship with the Alaska Commercial Company. Special progress was made in penmanship, composition, writing and drawing. Greater progress could be made if the pupils spoke English at home; but in their homes and out of school they hear nothing but the Russian language; as a natural consequence very few of the smaller pupils comprehend enough of English to understand what the teacher is saying to them. Singing continues a great attraction in the school. At the close of the school year an entertainment was given to a crowded audience of parents and citizens generally. The children performed their parts well, eliciting many expressions of commendation from the audience. As intemperance is so rife in nearly all Alaskan communities it is a source of special gratification to the teacher that the school children have all signed a promise not to taste any intoxicating liquor of any kind until they are 21 years of age. They show much pride in being called "temperance boys and girls," and sport their blue ribbon badges. A suitable woodshed has been constructed during the year in connection with this schoolhouse.

Haines.—W. W. Warne, teacher; Miss Fanny Willard (native), assistant teacher; enrollment, 64; population, Thlinget. The past year has been one of progress and the best of the four years that the present teacher has been in charge. This is largely due to the increased number of children in the Presbyterian Home. Experiments have been made with fair success in raising garden vegetables and opening up a small farm.

Sitka, No. 1.—Mrs. G. Knapp, teacher; enrollment, 37; population, white—American and Russian. The opening of a parochial school in connection with the Russian Church and the ever changing population of the town caused a considerable diminution in the attendance at this school. A kindergarten was conducted for the white children—American and Russian—during several months of the year.

Sitka, No. 2.—Miss Cassia Patton, teacher; enrollment, 180. Several of the adult natives have been as anxious to learn to read and write English as the children, and as most of them had to work during the day, the teacher gave them instructions after school hours As usual, the spring migration to the fishing grounds carried with it the majority of the children.

Juneau, No. 1.—S. A. Keller, teacher; enrollment 54; population, white. The schoolhouse during the year has been repainted and refurnished, new sidewalks were built to and around the schoolhouse, and pure, clean water conducted to the building from the city waterworks; also a small sum was spent in draining the marshy, swampy school ground and removing some of the stumps. The work should be continued on the playground until all of the stumps are removed and the ground thoroughly drained. The school itself has received more than usual sympathy and encouragement from the people themselves. The pupils are reported as bright and intelligent beyond the average. The winter being unusually mild, the regularity of the attendance of the primary class was better than ever known before; at the same time a large percentage of the children between 6 and 14 are still very irregular, and the teacher, in common with all the other teachers in Alaska, pleads for some law obliging regular attendance. At present no school in Alaska has advanced beyond the ordinary grammar grade. There are some pupils, however, that wish very much to continue the high-school work, and the hope is expressed that in time a high-school department may be established which shall draw advanced pupils from other sections. There is also great need for a primary teacher, Juneau having 40 children of the kindergarten age.

Juneau, No. 2.—Miss Elizabeth Saxman, teacher; enrollment, 50; population, Thlinget. During the year a comfortable building has been erected in the neighborhood of the native village. Here, as in several other places, the children of the Mission Home (Presbyterian) were the most regular in their attendance. The branches taught were reading from chart to World Reader, history, language, arithmetic, hygiene, geography, writing, and spelling. A small stock of kindergarten materials supplied the teacher proved of great service. Among the pupils was a middle-aged man who was so anxious to learn to read that he was always present at school whenever he was out of work. His diligence and zeal, although not accomplishing much for himself, was an inspiration to the children.

Douglas, No. 1.—L. A. Jones, teacher; enrollment, 42; population, white. During the winter an epidemic of scarlatina interfered very much with the progress of the school.

Douglas, No. 2.—Miss F. A. Work, teacher; enrollment, 26; population, Thlinget. This school consisted principally of children who were in the Friends' Mission Home. The pupils seemed anxious and willing to do anything required by the teacher, and while very bright in reading, writing, etc., seemed very dull in mathematics. As the Friends are proposing to establish a school the coming year for the native children, the Government will next season transfer this school to the neighborhood of the Treadwell Mills, where provision has been made for the erection of a suitable schoolhouse and teacher's residence.

Fort Wrangel.—Miss Anna R. Kelsey, teacher; enrollment, 61; population, Thlinget. During the previous vacation the well lighted and ventilated schoolroom had been further brightened up by a fresh coat of paint, adding much to its attractiveness to the children. The school has a moderate supply of apparatus, embracing physiological charts, maps, globe, numeral frame, unabridged dictionary, etc. A small supply of kindergarten material furnished the teacher has proved a valuable assistance. As at the other schools of the place, a Christmas entertainment was given the pupils. Much complaint is made of irregular attendance, many, even of children of 7 and 8 years of age, being kept from school to attend the native dances. A spirit of emulation, a desire to stand well in their classes, which has sprung up helped to secure good progress.

Klawack.—Miss Anna R. Kelsey, teacher; enrollment, 50; population, Thlinget. Owing to the smallness of the appropriation of Congress, this school has been closed for several years, and was opened during the present summer only during the vacation of the school at Fort Wrangel; but little more was accomplished than to keep up

a lingering hope in the minds of the population that some day they may be able to have school facilities for their children.

Jackson.—Mrs. C. G. McLeod, teacher; enrollment, 80; population, Thlinget. From year to year decided improvement is seen in the influence of the school upon the village. During the past year for the first time sufficient progress had been made to grade the school. The children are also showing a greater anxiety for education than formerly. A mother said to the teacher with regard to her 8-year-old boy: "What is the matter with Powell? He did not formerly care much for school; now he seems hungry for it, and frequently when the family breakfast is late, goes without his breakfast rather than be late at school."

Church Missions.

Cape Prince of Wales.—American Missionary Association (Congregational), Mr. and Mrs. William T. Lopp, missionaries; enrollment, 142, population, Eskimo. Upon the murder of Mr. H. R. Thornton, on August 19, 1893, there being no way of communicating with the outside world and securing another missionary, the station was suspended. In August, 1894, Mr. and Mrs. Lopp, who had been previously associated with Mr. and Mrs. Thornton, reopened the station. The past year has been the most successful and prosperous that the station has ever had. The total enrollment of the school was 142, and the average daily attendance during the school year was 108. In addition to the general exercises of the schoolroom, Mrs. Lopp conducted private classes of the advanced pupils and instructed the girls in knitting and sewing. In the fall of 1894, the Government gave the station 119 head of reindeer. During the past spring 78 fawns were born to the herd, of which 71 lived; at the present time the herd numbers 171. The reindeer were cared for by one experienced Siberian and five native Eskimo boys, ranging in ages from 14 to 19. Until April these herders lived in a log house 7 miles north of the village, and since then they have lived in a tent. The winter was unusually severe, and on several occasions when blizzards were raging the herd or parts of it were lost; but when the weather cleared up the missing ones were always found. Early in the winter of 1894 the natives seemed much interested in religion, so much so that a letter was sent to the Swedish Evangelical missions on Norton Sound inviting some of them to visit and help conduct a revival meeting. They responded by sending, in March, the Rev. David Johnson, who held special meetings for several weeks, with the result that a number of the Eskimos renounced their heathenism and accepted the religion of their teachers. Committees from a number of native villages have applied to Mr. Lopp to provide them schools.

Swedish Evangelical Union Missions.

Unalaklik.—Missionaries, Rev. and Mrs. A. E. Karlson, Mr. David Johnson, Miss Hanna Svenson, and Miss Malvina Johnson; population, Eskimo; enrollment, 64. This is the central station on Norton Sound.

Golovin Bay.—Native missionaries, Rev. August Anderson, Rev. Mrs. N. O. Hultberg, and Mr. Frank Kameroff; enrollment, 49.

Yakutat.—Missionaries, Rev. and Mrs. Albin Johnson, Rev. K. J. Hendrickson, and Miss Selma Peterson; enrollment, 60; population, Thlinget.

Protestant Episcopal Missions.

Anvik.—Rev. and Mrs. J. W. Chapman, Miss Bertha W. Sabine, and Dr. Mary V. Glenton, missionaries; population, Ingilik. During the year a new church building has been erected, and also a schoolhouse with accommodations for a few girls as boarding pupils; 3 girls were received as boarders during the winter. School was kept 173 days, with an average daily attendance of 16. Great prominence was given to instruction in English, with frequent translation exercises of native words into English and English into the Ingilik language; also the daily work has been first reader, reading chart, blackboard exercises, writing on slates, and translation exercises. During the three winter months Mr. Chapman took some of the older boys and gave them additional lessons outside of school hours. They can read at sight any simple English, write a clear, legible hand, translate fluently, and express themselves clearly in writing. A few of them are beginning to talk considerable English. A number of the psalms and hymns have been memorized by the school. The boarding girls take great interest in housework. Margaret, 10 years of age, makes excellent bread, biscuits, boiled rice, cleans fish or grouse, and keeps everything about the kitchen neat and bright. The day pupils among the girls do not make the same progress or take the same interest that the boys do. During the year Dr. Glenton has done much to mitigate the suffering of the people from disease and to teach the younger portion of them more attention to sanitary laws. Their language is the Ingilik. One of the teachers writes that the great trial of their work is not so

much isolation from the world with but one mail a year, nor the long, dark days of the Arctic winter, nor the severe cold, 40° below zero, but the three months of mosquitoes in summer, beside which the other annoyances become pleasures.

St. James Mission, Fort Adams.—Missionaries, Rev. and Mrs. J. L. Prevost, and Dr. Mary V. Glenton, medical missionary. The work at this station was suspended during the year while Mr. Prevost was East securing a needed rest.

Point Hope.—Missionaries, John B. Driggs, M. D., and Rev. H. E. Edson; enrollment, 86; population, Eskimo. The advancement of the children, while somewhat slow, has shown an improvement over preceding years and the question has not so much been how to secure the attendance of the children as to give attention to the number that come. This speaks well for the interest of the children, as the schoolhouse is more than a mile from the nearest residence, and a 2-mile round trip to school and return in that Arctic climate is no small journey.

ROMAN CATHOLIC MISSIONS.

The foundation of these missions on the Yukon River dates from 1886. The priests entered the Yukon Valley by way of Juneau, and first settled at Nulato, where a small day school was started. In 1888–89 a new site was selected lower down the river, and called Holy Cross Mission. This is situated about 350 miles from the mouth of the Yukon and is known on the map as Koserefski. Four sisters of St. Anne arrived, and a boarding school was started, which has proved to be most satisfactory. Soon about 40 girls and 30 boys were collected; several of these were very young, some only 3 to 4 years.

The majority of the pupils remain all the year; only a few of the children of traders go to their homes during the vacation season. With the increase of pupils extra help was needed and seven more Sisters were sent up.

The girls are taught how to sew and to make their clothing, and are also instructed in their native fur work, bootmaking, etc., by an Indian woman who has been with the Sisters from the start. The Sisters cultivate a large garden which produces potatoes, turnips, cabbage, cauliflower, radishes, and carrots. Experiments with other vegetables are made, and a large variety of hardy flowers have been raised with great success. The priests have also an extensive garden—this year one entire acre has been planted with potatoes. Timothy has been introduced, and its prospects are most favorable. The garden work is carried on entirely by the children. The natives of the neighboring village begin to show some little interest in gardening, but as yet none have acted on our advice to attempt a garden for themselves. They have coined a word meaning "big leaves," by which they designate cabbage, and are yet resting after this first agricultural effort. As an object lesson for them, we transplanted a number of wild raspberries and currants to a corner of the garden, and hope to improve these fruits by cultivation.

The children are taught to read and write, and the simple rules of arithmetic. They all, as a rule, write very beautifully, and also readily learn drawing. English is always spoken, and in a very short time there will hardly be found a village on the Yukon where a few English-speaking young people are wanting.

In connection with the boarding school at Holy Cross there is also a day school. This is held in a separate building, and is for the children of the adjoining village. The average attendance is about 30, and a number of women come very regularly. These receive a lunch of bread and tea in the middle of the day.

Innuit School.—Last year a school was started in the Delta region for the benefit of the coast Eskimo. Four Sisters have charge, and the routine, etc., is carried on exactly as at Holy Cross. There are two villages situated about forty-five minutes' walk from the school, and the children come with great regularity. Only a few as yet have been admitted as boarders, for experience teaches that it is better to keep them for a while on probation as day scholars. The Eskimos are most devoted parents and very loath to surrender their offspring. When, little by little, they see the benefit their objections fade away.

Russo-Greek Church.—The Russian Church has numerous stations along the southern coast of Alaska, with one on the Nushagak River, one upon the Yukon, and one at St. Michael.

MORAVIAN MISSIONS.

Bethel.—Missionaries, Rev. and Mrs. John H. Kilbuck, Mr. and Mrs. Benjamin Helmich, Miss Mary Mack, and George Nokochluch (native) and Miss Philippine King; enrollment of pupils, 32; population, Eskimo. The school work was recommenced July 21, and was carried on very much as in previous years without any special changes or incidents to mark its even course. A special Bible class of the oldest boys was organized, who read the English fluently and translate readily into the native language. They are to be trained as catechists to visit and preach in villages when the white missionaries can not go. At the same time the missionaries form themselves

into a class for the study of the native language. In the last spring an Eskimo by the name of Neck invented a system of hieroglyphics for writing their language. He has translated several things into those characters, among them being the manual of the church and many of the parables and incidents in the life of the Savior He can read this as readily as we read our print. On the 4th of October Miss King was transferred from Ougavig in order to assume the duties of the matron of the school. The Rev. Mr. Kilbuck had a severe attack of pneumonia which laid him aside for work from November to March. This, however, called out the zeal of the native element, and the catechists made eleven preaching journeys in Mr. Kilbuck's place. The interest created by these preaching tours was so great that the three villages of Napaskiegamieut, Napagjechagamieut, and Loamavigamieut have each asked for a religious teacher to reside permanently in their village. During the fall an important conference was held, in attendance upon which there were 21 native helpers and delegates in addition to the missionaries. At this conference the work was carefully mapped out for the year. During Mr. Kilbuck's sickness the shamans had a great gathering of the people at Qurechlagamieut for the purpose of creating opposition to the missionaries. They claimed that by their sorcery they had made Mr. Kilbuck sick, and that he would die; and that they would make all the teachers sick and die, and all the people that believed in the teaching of the missionaries should die. After they had worked themselves up to considerable frenzy against the mission work, David Skuviuk, an Eskimo boy who had attended school at Carlisle, Pa., got up before the assembled crowd and made an address so striking and convincing that the opposition was allayed and the assembly was turned from denunciation and hatred to praise and friendliness. He was followed by several of the schoolboys offering prayer. The boys taking part in such a large assemblage and in presence of their elders was a thing never before seen in that section. After the service one of the principal men from the seacoast said: "I have argued with men, but they have never shaken my determination to hold to the old tradition; but that little boy, in the presence of this audience, by his prayer unsettles me; there is something more than human that enables that boy to stand up and speak like that." The year has been one of large spiritual interest.

Ougavig.—Missionaries, Rev. and Mrs. Ernst L. Weber and Mr. and Mrs. David Skuviuk (natives); enrollment in school, 21. Twenty-six persons were confirmed to the church during the year, the native church numbering 52 communicants.

Carmel.—Missionaries, Rev. and Mrs. John Schoechert, Misses Mary and Emma Huber; enrollment in school, 30, and average of 27; population, Eskimo. Nineteen boys and 9 girls were boarded in the home. During the year 13 communicants were added to the church. A temperance society was also formed, and a paper was signed by nearly all the fishermen and white men on the Nushagak River, promising their support in aid of efforts to maintain order and prevent the natives from making intoxicants

METHODIST EPISCOPAL MISSIONS.

Unalaska.—Missionaries, Mr. and Mrs. John A. Tuck; attendance, 30 boarders; population, Aleut. During the year a commodious two-story building has been erected for the Jesse Lee Memorial Home, costing about $5,000. Many of the 30 girls in the home are orphan waifs, gathered from various portions of the Aleutian chain of islands; they have been taken in, housed, fed, clothed, and educated; they are taken out of the misery and degradation that surrounded them in their aboriginal state, and are being trained up to become a civilized race, the future wives and mothers of that section of the country. In the vast territory tributary to Unalaska are numerous children, many of them children of white men and native mothers whose fathers have abandoned their mothers. Left to the care of poor, ignorant, and often drunken mothers, with no one to provide suitable food and clothing, in destitution and want, growing up like animals, it is not wonderful that this central home seems to them the very gate of heaven. Once under its Christian influences they rapidly become an independent, well-behaved set of children. Those who have been inmates of the home for three years or more, not only read, write, and speak, but seem to do their thinking in English. This is one of the bright spots in the midst of the general darkness and heathenism of western Alaska. In the fall of 1895 Mr. and Mrs. Tuck retired from the charge of the home, Mr. Tuck giving his entire attention as principal of the Government school. Miss Agnes I. Sowle, of Hagaman, N. Y., was appointed to the principalship of the home: Miss E. Mellor, assistant.

BAPTIST MISSIONS.

Wood Island.—Missionaries, Mr. and Mrs. W. E. Roscoe and Miss Lulu Goodchild; attendance, 25 boarders; population, Russian creole. This mission is the only one in a distance of 1,100 miles. It is equipped with a good two-story frame building. At the close of the year Mr. and Mrs. Roscoe expect to retire from the work; their places to be supplied by Mr. and Mrs. C. T. Coe and Miss Hattie Snow. There are

hundreds of native settlements tributary to the mission, and the extent of the work is limited by the amount of funds which the Woman's American Baptist Home Missionary Society can secure for that purpose.

INDEPENDENT MISSION.

Metlakahtla.—Mr. William Duncan, superintendent; enrollment, 105; population, Tsimpsheans. This unique settlement continues on the even course of its way; year by year progress is made. During the past year a handsome church has been erected by the community. The salmon cannery, in addition to paying out $14,000 in wages to the community, has netted a dividend of 15 per cent upon capital invested.

PRESBYTERIAN MISSIONS.

Point Barrow.—During the fall of 1894 and spring of 1895 Mr. L. M. Stevenson succeeded in erecting and completing the mission house. Efforts were commenced as early as 1891 to send to this point building material, but owing to the inaccessibility of the station (300 miles north of the Arctic Circle), these efforts failed year after year until 1894. The erection of this house secures a comfortable home for the missionary, and furnishes an opportunity of carrying on his work with greater efficiency. During 1894–95 school was kept during November, December, and January, with an average daily attendance for two months of 51. Studies taught were spelling, first and second readers, and arithmetic. This station greatly needs a devoted man and his wife, who will go there expecting to make it their life work.

Last summer the revenue cutter was prevented by the arctic ice from reaching the Point, and the mission this winter is without its usual supplies. Owing to this, it has been reported that the school is closed.

St. Lawrence Island.—This large island is situated in the northern part of Bering Sea, almost under the Arctic Circle. In 1894 Mr. and Mrs. V. C. Gambell, of Wapello, Iowa, were landed and left there by the U. S. revenue cutter *Bear*, after a long and perilous trip from San Francisco to Bering Strait on a whaler.

The house which had been built three years previous was found comfortable, and the work more pleasant than expected. The school grew in interest from the opening to the close. At first all ages and classes came, crowding the schoolroom to suffocation. To secure better results, the pupils were limited to the children and young men and women. They proved apt scholars and took a pride, out of school, in airing their English, repeating to their parents and friends the English names of familiar objects. There was also no difficulty in preserving discipline, the young people seemingly not knowing how to act disrespectfully to their elders. After school the teachers frequently accompanied the pupils out upon the ice, climbing and sliding down the small icebergs or hillocks; sometimes out to a lake, where the skates of the teachers were an unfailing source of interest to the pupils. The year has been one of much success in the work. Last summer a good sewing machine and a cabinet organ were sent to the mission. Mr. and Mrs. Gambell sent by their annual mail a check for $25 for the new Christian college in Utah. Point Barrow and St. Lawrence Island have a mail but once a year.

"Last winter was a very trying one for the native population. Food was scarcer than it had been any time since the famine of ten years ago, when three villages starved to death. As they depend almost entirely upon the sea for their food, the condition of the ice is a very important matter to them. When the wind is toward the shore, the men go out to considerable distances, seeking walrus, seals, and whale. Last winter while a large number were out a strong north wind suddenly set in, driving the ice from the shore and exposing them to great danger. All but four reached land in a short time, but these four were out until the next morning and almost perished. A snow storm set in, hiding the village from them; so a light was hoisted to the vane of the teacher's house, and the big bell kept tolling all night, enabling them to keep their bearings, as they could not otherwise have done. When, as happened to be the case last winter, the north wind brings the ice down in great blocks, and piles it up high as haystacks along the beach and far out into the sea, the natives are not able to go out from land, and great destitution prevails. Every seal that is caught is divided among the people, suffering having taught them compassion. The want of food was so great that in some houses every scrap of food was eaten, even to the walrus hide, which can be compared to nothing but the raw hide in a riding whip. Some of the natives had eaten even their dogs; which are as valuable to them as horses to us. Mr. Gambell gave as freely as possible of his own stores, always, however, exacting something in return, so as not to foster begging among them, a trait that is sadly prevalent. During the time of greatest straits, he several times gave the school, 30 or 40 boys, a dinner. Beans were once the bill of fare. While the meal was in progress he gave them the empty tin cans, telling them that he had no further use for them. The guests immediately ceased eating, hungry as they were, packed the beans back into the cans, and carried them home to share with their

families. When he gives them hard tack for shoveling snow, they carry it home to divide with the starving ones there. Where, in our country, would we find such self-denial and thoughtfulness among a crowd of hungry, starving boys? This destitution has greatly touched the missionaries. They forbear to waste a scrap of food, 'nothing being thrown out but potato parings and the scrapings of the mush pot.' They one day noticed the boys picking up something from the yard, and on investigation found it to be cherry seeds that they were saving to get the pits from to eat."

Haines.—From St. Lawrence Island to Haines is a journey of about 2,000 miles. At Haines is the ordinary force of workers, Rev. and Mrs. W. W. Warne, Miss A. M. Sheets, and Miss Fannie Willard (native). The sowing has been followed by the reaping, and the teachers are rejoicing in an outpouring of God's spirit upon the natives. The religious meetings are so crowded that all who would like can not attend. The greatness of the blessing necessitates an enlargement of the work. The schoolhouse, used also for church, should be enlarged so as to hold from 250 to 300. Also a consecrated layman and wife should be sent to relieve Mr. Warne of a portion of his secular duties and give him more time for evangelistic work.

Hoonah.—Here Mrs. John W. McFarland and Mrs. Mary Howell, two lone women, are holding the fort. They look after all the interests of the village, hear and settle disputes, care for the sick, keep school, and carry on all the religious services. This they have been doing for two years past. They greatly need the help of a devoted minister, and the Board of Home Missions is now corresponding with a student at McCormick Seminary for the place.

Juneau.—The workers in the native mission are Rev. and Mrs. L. F. Jones, Miss Sue Davis, Miss M. E. Gould, and Mr. Frederick Moore (native). The home, owing to the inability of the woman's executive committee to supply the necessary support, has not been as full as usual. The progress of those left in it, however, has been encouraging. The attendance at church continues good, and every communion sees new ones receiving Christian baptism and making a public profession of their faith in Christ and commencing a Christian life.

The white church is still without a pastor. There is a good probability, however, that one will be sent this coming spring. It is a very needy and important field. Rev. Mr. Jones, in addition to his work for the natives, is doing what he can in holding services and looking after the interests of the white population.

Sitka.—This central mission station continues to make progress from year to year. At the present time Mr. Austin writes that a very gracious revival is in progress and a large number have been received into the church on profession of faith. The native church now numbers over 600 communicants.

The attendance at the industrial school is smaller than usual as over 50 pupils had to be sent away last year on account of scarcity of funds. If the church at large could see the result of sending away these immortal beings, just coming to a knowledge of the light, the treasury would be filled to overflowing even in these hard times. Some of the girls sent away were sold by their friends, one to a Chinaman. Rev. A. E. Austin continues pastor of both the native and white churches, and Mr. U. P. Shull is superintendent of the industrial school. Professor Shull has an efficient corps of 13 godly men and women to assist him in the school. Messrs. Shull, Austin, and Wilbur issue a small monthly paper called the North Star, that should be in every family in the church.

Fort Wrangell.—This oldest mission station has had many reverses and drawbacks during its existence, but Rev. and Mrs. Clarence Thwing are bravely toiling away. The home has been closed from want of funds. Dr. Thwing publishes a small quarterly, the Northern Light, which is full of missionary news. If those who complain of want of material to interest missionary meetings will subscribe for the North Star and Northern Light they will be supplied with Alaska matter at least.

Jackson.—The workers are Rev. and Mrs. J. L. Gould, Mrs. A. R. McFarland, and Miss A. J. Manning. Miss C. Baker was transferred last fall from the mission to the Government school. The boys' home has been discontinued for want of funds. This is an important field.

Saxman.—For seventeen years past the Cape Fox and Port Tongas natives have been clamoring for a missionary. They were so few in number that the church would not be justified in establishing two missions. They were informed, however, that if the two tribes would settle in one place their request would be granted.

To assist in bringing this about, in the early winter of 1886 Mr. S. A. Saxman, Mr. Louis Paul, and Mr. Edgar started to select a suitable place. They were lost at sea in a storm, and for a time the whole matter dropped. In 1894 the two tribes again became clamorous for a missionary, and on the 4th and 5th of July, 1895, I held a convention with them on the subject. A site was selected and the people agreed to abandon their present villages and build upon the new site in order to have school and church privileges. In moving to the new place they sign a paper, similar to that required for settlement in Metlakahtla, and which is in effect that no intoxicating liquors shall be brought into the village, none of their former

heathen customs, dances, rites, etc., shall be practiced, that when sick they will not apply to a shaman, and that they will attend church, school, etc.

Mr. James W. Young, with Henry Phillips as interpreter and assistant, is in charge of the Government school. A consecrated minister and wife will here find a door of usefulness wide open—a needy field where the people are hungry for the gospel, and an opportunity to mold the destinies of two tribes and bring them out of heathen darkness and barbarism into the marvelous light and joy of a Christian civilization. The new station has been named Saxman.

Klawack.—This station is still closed for want of funds. Miss A. Kelsey, of Fort Wrangell, taught the school for three months during last summer. Rev. Mr. Gould, of Jackson, has occasionally given the place some attention, and with much encouragement.

Personnel.

Dr. Sheldon Jackson, Alaska, general agent of education in Alaska; William Hamilton, Pennsylvania, assistant agent of education in Alaska; William A. Kelly, Pennsylvania, superintendent of schools for the southeastern district of Alaska.

The First Comptroller of the United States Treasury, in a letter dated February 5, 1894, made a ruling that the voucher of James Sheakley, governor of Alaska, for services as councillor of the office of education in Alaska, from January 1 to June 30, 1894, amounting to $100, could not be paid for the reason that he was a United States official drawing a salary from the Government, and could not be paid a second salary for looking after school matters. The advisory board was composed of the governor of the Territory, the United States district judge, and the general agent of education, all three officers of the Government, and as this decision prevented the payment of their compensation for extra services the advisory board was discontinued.

TEACHERS AND EMPLOYEES IN CHURCH MISSION SCHOOLS.

Anvik (Episcopal): Rev. and Mrs. J. W. Chapman, Miss Bertha W. Sabine, Mary V. Glenton.

Point Hope: Rev. E. H. Edson, J. B. Driggs, M. D.

Yakutat (Swedish Evangelical): Rev. H. J. Hendrickson, Rev. and Mrs. Albin Johnson, Miss Selma Peterson.

Unalaklik: Rev. A. E. Karlson, Mr. David Johnson, Miss Malvina Johnson.

Golovin Bay: Rev. August Anderson, Rev. N. O. Hultberg, Mrs. N. G. Hultberg, Mr. Frank Kameroff, assistant.

Bethel (Moravian): Rev. and Mrs. John H. Kilbuck, Mr. and Mrs. Benjamin Helmick, Miss Mary Mack, Miss Phillippine King, and George Nokochluch (native).

Carmel: Rev. and Mrs. John Schoechert, Misses Mary and Emma Huber.

Ugavig: Rev. and Mrs. Ernst L. Weber, Miss Philipine King, David Skuviuk (native).

Quinehaha: Kawagaleg (native).

Kozyrevski (Roman Catholic): Rev. Paschal Tosi, prefect apostle of Alaska; Rev. R. Crimont, S. J.; Brother Rosatti, S. J.: Brother Marchesio, S. J.; Brother Cunningham, S. J.; Sisters M. Stephen, M. Joseph, M. Winifred, M. Anguilbert, M. Heloise, M. Damascene.

Nulato: Rev. A. Ragaru, S. J.; Rev. F. Monroe, S. J.; Brother Giordana, S. J.

Shageluk Station: Rev. William Judge, S. J.

Kuskokwim River, Urhhamute: Rev. A. Robant, S. J.

St. Josephs, Yukon Delta: Rev. J. Treca, S. J.; Rev. A. Parodi, S. J.; Rev. F. Barnum, S. J.; Brother Twohigg, S. J.; Brother Negro, S. J.

Girls' School: Sisters M. Zypherine, M. Benedict, M. Prudence, M. Pauline.

Juneau: Rev. John Althoff, Sisters Mary Zeno, M. Peter, and M. Bousecouer.

Cape Prince of Wales (Congregationalist): Mr. and Mrs. William T. Lopp.

Wood Island (Baptist): Mr. and Mrs. W. E. Roscoe, Miss Lulu C. Goodchild.
Unalaska (Methodist): Mr. and Mrs. John A. Tuck.
Douglas and Kake stations (Friends): No report.
Haines (Presbyterian): Rev. W. W. Warne, Miss Anna May Sheets, Miss Frances H. Willard (native).
Fort Wrangell: Rev. Clarence Thwing, Mrs. Clarence Thwing.
Hoonah Mission: Mrs. J. W. McFarland, Mrs. Mary E. Howell.
Hydah Mission: Rev. J. Loomis Gould, Mrs. A. R. McFarland, Miss Christeana Baker, Mrs. R. R. Gould, Frank P. Loomis, Mrs. Frank P. Loomis.
Juneau Mission: Rev. L. F. Jones, Mrs. L. F. Jones, Miss Susan Davis, Miss Mollie E. Gould, Miss Etta R. Berk, F. L. Moore.
Point Barrow: L. M. Stevenson.
St. Lawrence: V. C. Gambell and Mrs. V. C. Gambell.
Sitka Mission: Rev. A. E. Austin, Mr. U. P. Shull, superintendent; Mrs. A. E. Austin, Mrs. U. P. Shull, Mrs. Margaret C. Wade, Miss Hattie E. Weaver, Mrs. Matilda K. Paul (native), Mrs. Ella C. Heizer, Mrs. Margaret A. Saxman, Mrs. Sadie L. Wallace, Miss Essie Gibson, A. T. Simson, Mrs. A. T. Simson, J. A. Shields, John E. Gamble, Willie Wells, B. K. Wilbur, M. D., Mrs. Adelia H. Carter, Charles E. Coates, Mrs. Charles E. Coates, Mr. Solberg, Mr. George J. Beck, Mr. F. E. Frobese.

ITINERARY.

On the 6th of May I left Washington for Alaska, and reached the mail steamer *City of Topeka* at Seattle on the 24th. Schools and stations were visited during the summer at Metlakahtla, Fort Wrangell, Juneau, Douglas, Haines, and Sitka.

In July I made a special trip to the Cape Fox and Port Tongass Thlingets. For eighteen years past they have again and again asked for a school. As they were very much scattered they were told that it would not be practicable to place a school in each of their villages—that if they would unite in one place their request would be granted. To assist in bringing this about in 1886 Mr. and Mrs. Louis Paul were sent by the Home Mission Society of the Presbyterian Church, and Mr. and Mrs. S. A. Saxman by the Government to establish a school and mission work.

During the winter of 1886–87 Messrs. Saxman, Paul, and Edgar, while off in search of a suitable location for the new village, were drowned, and the enterprise, for the time being, was abandoned.

Unexpectedly in the spring of 1895 a special appropriation of Congress opened the way for a school building and negotiations were reopened.

The leading men of both tribes were notified, and a council called to meet me at Ketchikan July 4. During the morning of that day a small steamer passing up the coast made a landing and sold some liquor, upon which several of the leading men got drunk.

This delayed the council until the 5th. On the 5th there was a large attendance of men, with a long, full, and satisfactory consideration of the question of a new village and school.

With considerable unanimity public sentiment was in favor of a site at the lower end of Tongass Narrows. It was visited, carefully looked over, and a site marked for the schoolhouse.

The building, containing a schoolroom and a teachers' residence, was erected during August.

The consolidated village was named Saxman after the Government teacher who lost his life in looking for a suitable location for the village.

On the 15th of August I was back again at the office in Washington. The supervision of western and Arctic Alaska was this year delegated to my assistant, Mr. William Hamilton.

Leaving Washington on the 15th of April Mr. Hamilton reached Tacoma six days later, and took the *City of Topeka* for Sitka. At Sitka, taking passage May 1 on the mail steamer *Dora*, he visited Yakutat, Nucheck, Prince William Sound, Wood Island, Kadiak, Karluk, Unga, and Sand Point, reaching Unalaska May 12.

While waiting to join the United States revenue-cutter *Bear* in its Arctic cruise he became intimately acquainted with the work being done in the home under the supervision of Mr. and Mrs. Tuck, and reports that a neater, more intelligent, well-behaved set of children it would be hard to find anywhere in the country. In the schoolroom, which he visited repeatedly, he found that good progress had been made in the acquisition of the English language. From its commencement in 1889 until the past summer the home has been maintained in a small one and one-half story rented cottage. During the summer a commodious boarding house was erected.

Mr. Hamilton joined the *Bear* at Unalaska. The cruise of the *Bear* in 1895 was over much the same course as in previous years.

After patrolling the North Pacific during May and June the *Bear* left the wharf at Dutch Harbor, Unalaska, on June 24 for her Arctic trip. The next day she sighted through the fog first St. George Island and then St. Paul. The sea being too rough

to land, the ship pushed on to the northwest, passing St. Matthew Island on June 26 and reaching anchorage at St. Lawrence Island on June 28. Very soon the natives swarmed on board, bringing tidings that Mr. and Mrs. Gambell, in charge of the Government school on the island, were in excellent health and had had a very successful year. A sewing machine and a cabinet organ for Mrs. Gambell, with supplies for the family and a twelve months' mail, were landed safely through the surf. Hoisting anchor on June 30 the *Bear* crossed over to Indian Point, Siberia, about 40 miles distant. There two Cossack officers of the Russian army were found taking a census of the village. This was the first visit of Russian officials to that section of the Siberian coast in many years, and the natives brought the Russian coins they had received from them over to the ship to sell as curios. Here, as elsewhere on the trip, the ship's surgeon went ashore to treat the sick and ailing. The principal native of the village is Koharri, who is a noted trader all along the coast. He has a little frame whale house filled from floor to ceiling with tobacco, flour, and looking-glasses, which he has obtained from the whalers and from which he supplies the country for hundreds of miles around. This man has been known to have as much as $75,000 worth of whalebone in his storehouse at one time. He does a business of probably $100,000 a year, and yet not a single coin of gold or silver nor a single bank note or bank check is used, nor are any books kept. All transactions are by barter, furs and whalebones being exchanged for tobacco, flour, and whisky. This wholesale merchant of the north Siberian coast can neither read nor write, nor can anyone associated with him. Although so wealthy, he lives in an ordinary tent and sleeps on the ground on a pile of reindeer skins.

On several occasions the *Bear*, in search of reindeer, has turned southward from Indian Point and sailed up Holy Cross Sound, at the head of Anadir Gulf, some 300 miles into Siberia. In 1893, while in search of reindeer, we discovered a large river emptying into Holy Cross Sound. After visiting a herd of reindeer, an officer and crew entered the mouth of this stream, the *Bear* being the first ocean steamer that ever plowed those waters. This season the *Bear*, turning northward, anchored, on July 1, off South Head, St. Lawrence Bay. Peter and Kaimok, the leading men of that section, came on board and sold 40 head of reindeer. The herd, however, was on the opposite side of the bay and could not be reached until the ice should go out, a month later. Being unwilling to wait, the captain set sail for King Island, which was reached the next morning. At this point during two previous seasons the *Bear* was caught and imprisoned in large ice floes.

Leaving the island at 8 a. m., the *Bear* soon encountered large cakes of ice at the entrance to Port Clarence. Forcing her way through the ice, she found seven whalers at anchor inside, and news was received of the successful winter of the reindeer herds. The 4th of July was spent with the whaling fleet, at anchor. A baseball game on shore and a salute of twenty-one guns at noon, with a dinner on the *Bear* to the whaling captains, comprised the public celebration of the day. On July 5 the *Bear* left for St. Michael, where she arrived the following day. On July 8 anchor was hoisted and a trip was made to the native village on Sledge Island. On July 9 the steamer made Bering Straits, calling at East Cape, where four or five influential natives were taken on board to aid in procuring reindeer. Learning that there was a large herd about 50 miles to the northward, the vessel entered the Arctic Ocean. Early in the morning of July 11 the *Bear*, picking and pushing her way through the ice, reached Utan. At this place 16 deer were purchased and brought on board. Continuing the trip up the coast, the *Bear* tied up to a huge ice floe near Cape Serdze, Siberia. While there target practice was had at distant pieces of ice. On the 14th, learning that there were some deer at Chacoran, the vessel steamed over to that village, where 22 deer were secured. The ice closing in, the cutter was compelled to move a few miles farther south. At this point 73 head of deer were purchased, and at midnight the *Bear* got under way for the reindeer station at Port Clarence, passing through a gale on the 16th and reaching Point Spencer on the 17th, where she anchored. About noon on the 20th, the gale having subsided, the *Bear* steamed over to the station and landed the deer. The brig *W. H. Meyer*, with the annual supplies for the several stations and schools, was found wrecked on the beach in front of the station, having gone ashore during the gale on the night of the 17th. The supplies for the reindeer station had fortunately all been landed, but those for the schools at Cape Prince of Wales and Point Barrow were lost.

On July 22 the *Bear* weighed anchor and headed for Siberia for another load of reindeer, and on July 23 she reached St. Lawrence Bay. On the 24th she steamed to the head of the bay, where 43 head were secured. The next day she returned to the reindeer station, where the deer were landed on the 26th. On the 28th, the *Bear* having taken on board Mr. and Mrs. Hanna, who had been wrecked on the *W. H. Meyer*, with their supplies received from reindeer station, sailed for Cape Prince of Wales, where they were landed that afternoon. Again hoisting anchor the steamer left for Kotzebue Sound. On the way the schooner *Jessie* was boarded and examined. On July 30 the *Bear* anchored in the lee of Chamisso Island. On the 31st, while the

vessel was lying windbound, Dr. Sharp and Mr. Justice, of the Philadelphia Academy of Sciences, and Mr. Hamilton, together with a party of officers, made an excursion to Choris Peninsula. On August 5 the steamer left for Point Hope, where it arrived next day. Here the school and whaling stations were visited, and Dr. Driggs, one of the teachers, who had been in that country for five years, was taken on board to return to the States for a vacation.

On August 7 the *Bear* started up the coast for Point Barrow, wending its way through large packs of floating ice, and on the following day caught up with the whaling fleet at anchor near Icy Cape, at the southern edge of the great Arctic ice pack. The whaling fleet had been at anchor for nineteen days, waiting for the ice to open. The *Bear* lay there for fourteen days longer, waiting for an opportunity to get farther north. Parties from Point Barrow who came down the coast for their mail reported that the past winter had not been very cold, the lowest temperature being 30° below zero. Giving up all expectation of getting farther north, young ice forming on the sea and on the rigging of the vessel, the captain concluded to turn southward, which he did on August 22. The following day a shoal of walrus was sighted several miles away, and hunting parties were sent out and secured 10 of them. Picking up the walrus, the vessel continued southward, calling at Point Hope the next day and reaching the reindeer station August 27. Two days were spent in securing requisitions and finishing up the business of the year. On September 1 the steamer, while near St. Michael, took on board 16 destitute miners from the Yukon region. On the evening of September 4 the vessel anchored off the St. Lawrence Island village. The evening was spent in closing up the season's business at the station. Requisitions were made out for another year's supplies, last letters were received, farewells were spoken, and Mr. and Mrs. Gambell were again cut off from all communication with the outside world for another year. At 4 a. m. on September 5 the *Bear* was again under way. September 6 St. Matthew and Hall Islands were passed, and on the 7th anchor was dropped at St. Paul Island, where on the 8th a landing was made for a few hours. On September 9 a similar landing was made at St. George Island, and at noon on September 11 anchor was dropped in Dutch Harbor, Unalaska, closing the Arctic cruise of 1895.

At Unalaska, by the courtesy of Capt. C. L. Hooper, Mr. Hamilton was received on board the United States revenue-cutter *Rush*, on which he remained until her arrival at San Francisco, October 6. On October 9 the start was made for Washington, which was reached on the 14th, completing a trip of about 16,000 miles during the season.

Introduction of Domestic Reindeer into Alaska.

When in the year 1890 I visited arctic Alaska for the purpose of establishing schools, I found the Eskimo population slowly dying off with starvation. For ages they and their fathers had secured a comfortable living from the products of the sea, principally the whale, the walrus, and the seal. The supplies of the sea had been supplemented by the fish and aquatic birds of their rivers and the caribou or wild reindeer that roamed in large herds over the inland tundra.

The supply of these in years past was abundant and furnished ample food for all the people. But fifty years ago American whalers, having largely exhausted the supply in other waters, found their way into the North Pacific Ocean. Then commenced for that section the slaughter and destruction of whales that went steadily forward at the rate of hundreds and thousands annually, until they were killed off or driven out of the Pacific Ocean. They were then followed into Bering Sea, and the slaughter went on. The whales took refuge among the ice fields of the Arctic Ocean, and thither the whalers followed. In this relentless hunt the remnant have been driven still farther into the inaccessible regions around the North Pole, and are no longer within reach of the natives.

As the great herds of buffalo that once roamed the Western prairies have been exterminated for their pelts, so the whales have been sacrificed for the fat that incased their bodies and the bone that hung in their mouths. With the destruction of the whale one large source of food supply for the natives has been cut off.

Another large supply was derived from the walrus, which once swarmed in great numbers in those northern seas, but commerce wanted more ivory, and the whalers turned their attention to the walrus, destroying thousands annually for the sake of their tusks. Where a few years ago they were so numerous that their bellowings were heard above the roar of the waves and grinding and crashing of the ice fields, last year I cruised for weeks seeing but few. The walrus, as a source of food supply, is already very scarce.

The sea lions, once so common in Bering Sea, are now becoming so few in number that it is with difficulty that the natives procure a sufficient number of skins to cover their boats, and the flesh of the walrus, on account of its rarity, has become a luxury.

In the past the natives, with tireless industry, caught and cured, for use in their

long winters, great quantities of fish, but American canneries have already come to some of their streams, and will soon be found on all of them, both carrying the food out of the country, and, by their wasteful methods, destroying the future supply. Five million cans of salmon annually shipped away from Alaska—and the business still in its infancy—means starvation to the native races in the near future.

With the advent of improved breech-loading firearms the wild reindeer are both being killed off and frightened away to the remote and more inaccessible regions of the interior, and another source of food supply is diminishing. Thus the support of the people is largely gone, and the process of slow starvation and extermination has commenced along the whole arctic coast of Alaska.

To establish schools among a starving people would be of little service; hence education, civilization, and humanity alike called for relief. The sea could not be restocked with whale as a stream can be restocked with fish. To feed the population at Government expense would pauperize and in the end as certainly destroy them. Some other method had to be devised. This was suggested by the wild nomad tribes on the Siberian side of Bering Straits. They had an unfailing food supply in their large herds of domestic reindeer. Why not introduce the domestic reindeer on the American side and thus provide a new and adequate food supply?

To do this will give the Eskimo as permanent a food supply as the cattle of the Western plains and sheep of New Mexico and Arizona do the inhabitants of those sections. It will do more than preserve life—it will preserve the self-respect of the people and advance them in the scale of civilization. It will change them from hunters to herders. It will also utilize the hundreds of thousands of square miles of moss-covered tundra of arctic and subarctic Alaska and make those now useless and barren wastes conducive to the wealth and prosperity of the United States.

A moderate computation, based upon the statistics of Lapland, where similar climatic and other conditions exist, shows northern and central Alaska capable of supporting over 9,000,000 head of reindeer.

To reclaim and make valuable vast areas of land otherwise worthless; to introduce large, permanent, and wealth-producing industries where none previously existed; to take a barbarian people on the verge of starvation and lift them up to a comfortable self-support and civilization is certainly a work of national importance.

Returning to Washington on November 12, 1890, I addressed to the Commissioner of Education a preliminary report of the season's work, emphasizing the destitute condition of the Alaskan Eskimo and recommending the introduction of the domestic reindeer of Siberia.

On the 5th of December following, this report was transmitted by the Commissioner of Education to the Secretary of the Interior for his information, and on the 15th transmitted to the Senate by Hon. George Chandler, Acting Secretary of the Interior. On the following day it was referred by the Senate to the Committee on Education and Labor.

On the 19th of December Hon. Louis E. McComas, of Maryland, introduced into the House of Representatives a joint resolution (H. Res. No. 258) providing that the act of Congress approved March 2, 1887, "An act to establish agricultural experiment stations in connection with the colleges established in the several States," should be extended by the Secretary of the Interior over Alaska, with the expectation that the purchase, improvement, and management of domestic reindeer should be made a part of the industrial education of the proposed college.

The resolution was referred to the Committee on Education, and on the 9th of January, 1891, reported back to the House of Representatives for passage.

It was, however, so near the close of the short term of Congress that the resolution was not reached. When it became apparent that it would not be reached in the usual way, the Hon. Henry M. Teller, on the 26th of February, moved an amendment to the bill (H. R. 13462) making appropriations for sundry civil expenses of the Government for the year ending June 30, 1892, appropriating $15,000 for the introduction of domestic reindeer into Alaska, which was carried. The appropriation failed to receive the concurrence of the conference committee of the House of Representatives.

Upon the failure of the Fifty-first Congress to take action, and deprecating the delay of twelve months before another attempt could be made, I issued, with the approval of the Commissioner of Education, an appeal in the Mail and Express of New York City, the Boston Transcript, the Philadelphia Ledger, the Chicago Inter-Ocean, and the Washington Star, as well as in a number of the religious newspapers of the country, for contributions to this object. The response was prompt and generous; $2,146 were received.

As the season had arrived for the usual visit of inspection and supervision of the schools in Alaska, in addition to my regular work for the schools I was authorized to commence the work of introducing domestic reindeer into Alaska. The natives of Siberia who own the reindeer, knowing nothing of the use of money, an assortment of goods for the purpose of barter for the reindeer was procured from the funds so generously contributed by benevolent people.

The honorable Secretary of the Treasury issued instructions to Captain Healy to furnish me every possible facility for the purchase and transportation of reindeer from Siberia to Alaska. The honorable Secretary of State secured from the Russian Government instructions to their officers on the Siberian coast also to render what assistance they could, and on May 25, 1891, I again took passage on the revenue cutter *Bear*, Captain Healy in command, for the coast of Siberia.

The proposition to introduce domestic reindeer into Alaska had excited widespread and general interest. In the public discussions which arose with regard to the scheme, a sentiment was found in some circles that it was impracticable; that on account of the superstitions of the natives they would be unwilling to sell their stock alive; further, that the nature of the reindeer was such that they would not bear ship transportation, and also that, even if they could be purchased and safely transported, the native dogs on the Alaskan coast would destroy or the natives kill them for food. This feeling, which was held by many intelligent men, was asserted so strongly and positively that it was thought best the first season to make haste slowly, and instead of purchasing a large number of reindeer to possibly die on shipboard or perhaps to be destroyed by the Alaskan dogs (thus at the very outset prejudicing the scheme), it was deemed wiser and safer to buy only a few.

Therefore, in the time available from other educational duties during the season of 1891, I again carefully reviewed the ground and secured all possible additional information with regard to the reindeer, and, while delaying the actual establishment of a herd until another season, refuted the objections that the natives will not sell and the deer will not bear transportation by actually buying and transporting them.

The work was so new and untried that many things could only be found out by actual experience.

First. The wild deer men of Siberia are a very superstitious people, and need to be approached with great wisdom and tact. If a man should sell us deer and the following winter an epidemic break out in his herd or some calamity befall his family, the Shamans would make him believe that his misfortune was all due to the sale of the deer.

Second. The Siberian deer men are a nonprogressive people. They have lived for ages outside of the activities and progress of the world. As the fathers did, so continue to do their children. Now, they have never before been asked to sell their deer; it is a new thing to them, and they do not know what to make of it. They were suspicious of our designs. Another difficulty arises from the fact that they can not understand what we want with the reindeer. They have no knowledge of such a motive as doing good to others without pay.

As a rule, the men with the largest herds, who can best afford to sell, are inland and difficult to reach. Then business selfishness comes in. The introduction of the reindeer on the American side may to some extent injuriously affect their trade in deer skins. From time immemorial they have been accustomed to take their skins to Alaska and exchange them for oil. To establish herds in Alaska will, they fear, ruin this business.

Another difficulty experienced was the impossibility of securing a competent interpreter. A few of the natives of the Siberian coast have spent one or more seasons on a whaler, and thus picked up a very little English. And upon this class we have been dependent in the past.

However, notwithstanding all these difficulties and delays, Captain Healy, with the *Bear*, coasted from 1,200 to 1,500 miles, calling at the various villages and holding conferences with the leading reindeer owners on the Siberian coast. Arrangements were made for the purchase of animals the following season. Then, to answer the question whether the reindeer could be purchased and transported alive, I bought 16 head, kept them on shipboard for some three weeks, passing through a gale so severe that the ship had to "lie to," and finally landed them in good condition at Amaknak Island, in the harbor of Unalaska.

Upon my return to Washington City in the fall of 1891 the question was again urged upon the attention of Congress, and on the 17th of December, 1891, Hon. H. M. Teller introduced a bill (S. 1109) appropriating $15,000, to be expended under the direction of the Secretary of the Interior, for the purpose of introducing and maintaining in the Territory of Alaska reindeer for domestic purposes. This bill was referred to the Committee on Agriculture and Forestry, Hon. Algernon S. Paddock, chairman. The committee took favorable action, and the bill was passed by the Senate on May 23, 1892. On the following day it was reported to the House of Representatives and referred to the Committee on Appropriations. A similar bill (H. R. 7764) was introduced into the House of Representatives by Hon. A. C. Durborow and referred to the Committee on Agriculture.

On April 15 Hon. S. B. Alexander, of North Carolina, reported the bill to the House of Representatives with the approval of the Committee on Agriculture. The bill was placed on the calendar, but failed to pass the House.

On the 2d of May, 1892, I started for my third summer's work on the coast of Siberia and Arctic Alaska in the United States revenue-cutter *Bear*, Capt. M. A. Healy, commanding, and, on the 29th of June following, selected in the northeast corner of Port Clarence (the nearest good harbor to Bering Straits on the American side) a suitable location for the establishment of an industrial school, the principal industry of which is the management and propagation of domestic reindeer. The institution is named the Teller Reindeer Station.

During the summer of 1892 I made five visits to Siberia, purchasing and transporting to Port Clarence 171 head of reindeer. I also superintended the erection of a large building for the offices and residence of the superintendent of the station, Mr. Miner W. Bruce, of Nebraska.

Returning to Washington in the early winter, agitation was at once commenced before Congress, resulting in an appropriation by the Fifty-second Congress, second session (March 3, 1893), of "$6,000, to be expended under the direction of the Secretary of the Interior, for the purpose of introducing and maintaining in the Territory of Alaska reindeer for domestic purposes." The management of this fund was wisely laid upon the Commissioner of Education and was made a part of the school system of Alaska.

During the spring of 1893, 79 fawns were born to the herd at the Teller Reindeer Station, and during the summer 127 deer were purchased in Siberia and added to the Alaska herd.

At the expiration of his year's service Mr. Bruce resigned, and Mr. W. T. Lopp, of Indiana, was appointed superintendent.

During April, May, and June, 1894, 186 fawns were born to the herd, of which 41 were lost by being frozen or deserted by their mothers. During the summer I purchased in Siberia 120 head, which were added to the herd.

Siberian herders were employed at the beginning of the enterprise, not because they were considered the best, but because they were near by and were the only ones that could be had at the time. It was realized from the first that if the Alaskan Eskimo were to be taught the breeding and care of the reindeer, it was important that they should have the benefit of the most intelligent instructors and of the best methods that were in use. By universal consent it is admitted that the Lapps of northern Europe, because of their superior intelligence (nearly all of them being able to read and write and some of them being acquainted with several languages), are much superior to the Samoyedes deer men of northern Europe and Asia and the barbarous deer men of northeastern Siberia. Intelligence applied to the raising of reindeer, just as to any other industry, produces the best results.

Therefore, when in 1893 it was ascertained that the herd at Port Clarence had safely passed its first winter (thus assuring its permanence), I at once set about securing herders from Lapland. There being no public funds available to meet the expense of sending an agent to Norway in order to secure skilled Lapp herders, I had recourse again to the private benefactions of friends of the enterprise, and $1,000 was contributed.

Mr. William A. Kjellmann, of Madison, Wis., was selected as superintendent of the Teller Reindeer Station and sent to Lapland for herders. He sailed from New York City February 21, and landed upon his return May 12, 1894, having with him seven men, their wives and children, making sixteen souls in all. This was the first colony of Lapps ever brought to the United States. They reached the Teller Reindeer Station safely on July 29, having traveled over 12,500 miles. Upon reaching the station Mr. Kjellman took charge, relieving Mr. W. T. Lopp, who desired to return to the mission work at Cape Prince of Wales.

In 1894 the Fifty-third Congress, second session, increased the reindeer appropriation to $7,500, and the same amount was appropriated in the spring of 1895, at the third session of the same Congress.

Owing to the serious illness of his wife, and her need of the services of a physician, that could not be had at the station, Mr. Kjellmann resigned on the 20th of July and returned to the States. The same day Mr. Jens C. Widstead, of Wisconsin, the assistant superintendent, was made superintendent, and Mr. Thorvaald Kjellmann, of Norway, was appointed his assistant.

The experience of the past year has demonstrated the wisdom of procuring Lapps for herders. Their greater intelligence, skill, and gentleness in handling the deer, and the introduction of their improved methods of treatment, have greatly promoted the welfare of the herd. In 1894, 41 fawns out of the 186 born were lost under the supervision of the Siberian herders. In 1895 under the care of the Lapps but 10 fawns were lost of 280 born at the three stations, and 7 of these were from the herd at Cape Prince of Wales, where no Lapp was present, thus reducing the percentage of loss among the calves the past spring from 22 per cent in the previous year to less than 1 per cent for the present year. This great saving is due to the greater skill of the Lapps, and would alone pay the extra expense of procuring them as herders. It

has also been found that there is a hearty agreement in the work between the Lapps and the Eskimo.

In August, 1894, a commencement was made in the distribution from the central herd at the Teller Station, 119 head of deer being given to Mr. W. T. Lopp, in charge of the mission of the American Missionary Association at Cape Prince of Wales. In the spring of 1895 the herd was increased by the birth of 68 fawns.

The Eskimo have been so little accustomed to assistance from the whites that they have been somewhat skeptical concerning their being permitted to ultimately own the reindeer. As evidence of good faith, in February, 1895, a herd of 112 head was intrusted to three or four of the most experienced native apprentices. The following spring during fawning season a Lapp was sent to their assistance, and they lost only one fawn out of the 73 born.

The experience of the past four years has demonstrated the fact that the present system of procuring reindeer is too slow, and will take many years to accomplish the purpose of the Government. To expedite matters I would respectfully suggest the propriety of placing, with the consent of the Russian Government, a purchasing station somewhere on the Siberian coast, to remain through the year. If successful such a station ought to gather together 2,000 or 3,000 head and have them ready for transportation during the summer. Another plan, and a more feasible one, will be to contract with responsible parties for the purchasing and delivering of so many head of reindeer annually at certain designated points in Alaska. This latter plan will relieve the office of much anxiety.

THE POSSIBILITIES OF THE FUTURE.

There are in northern and central Alaska, at a moderate estimate, 400,000 square miles of territory that are unadapted to agriculture or the grazing of cattle, and that region is without an adequate food supply for the Eskimo inhabitants or the white miners and others who are now penetrating it in search of gold or trade. But that whole region is supplied with a long, fibrous white moss (*Cladonia rangiferina*), the natural food of the reindeer. This is capable of becoming food and clothing for men only by its transformation into reindeer meat and furs.

The best results in the raising of reindeer, and the most complete statistics, are found in Norway and Sweden. Taking those countries as a basis, we find that the northern provinces, known as Lapland, contain an area of 14,000 square miles, in which are 322,568 head of reindeer. This gives an average of 23 reindeer to the square mile.

Applying this ratio to the 400,000 square miles of arctic and subarctic Alaska (and there is no known reason in the general character of the country why we should not), we have as a result that Alaska is capable of sustaining 9,200,000 head of reindeer, which, at the valuation of $9 each (the price in Sweden), will be worth $83,000,000.

In Lapland there is an average of 32 head of reindeer to each person among the reindeer Lapps. Applying the same average to Alaska, the 9,200,000 head of reindeer will support a population of 287,500, living like the Lapps of Lapland.

EFFECT UPON ALASKA.

The stocking of Alaska with reindeer means—

First. The opening up of the vast and almost inaccessible region of northern and central Alaska to white settlers and civilization.

The original purpose in 1890 to introduce reindeer into Alaska was inspired by a desire to provide a new and more permanent food supply for the half-famishing Eskimo.

Since then the discovery of large and valuable gold deposits upon the streams of arctic and subarctic Alaska has made the introduction of reindeer a necessity for the white man as well as the Eskimo. Previous to the discovery of gold there was nothing to attract the white settler to that desolate region, but with the knowledge of valuable gold deposits thousands will there make their homes, and towns and villages are already springing into existence.

But that vast region, with its perpetual frozen subsoil, is without agricultural resources. Groceries, breadstuffs, etc., must be procured from the outside. Steamers upon the Yukon can bring food to the mouths of the gold-bearing streams, but the mines are often many miles up these unnavigable steams. Already great difficulty is experienced in securing sufficient food by dog-train transportation and the packing of the natives. The miners need reindeer transportation.

Again, the development of the mines and the growth of settlements upon streams hundreds of miles apart necessitates some method of speedy travel. A dog team on a long journey will make on an average from 15 to 25 miles a day, and in some sections can not make the trip at all, because they can not carry with them a sufficient supply of food for the dogs, and can procure none in the country through which

they travel. To facilitate and render possible frequent and speedy communication between these isolated settlements and growing centers of American civilization, where the ordinary roads of the States have no existence and can not be maintained except at an enormous expense, reindeer teams that require no beaten roads, and that at the close of a day's work can be turned loose to forage for themselves, are essential. The introduction of reindeer into Alaska makes possible the development of the mines and the support of a million miners.

Second. The opening up of a vast commercial industry. Lapland, with 400,000 reindeer, supplies the grocery stores of northern Europe with smoked reindeer hams, 10 cents per pound; smoked tongues, at 10 cents each; dried hides, at $1.25 to $1.75 each; tanned hides, $2 to $3 each, and 23,000 carcasses to the butcher shops, in addition to what is consumed by the Lapps themselves.

Fresh reindeer meat is considered a great delicacy. Russia exports it frozen, in carloads, to Germany. The Norwegian Preserving Company use large quantities of it for canning.

The tanned skins (soft and with a beautiful yellow color) have a ready sale for military pantaloons, gloves, bookbinding, covering of chairs and sofas, bed pillows, etc.

The hairs are in great demand for the filling of life-saving apparatus (buoys, etc.), they possessing a wonderful degree of buoyancy. The best existing glue is made of reindeer horns.

On the same basis Alaska, with its capacity for 9,200,000 head of reindeer, can supply the markets of America with 500,000 carcasses of venison annually, together with tons of delicious hams and tongues and the finest of leather.

Surely the creation of an industry worth from $83,000,000 to $100,000,000 where none now exists is worth the attention of the American people.

Third. The perpetuation, multiplication, and civilization of the Eskimos of that region. The Eskimos are a hardy and docile race. Their children learn readily in the schools, and there is no reason why they should not be made an important factor in the development of that land. The density of population in any section being largely dependent upon the quantity of the food supply, the increase of food supply will naturally increase the number of hardy Eskimo.

For the nurture of the reindeer and the instruction of the native people in this industry, it is desirable that there should be a migration to that country of skilled herders and their families. The inviting of this class of European settlers will not crowd out the native Eskimos, but will greatly assist them in their efforts to adjust themselves to the raising of reindeer. Lapp families, with their greater intelligence, skill, and gentleness in handling reindeer, and their improved methods of treatment, wisely distributed among the Eskimos, will be an object lesson to stimulate, encourage, and instruct them.

To awaken an interest in Lapland and open the way for the securing a larger number of Lapp herders, I would suggest the publication for distribution in Lapland of a small pamphlet in the Norwegian language upon the advantages of raising reindeer in Alaska.

Decennary Review.

As the present year closes ten years of education in Alaska by the United States Government, it seems an appropriate occasion for recalling the history of the past. Information concerning education under the Russian Government is very meager, the only available sources to the English reader being the admirable work of William H. Dall, Alaska and its Resources (pp. 351 and 352), and the annual reports of the Bureau of Education.

The first European settlers were Russians, attracted by the valuable furs and skins. Many of these married Indian women and raised families of mixed blood or creoles. As these children increased in number and grew up there began to be on the part of some of the fathers a felt need for schools. Accordingly Gregory Shelikoff, governor of the colony, and founder of the Russian-American Fur Company, established a school at Kadiak about the year 1792, which was taught by the trader. In 1793 Catherine II, Empress of Russia, through a ukase ordered missionaries to be sent to her North American Colony. In accordance with this order the following year 11 monks sailed from Ochotsk for Kadiak Island in charge of Archimandrite Josasaph, an elder in the order of Augustine Friars, who were expected to take charge of schools as well as churches. In 1805 the Imperial chamberlain and commissioner, Count Nikolai Resanoff, organized a school at Kadiak under the name of the "House of Benevolence of the Empress Maria," in which were taught the Russian language, arithmetic, and the Greek religion. In 1805 a school was opened at Sitka. It held a very precarious existence, however, until 1820, when it came under the charge of a naval officer who kept a good school for thirteen years. In 1833 this school came under the direction of Etolin, who still further increased its efficiency. Etolin was a creole, who by force of ability and merit, raised himself to the highest position in the country, that of chief director of the fur company and

governor of the colony. He was a Lutheran, the patron of schools and churches. While governor he erected a Protestant church at Sitka and presented it with a small pipe organ, which is still in use.

In 1840, besides the colonial school at Sitka, was one for orphan boys and sons of workmen and subaltern employees of the fur company, in which were taught reading, writing, arithmetic, grammar, mechanical trades, and religion. In 1839 a girls' school of a similar character was established and the number of boarders limited to 40. In 1841 a theological school was established at Sitka, which, in 1849, was advanced to the grade of a seminary. This made five schools at Sitka—two for the children of the lower class, two for the higher class, and one seminary. About the time of the transfer of the country the teachers were recalled to Russia and the schools suspended.

But with the change of government came a new people. The majority of the Russians left the country and their places were taken by Americans. Many came in from California, and on the 8th of November, 1867, less than a month from the time that the country passed under the United States flag, the citizens called a meeting and formed a temporary local government, and on the 18th of December, 1867, a petition, formed by 49 persons, 2 of whom "made their mark," was presented to the common council, asking that a citizens' meeting might be called to empower the council to establish a school. On the 20th of March, 1868, the council adopted some school regulations and appointed three trustees, who exercised a joint control with a committee of officers from the military post at Sitka. During the winter of 1868-69 a school building was purchased. The annual reports of the trustees have disappeared, and there is nothing to show the time when teaching commenced. In October, 1869, the council voted that the salary of the teacher should be $75 per month in coin, and on March 1, 1871, it was ordered to be $25 per month, which evidently means that at the latter period the post commander withdrew the $50 per month which had been paid from the army funds. On the 12th of August, 1871, permission was given the bishop of the Greek Church to teach the Russian language one hour each day in the public school. During 1873 the school seems to have died out.

In 1879 and 1880 an attempt was made to establish a school for Russian children, which was taught by Mr. Alonzo E. Austin and Miss Etta Austin. In the winter of 1877 and 1878 Rev. John G. Brady was appointed to Sitka, and in April, 1878, a school was opened by Mr. Brady and Miss Fanny E. Kellogg. In December, through a combination of circumstances, it was discontinued. In the spring of 1880 Miss Olinda Austin was sent out by the Presbyterian Board of Home Missions from New York City, and commenced school April 5 in one of the guardhouses, with 103 children present. This number increased to 130. Then some of the parents applied for admission, but could not be received, as the room would not accommodate any more.

In November some of the boys applied to the teacher for permission to live in the schoolhouse. At home, they alleged, there was so much drinking, talking, and carousing that they could not study. The teacher replied that she had no accommodations, bedding, or food for them. But they were so much in earnest that they said they would provide for themselves. Upon receiving permission, seven native boys, 13 and 14 years of age, bringing a blanket each, voluntarily left their homes and took up their abode in a vacant room of one of the Government buildings. Thus commenced the boarding department of the Sitka school. Soon other boys joined them. Capt. Henry Glass, who succeeded Captain Beardslee in the command of the U. S. S. *Jamestown*, from the first, with his officers, especially Lieut. F. M. Symonds, U. S. N., took a deep interest in the school. As he had opportunity he secured boys from distant tribes and placed them in the institution, until there were 27 boys in the boarding department.

In the winter of 1882 the schoolhouse was burned, and the boys took refuge in an abandoned Government stable, which was fitted up for them. In the fall of 1882, after consultation with the collector of customs, the commander of the United States man-of-war, and the leading citizens, I selected a new location for the school outside of village limits and erected a two-and-a-half story building, 100 by 50 feet in size. This location was donated to the Board of Home Missions by the Rev. John G. Brady.

In 1869 Mr. Vincent Collier, secretary of the Board of Indian Commissioners, paid a visit to the native tribes along the southern coast of Alaska, and upon his return to Washington made a report of his journey, among other things, recommending an appropriation of $100,000 to provide schools of instruction in the primary branches of the English language for the natives of Alaska. The report was indorsed by the Hon. J. D. Cox, Secretary of the Interior, and on April 22, 1870, transmitted to the Hon. James Harlan, chairman of the Committee on Indian Affairs, United States Senate. In the bill before Congress making appropriation for the Indian Department, etc., for 1870-71, a proviso was added for the support of industrial and other schools among the Indian tribes not otherwise provided for, to be expended under the direction of the Secretary of the Interior, $100,000. The Indian Peace Commission had recommended a specific appropriation for the Indians in Alaska, as also

had the Secretary of the Interior. Congress preferred to make the appropriation general, leaving it to the Secretary to apply such part to the Alaskan Indians as in his discretion he might think best.

On the 16th of March, 1870, the Hon. John Eaton, Ph. D., LL. D., was appointed United States Commissioner of Education. From the very first he took a special and deep interest in trying to secure education in Alaska; and in his first Annual Report (1870), pages 336, 337, and 345, he makes a plea for the establishment of schools in Alaska. Again, in his Annual Report for 1871 (p. 404) he calls attention to the appropriation of $100,000 previously mentioned, and states the fact that nothing had been done with it so far as pertained to education in Alaska, and closes with this paragraph:

"At the last session of the Forty-first Congress, an appropriation of $100,000 was made for 'industrial and other schools among the Indian tribes not otherwise provided for.' This amount was recommended by the Board of Indian Commissioners, with the expectation that a considerable proportion would be used in establishing free schools among the Alaska and Aleutian Indians. It does not appear that any steps have been taken for that purpose, the money being expended among other tribes. No effort has so far been made to educate these Indians, estimated as numbering more than 70,000 souls. The discovery of gold induces the migration of whites. The few trading operations are also gathering a large force of employees. There is great need of some practicable educational work in this Territory."

In his Annual Report for 1872 (pp. 20, 21), he again calls attention to the neglected condition of Alaska, saying:

"Alaska lies entirely outside of all organized efforts for education, and presents the singular fact of being an integral part of the boasted most progressive nation in the world, and yet without the least possible provision to save its children from growing up in the grossest ignorance and barbarism. No report has been received by the office from the two schools which the Fur-Seal Company is bound by its contract to support among the Aleutians."

In his Report for 1873 (p. 424), he publishes a letter from Capt. Charles Bryant, agent for the United States Treasury Department, giving information of the two schools upon the Pribilof Islands, which the Alaska Commercial Company, in virtue of its lease with the Treasury Department, is under obligation to maintain during eight months in each year of the lease, commencing with May 1, 1870. In the Annual Report for 1875 (p. 463), he publishes a long letter from William H. Dall with regard to the need of educational privileges in Alaska. In the Annual Report for 1877 (p. 3, xl), he publishes a long report from Sheldon Jackson, superintendent of Presbyterian missions in Alaska, giving an account of the commencement of schools by the Home Missionary Society of the Presbyterian Church of the United States of America. In the Annual Report for 1878 (pp. 2, xvii and 266), he gives a second report of Sheldon Jackson upon the progress of the Presbyterian schools in southeast Alaska; also, the character and customs of the native population. In the Annual Report for 1879 (p. 264), he publishes the third report of Mr. Jackson. In the Annual Report for 1880 (pp. liv and 350), occurs another report of Mr. Jackson on the progress of the Presbyterian schools. Also the Annual Report of Education for 1881 (pp. lxxviii and 286).

This brings us to the commencement of organized education by the United States Government. The securing of action during all these years it will be noticed the deep interest taken by Dr. John Eaton, Commissioner of Education, and when, in the year 1877, I came to Washington to try and influence Congress to make provision for education in Alaska I received a warm welcome from the Commissioner and every facility and encouragement that it was in his power to render. I found in the general public very great indifference with regard to Alaska. The prevailing opinion was that there was nothing in that distant section worth the attention of the national Congress. The struggle to awaken a public interest throughout the country and through that influence to secure action by Congress was a long and tedious one.

In the winter of 1877–78 I visited many of the leading cities of the country from Boston to Chicago and St. Louis, making addresses upon the condition of Alaska; also as I had opportunity wrote articles on the subject for the public press. These addresses and articles were repeated again in the winters of 1878, 1879, 1880, 1881, 1882, and 1883.

On December 10, 1877, at my suggestion the Revs. Dr. Henry Kendall and Cyrus Dickson, secretaries of the Board of Home Missions of the Presbyterian Church, addressed a letter to the honorable Secretary of the Interior, asking for Government aid for education in Alaska. In the spring of 1879 Hon. Carl Schurz, Secretary of the Interior, called upon Dr. Henry Kendall and Dr. Sheldon Jackson, who were about to visit Alaska, for a report upon the condition of the natives of Alaska, which report was sent to the Secretary of the Interior October 15, 1879. In reply the honorable Secretary of the Interior suggested the enlargement or increase of former efforts in the way of holding conventions throughout the country and rousing public sentiment.

This suggestion was adopted with the result that petitions and memorials commenced pouring in upon Congress. In January, 1880, Hon. James A. Garfield presented a series of these memorials[1] in the House of Representatives, and on the 2d of February, 1880, Hon. Henry L. Dawes presented similar memorials in the Senate.

Through the rising public sentiment, and especially the influence of Gen. John Eaton, the Commissioner of Education, there was secured on December 1, 1880, an official recognition of the needs of Alaska when President Hayes, in his message to Congress, said with regard to Alaska: "The problem is to supply the Territory for a population so scattered and so peculiar in its origin and condition. The natives are reported to be tractable and self-supporting, and if properly instructed doubtless would advance rapidly in civilization, and a new factor of prosperity would be added to the national life. I therefore recommend the requisite legislation upon the subject."

Again on December 6, 1881, recognition was secured in the annual message to Congress of President Arthur, who says: "I regret to state that the people of Alaska have reason to complain that they are as yet unprovided with any form of government by which life or property can be protected. While the extent of its population does not justify the application of the costly machinery of territorial administration, there is immediate necessity for constituting such a form of government as will promote the education of the people and secure the administration of justice."

Again in his message to Congress December 4, 1882, President Arthur says: "Alaska is still without any form of civil government. If means were provided for the education of its people and for the protection of their lives and property the immense resources of that region would invite permanent settlers and open new fields for industry and enterprise."

Upon the 4th of February, 1882, Gen. John Eaton sent a special letter to the honorable Secretary of the Interior calling attention anew to the need of schools in Alaska. On the 8th day of the same month the Hon. S. J. Kirkwood, Secretary of the Interior, transmitted the same to the President, and upon the 15th of February, 1882, the President transmitted both letters to the Senate and House of Representatives."[2]

---

[1] Whereas the United States is responsible for the proper care and government of Alaska, the native inhabitants of which and creoles of mixed blood are docile, peaceful, partially civilized, apt in the mechanical arts, and anxious for instruction; and

Whereas it is believed to be the wise policy as well as duty of the Government to adopt prompt measures for their education, with a view to their admission to the rights of citizenship; and

Whereas it is both cheaper and more humane to give them educational facilities now than to fight them hereafter at a largely increased cost; and

Whereas they are a self-supporting people, needing no annuities, clothing, or rations from the Government, but do need teachers, which they can not procure for themselves; and

Whereas the Government receives an annual revenue from Alaska of $317,500, and only returns to that country in the form of salaries of United States officers, pay of monthly mail steamer, support of steam revenue cutter, etc., the sum of about $65,000, leaving a net revenue of over $250,000: Therefore,

We, the undersigned, citizens of the United States, do hereby memorialize your honorable body to appropriate from the revenue of Alaska in the Treasury the sum of $50,000, or so much thereof as may be necessary, to be expended by the Commissioner of Education, under the direction of the honorable Secretary of the Interior, for the establishment, under competent teachers, of schools for the instruction of the native population and creoles of Alaska in the English language, the common branches of an English education, the principles of a republican government, and such industrial pursuits as may seem best adapted to their circumstances.

[2] *To the Senate and House of Representatives:*

I transmit herewith, for the consideration of Congress, a letter from the Secretary of the Interior, inclosing a letter from the Commissioner of Education, in which the recommendation is made that an appropriation of $50,000 be made for the purpose of education in Alaska.

CHESTER A. ARTHUR.

EXECUTIVE MANSION, *February 15, 1882.*

DEPARTMENT OF THE INTERIOR,
Washington, February 8, 1882.

SIR: I have the honor to transmit herewith, for your consideration, a letter from the Commissioner of Education, in which he recommends that an appropriation of $50,000 be made for the establishment and maintenance of schools in Alaska.

I concur in the recommendation that the appropriation be made.

Very respectfully,

S. J. KIRKWOOD, *Secretary.*

The PRESIDENT.

DEPARTMENT OF THE INTERIOR, BUREAU OF EDUCATION,
Washington, February 4, 1882.

SIR: My attention is called to the provisions of the law determining the purpose and duties of this office, which provides that it shall "collect statistics and facts showing the condition and progress of education in the several States and Territories, and to diffuse such information respecting the organization and management of schools and school systems and methods of teaching as shall aid the people of the United States in the establishment and maintenance of efficient school systems and otherwise

Following this movement of the highest officials of the land, a series of lectures by myself on Alaska was arranged in the various churches of the different denominations in Washington, in February, 1882, and a card of invitation giving the dates and places of said lectures, was sent to each Congressman. In April of the same year, Dr. John M. Reid, secretary of the Methodist Episcopal Missions, and Dr. Henry L. Morehouse, secretary of the Baptist Home Missions, and Dr. Henry Kendall and William C. Roberts, secretaries of the Presbyterian Home Missions, at my request sent printed circulars to leading and influential men of their respective denominations throughout the United States, asking them to circulate petitions in their sections for signature to be mailed to their respective Congressmen, asking for the establishment of schools in Alaska.

The general assembly of the Presbyterian Church in the United States of America, in session at Saratoga Springs, May, 1883, took the following action:

"In view of the pressing needs of Alaska, where our missions have been singularly successful, we recommend that the general assembly appoint a committee of five persons, who shall wait upon the President of the United States and the Secretary of the Interior, asking of the Government through them the establishment of civil government among these people of Alaska, and pressing upon them the necessity of establishing industrial schools in that Territory."

At the fifty-first annual meeting of the American Baptist Home Mission Society, Saratoga Springs, May 25, 1883, the following resolution was adopted:

"The committee on work among the Indians reported. * * * From the country of Alaska comes a cry for help as pitiful and as hopeless as any that ever startled Christian ears from the lands beyond the sea. What answer will our great denomination make to this repeated appeal? We repeat the recommendation made to the society a year ago, that missionaries be sent as soon as practicable to the Indians of Alaska." Report adopted.

The following was ordered sent to the President of the United States and the Secretary of the Interior:

"*Resolved*, That as Alaska is the only section of the United States where Governmental or local aid has not been furnished for the education of the people; and as the establishment of schools will assist in civilizing the native population, prevent Indian wars, and prepare them for citizenship;

"Therefore, the American Baptist Home Missionary Society in session at Saratoga Springs, May, 1883, would respectfully petition you to renew your recommendation to Congress for an educational appropriation for Alaska."

---

promote the cause of education throughout the country;" and it is affirmed that I have not yet made any specific recommendation with regard to education in Alaska. I can not claim to be ignorant of the fact that there is no law either for the protection of life or property or for the establishment of schools in that Territory, nor would I be among those who are indifferent to facts reflecting so unfavorably upon us as a people. I have sought diligently to gather all information in regard to the education of the children of Alaskans, as will be seen by reference to the several reports of this office. Prior to the purchase of Alaska the Russian Government had schools in portions of that country. When it was transferred to the United States those schools were generally discontinued, and the entire Territory, with few exceptions, has been left without any means of education. From the census of 1880 we learn that there are about 30,000 people in Alaska, and of these it is believed there are about 10,000 children or young people who ought to have some school privileges.

With regard to this people, it may be observed—

(1) That they are docile, peaceful, and have here and there some knowledge of useful industries; are apt in the mechanical arts, and anxious for instruction.

(2) They are a self-supporting people, needing no annuities, clothing, or rations from the Government, but do need teachers that they can not procure for themselves. These teachers should instruct them not only in letters, but in the arts of civilized life and the duties of American citizenship.

(3) If given an opportunity for this kind of instruction for a few years they would, it is believed, make good progress in throwing off tribal relations and in preparation to become an integral portion of the American people, thus contributing to the common wealth and prosperity of the country.

(4) It is well known that civilization in approaching an untutored people may be their destruction by sending its vices before its virtues. It is equally well known that various weeds spring up spontaneously where useful plants must be cultivated, and that not neglect but painstaking care is necessary to the improvement of the human mind.

The people of Alaska having received some measure of aid from the Russian Government, have expected the same from the United States. The natives, already to a limited extent demoralized by the introduction of intemperance and disease, it is thought would, by the introduction of schools, be prepared better to resist these evils and stand a far better chance to be a permanent and prosperous race.

(5) The development of the fishing interests, the discovery of gold, and the increase of commerce in that region are now calling public attention to it, and the time seems to have arrived when school privileges should be immediately provided. In 1870 Congress appropriated $50,000 for educational purposes in Alaska, which, on account of difficulties of administration at that time, was not expended there. This amount could now be expended there, I am sure, with most satisfactory results.

In accordance, therefore, with these considerations, and in order not to come short of any duty required of me by law, I have the honor to recommend that Congress be requested to appropriate $50,000 for the establishment and maintenance of schools for instruction in letters and industry, at such points in Alaska as shall be designated by the honorable Secretary of the Interior.

I have the honor to be, very respectfully, your obedient servant,

JOHN EATON, *Commissioner.*

THE SECRETARY OF THE INTERIOR.

Feeling the need, not only of enlisting the churches, as had been done through their central missionary societies, but also the educators of the land in behalf of Alaska, on the 23d of March, 1882, through the courtesy of Gen. John Eaton, Commissioner of Education, I was invited to address the superintendents' section of the National Education Association, at their meeting in Washington, on the needs of Alaska. The association unanimously adopted the following resolution:

"Whereas the native population of Alaska have alone of all sections of our common country been overlooked in educational provisions, and, whereas, the President has sent to Congress a special message asking for an appropriation of $50,000 for education in Alaska, to be disbursed through the National Bureau of Education; Therefore,

"*Resolved*, That this association earnestly request the Committees on Education and Labor of the Senate and House of Representatives to give favorable consideration to the above request."

The year 1883 was signalized by the unanimous action of the various educational associations that I could visit and address. On July 11, 1883, at the twenty-second annual meeting of the National Education Association held at Saratoga, N. Y., the following resolutions were unanimously adopted:

"*To the Friends of Education:*

"The National Education Association of the United States, in session at Saratoga Springs, July 9–11, 1883, took the following action with reference to education in Alaska:

"Whereas Alaska is the only large section of the United States for which some educational provision has not been made by law; and

"Whereas it is a reflection upon our interest in universal education that Alaska should be worse off than when under the control of Russia, the United States having neglected to continue the schools that for many years were sustained by the Russian Government, or substitute better ones in their places; and

"Whereas the President of the United States transmitted to the last Congress a paper from the honorable Commissioner of Education, calling attention to this neglect; Therefore,

"*Resolved*, (1) That the president and secretary of this association be requested to prepare a paper asking the Government to make some provision for an industrial training school at Sitka, the capital; and for an appropriation to be expended by the Commissioner of Education, under the direction of the honorable Secretary of the Interior, for the establishment of schools at such points in Alaska as may be designated by the Commissioner of Education.

"(2) That copies of the paper so prepared, signed on behalf of this association by the president and secretary, shall be transmitted to the President of the United States, the honorable Secretary of the Interior, and the Committees on Labor and Education in the Senate and House of Representatives.

"Similar action has been taken by the department of superintendence of the association, by the National Education Assembly, and by the Massachusetts, Vermont, New Hampshire and Connecticut State teachers' associations.

"In accordance with the above resolution of the association, we have sent memorials to the President, the Secretary of the Interior, United States Commissioner of Education, and both Houses of Congress.

"Since then we are gratified to notice that the President in his annual message, and the Secretary of the Interior and Commissioner of Indian Affairs in their annual reports to Congress have earnestly called the attention of that body to the needs of Alaska.

"Further action is dependent upon Congress. But in the many interests claiming the attention of Congress and the pressure of political matters preceding a Presidential election, nothing will be done, unless the friends of education flood Congress with petitions asking special attention to the urgent needs of schools in Alaska.

"Please therefore take the inclosed, or some similar petition, sign it yourself, offer it to as many friends and neighbors as convenient, and then mail it at an early date to your Representative in Congress, or to either of the Senators from your State, or to the person named in the petition.

"THOMAS W. BICKNELL, *President.*
"H. S. TARBELL, *Secretary.*"

This paper was printed as a circular and sent by the thousand to the public-school teachers of the country.

At the second annual meeting of the National Education Assembly held at Ocean Grove, N. J., August 9–12, 1883, upon motion of Gen. T. J. Morgan, the following action was taken:

"*Resolved*, That we recognize with profound gratitude to God the cheering progress that marks the efforts to civilize the American Indians; that we see in this an unanswerable argument in favor of the continuance on the part of the Government

of the so-called peace policy; that we urge upon Congress the enlargement of the work already in progress, until adequate provision shall be made for the systematic education of all Indians of proper school age; that we specially urge the importance of appropriation of money for general education in Alaska and for the establishment of an industrial and normal school at Sitka; that we pledge ourselves, and call upon all philanthropists, not only to aid the Government in this great work, but to do all that can be done, privately and publicly, to carry forward this great enterprise, until the American Indians become American citizens, with individual rights of property and suffrage and individual responsibilities and duties."

On the 19th of October, 1883, the Connecticut State Teachers' Association, in session at New Haven, took action as follows:

"*Resolved*, That we specially urge the importance of the appropriation of money for general education in Alaska and for the establishment of an industrial and normal school at Sitka; that we pledge ourselves and call upon all philanthropists not only to aid the Government in this great work, but to do all that can be done privately and publicly to carry forward this great enterprise until the American Indians become American citizens with individual rights of property and suffrage, and individual responsibilities and duties."

They were followed by the Vermont State Teachers' Association, in session at Montpelier October 25, 1883, who reported:

"The Vermont State Teachers' Association, in session at Montpelier October 24 to 27, 1883, learn with regret that since the transfer of Alaska from Russia to the United States, sixteen years have been allowed to pass without extending to the population educational advantages. We feel ashamed as American citizens that any section of our land should be worse off under our control than under the control of Russia, we having failed to continue the schools which for many years were sustained by the Russian Government. We learn, therefore, with great pleasure that on February 15, 1882, the President transmitted to Congress a communication from the Secretary of the Interior recommending that an appropriation of $50,000 be made for the establishment and maintenance of schools in Alaska, and that the honorable Secretary of the Interior proposed to make to the coming Congress a recommendation for industrial schools in that country; therefore, we join in the earnest request of the better portion of the American people that an appropriation be made for the establishment of an industrial training school similar to those at Carlisle and Hampton, at Sitka, the capital. Also for the establishment under the direction of the National Bureau of Education of schools at the thin centers of population in Alaska. That copies of this paper signed by the president and secretary of this association be transmitted to the honorable Secretary of the Interior and to both Houses of Congress."

The same resolution was presented and adopted at the New Hampshire State Teachers' Association the following day.

Massachusetts brought up the rear at her State Teachers' Association in session at Boston, December 27 to 29:

"*Resolved*, That this association cordially seconds the efforts of those who are striving to induce the Congress of the United States to appropriate money for public education in the Territory of Alaska."

This list of educational conventions was crowned by a mass meeting held in Park Street Congregational Church in Boston on Sabbath evening, December 30. It was to have been presided over by Hon. Wendell Phillips, but being prevented from attending, Mr. Joseph Cook took his place. Mr. Phillips, however, showed his special interest by sending to the mass meeting the following letter, which was his last public letter on earth—a fit closing for his noble life. As his strength had been spent for the freedom of the slaves and the deliverance of the oppressed, it was suitable that his last public act should be a plea for Alaska.[1]

---

[1] BOSTON, MASS., *December 29, 1883.*

MY DEAR SIR: What excuse the United States Government can offer for leaving Alaska without magistracy or schools passes my conjecture.

For some fourteen or fifteen years we have owed her a government and received large revenue from the Territory. Still it remains without law, magistracy, or schools. If it were so poor a country that we dreaded the expense of a government we might make some pretense of explanation—though in any circumstance we are bound to protect life and property wherever our flag floats, and see that the rising generation are fitted for citizenship and the duties of life. But Alaska has poured millions into the treasury, and one-third of what we have annually received would suffice for the whole expense of a government and schools. If we were called upon to make a beginning and introduce law and education there might be a shadow of excuse in this delay. But Russia had provided for both, and when we bought the province we had but to continue what she had established. From every point of view the condition of Alaska is a disgrace to our Government, and calls for immediate action. Cease to receive revenue from Alaska or give her an equivalent by protecting life and property, securing peace, and offering to every man, woman, and child the means of fitting themselves for citizenship and their duties. If we have not leisure to attend to our citizens, then, as the woman said to Philip of Macedon, "Cease to be King." I wish I could be with you to-morrow evening and give my aid in urging all this on the immediate attention of Congress.

Yours, respectfully, WENDELL PHILLIPS

Rev. SHELDON JACKSON.

With the hearty action and request of the National Education Association, already quoted, petitions were printed by the hundred thousand and sent to the public-school teachers of the United States, large numbers of whom secured signatures in their respective sections, and then sent them to Congress. Accompanying these, President Arthur, on the 4th of December, 1883, in his message to Congress, says:

"I trust that Congress will not fail at the present session to put Alaska under the protection of law. Its people have repeatedly remonstrated against our neglect to afford them the maintenance and protection expressly guaranteed by the terms of the treaty whereby that Territory was ceded to the United States. For sixteen years they have pleaded in vain for that which they should have received without the asking. They have no law for the collection of debts, the support of education, the conveyance of property, the administration of estates, or the enforcement of contracts; none, indeed, for the punishment of criminals, except such as offend against certain customs, commerce, and navigation acts. The resources of Alaska, especially in fur, mines, and lumber, are considerable in extent, and capable of large development, while its geographical situation is one of political and commercial importance. The promptings of interest, therefore, as well as considerations of honor and good faith, demand the immediate establishment of civil government in that Territory."

Spurred by the tens of thousands of petitions, as well as the repeated messages of the President, Messrs. Miller, Platt, Harrison, Rosencranz, Phelps, and others introduced bills either in the Senate or House of Representatives for establishing a civil government of some sort for the Territory, which resulted in the adoption of what is known as the Harrison bill, creating a government and schools in Alaska, which became a law on May 17, 1884. Thus culminated my long struggle, from 1877 to 1884, for education and civil government in Alaska, during which I delivered over 900 addresses on Alaska, held public meetings in all the leading cities from the Atlantic to the Pacific, had hearings before the committees of the Forty-sixth, Forty-seventh, and Forty-eighth Congresses, besides securing the cooperation of the missionary societies and the educational interests of the entire country.

The "campaign of education" that secured from Congress schools for Alaska, also secured the extension of law and government over that section.[1]

---

[1] The Hon. John Eaton, LL. D., then Commissioner of Education, in his annual report for 1882–83 (pp. xlv, xlvi), says:

"As this report is going through the press, the House of Representatives, on the 14th of May, 1884, passed the Senate bill providing a civil government for Alaska, which was signed by the President on the 17th. This act creates a governor at a salary of $3,000, a judge at $3,000, a district attorney at $2,500, a marshal at $2,500, a clerk at $2,500, four commissioners at $1,000 each and fees, and four deputy marshals at $750 each and fees. These officers are appointed by the President, with the exception of the deputy marshals, who are appointed by the marshal. The seat of government is established at Sitka. The four commissioners and four deputy marshals are to reside respectively at Sitka, Wrangell, Juneau, and Unalaska.

"The laws of Oregon, so far as applicable, are extended over the district. A term of the district court is to be held each year at Sitka, commencing on the first Monday of May, and one at Wrangell, beginning on the first Monday in November. No provision is made for a territorial legislature or a delegate in Congress. The general land laws of the United States are not extended over the country. The squatter rights of Indians and others are recognized. Mission stations are continued in the occupancy of the 640 acres now claimed by them. The owners of mining claims can perfect their titles in the usual way.

"The governor is required to inquire into the operations of the Alaska Commercial Company and annually report to Congress the result of such inquiries and any and all violations by said company of the agreement existing between the United States and said company.

"The Secretary of the Interior is directed to select two of the officers, who, together with the governor, shall constitute a commission to examine into and report upon the condition of the Indians residing in said Territory; what lands, if any, should be reserved for their use; what provision shall be made for their education; what rights by occupation of settlers should be recognized, and all other facts that may be necessary to enable Congress to determine what limitations or conditions should be imposed when the land laws of the United States shall be extended to said district.

"The importation, manufacture, and sale of intoxicating liquors in said district, except for medicinal, mechanical, and scientific purposes, are prohibited.

"The Secretary of the Interior is directed to make needful and proper provision for the education of the children of school age in the Territory of Alaska, without reference to race, until such time as permanent provision shall be made for the same, and the sum of $25,000 is appropriated for this purpose.

"Thus, after seventeen years of delay, a government has been secured for Alaska. In respect to this successful result this Bureau has endeavored to do its whole duty by obtaining trustworthy information in regard to the condition of the inhabitants and their educational needs, and by furnishing it to the Government officers and to the people. In this effort Prof. W. H. Dall, of the United States Coast Survey, and Rev. G. H. Atkinson, D. D., of Oregon, were especially helpful.

"The report of this office for 1870 had a notice of education in Alaska, and year after year these notices were continued as data warranted.

"In 1876 the Commissioner of Education, as representative of the Department of the Interior, expended a portion of the funds at his control to secure a representation of native life in Alaska for the Centennial Exposition at Philadelphia.

"In February, 1882, a special report from this office on Education in Alaska, recommending an appropriation of $50,000 for schools, was made to the Secretary of the Interior, and by him forwarded to Congress through the President.

"In 1877 Rev. Sheldon Jackson, D. D., superintendent of Presbyterian missions for the Rocky Mountain Territories, having had his attention called to Alaska, visited the southeastern portion, and

ESTABLISHMENT OF PUBLIC SCHOOLS.

On the 2d day of March, 1885, the honorable Secretary of the Interior assigned the work of making provision for the education of the children in Alaska to the Bureau of Education.

"DEPARTMENT OF THE INTERIOR,
"*Washington, D. C., March 2, 1885.*

"SIR: Section 13 of the act providing a civil government for Alaska devolves upon the Secretary of the Interior the duty of making needful and proper provision for the education of children of school age in that Territory until permanent provision shall be made for the same.

"The nature of the duties assigned by section 516 of the Revised Statutes to the Commissioner of Education would seem to point him out as the proper officer through whom the purpose of Congress should be carried into execution.

"I have to request, therefore, that you prepare a plan of operation and initiate such steps as are necessary and proper for carrying into effect the legislation above referred to, reporting the results of the same as may be hereafter directed by the Secretary of the Interior or whenever in your judgment there may be occasion for so doing.

"Very respectfully, etc.,

"H. M. TELLER, *Secretary.*

"The COMMISSIONER OF EDUCATION."

It was a work of great magnitude, in a new and untried field, and with unknown difficulties. It was a work so unlike any other that the experience of the past in other Departments could not be the sole guide. It was a problem peculiar to itself, and must be worked out by and for itself. It covered an area of one-sixth of the United States. The schools to be established would be from 4,000 to 6,000 miles from headquarters at Washington, and from 100 to 1,000 miles from one another. And that in an inaccessible country, only one small corner of which has any public means of intercommunication. The teachers of five schools in southeastern Alaska would be able to receive a monthly mail; the larger number of the others could only receive a chance mail two or three times a year, and still others only one annually.

It was to establish English schools among a people the larger portion of whom do not speak or understand the English language, the difficulties of which will be better appreciated if you conceive of an attempt being made to instruct the children

---

established the first American school in that section on the 10th of August, 1877, with Mrs. A. R. McFarland as teacher. Later he established schools at Sitka, Haines (Chilkats), Boyd (Hoonahs), and Jackson (Hydahs). Returning to the States, Dr. Jackson commenced an agitation to arouse the dormant public sentiment of the country in behalf of a government and schools for Alaska. He held public meetings in many of the leading cities and many of the prominent towns from the Pacific to the Atlantic, delivering from 1878 to 1884 about nine hundred addresses on Alaska. He went before committees of the Forty-sixth, Forty-seventh, and Forty-eighth Congresses, and with unflagging zeal sought to enlist the interest of Congressmen. He secured the hearty cooperation of the missionary societies of the Baptist, Methodist, Congregational, Episcopal, Moravian, and Presbyterian churches.

"In 1880 he published a book on Alaska, and on March 23, 1882, delivered an address before the Department of Superintendence of the National Educational Association, which was printed by this Bureau in Circular of Information No. 2, 1882. Of this circular three editions have been called for, making an aggregate of 60,000 copies. During the summer of 1883 he visited the twenty-second annual meeting of the National Educational Association of the United States, the second National Educational Assembly, and the State Teachers' associations of Vermont, New Hampshire, Massachusetts, and Connecticut, each of which passed strong resolutions asking Congress to provide a school system for Alaska.

"Through these meetings the teachers became interested, and thousands of petitions from teachers, scattered from Maine to Texas and from Florida to Oregon, were sent to Congressmen, asking for schools for Alaska. So persistent and continuous was the pressure invoked by Dr. Jackson from so many, varied, and widely separated forces, that when the bill was reached Congress passed it with great unanimity."

HOUSE OF REPRESENTATIVES, *Washington, D. C., May 1, 1885.*

MY DEAR SIR: In view of the very great and general interest manifested in regard to everything pertaining to Alaska, I feel like congratulating you on the reward you are now receiving for your long, unwearied, and very efficient labors on behalf of that distant portion of our country. When I remember your faithful work for Alaska while you were superintendent of Presbyterian Missions for the Rocky Mountain Territories, your able and successful efforts to arouse public sentiment in behalf of a government and schools for Alaska, and your addresses all over the country on the subject, taken with what has come under my personal observation while a Member of the Forty-eight Congress and a member of the Committee on Territories and on the sub committee having in charge the bill proposing a civil government for Alaska, I say without any hesitation that in my humble judgment, to you more than to any other one man or agency is due the success thus far attained in the direction of the establishing of a form of government, and the improvement in the condition of the inhabitants of Alaska. I took from the first, a special interest in the bill before our committee because of the information you furnished and your connection with the matter. Please accept my sincere congratulations on your appointment as the first superintendent of public instruction for Alaska, and believe me

Yours, very truly,

F. A. JOHNSON,
Member of Congress Twenty-first District, New York.

Rev. SHELDON JACKSON, D. D.

of New York or Georgia in arithmetic, geography, and other common-school branches through the medium of Chinese teachers and text-books. Of the 36,000 people in Alaska, not over 2,000 speak the English tongue, and they are mainly in three settlements.

It was to instruct a people, the greater portion of whom are uncivilized, who need to be taught sanitary regulations, the laws of health, improvement of dwellings, better methods of housekeeping, cooking, and dressing, more remunerative forms of labor, honesty, chastity, the sacredness of the marriage relation, and everything that elevates man. So that, side by side with the usual school drill in reading, writing, and arithmetic, there is need of instruction for the girls in housekeeping, cooking, and gardening, in cutting, sewing, and mending; and for the boys in carpentering and other forms of woodworking, boot and shoemaking, and the various trades of civilization.

It was to furnish educational advantages to a people, large classes of whom are too ignorant to appreciate them, and who require some form of pressure to oblige them to keep their children in school regularly. It was a system of schools among a people, who, while in the main only partially civilized, yet have a future before them as American citizens.

It was the establishment of schools in a region where not only the schoolhouse but also the teacher's residence must be erected, and where a portion of the material must be transported from 1,500 to 4,500 miles, necessitating a corresponding increase in the school expenditure.

It was the finding of properly qualified teachers, who, for a moderate salary, would be willing to exile themselves from all society, and some of them settle down in regions of arctic winters, where they can hear from the outside world only once a year.

To the magnitude of the work, and the special difficulties environing it, is still further added the complication arising from the lack of sufficient funds to carry it on, there being appropriated only $25,000 with which to commence it.

On the 9th of April the Commissioner of Education addressed a communication[1] to the honorable Secretary of the Interior, requesting authority to appoint a general agent to take charge of the Alaska work, and upon the 11th of April, 1885, the Secretary granted the request and directed the establishment of the office of "general agent of education in Alaska."

On the 11th of April, 1885, Rev. Sheldon Jackson, D. D., was appointed by the Commissioner of Education general agent of education in Alaska and at once entered upon the work.

In southeastern Alaska the establishment of schools, in comparison with the difficulties met in other sections of this land, was easy, as four of the seven schools can

---

[1] DEPARTMENT OF THE INTERIOR, BUREAU OF EDUCATION,
Washington, D. C., April 9, 1885.

SIR: In carrying out the orders of the Department under the law providing for the establishment of common schools in Alaska, I find a condition of facts which I wish to submit to your consideration, together with a recommendation. The nearest school in Alaska will be about 4,500 miles from Washington, and all of the schools will be widely separated from each other, some of them doubtless over 6,000 miles from this city. The appropriation of $25,000 for the entire work is very small, and much should be done in the way of inducing the communities where there is money to cooperate in bearing expenses, and thus increasing the amount to be accomplished by the small fund at command. I see no way to organize schools sufficiently under these circumstances but by the appointment of someone in Alaska as a general agent of education.

Residing at Sitka, this superintendent could go out in the naval vessel to visit the several chief centers of population, where schools can be established, and interest the people, judge intelligently of the requirements for buildings, teachers, etc., and thus furnish the data for intelligent direction of the schools here in Washington. I therefore recommend that a general agent of education for Alaska be appointed by the Secretary of the Interior, to report to this office for orders and instructions, at a nominal salary of $1,200 a year, which will but little more than cover expenses. Before concluding to make this recommendation I may add that I have conferred with a considerable number of very intelligent persons who have visited Alaska, all of whom thoroughly concur in the view that it would be impossible to manage schools there efficiently without a local superintendent.

The governor of the Territory when here recently expressed himself to the same effect. In looking for the proper person to become such an agent, I find no one either so well qualified or so strongly recommended as Mr. Sheldon Jackson. He has repeatedly visited considerable portions of the country, and written a book which is a popular source of information in regard to its people and their progress, and led the way in the establishment of the schools at present taught in the Territory, and is now their superintendent. He was unanimously recommended for the position of superintendent of instruction by all of the private organizations some time since aiming to promote education in Alaska, and by a considerable number of prominent men. I have known Mr. Jackson thoroughly for a considerable number of years. He is a Christian gentleman of excellent ability, great energy, and, I believe, specially fitted to carry through successfully the plan of establishing schools in that far-off country.

I have the honor to be, very respectfully, your obedient servant,

JOHN EATON, *Commissioner.*

The SECRETARY OF THE INTERIOR, *Washington, D. C.*

Approved:
L. Q. C. LAMAR, *Secretary.*

be reached monthly by the mail steamer. Further, schools had been kept at all these points but two for several years by teachers in the employ of the Board of Home Missions of the Presbyterian Church. This missionary organization was the first of the American churches to enter that neglected land. Finding no schools, they established them side by side with their missions, proposing to furnish educational advantages until the General Government should be ready to do it. Therefore whenever the Government was ready to undertake the work in any village occupied by the Presbyterians, they turned over their schools to the Government. As the Presbyterians had a body of efficient teachers already on the ground, acclimated, experienced in the work, more or less acquainted with the native language, and possessing the confidence of the people, it was both more economical to the Government and for the best interests of the schools that they should as far as possible be reemployed, which was done.

Special requests having been received for an early inauguration of the public-school system in Sitka and Juneau, I gave them my first attention.

Sitka.—By permission of the collector of the port, who is the custodian of the Government buildings, I took possession of a log house in the center of the village and repaired it as best I could under the circumstances. In this building a school was opened on June 22, 1885, with Miss Margaret Powell, of western Pennsylvania, as teacher. The pupils were from white and Russian creole families. On the 16th of November, 1885, a public school was established for the native children, with Miss Kate A. Rankin, of western Pennsylvania, as teacher.

Juneau.—This was the principal mining center of Alaska, with the largest American population of any place in the Territory. A log carpenter shop was erected and fixed up for the school room, and the school opened on the 1st of June with Miss Marion B. Murphy, of Oregon, as teacher. Looking forward to the erection of a suitable school building in the near future, I selected a block of land in the center of the village, with the concurrence of the United States Commissioner, and had a cheap fence thrown around it, in order to secure it for school purposes.

Hoonah.—This important village is 130 miles by water north from Sitka. The school, originally started by the Presbyterian Board of Home Missions, was transferred to the Government and the fall term opened on Tuesday, September 1, the teacher being Mrs. Maggie Dunbar McFarland, wife of the missionary at that place.

Fort Wrangel, 333 miles southeast of Sitka, had a school which had been under way since 1877, supported by the Woman's Home Missionary Society of the Presbyterian Church. It was transferred to the Government and opened the 1st day of September, with Miss Lydia McAvoy as teacher.

Haines (200 miles by water north of Sitka).—This school likewise was transferred from the missionary society and was opened the 1st of September, with Miss Sarah M. Dickinson, an educated half-breed, as teacher.

Jackson.—This village is 533 miles by water south of Sitka. The school that had been opened by the Presbyterian missionaries in 1881, was likewise transferred to the Government and opened as a public school on the 1st of September, 1885, with Miss Clara A. Gould as teacher.

There being no regular communication between Sitka and western Alaska, and as it would take the entire season to go from Sitka to San Francisco, visit the leading places in western Alaska and return, I was unable the first year to do more for that section than to send Mr. Salomon Ripinsky to Unalaska, where a school was opened in October, 1885.

Communication with interior Alaska in 1885 was very difficult. If I wished to visit the school on the Yukon River, my nearest way was to take the mail steamer from Sitka to Juneau, 166 miles, then hire a canoe and natives to take me, together with blankets and provisions, to the head of Dyya Inlet, about 100 miles. Then leaving the water, a fresh crew of natives would be hired to carry my supplies 25 miles on foot, over a dangerous mountain trail, to the upper waters of the Yukon, then construct a raft and float down the stream 1,500 miles to Nulato, or 1,750 miles to Anvik. The trip would occupy two months. Another practicable way was to take the mail steamer to San Francisco, 1,600 miles, then a chance steamer to St. Michaels, 3, 264 miles, then a small river steamer that makes one trip a year to Nulato, 769 miles, a total distance of 5,633 miles. To make the trip and return in the same year would require close connections.

If I wished to visit the school at Bethel, I could take a mail steamer from Sitka to San Francisco, 1,600 miles, then wait until some vessel sailed for Unalaska, 2,418 miles, then wait again until some trading vessel had occasion to visit the mouth of the Kuskokwim River, 461 miles, and go from thence in a bidarka (sea-lion-skin canoe) 150 miles up the river, a total of 4,629 miles. By the same tedious route the teachers received their annual mail, except that it started from San Francisco.

During the summer of 1884 the American branch of the Moravian Church, upon my representation, had sent a commission, consisting of Rev. A. Hartman and Rev. H. Weinland, to visit the western section of Alaska and secure a suitable location

for a mission to the Eskimos. The result of their exploration was the locating of a mission station named Bethel, 150 miles up the Kuskokwim River.

On the 18th of May, 1885, a party consisting of Rev. William H. Weinland and Rev. J. H. Killbuck (Delaware Indian) and their wives, with Mr. John Torgerson, the mechanic and lay assistant, sailed from San Francisco, reaching the mouth of the Kuskokwim on the 19th of June. Being on the ground I appointed Mr. J. H. Killbuck teacher at Bethel.

At Killisnoo, 80 miles northeast of Sitka, a school was opened in January, 1886, with George B. Johnston as teacher. The same winter Mr. Louis Paul, a native, was sent to open a school at Port Tongass.

Having given the entire school year for 1885–86 to the organization of public schools in southeastern Alaska, I commenced early arrangements to make a trip to western Alaska during 1886–87.

The work of education in Alaska for 1886–87 was greatly hindered by the delay of Congress in making the appropriation. Until it was definitely known how much would be appropriated for education no plan of work could be arranged. Until the appropriation was actually made the office was left in doubt whether it would be able to enlarge the work, or merely continue existing schools, or disband them.

The appropriation was not made until August, 1886. In the meantime the trading vessels that sail from San Francisco to Bering Sea in the spring and return in the fall had all sailed, and with them the only regular opportunity of sending teachers and school supplies to western Alaska. To wait until the following spring would involve the delay of another year in establishing the schools. Under the circumstances there was no alternative but to charter a vessel for the work of the Bureau. This, in addition to meeting a necessity, enabled the Commissioner to secure reliable information concerning the educational needs of the principal centers of population among the civilized Russians, Aleuts, and Eskimos of southern and southwestern Alaska.

With the commencement of the public agitation, which resulted in securing schools for Alaska, the Commissioner had sought diligently for reliable and explicit information concerning that unknown region. When, in 1885, the responsibility of establishing schools in that section was placed upon him he more than ever felt the need of the information that was necessary for intelligent action in the school work. An application was then made to the honorable Secretary of the Navy, and he issued instructions to the commanding officer of the U. S. S. *Pinta*, then in Alaskan waters, to take the general agent of education in Alaska on a tour of inspection along the coast. A combination of circumstances prevented the ship from making the trip.

The necessity which arose in the fall of 1886 of sending the teachers furnished the long-desired opportunity of securing the needed information.

The schooner *Leo*, of Sitka, was chartered, because the terms were lowest, and because the vessel had auxiliary steam power, which enabled it to get in and out of harbors and through the narrow channels between the islands, where, without this auxiliary power, we would have been delayed weeks.

The cruise proved a stormy one, consuming one hundred and four days. Passing through the equinoctial storms, we encountered the early winter gales of that high latitude. We lost 2 sails, were stranded on a reef of rocks, nearly lost a sailor overboard, while repeatedly great seas washed completely over us.

Taking on board of the *Leo* Mr. John H. Carr and wife; Mr. W. E. Roscoe, wife and child; Rev. and Mrs. James A. Wirth, and Rev. and Mrs. L. W. Currie and child, together with their household effects and provisions, also necessary school supplies, I sailed from Puget Sound September 3. Visits were made to Kadiak, Wood Island, Spruce Island, Afognak, Karluk, Akhiok, Ayakharalik, Kaguiak, Unga, Belskofsky, Unalaska, Jackson, Klawak, Tuxikan, Sitka, Killisnoo, Hoonah, Juneau, Douglas, Wrangell, Loring, and Port Tongass. At Unga, on the Shumagin Island, I landed Mr. and Mrs. John H. Carr with school books, desks, etc., for the establishment of a school. Mr. and Mrs. W. E. Roscoe were similarly landed at Kadiak; Rev. and Mrs. James A. Wirth were landed through the breakers at Afognak, and the Rev. L. W. Currie and family were landed at Tuzikan, at all of which places schools were established.

On the 1st day of July, 1886, a contract was entered into with Dr. William S. Langford, secretary of the Protestant Episcopal Mission Board of New York City, by which Rev. Octavius Parker, of Oregon, was appointed teacher, and directed to establish a school in the Yukon Valley. Being unable to reach his destination the first season the school was opened temporarily at St. Michael on the coast. A similar contract was made with the officers of the missionary society of the Moravian Church to establish a school at the mouth of the Nushagak River. Rev. Frank E. Wolff, of Wisconsin, accompanied by his family and Miss Mary Huber, were sent as teachers to that place. These schools, with the one at Bethel, 500 miles from each other, and central to a population of from 10,000 to 12,000 uncivilized Eskimos in western Alaska, were the entering wedges to the civilization of that whole great

region—the beginning of better things. Prof. S. A. Saxman and wife were transferred from Loring, which school was abandoned, to Fort Tongass. The year 1887 was marked by the visit to southeastern Alaska of the Hon. N. H. R. Dawson, then Commissioner of Education; also the establishment by the Secretary of the Interior of a Territorial board of education composed of the governor of the Territory, the judge of the United States district court, and the general agent of education. Under the new order of things a set of rules and regulations for governing the schools of Alaska was issued by the Secretary of the Interior on June 15, 1887. The year was also noted by the removal of some 700 civilized and christianized Tsimpshean natives, under the lead of Mr. William Duncan, from Metlakahtla, British Columbia, to Point Chester, Annette Island, Alaska; the colony was called New Metlakahtla.

The school temporarily established the previous year at St. Michael on the coast of Bering Sea was removed to Anvik in the Yukon Valley. During the year a second school was established at Juneau for the use of the native children; considerable friction was developed by the attempt to unite the children of the white and native population in the same school room. During the year a school building was erected by the Government at Killisnoo. This was the first school building erected by the Government in Alaska.

The native industrial training school, Sitka, Alaska, was established by the Woman's Missionary Society of the Presbyterian Church, in 1880. In the absence of any public provision by the Government for needy orphans, they were freely received into the school. Small children whose mothers had died, and for whom there was no one to care, were also received. It became a refuge for homeless and friendless waifs, for children fleeing for their lives from the tortures of witchcraft. It gave them a good home and a training that made them good citizens instead of allowing them to grow up vagabonds. It also became a reformatory to which the United States district court, not knowing what else to do with young offenders, committed them. It was the only place in Alaska where a young man could learn a trade. It also became the high school to which bright pupils in the various day schools, desiring greater advantages than their local school could afford them, were advanced. It also, to a limited extent, gave normal training to the first of the native teachers of the country. In 1884 it was made a contract school under the Indian Bureau of the Government, but in 1887 it was transferred to the care of the Bureau of Education, with an enrollment of 186 pupils, representing 15 nationalities or tribes. During the year an English school and mission was opened at Yakutat by Rev. Adolf Lydell, representing the Swedish Evangelical Mission Union of the United States. During the school year 1887–88, schoolhouses were erected at Sitka and Juneau, and the Government hospital at Wrangell refitted and made into a comfortable schoolroom. The school year 1887–88 was marked by the death of Rev. L. W. Currie, teacher at Klawack, the erection of a building for school No. 2 at Sitka, the transference of 2 boys and 4 girls from the training school at Sitka to the East for education. The 4 girls were sent to the Ladies' Seminary at Northfield, Mass., at the expense of Mrs. Elliott F. Shepard. The 2 boys were cared for at the Indian school at Carlisle.

During the year 1888–89 the former school board of three was increased to five by the addition of the United States commissioner at Fort Wrangell and Mr. William Duncan, superintendent of the colony of Metlakahtla. In 1889–90, to take effect on the 1st of July, 1890, the Secretary of the Interior issued a new set of rules and regulations for the conduct of schools and education in the District of Alaska. Among the important changes made by the new rules was the discontinuance of the Territorial board of education, experience having proved that it did not work well, and a system of local unpaid school committees was inaugurated. Owing to the growth of the work it was deemed advisable to create the position of assistant agent. Mr. William Hamilton was appointed to this position. During the year comfortable frame schoolhouses and teachers' residences were erected at Kadiak, Karluk, and Afognak. At Douglas a substantial frame schoolhouse was erected, and at Chilcat a log schoolhouse.

Of the Alaskan children in eastern schools Miss Frances Willard graduated at a young ladies seminary at Elizabeth, N. J., in June, 1890, and was the first to return to Alaska and take up teaching; she was appointed assistant teacher in the industrial school at Sitka.

The inauguration of schools in Arctic and subarctic Alaska among the Eskimos was the special feature of educational work in Alaska for 1890–91. Hitherto the schools had largely been confined to the North Pacific and Bering Sea coasts of Alaska, together with the valleys of the Yukon, Kuskokwim, and Nushagak rivers. But in 1889 Commander C. H. Stockton of the U. S. S. *Thetis*, who had recently returned from a cruise along the Arctic coast of Alaska, made a personal representation to me of the need of schools among the Eskimo settlements of that region. Upon reporting the request to the Commissioner of Education I was authorized to

visit the headquarters of the various missionary societies and confer with the secretaries of the same with regard to the establishment of contract schools in Arctic Alaska, with the result that the Woman's Executive Committee of Home Missions of the Presbyterian Church, agreed to establish a school at Point Barrow, the northernmost point of land on the main continent of North America. The American Missionary Association of the Congregationalists agreed to establish a school at Cape Prince of Wales on Bering Straits, and the Episcopal Board of Missions at Point Hope, lying about midway between the other two. These comprised the three principal villages on that part of the coast. School buildings were erected at Cape Prince of Wales and Point Hope, and a room in the Government refuge station was secured for the school at Point Barrow.

In the spring of 1890, by permission of the Secretary of the Treasury and the courtesy of Capt. L. G. Shepard, chief of the Revenue-Cutter Service, and Capt. M. A. Healy, commanding the revenue-cutter *Bear*, I was able to visit the entire Alaska coast of Bering Sea and the Arctic Ocean; also about 100 miles of the coast of Siberia, both south and north of the Arctic Circle. As the captain of the ship had been requested to take a census of the coast villages of that region, I had unusual facilities for reaching the larger portion of the people. My trip also enabled me to attend in person to the locating of the teachers at Cape Prince of Wales, Point Hope, and Point Barrow, the erection of the buildings, and the providing of the necessary supplies. In visiting the various localities I found a great lack of sufficient food supply in the country. The ancestors of the present population had an abundant food supply in the whale and walrus of the sea, and the fur-bearing animals of the land, but the destruction of the whale by the American whalers, and of fur-bearing animals by improved breech-loading firearms, had so diminished the food supply that the present inhabitants were slowly decreasing in number for want of food. While coasting along the shore of Siberia I found a barbarous people similar to the Eskimo of Alaska with an abundant food supply because they had large herds of domestic reindeer. As it was impossible to restock the ocean with whale as a stream could be restocked with fish, the suggestion was very natural to introduce the domestic reindeer of Siberia into Alaska, teach the Alaskan natives the management and breeding of the deer, and thus not only produce a new supply but also lift the population a step forward in civilization, change them from hunting to herding, accumulating property, etc. Upon my return to Washington I made a report to the Commissioner of Education, which was transmitted to Congress, urging the adoption of this plan of introducing reindeer into Alaska.

During the year a large, substantial school building was erected at Yakutat and a small school building at the Kake village on Kupreanof Island.

In 1891 I made my second annual tour to the Arctic, inspecting schools on the Alaska side; also purchasing and transporting reindeer from Siberia.

The leading event of the year 1892 was the actual introduction of domestic reindeer into Alaska, an account of which is given in this report under the head of "Introduction of domestic reindeer into Alaska."

On January 10, 1892, Mr. C. H. Edwards, Government teacher at Kake, while endeavoring to protect the natives of the village where he lived from the landing of whisky contrary to law by some smugglers, was shot by them and a few days afterwards died. After the farce of a trial, the murderers were turned loose to continue their nefarious operations.

On the 29th of June, 1892, an industrial school for the instruction of Alaskan young men in the raising and breeding of reindeer was established at Port Clarence, near Bering Straits. This school was named the Teller Reindeer Station, and on the 4th of July the first reindeer for the herd were landed at this station from the revenue cutter *Bear*.

On May 1, the Hon. James Sheakley, who had been local superintendent of schools in southeastern Alaska for the past three years, resigned, and Mr. William A. Kelly was appointed in his place.

On the 19th of August, 1893, Mr. Harrison R. Thornton, teacher at Cape Prince of Wales, was shot with a bomb gun in the hands of two or three hoodlum young men, who had been debarred the privileges of the school because of misbehavior. The young men were immediately shot by their relatives and neighbors, as the only method the villagers had of showing their abhorrence of the deed.

On February 18 the schoolhouse at Killisnoo was discovered to be on fire, and burned to the ground. On account of the smallness of the appropriation for schools, the building could not be rebuilt, and the school for the time being was closed.

In the spring of 1891 I secured seven families of Norway Lapps and sent them to the reindeer station, to take the places of teachers previously secured in Siberia, a fuller account of which is found under the head of "Reindeer." During the summer and fall of 1895 school buildings were erected at Unalaska and Saxman.

I have the honor to be, very respectfully, yours,

SHELDON JACKSON,
General Agent Education for Alaska.

CHAPTER XXXIV.

THE SOCIAL UNIT IN THE PUBLIC SCHOOL SYSTEMS OF THE UNITED STATES.[1]

Early inclusion of school affairs in New England as a part of the local civil affairs of the "town."—Birth of the district community system as population dispersed itself in the wilderness.—The form of administration this community system assumed when the boundaries of the "town" again became those of the school disirict ("township system").—The form of school administration in the Southern States upon the introduction of public schools after the close of the civil war (county district system).—The members of the school community.—Its area.—Its functions.

I. THE ORIGIN OF THE SCHOOL DISTRICT.

At one time or another an institution has appeared, and in the great majority of cases still exists, in almost all of the States of the Union which is probably the most communistic as well as democratic feature of our political institutions and is certainly the smallest minor civil division of our system. This institution may be called generically the school community in the United States. Its communistic feature is that wealth and occupation are taxed for the support of schools irrespective of the benefit directly derived by the individual owner or laborer and its democratic feature is that the component members of this school community form or originally formed a legislature for school affairs which votes to tax itself and elects persons to manage its affairs during the intervals elapsing between its meetings. It is evident that such a community could come into existence, at least spontaneously, only in an environment marked by the absence of well defined and acknowledged shades of social standing;[2] for a symmetrical and homogeneous organization of public education, a very democractic process, if left to develop freely is sadly impeded in a State whose population has in the course of time been segregated into nobility, gentry, trades-people, yeomen, and wanderers in search of work, as in England in the times of Henry VIII and Elizabeth, or of nobility, professional persons, tradesmen, and peasantry, as in France or Germany before the French Revolution.

There is considerable probability in the assumption that the education of the people first became an affair of political self-government in the Puritan or religious commonwealth of the New World. Every "township"[3] of 50 householders was required to appoint a teacher who was to be paid by the parents or masters of those who received instruction, or by the inhabitants in general by way of supply as "the major part of those who order the prudentials of the town shall appoint." Here for practical purposes is first connected the word township with school affairs.

In 1636 the general court of Massachusetts gave public sanction to the township, an institution which had become spontaneously the political unit of the colony.[4] In New England, as a rule, entire communities settled down and erected at once a township, which was not merely an aggregation of human beings nor a mere municipal organization, but a well-defined and represented political entity.[5] It became a body corporate as well as politic, could possess and dispose of property, could sue and be sued.[6] But it was a close corporation. Not residence but votes gave

[1] By Mr. Wellford Addis, specialist in the Bureau.

[2] It is noticeable how the exceptions to this remark in past times originally appeared as one passed southward from New England. In Pennsylvania, for instance, the constitution of 1790 contained the following provision: "The legislature shall provide for the establishment of schools in such manner that the poor may be taught gratis." This provision was repeated in the constitution of 1838. Mr. Wickersham refers to the provision as an "objectionable policy of educating the poor as a class." Hist. Ed. in Pennsylvania, p. 276.

[3] It will be observed that this old law calls the New England town a township. It was so in England, the word town and township being used interchangeably.

membership, and either by law or the force of public opinion every member, or freeman, as he was called, must be a member of the recognized church,[1] and thus voters in church meetings and voters in town meetings were the same persons, until the religious test gave way to other qualification. It has been maintained that the town meeting was merely the vestry meeting of the parish of the Anglican church adapted to Puritan needs in the American wilderness. But it must be remembered that there was more than one kind of parish in England at the time of the Puritan emigration to America. "For the purpose of civil government the term 'parish' meant a district separate from the ecclesiastical parish, from the 'highway parish,' and from the civil division called a township,[2]" it being especially created in 1601 as a poor-law parish. The lay business of the New England town was not a part of the ecclesiastical proceedings, but the ecclesiastical business was a part of the proceedings of the town meeting, which was a body politic sending representatives to a general court or legislature, which also considered ecclesiastical concerns. Into this town meeting, as has just been remarked, was also carried the—at that date—church duty of education, which thus became a civil instead of an ecclesiastical function as far as English America is concerned. Education in Europe in the age of the Reformation, says Francis Adams, "was not a civil but an ecclesiastical matter, and its aim was religious, not political."[3]

The wisdom of endowing the local unit of civil administration with this formerly special function of the ecclesiastical unit is unimpeachable. As early as 1616 the English privy council and in 1633 Parliament had enacted that a school should be established in every parish (ecclesiastical) of Scotland, where practical, at the expense of the parishoners, and in 1646 authoritative supervision of the schools was placed in the hands of the presbyteries. The expenses of the schools were to be borne by the landowners, though one-half of the rates might be obtained by them from their tenants.[4] But after a century or more of irreligious wrangling between the presbyteries, who directed, and the lairds, who paid for the education of the Scotch, the former appealed to the central government at London for pecuniary relief, while the English church, after incubating the matter for a century or more, gave birth to the wild and tumultuous efforts of Bell and Lancaster,[5] parliamentary inquiries as to the misappropriation of "foundations" for elementary education, and finally after 1870 to a rapid series of acts which established a system noted for its peculiar manner of operation and general intricacy. In 1795 a bishop of the Anglican church, from his political place in the House of Lords, naively remarked, in answer to the demand that the law-making power should be educated, that he did not know what the mass of the people in any country had to do with the laws but to obey them; which, according to him, is their raison d'être.

In America the spirit of the political government of schools has at length spread over the whole country. But as the environment changed in which the idea was first applied it has frequently been modified to suit changed conditions. In general this modification has been made in one of two forms, one of which is called the "school district system," or more properly the school community system; the other the "township system," or more properly the township school district system. The school district or community system seems to have originated somewhat in this way. As the population of each little nucleus of settlement spread itself out from the center of the original "plantation," it early became convenient in Massachusetts and Connecticut, at least, to allow neighboring families at a distance to form themselves into a school district, and this system so necessary in a growing agricultural community, such as Massachusetts was before the war of 1812, was adopted after years of use[6] as the State system by the act of 1789, and was not repealed until manufacturing had restored those concentrations of population which in the early colonial days had invited township control of school affairs. This originated the school district community, which is the form of public school management operated in the greater number of the States.

It is evident, however, that whatever form the exigencies of each particular territorial or economic situation compelled or induced the people to adopt, the success of local self-government in school affairs depends upon the willingness of the constituent individuals of the community to tax themselves for the benefit of their children,

[6] Martin, Evolution of Massachusetts Public School System, p. 92

and upon their willingness, at whatever cost, to deprive themselves of any immediate pecuniary benefits arising from the sale to others of their children's time or the personal monopolization of it at home; in general, the absence of a narrow or selfish spirit not only in the family but also in community affairs; or, to say the same thing, in other words a spirit of reasonable emulation and compromise. This desire, of course, is dependent on the value attached to education by the parent and in a measure upon the inclinations of the child. As it has been found that some communities are not always willing or able to tax themselves as highly as other and perhaps neighboring communities, a persevering attempt is being made to rectify what is considered to be not a necessity but a defect of the administration of our school systems. The question is largely dependent upon the economic condition of the locality and of the State; in other words, upon the unequal distribution of wealth and upon a general desire to distribute the highest benefits to all, irrespective of the inability of some to pay for them.[1]

Other than the political and corporate side of the school community there is another which has reference to the territory over which its jurisdiction extends. In Massachusetts the early judicial and administrative relations of the towns were with the central authority called the General Court. For the purpose principally of judicial convenience, the New England colonies were at various times after 1643 divided into counties, the administrative and representative functions of the towns not being interfered with. Like the General Court of Massachusetts, the House of Burgesses (borough representatives) of Virginia was composed of members representing "hundreds and plantations," but in 1634, when the population of Virginia had increased to 5,000 and had spread itself over the land with the view of finding eligible tobacco fields, then shires or counties were created and the burgesses were thereafter returned as representatives of the counties.[2] The community of Virginia was a series of plantations which were indistinguishable from one another inasmuch as tobacco culture gave them the same character by tending irresistibly to promote the constant expansion of the area of each plantation,[3] which thus became in area a small principality containing a squire, his family, and their numerous servants—in short, the Latifundia of the later Roman Empire. In Virginia, therefore, the county is made the unit of administration which was under the jurisdiction of the "commissioners of the county court"[4] with a grand jury to move attention to defects in county administration. In the public lands of the West it is true that the blocks of land that were laid off into counties as they get a sprinkling of population are divided with mathematical regularity into squares of 36 square miles called townships, but it is particularly necessary to note that the New England settlers of these squares of lands are careful to distinguish them from real "towns" by calling them Congressional townships because the survey of the original wilderness was authorized by the act of Congress of 1786.

II. LEGAL AND POLITICAL CHARACTER OF THE SCHOOL DISTRICT.

Although the law books insist that the school district is a quasi corporation, in almost every State the legislature has specifically made it or its executive body a body corporate and in three States (Ohio, Illinois, and Kentucky[5]) a body politic and corporate. The circumstance that has caused the law writers to use the term "quasi corporation" seems to be the original formation of the district in New England, where the district school probably was looked upon as an educational succursal or outlying post of the original "town" school, tolerated as it were by reason of the distance that attendance at the village or "town" school proper would require to be traveled. Thus when a neighborhood built its own school and formed itself into a body for managing its own school affairs without legislative sanction, as was originally in New England the case, it was called a quasi corporation to accommodate the fact to legal necessities.

As beyond doubt the school district is a body corporate, it remains to inquire if it be not as it exists to-day also a body politic. It is admitted at the outset that it is a body established for a special purpose and that it is unrepresented as such in the State legislature. But on the other hand, it embraces all the inhabitants within a series of well-defined areas which together form the area of the State, and though in some cases it excludes nontaxpayers and in others it includes women, nevertheless practically its voters are the voters of the State. The particular fact, however, that goes to show that the school community is a body politic is the power it possesses

[1] "No sooner had the towns taken the schoolhouses than the same people who, in the district meetings had resolutely opposed any improvements, came forward and demanded new houses in the district." (Martin, Evolution of Massachusetts Public School System, p. 209.)

[5] In Oregon it has been decided that a school district is a public corporation. (2 Oreg., 306.)

of levying taxes, especially for purchasing sites and erecting buildings and its place in the administration of the affairs of the State so far as they relate to school affairs.[1]

The corporate and political character of the school community having been shown, it remains to point out the several forms which it has assumed. The most widely disseminated form of the school community is the so-called "school district." In this system are found frequently a "school meeting" and always a school board of trustees or of directors, or of education, elected by the voters of the district, in whose hands is placed the administration and the control of school affairs with the exception that teachers who have not received a certificate from a State or county authority may not, in the great majority of cases, be employed, and the local taxation is not always entirely dependent upon the local will. Another characteristic is the changeableness of its boundaries, which may vary from year to year if certain legal provisions are complied with. Such a system as this may be called the district community system to distinguish it from another form of the district which has wholly or in practice inflexible boundaries such as the school district whose boundaries are coterminous with those of the "Congressional township" (of 36 square miles) as in Indiana or in Alabama or with the boundaries of "towns" as in New Hampshire or Massachusetts. Districts having these inflexible boundaries are usually said to have adopted the township system, but as each district or township has a board of education, trustees, or school committeemen to administer the school affairs of the township, the difference between such a system and the district community system must be found in the larger extent of territory under its control and its connection with the other civil authority whose jurisdiction is confined within the same limits as its own.[2]

From the foregoing it would seem that there are in every State two systems of administration, one for civil and the other for school affairs, though in both the controlling powers are the same. These powers are (1) the voters (who in the district community system form the "district school meeting"), (2) the State legislature who, though elected by the voters, may not be considered as quite the voters themselves, and (3) the boards of trustees, committeemen, or of education elected by each local community, whether district, town, township, or county, which wholly inaugurates and administers local school business, except where the district meeting is something more than a voting place.[2] Occasionally an exception is found. In the case of North Carolina the board of county commissioners (a "civil" authority) sits as a "county school board," and in the city of Buffalo the common council administers the affairs of the city public schools, but these instances must be considered lightly. This isolation of the administration of school affairs is not an anomaly in the administration of English-speaking nations from time to time. England was divided into poor-law parishes, land-tax parishes, burial-acts parishes, and highway parishes, and eventually consolidated into the "civil parish," and in America the administration of poor laws through overseers of the poor in Massachusetts and New York, but not in the Southern States, presents an analogy.

The two forms of school districts which have been alluded to in the foregoing one as the school district community system, and the other as the district township or district county school system, as the case may be, are mainly distinguished from each other by their political, territorial, and financial relations to the civil authorities; and in investigating the nature of these differences it is advisable to speak first of the constituency, then of the area of the school district community, which apparently came into being about the middle of the eighteenth century, was legalized in Massachusetts in 1789, and was endowed with the power of taxing itself in 1800. If by way of illustration school township districts are spoken of, it will be understood that the constituency and area of such districts are not being treated of as

---

[1] Of Delaware it is interesting to note that each Catholic congregation or its vestrymen are made a body politic and corporate.

Mr. Martin, in History of the Massachusetts Public School System, in speaking of the evils of the district system, a system which sprang into existence spontaneously about the middle of the eighteenth century, remarks: "When the church affairs had been given to the parish, the care of roads and the care of schools to the district, there was little left for the town to do."

[2] Perhaps there is another characteristic feature that distinguishes the two forms of the district system usually pitted against each other as the "township versus the district system." If this be the case the import of the other characteristic is readily inferred from the following:

"The school committee [of Massachusetts towns] are an independent body, intrusted by law with large and important powers and duties; and, although every discretionary power is liable to abuse, against which no perfect safeguards can be provided, yet we [the supreme court of Massachusetts] are aware of no substantial reason for supposing that the power of fixing teachers' salaries is more liable to abuse by the school committee than by the city council." (Bachelder *v.* Salem, 4 Cushing, 603, as quoted in 98 Mass., 587.)

In Indiana the supreme court has used the following language regarding the power of a trustee of a school township: "The township trustee is clothed with almost autocratic powers in all school matters. The voters and taxpayers of the township have little, if, indeed, any, voice or part in the control in the details of educational affairs. So far as actual authority is concerned the trustee is the corporation, although in contemplation of law it is otherwise." (Wallis *v.* Johnson Tp., 75 Ind., 374; Bucknell *v.* Widner Tp., 73 Ind., 501.)

they are only the school side of the well defined "civil" political body and area which it is the purpose of an increasing number of text-books to make understood.

CONSTITUENT MEMBERS.

The constituency of the school district community being in the great majority of cases specifically a body corporate for public school purposes, and as such embracing within well-defined local territorial demarkations practically all the electoral body of the State, it naturally follows that the qualifications for voting at a school meeting should be those required at an election for representatives in the legislature. Such, in general, is the case, though from the school district being a territorial unit occasionally a provision is found requiring a residence within its boundaries of 30, 40, or 60, or even 150 days immediately preceding the election.

There are, however, two exceptions to the general statement that the qualifications required from the voter in the school district meeting or election are those required of the voter at general State and local elections. One of these is that in a number of States women are allowed to vote, a provision which enlarges the right of franchise, and the other is that a property holding or tax paying, or child-having (either as parent or guardian) qualification is exacted, which seemingly restricts the electorate, giving it a tinge of self-protection as though the property holders were afraid to permit their possessions to the rule of the majority. Certain provisions for the endowment of women with suffrage in connection with school affairs are worthy of note. In Kentucky "any widow having a child 6 to 20 years of age, and any widow or spinster having a ward between the ages of 6 and 20, may vote at a school district election." In Michigan and Connecticut no woman, though 21 years of age, the usual requisite, may be registered unless she can read in the English language. In New Jersey a woman can not vote for the election of members of district trustees, though she may vote upon all other school questions. The case of New Jersey is an apt illustration of the two bodies politic within the same territorial confines, for at a civil township election a woman can not be permitted to vote, while at a school district election (the school district being a township) she is entitled to vote on all questions except for trustees, to which office, however, she is eligible.

The other occasional departure from the usual course of bestowing the franchise in this country is well stated in the law of Idaho, which recites that "none but actual resident freeholders and heads of families of each school district shall vote at an election [for levying a tax]." That this provision where occuring may not necessarily be made to work any particular injustice may be attested by the character of the law of New York, where every person of full age residing in the district for thirty days next preceding any school district election may vote thereat if he or she owns, hires, or leases real property in such district liable to taxation for school purposes, or is the parent or has the quasi custody of a child of school age having attended the district school for eight weeks within the year last past, or who owns personal property assessed on the last preceding assessment roll of the town exceeding $50 exclusive of exemptions. Frequently the delinquent payer of school taxes is debarred from voting, and in some cases of deciding in regard to borrowing money for building, a mere plurality of votes will not carry the measure at issue.

There are characteristics in the organization of the school community of the South Atlantic and Gulf Coast States, Texas accepted, that mark those communities as an exception. It is extremely doubtful if this phenomenon can be attributed to the social conditions existing in the Southern States which require the maintenance of two systems of public schools. But whatever be the explanation it seems legitimate to conclude that the school systems of the southeastern and southern coast are systems of State schools, while in Massachusetts, to take the most striking example, the school system is a town[ship] system, though most freely directed by the legislature to carry out reforms or inaugurate innovations. Five Southern States have a county board as the real local school authority. In one of these (Florida) the county is divided into three districts, and a member of the board is elected from each; in another (Georgia) the grand jury choose the county board; in another (Mississippi) the county board is composed of a member from each supervisor's district appointed by the State superintendent, and in the fourth and fifth the county board is appointed by the governor. The other States of our southern coast have a county superintendent as the local school authority, who is appointed in Alabama and Virginia by the State superintendent, and in South Carolina (under the old law) is elected by the people. North Carolina has no county superintendent, and its schools are under the authority of its "county commissioners," sitting as a "county board of education." The more local or district authority, as far as it occurs, is appointed by the county authority, except in Mississippi, where the "patrons" elect three district trustees, and in Virginia, where an electoral board, composed of the county judge, commonwealth attorney and county superintendent, elect the district boards for the school subdivision of the county.

AREA.

The "school district" as a part of the earth's surface, is constituted on quite different lines from the "Congressional township," and even from the original "towns" of New England. The area of a school district is a matter of convenience determined by its inhabitants, and its boundaries, judging from the ever present and numerous provisions for changing them, are readily manipulated. The school district is formed in one of three ways—either offhand by an authority of the county, by petition to such authority by certain inhabitants of the district, and subsequent vote, and finally, by local organization and subsequent notification of the county authority. When the legislature has fixed the boundaries of a district as coterminous with those of a "Congressional township," as in Indiana and Alabama, or as coterminous with those of a "town," as in New Hampshire, the school district system is said, in common pedagogic parlance, to have been abolished and the town system to have been adopted; but the original fact that each school community had but one "district school" must not be allowed to obliterate, another fact that any given amount of territory called a school district may have more than one "district school" if there are pupils enough to warrant them. Nor must it be forgotten that, when the increase of population in a large district called for two schools in one district, the ease with which a school district could be formed naturally invited the formation of a new district from the old one, and consequently a new set of officers was required in addition to the set already in existence. The effort to minimize the distance which the child would have to travel and the contrary evil of having two or more weak schools is apparent in the legislation of States having the district system. Even in the township school district system a deep stream to be crossed or a difficult road to be followed will sometimes make it necessary to carve out a district irrespective of township lines. The principle of the district system is that the school community immediately served should have charge of its school or schools; the principle of the township system is that a few persons should not have charge of the affairs of the school by which it is served, as it tends to foster petty local animosities, contrariness, and over economy. The school district meeting is the assemblage of a neighborhood, the township system or "school township district," as it is sometimes called, is the removal of such questions to a more varied assemblage or to a board.[1] When the area of the school district is broadened so as to embrace a large county the assemblage of the school community is impossible and direct legislation by it is out of the question.

Before passing to the consideration of the formation of the two kinds of districts, the rather anomalous case of the State of New York must be noted. The subdivision of that State is done in a manner which distinguishes it at once from the town school system of New England, the district community system of both the Mississippi Valley and of New England, and the county system of the Southern States. The legislature has divided the State into school commissioner districts, and each school commissioner subdivides his school commissioner district into common school districts. There were, in 1894, 114 school commissioner districts in New York, each, on the average, containing 425 square miles, and 97 common school districts. But no city may be included in any school commissioner district. Each of these two classes of areas, excluding the city district class, is solely a school area, and although the functions of the school commissioner are probably the same as those of the county superintendent in the South and West, the school commissioner is not a county officer.

FUNCTIONS.

Under the two preceding sections the members and the area of the school district community has been spoken of; it yet remains to compare its functions with that of the school township district.

In many States the school meeting is a legislative institution as conclusive in its decisions, so far as untrammeled by the law, as it is regular in its assemblage. Its functions are (or may be): (1) In every case to elect the officers required by law to be elected in order to supervise and accomplish the business of the school district; (2) to provide school accommodations; (3) in many cases to levy tax for the general support of schools, and (4) in some cases to decide questions regarding the administration of the schools of the district. In general, the duties of the meeting are to elect officers, pass upon financial questions, fix the site of schoolhouses, and vote upon changing boundaries.

The "school meeting" is not a feature of the township district system. In Massachusetts, for example, the town meeting elects the body that manages school affairs. In New Hampshire, however, where the civil town and the school district town are coterminous, there is a town meeting and also a school district meeting, which may be held between the 1st day of March and the 20th of April at the usual place at

[1] See footnote 2 on p. 1460.

which town meetings are held. Pennsylvania and other States, whose school districts are townships, have no school meeting in the proper sense of the term, though elections are held for officers. In Indiana it has been remarked from the bench that the voters and taxpayers of the township have but little, if indeed any, voice or part in the control of the details of township educational affairs, although in contemplation of law it was otherwise; the voters may petition the trustee to locate a schoolhouse, but he may use his discretion in the matter. Compare the position of the Indiana trustee, whom the court called an autocrat, with the condition of affairs in the time of school districts in Massachusetts, where, in one instance, farmers who never came out at a Presidential election came forth with great alacrity during two years to attend ten district school meetings made necessary by a contention as to the proper location of a schoolhouse. A peculiarity of administration in our southern coast States has been pointed out under the constituency of the school district of that portion of the Union (p. 1461).

But it is not in the manner that local wishes make themselves felt that the distinguishing characteristic of the two kinds of management of school affairs is evident. That characteristic is found in the taxable area, or, in other words, the financial arrangements proper to each of the two systems. Each board of local school officers has four functions to perform connected with (1) the reception of money from the State or county, (2) its disbursement, (3) the levying, and (4) disbursement of local taxes. To show these facts as far as given, it is convenient to arrange the methods adopted in each State in the following form, which is published subject to future emendation:

Maine.—The town meeting elects a school committee and levies local taxes, which are collected as other taxes are. State money is paid to town treasurer. Disbursements are made upon written order of municipal officers on certified bill of items being presented.

New Hampshire.—Town school district meeting elects school board. The civil authority of the town assesses a tax at a rate fixed by legislature, and pays over amount to the town school district board. A town school district may raise money for support of schools, which shall be assessed and collected and paid over by town as other school taxes are. It may also raise money for purchasing sites and erecting buildings and furnishing and insuring them; but the civil authority, on application of the creditor shall annually assess one-fifth of such debt, such tax being held by the town (civil) treasurer to the order of the creditor. Each town school district has its own treasurer, who disburses school funds upon the order of the school board; it also has one or more auditors to examine the treasurer's accounts.

Vermont.—The town meeting elects board of school directors, and assesses a tax which is recommended by directors; but such tax shall not be less than one-fifth nor more than one-half of the poll tax and 1 per cent of assessed value of real and personal property, unless town, by special vote, increases the amount. Town treasurer receives money coming to town through hands of State authorities, and also the amounts raised within the town; he disburses these sums on the order of the board of school directors.

Massachusetts.—The town meeting elects a school committee and levies tax, which is assessed, collected, and disbursed in like manner as other town taxes. The money apportioned to town through State officials is placed in its treasury.

Connecticut.—There are as yet two systems in this State, the permissive town district system and a district community system.

In the case of the town district system the town meeting elects a school committee and levies tax estimated to be necessary by school committee. Selectmen (civil authority) and school committee of town deposit all moneys and securities "coming into their hands" with town treasurer, who also has custody of money coming from State officials.

In case of district community system the district meeting elects a district committee and levies taxes for establishment of schools, payment of teachers, and for construction, purchase, repair, and furnishing of schoolhouses, and in general has power to make all agreements and regulations for establishing and conducting schools not inconsistent with the regulations of the town, having jurisdiction of the schools in each district. But the [minimum] amount to be raised by each district is fixed by the school visitors of the town and the selectmen in joint meeting, and the amount so fixed is certified to district committee. [It is impossible to say whether this tax is in reality a town tax or district tax. The creation in Connecticut of a board of school visitors of a town was evidently a measure looking toward the consolidation of the school districts in each town into one large district, whose boundaries would coincide with those of the town. It may be said of Connecticut and of Rhode Island that the legislature considers the town as the ultimate political unit.] Each district has its treasurer and collector.

Rhode Island.—The town must establish and maintain schools, but may divide itself into districts. The town meeting elects a school committee and levies tax,

which is paid over to town treasurer, who keeps a separate account of money received from the State officials and from the town collector. [A proportionate part of money received from the State is called "teachers' money."]

If a town divide itself into districts each district elects a board of trustees and taxes itself to support public schools and to provide facilities, including buildings and sites, for instruction, but all district taxes shall be collected by the district collector (or the town collector, if the district so vote) in the same manner as town taxes are collected. Each district has its treasurer and collector, whose duties are those performed by the town treasurer and collector when handling school money.

New York.—There are two kinds of educational areas (excluding cities) one of which appears to be merely the sphere of influence of an official, while the other, under the name of the common school district, is a body corporate. The common school district meeting elects 1 or 3 trustees, and levies taxes to supply deficiencies in teachers' wages after money received from the State has been exhausted, to supply buildings, sites, and other facilities for instruction, and judgments of record and other incidentals. The district has its own collector and may have its own treasurer, who disburses the money received by the district from the State or from its own levies, on order of the district school trustees.

New Jersey.—The voters in the school township meeting (cities excluded from the school township) elect a board of education and may raise by tax such other sums as may be needed for school purposes, which is collected like other township taxes, and is held and disbursed by collector of township on order of the president and clerk of the board of education. The State tax comes to the township collector through the county collector by order of county superintendent of education.

Pennsylvania.—Townships (and boroughs and cities) elect a local board, which fixes and levies tax for support of schools and for buildings, and also elect assessors. A member of the board shall act as treasurer, or a treasurer may be elected, who receives all State appropriations, district tax, and other funds of the district, and disburses the same on order of the board. [It is regretable that, in the digest of public schools, appearing in the annual report preceding this, by an inadvertency in transcribing notes the annual appropriation of $1,000,000 made by Pennsylvania was not mentioned under this State.]

Delaware.—Stated school meeting elects a school committee and votes the amount to be raised for free school or schoolhouse, but if the majority vote is against tax the amount required is raised by subscription. School committee collects its levies through its own collector or the collector of the hundred. It draws orders on the trustee of the State school fund when entitled to do so.

Maryland.—The district school trustees are appointed by the county board of school commissioners, who are themselves appointed by the governor. The county board elects a treasurer and in case the State money coming into his hands (which is to pay teachers and provide school books and stationery) is insufficient the county school commissioners are directed to levy and collect a tax approved by "civil" county authority, which tax is collected as are other county taxes, but are eventually paid to the treasurer of the school county.

Virginia.—The county judge, commonwealth's attorney, and the county superintendent are a board for the election of [district] school trustees, who estimate amount of money required for extra expenses of district and report same to county school board, which is composed of all the members of all the school boards, with the county superintendent as chairman. The county school board recommends to the "civil" authority the tax required for "county school purposes," which or so much as may be allowed the civil authority levies, and also recommends a tax to be levied upon a district which has reported that it requires for school purposes more money than its proportion of the tax for county school purposes will bring to it. This latter tax is also levied by civil authority. State money is paid by warrant to county superintendent, who indorses it over to civil county treasurer, who collects and disburses all county school moneys, but he keeps the State, county, and district money separate. Disbursements seem to be made by order of district board.

North Carolina.—County board of education, which is school title of "civil" authority, elects district committee. County levies tax to supply deficiency of money received by county from State and apportions all school moneys among the districts, which when so apportioned is subject to the order of the district committee. The civil county treasurer is the custodian of school funds received by the county from the State or from its own levies.

South Carolina.—A board of district school trustees are to be selected in a manner to be named by legislature, and any school district may by authority of legislature levy "an additional tax for the support of schools" beyond that levied by the civil county authority and apportioned to districts in proportion to enrollment in schools. County civil treasurer is custodian of all State and county funds. [Provisions of new constitution.]

Georgia.—Each county shall constitute one school district, which is under the

authority of a county board of education selected by the grand jury. The county board may levy a local tax to supplement the State apportionment after two successive grand juries have acquiesced in the proposition to submit the matter to the voters and two-thirds of the voters have voted for the tax. The State treasurer holds the State school money until it is wanted by county school district board for payment of debts due and awaiting payment on the 30th of April, 31st of July, 31st of October, and 31st of January of each year.

Florida.—The county school board is elected by the people. It recommends the amount of tax to be levied for support of schools to county "civil" authority, by which estimate is accepted or modified. County "civil" collector collects money which is disbursed by county "civil" treasurer as school treasurer. Subdistricts may be formed having a board of trustees elected by the people; such districts may levy a special-school tax.

Alabama.—The county superintendent, who, if not elected by people, is appointed by State superintendent, is charged with the reception and disbursement of school moneys, but all local school funds raised by taxation or otherwise are expended in district where raised.

Mississippi.—The patrons of the school (except in separate school districts, i. e., a municipality) elect a board of trustees. When funds received through State officials are not sufficient to carry on schools for more than four months the civil county authority may levy tax on all property and polls not situated within a separate school district, such tax to be collected and disbursed by county treasurer. Any municipality of a school district may levy tax in same manner. State money for school purposes is first paid to county treasurer and to treasurer of separate school district.

Louisiana.—The parish (county) school board is appointed by the State board of education. The police jurors of the parishes and the boards of cities, towns, and villages may levy a parish or municipal tax. Whenever one-tenth of the property taxpayers of any parish, city, or incorporated municipality shall petition the police jury or municipal authorities to increase the rate of taxation for the purpose of constructing public buildings, the body petitioned orders an election to decide whether the levy shall be made. The parish "civil" treasurer has custody of all school funds whencesoever coming.

West Virginia.—The district board of education, which is elected by people, determines the rate of taxation necessary for teachers' and building funds and outstanding debts. The amount received from the State and the levy for teachers' pay is called the "teachers' fund." State money is apportioned to districts through county superintendent. The county "civil" assessor assesses the rate fixed by district board and the sheriff or collector collects and disburses it.

Ohio.—The several kinds of districts (city, village, or township) elect a board of education which determines the entire amount of money necessary to be levied as a contingent fund for the continuance of the district school or schools after the State funds are exhausted, and for other purposes. The money from the State comes through the county officials, and district levies are assessed and collected as county taxes are, but are paid over to district treasurer, by whom it is disbursed.

Indiana.—A school township district board of trustees is elected by people, which board may levy a tax and has the custody and disbursement of all school funds.

Illinois.—Each township is a township for school purposes and the school business of the township [auditing accounts and reporting statistics?] is done by a board of trustees elected by the people. But townships are broken up into "one or more" districts having a district board of directors, and incorporated cities and villages have their own board of education. The board of directors of each district and the board of education of each city or village must levy a tax for support of schools; but all school funds are held by township treasurer subject to the order of the board.

Kentucky.—District trustees are elected by people. District may vote to tax itself but must appoint a treasurer. In cities the board of education may levy tax or request civil authorities to do so. Teachers' salaries are paid by county superintendent on certificate of board of trustees. The county superintendent appears to be the custodian of moneys received from the State; cities appear to receive their share of State money directly from State treasury.

Tennessee.—The board of district school directors is elected by people; but in case it is necessary to supplement State and usual county funds in order to continue school five months, the county court must levy an "additional tax," or submit matter to voters. The civil authority of incorporated places may also levy supplementary tax. The county "civil" trustee is the custodian of all moneys received from the State or raised in the county, but he must keep the school accounts separate from the accounts for civil affairs.

Michigan.—As in Illinois, there is a semblance of township district organization, but there is a district community system, each community having its district board of directors, which is elected by the school meeting. The board levies taxes for

general school purposes. The supervisor of the township assesses the taxes voted by the school district, as well as others laid upon it, which is collected by the township treasurer and disbursed by him on order of the proper district officer.

Wisconsin.—The annual school meeting elects a district school board, a member of which is treasurer. No district may contain more than 36 square miles, and any township may adopt the township system. The district meeting levies taxes for support of schools, which taxes are assessed and collected by town, whose treasurer appears to hold district money subject to the order of the district board. The money apportioned to the districts by the State (teachers' money) comes to them through the hands of the county and township officials; money raised by township is apportioned by township to districts.

Minnesota.—Any district may contain an entire township or 36 square miles in different townships. The district meeting elects a district board of trustees, one of whom is treasurer. In addition to the 1 mill county tax assessed by county on each district and returned to it, each district meeting may vote a tax for support of schools or for building purposes. It would appear that the district treasurer receives all money raised and in the district. He disburses all moneys coming to the district either mediately or directly from county officials.

Iowa.—Each civil township and each originally independent school district is a [township] school district, but each township district is divided into subdistricts. Each subdistrict elects a subdistrict school director and the subdistrict school directors form the township school district board. This board estimates the amount necessary to support the schools, which the county "civil" authority levies and eventually pays over in the same manner as other township taxes are paid over. The county "civil" authority also levies and apportions a county tax. The financial agents of State and county school funds are the same as control State and county revenue. Each board of township directors has its own treasurer, who receives money from county "civil" treasurer.

Missouri.—The school meeting elects a board of district school directors and fixes the rate of tax to be levied, which is apparently collected and disbursed by "civil" township authority. State moneys are apparently disbursed by county "civil" treasurer.

Arkansas.—District school meeting elects district board of directors and may levy tax, which apparently is collected and paid over by county "civil" authority.

Texas.—The voters of each community (district) elect a board of district trustees and may vote tax upon itself, which is levied and collected by county authorities, by whom it is disbursed, as are (presumably) all school moneys coming from the State treasury.

North Dakota.—Each civil township not organized under the district system is a [township] school district, which elects 3 school directors and a treasurer. The board levies tax by resolution, which tax is collected by county auditor and is paid by his order on the county treasurer to the district treasurer.

South Dakota.—Each civil township in each county not organized under the district community system is a school township district, but each school township district may be subdivided by vote. The voters elect a district school board, and may levy taxes for the support of schools. One member of the board is elected as treasurer. The tax voted by district is levied by "civil" county authority at the same time as county school taxes are levied. The school district treasurer disburses school moneys on order of board, which moneys he receives from county "civil" treasurer on order of the county superintendent.

Nebraska.—The electors of each school district elect a district school board, one member of which is treasurer, and decide what tax shall be levied (through the county "civil" authority). The State and county money is held in county treasury until apportioned by county superintendent, when it is received and disbursed by district treasurer. The district money is paid by county "civil" treasurer to school district treasurer on order of district board.

Kansas.—The voters, in school meeting, of each school district, elect a district school board, one member of which is the treasurer, and may levy a tax. State and county money is paid to county "civil" treasurer, from whom it is drawn by school district treasurer, after being apportioned by county superintendent.

Colorado.—The voters of each district elect a district board of school directors, and may levy tax if money received from State and county taxes is insufficient to pay school expenses. Such tax is levied by county "civil" authority, and held in county treasury as are the other school moneys coming from State and county, subject to the order of the district board.

Wyoming.—The voters of the district elect a board of directors, who may levy a tax, which is levied by the county "civil" authority, at the same time that the county school taxes are raised; but the collector shall pay the district tax directly to the treasurer of the district that voted it. State and county school money are held in county treasury subject to the order of proper officers.

Montana.—The voters of each school district elect a district board of trustees, and may tax itself for school purposes, but such tax is collected by county "civil" authority, and when collected is held to the credit of the district. State and county money is apportioned by county school superintendent.

Idaho.—The voters of the school district elect a board of school trustees and vote tax which shall be levied by county "civil" authority, which levies and collects the county school tax. The county superintendent apportions State and county money in county treasury to each district to whose order it is thereafter subject. In independent districts the board of trustees may levy tax.

Washington.—The voters of each school district elect a board of district directors, which may levy tax if ordered by vote of electors. Such is levied and held by county "civil" authorities subject to order of district, as are the State and county school money when apportioned by county school superintendent.

Oregon.—The voters of each district elect a board of district school directors, and may levy tax. The county treasurer is the custodian of all funds apportioned to districts in the county, and holds such funds subject to order of clerk of school district when they have been apportioned by county superintendent.

California.—The voters of the district elect a district board of school trustees, and may vote tax, which the county "civil" authority levies and collects at the time of collecting county school taxes. The county superintendent apportions State and county school money to districts, but the State funds may be used only for paying teachers. The county treasurer seems to be the general custodian of all school money received by or raised in county, cities excepted. No county assessor, collector, or treasurer is entitled to fees for handling school money.

Nevada.—Each village, town, or incorporated city is a school district, which elects a district board of school trustees, and may levy tax, which is levied and collected by county "civil" authority at the same time as county school taxes are collected, all of which are collected into county treasury as on special deposit. State school money is devoted entirely to paying teachers, and it and the county school money are apportioned to the districts by county superintendent.

CHAPTER XXXV.

THE CONVEYANCE OF CHILDREN TO SCHOOL.

The question of the consolidation of rural schools continues to receive the thoughtful attention of educators. It has been frequently demonstrated and is generally conceded that it would be better, both on economical and on pedagogical grounds, to unite the many small and weak schools of a township, dispersed over a large extent of territory, into a few strong, well-equipped and well-conducted graded schools, located at convenient points.

The adoption of the town system in the management of school affairs in several States has rendered this procedure more feasible, by placing the control of all the schools under one central authority, with power to locate and discontinue schools wherever needed in its discretion, and which is competent to reduce the disjecta membra of a school system to healthy and well-rounded educational organisms. The chief hindrance to consolidation now to be considered lies in the distance some of the pupils would have to travel from their homes to reach the nearest union or graded school, in thinly populated sections.

The expedient has been tried on a considerable scale in Massachusetts, and is being favorably considered elsewhere, of transporting the more distant pupils to school at the public expense. The importance of this experiment and the influence it may exert in determining the future character of rural and village schools, would seem to render it advisable to recapitulate what has been undertaken and accomplished in this direction.

A law of Massachusetts approved April 1, 1869, reads as follows: "Any town in this Commonwealth may raise by taxation or otherwise, and appropriate money to be expended by the school committee in their discretion, in providing for the conveyance of pupils to and from the public schools."

The then secretary of the State board, J. White, refers to this act as "introduced into the legislature through the efforts of a practical man from one of our rural towns of large territory and sparse population, where the constant problem is, how to bring equal school privileges to all without imposing undue taxation.

"In too many cases the town seems to have forgotten that the most important element in the solution of the problem has been the character of the school, and have bent their efforts to making them accessible to all. This has led to such an unwise multiplication of them as not only to shorten the time of their continuance, but greatly to diminish their efficiency, while at the same time the expense of maintaining them has been largely enhanced.

"The act recognizes the fact that it is a far better policy for the town to spend a few dollars in conveying, in severe and stormy weather, and through drifts of snow, children who have no means of conveyance, to a well appointed and good school, rather than to waste hundreds in planting small and feeble schools at their doors.

"I have little doubt that the future history of not a few of them will amply justify the wisdom of the grant.

"It is to be remembered that the law is not compulsory. It simply gives the power to the towns, whose citizens are amply qualified to judge as to the propriety of exercising it. Certainly there is little danger of its abuse."

Secretary White then quotes from a letter written by the chairman of the school committee of an important town in Worcester County, which he says "shows what has already been accomplished by the aid of this act and of the act to abolish the school district system, and is a sufficient reply to the sneering criticism to which it has been exposed in high quarters." The letter runs as follows:

"We have been consolidating and grading since spring. Instead of 11 schools of the old six-months grade, we have now 5 primary and 2 grammar, and shall be able to keep at least eight months this year, with no addition to the appropriation, though we pay better wages and transport the children in two districts at an expense of $10 per week."

The first general statement of the results in Massachusetts of the law authorizing the public conveyance of pupils to school was made by Supt. W. L. Eaton, of Concord, in 1893, in a pamphlet prepared for the Massachusetts public school exhibit at the World's Columbian Exposition. In it he said:

"Since the year 1869 the cities and towns of Massachusetts have been authorized by law to appropriate and expend money for the conveyance of pupils to and from the public schools. At first this authority was used, in accordance with its apparent purpose, mainly to convey pupils to the high school, as generally there was but one such school in a town. Within a few years, however, many communities have used this authority to increase the educational advantages of the children—constantly decreasing in numbers—who live in the districts at a distance from the centers of population. This has been accomplished by closing many district schools and transporting, at public expense, their pupils to the neighboring district school or to the village. * * *

"In order to secure full information regarding this important movement, a circular letter of inquiry was sent to 165 cities and towns. Replies have been received from 135, and the answers tabulated. The following summaries are of interest:

"I. The cities and towns that reported an expenditure for 1891-92 of $33,500, will expend for the current year $48,300.

"II. Fifteen towns and cities report conveyance to high school only, at a cost of $8,650.20 for 462 pupils.

"III. It appears that in the remaining 120 towns and cities there were, prior to the beginning of this movement to consolidate, 632 outlying schools. Of this number, 250 have been closed within the past twelve years, and to-day nearly 2,000 pupils are being conveyed to adjacent district schools, or to the village schools.

"IV. To the question, Is it the policy of your town ultimately to close all the schools outside the centers of population? twenty-five answer yes, without qualification; forty answer no; and nearly all the others reply that their towns are working for that end, or are considering the question, or hope to accomplish such a result.

"V. To the request of a brief statement of the reasons that determined the towns to close district schools and transport the pupils to other schools, the replies indicate two distinct purposes—one financial and the other educational. In many of the towns of the State the depopulation of the districts outside the villages has made it cheaper to transport to other schools the few pupils living in the districts than to teach them in situ. In other towns the desire to make strong central schools, and the purpose to give all the children of the town the benefit of better teachers, better appliances, and better supervision, have been the dominant motives to determine consolidation.

"VI. To the question whether the results have been satisfactory, there is a substantial agreement in the affirmative. The most emphatic expressions of satisfaction come from those towns in which the educational motives have been the dominant ones. Repeatedly comes the assertion from this latter class of towns that the parents would not return to the old system of isolated schools if it were possible.

"The town of Concord is regarded generally and properly as the pioneer in this movement to close all district schools and to convey their pupils to the graded central schools."

State Agent G. T. Fletcher thus reports (Mass., 1893-94):

"The exodus of young men and women to the cities of Massachusetts and the States of the West has left many of the towns poor in people and property. For what these rural communities have done and may do for the Commonwealth they deserve aid in their time of need. The State should cooperate with the towns in securing for their children educational advantages equal to those possessed by wealthy communities. The school population has diminished in a greater ratio than that of the adults because large families of children were common formerly, uncommon now; but the number of schools has not been reduced in like proportion to the number of the children, and as a result many schools are too small to be interesting and profitable.

"Last year sixteen towns in three counties had a school attendance of only 1,076 pupils, an average of 11 to a school, for seven months in the year. The average cost per pupil for schooling was $18.33. As some schools had only 6 pupils, and a few only 3, the cost per pupil was much greater, being as high as $60 in the smallest school, while in a school of 25 pupils, the cost averaged less than $8. These figures show the expensiveness of educating pupils in small schools, a fact which the people do not seem to realize. The average wages of teachers in these towns was only $5.50 a week, for which sum good teachers can not be secured.

"Two things may be regarded as objects to be kept in view—efficiency and economy. Means to secure these ends are comfortable and convenient schoolhouses; necessary appliances; no more schools than are needed; intelligent teaching and skilled superintendence. There can not be efficiency without economy in school matters. A scattered population with small means must endure some privations not

felt in thickly settled communities, such as remoteness from post-office, stores, church, schools, physicians; but in this Commonwealth every child should have opportunities for a good common-school education. The State must give more pecuniary aid, perhaps by increase of school fund and distribution of all the income of it among the poorer towns.

"Country people should perceive that the conditions under which the old district school was a power in the land no longer exist. Fifty pupils in one school, ranging in age from 4 to 21 years, many of them mature young men and women, was no uncommon occurrence less than fifty years ago. Last year nine towns had less than 50 pupils as an average attendance in all of their schools, and twenty-one towns had less than 75 pupils as a total average attendance; but some of these towns had 8 schools. It must be evident to every intelligent, candid person who gives the subject consideration that a less number of schools is a necessity and that only by combination can this result be attained. If a rural school has 25 pupils, a competent teacher can be economically employed. In a good community such a school has advantages not possessed by village or city schools. When the attendance is small in schools it seems to be wise to effect in some way a union of schools.

"In many towns the schools can be conveniently united by twos or threes, according to size and location. In other towns all the children can be gathered at a center where a graded school can be established. Only in this way can the best primary instruction be secured and a high school become a possibility.

"These facts should have great weight with the people. A few good schoolhouses will be needed, and the cost for repairs and fuel will be reduced. Fewer and better teachers will be employed and the children will receive better instruction, which is the ultimate object to be reached, as only for them do schools exist.

"There are some objections to any plan of union, but they are overbalanced by the advantages. When the people in the rural towns are willing to do all they can to educate their children, the State should supplement these efforts wisely by money and management. Many towns have made a good beginning in this work.

"The following letter from Seymour Rockwell, esq., of Montague, for nearly thirty years a member of the school committee of that town, is given here at my request, for the results of his experience:

MONTAGUE, MASS., *December 6, 1893.*

"'DEAR SIR: For eighteen years we have had the best attendance from the transported children; no more sickness among them and no accidents. The children like the plan exceedingly. We have saved the town at least $600 a year. All these children now attend school in a fine house at the center, well equipped. The schools are graded. Everybody is converted to the plan. We encountered all the opposition found anywhere, but we asserted our sensible and legal rights and accomplished the work. I see no way to bring up the country schools but to consolidate them, making them worth seeing; then the people will be more likely to do their duty by visiting them.

"'Yours, truly, SEYMOUR ROCKWELL.

"'Mr. G. T. FLETCHER.'"

Mr. George A. Walton, agent of the Massachusetts State board of education, reported in 1894 concerning the schools of Barnstable and Middlesex counties as follows:

"The schools have been consolidated, small schools being brought together and united with larger ones. This process has been proceeding at a rapid rate within the past six or eight years, and includes a large number of schools in both Barnstable and Middlesex counties. Orleans has brought into one building all her schools; Harwich has voted in favor of a complete consolidation; the town of Barnstable, with the advent of the new normal school at Hyannis, will concentrate all her children of lower grades of that village in one building, as she has already concentrated the advanced grades of that and the neighboring villages in her high school. Mashpee and Sandwich and other towns are moving in the same direction. In many towns the process is phenomenal. Some notable instances of consolidation within a few years in Barnstable are Orleans and Mashpee; in Middlesex, Acton, Ashland, Bedford, Belmont, Billerica, Concord, Dracut, Holliston, Lexington, Maynard, North Reading, Sherborn, Sunbury, Tyngsboro, Wayland, and Weston. The consolidation in Concord, Bedford, and Lexington is as creditable a part of our school history as their stand in colonial days is of the history of the nation.

"The extent to which the schools are consolidating may be inferred from the expenditure returned for transporting children, the expenditure being made to aid the consolidation. Eight out of the fifteen Barnstable County towns and thirty-six out of the fifty-four Middlesex towns pursue the policy of transporting to school. The expenditure for this purpose has increased in the county of Barnstable from $2,682.66 in 1893 to $3,033.85 in 1894, and in Middlesex from $13,901.87 to $18,155.36.

"A result which follows from consolidation is a better grading of the schools. Concord, whose schools fifteen years ago were as confused a set as could be found anywhere, is now a model of complete and systematic classification. She began the work of consolidating and grading under Supt. John B. Tileston, and has fostered and perfected it under her present superintendent, William L. Eaton. Forty towns and cities in Middlesex have all their schools, with here and there an exception, under a good system of grading. Included in these are schools ten years ago found at the crossroads and in the highways. The same is true of towns in Barnstable County.

State Agent John T. Prince reports the same year (1894) on the schools of Bristol and Norfolk counties as follows:

"Increased attention has been given in recent years to the consolidation of schools, either for the purpose of better grading, for bringing together small schools, or for uniting small outlying schools with a central school. In either case it becomes necessary frequently to convey children from one neighborhood to another or from an outlying district to the village center. Three different plans of conveyance are followed:

"(1) Conveyance by carriage from some central point, as, for example, the abandoned schoolhouse, to the school or schools which the children attend.

"(2) Conveyance by carriage which passes through the principal thoroughfare of the neighborhood from the most distant point, the children being obliged to walk to the carriage from homes which are situated on the side roads.

"(3) Conveyance by carriage from the homes of all the school children of the neighborhood.

"It is evident that the latter plan, although more expensive than either of the other plans, is the one most convenient for the pupils, and it has been found by experience to be the one which gives the greatest measure of success.

"The amount paid for conveyance and the basis of payment vary greatly according to circumstances. Some towns pay so much a week or mile for each pupil carried, and some so much by the season for carriage and driver. Experience has demonstrated the importance of making a careful selection of a driver who can take proper care of the children and keep them in control.

"The following towns of Bristol and Norfolk counties have to a greater or less extent consolidated their schools within the past few years, and to accomplish this purpose some of them have been obliged to convey the children by carriage or cars at public expense: Braintree, Cohasset, Dartmouth, Dover, Fairhaven, Foxboro, Franklin, Mansfield, Milton, Norfolk, Norton, Quincy, Raynham, Seekonk, Taunton, Walpole, Westport.

"Some of the above-named towns are contemplating extending the plan to other schools, and other towns not included in the list are considering the matter. It may be of some interest to know what the result of the experience of these towns has been. In response to my inquiries, superintendents and secretaries have reported as follows:

"*Braintree.*—We have consolidated three schools—Middle Street, Iron Works, and East—into the new James Perkins School, East Braintree. The Middle Street School pupils are transported in a barge. We have closed the ungraded school at Mayflower Park, and its pupils are transported by the street railway at half fare to the Pond and Monatiquot schools. Last year we closed the West School, and transported the pupils by barge to the Pond and Monatiquot schools. Consolidation is cheaper. The people were apprehensive of trouble at first. They find that the pupils do so much better in the large graded schools with excellent heating, ventilation, and sanitation, that it would be impossible to induce them to change back to ungraded schools. On bringing the pupils of different schools together, we found that those in the ungraded schools had done on the whole just about three years' work in four years. In all-round development they were more than this behind. Our schools are all perfectly graded now—one class, each doing a year's work, in each room—with only one exception, where the two highest grammar classes in one school are quite small and are in one room. I think there can be no question that well-graded schools in which the classification is not rigid, and in which it is easy for pupils to pass either way, up or down, can do much better work than ungraded schools. This is certainly being proved by our experience.

"*Cohasset.*—All except the primary schools of outlying districts are brought into one central building. The result is an undoubted increased efficiency of the schools.

"*Dartmouth.*—We have consolidated one school—Allen Street—during the past year by transporting the children to Smith Mills. Two schools were consolidated previous to this year. All parties concerned are well pleased with the consolidations, and much better work seems to be done for the pupils.

"*Dover.*—The pupils of the North School neighborhood are transported to the Sanger School at the center. Thus far it is a complete success.

"*Franklin.*—The results have been beneficial.

"*Mansfield.*—Beneficial in every way.

"*Milton.*—One grammar school was given up in 1893, and the pupils distributed among three others which were better graded. Better results came from associating children with others of the same attainments and advancement. All the advantages of better classification are secured.

"*Norfolk.*—A small school was closed a year ago last September. Very good results have followed, as we are able to have three schools at the center—of primary, intermediate, and high-school grades.

"*Norton.*—One school building was closed. The pupils are conveyed to another school near by. All agree that it was a wise move.

"*Quincy.*—Consolidation of schools was made several years ago. Results excellent for the child, the school, and the city.

"*Randolph.*—There was consolidation some few years since, the effect of which, I think, is bad, for the reason that too many scholars are in some rooms at present, and give the teacher too much to do, otherwise I do not know of any objections. No other objection has come under our observation.

"*Raynham.*—One school was closed, and the pupils sent to another, after obtaining the consent of parents in one district to send their children to the other school, without additional expense to the town. Think we may have to transport some of the pupils this winter term. The results are more than we anticipated. Better results follow in the school work. Most parents appreciate it, and it is a financial saving to the town.

"*Seekonk.*—We have removed the schoolhouse at Luthers Corner to a lot containing one-half an acre, and built an addition to it, 25 by 32 feet, which gives us two good-sized rooms. The primary and intermediate grades occupy one room, the grammar grade the other. The school in the adjoining district has been discontinued. Most of the scholars from that district attend the new school, conveyance being furnished. The result is very satisfactory to both parents and scholars, with one exception.

"*Taunton.*—Three schools have been closed on account of the small number of pupils, and these few have been transported to other small schools. The cost has been between $900 and $1,000. I like the plan so well that, if possible, I would close others.

"*Walpole.*—One section of the town belonged to a union district. The house was in Dedham. The house was destroyed by fire a year ago last September. Since that time the pupils of this section have been transported to the North district. Good results."

Another Massachusetts State agent, Mr. A. W. Edson, discusses the question of public conveyance of pupils as follows:

"*Consolidation and transportation.*—There is a decided tendency on the part of intelligent and progressive communities to close the small schools in remote districts and to transport children to the graded schools of the villages, where better classification, better grading, and better teaching are the rule. This is done not so much from an economic standpoint as because of the firm conviction that the children receive greater educational advantages there than in the small ungraded schools.

"The number of children in the back districts is small, and growing less every year. With few children and small classes there can be but little enthusiasm and progress.

"The leading arguments in favor of this movement are:

"1. It permits a better grading of the schools and classification of pupils. Consolidation allows pupils to be placed where they can work to the best advantage; the various subjects of study to be wisely selected and correlated, and more time to be given to recitation.

"2. It affords an opportunity for thorough work in special branches, such as drawing, music, and nature study. It also allows an enrichment in other lines.

"3. It opens the door to more weeks of schooling and to schools of a higher grade. The people in villages almost invariably lengthen the school year and support a high school for advanced pupils.

"4. It insures the employment and retention of better teachers. Teachers in small ungraded schools are usually of limited education, training, or experience, or are past the age of competition. The salaries paid in cities and villages allow a wide range in the selection of teachers.

"5. It makes the work of the specialist and supervisor far more effective. Their plans and efforts can all be concentrated into something tangible.

"6. It adds the stimulating influences of large classes, with the resulting enthusiasm and generous rivalry. The discipline and training obtained are invaluable.

"7. It affords the broader companionship and culture that comes from association with large numbers.

"8. It results in a better attendance of pupils, as proved by experience in towns where the plan has been thoroughly tried.

"9. It leads to better school buildings, better equipment, a larger supply of books, charts, maps, and apparatus. All these naturally follow a concentration of people, wealth, and effort, and aid in making good schools.

"The large expenditure implied in these better appointments is wise economy, for the cost per pupil is really much less than the cost in small and widely separated schools.

"10. And, again, it quickens public interest in the schools. Pride in the quality of the work done secures a greater sympathy and better fellowship throughout the town.

"These reasons for consolidating schools and concentrating effort have great force with people interested in the proper education of the coming generation. The future is likely to see increased attention given to this movement.

"There are, however, objections raised to the plan, some of them frivolous, others deserving careful attention, chief among which are:

"1. Depreciation of property; decreased valuation of farms in districts where schools are closed.

"2. Dislike to send young children to school far from home, away from the oversight of parents; and to provide a cold lunch for them rather than a warm dinner.

"3. Danger to health and morals; children obliged to travel too far in cold and stormy weather; obliged to walk a portion of the way to meet the team, and then to ride to school in damp clothing and with wet feet; unsuitable conveyance and uncertain driver; association with so many children of all classes and conditions; lack of proper oversight during the noon hour.

"4. Insufficient and unsuitable clothing; expense to parents of properly clothing their children.

"5. Difficulty of securing a proper conveyance on reasonable terms; or, if the parent is allowed compensation, of agreeing upon terms satisfactory to both parties, parents and town officials.

"6. Local jealousy; an acknowledgment that some other section of the town has greater advantages and is outstripping any other locality.

"7. Natural proneness of some people to object to the removal of any ancient landmark or to any innovation, however worthy the measure or however well received elsewhere.

"To these objections it may properly be said:

"The first one is more imaginary than real, for any level-headed man with children to be educated will place a higher value on the quality of the schools and the school spirit in the community than upon the number and accessibility of the schools. Experience has demonstrated the fact that property in towns committed to this plan has appreciated rather than depreciated in value.

"The second and third objections are the most serious. It behooves school authorities to see that the danger is reduced to a minimum. Suitable conveyances, covered, should be provided, and competent and careful drivers selected. No risks should be taken. During the noon hour some teacher should remain with the children who carry luncheon.

"The fourth, fifth, and sixth objections have no great weight. The last one has great influence with those people who choose to live, move, and die as did their ancestors, on the theory that this is the last generation, and that any special efforts at improvement are just so much more than is wise or necessary."

Amount expended for transporting children to school for the past seven years in Massachusetts.

Year.	Amount.	Year.	Amount.
1888-89	$22, 118, 38	1892-93	$50, 590. 41
1889-90	24, 145. 12	1893-94	63, 617. 68
1890-91	30, 648. 68	1894-95	76, 608. 29
1891-92	38, 726. 07		

In connection with these figures the secretary of the State board of education, Hon. Frank A. Hill, remarks:

"The law authorizing towns to pay for the transportation of pupils was enacted in 1869. The object of the law was to favor the establishment of better equipped, better supported, and better taught schools, without, however, increasing necessarily their cost. This could be done by the consolidation of scattered and feeble schools, the maintenance of fewer but better buildings, and the hiring of a smaller

number of higher-grade teachers. But the difficulty to be overcome was the disposition of children remote from the central schools. This was met by the transportation law. The growth of the transportation expenditure is largely the measure of the extent to which consolidation is carried. To a slight extent it is due to a possible increasing indulgence to pupils who can walk the required distance to school, but whose parents are averse to their doing so.

"The expenditure for 1894–95 was $76,608.29, an advance of $12,990.61 from the expenditure of the preceding year. Two hundred and thirteen towns, as against 199 last year, make returns for transportation expenditures, ranging from $1.55, $3, and $5 for Carver, Goshen, and Swansea respectively, to $2,195, $2,523.75, and $2,699.85 for Concord, Lexington, and Weston respectively.

"While vexatious questions not unfrequently arise about the necessity, the kind, the extent, the distance, and the cost of transportation, the general policy of transportation as a factor in the solution of the question as to what can be done for small ungraded schools in sparsely settled regions of the State is proving to be very helpful.

"While the school committee has no right to expend money for transportation unless the town has specifically authorized such expenditure, it has exclusive and absolute charge of the settlement of all details about transportation after it has once been authorized by vote of the town. Whatever the committee does, it is always under statutory obligation to provide convenient schooling for every eligible child. Schooling is made convenient by locating the schoolhouse near the child or transporting the child to the schoolhouse. What is a reasonable walking distance the committee must decide for itself. The secretary, when asked his opinion about reasonable distances, inclines to the view of his predecessor, that little children should not be made to walk much over a mile, although older children of grammar-school age may walk a mile and a half or even more. But numerous conditions may serve to modify this opinion. If for little children the mile lies through lonely, unfrequented, wooded, or difficult roads, it would be too great or too dangerous a distance for them to walk. If, on the other hand, the way lies over a well-traveled thoroughfare, with good sidewalks, and houses all along the road, it would not be a hardship for the children to walk a considerably greater distance than one mile. Transportation should not be used to reduce sturdiness, self-reliance, and reasonable self-denial in boys and girls. It can not be made equally convenient for all families. It often has to be partial for some while complete for others. In cases of genuine doubt, the leaning should be toward the convenience of the child."

In the Massachusetts school report of 1894–95 are given the results of an inquiry regarding the rural schools of three counties in the western section of the State, conducted by State Agent G. T. Fletcher. The questions touching consolidation and conveyance submitted to the school committees and the gist of the answers thereto, as given by Mr. Fletcher, are as follows:

"Do you favor the consolidation of small schools, and the conveyance of pupils when necessary? Give reasons for your opinion."

Nearly all the replies are in the affirmative, so far as the theory is concerned, while many committees find difficulties and sometimes impossibilities in the way of application.

The reasons for consolidation of schools by conveyance of pupils are as follows: Increase in the size of the schools, rendering it possible to have better classification; better attendance, because the school is more interesting and profitable, and pupils can ride in comfort and safety when weather conditions would be unfavorable for walking; and the saving of money by closing small schools, making it possible to employ better teachers.

Some maintain that the contact with a larger number of pupils excites a healthy emulation, and that the small district school does not bring the pupils into touch with the conditions of life which they must meet later.

"To what extent has the plan of uniting schools been tried in your town, and with what results?"

Eighty towns report a trial of the plan. Fifty of them state that results are favorable. As committees may desire particulars about methods of combination and conveyance and advantages secured, or the nature of obstacles and objections encountered, the names of some of these eighty towns are given: Ashburnham, Bernardston, Bedford, Carver, Dover, Dana, Essex, Erving, Egremont, Gill, Granby, Holliston, Huntington, Leverett, Littleton, Ludlow, Maynard, Montague, New Braintree, Norfolk, Phillipston, Rutland, Shelburne, and Templeton are among the fifty reporting favorably. Agawam, Carlisle, Conway, Lanesboro, Pelham, and Richmond report some favorable results but much opposition from parents. Auburn, Berkley, Prescott, and Worthington do not favor the plan. Other towns have not tried to unite schools.

Conveyance of children to union schools should be considered as a part of the expense of schooling, and not as a separate charge. The distance which children

may be required to walk to school is a question that gives committees much trouble, and in regard to which they would like some decision by authority.

NEW HAMPSHIRE.

A law of New Hampshire provides that town school boards "may use a portion of the school money, not exceeding 25 per cent, for the purpose of conveying scholars to and from the schools." This has been done by the school boards in various towns, and the results have been reported as follows:

1892.

Barnstead.—It was decided in the spring to open schools in nine districts. Later the parents at the North, Shackford, and Bickford districts petitioned for schools, representing the number of pupils to be 5, 6, and 7, respectively. It had been a rule with previous school boards to grant a school to any district containing five or more children of school age. Your board followed the rule and opened schools as petitioned; but after a trial of one term it saw fit to abolish both schools and rule. It was found that 6 and 7 on the petition meant 4 and 5 on the register. Schools were maintained for the remainder of the year in nine districts as at first intended.

After closing the school at the North, the pupils there were conveyed to Locke's Corner, during the fall and winter terms, at an expense of $36. Those of the Bickford district were conveyed to the Parade at an expense of $20, and in the winter term $17.50 was paid for conveying the pupils from the Tasker district to the South, the distance having been measured and found to exceed 1½ miles. Thus at an expense of $73.50 the maintenance of three schools was avoided, and a net saving effected of something over $250.

Epping.—The daily conveyance of the few scholars in the North River district, to and from the East Epping School, begun in 1890 and continued through the last school year, has resulted in improving the school and saving about one-half the expense of maintaining another separate school. It is now proposed to make a greater improvement and saving, by moving the North River schoolhouse to a new lot, centrally located for the united schools.

1893.

Alstead.—As in previous years, it has seemed best in some cases to furnish accommodations in neighboring schools, a course which has not been determined wholly by the number of pupils, but also by the opportunities for transportation and the advantages to be obtained in other localities. It is well known that larger schools offer many advantages. Better teachers can be secured, greater unity of method and purpose attained, and increased interest on the part of the pupils assured. On the other hand, there is a natural reluctance to having the old schoolhouse vacated, and our children taken to more distant ones. To adjust these conflicting interests is often the most difficult problem the school board has to solve.

Amherst.—All the schools, with two exceptions, have been in operation during the year. No. 7, which was discontinued in 1891, remained closed, the scholars, few in number, attending elsewhere. At the opening of the fall term it was thought best to pursue the same policy with No. 4, giving the scholars the privilege of the village schools, and providing for their transportation. So far as the board is aware, this change has been largely satisfactory and is a step in the direction of consolidation.

Colebrook.—It was thought practicable to take advantage of the present school law, and an effort was made to unite several schools and so do away with two or three small ones, but was nearly everywhere met with disapproval. There are 3 schools in town with an average of 5 pupils, and the expense of running these schools for the year has been about $300. Now it seems to us that if one-third, or even one-half, of this money had been used for transportation, and the remainder to lengthen the other schools, the children would have been the gainers. As long as these small schools continue, there will be a tendency to employ cheap and inexperienced teachers.

Walpole.—There is no more difficult problem that the school board is called upon to solve, or under existing conditions one more likely to come up anew with each returning year or term, than how to successfully graft the town system of schools to the old district accommodations. In this connection we refer you to the treasurer's report, which shows $244 as the sum paid during the year for conveying scholars to and from school, whose attendance we thought it was unreasonable to expect without in some measure overcoming the obstacle of distance. This is always a delicate matter for the school board to handle, and seldom can they arrange it satisfactorily either to themselves or to parents. If the town system is to continue as at present, we recommend to serious consideration whether it would not be wiser to

abandon the makeshift policy that we have been obliged to pursue in the past, and relocate some of the houses in the sparsely settled parts of the town, thereby avoiding in a great measure the cost of conveyance.

Westmoreland.—Money paid for the conveyance of pupils is a unique and peculiar application of the public taxes and should be paid out with particular consideration.

1894.

Barnstead.—By keeping the number of schools down to 9 we have had twenty-nine weeks of school for every scholar in town, the longest school year we ever had.

There has been some complaint about going so far as a few of our scholars are obliged to go to attend school, although conveyance is provided for them. We admit it is rather inconvenient to get ready every day and ride a mile and a half; so is it quite as hard for those who live just within the mile and a half limit to get ready and walk all the way. This they do, however, without murmuring. If a few small children living at a distance from the schoolhouse are unable to attend in the coldest weather, it must be borne in mind that the schools begin early in the season, and that they have as much schooling as they would if two or three more houses were opened and the length of term shortened accordingly, while all others have the advantage of the long school.

Dover.—The conveyance of pupils to and from the graded schools below the high school has been continued during the year with satisfactory results from Littleworth, Knox Marsh, and Eliot Bridge sections of the city.

Allow me to call attention to two other parts of the city to which this plan might be extended advantageously:

	Tolend school.	Upper factory school.
Total enrollment during the term	11	5
Average enrollment	10	5
Average attendance	7	4
Average attendance for December	3.5	2.8

The majority of the children attending these two schools live at such distance from them that they are obliged to take their dinners to school; stormy and cold weather interferes very seriously with their attendance; the schools are so small that enthusiasm is of necessity lacking; the children do not get the benefit of the courses in music and drawing conducted by our special teachers in all schools accessible to them.

It seems to me that if this matter were presented to the parents of the children of these schools, they would, on purely business principles, prefer to have the children carried to the graded schools rather than continue the present arrangement. Surely a child can ride in a covered barge 3 miles with less hardship and discomfort than he can walk half that distance. Comfortable transportation would nearly double the school advantages of some of the pupils here considered.

Hampstead.—It is probably impracticable, in a somewhat sparsely settled township like ours, to establish and maintain a graded system of schools in a large, central school building. Of course, if it were practicable, the board has no doubt that the town would willingly make such changes as would be necessary to bring about the result. The greatest obstacle to be overcome seems to be one of transportation, both in respect to its inconvenience to the pupils and the expense attending it. If these difficulties could be overcome, nothing would be of greater value to our children than such a graded school, which all pupils of the town could attend, from the primary to the highest grammar grade. A school of, say, four rooms would then enable the school course to be divided in its execution among four competent teachers, each of whom would push along the pupils of her room to the next, until the primary pupils would finally emerge from the school well prepared for the high school, whose course of study should be adapted to take the pupil at graduation from the highest room of the graded school, and pass him along without any break in his intellectual progress. The fact that at present nearly all of the applicants to the high school are obliged to enter the so-called preparatory course is not the fault, wholly, of the teaching done in our schools. Our teachers have far too many daily recitations. The recitations are much too short, necessarily so. In the hurry and rush of swiftly changing classes and brief recitations, almost no time can be found for extended explanation; and hence the pupil must depend too much upon the text-book and his own resources. Under these conditions the brightest, naturally, will do much, but the duller ones must suffer.

VERMONT.

The school law of Vermont contains a provision similar to that of New Hampshire, authorizing town school boards to expend not exceeding 25 per cent of the school moneys for the conveyance of pupils to and from school. State Superintendent of Education U. S. Stone, in his report for 1893–94, discusses the conditions in Vermont as follows:

"The question of transportation can not be discussed without a more detailed consideration of the fundamental question of unprofitable schools. The depletion of the remote school districts through the concentrating tendency of the times and the diminution in the size of families has brought with it a train of disadvantages and inequalities which it is the aim of the new law to minimize.

"A decrease in population in any community is always attended by a decrease in property valuation. This decrease increases the burden of taxation to the remaining inhabitants. It usually costs as much for repairs and fuel for a school of 4 as for a school of 40; also teachers' wages and the valuation of school property of the two schools are not proportionate to the respective number of pupils. If a new building is necessary the onus in some places is grievous and unjust. These financial conditions have resulted in the practice of economy, which is disastrous to good schools. It neglects repairs and supplies, shortens the length of schools, and invariably secures only the cheap and incompetent teacher.

"Furthermore, the small school in itself is unprofitable for the child. He loses that attrition of mind with mind which is necessary for keenness; he loses the stimulation to excel which can exist only in larger classes; he loses vigorous habits of thought and work unless well buttressed and supplemented at home.

"The new law contemplates the discontinuance of those schools financially and educationally unprofitable, and to mitigate cases of gross inconvenience and inequalities enacted the following law:

"Section 667 of the revised law says:

"'Schools shall be located at such places, and held at such times as in the judgment of the board of directors will best subserve the interests of education and give all the scholars of the town equal advantages so far as practicable; the board of directors may use a portion of the school money, not exceeding 25 per cent thereof, for the purpose of conveying scholars to and from school.'

"No provision of the law has been more vexing to school directors; no provision has so vitally touched the people. Opposition or hostility or sentiment against the closing of schools originated naturally enough from the instinctive dislike of parents to have their children committed to the conveyance of another, and to a long removal from home; also from an apprehension of a depreciation of real estate. The latter is partially fancied, the former is real. A remote good school has, in the opinion of an intelligent man, no more serious financial effect upon his property than a close poor school.

"In 1893 there were 153 schools of 6 pupils or less in the State; in 1894 there were only 65 such schools, making 88 less schools of the kind in 1894 than in 1893. The aggregate cost of these schools at the average rates would be about $25,000. After deducting the amount for transportation and dividing by the average cost per day throughout the State to run our schools, we find that by the closure of such schools we could give every boy and girl in the State three days more of schooling, making an approximate aggregate of 250,000 days of schooling.

"One of the impossibilities of human wisdom is to frame a law that will equalize the burdens of life. Our varied conditions necessarily produce inequities. Under any system it will cost one child more physical labor to attend school than another—not a legal fault, but an unavoidable condition.

"If the new system has enhanced these inequalities, the balance must be struck between such increased inequalities on one side and justice through equalization of taxes and larger advantages to pupils on the other.

"It is doubtful if this section of the law can be improved. As it is now, each board is a law unto itself and there is wisdom in such delegation of power. In some instances it might seem better if the town had a voice in the matter of transportation by appropriating specific funds and dictating conveyance. But the town can not easily and justly dictate what pupils should be carried, neither can the town by vote nor the State by law adjust inconveniences. Distance is only one factor in transportation; character and condition of roads and age of children must likewise be considered. The discretion of the directors is a safer solvent than any legal enactment or town vote."

Though there are no statistics on the subject, the practice of transporting pupils to school would seem to have made some progress in Vermont, inasmuch as the county examiner of Windham County reports to the State superintendent: "So far as my observation extends, the school directors have been quite conservative in the

matter of consolidation of schools, and, in most instances, liberal in providing transportation in cases where schools were done away with. In a few cases complaint has been made that directors were inclined to be rather frugal in payment for transportation charges, and there is some slight feeling that there should be some appeal from the decision of the directors in such matters. It is my own opinion that any change in that direction would be the cause of more loss than gain, as it would be a cause for litigation and expense to individuals and to towns."

CONNECTICUT.

A provision of the school law of Connecticut authorizes town school boards to unite the school of any district with that of an adjoining one whenever in their judgment the number of pupils is so small that the maintenance of a separate school is inexpedient, and provide transportation for the pupils of the school discontinued. The following extracts from town reports bearing upon this subject are given:

"*Litchfield.*—A matter which is going to cause much trouble and expense is that of transporting distant pupils to and from school. Several claims have been made for this during the year, only one of which was allowed. It is very difficult to decide just who should, or should not, be paid for such work. We have tried to have sessions of school within reasonable distance of the pupils' homes, and feel that the parents should supplement the efforts of the committee by extra exertion themselves. One of the great drawbacks of sparsely settled communities is the remoteness from schools. Farms thus located are cheap, and the dearth of educational and social privileges is only a part of the bargain. To remedy this the buyer must himself do something. It can not be expected that the town must help him out of his bad trade by bringing to his door these advantages the same as the grocer does his wares.

"*Enfield.*—The first important question discussed was the consolidation of schools. This subject was given much earnest thought and the most careful consideration. It was finally decided to maintain schools in Thompsonville, Hazardville, Enfield Street, Scitico, King Street, Wallop, and Weymouth, as the most central and accessible points, and to bring all the scholars of the town into these schools. Had there been any feasible way of bringing the scholars in Jabbok and Hubbard districts together into one school, it is probable that a school would have been maintained in that part of the town. A very careful survey of the whole town was now made, in order to apportion the scholars of those districts whose schools were abandoned to the several schools most accessible to each. A house-to-house canvass was made, the number of children in each family ascertained, and in all cases where it was possible the family was given their choice of schools. In this way all of these scholars were assigned to the schools which the committee had decided to maintain.

"By the closing of these small district schools, many scholars were of necessity left at a considerable distance from a school in active operation. In considering how best to get these scholars to the nearest school, the committee found itself confronted with that terrible form of affliction, that veritable nightmare of trouble and anxiety, known as transportation. The school laws say that the committee may furnish transportation. The law contemplates that the school committee has the power to discontinue and consolidate schools, and that the people are expected to get their children to school wherever the schoolhouse is located. If transportation is furnished it comes from the good will of the committee, and not from any necessity imposed by law. It was voted that transportation be furnished as far as expedient. This question of transportation has occasioned all the dissatisfaction toward consolidation which has come to the ears of the committee. Our attitude is this: Every dollar spent in carrying scholars, beyond what is absolutely and manifestly necessary, is a dollar wasted. School money is not intended for horse hire, but for purposes of education. In Massachusetts, where consolidation is in force throughout the State, advantage is taken of milk wagons and all manner of conveyances to lessen the expense of transportation, and save the school money for the legitimate uses of the school. The great difficulty is that people themselves are not anxious enough to get their children to school. They are not ready to meet the committee halfway. If a covered carriage would drive up to their door in the morning and get their children and bring them home every night, they would throw up their hats and hurrah for consolidation, and think they were doing wonders for the cause of education. The school board is in full sympathy with the idea of transportation, and heartily regrets that a few isolated families are inconvenienced in getting their children to school. The plan of gathering scholars from house to house is not feasible on account of time and expense, but everything has been done compatible with good judgment and the economical use of money.

"The following schools were abolished: Bements Brook, No. 12, with an average attendance for the past four years of 11 scholars; cost the town $267.25 in 1893.

Brainard, No. 10, with an average attendance for four years of 7 scholars; cost for 1893, $278.15. London, No. 9, average attendance for four years, 13 scholars; cost the town for 1893, $277.96. Jabbok, No. 6, average attendance for four years, 13 scholars; cost the town for 1893, $274.23. Hubbard, No. 3, average attendance for four years of 12 scholars; cost the town $338.81 for 1893. East Wallop, No. 11, average attendance for four years of 6 scholars; cost the town $253.15. Here were 6 schools with an aggregate attendance of 62 scholars, costing the town $1,689.55 for the school year. The simple perusal of these figures convinces the judgment that this is an extravagant use of school money. To transport these scholars for the past year it has cost the town $1,045, a net gain of $644 55. This saving in money is an item well worth consideration, but more important still is the fact that we have placed these scholars in schools where the advantages are superior to their old district schools.

"The committee has been able to reduce the number of schools in the town from 13 to 7, and to accommodate all the scholars without crowding. They have not found it necessary to build any new school buildings, nor to make additions to the old ones. We can not discover that the cost of maintaining our 7 schools has been materially increased by the addition of the scholars from the districts whose schools were discontinued. It is obvious that 7 schools can be carried on for far less money than 13, and this shows what an important item this $1,045 spent for transportation becomes. Whatever money we have saved by the consolidation of schools has been expended in such a way as to render value received for the expenditure. The expense incurred for transportation, although necessary and unavoidable, makes no showing in our record for the year, and we can not suppress a regret that so large an amount of money must be diverted from its legitimate purpose."

RHODE ISLAND.

[From the report for 1894 of State School Commissioner Thomas B. Stockwell.]

Conveyance of children.—In connection with the closing of some very small schools in towns where the district system has been abolished, there has arisen quite a question as to what extent the town should provide free conveyance or transportation for the children whose schools are thus closed to the nearest school.

Upon the general question the law is silent in so far as express terms are concerned, but it has always been the ruling of the department that the powers conferred upon the school committees with reference to the management of the schools were very broad and that matters found to be necessary for the best and wisest conduct of the schools were within the scope of the committee's power, unless specifically prohibited. Accordingly, in a few instances, at different periods, some committees have made more or less provision of this character. But the local feeling against the closing of a school is generally so strong that committees are very loath to take such action.

The time, however, has fully come when this question of what we will do with these few children scattered over large tracts of country must be answered, and that, too, in a manner that shall be consistent with the rights of the children and the duties of the town.

There are 64 schools in the State having less than 10 pupils each. These are divided among eighteen of the towns of the State, showing that the evil of small schools is quite well distributed. Now, for the purposes of a school, less than 10 children are worth but little; such small numbers give no chance for any system of classification; they afford no opportunity for the cultivation of the healthy spirit of emulation and interest which numbers always foster; the pupils fail to learn the lessons of personal adjustment and adaptation which are so essential a preparation for life and for which the public school, if it be of good size, affords almost the ideal conditions.

Now, it is very clear that it is useless to expect that, save in rare instances, these schools will ever attain to any larger size; hence, if we are to have larger schools, the only way is to bring these pupils together in a smaller number of schools. But this is impossible in many cases unless provision is made at public expense for carrying the children to and from school; instead of bringing the school to the child, which has always been the idea, we now reverse and carry the child to the school. The result is the same in both cases—the best facilities and advantages possible for the child.

In our neighbor on the north and east, Massachusetts, this experiment has been tried for several years, until it has passed beyond the experimental stage and has become recognized and advocated as one of the best and most satisfactory schemes of modern times.

The last report from one of the agents of the Massachusetts State Board of Education, Mr. George A. Walton, says that eight out of fifteen towns in Barnstable County and thirty-six out of fifty-four in Middlesex County pursue the policy of concentrating their schools into one or two and transporting the children to and

from school without charge. The gross sum expended last year in those two counties for the transportation of children was $21,189.21. It is their experience also that, after the people have once realized the difference between the two methods, they are never ready to go back to the old.

I think, therefore, the time has fully come to advocate this plan as a policy to be taken up and adopted. We have a number of towns where there are several of these small schools scattered all over the town. Not only the matter of keeping up the school must be taken into account, but the schoolhouse itself is in need of attention. Before more money is spent upon all of these small, scattered buildings, it should be carefully considered whether the time has not come to leave them and erect one or two houses in their place.

I believe this course to be in the line of economy, with reference both to the buildings and their care, and also to the efficiency of the schools and the interests of the pupils. While, as above said, it is undoubtedly within the province of a school committee to do this thing, and certainly within that of a town to decide upon such a course, it would very probably be helpful in bringing matters to a crisis if the law were so amended as to provide in express terms for this action.

NEW YORK.

[From report of State Supt. Charles R. Skinner for 1894–95.]

I can not refrain from again calling the attention of the public to the matter of the consolidation of weak rural districts. * * * There were 7,529 school districts in this State where the average attendance upon instruction in the public schools during the last school year varied from 1 to 20 pupils, while there were 2,983 districts in the State where the average daily attendance during the past school year was less than 10 students. To maintain a school, provide proper facilities, and employ a teacher for so small a number of students is manifestly a perversion of that aid which the people so generously accord the educational interests of the State. * * *

The township system, or some unit larger than the present system, in my judgment, is the only solution of the difficulty, and until the State shall have adopted that system, its rural schools will continue to decline in efficiency. There is, in my opinion, no better school in America than the union free school and village school of our State, but the results there obtained can not possibly be achieved in the weak rural districts where the average attendance is less than 20 pupils, and as shown above in nearly 3,000 districts, less than 10. The ambitions and rivalries of the students—incentives to greater exertion on the part of the pupils—which prevailed thirty-five years ago in these country districts no longer exist. The school is lifeless, can not be graded, there is little enthusiasm among the students and that activity and earnestness which comes from numbers is entirely lacking. * * *

My attention has been called to many districts of the State that have maintained a teacher during the past school year by the State teachers' quota of $100 apportioned to each district maintaining a teacher for a period of thirty-two weeks, where there have been no students whatever in attendance. The property in that district thereby escapes all taxation for school purposes, while in the adjoining district property of the same valuation is sometimes very largely taxed to provide the school facilities, and the State aid to that school is diminished by the teachers' quota, which some inhabitants of an adjoining district simply absorb without rendering any service whatever to the wards of the State. If New York hopes to maintain her preeminence in educational matters, this wrong must be righted. In my judgment it can never be under the existing district system. I earnestly bespeak the careful consideration of this problem on the part of legislators and people interested in the school system of the State. Until relief shall have been obtained, however, by legislation in this direction, these districts should be consolidated with adjoining districts. I have caused to be prepared a bill, which has been presented to the legislature at its present session, greatly facilitating such consolidation, and also providing for the transportation of pupils where such consolidation will make necessary long distances to be traveled by the pupils. Should this proposition meet with legislative and executive approval, I look for a substantial improvement in the school facilities of many of our rural districts. This relief is but tentative, and the full measure of improvement to which the pupils of the rural districts, as well as the taxpayers therein, are entitled will only come by the adoption of some system of district representation other than that which now exists.

CARRYING PUPILS TO SCHOOL.

[Communication to the Wisconsin Journal of Education.]

Some time ago we gave an account of the experiment at Concord, Mass., by which the country schools were abandoned and all the pupils carried to the village graded

school at a considerable saving of money and the advantage of having better schools for the country children and more months in the year. The plan has been adopted rapidly in Massachusetts in the last four years, and is now in use in more than half the towns. That State has the advantage of the town system of school government, which makes this method of bringing children to school instead of carrying the school to the children much easier to manage.

Now Ohio is following in the same line. Kingsville, in Ashtabula County, in the old Western Reserve, secured the necessary legislation to consolidate their subdistricts three years ago and carry the pupils to the center. The expense of schooling for pupils in the districts outside the center has been reduced from an average of $22.75 to an average of $12.25. Fewer teachers are employed and better salaries paid, and thus better teachers secured. More pupils attend school and they attend more regularly, and they have the advantage of larger classes and more time for each class. And there has been a saving in money to the taxpayers of more than $1,000 in the three years.

Madison, Lake County, has followed this example the present school year, and we take from the statement of the principal in the Ohio Educational Monthly some things of interest. He says:

"Fifty pupils from three adjoining subdistricts are conveyed in covered vehicles, or barges, at a total expense of $392 for the school year of nine months, three teams being required. All of the children are carried directly from their homes; none are compelled to walk any distance; the longest ride for any one is about 3½ miles. (This is an improvement on the Concord plan.)

"The job of carrying these pupils is let under a written contract, each contractor giving a bond of $100 for the faithful performance of his part of the contract.

"Following are some of the provisions of the contract:

"1. The contractor to furnish a covered conveyance which can be closed at the sides and ends as the weather requires, seats to extend lengthwise of the vehicle, with steps and a door at the rear end. There must be seating capacity sufficient to accommodate all of the pupils in the subdistrict without crowding.

"2. The contractor to furnish a good team, and robes sufficient to keep the children comfortable, and in very cold weather to heat the inside of the conveyance with soapstones or an oil stove.

"3. The team to be driven by the contractor or some trusty person of adult age who shall have control of the children, and be responsible for their conduct while they are in the conveyance, no profane or indecent language, quarreling, or improper conduct to be allowed therein.

"4. The conveyance to arrive at the schoolhouse not earlier than 8.30, nor later than 8.55 a. m., and to leave at 4.05 p. m.

"Following are some of the good results which I can already see in the new plan: (1) The pupils enjoy the advantages of that interest, enthusiasm, and confidence which numbers always bring; (2) pupils can be better classified and graded; (3) tardiness and irregular attendance are reduced to the minimum; (4) no quarreling, improper conduct, or improper language so common among children on their way to and from school; (5) no wet feet or wet clothing, nor colds resulting therefrom; (6) pupils have the advantage of better schoolrooms, better lighted, better heated, better ventilated; (7) this plan is sure to result in fewer and better teachers, better paid."

We have in Wisconsin an optional township law. This has been adopted only in the north and newly settled part of the State. It has not been popular in the older settled part of the State. But now let some town in Wisconsin try this plan of carrying the scholars to the school instead of the school to the scholars and show practically its advantages and it would be the strongest possible argument for a township system of school government. One public-spirited citizen in a town favorably located could work out this reform in his own town. Could not some one of our county superintendents inspire some school district officer to work up this plan for his own town?

CHAPTER XXXVI.

A CHECK LIST OF AMERICAN SUMMER SCHOOLS.[1]

I. POSITION AND OBJECTS.

The summer school is an American product and a mixture of two ideas. It stands as the nineteenth century form of the Greek games and represents also the mediæval desire to popularize knowledge. It was suggested largely by the camp meeting which is a sort of religious folkmote—a summer school of religion. It is a cross between the picnic and the lecture room, and in some places the former was made the more prominent of the two ideas.

The summer school is due in part to the fact that twenty years ago few had the idea of making themselves professional teachers; they were doing the work of a teacher as a stepping-stone to something else and all their spare time was used in preparation for their life work. Now teaching has become a life work and summer schools are used in preparation for it. Further, it is one of the results of the discovery that it is unnecessary to loiter away three months of the year, but that a considerable part of this time can be employed to advantage if accompanied with a change of environment and occupation. On this point writes Melvil Dewey, the apostle of the summer school: "Thousands testify after trial that the change of surroundings and occupation, the stimulus of congenial companions, interested in the same subjects, and the many provisions of our best summer schools for healthful recreation are better preparation for hard work the next year than a vacation spent in idleness. In brief, it is evident that the tendency is growing among teachers to congregate for a few weeks during the long vacation; our problem, therefore, is how to get the most good from these meetings."

On the other hand, the summer school has not had a road to travel that is entirely free from obstacles. Dr. W. B. Harlow, writing in The Academy (Syracuse) as early as 1886, introduces an article in opposition to the summer school with the quotation of a philosophic passage from Thoreau: "Sometimes in a summer morning I sat in my sunny doorway from sunrise till noon, wrapt in a reverie amid the pines and hickories and sumacs, in undisturbed solitude, while birds sang around or flitted noiselessly through the house; until by the sun falling in at my west window, or the noise of some traveler's wagon on the distant highway, I was reminded of the lapse of time. I grew, in those seasons, like corn in the night. They were not time subtracted from my life, but so much over and above my usual allowance." He continued by quoting Dr. Holmes: "All lecturers, all professors, all schoolmasters have ruts and grooves in their minds into which their conversations is perpetually sliding," and with these quotations as a preface Dr. Harlow emphasizes his own fear of the narrowing influence of the summer school by exclaiming: "It is from these ruts that our summer vacations may happily deliver us. During these times of recreation the companionship of others of our own profession may be agreeable; but if this results in so narrowing our lives that no other topic but school can awaken our enthusiasm, let us for two months at least flee from one another as if we were in danger of catching the plague," and continues by asking the question if the majority of "true teachers, after ten months of faithful labor in crowded rooms," are in a "fit condition to spend their vacation in brain work?"

A milder note of objection comes from Anna McClure Sholl, in The Bachelor of Arts, who enters a protest to one phase of the movement by contrasting the propagandism of university extension and the summer school with the usual conservatism of educational institutions; it used to be that the man sought the school, now the school seeks the man and like a real chapman takes to the road with its wares.

While the summer school is not an old institution it is one which has already outgrown its name. The term is now used to denote that large and increasing number

[1] Prepared by Dr. Stephen B. Weeks.

of schools which avail themselves of the comparative leisure that is offered by the summer vacation of teachers to emphasize methods of teaching or advanced instruction along particular or special lines. The idea of the summer school was at first to give normal instruction, or to make investigations into one subject only, but the movement is now developing into a general summer course, while some institutions, like the University of Chicago, the Michigan Mining School, and the Michigan Agricultural College, throw open their doors to a regular summer session, which they treat in all respects just as they do any other session of the school year.

The summer school has outgrown its original idea in another direction. It is now no longer a summer school, but a winter school as well. As the summer was originally chosen because of its comparative freedom and the greater suitability of climate in the Middle and Northern States, so the idea has been reversed in the extreme South and we have the Florida Chautauqua held at De Funiak Springs in February and March, and the Catholic Winter School of America, which held its first session in New Orleans February 16 to March 14, 1896, and was a financial success.

The length of the term varies in different schools from a few days to three months. The tendency to increase the length of time and make use of as much of the vacation as possible is increasing and there has been a material change in the character of the courses offered. At first it was the custom to give many short courses, or single lectures. It is now the custom to make the courses of lectures as continuous and connected as possible. The summer school has come down to business rather than pleasure.

Summer schools may be divided roughly into the following classes according to the phases of education which they emphasize particularly: (1) Schools that teach special branches of knowledge, as ancient and modern languages, literature, psychology, natural sciences, law, medicine; (2) schools of the arts, as drawing, industrial art, music, oratory, etc.; (3) professional, normal, or schools of methods where the training of teachers is the main idea—summer schools of pedagogy; (4) general, where all or nearly all the subjects in the general curriculum of education are treated; (5) Chautauqua, where the idea of study is united with that of rest and recreation and where the Chautauqua course of reading (C. L. S. C.) is made the basis of the educational work.

Again, from the standpoint of control they may be divided into several classes: (1) Private, which range in scope from a school devoting itself to preparing students for college or to making up the deficiencies of common school teachers, to a private school of chemistry, law, or Bible study; (2) college or university, which are usually more general in character; (3) State, which are generally devoted to the training of teachers, are more or less local and even migratory in character.

In the matter of fees they range all the way from the private with fees sufficient to support the school to the public State schools which are free. As a rule they are not self supporting.

In the matter of location, a change of environment is needed first of all. Consideration must be taken of the (1) available educational plant, and (2) the advantages of the environment of the locality chosen. Much depends on the contagious inspiration of large numbers with common sympathies. The location should possess several attractions; beauty, healthfulness, etc., are attractions, but many places other than summer resorts should be and are chosen. The value of life for two months to a country teacher in New York City in the environs of an institution like Columbia College are very great, while the advantages of life in the country to a city teacher are equally as great.

The summer school in modified forms now exists also in England, Canada, Scotland, Germany, Wales, Switzerland, France, Sweden, Turkey, and in Japan, where a summer school for Bible study and conference of Christian workers, modeled on the Northfield Conference, was held at Doshisha in 1887, and was transferred the next year to Hakone, where it had soon 200 students and lasted twelve days.

II. THE FIRST SUMMER SCHOOLS.

Harvard College seems to have been the first to recognize that colleges and universities were under obligations to students whose circumstances prevented them from attending the regular courses. In 1863 university lectures were given on Saturdays at Cambridge for the special benefit of teachers in the secondary schools. At a later date these lectures were abandoned.

A few years later, 1869, a dozen professors and students, chiefly from the scientific schools of Harvard University, made a trip to Colorado, where scientific results of considerable value were obtained. During the next four years parties of students under Professor Marsh and other Yale professors made several expeditions to the Rocky Mountains. They secured a large and valuable collection of geologic and mineralogical specimens which are now deposited in the Museum of Natural History in New Haven. Professor Orton, of Vassar, was also accustomed to spend a few

weeks with his students during the spring or summer vacation in the coal regions of Pennsylvania, in the Helderburg Mountains of New York, or in other regions of geological interest. These excursions served the purposes of instruction, but they were hardly schools; they were rather gatherings of special investigators than of students.

The first idea of a permanent summer school can probably be ascribed to Prof. N. S. Shaler, who first suggested to his colleague, Prof. Louis Agassiz, the establishment and maintenance during the summer of a seaside laboratory at Nantucket for the benefit both of university students and of teachers of science in secondary schools. The outcome of this suggestion was the establishment of the Zoological Laboratory, known as the Anderson School, on Penikese Island. Professor Agassiz, in a prospectus issued December 14, 1872, outlined the "programme of a course of instruction in natural history to be delivered by the seaside in Nantucket during the summer months, chiefly designed for teachers who propose to introduce the study into their schools, and for students preparing to become teachers." Financial difficulties threatened at first to overwhelm the school, but it was relieved by the generosity of John Anderson, of New York, who was attracted by the efforts of Professor Agassiz and offered as a station for the school Penikese Island, in Buzzards Bay, 25 miles southeast of Newport, R. I. The island was admirably adapted to the work, and this gift was soon supplemented by an endowment fund of $50,000 from Mr. Anderson. Another friend presented a yacht for collecting and other purposes. A building was erected with accommodations, including 58 lodging rooms. The school was opened July 8, 1873, and there were 43 students that year. In December, 1873, Professor Agassiz died. The work was conducted the next year by his son, Prof. Alexander Agassiz, and 46 students attended; but the school did not meet with sufficient support and the project was given up.

From this summer school of biology have grown a large and increasing number of schools, devoted to original research, just as in Europe seaside schools and laboratories may be traced to the influence of the International Marine Laboratory at Naples.

The most direct successor to the Penikese laboratory was the private laboratory of Prof. Alexander Agassiz established at Newport in 1877. In 1876 a summer school of biology was established at Salem, Mass., by the Peabody Academy of Sciences, but was discontinued in 1881. Then followed the Chesapeake Zoological Laboratory of the Johns Hopkins University in 1878 and one was opened at Annisquam, Mass., in 1881.

The influence of the work of Professor Agassiz soon began to make itself felt in other lines of study also. In 1874 Prof. Asa Gray, of Harvard, organized a summer school of botany to meet the same conditions and accommodate a similar class of students as the Penikese School. It was successful and has been continued since. The Kirkland School of Cleveland, Ohio, under Professor Comstock, of Cornell, attracted attention in 1875, but had no other session. Butler University, Indiana, conducted a successful migratory school through the mountains of Kentucky, Tennessee, North Carolina, South Carolina, and Georgia, during the summer of 1877. It was under the direction of Professors Jordan and Brayton and obtained valuable scientific results. Other early summer schools were the Bowdoin College summer school of botany, chemistry, and mineralogy, begun and continued for six weeks in 1876; Cornell summer school of zoology, 1876; the summer school of drawing, conducted by Walter Smith in Boston in 1875; the normal institute of drawing and painting of Syracuse University in 1876, and the Concord summer school of philosophy and literature (1879–1888). The Sauveur Summer College of Languages, first established and opened at Plymouth, N. H., in 1876, by Dr. L. Sauveur, is the oldest school of its class; from 1877 to 1883 the college was at Amherst, Mass. Dr. Sauveur then retired and in 1884 reopened his school in Burlington, Vt. It had a peripatetic existence and in 1894 was again united with the Amherst Summer School of Languages, which had been founded in 1877 by Dr. Sauveur, and the first joint session was held in 1895.

In the Southern States the pioneer was probably the University of Virginia, which began with a law school in 1870. Summer normals for the training of teachers were held at the University of North Carolina as early as 1877.

The mother of another class of institutions that cover the Union like a net work and stimulate summer schools proper was Chautauqua, founded in southwestern New York in 1874. It grew out of a Sunday school assembly. Chautauqua assembly itself was organized in 1874; the Chautauqua Literary and Scientific Circle (C. L. S. C.) in 1878; the summer college in 1879; the correspondence college in 1885. There are now some 59 summer assemblies on the pattern of Chautauqua in the United States. The summer meetings of Oxford and Cambridge are based on the same model—and there are reading circles in England, Russia, Japan, and Australia. It has also been imitated in America by the organization of the Catholic Summer School at Plattsburg, of which the first session was held in 1892, and by the modification of the Chautauqua Literary and Scientific Circle course to meet

the needs of Jewish readers, known as the Department of Jewish Studies. The history of Chautauqua, written with detail by Prof. Herbert B. Adams, will be found in another part of the present report.

But Chautauqua looked toward general culture, not special training. The Martha's Vineyard Summer Institute stands for the idea of the special training of teachers. This school started in the summer of 1878. Its originator and first president was Col. Homer B. Sprague, Ph. D., who first selected the place, interested others in the scheme, put the plan into operation, and got the school incorporated under the laws of Massachusetts. Another school of this class is the National Summer School of Methods, located at Glens Falls, N. Y., which grew out of the union of four schools, the National School of Methods, the school organized four years later at Round Lake, N. Y., the Glens Falls Training School, and the Niagara Falls School.

To these schools, in which the idea of pedagogical training or of special courses is predominant, must be added another class, which emphasize the idea of general training, counting in some cases toward a college degree. Professor Agassiz began the experiment at Harvard in the summer of 1869 with a geological school taught in part in Cambridge and in part in western Massachusetts. From that time summer instruction in geology, designed especially to acquaint teachers with methods of instruction to be followed in the field, has been continued to the present time, one of the most successful of its early sessions being that of 1875, which was held at Cumberland Gap. During the summer of 1896 courses will be given at Harvard as follows: 5 in English, 2 each in German and French, 1 in general American history, 1 in education and teaching, 1 in methods of teaching geometry and algebra, 3 in mathematics, 3 in engineering, 1 in freehand drawing, 1 in physics, 4 in chemistry, 1 in botany, 5 in geology, 1 in physiology and hygiene for teachers, 2 in physical training, together with courses at the medical school and dental school. Women are admitted to most of these courses, and it seems probable that their ultimate admission to American colleges on the same terms as men will be brought about through the summer school. The Harvard courses "are adapted to the needs of those who intend to be teachers in the several subjects. Several of the more elementary, however, are intended to meet the needs of beginners, and may be taken by students in lieu of the corresponding courses in the college and the Lawrence Scientific School, and may be counted toward a degree."

As has been remarked already, some institutions, like the University of Chicago, make no distinction between different parts of the year, and provide for a regular summer quarter.

CHAPTER XXXVII.

ORIGINAL ESTABLISHMENT OF STATE SCHOOL FUNDS.

By Rev. A. D. Mayo, M. A., LL. D.

In a former essay, in the Report of the United States Commissioner of Education for 1893–94, we sketched the rise and progress of the educational ideas and practices of the original thirteen American colonies from their settlement to the formation of the Government of the United States, 1790. We now come upon a period of American educational history equally important—the era of conflict for the supremacy of the common-school idea, during the first half century of the Republic, 1790–1840.

At the beginning of the present century every fundamental idea of popular education now in practical operation in the United States had been formulated in a manner sufficiently intelligible, with a hearing sufficiently extensive, to make it the common property of the educational public of the country. In the New England colonies, from the first, the basal idea of the American common school, that the people may educate all children through the agency of the State and local governments for American citizenship, had been adopted and put in general operation as far as private circumstances and the condition of public affairs would permit. In the central and southern colonies, owing to various peculiarities in their condition, this method of educating the children and youth had not been in favor. But even in the least favorable of these colonies we have seen that the same ideal was cherished. Especially were the foremost statesmen of Virginia and the famous men of the central colonies, like Benjamin Franklin, Dr. Richard Rush, and others of national renown, fully committed to this policy. So powerful had this impulse for universal education become that even before the organization of the National Government the Congress of the Confederation, by the unanimous vote of all States in attendance in 1787, had placed in the ordinance for the settlement of the Northwest Territory the provision for the setting apart of the sixteenth section of each township for public schools and of two entire townships of each new State for a university. By this memorable act the new Republic put on record its approval of the American idea of the support of education by the State, in all its departments, from the district school of the open country to the State university.

This idea, the contribution of the New England colonies to the new Republic, fixed in the great ordinance of 1787 by the insistence of New England men, was demanded by the original settlers of the Ohio purchase and destined thenceforth, like every original and characteristic principle of our American order of society and government at every period of the national development to appear with new vigor until it has become to-day the prevailing system of universal education in every State and Territory of the Union.

But all experience in popular government demonstrates that while it is one thing to formulate a splendid ideal in the conviction of the foremost minds, and even to incorporate it in the constitution and statute law of States and in the practical policy of the nation, it is quite another thing to place on the ground a vigorous and successful application of the same that shall actually perform what has been promised and realize even a moderate expectation of favorable results. More than half a

century ago Sir Bulwer Lytton, then a student in the university, commenting on the movement for public education at that time awakening attention in England, pointed out the fatal weakness of any general system of training the children of the British masses while the parents remained in their present state of ignorance and indifference. Even more essential is it in a country where all legislation is but the record of the people's will, and where every effective statute must represent the absolute determination of the majority of average voters, that the people, by an effective and permanent majority shall stand behind any successful scheme of popular education. It is impossible for the local, State, or National Government by any agency at its command to do more than put on the statute book fit laws and enforce them as far as popular opinion will permit.

Thus we shall see that the second period in the history of the American common school, now to be considered, the first half century of the Republic from 1790 to 1840, is a pertinent commentary on this fundamental condition of all representative government. Even in the educationally most favored portion of the Union—New England—where the people for one hundred and fifty years had been accustomed to the earlier phases of the common school, we shall see how slowly the ideal was realized and through what dreary years of open opposition, partial obstruction, and feeble maladministration from unfavorable or indifferent public sentiment the good work dragged on, even till the great rousing word of Horace Mann, like the "voice of one crying in the wilderness," challenged the New England people of all sorts and conditions to repent of their educational shiftlessness.

Violent conflicts mark the progress of the common school idea in the central section of the Union. Up to the close of this half century none of these important Commonwealths had a public school system satisfactory to any competent observer. The thirteen Southern, even the seven new Southwestern States, were compelled to wait through yet another long generation in that destitution of free public education which was their chief disability up to the close of the civil war. And the history of the new Northwest, so favored as the first recipient of the munificent national donations of public lands for popular education, not only bears testimony to the fact that the intense and persistent interest of the people is the breath of life to the people's common school, but also that no endowment of education, however bountiful by State or nation, can be relied on to support an effective system of universal education unless reinforced by vastly greater sums of money persistently voted and wisely applied by local communities that represent the unconquerable determination of a large working majority of the citizens.

The opening half century of the Republic was memorable in many ways as a period of amazing growth in all things affecting the material welfare of the people and the development of national stability and renown. In these fifty years the area of the Union had been extended by the purchase of Louisiana from 800,000 in 1783 to 2,000,000 square miles in 1819, five times the area of the original thirteen inhabited colonies, equal to 158 States as large as Massachusetts. Thirteen new States had been added to the national fold. Before 1830 the population of the country had tripled and in 1840 was 17,000,000. The four new States of the Northwest had already gathered a population of 3,000,000, almost equal to the human outfit with which the original thirteen colonies inaugurated the perilous experiment of tearing themselves away from the most powerful empire on the globe. There seem to be no reliable statistics of the property valuation of the nation at the close of these eventful fifty years, but it must have been in due proportion to the increasing extent, resources, and population of the country.

The great forward movement in new methods of labor and transportation, the child of the most marvelous revolution in modern history, the advent of labor-saving machinery, which has changed all the conditions of human existence in civilized lands within the past seventy-five years more than all the wars and legislation of the past five centuries, had been felt as an electric thrill in every portion of the Union. By 1840 there were 25 canals in operation, with 1,600 miles of waterway,

and more than 1,000 miles of railroad. Steam navigation had already peopled the vast world of the western American lakes and rivers by means of what the spectators of the first voyage of Robert Fulton's steamboat up the Hudson River pronounced "the wildest of all wild fowl." The invention of the cotton gin had fixed the destiny of the Southern States as slave territory for half a century. The growth of the manufacturing interest in the North had already predicted the impending conflict for the separation of the Union on the lines of the industrial protective policy. The second war against Great Britain and the close of the interminable skirmish with the Indian tribes had given peace and stability to the whole country east of the Mississippi. Yet still, with a population so largely hugging the seaboard, with the Atlantic States only partially occupied from a point some 200 miles west of the ocean, and with two-thirds the area of the occupied country so sparsely populated that, in comparison with the old world, the United States was still a straggling line of settlements in a boundless wilderness, it is easy to realize the obstacles to the establishment of any general system of education for the masses of young America.

ORIGINAL ESTABLISHMENT OF STATE SCHOOL FUNDS.

Yet, amid all the interruptions and discomforts of these turbulent first years of the Republic, the determination of the people to educate the coming generation for the great position of the new American citizenship was neither dead nor sleeping. Especially in all the Northern States, not only in the original seven, but in the six that had come into existence since the organization of the National Government, was this determination more plainly manifested with every decade. It is one of the most notable characteristics of an Anglo-Saxon people, at once after the primary question of the classes versus the masses has been disposed of, to begin that gradual, persistent, and irresistible march to the front for the security of every essential element of free institutions, which never fails of victory in the fullness of time.

In the Southern States of the Union, as we shall see, the purpose to inaugurate the coming American system of universal education was never absent from the mind and heart of its great statesmen; not one of the first class having been found in active opposition to the good schooling of the white children and youth. And, despite the persistent opposition to public education from social, ecclesiastical, personal, and political quarters, each of these States made the effort to lay up a permanent fund for education, and all at different times moved in the direction of the establishment of a general system of schools.

The little State of Delaware, between 1796 and 1837, had gotten together a school fund of $150,000 from bank stocks and the bonds of the State. We have already put on record the great service rendered to the whole country by the State of Maryland in the continuation of a movement inaugurated by Delaware, virtually compelling the consideration and final settlement of the disposition of the national domain in the Northwest, whereby all the States beyond the Alleghanies have been the recipients of increasing millions for the schooling of the children. This was a service not yet acknowledged by any sufficient recognition from Congress of the claims of the original thirteen States which won the independence and laid the broad foundations of the Union.

Although Virginia did not respond to the appeal of her great educational statesman, Jefferson, backed by the influence of every public man of the first order in the Old Dominion, for a complete system of common schools, yet in 1810 the literary fund was instituted which in 1812 amounted to $2,000,000.

In 1811 South Carolina, and North Carolina in 1825, made the same application of public funds, like Virginia, chiefly in the direction of the "free school" for the poorer class of white children and youth, or for their schooling by the subsidizing of private and denominational seminaries. One of the first acts of public policy in Georgia was setting apart a generous quantity of public lands, chiefly in local appropriations, for the only sort of schools then in vogue—academical and collegiate

establishments. Alabama, Mississippi, Louisiana, Missouri, and Arkansas shared in the national bounty inaugurated at the admission of Ohio to the Union in 1803, although in some of these States from various causes little is now left of all received in this way. In 1806 Congress gave to Tennessee 100,000 acres of land for every college, and similar appropriations for academies. The State received also one thirty-sixth of its remaining unoccupied territory for common schools. A large proportion of this went the way of a great deal of this early appropriation of the national drug, the wild lands of the far West and Southwest. The present school fund of this State was a later arrangement. Kentucky and Louisiana made large grants in 1821 for education; one-half the net profits of the Bank of the Commonwealth in Kentucky was appropriated as a literary fund for common schools. Later, in 1847, 800,000 acres of land, at that time a valuable investment, were voted by Louisiana for common schools.

But it was especially in the thirteen Northern States that this preliminary action of collecting funds for the permanent support of common schools was pushed with a will and a watchful care that was prophetic of great things to come.

As early as 1733 the Province of Connecticut had moved in this direction; and the first substantial fruit of the ordinance of 1787, which set apart a generous domain in northeastern Ohio almost as extensive as the home State, and known as the "Connecticut Reserve," was the dedication of the major part of the avails of that territory to education, making the common-school fund of Connecticut at least $1,000,000 in 1795.

In 1786 the State of New York set apart two lots in each township of its extensive tract of unoccupied lands for "gospel and school purposes," and in 1801 the net proceeds of half a million acres of vacant and unappropriated lands were turned into a permanent school fund of the State.

In 1821 New Hampshire placed a one-half per cent tax on all bank capital in the State as a fund for the support of common schools. Immediately after the accession of Maine to the Union, in 1821, that State appropriated the proceeds of twenty townships of public land for education.

In 1820 New Jersey laid the foundations of her present school fund in bank stock and the funded debt of the State. The States of Rhode Island, Pennsylvania, and Vermont relied on annual or occasional appropriations from the legislature to meet the exigencies of public instruction.

The State of Massachusetts, although foremost among the colonies in the movement for education, and to-day not behind any State of the Union in this respect, has never been an earnest advocate for the establishment of a large school fund, and only within the past six years has imposed a State tax for education. Her common-school fund of $3,870,548 is a comparatively late arrangement, its foundations having been laid in the appropriation of the vacant lands of the Province of Maine. Its income of $172,179 is about equally divided between the support of half a dozen normal schools, the salaries of the secretary and agents of the State board of education, and certain of the smaller towns. Of the $10,661,356 appropriated for the common schooling of her 412,593 children, an average of $31.20 for each child in 1894–95, all, save perhaps a quarter of a million, was raised by direct taxation and appropriation by the people in the 353 towns and cities of the Commonwealth. We believe this notable example of the yearly consecration of vast sums to this sacred use will more and more become a fruitful example for all the States.

In the year 1890–91, of the entire sum yearly appropriated for common-school education in the United States, but 5.6 per cent was drawn from the income of permanent invested funds; of the remainder, 18.7 from State, 67.8 from local taxation, and 7.9 per cent from other sources; Texas being the most indebted to invested land funds, 44.3 per cent.

Another favorite method of raising money for educational and religious uses in the earlier days of the Republic was the lottery. In the light of the recent violent conflict which has resulted in the overturning of the gigantic lottery system of

Louisiana, which threatened to bring more than one American Commonwealth into humiliating subjection to an unscrupulous and destructive corporation, it is significant that many of the original American colleges, including Harvard, Columbia, Williams, and numbers less celebrated, besides churches and benevolent organizations without number, were the favored recipients of this questionable source of revenue. The regents of the University of the State of New York, the original State board of education, projected a scheme by which one-fourth the avails of four lotteries were applied to academies and common schools. Union College, New York, with others, received aid in this way. The original movement for the establishment of the famous University of Michigan had resort to the same method of raising funds. In the same way the original seminaries of Georgia; William and Mary College, Virginia; and Brown University, Rhode Island, were among the number of the elect of fortune. Perhaps the last of these schemes was the lottery for the establishment of a public library in the city of Louisville, Ky., within the memory of the present generation.

It should be said that the moral and financial disapproval of the entire system of lotteries, outside the charmed circle of the "grab-bag" of the church fair and the devices of the ladies' benevolent society, is a development of the last fifty years in our country and that still, through half the civilized nations, this is regarded a perfectly legitimate means of replenishing the depleted treasury of the most sacred organization and the holiest of philanthropic and religious agencies.

The total amount of public lands dedicated to education during the first century from the breaking out of the war of independence, 1776–1876, was 80,000,000 acres with 60,000,000 acres additional swamp lands; 160,000,000 acres, with additional grants; in all 250,000 square miles; ten times the area of New York, equal to the entire area of Texas, twice the area of Great Britain and Ireland, and the full size of France; constituting 80 per cent of the $129,000,000 of the present State funds for common-school, university, and industrial education. Of this vast sum, until 1862, when the appropriation for agricultural and mechanical colleges included all the States, the old colonies, which ceded their original claims to the great Northwest and whose treasure and blood largely contributed to the gain of the imperial territory beyond the Mississippi, had received no gift of national lands. Since the admission of Oregon to the Union, in 1848, all the new States have received two sections of each township, the sixteenth and thirty-sixth. Several of the States beyond the Alleghanies by the careful administration of this magnificent gift of the people have accumulated large, permanent funds for education: Illinois, $12,000,000; Missouri, $10,000,000; Indiana, $9,000,000; Minnesota, $6,000,000; Nebraska, $5,000,000; Iowa, $4,000,000. But these figures are only a tentative estimate of the present value of these school lands, which are constantly appreciating. Most bountiful of all endowments for the children is the immense landed property of the State of Texas, made by the Republic and retained by the State on its admission to the Union. From this an annual income of $3,000,000 is now derived, and by fair management it may yet be relied on to educate the children of the State. Several of the larger Western cities have wasted a fund that, properly administered, would have educated their people; even the remainder constitutes an important source of income. In the appendix to this essay a table will be found containing all the information accessible concerning the amounts of land and money received by the various States for the schooling of the children.

Before 1841 sixteen States had received additional gifts of 500,000 acres of land each; an aggregate of $3,000,000 of their school funds for special purposes. Between 1849 and 1860 thirteen States received 62,429,000 acres of swamp lands appropriated to school uses. At one time from 3 to 5 per cent of the net proceeds from the sale of public lands were turned into the State treasuries. In 1818 one-sixth of similar income was given for universities, amounting to $1,000,000. Besides this, saline lands, public properties of large value, and, directly and indirectly, other large sums have been donated by the National Government, almost exclusively to the States

admitted since the provision of the Republic for schools. The ordinary estimates of these values give little idea of the present amount thus appropriated of the "treasure laid up in Heaven" for this sacred use too often, like other sacred deposits, ruthlessly broken into and despoiled.

In 1836 the Government of the United States distributed $42,000,000 as "surplus revenue" among the 26 States then existing. Of these States 16, in part or wholly, appropriated their portion to the establishment or increase of their school fund; 8 the entire sum, $10,000,000; 8 only in part; several gave nothing.

Within the last thirty years, beginning with 1862, the Government of the United States has distributed 9,600,000 acres of public domain to all the States for the encouragement of agricultural and mechanical education, and, with a few exceptions, this bounty has been well applied. The recent failure of the noble and statesmanlike Blair bill for the distribution of $70,000,000 to all the States for the overcoming of illiteracy, especially in the South, was much regretted by the most thoughtful friends of popular education in all sections of the country.

We have thus introduced this brief account of the establishment of permanent funds for the support of common schools at the beginning of our review of this period, particularly to direct attention to the fact that the only permanent and reliable method of support for universal education is the habit of yearly local appropriation from public taxation. Even in the States most favored in this respect, the income from this source would only put on the ground a feeble and intermittent system of public instruction. Instead of the $150,000,000 now appropriated in the country for the American common school, only $10,000,000 would be available as the income of permanent funds to-day—only equal to the sum the one State of Massachusetts now invests in the public education of her 412,000 children and youth.

We shall certainly fail to grasp the true genius and history of the American common school until we realize that by no feat of legislation, by no dispensation of skilled supervision, by no combination of the numerous devices that fill the pages of our educational journals and absorb the attention of so many "eminent educators" is this Republic to be saved from the curse of illiteracy, that working together for evil of all the forces of ignorance, superstition, shiftlessness, vulgarity, and vice which underlies the more superficial ailments of the body politic. From the first day of the least colony to the memorial year of this mighty nationality this work of training the coming generations for good manhood, good womanhood, and worthy citizenship has gone forward or fallen behind in proportion to the obstinate and continuous zeal of a reliable working majority of the people and their willingness to be taxed beyond all other purposes for this, the one abiding interest of a democratic State.

Still, this early American habit of "laying up against a rainy day" in the establishment of these school funds, and the persistent practice of the State governments in the same direction, are most conclusive proofs of that original interest in the education of the whole people, the final outcome of which is the present vast organization we call the American common school. A favorite device of all the open or secret enemies of this fundamental American institution, never so essential to our national existence and true glory as to-day, is the pretence that our present system of universal education is the fruit of private, corporate, ecclesiastic, or scholastic zeal, and, like all similar structures, may be changed or abolished at the will of its creators. But the American common school, like the American nationality and order of society, is a most characteristic creation of the whole people. Like all other characteristic productions of the national genius and experience, it has been a gradual growth, subject to great variations, exalted or depressed at the full or ebb tide of public opinion.

And one of the most convincing proofs of this fact is the way in which the people of the United States, during the first thirty years after the formation of the Union, when they numbered less than 10,000,000 responsible white people; in the poverty

that included the whole country for years after the exhausting struggle for independence; during the stormy first quarter of a century, when the government and people were deeply agitated by the French Revolution and worried by British aggression, culminating in the war of 1812; while the emigrants to the new portion of the country in the West were still cultivating their fields and worshiping God with one hand on the rifle and one eye on the track of the treacherous savage; when the whole population of the Union was scattered through a territory almost as large as that occupied by the swarming millions of Europe, and hindered by laborious methods of transportation from social intercourse and industrial cooperation; went steadily to work to lay up a treasure in the strong box of almost every State against the time when they could do more than at present for the schooling of the children. There is a moral sublimity, not only in the devotion of the great men of every State, but in the persistent effort of thousands of little poverty-stricken communities, to push this one interest amid all the distractions of rival claims. It will be well to keep in view, at every subsequent step of our reading of this "great and wondrous story," this original gathering of public opinion in a current steadily increasing in power and volume, just as the majestic career of the "Father of Waters" may be predicted by one who sits on its wooded shores up in the wilderness of the mysterious borderland out of which it issues, gathering breadth and depth and majesty at every mile of its resistless journey downward to the sea.

CHAPTER XXXVIII.

EDUCATION IN THE NORTHWEST DURING THE FIRST HALF CENTURY OF THE REPUBLIC, 1790–1840.

By Rev. A. D. Mayo, A. M., LL. D.

We are now prepared to begin a more detailed examination of different portions of the Union in their dealing with education during the first half century of the Republic. And by far the most interesting portion of the new nationality in this respect is the new Northwest. For here, at the earliest period, we find illustrated the facts we have already noted: (1) That only by the intense and persistent purpose of a whole people and its willingness to make a yearly sacrifice for the children can the American common school ever be placed on its feet, much less nursed up to its full stature. (2) We shall see how, even during their earliest years, the four Northwestern Commonwealths that had been admitted to the Union before 1840 were developing certain advanced ideas and broad methods of dealing with the entire subject of universal education which have become more powerful with the passing years, and, at present, are felt as one of the most decided modifying influences in the school systems of all the original States.

But we shall do great injustice to the people of these settlements in the boundless wilderness of the Northwest of 1790 if we estimate their progress in the establishment of an effective system of popular education by reference to the condition of the same communities within the period of the memorable era since 1860. The close of the civil war in 1865 left the group of Northwestern States by far the most conspicuous figure in the reconstructed Union. They had furnished nearly 1,000,000 soldiers, one-third the entire body of the Grand Army of the Republic. Their foremost military commanders had steadily gained the confidence of the people during these critical years, and the three who, in succession, held the supreme position in the national Army were natives of Ohio. With the exception of two Vice-Presidents called to the Chief Magistracy of the Republic by the providence of God and one President afterwards elected, the Presidency of the United States from 1860 to 1892 has remained in the narrow circle of the three Northwestern States first admitted to the Union. It was well-nigh impossible for the elderly Eastern visitor to the city of Chicago in the late memorial year to place himself back in the period of his own boyhood when the New England family was stowed away in the old-time emigrant wagon and the interminable journey "out West" began with a religious service in the old church, and home and neighborhood prayers and tears mingled with the "great expectations" and aspirations of its occupants. But if we can briefly run over some of the more evident obstacles to the establishment of a satisfactory arrangement of the general educational training of the children during the first thirty years after the settlement of Ohio, in the four States that then constituted the Northwest, we may better appreciate what was really accomplished against obstacles almost insurmountable.

1. First must be considered the original movement of the rival ecclesiastical forces of the old East to capture this new "land of promise" and preempt, especially, the

secondary and collegiate departments of the educational field as the most efficient agency of denominational religious propagandism. It is not just to impute to the leaders of this movement any save the highest motives, from their own point of view, in their attempt to cover the new country with their churches and schools, which would become the most important annex to the religious establishment.

We have already seen that the unanimity of theological belief and ecclesiastical polity, until the period of the Revolution, was one of the most favorable elements in the establishment of the common school system of the original Eastern States; since the "religious question," which is largely the question to what extent each religious body shall be able to use education as a factor in its own upbuilding, was thereby entirely eliminated. We have also seen how the diversity of religious sects in the Central and Southern Provinces made the establishment of anything like a satisfactory public educational system impossible, until many years after the formation of the United States Government. But the war for independence, like all similar upheavals of society, had, for the first time, introduced into New England the seeds of theological dissent and sharp ecclesiastical competition. At once, from all the older States east of the Alleghanies, the different religious bodies and the active apostles of what was then called "infidelity," made haste to take possession of the promised land. The result was that before the school lands could be made to yield an income sufficient for even a meager common school, the country had been occupied by private denominational and so-called "collegiate" seminaries, chiefly available for the families of the more prosperous sort.

2. This enterprise wrought along the lines of the social currents that were formed in these States at the very beginning of their existence. Although the mutual companionship of hardship and peril in a new country favored a certain democracy in public affairs, yet nowhere are the social lines more strictly drawn than in the original occupation of such a region as our new Northwest. New England was by no means a social democracy at the close of the war of the Revolution; and there were families and families among the emigrants from Massachusetts and Connecticut in the little society that was represented at the first "ball" in Marietta, Ohio, where fifteen ladies, "as conspicuous for politeness as elsewhere," appeared as the original "upper ten" of the Buckeye State.

But after the first spirt of emigration, largely from the soldier class of the East, the majority of the emigrants for an entire generation were from the Southern and Central States, where social discrimination was even more strongly marked. The bulk of the population of the Northwest, for the first twenty-five years, was strung along the 450 miles of the northern shore of the Ohio River. Of the 47 members of the convention that framed the constitution of Ohio, 16 were from Pennsylvania, Virginia, and Kentucky, 9 from New York and New Jersey, and only 8 from New England. There was less enthusiasm for the new Western life in the New England than in the Southern and Central States. Both Massachusetts and New York had large tracts of land on sale, and were in no haste to build up rival Commonwealths beyond the mountains. Until a generation later, when the growing tide of New England emigration was propelled through the new Erie Canal and the Lakes to the Northern section, the new West was largely a new South, Pennsylvania, and New Jersey. The people who came from this portion of the Union were unaccustomed to the common school and naturally fell into the home ways of educating the children according to the methods in vogue from the beginning in their own colonies.

3. The extreme poverty of the people, for all purposes save the actual supply of the necessaries of life, was a powerful obstacle to the early establishment of public schools. The New England contingent, respectable and progressive in ideas as it might be, was largely composed of families, left at the close of the war in absolute necessity of some "paying" occupation, with no resources save the indefinite land bounties and "certificates of indebtedness" issued by a Government representing an impecunious new Republic; a 20-shilling certificate not being equal to 5 shillings of available currency for actual use. Their one hope was to realize from this almost

hopeless source of support a new home in the far West. And, while the fruitful lands and genial climate of their new abode were an assurance against starvation, the history of the settlement of any American State, previous to the last fifty years, is a record of hardship, poverty, sacrifice, trial, fearful sickness and death, only paralleled by the waste of war. Amid these trials it is not strange that, outside a few village settlements, it was next to impossible to support the common school for all.

4. Even the possession of a generous endowment of school lands at first was little more than a prophecy of hope for an indefinite future. These public school lands were at first leased at low rates, especially in Ohio, were slowly taken up, and from lack of experience in such operations, often sacrificed. In time the generous provision of two townships for the support of a university was lost, except the saving of the meager income of a few thousand dollars a year; and the greatest of the Western Commonwealths was compelled to wait another half century before its final State university could be established. Col. Rufus Putnam, of Marietta, Ohio, informs Dr. Manasseh Cutler, of Massachusetts, at an early period of the settlement, that the entire resources of the common-school lands were but $3,000, and Dr. Cutler, as agent for the Ohio company, sends on a few hundred dollars to pay the first minister and teacher of the new colony. Ohio has never reaped any advantage from her educational fund of school lands comparable with the remaining four States of the original group of the Northwest.

5. Until the close of the second war with Great Britain, in 1815, these States were terribly worried by the peril from hostile Indians. This was only overcome by the decisive victory at the battle of the Thames, and the destruction of British influence through the entire region. Previous to the purchase of Louisiana there was the constant danger, emphasized by Washington and felt by all well-informed public men, of a revolt of the entire Western section, and the establishment of a rival government to the United States. One of the urgent reasons for the sale of the great track of land to the Ohio company, repeatedly enforced on public attention, was the advantage of sending to the banks of the Ohio a colony of ex-Revolutionary soldiers, under their honored commanders, of undoubted patriotism, knowing no other country than that for which they had given their past eight years of service to preserve and defend as a heritage. There can be little doubt that Virginia and the South were reconciled to the prohibition of slavery in these five new States, by the hope of protection for their settlements on their exposed northwestern border, as well as by the expectation of trade through the proposed channels of interior commerce suggested by Washington. This chronic state of border conflict was followed by the breaking out of the war of 1812, in which the entire territory of Michigan and the whole northern frontier, were for a time in the possession of the common enemy. Notably, the first twenty-five years of the Northwest was a period of "wars and rumors of wars," in all ages unfavorable to the organization of any save the few superior schools which are always established where a body of educated and well-to-do people is found.

6. The difficulty of this position in a country like the Northwest can only be partially understood, even by comparison with such a country as New England remained until a quarter of a century ago. Instead of the tolerable roads of a country founded and developed under the advantages of a compact township government, these new settlers on the "bottom lands" of the Ohio and its tributaries found themselves, during six months of the year, dwelling in a weltering continent of mud, and were always staggering through a wilderness, with none of the modern appliances for personal movement or the transportation of crops. Dr. Manasseh Cutler, in 1788, spent thirty days in his "new sulky" and on horseback in his first journey from Ipswich, Mass., to the new settlement of Marietta, on the Ohio. It was thirty-five years from this settlement before the construction of the Erie Canal in New York, and forty years before the Great Lakes and the Ohio River were connected by a new water highway. First, the track of the buffalo; then the

Indian trail; next the river "batteux" and the wilderness pack horse; and, "after many days," in 1818, the steamboat of the old time on the river represented the first great effort of the "wild West" to "get out of the woods" and in hand shake with the civilization "away down East," beyond the formidable barrier of the Alleghany Mountains. The traveler who sees the difficulties at the present time in the Southern States, which still live so largely under the conditions of a border land, in getting children to and from the scattered country schools, can partially realize this special hindrance to the early establishment of efficient instruction in the new Northwest.

7. Another formidable obstacle to the adoption of the New England common school system in these States bordering the Ohio was the constant peril that these Commonwealths would eventually become slave States, like their neighbors Kentucky and Tennessee. The broad views of the Congress of the Confederation that framed the great ordinance of 1787 soon gave place to the ambition of the extreme leaders of the slave-holding class to capture this new domain as an annex to the original South in its industrial, social, and political estate. At once, spite of the prohibition in the ordinance and its implied authority for all time, a persistent effort was made to force across the river the "peculiar institution." For more than 500 miles south of the Ohio, a slave State faced the wilderness that was to be changed to the new Northwest. A majority of the people emigrating to this country for the first thirty years were from the slave States or communities in sympathy with them. The original law, which is identified with the name of Jefferson, robbed of its half-way prohibition against the institution, was the only general statute of the Northwest Territory until the ordinance of 1787, by the insistence of the Ohio Company represented by Dr. Cutler, prohibited slavery through the entire extent of the Territory. But the original Virginia idea of State sovereignty was supposed to override this territorial statute and the new constitution of Ohio, in 1802, was made anti-slavery by the casting vote of one member of the convention. Governor William Henry Harrison was president of a convention called to urge the introduction of slavery into Indiana, and Jefferson, then President of the United States, was quoted in its favor. Indeed, for several years Indiana and Illinois were slave Territories, and only after a conflict that until recent years has never been understood by the student of American history, were both these great States secured at last for freedom; Illinois largely by the intrepid and far-seeing statesmanship of its Virginia-born governor, Cowles. This original conflict between the old and new civilization of the Republic on the banks of the Ohio was long and intense and greatly hindered the people from giving earlier attention to education. It was not till 1824 that this internecine war for the possession of the new Northwest was finally closed by the decision of the people that Illinois should be a free State. This contention left behind a trail of injustice in the form of a system of odious and oppressive "black laws" that remained on the statute books of Ohio until 1837. And even the "remainder of wrath" was revealed during the entire progress of the civil war.

8. Even at this period, 1820–1830, forty years from the original settlement, there were but 800,000 people in the entire Northwest, of which more than half were in Southern Ohio. Indiana had but 200,000; Illinois, 55,000; Michigan, 10,000, and Wisconsin was still a wilderness. In 1802, there were but 45,000 people in the entire territory of Ohio. In 1815, Cleveland, Ohio, was a small village; Cincinnati a town of 3,000 people. Columbus, the new capital, was being cut out of the woods in 1816.

That a people, not so numerous as the population of the three leading cities of these States in 1890, dispersed through a realm so vast and inaccessible, should linger in putting on the ground its final system of public education is not remarkable to the student of American history, who is well informed of the prodigious obstacles which the "march of Empire" surmounted in its progress toward this magnificent realm, to-day one of the most favored portions of God's heritage in any land.

With these preliminary considerations in mind, it may be well to introduce our review of the gradual development of the common school in the Northwest by a consideration of the relative historical position of these 17 Western States to the Union. And no view of this wonderful section of the Republic can be seen in true historical perspective unless the observer stands on the original natural outlook of Ohio.

OHIO

The historian, George Bancroft, has said: "Nature made Ohio the highway of ideas." The present accomplished United States Commissioner of Education, Dr. William T. Harris, has elaborated this forcible statement in its educational application by the following suggestive and illuminating sentences: "It seems that whenever a body of educational reformers with similar ideals became moved with a strong impulse to put their principles into practice, they chose Ohio as the scene for their experiment. Here were found intelligent people from the East, without the conventional limitations of the older communities which they had left, and at the same time with a warm appreciation of education. In this way Ohio has led the nation in several important educational movements, which, springing up on her fresh soil from her peculiar conditions, have spread to other places where similar conditions prevail. Especially in the West and Northwest is her influence traced. She was the first State formed out of the great Northwest Territory, and many of her problems had to be solved outright, without precedents from older States. Their solution was accepted by her younger sisters as they entered the family of States, and, in time, many of them have reacted upon the older East."

According to her latest historian, "prior to the ordinance of 1787 there is no trace of a magisterial or civil officer, French, English, or American, only squatter sovereignty;" and until 1796 no established road, in what is now the State of Ohio, the most eminent representative of the new American Northwest. In one century Ohio has become the fourth State in population in the Union, having risen from 42,000 in 1803 to 3,672,316 in 1890. In area Ohio is one of the lesser of the northwestern group, containing 41,060 square miles and 26,700,000 acres, with an extent of some 200 miles in each direction. With the exception of a ragged region in the southeast and a beautiful "rolling country" in the southwest, its surface is a sharp contrast to the old picturesque East, no hill reaching an altitude of 1,500 feet. In equable fertility of soil and general mildness of climate it surpasses all its older sisters in similar latitudes, while its mineral resources, still revealed by new discoveries, would set up an old-time empire.

In property valuation Ohio is excelled by only three of the States—New York, Pennsylvania, and Massachusetts—having piled up the enormous sum of $1,778,138,457 in less than a century. The governor declared, in 1890, that in percentage of school attendance Ohio led the Union. Of its eminence during the past thirty years in the military and civic history of the nation, it is hardly neeessary to speak. Though now surpassed in population by Illinois, with more than one metropolitan city in the Northwest greater than Cincinnati, and in special ways outstripped by several of her later-come sisters in the majestic galaxy of the seventeen Commonwealths of the Northwest between the Alleghanies and the Rocky Mountains, Ohio is still the most conspicuous and characteristic representative of this portion of the country. For the new Northwest is now foremost in population and political power, and evidently destined to remain the great controlling section, holding all outlying realms in orderly and harmonious relations in the august union of States.

What happened before 1787, during the two hundred and fifty years from the original discovery of the Mississippi River by De Soto in 1541, is not in the line of this essay. The leading European powers two centuries ago fell into the habit of ceding away the American continent "from sea to sea," to little squads of their emigrating subjects. During the half century before the war of the Revolution, the wilderness of the Northwest was little save a "dark and bloody ground;" Indians, Frenchmen,

Englishmen, pioneer Americans fighting there together in a succession of wars, in which the uttermost barbarism of unregenerate human nature had full swing, with a good deal of the elements of a vigorous manhood of the future. Happily for all, the earliest attention of the Congress of the new Republic was given to compromising the rival claims of New England, New York, Pennsylvania, and Virginia. All were at last buried in one of the most important political events of the country, the cession of the whole Northwest by these States, from the Alleghanies to the Mississippi, to the nation, and the speedy organization of this vast region under a Territorial government, simply a reservoir of new States.

Then and there were laid, for the first time in the history of the world, the original foundations of a group of Commonwealths which, with no previous experience of Old World governments or social arrangements, could begin the grand experiment of constitutional democracy and carry it on to a logical result. The foundation stones of this majestic temple of the new civilization were: First, free labor; second, freedom of religion; third, freedom of education, secured by the greatest national gift ever made to the people through the donation of a vast domain of land for a perpetual common school fund, with generous allotments for the higher instruction; fourth, political freedom, assured by the three fountain heads of life—labor, religion, and education. This great enactment, the ordinance of 1787, flung open Ohio, "the glorious gateway of the West," to the first general movement of populations on the northern latitudes toward the setting sun. From that day has proceeded, like an unfolding drama, the most wonderful story of human progress in the annals of time—the growth of the Northwestern United States between the western slope of the Alleghanies and the summits of the Rocky Mountains.

The original five States covered by the ordinance of 1787 now contain 250,000 square miles and a population of 13,500,000, more than four times the number of the whole country in 1787. Within the past forty years has come marching in the splendid procession of the new States beyond the Mississippi. This section of the Republic now includes seventeen Commonwealths, with Missouri and West Virginia. The Northwest now has an area of 1,230,000 square miles and a population of 23,553,000, excelling the New England and Middle States by 5,000,000, with a capacity for the development of material resources and dense occupation impossible to estimate. Its thirty-four United States Senators give it the foremost place among the four groups of States. It is an empire of young people, every American and European State having sent of its most vigorous, able, and progressive youth to swell the tide of its marvelous prosperity.

Since the *Mayflower* struck Plymouth Rock it has been the habit of New England to be "up in the morning early" and take a first hand in whatever good thing was going on the American Continent. Having fought a hundred years, and once sent one-sixth of her population up to the Adirondack country of New York to prevent France from isolating her from the then unknown country, the great West, and having captured the army of Burgoyne, who repeated the experiment of "leaving the Yankee out in the cold," New England was "on hand," foremost in the organization and settlement of the new Northwest Territory, the future home of her superfluous boys and girls. Whether Nathan Dane or Manasseh Cutler deserves the honor of engineering the ordinance of 1787 through Congress matters little. But the ordinance was largely made up from the laws of Massachusetts, and represented the New England ideal of Republican institutions, which, after a century of debate, closed by the civil war, was finally incorporated in the amended Constitution of the United States.

It was in keeping that this beginning should be followed by the establishment of the Ohio Company by New England men, to make the first permanent settlement in what we now call the Northwest. In 1788, after the wearisome business of getting the enterprise in motion, Rufus Putnam and a little group hardly larger than the Puritans of Plymouth two hundred and seventy years before, reached the headwaters of the Ohio River, built a fleet of boats, one named the *Mayflower*, sailed

down to the mouth of the Muskingum, and then, in honor of Queen Marie Antoinette of France, named the first town in Ohio, Marietta, celebrated the first Fourth of July in the Northwest, and, true to the habits of old Connecticut, held a mighty feast, where a "pike weighing a hundred pounds" was devoured at a barbecue, lasting "all night till broad daylight." Washington declared that this colony was the best body of emigrants the world ever saw, made up of the foremost people of New England, furnishing a good supply of the first civil and other dignitaries of the new territory. Marietta still remains one of the best towns beyond the Alleghanies—an educational center of no mean reputation.

The slave-holding population of Virginia and Kentucky at once took the alarm at this apparition of free society across the river, for already the French had introduced negro slavery in their vagrant occupation of the wilderness, and for a generation the question of the ultimate freedom of the Northwest was in debate. They gave the new territory the name "the Yankee State." But if Yankee means New England, the name was not well applied to Ohio, for while New England did first put down her foot, broad and strong, on the shore of "the beautiful river," and afterwards, broader and stronger in the Connecticut Reserve on the lake, and generally had her part in all the immigration from the old East, still Ohio followed the lead of New York, and, from its earliest days, was a cosmopolitan Commonwealth.

Next came John Cleve Symms, with his colony of New Jersey men, which, after a few years' paddling about at the mouths of the two Miami rivers, established Cincinnati, the first settlement in the Northwest to achieve metropolitan honors, still one of the most interesting and cultivated of the great cities of the Union, naming the county Hamilton, as Marietta was located in Washington. Next came the unfortunate venture of a speculating syndicate of New York sharpers that landed a colony of homesick Frenchmen on the Ohio River at Gallipolis, which, after unutterable hardships, faded out, making no mark on the new territory. Now came Virginia, having secured a valuable grant in the southeast corner of the new country as a military reservation, in a settlement which was like the prow of the Old Dominion ship thrust into the vitals of the new Northwest. Later, a colony of antislavery Kentuckians established themselves at Chillicothe. Then came on in succession the Scotch-Irish and Germans from Pennsylvania, in the center, the Connecticut and other Northeastern crowds occupying the north, which, from the difficulty of access, developed with a slower growth than the valley below.

From that day on these different elements of American population have divided the old Northwest into sections, often as exclusive as the original Eastern, Middle, and Southern States. As late as 1854, going to live in Cleveland, Ohio, we found the State virtually divided into three distinct portions—the New England element in the northeast, the Pennsylvania and Middle States in the center, and a cosmopolitan civilization, with a large influx of Southern blood and the inflow of the new German and British immigration, in the South. Ten years later, at Cincinnati, we found in this the most cosmopolitan of American cities, a third of its entire population of German origin, large numbers from the Middle and Southern States, and more people of French than of New England birth. The Northwest assumed, without question, what New York and the old middle region had been two hundred years in teaching—that young America was to be fashioned by "mixing the babies up" from all regions of the civilized with a sprinkling of the uncivilized world. The question of "native Americanism," in the political "slang" of thirty years ago, never disturbed the slumbers of the Northwest.

From the little select colony of "132 men, besides women and children," who began the fight with the awful "all out-doors" of the Northwest wilderness at Marietta; from the raw beginning of Cincinnati in 1788, when Grandfather William Henry Harrison testified that "he saw more drunken men in forty-eight hours than in all his life," with not over 5,000 in the whole territory north of the Ohio River in 1796, to the foundation of Cleveland, on the lake, with two Connecticut families and "one French house" in 1796; fifteen years after "the ordinance" only 40,000, at the

admission of the State to the Union in 1803—for a long generation, to the memorable year when the first steamboat burst like an apparition upon the thunderstruck inhabitants of the Ohio River, from Pittsburg to Cincinnati, in 1811, and its fellow on the lakes in 1818, the new State of Ohio was chiefly engaged in "getting out of the woods" and learning to stand on its young republican legs. There were 230,000 people in 1810, for, spite of the terrible journey from the far-away East to the interminable "far West," young America insisted on pushing toward the setting sun.

The most remarkable feature in the growth of Ohio and all the States of the Northwest group, save Kansas, which was born in the later revolution, was their quiet, uneventful, irresistible push to the front, only stopping to elbow out of the way some obstacles from the outside. The first business was to take the Indian in hand. He was effectually disposed of by "mad Anthony Wayne," first by administering a terrible thrashing, then conciliating the defeated savage, so that he actually remained a "good Indian" for twenty-five years. The second crisis came in the war of 1812–1814 with Great Britain, when it seemed that for the last time the fond delusion possessed the English that, through the Canadas, the Northwest might be reclaimed. That business was settled effectually by Commodore Perry on Lake Erie, and on land by the man that wore Grandfather Harrison's hat, at Tippecanoe and the battle of the Thames.

But that Western pioneer life, uneventful and, as Mr. Matthew Arnold would put it, "uninteresting," was of the sort that tried the souls and slaughtered the bodies of men and women, leaving the "fittest who survived" the bone and sinew of the new Republic. There is no pioneer life like it to-day, for nowadays an entire colony floats into New York Harbor from the ends of the earth on a "palatial" steamer, boards another palace on wheels and in a week is established in its new home on the farther slope of the "Rockies," with American civilization like a roaring ocean tide on its heels. We can remember when Cincinnati and New Orleans were the two cities beyond the Alleghanies toward which the ambitious young men of the East set their faces.

It was the peculiar privilege of Ohio, first of the States formed under the new dispensation, that it was never cursed by a great, crude, precocious metropolis. The city of Cincinnati grew slowly, and still, in its corporate limits, has less than 500,000 people. Cleveland, thirty years ago, was a big village of 30,000, and to-day has but a quarter of a million. In all the State there are not a dozen towns containing 25,000 each. There was a great deal more time in ten years of the moderate life of an Ohio farmer a generation ago than in half a lifetime of his "enterprising" descendant, tearing along the hot pavement of the Chicago of to-day. It remains the marvel of the world how Ohio, then in swift succession Indiana, Illinois, Michigan, Wisconsin, then on and on, ever faster, as the years sped along, the big sisterhood beyond the Mississippi came up, "growing while men slept," to the fateful hour when the old South confronted the new civilization of the Northwest, determined to rule this new America or be forever quit of its Northern side. In 1860 Ohio was foremost of the dozen States then included in the Northwest. Abraham Lincoln wrote to her governor at the beginning of the war, "Ohio must lead."

We all know how Ohio came upon the field, with her bodyguard of ten new States; first split Virginia in two, placing a new free State as big as South Carolina between herself and the fury of the seceding Old Dominion; then in four short years sent 320,000 soldiers to the front, more than one-tenth of the entire Union Army; while the Northwest gave to the country in its great emergency a group of military and civic leaders that, in the final judgment of the republic, will seem not inferior to the colonial fathers who made the Union.

But more instructive than dilating on this wonderful advent of the Northwest before the world in 1860 will it be to seek after the causes of this marvelous development, that in a brief half century built up the new America in the wilderness which, in the nation's hour of peril, came to the rescue of the republic on whose success depended the hopes of mankind.

First of all, we note the supreme fact that here in the Northwest, for the first time in history, human society was established on Democratic-Republican foundations, by a people whose ancestors, for two hundred years, in the thirteen colonies had been outgrowing old European habits of thinking and living, and had, at last, set up on a new continent a government made for man. Doubtless it was and still remains an advantage, in some important ways, to have been born and reared in the old eastern section of the nation, with its splendid history of two centuries, in which is written the inspiring record of the progress of humanity from the government of the masses by the classes to a government "of the people, for the people, by the people." But it is almost impossible for the average citizen, even of the new East of to-day, to understand what a burden was lifted from the life of the emigrant who, at any time before 1860, turned his back on the Atlantic coast and set his face toward the setting sun. Even in New England and the old Middle States all things that made for human progress in freedom of thought and natural ways of life went slow, badgered and flanked at every step by conventionalities from across the water, coming down from the beginning of the colonial life. But out on the plains of the "great West" all this was in the past. Here was a society that began where the foremost of the Old World left off, all ready to go on and realize a lofty ideal, with no obstacle save the inevitable resistance of physical nature and human nature to any radical change. It was not strange that under such an inspiration, environed with such an opportunity, human nature renewed itself, "Old things passed away, and all things became new."

2. Consider a moment what this new order of society involved. First, free labor. Here was no slave; every man his own master; the young man able to put forth his uttermost energies to become the best for which he was made. Second, freedom of religion. The new church in the wilderness was compelled to drop a good deal of the old tyranny of sect and creed. While there was a terrible temptation on the one hand to fanaticism, and on the other to a wild breaking loose from all authority, yet it was well that the old ecclesiasticisms, stiff and stained with the grime and blood of centuries of European conflict, should be summoned to a great washing day out on the frontier of Christendom. Third, a recast of social affairs in an order of society where capacity and fidelity in facing the tremendous perils of the new life should become the test of social merit. Here was a community where hopeless poverty as it festered in the basement story of the Old World order should be impossible. Here the necessities of good neighborhood, the peril of common dangers, the inspiration of common success, held good people together. Every worthy family going West found a generous domain, the gift of a great nation that had been set up to protect the rights of man.

3. The original settlers of Ohio were by all odds the best class of immigrants that ever occupied a new country. The same was true in a great measure of all the original five States of the Northwest, but none was so favored as Ohio. Almost every good family in the old thirteen colonies had its representative, often its superior young people, out West. From New England and New York, Pennsylvania, Maryland, and New Jersey, Virginia and the old South, and new Tennessee and Kentucky, the flower of the new generation thronged this new world. An important element was the class that left the South, like the Kentucky settlers of Chillicothe, Ohio, and the North Carolina Quakers of Indiana, driven out by the hatred of slavery. Many of these people liberated their slaves in the Northwest, sometimes not to the immediate advantage of the poor negro, who has had his battle to fight in the West as in the South. Every little county town for half a century was a university for the training of this crowd of able and ambitious youth. We are not surprised that the secretary of Lafayette, even in 1825, visiting the West, declared "Ohio the eighth wonder of the world," and it is certain that Abraham Lincoln knew what he was talking about in 1861 when he said, "Ohio must lead."

4. The development of the free common school in all its departments, where it for the first time was enabled to "have free course, run, and be glorified," was a mighty

uplift in the training of the new West for the critical years of 1860–1865. It is amazing how slowly this the most characteristic American institution grew up in the old Eastern land. In 1835 the common-school system of New England was little better than in some of the Southern States to-day. Horace Mann, worn out by his good fight for free education and free politics in Massachusetts, gave the closing days of his splendid life to his grand educational work at Antioch College, Ohio. To-day the great cities of the Northwest are all distinguished for their munificent provision for the free schooling of the children, and the magnificent educational policy of their States is the wonder of the world.

Free education for all was made possible for the new America in the West by the most munificent gift ever offered to a people in the allotment of public lands for the common schooling of all. At the beginning of the century New England, after almost two hundred years, had only gotton on the ground the beginnings of the American common school. The Middle States were behind, and the old South had not looked at universal education as a possibility. President Hayes has said that "this first opportunity, offered to the new State of Ohio, had more to do with the crop of distinguished people half a century later than any other cause."

5. Daniel Webster said that the bringing in of the correct business habits of New England, with its system of securing the title of lands, would forever deserve the gratitude of the West. The entire circle of home virtues, careful economies, and moderate habits of living which had been wrought out in the old colonies were a priceless heritage to the makers of this new empire beyond the mountains which until the war of the Revolution had bounded American civilization.

6. These opportunities, with the old East behind and a new West always beckoning ahead, greatly stimulated these people in a remarkable development of the executive faculty in every department of life. A distinguished statesman of Ohio, who read law at Harvard in his youth, says: "I was always struck by the amount of suppressed ability in the New England life of fifty years ago. I was sure that this man, who now managed a little farm, a little store, a narrow profession, could manage a bigger arrangement under more favorable circumstances." The first impression made upon us by life in Ohio in 1854 was the great number of young men concerned in important affairs. The second impression was that below the noise and confusion of these immature workers was a conservative body of quiet, able, thoughtful people, who wielded an influence even greater than in the older part of the country. Ohio has always been a conservative State, and from the one million of her people who have gone farther West has come a great number of able, wise, influential leaders of the recent States; made up of sometimes crude materials from abroad; subjected to periodical tempests of political, social, and religious excitement.

Out of these and similar opportunities was built up the Northwest of 1860, compacted from varied elements into that prodigious executive power then the supreme need of the Republic. On going to Cincinnati in 1862, where we lived till 1872, we realized at once the downright decisive type of this Western life. The man for the Union was all for the Union. His opponent was no shirk, but stood up and proclaimed his unbelief. The West, through these awful four years, with one hand held down a great body of disloyal people, chiefly of Southern origin, while she sent forth the armies and the great leaders under whose masterly generalship the Confederacy was not only defeated but destroyed. It was in the order of Providence that at this critical period of the nation's life the civilization of the new Northwest was developed just to that point of intelligent and decisive executive ability whereby it not only saved the Union, but easily and naturally became the controlling power in the public affairs of the nation which it remains to-day.

But since that already far-off day a new Northwest has come up that challenges every section in the honorable strife for leadership in the higher realms of the national life. The World's Columbian Exposition in Chicago in the summer of 1893 revealed to all nations what we already know of the new America beyond the mountains. What will be the influence of this great event on this group of

Commonwealths can hardly be questioned. With the deluge of people flowing in from all the world; with the marvelous appliances of prosperous industry and boundless opportunities for the aequirement of wealth; with the prodigious efforts for universal edueation and the eorresponding growth in general intelligenee and refinement through the mingling of races that brings to every eommunity the best experienee of mankind; with such noble ambitions as now inspire the foremost young people of this new land, what may not eome to pass during "the years of the right hand of the Most High" that are before the new Northwest.

It must be eonceded that the original suggestion for the dedication of a seetion of eaeh township of land in the new Northwest in behalf of universal education eame from New England. It was only a natural eonelusion that a people who for more than a century had supported the only eommon-school system in the New World by a persistent annual putting their hands to the poeketbook, with no help from permanent invested funds, should hail the first opportunity in Christendom to dedieate a splendid domain to the children. They were looking fondly to the "far West" as a home for the thronging millions of the eoming generations, and anticipated that the burdens of settling a new country would render sueh a heritage of inestimable value.

This idea found expression in two early plans for the organization of this land of promise; that of Timothy Piekering and Col. Rufus Putnam. But it was reserved for one man, whose eminent ability and worth and great serviees, at a eritieal point of action by the Congress of the Confederation in 1787, gave the new Republie the Northwest that saved it in 1860–1865, to wear the erown of honor for this preeminent aet of Christian statesmanship.

Dr. Manasseh Cutler insisted on the introduetion of the memorable elause of the ordinance of 1787: "Religion, morality, and knowledge being neeessary to good government and the happiness of mankind, sehools and the means of edueation shall forever be encouraged." In support of this deelaration, he made it a condition of the first great purchase of land from the General Government that the sixteenth section of each township should be reserved for common sehools, and that a similar provisien should be made for the support of the Christian ministry and a State university in eaeh of the States to be ereated from the orginal northwestern territory. Judge Ephraim Cutler, of Marietta, Ohio, also introdueed into the first constitution of Ohio the educational elause, and was on the floor of the House twenty years later thanking God that the new Commonwealth had finally eome to the point of organizing an effeetive system of public edueation and taxing the whole people for the common school.

Dr. Oliver Wendell Holmes has charaeterized the old-time Congregational ministry of New England as the "Brahmin elass." While possessing none of the vested power of either a Catholic or Protestant state priesthood; sinee the ehurch organization was, from first to last, like the government and the school, the ereature of the popular will, there was perhaps never in Christendom a class which by sheer weight of ability, eharacter, and practical exeeutive eapaeity for two eenturies held a group of communities, peopled by a restless, zealous, and self-asserting raee, in sueh willing loyalty. The eommon school of New England was in no sense the ehild of the ehureh, and in every sense the ehild of the people. But it was by no means the least lively member of that lusty group of triplets that, after the style of the old mythologies, leaped full born from the brain of New England—the state, the church, and the school. The ehureh and the ministry were the birth relatives of the eommon school. The old-time Congregational elergy were, to a great extent, the organizers, administrators, and teaehers of the eommon school, and without a fair estimate of their service we shall fail to understand many things in its original constitution or appreeiate the peeuliar diffieulty of transferring it, in its original fashion, to a new country like the Northwest.

Certainly, in the history of New England, no man stands up a more complete representative of the all-round, aetive, and effeetive New England "minister" of this

period than Manasseh Cutler. For two generations somewhat obscured even from public view by the pretensions of men his action forced into undue prominence, his recent biography by his descendants is one of the most valuable contributions to the history of his own section and indispensable to the understanding of the early settlement and educational beginnings of the first colony of the Northwest-Ohio.

Manasseh Cutler was born in Killingly, Conn., in 1742; "brought up" on a farm, and graduated from Yale College in 1765. He appeared first in Massachusetts as a teacher in Dedham in 1765, and married the daughter of Rev. Dr. Balch in 1766. Already a young man of promise, he seems to have been taken in hand by Providence, like so many of our most eminent Americans, and led from "pillar to post," held to one position just long enough to get at the heart of success therein; through a variety of experiences, trained and toughened for the crowning act of his life in a far-off wilderness, then almost unknown to the shut-up northeastern colonies along the stormy Atlantic coast. For three years he was a merchant at Marthas Vineyard, Mass., sending ships to sea and prospering at his business. He finally decided to return to Dedham to study divinity with his father-in-law, and "with great reluctance" submitted to the prevailing discipline of the divinity student of the period—having his hair cut off and his head covered with a dark wig. But he kept his own brain inside his head notwithstanding, and in due time was settled in the little town of Douglas as a minister of a colonial Congregational church.

In 1770, at the age of 28, he was made A. M. at Harvard and was also spotted by the "o'er guid" as "heretical." In the same year he moved to his final parish, in the little corner of old Ipswich called "The Hamlet," now the town of Hamilton, Essex County, where, as the minister of a country society, he remained fixed till the end of his life.

He never was a celebrated preacher, possibly preferring to air his "heresies" outside rather than inside the pulpit. But his journal, practically kept for fifty years, is a remarkable record of the power of human endurance displayed by the old-time Yankee parson. There were perpetual ministerial visitings in families, catechizing of children, a sense of moral supervision of the manners and morals of the community, and a general social life, often represented by a hundred people at dinner, and a throng always surging through the parsonage—all on an income of $1,000 a year. He was, like the more active of his class, farmer, gardener, real estate agent, doctor, in his case actually studying medicine and taking his degree for practice; for many years a teacher and perpetual "school committeeman," an office including all, and a good deal besides, the present duties of city superintendency; citizen at large, member of the legislature, and, finally, as long as he would serve, member of Congress. From 1782 he was principal of a private classical school that educated numbers of valuable people, among others the founder of the manufacturing city of Lowell, Mass. He was a close student, especially of natural science, and a member of all the learned societies in the country. He was a man of commanding presence and charming address, thoroughly accomplished in affairs. At 45, by unanimous consent, he was chosen to manipulate the Congress of the Confederation, which for a dozen years had floundered through a deluge of debate that would fill 40 stout volumes with the vexed question of organizing the Northwest Territory. In less than a week, with an order for the purchase of 5,000,000 acres of Western land in his pocket, he brought order out of confusion and dictated the formation of a new committee for a fresh consideration of the whole matter. Without eminent distinction, save for that time, as a careful and reliable student of nature, Dr. Cutler had the instinctive master faculty of reading the capacity of men for important services, the rare gift of irresistible persuasion, and a decisive executive power of "striking when the iron is hot" and holding on till the end. He lived to the age of 83, and for the last forty years of his life his mind and heart were bound up in the first serious attempt to plant on the northern shore of the Ohio a colony, largely from New England, which should give a notable impulse to a group

of new Commonwealths founded on the chief corner stone—"Religion, morality, and knowledge necessary to good government and the happiness of mankind."

OHIO IN EDUCATION.

We have already called attention to the history of the passage of the ordinance of 1787 and the settlement of Ohio at Marietta. It now remains to tell the less attractive story of the slow progress of the common school in a State from the first pledged to the education of the whole people.

When Dr. Cutler appeared before the committees of the Congress of the Confederation in 1787, he summed up the alternative on which, as on a golden hinge turned the decision of the Ohio Company concerning the contemplated purchase of a vast tract of the Northwest Territory for the purpose of settlement according to the New England plan of social organism. He said, "If we venture our all, with our families, in this enterprise we must know beforehand what kind of foundations we are to build on." It was his absolute insistence, specially on the essential conditions of free soil and government aid for free education, and the support of the gospel, that placed under the famous ordinance of 1787 this corner stone. He saw, with the prophetic vision of a true educational statesmanship, in this waiting wilderness the possibility of a group of mighty commonwealths in which, as he wrote, "the field of science may be greatly enlarged and the acquisition of knowledge placed upon a more respectable footing than in any other part of the world. This will be an advantage which no other part of the earth can boast, and which probably will never occur again; that, in order to begin right, there will be no wrong habits to combat and no inveterate systems to overturn. There is no rubbish to remove before laying the foundations." In placing in the ordinance the memorable sentence, "Religion, morality, and knowledge being necessary to good government," he and those he represented proposed that "the organic law of the Northwest should be the basis of a Christian civilization."

The good doctor did not propose, in the favorite saying of his neighbors, "to let the grass grow under his feet" after his great victory at New York. He returned home, as his journal records, to give a large portion of his time to the furtherance of the new scheme of colonization. On December 3, 1787, five months after the passage of the ordinance, the first colony for the occupation of the Ohio purchase left Ipswich Hamlet. The party was gathered in the old church, his own son, who afterwards lost his life in the new country, being one of the number; the doctor prayed and preached, and the procession moved—the little advance guard of the mighty host that New England has sent forth for more than a century toward the setting sun.

Six months later, June 20, 1788, we read that the doctor "bought a new sulky" and painted and reconstructed it with his own hand for the 1,000-mile journey on his first visit to the promised land. He even seems at times to have had a floating idea of casting in his own lot with the new community. For thirty toilsome days did he sit in the sulky, accompanied by two friends on horseback, until compelled himself to leave the carriage in western Pennsylvania and "rough it" across the Alleghanies to the Ohio River. He found Harrisburg, Pa., a pleasant village of 100 houses. Arriving in due time at Marietta, he preached the first sermon in Campus Martius Hall on July 28, and on September 9 turned his face once more to the East, which was hereafter to be his abiding place. One of his first cares was to make arrangements to send a Christian minister to the new colony, who arrived during the following year—the leading man of the settlement, in old-time New England fashion, having kept the service of Sunday alive meanwhile. In November, 1788, immediately after reaching home, the doctor sends back $200 to pay the preacher, Mr. Daniel Story, and the schoolmaster, probably the same person, "for the present." In December, 1738, Gen. Rufus Putnam, the "head center" of the new colony, writes that they continue religious exercises, and "last Monday we had the first ball in our country, at which were present fifteen ladies as well accomplished in

the manners of polite circles as any I have seen in the old States. I mention this to show the progress of society in this distant country."

It is not to be supposed that such a people would consent to remain long under the threatening shadows of a possible illiteracy for their children. On May 6, 1789, the directors of the Ohio Company ordered that General Putnam and Dr. Cutler "make such application to Congress as they shall judge expedient for passing a charter for the university and for the encouragement of learning in this settlement." On September 29 of the same year, Dr. Cutler writes to Winthrop Sargent, president of the Ohio Company: "If Congress should be disposed to favor the establishment of the university, I am confident that it will have no inconsiderable influence on the spirit of migration from this part of the country." In 1790 President Washington, in his message of January 8, emphasized the importance of the encouragement of education in the new settlement. Meanwhile Dr. Cutler was busily employed in visiting the 4 public schools in his own town, which he finds "in good state, pretty well supplied with Webster's last edition of the first part of his Grammatical Institute. The masters and committees spent the evening and supped with me." Three years later Ipswich Hamlet, under the vigorous engineering of the locally omnipotent doctor, emerged into the new town of Hamilton. His son Charles died in Marietta in the same year. The church, ministered to by the Rev. Daniel Story, was the first of the New England Congregational order formed west of the Alleghanies.

In 1799 General Putnam informs the company that the university township contains 46,080 acres. It included the two best townships in the whole province. It was already occupied by settlers, who, by some arrangement, seem to have secured free possession for five years. After that the land could be leased for $12 per 100 acres, which would furnish an annual income of $5,529.60 for the university. The common school and ministry lands amounted to 62,700 acres, which, loaned for $6 per 100 acres, gave the meager sum of $3,762, one-half for schools and one-half for the ministry. Here seems to have been the "beginning of sorrows" in the toleration of the free "squatter" occupation of these superior university lands, which grew into the usual pioneer greed for personal possession with an assured right to all that the settler could include in his horizon. This university domain was so loosely held by any responsible power that "the college" failed to receive its proper income and never has been able to lift its head high among the stately assemblage of Northwestern State universities.

It may have been some of these pioneer disasters that prompted Dr. Cutler to respond to the repeated and urgent demand from Marietta that he should prepare a plan for the organization of the university: "What has been passing in the world these last ten years has rendered me less democratic." Certainly the elaborate plan which he sent out to the colony for this organization appears to have been drawn up under the fear of a waste of the funds and in distrust of any public supervision of education. It tied up the entire fund for university and common school education, together with their disposal and management, the appointment of the faculty, and the details of school administration, in the hands of a close corporation of eleven trustees, forever renewing itself, the original board to be appointed by the company. Here was revealed the inevitable result of attempting to manage a pioneer American colony "at arm's length" by a company of men, however able, wise, and devoted, at another end of the country. This idea of the supervision of education in Ohio reminds one of the notion of more than one of our great educators to-day who see no hope for any system of universal education in this Republic which is not worked by an absolute educational supervisor, turning the crank in Olymphic state, in the solemnity and isolation of his own exclusive and unassailable position. General Putnam replies: "There are several academies in neighboring parts of Pennsylvania, Virginia, and Kentucky where Latin and Greek are taught, and the Muskingum Academy at Marietta is at present capable of teaching the languages, and I think it can not be long before Latin schools will be established in several places in the territory."

The Muskingum Academy was probably the first seminary of the kind established and the building erected for it the earliest structure built for educational use in Ohio. It was projected in 1797, at a meeting of the citizens of Marietta, of which General Putnam was chairman. But even before this organization, David Putnam, a graduate of Yale College, is found teaching there in 1793. President Andrews, of Marietta College, says: "It is probable that, from the beginning of the colony until the time that Marietta College was founded, in 1835, this town possessed almost uninterrupted facilities for instruction in the higher branches of an English education, and most of the time for such classical instruction as was required for preparation for college." The Territorial legislature, with an instinct for affairs that is the first break with the "close corporation" idea of the less confiding East, modified the plan of Dr. Cutler and appointed two boards of trustees, one for the management of the university and another for the common school and ministerial lands, with power to lease and secure the improvement of the estate.

Meanwhile, on December 30, 1791, a committee appointed by the Ohio Company assembled at Marietta to select the two townships of university lands and determine on the location of the institution. "In a fleet of canoes, propelled by the power of setting the pole against the swift and narrow channel of the Hocking River, accompanied by armed guards against the lurking savages, and carrying their own pork, beans, and hardtack that made up their rough fare, this committee of old veterans of three wars proceeded to fix, with compass and chain, the boundaries of the university lands." The estate selected was in the townships now called Athens and Alexander, in Athens County. In 1799 the Territorial legislature appointed a committee, with the inevitable General Putnam chairman, to lay off the college ground in generous pioneer style, with room for all necessary buildings, "bordering on or inclosed by spacious commons."

The work was done and approved by the legislature in 1800. The author of The Higher Education in Ohio declares of the original plan of Dr. Cutler: "In no way, directly or indirectly, did the proposed charter indicate that the university, when once created, was to stand in any public or semipublic relation to the State. No right was to be reserved to the legislature to modify the charter at any future time, or to exercise any authority in the affairs of the college." But in 1802 the legislature, by act, established the university and gave the land grant to it in trust.

But, in distrust of the narrow plan of organization proposed, it struck out the present practical conception of the new State university, now so prominent an element in the educational life of the Northwest. The first board of trustees was appointed by the legislature, representing the people, for life. But as its members passed away, their successors were to be chosen by the Territorial or State legislature. No limitation of the right to hold property was imposed. The legislature reserved the right to add to or take from the powers granted to the trustees, as might be regarded best for the progress of the university. This was the first of that series of legislative acts by which the people of the Northwest, through a good deal of blundering and some mischievous legislation, have built up the present American system of State universities, academical and industrial, which is the crown of the American system of common schools.

The new institution was called the "American Western University," a name prophetic of the type of institution it represented. The trustees were the foremost men of the colony. But the school really had no existence till 1804, when the State legislature passed an act which superseded the statute of 1802. The name was then changed to "The Ohio University," its objects and duties were declared to be "the instruction of youth in all the various branches of liberal arts and sciences, the promotion of good education, virtue, religion, and morality, and conferring all the degrees and literary honors granted in similar institutions." The curriculum of the college included the classical and English languages, mathematics, rhetoric, logic, geography, and mental and moral philosophy.

The governor of the State and the president of the university were ex officio members of the board of trustees. A reorganization of the university afterwards fixed the number of trustees at 21, who, at present, are appointed by the governor of the State, subject to confirmation by the senate. But 3 students appeared on the day the university opened. The first class of 2 was graduated in 1815.

Then came in the unwise and overindulgent habit of leasing the university lands, which virtually gave away this noble heritage to private settlers, and until the present day has kept this and its sister college at Oxford in a state of impecuniosity that has greatly hindered their usefulness and postponed for half a century the final effort of the people of Ohio to establish a State university worthy of this great Commonwealth. A splendid domain, valued at $1,000,000, is so burdened that it has realized only $7,500 a year. Until 1881 the State refused additional aid and the entire amount contributed by the legislature is less than $75,000. It is unnecessary to prolong the account of the first attempt to establish a State university in the Northwest. Like other similar collegiate institutions of the new States, this and its sister college, Miami, at Oxford, have numbered among their graduates many of the most celebrated public characters of the country. One of the first graduates from Athens was Thomas Ewing. But while it was reserved for the Northwestern States that were formed at a later date, especially Michigan and Wisconsin, to develop this most original and important feature of the higher education to an extent far beyond the limited support and supervision of the old-time college like Harvard, William and Mary, and Yale, the fundamental principle, that the people should establish, support, and, through elected or appointed bodies, control the entire policy of the highest organizations of educational life in the State, is plainly laid down in the charter for the Ohio University in the wilderness of Athens County, in 1804. "During the first quarter of the present century the Ohio University was the only institution of collegiate rank in the Northwest Territory, and the number of its graduates had not exceeded 25." The financial blight that followed it from the first culminated in 1813, when by legislative act the income was so limited that for several years before 1850 no class was graduated, and the institution was virtually closed, although afterwards reorganized and continued in moderate prosperity to the present time.

It would appear to have been a necessity that the new State of Ohio, considering the slow growth of population, the hinderances in travel, and the great distance between the two original settlements in the Territory should divide its all too meager outfit for the establishment of a university. Only a month after the passage of the ordinance of 1787, John Cleves Symmes, of New Jersey, proposed to purchase a tract of land at the opposite corner of the present State from the location of the Ohio Company, based on the great bend of the Ohio River, in the southwest angle of the State, and including the beautiful country between the Great and Little Miamis; a region not excelled in fertility and loveliness in the entire West. But it was not until September, 1794, that Washington, as President of the United States, confirmed this purchase. Symmes broke down financially with the result that the one township of land for the establishment of an academy and other public schools and seminaries of learning included in his purchase was finally located at Oxford, Butler County, outside the original purchase, but in what was called "the district of Cincinnatti." In 1809 the State passed an act intrusting the management of the landed estate to 14 trustees with power to establish a university described in the charter in the same terms as the Ohio University, now already at work in Athens. The town at Oxford sprung up at the call and to this day, like Athens, is known chiefly as a college town and educational center.

But it was not until 1816 that the new university was born, under the usual pioneer figure of a grammar school housed in a small wooden building. Eight years more elapsed before the child had grown to college dimensions. In 1824 Dr. Bishop, a Scotch ex-professor of Transylvania University, Kentucky, where he had acquired a reputation as a "defender of the faith" against imputed "irreligious influences,"

was placed at the head of the new college. This act seems to have fixed the ecclesiastical leanings of the institutions, for it is said that every president of Miami has been of the Presbyterian faith; although, being normally a State university, there has been no offensive display of sectarianism.

The school came up as a representative of the cosmopolitan population of the "Cincinnatti district," in contrast to the New England type of the Marietta settlement. It looked to the South largely for students and was always strictly conservative in its political leanings. Its curriculum followed closely the original type of the Southern college—classics, mathematics, and a "mental and moral philosophy" not easily distinguished from the Protestant Evangelical Theology. From the period of its beginning until a suspension of activities between 1873 and 1885 Oxford University had the checkered career that has been the fate of the majority of pioneer colleges in the West. But it has always maintained a good reputation for faithful scholarship and vigorous teaching within the lines of the old-time course of study and methods of discipline. Some of the ablest Western educators have been included in its faculty, of which, perhaps, Dr. W. H. McGuffey has the widest reputation as a teacher and maker of one of the best series of school readers ever put into the hands of American children.

But the blight of impecuniosity was over Oxford, as Athens, from the beginning. Its entire income was derived from the uncertain rentals of the university lands, tuition, and other college fees. The faculty worked on salaries from $500 to $1,200 a year. The great civil war cut off its supply of Southern student material and left it in 1873 "laid up for repairs" for twelve years, while its funds were accumulating. The State, practicing so much economy that it has not yet established a State normal school, has given it the sum of $50,000, all since the reopening in 1885.

But we do not call to mind any institution of the higher learning in the West that has done so much and so valuable work, on means so slender, amid conditions so discouraging as Miami University. It was from the first a place where a young man of small means and lofty aspirations could find a welcome. Its situation, in the heart of one of the garden realms of western America, near the most enlightened border of Indiana, was favorable. The entire fees for tuition were $15 per term, and opportunity has been always at hand to enable worthy and promising young men to "work their way through college." Among the number who have thus "worked their way" out and up into conspicuous position in the West and the Republic we find the names of 1 President of the United States, 4 governors of Western States, 4 United States Senators, 4 foreign ministers of the nation, 9 eminent judges, and as many lawyers of high reputation; clergymen without number, including some deservedly celebrated; 5 college presidents, and several dozen of the most influential men of affairs in the Northwest, including Oliver P. Morton, William S. Groesbeck, J. W. Noble, and others. Certainly, in the past days of American education, these little country colleges, officered by a hard-working faculty, not unfrequently by the foremost educators of the time, where the fashion was "lean living and high thinking," and where ambitious students often took to farm work to obtain resources "to keep the pot boiling" during term time, performed a service for American citizenship which points to the heart of college life; the grouping of an eager, resolute, indefatigable set of young men to live with half a dozen first-rate, all-round scholars, for four years, and carry away with their diploma a devoted and self-sacrificing manhood that will go before them, like a guiding star, as they climb the successive steps of a splendid career.

Oxford and Athens, within the past dozen years, seem to have renewed their youth, have enlarged their curriculum, adjusted their methods to modern necessities, and bid fair to retain their hold on the people, while at the same time they expose the unfortunate policy by which the State of Ohio in the early time virtually wasted its magnificent land endowment for education and, with all her splendid achievements, still lags behind in some of the most essential qualities of a great educational Commonwealth.

These were the only organizations of the higher education with which the State of Ohio concerned itself during the first fifty years of the Republic. Other collegiate and academical seminaries came up during that period—the Western Reserve College, now Adelbert, of the Western Reserve University, Cleveland, Ohio; the early days of Oberlin, Marietta, and St. Xavier's, of Cincinnati, being among the best known. All these were distinctively denominational institutions, although compelled by their connections and environments to cooperate in greater or less degree with the slow upward progress of the common school. "No State in proportion to its population has seen a larger number of colleges organized within its boundaries," says Dr. Harris, United States Commissioner of Education. Of these, 6, including a number established during the past forty years, are nonsectarian, and one of the most hopeful, the University of Cincinnati, is the highest department of the public school system of that city.

Along with this multiplication of "colleges" and "universities" went an early corresponding movement for the building of academies and private schools of every grade. The majority of the original settlers brought from the Southern and Middle States the old faith in the denominational and private, as opposed to the public support of the superior grades of the common school. A great deal of the good educational training for the first fifty years in the life of Ohio as a Commonwealth—training which revealed the State in 1860 to the world as a rival of New York and a future leader in the affairs of the Republic—was obtained at these numerous seminaries supported by the zeal of religious bodies and the contributions of their patrons.

It was given to Ohio thus to represent the transition period in the new Northwest between the British and American systems of educating the people. Certainly no American State has obtained better results from the old, and to-day no State goes before Ohio in zeal and progressive spirit in the adoption of the new methods of universal education. Many of its so-called "colleges" and "universities" have, by necessity, been only more or less vigorous academical schools; coeducational or for the separate instruction of boys and girls. And, at every step upward to its present educational eminence, all varieties of these institutions have been necessarily in almost vital connection with every class. There has been a special experience in the building up and in the amazing growth of several great private schools for the normal instruction of teachers which have sent forth hundreds of graduates to the West and South during the past twenty-five years. We shall refer to this side of the educational life of Ohio further on and trace the development of the more concentrated use of means and the massing of forces that has resulted in the "association of Ohio colleges" which dates from 1867.

While the new State of Ohio was thus engaged in the attempt to furnish its more favored class with the opportunity for the academical and collegiate education of their children, the common school for the elementary instruction of the masses during the first thirty years from the settlement at Marietta and for a full quarter of a century from the organization of the State could hardly be said to exist. Governor St. Clair was installed over the Territory in 1788, but in his first message to the Territorial legislature made no reference to education, although, doubtless, he owed his position to the good will of Dr. Cutler as a recognition of his service in securing the passage of the ordinance of 1787. The land grant for educational purposes is declared by competent authorities to have been "sufficient for a liberal independent support of common schools with a university." At once the people seemed to have made an effort to utilize this source of educational support. But this system of leasing lands to impecunious settlers and afterwards of selling lands for a nominal price, then inaugurated and still in vogue in some of the new States, was better calculated to attract a population than to educate the children of the emigrants who actually occupied the country. The Territorial legislature, in 1800, "discussed" the subject and recommended the Delegate in Congress, W. H. Harrison, "to secure equal rights to school lands for all children." In 1802 the new constitution of the State was formed. By

the efforts of Judge Ephraim Cutler and other like-minded members of the convention this clause was placed in the fundamental law:

ARTICLE VIII.

SEC 3. * * * Religion, morality, and knowledge, being essentially necessary to good government and the happiness of mankind, schools and the means of instruction shall forever be encouraged by legislative provision, not inconsistent with the right of conscience.

SEC. 25. That no law shall be passed to prevent the poor in the several counties and townships within this State from an equal participation in the schools, academies, colleges, and universities within this State, which are endowed, in whole or in part from the revenue arising from donations made by the United States, for the support of schools and colleges; and the doors of the said schools, academies, and universities shall be opened for the reception of scholars, students, and teachers of every grade, without any distinction or preference whatever, contrary to the intent for which said donations were made.

We seem to recognize here the appearance of that sectarian jealousy of the public school which for so many years waged a persistent war against everything save the most meager and ineffectual arrangements for public elementary schooling, reserving to itself the control of all the higher grades of education.

Under these conditions it is not remarkable that this constitutional provision remained virtually a dead letter for almost twenty years. Until 1820 we are informed that the only schools of importance were found in the larger towns, while the masses of the people were left poorly supplied. A school bill, offered by Judge Cutler, was lost in the upper house of the legislature. The common practice seems to have been similar to that of many of our Southern States previous to their recent revival in popular education; to use the small amount of money gathered from the land lease to pay tuition bills to such schools as might be on the ground. At first these schools were really private as distinguished from public. Gradually, in the more prosperous counties, the little private seminary was evolved into a common district school. In 1806 a portion of the State was districted and funds from the sixteenth sections and military lands ordered to be secured. In 1817 Governor Worthington recommended the establishment of a free school at the new capital of the State, "to educate, at same expense, the sons of poor parents (no other) for teachers." Without any definite system of public schools, with no recognition from the legislature, which was absorbed with matters vastly more important to the physical status of affairs and the safety of the Territory, the more progressive people did their uttermost to supply the children with the means of education. Doubtless, in all such formative periods of the American common school, these local movements, in communities widely separated, without cooperation with each other, do not receive due credit from the historian; for history, in the regulation sense of the term, chiefly concerns itself with the record of exceptional men at the moment of their supreme influence; like a celestial geographer of our planet, stepping over the mountain tops of this world and handing in a report of these summits up aloft as a veritable "description of the earth." Still, in lack of more interesting details of these early movements, at present only to be obtained by laborious investigation of township and village chronicles, we are grateful to be able to call attention especially to the two men who, by common consent, were the leaders recognized and followed by the educational common-school public which achieved its first substantial advantage in the legislation of the years 1820–1824.

Nathan Guilford was born in Worcester County, Mass., in 1786; was graduated at Yale College, and, in 1816, is found established in the law, the favorite profession of educated young Americans, in a new State; a sort of "open court" with avenues leading out into every form of industrial, public, or philanthropic activity. He brought with him from New England the profound conviction that the real motive power of a new commonwealth must be generated in the fit education of the children. Cincinnati, at this time already the literary center of the entire region beyond

the Alleghanies, had no system of public schools, and there was nothing of importance of the sort in the State. Mr. Guilford drifted more and more into the position of a general reformer and agitator for the upper story of civilization in the city and State of his adoption. For seven years he edited "Solomon Thrifty's Almanac," a clever imitation of Dr. Franklin's "Poor Richard," with decided influence. In 1820, as chairman of a self-appointed committee, he addressed a forcible plea for popular education to the legislature and people of Ohio which brought him into large public notice as a leader in the first crusade for "young America" out west. In 1821 we find him in the legislature of the State, in company with Ephraim Cutler, as member of a committee of 7 appointed to draw up a scheme of public school instruction. The majority of the committee reported a bill which was declared by Guilford and Cutler useless for practical purposes. Under the form of a minority report they prepared a document that woke up a controversy which arrested the attention of the entire Commonwealth, and four years later, 1824, resulted in carrying through the legislature a bill, framed and engineered by these two great leaders, "for the founding of a general system of common schools, to be built upon and improved."

This bill contained provisions for a county tax of one-half mill on the dollar for education; for the township clerks and city auditors to be school officers; for an examination of teachers; a division of townships into school districts by vote of householders, with other useful provisions, but with no provisions for its own enforcement. Yet it was only by the most strenuous appeals of these courageous leaders that this bill was forced through the legislature, and Judge Cutler, now a veteran in the service of education, is said to have exclaimed on the final passage: "Lord, now lettest thou thy servant depart in peace, according to thy word; for mine eyes have seen thy salvation."

But a statute thus carried by a worked-up majority through the legislature, "at the point of the bayonet," proved unpopular and difficult of enforcement. For eleven years more the ship of state in Ohio was educationally in the hands of a crew that sailed "by guess," with no chart or compass and no accurate observation of the north star. But the good seed once sown did not perish under the faithful culture of its devoted friends. Between 1825 and 1836 the people of Ohio were gradually opening their eyes to the fact that only a community that would put its hands deep into its own pockets can be assured of an effective system of public education. From one-half mill the school tax was carried to three-fourths, then to 1, and in 1836 to 1½ mills on the dollar, and the county commissioners were given power to add one-half mill in 1836.

Meanwhile the foremost teachers of the State were every year becoming more alive to the importance of the movement for better common schools. In 1831 "The college of teachers" was formed in Cincinnati, including among its leaders Pickett, Kinmont, Williams, Samuel Lewis, Dr. McGuffey, and Dr. Ray, for the time the most distinguished of Western educators. The membership was made up of the most eminent literary and school men of the Mississippi Valley and, with its meetings, discussions, printing of reports and pamphlets, became a great power in the land. In 1833 this body demanded State supervision of schools with other reforms. In 1835 the State legislature was induced to vote $500 to aid Prof. Calvin Stowe, of Lane Theological Seminary, Cincinnati (the husband of Harriet Beecher Stowe), in the inspection of common schools in Germany. His report, with another from Horace Mann, of Massachusetts, was largely influential in moving the sluggish waters. In 1836 the first State convention of teachers in Ohio was held at Columbus, and seems to have given a powerful impetus in the right direction. Samuel Lewis made one of his "great speeches," and Professor Stowe read a portion of his report. The convention demanded the improvement of common schools, the establishment of school libraries, and the election of a State superintendent of education. By a majority of 1 in the house of representatives a State superintendency was ordered, and Samuel Lewis was appointed to the office in 1837. For a dozen years school funds had been collecting from the sixteenth section of the United States land grant,

from the income of saline lands, and later from the interest of the surplus revenue of the United States divided among the several States.

But the good work was only well begun. In 1831 "the State had no school fund; not more than half the school districts had schoolhouses, and they not worth $10 each; the tuition fee was universal, and the country schools were in session but three months in a year." During the six years before the election of Lewis to the superintendency something had been done in the accumulation of funds and a good deal in the waking up of a public opinion demanding that, after fifty years of "fooling" with this great practical interest of the State, something worthy of a Commonwealth like Ohio should be done. "The acceptable year of the Lord" had already come to New England in the revival that resulted in the establishment of a State board of education of Massachusetts and the appointment of Horace Mann as its first secretary, really dictator of public-school affairs in the Bay State during the subsequent fifteen years and leader of a body of educators in all the Northern States whose patriotic zeal, thorough comprehension of the public needs, and absolute consecration to the public good, may not inaptly be compared to the original group of fathers of their country. By their effort the tide of battle between the common school and its open enemies and half-hearted advocates, which for so long had wavered to and fro, was now turned and the victory was won for the children of the Republic.

Of this noble brotherhood none deserves higher honor than Samuel Lewis, first superintendent of common schools in the State of Ohio. He was, in the best sense of the word, "the people's man" in the crisis that now confronted this great Commonwealth, just entering on the second period of its career in training for the eminence into which it vaulted as the foremost State of the Republic in the nation's hour of supreme peril in 1860. A native of the same State as Nathan Guilford and Ephraim Cutler, though thirteen years the junior of Guilford, Samuel Lewis was born in Falmouth, Cape Cod, Massachusetts, in 1799, and at the age of 14 emigrated to Cincinnati, Ohio. At first a farmer, then a house-builder, at 20 he adventured on climbing the "steep and rugged way" of the study of law, on an income of $150 a year and living on bread and water, in the office of Judge Burnett. At 22 he was admitted to the bar and, like his friend Guilford, drifted to the higher profession of educational reformer by native instinct. He persuaded his friend, William Woodward, to make the original contribution which became the corner stone of the famous Woodward High School of Cincinnati and was also influential in persuading Mr. Hughes to make a similar donation, on which the present Hughes High School of Cincinnati is founded. Out of this original custom of the gift of property for education, including the university fund by McMicken, grew up a public spirit of generous giving that, within the past 30 years, through munificent benefactions, has given to Cincinnati perhaps the most complete system of popular instruction of any American metropolis.

The eminent services of Lewis in behalf of popular instruction pointed to him as the fit pioneer State superintendent of education. On a salary of $500 a year he entered upon his great work in 1837. He traveled on horseback 1,200 miles through the State, visited 300 schools, everywhere stirring up the people and carefully observing the condition of affairs. In his first report, in 1838, he recommended school buildings, town boards of education, the establishment of a State fund of $200,000, the giving to cities and important towns the right to tax themselves for the secondary and higher education; that school districts be empowered to lay taxes to build schoolhouses and that boards of examiners for school-teachers be appointed. As in the case of Horace Mann, the difficulty was to obtain reports from the local authorities. In the year 1835–36, only 33 county auditors had complied with the request, and their reports were unreliable. The salary of the superintendent was afterwards raised to $1,200, and he issued several numbers of an influential document, but the labors of years of incessant activity were now telling on this faithful servant of the people. He resigned his position in 1839. The office of State superintendent was abolished by a reaction of public opinion in 1840, and

its duties thereafter thrown upon the shoulders of school officials and teachers, town assessors and, especially, the fidelity of women teachers in the schools of the State.

But a great work had already been done. From 4,300 schools and 150,000 pupils in 1837, the administration of Samuel Lewis had lifted the number to 7,300 schools and the attendance to 250,000, almost doubling the number of schools and pupils and multiplying the agencies at work for improving the quality of popular education. From $350,000 in 1837, the State had climbed to the expenditure of $1,000,000 in 1839–40. The remainder of the twelve years of the life of Mr. Lewis was spent largely in the advocacy of several advanced movements, temperance, and anti-slavery, and by frequent "running for office" on those hopeless tickets upon which we find the names of the early reformers of that day.

Both these remarkable men, Guilford and Lewis, were residents of Cincinnati, but previous to 1837 that city had no system of public schools. Having led "the army of the Lord" to its first great legislative victory in 1824–25, Nathan Guilford concentrated his attention on his own city to make it an educational object lesson of what a new American metropolis should be. From the first Cincinnati had among its earlier settlers a group of enlightened and public-spirited men and women who, for many years, made it the center of literature, art, music, and progressive ideas in the new West. Nathan Guilford wrought with the most enlightened and practical efficiency as a true friend of the Commonwealth. Having obtained from the legislature a law authorizing the establishment of a city system of public schools, the city council refused to impose a school tax. Guilford then was elected a member of the city council and "forced the fighting," obtained a grant of $40,000 for the first great schoolhouse, and made Cincinnati the leading free school city beyond the Alleghanies. He was elected first superintendent of the common schools, and by a famous educational festival, in which the children marched with music and banners about the streets and assembled in the First Presbyterian church to hear addresses of congratulation, captured the heart of the Queen City, which, from this day for half a century, has never for a year been found wanting in its warm regard for the children. Mr. Guilford served as city superintendent from 1849 till 1852, and died in 1854 at the age of 68. His estimable wife was still living ten years later, one of the most thoroughly alive women in the great city Cincinnati had then become in all the good works and forward movements of the stirring period of the civil war.

Here we reach the limit of our present discussion of the common-school life of the first Western State during the first half century of the Republic. We have given the history of the beginnings of the common school in Ohio somewhat in detail, because here was first fought out on the great open field of the Northwest the battle between the New England idea of the people's school and the various forms of private, parochial, and corporate education prevailing in the Central and Southern States. Though the conflict was long and at times uncertain, extending through the entire period of sixty years from the occupation of the Territory to the great revival of popular education in 1840, the leaders of the masses thus far are seen to be largely of New England origin and to them must be awarded the credit of the final victory. But in this long period of warfare "the people of all sorts and conditions" and the foremost men of all sections of the country had done "a power of thinking" on this matter. Almost every scheme for training a generation of young Americans had been tried; various new expedients suggested; broader methods of instruction struck out; and a school public steadily established. The result was that to Ohio must be given the credit of inaugurating the majority of the educational movements which have given a peculiar character to the northwestern type of the American common school. Some of these movements, like the complete organization of the State university, normal training of teachers by the State, county supervision of schools, and the vigorous handling of the local district school, have been carried out with more eminent success in the neighboring States; and the time

is rapidly coming when Ohio must "take a new start" if she proposes to lead, even in Western educational affairs. But for more than half a century, even to the close of the civil war, this State was the natural leader of the Republic west of the Alleghanies in all that concerned the training of its singularly able and cosmopolitan people for the grand demonstration in arms, statesmanship, industrial activities, and general mental and social culture, which, in the decade of 1860–1870, drew to her all eyes from every quarter in Christendom.

In the development of the American common school, from its early beginnings in the New England colonies to its complete acceptance as the reliance of the American people in the training for American citizenship, each State and every section of the country has borne its own honorable and essential part. We have seen how the idea of universal education, by the aid and under the supervision of the State, obtained the unanimous indorsement of the Congress of the Confederation. One of the first acts of the Congress of the United States was the ratification of the ordinance of 1787, which pledged the five original Northwestern States to complete civil and religious liberty and the "encouragement forever of schools and the means of education." Five years before this memorable closing act of the Continental Congress, a fit companion piece of the Declaration of Independence, the first proposition for an appropriation of public lands in the Northwest Territory for the support of education appears in a bill offered by Colonel Bland, of Virginia, June 5, 1783, although it appears to have gone no farther than the prevailing Virginia idea of the period, the founding of a "seminary of learning." The suggestion was incorporated in the law of 1785 when, at the suggestion of New England members, it became a part of the general law for locating and disposing of lands in the new Territories of the Northwest; and we finally meet it, in the more extended form in which it now appears, in the ordinance of 1787, the title deed to education for every child henceforth to be born in the New World beyond the western mountains.

INDIANA.

We have already traced the action of the State of Ohio, the first Commonwealth wrought out of the imperial northwestern realm, and noted the gradual steps by which this, now one of the four leading States in the Republic, availed itself of the priceless privilege of universal education there offered. And we have seen that every idea that has since become a characteristic of the elaborate public-school system of the Western and Pacific States appears as a suggestion or an actual experiment during the formative period of the common school in that State; the period now under consideration from the establishment of the Union to the year 1840, the first fifty years of the Republic.

But alongside of Ohio, originally a part of her vast territory, was meanwhile growing up a new Commonwealth, in which the educational drama rehearsed by its older sister was to be acted in a style peculiar to itself. The earliest settlers of Ohio were so largely of New England origin that they can be said to have brought with them the old-time pattern of the New England common school and, in a halting and ineffectual way, attempted its establishment in their new home. But the Territory of Indiana had quite another origin. It was discovered and partly occupied by a French emigration from the Canadas as early as 1680, and at the formation of the National Government was a remote settlement chiefly of French colonists in a far-off wilderness, largely in possession of the Indian tribes and, outside the village of Vincennes, only beaten up by a wandering crowd of hunters, traders, and trappers.

"For one hundred and thirty years Indiana had no capital within her own territory." Her small affairs were tossed about from hand to hand in Paris, London, Quebec, New York, Philadelphia, and Marietta. At the organization of the Northwest Territory, Governor St. Clair wrote that "the inhabitants of the Wabash Valley are the most ignorant people in the world. There is not a fiftieth man that can either read or write." During the century of the occupation by the French

there is no record of a school until the appearance of the Anglo-American settlers. As the inevitable result of this collision during two brief decades, the few thousand French people included in what is now Indiana, Illinois, Michigan, and Wisconsin, had fallen to the rear, hereafter never to be recognized as an important element in the making of the Commonwealth.

But to no State in the Union may we look for a more instructive history of the natural growth of the common school idea than to Indiana; and nowhere is that idea, in several respects, now more completely organized and more effectively administered than in the State whose opening years were so inauspicious. But this great work—whose splendid outcome is now seen in a State school fund of $10,000,000, an annual expenditure of more than $5,000,000 for common schools, in perhaps the most thoroughly articulated system of public instruction in the Union, and especially in the success in the grading of the country district school—has been a slow and tortuous growth of more than half a century, dating from the organization of the Northwest Territory in 1790 to the formation of its new constitution in 1851; half a century from its admission as a State in 1816 to the final establishment of its present educational system by the school law of 1865.

The peculiar interest of this history is found in the fact that the early American settlers of Indiana were chiefly from those portions of the country that had not yet adopted the idea of the formation of any system of public education. While the foremost men, including the first territorial governor, William Henry Harrison, brought thither the prevailing opinions of their native States concerning the necessity of the higher education for a superior class, the masses, who for a third of a century were struggling with the obstacles of settling a new country nowhere more formidable than in the densely wooded lowlands of this territory, until 1820 confined to the border of Ohio and the shores of the Ohio and Wabash rivers, in 1815 numbering but 65,000, battling with Indians and a terrible unhealthiness more destructive than war, were in no condition either to rise out of their own illiteracy or to produce the means for the schooling of their own children. Large numbers of the poorer people from the old Southern States were among these settlers, for whom a rough life in a new country for half a century seemed necessary as a "lift" even to the old-time district schoolhouse door.

Another great obstacle to the early establishment of the public or any effective system of schools was the peculiar political organization that involved the infant Territory in perpetual agitation.

Although the ordinance of 1787 prohibited negro slavery in the most peremptory terms and was thought by its authors to require the abolition of the institution as it was inherited from the French and English government, it still required a campaign of thirty years to put it under the ban of constitution and law, thence to linger in its original haunts, the valley of the Wabash, for other years. The majority of the early inhabitants of the Territory were from slave-holding States. Governor Harrison, a Virginian, seconded the effort to repudiate the original compact. Even Thomas Jefferson, President of the United States, was not averse to the toleration of "the peculiar institution" for a time, so long that it would be equivalent to fixing the destiny of Indiana as a slave State. While this fundamental question was up no progress could be expected in the organization of the educational life of such a community.

The State of Indiana has furnished within the past ten years perhaps the most philosophical and illuminating group of local historical writers concerning its early history of any Commonwealth west of the Alleghanies. In the history of Indiana, previous to its organization as a State, by Dunn, the story of the early conflict in the Territory for freedom has been for the first time fairly put on record. The circular of information issued by the National Bureau of Education, "The higher education in Indiana," by Prof. J. A. Woodburn, of the University of Indiana, is a complete record of the growth of the State into its present educational condition. The same institution has given to the public the best general history of education

in the United States by Professor Boone. A reference to these publications will put the reader in possession of the details of this most interesting narrative—the rise and progress of the public school idea in Indiana; its slow and sure growth from decade to decade; its final victory over all effective opponents in 1851, and its complete triumph as the logical close of the splendid war record of the State in the final school system of 1865. It is only necessary in this connection to briefly refer to the successive steps by which this result has been achieved.

When the Government of Prussia, at the close of the first Napoleonic wars, cast about for a method to promote the future security and eminence of the State, it intrusted to the most eminent educators of the kingdom the formation of a complete school system, which was enacted into law and enforced on the people by the irresistible power that, even now, overrides the popular will in the German Empire. But, whatever may be the impulse and inspiration derived from distinguished leaders, no American community has been thoroughly established in the habit of universal education except by a slow learning of the lesson through long years of painful and humiliating experience of the miseries of popular illiteracy.

For a series of years before 1850, these facts of the actual educational condition of the State of Indiana were spread before the government and people with the same relentless statement of home truth as by Horace Mann and Henry Barnard in New England. It was then revealed to the Government that Indiana, at the end of the first half century of its life as a State, rated lowest among the free States in popular intelligence and the means of popular education. Until 1853 the capital of the State had no free schools. Of 273,784 children of school age, only 48,180 attended the common schools. In 1840 "one-seventh of the adult population could not read, and a good proportion of those who could, read indifferently." In 1850, the State had sunk to the rank of twenty-third among the twenty-six States in popular intelligence, only three slave States below her. Between 1840 and 1850, with an increase of population of 50 per cent, the illiteracy had increased 100 per cent.

Indeed, as stated in the opening pages of Professor Woodburn's circular of information, in 1848 for the first time the question of the public support of free schools was submitted to the popular vote, with the result that, in a vote of 100,000, the small majority of 16,836 decided the future policy of Indiana as a free-school Commonwealth.

But this result was not the vote of a temporary majority, worked up in the fierce heat of a revival season, but the somewhat reluctant, though final, decision of a State which, perhaps more completely than any in the Union, was ruled by and always has been under the control of the masses of the people; of masses drawn for years from States not yet committed to the common school idea. Even before the separation of the territory from Ohio, measures had been taken looking to the security of the school lands in the sixteenth section of each township.

In 1804, four years after this separation, an act of Congress set apart the sixteenth section of every township for common schools and a complete township in each of the grand divisions of the new Territory, including the remaining three States of Illinois, Michigan, and Wisconsin for a university. President Monroe designated a township in a county named for himself as the endowment of the "Seminary of Learning." The first general assembly in the Territory, at Vincennes, incorporated "An university in the Indiana Territory," in a highly rhetorical prelude, and the act was approved by Governor William Henry Harrison in 1806. The Vincennes University was ushered in by another magnificent educational "thundering in the index." The Indians were invited to patronize it, and a lottery was established for raising the $20,000 necessary to set it in operation. It was not till 1810 that the school was opened. Until 1825 it lived a precarious life, unsupported and neglected by the State, which in 1824 withdrew from its connection. Through a long period of litigation with the State, under different names, this seminary emerged in 1853, and now exists as a flourishing academical secondary school.

It was not till the admission of Indiana to the Union, in 1816, that the idea of universal education appears as a feature in the life of the new Commonwealth. The first constitution of the State contains the following provisions on the general subject of education:

ARTICLE IX.

SEC. 1. Knowledge and learning generally diffused through a community being essential to the preservation of a free government, and spreading the opportunities and advantages of education through the various parts of the country being highly conducive to this end, it shall be the duty of the general assembly to provide by law for the improvement of such lands as are, or hereafter may be, granted by the United States to this State for the use of schools, and to apply any funds which may be raised from such lands, or from any other quarter, to the accomplishment of the grand object for which they are or may be intended. But no lands granted for the use of schools or seminaries of learning shall be sold by the authority of this State prior to the year 1820; and the monies which may be raised out of the sale of such lands, or otherwise obtained for the purposes aforesaid, shall be and remain a fund for the exclusive purpose of promoting the interest of literature and the sciences and for the support of seminaries and public schools. The general assembly shall from time to time pass such laws as shall be calculated to encourage intellectual, scientific, and agricultural improvements, by allowing rewards and immunities for the promotion and and improvement of arts, sciences, commerce, manufactures, and natural history, and to countenance and encourage the principles of humanity, honesty, industry, and morality.

SEC. 2. It shall be the duty of the general assembly, as soon as circumstances will permit, to provide by law for a general system of education, ascending in a regular gradation from township schools to a State university, wherein tuition shall be gratis, and equally open to all.

SEC. 3. And for the promotion of such salutary end the money which shall be paid as an equivalent by persons exempt from militia duty, except in times of war, shall be exclusively and in equal proportion applied to the support of county seminaries; also all fines assessed for any breach of the penal laws shall be applied to said seminaries in the counties where they shall be assessed.

SEC. 4. It shall be the duty of the general assembly, as soon as circumstances will permit to form a penal code, founded on the principles of reformation and not vindictive justice, and also to provide one or more farms, to be an asylum for those persons who by age, infirmity, or other misfortunes may have a claim on the aid and beneficence of society, on such principles that such persons may therein find employment and every reasonable comfort, and lose by their usefulness the degrading sense of dependence.

SEC. 5. The general assembly, at the time they lay off a new county, shall cause at least 10 per cent out of the sales of town lots in the seat of justice of said county to be reserved for the use of a public library in such county, and at the same session they shall incorporate a library company, under such rules and regulations as will best secure its permanence, and extend its benefits.

"No efficient school law was ever passed under that constitution" under which the State lived for thirty-five years, until 1851. During this period a succession of educational laws were placed on the statute books; but none of them relating to the building up of a public school system appear to have been of any considerable effect.

The first of these statutes dates from the beginning of the State, 1816, and gave permission for the electors of townships to establish schools; but, "with no visible means of support," the schools, save in a few favored districts, did not appear. In 1818 power was given the governor to appoint a seminary trustee for each county to accumulate funds for an academical school. In 1824 the law directed the establishment of a seminary in each county and a district school. In 1828 "The College," afterwards the University of Indiana, was established by law at Bloomington, and all university funds transferred thereto. In 1837 further legislation was had concerning public schools. Still other school laws, in 1849, added to the mass of legal educational literature, while the educational status of the Commonwealth was sinking, as heretofore described.

The radical defect of this entire system of laws, any one of which, could it have been operated, would have at least arrested the spread of illlteracy, was the old weakness of all public school legislation in the Southern and some of the Central

States, its merely permissive character. All these statutes virtually left the people of every school district in the State to judge whether they would attempt the education of their children at public expense. Of course, the more advanced communities were moved to avail themselves of these provisions; while the great majority, which needed the sharp goad of compulsion, took no action and feebly leaned on the frail reed of private, denominational, and corporation schools for their supply of intelligence.

But a lesson seems to have been learned from the experience of Ohio concerning a better care of the public lands of the State which were the foundation of the school fund. From the first, under a system of leasing, and after 1824 by sales, these lands were handled with a jealous care. Yet, from this source a sum less than $3,000,000 was realized. But, from subsequent sources—the United States surplus revenue fund, sales of swamp and saline lands, management and taxation of banks, etc.—the fund has steadily grown, until Indiana boasts of $10,000,000, one of the largest State school funds in the Union.

During this period of the education of the people for the final adoption of the common school, a system of county seminaries, somewhat resembling the subsidized academies of New England, was developed. Between the years 1825 and 1843, 24 of these institutions were incorporated by the State. The buildings, furnishings, and fuel were supplied by county funds, while a moderate tuition fee was charged for instruction. Beside these, 37 denominational, private, and corporate schools of the same sort had been given charters by the legislature during the same period. This group of 60 academical institutions, with the aid of several denominational colleges and the young State university, furnished an opportunity for the schooling of numbers of men and women, afterwards eminent in public and private life, and kept alive the sacred fire till its outbreak at a later day. That it was from these institutions that the final public school system was evolved, a familiar claim by the successors of their original faculties and patrons, is not in all cases so clear. One of the most persistent forces in every American State in the hindrance of universal education under the protection of the Commonwealth has always been found in a considerable class of these academical and collegiate schools, although their more progressive teachers have often been foremost in the leadership of the people toward better things.

Up to 1840, the limit of the present inquiry, the struggle for some effective method of educating the people of Indiana was still going on. But the effort was bearing fruit. Step by step the friends of the common school made their advance. Every device of the enemies of popular education was met, seen, and conquered. The young State university, like the majority of State institutions, beat up against a teasing wind of opposition. But, in a warfare like this, protracted through half a century and including two or three generations of children, an American people learns what is never forgotten. The result of this hard-fought conflict was that in no State of the Union has the great lesson been better learned. The present organization of the public school system of Indiana, through all its departments, will be found to contain several unique features, decidedly in advance of the older States. It is especially strong where Ohio is weak—in the organization of an effective system of country district schools, in the county supervision, and in the institutions and agencies for the instruction of teachers. For the details of this deeply interesting period we refer again to the circular of information of the National Bureau of Education, prepared by Professor Woodburn, to whose exhaustive and philosophic review of the entire history of education in Indiana we are largely indebted.

ILLINOIS.

The history of the common school in the State of Illinois falls largely outside and beyond the limits of this portion of our essay—the first half century of the Republic, 1790–1840. At this latter date, 1840, a historian declares, "Illinois was no

more a wilderness." Discovered and partially explored by Marquette, La Salle, Hennepin, and Joliet, in the later quarter of the seventeenth century, the new territory along the borders of the Mississippi became, first the missionary and afterwards the trading ground of scattering emigrants from the Canadas on the north, and later from Louisiana on the south. Kaskaskia and Catokia were the first of these settlements, followed by Peoria and Fort Chartres. But all finally gravitated to Kaskaskia, which became the rural metropolis of this little Creole paradise.

Gossipy old Governor Reynolds, the Froissart of the Northwest, dilates on the ideal condition of this early French community until the relentless English, fifty years later, 1735, began to stir up the Chickasaw Indians to antagonize the French, who claimed possession of the entire region between Quebec and New Orleans. We are told by him of the "innocence, morality, and honesty" of this little colony in the far-off wilderness on the shore of the Father of Waters that such a people as they "need no government;" and that there was neither government nor court in the territory until, by the treaty of Paris in 1763, the Northwest Territory became a portion of the British possessions in America with headquarters in Quebec. At this time there were 3,000 people, almost exclusively French, in Illinois. Two-thirds of these at once abandoned the country and the remainder melted away, as was probable a people with neither court, government, wealth, nor education would do on collision with the stalwart race that from the group of little stormy islands in the North Atlantic seas weaves its web of commerce, constitutional government, education, and compact society around the world.

But the "seamy side" of this Creole millennium appears in the light cast upon it by the zealous and devoted Catholic Jesuit priesthood that stood for all that government implies for this people during the half century of French occupation in the Northwest. The educational ideal of this fraternity, as far as related to this colony, was the conversion of the Indians to Christianity. But although a portion of the common people cooperated with them by marrying the Indian women and although the colony generally managed to keep the peace with the "noble savage," yet one of the most zealous missionaries writes: "Our life is spent in rambling through thick woods, in climbing over mountains, in paddling the canoe across lakes and rivers, to catch a poor savage, who flies from us and whom we can tame neither by teaching nor caresses."

Father Reynolds tells us that these happy settlers "had use for neither knowledge nor wealth and therefore possessed not much of either." But they had, unfortunately, the usual supply of the natural instinct of laziness and at once took to negro slavery with a relish. In 1719 a French adventurer, acting under the auspices of the "Company of the West," established in Paris in 1717 as a result of the grand boom of John Law, brought to the Illinois territory a colony of 200 French mechanics and 500 negro slaves bought in the West India Islands. The Jesuits established "a college" in Kaskaskia in 1721, which does not seem to have greatly disturbed the stolid ignorance of the common people. The poetic sentimentalism that fashions an ideal community out of such a condition of affairs is rudely shattered by what came from half a century of this experiment on the banks of the Mississippi. Apart from the general arrest of the valuable emigration of a more vigorous race, this beginning of "free and easy" bequeathed to Illinois another half century of conflict over the institution of slavery almost as intense and bitter as the subsequent civil war in which the father of the new republic, Abraham Lincoln, was called from this same region to govern, suffer, and die in behalf of the Union.

The establishment of slavery on "the American bottoms" and on the lowlands of the southern portion of the territory brought thither an emigration, largely of the least forcible and intelligent of the southern people, nonslaveholding at home, but moved with a desire to become slaveholders on the new soil. From the day of the organization of the Territory of Indiana, which included Illinois, in 1809, till the final vote of the people in 1823 when the question of a convention to place a

proslavery clause in the new constitution of the State was voted down, after a turbulent campaign of two years and by only 1,800 majority, the Territory and State paid dearly for its half century's experience of ignorance and superstition.

As in the history of a family left to come up in the "natural" way of no government and the indulgence of all the unregulated whims of childhood, so a state pays heavily for an early "outing" of the ignorance, superstition, shiftlessness, vulgarity, and vice, the constituents of that illiteracy which is a poison in the blood of an American colony. It is almost incredible that it can be said of the third State in the Union in population and the seat of the wonderful metropolis of the Northwest that for the first one hundred years after its settlement it "had no schools." Of course, there was, meanwhile, as always in any country out of barbarism, an irregular habit of teaching by the clergy and educated people that composed the governing class. But with this exception the educational history of Illinois dates from its incorporation in the Territory of Indiana, set off from Ohio in 1800.

The British occupation in 1763 was followed by the terrible Indian war which is the theme of the earliest volume of the historical series of Francis Parkman, The Conspiracy of Pontiac. The entire northern region of the Northwest Territory was overrun, and 20,000 emigrating Virginians pushed back over the border. For thirty years, through the Revolutionary epoch until 1795, the history of the Northwest is little more than a record of the bloodiest series of Indian wars on the continent. There could be little space for education, especially in any shape like the American common school, to develop amid such a condition of affairs.

It is the opinion of some of the northwestern historians that had George Rogers Clark, who certainly displayed a marvellous genius in frontier warfare, been vigorously supported by Virginia or the Continental Congress he could have accomplished the conquest of the Canadas from the rear, which had failed in the assault at the front door with the defeat of the expedition of General Montgomery. However this may have been, it was not till the overthrow of the British influence at the battle of the Thames, in 1815, that England really let go her iron grip on what is now the most prosperous division of these five great Commonwealths.

Illinois was set off from the Territory of Indiana in 1809 and admitted as a State into the Union in 1818, with an area of 56,000 square miles and a population of 55,000. We are favored with a list of several early schoolmasters whose heads rose above their weaker brethren during the early days of Territorial life. John Doyle taught a school at Kaskaskia in 1778. The "first American schoolmaster" is reported to have been John Seely, in 1783. These early pedagogues, as in the Central and Southern States, were largely a wandering tribe from foreign parts. One "Halfpenny," an enterprising Irishman, is spoken of as "schoolmaster in general of Illinois, having taught all the children that were educated about this period." Jacob Clarke figures as the pioneer instructor in the higher branches. As in early New England, the education of the day did not bar out the approach of superstition, for as late as 1790 the Illinois Territory had its craze on witchcraft, or hoodooism, in which several unfortunate negroes were sacrificed.

In 1800 "schools were scarce," the tide of emigration from the least intelligent side of the South and Southwest not furnishing an encouraging field for the schoolmaster. As late as 1814 Bibles and schoolbooks were only to be obtained from the educational centers of the East. But, although immigration flowed in from the date of the separation of the Territory of Ohio, in 1800, and especially from the establishment of its own Territorial status, in 1809, with a Maryland governor, the second war with Great Britain, lasting until 1815, held the attention of the people to the exclusion of higher interests. The close of this war also brought in a blessed era of peace with the Indians, only disturbed by the brief episode of the Black Hawk war later on.

About this time the story of the youth of John Reynolds, afterwards governor and Senator in Congress from Illinois, and one of the most picturesque of the numerous fathers of this new country, comes in. The son of an Irish family, and a

good hater of "perfidious Albion," he drifted from the East to this new land of promise. In his paternal home, one of the best in the neighborhood, but without shingles or glass windows, at 15 he felt the stirring of a mighty desire for the knowledge which is power. On horseback, by a journey of 500 miles through a wilderness, he sought the new college of Tennessee, at Knoxville, where he appeared clad in homespun and wearing a cap of fox skin. He studied the Latin and mathematical course of the period and, like so many boys of the old time, fell back upon his mother's home, broken in health, only to "endure unto the end and be saved." It is not strange that such a man, on becoming governor of Illinois in 1830, should insist that the income of the school lands, long practically useless, should be appropriated for the children then on the ground. The usual disorder of the old frontier life seems before this to have neutralized it. Lynch law is said to have been first known by that name in Illinois in 1805. Negro slavery, under the French holding, still held on until abolished by a decision of the courts in 1845.

The constitution of the new State of Illinois, admitted to the Union in 1818, accepted the conditions imposed by Congress that the sixteenth section of each township should be sacredly preserved for the education of the whole people, and that two entire townships should be held for the establishment of a seminary and university. The first governor of Illinois was Ninian Edwards, who, thirty years later, in his old age, became the first State superintendent of education.

The city of Upper Alton led the new State in the establishment of common schools by donating 100 town lots—half "for the support of the gospel" and half for public schools—and by imposing a tax on the remainder of the real estate. But there was no general attempt to establish a common-school system until 1825.

The first school law of Illinois, like most similar statutes, is ushered in with a very ambitious prologue. This law was only a permissive act, whereby schools could be opened in all the counties of the State for all white children between 5 and 20. The voters of the county were permitted to establish school districts, elect school officers, and impose a tax of one-half mill per 100 on the valuation for the support of education. The State board itself was thus empowered to pay $2 of every $100 raised by taxation for roads and schools, five-sixths for the latter use. The avails of the school lands were to be given only to such communities as complied with these conditions.

But this law failed of general effect from the old weakness of being a permissive act. A majority of the people of the State had not yet been educated into the idea of taxation for "schooling other people's children." There was but a partial response, and a reaction which sent to the statehouse a legislature that, four years later, repealed the clause concerning State aid and forbade the taxing of any man for school purpose unless by his own consent in writing. This action, which virtually made a system of common schools in Illinois impossible, carries us to 1830.

For the next twenty years the State worried on through that thicket of legislation by which a half-hearted Commonwealth pretends to satisfy the demands of a restless educational agitation without committing itself to any established policy of universal education. But meanwhile a rising power was being evolved in the denominational colleges and seminaries established especially in the more intelligent counties, like Edwards, settled by a colony of English people, by whose vote, it is claimed, the anti-slavery majority in the contest of 1823 was obtained. In 1818 Dr. John Murray, a celebrated Baptist missionary from Connecticut, established what became a theological seminary. The same work was done by Peter Cartwright for the Methodist brotherhood in 1828. Illinois College was set up by the Congregational denomination in 1832, with one of the most vigorous of the great Beecher brotherhood, Edward Beecher, as president. The Episcopal, Catholic, Presbyterian, and other religious bodies followed the example, and by 1840 the State, "no longer a wilderness," was reasonably supplied with the usual style of academic and collegiate seminaries, chiefly under ecclesiastical government.

It was largely owing to the heroic efforts of the presidents and faculties of some of these institutions that "the good fight" for an effective system of common schools was pushed to a victory in 1854. The friends of universal education were now reenforced by the immigration from the Eastern States, now at high tide of the great wave of educational progress setting from New England even to the farthermost border of the new West. The Ladies' Association for the Education of Girls, formed in 1833; the Illinois Institute of Education in 1835; the State Association of Educators, in 1853, with other similar arrangements of the friends of the common school, were a powerful stimulant. Especially was the good work pushed on by an important convention held in 1844, at Peoria, which addressed a memorial to the legislature demanding the establishment of a State superintendency of education and the imposing of a general school tax. This was followed by a movement of inquiry from the legislature, to which only 59 of 97 counties replied with unsatisfactory information of the state of affairs. It was found, in 1850, that the State had 2,640 public schools with 132,000 pupils in attendance; the number of schools having doubled and the attendance increased fourfold in the ten years since 1840. At this time the State fund had increased to $1,000,000. By 1854 this movement had come to a head in the establishment of a State superintendency of education. Ninian Edwards was the first occupant of the post, and his elaborate first report was foremost in a procession of able official documents which record the stages of progress of the common school in Illinois up to the present year.

With the consideration of the educational history of the three northwestern Commonwealths first admitted to the Union (Ohio, Indiana, and Illinois), we reach the close of what may be called the era of conflict over the establishment of the American common school through the vast area now occupied by the twenty States which, at present, aspire to the domination of the republic. The emigration of the people of the United States westward where "the course of empire takes its way" has been largely on parallels of latitude and the social, educational, and political status of the northern and central West was for many years largely determined by this fact. A line projected from the southern boundary of Connecticut to the Mississippi River includes, on its northern boundary, the entire State of New York, with the exception of the city; a portion of northern Pennsylvania, the northern section of Ohio, Indiana and Illinois, and the entire States of Michigan and Wisconsin. Along this parallel, with the exception of the original settlement of Ohio, has flowed the tide of emigration from New England.

Previous to the Revolution the enterprising farmers of Yankeeland "had no call" to invade the domain of the patroons and their Dutch colonies, who with an increasing element from Great Britain and the Continent, were in possession of the valley of the Hudson and Mohawk rivers as far as Utica, where the mighty western wilderness set in. A sprinkling of New England people in this region, with a larger number on Long Island and the towns about the harbor of New York, the colony of Connecticut people in the valley of Wyoming, Pennsylvania, for which the Western Reserve in northern Ohio was afterwards exchanged; the unique settlement of Massachusetts emigrants in Liberty County, Ga., with scattering merchants and adventurers down the southern Atlantic coast, were the overture to the grand march of this New England army of occupation which has so indelibly impressed itself on the entire region between central New York and the Mississippi River.

If there were any doubt where the American common school had its origin and where it became an undestructible factor in the civilization of the State, that doubt would be dispelled by its history north and south of the parallel of latitude already described. Even so notable an illustration as the State of New York is a case in point. The common school only obtained a solid foothold here when the settlement of western and northern New York brought to bear the public opinion of that portion of the State which reflected the educational ideas of New England. The city of New York, on the southern side of the Connecticut parallel, was still in the hands

of "The Public School Society," a private corporation; and almost the entire valley of the Hudson, including the city of Albany, in the rudimentary stages of the common school, when western New York, from Oneida County on to the lakes, was alive with the new educational impulse. Outside the movement by the Connecticut colony in the valley of Wyoming, there was no considerable interest in behalf of popular education in Pennsylvania till the beginning of the second third of the present century. The history of the protracted conflict for the introduction of the people's school into southern Ohio, Indiana, and Illinois, notwithstanding the bounty of the nation in the bestowal of immense land grants, involved with the contest to make each of these new States an appendage to the slaveholding section of the Union, has already been noticed.

But it is a significant fact that the new Northwest was saved from this fate by the wise and patriotic leadership of three Virginia statesmen. Thomas Jefferson first introduced the prohibitory clause against slavery in his original bill for the organization of the Northwestern Territory. Without the aid of a committee with a southern majority, Manasseh Cutler would have been powerless in his campaign in behalf of the ordinance of 1787. John Randolph, at a subsequent period, through his report in Congress, secured the rejection of the petition of the Territory of Indiana for the establishment of negro slavery. Governor Coles, of Illinois, was the prime factor in the final dedication of that State to freedom. But all these States were at first settled by a majority from the central and southern portion of the country, where the common school had no existence, save in the aspirations and devoted efforts of a group of their most enlightened statesmen and educators. The result was that, for an entire generation after the settlement of Ohio, Indiana, and Illinois, all these States, now so prominent in their devotion to popular education, were in the throes of a conflict which, with other causes, greatly hindered the beginnings of the common school and left the State university at the close of the period now under consideration little more than a country college, striving against rival denominational institutions which, for many years, prevented its ascendency.

MICHIGAN.

It is sometimes a great advantage to a State as well as to a child to have been born late in the history of a nation or a race. It was in many ways a prodigious advantage to the States of Michigan and Wisconsin that their educational history practically began at the close of this period of conflict between the Western people and the sects and classes which stood between them and the attainment of universal education. Although Michigan was discovered as early as 1609 and settled in the inefficient French missionary and trading style in 1668, Detroit, the umbilical cord that bound the civilization of this territory to the United States, was not occupied till 1701. There was a good deal to interest the antiquarian, the novelist, and the student of race peculiarities in the hundred years of French occupation of the territory until the year 1763, at the close of the French and Indian war, when Great Britain became the mistress of the colonies and at the same time of the Northwest. But, despite the persistent efforts of the Catholic priesthood for the general uplift of the French and the conversion of the Indian population, the educational history of Michigan was a blank during this entire period.

A shrewd observer of this time remarks that "an Indian would be baptized a hundred times a day for a hundred dinners," and that "the only good missionaries do is to baptize children and old people who die." But this hard-working and self-sacrificing class, of which Father Richard was a noble example, did what their English and American successors never could accomplish. They kept the peace between the savages and the colonists and made this period of the early life of the Northwest the only approach to an idyllic state of anything in the record of the white occupation of the country beyond the Alleghanies. But the most philosophical historian of Michigan remarks: "Until the occupation by the British in 1760 there was not a sail on the lakes nor a printing press in New France."

Little more was achieved for the education of the people during the British occupation, 1760–1796, when, as the result of Jay's treaty, the American flag was first displayed in Detroit. In 1805 the Territory became a portion of Indiana by separation from Ohio and in 1802 Detroit became a town. But, even then, Michigan was little more than a settlement of some 4,000 white people, chiefly French, on the outward margin of a vast unknown wilderness along the borders of the Great Lakes, chiefly interested in the fur trade, with but 400 farms. Until 1812, the agricultural interests of this magnificent realm were in abeyance. It was supposed that the interior was an uninhabitable area of swamp lands and the little colony relied on Ohio, hundreds of miles away, across a perilous region of forest and lake shore, for its regular supplies. Almost immediately on the American occupation came a new peril from the ferocious Indian wars which for fifty years desolated the Southwest and Northwest, followed by the second war with Great Britain in 1812. It was not till the victory of Perry on the lakes and the defeat of Proctor and the most important Indian ally of the British, Tecumseh, at the battle of the Thames in 1813, that the Territory had a breathing spell from the buffetings of its stormy childhood.

Then, under the leadership of its great Territorial governor, Lewis Cass, of New Hampshire, did the infant colony rise slowly upon its feet and begin to "run the race" for empire. Still, in 1820 there were but 10,000 people in Michigan, the easy-going French in the majority. But, with the completion of the Erie Canal in 1825, began the hegira from New England, where the school boys were singing:

> Come, all ye Yankee farmers who wish to change your lot,
> Who've spunk enough to travel beyond your native spot,
> And leave behind the village where pa and ma do stay
> Come follow me and settle in Michigania.

In 1830 preemption rights to the public lands were first granted. In 1825 there were seven steamboats on Lake Erie, and a daily line of steamers from Detroit to Buffalo in 1830. At this date the population had increased to 32,000 and Governor Cass, who had led the people, was called to Washington as a member of the Cabinet of President Andrew Jackson.

From this time on the population of the new Territory was drawn almost entirely from New England or western New York and northern Ohio, which were largely an extension of "Yankee land." In 1832 there were 50,000 and in 1834 80,000 people in Michigan. The Territory was separated from Wisconsin in 1818 and admitted as a State into the Union in 1837.

Then came in the most formidable of the diseases characteristic of a new American State, the inflation of values; a wild era of speculation and financial air-castle building, with the inevitable reaction that follows alike the distemper of youthful "big head" and a young community inflated with a sense of its own prosperity and half insane with a boundless expectation of wealth and power. The real history of the common school in Michigan does not begin until ten years later, when the new country planted itself firmly on the idea of building up the American system of universal education in a way even more complete than had yet been achieved by any of the twenty-five preceding States of the Union.

The educational history of Michigan thus falls chiefly within that period of school history beginning with the great revival of the common school in New England in 1830–1840, under the leadership of Horace Mann, Henry Barnard, and the group of remarkable men and women who caught the inspiration which, like the beacon in the old Scotch Highlands, smote the summit minds of the nation from the northeastern Atlantic coast to the far-off Mississippi and flashed a light downward to the Gulf. The leadership of public education in Michigan, from the first until a recent date, was more largely from the region east of the Hudson than elsewhere. Crary and Pierce, to whom the Territory owed its early movement in the organization of the common school, were both from this quarter. The successive presidents

of the University of Michigan, Tappan, Frieze, Haven, and Angell, represent eastern New York, Massachusetts, Connecticut, and Rhode Island.

During the period of early French and English occupation something was done by the Jesuits and the priesthood, especially by Father Richard, to establish primary and secondary schools. His attempt to obtain from the legislature the endowment of his system was not successful. The usual attempts were made, before and during the war of the Revolution, to establish private English schools, and the advent of the New England people was signalized by the push of the different religious bodies to inaugurate the regulation system of denominational academies and colleges. Before 1850 several of these foundations were laid which, in time, became flourishing and useful institutions of learning. But, for some reason probably connected with the early trials of the country from war and financial embarassment, all these movements were anticipated by the activity of the public school, broadened to establish a system of public education similar to the attempt in New York and Georgia, in which a grand university organization was made to include the entire arrangement for schooling the whole population.

In 1817 the legislature passed "An act to establish the Catholepistemiad, or University of Michigan," and an attempt was made in Detroit, a building erected, and a small school of the elementary and secondary grade established. The plan included a central university and the establishment of local schools of all grades in a complete system. The leading central school was to be under an unsectarian influence, the leaders of the different churches being interested in the administration, and the use of the Bible being directed for moral instruction. It was a happy stroke of educational policy that identified the first real attempt to educate the people of Michigan with that uniformity of the entire system of popular instruction that has not yet been reached in any State east of the Alleghanies. As the first logical outcome of the New England common school was the cooperation of all sections in placing the educational clause in the ordinance of 1787, so the second and final step was taken when this grotesque Catholepistemiad, the University of Michigan, was held to include all that a great State could achieve for the schooling of its entire population.

In 1821 this motley group of Latinized pedantry slowly evolved into plain English as the beginning of a State university. The State was empowered to establish colleges, academies, and schools tributary to the University of Michigan. Religious tests in public education were, once for all, abolished. But it was not till 1829 that the general school laws were revised, a department of education established, and a superintendency of common schools recommended. The result was a three-months' annual common school, still incumbered by a rate bill, only to be remitted to the children of the poor. But even then, according to our own experience in our student days at a period a dozen years later, the wages of teachers were on a par with those of the present negro schoolmasters and mistresses in Mississippi, $6 to $8 per month for women and $12 to $20 for men. The territorial council granted charters for a few private and denominational academies.

The leader of the common-school movement of Michigan was John D. Pierce, whose service to the State was as valuable as that of Horace Mann to Massachusetts, or Henry Barnard to Rhode Island and Connecticut. A missionary, sent from the East and a graduate of Brown University, Rhode Island, he saw at once the great necessity and opportunity of the new land in which his lot was cast, and where he gave up his beloved and accomplished wife to early death.

In 1835 a convention, which planned the admission of Michigan to the Union, placed in the first constitution of the State a provision for a three months' school and the establishment of the university. This provision was the united work of General Crary and Mr. Pierce. Crary was an Eastern man who had acquainted himself, like the educators of the Eastern States, with the early educational system of Prussia and the report of Victor Cousin of France. It was to his wise and farseeing

policy that the school lands of the new State were rescued from the wasteful management of the townships and intrusted to the permanent charge of the State. It is owing to this that the 1,000,000 acres of common school and 46,000 acres of university lands bequeathed to the State have been so wisely managed as to inaugurate a new policy in this respect for the entire Northwest.

The constitutional provision of 1835 reads as follows:

ARTICLE X.—*Education.*

SEC. 1. The governor shall nominate, and by and with the advice and consent of the legislature, in joint vote, shall appoint a superintendent of public instruction, who shall hold his office for two years, and whose duties shall be prescribed by law.

The legislature shall encourage by all suitable means the promotion of intellectual, scientifical, and agricultural improvement. The proceeds of all lands that have been or hereafter may be granted by the United States to this State, for the support of schools, which shall hereafter be sold or disposed of, shall be and remain a perpetual fund; the interest of which, together with the rents of all such unsold lands, shall be inviolably appropriated to the support of schools throughout the State.

The legislature shall provide for a system of common schools, by which a school shall be kept up and supported in each school district at least three months in every year; and every school district neglecting to keep up and support such a school may be deprived of its equal proportion of the interest of the public fund.

As soon as the circumstances of the State will permit, the legislature shall provide for the establishment of libraries; one at least in each township; and the money which shall be paid by persons as an equivalent for exemption from military duty, and the clear proceeds of all fines assessed in the several counties for any breach of the penal laws, shall be exclusively applied for the support of said libraries.

The legislature shall take measures for the protection, improvement, or other disposition of such lands as have been, or may hereafter be, reserved or granted by the United States to this State for the support of a university; and the funds accruing from the rents or sales of such lands, or from any other source for the purpose aforesaid, shall be and remain a permanent fund for the support of said university, with such branches as the public convenience may hereafter demand for the promotion of literature, the arts and sciences, and as may be authorized by the terms of such grant; and it shall be the duty of the legislature, as soon as may be, to provide effectual means for the improvement and permanent security of the funds of said university.

This action was followed by the appointment of Mr. Pierce as superintendent of public instruction in 1836, on the admission of Michigan as the thirteenth new and the twenty-sixth State in the Union. For five years the new Commonwealth enjoyed the great advantage of having this wise and enthusiastic leader of education in the foremost official position in the Commonwealth. His educational ideas were largely influenced by his careful inspection of all that was being done in the East, and by his friendship for the great leaders of the "revival season" of 1830 to 1860. The organization of the university that took place in 1852 was a happy outcome of the experience of all the great collegiate institutions that have come up, under different auspices, in the older portions of the country.

By 1840 the educational system of Michigan may be said to have been well begun, although it was yet a full decade before it was in fair operation. At this time there were in the State more than 200,000 people, and the great agricultural and mining industries were getting well on their feet.

With this brief record of the earlier years of public education in Michigan, the first chapter of the story of the common school in the Northwest is virtually closed. Until the end of the first half century of the Republic in 1840, the States of Ohio, Indiana, and Illinois had been, as Territories and Commonwealths, for almost this entire period enjoying the benefit of national aid to education from the munificent gift of public lands for the common and university schooling of their entire youthful population. Yet in all these States the progress from the old-time, scattered, inefficient, and almost hopeless private, church, and corporate system prevailing in the Central and Southern States from which a majority of their early emigration was drawn, had been slow and discouraging to the friends of universal education. But, by the year 1840, these States had made their way educationally "out of the woods,"

and were reasonably sure of a permanent success in the great enterprise of educating their own people. But more than one decade was to pass before either of them came in sight of their splendid achievements in popular education during the past quarter of a century.

The State of Michigan alone was an exception to this record because of the delay of its final settlement until the earlier conflict of the organization of the northwestern country had passed by. Being chiefly settled by colonists from New England, western New York, and northern Ohio, who brought with them their favorite idea of popular education and the actual common school of the earlier years; being also greatly favored by the first continuous line of transportation between the Northeast and the Northwest through the Erie Canal, and the introduction of steam navigation on the Great Lakes, Michigan was able to begin at the point where its older and more southerly neighbors had left off. There was never in this State any real struggle for the establishment of the common school such as we have recorded in its three neighbors, Ohio, Indiana, and Illinois. Here, first, the wise policy of an effective correlation of all departments of public instruction was introduced and carried out with a vigor and public spirit that has placed Michigan high up on the roll of American States. Although, notably in Massachusetts and Virginia, and in less degree in New York and some of the later sixteen Commonwealths, State aid had been obtained for the earlier colleges; and, probably, the intention of the founders of Harvard was that it should become a State institution; and in the five new States beyond the Alleghanies a fair beginning had been made in the direction of establishing a State university founded on the land grant of Congress; yet in Michigan this policy was most fully apprehended and, from the first, carried out in an intelligent and successful manner. As a result, the University of Michigan now ranks all the State universities and maintains an enviable companionship with the most celebrated of the original foundations of the East; being in some ways the rival of them all and, in others, a model for the imitation of all establishments for the free higher education at the cost of the Commonwealth.

WISCONSIN.

The State of Wisconsin, last of this illustrious group of States organized out of the original Northwest, was, in succession, a portion of the Territories of Indiana, Illinois, and Michigan. The early history of its occupation by the French missionaries and traders from Canada, and the thrilling story of its Indian wars is every way as romantic and suggestive as of either of its neighbors. But in all this record there is little to interest the student of the American common school. No such idea as is contained in this title ever seems to have entered into the head of the benevolent "Fathers," who, through almost incredible toils, perils, and sacrifices, often unto death, for more than a century, virtually held the spiritual, social, and, in large measure, the industrial and civic affairs of this immense region under their control. Many of these were men of more than ordinary culture, and all of large native endowment for the work in which they were engaged. In some degree they provided for the schooling of the small class of superior families that were content to abide in the wilderness; and they gave to the children and youth of the "common people," and even to the Indians, the benefit of the regulation church catechizing, in some cases with the addition of the most elementary instruction in letters. But in neither the original civil nor educational government of the French provinces in the Canadas or Louisiana was there any real intention or practice of educating the masses of the people up to the self-respecting and self-helping conditions of their neighbors, the British provinces along the southern border.

The actual settlement of Wisconsin was delayed even beyond that of Michigan, of which it was, up to 1836, the "wilderness" portion. In 1818 the two counties of Brown and Crawford included its entire area of 54,450 square miles. In 1823 the Territory was first made a separate judicial district. In 1834 there were less than

5,000 people within its borders. Milwaukee was founded in 1835 and in this year the Territory sent its first delegate, George W. Jones, to Congress, and assumed its proper condition of separate Territorial existence in 1836. In 1836 the first Territorial legislature held its session, and in that year the first public school was opened, taught by Mr. West in Milwaukee. In 1838 the legislature took up its residence in the beautiful capital city of Madison, and in 1841 J. D. Doty was appointed governor. In 1846 the people voted on the decisive change to Statehood, and in 1848 Wisconsin was admitted to the Union—seventeenth of the new and thirtieth of the entire group of American Commonwealths. There were but 10,000 people in the Territory in 1836; but twelve years later, on its admission to the Union, there were 210,000.

The beginning of the common school in Wisconsin, in 1836, was made under the Michigan Territorial law. In 1836 the State University was nominally established by the dedication of two townships of Government lands, 46,000 acres, as its endowment, and the choice of Madison as its seat. Its original organization followed that of Michigan, and included the impracticable New York and Georgia scheme of making the university the working hand, instead of the crown, of the entire public school system; including, also, the establishment of subordinate schools and a board of examiners for them. At the beginning, apparently without serious debate, the public school system was rescued from all ecclesiastical entanglements by a declaration of absolute religious freedom in its administration.

In the first constitution of the State we read:

ARTICLE X.—*Education.*

SEC. 1. The supervision of public instruction shall be vested in a State superintendent and such other officers as the legislature shall direct. The State superintendent shall be chosen by the qualified electors of the State, in such manner as the legislature shall provide; his powers, duties, and compensation shall be prescribed by law: *Provided*, That his compensation shall not exceed the sum of twelve hundred dollars annually.

SEC. 2. The proceeds of all lands that have been or hereafter may be granted by the United States to the State for educational purposes (except the lands heretofore granted for the purposes of a university), and all moneys and the clear proceeds of all property that may accrue to the State by forfeiture or escheat, and all moneys which may be paid as an equivalent for exemption from military duty, and the clear proceeds of all fines collected in the several counties for any breach of the penal laws, and all moneys arising from any grant to the State where the purposes of such grant are not specified, and the five hundred thousand acres of land to which the State is entitled by the provisions of an act of Congress entitled "An act to appropriate the proceeds of the sales of the public lands and to grant preemption rights," approved the fourth day of September, one thousand eight hundred and forty-one, and also the five per centum of the net proceeds of the public lands to which the State shall become entitled on her admission into the Union (if Congress shall consent to such appropriation of the two grants last mentioned), shall be set apart as a separate fund, to be called the school fund, the interest of which, and all other revenues derived from the school lands, shall be exclusively applied to the following objects, to wit:

1. To the support and maintenance of common schools in each school district and the purchase of suitable libraries and apparatus therefor.

2. The residue shall be appropriated to the support and maintenance of academies and normal schools and suitable libraries and apparatus therefor.

3. The legislature shall provide by law for the establishment of district schools, which shall be as nearly uniform as practicable; and such schools shall be free and without charge for tuition to all children between the ages of four and twenty years, and no sectarian instruction shall be allowed therein.

4. Each town and city shall be required to raise by tax, annually, for the support of common schools therein, a sum not less than one-half the amount received by such town or city, respectively, for school purposes from the income of the school fund.

5. Provision shall be made by law for the distribution of the income of the school fund among the several towns and cities of the State, for the support of common schools therein, in some just proportion to the number of children and youth resident therein between the ages of four and twenty years, and no appropriation shall be made from the school fund to any city or town for the year in which said city or town shall fail to raise such tax, nor to any school district for the year in which a school shall not be maintained for at least three months.

6. Provision shall be made by law for the establishment of a State university at or near the seat of the State government, and for connecting with same, from time to time, such colleges, in different parts of the State, as the interests of education may require. The proceeds of all lands that have been or may hereafter be granted by the United States for the support of a university shall be and remain a perpetual fund, to be called the "university fund," the interest of which shall be appropriated to the use of a State university, and no sectarian instruction shall be allowed in said university.

7. The secretary of state, treasurer, and attorney-general shall constitute a board of commissioners for the sale of the school and university lands and for the investment of the funds arising therefrom. Any two of said commissioners shall be a quorum for the transaction of all business pertaining to the duties of their office.

8. Provision shall be made by law for the sale of all school and university lands after they shall have been appraised, and when any portion of such lands shall be sold, and the purchase money shall not be paid at the time of the sale, the commissioners shall take security by mortgage upon the land sold for the sum remaining unpaid, with seven per cent interest thereon, payable annually at the office of the treasurer. The commissioners shall be authorized to execute a good and sufficient conveyance to all purchasers of such lands, and to discharge any mortgages taken as security when the sum due thereon shall have been paid. The commissioners shall have power to withhold from sale any portion of said land when they shall deem it expedient, and shall invest all moneys arising from the sale of such lands, as well as all other university and school funds, in such manner as the legislature shall provide, and shall give such security for the faithful performance of their duties as may be required by law.

In 1850, at the second session of the State legislature, a complete system of public schools was established by law and a State superintendent of education appointed. The second report of Superintendent Root, in 1851, shows a phenomenal increase of interest during the first term of his administration. There were then 29 counties and 339 towns in the State; 1,800 entire and 700 partial school districts; 2,200 places where public school work was actually going on, with 68,000 children enrolled; 67 per cent of the school population in some sort of attendance five months in the year; men teachers receiving $17 and women $8 per month. There was $173,000 invested in 1,223 schoolhouses. There were also 87 private schools in the State, in which 3,500 pupils were instructed. The State school fund at that early period of its development amounted to $538,000, with an income of $47,000, about half a dollar a year to each child. Ten per cent of the State fund was appropriated for school libraries. This was the first response of Wisconsin to the new departure of its earliest State legislature in abolishing all Territorial statutes and inaugurating a complete system of instruction for the Commonwealth.

With this splendid record of the fifth and last of the original Northwestern States admitted to the Union, we suspend the attractive task of telling the story of the great development of popular education in the Northwest.

CHAPTER XXXIX.

THE AMERICAN COMMON SCHOOL IN NEW ENGLAND FROM 1790 TO 1840.

By Rev. A. D. Mayo, M. A., LL. D.

In a speech in the British Parliament, on the "Government plan of education," in 1847, Thomas Babington Macaulay said: "Illustrious forever in history were the founders of the Commonwealth of Massachusetts; though their love of freedom of conscience was illimitable and indestructible, they could see nothing servile or degrading in the principle that the State should take upon itself the charge of the education of the people."

We have traced the New England idea of universal education from its incorporation in the earliest colonial law of 1642 till the formation of the constitution of the State of Massachusetts, in 1780, the first time the duty of the State to educate the whole people was placed in the written fundamental law of a Commonwealth. Beginning now with Massachusetts, we are to follow the working out of this original ideal through what may be called the period of conflict; for through the first half century of the Republic the great enterprise, so bravely inaugurated and persisted in for one hundred and fifty years by the foremost colonies of New England, of schooling the entire population by the aid of a people's government, found itself beset with new difficulties and somewhat arrested in its logical development. No study can be more instructive in the peculiar method by which a characteristic American State, by means direct and indirect, encounters, deals with, and finally overcomes a great public peril than the story of the American common school during this most critical period in its career. For it must be evident to every careful student of the national history that had this fundamental institution of the New England civilization gone down in the struggle, the final establishment of any satisfactory scheme of universal education for the whole people of the United States would have either been an impossibility or have suffered an "indefinite postponement."

The victory in the war for independence and the mighty effort of organizing the new nationality of the United States were not achieved without the reaction on society, inevitable from every supreme effort of human nature. One of the most important of these results was the final breaking up of the virtual unanimity of religious belief and ecclesiastical administration which, for almost two centuries, had held the New England people in a grip of iron, and was the central inspiration of all activities in church, state, education, and social life. Even before the breaking out of the war the indications of this great change were apparent. Indeed, after the first forty years in the Massachusetts colony, the attempt to found a government on a theocracy of the Old Testament pattern had been abandoned with the abolition of the religious test of the suffrage. There still remained a personal tax imposed on every citizen for the support of public worship; but in time this was modified by the permission to appropriate it according to the ecclesiastical convictions of the taxpayer. But this was not felt to be a hardship in a community as

completely of one mind in religious matters as has ever been seen in any intelligent portion of Christendom. It has already been explained how, because of this unanimity in theological belief and church polity, the "religious question," which beyond the Hudson River for generations prevented the establishment of any general system of public instruction, did not appear as an obstacle in the leading New England colonies. For, while, as a matter of course, there was a good deal of religious teaching in all the schools, it did not provoke dissent, and, below the organism of the ecclesiastical congregational polity, the people had their own way in all public affairs. Until the period now considered the schools were all essentially public, being to a greater or less extent supported by State or local aid and always dependent on the legislature for their final status.

But the prodigious agitation of the Revolutionary epoch, with the intimate mingling of the New England soldiery, the majority in the field, with the people of the other colonies, brought in a loosening of the bonds of religious uniformity and filled the land with dissent and contention in the most vital concerns of the public welfare. Already, half a century before the Revolution, Harvard College, the theological barometer of Massachusetts, had been shaken by frequent outbreaks of what were regarded by the extreme religious party as "unsettled and heretical views" in matters religious. The old severe type of student discipline, imported from the British schools, had been overthrown. The offensive discrimination in social standing in classing the students had been done away with. An important official of the university had been chosen from the laity. In every struggle between the more stringent and liberal elements in the election of president and members of the faculty the victory more and more inclined to the broad-church side. It was a striking fact that even in the days of complete outward unanimity of religious sentiment and in the relentless application of a severe creed even to the affairs of social life neither Harvard University nor the grammar schools that were tributary to it were bound by any theological test. It was the inevitable development of this ideal of the freedom of education that now for a time came in, and, by its sharp collisions with the principle of denominational control of schools, greatly embarrassed the entire system of public instruction in New England for half a century.

The first result of this movement was the dissent of a considerable branch of the New England people from the dominant church and the coming up of the Baptist, Methodist, and Independent organizations. The Revolutionary epoch left a great deposit of open and secret unbelief in any form of Christianity, which the intimate connection of the American people with France and the popular sympathy with the earlier phases of the French Revolution intensified. The extreme republican views of Thomas Jefferson and the rising party in public affairs that owed allegiance to him provoked a strong reaction in the New England States, and the Puritan clergy became, in large measure, his most decided opponents.

The first educational demonstration was the effort to present Yale College in Connecticut to the people as the theological rival of Harvard, and for several years this institution contained the larger number of students. As early as 1762 the attempt to establish a rival college in Massachusetts alarmed the friends of Harvard. But it was not till 1795 that the free school, supported by the legacy of Col. Ephraim Williams, who lost his life in the French war in 1755, appeared as a challenge to Harvard in Williams College, in the northwest corner of the State.

Within ten years the remarkable religious movement that was the origin of the American Foreign Missionary Society gave to this new college, on the far-off border of the State, a name and fame it has never lost. Later came the establishment of Amherst College, in the valley of the Connecticut, in the year 1818, developed also from an academy founded in that beautiful village as early as 1815. Both these new colleges, with Harvard, up to the year 1840 were to a greater or less extent the recipients of the State's bounty; and, while greatly extending the application of good culture to the people, were also powerful instrumentalities in the develop-

ment of the religious dissent that wrought at cross-purposes with the complete success of the people's common school.

For it must always be kept in mind that the Massachusetts policy of general education, afterwards developed into the idea of the American common school, included all grades of instruction. It began at the top, in the founding of Harvard College in 1637, by what was then a munificent endowment for a colony so small and straitened in the goods of this world. To all intents and purposes Harvard was as essentially a State university during the first century of its existence as any of the great schools called by this name later in the West. The legislature of the colony always claimed and exercised the right of changing its organization, to a considerable extent subsidized it, and, till a later period, the governor, lieutenant-governor, and a portion of the senate of the State were included in its board of overseers. The liberal arrangements and free spirit which, from the beginning, had characterized this in many respects most catholic of American universities kept it in close communication with the public grammar schools on which it depended for its student material. For many years the grammar and even the common district schools of the State were being taught by the clergy, students, and young graduates of the university and the colleges.

These "free schools," "grammar schools," "academies" were the second step made by the people of the colony toward a complete system of public instruction, already a sort of university extension "dispensed to the superior people." During the entire period before the Revolution they constituted the most influential department of the common school system. With few exceptions organized by a movement of the whole people, incorporated by the legislature, their boards of administration chosen by the people or appointed in their charter, to a considerable extent supported by public appropriations, State or local, these seminaries were the ancestors of the free high school which now in Massachusetts has obtained its highest development in the Union. Ninety per cent of the children of that State live in towns where a high school is located and all towns are empowered to support students in them—the only State in which the establishment of this class of schools is made compulsory by legal enactment.

In the year 1789 the somewhat languid organization of public instruction below the free grammar schools was strengthened by the act requiring every town of 100 families to maintain 1 school for six months, or 2 or more for terms that should together be equivalent to six months, in which should be taught orthography, reading, writing, English grammar, geography, and "decent behavior." From this act dates the appearance of the "district school system" in New England, by which every town was divided into districts, to favor the attendance of the children. Towns of 200 families and upward were required to support a grammar school and teachers to obtain a certificate of good morals and reliable character. In 1800 the towns were empowered to call meetings of the people of their districts for the purpose of raising money to build and furnish schoolhouses, and in 1817 school districts were made corporations and empowered to hold property for educational purposes.

This organization of public instruction, by making the district within the town the unit of activity, was a natural outcome of the intensely independent character of the New England people, who reluctantly parted with the least fragment of local authority. It was also, in great measure, enforced upon the people by the necessities of the case; the population outside the villages living in a sparsely settled, rural country; the towns 6 miles square; rapid transit impossible from the borders over the lofty hills and through the dense forests, and during the winter greatly hindered by deep snows and the severity of the weather.

There was yet no educational State school fund, the earliest movement for this dating from 1834, and there has never been in Massachusetts any considerable State tax for education; up to a very late period all, save perhaps $150,000, of the nearly $10,000,000 expended on schools in the State being raised by local taxation, personal

gifts, or some form of cooperation. There can be little doubt that in the earlier stages of the development of the elementary department of public instruction the district arrangement was a powerful agency of success. It bound up the families of a little neighborhood district in a corporation, intensely interested in the most vital need of a community—the education of the children; made the district school the focus of public interest, even more than the sometimes distant church, and ground into the conviction of the people the all-important fact that the schools must be supported by their own ample and annual contributions. This is the first and most important condition of the success of any complete system of common schools, for, until the habit of local support is formed, there can be no security that the system of public education will have any but a variable income. The very slow growth of the public school in the new Northwest, and the present condition of the common school system of the Southern States, testify that this is the "previous question" which cuts off all others in the successful administration of this institution.

That the New England "district system" did at first accomplish this there can be no reasonable doubt. That, as the years went on, with the rapid development of village and city life, and the concentration of wealth in centers of industrial activity, serious disadvantages were developed which hindered the best results in the country district schools of New England, there can be as little doubt. The strong conservative instincts of the New England people still clustered about this, one of the most characteristic features of the old-time society. Even the fiery zeal of Horace Mann and his startling exposure of the disadvantages of the arrangement, especially after the drift of active young people from the rural districts caused by the rise of manufactures at home and the emigration to the West, could not prevail against this love of dealing at first hand with an interest so sacred as the schooling of the children. It was not till 1882 that the district system was finally abolished in Massachusetts and the town made the unit of school administration. In the remaining New England States this system held on till a later date, and it still obtains in Connecticut to the confessed injury of its educational interests.

The second colonial act for the furtherance of education, in 1647, had established a common-school system which was both compulsory on the people and free, as far as the elementary schools were concerned. This act required every town of 50 householders to support a school for all to learn to read and write; and every town of 100 families to establish a grammar school, where "youth may be fitted for the university." It is affirmed that this is the first act of any State to establish a free public school, supported and supervised by the whole people. In 1683 all towns of 500 families were required to maintain 2 grammar schools and "two writing schools;" the latter corresponding to the present elementary schools, although they gave little more than the bare elements of knowledge. The provision in the constitution of the State adopted in 1780 seems to give a much wider latitude to the legal support of education. It includes "the university at Cambridge; public schools and grammar schools in towns; the interests of literature and the sciences and all seminaries of them; encouraging private societies and public institutions by rewards and immunities for the promotion of agriculture, arts, sciences, commerce, trade, manufactures, and a natural history of the country," besides a generous measure of public supervision and encouragement of all the private and public virtues. This ideal of State oversight of the higher interests of the people was written by John Adams and stands in the constitution of the Commonwealth to-day, although by successive legislatures the sphere of governmental interference with the general mental and moral development of the people has been greatly limited. It was under the broad provisions of this fundamental law that the acts already referred to, of 1789, 1800, and 1817, were passed.

It is probable that, with the development of the district school system and the increasing expense of building houses and keeping alive a four-months school in the year, the ability of all save the few larger towns was not sufficient for the support of the old-time grammar school "to fit youth for the university." At any rate this

clause of the school law seems to have fallen into desuetude as early as the beginning of the present century. In order to meet this growing necessity of the secondary education, the general court in 1797 acted on the report of a committee, of which Nathan Dane, already identified with the great ordinance of 1787, was chairman, in which the practice that had grown up of endowing academies by the gift of wild lands in Maine, then a part of Massachusetts, was raised to a definite policy and was continued for twenty-five years. At this time 7 academical schools, 4 in Maine and 3 in Massachusetts, had already been subsidized by gifts of a township of land to each. It was further provided that half a township of land should be given to several more of this class of schools that there might be an endowed academy for every 25,000 people in the Commonwealth. By this act the State reaffirmed its original policy of subsidizing the secondary as well as the higher education. These schools, first called academies by the dissenting religionists of England who were debarred from the use of the universities and great public schools by religious disabilities, were not essentially different from the free high and middle schools of Great Britain, although somewhat modified from their ancient exclusively classic character to meet the demand for the general education of all who desired to go beyond the district common school.

Besides these academies endowed by the State a large number came up by the action of the towns, chartered by the State and empowered to hold educational funds from $5,000 to $100,000; the majority not exceeding $20,000, and yet purely local in their establishment, private, or denominational. In 1800 there were 14 of these incorporated academies, but the number rapidly increased until, in 1840, there were more than 50 in the State. The benefaction of Governor Hopkins, of Connecticut, at an earlier period, had given to New Haven and Hartford, Conn., and Hadley and Cambridge, Mass., a lift in this direction. Dummer Academy at Byfield, Newbury, was the oldest of these academical schools, established in 1763. In a report to the legislature in 1859 it is stated that "no academy endowed by a town or a State is a private school. Academies are all, to a certain extent, public schools, established as such upon a legal basis of public policy."

These schools were established with the fixed intention of extending the advantages of a superior education. They were all of local importance, enabling the youth of both sexes to extend their acquaintance with letters. Many of them were noted in their day, and, like the celebrated Phillips academies, are still among the best seminaries of the country. A succession of able and often admirable men presided over them, and the generation of famous public characters in New England during the first half of the present century was largely educated therein. In respect to the teaching of the classics, even in the early colonial days, the grammar schools were not inferior to the best in England. The student was required to read, write, and speak Latin, and be well informed in the Greek grammar in order to be admitted to Harvard, and both languages, with the Hebrew, were included in the college curriculum.

And not the least of the merits of the better academies was their social influence upon their pupils. They made the towns in which they were established the proper educational and cultivated social centers of the State. Here came the ambitious boys and girls from "the whole region round about," often at desperate sacrifice, to obtain the schooling necessary to enable them to teach and fill all honorable places in the community, as well as to fit themselves for college. The discipline was good, and the intercourse between the sexes generally a model of natural and virtuous conduct. The village in which the school was located was to its pupils a great, open household, where they came and went with the confidence and enjoyment of a generous hospitality. The churches were closely connected with them, and depended largely on their teachers and older pupils for aid in music and teaching in the Sunday school. None of them gave free tuition; but the expenses were not discouraging, the wages of a district school teacher for a term of three months at $10 to $20 a month being sufficient for all charges for a corresponding term. Many

students from the best families of New England were thus schooled in the intermediate time before the present elaborate orgnization of the common school. And, although the present high school of Massachusetts, to which every child has free access, is often a better school, especially in the breadth of its course of study and superior methods of instruction, yet there went forth from the old-time academy a peculiar and powerful influence to bind together the rising hope of the land, which no longer is enjoyed or even understood by the present favored generation.

But the people of Massachusetts were not satisfied even with this opportunity, and, in 1826, the law now in force was passed, compelling every town of 500 families to support a free English high school, and every town of 4,000 inhabitants a high school where pupils could be fitted for college. This has now become a permissive law for all the remaining towns in the State, with a provision that children in communities not supporting a high school may be educated at public expense in a neighboring town.

In 1826 all towns were required to elect a school committee, which exercised a restraint on the conduct of "the prudential committees" of the districts, also examined teachers, and in a general way supervised all the schools. This could be made an admirable system of supervision. The school committee of 3, or some number divisible by 3, elected in successive years, was generally composed of the clergymen and other leading citizens who, with small compensation, rendered valuable service to the people by a constant and affectionate oversight of the school children. The school districts after 1827 were empowered to hire their own teachers, but their power was limited by the examining board, consisting of the school committee of the town. Outside of this there was no supervision of the common schools. The county is a comparatively uninfluential factor in the civil administration of New England and only in one State, Massachusetts, has a system been recently established of district supervision whereby several towns unite for this purpose. Boston did not recognize the need of a city superintendent until 1851, and few of the cities of New England followed her example till a considerably later period. The obstinate faith in the Yankee mind and heart that the people, by their direct representatives, themselves watched and supervised by everybody in town, were capable of managing their own educational affairs, had its good and evil side. It did build up a wondrous public sentiment and a remarkable capacity for dealing with the largest affairs of the country. It sent forth thousands of young men and women to all parts of the nation, competent to any demand of public responsibility. It kept alive the love for education, growing year by year, and to-day, under conditions so widely different, it holds up New England, on the extreme corner of the Union, to an excellence in educational matters not only confessed at home but well understood in all the great centers of good learning in christendom.

The city of Boston, from the first the head and front of New England culture, industrial enterprise, and philanthropic zeal, always had its own "notion" concerning public school matters. It was deeply concerned in the establishment and support of Harvard College in Cambridge, and for a century the great school of the city. The legislature that established the school sat in Boston and it was only an hour's walk from the old State House to College Green. At first Harvard was only a grammar school, and later a secondary school was set up by its side. The faculty were chiefly taken from the most distinguished classes of the city, and the Puritan preachers generally were educated there. For sixty-five years the graduates numbered only 8 a year; but out of its student population came a body of men that made a deep impression on the provincial life. Some of them were from England and returned to achieve high distinction in important positions. The ministers and teachers of New England for a century, and especially of Massachusetts, were largely drawn from this favored class. While the original endowment of £400 came from the colonial legislature, and the first private gift of importance from a young English gentleman, John Harvard, hardly domiciled in the province, the college, for more than half a century, was cherished in the heart of the people. The leading New England colonies

were assessed in private and public contributions for its support, and until the Revolution there was a steady wind of benefaction blowing across the ocean from Great Britain. But Boston was always at its right hand for material and spiritual aid. A marvelous and almost pathetic combination of gifts was all the time flowing in. Such was the early habit of giving for education that there can be no doubt that this city, for regular and systematic contributions to education, charity, science, and arts, is unsurpassed by any community anywhere.

The Boston Latin School, established about the same time, was from the first the pride of the city. A second school of the same type, afterwards set up, was abolished and the present institution is now one of the best known and highly esteemed schools of the higher secondary grade in the United States. Up to the period now in review, the schools of Boston were classed as "reading" and "writing;" the former proper academies, and the latter a meager arrangement, generally in session at the off hours of the regular school. The children, before the age of 7, were instructed entirely in private. The ability to read English was the condition of admittance to the grammar school. The girls were only permitted to attend the writing schools until 1789. Then Caleb Bingham opened a private school of a superior grade, which at once attracted a crowd of young women, and so prevailed with the fathers of the town that they "broke the record" of a century and a half and reconstructed the school system, giving the boys and girls alternate sessions in a double-headed grammar school course. This arrangement held on for forty years. Still the girls were allowed to attend but six months in a year, from April to October; though all this time, and long before, the common schools of the rural districts and villages were coeducational. The Latin school at this time taught only Latin, and its pupils were obliged to go to the grammar schools or to private schools taught by the regular teachers for what they could gather in English. At this time a school board of 12 members was established, taking the place of the "selectmen" of the town and volunteering assistance in the management of the schools; and among them are found the names of the most distinguished men of the city.

The Latin School dates from 1649; the grammar schools from 1684. In 1685 there were 4 grammar schools in the city. In 1812 a special school was established for colored children. In 1818 $5,000 was appropriated for the schooling of children from 4 to 7 years of age, the beginning of public primary education in Boston. In 1821 the present English High School for boys was established; and in 1828 a similar school was opened for girls. But Boston was not yet enlightened on the "woman question" in education, and abandoned this school after a few years, granting in its place an extra two years in the grammar schools to the girls. In 1828, 10 schools, 1 in each primary district, were established as intermediate between the grammar and the primary schools.

The Boston "master," from the days of old Master Cheever down, was a mighty man in the land. He did not lose his importance as the years rolled on. One of the most strenuous of the many battles of Horace Mann was fought against a combination of these Boston masters who were dissatisfied with his upsetting policy; and not until 1851 did they bend their necks under the easy yoke and the light burden of the amiable régime of a Boston school superintendency, which has always been the mildest method by which a supervising man could persuade, coax, and, often by indirect policy, bring in the most important educational reforms.

It is a difficult, almost an impossible task, to determine the quality of the instruction in the schools of Massachusetts during this period. Beginning with Harvard University, it may be said in general that, while the fifty years between 1790 and 1840 were not the period of its greatest celebrity, compared with the present administration a day of small things, yet there was on several lines a steady advance, and at no time did this institution lose its original character as the foremost of American universities.

One cause of its apparent loss of ground during these years was the theological and ecclesiastical entanglement into which it was forced by the logic of its original

unsectarian foundation. In common with all the public grammar schools of the colony Harvard, in its original charter, set up no restraint in the direction of religious belief as concerning its student population. The fundamental idea of the college was that of an institution of learning, sworn to fidelity to the Christian religion, and consecrated to the training of young men for the Christian ministry. The first college seal which, after two changes, still remains the one authorized by the college record—"three open Bibles on the field of an heraldic shield with a syllable of 'veritas' upon each of them"—was significant at once of Christian discipleship and confidence in the power of truth. The sentences, "In Christi gloriam" and "Christo et ecclesiæ," marked the force of the Puritan influence near the beginning of the eighteenth century. But despite the pressure of a portion of the more zealous clergy and the almost complete occupation of all its positions of eminence by this class, Harvard at heart always seems to have been a layman's college, and in all her dealings with ecclesiastical affairs to have gravitated to the convictions of the foremost civic, literary, and educational leaders of the State.

At the period now spoken of, owing to the notable change in the theological complexion of many of the old Puritan churches, which, following the lead of Dr. Channing, were carried over to a position of extreme independency and a sympathy with what was known as the Unitarian belief, the body of overseers, drawn from public men and the clergymen of the six towns adjacent to Boston, became identified with what was regarded the new heresy; the clergy and laity representing churches with which many of those of the "Evangelical" persuasion would hold no "communion." This change for a generation threw the university almost entirely in charge of a management drawn largely from the membership of the fifty leading churches of the Unitarian faith in and around Boston. The theological school became the headquarters for the clerical supply of these churches, and the president and professors of Harvard, with few exceptions, were of similar type. This did not in the least change the theoretical attitude of the college, which remained open to the utmost freedom of thought with no spirit of persecution to opponents in the faith. As all but one of the remaining colleges of New England, now several in number, were directly connected with one of these great evangelical bodies, and all offered respectable opportunities to their students at smaller pecuniary cost than Harvard, it was not strange that its patronage did not rapidly increase, and that it fell somewhat under the imputation of being a Boston preserve—a sort of educational "chapel of ease" for the sons of wealthy families of city proclivities, moderately reinforced by a similar class from other States.

Another cause of this partial suspension of activity and influence was the habit, half a century ago confirmed in all American colleges, of raising clergymen or professional scholars to the presidency. For an academy or a small college of the denominational type this was a good enough policy, and many of the most eminent presidents and professors of the country have been drawn from the clerical ranks. But it is not often that the large financial and executive capacity and the knowledge of and broad cosmopolitan sympathy with the world now essential to maneuver a great collegiate school through the tempestuous seas of American life is found in connection with this profession. The presidents of Harvard during this half century were a body of admirable men, several of great scholarship and some on the way to distinguished public station. But it was evident that the college was still in a degree local in its sympathies, representing the spirit of the eastern New England religious, literary, and social class, and not sufficiently open to impressions from other parts of the Union. The growing alienation of the Southern States from the North, especially from New England, which was regarded as the head and front of the great political heresy of "abolitionism," also diverted from the college a considerable number of students from this quarter. The university was still in theory largely under the influence of the State; its board of overseers, the governor, lieutenant-governor, senate, and the State still claiming a sort of authority as a final court of appeal. But its real "steering committee" was, as now, the

corporation of Fellows, a body of 7 men, practically a close corporation where all important matters originated, and without whose consent nothing could be done.

But as far as concerned the discipline, the curriculum, methods of instruction, general spirit, and steady increase of educational force, this period was one of the first importance. During these years, apparently uneventful, the old Harvard was steadily renewing itself and laying the strong foundations on which could be erected the imposing superstructure of its present great prosperity and world-wide fame. More than 20 of the most important professorships and lectureships were either founded or fully endowed between 1790 and 1840. Several of these chairs were occupied at different times by men like Buckminster and Channing, Parker and Story, Pierce, Longfellow, Frisbie, Ticknor, Follen, and Sparks, while the latter, with Everett, Walker, and Felton, sat in the presidential chair. The type of instruction was not inferior, indeed confessedly superior, to anything then in vogue in the country. The course of study had been greatly enlarged. It was during this period that the first attempt was made to introduce the present elective system of study. In the year 1824 the old ironclad scheme of two centuries was first broken into, and under the influence of Prof. George Ticknor and Judge Story a new arrangement of studies was effected in 1825–1827. This movement continued with variable results until 1849, when the college fell back, and until 1886 Harvard went on in a course of study not dissimilar to that of the larger American colleges, although of somewhat broader scope and adorned by the eminent scholarship and literary power of some of its great professors.

Jared Sparks, Andrew Peabody, F. H. Hedge, James Walker, Charles Follen, Francis Bowen, Thomas Hill, and others, had a reputation far beyond university walls. In the theological department were found Norton, Palfrey, Francis, Noyes, Stearns, Abbot, Peabody, and the two Wares, and from this school went out a body of clergymen of the Unitarian faith who became largely identified with the support of education, philanthropy, and reform politics in all portions of the Union.

But perhaps the most evident change in Harvard during this period was the complete abolition of the old semimonastic type of discipline, in which it had writhed, as in an iron cage, for two centuries. The reading of the original body of "rules and regulations" under which, with slight modifications, the college went on for one hundred years, is like witnessing a sort of dumb show of human nature on the rack of a scheme of life that in aiming at spirituality and the supernatural is all the time hovering on the verge of a half-savage brutality. The result was that for more than a century the reputation of Harvard as a college for disorder of many kinds made it a byword and a warning to the country. It was only after a generation of this experience that the authorities of the institution learned that after all a college student is a man in the making, and that a boy, a mischievous or even a wicked boy, can be handled best along the lines of a Christian sympathy and confidence combined with the example of a faith which, even in learned pundits and doctors in spectacles, has not parted with humanity and common sense.

From a condition of affairs in which the members of the lower classes lived in a state of perpetual humiliation toward their superiors; when the solemn farce of trouncing a bad boy was opened and closed with prayer by the venerable president, himself the executioner; when a system of constant suspicion and tireless vigilance in spying out offenses was in full blast; when the relation between student and professor was, at best, a sort of "armed neutrality," to the present state, with the improved relations between the classes; the college gymnasium and "athletics" in which the bounding animal spirits of the young men can be duly exploded, and the perpetual stimulus of a course of study that by its variety, thoroughness, and adaptation to all grades of capacity and taste, appeals to all but invincible dullness or incurable levity or vice, is one of the most striking proofs of the growth of a wise and Christian educational theory and practice during the lifetime of one set of college men. The two rival colleges, Williams and Amherst, coming up at a later date, were never encumbered with this absurd mechanism of instruction and discipline.

Under the admirable presidency of Mark Hopkins and Dr. Humphrey, sustained by a remarkable body of scholarly and devoted professors, these schools grew steadily in favor with the New England people. Within the past twenty years they have shared in the prodigious expansion of endowment and patronage enjoyed by all the New England colleges, and at present are not excelled by any similar institutions of the higher education in the country.

It is unnecessary to add to what has already been said respecting the change from the old-time system of public grammar schools to the academical régime of this period. In one respect it was not an advantage; for while, as late as 1840, probably not a dozen towns in Massachusetts were supporting a free high school of special merit, there was space for all that the 50 or more academies and private seminaries in the Commonwealth could accomplish. Some of these during these years achieved a commanding reputation, and to-day, for a thorough and extended course of study, rank with many colleges of other States. A few had little cause for existence and "died a natural death." But the majority, while sharing the defects of the prevailing secondary educational methods and generally short in teaching force, were a real opportunity to the youth of the adjoining regions. Without them it would have been impossible that the work of the secondary education could have been carried on. While, doubtless, in some ways a barrier to the more rapid advancement of the common school, they were not often found in public opposition to it. The teachers of the common schools for fifty years found in them the only competent instruction for their work, a large proportion of their students being engaged during the winter and midsummer months in the district and village schools of their respective neighborhoods. Notwithstanding the opposition of some of the more conservative principals, the majority of the smaller academies gracefully yielded to the necessity of the more complete system of high schools which came in with the new development of village and city life, the attractions of manufacturing industry, and the concentration of population. Many of them were finally merged, with their buildings and funds, in the new high school of the town, and bear an honorable record of the educational life of the neighborhood seminary from its earliest settlement.

Such was the organization of the common school system of Massachusetts up to the year 1837, when, by the establishment of the State board of education and the appointment of Horace Mann as its first secretary, the State for the first time laid its powerful hand in earnest to the gigantic work of revising the entire system of public instruction. The early reports of Secretary Mann revealed the actual condition of educational affairs at this time as respects the elementary district schools of the several districts and villages of the State. Without entering on the complete discussion of these famous reports, we now refer, in passing, to the results achieved for popular education by the support of the common school system two hundred years in this the first American State to adopt it, and, in several important particulars, the Commonwealth which has the honor of establishing the present system of the American common school.

At the close of the first half century of the Republic, 1840, the State of Massachusetts had a population, in round numbers, of 700,000, and a taxable valuation of $206,500,000. There were 3,000 public schools in the State, with 265,000 pupils, and an average attendance of 207,000, six months and twenty-five days in the year. There were 6,000 teachers of all grades; two-fifths of the number men. These teachers were paid on an average $25.44 for men and $11.38 for women per month, with board in families of the district or at a permanent place. There was raised by taxation for public schools $465,000, by a tax of .0022, $2.63 for each child between 4 and 16. There were 854 academies and private schools in the Commonwealth, attended by 27,000 pupils, costing the people $340,000. The country teachers often were supported by the system of "boarding round," each family entertaining in proportion to its number of children in school. It will be seen that Massachusetts at that time was expending for the education of 27,000 children and youth—one-tenth

of the whole number attending school in private institutes—three-fourths the entire sum paid for 265,000 pupils in the common schools.

Notwithstanding the law of 1826 regarding the establishment of free high schools in towns of a certain population, only 14 of the 43 to which the statute applied had complied therewith. The supervision of the schools was completely in the hands of the school committee; there was not a city, district, or State supervisor in the Commonwealth, and in many of the towns, even in some of the considerable places, the school committees were grossly negligent of their duty. In only one-fifth of the towns did the school committees receive compensation for their labor, and the demand for remuneration often resulted in the loss of a reelection. In the first report of these committees, including 294 of the 305 towns in the State, "there was great complaint of the condition of the schoolhouses, of the literary and professional qualifications of the teachers, irregularity of attendance, and the general apathy manifested by all toward popular education."

In 1827 Governor Levi Lincoln said in his message: "The cause of learning languishes both from the parents and incompetence of instructors." There was no school for the special instruction of teachers in the State, although from 1827 repeated efforts had been made in the legislature to appropriate funds for a normal school. The result of all these efforts was the establishment of a State school fund in 1834 from the sale of wild lands in Maine, the claim of the State on the Government of the United States for military services, and 50 per cent of all moneys thereafter to be received from the sales of public lands. The State fund was limited to $1,000,000 and its distribution left to the legislature. Until 1826 the election of school committees by towns was optional, afterwards compulsory, and in 1838 they were required to present annual reports to the towns and to contract with the teachers of the public schools, with $1 a day for their services. Since the passage of the law of 1789 the towns had been divided into school districts, which in 1817 were made corporations and in 1827 authorized to elect prudential committees for local administration. Horace Mann declared "the law of 1789, authorizing towns to divide themselves into school districts, the most unfortunate law on the subject of common schools ever enacted in the State." And Secretary Dickinson declares that "in every section of the country education had found this law the greatest obstacle to any intelligent progress in the schools." It was forty years later, 1882, that after repeated efforts the district system was finally abolished and the town or city made the unit of common-school administration in Massachusetts. The movement to supply the schools with libraries was one feature of the "new departure" of 1837. Previous to this only social and private libraries had existed, rarely free to all readers.

The operating causes of this condition of educational affairs in a State that for two centuries had been foremost in its regard for popular instruction, and was never indifferent to good culture, must be found radically in the spirit of personal and local independence, which is one of the most potent elements of the success of New England, and still remains a marked characteristic of the native-born New Englander. It was this that for ninety years held on to the district school system in town and city in Massachusetts, and in several of the New England States even for one hundred years. There being in Massachusetts no system of State taxation for education, and until 1834 no State school fund, the people relied solely on their own local taxation for the support of their schools. In the majority of towns the people were in no condition to supply the funds needed for the building of good schoolhouses, the payment of competent teachers, and the general conduct of good schools. The physical structure of the country through nine-tenths of the State, at first a wilderness of hills and dense woods, and the severity of the climate in winter compelled a division of each township into several districts, often little more than a neighborhood.

Another cause is found in the fact that this was emphatically the period in New England of church disintegration; the first great breaking up of the old Puritan

organization of religious affairs, which until the beginning of the century had virtually included the whole population of the State, into antagonistic denominations. Each of them was moved by a natural impulse to establish its own system of academies and colleges, and each of the leading Protestant bodies soon had in New England a college and a theological seminary of its own faith. And while there seems to have been no general crusade against the public school system from this quarter there was a powerful indirect influence, especially among the more cultivated and zealous religious people, to send their children to the denominational schools.

In 1837 there were nearly three times as many private and academical schools in the State as towns, and it became a fashion for every village of any importance to attempt to support a school of the secondary sort. There was also a custom of holding a "fall" school for one term in the autumn. It was of a higher grade than the district school, and was attended only by those who paid tuition fees. In these academies, private schools, and colleges the superior common school teachers received all the education required by the popular demand, but with practically no training in pedagogics. It was very much the practice that every ambitious young man and woman at all inclined to study regarded it almost a social necessity to "keep school" for one or more terms in summer or winter. The old-time ideas of social distinction were still in force, and the "upper ten" did not take to the notion of "mixing" their own offspring with the children of the "common people."

These causes, combined with the great public agitation of these troubled years, the war with Great Britain in 1812, so disastrous to the industrial interests of New England, and the slow recovery from the fearful poverty in which the whole country was left by the Revolutionary epoch, sufficiently explain the fact that in 1837, after two hundred years of the common school, the State of Massachusetts did not appropriate so large a sum per capita for the children in her public schools as any State of the South to-day, and that the average wages of the teachers in these schools did not exceed those of the present negro instructors of common schools for the colored children of this entire section.

But below this record of the outward condition of the common schools of Massachusetts, then the best in the Union, lies the more important estimate of the quality of the instruction there dispensed and the question what actual progress had been made in this respect during this period of fifty years.

We are compelled to believe that the common school of New England of this period has suffered injustice in the critical estimate of the expert educator of the present time. In American affairs it is always probable that the expert of any sort, at home or abroad, will fail to appreciate the actual condition of the national life. For affairs in a Republic constituted like our own depend not only on the present will, but the actual mental and moral status of the people who, in fact, reconstruct every American institution with every new year. The American common school, at any period of its existence, can never be fairly estimated by comparison with a system like the German, in which a practically despotic power at the head of national affairs determines its organization and is felt as a directing hand to the outermost extremity of its administration, enforcing compulsory laws of school attendance, and holding the entire scheme of secondary, university, and professional instruction, public and private, under its control. Especially in the New England States, in the period now under consideration, the common schools were exclusively in the hands of the people of each locality, and in the continental European estimation would not be regarded a system at all, being mainly dependent on the ability and spirit of the people of each neighborhood in a civilization where a forcible executive personality was the ideal of superiority, and a lively political jealousy was always on the alert against aggressions on the common welfare, combined with the overweening influence of men of strong prejudices and obstinate will. Hence it is only by a general survey of the condition of New England society as a whole and the educational spirit and habits of a State like Massachusetts, especially by an

intimate knowledge of the peculiarities of society in the New England towns, that a fair conception can be obtained of the actual status of education at this time. Our own early educational experience dates back to the last decade of this period—1830–1840—and with that in view we are able to estimate facts greatly modifying the conclusions that might be drawn from the study of the school life of that day.

The one fact apparent to every well-informed person in this period of the life of New England in general, and Massachusetts in particular, is that there was in every region of society a profound respect for education and a universal habit of reverence for an educated class. In every little town, however backward, there were children and youth whose proficiency in the common school and love for study made them conspicuous, "the town talk." The deep interest with which the progress of such a boy or girl was watched, and the great efforts of parents, friends, often strangers, to aid any capable and aspiring student in "getting an education," were a beautiful feature of the town life. The clergy were especially noted for this patriotic spirit. They were generally members of the school committees and often watched the schools with sleepless vigilance. Their sons and daughters were often the teachers, and every country minister of any pretension to scholarship drew about him a group of bright young people for mental improvement, often "fitting for college" those who were unable to pay the expense of attendance on a classical seminary. The district school shared with the church the constant interest of the people in all save exceptional towns. In the dearth of popular amusements and an exciting outward life, its goings on were canvassed in every household, and the influence of the superior people was a powerful factor in its success.

The college and academy were at that time a far more pronounced subject of general interest than at present. There was, in the rural districts and the villages, practically no element of population supplied from "foreign parts," and no organized religion opposed to the prevailing Protestant church. The clergymen were almost universally graduates of the colleges and the influential teachers and directors of the leading seminaries, and they constantly kept before the people not only the merits of the higher education, but a personal interest in the president and professors of the college and the principals and teachers of the best secondary academic schools in the neighborhood. Notwithstanding the dearth of books for general circulation and the feeble estate of journalism, there were still, in almost every town, small collections of good English literature accessible to every eager youth. It was a fixed habit of the men to meet at the village store, the shoemaker's, blacksmith's, and carpenter's shops, the various mills, especially the gristmill and sawmill, to hear the weekly "paper" read and to thoroughly discuss its contents, and this kept alive an intense interest in the discussion of all affairs of public and local interest. A New England town of 1,000 people, seventy-five years ago, with a village at the center of half a hundred houses, during the long winter months shut up from travel, with all its energies turned in upon itself, was a battery of electric brains. Men, women, and the older children, were in constant social communication, meeting often several times a week at church, lyceum, and visiting; kept alive by a vital interest in all things important to a good community. The one unfortunate habit of "drink," which was the scourge of so many of these places, had not yet undermined the personal virtue of the people to a dangerous degree; and the old-time style of personal self-respect, of noninterference with the rights, opinions, and even prejudices of neighbors and townsmen, so favorable to the growth of practical good living, original thinking, and common sense, was a prodigious power in shaping the peculiar life of the New England town.

And there can be no question that the teachers of the district schools in New England during this period were drawn from a superior grade of the population, and in many instances were more competent than at the present time. Notwithstanding the low rate of wages, school teaching was almost the only occupation by which ready money could be earned by young people of either sex. Especially was this true of the young women who had not fallen upon the days when 350 ways of getting a

respectable livelihood are open to the sex. The occupation was thoroughly respectable, even honorable, and the schoolmaster and schoolmistress were, as often as otherwise, called from the best social and educated class. It would be a singular community in which many of the young women in highest estimation had not been, for a year or two, occupied in this way. The boys who proposed to go to college or look toward professional life taught school in the winter term of two to four months, and thousands of students in this fashion "paid their way" through the academy and college. The habit of "boarding round" brought these teachers in contact with the families of their pupils. Or, when the teacher was domiciled at home or in a permanent place, the best society of the district and town was opened to the newcomer.

The coming to a town which supported half a dozen district schools of several college students every winter, or of fine young women from abroad during the summer, was a positive element in the society of the place. For a term of several months of their residence these interesting strangers were the center of attraction, and, if superior young people, they became a notable addition to the mental and moral resources of the home-staying youth. They were the "main-stay" of the winter lyceum, the delight of the winter evening party, the zest of the summer trip to the mountain, or the Saturday outing, and often the most interesting relations of life were the outcome of this experience. In this way there was a perpetual circulation of the genuine life-blood of society, consisting of the most attractive and promising young folks of the Commonwealth through all portions of the State; and a true democracy of character, ability, and culture was thus obtained. And this was the time when the best portion of the New England people were living in the villages and rural districts, before the evil day when the farms were losing the most substantial classes. These New England district school boys and girls and their teachers were the material from which was drawn in the generation following, in the nation's hour of peril, the leadership in State, church, business, army, and society, and the progressive and political class that saved the Republic.

Of course these schools were greatly deficient in what we now regard the superior methods of instruction, facilities for illustration, school books, convenient buildings, and much that is now regarded of supreme importance. But, after a generation devoted to the improvement of public education in these respects, we are coming to understand more clearly that after all the chief elements of success in school life are good material in the pupil, worthy manhood and womanhood in the teachers, and a love for knowledge and ambition to excel which dominate the work. The great teachers of music tell us that, in a scale of 10, 9 points of success in a public singer imply a good natural voice.

Nothing in school life will atone for the lack of good natural ability, enthusiasm, persistence, and an all-round common sense in finding the best way to get at the main point. Wellington said: "The art of war is nothing but two men fighting with clubs, and the one that has the longest club, the most strength, pluck, and endurance will come off conqueror." The good teacher in the old-time school had a more familiar acquaintance with the better class of pupils than is now possible in the graded schools of our cities and often gave them a generous portion of time, out of school or on holidays. And nowhere on earth does unusual ability, personal magnetism, force of character, and high enthusiasm for living tell in molding and inspiring a group of children more powerfully than inside one of these old-time Yankee schoolhouses.

During this period, the first notable advance was made in the improvement of school books. George Washington sat down to his table, after he left school at 13, and wrote out, in his own plain, bold hand a series of short treatises on the different branches studied "in the field" and family schools of his early youth; probably the pith of the few awkward and pedantic apologies for text-books to which he had access. Before 1800 arithmetic had not been taught with books in the New England common schools; geography was still a college study; science did not exist for the

public school; indeed, outside the college, later than this, "philosophic geology was not taught in New England and there was not even a bare catalogue of the animals of Massachusetts." Noah Webster had just entered on his great career of supplying the children and youth with a better sort of readers and spellers, with an appendix of grammar and matters of general intelligence, than had before been accessible. The catalogue of helps to learning that figures in the report of many of the foremost men of the time, in the memory of their school days, is meager to the last degree. But before 1840 a great advance had been made. The Assembly's catechism no longer was regarded as the standard central dish at the feast of knowledge. The Bible came to be read and understood in a way more natural and less mechanical. The series of school readers prepared by Rev. John Pierpont was perhaps the most valuable ever made in any land, being a complete introduction to the best literature of the language. Woodbridge, Morse, and Olney in geography; Adams and Smith in arithmetic; Murray and Greenleaf in grammar; with an increasing number of text-books of equal merit, especially Colburn's mental arithmetic, were a godsend to the studious youth.

But, after all these helps to knowledge, there has been found no substitute for the act of "taking off your coat and rolling up your sleeves" and going to work to "dig out" the heart of the matter in any school task on hand. The dire necessity of school work and the strict government of the schools of that early day were a valuable discipline which is often found wanting in the elaborate expedients for cultivating the "play instinct" in children, in which the necessity of discipline in child life is left out and only the very natural desire to play remains. And, despite the severity of the discipline, there is a solid merit in the old style of "keeping order," compelling a bad boy or a mischievous girl to fall into line and obey the "rules and regulations," that can not be dispensed with in the training for republican citizenship. The popular estimation in which a teacher was held who displayed the governing faculty amid the trials of old-time New England school-keeping was, in itself, a powerful stimulus to the cultivation of that faculty for doing things and leading in all worthy enterprises which has made the New England man and woman famous at home and known and respected all around the world.

Thomas Carlyle once said to Theodore Parker: "There is nothing like the preaching of hell to take the conceit out of a man." The teaching of the gospel of obedience to law, illustrated by the certainty of a sound thrashing, has made a man of many a boy who, under a vacillating or feeble dispensation of discipline, would have grown up a bully, a sneak, or a brute. The goings on in the old New England schoolhouse was like the continuous session of a court of justice in the heart of a community, and, in connection with the sittings of the justice of the peace in the tavern hall and the town meeting in the great meeting house, kept the mind of the neighborhood fixed on that reign of law and order which saved it from the excesses of border life and the anarchy of lynch law. The democracy of the common school was a prodigious training for good citizenship; for here there "was no respect of persons" and the son of the minister, lawyer, doctor, or richest man in town was as sure of a "trouncing" for obstinate disobedience as any boy in school; and the parent who would presume on any family or personal superiority as an exemption from the school discipline of his child was sure of the imperative negative of the entire neighborhood. And by the patriotic extracts in the old-time school readers, the declamation of the speeches of great statesmen, and the constant excitement of partisan politics that raged about the little red schoolhouse like the lashing of an angry sea upon a storm-beaten island, the boys and girls were schooled in that patriotism which, a generation later, flamed out in the rush from the old Lexington and Concord battle grounds to Washington of the first regiments to "rally round the flag" and save the Union.

There can be no indirect training so good in its general mental and moral results as the constant outdoor occupation of the Yankee boy and the drill of his sister in good housekeeping that went on, "never hasting, never resting," like a procession

of the powers of nature. It was still the day when the New England woman had not yet found relief from the terrible trial of good housekeeping in a newly settled country which built up the soul while it wore out the body. There was no great leisure class in the country, not even in the village or city; and the woman of superior natural gifts, generous culture, and graceful manners was as often as otherwise her own housemaid and taught her daughters how to live as the "helpmeets" of the men who were building a mighty republic.

And, in the estimate of the results of the common school of that period, we must also take into account the fact that New England society was the most concentrated and powerful human agency ever put on the ground of a new country to bring good things to pass. It was a voluntary combination of men and women, generally of native power and obstinate will, of unusual capacity for mental and moral accomplishment, driven as by a high wind toward one great purpose, the building of the new Republic. In the society of the New England of that early day all good things went together—church and school, business, home, and public duty, were but the vital forces of a life concentrated, almost beyond conception in these days of dissipated energy and boundless distraction, on self-control and effective power. This combined energy of the whole town ebbed and flowed through the schoolhouse like a resistless tide. Out of this contact with public opinion came a great influence on the humblest school, an influence that in the superior communities was felt in sending out a large number of public and famous people who made their mark all the way from the Atlantic to the Pacific. And while in a certain way the district school (and there was rarely any other) was held in low esteem by the academy and the college, yet all the higher institutions of learning and agencies of culture were a part of a great movement that was felt by every ambitious boy and girl every day of the school life.

These fifty years were the seed time when so many of the great educational agencies were planted in New England that have borne mighty crops of good culture for the nation. The American Academy of Arts and Sciences was established in 1780. The New England and Boston Societies of Natural History came up between 1815 and 1830. The Boston Athenæum in 1806 was a child of the club that published the Monthly Anthology, the first literary magazine that appeared after the Revolution. The American Philosophical Society was established in 1816; the American Academy in 1780; the Massachusetts Historical Society in 1790; with other associations that, in subsequent years, became important instrumentalities of national culture and the models of similar organizations in all portions of the land. All these were then in that state of enthusiastic operation when their influence, especially on the aspiring youth of a State, is at its best. It was the day of the beginning of the library, Concord, Mass., claiming the oldest of all, in 1672, and New Bedford, Mass., the first free public library. In 1841 Harvard College had 41,000 volumes in the library which had risen from the flames that consumed the precious collection given by John Harvard. In 1838 there were 50 district school libraries, with 10,000 volumes, in the State. Almost every little town had one or more collections of books and the use of a "social" or "ladies' library," or the private collection of the minister, or doctor, or well-to-do family were accessible, by friendly loan or at a nominal fee, to every boy or girl who would be careful in the use.

And, although the era of metropolitan journalism and the modern magazine had not yet dawned, the weekly newspaper, coming up from Boston or the county town once a week; read at the post-office to the eager crowd of farmers, talked over in the store, the tavern, the carpenter's, shoemaker's, and blacksmith's shop, and while waiting for the grist to be ground at the mill, was a power in the land. The habit of meeting in the long winter evenings by the men at these central places, and the interminable visiting between families, where the brisk talk always gravitated to the events of the day of local and general importance; where all things in heaven and earth were discussed in a straightforward, courageous way, made every town a practical university. And there were great themes to be discussed: the administrations

of Presidents George Washington, John Adams, Thomas Jefferson, the French Revolution that shook America like an earthquake, the war of 1812 with Great Britain, the settlement of the new West, the Indian campaigns of Jackson and Harrison, the naval victories of Perry and Decatur, the great battle over the Missouri compromise, which was the alarm bell that summoned the nation's defenders to arms for the great civil war yet forty years off.

The lyceum was not the least of these outside agencies of popular culture; indeed, it became almost an annex to the New England district school. It came up about the year 1788, introduced by Josiah Holbrook, of Connecticut, and spread like a prairie fire all over the land. Beside the proper work of the weekly lyceum, by which it was best known, it grew by 1830 to a vast organization for general improvement. Through a series of years it held great conventions in the chief cities of the country, became a powerful propagandist for the establishment and improvement of public schools, favored the collection of libraries, introduced the system of popular lectures, and in many indirect ways pushed forward the general work of creating the public opinion that demanded the educational revival of 1830–1840. The most eminent men in the Union were deeply interested in it, presided at, and addressed its conventions. Out of it came the Boston Society for the Diffusion of Useful Knowledge in 1828, the American Institute of Instruction founded in Boston in 1830, the American Lyceum (national), in 1831, whose object was the advocacy especially of common-school education and the general spread of knowledge. The American Annals of Education, of Boston, and the Magazine of Useful Knowledge, in New York, were indebted to this powerful movement for their existence. Its general conventions were held from 1828 to 1839 in Boston, New York, Philadelphia, and Hartford. At a national delegate convention, called to discuss education in the United States, held at Philadelphia in 1839, Hon. Theodore Frelinghuysen, of New Jersey, presided, and other celebrated public characters were present. This meeting memorialized Congress to appropriate money for elementary education in the South; proposed the dedication of the public lands to the same purpose, and was only suspended by the overshadowing of its work by the educational uprising of the people, which was largely a result of its persistent agitation.

But nowhere was it so influential as in New England, and it is doubtful if any agency of popular intelligence was ever more effective in the country. Once a week, from December to June, the people of these towns thronged the big schoolhouse or, on occasions of special interest, the largest church or the tavern hall to witness the tournament of debate, where all the mental athletes of the community were enlisted in the discussions; the best literary talent impressed for "the paper," generally edited by the women, and the entertainment was often introduced by a free lecture, usually given by some invited guest. The women brought their "knitting work" and listened while the needles flew. The big boys and girls heard with all their ears and souls. The questions discussed ranged through all themes interesting to thoughtful men and women living in the morning glow of the making of a mighty nation; the annexation of Texas to the Union, capital punishment, the national bank, education, matters of local interest, tariff, war and peace, slavery, woman's rights, religious and moral topics outside sectarian limitations, temperance, the economies of home life and training of children, public improvements in town and State—all came up for "high debate" and the final adjudication of a vote. Here originated the lecture system that a generation later became such a powerful agency in all the Northern States of the Union, and, during the twenty years before the outbreak of the civil war, like a stout ship drawn into the vortex of a mælstrom, went circling about the awful question of slavery into whose "bloody chasm" the old Union was plunged in 1860 to emerge as the new Republic in 1865.

The temperance reformation was at the height of its early enthusiasm during the later years of this period, and the country was shaken by the appeals of an army of "reformed drunkards" and professional lecturers. The religious revival was mighty for waking up the deeper nature of the people, and often the cause of violent

controversy on the highest themes of human interest. In short, during this period the whole people of the United States, from the city out to the most quiet hamlet, were agitated with the tremendous stir of a mental and moral interest prophetic of the mighty upheaval of the nation's life in the revolutionary epoch, on the perilous edge of which the nation stood; and the country district school, the academy, and the college were the "nerve centers" of this profound agitation; the older pupils being often more educated by what was going on without than within the schoolroom. In this way the common school of that day was not less a seminary for the entire community than a school for the children. It was the one center of the common intelligence, where the vital energies of the people were concentrated, and, more notably than any other institution, contributed to the training of a people already dimly looking forward to the awful period of conflict for the preservation of the Republic.

In the American order of society no permanent leadership is possible. Twice in the nation's history the patriotic people have leaned on Washington and Lincoln as the providential father of the old and the new Republic. Happily for us no Bismarck or Gladstone can ever become an American possibility. The great revival of the common school, inaugurated in Massachusetts by the establishment of the first State board of education and the appointment of Horace Mann as its first secretary, spreading from State to State till the entire northern section of the country was involved, and even the educationally far-off South was stirred as never before, was the work of no one man, nor even a group of "great educators." It came "in the fullness of time," when, as in all matters of supreme interest in our country, the half-conscious masses were pushing upward from below and the best informed and most effective lifting from above, and at the fit moment the man or the group of men appear in whom both these movements are incarnated and good things are done in a way that, for rapidity, thoroughness, and permanence, is the amazement of the world.

It was a prodigious advantage, especially to Massachusetts, that at the period we now consider there was in reality no considerable class of public or influential people of any station that desired to be known as the opponents of the common school. Inherited from the days of the fathers, and consecrated by the toils, sacrifices, and prayers of almost two centuries, whatever might have been the disposition of a portion of the more favored classes to educate their own children in the academic and private schools, which, as far as the opportunity for the secondary education was concerned, were, outside a few localities, the only agencies available, yet the advocate of popular education in any form was sure of a hearing among the more intelligent people, and only counted on the personal interest and professional prejudice of those directly concerned as patrons and teachers in these seminaries for secret or open antagonism. Daniel Webster sounded the keynote of New England statesmanship when he said, "If I had as many boys as old King Priam, I would send them all to the country district school." He had been a country schoolmaster, and for a few months had Edward Everett as a pupil—preeminently the educational statesman of the period, repeating in New England in characteristic way the position of Thomas Jefferson at an earlier date in the Atlantic South. Almost every public man of high distinction in New England had been in his youth a common-school boy, and frequently a teacher in the district school. While the clergy of New England were to a greater or less degree deeply interested in the colleges and academies, yet in Massachusetts at this time they were oftener than otherwise the working members of the school committees, and from their number came perhaps the majority of the splendid body of educational reformers that ushered in the glorious day of the advent of Mann, Barnard, and their immediate associates. It was most fortunate that Edward Everett was governor of Massachusetts at the time the legislative committee was appointed which, next to the committee of the Congress of the Confederation that fifty years before reported the ordinance of 1787, gave the American common school to the new Northwest. Another most influential friend of

popular education was Dr. William Ellery Channing, who, although burdened with the double leadership of an important religious movement and the unpopular advocacy of the more conservative type of the antislavery agitation, was always at hand to give the weight of his lofty reputation and matchless eloquence to the good cause. Levi Lincoln year after year had been the honored governor of Massachusetts and a firm friend of the common school. He inaugurated the movement that twelve years later resulted in the establishment of the first State normal school in the United States.

But there was a yet more influential class of practical educators, leading teachers, professors, and presidents of the colleges and superior schools of the State, who constituted the inner circle of this rising reform and most distinctly voiced back to the masses of the people this educational gospel in the practical form it finally assumed. Some of them had been for many years "known of all men," as "in season and out of season" pleading for the coming generation. Others came in at the "beginning of the end" of the agitation and were at once swept into active and often conspicuous service during the coming years. It would be a grateful task to recount, in a memorial volume, the names and services of this splendid body of men and women from New England alone. No "circular of information" could be more instructive and full of encouragement to the workers in our Southern States than the story of the labors, trials, and discouragements through which these heroes of the good fight pressed forward, "putting the hand to the plow and looking not back," at a time when the common school in Massachusetts was in a more discouraging condition than in Virginia and Texas to-day. We can only refer, as in a catalogue, to a few of these most conspicuous workers of the different States, as they come up in the progress of our story, although aware that many names may be omitted perhaps equally worthy of recognition. Those now mentioned were all natives of Massachusetts or spent their professional life chiefly in that State. Some of the most eminent were identified with the new departure of the common school beyond the Berkshire hills, in the Middle and Western States.

Warren Colburn was one of the benefactors of half a dozen generations in preparing, in connection with George B. Emerson, that joy of all school children, Colburn's Mental Arithmetic, which even now is one of the best text-books in use. William Russell was an indefatigable lecturer on education, and exposed without fear or favor the defects of the common schools, especially protesting against the neglect of the old-time grammar and new free high-school system in favor of the private and denominational academy. He made an unsuccessful attempt to establish a private normal school in Lancaster, Mass. Lowell Mason was the father of music in the common schools of America; indeed was the great leader of the movement that woke up the people to the appreciation of good music and organized the popular musical associations in Boston which have made that city so distinguished in this department of the fine arts. He was a devoted friend of the common schools. Gideon F. Thayer established in 1818, in Boston, the first Chauncey Hall private school.

Samuel N. Hall was born in New Hampshire, but, like many of the great sons of the Granite State, found his proper sphere of labor in Massachusetts. He has the reputation of establishing in New Hampshire and afterwards in Andover, Mass., the first effective school of pedagogics in the Union, and his writings and experiments as a teacher had great weight in the final adoption by the State of the normal-school system in 1837–1840. No man was more conspicuous and indefatigable than James G. Carter. For years he lectured, wrote, and in every public way labored to lift the educational wheel out of the slough of indifference and despond in which it was mired for half a century. He was the chairman of the legislative committee that reported the act for the establishment of the State board of education, and was appointed the first member of the board by Governor Everett. George B. Emerson began his career as teacher in Boston as the first principal of the Boys' English High School in

1820. Afterwards he established one of the most celebrated private schools for girls in the country, in the same city, which lost its illustrious master in 1855. He was also a member of the first State board of education and deeply interested in the establishment of the first 3 State normal schools, the assistant of Warren Colburn in making his mental arithmetic and algebra, and an active member of the Boston Masters' Association and Natural History Society.

John Lowell, too early called from life, was a member of the distinguished family of manufacturing capitalists which gave its name to the city of Lowell. He left a handsome fortune to establish the Lowell Institute, a free lectureship that for half a century has offered every season courses of valuable public lectures on a variety of themes, and has enriched the educational literature of the country by the moderate library of its own publications. William C. Woodbridge, a relative of Dr. William Ellery Channing, was a most untiring worker in all that concerned the welfare of common schools. He practically introduced in them the study of geography, which until 1824 had been taught in few public schools, by his text-books, written in connection with Mrs. Emma Willard after extensive study and foreign travel. He was always interested in the early efforts at educational journalism in Massachusetts; published the Annals of Education, in which the improved methods of instruction he had become acquainted with in Europe were illustrated. He was an active worker in the Hartford, Conn., societies for the improvement of common schools. He was called in as adviser in connection with the school system of New York, and was largely influential in persuading Lowell Mason to transfer his residence from Georgia to Massachusetts and inaugurate his great work for music in the schools. He was closely identified with the organization of the lyceum and the American School Society. Always a sick and poor man, and dying at 50, broken down by his enormous labors, his life was a shining example of the consecration of great and varied powers to the welfare of humanity.

President Mark Hopkins, of Williams, and President Heman Humphrey, of Amherst College—the former perhaps the most eminent of the New England educators, the instructor of Garfield, Dawes, Dickinson, and scores of men distinguished in all departments of professional life; the latter the powerful president that lifted the new Amherst College to a respectable rank among American institutions and combined a solid scholarship and zeal for religion with "a saving common sense," whose sons have become conspicuous in the great centers of influence in the Union—were both warm and influential friends of the common schools. Samuel Appleton, a member of a distinguished Boston family, was a generous benefactor of schools—one of the noble band of wealthy men and women whose gifts to education, charity, and art have made their city famous.

Josiah Holbrook was a native of Connecticut and a graduate of Yale College, but his prodigious work in the organization of the American lyceum, a common school for all people, which afterwards went through the Union, and under whose auspices great conventions were held in all parts of the country, enlisting the good will of the most eminent statesmen, scholars, and professional leaders everywhere, was so intimately connected with Boston and Massachusetts that he may be included among the celebrities of this calendar. In connection with the foremost educators of the State, he was deeply interested in the organization of the Boston Society for the Diffusion of Useful Knowledge in 1829 and the American Institute of Instruction in 1830; next, to the National Association of Teachers—still the most important organization of American educators, and many associations connected with his private interests. He was largely engaged in the introduction of school apparatus, hitherto almost unknown—the meager blackboard being the first appearance of any outside help in the district school. With Senator Henry W. Blair, of New Hampshire, he shares the distinguished honor, at an early day, of laboring to move the American Congress to act in behalf of popular education in the Southern States. It is impossible to overrate the influence of the American Lyceum—the most effective extemporaneous university on record—in the awakening of the people to the educational

needs of the country and the organization of the mighty movement for educational reform in 1830–1840.

Ebenezer Bailey will be long remembered as the accomplished master of the first free high school for girls in Boston, the subsequent principal of a famous "female academy," and the author of a text-book in algebra that was a decided advance on previous treatises in this to the children of fifty years ago, abstruse science. John Bromfield was the generous giver of a sum—for the time munificent—which established the Boston Athenæum Library and Museum of Fine Arts. The Athenæum is now a choice library of 150,000 volumes, and the art treasures are in the possession of the Academy of Fine Arts in Boston. Rev. Samuel J. May was one of the most zealous and effective of the clerical advocates of the new departures in the schools; a friend of Horace Mann; for a time principal of the State normal school at Lexington, Mass., and during the later portion of his life a most efficient friend of popular education and all good reforms in Syracuse, N. Y. Rev. Charles Brooks was an eloquent lecturer on education, and largely contributed to the formation of the public opinion that stood behind Horace Mann. He was especially interested in the establishment of normal schools. Rev. Cyrus Pierce was already a distinguished teacher when called by Horace Mann in his later life to be the first principal of the first State normal school in America. He labored so effectually that the name "Father Pierce" is still a household word in Massachusetts, along with the associated name of Nicholas Tillinghast, first principal of the State normal school at Bridgewater. William A. Alcott was one of the roundabout men of all educational work who appear at a providential juncture and shoulder the tasks of many good men. He was united with those already mentioned, and there was nothing good going in the way of popular education that was not connected with his name.

Besides this illustrious group of educators at home, true to her instincts, as described by Washington, of "spreading herself," New England was at this time sending abroad a large number of active and distinguished workers in the great good cause of the children and youth. Among the most celebrated were John S. Hart, so well known as the famous principal of the Philadelphia free high school for girls, and an author of wide celebrity; Rev. Calvin E. Stowe, husband of Harriet Beecher Stowe, who made the important report on free schools at a critical period in the educational movement in Ohio; Francis Dwight, the brilliant editor of an educational journal in Albany, N. Y.; David R. Page, principal of the first State normal school of New York, at Albany, both too early removed by death; Dr. Johnson, in Pennsylvania; Rev. George W. Hosmer, who as a clergyman in Buffalo, N. Y., became an important worker in the schools of that city and afterwards the successor of Horace Mann in the presidency of Antioch College, Ohio; Rev. John H. Heywood, a native of Worcester, Mass., first a teacher in New Jersey, afterwards for half a century an honored clergyman in Louisville, Ky., a most efficient member of the school board of that city and still a fast friend of the common school; Rev. James Freeman Clarke, who as a young man, the minister of a new and unpopular church in Louisville, Ky., still so commended himself to the people that he was placed on the school board, and for a time served as superintendent of common schools, perhaps the first man who held that office west of the Alleghanies, and Rev. William G. Eliot, who, although born and educated in Washington, D. C., was of a distinguished New Bedford, Mass., family. He went as a young man to St. Louis, Mo., when the town had but 8,000 people, opened the first free school west of the Mississippi River in the basement story of his new church, built by Boston money; and at the end of a long and useful life could point to Washington University, one of the most complete and effective organizations for the secondary and higher, academic and collegiate, artistic and industrial, medical and legal education west of the Mississippi River in the Union, as one result of his varied labors in his adopted State. But lack of space alone compels us to close this catalogue of celebrities who so devoted themselves to the people's uplifting on the eve of the great common-school revival at the opening of the second half century of the Republic.

The era of the higher education of woman had not yet come. But there was a great amount of excellent work done in the academies for girls in Massachusetts and other States. Notable among these institutions was the Troy (N. Y.) Female Seminary, where Mrs. Emma Willard so long sat at the head of the movement for the advanced education of woman, affectionately remembered in the history of education in Connecticut, Vermont, and New York. Chief in importance of the daughters of Massachusetts was Mary Lyon, who, in the establishment of the Mount Holyoke Seminary (now College), first rendered it possible that the girls of New England could obtain a superior education at a rate so reasonable that few were left out for lack of means. This famous seminary, where, even until the present day, the domestic labor of the students has been combined with a solid method of mental training, has been a power in the land; having educated great numbers of girls from all portions of the Union, furnished the original suggestion for Wellesley College, and been the model for numbers of excellent schools elsewhere, sending forth many efficient teachers and devoted Christian missionaries to heathen lands.

It is always difficult to place before even an intelligent and sympathetic reader the secret of a situation or an institution which alone can account for its celebrity. The old-time district school of New England has fared badly in the estimate of a class of critics, trained amid the abundant opportunities and expert methods of instruction and discipline now as thoroughly appreciated and used in the schools of Massachusetts as anywhere in the country. But even the present generation of New England educators does not always appreciate the fact that the finest results of the present were bound up in the system of the grandfathers and grandmothers. It has even been denied in high quarters that New England ever had a system of schools deserving the name till within the past five and twenty years. Perhaps a realistic picture of a typical small New England town in the Massachusetts of sixty years ago may help to the understanding of the vitality there was in this early school-keeping and why it has "had free course, run, and been glorified" now ever since the great day when Horace Mann marshaled the forces of reform that had been slowly gathering during a generation and led them to the victory that finally declared the American common school the foremost educational agency in training the children for good citizenship in the Republic.

The following quotation from a personal sketch describes a typical family of pioneers:

My own childhood and youth, until one and twenty, was cast in one of the most characteristic of the mountain towns of western Massachusetts, near the valley of the Connecticut River, on the border of New Hampshire and Vermont. The town was 6 miles square, and was originally set apart by the Colonial legislature just before the Revolutionary war to the families of a company of soldiers enlisted from what is now the city of Boston for service in the French and Indian war, all of whom had lost their lives in this dangerous and exhausting campaign. Several of these families were among the best of old Boston and all were of the good stock that sent one-sixth of its entire population to the great northern battlefield of the Adirondack woods and waters, which for half a century before the war for national independence was the training school of the New England soldiery met by Washington at Cambridge and, as he said, of which almost the entire Regular Army was composed at the close of the war. They went up, my grandfather and grandmother, with the rest, and "possessed the land," apportioned according to the special claims and needs of the families, about the year 1776. My grandfather, who had just been married, was one of the heroes of Bunker Hill, having dug in the trenches all night and slept the sleep of a tired-out warrior during the battle. But he did the next best thing to fighting; he married a good Boston girl and took her up to her home in the wilderness, riding behind him on horseback on a "pillion," where the grandmothers used to sit clasping the strong support on the saddle before. Then he went to New Jersey and served a full term under Washington and came back to his mountain farm; worked hard at everything that came up—farmer, storekeeper, tavern keeper, maker of potash, mechanic, deacon of the church, "esquire" and representative to the "great and general court" for the town; dying at 83, one of the best off in worldly goods and not behind in any way among his contemporaries in the entire county. My great-grandfather, on my mother's side, at 96 "took the western fever"

in the valley of the Connecticut in Massachusetts; sold his farm and emigrated to St. Lawrence County, in northern New York, to "grow up with the country;" voted for Gen. William Henry Harrison for President of the United States at 100, and died of a "cold" caught walking at the head of a procession to celebrate the inauguration of the "hero of Tippecanoe," who followed him soon to the grave. Another grandfather was one of the old-time "men of all work" that held a New England town together; storekeeper, apothecary, tailor, settler of estates, the friend of widows and orphans; at his death the oldest postmaster in the Union, except a brother of the first grandfather, who held that position for an equal term in Kentucky. There were a score of men in that county who had this outfit of practical education and have done first-rate service to the State. In my childhood the town was not yet 60 years old and all the original families still occupied the land, the young people being the second generation from the settlement.

The town was one of those picturesque "blocks" of land that seemed created for the admiration of the lover of nature. A mountain, 1,600 feet above the sea, overlooked the central village, itself shelved on a terrace 1,000 feet above high tide. Half a dozen noble hills, from 1,000 to 1,200 feet in height, divided the territory into a series of narrow valleys, each known by the name of the brook that flowed into one of the three rivers that watered its southern, western, and northern borders. Off at the northeast the hills climbed up to Mount Monadnock that towered, an azure pyramid, 20 miles away. The town was said to have been originally a dense forest of New England pine on the lowlands, while the rains had worn the steep slopes of the mighty hills to their granite bones. Half a dozen clear ponds dotted the surface, each still in my day good fishing ground in the summer, and in the winter a natural "skating park," encircled by the solemn woods and roofed by a sky resplendent with a sunlight and moonlight such as never yet had "shone on sea or land." There were certain meadows, green, silent, and mysterious, that haunted the dream of every truant boy. Nine-tenths the town was on a hillside, and there was hardly a farm a western New York or Ohio farmer "would have taken as a gift."

At that time of settlement there was no civilized West beyond the valleys of the Hudson and the eastern section of the Mohawk River; both these charming valleys were largely occupied by the New York Dutch territory of the great patroons, who still lorded it over their dependents in a way no well-constructed Yankee would endure. Now and then one of our restless young men pushed out to teach school in the region around Albany and Troy, and came back to entertain the neighbors with "the tricks and manners" of the natives of that distant country where his lot had been cast. At the time now spoken of not half a dozen young men of the town had "gone West," although several enterprising youngsters had ventured to Boston, to Maine, and the new manufacturing cities of New England to become men of mark among the foremost of the land, and from them have descended a remarkable group of men and women in every department of society in all portions of the Union.

There were never 1,200 people in the town, and out of that little company have come a dozen clergymen, several judges of the courts, doctors enough to kill or cure a city of half a million, mayors of cities, and members of legislatures and of Congress, artists, authors, scholars, and successful people without number, a larger proportion of the population, it is said, living to a greater age than in any town of similar class in the nation. Women distinguished at home and abroad were not wanting, one becoming the wife of a wandering Englishman of rank, who "came, saw, and" was "conquered," and bore her off to a palace in the lake district in England. There are now but 700 people left in the old town, but last year they were reported to have read more books in proportion to their numbers than the people of any town in the State, for, shut up through the long winter in the town without railroad connection with the outer world, they are compelled to live on each other and the good library established by one of the sons or daughters of the town now living in a far-off city.

There were eight school districts in the town, in which the 200 or 300 "children and youth," with occasional pupils of larger growth, were schooled from four to six months in the year. The terms were divided between summer and winter, with perhaps, each year, a private school of a higher grade "kept" during the three autumn months in the basement room of the leading church. For more than fifty years after the settlement of the town the people had worshipped and "sat under preaching" together in the great "meetinghouse" on the common, big enough to contain the entire population; the high pulpit, overhung by a threatening "sounding-board;" the two rows of seats on the pulpit front below the parson for the deacons and chief men of the place; a double row of galleries for the volunteer choir of 50 young persons and half a dozen musical and unmusical instruments; in my day the highest gallery pews overlooking the minister's head being appropriated by such of the small boys as were permitted, on a solemn promise of good behavior, to sit up aloft. The walls of the great wooden temple were pierced with small windows, and when at the first Christmas celebration they burst forth at dusk in a

blaze of glory there was little more to be desired in this world by the boys and girls assembled on "the common" to witness the grand illumination.

The central schoolhouse, which sufficed for the "upper and lower villages," was built on a granite ledge that on one side fell down in a precipice to the high road. It was a square wooden building, painted red, with a big ruinous woodshed and dilapidated outbuildings, surmounted by a cupola in which a lightning rod was fixed with no connection with the ground. To-day the school-house occupies the site of the old meetinghouse, and a sweet-toned bell from a Louisiana sugar plantation, that received it from some convent in Spain in the olden time, found at the Union occupation in 1863 in a pile of metal in New Orleans, destined to be cast into Confederate cannon, and brought home by a returning soldier, rings the children to school. There were never 50 scholars in the old school-house, and the outlying districts furnished from 15 to 30 each in their better days.

Here every summer, for three months in the village and two in the outer districts, and an equal term in the winter, all the children went to school. Beginning at 5 or 6, they sometimes held on till past 20, especially in the winter, when a class of big boys and girls were installed on the higher back seats, the benches rising, as in a medical lecture room, from the foot of the master's desk to within a short distance of the roof. A big sheet-iron "cap" was fitted upon the huge open fireplace beside the master's platform, and all winter a fierce fire of round and split logs roared up the chimney, possibly efficient to warm "the little angels that sit up aloft," but requiring a perpetual "going to the fire" to keep the children in this lower world from freezing. The schoolhouses were all moderately comfortable—as well heated and ventilated as the farm houses—though wanting the conveniences of modern seats and the appliances for the easy learning of anything. Each had around it a spacious yard, sometimes a grove, and there was no lack of opportunity for sliding, skating, or "rasseling" in winter and all sorts of games in summer, the exercise now called "manual training" being sufficiently attended to at home, where every boy and girl was in constant "training" for a New England worker. In my case the discipline consisted in driving two cows a mile to pasture before breakfast and driving them home after supper, "tending store" at odd hours, and working on my grandfather's farm in haying time, at 25 cents a day, to buy the Albany Weekly Journal and the Penny Magazine, with now and then the luxury of a book long desired and fondly cherished.

There were two or three libraries in town, containing perhaps 500 volumes, and the old minister had a good collection of the authors of Queen Anne's day. A new doctor brought to town the first copy of Shakespeare I ever saw. Half a dozen of us boys and girls read it through in a week. I was so "fired up" by the "tragic muse" that I rose up from an hour with King Henry V to offer battle royal with a squad of good-natured big schoolfellows, who never understood why they were set upon in that special way. But they rallied, and speedily I found myself "reduced to the lowest terms." The old doctor, who was jealous of the rival newcomer, said to my father: "Your boy is not a fighting character. He has been reading Shakespeare. That Shakespeare makes boys 'sassy' and we must put it down." The good old doctor long ago went to his reward, but "that Shakespeare" holds on.

I had read every book in town that I could understand when I left home at the age of 20 to go to college, and I doubted if the parson or even the new doctor himself could understand a good many of the musty volumes that I tried anew and gave up in despair every year.

But there was teaching and "government" in the 8 district schools that somehow developed from that crowd of 300 "children and youth" a remarkable set of men and women, who achieved a success in life of which any country might be proud. And the explanation was not found in the possession by their teachers of any special "method of instruction," for I doubt if one of them had ever heard of a normal school. I never in my youth heard a discourse or read an "article" on school discipline; but the school master or mistress that couldn't "keep order" and teach "good morals and gentle manners" in this little republic was either summarily "run off" by a rebellion among the big boys or dismissed with no recommendation by the school committee. The ordinary teachers dealt with the three R's, especially arithmetic; a little history and geography of the Peter Parley order, and occasionally the easy beginnings of algebra. The "languages" were taught in private by the minister or at the "fall school" of select scholars. We had already come into the use of a greatly improved style of schoolbooks—Rev. John Pierpont's admirable readers; Adams's, Smith's, and Colburn's arithmetics and algebras; Morse's, Peter Parley's, and Olney's geographies, and Greenleaf's grammar. There was also a good deal of instruction out of school, given generally by the better set of teachers to the more promising pupils during the long winter evenings, sometimes in a regular evening school for arithmetic or spelling, or to a little squad of youths gathered about the master or mistress or assembled in the minister's study.

But besides this work at the schoolhouse, the whole town "kept school." In a community so concentrated as a school district every family had its eye on the schoolhouse from the first to the last day of the term. The teacher was the "town talk," especially if a stranger, a college graduate, or a minister's daughter. They were taken up at once into the society of the place, petted and "treated to all there was in the house." And rarely would one come across a group of young men and women more worthy of the affection and respect of a superior community than the teachers of these schools during the fifteen years of my acquaintance with them. The young men were often students or graduates from college, with few exceptions the best of the best families; the young women the daughters from the most cultivated homes in the county—the choice young folk that afterwards became "leading spirits" all the way from the Atlantic to the Pacific Slope. The schoolmasters were the life of society during the winter; kept the village lyceum at the high-water mark; managed an extempore theater, under the innocent name "speaking school;" presided over the "spelling school;" and were often the chief singers in the church choir. They gave all they had, almost "without money and without price," for the poor little salary of $12 to $25 per month and board for men, and $6 to $10 for women. Each of them had often an entire class of the more ambitious boys and girls "fitting" for the academy or college. Among these teachers, perhaps half a hundred in all the schools in town during the fifteen years of my acquaintance, there had been but few failures. And the best of this business was the result of this "working together for good" upon the children. The youthful side of the community came up in the focus of the interest and affection of a whole people. The superior youth were followed by the most stimulating and inspiring good will of their native town. No training of mind, morals, or manners by a select class, that isolates the child from this large observation and sympathy of a friendly community, can take the place of a concentrated public which made a university of every respectable town in New England during the most critical period of its developing civilization.

A small number of our young folk were able to leave home, for a term or a year, for attendance on one of the several academies within 20 miles of the town. I suppose, as in my own case, the chief advantage of a short period spent in this sort of schooling was the social opportunity of contact with the best life of the country and the acquaintance with the considerable number of superior young people brought together in this way. If a boy was "fitting for college," he sometimes "took off his coat" and studied hard; as young Horace Mann prepared for admission to Brown University in four months. But even at Harvard the entrance examination was not a very formidable ordeal. Anybody who had passed with credit through the common school and, at the academy or at home, had acquired a moderate English education, read a few hundred pages of Latin and Greek, with less mathematics, got in at the country colleges. Yet even in these seminaries the real "tug of war" began and was not relaxed until "commencement day." Half a dozen fortunate fellows from the Boston Latin School, Andover, and Exeter, or a superior country academy, came well prepared for the freshman class, and on that scale the class work was organized. And this made the life of three-fourths the members of the first class in college emphatically "a hard road to travel," especially for those who during the winter months were compelled to teach school, often beyond the vacation term, to "keep the pot boiling" at college. Yet the honors of the senior class were often won by these hard-working country boys, too often at a sacrifice of health and life that would shock the educational public of to-day. Half my own class of 30, including myself, "broke down" and drifted away, and not half a dozen are now alive. The old-time New England college was an educational slaughter house, and any institution of learning that should now present such a physical record would itself be condemned with universal execration. The almost absolute lack of provision for physical training; the struggles of ambitious young men, imperfectly prepared for college life; the exhausting vacation labors at school-teaching or other occupations, and the detestable arrangements for diet and comfortable living made the enterprise of "getting an education" almost as hazardous as service in the army in war time.

The girls had not yet come to their day of opportunity, although a few went to Mount Holyoke Seminary, Mrs. Willard's famous school at Troy, or some less celebrated female academy. Many of these academies were coeducational, and these, I believe, had the best record of educational and social success.

The whole educational life was bound up with the heart and mind of the people, and the district school was a great educator in more than one way, because it was the vehicle through which learning, virtue, and enterprise were dispensed to the children in a town of 1,000 people. It was also the one place where the children were gathered together, free from that "strife of tongues" in politics, religion, business, and social scandal which was the terror of the old New England society. The Bible was read, prayers were made, and the good master and mistress preached,

often better sermons than the parson in the church, on all the common duties of life and the practical applications of religion, but rarely with any purpose of sectarian proselytism.

Not the least of the good things in the old-time district school of New England was the discipline of "keeping school" upon the large number of young people engaged in it. To a careless, ignorant, selfish spirit no toil is so hateful, no weariness so exhausting, no return so thankless as the service in the schoolroom. But the majority of the teachers in these schools, especially in the better sort of towns, were the best young men and women of the time, and the proportion of this class engaged in this work was larger than at present. It is impossible that a right-minded, ambitious, tolerably intelligent young man or woman, working in the focus of public observation, brought in such intimate relations with the best and in a position to observe the worst elements of society, should not be improved, disciplined, and in all ways impressed. Thousands of teachers in the country and village district schools of New England of half a century ago were educated by their first term of professional service as in no other way, especially in the knowledge of character, the ability to govern and influence other minds, and the aspiration for higher authority and a loftier success in life. I can truly say that to my own five winter terms of service as teacher in the district school, never receiving a salary as large as the better class of negro teachers now expect in the Southern States, I owe an inspiration and an insight into life which I never obtained in school and scarcely found in church.

A singular moderation and discretion seemed to hedge about the school from the distracting life of the neighborhood. It was "a peculiar people" that trained and educated their children in this way. The way was not, perhaps, the modern high-road to knowledge, but for the waking up of deep thoughts, high purposes, and noble ambitions it was a great school. There was in it all, in the entire arrangement of society in the New England life of half a century ago, a profound respect for knowledge, a reverence for eminent attainments and ability, and a willingness to aid youthful capacity and worth in its fight for success. Hence the condition of a New England town in its school keeping at that early day had a special value, from the fact that the majority of the tolerably intelligent people and everybody of good faculty of observation knew what they were talking about and directed their minds to something really valuable in view of some particular people or class of children. One notable feature of the carefully guarded and supervised education of the present is that it is practically a department of society, lifted out of reach of common observation, of which as little is known as of the goings on of any other sort of professional activity. Thus a good part of the public and private contention over the schools is by people practically unacquainted with the record of the American common school, unacquainted with what is going on in the schoolroom, often with only a formal or intermittent interest in public education. It is all the difference between a whole people doing a good thing with all the force of their highest ability and best intelligence through a beloved institution and in cooperation and sympathy with the practical world, and a professional class teaching in an isolation only broken by the grind of expert supervision, with the "hope delayed" of a wise or intelligent response to any appeal to the community for justice, sympathy, or cooperation in this difficult work. Despite all its shortcomings, new Massachusetts owes to the district school of fifty years ago a debt the present generation will never repay.

The civilization of the New England colonies for the one hundred and fifty years before the Revolutionary war was one of the most concentrated and isolated in the records of modern history. The stormy New England seacoast of 700 miles furnished its only practical communication with the more civilized portion of the world. On the north were the Frenchman and his Indian allies, always prepared for war. The splendid valley of the Hudson was first in possession of the Dutch, who had bequeathed to their British successors a system of land occupancy abhorrent to the independent and intelligent farmers of the eastern colonies. At an early date some enterprising "mynheer" of Manhattan had built a fine stone tavern on the East River to accommodate the travel of the Yankees to Virginia. It is well remarked by a careful student and illuminating historian of these colonies that "the neglect of Old England was a great factor in the early progress of New England." Originally cast by the religious intolerance of the mother country into a far-off wilderness, and for one hundred and fifty years chiefly noticed for some new manifestation of industrial, social, or political hostility, this people, who were largely drawn from the class that fifty years later wrought the greatest revolution in the British Islands,

early learned to stand by each other and work out their own salvation with fear and trembling before the Judge and Sovereign of all the earth.

Never was there a people with a more notable genius for local self-government. "Before there was any royal or colonial constituted authority the towns of Massachusetts, Connecticut, and Rhode Island, of their own right, were exercising all the necessary powers of government." In religion pledged to the theocratic ideal of government, and at first making an honest effort to establish a theocracy in the New World, their practical executive faculty soon got the better of their creed, and after a brief period they settled down to a virtual republic. State, church, school, social, and industrial affairs were all the direct offspring of the will of "the responsible people," and never after in any essential respect were permitted to break loose from their sovereign's control. The congregational polity of the church and the original fashion of the elementary school were the results of the common necessities of such a community. The force that held all together was a common sense of public affairs that touched every detail of the life in this world, while looking upward with the intense faith of the devotee to the world to come, all worlds being included in the personal and watchful providence of God. In forty years after the first settlement of the colonies New England was in all essential respects a government and order of society as compact and thoroughly outlined as to-day. With one hand it tilled the stubborn soil and out of its meager supply of mineral wealth laid the foundations of American manufacturing industry. From its stores of fish, tobacco, and native products it built up the first American commerce. In marked contradistinction to the policy of the Middle States, the New England people were jealous of foreign interference and limited the occupation of every new town by a careful discrimination.

In its early experiments at establishing a currency New England exploded half a dozen financial theories. Its township system of government was the training school of the most influential and powerful section of the nation, the original Northwest, and well might Thomas Jefferson say in his conflict over the embargo: "I felt the foundations of the Government shaken under my feet by the New England township." At first the minister of the church was chosen in town meeting, everybody was taxed for the support of public worship, and church attendance was made compulsory. But the Bible could not be read at any public ceremony, nor a minister permitted to perform the rite of marriage, so great was the jealousy of a union between state and church. By arrangements for ownerships of lands and herding cattle in common, in connection with the most obstinate individuality in private possessions, the people learned the great art of living together. Indeed, despite the theory that New England was the child of Holland, "about all the Puritans of the Plymouth colony learned in Leyden was how to live together in a foreign country." "They knew they were Pilgrims and looked not much on those things they had left, but lift up their eyes to ye heavens, their dearest countrie, and quieted their spirits." They believed in fighting for all their rights, and practically exterminated the Indian as soon as he proved an obstruction to civilization, although he was offered every opportunity to be converted and educated "and made a man of."

For half a century before the Revolution New England was in almost continual warfare on its northern border, and the magnificent Adirondack world of northern New York was the military academy where was trained the soldiery which not only composed the majority of the Revolutionary Army, but, as Washington said, "was almost the entire Army at the close of the eight years' conflict." Although the early common school was the handmaid, it was never the child or the annex of the church. Both church and school were the offspring of the "reasonable" voting people. In 1641, at the first movement for the election of delegates to a "general court," "a body of liberties" was drawn up almost in the terms of the later Massachusetts "bill of rights," its fundamental political principles being essentially republican. One of the first laws of Massachusetts was for the compelling of parents, guardians, and employers of children and youth to attend to the education that would qualify them for good

citizenship. In Windsor, Conn., children bound out to apprenticeship were secured in the opportunity to be taught reading, writing, "casting accounts," and a trade, with an outfit of clothing, a musket, and 20 shillings at manhood.

In short, it has been well said that "the most noteworthy contribution of New England to history is the contribution of solid common sense to the art of living." But the "common sense" here noted is not a superficial knack of handling the common affairs of the material side of life, but that rare and decisive blending of all faculties in the sovereign art of "good judgment" applied to life itself in all its amplitude of interest, from the least duty of the moment to the vast concerns of national affairs and the uplifting expectations and hopes of eternity.

CONNECTICUT.

It can not be denied that the settlement of the Massachusetts Bay Colony included a larger contingent of able men and, on the whole, was a better representative of the broader and more cultivated element of the New England life than its neighbors. The settlement of Connecticut was effected by a class of men equally obstinate and capable, but somewhat repelled and worried by the tendencies that, after the close the English migration in 1640, pointed to the enlargement of the Puritanic social and religious limitations. Hartford and New Haven were in no respect below their predecessors in their love for education. We have already seen that the first Massachusetts school laws were at once reproduced in Connecticut; that for half a century the new colonies sent a regular detachment of students to Harvard and contributed according to their means for its support; and that more than one of the pious old schoolmasters of Boston, including Cheever and Bailey, were called from New Haven. There is little doubt that the claim of Dr. Henry Barnard is correct, that up to the Revolutionary war the condition of public education in Connecticut was a nearer approach to the present American common-school system than in any of the remaining colonies. Indeed, at this period, if we are to believe the reports of the day, there was little or no illiteracy in Connecticut. The parent and guardian was compelled by law to instruct his children and wards and bring them up to some calling or employment. Every town was taxed 40 shillings on £1,000 with a State tax, which was paid only to those towns which obeyed the statute for local taxation. A common school was kept six months in the year and the grammar school was, in most of the larger country towns, to fit students for college. Yale college, established in 1700, was a corporation somewhat under the control of the legislature, which appropriated £120 yearly for its support. Neither social nor sectarian distinctions were permitted to intrude. "All were brought under the assimilating influences of early association and similar school privileges." It is not remarkable that a colony, which for more than a century had been developed under such auspices, should have come forth in the Revolutionary epoch as one of the foremost of the land and at one stride should have taken a position among American States never to be essentially shaken. And one of the most conclusive proofs of this superiority was the establishment of the first State school fund in the Union. Begun in 1650, it was consummated in 1795 by the dedication of the proceeds of the sales of the Western Reserve of Ohio as "a permanent and irreducible fund" for the support of common schools. In 1800 the population of Connecticut was 250,000 and, up to that date, it had gone on under the educational statute of 1650 as modified by successive acts of the legislature during one hundred and fifty years.

It would seem to be a strange anomaly that the two American colonies most prominent for the obstinate individuality of their people should have consented to sit down through many years of the national life under the charters of their earlier days, conferred by the Kings of England, with no serious attempt to frame constitutions appropriate to a republican Commonwealth. But such was the case with Rhode Island and Connecticut. The charter of 1650, given to the united colonies of Hartford and New Haven by King Charles II, was adopted as the constitution of

the State of Connecticut and so remained until the formation of the first original fundamental law in 1818 in a convention authorized by a bare majority of the people. The reason for this may perhaps be found in the liberal provision for suffrage in the colonial charter, every man swearing loyalty to the government being qualified to vote for magistrates, and the legislature thus chosen empowered to appoint the judges of the courts. There was no mention of education in this charter and none was added on its indorsement by the State in 1776, and, with the exception of a brief provision respecting Yale College and the State school fund, no addition was made in 1818. The people took the responsibility from the first and established a system of public schools more stringent than now exists in this or any other Christian country. The towns were required under penalty to establish common and the cities high schools. The parent, guardian, or master was charged with the triple obligation of teaching the children to read, write, and cipher, or some equivalent; to guard the morals of youth; and to bring up the boys to a "trade, calling, or occupation." In default of this, was a penalty or fine and, in case of aggravated disobedience, the child was taken in charge by the State and "bound out" or put into a manufactory. For years the hideous law of the old-time Hebrew and Roman barbarism remained on the Connecticut statute books, whereby a child could be put to death by the public authorities for persistent rebellion against parental control. We are not aware of the proof that any child was slaughtered under this edict. And it is not easy to decide whether the perpetual complaints of youthful "ungodliness," disorder, and general depravity were the morbid exaggeration of the "ower-guid," or the natural reaction from this attempt to build up a new Hebrew theocracy and revive the Old Testament code in a new world.

But this ironclad system of compulsory education was, singularly enough, enacted and enforced in the most democratic of all the colonies; where the clergy were elected by the people of the "societies," as the church was called, were forbidden to administer marriage, and where Yale College went on for several generations with no religious-test charter. But the historian who looks for superficial legal consistency in the days of these powerful and "stuffy" old makers of New England will be in chronic maze. The fundamental ideal of the New England of the colonial period was that the people, under God, were the creators and administrators of state, church, school, and, as far as may be, of social and industrial life. No rule is so despotic as a democracy where all are of one mind "to will and to do" according to their own good pleasure. In such a State, every caprice, prejudice, or malignity that for the time possesses the popular brain will be "enrolled in the capitol" as law and enforced at all hazards. The isolation of the Connecticut colonies doubtless intensified popular opinion and held this small number of able and conscientious folk in a compact body for the first one hundred and fifty years of their history. But one thing was secured—the most intelligent community of people then in the world. There was probably very little illiteracy in Connecticut up to the Revolutionary period, although, in notable, broad-minded, and influential men in every department of life this colony was not distinguished especially above Virginia, Massachusetts, and New York.

From the first, however, the clergy of Connecticut seemed to have been relatively a more influential body than in Massachusetts. Sandwiched between the comparatively progressive colonies of the eastern section of New England and the serene solidity of the Dutch of Manhattan these "defenders of the faith" early began to warn against the danger of heresy in Boston. For sixty years, however, Harvard College was the head school of the higher education for Hartford and New Haven; every Connecticut town was supposed to contribute something toward the new seat of learning; and a large contingent of students, including the leading families, was constantly on hand. But up to this period Harvard was little beyond a school for the clergy, who were utilized in large numbers as teachers of the common schools. But, as early as the beginning of the eighteenth century, the elements of religious

progress and dissent appeared in Cambridge. The Connecticut "watchman on Zion's walls" sounded the alarm, as did the college in northwestern Massachusetts. Both Williams and Yale came into existence somewhat as a quiet protest against the dangerous tendencies of the university. Yale College was founded by a club of ten Connecticut ministers, who "pooled" their libraries and "put their heads together" to build up a home center of scholarship and religion which should be a bulwark against the outer world.

As long as the people were of the same mind the common-school system went on under the direction of the towns which made the "societies" or parishes, the same people voting in town and "society" meetings for the administering of their respective interests. There is no evidence of revolt by the exclusive religious or social public against the democratic equality in these early schools, where the children of rich and poor, high and low, sat on the same rude benches and "meekly received the engrafted word." This was a mild combination of the most elementary preparation of the three R's, flavored with a daily dispensation of the Westminster Catechism and all "well rubbed in" by "the terrors of the law;" that ironclad discipline which turned the heart of one of the greatest educators in America, Dr. Eliphalet Nott, in his boyhood in Connecticut, against the barbarism of the birch, strap, and ferule and sent him forth to organize in Union College, at Schenectady, N. Y., the famous "moral suasion" system of discipline which has now become the habit of every respectable college and university and public and private high school in the country.

But it was inevitable that the heresies of the outward world by the dissenting bodies of Massachusetts and Rhode Island and the good-natured indifference of the Dutch of Manhattan should invade this Connecticut preserve of "pure and undefiled religion." As early as 1712, a dozen years from the establishment of Yale College, the first movement was made by the ecclesiastical party to capture the educational system of the colony and make the "society," properly the parish or church, the unit of school administration. By the law then enacted the parish then existing or to be created was practically made a school district, bound to attend to the local administering of the education of all children, and the public tax of 40 shillings on £1,000 was paid over to the society authorities. This is declared by Dr. Henry Barnard, the learned author of the History of Education in Connecticut, the first departure from the time-honored school system of New England, in which the town, without the legal cooperation of the church, established, administered, and with the aid of rate bills collected from the patrons, supported the common schools. The first step in 1712 was to make the society or parish church a school district and put into its hands the responsibility and labor of local management, although the towns still reserved the power in the background as the recognized authority for all that was done.

But "it is the first step that costs" in all things. This "first step" so emphatically taken, the others followed in due order. By a series of laws (all of which can be read in that masterly state paper, the educational report of Supt. Henry Barnard, in 1853), these parishes were clothed with increasing powers. They could divide the parish into separate school districts, choose a school committee, and, finally, came to be the recognized administrators of both the district and county high schools. The details respecting the obligation of towns and methods of taxation underwent changes, but through all these successive variations is heard the steady tramp of the church and the clergy to establish a control of popular education as complete as in any European nation in any period of modern history.

The climax was reached when, in 1795, the preliminary steps taken sixty years before toward the establishment of a permanent school fund were completed in the dedication of the $1,000,000, received from the sales of State lands in the Western Reserve of Ohio, as an "irreducible fund" for the education of the people, thus making Connecticut the leader of American States in this regard. This act precipitated the collision between the churches and clergy and the majority of citizens

who still held to the original right of the whole people, in their fundamental function of voting in town meeting, to the control of the schools. For a short period already a law had been on the statute book by which no private school could be established and no person teach at all without a license from the proper authorities, thus placing the entire system of education in the hands of "the societies." Now a further effort was made to give to the churches or parishes, under the thin disguise of "school societies," (1) the entire responsibility for the initiation, organization, and administration of all public schools, and (2) the control of the new State fund for the entire management of the church and school. By the law of 1793 the annual income of the State school fund was to be distributed among the school societies according to their population, etc., for the support of the clergy and the schools. The societies were empowered, in addition, to receive the avails of the State school tax and to impose additional taxes, by a vote of two-thirds of the people, for additional advantages in the county and the establishing of the secondary education in high schools. This would have established, at the beginning of the century, in the heart of a New England colony, a system of public schools, in their practical operation similar to that now in the mind of one portion of the Roman Catholic hierarchy in this country, public in name, subsidized by the State, but really in the hands of the clergy. Yale College was already a denominational school, yearly growing into a stronger antagonism to what was regarded the "skeptical tendencies" of the more Eastern States, still to some extent dependent on the State for support.

But here the people "drew the line." The new bill secured the powerful support of Rev. Timothy Dwight, the prospective president of Yale, who in an elaborate sermon defended it by the same line of argument by which the Catholic bishop of Connecticut now defends the subsidizing of the parochial schools of his own church. The bill was also supported by the clergy as a body, who certainly had the plausible excuse that here was a provision for their support that somewhat relieved them from the unreliable dependence on the yearly vote of supplies by their people. But a violent discussion was precipitated through the press and in the legislature, which resulted in the compromise measure of 1794. By this statute the income of the State school fund was to be given to the school societies, but for the sole use of the schools; and the parishes were compelled to make special application to the legislature for the use of any portion of the money for church purposes. But on the real fighting ground, the right and power of the parish, under the name "school society," to manage the education of the people, the ecclesiastical party held its own. It confirmed public education in what has been well named "the disastrous policy" for almost half a century, under which, from the foremost, Connecticut was steadily drifting to the rear column of the common-school army of the Union.

The first division of the income from the school fund, in 1800, amounted to $23,651, and in 1813 reached $35,000. But it was soon discovered that, as in so many States of the Union, this, the biggest "pile" of money in the Commonwealth, was becoming the carcass where all the eagles were gathered together. Here the people once more took the field and summoned Hon. James Hillhouse from his seat in the Senate of the United States to the office of "commissioner of the school fund." Anticipating the career of the rising young politician Horace Mann, in Massachusetts, twenty-five years later, Mr. Hillhouse left his high place in the national Senate to go home and work for the children. During the fifteen years of his admirable administration the fund was increased and a sum distributed to the schools larger than the original plant. In doing this, Commissioner Hillhouse established a precedent of incalculable value to the country. His successor was Hon. Seth Beers, for years an assistant trained in his office, and who afterwards was made superintendent of public schools as one function of his office as commissioner of the school fund. From the administration of Hillhouse the fund was increased by 1825 to $1,700,000, and during the twenty-three years of Hillhouse and Beers, $1,200,000 had been expended in the distribution.

But even this beneficent provision for the children was perverted through the

administration of public education by the "school society," during the entire period from the beginning of the century till the great educational revival of 1830-1840. It is no special reproach to any church that it can never administer a system of popular education save as an annex to its own ecclesiastical and spiritual establishment. Intrusted by the common consent of mankind with the high special function of ministering to the religious nature and the guardianship of personal piety and morality; dealing with the awful issues of sin and holiness and the eternal fate of the human race, it can not be expected that any matter, in comparison so unimportant as the training of childhood and youth for the duties of good citizenship in this world, will be administered in any but a half-hearted or a partisan way. Any school, save one of the higher sort which is a training seminary for a priesthood, will always in this connection be a sectarian preserve, under the control of a body of men or women consecrated to and honestly working for ends so infinitely superior to those proposed by the common school that the education will be, in fact, of the Sunday-school type, and the school only an "annex" of the church. Moreover, the Protestant ecclesiastic was, during the first fifty years of the Republic, the most influential class in New England, and nowhere in New England was this class more able, devoted, and influential than in Connecticut. But during these years this State was still one of the smaller Commonwealths in population; was a fearful sufferer from the effects of the war of 1812; greatly depleted by the first rush of emigration to the new Northwest, and in no good condition to assert itself in the line of an effort for the advancement of the common school. The churches were poor; the clergy lived in narrow circumstances, and public affairs in State and nation were greatly disturbed.

Under all these conditions it is not remarkable that the district school, under the sole direction of the school society which represented the ecclesiastical more than the public interest, steadily declined in public favor, lost the approval of the superior people, and fell into disrepute even with those whose sole dependence was upon it for the education of their own children. The provincial laws for local taxation and the support of the higher grades of instruction fell into desuetude. From the gift of Governor Hopkins, Hartford and New Haven were able to support respectable high schools. New London and some other places still kept alive the old-time county high school. But more and more the people came to depend on the annual distribution of the income of the State fund for their chief reliance, eking out a deficit by an occasional extension of the term through private subscription. In 1820, when the distribution of the State fund reached $62,000, the State tax was thrown overboard and the school system of Connecticut declined to a commonplace district school; in session a short term in winter and summer, taught by incompetent teachers; in a majority of cases confined to the most elementary branches, with school books often little better than useless; with no aids for the teacher, who often "boarded round;" in schoolhouses generally unfit for occupation and with next to no arrangements for the illustration of the best oral method of instruction, so necessary to the instruction of young children.

During this period some unimportant and some valuable additions were made to the school legislation of the State. The most important was the law compelling manufacturing corporations to be responsible for the education, industry, and morals of children in their employ. This was, possibly, the beginning of this type of valuable legislation in the country. But the abolition of the State school tax in 1820 was a reactionary policy, and the growing neglect of the habit of local taxation for schools became a chronic evil, fatal to the success of any effective system of public education. Naturally, the wealthy and educated class, as in all similar conditions of public opinion and policy, provided for themselves through the multiplication of private and academical schools. In 1830 it was ascertained that the people of Connecticut were paying for the schooling of 10,000 children and youth in the academies and private seminaries as much as for the 70,000 in public schools. The old reputation of the "land of steady habits" for popular intelligence was rapidly

passing away. The coming in of a foreign-born population at the call of the rising manufacturing interest was giving the State a new experience of an illiteracy of the European rather than of the American type.

In 1824 there seems to have been a passing tidal wave of reform in American school affairs that swept through the Eastern and Middle and beat lightly against the shores of the new Western and Southern States. The chief result in Connecticut was to wake to an active and aggressive life a body of notable men and women who cooperated under the name of The School Society. They began a systematic agitation, through the press, public address, and especially by the formation of the earliest educational associations in the country for the reform of common-school education. In 1827 was formed at Hartford the Society for the Improvement of Common Schools, with men like Noah Webster, Henry Barnard, Gallaudet, May, Olmsted, Skinner, Holbrook, Hillhouse, Williams, and others as its moving spirits. These men at once put themselves in communication with a similar class in Massachusetts—Fowle, Brooks, Alcott, Carter, Hall, Russell, Woodbridge, Emerson, and their associates. A lively campaign for the children was inaugurated which, during the coming ten years, increased till "it thundered all round the sky."

As early as 1816, Denison Olmsted, principal of the New London High School, had begun the vigorous exposure of the inefficient system of public education. He advocated "an academy for teachers" twenty years before the first State normal school was established in Massachusetts. In 1822 Governor Wolcott called the attention of the State, in no unmistakable language, to the condition of public school affairs. From the old habit of eleven months' school in every town, they had declined "till there was not a school of sufficient grade in the State, supported by public funds." At this time Commissioner Hillhouse was succeeded by Hon. Seth Beers, under whose vigorous administration the State fund still accumulated. In fifty-six years $4,200,000 had been distributed to the people on an original capital of $1,000,000.

In 1826 the governor of the State returned to the agitation and a legislative report revealed the gravity of the situation. There was absolutely no State supervision of the schools supported in large measure by the distribution of the income of the State fund, and no reliable public information of their condition. The neighboring State of New York had moved in the matter of State superintendency in 1812 by calling Gideon Hawley, of Connecticut, to the position of first state school commissioner and, on the abolition of the office, combining its duties with those of secretary of state. Meanwhile attention had been attracted to the admirable management of the State school fund of Connecticut, but at the same time the weaker features of the school system of the State were exposed to national observation. The opposite policy of Massachusetts, in supporting her common schools almost entirely by local public taxation, was approved by the leading educators of the country.

In 1830 an important convention was held in Hartford in the interest of common-school reform. The venerable Noah Webster presided, and President Heman Humphrey, of Amherst College, Massachusetts, made a powerful and illuminating address. At this time there were 1,600 school districts in the State. Schoolmasters were paid $11, and schoolmistresses $4 a month, generally "boarding round." The committees of the school societies were declared grossly negligent of their duties, and often there was no school in session during the summer. In 1828 an important document had revealed to the people the condition into which this fatal policy of handing over to "the societies" the most precious interest of the State had landed Connecticut in one generation. Unless this and similar representations were grossly exaggerated, there is no State of the Union to-day in a more desperate plight in respect to popular education than Connecticut in 1830.

In 1834 a legislative committee reported that the attempt in 1831 to collect educational statistics had been a failure. Only 136 of 209 school societies had responded to the inquiry, and they imperfectly. The committee urged further action along the same line. In 1836 the sum of $739,000, received by the State as its portion of the distribution of the "surplus revenue," was deposited with the towns, with the

direction that one-half, and, by the consent of the town, the whole amount should be held as a permanent school fund. In 1837, after fifteen years' agitation, the school societies were required by the legislature to make definite reports on the condition of the schools. Henry Barnard had now come to the front as the Erasmus of the great reformation of which Horace Mann had already appeared as the Luther, in Massachusetts. The report issued by the legislative committee of which he was a member was a sufficiently explicit document to arouse a community even more impervious to assault than the "school society" public of Connecticut. It was seen that men teachers were paid $14.50 and women $5.75 per month, chiefly "boarding round." The State was in a disgraceful condition of demoralization in regard to school books. In one polyglot school were found 5 different spellers, 24 readers, 9 geographies, 11 arithmetics, 7 histories, and 6 grammars. Six thousand children in the State were in no school, and 10,000 children and youth of the well-to-do families were costing, in private, more money than 70,000 in the common schools.

In 1838 matters came to a head. A State board of education appointed by the governor was authorized, with an additional member for every county. This board appointed Henry Barnard as its secretary.

No document in the educational history of this country is more instructive than the elaborate chronicle of the common schools of Connecticut prepared by Henry Barnard and issued by him as his eighth report on assuming the position of State superintendent of education for a second term in 1853. So thorough was the lesson learned from this that the educational movement which characterized the second half century of the Republic adopted, as a fundamental idea of public educational policy, the absolute separation of church and state in the common school. Since that disastrous experiment no American Commonwealth has called on any or all of its religious bodies to relieve the people of their responsibility of superintending public education by officials directly responsible to themselves. "Religion, morality, and knowledge" are still inscribed on the pillars of the schoolhouse as "essential to good government and the happiness of mankind;" but it is "religion, morality, and knowedge" as apprehended by the whole people in their actual relations to life, and applied by their own elected representatives for the making of good citizenship.

The State school fund was built up from the sale of the public domain secured to Connecticut at the time of the final decision respecting the claim of several States to the Northwest Territory before the establishment of the present Union. The only lesson to be drawn from this record is the bad policy of depending entirely either on a State school fund or State taxation for the support of public education. As a demonstration of the danger of such abuse of school funds by an American Commonwealth, this is a valuable object lesson, further illustrated in the case of several of the Northwestern States, that for a generation depended so largely on the income of the land grants secured by the ordinance of 1787; for all experience has demonstrated that the only effective motive power of the common school is an enlightened and resolute public opinion that moves the people to generous and persistent local taxation for education.

The most important lesson taught the American people by the example of Connecticut during these melancholy years is the absolute necessity of refusing any complicity with the ecclesiastical power under any denominational name by any scheme, however specious, in the administration of the common school. The people of Connecticut before this period were the foremost of all the colonies in the hearty support of public schools and the most successful in securing a high condition of public intelligence. In proportion as they permitted the church and the ecclesiastical power to encroach on their prerogative, they fell from their high estate. Although the same people ruled in town meeting, as citizens of the State, and in the parish meeting and "school society" under the influence of the church, yet in the one case they recorded their own judgment on matters very near their common interest and on which they had deeply thought, while in the other relation

they followed the lead of their spiritual advisers on a subject too often left to the judgment of ecclesiastics and scholars by the parents and guardians of children.

For half a century did the people of Connecticut battle in vain to get out of the maze of this entanglement. It was not till 1856 that the school societies were finally abolished and all their properties and functions turned over to the common-school authorities of the towns. And still the vicious system of individual school districts which has held on with such an obstinate grip in New England is retained in this State, to the acknowledged harm of the general educational interest, while the common schools are more than half supported by local taxation and improved in many essential ways.

But even more than we have seen in Massachusetts, the depressing effects of this long interregnum in popular education in Connecticut was modified by an environment of eminent people. They kept alive the best educational tendencies of the State, made Yale College a strong tower of the higher education, and prevented the people from going to sleep by an agitation through the press and speech that gathered strength with every successive year. The good cause was also greatly favored by the influential position occupied by many Connecticut men and women who, in other States, stood foremost in the upper walks of college, academic, and public responsibility, and were careful that the great success of the State in the development of its school fund should not be forgotten.

One of the most conspicuous advantages of our republican form of government, especially in an intelligent community, is that, when legislatures fall behind in wisdom and honesty, even into a slough of corrupt politics, the brain, character, and executive power, always latent in the community or State, assert themselves through every channel of influence outside political agencies and finally bring the majority of the people to recognize their danger and perform their duty. There is always a special difficulty in arousing an American city or State to the neglect or abuse of its common-school interest, because it is so easy for the people of wealth and culture, especially the professional classes, to withdraw their own children into the exclusive circle of private or denominational church seminaries and let the "common herd" struggle on as best they can. Besides, the education of children and youth has been for so many centuries an almost unquestioned prerogative of the clergy and the scholastic class in Europe, that it is not remarkable that our new American colonies, which were, even to the last, deeply attached to the mother country, were disposed to let matters in this respect drift in the "good old way" of the fathers, and not risk the novel and expensive experiment of educating the younger third of the State by putting their hands deep in their pockets, at best fearfully shallow.

Connecticut, for reasons already mentioned, was, and remains to the present day, the most conservative of the New England States. The State lived under the provincial charter of King Charles II for thirty years after the establishment of the Union; resisting far more strongly than the more Eastern colonies the progress of theological and educational reforms. But, as a compensation for the slow movement of the masses and their average clerical advisers, no American community during the first half century of the Republic produced a greater number, not only of eminent, but "first men," in several important movements that have so largely modified the educational policy of the whole country. It would be a valuable contribution to our educational literature if somebody would gather up the deeply interesting facts stored in that great educational treasure house, Barnard's American Journal of Education, and supplement it by a volume containing the biography of the grand army of Connecticut educators, who from the earliest period have emigrated from the old colony even to the nation's "jumping-off place" in every direction, to say nothing of the not less notable host who at home have battled for the better time to the children and youth. A brief notice of a few of the best known of these admirable men and women will only reveal the great company of

the true and good that can be remembered to the honor of the State and for the encouragement of every friend of popular education the world over.

At the beginning of New England education in Connecticut and Massachusetts Master Ezekiel Cheever, born in England, began his long and honorable career as the head of the first school in New Haven, Conn. Finding the ecclesiastical atmosphere somewhat too rare in that locality, he emigrated to Massachusetts and, first at Ipswich and afterwards in Boston, won and wore the laurels at that day accorded to the successful teacher of youth.

Later we find Caleb Bingham, a native of Connecticut, who took up the educational work in Boston at a critical point, led the Boston girls up to the open door of knowledge and lifted the inefficient common-school system of the city out of the ruts into the beginning of its present estate, where $2,000,000 are yearly expended for the training of 80,000 children in public and private schools.

About the middle of the seventeenth century, Governor Hopkins, of Connecticut, left one of the earliest of the generous contributions for education in the Hopkins fund, with which the famous high schools of Hartford and New Haven are to-day partially supported, and in which Hadley, Mass., and Harvard College are, to some extent, still participating.

During the past century the State of Connecticut has given three men of commanding ability to the national leadership of common-school education; each at a critical period appearing as a providential educator—Noah Webster, Henry Barnard, and William T. Harris. Of these, Noah Webster was the patriarch in respect to time, and with the progress of the years may be declared most eminent of all the prophetic minds who, at the beginning of the Republic, laid the foundations for the training of the whole American people for American citizenship. Certainly no man, at a period so early, grasped the idea that any system of universal education in the United States must be essentially an American system, like the National Government, industry, church, and social order, born of the genius and organized and administered by the executive faculty of the whole people. With a prescience and singleness of mind that earned for him the name of fanatic and estranged the literary class of more than one generation, he early laid hold of the idea of a national culture for a republican order of affairs in a new world, and, with a patience born of insight, wrought during sixty laborious years to forge the implements by which the youth of the New World might fashion their destiny.

He never concerned himself especially with the details of school keeping in any department, well knowing that if the masses of the people could be furnished with the suitable agencies for making their way to the sources of knowledge, they could be trusted, with the passing years, to fashion a practical and effective scheme for general enlightenment. Like all reformers in the misty and illimitable realm called education, he was some what ridden by fancies and wasted too much time and strength in the trial of impracticable experiments. But, with the development of the higher scientific and educational agencies of the country, these have disappeared, and Noah Webster is now remembered as the man of whom such weighty sentences as the following can be written: "He saw the vast crowds of American children. He knew that the integrity of the country was dependent on the intelligence of their votes." * * * "He made a speller which has sown votes and muskets." * * * "He made also a dictionary which has grown under the impulse he gave it into a national encyclopedia, possessing an irresistible momentum." * * * "He made elementary education possible at once and furnished the American people with a key which moved easily in the lock." It was such anticipations as these that supported the colonial educational movement of Dr. Benjamin Franklin; inspired the more radical and comprehensive scheme of Thomas Jefferson; made possible the great revival under the lead of Horace Mann, Henry Barnard, and their coadjutors, and is now being realized in the national advance along the lines of the new education, of which the most eminent representative is the present United States Commissioner of Education, Dr. William T. Harris.

Noah Webster was born of a good family in the village of East Hartford, Conn., in 1758. He soon got through with the poor-enough district school of the day and, by the help of the Rev. Mr. Perkins and the Hopkins Grammar School, of Hartford, entered Yale College at the age of 16 and graduated in due time. At this date Yale had 150 students, 3 professors and 3 tutors, and a library of 4,000 volumes. The only public library of New England was a collection of 12,000 books made by a Boston bookseller, who advertised a stock of 10,000 on his shelves. Young Webster's college life fell upon the opening years of the Revolutionary war. He played the fife at the head of the student brigade, which escorted Washington through New Haven on his way to assume command of the Continental Army at Boston. He spent a vacation under arms in the reserve to the extemporized crowd of "embattled farmers," who fought, conquered, and "led captive" the army of Burgoyne from northern New York to the New England seaboard.

After graduating he opened a private school at Sharon, Conn., studied law, and in 1780 was admitted to the bar although he never became a professional lawyer. Yale College was passing through its transition state from a local school of theology to a proper institution of the higher education. Between 1748 and 1778 the per cent of clerical graduates had fallen from one-half to one-tenth of the student force; the old-time system of classification of students by social standing had given place to the alphabetical arrangement; and the time was approaching when Dr. Timothy Dwight would take the reins as president and give the first positive impulse that has placed the little academical and clerical school of the last century in the forefront of American universities.

It was the day when the almanac did the work of the newspaper and, outside two or three New England colonies, the mass of the American people had not come up to any reliable intention of promoting general elementary education. Webster said in 1790, "Knowledge is more diffused among the laboring people (the farmers) of New England than in any country on the globe. They read, write, calculate, read the Bible and about all the best English authors—the Spectator, Rambler, Dr. Doddridge, etc. On political subjects the learning of our eminent American statesmen is superior to that of most European writers, and their opinions more correct. There is a lack of clerical and scientific learning, and there are few tolerable libraries, and these exceedingly imperfect. Great numbers of the most valuable authors have not found their way across the Atlantic. There is little hope of education from the action of legislative bodies. Some false theories and errors in science which the British nation has inherited from illustrious men, and nourished from an implicit reliance on their authority, are to be overthrown by the genius of America."

In sentences like these we come upon the radical genius of Noah Webster. He saw at once that it was neither from reliance on European leadership nor dependence on the assumption of legislative authority at home that the American people must expect the schooling that would make, for the last and most hopeful human venture on earth, the new American citizenship. He saw more clearly than many a "great educator" of the present day that in this respect the American people would get only what they demanded and were willing to pay for, organize, supervise, and stand guard over from generation to generation, whatever might be the opinions or action of the leaders of the higher education or self-appointed magnates of the national culture. He realized that during his own life he might be subjected to a practical ostracism from the large and influential class whose intellectual life revolved within the narrow circle of Old World ideas and ideals of education. At an early age he entered upon the prodigious work of putting into the hands of his countrymen, of "all sorts and conditions," the tools with which, educationally, they could "work out their own salvation."

His labors were concentrated upon such an arrangement for adjusting the native language to the use of the heterogeneous populations of the colonies as would furnish a proper medium for the imparting of knowledge and fusing into one people the multitude of many nationalities and tongues that found themselves within the

frail inclosure of the Confederation and the scarcely more reliable bond of the Union of 1788. He lost no time in "fooling" with his radical work and less than might be predicted by trifling with impracticable experiments. As early as 1782, at the age of 24, he planned his famous Grammatical Institute, the fruitful parent of the great world of American schoolbooks and the first publication in the interest of general education which attracted at once the attention of the foremost men of the country and was adopted by the people with an eager relish prophetic of much in the years to come. This threefold work included the famous spelling book, a grammar, and a series of readers; and during the coming years evolved into a succession of useful popular educational works, a History of the United States, The Teacher, Manual of Useful Studies, etc.

While getting on his feet he "kept the wolf from the door" by teaching, lecturing, editorship, vigorous public pamphleteering, the all-round work which any rising young man was compelled to undertake in those days when the first severe strain came upon the new system of republican government. But his political and journalistic writings were but a sort of preparation for the continuous labors of his mature years. Indeed, as a writer, his theme was one long deliverance on patriotism; the necessity of emancipation from the characteristic ideas, as from the political domination, of the Old World; the culture of self-reliance in a young people, hitherto regarded as a backwoods population at the farther end of creation, but destined to become at no far distant time the instructors of the world along the lines of popular self-government and a new order of social affairs.

While the northern division of the Army of Independence was resting on the Hudson River awaiting the final order to disband, Noah Webster was putting the finishing touches to his new spelling book in a neighboring village. Timothy Pickering sat up all night to read through an early copy and wrote home to his wife that it was "a work that would do honor to the country." The speller was the first American schoolbook that won national fame and received from several States the first copyright. In 1783, largely from Webster's urgency, Congress recommended a general law of copyright, and in 1790 the first national laws in behalf of the rights of American authors were passed. Of the success of Webster's spelling book it is hardly necessary to speak. By 1849 24,000,000 copies had been sold, and the demand continued at the rate of 1,000,000 copies a year. It was everywhere bought by the country storekeepers as a necessary part of their stock in trade. During the civil war it was republished for the South. The revival of education in this section at the close of the war brought it forward and from 1866 to 1873 8,000,000 copies were disposed of. It lay next the Bible in the home of the freedmen, and is still held in peculiar reverence through large sections of the Union.

The grammar was an attempt to construct a text-book on the basis of the English language that should not be practically a translation of a Latin accidence. The readers were filled with extracts from the patriotic speeches and writings of American statesmen and divines. Each of these works contained an annex of useful general knowledge, and in a way this series of Webster's schoolbooks covered the entire field of the elementary popular education, supplanting the clumsy and misleading text-books of the eighteenth century, out of which George Washington, at the age of 13 graduating from all he knew of a school, probably concocted his famous series of manuscript treatises on the different branches of knowledge, which are now preserved, among other treasures of early American literature, in the library of the State Department at the national capital.

But all these studies and essays at authorship up to the age of 50, however important in themselves, were regarded by Noah Webster as preliminary to the central work of his life, to present a "revised and improved" encyclopedia of language to the American people which should redeem the mother tongue from the corruptions and entanglements in which it had been involved by the writers and lexicographers representing the Johnsonian era of British literature.

Dr. Samuel Johnson was then the undisputed authority in all matters connected therewith, not only at home but on this side the water. Webster had come to the conclusion that Johnson's Dictionary had wrought a corruption of the English of an earlier day and, in a controversy with Dr. Ramsay, the head of the literati of Charleston, S. C., stoutly maintained this assertion. He was also greatly impressed with the difficulty of English spelling and, like Dr. Franklin before him and an increasing throng of American scholars at the present day, labored for a reformation. He asserted that an abbreviated spelling would serve the double purpose of making the language far more easy of acquirement, save years of time to the learner, be a great agency in the unification of the different portions and classes of the country, favor the publication of American books, and be a powerful influence in emancipating the American people from British ideas and habits of life. He also proposed and partly executed a new translation of the Bible. He spent a year in Philadelphia with the aged Dr. Benjamin Franklin, and became in a way the inheritor of the opinions and labors of this greatest popular educator of the colonial American mind.

With all these vast and vague aspirations surrounding his central purpose, like a drifting world of golden clouds and rainbow mists enveloping a mighty mountain summit, he sat himself down in 1806 at the age of 50 to begin the work of his life, the preparation of his Comprehensive Dictionary of the English Language. He had already published a Comprehensive Dictionary, containing 5,000 additional words beyond Johnson's, with reliable tables of importance, which were an innovation on the lexicography of the period. Previous to this he had begun a series of extended journeyings through his own country which he continued through his life, lecturing, studying, and mingling with all classes in all sections of the Union. Some of his theories have the mark of a shrewd originality; as that the nasal pronunciation of the New England people was a result of their equality of social position, a state of society in which the peremptory habit of speaking characteristic of the slave-holding States would not be tolerated, as every man spoke to his neighbor in a deliberate and half-inquisitive manner. It was his conviction that his labors tended to wake up and make permanent a spirit of mental independence among American youth. He said, "I have contributed in a small degree to the instruction of at least 4,000,000 of the rising generation, and it is not unreasonable to expect that a few seeds of information planted by my hand may germinate and grow and ripen into valuable fruits when my remains shall be mingled with the dust."

Having made this initial essay toward his final work, he set about the preparation of his great dictionary, well named "A Vast People's Schoolbook," in the most deliberate and determined manner. He sold his ancestral home and lived in a plain cottage in the country; changed his abiding place from time to time in pursuit of economical living, and resisted all appeals of family and friends for additional personal comfort and enjoyment that would wean him from the one mission of his life. He lived at New Haven, Conn.; Amherst, Mass.; New York, then a city of but 3,500 houses; at Princeton, N. J.; and Philadelphia, Pa.; finally, from necessity, at Paris and Cambridge University, England, where, in 1825, he finished his stupendous work, which was published in 1828 and thoroughly revised in 1840. He died in 1843, engaged in a further revision, at the age of 85. His original dictionary was the first publication to take advantage of the national copyright law in 1806.

One of the peculiarities of the final work was the liberal quotations from American writers in illustration of the use of words. He maintained that the best authors of our country wrote the language as well as contemporary Englishmen. He anticipated the day when President Eliot, of Harvard, could inform a club in Boston, on his return from an extended vacation tour through the north of Africa, Asia Minor, and southeast Europe, that "the English language is now a sufficient guide to a traveler in any part of the civilized world." Webster declared that in two centuries English would be spoken by more people than any other language, save possibly the Chinese, the language of the vast population of that still

half-barbaric realm. He seemed already to hear the approval and encouragement of his labors from the thronging millions of the English-speaking people around the globe.

It is not in the line of this essay to engage in the long-drawn discussion of the merits and defects of the original or the present Webster's Dictionary. That at the time of its earliest publication, seventy years ago, it was a prodigious advance in the direction of introducing the English-speaking people on this side the Atlantic to their own magnificent language, the language of constitutional government, the depository of the world's noblest literature, destined to follow the progress of free government and universal education around the earth, can not be denied. His theories and crotchets concerning a revised spelling were at least as rational as most of the similar "reforms" of the present day; and his often eccentric notions of derivation and pronunciation, with other fancies which were the changeful environment of his great central achievement, have gradually been eliminated from his work. At first derided by a portion of the literary and learned class in his own country and neglected abroad, his dictionary has been adopted by the ablest group of philologists in America as the substance of the most useful popular dictionary of the English tongue, and is more widely in use than any rival. It doubled the number of words found in any dictionary of the period.

That it should have done all this at the time and under the circumstances of its authorship places Noah Webster at the head of the long line of American men and "noble women, not a few," whose lives have contributed to that type of culture of the American people which has passed into and abides in the most characteristic national creation, the American common school. It was significant that his own college, Yale, that was always nearest the heart of the American people in the old days, and still, of all the educational collegiate establishments that have come down to us from the colonial period, is most in touch with our new American life, should at last adopt the work of its most famous early graduate and give to its enlargement and perfecting the best effort of long years of philological investigation, never leaving its hold on his original idea till it became the best known handbook of the American use of the English language.

While in the organization, administration, arrangement of methods of instruction, and general manipulation of the common school in all its departments we must assign the foremost honors to others, the final verdict of the American educational public will be that in the department of the preparation of an original school literature, the beginning of the prodigious national industry of the making of common-school books in which American authors hold an undisputed preeminence, Noah Webster stands without a rival, the patriarch and prophet among them all. Here is honor sufficient for one man and, with the added distinction of other educators, like Henry Barnard, Emma Willard, Eliphalet Nott, and others only less celebrated, places the little Commonwealth of Connecticut at the head of the column of direction leading up to the decade of the auspicious revival of American popular education in 1830–1840, during the first half century of the national experience of the American common school.

In a similar line we find James Wadsworth, the head of the honored family of that name, established in the valley of the Genesee, in western New York. With his earliest appearance in what was then the American "out West," his interest and activity in popular education began and continued through his long and beneficent life. Born in 1768, in Connecticut, he became an efficient agent in the first important movement in his adopted State, New York, for the improvement of the common schools. It is claimed that the Empire State was the pioneer in the system of free school libraries, which have not only been a growing local blessing to the whole country but, in many of our larger cities and villages, have become the nucleus of the free public library that is now justly regarded as the right hand of the common school. By personal effort and the free use of his money he was perhaps the most

influential of all men in this movement, which extended at a later date to Massachusetts and Ohio.

When the State of New York in 1812 awoke from the lethargy of two hundred years and, under the vigorous leadership of De Witt Clinton and other distinguished publicists, took the first advanced step in the steady march toward the great educational achievement of the present day, it called a young lawyer of Albany, Gideon F. Hawley, of Connecticut, to the post of first State superintendent of education, more than twenty years before Massachussetts appointed Horace Mann and nearly thirty years before Connecticut called Henry Barnard to a similar position. Mr. Hawley was also for many years the secretary and later a member of the New York board of regents of the University of the State of New York.

William A. Alcott was born in Connecticut in 1798, and during the period now under consideration was emphatically the "man of all work," besides his service as a tireless public and private worker in nearly every important associated effort in behalf of education. The catalogue of his popular books includes more than one hundred publications and for an entire generation his name was a household word among the homes, churches, and schools, especially of New England States. Says his biographer: "No living individual has devoted more hours during forty years to education, especially in the common school and the family." He was not only the working man in many of the educational organizations of that day, but the inspiration of thousands of young men and women who, in their own way, have become shining lights in the educational history of the nation.

During the same period Prof. Charles Davies, born in Connecticut in 1798, had lived through his career as an educator of national reputation and had been professor at West Point, Columbia College, and the State normal school in Albany. He was the author and translator of a series of text-books in mathematics of wide repute and became an honored leader in that class of studies through all the colleges west of the Hudson River.

Thomas H. Gallaudet, though born in Philadelphia of Huguenot extraction on his father's side, was a son of a Connecticut mother and lived out his crowded and beneficent career in Hartford, Conn., where he came as a schoolboy. He was the leader in the great enterprise of establishing the institution for the deaf, dumb, and blind in that city; was also a fast friend and indefatigable worker in the interest of the public instruction of the masses, and a member of the first society in New England for the improvement of the systems of universal education. He was the author of the memorable saying, "public schools a public blessing."

John Kingsbury, born in Connecticut in 1801, rendered a most valuable service to the city of Providence and the State of Rhode Island by founding one of the most celebrated female seminaries in the country. In this school the gospel of thoroughness, which has now become the watchword of the new education in every superior school for the sex in the Union, was ground into the very texture of the instruction, under which an entire generation of the young women of Providence were schooled.

President Timothy Dwight, still one of the most celebrated of the presidents of Yale University, as the head of the higher education in Connecticut for a generation, although in his early ministry found on the wrong side in the critical discussion concerning the original distribution of the State school fund, was still a most earnest friend of the common-school revival of 1838.

President Heman Humphrey, of Amherst College, Massachusetts, remembered by the students of my own generation as the venerable father of us all, especially through his wise and instructive preaching in the college chapel and his admirable series of "freshman lectures," was an enthusiastic friend of popular education, and gave one of the most stirring addresses at the celebrated convention in Hartford that "forced the fighting" in 1838.

Another president of Yale College, and in more than one respect one of the leaders of the educational reform of a later period, Noah Porter, did yeoman's service

in this revival by a prize essay on "Popular education in Connecticut," while still a young minister in Springfield, Mass. This essay is one of those classics that could be republished to-day with great profit, bound up with the remarkable pamphlet of President Thornwell, of South Carolina College, the racy address of Hon. Henry A. Wise, of Virginia, to his constituents on public education, and other not less characteristic and "epoch-making" deliverances in other portions of the Union.

Rev. Wilbur Fisk, not a native of Connecticut, but closely identified with the higher education as first president of Wesleyan University at Middletown, should not be forgotten. At this juncture he stood up, a tower of strength, in the good cause of a broader and higher scholarship in the upper story of the educational temple which, without a foundation on the bed rock of general intelligence in the people, is in our country "a house built on the sand."

Foremost among the famous women of the country, in a period when it required the courage of the greatest scholar of the "stronger sex" to assert the right of American girls to the higher education, were the sisters Emma Willard and Almira Lincoln Phelps. These two admirable women, who made a splendid record at the Troy (N. Y.) Female Seminary, which for years stood foremost as the promise and prophecy of the hundreds of important institutions now opened to the young women of America, were born and educated in Connecticut. Mrs. Willard's seminary became a national school for the mental, moral, and social uplift of the young women of many States. At the Patapsco Seminary, in eastern Pennsylvania, her sister, Mrs. Lincoln Phelps, labored at the preliminary stages of popular nature studies, then almost neglected in seminaries for girls, but now made one of the most attractive departments of study in all the American women's and coeducational colleges in the land.

We have already made mention of James Hillhouse, distinguished as the manager of the first considerable public educational State fund of the country—that of Connecticut. His name can never be left out of the record of the faithful public servants who, in every State, with a holy obstinacy, have guarded the children's money from the assaults of the public plunderer. He was, besides, for fifty years, the treasurer of Yale College, and his name is cherished as one of the first citizens of his native State.

Josiah Holbrook, born in 1788, has already been commemorated in this essay as the author of the American Lyceum, founded in the town of Millbury, Mass., in 1826. It would be impossible to estimate the influence of this great "man of the people," a sort of educational Benjamin Franklin, during his long and active life, working in every possible way in behalf of popular intelligence. The lyceum was an influence all the more powerful because so widely diffused and often so elusive and indirect. But no living educator who, as a boy in school sixty years ago, found in the village lyceum the delightful entertainment of the northern winter evening can be indifferent to the vast influence of what came from the long and varied labors of this remarkable man.

Prof. Denison Olmsted, as early as 1816, while master of the New London (Conn.) High School, was a reformer of the district school work in Connecticut. From that day until he became a member of the first State board of education in 1840 he never withheld his voice or pen in the campaign of a quarter of a century for the people's school. He advocated "an academy for teachers" twenty years before Massachusetts and twenty-five years before Connecticut moved for a State normal school. As the author of valuable text-books on natural science, his name was familiar to every student in the country.

Most eminent of all this illustrious company, and not second among the greatest educational men of this period, was Henry Barnard; still, by a gracious Providence, spared to a generation that can hardly conceive the state of popular education into which he was born in Connecticut in 1811. Early dedicated to the cause of universal education; fitted by the best home training, foreign travel, and wide acquaintance

with men and affairs, for a "nation's man;" with a large historical faculty and an industry that was never fatigued, he has lived through a brilliant career of active service as the first State superintendent of schools in Connecticut and Rhode Island; later, president of the State University of Wisconsin, and first United States Commissioner of Education. But far beyond any or all his achievements in these laborious offices is the value of the collection of educational literature in the 30 volumes of the American Journal of Education, which has received the highest honors of recognition from the school authorities of France, Austria, and Italy, and still maintains its unquestioned place as the great treasure-house of information in the educational literature of the English language.

Rev. John Pierpont, a native of Connecticut, was not only distinguished as one of the foremost preachers and temperance reformers in Boston and as not the least of the earlier group of American poets, but in his two school books, the National Reader and American First Class Book, gave the country by far the best series of school readers for the superior grades of pupils that has been printed in the English language. Thousands of young people owed their introduction to good English literature to the admirable selections in these volumes, the extensive use of which during the period now considered atoned for many defects in the common schools of the day.

Joseph T. Buckingham rose from a poor boy in a neglected Connecticut family to one of the magnates of the Boston press and a public man of large influence in Massachusetts.

Dr. William B. Sprague, for many years a distinguished Presbyterian divine in Albany, was one of the early graduates of the theological class of President Timothy Dwight of Yale College and a native of the State. In his elaborate work, Annals of the American Pulpit, he did a work for the churches of America similar to that of Henry Barnard in the educational biography of the country.

Dr. Horace Holly, for a time the leading preacher of Boston, was one of the first and by far the most distinguished of the presidents of Transylvania University, Kentucky. Although transplanted from New England to Kentucky somewhat before the fit time for his appreciation and hearty acceptance, he is still a name of power in the Southwest through the admiration of many distinguished men who dated their first awakening to noble ambitions to their student days under his presidency. More fortunate in their location were his two brothers, Myron and Orville L. Holly, who removed to the State of New York and became eminent, the former in connection with the building of the Erie Canal, the latter through his long and valuable labors as the editor of historical papers in connection with the State library. Sally Holly, the daughter of Myron Holly, spent her life in teaching the freedman in Virginia, and other members of the family have acquired national reputation.

Dr. Jared Sparks, president of Harvard College, author of the life of Washington and Franklin, and editor of the valuable series of American Biography, was also a native of Connecticut. In theology Moses Stuart and Dr. Robinson, of the Andover Theological Seminary, were students of the Yale theological school during this period; earlier and later associated with the memorable names of scores of clergymen of high repute, the Beecher family, Horace Bushnell, Dr. Taylor, Emmons, Hopkins, Jonathan Edwards, and numbers more or less celebrated.

All these men in many ways represented the educational influence of Connecticut at home and abroad. Hon. Robert C. Winthrop, of Boston, the adviser of George Peabody in his grand benefaction of the Peabody educational fund, and from the first president of its board of trustees, traced his family record to the Winthrops of Connecticut.

Later in this illustrious roll of educational celebrities must be mentioned Dr. William T. Harris, who, born in Connecticut in the opening year of the educational revival, 1835, a student of Yale College, became first known by his great work in the organization of the public school system of St. Louis, Mo. As a learned scholar and the most distinguished American representative of the spiritual as opposed to the

material systems of philosophy, he is known in all the higher circles of philosophic culture. At present, as fourth United States Commissioner of Education, he stands without a peer as a representative American educator.

In the year 1856, on the occasion of an article in the Atlantic Monthly, then especially the organ of the Boston literati, Rev. J. M. Tarbox, D. D., of Connecticut, published an interesting article in the New Englander, a New Haven magazine, afterwards reprinted in a pamphlet styled Old Connecticut v. The Atlantic Monthly. To this racy and instructive monograph we may refer any reader who desires to pursue at greater length the glorious record of the contribution of the little State of Connecticut to the higher life of the Union. "The roll of honor" spread on these glowing pages included only such names as could be gathered from the first half century of the nation's life and, of course, was relatively greater than could be gathered to-day, when the West has come up to a notable literary, educational, and especially a public life of its own. But even now there seems to be little cessation in the reliable contributions of the "old hive" to the rapidly rising civilization of the new West and the Pacific Slope.

According to this statement, no State in the Union, during the formative first half century of the national life, had made so many and so important contributions, public, professional, and educational, to the Republic as the Commonwealth which the French De Tocqueville called "that little yellow spot on the map of the Confederation that seems to me one miracle." To say nothing of its contribution to the earlier literature of the nation, in which Trumbull, Barlow, Dwight, and other authors were conspicuous, we find later, the Beechers, Percival, Mrs. Stowe, Mitchell, Holland, Winthrop, and by descent, Dr. Oliver Wendell Holmes. The claim that Connecticut has been especially noted in the "first men" who were the authors of "first things" seems well made out. In 1821, thirty-three of the one hundred and twenty-six members of the convention that revised the constitution of New York were from this State, and in 1860 there were fifteen Connecticut men in the legislature of New York. Early in the century one-fifth of the members of the Congress of the United States hailed from this little Commonwealth; and John C. Calhoun declared that, at one period, the descendants of Connecticut and graduates of Yale College were only 5 less than a majority of the members of Congress. Said De Tocqueville: "This little yellow spot on the map of the United States has produced the clock peddler, the schoolmaster, and the Senator. The first keeps time, the second tells what to do with it, and the third makes laws and civilization." Sixteen college presidents in many States, in 1856, came from the "land of steady habits," while Massachusetts had produced but 18, with a population then twice as large. Of these, 2 were presidents of Columbia, 2 of Union, and 4 of Hamilton College, New York; 2 of the College of New Jersey; 2 of Illinois College; 1 of Oberlin, Ohio; 2 of the University of Georgia, and others. Among these are the names of Jonathan Edwards, father and son; President Nott of Union, and Finney of Oberlin. Up to 1835 Connecticut had sent 158 Congregational and Presbyterian clergymen to northern Ohio alone. The first law school in the Union was established at Litchfield, Conn., in 1784. The little village of Lebanon, Conn., thirty years ago, had furnished 69 graduates of colleges and 5 governors of States. Professor Silliman, so well known in natural science, should not be forgotten. Cassius M. Clay, of Kentucky, a graduate of Yale, reports that the chief justice of Connecticut declared he had found in all his acquaintance but two Connecticut men who could not read and write. This referred to the period before the Revolution, previous to the decline of popular education during the first fifty years of the Republic.

It should not be forgotten that the early and most successful efforts to Christianize and civilize the Indians were made in this State. Eliot, in 1657; Pierson, in 1662; Newton, in 1648; the agents for the Society for the Propagation of the Gospel, in 1752, and others gave to this work great labor and a devotion that deserved better rewards. The movement by Eleazar Wheelock, 1730–1740, to establish a seminary for the Indians, was practically the beginning of Dartmouth College, at Hanover, N. H., to

which place the Connecticut school was removed, as nearer the homes of the students of this race.

The history of education in Connecticut with Yale left out would be the best possible illustration of Hamlet minus the Prince of Denmark. Yale College, from its foundation by a close corporation of ten Connecticut evangelical clergymen in 1700, was in many ways a different institution from the great university of the present; but it was in a far more intimate way than any college or university in New England now the center and head of the somewhat contradictory agencies that gave to this little State its prodigious influence in the upper regions of American civilization.

For, while, with the exception of Harvard, for one hundred and fifty years previous to the Revolution, none of the New England colleges were "State institutions" in the sense in which the present group of "State universities" hold that name, yet, by the very conditions of New England society, both these institutions of learning stood in very intimate relations to the common schools, and were even more intimately connected with the academies which sent up their yearly tale of students for their entrance examinations. Unlike the almost universal habit in the Western and Southern States, these colleges have never maintained a preparatory department, the work done in this, often the largest department of the college, being usually done in the earlier days by the academies or private tutorship by the clergymen of the town.

It is true that, especially in the smaller country colleges, up to the period included in this portion of our essay, the entrance examination was often deplorably superficial, the boy who gave indication of any capacity for study being admitted without conditions. A large proportion of their students, as of Yale and Harvard, were country boys, whose opportunities for preparatory study had been confined to the "coaching" of the village parson and a few terms at a country academy, the funds for this and the college term being earned by teaching school during the winter months and often by severe labor for hire. But it was also true that, once inside college walls, there was generally no lowering of the standard to suit the unprepared A special hardship was that, while a small group of the freshman class came in well fitted, through training schools like Exeter, N. H., Andover, Mass., and the Boston Latin School, the majority were expected to "keep up" in a course of study that from the opening day was comparatively easy to the more favored, but "Latin and Greek" to them. The drudgery was increased by the frequent necessity of the country-bred student to spend the entire winter months at school teaching, the term sometimes exceeding by several weeks the midwinter college vacation. To this and the sanitary arrangements of these colleges, there being few inducements to needful exercise, and to the half-starvation rations on which these boys attempted to climb the steep hill of science, encouraged by the educational "fad" of that period, "lean living and high thinking," must we ascribe the melancholy wreck of life and health in all these seats of learning. Half the class in which the writer of this essay was a freshman, including himself, dropped out during the early years of the course, almost uniformly from failure of health. The opponents of the higher education of woman on sanitary grounds would find themselves confuted to their entire confusion by the study of the health and life record of the boys' colleges in the New England of fifty years ago.

But these very conditions brought the higher institutions of learning in New England nearer the heart of the people. Their students and graduates were the best teachers of the "winter schools" in all the districts that were so fortunate as to employ them, and their superior graduates, as at present, furnished almost the entire corps of instructors for the better sort of academies. It was a common habit in the smaller New England towns to open a subscription school for three months in the autumn, where a higher class of studies, including the classics, could be pursued, and the teacher was usually a college graduate of the previous summer or a student from one of the theological schools. Until the Revolutionary war the teachers of the best public schools were often the clergymen, and rarely any but

the graduates of Harvard, Yale, Dartmouth, and Brown. And however earnestly the more ecclesiastical portion of the clergy of all the religious bodies might insist in holding up the ideal of a "Christian" as opposed to their notion of the common-school "secular" education in the colleges established under the auspices of their own sect, the people of New England could always be trusted to capture and use for the purposes of the broadest educational training then required every college and academy they cared to favor with a constant and remunerative patronage. There is not in New England to-day, outside the borders of the high-church Protestant and Catholic following, a college, rarely an academy, that cares to place in the foreground its denominational religious association or in any way, even indirectly, makes its theology or polity a bar to perfect freedom of study and thought in its classes. Harvard and Yale at first, and the former always, repudiated any test of this sort. Thus, in the absence in New England and the Middle States to-day of the subsidized State university of the West and South, all its colleges and universities and the majority of its private academies and corporate schools have, in some respects, the same relation to the people as if entirely supported by the State.

The clerical organization of Yale College at the beginning somewhat differentiated it from Harvard, which was the child of the State, and, until a later period of its history, in vital connection with the Commonwealth. Its founders were ten clergymen, of the Connecticut Evangelical Congregational type of their time; and even to-day their successors are the core of the governing body of Yale University. We have already referred to the very evident reaction, especially in western Massachusetts and Connecticut, against the growing liberty in thinking of Harvard which appeared in 1700 and a hundred years later left the college practically for half a century in the hands of the most unecclesiastical and unorganized of the religious bodies of the country. Yale appeared at once in a certain way as a "defender of the faith" of the fathers; although, at a later period, there sprang up in its very heart, the theological department, a movement represented by the famous Dr. Taylor, which, perhaps, is destined to a much wider influence on theological opinions than the bolder and more aggressive attitude of its older rival.

This period, from the beginning of Yale till the elevation of Rev. Timothy Dwight to the presidency, in 1795, was so filled with complications regarding its connection with the State and personal and theological differences that, at the election of this distinguished clergyman to the presidency, the college was at a low ebb.

Timothy Dwight was born in Northampton, Mass., in 1752; was a graduate of Yale College, served as tutor in his alma mater, and was a chaplain in the Revolutionary Army. At the time of his accession to the presidency of Yale, in 1795, he was a clergyman of established reputation in the town of Greenfield, Conn., where he also had established a flourishing private school for boys. His eminence as a preacher and educator pointed to him as the providential president who could lift the college out of the ruts and place it in its proper attitude before the State and the country. At this time it was little more than a collegiate school, with 100 students, taught by 1 professor and 3 tutors, with the pittance derived from a small legislative subsidy and tuition fees for its support. Its buildings were dilapidated, and its reputation was somewhat "worse for the wear" as the result of local controversies now forgotten. It would seem that a young man of whatever promise must have had great confidence in himself to put his shoulder against a wheel so obstinately sunk in the mire with any except the idea of sacrifice, prolonged through years of toil and weary waiting for a result that never comes.

But the new president had in him the stuff of which great men are made. He came to the work fully armed for all the requirements of the situation. At once he took the burden of the entire instruction of the senior class in college; preached twice a Sunday in the college chapel; taught the students of theology, among whom were Moses Stuart, Lyman Beecher, William B. Sprague, and Nathaniel W. Taylor, and had his eye on all that was going on within college walls. With rare insight

into the ability and adaptation of men, he placed in three new professorships, Day, Silliman, and Bailey, each of whom became educators and authors of national reputation, and one, Professor Jeremiah Day, his immediate successor in the presidency. At one whirl of the big college broom he swept out of doors a whole set of college customs and reformed the entire spirit and method of college discipline. He abolished fines as a penalty for college offenses, and, during his entire presidency of seventeen years, like President Nott, of Union College, New York, relied far more on his profound knowledge of student nature and personal influence than on college edicts for government, although, when a crisis invited, he soon established the idea that a college is not a realm outside the power of civilized, moral, and legal restraint. He was able to get the means for gradual improvements, new buildings, and additional teachers, although, even in 1840, the income of Yale from additional funds was only $1,500 a year, and the deficit in tuition fees was made up by personal solicitations from wealthy friends.

When Dr. Dwight began, he found little taught in the college except a very moderate allowance of Latin and Greek, mathematics, astronomy, and physics, chiefly from text-books. In bringing Day, Silliman, and Wolsey to their several departments, he had placed on a broad foundation the study of mathematics, natural science, language, and belles-lettres. Within four years the attendance on the college doubled. The vigorous administration attracted attention all over the country, and at once Yale began to draw a considerable proportion of its students from beyond Connecticut, especially from New York City and the Southern States. President Dwight, finding it little more than a "collegiate school," left it a college of national fame on the high road to its glorious future. His reputation as a religious head of the college was greatly enlarged and extended by his success in dealing with the growing unbelief in religion of the French type of half a century ago, implanted largely through our relations with France in the Revolutionary and subsequent period, while his scholarship pointed out Yale at once as one of the most catholic and liberal of all the centers of clerical education in the land.

President Dwight resigned the presidency of Yale in 1817. He had already indicated Jeremiah Day as his successor, and this very able man was at once introduced to the presidency, which he held twenty-nine years, till 1846. His life was prolonged until the great age of 94, to the last devoted to his beloved Yale. Under his administration it is noted that the personal element in the government of the college, so prominent and essential during the years of his predecessor, fell into the background, and the faculty assumed its rightful place as the governing power of the interior life of the student community. It was during this period that Theodore D. Wolsey first appears at Yale as professor of Greek, ending as the president of the college for twenty-five years—1846–1871—having also become an author, especially in civics and social science, of national reputation. The medical, theological, and law departments of the college were strengthened by additional endowment, and men of ability, and not unfrequently of national fame, installed as teachers therein. During this period occurred the two notable student rebellions of the college, both of which were so wisely and successfully dealt with that Yale for the past fifty years seems to have been remarkably free from such unpleasant occurrences.

The startling increase in numbers at Yale is proclaimed by the wide territory from which students were drawn. During the last fifteen years of President Dwight's administration nearly every State in the Union was represented. At this time came up the great influence of Yale on the rising college and academic life of the new Northwest. Illinois College, in 1825, was a child of an extemporized society for home missions. With this movement toward the new West the college put on a certain cosmopolitan air and a sympathy with the educational life of the masses, which the university of to-day still retains. It is justly claimed that the faculty of Illinois College was one of the powerful influences in the final establishment of the common-school system in that State, after a bitter conflict of an entire generation.

Many of the older generation of distinguished men in the Union are published as the graduates of these and the following twenty years. William M. Evarts and Chief Justice Waite, Samuel J. Tilden and Edwards Pierpont were of the class of 1839. The Yale Literary Magazine and the American Journal of Science, established by Professor Silliman, were among the strongest of the rising publications of the country. Noah Webster graduated in 1798, and to Yale belongs the credit of taking up his unfinished labors in the molding of the American type of the English language and embodying the highest results of philological science in the successive later editions of Webster's dictionaries. The original government of the college has been modified by successive changes, and now consists of a central group of the successors of the original 10 among the 18 "fellows" and of the governor and lieutenant-governor of the State, and 6 representative graduates elected by the alumni.

During the administration of President Day of twenty-nine years, 2,500 students were graduated from Yale and probably no similar body of young men were ever sent forth from an American college whose career has been more decisive in the building of the nation and especially the new States of the North and Southwest. Among them were a score of eminent judges, including a Chief Justice of the United States and the heads of the supreme courts of New York, South Carolina, and Ohio; Chancellor Kent and Jeremiah Mason being among the number of its law graduates. John C. Calhoun was of the class of 1804 and Cassius M. Clay, of Kentucky, was a student of a later date. In education, 80 colleges in different parts of the country have been indebted to Yale for their presidents or for prominent members of their faculties. Six of the presidents of Yale, 38 professors and 316 tutors in 1865, had been chosen from its own graduates. In all, 18 college presidents in 15 States; in New England, 6 presidents and 29 professors; in New York, 9 presidents and 16 professors; in New Jersey, 5 presidents and 8 professors; in Ohio, 11 presidents and 17 professors; in Indiana, 1 president and 2 professors; in Michigan, 7 professors; in Illinois, 3 presidents and 7 professors; in Wisconsin, 2 presidents; in Missouri, 5 presidents and 8 professors; in Colorado, 2 presidents and 4 professors; in Virginia, 1 president, and 1 professor; in North Carolina, 4 professors; in South Carolina, 1 president and 4 professors; in Georgia, 2 presidents, and 1 professor; in Alabama, 3 professors; in Mississippi, 2 presidents; in Louisiana, 1 president and 2 professors; in Kentucky, 1 president and 1 professor; including 27 States, 4 West Point and 4 Naval Academy professors, "with a multitude no man can number" of academic, professional, and common-school men in all portions of the country, have scattered from this great center of civilization. In 1877 more than 2,000 clergymen were numbered in the roll of its theological graduates, including such names as Timothy Dwight, Jonathan Edwards, and Manasseh Cutler. The fruitful last twenty years have been no exception to the great reputation of Yale as an educator to the American people, including President Gilman of Johns Hopkins University, of Maryland; William Preston Johnston, of Tulane University; Oscar H. Cooper, of Texas, most accomplished of the State superintendents of education in the Southwest; President Harper, the head of the important university experiment at Chicago; and Chauncey M. Depew, whose oratory has become one of the best of American high schools. In science and invention Eli Whitney and Professor Morse, two men who, perhaps more than all others, have determined the material prosperity of the country, were graduates of Yale. But this essay is not a catalogue of American universities. The object of this sketch of the educational history of Connecticut is to show that while, from local and temporary causes, the peoples' common school suffered eclipse during the first fifty years of the Republic, yet, within its own borders, was found a group of the most distinguished of the common-school men and representatives of popular education, in Webster, Barnard, Holbrook, Harris, and their colaborers, in every year from the beginning of the great revival of 1830–1840 to the present day.

VERMONT.

For one hundred and seventy-five years from its discovery the valley of Lake Champlain was only a battlefield. The French Government had apportioned the land on either side in great feudal grants, which fell to the ground in 1760 on the conquest of the country by the English. The whole region, outside the shadow of its fortified posts and away from water carriage, was almost inaccessible. A bitter feud raged between the colonies of New York and New Hampshire for the possession of the territory of Vermont, and the few settlers there lived in a state of contention little short of war. Ethan Allen, a stout, shrewd, and profane border champion, led the rough Green Mountain boys in their resistance to the Dutchmen of the Hudson Valley, and left the seeds of a hatred that yet lingers in the "sleepy hollows" of eastern New York. The invasion of Burgoyne swept the western shore clean of its population, and at the close of the Revolution there were not 1,000 people in the whole valley, and they chiefly in Vermont, opposite Crown Point, and at the head of the lake, at Whitehall.

But now the difficulties between the colonies were composed by the admission of Vermont into the Union in 1791. Land titles were adjusted, military bounties were paid in grants, and population flowed in. In 1791 7,000 people were dispersed through the valley. Burlington is scarcely older than Cincinnati, and the real settlement of the Valley of Champlain and the Valley of the Ohio date from the same period, the establishment of the American Union.

But even under conditions so discouraging the early settlers of the Green Mountain State made provision for the common schooling of their children. The town of Bennington as early as 1763 levied a school tax and established the district school. In 1777 the territory so long fought over with bitter controversy and occasional border violence between the Yankees of New Hampshire and the Dutchmen of New York, by the pressure of events, became the independent State of Vermont. In 1778 the first State constitution was adopted. In 1782 the legislature empowered the towns to establish schools and appoint school trustees, and districts were authorized to choose officers to hold property, establish schools, build schoolhouses, etc. The constitution of 1793 contained the provision quoted in an earlier portion of this essay.

Four years later, 1797, the legislature made the provision for establishing common schools compulsory upon every town. In 1796 an English writer on the United States, in a work published in London, declares that "in every charter of a town provision is made for schools, with a certain quantity of land for support. In 1791 the legislature established a college at Burlington with 10 trustees. Mr. Ira Allen had offered the sum of £4,000, on certain conditions, toward its establishment." This college was the University of Vermont, founded on paper in 1791, but not opened until 1800. The establishment of this university by the State was rather in accordance with the coming policy of the new Northwest than of the New England of the period, as it has always remained substantially a State university, and at present includes as one department the agricultural and mechanical college established by the donation of national public lands in 1862, with added appropriations in 1890. The nation owes to the venerable senior member of the United States Senate, Hon. Justin S. Morrill, of Vermont, the inauguration of this most valuable legislation in behalf of industrial education, which, after long agitation and one Presidential veto, was perfected in 1862, amid the excitements and financial burdens of the great civil war.

The first place in the United States referred to as "Out West" in New England was the present village of West Springfield, on the farther shore of the Connecticut River, opposite the beautiful city of Springfield, Mass. Much more was the new State of Vermont and the part of New York west of Schenectady and north of Saratoga in the opening years of the Republic associated with that inspiring name.

The speedy movement of the few thousand people on the western slope of the Green Mountains to plant the town, district, and county grammar schools, and the State university, all before the beginning of the present century, was a happy augury for the success of the new Commonwealth. Middlebury College, representing the prevailing Congregational Church of New England, was also established on the basis of the Connecticut, western Massachusetts, and Rhode Island institutions, as a proper denominational seminary; and the Protestant Episcopal Church set up in 1834 the only remaining seminary of collegiate grade in the State.

During the first twenty years of the century the progress of common-school education in Vermont was necessarily slow. Until 1841 there was no provision for more than one public school in a district, and not until 1850 were the common schools declared free. The secondary schooling during these early years was almost entirely in the hands of private and denominational academic schools, there being thirty-two seminaries of this sort in the State in 1832. Vermont grew slowly and was early depleted by the migration of enterprising youth to the rising West, to which this State has contributed a large number of distinguished men, Stephen A. Douglass, of Illinois, and Horace Greeley and Henry J. Raymond, of the city of New York, being representatives of a catalogue that, if published, would bear ample testimony to the vigorous stock and remarkable faculty of success possessed by the boys and girls of the Green Mountains.

But the home-staying Vermonter has always shown a remarkable ability of "getting on the Lord's side" as far as the affairs of this world are concerned. Even during the stormy period that preceded and followed the second war with Great Britain, practically extending to 1820, the good work of educating the children went steadily on. The New England district arrangement was established at an early day, and, although probably a stimulant to local effort at first, became in time, here as elsewhere, an obstacle to the development of the most effective system of public instruction. The obstinate policy of Vermont, New Hampshire, and even Massachusetts, in holding out for this narrowing and obstructive method of school administration, prolonged to a very recent period in all New England outside Massachusetts, would form an instructive object-lesson for the warning of all American States.

In 1821 the grand jury of each county was required to examine into the condition of the school districts in respect to their compliance with the statute securing to all the children of the State an opportunity for education. In 1827 the towns were instructed to withhold the distribution of school funds from the districts that did not support the schools. Not till 1870 were the towns permitted to abolish the district system, and even at present the States of Vermont and New Hampshire have scarcely recovered from the wrench caused by this change of administration. At first instruction in the district schools was confined to "the three R's." By 1827 the laws required reading, writing, geography, arithmetic, history of the United States, and "good behavior." Contiguous districts were permitted to unite for the support of one additional school of superior grade before the advent of the free high school, at a date previous to the period referred to in this portion of our record.

In 1827 the revised school law established committees of supervision in the towns and a State board of commissioners of education, but this law was repealed in 1833. It was not till 1844 that the general assembly was required to elect a State superintendent of schools. The office was held from 1845–1850 by Superintendent Eaton. Charles G. Burnham succeeded for a year, when the law was ignored by the refusal of the legislature to elect until 1856. Since then the State has been served by a series of faithful officials. Gradually the present method of supporting public education has been wrought out, by which the towns depend on the income of lands originally given them and of the United States surplus revenue, supplemented by State and local taxation. The State has no permanent school fund. Vermont is one of the few States that protects the child in the right to, at least, a twelve-weeks annual schooling by compulsory law. There are three subsidized academies now attempting the work of normal schooling in the State.

In 1832 Vermont had a population of 104,000 and expended in the neighborhood of $100,000 for its public school system. With a school population averaging 43 to each district, the attendance was only 20; the school age being 5 to 20. At this time Burlington had a population of 5,500. The State university already had 175 students and several college buildings, superbly placed on an elevated plateau commanding a magnificent prospect of the Green Mountain range toward the east and a western outlook over Lake Champlain to the Adirondack wilderness. The university has always maintained an honorable reputation for faithful work and, in later years, has shared with all the New England colleges the harvest of generous giving for the higher education which has placed them on permanent foundations and made Harvard and Yale among the most prosperous and well endowed seats of learning in America.

NEW HAMPSHIRE.

Nothing in American history more plainly declares the vital influence of popular education upon a people determined to secure it for their children than the development of the three northern States of New England during the past 250 years. When we contemplate the present condition of that portion of the vast Appalachian Mountain realm, central to the original Union, lifted up between the Atlantic Coast and the valley of the Mississippi, its great extent, inviting climate, and astonishing resources in mineral wealth, water power, forest, and pasture lands, to say nothing of the large amount of fertile soil in its valleys, even to-day only on the threshold of what must be a great future, and contrast with it the success of Vermont, New Hampshire, and Maine, in all except the seacoast of the two latter States, beyond comparison inferior in everything that invites population and makes for the success of an American Commonwealth, we realize the supreme influence of education in the prosperity of an American State.

No American State has so happily illustrated the capacity of a superior people to wrench success out of the grip of a hostile nature as New Hampshire. The State has a territory of only 9,392 square miles, and a country whose one superior advantage of a marvelous sublimity and beauty of natural scenery is weighted by a soil always stubborn and often sterile, and a stern climate where "the farmer has three months to raise things and nine months to eat them up." Yet, from the earliest settlement, its people looked to the education of the children as the hope of the future, and no State has earned a nobler fame by the men and women it has sent forth to every corner of the Republic.

After various provincial changes, New Hampshire finally became an independent colony in 1680. Until the establishment of its State government it was, in educational matters, practically like the adjoining province of Maine, an outlying region of Massachusetts; its school arrangements were under similar laws, and it suffered from the toils, hardships, and exposures of a border life. But as early as 1743 Dartmouth College was established by the transfer of Eleazar Wheelock's Indian School of 20 pupils from Lebanon, Conn., through a generous gift of land by the province. A charter was granted by Governor Winthrop in 1769. The Indian department, like all similar attempts to educate the American Indian as an undeveloped Anglo-Saxon American, failed, half the Indian students having fallen back upon savage life. At the first commencement in 1771 four graduates appeared. The college received its name from the Earl of Dartmouth, who was the president of an association formed in England to assist the movement. Wheelock died in 1779, but his son retained the presidency of the college till 1815, when he was supplanted and a new organization adopted. This, in turn, fell to the ground by a decision of the Supreme Court of the United States reaffirming the validity of its original foundation. It has been a great blessing that New Hampshire has been almost the only State of the Union to resist the mania for the multiplication of colleges. Dartmouth, from the first, has been the pride of the State, always respectable as one of the upper strata of institutions for

the higher education, a nursery of famous men, and never more prosperous or worthy of praise than at the present time. Although at different times the recipient of the bounty of the State, it has never been a State university in the sense of the University of Vermont. The agricultural and mechanical college of New Hampshire, for a time an annex of Dartmouth College, is now a separate institution, dedicated the year of this writing.

But from the first New Hampshire has been rich in academies. As early as 1781 Phillips Academy was established at Exeter, and during the following thirty years a large number of excellent schools of the secondary education gave to the State the enviable reputation for academical opportunity it retains to the present day.

As in Massachusetts, before the Revolution the larger towns of New Hampshire were expected to support a grammar school, whose preceptor must teach the elementary branches, unless the town came to the rescue by the establishment of schools for this purpose. The Indian wars and the strain of the Revolutionary epoch told severely on the ability of the people to sustain their original system. But in the first constitution of the State, in 1784, appears the comprehensive clause previously quoted securing to the children of the Granite State forever that great American chance of public instruction for every American child, concerning which Daniel Webster said: "If I had as many boys as old King Priam I would send every one of them to the country district school."

Perhaps a glimpse at the boyhood and early manhood of this foremost of the group of eminent statesmen that New England has given to the Republic will best light up the condition of educational affairs in New Hampshire during the last twenty years of the eighteenth century:

Daniel Webster was born in 1782 in the little provincial town of Salisbury, now Franklin, N. H.; the younger of two sons and the fourth child of the second wife of his father. He was not himself born in a log cabin, but the elder children were, for the family home was on the frontier, with a vast northern wilderness beyond, stretching to the southern plains of Canada. Daniel said he did not remember when he could not read the Bible, his mother and sisters having been his first teachers. While still a child he was sent from 3 to 4 miles every day to a little district school where only reading and writing were served up, and when this meager seminary was too far off he was boarded with a neighboring family for convenience in going to school. One of the graceful acts of his later life was shown in a series of kindly letters addressed to one of his old teachers, Master Tappan, the third under whom the boy was tutored. This relic of the old-time New Hampshire schoolmaster, in his old age, was a parishioner of the author of this essay. He died at a great age; his mind faded away almost to the memory of his "scholar," Daniel Webster, "the godlike" Little Daniel was no prodigy, and, while he "read better than his master," writing was always to him a difficult and hateful act. He devoured all the books at home, the Spectator of Addison, Dr. Watts's Psalms and Hymns, and other volumes in the little village library.

In 1796, at the age of 14, his father placed him in Phillips Academy, Exeter, where as the junior of 90 boys, "like a cat in a strange garret," he began the real work of his school education. During the first term he gave his mind to reading, grammar, and arithmetic. The Latin grammar came with the following term, under the instruction of three men afterwards celebrated—Rev. J. S. Buckminster, Judge Thacher, and Counselor Emery. One of them sent him up to a higher class with the prophetic message, "Webster, you will go into the other room, and, boys, you will never see him again."

Returning home in 1797, his father placed him in the family and under the tutorship of Rev. Mr. Wood, in the neighboring town of Boscawen. It was on this memorable journey that his father told him he "lived only for his children," and proposed to send his dear boy Daniel to Dartmouth College; and the boy laid down his head on his father's shoulder and wept tears of joy. To do that required a sacrifice that not only pledged the father, but the entire family, to years of toil and careful

economy. He studied with Mr. Wood, and very soon was sent "up aloft" as before, entering Dartmouth in 1798. At college he read English history and devoured Don Quixote at one sitting, "not laying down the book for five minutes." He paid his board at college by editing a village paper containing abundant extracts from the English literature accessible to the editor, and made a few addresses, which he declared were "written in an unnatural and flashy style." It was characteristic that at Phillips Academy he never was able to muster courage to appear on the platform for declamation. In his sophomore year he summoned a family council in behalf of a college course for his elder brother, Ezekiel, and after a serious overlook "of the sinews of war," by his own offer of aid this brother, who died a young man of great promise, became his companion in study.

At the age of 19, in 1801, he graduated from college. Having already begun the study of the law, he taught a school at Fryeburg, Me., for $350 a year, earning 50 cents additional at night by copying law papers. His law studies were continued with this local lawyer until the graduation of his brother. Then, obtaining a school for Ezekiel in Boston, he went thither to the beginning of his illustrious career.

But it was not every son of New Hampshire who had the pluck and "sacred fire" to push through these formidable obstacles to an education at this period; nor was many another son blessed with a father, mother, and sisters ready to pledge all things in this world for the furnishing of the upper story of life. The first constitution of the State of New Hampshire, framed in 1784, contains the already quoted declaration of the obligation of an American State to its children.

In 1789 the legislature fixed a rate of assessment for the school tax and provided for the examination of teachers. In 1808 a further addition was made by an increase of the tax and appointment of a supervising committee in the towns. At an early day the subject of gathering school libraries appears to have been mooted in the towns and school districts. In 1821 the State began the establishment of a literary fund by a tax of one-half of 1 per cent on the capital of all banks. In 1827 there was further revision of the school laws, which gave to the towns a somewhat larger function of administration, although the district school committee had the practical management of school affairs, a local right which only during the past twelve years has been surrendered after a fight of a century's duration, and the town finally has been established as the unit of school life.

For two centuries in New Hampshire the progress in the evolution of an efficient system of public education was slow, and only a dozen years after the waking up, by the great revival in the neighboring States of Massachusetts and Connecticut, did New Hampshire follow in the establishment of teachers' institutes, which continued from 1846 till 1874. It was 1848 before a State board of school commissioners was appointed, and in 1867 the State superintendent of education reported the country school realm a field sorely in need of vigorous supervision. From that day the State has shared in the great educational progress of the country, and to-day, with the disadvantage of the steady drain of the efficient people from its rural districts, is not behind in the race for intelligence, with a strong increase of opportunity for the secondary education in a State normal and free high schools. Previous to the beginning of the century there seems to have been an unusual prejudice against the employment of women as teachers, and in 1800 the wages of the pedagogue ranged from $4 to $10 per month; the master or mistress often boarding around.

MAINE.

In the early colonial era Massachusetts was by no means, in physical proportions, the "pent-up Utica" of to-day. With her nearest attachment of New Hampshire, more extended than herself, and her vast "down-east" annex, the province of Maine. her dominions were not inferior even to the original Commonwealths of the Northwest, and amounted to 50,000 square miles. New Hampshire at an early date shook off her dependence, and in 1680 set up for herself. But for one hundred and

forty years more the outlying territory of Maine held on with a somewhat divided allegiance. During the last thirty years of this period the great landed estate of Maine enabled Massachusetts to act with liberality in the endowment of academies, and afterwards, in 1834, to lay the foundations of her State school fund from the sale of her extensive, though still undefined, distant possessions.

Before 1820, when Maine was admitted to the Union as a State, its educational history was involved in that of Massachusetts; the school legislation and general educational arrangements being as nearly alike as circumstances would permit. Bowdoin College, chartered in 1794, was twelve years in getting out of its cradle upon its feet, and was lifted in 1806 into active operation by the gift of 6,000 acres of land by Hon. James Bowdoin, of Boston, from whom it received its name. Waterville College was also established at an early period. Fryeburg Academy was founded in 1792, in a region just reclaimed from the northeastern wilderness. From that date, year by year, we read the names of a succession of academical schools, the majority subsidized by gifts of land, which ministered to the growing need of something better than the meager common school of the day in a country so sparsely populated could supply. These district schools were not essentially different from those of the other portions of New England similarly situated.

But the people of the Pine Tree State were by no means disposed to be "left out in the cold" in the movement for a better schooling of the children, that gathered strength in New England from the close of the Revolution till the final peace between the mother country and the new Republic in 1815. The constitution of the State, adopted in 1820, contains the following relating to literature:

A general diffusion of the advantages of education being essential to the preservation of the rights and liberties of the people, to promote this important object, the legislature is authorized, and it shall be their duty to require, the several towns to make suitable provision, at their own expense, for the support and maintenance of public schools; and it shall further be their duty to encourage and suitably endow, from time to time, as the circumstances of the people may authorize, all academies, colleges, and seminaries of learning within the State: *Provided*, That no donation, grant, or endowment shall at any time be made by the legislature to any literary institution now established, or which may hereafter be established, unless, at the time of making such endowment, the legislature of the State shall have the right to grant any further powers to alter, limit, or restrain any of the powers vested in any such literary institution as shall be judged necessary to promote the best interests thereof.

As soon as possible the legislature moved for the passage of a law for the taxation of each town to the extent of 40 cents for every inhabitant, the avails of the tax to be distributed among the school districts for education. From the first the schools were free and, with an endowed academy in almost every considerable center of population, furnished a respectable opportunity, as things went at that day, for the beginnings of an education. The free high-school system of the State was delayed for half a century more, until 1873.

In 1825 there were in the new State 2,419 school districts with 138,000 children and youth of school age; 101,325 were actually in school, and $137,000 was expended for public education. There were then 337,000 people in the State and it was estimated that in 1833 there would be 140,000 children and youth of school age, 5 to 20. The schools of the State began with a large per cent of "regular attendance" and to-day Maine has the largest relative number of children between 6 and 14, under this head, in the Union. At this time, 1825–1830, the schools remained in session four and one-half months in the year, with an average of 40 pupils to a district, and an expenditure of $1.35 per capita for the number attending. There was already more than $220,000 invested in academic schools, attended by 1,000 pupils at a yearly expense of $50 to $60. The record of this period closes fitly with the establishment of a State board of education in 1846 composed of one member from each county, elected by the local school committees in joint session. The first official secretary of this board was W. G. Crosby, who served from 1846 to 1849. The great movement for popular education in Maine has come since the close of the civil war.

RHODE ISLAND.

Of all the thirteen early American Colonies the most unique was what might almost be called the nation of Rhode Island. It was settled by Roger Williams, who, with his well-earned reputation as the founder of the first human government established on the idea of the absolute separation of state and church, combined a restless and "come-outer" disposition which drove him out of the ministry of the most democratic of all the religious bodies into the position of a "seeker" after religion. A colony thus founded, sandwiched between three provinces as obstinate in their religious policy as Plymouth, Massachusetts Bay, and Connecticut, would naturally attract a population as far off from its neighbors as might conveniently be. Thus grew up, around the lovely shores of Narragansett Bay and Providence River, with headquarters at Newport, a little dominion, in which each of its four counties claimed and possessed a state house, every town was relatively a kingdom, and every family a "peculiar institution."

It does not seem that the zeal for "civil liberty" by the early inhabitants of Rhode Island, largely of the Baptist denomination, conduced to either superior culture, unusual morality, or Christian courtesy. The way in which good Parson Manning, first president of Brown University, spoke and wrote of a clerical brother in the church, who had apostatized from the popular denomination in favor of a creed that stretched the infinite love of God to the incredible extent of infolding not only sinful man but fallen angels and even the Prince of Darkness in "the restitution of all things," bears mournful testimony to the difficulty of casting out the devil of personal intolerance, even while ready to live and die in behalf of "freedom of conscience." While the neighboring Colonies of Massachusetts and Connecticut established Harvard and Yale universities with no religious test, the movement for the charter of Brown in 1764 culminated in a violent controversy with Rev. Dr. Stiles, of Newport, who, invited to draw up the charter for a new college, made the governing body consist of a majority of non-Baptist officials, under the impression that what was called for was a union college in which each evangelical body should be represented in proportion to its membership. This charter was defeated. But once rid of this incumbrance and the governing power lodged in the Baptist denomination, the college at this early day did repudiate all religious tests in its methods of instruction, and in this respect has maintained a broad and progressive spirit of administration even to the present day.

The early history of the higher education in New England would be incomplete without a brief reference to George Berkeley, bishop of Cloyne. He was born in Kilcrimmin, Ireland, in 1684, and died at Oxford, England, in 1753. His life of well nigh 70 years was contemporaneous with Swift, Locke, Leibnitz, Boyle, and Newton, and he left a name in philosophy and a reputation for a broad and practical catholicity in religion that declared him one of the ornaments of the literature and church of England. His graduation at Trinity College, Dublin, was followed by a fellowship and a series of promotions as traveling companion of a bishop's son and a secretaryship to the Earl of Peterboro and the lord lieutenant of Ireland; followed by an appointment as dean of Derry, in 1724, at the age of 40.

An idealist by temperament and philosophy, he was of all others the man to be caught up into the seventh heaven of romantic aspiration for a mission of education and evangelization in a new world, still to the young Irish poet, priest, and scholar a wonder world of hope and splendid opportunity. Discouraged and disgusted with the routine life of a regulation Church-of-England official at home, he struck out on a magnificent plan for the founding of a college for the enlightenment and christianization of the natives, but apparently with no prejudice against the ignorant and vicious white folk of the British Colonies over the sea. A fund, derived from lands acquired by a recent treaty with France, hove in sight as an endowment of £20,000 for this institution, and he was the man to burn his ships and "sail out into the west," a new Columbus on a nobler mission than the discovery of the Indies. He

seems to have inspired several young men with his own enthusiasm, one of whom was the first artist imported into the Colonies from Great Britain. In 1728, soon after his marriage, he left his deanery and, with all his worldly goods and household gods, pushed off into what was regarded with good reason as a visionary experiment.

As a practical enterprise, this cherished plan came to nothing, for he did not go to the Bermuda Islands, but landed at Newport, R. I., in 1728, with his young wife, a lady companion, and the three apostles of his educational project. Here he purchased a farm of 100 acres, built a residence, and spent a few years, chiefly occupied in writing and hoping against hope for the fruition of his grand mission. But the hard-headed ministry at home did not dispense the £20,000, his own fortune rapidly disappeared, and the impossibility of the millennium that hovered for years before his imagination was at last admitted. He returned to England to an appointment as bishop of Cloyne, an Irish diocese, and spent the remainder of his life upon the philosophic, scientific, and literary works which have made a positive addition to the literature of the language.

But, like so many men whose dearest plans fail of execution, the influence of Bishop Berkeley on American educational affairs turned out far greater, broader, and more beneficent than the sinking of $100,000 in another abortive effort to civilize and christianize the North American Indians through the agency of the English school and church of one hundred and fifty years ago. The little city of Newport, R. I., had then a population of 6,000 and was the most thriving town in America of its size, with a mixed multitude divided into sects and fragments of sects—four sorts of Anabaptists, Presbyterians, Quakers, infidels, and many of no profession at all. The good missionary of higher things was not to be suppressed by any discouragement. He wrought with all diligence as preacher, center of culture, promoter of good enterprises, author, and friend of the superior education. He was greatly charmed by the natural loveliness and salubrity of the place, and would gladly have founded his college there had it been possible there could be a college at all.

One of the most useful of his numerous inspirations was the establishment of the literary association that founded the Redwood Library, at one time the second in importance in America, and from the first a great power in the Colony. William Ellery Channing pursued his studies there after his graduation from college, and one of his most eloquent periods was called forth as a reminiscence of his life among the books and strolls along the sea-beaten cliffs of Newport. An acquaintance with Rev. Mr. Elliott and Rev. Samuel Johnson turned his attention to Yale College. After his return to England he gave his estate of 100 acres to this struggling seminary as an endowment for scholarships which, like so many similar gifts of those days, has become rather a pleasant tradition than a positive aid to education. His subsequent donation of 1,000 volumes, valued at £500, to the library of Yale, was in its time a great benefaction. He proposed doing something of the kind for Harvard, and encouraged the plan of a college at New York of the Church of England type; afterwards realized in Kings, now Columbia College, of which his friend, Rev. Dr. Johnson, was first president.

There can be no doubt that the residence of Berkeley at Newport was a positive agency in the establishment of Brown University; and, in all the ways by which the residence of a man of commanding personality and powerful influence in the uplift of a community can enter into the tendencies and inspire its best efforts, he was one of the highest and noblest ministers of a Christian civilization in the eighteenth century to Rhode Island.

But the gift of foresight and prophecy is often a more potent influence in the progress of a people than any special good work wrought in the lifetime of the best man. Berkeley celebrated what he supposed the success of his great educational project by a burst into song. His "Verses on the prospect of planting arts and letters in America," though of no high merit as poetry, were prophetic in a vaster and more

exalted sense than the writer dared to hope, and add another to the long roll of inspired predictions of a future quite beyond the present realization of the prophet. It is always in order "to keep before the people" such words as this great and good man wrote under the uplifting inspiration of a purpose that has embalmed the name of Berkeley in the memory of every lover of American education and liberty.

Verses on the prospect of planting arts and learning in America.

The Muse, disgusted at an age and clime
  Barren of every glorious theme,
In distant lands now waits a better time,
  Producing subjects worthy fame.

In happy climes, where from the genial sun
  And virgin earth such scenes ensue,
The force of art by nature seems outdone,
  And fancied beauties by the true;

In happy climes, the seat of innocence,
  Where nature guides and virtue rules,
Where men shall not impose for truth and sense
  The pedantry of courts and schools—

There shall be sung another golden age,
  The rise of empire and of arts,
The good and great inspiring epic rage,
  The wisest heads and noblest hearts.

Not such as Europe breeds in her decay;
  Such as she bred when fresh and young,
When heavenly flame did animate her clay,
  By future poets shall be sung.

Westward the course of Empire takes its way;
  The four first acts already past,
A fifth shall close the drama with the day:
  Time's noblest offspring is the last.

But it was in respect to the education of the children and youth of the State for good citizenship that the people of Rhode Island, for one hundred and fifty years, fell into the same delusion as the strictest of all sects who can see no halfway house between an ultra sectarian administration of public education and an ultra secularism that repudiates all acknowledgment of religion. The only logical attitude of such a mind is the absolute denial of the right to educate at all by the State; since education by common consent does imply more or less the public confession of obligation to practical religion and public morality. The early settlers of Rhode Island did not hesitate before that dilemma, and for one hundred and fifty years, till the middle of the nineteenth century, would have none of the common schools of Connecticut and Massachusetts, and even refused to subsidize the higher education.

The result could have been predicted from the first. The colony, from its peculiarly favorable situation for commerce, grew into an important industrial community, Newport at one time being the second city in the provinces. From the social pretension of its leading class and the prevalence of negro slavery, it being the headquarters of the slave trade, Rhode Island was more in touch with the aristocratic Southern than with the more democratic Northeastern colonies. The well-to-do families educated their children abroad or at private schools, some of which were established immediately after the founding of Providence, Newport, and the few large towns. From the intimate connection which the people held with their neighboring provinces and the gradual coming in of settlers therefrom, there came up a superior class of remarkable ability and influence; so that the long hesitation of this least of all the colonies in coming into the new Union was felt as a peril to the new experiment of the national government. The establishment of Brown University, as early as 1764, with its Latin school annex at Providence, and the vicinity of Harvard and Yale for the more favored minority of the people, were

doubtless, for a time, a hindrance to the legitimate results of this obstinate policy of noninterference by the State in matters educational.

But, as always must be true, the final outcome of all ultra individual theories of life leads inevitably to the semibarbarism of "every man for himself;" the most extreme form of a privileged class in sharp contrast with dense ignorance and a low grade of morality at the opposite pole. The Colony of Rhode Island found itself at the middle of the nineteenth century in the unenviable condion of having, for one hundred and fifty years, denied to the children of the poor man the one chance of rising to that equality of opportunity and rights without which society is only another name for slavery. It is a somewhat discouraging result that this long agitation for "personal liberty," in a State so favored by nature and an exceptional population, drove the mass of its people finally into a revolution which trembled on the precipice of a civil war to earn the common rights so completely enjoyed by other States.

Until the year 1799, Rhode Island has no common-school history. Brown University was founded in 1764, seventh in the roll of the American clerical collegiate schools that survive to the present day. Its foundation was not from within but from the demands of a convention representative of the Baptist people, held in New Jersey, that, after the successful building up of an academic and theological seminary at Hopewell, N. J., something should be attempted on a larger scale. The fact that the Baptist people of New England had concentrated in Rhode Island was deemed a reason for founding the university in that State, and Jared Manning, a graduate of Princeton, and a young minister of shining abilities and great zeal, was sent to Newport to feel the educational pulse of the Colony. According to the explanation of Manning and his associates, he was outwitted by Dr. Stiles, whom he employed to draw up a charter for the proposed school. The doctor "fixed" the board of fellows, the governing board, as an anti-Baptist "ring." The discovery of this in the legislature postponed the movement. But in 1764 it had its foundation, beginning practically as a parish school kept by Rev. Mr. Manning, who had removed to Warren, where he opened a private Latin school in connection with the college department. In a few years the institution was removed to Providence, then a town of 4,000 people, being invited by a gift of £400. The larger offer of Newport was rejected and the larger city made a sharp effort at the establishment of a rival college. But this plan having failed, Providence was left to support the "College of Rhode Island" as it might.

The first Baptist church of Providence, whose pulpit had been left vacant by the secession of Roger Williams, gladly accepted Rev. Mr. Manning, who, with a college class of 20 and a united salary of $500, worked on with small encouragement until his death in 1798. The president was of Scotch descent; trained in the old-time discipline of the classics; translating Greek and English into Latin as a condition of admission to college; with a severe ideal of discipline. At Princeton, his alma mater, the student was expected to "take off his hat within 10 yards of the president and 5 of the tutor," while the freshman was required to act as a fag, in the sense of always being ready to run on an errand for a superior student or teacher.

It was high time this large and devout body of Baptist Christians moved in education. The president of Brown testified that but two clergymen of the sect had a liberal education, and "they not clear in the doctrines of grace." Both in England and America, during its early days, this now great and progressive denomination of Christians was under the eclipse of a strong prejudice against learning among the clergy and a great lack of education in the laity.

But President Manning had no faith in ignorance, and toiled on, with an heroic and patient devotion during this early period. At the first commencement, in 1769, 7 graduates were sent abroad, and out of this little early class a majority became known and honored for ability, public usefulness, and good culture. The college was supported by subscriptions gathered from various portions of the country. The South sent £500. Every member of the denomination was urged to contribute a

sixpence a year for three years. A gift of £800 came from England, with the names of Benjamin Franklin, Benjamin West, and Hollis, the benefactor of Harvard, among the contributors. The corner stone of the first building was laid in 1770 by one of the numerous and generous family of Brown, which, after the munificent gift of $158,000 by a younger member of the family, bequeathed its name to the university in 1804. But during the life of President Manning the school languished with 20 to 40 students, 1 additional professor, and several outside lecturers; the president acting as pastor of the great church, teacher of the Latin school, and general representative of the educational spirit of the time. He commanded the respect and affection of the people at home, and was sent as a representative of Rhode Island to the Congress of the Confederation by the legislature.

The war of the Revolution came upon the new enterprise with crushing force. The buildings were occupied as barracks by the American and French soldiery. Newport was once in the hands of the enemy and poverty and distress were the order of the day. In 1777 the school was suspended till 1780. From the depreciation of the currency of the colony, four-fifths the president's salary was cut off and he was left in dire extremity for a livelihood. He "freed his mind," in good old-time clerical fashion, by declaring that "a more infernal set of men, under the name of a legislature, never, I believe, disgraced the world." But he persisted in his good work. Invited to open with prayer the session of the convention of Massachusetts that was wrestling with the problem of coming into the new Union, he fell on his knees and prayed for the Union with an eloquence and pathos that greatly contributed to the final decision. He labored against some of his own clergy in Rhode Island to the same good result.

He was a firm friend of popular education, and his last work, as the chairman of a committee, was the drawing up of a forcible petition for the establishment of a system of free schools for Providence. This was presented to the town meeting ten days after his death, in 1791. Whether his constant plaint on "the decadence of religion" during the Revolutionary epoch was more than a formal disapproval of all religious sects except that to which he had so faithfully consecrated his life, is not evident. But the dense bigotry of creed and the narrow code of social morality at that day was responsible for a good deal of dissent that broke out into a violent prejudice against the church, clergy, and all that was held up as the religion of Jesus Christ.

In 1790 President Washington, accompanied by Thomas Jefferson, his Secretary of State, visited Providence and was received with honor by the college. He made the usual official speech in reply. It would be interesting to read the speech that was not made by Jefferson, then the foremost educational philosopher and the coming statesman of the Union.

A gift of 1,300 volumes from Rev. Mr. Richards, of Wales, was a great boon to the college. Indeed, at the death of President Manning, the institution was a great way from being an accomplished fact. In 1792 there were but 22 students, and the library numbered 150 volumes; the philosophical apparatus consisted of an electrical machine and a microscope, with an air pump in prospect. Its entire endowment was but £900. Good President Manning was often grieved to the heart by the depravity of his students, some of whom had broken the windows of the Friends' meeting house. Mr. Hart, of South Carolina, writes urging him not to "spare the rod" in the discipline of his son John. Through the entire administration of the first president, the college of Rhode Island had but one building over its head, and the students and teachers boarded at $1 a week. It was out of such beginnings that the great American universities of to-day were built up; every brick and beam of the structure being consecrated by the prayers and tears and lifeblood of their devoted friends.

The thirty-six years between the death of President Manning and the beginning of the long and powerful administration of President Francis Wayland, 1791–1827, were marked by a gradual increase of attendance and greater ease in matters financial

than this disheartening beginning. Until 1802 the college moved on under the charge of its new president, Maxcy, who still retains the reputation of an accomplished scholar; two professors, 2 nonresident lecturers, 3 medical lecturers, and 2 tutors. The vacancy occasioned by the departure of President Maxcy was filled by President Messer, who held the position till 1827. This long period of service by a president who, with great imputed professional and scholastic merits, seems to have combined an eccentricity of personal character and manners, brought the institution into a state satisfactory to none of its friends. The methods of instruction seem to have been superficial, the teachers too often only partially attached to their classes, and the college was getting a bad name for the disorder among the students, which is the inevitable result of placing even a worthy and able man of grotesque and obstinately repulsive personality over a college full of young Americans. From 1804 dates the new baptism of the school into the name of Brown University, under which it has acquired its present reputation among American colleges. The generous and distinguished family to which the university owed its financial success during the coming fifty years of its history contributed in the neighborhood of $158,000 to its endowment and placed on the ground the buildings which were Brown University until a considerably later date than 1850.

Meanwhile the absence of theological teaching and the general liberal spirit of the institution were a strong point in its favor, in a measure compensating for the absence of better educational facilities. Brown University had its roll of celebrated men from the beginning. The repudiation of the common school by the people of Rhode Island for three-fourths of a century from its establishment forced the college into an intimate and popular attitude before the people. Its Latin school annex was one of a number of good secondary schools which came at the demand of the increasing wealth, culture, and public importance of the State. It was in the period including this chapter of our essay, previous to 1845, that it numbered among its graduates Horace Mann and Barnas Sears, the two great apostles of the American common school in the northern and southern sections of the Union, and George William Curtis, for twenty-five years the most conspicuous representative of the higher journalism of the country. Its two greatest presidents, Wayland and Sears, have been more conspicuously identified with the common-school interest of the Republic than any similar officials of the older colleges of the New England States. Brown was the first university of large reputation that established a professorship of didactics, and in Prof. S. S. Green, who held this chair, the State of Rhode Island and the country possessed one of the most charming lecturers and wisest experts developed by the later movement we call the "new education."

The advent of Francis Wayland to the presidency of the university in 1827 ushered in the period of the renaissance of Brown University. He came to the post unburdened by the narrow college methods and ideals of the day, and beyond all other men, except President Mark Hopkins, at Williams College, was the most conspicuous representative of the higher education in New England for a full third of a century. A native of New York, a graduate of Union College, and, as far as such a man could be, a disciple of the great college reformer of the period, Dr. Eliphalet Nott; with an established reputation, and on the high road to fame as one of the foremost preachers and thinkers in the American Protestant Church, he had just accepted an important professorship in his alma mater when called to the presidency of Brown. It was an experiment that might have appalled even an abler and more positive man than himself, for the problem was, in a State that still persisted in opposing the general sentiment concerning popular education in the northern section of the Republic, among a people celebrated for a personal independence that verged on the border of impracticability, dependent on the most aristocratic social class of New England, to lift a college that for more than half a century had been struggling for existence, with dilapidated buildings, a wreck of a library, and not sufficient material to do proper work, with a reputation for scholastic inferiority and a disorderly student population, up to the level of the leading colleges of the time.

But the work was done; so well done, from the beginning, that there has never come the necessity of doing it over. Whatever may have been the original opinions and expectations of President Wayland, the earlier years of his presidency were wisely and firmly given to establishing the university on solid educational foundations. With an iron hand, but in a spirit eminently judicial, he suppressed the "glorious independence" of the student contingent, and during his entire administration could boast that hazing the freshmen at Brown was "a lost art," and "rebellion" a practical impossibility. He dusted out the corps of temporary tutors, who "drop in" upon a college recitation room to eke out a subsistence, or illustrate a professional reputation by "substituting" in place of a professor. He insisted that, only in the last necessity, should the text-book be seen open in the recitation room, both teacher and student being required to have the substantial contents of the lesson of the day in mind, and so well in hand that the treatment of a subject and not a mechanical recitation should be the work of the hour. He awoke confidence among the men of wealth and influence in the State; obtained money for a new outfit of illustrative apparatus, library, and buildings, and raised the institution from the reputation of financial impecuniosity to educational respectability. All these years, at the risk of being stranded by what was regarded an undue severity of discipline and an unpopular demand for thorough scholarship, in the face of the lingering jealousy of the higher education and the clamor for a cheap and superficial outfit, even for the ministry, he persisted in these reforms.

It was a providential coincidence that this period of President Wayland's service at Brown University covered the first years of serious effort by the people of Rhode Island to establish a genuine system of common schools. How much the known sympathy of the great president upon the hill in Providence contributed to the result is not easy to be determined. Even more, the persistent effort of the head of the college to raise the standard of scholarship would force upon the thoughtful people of the State the necessity of laying broader foundations in the better schooling of the masses below. But when the hour struck and the decisive day had fully come, Dr. Wayland was found all ready for the new departure in college life, which was the real initiative in the readjustment of studies and the inauguration of the elective system in every American college and university of the first class.

Meanwhile, alongside the new administration at Brown, was found in John Kingsbury, one of its early graduates, a reformer equally efficient, if less widely known, in the neglected sphere of the superior education of young women. A class companion in college of Prof. Edwards Park, of Andover, and Bishop Burgess, of Maine, Mr. Kingsbury, near the time of the appearance of Dr. Wayland at Brown, opened a school for girls in Providence, which, during the thirty years of its existence, educated 5,000 young women in a way rarely experienced in New England before. He began with an exposure of the quality of "educational hash" served to its students by the average female seminary of the day. According to Dr. Kingsbury, there was, "beyond the elements, a little history, a smatter of French, Latin, algebra, and geography only in a few schools outside of Boston." He challenged his patrons with declarations like these: "No school can remain good which is not in some things distasteful to the young and clashes with the current sentiment of much called good society;" "to educate the whole number well, rather than to educate a few to distinction;" "common sense more valuable than literary or scientific culture;" "adopting every improvement, whether demanded by public sentiment or not, rejecting all that does not commend itself, whether demanded or not;" "daily seeking aid of heavenly wisdom and guidance."

He discarded at once the mischievous and exhausting habit of elaborate examinations and public exhibitions; placed his girls and their instructors upon their honor; never but three times in thirty years was late at his desk, and generally "toned up" the entire realm of woman's education. Besides all this, he was active in the American Institue of Instruction; a great friend of Sunday schools and missions; the secretary of Brown University, and, in his later years, one of the commissioners of common schools for the State.

Another valuable institution, largely favored by the bounty of another of the numerous family of Brown, was the Providence Athenæum, which became a literary center for the city of Providence, as the Redwood Library, at one time second in importance in the United States, had for many years occupied a similar place in Newport.

The Friends' school, one of the most substantial and useful of the secondary seminaries of New England, owes a debt of gratitude to the benevolence of another member of the Brown family. Inaugurated as a representative school of this religious body in 1794, it was kept alive from year to year by personal contributions. But not till its removal to Providence, through the liberality of Moses Brown, in 1819, did it take the position it has since occupied. At present it seems not only to be an excellent school of a genuine academical order, but furnishes an advanced course of study. For several years its faculty included several members of the Smiley family, so well known of late as enlightened friends of Vassar College and deeply interested in the work of home evangelization.

It is one of the characteristic and most hopeful features of our American civilization that, even when the masses of any community, State, or section of the country for a long period seem indifferent or hostile to the universal education which is the highest interest of republican society, the entire system of the secondary and higher education, so fixed and unalterable abroad, becomes flexible, leans downward, and goes out of its way, sometimes "across lots," to repair the damage and avert the uttermost consequences of this radical neglect. Even in the vast realm below the Potomac and Ohio rivers, including a region as extensive as Central Europe, this was done, in a measure, by extending the opportunities of the best schooling to the superior children of the humbler classes; even putting in peril the integrity of the secondary and higher instruction to meet the wants of the great varieties of pupils drifted in reach of the sheltering arms of the academy and college. But in Rhode Island, the most compact of American Commonwealths, only 1,250 square miles in extent, with more than three-fourths its population of 345,000 in 1890 massed in its two chief cities, two-thirds of it being in Providence, this adjustment of the higher to meet the crying need of the less intelligent strata of citizenship was most evident. It was, perhaps, because of the excellence of much that was in active operation in these larger cities and towns, and the satisfaction of the well-to-do classes in this direction, with the constant lifting up from the lowest estate that is only found in our American life, that the organization of common schools was so long delayed.

We have already indicated the residence of Bishop Berkeley at an early day in Newport and the gathering in that city of a brilliant and cultivated society as one of the incitements to the first building up of Brown University, and afterwards to the establishment of the private schools of Newport, Providence, and the lesser capital cities of the little Commonwealth.

But all this was only the old story of the past order of affairs, wherein the precious opportunity of acquiring the knowledge and mental discipline of the schools is withholden from the masses. Until the close of the eighteenth century the colony from its settlement was a protest against religious bigotry; but neither the State government nor the leading class seem to have been strongly moved with an intimation of the duty of every civilized and Christian community to care for the improvement of a majority of the people on whom the very material existence of a State depends. The attempt of President Manning, representing the latent sense of this obligation, which, after the State fully allied itself to the new Republic, was somewhat more evident than before, to persuade the city of Providence to assume the schooling of her own children, failed. It was not till ten years later that a sharp reminder from the opposite quarter of society brought the legislature face to face with that imperious question of public education which "will not take no for an answer," and finally prevails despite every form of private, social, ecclesiastical, and public hostility.

The first apostle of the common school in Rhode Island was found in John Howland, an influential member of the Mechanics' Association of Providence, and himself

a successful worker in that craft. In 1798 he brought the subject of the dearth of suitable opportunities for education before this association. When it was determined to move, there was a hesitation concerning the preparation of a suitable memorial to the legislature, and the suggestions of Mr. Howland were adopted. With characteristic moderation the legislature reported a provisional act which was submitted to the towns for examination. It was not till 1800, after Providence and Newport had approved, that an act was passed appropriating 20 per cent of the State taxation to education on condition that the towns would support schools under certain limitations proposed by the State. At once Providence, stirred up by Mr. Howland, availed herself of the law. Several private schoolhouses were bought by the city for $6,000 and a system of public education was at once inaugurated. But the inevitable reaction came in 1803 when the law was repealed, no town save Providence having taken advantage of its provisions. Mr. Howland declared that "while the wealthy and educated people of the State did not oppose, the class for whose benefit the law was specially intended was largely indifferent or hostile." An arrangement by which the small rural districts have always retained a greatly disproportioned representation in the legislature, then, as afterwards, bore its legitimate fruits. The voice of the two cities, in which three-fourths of the population, wealth, and personal influence of the State were concentrated, was suppressed by this disposition of political power conferred upon the least prosperous, intelligent, and progressive portion of the State.

During the following eighteen years the people of Rhode Island were not disturbed even by any "revisiting the glimpses of the moon" by the "perturbed spirit" of the dead and buried common school. In 1821 the legislature appointed a "committee of inquiry" into the condition of public education. But this report, if indeed written, was not considered, and for six years more things went on as before. But in 1827, the year that Dr. Francis Wayland put his hand on the helm of the storm-beaten craft of Brown University, there came in a responsive wave of educational revival. Newport, in 1825, voted to raise a tax for the support of a free school. In 1827, after an agitation of a generation, the legislature set apart, from the income of a tax on lotteries and other assessments, the sum of $10,000 annually for public schools.

Every town was empowered to collect a tax, not exceeding twice the amount received from the State, to supplement the appropriation. This preliminary legislation was followed by other acts for the building of schoolhouses. In 1836 the city of Providence finally "got itself together," established a system of graded schools similar to those of other New England cities of its importance, and appointed Nathan Bishop superintendent. It is claimed that in the matter of city supervision of schools Providence led the Union. From that day the schools of Providence have been generously and successfully supported. In 1839 the State raised its annual appropriation to $25,000, aided by the reception of the United States surplus revenue. But still the good work dragged on; the situation more discouraging to the educational public from the poor pretense of doing what was in no large sense well conceived or executed.

In 1843 the first correct revelation of the educational condition of the State was made to the legislature. The retribution of long years of neglect of the people's fundamental right and necessity had come at last. The combination that had held the State in the grip of the original charter, granted to the colony by King Charles II of England, for more than half a century of the national life was confronted by an uprising of the people that, for a time, threatened to reach the dire extremity of a civil war. In the emergency both political parties in the legislature turned to the people's common school as a reconciling agency. The revelations of the report, presented by a committee of inquiry, were a surprise and humiliation to a people who had lived all their lives alongside a state of affairs of which they seemed to have no real conception. It was found that 1,600 in 108,000 of the people of Rhode Island were wholly illiterate, while the neighboring State of Connecticut, although in the bonds of its inefficient school system, could boast that only 526 in 309,000

were in utter ignorance. Outside the two chief cities and a few large towns, the schools were in a disgraceful condition; schoolhouses dilapidated, teachers meanly paid, probably at their full worth, and the schools practically useless.

The new constitution, born amid the throes of a popular revolution, contains this decisive and comprehensive clause:

ARTICLE XII.—*Of education.*

SEC. 1. The diffusion of knowledge, as well as of virtue, among the people, being essential to the preservation of their rights and liberties, it shall be the duty of the general assembly to promote public schools and to adopt all means which they may deem necessary and proper to secure to the people the advantages and opportunities of education.

SEC. 2. The money which now is, or which may hereafter be appropriated by law for the establishment of a permanent fund for the support of public schools, shall be securely invested, and remain a perpetual fund for that purpose.

SEC. 3. All donations for the support of public schools or for other purposes of education, which may be received by the general assembly, shall be applied according to the terms prescribed by the donors.

SEC. 4. The general assembly shall make all necessary provisions by law for carrying this article into effect. They shall not divert said money or fund from the aforesaid uses, nor borrow, appropriate, or use the same, or any part thereof, for any other purpose, under any pretense whatsoever.

The time was now ripe for such a thoroughgoing reformation in popular education as has seldom been witnessed in any state in Christendom. With the new constitutional provision as a corner stone, with the example of Massachusetts already for ten years awakened from the lethargy of half a century by the thunderstorm of Horace Mann's cyclonic proclamation of his modest office of "secretary of the board of education," with Connecticut thoroughly aroused on the hither side, and, last of all, with the revelation of her own condition before the whole country, and with the leading educators in all the high places of university and academic life urging on, matters came to a head. Henry Barnard, of Connecticut, was invited to look over the field and suggest a plan of operation by which the good work could be well begun. He came, and, after due investigation from a tour of observation through the whole country, made a statement before the legislature and prominent citizens so convincing and reasonable that his hearers were not only "fully persuaded," but "showed their faith by their works," and offered him at once the laborious and difficult position of first superintendent of common schools of the State of Rhode Island.

The story of how he accepted the offer, and how, through four memorable years, he wrought in his place, until he was recalled in 1850 to his own State for a second time to serve as the guide of its common school system, remains to be told as one of the most inspiring chapters of the record of the "great revival of education in the United States," midway of the nineteenth century.

If we have seemed to linger too long on the story of the common school in New England during this critical period of the first half century of the national life, it is because in what did not happen then and there and in what was made to happen by the great outbreak of enthusiasm and energy at the close of these years, this little northeastern corner of the Union stood conspicuous among all the States of the North and in sharp educational contrast to the Southern section of the Republic. For still another thirty years was New England to retain her leadership in this great national enterprise, the training of Young America, under the auspices of the State, for good American citizenship.

Of the numerous services rendered to the national life by New England this is by all odds the most conspicuous and permanent. That in due time this leadership, like her eminence in material prosperity, industrial genius, literary and artistic production, and the initiative in social, political, and moral reform, will pass onward into the charge of the great central realm of the West, from the valley of the Hudson to the Rocky Mountains, so largely settled by her own progressive sons and daughters, is neither to be denied nor regretted. For to every section of this Republic comes in

its own good time the opportunity to make a prominent and characteristic impression upon the nation. New England has done this, her best work, for all time. But such work leaves no individual or State exhausted and obsolete. Rather is it a perpetual inspiration at home, ever burning like a quenchless flame on the altar; inspiring to a more profound and broader conception of education itself; demanding of every new generation that intense and vital interest on the one theme whose faithful and persistent working out through the passing years will alone insure the perpetuity of that type of American society which shall become the normal school of freedom for all men in all lands around the world.

[Errata. Page 1542, paragraph 2, last sentence, should show that Ninian Edwards was Territorial governor of Illinois (1809–1818) and third governor of the State (1826–1830); also that his son Ninian W. Edwards was first State superintendent of instruction, 1854. Ninian Edwards died in 1833.]

CHAPTER XL.

PAROCHIAL SCHOOLS.[1]

INTRODUCTORY REMARKS.

Parochial schools, called also parish schools, have not been separately shown in previous reports of the Bureau of Education. It is therefore fitting to explain conditions relating to these schools with a fullness that would not otherwise be desirable. It will be the effort to make an unbiased statement of historical accuracy. As far as it can be conveniently done, the views of authorities cited will be given in their own language.

There is some difficulty in clearly defining parochial schools, owing to variation in the use of the term. For example, a number of denominations maintain schools for their children which some might consider parochial, with no violence to the general definition, and yet it might be very difficult to separate some of these maintained by congregations from kindred schools maintained by the denomination. It has been found more convenient to treat the schools of the Friends, for example, as private denominational schools, although their elementary departments and some elementary schools may closely correspond to the parochial schools of some other denominations.

Moravian parochial school.—A peculiar case is that of the Moravians at Bethlehem, Pa. Besides a theological seminary and a seminary for young ladies, there is a school, established in 1742, still known as the Moravian parochial school. It is maintained by the congregation. Religious instruction is regularly given. The pupils from Moravian families observe the holidays of the church. The school has expanded within a few years so that it embraces a full set of departments from kindergarten to classes fitting for college. The advanced classes are partly made up of tuition pupils without regard to residence or religious profession. The elementary departments correspond to what are popularly called parochial schools, while the advanced departments correspond somewhat to an academy or other preparatory school. This school is remarkable for the long record it has as a school of elementary religious instruction and for the steadiness with which it has been quietly held to its original purpose.

Some similar combinations of elementary and advanced religious instruction in care of congregations might be found in other denominations. Some denominations have devoted great attention to education without establishing distinctively elementary congregational schools for the inculcation of their tenets.

Parochial schools defined.—The term parochial or parish school as here used applies to elementary schools maintained by congregations for their children with particular reference to their religious instruction. Such schools are to be distinguished from institutions maintained by groups of churches, such as dioceses, presbyteries, synods, assemblies, conferences, associations, or denominations, or supported as missions.

THE GENERAL DEMAND FOR RELIGIOUS INSTRUCTION.

Over all the world, wherever civilization has advanced to the establishment of schools of any sort, in any age, the prevailing religious system makes the study of truth as shown in the books deemed sacred the fundamental idea in education, if not directly, yet as the ultimate foundation.

---

[1] By James H. Blodgett, A. M.

Hindoo boys repeat whole books of their sacred literature to their Brahman teachers, and the texts of the Koran are the fundamental teaching of such schools as are maintained by Mohammedans in India, western Asia, or northern Africa. From Mosaic times the Jews have made the religious instruction of children paramount. When the Christian religion grew out of the Jewish the same ideas as to the instruction of children were carried over into the new conditions. With a general agreement of purpose in this respect there is a wide diversity in the methods used, and parochial schools are not maintained by those who, aiming for a like result, deem other agencies in operation adequate for elementary purposes.

In the United States we have now many forms of religion, but only Jews and Christians of some name are in such numbers as to affect statistics noticeably.

The Jews.—The devout Jew is hardly less earnest than of old as to the importance of religious instruction of children. In the persecutions of the centuries much of this instruction was driven to the privacy of the home, and the organization of Jewish schools was so far forbidden, discouraged, or interrupted that the Jew has not brought a formal habit of parochial schools to this country. There are numerous classes on Saturday, or at hours outside ordinary school, for the special purpose of impressing the doctrines of Judaism, but they are carefully planned to avoid conflict with the appointments of the public schools of their vicinities. The Jews have also some schools reaching to maturer work and to trade education, in part of which, at least, it is required that candidates for their privileges shall have been in regular attendance at ordinary day schools. The Jew therefore does not have parochial schools in the United States.

Christians.—Those who accept the Christian Scriptures in this country are in the first analysis, by order of number, Protestants, Roman Catholics, and Latter-Day Saints, or Mormons. The latter people add another revelation to that of the Old and New Testament. They are principally found in Utah and adjacent regions. As a church they take a positive charge of the education of their children, and some of their elementary schools might not be easily distinguished from parochial schools, yet the term denominational schools seems more fitting under the circumstances. The secretary of the board of education of the Latter-Day Saints or Mormons reported at the Eleventh Census (1890) 5,092 pupils in schools ranging from elementary to superior, of whom 113 were in Arizona, 696 in Idaho, and 4,283 in Utah. Owing to their location their schools have attracted little national interest. In 1893 there were reported 637 Mormon teachers and 46,099 children of Mormon parents in the public schools of Utah.

The following statement of the Mormon position in education is from the circular of the Juab Stake Academy for 1894–95:

"The growth of infidelity among the young establishes the fact that without the introduction of religious principles the final object of all education, 'Be ye therefore perfect, even as your Father in heaven is perfect,' as expressed by Christ, the greatest of all educators, can not be accomplished. It is also a fact equally demonstrated that the church school system of which this institution forms a part, remedies the growing tendency toward an unbelief in a divine creator.

"The following extract from a letter of President Woodruff of the general board, in which he urges the appointment of stake boards of education, voices the conclusion of every true Latter-Day Saint:

"'We feel that the time has arrived when the proper education of our children should be taken in hand by us as a people. Religious training is practically excluded from the district schools. The perusal of books that we value as divine record is forbidden. Our children, if left to the training they receive in these schools, will grow up entirely ignorant of those principles of salvation for which the Latter-Day Saints have made so many sacrifices. To permit this condition of things to exist among us would be criminal. The desire is universally expressed by all thinking people in the Church that we should have schools wherein the Bible, the Book of

Mormon, and the Book of Doctrine and Covenants can be used as text-books, and where the principles of our religion may form a part of the teachings of the schools.'

"The past years have proven that an academy based upon the principles of the everlasting gospel can be successfully run in this Stake[1] of Zion."

Early conditions in the United States.—The Protestant settlers of New England had broken with a state church, yet had retained so much of the impressions of unity of church and state that at first citizenship and church membership, when not identical, were closely related, and religion was a dominant subject in founding schools of every degree from the humblest to Harvard College. The adherents of the state church who settled Virginia kept religion prominent in such educational work as they did.

For two centuries New England and the Virginias and States of like settlement were under the control of the descendants of the original settlers and those in sympathy with them. All the institutions in each group were in harmony with the leading religious sentiment. Religious instruction was dominant in some schools, prominent in many, and, generally speaking, tolerated in all. Louisiana and such portions of Spanish America as have been absorbed into the United States were strongly Roman Catholic, the States from Spanish America having been under Catholicism as a state religion till near 1825, and such schools as existed were strongly marked by a religious character. Maryland was settled by liberal English Catholics, but their controlling influence was soon disputed by adherents of the Protestant Episcopal, Established Church of England. As long as any portion of the country remained under the control of the views of the original settlers the religion of their preference was expected to be in their schools, though by lack of interest it often occurred that Protestant communities allowed the disuse of the Bible and religious exercises.

In early settlement Pennsylvania probably covered the greatest number of religious bodies that could not accept the tenets nor understand the language of one another. There were Swedish and German Lutherans, English Friends or Quakers, Dutch Mennonites, German Moravians, and Scotch-Irish Presbyterians.

From the organization of the Federal Government into the second quarter of this century the influence of foreign immigration was slow in its effects, and each State, or even a group of States, tended toward something of a homogenous religious sentiment, in accordance with which its schools were molded.

Public schools maintained by local taxation, as now existing in part of the nation, were almost unknown. Even near the end of the second quarter of the century Horace Mann said in his report upon the schools of Massachusetts for 1846: "There is not at the present time, with the exception of the States of New England and a few small communities elsewhere, a country or a State in Christendom which maintains a system of free schools for the education of its children. Even in the State of New York, with all its noble endowments, the schools are not free."

Effect of quickened immigration on school systems.—In this second quarter of the century an active immigration began to pour into the Northern States that has only varied and not ceased to this date. The digging of canals and a little later the construction of railroads induced Catholic laborers from Ireland to come by thousands and scatter among Protestant communities. The failure of their potato crop gave tremendous enlargement to the Irish emigration just before 1850. The revolutionary conditions of the continent greatly stimulated German emigration about the same time. The Germans were partly Catholic and partly Protestant Evangelical of Lutheran profession, each form recognized in the provisions for religion by the State in their native regions. Later came Scandinavian Lutherans, bred in a State church, often in numbers sufficient to form colonies and organize and maintain local institutions, as was true in a degree of Germans. Such German or Scandinavian colonies

[1] Stake is the term used for a settlement by the Mormons.

became especially numerous in Illinois, Wisconsin, Minnesota, and the States immediately west of them. Wisconsin gave the privilege of suffrage to immigrants of one year's residence, a welcome which had a desired influence in determining migration thither.

In the two decades, 1850–1870, the free public school maintained mainly by local taxation came to be the educational watchword and almost uniform practice north of the Ohio River, and it has continued to extend with the westward expansion of settlement and the development of the South.

In the South, below the border States, public schools, outside of some considerable cities, are of recent growth, and such schools often have some tuition fees, as they did in Northern States generally almost to 1850 and irregularly to the time of the civil war. The Southern States are not yet much affected by foreign immigration, and they conserve the views of a white ancestry chiefly English in origin in a degree not elsewhere equaled.

It is to be noted that the growth of our public free-school systems has been largely coincident with the great foreign immigration, and its development has been promoted and modified by the views of adopted citizens, especially from countries possessing efficient systems of popular education. Foremost of these was the combination of States which we know as Germany. The schools of Germany had not generally been free, but in the revolutions of 1848 free schools was one of the popular demands generally attained for a time, though tuition fees again became common,[1] and now again fees have been abolished in elementary schools of Prussia.[2]

EDUCATIONAL CONDITIONS IN COUNTRIES FURNISHING IMMIGRANTS.

To understand the views with which citizens of foreign nativity have aided to build up and maintain local public schools and especially to understand their attitude toward religious instruction in such schools, it will be appropriate to consider the conditions under which they or their parents were born.

The tables, derived from the Eleventh Census (1890), here used to show the ratio of persons of foreign parentage, point out only conspicuous countries of their origin and indicate the portions of this country most affected by each. The great masses of immigrants have come from Ireland, Germany, Great Britain, Canada, and Scandinavia, or Sweden, Norway and Denmark.

The first table shows the entire population separated as of native parentage and of foreign parentage. This table includes the colored population of which the foreign-born portion is so small as to require little notice here. The people of African descent are chiefly in the South, where, having learned English ways at second hand, they add something to the conservatism against customs brought in by recent immigration. Taking all Northern and Western States together the population of foreign parentage is but little less than half the whole; taking all Southern States together the population of foreign parentage is close to one-tenth.

[1] Laishley, R. [2] Statesman's Year-Book, 1896.

TABLE I.—*Population distributed according to native or foreign parentage, by States and Territories: 1890.*

The following table will enable anyone to see what numbers and what per cent those of foreign parentage, white or colored, reach in any State or Territory. The per cent of colored foreign parentage is exceedingly small, and the per cent of whites of foreign parentage is usually low in the South.

TABLE II.—*Number and percentage of white and colored population of foreign parentage, 1890.*

a Persons of negro descent, Chinese, Japanese, and civilized Indians.

The next table, dealing only with whites, will enable one to see the lines of heredity for the large bodies of immigrants as indicated by the countries of their origin and to judge in what States and Territories any form of foreign ancestral habit or opinion is likely to be influential. The minor bodies of foreign parentage have been omitted, as their influence is too small for consideration in a statement that aims only to be suggestive.

TABLE III.—*Number and percentage of white persons of foreign parentage having either one or both parents born in specified countries, 1890.*

It is to be observed that all the immigrants from the European countries named, except those coming from Ireland since 1870, were born under the influence of a state church. This fact has an important bearing on their views of the proper attitude of civil government toward religious and educational institutions.

Ireland.—The Irish were mostly Catholics, bred in an antagonism to the Established Church, not so much because it was supported by the State, as because it required taxes from those who did not accept its doctrines and spent relatively little for the popular church of the island. Disestablishment was brought about in 1870.

In his report to the board of education of Massachusetts for 1843 Horace Mann explains the conditions of Irish public schools as he found them:

"In Ireland a national board of education was constituted in 1831. It is founded on the principle of religious toleration and conciliation, as between the two great sects into which that country is divided. * * * All religious instruction is expressly prohibited in the schools; and this prohibition includes 'the reading of the Scriptures,' 'the teaching of catechisms,' 'public prayer,' and 'all other religious exercises;' but separate hours are set apart in which all the children receive religious instruction from the clergymen of their respective denominations, the principle being to give combined literary and moral with separate religious instruction."

The Irish national schools continue largely to follow the principle noted by Mr. Mann over half a century ago. In the report for 1891, "Rules and regulations," the commissioners of national education in Ireland state that:
