"1. The object of the system of national education is to afford combined literary and moral and separate religious instruction to children of all persuasions, as far as possible in the same school, upon the fundamental principle that no attempt shall be made to interfere with the peculiar religious tenets of any description of Christian pupils. * * *

"6. The schools to which the commissioners grant aid are divided into two classes, viz: (1) Vested schools, of which there are two sorts, namely, (*a*) those vested in the commissioners, and (*b*) those vested in the trustees for the purpose of being maintained as national schools; (2) nonvested schools, the property of private individuals. * * *

"75. Opportunities are to be afforded (as hereinafter provided) to the children of all national schools for receiving such religious instruction as their parents or guardians approve of.

"76. Religious instruction must be so arranged (*a*) that each school shall be open to children of all communities for combined literary and moral instruction; (*b*) that, in respect of religious instruction, due regard be had to parental right and authority; and accordingly, that no child shall receive, or be present at, any religious instruction of which his parents or guardians disapprove; and (*c*) that the time for giving religious instruction be so fixed that no child shall be thereby in effect excluded directly or indirectly from the other advantages which the school affords. * * *

"83. In vested schools such pastors or other persons as shall be approved of by the parents or guardians of the children, respectively, shall have access to them in the schoolroom, for the purpose of giving them religious instruction there, at times convenient for that purpose—that is, at times so appointed as not to interfere unduly with the other arrangements of the school.

"84. In nonvested schools it is for the patrons or local managers to determine whether any, and, if any, what religious instruction shall be given in the schoolroom; but if they do not permit it to be given in the schoolroom, the children whose parents or guardians so desire must be allowed to absent themselves from the school at reasonable times for the purpose of receiving such instruction elsewhere. * * *

"86. The reading of the Scriptures, either in the Protestant authorized or in the Douay version, the teaching of catechisms, public prayer, and all other religious exercises, come within the rules as to religious instruction."

Scotland.—In Scotland the Reformed Church laid great stress upon general education. Without taking space to quote John Knox (1505–1572) or Thomas Chalmers

(1780–1847), reference may be made to a work by David Stow, a prominent Scotch Presbyterian educator before and through the second quarter of this century. This author states that the Scottish Church, in its polity, originally provided a minister and a schoolmaster and a staff of elders for every small rural parish of perhaps 1,000 souls. A grammar school was provided in each of the burgh towns, at that time small.[1] In this duodecimo of 474 pages, training is emphasized as distinguished from teaching, and Bible lessons are everywhere made fundamental.

The Scotch were thus trained in sympathy with the idea of religious instruction in elementary parish schools, though the system of parochial schools had been limited to the rural communities. Scotland has had a state church, Presbyterian in form. In 1843 a strong element withdrew and became the Free Church of Scotland, without modification of creed, on account of what were deemed encroachments of the crown in ecclesiastical matters. This Free Church has been supported by voluntary effort corresponding to conditions of church support in the United States.

In the words of Right Hon. Herbert Henry Asquith, in the debate on the second reading of the school bill pending for England and Wales (1896):

"In the ordinary schools of Scotland the elements of the Presbyterian doctrine are taught, Presbyterianism being the religion of the vast majority of the population of the country, and special provision being made for giving facilities for separate schools for the minorities."

Scandinavia.—The Scandinavian countries are almost completely Lutheran. Everyone is required to attend school at a stated age, and religious instruction is a prominent feature of the work.

Europe as seen by Horace Mann.—The reports of certain men who have studied the schools of various countries give us comparative views of value in this connection. Horace Mann visited Europe (1843) before the establishment of a public-school system in England and before the revolutions that made the present Germany. He says:

"Nothing receives more attention in the Prussian schools than the Bible. It is taken up early and studied systematically. * * * In all the Protestant schools the Lutheran catechism is zealously taught, and in all the Roman Catholic schools the catechism of that communion. * * * If the parents are all of one religious denomination, the teacher generally gives the religious instruction. Where a diversity of creeds exists the teacher usually instructs those of his own faith, and the Lutheran or the Catholic clergyman, as the case may be, attends at certain hours to give instruction in a separate apartment to those of his faith.

"In Holland all doctrinal religious instruction is excluded from the schools. The Bible is not read in them. Children are permitted to withdraw at a certain hour to receive a lesson in religion from their pastors; but this is not required. It is optional to go or remain. * * *

"In England, as there is neither law nor system on the subject of education, each teacher * * * does as he pleases. In the schools sustained by the church the views of the church, both as to religious doctrine and church government, are taught, and sometimes, though not always, in the schools of the Dissenters their distinctive doctrines are taught. There are, however, a few other schools which are established on a neutral basis as between opposing sects. In these the common principles and requirements of morality and all the preceptive parts of the gospel, as contradistinguished from its doctrinal, are carefully inculcated."

The leading German State was Prussia, and Prussian schools are those which have been most cited by travelers.

Great Britain is by law Protestant Episcopal in England and Wales, and Presbyterian in Scotland. In both ends of the island the forces of Dissenters, or Nonconformists, as all Protestants not of the Established Church are called, are strong. Catholics have a powerful organization in England. The effectiveness of schools in Scotland is closely connected with the churches.

[1] The Training System, the Moral Training School, and the Normal Seminary. By David Stow, eighth edition, 1850, p. 72.

England makes no claim to anything like a general public common school system prior to 1870, though public funds have been expended for education in some form for centuries.

Continental Europe as seen by Matthew Arnold, 1865.—Matthew Arnold in 1865 reported:

"The two legally established forms of religion in Prussia are the Protestant (evangelisch) and the Catholic. All public schools must be either Protestant, Catholic, or mixed (Simultananstalten). * * * In general, the deed of foundation or established custom determines to what confession a school shall belong. The religious instruction and the services follow the confession of the school. The ecclesiastical authorities—the consistories for Protestant schools, the bishops for Catholic schools—must concur with the school authorities in the appointment of those who give the religious instruction in the schools. * * * Where the scholars of that confession which is not the established confession of the school are in considerable numbers, a special religious instructor is paid out of the school funds to come and give them this religious instruction at the school. * * * When the scholars whose confession is in the minority are very few in number, their parents have to provide by private arrangement of their own for their children's religious instruction. * * *

"The wide acceptation which the denomination Evangelical takes in the official language of Prussia prevents a host of difficulties which occur with us in England. * * * In all schools of the Evangelical confession Luther's catechism is used, and all Protestant boys of whatever denomination learn it. Not the slightest objection is made by their parents to this. It is true that Luther's catechism is perhaps the very happiest part of Lutheranism, and therefore recommends itself for the common adoption, while our catechism can hardly be said to be the happiest part of Anglicanism."[1]

The reports of Matthew Arnold here cited were made at long intervals after that of Horace Mann. Meantime, Germany had been consolidated (1871). Prior to Mr. Arnold's last report (1886) France had secularized her schools (1882, 1886) and England had adopted something like a national school system (1870).

Matthew Arnold, special report, 1886.—The following is from Special Report on Certain Points Connected with Elementary Education in Germany, Switzerland, and France, by Matthew Arnold, presented to both Houses of Parliament in 1886, twenty-one years after his report just cited:

"The article of the Swiss constitution which establishes the obligatoriness and gratuitousness of the popular school goes on to say next: 'The public schools shall be capable of being attended by adherents of all confessions without injury to their freedom of faith and conscience.' Whoever has seen the divisions caused in a so-called logical nation, like the French, by this principle of the neutrality of the popular school in matter of religion might expect difficulty here. None whatever has arisen. The Swiss communities, applying the principle for themselves, and not leaving theorists and politicians to apply it for them, have done in the matter what they find suitable to their wants, and have in every popular school religious instruction in the religion of the majority, a Catholic instruction in Catholic cantons like Lucerne, a Protestant in Protestant cantons like Zurich. There is no unfair dealing, no proselyting, no complaint. In the German countries generally I have been struck with the same thing. In Germany the schools are confessional, or, as we say, denominational; that is—for the sect ramifications of Protestantism are not regarded—they are Evangelical, Catholic, or Jewish. When there are enough children of the confession of the minority a separate school is established for them, but where there are not enough, and they are taught with the children of the confession of the majority, there is, so far as I could learn, no unfair dealing and no complaint. In Saxony, where the Catholics are a small minority—in round numbers, 73,000 to

[1] Schools and Universities on the Continent, p. 199.

nearly 3,000,000 of Protestants—there are confessional schools for Catholics, but of course many scattered Catholic children are attending the Protestant schools. Of these children the elder ones must stay away from the religious instruction; the younger ones may follow it if their parents please, and often do follow it. In the great town school of Lucerne I found about 400 Protestant children in class with 2,900 Catholics; the Catholic children receive their religious instruction at the school, the boys from the director of the institution, the girls from a priest; the Protestant children receive theirs out of school and out of school hours. But at the large country school of Krientz, near Lucerne, I found that even in the head classes the few Protestant children were receiving religious instruction along with their Catholic schoolmates, the parents approving. The only case of religious difficulty which came to my notice was at Zurich, where some excellent people, Evangelical Protestants, considering the Protestantism of the public training college and schools too broad and too lax, had founded by private subscription a more strictly Evangelical college and school, which have been very successful."

Reports of R. Laishley.—Mr. R. Laishley spent 1883–1886 in an investigation of popular education in Europe and the United States in behalf of the Government of New Zealand. His observations upon the United States show a keener perception of the situation than is obtained by ordinary visitors who land at New York, glance at the schools of Massachusetts, visit the national capital, and write their impressions of the "American system." Mr. Laishley sees what many born in the country have yet to learn, that every State and Territory has an educational character of its own and that there is no comprehensive national system.

Mr. Laishley says: "The countries written of are Great Britain, France, Switzerland, Italy, Germany, Belgium, and the United States. * * * The religious and financial aspect of national education have especially engaged my attention. * * *

"It is most seriously questioned whether the British, a de facto religious, system tends to diminish crime, and whether a secular one is not distinctly dangerous.

"It is not for me to enter here, however, into the questions as to (1) whether religion is the foundation of morality or conducive to it, or whether morality can be taught without it, or (2) whether by teaching no religion a creed is not as arbitrarily taught as if Calvinism, or any other form of ism, were inculcated?

"It suffices for my purpose to believe (1) that there should be on the part of a State great care that the utmost consideration be shown toward the religious feelings of all; (2) that no form whatever of merely secular instruction will satisfy the great majority who believe that education without religion is impossible; (3) that there will be, if there be not already, 'a strong reaction against allowing sectarian jealousy to cause numbers of the population to grow up without the simplest elementary knowledge,' and (4) that friction as between the State and religionists retards, if it does not prevent, the perfect working of any State educational system.

"And, if any proof were needed, surely the anticlerical agitations in Belgium in 1884 show the seriousness of the questions involved in the arbitrary exclusion of religious teaching from public schools. * * *

"*Great Britain.*—The ordinary elementary day schools receiving State aid are of two classes:

"(1) Voluntary, controlled by religious denominations, or other managers, but which receive an annual grant from the Government; and

"(2) Board, managed by the boards, which receive an annual grant, and also the amount derived from local rates claimed or levied by the boards in their respective districts.

"The former class comprises nearly 76 per cent of all state-aided elementary day schools in England and Wales; but in order to obtain grants the schools must be conducted in accordance with the conditions required to be fulfilled by all elementary schools in Great Britain receiving state aid. * * *

"It therefore rests entirely with the boards and managers to order and regulate, or prohibit, religious teaching.

"The restraining sections are (*a*) 'the conscience clause,' applicable to all elementary schools receiving state aid; (*b*) the section prohibiting 'any religious catechism or religious formulary which is distinctive of any particular denomination,' which affects board schools only, and (*c*) the proviso that no by-law can be made preventing the withdrawal of any child from any religious observance, or instruction in religious subjects, or requiring any child to attend school on any day exclusively set apart for religious observance by the religious body to which his parent belongs, which, of course, affects board schools only. * * *

"By a return made to the House of Lords, 1884, it appears that (*a*) in an overwhelming majority of board schools in England and Wales religious exercises take place, in most instances daily; * * * (*b*) the services generally consist of reading the Bible, with or without comments, prayers, and hymns; * * * but in some cases the Bible is not read.

"*France.*—Education in all the national educational establishments is exclusively secular. And by the law passed in 1886 'in public schools of every description all instruction is to be given exclusively by laymen.' * * *

"Religious instruction must not now be given in schoolhouses; * * * optional in private schools. * * *

"Private schools * * * are subject to state supervision in respect of (*a*) morality, (*b*) sanitary arrangements, (*c*) the keeping a register of, and reporting, absences, and (*d*) so that the books used be not such as are contrary to the actual constitution or principles of government.

"*Switzerland.*—Switzerland is a republic where there are no universal sympathies of race, language, or religion. The Swiss apparently have concluded (1) that the existence of such a republic, unless all its citizens are sufficiently educated, is an impossibility; and (2) that to secure such universal and sufficient education (*a*) compulsory-attendance laws and gratuitous instruction are necessary; (*b*) religion must be admitted as the basis of education, but consideration must be shown for the religious feelings of all; (*c*) there must be local government in all matters primarily affecting localities. * * *

"*Italy.*—Italy is progressing rapidly in state education. * * * But state education in Italy is not, as yet, in that matured condition which warrants looking to it for profitable example. * * *

"Its religious feature consists in the lay head masters conducting once a week, on Saturdays, a religious exercise in the great majority of schools, although there are some exceptions where this is entirely left out of the programme. But even religious instruction is only given to those children whose parents express a wish for it; and all the children may be exempt from it by going to school one hour later than ordinarily.[1] * * *

"In each province there is a school board under the presidency of the prefect, which board has the supervision of private as well as public primary and secondary schools in respect of sanitary and moral matters. * * *

"*Roman Catholic schools.*—In addition to state-aided and private schools there exist numerous primary and secondary schools established by the Roman Catholic Church which are gratuitous, well-attended, well-conducted, and carried on under the presidency of the clergy. There, of course, religious instruction is a main feature. * * *

"I ascertained (1) that the Roman Catholic authorities are not at all satisfied with the system of state education in Italy, hence they have felt compelled to carry on their own free schools; and (2) that the principal grounds of their dissatisfaction are (*a*) that religious instruction is not, in state schools, the basis of education; (*b*) and when given, is not conducted as they approve, which defects are considered to have a most depraving effect upon the morale of the school."

---

[1] It is said, however, to be very rare that families refuse religious instruction. Nearly everywhere Jews, with a few Protestants, are the only ones to absent themselves.

Mr. Laishley also quotes a high authority on education at Rome, who thinks (*a*) far too many subjects are taught in the state schools, (*b*) that it would be infinitely preferable to have a few subjects taught thoroughly, and (*c*) that education should not be compulsory, but left to parental discretion.

Germany.—Mr. Laishley finds in Germany "(*a*) consideration for the feelings of virtually all in religious matters;[1] (*b*) local government, including regulation of religious instruction (subject to the protection of minorities), of direct taxation, of expenditure, and of administrative details; (*c*) religion (subject to certain conscience clause provisions) considered as the basis of instruction, and therefore placed as the primary subject on elementary school programmes; (*d*) compulsory attendance laws; (*e*) thorough qualification of all teachers for private as well as for public schools, (*f*) and recognition of the great importance of gymnastic exercises.

"So that in Germany, as in Switzerland, we find friction between the State and the citizens in religious matters provided against.

"*Belgium.*—From recent changes in the Belgian educational system, and from the circumstances surrounding them, valuable lessons can be derived. It is, therefore, an opportune time for comment. It is requisite to remember that Belgium is a country where, at least nominal, Roman Catholics very largely predominate, and where the Roman Catholic clergy have great influence; that the state system in force under the law of 1st of July, 1879, was a secular one; and that the sole provision for religious instruction was that if parents wished their children to be benefited by the ministrations of the clergy, such ministrations could only be given (upon the application of the parents) before or after school hours—the principle adopted being that religious instruction should be left to the care of families and ministers. The result was that religious training in schoolhouses virtually amounted to nothing; and that the Roman Catholic authorities established primary schools, and added to the number of their secondary schools (écoles moyennes et colleges), all which were, and are still, largely attended. But there grew up in consequence a very bitter and deep feeling of hostility, created or fostered by the clergy, against the state system; and when the clerical party latterly obtained political ascendency, educational reform was carried out.

"It is unnecessary to detail the violent agitation, almost amounting to revolution, caused by the enacting of the new law; affording, it would seem, clear proof of the impolicy (to say nothing of the injustice, which, of course, is always impolitic) of a state identifying itself with a nonreligious or religious educational scheme, without providing that every consideration be shown toward the religious or nonreligious convictions of all its subjects.

"The recent act is strongly condemned by the Liberals, but it will certainly be maintained so long as the Conservative party are in power.

"The reform is an advance upon that of 1st of July, 1879, as more favorable to local government, especially in religious matters.

"The communes have now more power; for instance, when the inhabitants in a commune are unanimous respecting religious teaching, it is open to them to subsidize, as primary schools, clerical ones, and to thereby virtually abolish undenominational schools. Even when ratepayers are not unanimous, a minority of 20 fathers of families is entitled to claim that a school shall be established for the use of their children, where religious teaching according to the views of the parents may be conducted as a main feature in education, and under certain circumstances they can indicate one or more schools that they wish adopted; the sole conditions imposed by the state being that (*a*) the school must be established in a suitable place; (*b*) half at least of the teachers must have obtained diplomas, or have successfully passed an examination for teachers before a board organized by the Government; (*c*) the

[1] At Berlin even the comparatively small number of Jewish pupils in primary schools are to be supplied with Jewish teachers for religion.

instruction given must come up to the proper standard; (*d*) the children of the poor are to be received gratuitously; and (*e*) the school is subject to Government inspection. The defect, however, seems to be the nonprovision for a minority of less than twenty fathers.

"The effect will probably be that there will be in towns as many undenominational schools as ever, but that in the rural districts, where the Roman Catholic clergy have greater influence than in many of the towns, there will be great changes and the peasantry will be relieved from the serious hardship of paying for schools which they do not use. The law, as regards State schools, still remains intact in respect of its secular character and in respect of the provisions for religious teaching, but the main amendment promotes the support of schools where such religious doctrines and formularies, be they Roman Catholic or otherwise, as the managers of the school think proper, form a portion of the ordinary plan of study.

"However, until such measures be introduced as provide that consideration be shown toward all, one can scarcely expect to find that the Belgian educational system will be devoid of that friction which would alone prevent the perfecting of details apart from those relating to religious teaching.

"*The United States of America.*—The range of country is so immense and the social conditions so diverse that it is difficult to make general statements applicable to the States as a whole. The condition of education in each State or Territory must be judged on its merits.

"Very great allowance must be made in view of (*a*) the colored race element, a result of the abolition of slavery, whereby some additional millions became entitled to claim State rights, and (*b*) of the vast number of immigrants of various nationalities continually pouring in, to whom the system of the majority has to be adapted. * * *

"Sectarian instruction is not given in the public schools. It is quite a common practice to open or close the public schools with Bible reading and prayer. Singing of religious hymns by the entire school is still more common.

"The influence of the schools is wholly on the side of morality and religion. Religious teaching, however, is entirely intrusted to church and family agencies. * * *

"In truth, arrangements for religious teachings are a source of discontent in the United States, especially to the Roman Catholics. They are not upon a basis which satisfies all, or virtually all, and can not be deemed permanent."

Mr. Laishley presents a tabular contrast of all the countries under discussion, from which the following is a condensation, to show the extent of religious instruction in public schools and supervision of private schools. He has rated the prevalence of religious instruction in public schools of the United States too high.

Name of country.	Religious instruction in public schools.	State supervision of private schools.
Great Britain	As directed by boards and voluntary school managers.	None, except that the board must be satisfied "a child is under efficient instruction."
France	None	Yes; teachers must have certificates.
Switzerland	Yes.	Yes.
Italy	Yes.	Yes.
Germany	Yes.	Yes; teachers must have diplomas.
Belgium	Optional with communes	No, if wholly private; yes, if receiving State aid.
United States of America	No universal rule; in most places a certain amount; the system must be deemed secular; there is dissatisfaction, and therefore friction.	No.

In Belgium to 1879 religious instruction was regularly given in public schools. In that year the schools were completely secularized. The reaction of 1884 restored religious instruction, with some modification, as before the act of 1879.

The law of September 20, 1884, however, left religious instruction optional with the communes. In 1895 only 153 out of 5,778 schools did not have daily religious instruction on their programmes. By a law of that year (1895) religious instruction one-half hour daily was made obligatory, except for children whose parents ask that they be excused. The instruction is to be given by the ministers of the several denominations, or, under their supervision, either by the teacher, if he consents, or by another person approved by the communal council. The inspection of the religious instruction is by the "chief of the confessions" through their delegates, and not as part of the State inspection.

Teachers must abstain from any attack on the religious belief of the families whose children are intrusted to them.

In brief, the pupils are to have religious instruction in the schools, under the faith of their parents, or to be excused from religious exercises so far as parents ask it.

France is the only European country at this time whose schools are rigidly secularized, and there Thursday is kept as a holiday to give opportunity for religious instruction elsewhere.

These glimpses at conditions in the countries where parents were born will be suggestive as to the views of public education, especially as related to religion, to which a large part of our people are accustomed. This statement is only suggestive, and therefore only the States are named in the following paragraphs in which the descendants of any nationality specified form a prominent fraction. It will be evident that the influences of a given nationality are quite local, and that their diversity tends to maintain the specialization of our State systems.

HIGH RATIOS OF FOREIGN PARENTAGE.

In North Dakota and Minnesota more than three-fourths of the population is of foreign parentage; in Wisconsin almost three-fourths; in Utah close to two-thirds; in South Dakota near three-fifths; in Massachusetts, Rhode Island, Connecticut, New York, Michigan, Montana, Arizona, Nevada, and California just over one-half; in New Jersey, Illinois, and Wyoming just below one-half; in Iowa, Nebraska, Colorado, Idaho, and Washington over two-fifths; in Pennsylvania and Ohio just above one-third; in Oregon not quite one-third; in Kansas and Missouri just over one-fourth, and in Maryland just below one-fourth.

The localization of the principal elements of foreign parentage—from Ireland, Germany, Great Britain, Canada, and Scandinavia—appears in the following paragraphs.

Ireland.—Persons of Irish parentage form just above one-fourth of the whole population in Massachusetts, Rhode Island, and Connecticut; barely under one-fifth in New York; just below one-sixth in New Jersey; barely over one-seventh in Nevada; close to one-eighth in California, Pennsylvania, and Montana.

Germany.—Persons of German parentage are much above a third of the whole population in Wisconsin; above one-fifth in Illinois and Minnesota; a little below one-fifth in New York; close to one-sixth in Ohio; more than one-seventh in New Jersey, Nebraska, Iowa, and Michigan; just below one-seventh in Missouri, South Dakota, Maryland, and Indiana; barely short of one-ninth in Pennsylvania; and a little more than one-tenth in North Dakota and California.

Great Britain.—Persons whose parents were born in Great Britain form more than one-third of the population in Utah; more than one-seventh in Idaho; close to one-sixth in Wyoming; one-eighth in Nevada, and nearly one-eighth in Montana and Rhode Island. The United States is so closely allied to Great Britain by early settlement, colonial government, habits of thought, community of language, and ready intercourse that the figures which show persons not more than one generation removed from foreign birth do not adequately represent the ratio of British influence on our social condition. As illustrating indirect ways by which British methods touch public sentiment with us, attention may be directed to the assistance missionaries from this country receive from British colonial governments for their schools.

When a Congregational missionary from Bombay, India, for example, reports to his friends in this country, his balance sheets are likely to show a Government grant of one-half the cost of his manual training school shop, one-fourth the cost of the teacher's residence, and an allowance, according to results shown upon examination by the Government inspector, not exceeding one-third the current expenses. This same missionary will state that the Government pays no attention to the religious teaching and stands ready to make kindred grants to schools of any religion, or of no religion, that put themselves under its inspection and produce like results in so-called secular education. This is in sharp contrast with recent denominational action in this country where several religious bodies relinquished government contracts for Indian schools in the movement to separate Government action from any relation to sectarianism. One can hardly help inquiring whether the present current of sentiment in the United States will lead to instructions from mission boards here to their missionaries in the British dominions to refuse Government aid, or whether the experience of the missionaries will tend to modify the current feeling at home.

Canada.—Persons of Canadian parentage are more than one sixth the entire population of New Hampshire and Vermont; just over one-eighth of the population of Massachusetts and Maine, and just below one-eighth in Michigan and Rhode Island.

Scandinavia.—Persons of Scandinavian parentage form close to one-third the whole population of North Dakota; over one-fourth in Minnesota; just above one-sixth in South Dakota; just below one-sixth in Utah, and almost one-ninth in Wisconsin.

European conditions summarized.—The people of Continental Europe, the Germans and the Scandinavians, have been accustomed to a state church, to compulsory education, to religious teaching based upon the Bible, but accommodated in a catechetical form to certain faiths, in the state schools, and to tuition fees above the elementary schools. The exceptional conditions of France, are recent (schools secularized by laws of 1882 and 1886), and affect us little, except through their example in the great movement of cosmopolitan public opinion, that country furnishing as yet few immigrants, and those hardly grown used to the new conditions of their own country.

CURRENT DISCUSSION IN ENGLAND.

The English, although having a state church, are like ourselves in some aspects of their experience with religious teaching. They have a recent public-school system, but questions of religious instruction are subject to local views of policy. Protestant dissenters or nonconformists appear among the active opponents of religious instruction in the public schools. The English have not even now a school system for general education, like that of Massachusetts, for example. They have been accustomed since 1839 to a "grant in aid" system, by which the Government has aided schools of any or no faith, according to results in secular education and the conditions of the schools. Not half the pupils are in schools under charge of public-school boards.

The English people have now two prominent types of procedure as to religion in public schools. One is illustrated in schools of the London school board, where religious instruction, called unsectarian, is made prominent. The Bible is studied, not merely read. The other type is known to some under the name of the Birmingham method, because adopted by the Birmingham school board, in whose schools only secular instruction is given. Permission is given for the children whose parents so desire to attend religious instruction under forms which they select during certain school hours. The London type reaches all pupils except those specifically excused on their parents' request. The Birmingham method leaves all who do not distinctly select religious instruction wholly without it.

The public schools of England are in a transition state, with legislation pending of sufficien importance to affect party issues and the stability of the ministry. The public interest hinges mainly upon the proposed treatment of religious instruction, which the opposition interpret as too favorable to the Catholic and the Anglican (Episcopa churches.

The following paragraph is in the pending educational bill for England and Wales:

"27. (1) One of the regulations in accordance with which a public elementary school is required to be conducted shall be that if the parents of a reasonable number of the scholars attending the school require that separate religious instruction be given to their children, the managers shall, so far as practicable, whether the religious instruction in the school is regulated by any trust deed, scheme, or other instrument or not, permit reasonable arrangements to be made for allowing such religious instruction to be given, and shall not be precluded from doing so by the provisions of any such deed, scheme, or instrument.

"(2) Any question which may arise under this section as to what is reasonable or practicable shall be determined by the education department, whose decision shall be final."

Sir John Gorst, in asking leave to introduce the bill, said: "Last year the voluntary schools educated 2,445,812 children, as against 1,879,218 educated in the board schools; or, to put the matter in a more popular form, of every seven children educated by the State, three were educated in board schools and four in the voluntary schools. * * *

"The Roman Catholics and a very large part of the members of the Church of England make it a point of conscience that their children should be educated by teachers of their own denominations, and it would be impossible to force those children out of their own schools into the board schools without being guilty of a piece of religious intolerance which the people of England in these enlightened days would never consent to."

On the second reading of the bill Mr. Gorst said:

"In our country, where we quarrel so much about religious matters, there is only one principle by which we can obtain peace in our schools, and that is by the recognition of the right of the parent to have his child brought up in the religion which he selects. * * *

"In the east end of London the London school board has most properly established Jewish schools, where the Jewish religion is taught by persons approved by the rabbi."

The bill represents the views of the party in power, but it is strongly opposed. In debate Mr. Asquith said of section 27, quoted above:

"I do not hesitate to describe that scheme as an endowment on a vast and unprecedented scale, out of public money, of a system of denominational teaching. * * * The principle which has governed us hitherto in this matter has been this: We have two sets of schools. First, the board schools, entirely supported out of public resources, imperial and local. In those schools the teaching of any religious formulary or catechism is absolutely prohibited. We have another class of schools—denominational schools—which are largely supported out of the public funds. Yet, as in the view of the framers of the act of 1870, they were to continue to make substantial contributions of their own, they have given to them the power, while subject to a conscience clause, to teach any religious formulary they please. That is the compromise that was worked for twenty-five years. What occasion is there to disturb it?"

The education grants were introduced in England in 1839. The following table shows, by denominations, the entire amounts granted to schools and the amount for 1895, as given in The School Master (England), April 18, 1896, in pounds,[1] disregarding shillings and pence for the last column:

Education grant.

Denomination.	In 1895.	Since 1839.
Church of England	£2, 785, 522	£43, 372. 290

CURRENT DISCUSSION IN CANADA.

In Canada school questions are deeply stirring the people. It has long been the practice in Lower Canada, or Quebec, strongly Catholic, and furnishing most of the French-Canadian immigrants for New England, to have separate public schools for Protestants. In Upper Canada, or Ontario, Protestants are in the majority, and separate schools for Catholics or for Protestants have been allowed since 1863. In Manitoba the act of 1871 established separate schools. In 1890 the provincial legislature of Manitoba abolished separate schools, and there has been an active contest between the provincial and the Dominion authorities regarding their restoration. The Canadians expect some religious exercise in school, and "in part of Canada there is a State concession that any person liable to be taxed may, if he please, have the right to elect to support a denominational school, and be thereupon to a certain extent exempt from public rates."[1]

The details of administration differ greatly in Great Britain, Canada, and the United States, but there is a coincidence of present agitation in all upon the relation of the state to religious instruction in general education.

CURRENT CONDITIONS IN THE UNITED STATES.

Matthew Arnold suggests an explanation why popular education in England was not equal to that of Germany and Holland:

"Perhaps one reason why in England our schools have not had the life and growth of the schools of Germany and Holland is to be found in the separation with us of the power of the Reformation and the power of the Renaissance. With us, too, the Reformation triumphed and got possession of our schools, but our leading reformers were not at the same time like those of Germany; the nation's leading spirits were there—the reformers; in England our best spirits—Shakespeare, Bacon, Spenser—were men of the Renaissance, not men of the Reformation, and our reformers were men of the second order. The reformation, therefore, getting hold of the schools in England was a very different force, a force far inferior in light, resources, and prospects to the reformation getting hold of the schools in Germany."[2]

Would Matthew Arnold look upon the conditions in the United States as a natural perpetuation of English conditions? Horace Mann's comment on teachers in English schools of 1843, as to each following his own course, applies, more than most persons are aware, to our States and communities.

It must be observed that the United States as such has no general school system. There are certain features of public-school administration in which different States or different cities resemble one another, but one can not be too careful in stating the geographical limitations of his facts. Foreign and native educators have fallen into the way of taking the schools of Massachusetts as the type of schools in the United States without recognizing the differences that begin as soon as one crosses the State line.

The Government of the United States maintains special isolated schools, as the Military Academy, the Naval Academy, and the schools on Indian reservations, but the only geographical areas on which the nation takes charge of education are, directly, Alaska, where some 2,000 pupils are in schools administered, according to their varying conditions, by the Bureau of Education, and, indirectly, the District of Columbia, whose municipal laws are made by Congress. It is noteworthy that while many are denouncing as impracticable any plan for public schools of different sects or classes the District of Columbia, in common with all the States where the African race is prominent, has separate schools for whites and blacks, and even has a separate superintendent for the schools of each race, although all the schools are under the charge of one board and are supported without discrimination of funds.

---

[1] Laishley, note.

[2] Schools and Universities on the Continent, p. 153.

This, therefore, in a peculiar though limited sense, is the national system of education in the United States.

Massachusetts.—Horace Mann was in a sense the apostle of the enlarged public school systems of the day, and the historian of the schools of Massachusetts as they were when he was connected with them. In his lecture 5, Historical View of Education, 1840, he says: "As educators, as friends and sustainers of the common school system, our great duty is to prepare these living and intelligent souls; to awaken the faculty of thought in all the children of the Commonwealth; to give them an inquiring, outlooking, forthgoing mind; to impart to them the greatest practicable amount of useful knowledge; to cultivate in them a sacred regard to truth; to keep them unspotted from the world—that is, uncontaminated by its vices; to train them up to the love of God and the love of man; to make the perfect example of Jesus Christ lovely in their eyes, and to give to all so much religious instruction as is compatible with the rights of others and with the genius of our Government, leaving to parents and guardians the direction, during their school-going days, of all special and peculiar instruction respecting politics and theology; and at last, when the children arrive at years of maturity, to commend them to that inviolable prerogative of private judgment and of self-direction, which in a Protestant and a republican country is the acknowledged birthright of every human being."

In his first annual report, dated January 1, 1838, Mr. Mann says:

"In regard to moral instruction, the condition of our public schools presents a singular and, to some extent at least, an alarming phenomenon. To prevent the school from being converted into an engine of religious proselytism, to debar successive teachers in the same school from successively inculcating hostile religious creeds, until the children should be alienated, not only from creeds but from religion itself, the statute of 1826 specially provided that no schoolbooks should be used in any of the public schools 'calculated to favor any particular religious sect or tenet.' The language of the Revised Statutes is slightly altered, but the sense remains the same. Probably no one would desire a repeal of this law while the danger impends which it was designed to repel."

He regrets that in all the libraries of books none have been found without a sectarian bias in favor of tenets or sects that puts them under the prohibition, so that there is an entire exclusion of religious teaching.

In his second annual report, dated December 26, 1838, Mr. Mann says:

"In my report of last year I exposed the alarming deficiency of moral and religious instruction then found to exist in our schools. That deficiency, in regard to religious instruction, could only be explained by supposing that school committees, whose duty it is to prescribe schoolbooks, had not found any books at once expository of the doctrines of revealed religion and also free from such advocacy of the 'tenets' of particular sects of Christians as brought them, in their opinion, within the scope of the legal prohibition. * * * Of course, I shall not be here understood as referring to the Scriptures, as it is well known that they are used in almost all the schools, either as a devotional or as a reading book."

In his report for 1848 (twelfth annual) he uses 49 pages in the defense of unsectarian religious teaching in the schools and cities. He cites the eighth report (1844) of the State board of education as "a document said to be the ablest argument in favor of the use of the Bible in schools anywhere to be found." That document (p. 16) says: "The Bible has nothing in it of a sectarian character. All Christian sects regard it as the text-book of their faith."

In the report for 1848 he repels earnestly all representations that he has ever opposed its use. He points out how recent is the unsectarian freedom which he claims is represented by the use of the Bible without note or comment.

"It was not, indeed, until a very recent period that all vestige of legal penalty or coercion was obliterated from our statute book, and all sects and denominations were placed upon a footing of absolute equality in the eye of the law. Until the 9th day

of April, 1821, no person in Massachusetts was eligible to the office of governor, lieutenant-governor, or councilor, or to that of senator or representative in the general court, unless he would make oath to a belief in the particular form of religion adopted and sanctioned by the State. And until the 11th day of November, 1833, every citizen was taxable by the constitution and laws of the State for the support of the Protestant religion, whether he were a Protestant, a Catholic, or a believer in any other faith. Nor was it till the 10th day of March, 1827, that it was made unlawful to use the common schools of the State as the means of proselyting children to a belief in the doctrines of particular sects, whether their parents believed in those doctrines or not. * * *

"The Bible is the acknowledged expositor of Christianity. In strictness, Christianity has no other authoritative expounder. This Bible is in our schools by common consent. Twelve years ago it was not in all the schools. Contrary to the genius of our Government, if not contrary to the express letter of the law, it had been used for sectarian purposes, to prove one sect to be right and others to be wrong. Hence it had been excluded from the schools of some towns by an express vote. But since the law and the reasons on which it is founded have been more fully explained and better understood, and since sectarian instruction has, to a great extent, ceased to be given, the Bible has been restored. I am not aware of the existence of a single town in the State in whose schools it is not now introduced, either by a direct vote of the school committee or by such general desire and acquiescence as supersede the necessity of a vote."

After saying that the State of Massachusetts as an alternative for the course pursued "might establish schools, but expressly exclude all religious instruction from them, making them merely schools for secular instruction," he says: "I do not suppose a man can be found in Massachusetts who would declare such a system to be his first choice."

Conditions in Massachusetts have changed but gradually in the last sixty years, though even there the views which Horace Mann held as the broadest, unsectarian liberality are not uniformly accepted as liberal enough for present conditions.

American Association for the Advancement of Education.—At the meeting of the American Association for the Advancement of Education in 1855 the retiring president, Prof. A. D. Bache, made some remarks upon a national university in which he referred to moral and religious education as the better part of the work. Thereupon the following resolution was offered:

"*Resolved*, That the sentiments expressed by our late president, Professor Bache, in his recent address, that moral and religious instruction should form a prominent part in all our systems of education, is in accordance with the firm belief and earnest convictions of this association."

This gave rise to a discussion as to the Bible and religion in public schools which occupied parts of three sessions and in which substitutes of similar purport were offered in the effort for a harmonious expression of opinion, all ended by laying the subject on the table. Prof. Charles Daviess, S. S. Randall, superintendent of public schools in the city of New York, Rev. Gorham D. Abbott, Prof. Alfred Greenleaf, Amos Perry, Caleb Mills, superintendent of public schools of Indiana, Gideon F. Thayer, Prof. E. A. Andrews, President Henry P. Tappan, of Michigan University, Prof. James N. McElligott, and others spoke with earnestness favoring such a resolution. Bishop Alonzo Potter, of the Protestant Episcopal Church, stood nearly alone in opposing it, Erastus C. Benedict supporting him in a degree. The Bishop spoke at great length, including the following sentences:

"The fact is that in this country the subject is surrounded by the greatest practical difficulties. Yet I think these difficulties are destined to be overcome, and we are in the way of overcoming them. * * * If the question was distinctly at issue whether we should have schools with no Bible, no religious instruction in them, or no public schools at all, I would say that I would surrender the Bible. There are

other places where the Bible can be taught. Give me a place where the children shall be taught to be able to read the Bible, and I will take care that they shall read the Bible out of school, if they do not in school. * * *

"It is the proposition that in all schools the Bible should be daily read. I have no doubt that it ought to be read in all schools where it can be read without the sacrifice of an interest greater than that which you can gain from it. Suppose that the only teacher you have to fill the place is one who demonstrates by his daily life that he is godless, without the fear of God before his eyes, who can not help, by the process of unconscious tuition, proclaiming the fact in his school that he does not fear God, that he does not in his heart regard the Bible. Now, will that man perform the duty you would impose upon him by law in such a way as to promote reverence for the Scriptures, in such a way as to deepen in the hearts of those little ones the fear of God and the love of Christ? I say no. The whole process will be regarded by them not as a solemn mockery but as a farce. A worse impression upon the religious character and associations could not well be produced."

The incident is noteworthy for the date, 1855, over forty years ago; for the educational position of the speakers; for their representative position as Protestant citizens, and for accepting by the leading speaker one as a teacher who "does not fear God" or "in his heart regard the Bible."

New York.—The first general act for the establishment of common schools in the State of New York was passed in the year 1812. In 1813 a supplementary act relating to the schools of the city of New York directed the payment of school moneys to such incorporated religious societies in said city as maintain charity schools. An act of 1822 gave funds for building schoolhouses to the Bethel Baptist Church, under which act gross abuses occurred, so that in 1824 an act was passed placing the selection of schools and institutions to receive public money in the common council of the city. This was held to exclude churches as such. In 1840, eight Catholic churches, a Jewish congregation, and a Scotch Presbyterian church petitioned the council for a share of the public money for schools under their care—the latter two basing their action on the report that a Catholic petition was to be presented. Remonstrances came in from the Public School Society, one from the Methodist Episcopal Church, with a contingent request that, if the moneys asked for were granted, a grant should also be made to restore a school formerly maintained by the Methodists.

In the remonstrances of the trustees of the Public School Society the distribution to churches for their schools is called:

"Unconstitutional * * * that the community should be taxed to support an establishment in which sectarian dogmas are inculcated. * * *

"Inexpedient, because the question was fully examined by the common council in 1822, and all the church schools, including the Catholics, which had previously drawn from the school fund were cut off, and the great principle of nonsectarianism adopted as the basis for subsequent appropriations from this fund."

Remonstrances from Reformed and Baptist churches and from citizens discussed various phases of the question. The petition for division was not granted.

The University of the State of New York has granted allowances from public funds to academies attaining its standards. In 1893 there were 69 undenominational, 22 Protestant, and 35 Catholic academies and academic departments that received such allowance. The constitution of 1894 prohibits the appropriation of public money to any institution under sectarian control. The regents of the university,[1] citing the Wisconsin decision that King James's version of the Bible is a sectarian book, state that they do not so consider it under conditions in New York. The parallels between practice in New York and English practice are evident, as well as the recent departure from English practice by cutting off from "Grants-in-aid" all schools that have a denominational character. A peculiar discrimination is likely

[1] Report for 1893.

to develop in present conditions in New York. A devout Christian teacher may conduct his school to all outward appearance just like that of his fellow-churchman across the way, but if one is formally indorsed by his denomination he can not receive the allotments of public funds still available for one not so indorsed.

Cities.—Not to follow the question of custom in the use of the Bible in the common schools State by State, it will be sufficient to cite conditions in some of the great cities of 1856—Boston, New York, Philadelphia, Cincinnati, St. Louis, and New Orleans. In the schools of Boston the Bible was in use. In some schools of New York and Philadelphia it would have been found, but not uniformly. In Cincinnati it was in use, though one might have detected the indications of the contest in which its use was discontinued a few years later (1869). In the public schools of St. Louis the Bible was not used, notwithstanding something like a wholesale importation of New England teachers in 1853, notably from the Bridgewater Normal School, for superintendent, principals, and high-school teachers, to give character to the city system. The Bible had been in use in the schools of New Orleans, but was not in use there in 1856.

WANT OF UNIFORMITY IN USE OF TERMS.

Persons who have carried in their impressions the ideal of the Massachusetts common school have very generally regarded the question of the Bible in the schools as a question of defense, as though it were in general use, and not as an aggressive question that it might be adopted. In point of fact, it has not been in any such general use as assumed by a multitude of writers and speakers. When Calvin E. Stowe addressed an Indiana audience in 1840 it was clearly the New England custom of using the Bible that he was defending. The common schools of Indiana at that date were very primitive, and could hardly be said to have a prevailing custom in any detail. Professor Stowe uttered similar views before the American Institute of Instruction, Portland, Me., 1844, in a region where his statements fitted the conditions. He was willing to have Protestants and Catholics each use their own Bible. In the Indiana address he said: "Every attempt to pervert the common-school funds so as to accommodate children of different languages or different religions with a separate education should be steadily resisted by every true friend of his country."[1]

The lack of definition of terms, or of the sense in which they are used, has led to much confusion in the discussion of the proper functions of the public school, and the variable meanings authors attach to "sectarian," "public school system," and other expressions give a character of unstable equilibrium, as it might be called, to many of the arguments regarding the functions of the schools. As an example, the royal commission of 1888 to examine the condition of elementary schools in England and Wales sent circulars to various foreign countries, and to each of the States and Territories of this country. The replies were condensed into tabular form in the report of the commission. In the column for religious instruction the word "None" appears against every State reporting except Florida, "Devotional exercises, nonsectarian;" Maine, "General, not sectarian, optional;" Michigan, "Nonsectarian;" New Jersey, "Bible read without note or comment, not obligatory;" Oregon, "Given by teacher, not compulsory, no special provision;" Vermont, "Bible read in most schools, not compulsory;" Virginia, "Not required by State, teachers usually give unsectarian religious instruction." The facts are not clearly shown, by reason of the varying significance attached to the term "religious instruction" by the officials who filled out replies. Massachusetts has a formal requirement that the Bible shall be read daily in all public schools, yet in the table cited eight States less stringent on the point have some entry indicating attention to religious instruction, while against Massachusetts is entered "None," as well as against other States in which the use of the Bible is favored.

---

[1] Wisdom and Knowledge the Nation's Stability. An address before the Euphonian Society, Wabash College, July 7, 1840.

Some allowance is to be made for the changes in the use of terms as the years go by. When all accept a dogma it is hardly sectarian, but when a community is divided in the acceptance of the same article of belief those who accept it or its opposite form a sect as related to their neighbors.

The Douay (Catholic) version of the Bible was judicially called sectarian in Nevada some years ago (State of Nevada *v.* Hallock, 16 Nevada, 373) and more recently came the Wisconsin decision that the King James version of the Bible was sectarian.

The discussions cited convey widely different impressions of the writers' views according to the sense in which they appear to have used terms that have come into the variable use indicated.

In the New Englander (Congregationalist), April, 1848, was an article contending for the common schools as against parochial schools advocated by Old-School Presbyterians. The author assumes that the common school is in accordance "with the comprehensive character of Christianity," but after a number of pages he says:

"IV. The preceding course of argument fully evinces the duty of good citizens to sustain the common schools rather than introduce the church schools, provided the varieties of religious belief in our communities do not render any safe and valuable system of instruction in the former impracticable.

"This brings us to the great, and, so far as appears, the only objection to the common-school system—the religious objection. * * *

"If the several religious denominations will act with an enlightened public spirit, * * * the practical difficulties will be found very few and small. * * * In common schools, schools under State and civil patronage, all religious denominations should stand on the same footing. * * * The opposite principle which has been so extensively adopted in the discussion of this subject, that in this country the State or civil power is Christian and Protestant, and therefore that schools sustained and directed in part thereby are Christian and Protestant, and that whoever attends them has no right to object to a rule requiring all to study Christian and Protestant books and doctrines, we wholly disbelieve and deny. The State, the civil power in whatever form in this country, is no more Protestant, or Christian, than it is Jewish or Mohammedan. It is of no religion whatever. * * *

"We fully admit, and, if necessary, would strenuously contend, that of a complete education the religious instruction and influence is an essential part, and far the most important part, and that it should be given in all the periods of a child's life. Any educational institution, therefore, which assumes for any considerable period the whole education and training of a child or youth * * * and yet gives no religious instruction and training, is justly said to give an irreligious and godless education. But to say the same of a day school which gives only secular instruction—instruction that does not discredit or interfere with, but prepares the way for, and indirectly aids, religion—during only four or six hours in the day, avowedly leaving religious instruction to other and better teachers, is palpably illogical and unfair.

"* * * There may be a division of labor, and secular teaching may be the exclusive department of the day school, while religious teaching is provided in other and better ways. * * *

"Very little jealousy has been encountered with regard to religious influence in the common schools of New England."

After stating that ministers are often on school boards, and usually find no difficulty on their visits to the schools in giving religious instruction approved by their judgment, the writer goes on to say: "If there should be districts, as probably there would be a few, in which the members of different religious denominations, not satisfied with the teaching of the common Christianity, should insist on the teaching of their distinctive doctrines, even so let it be. Let each scholar read or study his own Bible and his own catechism. The pupils might, if it should be thought most convenient and wise, when the time for religious instruction arrived,

be classified for this purpose." And, naming six denominations for possible separate classes, he adds: "And if there should be other varieties let them be classed accordingly."

This article was reprinted in the Common School Journal of Massachusetts and issued in pamphlet form for gratuitous distribution at the expense of a friend of New England common free schools.

NOTED PERIODS OF DISCUSSION OF RELIGIOUS EDUCATION.

In 1840 the effort of the Catholics to secure appropriations of public school money in the city of New York attracted some attention elsewhere, and there has been some continuous interest on the subjects of parochial schools and appropriations of public money for denominational schools. Two periods, however, are especially noticeable for general attention to these subjects. The first was that known for the so-called "Know-Nothing" movement, which had a distinctive existence long enough to elect some mayors of cities and some governors of States in the early fifties. The second period may be said to have begun about 1889, and it has not yet ended.

In 1854, M. J. Spalding, D. D. (Catholic), bishop of Louisville, discussing the subject of education, directed attention to the arrangement for separate schools existing in other countries:[1]

"In countries much less free than ours the common school system is so organized that Catholics and Protestants have separate schools. Austria, with all her alleged tyranny and with her triumphant Catholic majority of population, freely grants separate schools, supported out of the common fund, to the Protestant minority. England, with all her hereditary hatred of Catholicity, permits the Catholics to have their own separate schools; and this is not found to conflict in practice with her common-school system. Lower Canada, with its immense Catholic majority, freely concedes the privilege of separate schools to the small Protestant minority; and everyone who reads the public prints must be familiar with the controversy which is now carried on in Canada, and even in the Canadian Parliament, on the same equitable provision, extended, in all its privileges, to the Catholic minority of Upper Canada.[2] Strange that Catholics, when in power, should be so liberal in granting a privilege which a Protestant majority is so slow to concede!"

Under the title, "Shall our common schools be destroyed," Joseph P. Thompson, D. D., pastor of Broadway Tabernacle, New York City, delivered an argument against perverting the school fund to sectarian uses (1870). Dr. Thompson was one of the original editors of the (New York) Independent, established as an organ of Congregational polity. He cites Judge Cooley:

"Mr. Cooley (Constitutional Limitations, p. 469) enumerates the following things concerning religion as not lawful under any of our State constitutions:

"1. Any law respecting an establishment of religion. * * *

"2. Compulsory support by taxation, or otherwise, of religious instruction.

"3. Compulsory attendance upon religious worship.

"4. Restraints upon the free exercise of religion according to the dictates of conscience.

"5. Restraints upon the expression of religious belief."

He embodies in his address a letter which he had written at the request of Richard Cobden in 1853, and which had been published by order of the British House of Commons. It is a token of the reciprocal action of English thought, as represented in the home country and in other English-speaking nations.

Dr. Thompson severely condemned the attempt "to secure the aid of the State directly to the support of a particular sect," and to divide the school fund among sects.

---

[1] An address to the impartial public on the intolerant spirit of the times, p. 34.

[2] A law allowing separate schools was passed in 1863.—J. H. B.

"We have no right to force any to receive their religious teaching from the State, nor does the State become atheistic by refusing to teach religion. Religion must be taught in the family. It will be taught in the Church. It will be taught in the Sunday school. Christians for whom I speak are content with these modes of teaching religion. Shall they who are not content with such modes, or do not feel that these will satisfy them, compel us to pay for teaching their religion in some other way? That is the question! Let the Roman Catholic Church teach her tenets in these and other lawful ways, but not tax you to pay for it."

In January, 1887, an article in the New Princeton Review, "Religion in the public schools," by A. A. Hodge, D. D., insisted on religious instruction, advocating an agreement between Catholics and Protestants "with respect to a common basis of what is received as general Christianity * * * especially in the literature and teaching of our public schools. The difficulties lie in the mutual ignorance and prejudice of both parties, and fully as much on the side of Protestants as of the Catholics. Then let the system of public schools be confined to the branches of simply common-school education. Let these common schools be kept under the local control of the inhabitants of each district, so that the religious character of each school may conform in all variable accidents to the character of the majority of the inhabitants of each district. Let all centralizing tendencies be watchfully guarded against."

RECENT DISCUSSIONS.

National Educational Association.—There have been recent notable debates upon the subject of moral and religious teaching in the public schools. At the meeting of the National Educational Association, July, 1889, Cardinal Gibbons and Bishop Keane presented the Catholic view, Edwin D. Mead and John Jay, other views.

Cardinal Gibbons said: "It is not sufficient, therefore, to know how to read and write, to understand the rudiments of grammar and arithmetic. * * * We want our children to receive an education that will make them not only learned, but pious men. * * * We wish them to be not only men of the world, but, above all, men of God. * * * The religious and secular education of our children can not be divorced from each other without inflicting a fatal wound upon the soul. * * * The only efficient way to preserve the blessings of civil freedom within legitimate bounds is to inculcate on the mind of youth whilst at school the virtues of truth, justice, honesty, temperance, self-denial, and those other fundamental duties comprised in the Christian code of morals.

"The catechetical instructions given once a week in our Sunday schools, though productive of very beneficial results, are insufficient to supply the religious wants of our children. They should as far as possible breathe every day a healthy religious atmosphere in those schools in which not only is their mind enlightened, but the seeds of faith, piety, and sound morality are nourished and invigorated. This would be effected if the denominational system, such as obtains in Canada, were applied in our public schools.

"The combination of religious and secular education is easily accomplished in denominational schools. To what extent religion may be taught in the public schools without infringing the rights and wounding the conscience of some of the pupils is a grave problem, beset with difficulties and very hard to be solved, inasmuch as those schools are usually attended by children belonging to the various Christian denominations, by Jews also, and even by those who profess no religion whatever."

Bishop Keane said: "A distinguished orator of our day has truly declared that the civilization and prosperity of our country depend on its Christianity, and that its Christianity depends on education. But, alas, how illogically he concluded from these premises that therefore the welfare of our country was to be safeguarded by a system of education in which it is not permissible to teach Christianity. * * * Look now at the people of our country and we see them divided into two classes.

On the one side the Catholic church emphatically declares for Christian education, and with us side all those non-Catholics, whatever may be their denomination, who believe in Christian schools, and in them are giving their children an education, leavened and animated by Christianity as they understand it. Can anyone in his senses hesitate which of these two sides is for the real welfare of our country?"

Mr. Edwin D. Mead said: "Whenever, therefore, the parochial school or any school accompanies its demand for place in America by a petition for public money or remission of taxes, by any claim that is opposed to the integrity of the public school system, we may say very plainly that it has not proper place in America. * * *

"The Roman Catholic school, parochial or other, does properly have the same place in America (and this right must be firmly secured it) which the Episcopal school has, the Unitarian school, the Lutheran school, or any private school whatever—the right to open its doors, to make itself as attractive as it can, and to invite anybody it will. Like every other private school it must satisfy the standards of the State, but it has the same right as every other to resent all officious meddling. * * *

"I have confined myself to the Catholic parochial school because no other raises any serious problem in our society. * * *

"The public schools are the great moralizing institution in America to-day. This is shown by the simplest analysis of the discipline and essential methods of the schools—the training which they give in habits of punctuality, order, obedience, industry, courtesy, and respect for simple merit."

Mr. Jay deals with two points: (1) The exclusion of the Bible from the public schools; (2) the claim for public money for denominational schools. He speaks as if the Bible were generally used in the public schools, and quotes Judge Bennett, of Wisconsin, in the case of Weiss *v.* School Board of Edgerton, approvingly:[1] "But the Bible remains, and it would seem like turning a good, true, and ever faithful friend and counselor out of doors to exclude it from the public schools of the State. And I have been unable to find any authority in the decisions of the courts for so doing."

Mr. Jay sees the present public schools as Christian schools:

"The Puritans of New England appreciated the necessity of public schools, and that feeling was shared by the Huguenots and the Hollanders, by the Walloons from Flanders, the Vaudois and Waldenses from the Italian Alps, Protestants from Germany and Scandinavia, by the followers of Huss from Bohemia and Zwinglius from Switzerland, by the United Brethren, the Moravian Brothers, the Salzburg exiles, with Christian reformers of every race and tongue who had contended at home, even to the death, for the open Bible as the true standard of Christianity, and the only sure foundation of civil and religious freedom. Touching the instruction given in our American schools during the colonial period, the teaching of Christian ethics was from the first an essential feature. * * *

"The movement for religious liberty by separating church and state began, nearly simultaneouly, in New York, Virginia, and Pennsylvania soon after the Declaration of Independence; but in separating church and state they were careful not to separate Christianity from the common law. * * *

"The public school, if faithfully maintained, as established by our fathers, teaches not only the elements of education, but teaches personal responsibility, freedom of conscience and of thought, loyalty to American principles and constitutions, love of country, and duty to our fellow-men. * * *

"The aim of the parochial school is to form a subject of the Pope and not an independent citizen of the American Republic, and the character of the education is admirably fitted for this purpose. * * *

"As an American author who has studied the question well remarks: 'Roman

[1] The Supreme Court of Wisconsin in the appeal from the circuit court, where Judge Bennett presided, reversed his decision and granted a mandamus to exclude the Bible. This is more fully noticed elsewhere, p. 1647. — J. H. B.

Catholicism and modern civilization stand apart as the representatives of two distinct epochs in the world's history; not only are they unlike, they are absolutely antagonistic and irreconcilable; * * * what is life to one is death to the other.' * * *

"To allow each denomination to teach its own peculiar doctrines, and to receive its share of the public money * * * is converted into an act of inequality and unfairness to all other Christian denominations * * * by the fact that the Roman Pontiff claims as belonging to the Church of Rome, and subject to its teaching and discipline, all persons whomsoever who have been baptized no matter by whom the ceremony was performed. * * *

"Then comes the serious objection that the eminent cardinals and prelates of the Roman Catholic Church, who make this proposition to tax the people for the support of the parochial schools, * * * do not represent the great body of Roman Catholic laymen in this country."

Symposium in Public Opinion.—In a symposium, Public Opinion, July 13, 1889, Cardinal Gibbons furnishes his address delivered before the National Educational Association, already cited. Thomas Hill, D.D., LL.D., ex-president of Harvard University, insists that "religious instruction is, as the State of Massachusetts declares it to be, the first and most important end to be aimed at by all teachers of youth, whether in public or private schools. * * * Some men seem to have been dazed by claims of the Catholic Church upon the one side and of agnosticism on the other. * * * It is not required by justice to yield to these claims."

Minot J. Savage, D.D., says: "The public may be divided into two classes. First, there are those who sincerely believe that the eternal welfare of their children's souls depends on the teaching and acceptance of their particular kind of religion. Secondly, there are those who do not believe this. Now, in the case of those who do believe that the salvation of their children is at stake, there can not possibly be a more odious tyranny than that of compelling them to submit to a teaching that to their minds entails such unspeakably horrible consequences. 'Taxation without representation' is a trivial grievance compared with it. So far as this goes, therefore, my sympathies are entirely with the Romanist as against the teaching of any form of Protestantism in the schools. * * * If a Calvinistic father wants to teach his boy Calvinism, nobody questions his right to do it. But most certainly he has no right to take money out of my pocket (by a tax or in any other way) to do it with. And the same holds true of the Romanist, or the Jew, or the agnostic."

William T. Harris, LL.D., says: "It seems to me that religious instruction in the public schools is inexpedient on the ground that these schools are for all citizens, whatever their religious belief, or no belief, just as the public market, the public library, the municipal government, and the States are for all alike, whatever their creeds. The question is not in regard to boarding schools or asylums or reformatories. In those institutions the school takes up the functions of the family and should provide religious instruction, in my opinion. But in the case of the public school, which receives a child for only a few hours daily, the family and the church are left sufficient time for religion."

Illinois State Teachers' Association.—In December, 1890, a joint discussion occurred between Right Rev. J. L. Spalding (Catholic), bishop of Peoria, and George P. Brown, editor of the Public School Journal, before the Illinois State Teachers' Association. Bishop Spalding's address is not at hand, but his views can be seen in his books, especially in Means and Ends of Education, containing a chapter on the Scope of Public School Education, where he says:

"All true belief, when we come to the last analysis, is belief in God, and the teacher of religion must keep this fact always in view. * * * Public school education, to be education at all in any true sense, must be a training, discipline, development, and instruction of man's whole being, physical, intellectual, and moral.

"All these thinkers [Herbert Spencer, Montayne, Comenius, Milton, Locke, Herbart, Kant, Fichte] agree that the supreme end of education is spiritual or ethical. * * *

"The scope of public school education is to cooperate with the physical, social, and religious environment to form good and wise men and women. Unless we bear in mind that the school is but one of several educational agencies, we shall not form a right estimate of its office. It depends almost wholly for its success upon the kind of material furnished it by the home, the state, and the church; * * * hence the teacher's attitude toward the child should be that of sympathy with him in his love for his parents, his country, and his religion. * * * The fountain heads of his purest and noblest feelings are precisely his parents, his country, and his religion, and to tamper with them is to poison the wells whence he draws the water of life. * * *

"What the teacher is, not what he utters and inculcates, is the important thing. The life he lives, and whatever reveals that life to his pupils, his unconscious behavior, even, above all what in his inmost soul he hopes, believes, and loves, have far deeper and more potent influence than mere lessons can ever have. * * *

"The purpose of the public school is, or should be, not to form a mechanic or a specialist of any kind, but to form a true man or woman. Hence the number of things we teach the child is of small moment. Those schools, in fact, in which the greatest number of things are taught give, as a rule, the least education. * * *

"I am willing to assume and accept as a fact that our theological differences make it impossible to introduce the teaching of any religious creed into the public school. * * *

"The fact that religious instruction is excluded makes it all the more necessary that harmonizing and ethical aims should be kept constantly in view. * * *

"The Catholic view of the school question is as clearly defined as it is well known. It rests upon the general ground that man is created for a supernatural end and that the church is the divinely-appointed agency to help him attain his supreme destiny. If education is a training for completeness of life, its primary element is the religious, for complete life is life in God. * * *

"The atmosphere of religion is the natural medium for the development of character. * * * If the thinkers, from Plato and Aristotle to Kant and Pestalozzi, who have dealt with the problems of education, have held that virtue is its chief aim and end, shall we thrust from the school the one ideal character who, for nearly nineteen hundred years, has been the chief inspiration to righteousness and heroism? * * * Current American opinion assigns to them [the family and the church] the business of moral and religious education. But this implies that conduct and character are of secondary importance; it supposes that the child may be subject to opposite influences at home and in the school, and not thereby have his finer sense of truth and goodness deadened. * * *

"If the chief end of education is virtue; if conduct is three-fourths of life; if character is indispensable, while knowledge is only useful, then it follows that religion, which more than any other vital influence has power to create virtue, to inspire conduct, and to mold character, should enter into all the processes of education. We have done what it was easiest to do, not what it was best to do; and in this, as in other instances, churchmen have been willing to sacrifice the interest of the nation to the whims of a narrow and jealous temper. The denominational system of popular education is the right system. The secular system is a wrong system. The practical difficulties to be overcome that religious instruction may be given in the schools are relatively unimportant, and would be set aside if the people were thoroughly persuaded of its necessity."

The following is Mr. Brown's summary of his position:

"The doctrine of this paper is:

"(1) That the separation of the church from the state in the fundamental law of the land forbids the teaching of any theory and practice of religion in the State schools by order of the State.

"(2) That the teaching of religion in State schools will tend to work an injustice to individuals, for the reason that the church is divided into numerous churches because of differences among the people in respect to the theory of religion.

"(3) That it is better for both science and religion that they be taught by different teachers and in different places. The church furnishes the best environment for the teaching of religion. The theory of religion can not be understood by children, and the atmosphere of scientific teaching is unfavorable to the successful teaching of religious dogma.

"(4) The school is made no more godless by this exclusion of religious instruction than are nature and the secular institutions of man. And these are held to be not godless but god-full by any rational interpretation of Christianity.

"(5) The ultimate solution of this and all other school problems will be found in a more permanent, more devoted, more scholarly, and freer body of teachers, and in a more Catholic clergy, who shall join hands in working for both the temporal and the eternal welfare of the children, and shall see that nothing can be helpful to the one that is harmful to the other."

Minnesota.—In the closing months of 1889 a dispassionate correspondence occurred between Hon. D. L. Kiehle, LL. D., then superintendent of public instruction for the State of Minnesota, and Right Rev. James McGolrick (Catholic), bishop of Duluth. There were two letters by each, forming a pamphlet—The Public Schools and the Catholic Clergy.

The essential points of the correspondence were the following:

Hon. D. L. Kiehle wrote November 27:

"My Dear Sir: I feel bound to avail myself of your late patriotic utterance and expression of good will toward the public schools of Minnesota, and to ask that you express yourself with definiteness respecting the attitude of the priests of the Catholic Church toward the common schools of the State. * * * In discharging the duties of my office, devising ways and means for the improvement of common school education among the people, I have met obstacles of ignorance and prejudice in extended neighborhoods of our foreign population, which to this time show few or no signs of yielding. In these neighborhoods prevails not only a foreign language, but often an illiteracy, habits of intemperance, and lack of culture that disgrace our civilization. In our efforts to penetrate this obscurity, and to encourage good schools, we have frequently been opposed by the authority of priests, who, by reason of the circumstance that these people were in some cases Catholics, have seriously retarded their progress toward intelligence, and what else belongs to American citizenship. It is, therefore, with a view to a better information, and to secure all reasonable cooperation from yourself and those over whom you have authority, that I respectfully ask the following:

"First. Do you recognize it as the duty of American citizens of the Catholic faith to support the public school system in that spirit of loyalty with which they support other departments and institutions of the Government?

"Second. Have American citizens of the Catholic faith the right to exercise their independent judgment, and to send their children to the public school, when they are satisfied that it is in the best interest of their children?

"Third. Is it the position of the priests of the Catholic Church that American citizens of the Catholic faith sending their children to the public school without permission of the priests commit sin and forfeit their right to the sacraments of the church?"

Bishop McGolrick wrote November 30:

"My Dear Sir: * * * I am well aware that in dealing with our foreign-born population you have met with many disagreeable and foolish objections; but it is well to remember that they often come from countries where, both openly and under disguise, education was made the means of proselytism and an engine for the destruction of the faith. A great and powerful state church built up an edifice into

which they hoped to drive an unwilling people, and actually used the whole force of the state by fines, imprisonment, banishment, and even death, in the effort to turn poor, uneducated Catholics into enlightened Protestants. These faithful people were made to support a religion in which they did not believe, and every power in schools and colleges was directed to the undermining of their faith. * * *

"If you ask me, 'Ought Catholics to support a system of common free schools?' I would say without hesitation they ought to support and should be in favor of such free schools; but when you ask, 'Ought they support the present public school system?' I answer that there are certain obstacles in the way of conscientious Catholics availing themselves of these schools as at present constituted, and I trust you will give them kindly consideration.

"It is the duty of the state to foster and encourage education; but the parent is by divine right the natural educator. To the family belongs this highest mission, and the parent must not be ousted from this right, but assisted in his efforts to educate, that Government being best which interferes least. * * * Of course, the state could take due action in case of the criminal neglect of parents in the education of their children; it is the right and duty of the state to see that such education is given, but to form the good citizen this is the work of parent, religion, and school. * * *

"Then, the public school system under its present rules can not teach Christianity, for the Jewish children would be offended, and could justly protest. Neither can it teach morality, for morality must be founded on religion, and the state can not teach religion. There are those interested in the workings of the schools who propose a hybrid system of morals. * * * Such slipshod methods will not teach the child the controlling of strong passions. * * *

"To this [second] I answer, certainly; they can do so when they are satisfied it is for the best interest of their children. But 'interest' is a doubtful term. There are worldly interests and 'interests' of an eternal importance. With the explanation given above, as faithful children of the Catholic Church, they would not sacrifice the eternal interests of their children for any worldly interest, and so would not endanger willingly the faith of those so dear to them. * * *

"Answer [third]. 'The lips of the priest shall keep knowledge and they shall seek the law at his mouth.' The priest is the guardian of the sacraments, and if there be for his flock any proximate danger of sin they are bound to warn them and prevent, if possible, the danger. But it must be remembered that the priest is a member of a living church and that he can not, according to his whims and fancies, make laws; his business is to act according to the laws made by the church, and interpret and condemn as she interprets and condemns.

"From all this you can readily understand that while we rejoice at the spread of education, Catholics maintain that an additional element is wanting to complete the great work of forming good and true citizens, and this must somehow be supplied. In Canada, perhaps soon to be an integral portion of our great Republic, the difficulty is admirably solved.

"Notwithstanding the bitter opposition to the position of the Catholics, I have entire trust that this will pass away, and so fair-minded a people as the Americans in our liberty-loving Republic will find some way by which all can share in the common benefits of a thorough education under the fostering care of the state."

The establishment of parochial schools by Catholics engrossed attention so fully that it sometimes seemed as if they alone had an interest in controlling the religious training of their children. The occasional expression of Presbyterian authorities of the desirability of such schools passed unheeded, the rare establishment of parochial schools by a Protestant Episcopal Church was hardly recognized, and the people of the country at large scarcely knew that other bodies of Christian people not less in earnest than the Catholics were maintaining schools for the especial purpose of impressing their religious faith upon their children.

THE SO-CALLED BENNETT LAW.

The most striking incidents connected with recent popular attention to parochial schools occurred in Wisconsin. They were closely parallel in Illinois, and there was an eagerly expectant attitude in adjacent States.

The Catholics had strong parochial schools, and whatever the framers of new legislation might have intended, the popular support which their effort received was largely the continuation of the current feeling against a possible Catholic domination. To many people it came in the nature of a surprise that the law which they had indorsed bore heavily upon large bodies of most earnest Protestants.

It occurred in 1889 that a suit was instituted against a school board (City of Edgerton, No. 8) of Wisconsin to cause the discontinuance of Bible reading in its schools. The lower court refused the mandamus asked for, and the case at this stage was cited in national discussions[1] as establishing the use of the Bible in the public schools of the country. When the case reached the supreme court the decision of the lower court was reversed, and the reading of the Bible was decided to be unlawful on the ground that it was a sectarian book. The Catholics, part of them using the German language, and the Lutherans and Evangelicals, partly German in tongue, partly Norwegian and Swedish in speech, were busily teaching their religious convictions in schools of their own. At the time of the decision that King James's version of the Bible was a sectarian book, a zealous campaign was in progress to bring all children under English instruction in the common schools. A law was enacted known as the Bennett law, the essential provisions of which were as follows:

"*The people of the State of Wisconsin, represented in senate and assembly, do enact as follows:*

"SECTION 1. Every parent or other person having under his control a child between the ages of seven and fourteen years shall annually cause such child to attend some public or private day school in the city, town, or district in which he resides, for a period not less than twelve weeks in each year, which number of weeks shall be fixed prior to the first day of September in each year by the board of education or board of directors of the city, town, or district, and for a portion or portions thereof, to be so fixed by such boards, the attendance shall be consecutive, and such boards shall, at least ten days prior to the beginning of such period, publish the time or times of attendance in such manner as such boards shall direct; provided, that such boards shall not fix such compulsory period at more than twenty-four weeks in each year.

"SEC. 2. For every neglect of such duty the person having such control and so offending shall forfeit to the use of the public schools of such city, town, or district a sum not less three dollars nor more than twenty dollars, and failure for each week or portion of a week on the part of any such person to comply with the provisions of this act shall constitute a distinct offense; provided, that any such child shall be excused from attendance at school required by this act, by the board of education or school directors of the city, town, or district in which such child resides, upon its being shown to their satisfaction that the person so neglecting is not able to send such child to school, or that instruction has otherwise been given for a like period of time to such child in the elementary branches commonly taught in the public schools, or that such child has already acquired such elementary branches of learning, or that his physical or mental condition is such as to render attendance inexpedient or impracticable, and in all cases where such child shall be so excused the penalty herein provided shall not be incurred.

"SEC. 3. Any person having control of a child, who, with intent to evade the provisions of this act, shall make a wilful false statement concerning the age of such child or the time such child has attended school, shall for such offense forfeit a sum of not less than three dollars nor more than twenty dollars for the use of the public schools of such city, town, or district."

[1] For instance, John Jay before National Educational Association, elsewhere herein cited.

SEC. 4 provides that five days prior to prosecution under the act the board shall cause written notices to be served; and if on hearing of the prosecution the court is satisfied that the party has caused the child to attend as provided, in good faith and with intent to continue, the penalty shall not be incurred.

"SEC. 5. No school shall be regarded as a school under this act unless there shall be taught therein, as part of the elementary education of children, reading, writing, arithmetic, and United States history in the English language."

SEC. 6. Prosecution by the authority of and in the name of the school board, and all fines and penalties for the benefit of school moneys.

"SEC. 7. Jurisdiction to enforce the penalties herein described in this act is hereby conferred on justices of the peace and police magistrates within their respective counties."

SEC. 8 pertains to truancy.

SECS. 9-13 relate to employment of children under thirteen years of age, prohibiting it except under a permit from judge of county court.

"SEC. 14. This act shall take effect and be in force from and after its passage and publication.

"Approved April 18, 1889."

A law in Illinois of a similar character was nearly coincident with the above law. It will be convenient to treat the laws as essentially the same, without separate detail of minor circumstances, in the two States, but it will be well to point out the differences that existed in the laws themselves.

Section 1 of the Illinois law required attendance for at least sixteen weeks, eight of which were to be consecutive, at some public day school in the city, town, or district where the child resides, the time to begin with the opening of the first term of the school year or as soon as notice is served. Fine $1 to $20 and stand committed till costs are paid. The words of section 5, Wisconsin, are included in section 1, Illinois.

Sections 2, 3, Illinois, pertain to truancy.

Section 4, Illinois, resembles section 6, Wisconsin, but requires prosecution to be in the name of the State.

Section 5, Illinois, corresponds to section 7, Wisconsin, but adds "judges of the county court."

The Illinois law had no provisions regarding employment of young children; a subject treated in another law. It was approved May 24, 1889.

The opposition that at once made itself manifest was centered upon the Bennett law as it was called, of which the Illinois law was treated as a duplication. It was plain that there was an intention to secure similar legislation in adjacent States. The Lutherans were thoroughly roused. Various synods took action, and a mass of literature from a Protestant source was added to that which had been accumulating for over half a century almost wholly in discussion of the Roman Catholic view.

In June, 1889, the Lutheran Synod of Wisconsin adopted this declaration:

"We are not enemies of the public schools; we consider them and declare them to be a necessary institution. We are ever willing to pay our taxes for the support of the public schools. We are opposed to any and every grant of public school funds to private schools. But we insist upon enjoying the privilege of founding private schools with our own means, of regulating them and governing them, without external interference, according to our conviction and according to sound principles of pedagogy, for the sake of making our children loyal and good citizens. We therefore protest against the assertion which has been made by so many, and even by officers of the State, that our Lutheran Church is hostile to the public schools, and that our parochial schools are a standing menace to the public schools."

In a pamphlet entitled The Bennett Law and the German Protestant Parochial Schools of Wisconsin, Christ. Koerner cites cases of arbitrary ruling in Illinois where the power of approving a school was abused. In one case directors of three

districts are said to have approved a German Lutheran school which the directors of a fourth district refused to approve, and the father of a child attending from this last district was therefore fined.

As the law has ceased to have any interest except as a matter of history, with its lessons for the future, some of the objections that died with it may be passed over. There are some points that will have value till some kind of settlement is reached and accepted as to religious instruction or the use of the Bible in public schools.

Mr. Koerner quotes this provision of the constitution of Wisconsin: "The right of every man to worship Almighty God according to the dictates of his own conscience shall never be infringed, * * * nor shall any control of or interference with the rights of conscience be permitted, or any preference be given by law to any religious establishments or modes of worship."

He goes on to say: "With this constitutional provision the Bennett law, if enforced, will come into conflict. * * * Our children we hold, should, if possible, constantly be surrounded by a religious, a Christian atmosphere. Now in our public schools knowledge of God and Christ and love and fear of God are not taught, and can not be taught, for they are established for all children whose parents wish to make use of them. * * * In order, therefore, to give their children Christian instruction and training, very many German congregations in this State have established parochial day schools, which, as a rule, are well attended; we support these schools at a great expense because our conscience demands that we bring up our children in such manner, in a Christian school."

German Protestants of the city of Milwaukee, after affirming their loyalty to the public schools—

"*Resolved*, That as the Bennett law is in direct opposition to the personal liberty of conscience guaranteed us in the constitutions of the United States and of this State, we will oppose the same with all lawful means in our power and endeavor to have the same repealed.

"And as execution of this law, so far as we are concerned, is intrusted to our city officials, be it

"*Further resolved*, That we will use our influence at the coming city election and will vote for such candidates only as are opposed to the Bennett law."

The following platform was adopted by the anti-Bennett law State convention, held at Milwaukee June 4, 1890:

"I. We, citizens of Wisconsin, in convention assembled, in order to protest against the so-called Bennett law, in the first place consider it necessary to defend ourselves against false representations calculated to prejudice our cause, and do therefore declare:

"1. We are not enemies of the English language; on the contrary, we endeavor to furnish our children the very best instruction therein.

"2. We consider public schools necessary, but maintain that parents have the right to establish and select for themselves schools for their children.

"3. We claim no part of the public school fund for the use of parochial or other private schools.

"4. We are not opposed to a law prohibiting the employment of children in factories, nor to an enactment providing for reasonable compulsory attendance at school, nor do we object to an interference by the State with schools conducted contrary to the public order and morality.

"II. But we protest against the so-called Bennett law, because it unnecessarily and unjustly curtails our civil and religious liberty; for it—

"1. Offers the school boards an opportunity of determining arbitrarily that a child, during the period of enforced attendance, must attend a school in the city, town, or district to which it resides, thus depriving parents of the right to send their children to a better or more suitable school outside the district.

"2. It compels parochial and other private schools to observe the time or times

of attendance fixed by school boards, without regard to the rights and customs of churches or their schools.

"3. It prescribes certain studies as also the medium of instruction therein; furthermore, its wording is such as to afford school boards ample opportunity to usurp powers not given them, although the State and its officers have no right to interfere with the management of parochial and other private schools.

"III. We therefore declare that, regardless of former party affiliations, we shall vote for such candidates only as pledge themselves to work for the repeal of the Bennett law.

"IV. As patriotic citizens, maintaining human rights, both civil and religious, advocating sound principles of education, and with no enmity toward the English language, opposed, however, to all measures tending to oppress the immigrated citizens or to suppress their native tongue, we call upon all those who cherish liberty, regardless of party and nationality, to join us in the effort to have this unnecessary, unjust, and discord-breeding measure repealed."

A committee of the Illinois district of the Missouri Synod put forth a pamphlet of objections, among which were:

"The law is an infringement of the liberty of conscience guaranteed by the constitution of Illinois.

"The law interferes with the free exercise and enjoyment of religious profession and worship.

"The law denies to the defendant in suits under the law the right of a fair trial and defense against injustice and malice.

"The law establishes a dangerous precedent for future encroachments upon religious parental educational privileges.

"The law is responsible for a dangerous element introduced into politics; members of Christian churches are compelled to enter the arena of politics in the defense of their religious rights.

"The law * * * manifests an inimical spirit toward private and parochial schools."

The pamphlet incorporates an extract of a discourse delivered in Ohio in 1889 defining the Lutheran position upon parochial schools:

"Why is it that we Lutherans go to the trouble of erecting and maintaining parochial schools? * * *

"Let me say right here that we Lutherans are not bent upon opposing our public schools. We are aware that for many reasons our civil authorities are obliged to erect and maintain schools, and we are glad to see them take an interest in the education of our country's children so as to make them intelligent citizens. We know that a large number of our country's children would be left without any instruction whatever by their parents if our State authorities did not look to their education. For this reason we cheerfully and willingly pay our taxes for public institutions of learning. It is our desire that not a cent of these taxes be expended for sectarian purposes, but that every cent be used in the interest of the public and community at large. We seek to discourage all attempts that are being made to appropriate money from the public school fund for private and denominational schools. * * *

"Our parochial schools are institutions of learning, where the attending pupils receive an education in reading, writing, arithmetic, geography, history, and grammar, but in connection with these secular branches of knowledge they are daily instructed in the histories and doctrines of the Bible, so that on their dismissal from school they are thoroughly acquainted with the law and commandments of their God and the way unto salvation. And if I were asked to give a brief reply to the question why we Lutherans erect and maintain such schools, I should answer, Because we know it to be our sacred duty to give our children a thorough Christian education, and we are convinced that under present circumstances this duty may best be performed by means of congregational schools. * * *

"You will allow me to say a few words in regard to the prevailing Sunday-school system. * * * Common sense and experience tell that the Christian education which children derive by means of our Sunday schools must needs be very superficial. * * * We can not be satisfied with having our children instructed an hour a week in matters that pertain to the eternal salvation of their immortal souls. We are convinced, and this conviction of ours is based on experience, that if our children are to receive a thorough knowledge and lasting impression of the Bible, its divine truths and commandments, they are in need of daily religious instruction. The law of God will have to be called to their minds, explained to them, and brought home to their hearts by competent teachers day after day. And that is what we are aiming at in our parochial schools. In all discipline exercised in our schools we strive to make the word of God the governing element. And even the secular sciences taught in our schools are pervaded by a Christian spirit. That is what we, under present circumstances, deem the best if not the only correct method of bringing up our children in the nurture and admonition of the Lord; and that is the reason why we Lutherans make it a practice to establish, build, and maintain parochial schools."

The (Lutheran) Synod of Missouri, Ohio, and other States, in June, 1889, adopted the following statement:

"1. By the law of nature, as well as by Divine command, parents are entitled and in duty bound to provide for the education of their children.

"2. It is therefore the right and duty of all parents to select such schools for the education of their children as they are convinced will best promote the welfare of their children.

"3. In case parents neglect their duty the State is justified in compelling them, by appropriate legislation, to the discharge of their duty.

"4. If, however, the State assumes the right to educate, unless for such cause, it is an infringement of the natural right of parents.

"5. The conduct of the State in such case is, furthermore, unconstitutional, as the constitutions both of the United States and the State of Wisconsin proclaim liberty of conscience and religion, which liberty is set aside, not only by forcing upon anyone that which opposes his religion or is in conflict with his conscience, but also when a person is hampered in any manner in 'the free exercise of religion' and 'rights of conscience,' provided he does not act in open violation of law and morality.

"6. In view of the foregoing declarations we are compelled to combat with all lawful means in the courts such encroachments, and at the polls to withhold our vote from every candidate and party not publicly pledging themselves to do all in their power to bring about a repeal of the obnoxious sections of said [Bennett] law.

"7. To avoid all misunderstanding, we declare that we consider our public-school system a political necessity, and that we are willing to support it in the future as we have in the past. We are also convinced that by opposing said school laws we do not only contend for our inherent rights, but also best promote the true welfare of our free country. We finally declare most emphatically that it has always been and ever shall be our aim to provide in our parochial schools for the best instruction in the English language."

The outcome was that the Lutherans as well as the Catholics defended their position so earnestly that the party in power in each State was displaced and the obnoxious laws were quickly repealed.

The intense feeling prevalent during the existence of the Bennett law has in large measure passed away, but the secularization of public institutions has gone on at a rapid rate, so that many institutions, including State universities, that lately had devotional exercises, no longer have them as part of their programmes.

INCIDENTAL INFLUENCES.

Rulison v. Post.—In this contest of the middle northwest incidental occurrences have had a great weight. For example, a decision is quoted in the anti-Bennett law pamphlet to establish the freedom of parents and guardians to determine the extent to which they will render the provisions of a common-school education available to the children of their charge. The same case has been cited to show that parents may properly object to participation in devotional exercises in school. The case did not directly involve the Bible or religion. It is in 79 Illinois and is known as Rulison *v.* Post. A school board laid out a compulsory course of study. A young lady under directions from home declined to study bookkeeping, and was therefor expelled by the principal under instructions of the school board. Thereupon suit for damages was brought against the teacher in the name of the young lady. The decision in the lower court was in her favor, and on appeal to the supreme court damages were allowed under such instructions that any other subject—the Bible, for example—might be inserted for bookkeeping in the assertion of the parental right to select or reject studies from those provided.

The Illinois flag law.—A law known as the "flag law" became operative in Illinois without the governor's signature, June 26, 1895. This law prescribed that a national flag not less than 4 feet by 8 feet should be kept floating from 9 a. m. to 4 p. m. every day when the institution was in session over every building used for educational purposes in the State, public, sectarian, or private, under penalty of misdemeanor, finable from $3 to $10 and costs for every day of neglect. Some friends of parochial schools interpreted it as a new effort to worry them. By a singular course of circumstances the suit under which the law has just been declared unconstitutional was against the State University, which had a flag on its principal building, but did not have a flag on every building.

The stress of this law may be clearer by contrast with the Massachusetts flag law of March 27, 1895, which requires school committees "to provide for each schoolhouse in which public schools are maintained * * * a United States flag of silk or bunting not less than 4 feet in length * * * displayed on the schoolhouse grounds or schoolhouse buildings every school day, when the weather will permit, and on the inside of the schoolhouse on other school days." The Massachusetts law deals only with public schools, the minimum size of flag is but half as large as under the Illinois law, and the Massachusetts law allows some discretion as to hours and weather.

NATIONAL LEGISLATION.

The movement for the insertion of an explicit recognition of the Deity in the Constitution of the United States has been latterly obscured by efforts to remove all religious expression from official action. In 1876, Samuel T. Spear, D. D. (Presbyterian), gathered a series of his contributions to the (New York) Independent into a volume—Religion and the State, or the Bible and the Public Schools. In this volume he advocates the exclusion of the Bible from the common schools, and cites approvingly the amendment to the Constitution proposed by Hon. James G. Blaine in the House of Representatives that "No State shall make any law respecting an establishment of religion, or prohibiting the free exercise thereof; and no money raised by taxation in any State for the support of public schools, or derived from any public fund therefor, shall ever be under the control of any religious sect. Nor shall any money so raised ever be divided between religious sects or denominations."

President Grant in his message of December 7, 1875, had urged an amendment of similar tenor, as still earlier (1875) in a speech at Des Moines, Iowa, he said: "Keep the church and the state forever separate."

There are some who, like Horace Mann, consider church and state separated in the schools when the English Bible was read without note or comment. There are some who, like Samuel T. Spear, consider "the Protestant public school, in which King

James's version of the sacred Scriptures and religious exercises, Protestant in their type and tendency, are incorporated into its educational system 'unjust toward the Catholic, the Jew, the infidel, and indeed all who dissent from Protestantism.'"

Mr. Spear said: "The same method of reasoning is equally applicable to a Catholic public school, a Jewish public school, or any public school which is made the organ of religious instruction or worship in any form."

Horace Mann, as already stated, protested against being cited as opposed to the Bible in school, but both he and Dr. Spear, as well as Mr. Blaine and President Grant, are cited by those who would go to the length of abolishing all religious tests, oaths, Sunday laws, chaplaincies, and proclamations.

Mr. Blaine's proposition passed the House of Representatives August 14, 1876, by a vote of 180 to 7. In the Senate a clause was added stating that "This article shall not be construed to prohibit the reading of the Bible in any school or institution." On the article thus amended the vote was 28 to 16, showing that the majority of the Senate did not consider the Bible sectarian. This proposition failed for lack of a two-thirds vote.

In 1889 an effort was made to secure a similar amendment. The first section was almost identical with the first clause of the Blaine amendment, and yet the second section prescribed that "each State * * * shall establish * * * a system of free public schools for the education of all the children * * * in the common branches of knowledge, * * * and the principles of the Christian religion. But no money raised by taxation * * * shall ever be * * * given to the use or purposes of any school * * * whereby instruction * * * shall be given in the doctrines * * * peculiar to any sect, * * * religious in its character, nor shall such peculiar doctrines * * * be taught * * * in the public schools."

This proposed amendment was supported in hearings before the Senate Committee on Education and Labor, February 15 and February 22, 1889, by representatives of the National Reform Association, the Evangelical Alliance, and the Boston Committee of One Hundred.

It was opposed in the same hearings by mammoth petitions and by clergymen of the Seventh Day Baptists, one of whom cited the argument of Stanley Matthews, at the time (1889) a member of the Supreme Court of the United States, as attorney in the case of Minor et al. *v.* Cincinnati School Board et al. The Cincinnati school board resolved that the reading of the Bible at the opening of the schools should cease. As cited, Mr. Matthews said: "I do say that the reading of the Holy Bible in the manner repealed by this resolution is the teaching of a dogma in religion, held by only a portion of the religious community, objected to by a large part of the others. * * *

"Protestants have no rights, as such, which do not at the same time and to the same extent belong to Catholics, as such, to Jews and infidels too. * * * It is not a question of majorities against minorities, for if the conscience of the majority is to be the standard, then there is no such thing as right of conscience at all. It is against the predominance and power of majorities that the rights of conscience are protected and have need to be.

"If it be said that the Protestant conscience requires that the Bible be read by and to Protestant children, and that it is a denial of the right of conscience to forbid it, waiving at the present time the obvious and conclusive answer that no such right of conscience can require that the State shall provide out of the common taxes for its gratification, it is enough to say that Catholics then, too, have the same right to have their children taught religion according to their views, not out of the Douay Bible if they do not consider that sufficient, but by catechism and by celebration of the mass, if they choose to insist; that Jews have the same right to have their religion taught in the common schools, not from the English version of the Old Testament, but according to the practice of their synagogues, and infidels have the same right to have their children taught deism, or pantheism, or positivism."

The discussions in Congress and the action upon appropriations for Indian and negro schools maintained wholly or in part by national funds have latterly indicated a determination on the part of some to allow no appropriations which might aid an institution maintaining religious exercises, thus pushing the interpretation of sectarian to the utmost extreme reached in any local decision.

RECENT STATE CONSTITUTIONS.

The State constitutions recently formed or revised, as well as some older ones, have generally clauses forbidding sectarian instruction in public schools and any use of public school funds to aid institutions under sectarian control.

It will be observed that some forbid the use of any public funds for sectarian schools, as South Dakota, Idaho, Utah, New York, South Carolina; some require that any aided educational or charitable institution shall be wholly under the control of the State, as Montana and Wyoming; some shut out religious benevolent institutions from public funds, as South Carolina; some limit the prohibition to public school funds, as North Dakota, Kentucky, and Texas; Mississippi specifies that the limitations shall not be interpreted to exclude the Holy Bible; South Carolina expressly recognizes the Deity in the preamble; some forbid any religious tests or requirements to attend religious exercises, as Montana and Wyoming.

North Dakota.—The constitution of North Dakota, November 2, 1889, Article VIII, section 147, provides: "A high degree of intelligence, patriotism, integrity, and morality on the part of every voter in a government by the people being necessary in order to insure the continuance of that government and the prosperity and happiness of the people, the legislative assembly shall make provision for a system of public schools * * * free from sectarian control." Section 149 says: "In all schools instruction shall be given, as far as practicable, in those branches of knowledge that tend to impress upon the mind the vital importance of truthfulness, temperance, purity, public spirit, and respect for honest labor of every kind." In section 152 occurs the prohibition: "No money raised for the support of the public schools of the State shall be appropriated or used for the support of any sectarian school."

South Dakota.—The constitution of South Dakota, November 2, 1889, provides in Article VIII, section 1: "The stability of a republican government depending on the morality and intelligence of the people, it shall be the duty of the legislature to establish * * * a * * * system of public schools." Section 16 provides that: "No appropriation of lands, money, or other property or credits to aid any sectarian school shall ever be made by the State, or any county or municipality within the State, * * * and no sectarian instruction shall be allowed in any school or institution aided or supported by the State."

Montana.—The constitution of Montana, November 8, 1889, provides in Article V, section 35: "No appropriation shall be made for charitable, industrial, or benevolent purposes to any person, corporation, or community not under the absolute control of the State, nor to any denomination or sectarian institution or association." Article XI, section 8, reiterates the same idea in more definite terms. Section 9 provides that: "No religious or partisan qualifications shall ever be required of any person as a condition of admission into any public educational institution of the State, either as teacher or student, nor shall attendance be required at any religious service whatever, nor shall any sectarian tenets be taught in any public educational institution of the State."

Washington.—The constitution of Washington, November 11, 1889, provides, Article IX, section 4: "All schools maintained or supported wholly or in part by the public funds shall be forever free from sectarian control or influence."

Idaho.—The constitution of Idaho, July 3, 1890, provides, Article IX, for public free schools: "The stability of a republican form of government depending mainly upon the intelligence of the people;" and provides, section 5, that: "Neither the legislature nor any county, city, town, township, school district, or other public

corporation shall ever make any appropriation, or pay from any public fund or money whatever, anything in aid of any church or sectarian or religious society, or for any sectarian or religious purpose, or to help support or sustain any school, academy, seminary, college, university, or other literary or scientific institution controlled by any church or sectarian or religious denomination whatsoever; nor shall any grant or donation of land, money, or other personal property ever be made by the State, or any such public corporation, to any church or for any sectarian or religious purpose."

Wyoming.—The constitution of Wyoming, July 10, 1890, provides, Article I, section 19: "No money of the State shall ever be given or appropriated to any sectarian or religious society or institution." Article III, section 36, says: "No appropriation shall be made for charitable, industrial, educational, or benevolent purposes to any person, corporation, or community not under the absolute control of the State, nor to any denominational or sectarian institution or association." Article VII, section 12, prescribes that: "No sectarian instruction, qualification, or tests shall be imparted, exacted, applied, or in any way tolerated in the schools of any grade or character controlled by the State, nor shall attendance be required at any religious service therein, nor shall any sectarian tenets or doctrines be taught or favored in any public school or institution that may be established under this constitution."

Mississippi.—The constitution of Mississippi, November 1, 1890, provides, Article III, section 18, that: "No religious test as a qualification for office shall be required, and no preference shall be given by law to any religious sect or mode of worship; but the free enjoyment of all religious sentiments and the different modes of worship shall be held sacred. The rights hereby secured shall not be construed * * * to exclude the Holy Bible from use in any public school of this State." Article VIII, section 208, provides that: "No religious or other sect or sects shall ever control any part of the school or other educational funds of this State, nor shall any funds be appropriated toward the support of any sectarian school, or to any school that at the time of receiving such appropriations is not conducted as a free school."

Kentucky.—The constitution of Kentucky, April 11, 1891, provides in section 197: "No portion of any fund or tax now existing, or that may hereafter be raised or levied for educational purposes, shall be appropriated to, or used by, or in aid of, any church, sectarian or denominational school."

Texas.—The constitution of Texas as amended September 22, 1891, Article VII, section 5, provides that: "No law shall ever be enacted appropriating any part of the permanent or available school fund to any other purpose whatever, nor shall the same or any part thereof ever be appropriated to or used for the support of any sectarian schools."

New York.—The constitution of New York, September 28, 1894, Article IX, section 4, provides: "Neither the State nor any subdivision thereof shall use its property or credit, or any public money, or authorize or permit either to be used, directly or indirectly, in aid or maintenance, other than for examination or inspection, of any school or institution of learning, wholly or in part under the control or direction of any religious denomination, or in which any denominational tenet or doctrine is taught."

Utah.—The constitution of Utah, November 5, 1895, provides: "Article X, section 12: Neither religious nor partisan test or qualification shall be required of any person as a condition of admission as teacher or student into any public educational institution of the State. Section 13: Neither the legislature nor the county, city, town, school district, or other public corporation shall make any appropriation to aid in the support of any school, seminary, academy, college, university, or other institution controlled in whole or in part by any church, sect, or denomination whatever."

South Carolina.—The present constitution of the State of South Carolina, ratified December 4, 1895, has the following preamble:

"We, the people of the State of South Carolina in convention assembled, grateful to God for our liberties, do ordain and establish this constitution for the preservation and perpetuation of the same."

Article I, section 4, provides, "The general assembly shall make no law respecting an establishment of religion or prohibiting the free exercise thereof."

Article XI, section 9, provides, "The property or credit of the State of South Carolina or of any county, city, town, township, school district, or other subdivision of the said State, or any public money, from whatever source derived, shall not by gift, donation, loan, contract, appropriation, or otherwise, be used directly or indirectly, in aid or maintenance of any college, school, hospital, orphan house, or other institution, society, or organization of whatever kind which is wholly or in part under the direction or control of any church or of any religious or sectarian denomination, society, or organization."

TENDENCY TOWARD SECULARIZATION.

Reading the Bible daily without note or comment is required by State law in Massachusetts for the public schools. It is practiced to a greater or less extent throughout New England. The Bible has no standing in the schools of the State of New York except by common consent in each locality. It is used in a multitude of schools like dots over the country, but after leaving New England there is no considerable area where its use can be said to be uniform. This condition has come about as much by indifference as by opposition. The Bible was displaced from the public schools of Cincinnati through a contest that attracted national attention. In that contest many people expressed themselves warmly against its rejection at Cincinnati who had not observed its disuse at the schools attended by their own children.

There has been a change in public sentiment gradually growing toward complete secularization of the Government and its institutions. In the original predominance of Protestant views based on King James's version of the Bible and the inbred idea of a state church, the religious expression was expected in public affairs, but in the growth of population of miscellaneous views it dawns upon men's minds that a majority vote may oppress a respectable minority of which they find themselves a part. Secularization of the schools is accepted or urged by many devout people who deem that safer than to trust others with the interpretation of the laws of conscience.

Early immigrants coming for religious motives established schools with a religious character, and recent devout immigrants, finding no religious instruction in the public schools corresponding to that in their native lands, have been zealous for their own elementary schools to make good what they regard essential. Native and foreign born citizens desiring religious instruction for their children claim to be more and more compelled, in the secularization of public institutions, to build up institutions of their own for conscience' sake.

In 1891 Rev. W. B. Williams thus summed up the legal relations of religious teaching in public schools:[1]

"We may then regard these points as settled:

"1. The State has no legal right to erect a chapel for the religious exercises of the students in State institutions.

"2. Regents and school boards have no legal right to appropriate rooms in public school buildings for the use of students' Christian associations.

"3. No State, except South Carolina, can ever employ any teacher to give religious instruction.[2]

"4. No teacher can be discharged on account of atheistical or skeptical views.

---

[1] The duty of the State to meet every educational want of its citizens. Rev. W. B. Williams, of Charlotte, Mich., pp. 18–20.

[2] This exception was made before the last revision of the constitution of South Carolina.—J. H. B.

"5. Hence Jews, Catholics, atheists, and agnostics can be employed as teachers in all our public schools and State institutions.

"6. The supreme court of Ohio decided that school boards are not transcending their authority in prohibiting the reading of the Bible and holding religious exercises in the public schools.

"7. Courts are unanimously of the opinion that children can not be compelled to attend religious exercises contrary to the written request of their parents or guardians.

"8. Courts decide that pupils can be compelled to bring a written request to this effect from parents or guardians as a condition of being excused.

"9. If they do attend they can be compelled to lay aside their books and maintain decorum.

"10. Courts are divided in opinion as to whether school boards can authorize Bible reading and prayer in the schools during school hours. In New York no portion of school hours can be so used if objection is made to it. In Massachusetts, Iowa, Maine, and Illinois their supreme courts hold that school boards may require the school to be opened with religious exercises. The courts in Kent County, Mich., and Mercer County, Pa., refused an injunction to restrain the teachers from reading the Scriptures and having religious exercises in school hours. According to New York decisions, teachers may be allowed to have religious exercises in schoolrooms before and after school hours in the presence of such pupils as may attend in accordance with their own wishes or the wishes of their parents.

"The supreme court of Illinois allows these exercises to be held out of school hours in accordance with the Catholic ritual. The supreme court of Maine justifies the board in excluding a pupil from the schools for refusing to use King James's translation of the Bible as a reading book.

"11. In Wisconsin the supreme court orders the reading of the Bible in the public schools to cease, on the ground that it is a sectarian book.

"12. The laws of Iowa and Illinois prohibit the exclusion of the Bible from the public schools, and the constitution of Mississippi is not to be construed as excluding it."

"The law of New Jersey permits the reading of the Bible and repeating the Lord's Prayer, but at the same time forbids any other religious service, ceremony, or forms whatsoever.

"While the law of Massachusetts requires that some portion of the Bible shall be read daily in every school, it distinctly specifies that it shall be 'without written note or oral comment.' The teacher may not add a word to explain a word or enforce a moral. It is clear that even in those States where the reading of the Bible is permitted and required it is hedged in by so many limitations and restrictions imposed by the laws, decisions of courts, and action of school boards, that we must despair of ever using our public schools as the agents for the diffusion of Christianity and conclude that whatever religious exercises are tolerated in the schools are there in most of the States merely by sufferance and liable at any time to be driven out.

"When we see that the secularization of our public schools is steadily going on and can not be prevented, then we must shape all our educational interests with reference to that."

In 1894 the same writer notes the rapid secularization of the public educational institutions to be accepted as a fitting thing:[1]

"The Prussian system as Americanized was adapted to a republican government without a state church, hence no provision was made in it for any religious instruction. * * *

"The normal and high schools, the agricultural colleges and State universities, as well as the common schools, started out with all the religious momentum that had

[1] Christian and Secular Education. Presbyterian Board of Aid for Colleges and Academies.

been accumulated in the Christian colleges and academies by the usages of two hundred years. * * *

"In 1890, an article published in the Andover Review indicated that the religious influence of State institutions was hardly second to that of the colleges founded for religious motives.

"By the decisions of courts, the action of school boards, the pressure of circumstances and the indifference of teachers, little by little, year after year, step by step, with never a backward step, Bible reading, prayer, and religious instruction are disappearing from our public schools and State institutions of every grade. Thus our system of State education is being crowded into the place assigned to it by the Constitution and the laws. * * * The State has made ample provision for secular instruction, none for religious."

LOCAL ADJUSTMENT OF THE RELIGIOUS QUESTION.

It can not be too strongly stated: (1) That public schools in the United States are not a national system, but a group of systems so far as the word system is fitly used; (2) that each State has its own peculiarities of social life, constitutional organization, legal enactment, and local administration; (3) that in the ultimate decision of the conduct of a public school the wishes of the people of the local unit of territory which maintains it will determine what shall be allowed or forbidden, especially as a complainant strange to the spot would have small interest and less power to interfere even if something not rigidly legal were introduced into the exercises by common consent. One community will have no dealings with the sects, another will welcome their aid in public education. Especially when a whole district, town, or county is populated by people of kindred opinions their schools will take on such form of religious or social opinion as suits the taxpayers, with no closely drawn line between legal and desirable. So it occurs that even in States where it is of doubtful legality there are districts with sectarian exercises, and there are many others where open contracts are made with religious persons or bodies for their work in education.

Savannah, Ga.—The people of Savannah, Ga., have incorporated the Catholic schools into the city system, satisfactorily to that community, as shown below.

PETITION OF THE CATHOLICS.[1]

"*To the Mayor and City Council of Savannah:*

"We, the undersigned Catholics, residing in the city of Savannah, lay before your honorable body an humble and respectful petition, which we trust will not be set aside. Forming a large portion of the population of the city, as appears from the report of interments in Laurel Grove and Cathedral Cemetery, we have organized schools, which are in the highest sense poor schools and free schools, and the scholars are so numerous that the public schools supported by the city could not physically accommodate them. We have done so because we believe it is far the better plan to teach children the elements of literature and science under the influence and shelter of the religion which they profess, as has always been done in time past, and we would consider it an infringement of the true liberty of conscience if we were obliged to subject our children to the influence of a religion which they do not profess, or of no religion at all. We therefore submit to your honorable body to consider whether it is proper to make us pay taxes for schools which we do not patronize, and whether it would not be better, in accordance with equity and genuine liberality, to divide the fund allotted for free schools, in the proportion of the free scholars found in each school."

(Signed by Bishop Verot, Rev. C. C. Prendergast, and also by a large number of others of the clergy and laity of the Roman Catholic Church in Savannah.)

[1]Report of the board of public education for the city of Savannah, Ga., and the county of Chatham to the mayor and aldermen of the city of Savannah, upon the petition of the Roman Catholics of Savannah for a division of the public school fund; submitted December 9, 1868.

The following is from the Thirtieth Annual Report of the Public Schools of the city of Savannah, Ga., and county of Chatham, for the year ending June 30, 1895:

"In 1869 the trustees of Chatham Academy granted to the board, free of rent, two rooms in the eastern part of the building. In 1870 it further gave the use of the entire eastern and central part of the building at the nominal rental of $1 a year. In 1886 the trustees, having purchased from the Union Society its property, then known as the Pavilion Hotel, for $50,000, offered to put the entire structure in perfect condition and give the use of it to the board of education for ten years at a rent of $1 per year, provided the board would pay over to the trustees $10,000 to aid the latter in the improvements of the building. The board assented to these terms and the lease will expire in October, 1896.

"Previous to the year 1870 two large parochial schools were maintained in the city by the authorities of the Roman Catholic Church. The support of these schools became a burden upon the Catholic population and induced Bishop Verot to apply to the city council, by which the public schools were at that time maintained, for a division of the school fund. This communication elicited much discussion in the council and was subsequently referred to the board of education.

"After many conferences between the board and the authorities of the Catholic schools a 'plan of union' was agreed upon, by and under which the two systems would be operated by the board of public education. This plan is fully set forth in the Sixth Annual Report of the Superintendent. As a part of the plan the two buildings known as the Cathedral and St. Patrick's schools passed under the control of the board of education free of rent. If, at any time, either party to the compact becomes dissatisfied it can withdraw by giving notice of three months. The board has had the free use of these two buildings for twenty-five years."

The plan referred to is as follows:

"PLAN.

"1. The Catholic schools shall be received under the control of the board of education.

"2. Catholic teachers shall be preferred for these schools when such as are qualified can be obtained.

"3. The text-books used in these schools shall be the same as are used in the other public schools, except books on history, which may be such as are commonly used in Catholic schools.

"4. These schools shall be opened with reading the Scriptures and the Lord's Prayer. Such versions of Scripture may be used as the teacher may prefer.

"5. The school building shall be under the control of the board of education.

"6. The trustees of the Catholic school buildings shall have power to withdraw them from the board of education at the end of any school year, whenever they are dissatisfied with the arrangement, provided that they shall give three months' notice of such withdrawal.

"7. In case of such withdrawal the board of education may remove all apparatus, books, movable fixtures, and furniture which they may have furnished for these schools.

"8. The board of education shall have full control of the discipline, instruction, and general management of these schools, the same as of the other schools under their care, including also the length of sessions, the arrangement of school, courses of study, work, and duties, and all the interests of the schools.

"9. The teachers of these schools will be expected to attend the meetings of the normal class the same as teachers of other public schools. They will give respectful attention to the suggestions and instructions of the superintendent, and are expected to exert themselves to carry out his views in the management and instruction of their schools.

"10. The holidays shall be such as are usually given in Catholic schools."[1]

[1] Sixth Annual Report of the Public Schools for the city of Savannah, Ga., and county of Chatham, for the year 1870–71.

New Haven, Conn.—In New Haven, Conn., there are Catholic schools within the public-school system.

By a vote of the board of education pupils detained from school on account of the Catholic holy days Feast of All Saints and Feast of Ascension, and the Jewish holy days New Year, Day of Atonement, Day of Tabernacle, Feast of Passover, and Feast of Weeks, are to be regarded as excusable for their absences, and are not required to make up lessons lost because of such absence. The committee on schools instruct teachers that children detained from school on account of the above-named holy days shall be reported as perfect in attendance during the year, if not absent or tardy at any other time; that a credit of recitations shall be given to each child so absent equal to the average credit of each study during the week. Pupils may be admitted on each of the days named above before 10 o'clock a. m. without being marked as tardy; provided they bring satisfactory notice from their parents that they have been detained by religious services.[1]

New Decatur, Ala.—Absence for religious exercises is freely granted in a city of Alabama:

"When the pupil is absent on account of church requirements * * * such absence shall not count against the pupil in perfect attendance; provided such pupil brings from the parent or guardian a written request to the teacher on the day preceding such church service."[2]

It is probable that almost any practice known in the schools of foreign countries can be found in limited use somewhere in the United States, notwithstanding the frequent statement regarding the impracticability of measures proposed for adoption.

CATECHETICAL CLASSES.

There are some religious bodies that gather the children at stated times for religious instruction, preparatory to confirmation, without organizing schools for the purpose. For instance, the Evangelical Association reports 556 catechetical classes and 6,270 catechumens,[3] but the association has no parochial schools. The classes reported are distributed approximately as follows:

Evangelical Association.

State.	Catechetical classes.	Catechumens.	State.	Catechetical classes.	Catechumens.
United States	556	6,270	Iowa	35	368
			Minnesota	97	1,184
New York	13	606	North Dakota	27	220
New Jersey	4	50	South Dakota		
Pennsylvania	21	580	Nebraska	34	333
Maryland	10	112	Kansas	30	462
Indiana	17	274	Texas	5	41
Michigan	16	240	Oregon	7	92
Illinois	54	738	California	3	45
Wisconsin	150	1,087			

The Reformed Church in America (Dutch in origin) has a small number of parochial schools, as indicated by the returns of the Eleventh Census (1890), used in the table for parochial schools (page 1664). The church deems catechetical instruction highly important, but finds a decadence of such instruction in the English-speaking churches.[4]

[1] Report, New Haven, 1894.

[2] Third Annual Report, Public Schools, New Decatur, Ala., 1892.

[3] Christian Family Almanac, Cleveland, Ohio, 1896.

[4] Acts and proceedings of the Eighty-ninth Regular Session of the General Synod of the Reformed Church in America, June, 1895.

There are 346 churches reported by names of church and pastor that have catechetical classes, with 35,734 catechumens, distributed as follows:

Reformed Church in America.

State.	Classes.	Catechumens.	State.	Classes.	Catechumens.
United States	346	35,734	South Dakota	12	434
			Nebraska	3	287
New York	125	12,654	Pennsylvania	2	139
New Jersey	84	10,886	Minnesota	3	126
Michigan	50	5,293	Kansas	2	92
Iowa	32	2,554	Indiana	2	58
Illinois	17	1,964	Ohio	1	40
Wisconsin	13	1,207			

A glance at the list will show the strength of the denominational catechetical classes geographically. It reaches over New York and Kansas as extreme eastern and western limits, with the greatest force in New York and New Jersey, but adding considerable figures to those otherwise reported as under formal religious instruction in the central Northwest.

In response to inquiry regarding parochial schools and catechetical instruction in the denomination, the stated clerk of the General Synod of the Reformed Church in the United States, writes:

"During the triennial term embracing the statistics of 1893, 1894, and 1895, no less than 33,646 were received into communion with the church by the rite of confirmation. The increase above the previous term embracing the years 1890, 1891, 1892, was 1,254.

"Those received by confirmation usually receive catechetical instruction once and twice a week for a period of five to six months, during the fall and winter season. In many of the congregations of the Reformed Church there are junior and senior classes. Those in the junior classes frequently attend instruction during two and three terms. Among many of our churches parochial schools are maintained, but none of the reports coming from the various synods give any data by which the number of pupils in attendance might be obtained."

The Evangelical Association has in late years become two denominations. One retains the old name and claims about 110,000 members, with catechetical classes as shown above. The second has taken the name of the United Evangelical Church and claims about 55,000 communicants. The discipline of the United Evangelical Church provides that wherever practicable the preachers in charge of congregations are to organize catechetical classes. The authorized statistical blanks contain the items, "How many catechetical classes?" and "How many catechumens?" The catechetical classes are strictly and solely for religious instruction in which the catechism of Biblical and doctrinal instruction is designed to be the text-book. Closely related as the two churches are by recent identity and long history, the United Evangelical Church reports no catechetical classes, which is thus explained by a prominent officer of the church:

"I suppose that the omission of catechetical classes from the statistics is occasioned by the fact that there are no classes to report, or that there are so few that the showing would be insignificant."

STATISTICS OF PAROCHIAL SCHOOLS.

The Roman Catholics, the Evangelical Lutherans, the German Evangelical Synod of North America, the Protestant Episcopalians, and the Holland Christian Reformed Church in North America report in their yearbooks the number of pupils in their parochial schools.

Roman Catholic.—The Roman Catholics report (Sadlier, New York; Hoffmans, Milwaukee) 3,361 parishes with schools. Most dioceses give parochial pupils distinctly, but certain dioceses, especially those in Texas, combine parochial pupils with those in academies. As most of the academies are reported individually, it is possible to separate the two classes of pupils to a considerable extent. The totals here given will be found to vary from the totals that included both academies and parochial pupils, for the cause just cited, but the present figures are believed to have a less error than would result from retaining academic pupils where reported in an item combined with parochial pupils. In round numbers, the parochial pupils approach 800,000.

Evangelical Lutheran.—The Evangelical Lutherans report 3,079 parochial schools, 2,926 teachers, and a little more than 200,000 pupils. The number in Hauge's Norwegian Synod was not reported. The Lutherans publish their returns by synods, which do not have geographical limits. The Lutheran churches in a given State, county, or city may belong to several synods. The column for Evangelical Lutheran pupils in the principal table is only a general approximation to the relation of numbers in each State, distributed in the proportions indicated by returns of the Eleventh Census (1890). The largest proportion of error is likely to be made in the States of smallest numbers, where the establishment or discontinuance of a single school would have a great proportionate effect. The authoritative returns by synods given in the following table[1] can be scanned by anyone who feels competent to derive better State totals from them:

[1] The table is mainly from the Church Almanac, 1896, Lutheran Bookstore, Philadelphia; for certain synods, from Evangelical Lutheran Almanac, Joint Synod of Ohio and other States, 1896, Columbus, Ohio. Some synods did not fully report through either.

German Evangelical.—The German Evangelical Synod of North America reports (Evangelischer Kalender, 1896, St. Louis, Mo.) 410 schools, 115 teachers, 385 pastors who conduct schools, and 17,911 pupils. These, like the Lutheran pupils, have been distributed for the State table by comparison with the Eleventh Census (1890), and are liable to the same error of distribution as the Lutheran figures, but they are not likely to mislead one who aims to get a clear outline of their principal locations.

Protestant Episcopal.—The Protestant Episcopal Church (American Church Almanac and Yearbook, 1896) reports 336 teachers and 6,860 pupils with their geographical distribution.

Holland Christian Reformed.—The Holland Christian Reformed Church in North America (Jaarboeckje ten dienste der Holl. Christelijke Gereformeerde Kerk in Noord Amerika, 1896) reports by name each congregation with a school, the teachers in charge, and the number of pupils. There are 17 schools and 2,229 pupils.

Moravian.—The Moravians, as indicated near the beginning of this statement, have a very old parochial school at Bethlehem, Pa., now grown to cover all primary and secondary departments. The pupils are reported in the table of academic and secondary schools in the reports of the Bureau of Education. Bishop J. M. Levering, under date of July 21, 1896, says: "The school at Bethlehem is the only parochial school maintained by the Moravian Church in the United States except a boys' school at Salem, N. C. * * * In making this statement I leave out of account a few little schools maintained during part of each winter in certain German country parishes in the West, the attendance at which all figures in the public school enrollment."

Mennonites.—A letter from Kansas dated August 31, 1896, says:

"The Mennonites of Kansas have no schools that are intended to supplant the public schools. In every Mennonite congregation, however, there is one or more summer schools for children. In these schools German is the language taught. In these schools, too, religious training is made prominent. The German Mennonite teachers of Kansas have formed an association which makes it a point to secure statistics of all the German schools among the Mennonites of Kansas."

Reformed Church in America.—The board of education of the Reformed Church in America has a small fund which it uses for the aid of parochial schools, but it has no report from unaided schools. During the past year the board has aided 6 schools, of which 2 have become self-supporting. There are 4 of the 6 in New York, with about 128 scholars, and 2 in New Jersey, with about 150 scholars, as stated by the secretary of the board.

For the German Presbyterians, the Reformed Church in America, of Dutch antecedents, the Reformed Church in the United States, of German antecedents, the Mennonites, the Reformed Episcopal, and the United German Evangelical, the latest full returns at hand are those of the Eleventh Census, which are here utilized.

There are a few scattered parochial schools among other denominations, especially those having a German membership, but they are for the most part small and temporary in their character.

The following table represents very closely the number of children in parochial schools in the United States:

Pupils in parochial schools.

States and Territories.	Total reported.	Roman Catholic. (a)	Evangelical Lutheran. a	German Evangelical Synod of North America. b	Protestant Episcopal.	Holland Christian Reformed.	Reformed Church in the United States. c	All others.

Nebraska	123	78		45			
Kansas	469			469			

a Eleventh Census, 1890. *b* See p. 1663.

A glance at the tables will show the general location of any group of parochial schools. Northern New England and, generally, the South have few parochial schools. The Roman Catholics have some parochial schools in nearly every State, are strong in southern New England, relatively strong in Maryland, Kentucky, and Louisiana, of the South, and California, of the West, and from Kansas eastward to the Atlantic Ocean.

Lutherans and other German and Scandinavian organizations are weak in New England and in the South, but are relatively strong in the States between New England and the Rocky Mountains.

The Holland Christian Reformed Church has considerable local strength in southwestern Michigan.

In the country as a whole the parochial schools report an enrollment about 7 per cent as great as the public common schools; in the North Atlantic Division, about 11 per cent; in the North Central, just below 10 per cent; below 2 per cent in either South Division; about 4 per cent in the Western Division. The Lutherans and kindred denominations have a multitude of small rural schools often in the vacations of public schools which the children also attend. The Catholics have many large schools of a permanent character in cities.

It is not easy to determine how many of the children counted as parochial pupils are also returned in the enrollment for public schools. In the North Central Division, especially, there are many parochial schools that last but a few weeks in a year. A careful canvass was made of German Protestant parochial schools in Wisconsin in 1890 by Mr. Christ. Koerner. He endeavored to determine how many of the pupils were also enrolled in the public schools. The returns were in general terms, and could not be reduced to numerical accuracy. Some schools reported that all the pupils attended public schools, others that half or more did so, a few that none attended, and a few that all attended before or after confirmation. The number of pupils distinctly reported as not attending public schools was very small.

There are a few cities where schools still reported as parochial in the Catholic yearbooks are also reported as public schools. The situation at Savannah, Ga., has been herein explained. The conditions are similar at Augusta, giving in this State a duplication of at least 1,324 counted in both public schools and parochial schools. A kindred case occurs in New Haven, Conn., producing a duplication of some

905. Public schools under Catholic control, enrolling small numbers, have existed within recent years in several States, but the conditions are often transient, constantly liable to change, so that a report of such union true in a given year has ceased to be true when investigated at a later date.

It appears that a majority of the pupils in the German Protestant parochial schools are at some time in the year enrolled in public schools. There is a known duplication of Catholic children as parochial pupils and public-school pupils at points named above (Savannah and Augusta, Ga., and New Haven, Conn.). It seems reasonable to suppose that about 500,000 are in parochial schools who are not enrolled during the year in public schools.

There are about 350,000 enrolled in denominational schools of higher forms, but those in academies, colleges, and seminaries are generally reached in the reports for private schools.

PURPOSES OF PAROCHIAL SCHOOLS.

There is a general accord among all denominations and sects as to the necessity of religious instruction, but there is not such general accord as to elementary religious instruction by each parish or church. Each of the great denominations has its board of education or some corresponding organization to impress the needs of its schools, especially secondary and higher, upon the people, but the specific attachment of an elementary school of an emphatically religious type to each congregation is a policy almost limited in practice to Roman Catholics and to Lutheran and other reformed groups derived from central and northern Europe, but theoretically valued by Episcopal, Presbyterian, and other bodies. Even the small denominations consider it urgent to maintain schools of their own wherever they can.

Moravians.—The Moravians are of relatively small numbers, not much known by the nation at large, but they have a remarkable record for devotion and for earnestness regarding education.

"The Moravian Church has always insisted upon special attention to the Christian education of the young, and therefore not only provides many religious services particularly for the children, but also regards its school work as second to no other branch of activity in its claim upon intelligent, prayerful interest, faithful consecrated effort, and cheerful, adequate support.[1]

"The Moravian parochial school of Bethlehem, Pa., owes its origin to the principle that education, whether under church, state, or private control, should be conducted in subordination to religion. Its management subscribes the proposition that Christian education consists not so much in imparting knowledge as in drawing out the grace of God for the work of life. Church members recognize the fact that knowledge is power, but a power for good only when pursued in the fear of God."[2]

Friends.—The following utterance of Friends, with variations of detail, would be indorsed in almost any denomination:

"We believe the duty to be incumbent upon Friends, as a religious body, to provide means for the liberal education of all their children, under circumstances favorable to the maintenance of our religious principles and testimonies. By our discipline, children whose parents are members are themselves members by birthright. The discipline also recognizes the care and concern for them by propounding these two familiar queries: 'Are Friends careful to educate their children in plainness of speech, deportment, and apparel; to guard them against reading pernicious books and from corrupt conversation?' And 'Do they place their children for tuition under the care of suitable teachers in membership with us?' * * * Does not the implied obligation of parents to place their children at the kind of school indicated by the query demand of us to have such schools, as far as practicable, within the reach of all our members?"[3]

---

[1] Report of the Moravian Congregation of Bethlehem, Pa., 1895.

[2] Catalogue, 1895.

[3] Address of some members of the Society of Friends, Baltimore, Philadelphia, and New York Yearly Meetings, 1861.

Presbyterians.—The Presbyterians maintain many academies, colleges, and theological seminaries, and there are Presbyterians who desire parochial schools, but, as expressed in a pamphlet, Denominational Education, in 1854, in language still applicable, "the sentiment of the church is very far from being united in favor of those measures."

Protestant Episcopal.—The following is the utterance of a national Protestant Episcopal convention (1871):

"The first educator is the parent, the mother, the father, to whom this duty is assigned by divine appointment. * * * A Christian education must begin at home. * * *

"Parochial schools are an important agency in the work of Christian education. And where they are practicable and can be rendered efficient, especially in those parts of the country where the common schools are deficient in number or in thoroughness of training, they should be heartily sustained. But they can only in a very limited degree supply the place of the public schools of the country. * * *

"The attitude which we should maintain toward the common schools of the country has engaged the attention of your committee. We feel that we ought to give to those schools our cordial support. * * *

"But while churchmen lend a firm support to the common schools from the dictates at once of patriotism and religion, they should unite their influence to secure in them as large a measure of religious instruction as may be expedient and attainable."[1]

The following Protestant Episcopal utterance comes close to a Catholic view as to distribution of public money:

"Protestants, according to their fundamental principle, are pledged to show the utmost liberty to all in the exercise of their religious tendencies, and we therefore conclude that the allowing any communion of Christians to educate their own children in their own schools, supported by an equitable proportion of their school tax, is no compromise of the boasted principle of American Protestantism.

"Your committee think that ultimately this plan may be adopted, not in opposition to, or in substitution for our free school system, but as supplemental to it, and so allaying irritation, securing religious education, and doing no violence to the freedom of conscience guaranteed by the Constitution.

"But such an arrangement is impracticable, and perhaps impossible, at this time. The convictions of the great majority are opposed, for the great majority have not yet learned to concede that minorities have rights even in matters of conscience."[2]

Roman Catholics.—The latest comprehensive authoritative statement of the position of the Roman Catholic Church in the United States upon the subject of education makes no explicit reference to a division of funds, but deals almost entirely with the duty of the church or its members toward the schools. It is as follows:

FOR THE SETTLING OF THE SCHOOL QUESTION AND THE GIVING OF RELIGIOUS EDUCATION.

The Most Rev. Francis Satolli, Archbishop of Lepanto, Delegate of the Apostolic See to the United States of America, to the archbishops assembled in New York:

I. All care must be taken to erect Catholic schools, to enlarge and improve those already established, and to make them equal to the public schools in teaching and in discipline. (Conc. Plen. Balt. III, No. 197, p. 101.)

II. When there is no Catholic school at all, or when the one that is available is little fitted for giving the children an education in keeping with their condition, then the public schools may be attended with a safe conscience, the danger of perversion being rendered remote by opportune remedial and precautionary measures,

[1] Committee on Education, General Convention, Protestant Episcopal, 1871.

[2] Christian Education, a report to the Ninetieth Annual Convention of the Diocese of New Jersey, 1873.

a matter that is to be left to the conscience and judgment of the ordinaries. (Ibid., No. 198, p. 103.)

III. We enact and command that no one shall be allowed to teach in a parochial school who has not proven his fitness for the position by previous examination. No priest shall have the right to employ any teacher, male or female, in his school without a certificate of ability or diploma from the diocesan board of examiners. (Ibid., No. 203, p. 108.)

IV. Normal schools, as they are called, are to be established where they are wanting and are evidently necessary. (Ibid., No. 205, p. 110.)

V. We strictly forbid anyone, whether bishop or priest,—and this is the express prohibition of the Sovereign Pontiff through the Sacred Congregation,—either by act or by threat, to exclude from the sacraments as unworthy, parents [who choose to send their children to the public schools]. As regards the children themselves, this enactment applies with still greater force. (Ibid., No. 198, p. 104; Conf., Tit. VI, Cap. I, II; Tit. VII.)

VI. To the Catholic Church belongs the duty and the divine right of teaching alnations to believe the truth of the Gospel, and to observe whatsoever Christ comlmanded (Matth., xxviii, 19); in her likewise is vested the divine right of instructing the young in so far as theirs is the Kingdom of Heaven (Mark, x, 14) (Conf. Conc. Balt. Pl. III., No. 194); that is to say, she holds for herself the right of teaching the truths of faith and the law of morals in order to bring up youth in the habits of a Christian life. Hence, absolutely and universally speaking, there is no repugnance in their learning the first elements and the higher branches of the arts and the natural sciences in public schools controlled by the state, whose office it is to provide, maintain, and protect everything by which its citizens are formed to moral goodness, while they live peaceably together, with a sufficiency of temporal goods, under laws promulgated by civil authority.

For the rest, the provisions of the council of Baltimore are yet in force, and, in a general way, will remain so; to wit: "Not only out of our paternal love do we exhort Catholic parents, but we command them, by all the authority we possess, to procure a truly Christian and Catholic education for the beloved offspring given them of God, born again in baptism unto Christ and destined for Heaven, to shield and secure them throughout childhood and youth from the dangers of a merely wordly education, and therefore to send them to parochial or other truly Catholic schools." United with this duty are the rights of parents, which no civil law or authority can violate or weaken.

VII. The Catholic Church in general, and especially the Holy See, far from condemning or treating with indifference the public schools, desires rather that, by the joint action of civil and ecclesiastical authorities, there should be public schools in every State, according as the circumstances of the people require, for the cultivation of the useful arts and natural sciences; but the Catholic Church shrinks from those features of public schools which are opposed to the truths of Christianity and to morality; and since, in the interest of society itself, these objectionable features are removable, therefore, not only the bishops, but the citizens at large should labor to remove them, in virtue of their own right and in the cause of morality.

VIII. It is long since the Holy See, after consultation with the bishops of the United States of America, decreed that parish schools and other institutions under the direction of the bishops, each according to the conditions of its own diocese, were opportune and necessary for Catholic youth, from the fact that it was held for certain that the public schools bore within themselves a proximate danger to faith and morals for various reasons (Conc. Pl. Balt. III., No. 194, seq.; App., p. 279); viz, because in the public schools a purely secular education is given—inasmuch as it excludes all teaching of religion—because teachers are chosen indiscriminately from every sect, and no law prevents them from working the ruin of youth—so that they are at liberty to instill errors and the germs of vice in tender minds. Likewise,

certain corruption seemed to impend from the fact that in these schools, or at least in many of them, children of both sexes are brought together for their lessons in the same room.

Wherefore, if it be clear that in a given locality, owing to the wiser dispositions of public authorities, or the watchful prudence of school board, teachers, and parents, the above-named dangers to faith and morals disappear, then it is lawful for Catholic parents to send their children to these schools, to acquire the elements of letters and arts, provided the parents themselves do not neglect their most serious duty, and the pastors of souls put forth every effort to instruct the children and train them in all that pertains to Catholic worship and life.

IX. It is left to the judgment and the wisdom of the ordinaries to decide whether, in a certain part of their respective dioceses, a parochial school can be built and kept up in a fitting condition, not inferior to the public schools, taking into consideration the temporal condition of the parents, while graver needs for procuring their spiritual welfare and the decent support of the Church are pressing. It will be well, therefore, as was the wont of our forefathers, and as was done in the early days of the Church, to establish weekly classes of catechism, which all the children of the parish should attend; for the better success of this measure let the zeal of pastors in fulfilling their duty and the love of Catholic parents leave no effort unspared. (Cf. Conc. Pl. Balt. III., No. 198.)

X. No reproach, either in public or in private, shall be cast upon Catholic parents who send their children to private schools or to academies where a better education is given under the direction of religious or of approved and Catholic persons. If they make sufficient provision for the religious training of their children, let them be free to secure in other ways that education which the position of their family requires.

XI. It is greatly to be desired, and will be a most happy arrangement, if the bishop agree with the civil authorities or with the members of the school board, to conduct the school with mutual attention and due consideration for their respective rights.

While there are teachers of any description for the secular branches, who are legally inhibited from offending Catholic religion and morality, let the right and duty of the Church obtain of teaching the children catechism, in order to remove danger to their faith and morals from any quarter whatsoever.

It seems well to quote here the words of our Holy Father, Leo XIII (see the Pope's letter to the archbishop of New York and to the bishops of the province): "We further desire you to strive earnestly that the various local authorities, firmly convinced that nothing is more conducive to the welfare of the commonwealth than religion, should by wise legislation provide that the system of education which is maintained at the public expense, and to which, therefore, Catholics also contribute their share, be in no way prejudicial to their conscience or religion. For we are persuaded that even your fellow-citizens who differ from us in belief, with their characteristic intelligence and prudence, will readily set aside all suspicions and all views unfavorable to the Catholic Church, and willingly acknowledge her merit, as the one that dispelled the darkness of paganism by the light of the Gospel and created a new society distinguished by the luster of Christian virtues and by the cultivation of all that refines. We do not think that anyone there, after looking into these things clearly, will let Catholic parents be forced to erect and support schools which they can not use for the instruction of their children."

XII. As for those Catholic children that in great numbers are educated in the public schools, where now, not without danger, they receive no religious instruction at all, strenuous efforts should be made not to leave them without sufficient and seasonable instruction in Catholic faith and practice. We know by experience that not all our Catholic children are found in our Catholic schools. Statistics show that hundreds of thousands of Catholic children in the United States of America attend schools which are under the control of State boards, and in which, for that

reason, teachers of every denomination are engaged. Beyond all doubt the one thing necessary, i. e., religious and moral education according to Catholic principles, is not to be treated either lightly or with delay, but on the contrary with all earnestness and energy.

The adoption of one of three plans is recommended, the choice to be made according to local circumstances in the different States and various personal relations.

The first consists in an agreement between the bishop and the members of the school board, whereby they, in a spirit of fairness and good will, allow the Catholic children to be assembled during free time and taught the catechism; it would also be of the greatest advantage if this plan were not confined to the primary schools, but were extended likewise to the high schools and colleges, in the form of a free lecture.

The second: To have a catechism class outside the public-school building, and also classes of higher Christian doctrine, where, at fixed times, the Catholic children would assemble with diligence and pleasure, induced thereto by the authority of their parents, the persuasion of their pastors, and the hope of praise and rewards.

The third plan does not seem at first sight so suitable, but is bound up more intimately with the duty of both parents and pastors. Pastors should unceasingly urge upon parents that most important duty, imposed both by natural and by divine law, of bringing up their children in sound morality and Catholic faith. Besides, the instruction of children appertains to the very essence of the pastoral charge; let the pastor of souls say to them with the Apostle: "My little children, of whom I am in labor again until Christ be formed in you." (Gal., iv., 19.) Let him have classes of children in the parish such as have been established in Rome and many other places, and even in churches in this country, with very happy results.

Nor let him, with little prudence, show less love for the children that attend the public schools than for those that attend the parochial; on the contrary, stronger marks of loving solicitude are to be shown them; the Sunday school and the hour for catechism should be devoted to them in a special manner. And to cultivate this field, let the pastor call to his aid other priests, religious, and even suitable members of the laity, in order that what is supremely necessary be wanting to no child.

XIII. For the standing and growth of Catholic schools, it seems that care should be taken that the teachers prove themselves qualified, not only by previous examination before the diocesan board and by certificate or diploma received from it, but also by having a teacher's diploma from the school board of the State, awarded after successful examination. This is urged, first, so as not to appear regardless, without reason, of what public authority requires for teaching. Secondly, a better opinion of Catholic schools will be created. Thirdly, greater assurance will be given to parents that in Catholic schools there is no deficiency to render them inferior to public schools; that, on the contrary, everything is done to make Catholic schools equal to public schools, or even superior. Fourthly, and lastly, we think that this plan would prepare the way for the State to see, along with the recognized and tested fitness of the teachers, that the laws are observed in all matters pertaining to the arts and sciences, to method and pedagogics, and to whatever is ordinarily required to promote the stability and usefulness of the schools.

XIV. It is necessary that what are called normal schools should reach such efficiency in preparing teachers of letters, arts, and sciences, that their graduates shall not fail to obtain the diploma of the State. For the sake of the Catholic cause, let there be among laymen a growing rivalry to take the diploma and doctorate, so that, possessed of the knowledge and qualifications requisite for teaching, they may compete for and honorably obtain positions in the public gymnasia, lyceums, and scientific institutions.

The knowledge of truth of every kind, straightforward justice united with charity, the effulgence and appreciation of the liberal arts—these are the bulwarks of the church.

All the above was read and considered in the meeting of the archbishops, the difficulties answered, and the requisite alterations made, November 17, 1892.

STANDARDS OF TEACHING.

The people of the United States have sought models for teaching in Germany and Scandinavia. Lutheran and Evangelical Germans and Scandinavians, interested in religious instruction, which we have dropped from public institutions, have established here a number of teachers' seminaries, besides nearly 30 theological seminaries, and about 45 colleges. This indicates their purpose to maintain a high standard of teaching.

The Roman Catholics have a great range of institutions from university to primary school, including teachers' seminaries. There are several brotherhoods and sisterhoods devoted to teaching, best known of which is probably the Brothers of the Christian Schools, with a long established professional reputation. As indicated in the document just cited, those in control expect the teachers to be capable of passing the examinations required of teachers in the public schools, that no comparisons of scholarly and professional equipment may be to the disadvantage of schools established with the religious motive.

CHAPTER XLI.

EIGHTY YEARS OF THE PUBLIC SCHOOLS OF WASHINGTON—1805 TO 1885.[1]

By J. Ormond Wilson, —
Formerly Superintendent of Public Schools, District of Columbia.

The limits of a paper to be read before this society will allow me to present to you only an outline sketch of the origin and development of the public school system of this city, including some important references and statements that may be of use to the future historian. As a matter of convenience, I have to some extent used the term "Washington" as synonymous with "District of Columbia," and in doing so have only anticipated the near future when they will become identical. Of the four independent systems of public schools originally established in the District of Columbia, that for the white schools of the city of Washington was the oldest and always the leading one; the others starting later copied it as closely as circumstances permitted, and therefore had so many points of resemblance that for the purposes of this paper it has not been deemed necessary to trace each from its origin down to the time when all were merged in one common system. The first eighty years of the public schools may be divided into three distinctive periods, which I have designated by the characterizing terms "initial," "transitional," and "developmental."

SOURCES OF INFORMATION.

1. The original record of the proceedings of the board of trustees of public schools from 1805 to 1818, now in the Force Collection, Library of Congress. Through the courtesy of Librarian Spofford I had a copy of this record made and placed on file in the office of the superintendent of schools.

2. No official record of the proceedings of the board of trustees from 1819 to 1844 has been found. The files of the National Intelligencer, accessible in the Library of Congress, and the acts of the city council and of the Congress during that period, are the chief sources of information.

3. The published annual reports of the board of trustees of public schools from 1845 to 1885. The series for each year is not complete. The reports from 1880 to 1884 were prepared with the usual care and labor, but the District authorities failed to provide for their publication. The twenty-second annual report for the school year 1865–66, prepared by Mr. William J. Rhees, is of special interest, containing "A compendium of the laws and resolutions of the city council of Washington relative to public schools from 1804 to 1867, chronologically arranged," "List of trustees from 1845 to 1866," and much other interesting historical material. The report for 1874–75 is also exceptionally valuable, as it was prepared with reference to the public school exhibit made at the Philadelphia Exposition of 1876, and contains brief histories of the public schools of the city of Washington, organized in 1805; the city of Georgetown, organized in 1810; the county, as the part of the District of Columbia outside of Washington and Georgetown was designated, organized in

[1] Read before the Columbia Historical Society of Washington, D. C., May 4 1896.

1864; and the colored schools of Washington and Georgetown, organized in 1864—the four independent systems of schools as originally established in the District of Columbia. These monographs were all written with intelligence and fidelity and as a labor of love by persons well qualified for their respective tasks; the first two by Mr. Samuel Yorke At Lee, the third by the Rev. Claudius B. Smith, and the fourth by the Superintendent of colored schools, Mr. George F. T. Cook.

4. Special Report of the United States Commissioner of Education on the Condition and Improvement of Public Schools in the District of Columbia, 1868.

5. The minutes of the board of trustees which have been published in recent years, to be found sometimes in connection with the annual reports and sometimes as separate documents.

6. The acts of the city council, the District legislature, and the Congress, and the orders of the District Commissioners relating to the schools.

7. The files of the Evening Star and other city newspapers published from time to time.

THE INITIAL PERIOD—1805 TO 1845.

Neither the framers of the Constitution nor the earlier Congresses contemplated the exercise of exclusive municipal legislation for the District of Columbia directly by the Congress, and hence as early as practicable after the removal of the seat of Government here the Congress ordained a municipal government for the city of Washington, and in 1804 by an amendment to its charter provided "for the establishment and superintendence of schools." On the 5th of December of the same year the city council passed an act "to establish and endow a permanent institution for the education of youth in the city of Washington," which provided for a board of 13 trustees, 7 to be elected by the joint ballots of the two chambers of the council and 6 to be chosen by individuals contributing to the promotion of the schools as provided for in said act. For the support of the schools the act appropriated so much of the net proceeds of the taxes on slaves and dogs and licenses for carriages and hacks, ordinaries and taverns, retailing wines and spirituous liquors, billiard tables, theatrical and other amusements, hawkers and peddlers, as the trustees might decide to be necessary for the education of the poor of the city, not to exceed the sum of $1,500 per annum. The act also provided for the appointment of a select committee of 3 councilmen, whose duty it should be to solicit or provide for soliciting, both at home and abroad, contributions in money or lots for the benefit of the schools. One of the largest contributions was that of $200, made by Thomas Jefferson.

It may be stated at the outset that the colored children of the District of Columbia were not included among the beneficiaries of the public schools in any legislation, either by the Congress or the city council, prior to the abolition of slavery in 1862.

The first board of trustees consisted of Thomas Jefferson, Thomas Monroe, Gabriel Duvall, Thomas Tingey, Joseph Brombey, John Tayloe, Robert Brent, William Brent, Samuel H. Smith, William Cranch, George Blagden, John Dempsie, and Nicholas King.

They met in the Supreme Court room, United States Capitol, August 5, 1805, and were called to order by Robert Brent. Thomas Jefferson, then President of the United States, was elected president of the board, and accepted the office in a letter dated Monticello, August 14, 1805, but was prevented from ever discharging its duties by "others of paramount obligation."

At a little later date the Rev. William Matthews, better known as Father Matthews, became a member of the board, and was most zealous and active in the cause of public schools for many years.

A very comprehensive report, setting forth in detail the plan of the entire educational system from an academy to a university, was prepared by a select committee and adopted September 19, 1805.

Mr. Jefferson's early and liberal contribution in money and his accepting and holding the offices of trustee and president of the board of trustees of public schools so

long as he resided here show his personal interest in their establishment, and the fact that he had several years earlier proposed a quite similar plan of education for the State of Virginia, and a few years later, in 1817, vigorously renewed his proposal, makes a strong probability that he himself was the chief author of the first plan of public education adopted for the city of Washington.

In their plan the board of trustees said:

"The academy shall consist of as many schools as circumstances may require, to be limited at present to two, one of which shall be situated east of the Capitol and within half a mile of it, and the other within half a mile of the President's house, it being understood that these positions are considered by the board as temporary, and consequently subject at any future time to alteration.

"In these schools poor children shall be taught reading, writing, grammar, arithmetic, and such branches of the mathematics as may qualify them for the professions they are intended to follow; and they shall receive such other instruction as is given to pay pupils, as the board may from time to time direct; and pay pupils shall, besides, be instructed in geography and in the Latin language. The schools shall be open each day, Sundays excepted, eight hours in summer and six hours in winter, to be distributed throughout the day as shall be fixed by the board, except during vacation, which shall not commence prior to the 1st of August nor continue after the 10th of September, and whose duration shall be fixed by the board."

A circular letter issued with the view of obtaining contributions for the erection of the college said:

"He who with the promise of success aspires to that eminence which shall qualify him for rendering service to his fellow men, must, in his early years, receive an education exempt from local prejudice and narrow views; and without derogating from the respect deservedly cherished for State institutions, it may be confidently affirmed that no place in the Union is so well fitted for this purpose as the city of Washington. The reluctance naturally felt by a parent to send a son from his own to a remote State whose institutions, manners, and habits perhaps widely differ will in a great degree, if not altogether, be inapplicable to a seminary not established in subservience to State views, and the professors in which will, as it is probable, be drawn from various States of the Union.

"There is another consideration which can not fail to entitle such an institution to the decided preference of a large portion of citizens. The parent who sends his son to Washington will find for him, in his Representative to Congress, a guardian and a friend who, during a large part of the year, will be his associate, will observe his progress in his studies, superintend his morals, and perceive the real condition and character of the seminary, and thus be able from time to time to satisfy parental inquiry and solicitude."

In this old record we catch a most refreshing glimpse of the typical Congressman at the dawn of this century.

There were two prominent features of this school system as originally devised for the city of Washington:

First. It was in some points of view very ambitious. There was to be a so-called academy, under which term was included what are now generally designated primary, grammar, and high schools, or elementary and secondary schools, a college and a university, each with functions similar to those of like institutions at the present day, and a public city library. Only the most elementary part of the academy was established at first; the college and the university have come into existence with but little governmental aid, and the public library is still on the list of things prayed for. The children of the poor alone were to receive tuition free of expense even in the lowest grade of schools, and their period of attendance at times was limited to a term of two years. The price of tuition to other pupils was fixed at $5 a quarter.

Second. The founders of this school system appear to have thought it neither right nor expedient directly to tax the general property of the municipality for the education

of even poor children, and they made their scant appropriations for this object out of the revenues derived from taxes on specialties and licenses, most of which were in the nature of a specific tariff on social evils. They probably considered themselves warranted at least in applying the homeopathic principle of similia similibus curantur, curing a social evil with a social evil.

Between 1812 and 1828 fourteen joint resolutions authorizing and regulating lotteries for the benefit of the public schools were passed by the Congress. A portion of the revenues derived from this source was invested in corporation or other safe stocks and designated the "school fund." The interest on these stocks was for many years applied to the support of the schools.

This school fund, created for the most elementary education of "pauper pupils," existed intact when in 1874 a government of the District by the Congress superseded all local autonomy, and when in 1878 that body began to make specific appropriations for the schools without reference to the school fund. In 1880 it amounted to about $80,000. The Congress at that time was averse to making any direct appropriation for a much-needed high-school building, but when attention was called to the existence of such a fund it was induced to authorize its application to this object by an act approved March 3, 1881; and so the first high-school building came into being. The public-school forefathers would probably be somewhat surprised if they should return to the city and behold their long-cherished fund for the education of "pauper children" transmuted into the concrete form of the imposing edifice now known as the Central High School Building, located on O street between Sixth and Seventh streets NW.

> There's a divinity that shapes our ends,
> Rough-hew them how we will.

The board adopted an elaborate code of rules for the government of the academy, among which was the following:

"Every scholar on entering the school shall take off his hat and bow to the preceptor."

Girls do not appear to have been in the minds of these rule makers, and, in fact, the education of girls, especially of the humbler classes, was then considered of small account.

A western school and an eastern school were established, and the first teacher to commence work, January, 1806, was Richard White, principal teacher of the western school, whose salary was to be $500 per annum. It will be noticed that at even that early day the west end was taking the lead. Poor Richard White! Prototype of many a successor! We find him, October 1, 1807, tendering his resignation, accompanied by a prayer in vain for pecuniary assistance to enable him to remove himself and family from Washington.

On October 27, 1806, the board authorized the erection of the first two schoolhouses, to be located on lots owned by the United States, the use of which for this purpose had been granted by President Jefferson. These schoolhouses might have been modeled after Noah's Ark, for we are told that they were built of wood, 1 story high, 50 feet long, 20 feet wide, and cost together $1,589.41.

The western schoolhouse appears to have been located on lot 27, square 127, now occupied by the sumptuous residence of Mr. Anthony Pollock, No. 1700 I street NW. This lot, containing about 2,600 square feet, was purchased by the corporation from the United States Government—Sam Lane, commissioner of public buildings—in 1821 for $100; the money was applied to the building of an iron fence to inclose the park around the Capitol. The corporation, John P. Van Ness, mayor, sold the lot with the improvements, in 1832, for $309.

In 1811 Mr. Robert Ould was sent out from England by Mr. Lancaster to take charge of a Lancasterian school established in Georgetown. He was the father of Robert Ould, esq., who, graduating from the Columbian College, became a prominent lawyer, United States attorney for the District of Columbia under President

Buchanan; then, going South at the beginning of the civil war, the Confederate assistant secretary of war and agent for the exchange of prisoners. The fame of this school reached the ears of the Washington school authorities, who in 1812 established a similar school in this city and, on the recommendation of Mr. Lancaster, brought over from England Mr. Henry Ould, a brother of the Georgetown teacher, and placed him in charge of the Washington school.

In 1813 Mr. Henry Ould made the first report of a Washington public school of which we have any record. It read as follows:

"FEBRUARY 10, 1813.

"This day twelve months ago I had the pleasure of opening under your auspices the second genuine Lancasterian school in America. The system was set in operation (as far as the nature of the room would admit) in this city on the 10th of February, 1812, in an inconvenient house opposite the general post-office; but notwithstanding the smallness of the schoolroom, there were 120 scholars entered on the list during the first three months. I was then under the necessity of delaying the admission of scholars, as the room would not accommodate more than 80 to 100 scholars. It now becomes my duty to lay before you an account of the improvement of the scholars placed under my direction in your institution, which I shall do in the following order:

"*Of numbers.*—One hundred and thirty scholars have been admitted into your institution since the 10th of February, 1812—viz, 82 males and 48 females—out of which number 2 have died and 37 left the school for various employments, after passing through several grades of the school, which therefore leaves 91 on the list.

"*Progress in reading and spelling.*—Fifty-five have learned to read in the Old and New Testaments, and are all able to spell words of three, four, and five syllables; 26 are now learning to read Dr. Watts's hymns and spell words of two syllables; 10 are learning words of four and five letters. Of 59 out of the whole number admitted that did not know a single letter, 20 can now read the Bible and spell words of three, four, and five syllables; 29 read Dr. Watts's hymns and spell words of two syllables; and 10, words of four and five letters.

"*Progress in writing.*—Fifty-five scholars are able to write on paper, and many of this number can write a good German-text hand, who never attempted a single letter of the kind before they came to your institution. Twenty-six are writing words of two and three syllables on slates; 10, words from two to five letters on slates, All those scholars that have left the school could write a tolerable and many a capital hand when they left the institution.

"*Progress in arithmetic.*—Twenty-six scholars are in reduction, single and double rule of three direct, and practice; 23 are rapidly progressing through the first four rules of arithmetic, both simple and compound."

This pioneer public school report was a concise, business-like statement of the work of the school, unincumbered by any modern psychological discussions. The law of apperception had not been discovered, the idea of culture epochs had not come, and the principles of correlation, coordination, concentration, and interest were away in the dim future.

In 1815, on the recommendation of the trustees, the city council established two boards in place of the one previously existing; one for the first school district, comprising the First and Second wards of the city, and the other for the second school district, comprising the Third and Fourth wards. This movement was apparently a step backward.

On the 30th of July, 1821, the Lancasterian school took possession of the small brick building on the southeast corner of Fourteenth and G streets NW., formerly occupied as a stable for President Jefferson's horses, the use of the building having been granted to the public schools. On that spot now stands the attractive floral establishment of John H. Small & Sons.

The formal taking possession was a noted event. "At 10 o'clock a procession of girls and boys, between 130 and 140 in number, preceded by their teachers and followed

by the trustees, moved from the old and incommodious building on F street to that prepared for them opposite to the Foundry Chapel. An address was delivered by the president of the board, who congratulated the assembly on the improvements in the system of learning and on the immense benefits promised, 'particularly to the poorer classes of society.' He hoped that this institution, supported as it was by the corporation and by the General Government, which had generously allowed the use of the building, would be the means of rescuing their fellow-creatures 'from the doom of ignorance and obscurity.'"

Mr. Joseph Lancaster, the founder of the system of schools bearing his name, was an enthusiastic but somewhat visionary schoolmaster, who adopted an inexpensive method of educating especially the masses of poor children. The curriculum of his schools included reading, writing, arithmetic, and the Bible. In his original school in London he enrolled 1,000 pupils to be taught by himself assisted by designated pupils, called monitors, the more competent assisting in managing and instructing the less competent. He had inscribed over his schoolhouse door:

"All that will may send their children and have them educated freely, and those that do not wish to have education for nothing may pay for it if they please."

One of his mottoes was: "Let every child have at all times something to do and a motive for doing it."

The motives which he incited were not altogether the highest, but more readily accessible in large numbers of his pupils, who under the circumstances could not be moved by an appeal to more transcendental ones. He relied chiefly upon a lavish system of rewards. He said: "It is no unusual thing for me to deliver one or two hundred prizes at the same time; and at such times the countenances of the whole school exhibit a most pleasing scene of delight, as the boys who obtain prizes commonly walk round the room in procession, holding the prizes in their hands, and preceded by a herald proclaiming the fact before them."

His punishments were "devices for bringing the public opinion of the orderly portion of the school to bear upon the offender by means of ridicule."

He came to the United States in 1818 and visited other countries. His system had great popularity in its day, was adopted in most of the civilized countries of the world, and did much good. Some features of it apparently found their way at an early date into the public schools of this city, notably the making use of selected pupils to assist in teaching, who were designated in the Washington schools "sub-assistants" instead of "monitors," and the elaborate system of prizes, which were continued for many years, but were gradually eliminated as the condition of the schools improved and they could be dropped without detriment.

In 1836 Mr. Joshua L. Henshaw was appointed teacher of the Western School, and at the end of his first year, in concluding his annual report, expresses his opinion of the character and value of the system on which the school is conducted, and his pleasure in doing so, as the result of his experience has been to satisfy his mind that it was admirably adapted for effecting the purposes intended; and he commends an economy that, at a yearly cost of $875, confers the benefit of education, in a single year, on 303 children.

Mrs. Emma D. E. N. Southworth, an American novelist, who still survives and is a resident of this city, was a stepdaughter of Mr. Henshaw, and was for some years also a teacher in the public schools of Washington.

The two original schools, supplemented for several years by the Lancasterian school, and for a short period by two subsidized Presbyterian schools, ran an intermittent course, without any considerable growth or improvement. The public-school system was handicapped at the start by class distinctions introduced in the provision for poor and pay pupils, by being established in slave territory, and by a lack of funds. Slavery and free schools can not flourish side by side, and for forty years the system struggled against a hostile environment without any substantial progress.

The epithets in such phrases as "charity schools," "poor children," "pauper pupils" are found freely scattered through the early records, until at last the school

system became so odious that it was of little value to any class of children, and a more enlightened and liberal public sentiment successfully protested against its longer continuance on its original basis.

TRANSITIONAL PERIOD—1845 TO 1860.

At the beginning of this period three men appeared upon the stage who had advanced ideas of a public school system—Mayor Seaton, the junior editor of the National Intelligencer; Councilman James F. Halliday, afterwards city collector of taxes, and School Trustee George J. Abbot, afterwards confidential secretary to Daniel Webster and United States consul at Sheffield, England.

As early as 1840 Mayor Seaton in his annual message had called attention to the census of that year, which showed that the whole number of children in the city between the ages of 4 and 16, inclusive, was 5,390; number in the public schools, 213; number in private schools, 776; whole number in school, 989; number not attending any school, 4,401.

He recommended the adoption of the New England plan, involving taxation of assessable property and universal eligibility, applicable, of course, only to white children.

Councilman Halliday heartily supported Mayor Seaton's more liberal policy, and in 1845, under his leadership, four school districts had been established, one board of trustees, consisting of three members from each district, had been substituted for the two boards previously existing, the fee for tuition of pay scholars had been reduced to the small sum of 50 cents a month and was shortly abolished entirely, and much larger appropriations were made, which enabled the board to establish several additional schools.

The members of the new board of trustees were: First district, Robert Farnham, George J. Abbot, and John F. Hartley; second district, Peter Force, Thomas Donoho, and John C. McKelden; third district, Noble Young, William M. Ellis, and Joseph P. Engle; fourth district, Thomas Blagden, Ignatius Mudd, and Aaron Miller.

They framed a code of rules so excellent that many of them, with little or no material change, have been in force ever since, and are to be found in the code of to-day.

Trustee Abbot, a graduate of Harvard College, thoroughly familiar with the New England public-school system, and then the principal of a private school of high repute in this city, was the intelligent, active, and persistent leader in the school board. Among the advocates of the reform who rendered substantial service by voice and pen were the Hon. John Quincy Adams, Mr. Justice Woodbury, the Hon. Caleb Cushing, the Hon. Charles Hudson, the Rev. Edward Everett Hale, and other prominent citizens and residents.

There was some doubt as to the authority in the municipal charter to appropriate the revenue derived from taxes on assessable property for the support of public schools, but a tax of $1 on every free white male citizen was levied for this purpose. During the first forty years the appropriations for the schools had shown an annual average of only $1,511.92, while the annual average for the first four years succeeding the reorganization was $5,345.90.

The board of trustees divided the schools into two grades, designated primary and district.

In 1845 the principal teachers in charge of the four district male schools were: First district, Mr. Joshua L. Henshaw; second district, Dr. Tobias Watkins; third district, Mr. Hugh McCormick; fourth district, Mr. Henry Hardy. The first special teacher of vocal music, Prof. J. H. Hewitt, was appointed the same year.

Mr. John E. Thompson succeeded Mr. Hardy as principal teacher of the fourth district male school in 1848, and there are hundreds of his pupils now living who hold his name in grateful remembrance and will testify to his zealous and thorough instruction.

Mr. Samuel Kelly, who was appointed to succeed Mr. Henshaw as the principal teacher of the first district male school in 1849, then occupying the Jefferson stable building, used to wind up his school and set it agoing like a clock, and then go out to call on his friends in the neighborhood and invite them to visit the school in his absence and see if it was not running all right. They would accept his invitation, go to the school, find every scholar sitting bolt upright at his desk with his eyes set on his book, and report to Master Kelly accordingly; and woe to the boys had it been otherwise.

Mr. Strong John Thomson, who commenced his service as a teacher in the public schools in 1852 and was promoted to be Mr. Kelly's successor in 1854, is now actively and efficiently performing his duties as the principal of the Abbot School, the senior of the corps, and without a rival in the number of Washington boys who have acquired under his tuition a sound and thorough education in the elementary studies.

Prof. Joseph H. Daniel was appointed teacher of vocal music in 1856, and I am happy to say has most acceptably filled that office down to the present time. The number of school children in this city whom he has gently and skillfully taught to sing during his long career would well-nigh equal the present population.

In 1858 the charter of the city was amended so as to authorize the levying of a tax on all assessable property for the support of public schools, and it provided that the revenue derived therefrom should be expended for no other purpose.

In the same year an act was passed by the city council which redefined the school districts, provided for the appointment of a board of trustees by the mayor, prescribed and enlarged their powers and duties, and generally outlined a more comprehensive and liberal school system. This organic act placed the schools under the independent administration of the board of trustees within prescribed limits, and, under this law, as their legal charter, they developed the system into its present form and, as a body, intelligently, faithfully, and zealously performed their official duties, down to 1885, when, contrary to all American precedents, and unfortunately for the schools, the District Commissioners assumed for themselves all the powers and duties pertaining to the management of the schools, and reduced the legal functions of a school trustee to those of a subordinate whose sole business it is to execute the orders of his superior.

The fifth section of this organic act contained the very proper and safe provision that no text-book should be changed unless by vote of two-thirds of the whole board of trustees, and it is still in force, although of late apparently ignored and possibly forgotten.

Notwithstanding the commendable progress I have indicated, there was ample room for greater improvement. An address published by the board of trustees in 1858 said "there is not at present, either rented from individuals or owned by the city, a single schoolroom entirely suited for school purposes."

During the years 1855–1860 the leading private and public school teachers and other citizens interested in education organized the Columbian Teachers' Association, of which some of the leading members were Secretary Joseph Henry, of the Smithsonian Institution; President Binney, of the Columbian College; Principals Zalmon Richards, of the Union Academy; Otis C. Wight, of the Rittenhouse Academy; Charles B. Young, of the Emerson Institute; John E. Thompson and Strong John Thomson, of the public schools, and Dr. S. L. Loomis. They met regularly, discussed practical educational questions, brought here prominent educators from abroad to deliver public lectures, and did much to improve the schools of the city, private and public, and to inform and interest the public mind on educational subjects. Under their auspices a school census of the city was taken and published December 10, 1857, which gave the following results:

Whole number of children in the city between the ages of 5 and 18, 10,697; number in public schools, 2,400—22.4 per cent; number in private schools, 3,228—30.1 per cent; number not in any school, 5,069—47.5.

Gradually an inexpensive two-room building had been erected in each of the four

school districts by the corporation, additional rooms, notably in basements of churches, had been rented, the walls and ceilings of which were punctiliously whitewashed just before the annual examination of the schools; somewhat improved school furniture, appliances, and text-books had been introduced; night schools had been organized which flourished for a time, and at the end of the school year, in the latter part of July, long processions of all the school children in each district, marshaled by their respective teachers and trustees, with the flag of their country and school banners emblazoned with appropriate devices and legends, were seen marching along the streets and avenues on their way to the Capitol Grounds at an earlier date, and at a later one to the hall of the Smithsonian Institution, there to receive, in the presence of a large concourse of gratified relatives and friends at the hand of his honor the mayor, the prizes—honorable mention, certificates, diplomas, books, silver and gold medals—awarded for merit in attendance, punctuality, and scholarship. President Fillmore conferred these honors at the Capitol Grounds in 1850.

During the latter part of this period and the first part of the following one each school—that is, the teacher and pupils in a single room, usually isolated—had its distinctive banner, legend, colors, character, reputation, and pride, which it was bound to defend and maintain against all rivals with a spirit worthy of a highland clan of Scotland in the first half of the seventeenth century. This stage of the school system had its peculiar merits and attractions, and produced scholarship of the very highest order of excellence in certain lines, varying in different schools. The best teachers of that day who continued their work later sometimes looked back and sighed for a return of the golden age; but the rapid increase in the number of schools made its continuance an impossibility had it been desirable. It became necessary to subordinate something of individual freedom to the general good.

The following statement shows the growth of the school system during this period:

	1845.	1860.
Whole number of teachers	4	54
Whole number of pupils	500	4,500
Value of school property	$1,500	$30,000

The cloud of negro slavery still overshadowed the schools, and this small and poor municipality, with very little assistance from the National Government, struggling to make the city a fit home for the nation's capital, found itself without the means to establish and support a public school system adequate to supply even the still quite limited demands of public sentiment.

THE DEVELOPMENTAL PERIOD—1860 TO 1885.

Of the third period I can speak more from personal knowledge and may be allowed to say *pars fui*, having been first appointed a member of the board of trustees in 1861 and the superintendent of public schools in 1870.

Early in this period the board of trustees was constituted as follows:

Mayor Richard Wallach, president ex officio; first district, J. Ormond Wilson, Richard T. Morsell, Robert Ricketts; second district, William J. Rhees, Mitchell H. Miller, Charles H. Utermehle; third district, Otis C. Wight, Dr. Francis S. Walsh, Frederick D. Stuart; fourth district, James E. Holmead, Jonas B. Ellis, John T. Cassell.

This board took as its motto: "Schools for all; good enough for the richest, cheap enough for the poorest."

Mayor Wallach was a most loyal and active supporter of the Union cause, and in his heart and administrative policy the advancement of the public schools of the capital city was second only to the preservation of the Union of the States. He regularly occupied the chair as the presiding officer at the meetings of the board of

trustees, was ever ready to give timely encouragement and counsel and to second the most advanced propositions, although often not knowing how he was to get the necessary funds to carry out the measures brought forward.

An application to the National Government for aid in establishing a public school system for the city of Washington was made as early as 1805, when the city authorities petitioned for a grant of some of the lots received by the Government from the original proprietors on the laying out of the city. In 1856, under the lead of Senator Brown, of Mississippi, a bill passed the Senate to appropriate from the Treasury of the United States for the support of the public schools in this city, for a term of years, a sum of money equal to that raised by the corporation for the same purpose. In 1858 another similar bill passed the Senate.

In 1874 a vigorous effort again was made to obtain aid for the schools from the National Government. It was based largely upon carefully prepared statistics showing: (1) What the National Government had done in the States and Territories from time to time in aid of education; (2) the large number of the "wards of the nation" to be educated, who had been thrown into this city by the exigencies of the civil war; (3) that about one-third of the regular attendance in the white schools was made up of children of nontaxpaying parents, who were engaged in Government service and held their citizenship elsewhere, (4) and that the National Government was the owner of one-half of all the property in the District of Columbia. This appeal was unanimously and strongly indorsed by the department of superintendence of the National Educational Association, then holding its annual session in this city. None of these efforts availed to secure the passage of a bill for the benefit of the schools through both Houses of Congress.

Liberal donations of city lots were made to Georgetown and Columbian colleges, but the only assistance ever received from the Congress by the public schools was the permission to occupy temporarily three or four vacant public lots or parts of public reservations, the gift in fee of the old Jefferson stable, the use of the old Union and Anacostia engine houses, and the site of the Force School, so long as they should be occupied for school purposes, the gift of an old frame building, a relic of the war, located on leased ground at the corner of Twenty-second and I streets NW., and on one or two occasions the advance of a sum from the United States Treasury to pay salaries of teachers in arrears, with a proviso for its repayment—a beggarly list of old clothes and small loans for short periods—until we come down to 1878, when the Congress assumed the payment of one-half of all the expenses of the District of Columbia, including those of the public schools. The District was then so heavily involved in debt that the public schools did not receive the full benefit of this national aid until after the close of the period of which I am writing.

By an act of the Congress approved April 16, 1862, slavery in the District of Columbia was abolished, and by a proclamation of President Lincoln dated January 1, 1863, slavery throughout the rest of the United States received its deathblow. The greatest obstacle to a proper development of the public school system was at last removed, leaving only the financial inability of the municipality to delay its progress; but this was greatly increased by the additional burdens imposed by the civil war.

In 1860 a tax of 10 cents on every $100 of assessable property was levied specially for the support of schools, and in 1862 an additional tax of 5 cents on every $100 of assessable property was levied specially for the purchase of sites and the erection of schoolhouses. The grading and designation of the schools was changed from primary and district to primary, secondary, intermediate, and grammar, a nomenclature better suited to the improved classification of pupils already effected. Each of these terms included a two years course of study.

The trustees had at last discovered the reason for the schoolboy's general want of respect for his desk and schoolroom—the desk and room were not respectable; and so they began to expel the desk and room instead of the boy. This change of policy proved very satisfactory. In the primary schools the little, loose, noisy, four-legged

chair without desk, and in the higher grades the old soft-pine double desk of rudest make and finish, usually with a board seat supported on the back of the rear desk, carved with a jackknife after the most fantastic designs and decorated free-hand with ink, were replaced by the Boston cherry single desk, mounted on iron standards of graceful pattern, and a comfortable chair supported by a single iron pedestal—all the product of the most skilled workmanship in wood and iron. The available portions of the walls of the schoolroom were converted into blackboards, and more abundant globes, maps, charts, reference books, and other useful appliances followed in the train.

The number of schools had been increased, the pupils had been better classified, better furniture and more appliances had been furnished, and the text-books, courses of study, and methods of teaching were in the line of progress; but the schoolhouses and rooms, largely rented to the corporation because their owners could find no other tenants, were totally unfit habitations for the schools. They were isolated, not in convenient locations, not of proper size or shape, generally without playgrounds, without cloakrooms, and the lighting, heating, ventilation, and all other sanitary arrangements were of the most primitive and defective character.

The board of trustees resolved to first provide a schoolhouse in a central position in each of the four school districts, large enough to hold all the schools of higher grade, and then to distribute around it at convenient points smaller schoolhouses enough to accommodate all the primary scholars. As the citizens of East Washington, then as now, were noted for an intelligent recognition of their interests and a vigorous assertion of their rights, it was believed that the surest and shortest route to the accomplishment of the whole plan must have its starting point in that section of the city, and although all sections were so needy that comparisons would have been odious, it was decided to locate the first schoolhouse of the series in the third district.

By an act of the city council passed at the instance of the board of trustees and approved October 18, 1862, the mayor as chairman, 2 aldermen, 2 councilmen, and 4 school trustees were created a joint committee with full authority to purchase a site and erect thereon a school building, and the same act appropriated the schoolhouse fund, amounting to about $15,000 a year, to that purpose.

The respective boards appointed their representatives authorized by the act, and the joint committee was constituted as follows: Mayor Richard Wallach, chairman ex officio; Aldermen A. C. Richards and George H. Plant; Councilmen Charles H. Utermehle and William M. Ellis; School Trustees J. Ormond Wilson, Mitchell H. Miller, Dr. Francis S. Walsh, and Jonas B. Ellis.

This method of purchasing sites, providing plans, and building schoolhouses through the agency of a joint committee appointed specially for the purpose was pursued for several years, and under it the Wallach, Franklin, Jefferson, Seaton, and other schoolhouses were erected.

A subcommittee was designated to select a site, and after a protracted and thorough canvass they recommended a portion of square 901, fronting on Pennsylvania avenue, between Seventh and Eighth streets SE., belonging to Georgetown College. As the result of an interview with the college authorities, they reported to Mayor Wallach that the price of the whole square was $7,000, and that the corporation could buy such portion of it as might be wanted for a schoolhouse at the same rate. He very promptly responded, "We will take the whole square," and ordered the purchase to be concluded without delay. Thus, a large square, containing 107,834 square feet of ground, on which are now located the Wallach, the Towers, and the Eastern High School, with ample playgrounds, was bought for $7,000, being at the rate of about 6½ cents a square foot.

The wisdom and foresight of Mayor Wallach in taking the whole square is now readily apparent, but at that time the committee had altogether only about $15,000 at its disposal, and some of the members were unable to see how a modern schoolhouse architecturally attractive, containing 10 schoolrooms, each with seats for from

50 to 60 pupils, and a large hall in which all the pupils could be assembled for general purposes, could be paid for out of the balance of $8,000 left after paying for the site.

The architects of the city were invited to submit plans for the building, and those prepared by Mr. Adolph Cluss, who had made an extensive study of the best school architecture in both this country and Europe, were accepted. Mr. Cluss subsequently prepared the plans and superintended the construction of the Franklin, Sumner, Seaton, Curtis, and Cranch school buildings. In hygienic, pedagogic, and architectural arrangements, the Wallach was in advance of its time, and the promise of better things to come. In April, 1866, a commission of the Boston school board and city council with Superintendent Philbrick visited the principal cities of the country to inspect schools and schoolhouses, and on their return home reported that the "Wallach School was in external architecture the most attractive school visited, while the Franklin School (not then finished) in its size, plans, etc., promised to be unsurpassed in the country.

The Wallach School building, in the presence of a large assemblage of interested citizens, was dedicated on the Fourth of July, 1864, with formal ceremonies, the most notable part of which was the scholarly, eloquent, and inspiring address of the Hon. James W. Patterson, then a Representative in Congress from New Hampshire.

In their annual report at the close of this school year the trustees said:

"It may be of interest to those who are to come after us to find it here recorded, that in this city, burdened with extraordinary expenses, distracted by the convulsions of a civil war, thronged with passing troops, in close proximity to great armies, at times within the sound of hostile cannon and almost in a state of siege, the public schools in the midst of all these adverse circumstances have not only steadily continued to dispense their benefits to the community, but have so advanced in usefulness as to mark the three years just ended as the beginning of a new and proud era in their history."

The term school had heretofore been applied to the pupils in a single room, in charge of one teacher; and some schools deservedly had acquired a wide local reputation for their excellence; notably among the girls' schools were the fourth district grammar school, taught for many years by Mrs. Margaret Milburn Amidon, whose name after her death was most appropriately given to one of the school buildings, and the first district grammar school, taught by Miss Annie E. Evans.

The best schools here and there were most useful object lessons and were held up as standards to be reached by all. Occasionally a bright, accomplished teacher, who had received a professional education at some one of the best normal schools of the country, was appointed to a position in this city and brought new and better methods, which were gradually absorbed by other teachers and so came into general use. In the absence of a normal school and supervision other than that of the trustees, no one means was found so effective in improving the schools as that of having in operation for observation and study schools of high standard producing actual results. Such schools could be visited by other teachers, their results could not be gainsaid, and their methods in producing them could be studied, while pedagogical theories, however ably presented in books or lectures, left room for doubts, discussions, and delays.

The advent of the Wallach School ushered in a new era not only in school architecture, but also in school discipline, and the coordination of the work of teachers in different grades. For the first time ten schools of several grades were brought together in one building, the teachers of which were in daily intercourse and became better acquainted with each other's work. Mr. William W. McCathran, a highly accomplished teacher and most estimable gentleman, was appointed the first principal of the school and worked out the new and vexatious problem assigned to him with admirable tact and patience. This change broadened the horizon of the

corps of teachers affected by the new organization; their professional outlook in their isolated situation theretofore had been limited to the narrow section of the course of study assigned to the grade in which they taught.

The other central district school buildings included in the plan stated above were the Franklin in the first district, finished in 1869, the Seaton in the second district, in 1871, and the Jefferson in the fourth district, in 1872.

It was Mayor Wallach's great ambition to signalize his administration by giving to the capital city the best public schoolhouse in America.

In getting possession of the most central and eligible site for the Franklin School many obstacles were encountered. The property belonged to minor heirs whose guardian must give consent, an order from the court must be obtained, the sale must be made by auction, and the strenuous opposition of influential neighbors must be outflanked; but, nevertheless, the ground, containing 14,945½ square feet, was purchased by the corporation at the rate of $1.26 a square foot, and cost $20,474.01.

The contracts for the building were given out by piecemeal, and with numerous delays, so that four years following the close of the civil war were consumed in its erection, and the currency had become so depreciated that in 1864 $1 in gold sold for $2.85 in currency, and the expense of building, under the circumstances, was more than twice as great as it would be to-day. The cost of the building was $187,229.71.

It, however, richly repaid its cost in lifting the public school system to its proper place in the estimation of the public. The pernicious idea of charity schools for poor children, on which the system was founded, and which had hitherto clung to it with seemingly insuperable tenacity, disappeared at once and forever. Applications for admission to the Franklin School, including those from the wealthiest and most aristocratic classes, from the day of opening, were received far beyond its capacity; distance of residence was considered no obstacle to attendance, and the schools themselves so fortunate as to be located there were impelled to make an advance that they might maintain the reputation that the building had suddenly given them.

The Franklin School, in its elevated and prominent location, grand proportions, and architectural characteristics, became at once one of the sights of the capital city. Gen. Francis A. Walker said that whenever he passed that noble American public schoolhouse he turned to look, and felt like lifting his hat in token of respect; and even to-day, more than a quarter of a century after its dedication, the intelligent guide, in making the rounds of the capital city to show to tourists its chief attractions, as he drives along Franklin Park halts and points with pride to the Franklin School.

The dedication of those earlier schoolhouses with formal ceremonies attracted wide attention. They were noted events in the history of the schools and contributed to their progress. The houses were crowded with interested citizens who came to hear addresses by eminent men; at the Seaton, Gen. Francis A. Walker and Gen. William T. Sherman, and at the Jefferson, Governor Cook, Prof. Joseph Henry, Professor Tyndall, the English scientist, the Hon. John Eaton, United States Commissioner of Education, and others. In time the advent of a new schoolhouse became so frequent and common an occurrence that formal dedications were abandoned.

In 1865 occurred a memorable incident in the history of the schools. The veteran armies of the Union, returning to their homes in the North, were to march past the Capitol on their route up Pennsylvania avenue to be reviewed from a stand in front of the Executive Mansion by the President of the United States, their commander in chief, the Secretary of War, the generals who had led them to victory, and other distinguished citizens. Every available spot along the entire route from which a glimpse of a procession, the like of which in interest and grandeur never had been witnessed before and may never be again in our country, was crowded with a most eager, grateful, and enthusiastic throng of citizens and visitors who had come from far and wide.

The public schools of the city were to participate in the ovation, and promptly at the hour named thousands were in the place assigned to them on the north portico of the Capitol and all down the grassy slope of the park in front extending to the line of march.

In the early morning of that bright and lovely 23d day of May, there they stood, all expectancy, in their spring attire, decorated with rosettes of "the red, white, and blue," laden with bouquets of fragant flowers and floral wreaths, waving thousands of miniature flags, and bearing aloft a multitude of banners of their respective schools, while high over all was displayed the great standard of that young army, inscribed: "The public schools of Washington welcome the heroes of the Republic. Honor to the brave."

As the famous General Custer approached the boys stepped forward and presented to him a large wreath of the choicest flowers, which he most gallantly and gracefully received and threw over his shoulder; when instantly his fiery charger, apparently frightened, stretched forward his neck and seeming to take the bit of the bridle in his teeth, furiously dashed down the hill and round into the avenue out of sight, carrying his rider, sitting firmly in the saddle, but bent forward, with his long and profuse Saxon locks streaming back in the wind, while the school children looked on in amazement and deep concern; their anxiety was soon relieved, however, by the welcome news that the horse did not get away from his rider, and then came the pleasant surmise that the "runaway" was only a ruse to compliment the school children with a little exhibition of his horsemanship.

For six hours during the march, without sign of weariness, the boys and girls presented their floral offerings, waved their flags, rent the air with cheers, and at intervals a grand chorus of 2,500 voices, under the lead of Director Daniel, sang The Star Spangled Banner, Battle Cry of Freedom, When Johnny Comes Marching Home, Victory at Last, and other patriotic songs and hymns, all of which were most gratefully received and heartily acknowledged by officers and soldiers. From all sides the highest praises were showered upon that great chorus of school children; and the sight of those grand armies with their bronzed faces, soiled uniforms, and tattered flags was to them an object lesson in patriotism never to be forgotten.

In this connection I am reminded that during the period of which I am writing the singing of the school children was so highly appreciated by the public that concerts with programmes made up for the most part of selections from their course of study in music so as not to interfere with their regular school work were given always to crowded houses. The proceeds of these concerts in the days of limited school appropriations were indispensable in supplying many things not otherwise provided for. All the pianos and other musical instruments, most of the important reference books, all the expenses incident to the various school exhibits made from time to time at home and abroad, and other things greatly needed were paid for in this way. A safe estimate of the total amount received from concerts and applied to the purposes mentioned would be at least $50,000.

In 1871, when the American and British Joint High Commission to arbitrate the Alabama Claims and other questions in dispute between the two countries met in this city, Sir Stafford Henry Northcote took up his residence near by the Franklin School, which he passed daily, and as he was about to leave the city, in June, he addressed a note to the superintendent, saying he had so highly enjoyed the singing of the children in that school, as their sweet young voices had reached him through the open windows, that he desired to visit the school, hear them sing again before his departure, and personally thank them for the greatest pleasure he had experienced during his stay in Washington, and accordingly he spent a morning in visiting those schools.

As the main source of supply of teachers was the young graduates of the public schools without any special training or even a high-school education, the most difficult problem of all to be solved was how to provide a corps of teachers not only

competent to do the work as it then was done, but also to keep step with the progress marked out for the future.

As I have said, the only supervision provided up to this time was that of the board of trustees, and although in its membership there were always to be found men of liberal education and usually some with more or less experience in teaching, yet as their services to the schools were gratuitous they could not afford to allow them to interfere seriously with their regular business.

Various means were employed to supply, as far as practicable then, the inadequacy of professional supervision and leadership. An institute, embracing the whole corps of teachers, was organized in 1863, under the conduct of Mr. Zalmon Richards, which held its meetings every Saturday for several months of the year and was well attended. Classes of school pupils were frequently present; the programme included both the theory and practice of teaching, and all the branches of study taught in the schools received attention. Lectures or talks were given by the conductor, trustees, and eminent educators, such as Prof. Joseph Henry, Henry Barnard, the editor of the American Journal of Education and afterwards United States Commissioner of Education, Mr. B. G. Northrop, agent of the Massachusetts State board of education, and the Hon. George S. Boutwell, then a member of Congress, but previously the secretary of the Massachusetts State board of education.

Great educators and teachers who represented the soundest educational psychology and pedagogy were brought here time and again for service in the line of teaching, to which they had specially devoted their lives. In mathematics, Professor Davies, of the Military Academy at West Point; in reading, Prof. Mark Bailey, of Yale College; in vocal music, Prof. L. W. Mason, a supervisor of vocal music in the Boston public schools and the author of a series of music charts and text-books still more widely used than any other in the public schools of this country; in geography, Professor Apgar, of the State normal school of New Jersey; in penmanship, Professor Spencer, well known in connection with the excellent system of penmanship bearing his name; in drawing, Prof. Walter Smith, of whom I shall have more to say.

All these men were not merely great teachers of their specialties, but more, great educators in a broader sense, and they gave an impulse to the schools that had not expended its force at the close of the period of which I am writing.

Their lessons were practical, accompanied by illustrations, and full of instruction and encouragement. They not only taught the teachers specifically how to do their work more intelligently and thus save time for new work, how to do new work, and, what is better, inspired them with the zeal and self-confidence essential to success, but they also enriched them with a knowledge and understanding of those fundamental principles of all pedagogy which would enable them to devise good methods of their own. These men rendered most valuable services in giving a solid character to the system as it was developed.

"As is the teacher so is the school" is an old and true adage, and the schools will advance only as does the corps of teachers. At first the course of study in the elementary schools included but little more than reading, writing, and arithmetic, and as each new study knocked at the door for admission an early objection to be met was the fact that the teachers were not qualified to give instruction in the proposed new subject; and many times, as notably in the case of vocal music and drawing, it was quite confidently believed even by the teachers themselves that some subjects never could be taught by other than special teachers. That meant an additional expense which was often an insuperable obstacle. In developing a public school system, therefore, the most important work of all is that of inspiring the teachers with a love of their work and an earnest desire to improve and multiply their qualifications and then furnishing them with the best facilities for so doing.

In 1869 the city council provided for a superintendent of public schools and thus supplied a most important factor in the further development of the system. Soon after the passage of the act, Mr. Zalmon Richards, heretofore spoken of, was appointed

the first superintendent. An office of this kind is never a sinecure. Its occupant does not embark for a pleasure voyage on a summer sea. Many times he must be chart, compass, captain, pilot, and man of all work, and will find himself in stormy weather sailing between Scylla and Charybdis. He must not go too fast or too slow, too far to the right or too far to the left, lest he may fail to gain and hold the confidence and loyalty of the corps of teachers whom he is to lead or the general approbation and support of the school board and the public, all of which are essential to his highest success.

The highest prize awarded in the public schools is a scholarship in the Columbian College. It was first given in 1855 by the medical department of that institution, largely through the instrumentality of its dean, Dr. Thomas Miller. This was followed by an interval of three years, when Mr. George Riggs gave a scholarship in 1859, and Dr. William Gunton gave one in 1860. The college itself then gave one annually for eight successive years.

The authorities of the college not feeling able to continue their annual gifts longer, in 1869 President George W. Samson and the writer called upon the Hon. Amos Kendall, then residing at what is now No. 708 Eleventh street NW., and at a ripe old age in person administering upon that portion of his estate intended for benevolences. We represented to him the good which had already been done by these scholarships, both to their recipients and to the schools in general, and the desirability of a foundation that would make them regular and perpetual.

As a result of this interview, shortly after he tendered to the board of trustees of the Columbian College $6,000, the amount that had been suggested to him as sufficient to found a perpetual annual scholarship, upon condition "that the trustees of the public schools in the city of Washington, in the District of Columbia, and their successors, by whatever names they may be called, shall have the perpetual privilege of selecting from said schools one pupil annually to fill said scholarship, and the pupils so selected shall each be entitled to instruction in said college for the term of six years, free of charge for tuition, use of library and apparatus, and for any other privileges allowed to paying students of the same grade." The gift was accepted by both the college and the school authorities, and it was declared that thereafter the first prize in the public schools annually should be the "Kendall scholarship."

The award of this scholarship in the Columbian College has been an event of public interest and notice annually since that date, and this beneficent gift to the schools has an unlimited future of usefulness which each year will recall with honor the name of its donor.

A glance at this scholarship roll, already quite long, sustains its claim to the highest honor conferred by the public schools. One finds there such names as Fabian Franklin, 1864, a distinguished mathematician and late Professor in Johns Hopkins University; Theodore W. Noyes, 1870, now assistant editor of the Evening Star of this city; Howard L. Hodgkins, 1878, now a professor in the Columbian University, and many others widely and favorably known in their respective callings.

In 1870 Mr. Matthew G. Emery was elected mayor of the city, and among his appointments was that of the writer to the office of superintendent of schools. Although Mayor Emery's administration was abruptly cut short at the end of the first year of his term of office by a change of the form of government of the District of Columbia, he made manifest his deep interest in the public schools by giving to them the Seaton and commencing the Jefferson and the Cranch buildings.

By an act of Congress, approved February 21, 1871, a Territorial government for the District of Columbia was established to supersede the several local municipal governments theretofore existing and to go into effect on the 1st day of the following June. It provided for a governor and a legislative assembly composed of an upper and a lower house.

The colored schools of Washington as originally established by the Congress in their management were entirely independent of the local municipal governments,

and no change was made in this respect by the act creating the new form of government.

The legislative assembly of the new District government by acts approved August 21 and 23, 1871, created the offices of superintendent of the Georgetown schools and superintendent of the county schools.

The governor reappointed the superintendent of the Washington schools and extended his jurisdiction to the Georgetown schools. He appointed Mr. Benjamin P. Davis superintendent of the county schools, who revised the course of study, improved the method of examining and certificating teachers, was instrumental in securing three larger and more commodious new schoolhouses, and generally discharged the duties of his office with intelligence and efficiency, but he retired at the end of a year, and the superintendence of these schools was then assigned to the superintendent of the Washington and Georgetown schools; and thus were the first steps taken toward a consolidation of the four school systems.

The legislative assembly also increased the tax levied for the support of schools, at one time in Washington to 60 cents on each $100 of the assessment, in Georgetown to 40 cents, and in the county to 50 cents.

The first governor of the District of Columbia, the Hon. Henry D. Cooke, had a high appreciation of the importance of education and an earnest desire to further the progress of the public schools, whose general interests were committed to his executive care, but the condition of the district treasury, as usual, prevented the full realization of the most liberal intentions. He, however, erected the Curtis School building in Georgetown, under circumstances that would have been a bar to any attempt on the part of most men. He commenced without any funds whatever in his treasury available for building schoolhouses, and borrowed the money from the trustees of two hitherto unapplied funds, which had been given to Georgetown some years before; one by Mr. Edward Magruder Linthicum, who had left a legacy of $50,000 to found a school for "indigent white boys and youths," and the other by Mr. George Peabody, who had given $15,000 to found a public library. Agreements were made under which these funds were borrowed for the purpose of erecting a large central schoolhouse for Georgetown, in which two suitable rooms were to be provided and set apart for the use of the trustees of said funds; one for a library to which the public schools were to have free access, the room to be fitted up, the books furnished, and the library managed by the Peabody trustees; and the other for a night school of a practical and industrial character, the room to be fitted up with laboratories, apparatus, and other appliances, and the school to be managed by the Linthicum trustees. Both of these institutions were to work in direct lines of projected improvements in the public schools, and so these funds became of twofold use in their time. The Curtis building was erected, and the two institutions occupied the rooms assigned to them and did a most important educational work that otherwise would have been postponed for several years. Eventually these loans were repaid, and the Linthicum trustees withdrew from the Curtis building and provided elsewhere a flourishing independent establishment for their institution; but the Peabody Library still continues its connection with the public schools, and is now especially valuable to the Western High School.

By an act of Congress, approved March 3, 1873, the governmental control of the colored schools of Washington and Georgetown was transferred from the United States Department of the Interior to the government of the District of Columbia, and it was made the duty of the governor to appoint a board of trustees, a secretary, a treasurer, and a superintendent for the practical management of these schools. They had been provided with a superintendent from the start, and Governor Cooke, in the performance of the duties imposed upon him by the act referred to, reappointed the incumbent of the office, Mr. George F. T. Cook. Thus another step was taken in the direction of consolidation.

By an act of the legislative assembly, approved June 23, 1873, the board of trustees

of public schools of the city of Washington was authorized to establish a normal school for the professional training of teachers.

A school of this kind would not only gradually supply the elementary schools with teachers specially educated and trained in both the theory and practice of their profession, but its work could always be made a practical illustration of the most advanced and best educational thought. The school would send its graduates into the corps of teachers, and be visited, observed, and consulted with profit by other teachers, especially those employed in the lower grades. A good city normal school is a central fountain in which all that is best in education may find place and be made to flow out to every part of the system; and for this reason it was given precedence of a high school.

A large majority of the teachers in the public schools were necessarily women, and hitherto the chief source of supply had been the bright, young graduates from the grammar schools, without any special professional training or experience. The qualifications that ought to have been possessed before assuming the duties of a teacher had to be acquired afterwards, if at all, and at the expense of the pupils committed to her charge, during a longer or shorter period, according to the natural aptness of the young grammar-school graduate. Sometimes for sweet charity's sake there was a long probationary period, one, two, or more years, ending at last in failure.

And yet it required careful and protracted effort to get legislative authority for a normal school. The bill was drawn so as to appear to conservative legislators as harmless as possible. It provided only for "the special education of advanced pupils who were to become teachers in the public schools of this city;" it was to be located in the Franklin School building, so that no expense for renting or erecting a building on its own account should be incurred; it authorized the appointment of only one teacher, the principal, at a very fair salary, $1,500 per annum, with a proviso "that no further expense should be incurred by this act than is now required for teachers in the public schools for the year ending June 30, 1874;" which, being interpreted, meant that the first class of pupils in the normal school, during the one year in which they were to get their professional training, must do enough teaching in the other schools to pay the expenses of their professional course. On this limited legal basis was the normal school commenced, built up, and rests to-day.

The school was very fortunate in its first principal, Miss Lucilla E. Smith, who, with superior natural aptitudes for her profession, was a graduate of one of the best normal schools of the country, subsequently a member of its faculty, and then a most successful teacher in several grades of city schools. Under her charge it soon won appreciation and favor, and its graduates well sustained all that had been claimed for the school. Great public interest was manifested in its annual commencements, and the large auditoriums used for those occasions were always crowded to overflowing, and often hundreds could not gain admission. At the commencement in 1875, Professor Henry delivered a short address, full of the soundest educational philosophy, in which he said:

"Another principle of human nature, very important in the art of the teacher, is that the several faculties of the human mind are not simultaneously developed, and the true system of education is that which meets these faculties in the order of their development. The earliest developed faculties are those of imitation; and in regard to education, we may divide them into two classes—the doing faculties, and the thinking faculties. By the doing faculties, I mean those mechanical habits which are essential to the acquisition of knowledge, and are pure arts, such as the art of reading, that of performing arithmetical operations with rapidity and correctness, that of expressing thoughts in legible characters and in words of grammatical arrangement. These arts can only be acquired by laborious drilling on the part of the teacher, and labor on the part of the pupil. They require little instruction but repetition, until they are performed with ease and almost pleasure. To neglect to impart these

habits is to do a great injury to the child; nothing should be substituted for them, though instruction in other branches which require more art and less thought may be mingled as recreations with them."

The paramount importance of a thorough knowledge of reading, writing, and arithmetic, and of laborious drill and repetition in teaching them to young pupils in common schools, is forcibly stated in the part of his address quoted. No amount of "ologies" and "osophies" can compensate for the want of thoroughness here, any more than additional branches can compensate for unsoundess in the trunk of a tree.

The graduating class of 1881 received their diplomas from President Garfield just a few days before his assassination, and the class of 1883 received theirs from President Arthur, who said that he himself commenced work in life as the teacher of a little country common school in Vermont, on a salary of $14 per month and "board around."

Industrial and manual training was included in the general plan for developing and improving the system of public schools, and this year, 1873, a beginning was made. As a knowledge of drawing underlies all other industrial and technical education and all manual training, it must be made the basis of the industrial education projected for the schools.

The first step taken was the appointment of Mrs. Susan E. Fuller as director of drawing, who was specially qualified for such a position, and has successfully filled the office since that date. The next step was to adopt a system of industrial drawing that would lead to practical results. A worthless so-called system of drawing had been introduced in 1868, but the only parties who had received any benefit from it were the author and publisher of the books used by the pupils.

It so happened that in 1870 the city of Boston and the State of Massachusetts had become so impressed with the necessity of improving the designs and workmanship of their manufactures that in order to hold their own against foreign competition they had brought over from England Prof. Walter Smith, an art master, trained in the famous South Kensington Art School, and for some time himself the head of a leading art school in England, to inaugurate a comprehensive system of teaching industrial drawing in the public schools of that city and State. His system was constructed upon the theory that all intelligent school-teachers could qualify themselves for teaching drawing as well as any other branch of the curriculum, and in order to introduce this subject into the public schools it was only necessary to employ a general director competent to lay out a course of study suited to the circumstances, to instruct the regular teachers so far as might be needed, and to supervise their work in the schools. He soon designed a series of text-books and manuals embodying his system, and they were at once adopted for use in the public schools of this city.

Prof. Walter Smith was one of the few men whose rare genius creates new epochs in their sphere of activity. The great forward movement in industrial and technical art education in this country during the past quarter century, received its right direction and greatest impulse from him, and the beneficent results of his labors are now to be seen throughout the length and breadth of the land. He assisted by his counsel in introducing into the schools of Washington the system that has produced the most satisfactory results here, and twice visited the city personally for this purpose. His numerous lectures here and elsewhere were masterpieces in their line. No teacher has ever appeared in this country to whom a more honest and larger debt of gratitude is due; and yet his fate, like many another, was a sad one. He became a naturalized citizen and hoped to end his days in his adopted country; but at the end of twelve years incompatibility of temper and mercantile greed stopped his great work here, and in bitter disappointment and poverty sent him back to England, where he was most heartily welcomed and immediately placed at the head of a prominent art school. Shortly after, when not yet past the meridian of a most useful and promising life, he died of a broken heart. On his tomb

might well be inscribed, as a legend, the lines which Virgil posted over the palace gate of Augustus:

Sic vos non vobis nidificatis aves;
Sic vos non vobis vellera fertis oves;
Sic vos non vobis mellificatis apes;
Sic vos non vobis fertis aratra boves.

Very few if any of the teachers were then qualified to give the required instructions in drawing. They however undertook the task of preparing themselves for their new duty with the most commendable good will and earnestness. A regular course of study for teachers, extending through several years, was mapped out by Mrs. Fuller, and the whole corps of teachers cheerfully became students under her instruction every Saturday morning during a considerable portion of each year. As they progressed, examinations were held and graduated certificates were given, until they were all duly qualified for their new work. Meanwhile the normal school included this subject in its curriculum and sent forth all its graduates admirably equipped to teach drawing.

It required some time to bring public opinion to a correct appreciation of the nature and value of the new study; to make it understood that its main object was not to make artists, but artisans. For this purpose an annual exhibition of drawing was held to which the public were invited, and as a part of the exercises addresses were delivered by men familiar with the general educational value of the new study as well as its practical relation to all industries. At the annual exhibition in 1877 Professor Henry made one of his felicitous and philosophical addresses. He was at the time physically so weak with his last illness as to require assistance in ascending the stairs to the hall of the Franklin building, and this effort was the last attestation of his deep interest in the public schools.

On these occasions only the actual results of the training received in the schools were allowed to be put on exhibition. The more artistic and to many eyes attractive work of extraordinary genius, and of those who had been trained by specialists outside of the schools, though offered in abundance at first, was rejected as not fairly representing the teaching of the schools.

Other work of the schools was also represented at these annual exhibitions; penmanship, map drawing and molding, compositions, examination papers, and a variety of subjects including manual training in its beginnings. No money had yet been appropriated specifically for instruction or materials in teaching the last named subject, but tentative experiments were being made as best they could be without money. There were two schools in the county, a white one at Benning and a colored one at Hillsdale, where excellent teaching in sewing and cooking was done; in the higher grades of the elementary schools and in the high school most creditable work was done in the way of making the apparatus to practically illustrate the principles of physics and other natural sciences taught in the schools. At the two public schools located at the Industrial Home above Georgetown, horticulture, floriculture, woodwork, sewing, cooking, and shoemaking were successfully taught. A room in the Franklin building was set apart at each annual exhibition for the products of this manual training, which attracted more and more attention. There one could see the practical results of manual training in all the lines indicated above. The teaching of shoemaking was notably successful for a time, and all the materials, tools, parts of the work as it progressed, the finished shoe, and the mended shoe, were fully represented in the exhibit.

The selection of a teacher of shoemaking was a very fortunate one. The teacher was an intelligent, apt, and enthusiastic young man, who very early in life had thoroughly learned both the theory and the practice of his art, and afterwards had studied theology. While employed in teaching shoemaking he wrote in poetry a treatise on the art of shoemaking and published an illustrated edition of his work. The treatise and illustrations were highly commendable, but the didactic part gained

nothing by the poetic form in which it was embodied. The fault may possibly have been in the subject. He left the school, and I know not whether shoemaking, theology, or the Muse has since claimed him as her own. I am confident, however, that the world has lost nothing by it, if the good shoemaker has stuck to his last.

As a further step in the introduction of industrial education into the schools, upon my recommendation, a standing committee of the board of trustees was given special charge of this subject, and it was made their duty to make a full examination into the subject and to report from time to time measures for its judicious and practical extension.

In 1873, also, the first exhibit of the public schools at an international exposition was made at Vienna. It included a model of the Franklin School building made on an exact scale, and in sections of a story each, so that they could be taken apart and studied in detail. It cost $1,000, and was a center of attraction in the educational department of that exposition. In 1876 another exhibit of the schools was made at Philadelphia, in 1878 another at Paris, and in 1884 another at New Orleans. On each of these occasions the schools received the highest award of medals and diplomas made in the educational department of the expositions.

The exhibit at Paris was unique in its arrangement, and Dr. Philbrick, the superintendent in charge of the educational part of the United States section, gave it the post of honor in his court. It was made up of thousands of specimens of all kinds of scholars' work, from the lowest primary to the normal school, neatly bound in volumes, a complete set of text and reference books used in the schools, a set of the annual reports of the public schools, copies of all record books and blank forms used, a chart giving all the educational institutions of the city of Washington with full statistics of the same, a map of Washington showing the location of all its schoolhouses, large photographs and plans of the more important ones, and a model of the Henry School building. A very large Danner's revolving bookcase, some 6 feet or more square at the top, was made by the manufacturer expressly for this purpose and presented to the school authorities. Just below the top of the case drawers were placed to hold the charts, maps, large photographs, etc., and were so arranged that they could be drawn entirely out and made to rest at an angle convenient for handling and inspecting their contents. On the shelves below were arranged in a classified order the bound volumes of the exhibit. The case was surmounted by a very fine model of the Henry School building, made on an exact scale and in sections of a story each. The whole was accompanied by a full printed catalogue arranged in the order in which the articles were to be found, and giving all necessary explanations. At the request of the French Government the exhibit was left in Paris to be placed in the pedagogical museum in the Palais Bourbon.

By an act of Congress approved June 20, 1874, the Territorial form of government of the District of Columbia was abolished, and a government by three Commissioners was set up in its place, the Congress reserving to itself the legislative functions of government.

The Hon. William Dennison, of Ohio, the president of the first Board of Commissioners, was fully alive to the importance of the public schools among the many interests committed to his charge. He was in office at a time when the comprehensive system of improvements projected, carried out, and under way by the heroic treatment of Governor Shepherd left him a narrow financial margin for building up a school system, yet it is due to him to say that he gave the schools the full benefit of all that the law allowed, and always used his somewhat indefinite prerogatives and his influence to the fullest extent in their behalf. The public schools at no time have had a more sincere and intelligent friend in the executive chair, and most worthily has his name been given to one of the prominent schoolhouses of the city. Soon after he came into office, by orders of the Commissioners dated August 8 and September 9, 1874, the four boards of trustees of public schools were consolidated into one, consisting of 19 members, thus taking another step necessary to a union in one system.

In appointing the new board of trustees Commissioner Dennison, who had special charge of the schools, had taken care to appoint some men who had large and successful experience in teaching, conducting, and organizing schools here and elsewhere, and also to select the members so that they should fairly represent all the local and separate interests then existing. The following is the list of members:

Col. George W. Dyer, A. Hart, Dr. R. B. Detrick, William R. Woodward, Gen. Charles E. Hovey, Edmund F. French, Elward Champlin, Benjamin F. Lloyd, W. W. Curtis, F. W. Moffat, John H. Brooks, Henry Johnson, William Perry Ryder, J. H. Ferguson, John Sullivan Brown, Rev. Claudius B. Smith, Solomon G. Brown, Philip L. Brooke, and Benjamin F. Packard.

In distributing the membership of the board the Commissioner recognized the school districts as they then existed and left any rearrangement that might be deemed desirable and all other details of the management of the schools as one system to the discretion of the new board of trustees. The task set before them was no light one. The schedules of salaries, the organization of the schools, the rules, the courses of study, the text-books used, and the state of advancement in the several systems varied more or less at that time; and there were the usual local preferences and jealousies to be subordinated and interests to be subserved. Commissioner Dennison, as governor of Ohio and otherwise, had had much to do with the excellent common schools of his own State, and his knowledge and experience made his counsel and influence valuable.

This board of trustees commenced by administering each of the former systems on its own basis, but gradually brought them all under a common educational régime with uniform courses of study and one code of rules. The rules which were then framed for a thorough and impartial examination of candidates for teachers' positions and promotions and granting graded certificates of qualifications were so excellent that they have been in force ever since without any material amendment.

As practically the schools now had yearly courses of study, the board abolished the nomenclature of primary, secondary, intermediate, and grammar grades, divided the schools into eight distinct grades, making the average work of a year constitute the course for each grade, and beginning with the lowest class designated it the first grade, and so on to the highest or eighth grade, with special provision for pupils to continue in the eighth grade two years, if this was found necessary in order to thoroughly complete the elementary course of study, which would give to a majority of pupils all the scholastic education needed for good citizenship and useful lives.

The white and the colored schools were separate, but were managed by a common board composed of a white and colored membership and had a common course of study and in all respects the same facilities. The unification of the school system had thus step by step reached its utmost practicable limit.

The schools increased so rapidly that the need of more professional supervision than could be given by the two superintendents was recognized, and in 1873 the first step toward supplying this want was taken by assigning an assistant teacher to a boys' eighth grade school in each district so that the principal might have some time for supervision of the other schools of his district. A little later the amount of time to be given to supervision by the principals was increased, although still teaching in and held reponsible for their respective eighth-grade schools. Finally, in 1880, they were relieved of all teaching and responsibility in any special school, and became a corps of assistant superintendents, or supervising principals, as they were designated.

The colored schools of Washington and Georgetown, which had retained their separate superintendency under the consolidated arrangement of the schools, fell into line in the matter of additional supervision.

The old Territorial name of school district was done away with to avoid the confusion arising from the use of the same term as applied to all the territory of the

seat of Government, and the schools of the District of Columbia were divided into eight groups, designated divisions, and a supervising principal was assigned to take charge of each division. The following is the list of names of the first corps of supervising principals:

Henry N. Copp, Nathaniel P. Gage, Alexander T. Stuart, John E. Thompson, Bernard T. Janney, Joseph R. Keene, Henry P. Montgomery, and Winfield Scott Montgomery; all but two of these, Mr. Copp and Mr. Thompson, are now in the service.

By an act of the city council approved as far back as November 1, 1858, the establishment of a high school was ordered to go into effect September 1, 1861, or as soon thereafter as the corporation should provide accommodation for the same. That accommodation was never provided by the corporation, and, consequently, as the schools increased and were improved, one after another high-school study was added to the grammar-school curriculum until it became overcrowded and burdensome. Meanwhile public sentiment had veered around and was quite strong against spending public moneys on high-school education, for the present at any rate. On the other hand the advent of the normal school had emphasized the necessity of furnishing candidates of higher qualifications for that school, whose course of study, limited to one year, was designed to be entirely professional; in fact there was no time for academic studies.

In 1876, therefore, all the pupils in the girls' eighth-grade schools sufficiently advanced to take up high-school studies were placed under a competent teacher in one school, designated as advanced grammar school, with a one year's course of study. This first modest step toward a high school fortunately alarmed no one, and at the end of the year the experiment had been so successful that there was a general and urgent demand for a similar school for the boys; it was accordingly established in 1877. In 1879 the course of study in both schools was lengthened to two years; in 1880 they had become so popular that it was safe to name them high schools; and this was formally done. As I have already stated the Congress had provided for a high-school building in 1881, and it was ready for occupancy in 1882.

It was located on a portion of the western half of the square bounded by O, P, Sixth, and Seventh streets NW., which had been purchased at an earlier date by the corporation as a site for a market, but the Congress having been convinced that the city needed schools more than markets, appropriated it to the use of the former. The Henry and Polk schools also are located on the same half square. The fact that the corporation already owned ground that could be utilized for a site greatly facilitated the passage of the appropriation for a building. A like circumstance favored the appropriation for the Jefferson School at an earlier date. A part of the site already belonged to the corporation, having likewise been purchased a few years before for a market.

In 1882 the two high schools were united and installed in their new building, with three courses of study, business, English, and classical, the latter lengthened to three years. As the cost of education in a high school is more than twice as great per pupil as it is in elementary schools, it was deemed best to have a high standard of qualifications for entering the high school and a shorter course of study after admission rather than a low standard for entering followed by a long and more expensive high-school course.

This arrangement was based upon the theory advanced by Professor Henry, quoted above, that the simple but most important arts of reading, writing, spelling, and arithmetic should be thoroughly taught in the lower grades of the schools and not be postponed to the high-school course, where, to say nothing of other disadvantages, the expense of acquiring these arts would be doubled.

Having a high standard for admission, the high school, with its three years course, had no difficulty whatever in preparing its pupils to enter any college in the country. The school was thoroughly equipped with physical, chemical, and other laboratories and all necessary appliances, and, as the nucleus of a reference and general library,

more than 5,000 valuable books of the old Washington Library Association, which had suspended operations a few years before, were turned over to the high school.

Mr. Edward A. Paul, an excellent organizer and executive officer, was appointed the first principal of the new high school, and he had to assist him a faculty of the brightest young men and women that could be found in the country. They were all full college graduates, and some of them had pursued post-graduate studies and taken the degree of doctor of philosophy. They were selected with reference to teaching special subjects, but at the same time were all-round teachers, as it was important they should be at that early stage of the school, when there was no money available for the employment of exclusive specialists. There was Mr. F. R. Lane, the present efficient and accomplished principal of the high school, who organized the course in English literature; Mr. George R. Israel, who organized the course in chemistry and the military training which has become so prominent and popular a feature of the school; Mr. Frank Angell, who organized the athletics, football, baseball, Indian clubs, etc.; Mr. C. Herschel Koyl, who organized the course in physics and the manual training; Mr. Elgin R. L. Gould, who organized the course in history and economics; Mr. Edward L. Burgess, who organized the courses in Greek and botany; Mr. William Bernhardt, who organized the course in German, and Mr. Camille Fontaine, who organized the course in French; and the eminent success which the high school at once achieved in all these and other lines of its undertakings was due to the intelligence, enthusiasm, and energy of its corps of bright young teachers.

But few of these first teachers are now in the school; some have died and others are filling high positions elsewhere. Mr. Angell is a professor in Leland Stanford Junior University, California; Mr. Gould, a lecturer in Johns Hopkins University, Maryland, and a well-known writer on economics; and Mr. Burgess, a professor in the New York Normal College.

The colored schools of Washington and Georgetown, while an independent organization, had established a high school at an early date, and a normal school for them followed close in the wake of that for the white schools.

The schools were growing so rapidly and making constant demands for new schoolhouses at a heavy expense that in the winter of 1883 the writer devoted much time to the study of plans of schoolhouses, both in this country and abroad, with the view of combining the best pedagogical and hygienic arrangements in a safe, plain, substantial schoolhouse at the least possible expense consistent with those essential requirements. The best authorities on shape and size of schoolrooms, arrangement of cloakrooms, space required for pupils, size and location of windows, ease and safety of stairways, location and size of ventilating shafts, placing of registers for heat and ventilation, location and construction of closets, and, in short, all the details of a good schoolhouse, were carefully studied.

After each detail had been decided upon and represented by floor plans, statements, figures, etc., this material was placed in the hands of an architect in this city, Mr. John B. Brady, now inspector of buildings, to be put in architectural form, with instructions that no architecture was to be indulged in that would in the least increase the expense of construction. There were two designs, one for a schoolhouse three stories high with 12 schoolrooms, and one two stories high with 8 schoolrooms. He very kindly undertook the work without any assurance of compensation for his services, and devoted a great deal of time and labor to tentative efforts before reaching results entirely satisfactory to us both.

It happened, fortunately, soon after, that he was appointed to a position, requiring a competent architect, in the office of the inspector of buildings, upon whom was devolved the duty of preparing the plans of new schoolhouses. These plans already prepared by him and approved by the school board were at once adopted by the Commissioners and the two buildings were shortly after erected—the Analostan with 12 rooms and the Amidon with 8 rooms. The Analostan, in the vicinity of the island bearing

that name, was so named after unusual consultation with citizens especially qualified to give advice in such a matter. The name was euphonious and derived from a race who were supposed to have held their great councils near by for generations before the white man came here. For some unaccountable reason the Commissioners subsequently changed the name to Grant. Opportunities in abundance to honor the great Union general in this way are afforded in the several new schoolhouses built each year, and it is to be hoped that the original name of this building will yet be restored.

When the large school building on Capitol Hill fronting Stanton Park was erected it was named L'Enfant School, and the name was carved on the bluestone panel, corresponding with the other stone trimmings, especially designed for this purpose. The citizens of that section of the city, as soon as the name appeared, vigorously protested against it, on the ground that it would always be mispronounced, and called "The Infant School." In deference to their wishes a change was made, and so a gray marble slab, inscribed "Peabody School," was placed over the original name. In a distant future some explorer may lift that marble slab and find buried beneath it the honors intended to be paid to Charle Pierre L'Enfant, the great engineer, who in planning this city left that reservation, which has now become a most beautiful park for the benefit of the hundreds of children attending the Peabody School.

The plan of the Analostan, the 12-room building, was in some respects the better one, but it was proportionately more expensive. An open court from the center of the building to the rear gave great advantages in keeping the central corridors supplied with pure air. The difficulties and expense of keeping an assembly room at all times supplied with pure air without the aid of window ventilation has been abundantly demonstrated in the two Halls of Congress, and everyone familiar with schoolroom ventilation fully understands this. In these two buildings, in order to have the assistance of window ventilation without harmful drafts upon the children, the upper part, about one-fourth of each window, was hinged at the bottom on a transom so that it could be opened from the top inward at any required angle by means of a fixture easily accessible, and thus any amount of fresh air desired could be admitted at the top of the room in a way that avoided all injurious drafts on the pupils. This arrangement gave the highest satisfaction to the schools, but the fixtures sometimes got out of order and became troublesome to the inspector of buildings, who had charge of such matters, and so, I regret to say, he ordered them to be taken off and the transoms to be permanently closed. In my judgment the fixtures should be restored, or some better means be found for making the intended use of these transom windows. A second building on the plan of the Analostan was erected, but the two-story plan has been the most popular for the time being, and all the buildings for elementary schools since constructed in the city have taken the Amidon as a type. The Amidon cost only about $20,000, and some incidental conveniences and architectural embellishments have been added to its successors from time to time as larger amounts of money have been available for construction.

In 1884 a voluntary effort was made to obtain a small library of reference and suitable reading books for each school of the higher grades. The books were to be obtained by loan, gift, and purchase, so far as funds were contributed for this purpose. In three months 212 schools had each succeeded in getting a very useful library of its own, making an aggregate of 10,176 volumes.

The schools became deeply interested in establishing and managing their little libraries, as well as in reading and consulting the books obtained through their own efforts.

The development of the school system during this period in respect to courses of study, methods of teaching, and improvements in supervision and discipline, does not admit of presentation in tabular form and must be gathered from what has been

said already, but the material growth of the schools is shown in the following statement:

	1860.	1885.
Whole number of teachers	54	565
Whole number of pupils	4,500	31,362
Value of school property	$30,000	$1,500,000

I have aimed to sketch only a correct outline of the origin and growth of the school system of this city for eighty years, commencing with two little schools in rented rooms, free only to poor children, progressing at first "with wandering steps and slow," and at last reaching the high American ideal of the public education required to make citizens useful and intelligent enough to maintain our form of government. A subbase of kindergartens for children between the ages of 4 and 6 years, especially for those who unfortunately have little or none of the parental care and training that belongs to a well-ordered home, was the only part of the plan not carried out as designed, and that is still in abeyance.

This sketch would not be complete without some note of the most valuable services rendered to the schools from 1870 to 1885 by the Hon. John Eaton, then the United States Commissioner of Education. His personal interest could hardly have been deeper and more practically effective had the schools by law been placed under his official charge.

In conclusion, if you ask what was the most important factor of all in this work, I answer, unhesitatingly, the corps of teachers; intelligent, progressive, faithful to duty, and loyal to their leaders as ever were the famous "six hundred."

CHAPTER XLII.

EARLY EDUCATIONAL LIFE IN MIDDLE GEORGIA.[1]

EARLY SOCIETY CONDITIONS.

The influences upon the being of mankind—intellectual, physical, and social—that are exerted by geographical, political, and other accidents are interesting to study. It seemed curious how unlike were the Greeks of Attica to those of Laconia, and how unlike were both these to the Bœotians, all dwelling not remotely apart. Not less unlike were the settlers of the middle to those of the southeastern regions of the State of Georgia. The latter consisted of English, Salzburgers, Vaudois, Piedmontese, Portuguese-Hebrews, and considerable numbers from the Hebrides Islands. Among the communities neighboring to Savannah, the mother city, particularly in the county of Liberty, which was settled by the most cultivated among the immigrants, a few reasonably good schools were commenced under the lead of educated masters.

Very different from these were the earliest settlers of the region now being considered. Before the war of independence considerable numbers had migrated to this region, beginning their settlements on Broad River, in the southeastern portion of what is now Elbert County, and extending southward between the Savannah River on the east and the Oconee on the west, through (now) Hancock, where the primary geological formation in the State ends. It had a salubrious climate, and a deep-red, exceedingly fertile soil. Undulating with small hills, extensive table-lands, and narrow valleys, well watered with rapid creeks and rivulets, despite its nearness to the Indians it became as choice an abode as any in the whole South. A region thus early occupied on the border of savage existence must have been unusually attractive. Not unfrequently a forage was made upon the two counties most exposed—Greene and Hancock. These and other dangers were such as only an adventurous, even rather audacious, people had hardihood to encounter.

Those settlers had come, many from North Carolina, but mostly from Virginia. Some were from Maryland, and a few from the Middle States and New England. Among them were almost none very prominent in property holding or mental culture. At the breaking out of the rebellion a few here and there sided with Great Britain, but most of these, called Tories, a name still odious, found it not safe to remain in a community wherein open manifestation of their sentiments was not seldom followed by an improvised hangman's rope and gallows in the open day or a rifle shot through the window under cover of night. Several individuals became noted for specially daring important services during the campaigns in the State, for which they were richly rewarded afterwards.

When the war was over great numbers of new settlers came in, many with considerable and a few with extraordinary gifts of understanding. Then began an astonishingly rapid development of the State's abundant resources. Probably at no period since has that region, less than 100 miles square in extent, had a larger number of men of distinguished ability. It is noteworthy that during a very brief period came the Crawfords, Gilmers, Cobbs, Lumpkins, Campbell's, Doolys, Waltons, Watkins, Nisbets, Lamars, who soon became illustrious in Federal and State politics, and the Mercers, Marshalls, Andrews, and Pierces in the pulpit.

Evolutions in social living were such as must always spring from admixture of classes in such conditions. None were very rich, and none very poor. Fortunately for the peculiar social development so beneficial to the whole State, there were no cities nor large towns, as in the adjoining State of South Carolina. Augusta (itself more convenient of approach to Carolinians than to the inhabitants of this region), on the Savannah River, with its population of four or five thousand, could be reached only after a journey of three or four days over roads the reddest, worse worked, and in winter the muddiest and toughest perhaps in the whole country, South or North.

[1] By Richard Malcolm Johnston

Among those dwelling nearest the western boundary, not one in ten ever saw this town, and interesting were the ideas among simplest country youth of its vastness and importance. Lads whose parents came from Old Virginia were free to admit that Richmond was a greater, but not another, and this was one item of their rivalries with North Carolinians who could tell of nothing to compare with the city on the James.

As in every new community, particularly when thus exposed to dangers from without, patrician rule obtained without question from lower ranks. Instinctive with all was conviction that in a society without ascertained principles of government, the ablest, most thoughtful, and prudent must be leaders. Inferior persons, with few exceptions, not only did not aspire to important offices, but they suppressed aspirations among those of their likes who were tempted to indulge them. Candidates for Congress, even those for the general assembly of the State, were not nominated by conventions. Leading citizens counseled and decided among themselves whom to put forth, and the multitude acquiesced in the selection; not that parties did not exist and contend with each other, often in acrimonious strife, as in after times. From the beginning opinions were variant upon questions regarding what were then named State sovereigntics and States' rights, as opposed to encroachments of the Federal Government, and the lower classes, in full confidence in their leaders, held themselves bound not only to vote but, if necessary, to fight for them on election days. Superadded to variances in political sentiments were rivalries more or less avowed between Virginians and North Carolinians; but those, after lapse of not long time, and mainly through frequent timely intermarriages, subsided. Certain it is that, in the legislature of Georgia from the year 1780 to 1830, the average of talent was notably above what it was afterwards when changed conditions seemed to make the best leadership less exigent.

ADMIXTURE OF CLASSES.

In such circumstances coalescence of the two classes of settlers was indispensable to individual and civil security. Man can not live alone. Even Timon of Athens must occasionally go away from home in order to find an audience to make known the contempt he claimed to feel for mankind. Whatever the degrees of an individual's understanding and culture, if he can not find his equals to associate withal, he will be drawn to his neighbors, however far his inferiors in these gifts. And so from the beginning the two ranks of this rural region coalesced, a fact which, more than any other, contributed to make the State what it became by the period of 1861. In a community so constituted, whatever was marked in individualities must be brought forth in neighborhood intercourse that was untrammeled except by unwritten laws instinctive in all minds. No man ever felt his freedom more heartily than the rustic of middle Georgia a century ago. His cultivated neighbor, away from convenient proximity to his own peers, sought his society, made him his friend, often his confidant and adviser. He learned his speech, and in time loved to speak it. Each imparted and received. Associations of this sort are regulated by influences which it is not well to resist. Among these influences negro slavery exerted its own peculiar. The humblest white man could have no apprehension of falling upon any lower scale, therefore his ambitions, whatever they might be, were unfettered. It was during that early period of fifty years that were developed those numerous striking individualities which afterwards became themes for the character sketching done in that region more than in any other of like extent in the whole South. A section so feeund in elements eontributing to prosperous, happy existence, was populated with much rapidity. Seventy years ago the voting population of some of those counties was far above what it is now, counting only the whites. Quick, reckless felling of forests, rushing, appallingly unskillful cultivation of rolling lands led to their speedy exhaustion. Those of the inhabitants most eager for the accumulation of riches, and most adventurous of spirit, disposing of their homesteads for small prices to those content to remain, followed not far behind the Indian, whom they drove farther and farther west.

To one who remembers the conditions and accidents of that former society, it is pleasant to recall the neighborliness, the oft warm affectionateness which, except among mean people (and these are in every community), generally obtained. Men of both ranks, none of whom were very rich, and none abjectly poor, intermingled with little reserve. Not seldom they sat at one another's boards, watched at one another's suffering bedsides, helped to bury one another's dead, when tears and strengthening words were alike grateful and consolatory.

SOCIETY AMONG WOMEN.

It was interesting to remark the relations between women in the two classes. The gentlewoman recognized the approach she might make when in company with the wives and daughters of her husband's humble neighbors, albeit his intimate friends

and advisers; and in general these wives and daughters, with instinctive feminine delicacy, understood the bounds to which they might easily advance, but not seek to overpass. Pleased at the hearty recognition of their husbands and fathers by leading citizens, they knew as well as any that the society of men among themselves was one thing and that of women among themselves was another. Thus the upper women guarded with prudence, yet with kindliness, the gates which their husbands, brothers, and sons, in their exuberance of generosity might sometimes leave too widely open; and the lower recognized and were content with these differing conditions. These two influences, the ardent, impulsive of men, and the conservative of women, made society such as it was, securest and happiest for all. These same women were always first to note among inferiors promise of fitness for higher social position, and, unlike some parvenus and *nouveaux riches*, were not afraid to admit and encourage it; and thus followed those frequent intermarriages from which have sprung a large majority of the leading minds in the State. As for the dialect, men of all degrees, except in the large towns, were addicted to it with fondness and habitually spoke it, except when in serious public discussion.

EARLY EDUCATIONAL CONDITIONS.

It is probable that not one of these settlers had received education beyond what could be gotten at the country and village schools in the States from which they had emigrated. They were less informed in text-books and other reading than were their parents before the war of independence. These parents of the upper class—at least many of them—had been to universities in the mother country, the colleges of William and Mary and of New Jersey and New England; but their sons, grown up in time of revolution and war, and that of recovery from the losses incurred by them, must be content with what amount was to be had in neighborhood schools. Differences in book knowledge, therefore, among those Georgians were less marked than those in any other particular, and these depended on the habit of vigorous, thoughtful minds, of endeavoring to supplement trifling school acquirements with study of the few standard books within their reach. It was notable what some of these accomplished in law, politics, and the pulpit. Many have not been surpassed, some not equaled by their successors. William Harris Crawford, whose family removed when he was a lad from Amherst, Va., is well known for his career in politics. He was minister to France, and would have succeeded Monroe in the Presidency but for the fact that, just as his nomination was agreed upon, he was stricken with paralysis. Upon John Forsyth President Jackson relied with entire and justified confidence in defending his administration against the assaults of Webster, Clay, and Calhoun. John Dooly, despite his eccentricities, was never surpassed, at least in mental ability, by any judge, although his court, as others in the State at that period, was only of nisi prius. Robert Watkins, so tradition has it, besides being a great lawyer, was a nigh resistless orator. In the case of Col. Benjamin Talliaferro, there is this interesting to say about his efficient administration as judge of the northern circuit in the early part of this century. Several leading lawyers of the circuit had been concerned in the famous Yazoo speculations. The people, who were intensely hostile to a measure believed to be an outrage upon their rights, became prejudiced against the legal profession generally. Crawford, who, with James Jackson,[1] of Savannah, had been mainly instrumental in the repeal of the Yazoo act, not able to name a lawyer for the bench with whom the people would be content, resorted to Talliaferro, who was a planter, and after considerable difficulty in overcoming his scruples, at length succeeded in obtaining his consent. It was said that he became in time an excellent judge. He imparted his name to the county formed in 1825 from the older counties of Wilkes, Greene, Oglethorpe, Hancock, and Warren.

If school keeping in rural districts during colonial and Revolutionary periods was conducted within narrow circumstances, it must be more so in new remote settlements. If there had been entirely competent teachers, boys, even girls, could not be spared from domestic work long enough to give—and that in intervals—more than two or three years' attendance at school, for gentlewomen and their daughters, like the rest, cut and sewed upon garments made of flax, wool, and cotton, produced, spun, and woven at home, while their husbands and sons felled the woods, tended the fields, and harvested the crops. In the most genteel families, along with proper morals, children learned good manners and were encouraged to read in the few choice books brought with them from the old homes. Some could recite from ancient English and Scotch ballads learned by their parents in peaceful and less exigent conditions. But education in schoolbooks was made, using a homely phrase, to

[1] This man resigned his seat in the United States Senate, and had himself elected to the general assembly of Georgia for this purpose. It was said that the argument that prevailed with Talliaferro was Crawford's suggestion to listen carefully to lawyers' arguments, then decide according to his own judgment, and give no reason for his decision. This was before the period of a supreme court for correction of errors in nisi prius courts.

"shift for itself." The ways in which this was done, if described with much circumstantiality, would make a long and somewhat unique record in the annals of Georgia's foretime.

SCHOOLMASTERS.

To an aged middle Georgian the old-field schoolmaster of his childhood, as he now recalls him, seems to have been somewhat of a myth, or at least a relic of a long-past decedent race, never existing except in a few individuals unlike any others of human mold, appearing during periods in rural communities, bringing in a red-spotted bandanna handkerchief his household goods, and in his tall, whitish-furred, long-experienced hat a sheet of foolscap, on which was set down what he called his "school articles." A rather reticent man was he to begin with, generally serious, sometimes even sad looking, as if he had been a seeker of things occult and was not content with the results of his quest. Within some months, seldom completing the year, with the same bandanna and hat, noiseless as he had come, he went his way. Generally he was unmarried, or, what was not so very far different, followed by a wife unique looking as himself, if possible some nearer a blank, who had never had the heart to increase the family any further. After his departure came on another, who might be larger and might be smaller, who might be fairer and might be browner, who might be more pronounced in manner and speech and might be less, but who had the distinctive marks that were worn by no other people under the sun.

Now the idea that a native-born citizen competent to instruct children would have been content to undertake such a work was not entertained. Somehow, keeping a school was regarded as at the bottom on the list of vocations, fit only for those who were not qualified for any other; who, if thus qualified, would never think of thus degrading themselves, and who, in view of the poverty of repute attending this last resort for the exercise of manly endeavor, deemed it well to go away from the places that knew them, and set up among strangers. As soon as he became well known, it seemed expedient for him, like Joe of "Tom All-Alones" in Dickens's Bleak House, to "move on." Recalling his uncongeniality with the rest of mankind, the writer is reminded somehow of a scene from the Pickwick Papers occurring on the journey from Whitechapel to Ipswich. Mr. Pickwick, Mr. Peter Magnus, Mr. Tony Weller, and his son Sam were together on the old man's coach. Mr. Pickwick had just announced his intention to make note of some highly interesting remarks of Sam and his father touching the intimate connection of poverty with oysters and pickled salmon.

"By this time they had reached the turnpike at Mile End; a profound silence prevailed until they had gotten two or three miles farther on, when Mr. Weller, senior, turning suddenly to Mr. Pickwick, said:

"'Wery queer life is a pike keeper, sir.'

"'A what?' said Mr. Pickwick.

"'A pike keeper.'

"'What do you mean by a pike keeper?' said Mr. Peter Magnus.

"'The old'un means a turnpike keeper, gen'men,' observed Sam, in explanation.

"'Oh,' said Mr. Pickwick, 'I see; yes; very curious, very uncomfortable.'

"'They're all of 'em, men as have met with some disappointment in life,' said Mr. Weller, senior.

"'Aye! aye!' said Mr. Pickwick.

"'Yes; consequence of which they retires from the world and shuts themselves up on pikes, partly with the view of bein' solitary and partly to revenge themselves on mankind by takin' tolls.'

"'Dear me! I never knew that before.'

"'Fact, sir,' said Mr. Weller; 'if they was gen'l'men you'd call 'em misanthropes, but as it is they only takes to pike keepin'.'"

If Mr. Weller had known the old-field schoolmaster, his reflections probably would have been on a line with the foregoing. His very name was strange; not exactly foreign, but rather outlandish, suggesting that if the place where he was born could be ascertained it would prove to be far away.

Everybody recognized the necessity of children receiving at least rudimentary instruction. In some sections, as will appear from this extract from White's Historical Collections (p. 591), demands on that score were far from being very exacting.

"There was no school in the Goosepond neighborhood on Broad River from its first settlement, in 1784, until 1796. The first teacher was a deserter from the British navy whose only qualification was that he could write. He whipped according to navy practice. On cold mornings, when fire could not be conveniently had, he made the children join hands and run round and round, while he hastened their speed by the free application of the switch."[1]

[1] Teachers in elementary schools in ancient Athens seemed to have been not only poorly paid, but to have been liable to contemptuous, even violent, treatment. In Plutarch's Lives the following about Alcibiades occurs:

"When he was past his childhood he went once to a grammar school and asked the master for one of Homer's books; and he making answer that he had nothing of Homer's, Alcibiades gave him a blow

This rudimentary instruction, as has been seen, was not practicable at home. The parents of few had means sufficient to board them at the better class of schools in the large towns. Some, indeed, did make the strain to send their daughters, when arrived at 15 or 16 years, to such schools in Augusta, Charleston, Salem in North Carolina, and even as far as Mrs. Willard's Seminary at Troy in the State of New York; but the majority acquired only what was to be gotten in the old field.

It was of a part with the constitution of that rural society, in the case of boys particularly, that they should be in frequent contact with their fellows in age for other purposes besides educational. By the hearty coalescence of men of all degrees in the community, the son of a man of property was taught to regard himself by birth alone not above any honorable poor man's son. Therefore, in the lack of a teacher native born, when the stranger made application, after "sizing him up" to the very moderate demands made upon him and not finding where they could do any better, citizens of all ranks signed his articles that in all conscience ought, in a matter of business, to have been satisfactory and let him make his start.

SCHOOLHOUSES.

A place was selected on the edge of a wood and a field turned out to fallow, sufficiently central, hard by a spring of purest fresh water, a loghouse was put up, say 30 by 25 feet, with one door and a couple of windows and shelves, with benches along the unceiled walls, and the session began. Most families breakfasted about sunrise, and a brisk walk of three-quarters of an hour brought even remotest dwellers to the early opening. The one who happened to reach the schoolhouse first on winter mornings kindled a fire. This was before the date of lucifer matches.[1] In winter half-burned logs were so disposed beneath ashes on the huge fireplaces as to preserve fire through the night, which was quickly rekindled by the aid of pine knots always on hand. To provide against failure, the master and some of the larger boys carried a small piece of rotten wood—punk—obtained from a decayed oak, which, being held under a flintstone and struck with a steel blade of a pocket knife, produced sparks, igniting the wood. There was seldom any suffering from cold.

At noon a recess of two hours was allowed for dinner and sports. On days when the sun shone, the hour was made known by its reaching a mark on the floor by the door or one of the window-sills. In cloudy weather it was guessed at. The idea of a schoolmaster owning a watch did not enter anybody's mind. When the day was done, dismissal was out and out. There were no keepings-in at noon or evening tide. Each day had its own history and no more; whatever was done was done for all henceforth—recitings, good or bad, punishments big or little, became things of the past, though their likes were sure to be enacted on every day thereafter. The meaning is that nothing was put off, no more than a breakfast, for the morrow. The master went silently to the house where he boarded, and the pupils, boys and girls, whipped and unwhipped, turning their backs upon everything, journeyed leisurely along, boys anon rallying one another on the day's misadventures, personal and vicarious, and the girls behind laughing at them, occasionally lingering to gather and weave into nosegays wild flowers, that in all seasons, except the depth of winter, bordered their way along roads and lanes.

---

with his fist and went away. Another schoolmaster, telling him that he had Homer corrected by himself; "How?" said Alcibiades, "and do you employ your time in teaching children to read? You, who are able to amend Homer, may well undertake to instruct men."

Lucian laughed much at the beggarly straits in the lower regions of bad kings, and satraps, and hucksters of dead fish, *and rudimentary schoolmasters*. (Charicles, by Rev. Frederick Metcalfe, M. A., p. 229.)

[1] It seems curious to look back to times so far agone and recall the shifts to which people sometimes resorted and the inconvenience to which they were subjected through lack of foresight in this behalf. On plantations where there were negroes they had such matter in charge, for the race loves the fire and dreads being ever without it; but improvident poor whites the morning sometimes found without even a piece of punk to supplement their lack of foresight touching this essential item of materials for getting breakfast, and one of the household must travel often a mile and more to obtain it from a neighbor. Besides the inconvenience to one fallen into this predicament, he had to endure some ridicule for his negligence when met on the road swinging the brand. This custom gave rise to a saying which to some extent obtains in the State to this day and with many who know not its origin. When one, after a call at a neighbor's and after a stay regarded too brief by the host, rose to go, the latter might say, "Why, it looks like you came for a chunk of fire."

The introduction of lucifer matches created much sensation, leading some simple rural minds to speculate as to whether there was any limit to the mind of man. The first of the kind were square blocks of wood, two-thirds of which had been cut with a small saw in both directions across the end surface and slightly covered with sulphur. When one was wanted it was carefully detached with the finger nail. A stick of these, containing about a couple of dozen, lasted quite a time, never being used except when necessary by the going out of fire on the premises. Compared with present prices, the first was enormous. Some old persons yet living are, from long habit, extremely economical in the use of them, sometimes slightly burning their fingers in trying to make one render as much service as possible.

IN THE SCHOOLROOM.

The fashion of studying aloud in schools, now so curious to recall, did not produce the confusion which those not accustomed to it would suppose. Besides the natural desire to avoid punishment, rivalries were often very active, particularly among girls, and during the time devoted wholly to study, there were few who did not make reasonable effort to prepare for recitation. Spellers, readers, geographers, grammarians, getters-by-heart, all except cipherers, each in his or her own tongue and tone, raised to height sufficient to be clearly distinguished from others by individual ears, filled the room and several square rods of circumambient space outside. In this while the master, deaf to the various multitudinous sounds, sat in his chair, sometimes watching for a silent tongue, at others, with lack-luster eyes gazing through the door into the world beyond, perhaps musing when and where, if ever in this life, this toiling, fighting, migratory, isolated, and about friendless career would find respite.

Pupils stood while reciting. In spelling and reading, except with beginners, the classes were few, seldom more than two or three in a study, arranged according to age and degree of advancement, boys and girls mingling together. Dread of the ridicule attached to the foot of the class prompted nearly everyone to strive to avoid it. Many a blush painted the cheek and many a tear dimmed the eye of a girl while descending to this position of dishonor. The effect was benign. Good spelling, particularly among the girls, was the rule in nearly every school. Seldom did any among half a dozen in the lead make changes of place. These were mainly below, increasing in frequency toward the end. The head was lost generally by accident or momentary negligence of keeping on the alert, and it required like default to make another change in that quarter.

In reading, excellence was on a scale very far lower. It was taught after a fashion solemn and formal, sometimes ludicrously so. With the master the sentiment seemed that after one rose from spelling to reading one must be taught to feel that what was printed in books had acquired beyond spoken words dignity to which readers must pay worshipful respect, pronouncing in measured, solemn flow. Many an older man in after years would rehearse in lengthened, sepulchral monotone his school rendering of those deeply affecting fables in Webster's Elementary Spelling Book, "The partial judge," the "Boy that stole apples," "The country maid and her milk pail," with illustrations taught to be the last, highest, and forever hereafter unsurpassable pinnacle of pictorial art. Indeed, regarding the last-mentioned story particularly, the artist ought to have done his best in representing a scene the preface to the recital of which is replete with such solemn admonition. How awfully, mysteriously severe the following words of warning sounded in the ears of children who had never made acquaintance with the meaning of one single big word:

"When men suffer their imaginations to mislead them with the prospect of distant and uncertain improvements of their condition, they frequently sustain real losses by their inattention to those affairs in which they are presently concerned."

Perhaps the solemn measured mode of reading then taught, together with the sort of school readers, gave rise to the idea among small children and even some uneducated grown persons, that all printed matter must necessarily be serious. The stately maxims of Webster's Spelling Book, although wholly unintelligible, yet, and for that reason, were believed to have in their profoundest depth words of vast meaning. The two reading books were Popular Lessons and Murray's English Reader. Than the former none could be better. It was made up of extracts from Mrs. Barbauld, Miss Edgeworth, and others. One chapter in particular had great fame among rural school children. It was "The story of little Jack." The hero, after the death of his mother when he was an infant, was nourished by the milk of a she-goat. For the good beast he grew to have fondest attachment. Her maltreatment on one occasion by a rash unfeeling youth provoked her youngling to such a pitch of filial indignation, that, although not at all passionate by nature and too little to make much headway in fight, he uttered some such words as the following: "She has been like a mother to me, and I will not hear her abused as long as breath is in my body." Then straightway he rushed to her defense. Than these words none uttered in the heroic age, than this act of courage none performed in that same, whether slaughter of lion, bull, serpent, or other ravaging beast, whether taking mighty cities or leading conquering armies, were regarded more pathetic, more glorious, more sublime.

One day the late Linton Stephens, who as a lawyer was superior to his brother Alexander, becoming one of the judges upon the supreme bench of the State, received a copy of this old book, sent by a friend who had lately purchased it among a lot of others of the sort at an administrator's sale. Message came along with it that the purchaser, although much inclined thereto, had not read the story of Little Jack, fearing that its perusal at that late day might subtract from the fondness with which, since the time of childhood, the two together had been wont to recall it. At the next meeting of these friends Judge Stephens said:

"You need not be afraid you won't cry in reading Little Jack. I read it aloud the other day to the children. They cried as if their little hearts would break, and I shed about as many tears as they did."

Remembered well are also some of Mrs. Barbauld's Hymns in Prose, whose teachings of duty, devoid of threatening, replete with tenderest persuasion, were a pleasing set-off to the hard, senseless despotism all around. Helped by the teachings of this precious little volume, school children could sometimes lift up their minds and get much of the blessing that comes from the contemplation of better things.

Older pupils used Murray's English Reader. Its title was extremely promising, running thus:

"Murray's English Reader, or pieces in prose and poetry, selected from the best writers, designed to assist young persons to read with propriety and effect; to improve their language and sentiments, and to inculcate some of the most important principles of piety and virtue, with a few preliminary observations on the principles of good reading, improved by the addition of a concordant and synonymizing vocabulary, consisting of about fifteen hundred of the most important words contained in this work. The words are arranged in columns and placed in columns over the sections, respectively, from which they are selected, and are divided, defined, and pronounced according to the principles of John Walker. The words in the vocabulary and their correspondent words in the sections are numbered with figures of reference. Walker's pronouncing key, which governs this vocabulary, is prefixed to this work."

To all which is appended the following from Dr. Johnson:

"Words can have no definitive idea attached to them when by themselves. It is the situation and tract in a sentence which determine their precise meaning."

In one of the prefaces to the improved edition, the author's disclaimer of any other than generous, most unselfish purposes in offering his work to the pupils is interesting in this generation, when few in the profession, if any, are so easily made content with such reward as he allows himself to hope for. The concluding paragraph reads thus:

"To improve the young mind and afford some assistance to tutors in the arduous and important work of education were the motives which led to the production. If the author should be so successful as to accomplish these ends, even in a small degree, he will think that his time and pains have been well employed and will deem himself amply rewarded."

This work enlarged upon the solemnly monitory readings that were interjected into the Spelling Book. The very first one of "Select sentences and paragraphs" seemed to intimate that these same virtues, however neglected by adults, were especially obligatory upon the young: "Diligence, industry, and proper improvement of time are material duties of the young." Yet a little afterwards they are encouraged by another containing the promise, "Virtuous youth gradually brings forward accomplished and flourishing manhood."

Notwithstanding too much preponderance of the serious and the monitory, many of the selections are of great excellence, being taken from such writers as Johnson, Addison, Blair, Thomson, Cowper, Merrick, and others. But to a schoolboy, healthy, at home happy, with no special aspirations or apprehensions about his own future, many of the titles could not be notably attractive. Witness the following: "The trials of virtue;" "The vanity of wealth;" "Reflections on a future state from a view of winter;" "Change of external condition often adverse to virtue;" "On the importance of order in the distribution of our time;" "The misfortune of men chargeable to themselves;" "On the immortality of the soul;" "The good man's comfort in affliction," and many other such subjects.

A book with such selections could not be expected to be read except in class, as was the case with Popular Lessons. When boys and girls became old enough to take serious interest in the meaning of what they read, they went to the few romances to be found here and there in the neighborhood, such as Children of the Abbey, Mysteries of Udolpho, Thaddeus of Warsaw, and Scottish Chiefs. It was always pleasant to feel and afterwards to remember the impressions made upon young simple minds by these books, then more than half believed to contain veritable chronicles of bravest men and loveliest women. They served purposes most benign. They largely contributed to the production of pure and generous aspirations, to the development of good manhood and good womanhood, each sex endeavoring and hoping, if not to equal, at least to approximate exalted ideals as near as was possible in existing limitations. In after years elderly ladies who had long ceased to read novels of any sort, when hearing young people praise later works of the kind, would never be made believe that they could be compared favorably with those which in their own young day drew so many tears from their eyes, and prompted so fondly to duty. These benign influences did not cease with experience of labor and cares and vicissitudes; they assisted throughout life in imparting strength steadfast in continuance at their work, and to fortitude in the enduring of misfortune.

A-BISSEL-FA.

Curious and interesting are some of the researches made by philologists into the earliest languages of several people, among them those relating to the names of the letters of the alphabet. Prof. E. S. Sheldon, of Harvard University, has written a very interesting monograph on the letter a. In it is some information on the subject gotten from Dr. Garland, late president of Vanderbilt University, through Prof. Charles Forster Smith, now professor of Greek in the University of Wisconsin. It was thus:

"When I was a boy at a country school in Nelson County, Va., about 1820, we used the word a-bis-sil-fa with accents on the second and last syllables, and were taught that it came from abbreviating the sentence 'A by itself A.' I also heard, but rarely, the vowel e used in a similar way."

This practice, including the other three vowels, obtained in middle Georgia, in the early part of the present century, but they were pronounced A-bissel-fa, e-bissel-fe, etc.

The system of teaching geography was as empty as possible of results beyond assisting the memory. The book used was Woodbridge's Universal Geography. The master was satisfied with answers in the words of the book which he held in his hands. No pupil ever undertook to draw a map, or imagined that such a thing was possible except to the printer of the book. Indeed such a thing as a blackboard may have been heard of, but never seen by any. Knowledge of a globe was as far away. Children learned that there were two continents, several oceans, quite a number of gulfs, rivers, and bays, a yet larger number of cities and towns somewhere, and were able, during a brief season, to be forgotten as soon as it was passed, to bound each of the States of the Union, and that was about all.

The chief among studies was arithmetic, generally called by the master and pupils "'rethmetic," and its students "cipherers." A cipherer, if advanced beyond rudiments, had the respect of all, master, as well as pupils. He was allowed to go out of the house when it seemed necessary to carry his ears out of the reach of voices sounding topics of low degree. The master was bound to be familiar with every problem, disgraced, as he knew he must be, if found unable to pull any boy through the most abstruse. The "great, the eventful day" with a boy was when he could say without a hitch the multiplication table. If the blows and imprecations gotten while tackling this sphinx in earliest school times could be known, they could not be counted by one man in a life of three-score and ten. But after victory came and he was called a cipherer, it was a triumph as sweet as that felt by the most eager office seeker to whom, after long waiting and sighing, and plying his wiles and fingering his wires, the place sought opens to receive him.

The text-books used were, by most, The Federal Calculator, by others, one whose title ran thus: "A new and complete system of arithmetic, composed for the use of the citizens of the United States, by Wilder Pike, A. M., A. A. S." It was always rather imposing when a big boy came in from his outdoor elaborations of great problems, sometimes with a smile on his face, oftener with mild solemnity, each indicating victory, and held up to the master his slate covered with details of the hard battle he had been fighting. The respect expressed in the faces of little children and the envy noted on those of some as big as he was he felt to be no greater reward than he deserved for such warfare as he had fought to the destroying of his enemies. There was one sum (as they called them) in particular which, as it had a trifle of humor, and produced a result not only wonderful but incredible also, always attracted attention. Sixty years afterwards old men could recite the story of it word for word. "An ignorant fop wanting to purchase an elegant house, a facetious gentleman told him that he had one which he would sell him on these moderate terms, viz, that he should give him a cent for the first door, 2 cents for the second, 4 cents for the third, and so on, doubling at every door, which were 36 in all. 'It is a bargain,' cried the simpleton, 'and here is a guinea to bind it.' Pray what did the house cost him?" Blackboards being none, results after achieved were announced aloud, when the finder looked around with triumph subdued by compassion at the awe and incredibility visible upon the faces of the young beings, as in sonorous, measured tones, he declaimed, "Six hundred and thirty-seven millions, one hundred and ninety-four thousand, seven hundred and sixty-seven dollars, *and* thirty-five cents!" Some grown-up men, calling back to mind whippings they had received times gone by while vainly pondering this vast problem, used resolutely to declare their belief that such a trade never did happen, and never could have happened; for that no fool, however big, was big enough to ask for one single, lone house by itself more money than every house in the State of Georgia, and the land belonging to it flung in, would fetch, if put up on the block; and that they hadn't a doubt it was put down in a book, like a many another, mostly to make some sort of excuse for beating boys' backs for not being quicker to find out what figures can

be made to mount up to when you fix them in a certain way and keep piling them up on top of one another.

The average schoolmaster had a reasonably good head for arithmetic, and by long practice became familiar with all the problems of the Federal Calculator. What he dreaded in this study was a sending to him by one of his patrons, or another citizen, of a problem not contained in the book. An occasion of this sort was long remembered. His failure to render satisfactory solution, and the mortification incurred from it, was avenged, after waiting for a convenient opportunity, by whipping the boy by whom the problem was carried for a dereliction so trifling that all knew the motive for the infliction.

But Murray's English Grammar was his favorite. He thought he knew all about it and a great deal more; he knew also that people not well schooled in it themselves were not very much concerned as to whether he did or not. As with geography, so here, the open book in his hand was an advantage used for all it was worth. Parsing was employed only on simplest sentences, over which ado was made often to most laughable degrees. English grammar was his pride, in which most of his harmless little productions were displayed. Upon the sweatband of his hat were inscribed grammar rules and maxims from Webster's Spelling Book, which when away from the schoolroom he fondly quoted in season and out. If a stranger, on meeting one for the first time, hesitated where to locate him, doubt instantly vanished when he took off his hat and opened his mouth.

Occasionally one of our masters when rather young essayed poetry, which, in the lack of magazine, he exhibited or let lie about for inspection. A lawyer, friend of the writer, once told him of having stopped for the night at a country house while on his way to attend court in the county adjoining. The neighborhood schoolmaster was a temporary boarder there, it being the custom among the patrons to give boarding and lodging by turns. Noting from his speech and the peculiar wearing of his hair that he had uncommon ambition, the lawyer was not surprised to find on a table in the room where he slept, which the poet had vacated for his accommodation, freshly written in copy-book hand, these verses:

We part, we part; but oh, I hope
We'll meet again before we lope
Into the dark and silent grave
Where there is nothing else to crave.

Next morning his evident gratification, when made aware that the effusion had been noticed, drew from this guest, a wag and a wit, some words of commendation which he had not the heart to withhold.

"Fact was," he pleaded, "I owed him something for the inconvenience to which he had been subjected on my account, and his manifest pleasure from the lie I uttered made me feel that it was venial. Besides, though that is saying a good deal, I have seen some that was as bad."[1]

His essays of lofty phrase, of course, were not criticised when put forth before his pupils; but experience had taught that he must use some guard when addressing himself to others, cultured or not. Indeed, the latter often were his most critical auditors. The former only smiled inwardly, while the latter, when detecting the flaw, sometimes indulged a broad grin, and, if of waggish turn, humbly asked that he "explain himself," if he pleased, or that he would "call that word over again and call it slow and distinct." It was, therefore, that such a man led a sort of double existence; bold, commanding in the school, and hesitating, often to timidity, elsewhere. Yet this skittishness could not altogether hinder his continuance among

[1] The rustic schoolmaster of olden times seemed, like him of the new, to have been of a type different from the rest of mankind. One was made immortal in Goldsmith's Deserted Village. This, as has always been understood, was Thomas Byrne, a veteran soldier, who had served many years in the Spanish wars. He was called by the name of Quartermaster Thomas Byrne. At Goldsmith's first school, kept by Mistress Elizabeth Delap at the village of Lissoy, whither the family had removed during his infancy, he was considered a dunce. What his dormant understanding needed, perhaps, was a stronger arm for wielding the rod, and so afterwards he was sent to this learned quartermaster, who was noted mostly for his love of lengthened, sonorous words.

"Well had the boding tremblers learned to trace
The day's disasters in his morning face;
Full well they laughed, with counterfeited glee,
At all his jokes, for many a joke had he;
Full well the busy whisper, circling round,
Conveyed the dismal tidings when he frowned;
Yet he was kind, or, if severe in aught,
The love he bore to learning was in fault.
The village all declared how much he knew;
'Twas certain he could write and cipher, too.
Lands he could measure, terms and tides presage;
And e'en the story ran that he could gauge.
In arguing, too, the parson owned his skill,
For e'en though vanquished he could argue still."

outsiders of the work within his own small circle, the only thing he knew anything about, namely, to teach, or try to teach, or look and talk as if he would very much like to teach everybody with whom he came in contact.[1] As to his fitness for imparting salutary counsel during periods of political campaigns, the following sketching serves to found an estimate:

In a community bordering upon the Oconee used to be a schoolmaster whose fame for several years survived his emigration for the sake of some special points of discipline that were rather interesting. He was an Irishman, rather a better scholar than native professors of the art of pedagogy, and although, like most of his neighbors, fond of good whisky, addicted to praying, when in public, in unambiguous pronouncement of what he desired from these petitions to Almighty power. He was as ardent a partisan in the politics of his temporarily adopted country as he had been and continued to be in those of his native country. In his time questions as to the relative powers of Federal and State governments were no less animating than they have ever been at any period since. The exponents of the two parties in the State were George M. Troup and Gen. John Clark, the latter of a family distinguished for services rendered in the war of independence, a favorite friend of Andrew Jackson, and ardent even to audacity in support of Federal claims. Troup, less impassioned and much more cultured, led the cause of States' rights and State sovereignty. Each in turn became governor of the State. The county in which this Irishman's school was situate was largely for Troup. The master eagerly attached himself to it, perhaps not less because of such preponderance than of its supposed likeness to that of Irish independence. As vigorous and as cheerful a whipper as ever reigned in a schoolhouse, yet the heartiness of his nature, joined with his passionate devotion to the Troup party, together with some peculiar manifestations of that devotion, made him much of a favorite. He felt in his soul that every means plainly or remotely possible for the overthrow of adversaries should be resorted to, from beseeching cries for Divine assistance down to the extending of all sorts of support to party leaders, as well in their personal as their public endeavors and aspirations. Called upon one Sunday to pray before a large congregation at the country meetinghouse, among other interesting things in his loud, passionate petition was that the good Lord would save His chosen people, not only from the world, the flesh, and the devil, but especially from the Clark party.

At the county seat was then a race course to which, during one week in the spring and another in the fall of the year, breeders of fine stock, not only in that county but in many others, resorted habitually. Active among these was the leader of the Troup party, a man who, although only a planter and without liberal education, had uncommon ability and several times was made speaker of the house in the general assembly.

The schoolmaster was deeply interested in some races that were to come off on a certain Saturday, particularly in the ventures of his political chief. So, one Friday afternoon, before dismissing the school, in which were a number of well-grown boys, he decided that it was a fit occasion to make some timely admonitions and suggestions touching the exciting scenes of the morrow. His harangue was about as follows:

"Byes, I suppose ye know that the races is to be in town to-morrow. Now, I advise that ye don't go to town at all, at all, and so keep yeselves out o' temptation. But if your parents let ye go, keep away from the race track. That's no place for byes. Yit if ye *will* go to the races, don't ye bet. Bettin' is a bad thing for grown people, say nothin' for byes. But yit, byes, if ye will go to town, and ye will go to the races, and ye will bet, be sure to put your money on Abercrombie's mare."

---

[1] This habitude of schoolmasters was not peculiar to our set. Charles Lamb, speaking of his embarrassment in the presence of one of this class who was his only companion in the coach while on one of his jaunts between Bishopsgate and Shackelwell, and who propounded questions upon several subjects that Lamb knew nothing about, said:

"Why are we not at ease in the presence of a schoolmaster? because we are conscious that he is not quite at his ease in ours. He is ashamed and out of place in the society of his equals. He comes like Gulliver from his little people, and he can not fit the stature of his understanding to yours; he can not meet you on the square. He wants a point given him like an indifferent whist player. He is so used to teaching that he wants to be teaching *you*. One of these professors, upon my complaining that these little sketches of mine were anything but methodical, and that I was unable to make them otherwise, kindly offered to instruct me in the method by which young gentlemen in *his* seminary were taught to compose English themes. The jest of a schoolmaster is coarse or thin. They do not tell out of school. He is under the restraint of a formal or didactic hypocrisy in company, as a clergyman is under a moral one. He can not more let his intellect loose in society than the other can his inclinations. He is forlorn among his servants; his juniors can not be his friends."

This account of the meeting is prefaced by this confession, which does not seem entirely inopportune:

"The fact is, a man may do very well with a very little knowledge and scarce be found out in mixed company; everybody is so much more ready to produce his own than to call for a display of your acquisitions. But in a tête-à-tête there is no shuffling. The truth will out. There is nothing which I dread so much as the being left alone for a quarter of an hour with a sensible, well-informed man who does not know me."

MEMORIZING.

One practice in these schools was so useful that to this writer it seems a misfortune that it did not obtain in academies afterwards established and that it was ever dropped from those of any grade. This was "getting by heart" and reciting a number of printed lines every day with, more often without, reference to their meaning. Omission of this exercise is the more strange since persons familiar with the history of the Greeks and Romans know that among them it was regarded of first importance in the education of boys. The poet Horace, in his ode Ad Augustum, tells how he was beaten when a little child by his master Orbilius Pupillus for unsatisfactory rehearsal of a crude translation of the Odyssey by Livius Andronicus. It appears afterwards that he was required to do the same with the Iliad. In his epistle Ad Florum are these lines:

Romæ nutriri mihi contigit atque doceri
Iratus Graiis quantum nocuisset Achilles.
Adjecere bonæ paulo plus artis Athenæ
Scilicet ut possem curvo dinoscere rectum
Atque inter silvas Academi quærere verum,

which are thus translated by Sir Theodore Martin, K. C. B.:

I was brought up at Rome, and there was taught
What ills to Greece Achilles' anger brought.
Then Athens bettered that dear love of song;
She taught me to distinguish between right and wrong,
And in the groves of Academe to sound
The way of truth, if so she may be found.

The author of Gallus, referring to the schools of the grammarians and rhetoricians, to which boys after learning the rudiments were sent, says:

"Dictation exercises were also frequently learnt by heart. Cicero (Ad Qu. Fr. iii, 1, 4) says, Meam (orationem) in illum pueri omnes tanquam dictata perdiscant. As with us the Ten Commandments are learnt by heart the Leges duodecim Tabularum were by the Roman boys." But afterwards Cicero complained that the habit at schools had begun to have less attention than when he was a boy. Discebamus enim pueri duodecim, ut carmen necessarium, quas jam nemo discit.

Quintilian, in "Institutes of oratory," discourses at much length upon the importance, to an orator, particularly of the cultivation of the memory, which as an art was first taught by Simonides. Some curious things are said to have been in this tuition, one of which was that the memory is assisted through localities impressed on the mind. The following are some of the suggestions as to application. After suggestion of taking certain places, for example, in which things that are to be specially remembered occurred, he proceeds:

"They then distinguish what they have written or treasured in their mind by some symbol by which they may be reminded of it, a symbol which may either have reference to the subject in general, as navigation or warfare, or to some particular word;[2] for if they forget they may, by hint from a single word, find their recollection revived. It may be a symbol, however, of navigation, as an anchor, or of war, as some particular weapon. These symbols they then dispose in the following manner: They place, as it were, their first thought under its symbol, in the vestibule, and the second in the hall, and then proceed round the courts, locating thoughts in due order, not only in chambers and porticoes, but on statues and other like objects. This being done, when the memory is to be tried, they begin to pass in review all these places from the commencement, demanding from each what they have confided to it, according as they are reminded by the symbols; and thus, however numerous be the particulars which they have to remember, they can, as they are connected, each to each like a company of dancers hand to hand, make no mistake in joining the following to the preceding, if they only take due trouble to fix the whole in their minds."

---

[1] In this the older Romans followed the example of the Greeks, who regarded such exercises indispensable to the education of even young children. The author of Charicles writes upon the subject thus:

"When the children could read, and understand what they read, the words of the poets were put in requisition, to exercise their minds and awaken their hearts to great and noble deeds. Plato (Leg. VII, p. 810) approves of this, and also recommends committing whole poems or select passages to memory, and this method of instruction seems to have been universal (see Strabo, 1, 2, 3): Λεγουσί πρώτην τὴν ποίητικὴν * * * καὶ τοὺς παῖδασ ἀι των 'Ελλήνων πόλεις πρωτιστα δια τῆς ποιητικῆς παιδευουσι."

The following from Συμποσίον of Xenophon gives a remarkable instance of the results of these exercises. Niceratus says of himself:

Ο' πατὴρ επιμελόυμενος ὅπως ἀνὴρ αγαθὸς γενοίμην ἠνάγκασέ μὲ πάντα τὰ Ομήρου ἓπη μαθεῖν-καί νὺν δοκαίμην ἂν Ιλιάδα ὅλην καὶ Οδύσσειαν ἀπὸ στόματος εἰπεῖν.

Doubtless many another could recite both these great poems from beginning to end. It is plain that mere cultivating of verbal memory was entirely independent of instruction in the poet's ideas.

[2] Thus, if a period begins with the word *solet*, *sol* may be the symbol for recollecting it.

From this most probably was derived the habit of speakers in the frequent use of the word "place." The author suggests another mode.

"Whatever will be of service, however, to everyone, is to learn by heart from the same tablets on which he has written; for he will pursue the remembrance of what he has composed by certain traces, and will look, as it were, with the eyes of his mind, not only on the pages, but on almost every individual line, resembling, while he speaks, a person reading. If, moreover, any erasion, or addition, or alteration has been made, they will be as so many marks, and while we attend to them we shall not go astray. This method, though not wholly unlike the system of which I spoke at first [that in foregoing paragraph] is yet, if experience has taught me anything, more expeditious and efficacious." (Institution Lib., 11, sec. 32.)

Further on, section 40, he says: "If anyone ask me, however, what is the only and great art of memory, I shall say that it is *exercise and labor*. To learn much by heart, to undertake much, and, if possible, daily, are the most efficacious of all methods. Nothing is so much strengthened by practice or weakened by neglect as memory."

In other passages he speaks of the importance of cultivating this faculty and its indispensable need to the orator, even in extempore speaking. He says, section 3:

"The ability of speaking extempore seems to me to depend on no other faculty of the mind than this; for, while we are uttering one thought, we have to consider what we are to say next, and thus, while the mind is constantly looking forward beyond its immediate object, whatever it finds in the meantime it deposits in the keeping, as it were, of the memory, which, receiving it from the conception, transmits it, as an instrument of intercommunication, to the delivery."

In the Old Field schools, not a pupil who could read at all (except a cipherer advanced high enough to be regarded above it) was excluded from this daily exercise. Perhaps nonunderstanding of the words had its own special advantage in quickening verbal memory and making it retentive. This was evinced in the Friday evening declamations, which it was understood that parents and other friends might attend when they chose. It was noteworthy how many boys learned to declaim well. Fortunate it was, perhaps, that the teacher was never a speaker himself, did not know the meaning of the word elocution, and had never heard of the methods since become common of imparting special instruction in it. Boys had this advantage, that there were no models below which imitators are always apt to fall by losing their own individuality and finding it impossible to acquire another's.[1] Stimulus to success was imparted by desire of praise and apprehension of ridicule from parents, friends, schoolmates, and most particularly sweethearts. Youthful orators declaimed in couples or singly, in adjoining woods, selections from masterpieces found in speech-books, notably one entitled the Columbian Orator. Practice upon practice enabled some lads of unusually good understanding, sons of the better class, to render these pieces with a grace and spirit intensely interesting, and were not unfrequently the beginning of a career that made the young orators famous in after years. The idea of prompting a speaker never occurred to teacher or pupil. The habit of daily memorizing made such help needless. The dull tongue of a dull mind might drawl words of passionate, fiery speech in such funereal style as to suggest the words of Theseus at the grief of poor Pyramus in Midsummer Night's Dream, "This passion and the death of a dear friend would go near to make a man look sad." As it was, it became sometimes needful in the audience to suppress loud laughter with coughings and stuffings of mouths with handkerchiefs; but the words, whether accurately enounced or not, were there with every syllable which when once learned

[1] The paucity of great orators within this generation has given frequent occasion for discussion of the causes. Among these one, in the opinion of some, has not received the consideration it deserves. This is the habit of many young men with aspirations prompting in that direction submitting themselves to be trained by what are now known as elocutionists, and thus, as it has been argued, parting or striving to part from portions of their own individualities and acquiring those of their professors. Now, this is what no man can do, and he is hurt by endeavoring to do it. At least, if he loses or seems to have lost his own, he can not acquire the individuality of another. A skillful actor does indeed personate another, many another, helping himself anon with disguisings and temporarily ignoring of what manner of being is his own. By his portrayings he may excite tears of sympathy for imaginary tragical events, as he excites those of laughter for the ludicrous. But these are known and felt to be not genuine. They impart to the hearer pleasure in contemplating himself thus softened at the sight of even imaginary suffering and amused at others' oddities and absurdities. But an orator is one fashioned after an entirely different mold. Personation of others, whether in the earnest or the sportive, comes not within the scope of his vocation, which is to convince, to warn, to persuade, to praise, to accuse, and these themes, never imaginary, but always real, never trifling, but always important. With one or another of these objects in hand, it is impossible to the handling of it efficiently that he have in view any but the theme itself and himself, its advocate. Herein sincerity must rise to its utmost. No great achievement in eloquence can be compassed without it. For this reason Quintilian argued that no man can become a great orator unless he be a good man. Truth, justice, mercy, whatever be his aim, he must love it with all his heart, as a mother loves her child, as the new bridegroom his bride; he must feel the eagerness of Peter when in anguish, for the apparent doubt of his master, he cried: "Lord, thou knowest that I love thee." This is a single combat, others' help only serves to confuse and to trammel. It is as if a combatant were holding in his hand two swords; his own and another's. It is a notable fact that when, after the death of Pericles and Demosthenes, who taught each himself, rhetoricians began to teach the art of oratory, it began and continued to decline.

no more than his A B C's could he forget. Stocks of words thus acquired, whose meaning was not understood, nor often inquired into, served as one of the elements in those numerous striking individualities in weak minds which rendered their ludicrous essayings to rise above their capacities themes for the character sketcher. A feeble understanding, so unconscious of its feebleness as to imagine itself particularly vigorous, attempting to make its sallies and displays notably interesting, is of the kind most common for the use of the humorist. In such minds memory of great numbers of words lengthened and sonorous had been lodged and begotten much fondness, occasionally harmless pride which must be gratified by their at least occasional display. What was the use of learning them and of being whipped over and over again for not learning them faster, if they were never to be put forth in after life? As for their meaning and special fitness in Friday evening declamations and class readings, they were never thought of by such as these. Why should it be critically considered when the user, no longer a schoolboy, was a man grown, a freeman, a voter, a married man, or a candidate for matrimony, sometimes for justiceship of the peace, for captaincy in his militia district, not seldom for the pulpit. The more one reflects upon what is known as the humorous in character sketching, the more one is apt to refer it in large measure to the innocent, often pathetic careerings of narrow understandings to exhibit themselves beyond their limitations. The eager sense of freedom, of individual freedom, settled in the being of the white men in this region was naturally more pronounced among weak than among strong minds. Never dreaming of the danger of misapplication, they could abandon themselves to full enjoyment of such rich possessions. Treated as equals by their superiors, the latter adopting their own language, often taking counsel, even in matters of grave import, with others in their rank, nothing seemed to them to be a hindrance to their use when occasions were presented of the higher language of those superiors as they often had heard it on the stump and in the court-house. The words learned at school from the spelling book and the English Reader were in their memories still, never to be forgotten. These the freeborn Georgian felt himself at liberty to employ whenever they seemed to him to fit in with his other attempts in exalting himself to a level to which, the weaker his abilities, the more ardent and hopeful his aspirations. Many, many scenes there were in that primitive simple society wherein sallies were put forth that must have drawn smiles from the weeping philosopher, and compel the laughing to exhaustion from the merriment. These scenes were in social parties, court-yards, in the jury box, on the benches of justices of the peace, at regimental and battalion musters, piazzas of village and country stores, election precincts, in love letters and love tales, containing quotations from great orators and great poets who in their day did not dream of such marvelous application of their mighty phrase. Even in the pulpit on monthly Sunday meeting days, were occasional expoundings of St. Paul's Epistles to the Romans and the Hebrews, which Dr. John Gill, Dr. Adam Clarke, Suarez, and Thomas of Aquinas would have been forced to acknowledge were far beyond their ken or comprehension.

In this region not very long back, numbers of persons, men and women, when far advanced in age could recite many of the pieces memorized in childhood. As for the Bible, but for this early habit, unaccountably strange would have been the familiarity they had with the books both of the Old Testament and the New. It was not very uncommon with college students half a century ago who, after writing a piece requiring half an hour for delivery, rendered it with entire accuracy after one reading. Yet, in the next generation, after memorizing had ceased to be a daily exercise in schools, speakers on college commencement occasions had to be supported by promptings, than whose low, sneakingly sounding coadjument few things fall more odiously upon the ears of audiences. Some relief to this odium was had occasionally when a prompter's voice, too slow and small to be heard by his principal, after a backward glance of angry disgust, ridiculous to all others, put itself forth again in braver, honester key.

Illustrating this practice so favored by Quintilian, a speech of those previous times was seen by the eyes of the speaker as plainly as if he were reading it on printed pages. He saw when to turn over from one page to another. In cases where a speech had to be revised and rewritten, he learned, after feeling the inconvenience of not doing so, to postpone study of the pages themselves until making the last copy from which he was to declaim. Fifty to sixty years after the passing of their school experiences, many could remember with undiminished clearness positions of rules and single words on the pages of text-books long become obsolete.

DISCIPLINE.

The young of that generation had been assiduously trained in one special virtue, deviation from whose observance had never a hope of toleration. That was absolute, unquestioning obedience to authority. Youth—youth advanced to nineteen and twenty—childhood, even infancy learned from the beginning that disobedience had

and that it could have but one end—punishment, prompt, and, according to circumstances, more or less condign. Delinquents knew that as sure as the morrow's sunrise would follow the sunset of to-day, punishment would succeed upon wanton disobedience. This punishment was corporal. It was not very often preceded nor accompanied by remonstration. It did its work without hesitation, and usually without anger; and the culprit after infliction easily resumed the position he held before in parental affection. Parents, with few exceptions, seemed to regard corporal punishment the only really effectual discipline for children, particularly for boys, and they did not hesitate to employ it when believed necessary, even up to incipient manhood. The idea, as all students in the history of mankind know, was not new. When and where it began in schools has not come down. Credited tradition gives account of Toilos, Homer's schoolmaster, whose flagellations of his pupil got for him the name of Ὁμηρομάστιξ. We know that it was in at least one of the schools of Falerii in the time of Camillus, centuries before Christ, when the boys, sons of the principal citizens, were led by their master to the besieging general, who, in horror of the treachery, had him stripped, bound, and driven back by his pupils with rods such as withal he was accustomed to belabor their backs. Centuries afterwards, Horace, disgusted with hearing Ennius called the Latin Homer, and his nephew, Pacuvius, praised above his betters in Greece, and recalling how he had been beaten by his master, Orbilius Pupillus, when a little child while learning to recite the clumsy translation of the Odyssey made by Livius Andronicus, complained of—

> Old Livius' poems which with ruthless cane
> Orbilius whipped into my boyish brain.[1]

This is one of the choicest among the numerous excellent writings of Horace. It was done after an intimation from the Emperor that it would please him if the poet would address one of his epistles to him. After the usual compliments he discourses among other themes upon the overvaluation of the older Roman poets merely because they were Roman, so of the numberless contemporary scribblers for the same reason. In this connection he made a noble appeal in behalf of genuine poets, who are the chiefest promotors of piety, patriotism, and all other virtues. The bard never had higher praise than these lines:

> Os tenerum pueri balbumque poeta figurat,
> Torquet ab obscenis jam nunc sermonibus aurem,
> Mox etiam pectus preceptis format amicis,
> Asperitatis et invidiæ corrector et iræ;
> Recta facta refert, orientia tempora notis
> Instruit exemplis, inopem solatur et ægrum,
> Castis cum pueris ignara puella mariti
> Disceret unde preces, vatem ni musa dedisset?
> Poscit opem chorus et præsentia numina sentit,
> Cœlestes implorat aquas docta prece blandus,
> Avertit morbos, metuenda pericula pellit,
> Impetrat et pacem et locupletem frugibus annum,
> Carmine di superi placantur carmine manes.

Some years later Martial was much more censorious, not, as would appear from personal experience, other than frequent annoyance from the noise and tumult coming to his ears from a schoolhouse in that quarter of Rome where now stands the Piazza Barberina, not far from which he had the misfortune to live, but from sympathy with the urchins who, in his judgment, were treated with needless harshness. Clamosus and Sceleratus, as well as Plagosus, were titles applied by him to the schoolmaster.[2]

The custom was for a schoolmaster to call for his pupils at their homes very early in the morning.

The usage came down unchanged to the time of our English forefathers. Dr. Richard Busby solemnly believed, doubtless to his dying day, that the great numbers of illustrious men who had been trained in Westminster School, of which he was head master for near sixty years, were owing mainly to the floggings that he inflicted habitually and remorselessly. It was said that he was particularly proud

---

[1] Non Equidem insector delendave Carmina Livi
Esse reor memini quæ plagosum mihi parvo
Orbilium dictare; sed emendata videri
Pulchraque, et exactis minimum miror.
(Epistola ad Augustum, Lib. II, I and XIX.

[2] Quid Tibi nobiscum est? ludi scelerate magister,
Invisum pueris, virginibusque caput?
Nondum cristati rupere silentis galli,
Murmure jam sævo verberibus que tonas.
(Ep. XII, lvii.)

Further he says:

> Jam tristis nucibus puer relictis
> Clamoso revocatur a magistro

of what these had done for Robert, afterwards Bishop South, whose uncommon dullness in boyhood made indispensable their daily application for a long time, and who lived to be the most eager and able advocate among all his contemporaries of "divine right" and "passive obedience." In the History of the Rod, by Rev. William M. Cooper, A. B., occurs a very interesting paragraph, the first sentence of which might suggest some guessing as to the comparative number of like achievements of Dr. Busby.

"It is recorded of a Swabian schoolmaster that during his fifty years' superintendence of a large school he had given 911,500 canings, 121,000 floggings, 209,000 custodes, 136,000 tips with the ruler, 10,200 boxes on the ear, and 22,700 tasks by heart. It was further calculated that he had made 700 boys stand on peas, 6,000 kneel on a sharp edge of wood, 5,000 wear the fool's cap, and 700 hold the rod" (p. 42). In all probability the head master of Westminster beat this record, as he was six years longer at the business. In the item of canings he may be safely set down for at least an even million; possibly in that of custodes (whatever they might have been) he may have fallen a trifle below.

Dr. Samuel Johnson, despite other faults in the master of Lichfield School, respected the rod although there were some irregularities in its infliction. Of him he said, "He was very severe—wrongheadedly severe. He used to beat us unmercifully, and he did not distinguish between ignorance and negligence, for he would beat a boy equally for not knowing a thing as for neglecting to know it. He would ask a boy a question, and if he did not answer it he would beat him without considering whether he had had an opportunity of knowing how to answer it. Often while flogging he would use these words: 'And this I do to keep you from the gallows.'" Yet, later in life he referred to the same person thus: "Mr. Langton, one day asking him how he had acquired such a knowledge of Latin, in which I believe he was exceeded by no man of his time, he said, 'My master whipped me very well. Without that, sir, I would have known nothing;' and then he added, 'I would rather have the rod to be the general terror to all to make them learn than to tell a child, if you do this and thus, you will be more esteemed than your brothers and sisters. The rod produces an effect which terminates in itself. A child is afraid of being whipped and gets his task, and there's an end on't. Whereas by exciting emulation and comparisons of superiority, you lay the foundation of lasting mischief; you make brothers and sisters hate each other.'"[1]

In our community rewards for welldoing other than the pleasure derived from giving satisfaction to superiors were not received nor expected. To be rewarded, even to be much praised for obedience to orders, did not seem to be a becoming item in domestic discipline. It was enough to escape punishment for its neglect. Yet nowhere were domestic affections and confidences more prevalent or more outspoken.

Such rule in families made that of the schoolmaster entirely secure. It was understood that to him in his official person full parental authority had been delegated. Now this functionary did not have, apparently did not desire to have, and it was not possible for him to have, acquaintance or approximation to acquaintance with genuine parental discipline. The injusta noverca complained of by the Shepherd in Virgil was not one with whom it was more hazardous to trifle. Continual manifestation of authority was necessary both for his own personal security and compass of the purposes for which he had been employed. The ideas of his predecessors in Magna Grecia, in Egypt, Phœnicia, and India, doubtless even in him who taught letters to Enoch, ancientest of authors, had descended to him without an item lost. Those ideas were that children, especially boys, came to him, as was done by their precursors throughout the period of letters, predisposed to shun, in every way possible, the doing of things which they were sent there to do; that they regarded him as their natural foe; that therefore they felt themselves at liberty to elude and deceive him, even in trifling particulars. And so, it was his province to suspect, watch, detect, and chastise without attempt or hope to mend their morals; added to this, to get into their heads as much as he could of the knowledge of books within his own, by meeting all resistances with flagellations. He believed through and through his small volume of understanding, that never had been, was not now, and never would be a schoolboy hesitating to utter falsehood at school whenever it seemed to be needful to screen him from punishment. If the truth were answered in entirety, he distrusted, and avowed his distrust because the truth was never expected. And so the schoolmaster, seldom cruel by nature, too slenderly and by too many odds and ends made up in his being to take actual delight in sight of pain,

[1] Boswell's Life of Johnson, I, 161.
Apropos are these verses from Crabbe's Schoolmaster:

"Students," he said, "like horses in the road,
Must be well whipped before they take the load."

Plutarch in his Life of Lycurgus has the following about schoolboys in Lacedæmon: "They were to give a good reason for what they said, and in as few words and as comprehensive as might be; he that failed in this, or answered not to the purpose, had his thumb bit by his master."

finding himself absolute monarch over a collection of unloving and unloyal subjects during eight and ten hours a day, assured in his mind that the average boy would not perform his tasks without compulsion, kept himself supplied with seasoned hickory switches and plied them with more or less rigor, according to circumstances. These circumstances were the varying conditions of his own temper, and what was expected of him by parents and others in the world outside. Not one of these but counted upon whipping of some sort with sufficient frequency and proper severity. The preacher's admonition about sparing the rod was accepted unanimously. Even a good boy, unless his body and legs were too little or too frail to endure it, must be whipped occasionally by way of prevention. Whipping was so good and precious a thing in itself that it would seem a hardship for even a good boy to be allowed to grow up without personal experience of its benign efficiency.[1]

Expected to whip, to the Georgia schoolmaster it did not seem necessary, or, if it was, he did not know how to gauge his flagellations by any defined scale. Some children he whipped oftener and harder than others, according to his knowledge of the expectations and claims of parents who insisted upon getting the worth of their money. Children, except in cases particularly hard and unmerited (which seldom occurred), did not usually report these things at home, foreseeing no sympathy, at least from their fathers, and it might be, apprehensive of ratification in the form of repetition. Besides, it was held dishonorable to "tell tales out of school." One of the very few incidents which the writer can recall of his first year at school, when he was 5 years old, was a remark made one evening by one of the neighbors to him and his own son of the same age. The question as to how many whippings each had gotten that day receiving answer of one apiece, he said, "Teacher's no account! Thought so when he first started. Looked too good-natured. There isn't a boy in this whole neighborhood that oughtn't to get at least two whippings every day at school and three at home every night. No account, no account!" He was doubtless partly in jest, yet most probably he was not very grossly exaggerating his real sentiments.

As for disgrace in such punishments, in the case of boys, nobody dreamed that any sort attached to it, although girls felt it keenly. So, resentment in after years

---

[1] The extent to which this idea used to be forced in English schools was so brutal that it is not easy to believe that such things ever were. In the History of the Rod is the following: "Erasmus was a favorite with his master, who had good hopes of his disposition and abilities, but flogged him to see how he could bear the pain, the result being that the rod nearly spoiled the child; his health and spirits were broken by it, and he began to dislike his studies. He describes, without naming, another schoolmaster who was of a similar disposition. This is thought to be Colet, dean of St. Paul's, who, although he delighted in children and was a good man, thought no discipline could be too severe in his school, and whenever he dined there one or two boys were served up to be flogged by way of dessert. On one of these flogging occasions, when Erasmus was present, he called up a meek, gentle boy of 10 years old, who had lately been commended to his care by a tender mother, ordered him to be flogged for some pretended fault, and saw him flogged till the victim was fainting under the scourge; "not that he deserved this," said the dean to Erasmus while it was going on, "but it was fit to humble him."

Indeed, so indispensable was this instrument regarded in schools that princes had to undergo its infliction, but through a substitute, who was called "a whipping boy." There is an old play, published in 1632, in which a prince (supposed to be Edward VI) holds a dialogue with his "whipping boy."

"*Prince.* Why, how now, Browne, what's the matter?

"*Browne.* Your grace loyters, and will not plye your books.

"*Prince.* Alas, poor Ned! I am sorry for it; I'll take the more pains and entreate my tutors for thee." (His. of the Rod, p. 428.)

Eton College was not to be beaten by any in loyalty to the rod. Nicholas Udall, author of Ralph Royster Doyster, the first English comedy, who, besides being head master, was canon of Windsor, was celebrated by an old pupil, Thomas (usually called Thommy) Tusser, who became author of a famous old Georgic entitled A Hundreth Good Pointes in Husbandrie, thus wrote:

> From Paules I went, to Eton sent
> To learn straight waies the Latin phrases;
> Where fifty-three stripes given to me
> At ones I had.
>
> The fault but small, or none at all,
> It came to pass thus beat I was:
> See, Udall, see, the mercie of thee
> To me, poore lad.

Yet Udall was surpassed by one who flourished as late as the year 1830, Dr. Keate, whom Kinglake, author of Eothen thus describes: "He was little more, if more at all, than 5 feet in height, and was not very great in girth; but within this space was concentrated the pluck of ten battalions. He had a really noble voice, and this he could modulate with great skill, but he had also the power of quacking like an angry duck, and he almost always adopted this mode of communication in order to inspire respect. He was a capital scholar, but his 'ingenuous learning' had *not* 'softened his manners,' and *had* 'permitted them to be fierce'—tremendously fierce. He had such a complete command over his temper—I mean of his good temper—that he scarcely ever allowed it to appear; you could not put him out of humor; that is, out of *the ill* humors which he thought to be befitting for a head master. His red, shaggy eyebrows were so prominent that he habitually used them as arms and hands for the purpose of pointing out any object toward which he wanted to direct attention; the rest of his features were equally striking in their way, and were all and all his own. He wore a fancy dress, partly resembling the costume of Napoleon, and partly that of a widow woman." The author of History of the Rod tells many other things of this satyr, some of which though atrocious are intensely ludicrous.

seldom had place in men's recollection of schoolboy scenes. One case only used to be told: One day in the town of Milledgeville, a young man upwards of 30, while sitting on the sidewalk before a tavern, observed a strange looking, rather elderly gentleman passing by. Attracted by his looks and gait, after some moments he rose and followed him. Overtaking him he asked if his name was Nahum G——, and if he ever kept a school in the county of Hancock. Answer being in the affirmative—

"In that case," said the youth, "I owe you a debt that has been standing ever since. My name is Seymour B——. Fifteen years ago you whipped me for nothing, and I then took an oath that if I should live to be big enough and meet with you I'd pay you back."

Then he knocked him down. The gentleman, rising, said:

"Well, young man, you bear malice right long; are you satisfied?"

"Entirely. You'll discharge me of the interest, I doubt not. We are even; good day."[1]

This case was an exceptional one, for this school discipline, however absurd and needlessly rigorous, was not often marked by cruelty or very much asperity of temper. Habit certainly obtunded the sympathy with which such men might have been born, and so habit served to subdue much of the wrath liable to be indulged against daily derelictions, real and imaginary.

There was one exception, and that in the case of one native born. Oldest of a family of seven boys, with several girls coming on later, son of an upright but stern, saturnine, generally eccentric father, he opened a school, where it was soon made manifest that even above the glory he took in his knowledge of ciphering and possession of an excellent handwriting, and next to the pay he got, was that of wielding the rod and the ferule. It was interesting to note the cheery smiles bespreading his face and the glistening of his white teeth as he looked into the weeping eyes and heard the beseeching cries of his victims. Hardest of all he was upon his younger brothers, perhaps because in his view they were far too supernumerary. One of these particularly, the fifth on the family list, he seemed to hate because he could never make him afraid of him. Occasionally the lad, then about 10 or 11, caught the switch in his hand, remonstrated against his brother's unfeelingness, and declared that he would inform his father. Jerking the weapon away, he laid on with fresh vigor, saying about thus:

"Tell him and welcome, you scoundrel, and get two more whippings in the bargain, one from him and another from me." The boy well understood the efficacy of this threat; but it was interesting and it was pathetic to note the resoluteness with which he continued to resist the audacious despotism and hold out against being subdued in spirit. It got for him many an additional stripe; but this did its own work in developing the manhood that was in him.

Yet such extremes happened not often, and except with his own and some of the lowliest in social standing, this man kept within limits that he knew he could not overpass in safety. He often chose to diffuse his inflictions in ways more funny than harsh. Sometimes placing his chair in the middle of the room, he caused urchins, after forming a ring, to trot around him while he tapped their legs with one of his switches. A favorite exercise was one that he called "horsing." A boy, taking upon his back one of his fellows and coevals, curveted about the room, while the master, pursuing, switched the rider on the part of his body that was most fleshy and exposed. After satisfactory chase, the equestrian entertainment was reversed, rider and horse changing places.

The original of this exhilarating, but rather one-sided sportive exercise, dates farther back than it may be generally supposed. In a letter received by the author of a printed collection of stories of southern life from Dr. Charles Forster Smith,

---

[1] There is an account of a like intent, but with different results, with a Scotch schoolmaster, one Hacket, and Anderson, an old pupil. "His punishments were so many and unjust that Anderson, who had many a bitter taste of the birch, conceived the most deadly sentiments of revenge against his master. He left the school, went to India, acquired a competency, and returned to spend his days in Scotland. During his long residence in India he never forgot his floggings at school, or his determination to be revenged on Hacket. On his arrival in Scotland he purchased a whip, traveled to the town where he had been educated, and having ordered a dinner for two at an inn, sent a message to Hacket (who had retired from his profession) inviting him to dine with an old pupil. Old Hacket accepted the invitation, dressed himself in his best, and went to the inn. He was ushered into the room where he saw a gentleman who, as soon as he entered, locked the door; then, taking down the whip, introduced himself, and informed the astonished Hacket that he was now about to punish him for the many flagellations he had inflicted upon him at school. So saying he ordered him to strip and receive the punishment. Hacket's presence of mind did not desert him in such untoward circumstances. He acknowledged that perhaps he was a little severe with his boys in old times, but if he had to be punished, he would prefer having dinner first and the flogging afterwards. Anderson could not but assent to such a reasonable proposal, although inwardly resolving that the flogging should be none the lighter for the waiting. So they sat down to the dinner, which proved excellent; and old Hacket's conversation was so fascinating and agreeable that gradually Anderson found his purpose of revenge growing weaker. At last he gave up all thoughts of his whip and the intended flagellation. Hacket got home in perfect safety, for his host insisted upon escorting him to his own door." (His. of the Rod, p. 447.)

professor of Greek in the University of Wisconsin, occurs the following passage: "I have had occasion to refer several times recently in lectures on old Greek schooling to the account of the method of punishment called, I believe, "horsing" or "playing horse," as an interesting survival, practically, of old Greek and Roman ways of punishing. An elderly lady told me the other day that she had known this method applied in a single case in England, but there the teacher may have been consciously imitating Roman customs."

Parker, in the work before quoted, says (p. 449): "In some of the schools in Edinburgh 'horsing' was practiced—one boy being flogged on the back of another boy. In English schools 'horsing' was also prevalent."

Nigh as formidable as the rod was the ferule.[1] But this was used mainly on the girls.

Here one is again reminded of Charles Lamb. Referring to a school kept by one Bird, which in their youth was attended by his sister Mary and himself, he said:

"Whippings were not frequent, but when they took place the correction was performed in a private room where we could only hear the plaints, but saw nothing. This heightened the decorum and the solemnity. But the ordinary punishment was the bastinado, a stroke or two on the palms with that almost obsolete weapon now, the ferule. A ferule was a sort of flat ruler, widened at the inflicting end into a shape resembling a pear—but nothing like so sweet—with a delectable hole in the middle to raise blisters, like a cupping glass. I have an intense recollection of that dismal instrument of torture, and the malignity, in proportion to the apparent mildness, with which its strokes were applied. The idea of a rod is accompanied with something ludicrous; but by no process can I look upon this blister raiser with anything but unmingled horror. To make him look more formidable—if a pedagogue had need of these heightenings—Bird wore one of those flowered Indian gowns formerly in use with schoolmasters, the strange figures upon which we used to interpret into hieroglyphics of pain and suffering.

"I have been called out of my bed, *and waked for the purpose*, in the coldest winter nights—and this not once, but night after night in my shirt, to receive the discipline of a leathern thong[2] with eleven other sufferers, because it pleased my callow overseer, when there had been talking heard after we had gone to bed, to make the six last beds in the dormitory, where the youngest children slept, answerable for an offense they neither dared to commit nor had any power to hinder."

This instrument, the ferule, in the hands of the master who is now being considered, was occasionally diverted from use among the girls, partly for the sake of variety, more often for inflictions undertaken vicariously.

A year or so back a friend of this writer sent to him a copy of a volume lately published in Paris, a production of M. Varigny, entitled Les Femmes des États-Unis. The opening sentence, "L'Europe s'américanise," attracted to its perusal at once. It contains quite a number of commentaries, some quite amusing, and some as thoughtful upon society in the United States, particularly as it is affected by the chivalric sentiment felt by men for women. One occasion when this sentiment was displayed seemed to him peculiar, and he devoted considerable space to its consideration, giving an extract of several pages taken from a character sketch entitled "How Mr. Bill Williams took the responsibility." The story was founded upon a custom obtaining in old-field schools in middle Georgia, in which when a girl was judged to come under need of punishment, she might escape by substitution of one of the boys.[3] When and where the custom originated could not, it is most probable,

---

[1] A name well derived from "ferire," to strike.

[2] Possibly the only instance of this diversion from the instruments aforementioned occurred in a school situate on the western section of our region. The master used a leather strap which, among others, served the purpose of rod and ferule. On one occasion, in the hurry of castigation, he grasped it by the tail instead of the head, and had proceeded but a little way when the boy, writhing with the uncommon pain, shrieked: "The buckle end, Mr. Dobbin! You're givin' me the buckle end!" The fun was so exquisite that infliction was suspended sooner than usual that the master might laugh his laugh.

[3] In this very interesting book are reflections upon the relations between President Jackson and Mrs. Eaton, between Jerome Bonaparte and his first wife, Elizabeth Patterson, of Baltimore, and between Jay Gould and his wife. The following is a portion of the concluding page:

"Si l'Union américaine est aujourd'hui l'un des premiers pays du monde, elle le doit, en grande partie, à la femme américaine qui fut et qui est encore un important facteur de son étonnante prospérité. Les États-Unis lui doivent d'avoir conservé la foi religieuse, ce principe de vitalité, importé par les Pilgrim Fathers sur les côtes de l'Amérique. Elle a été l'efficace artisan de l'œuvre première; elle l'a maintenue, étendue, élargie par le temple et l'école. Aux heures difficiles, lors de la guerre de l'indépendance et, plus tard, lors de la guerre de sécession, le patriotisme de la femme a soutenu le courage de l'homme. En toutes circonstances, elle fut sa compagne et son égale. Comme telle, il l'a respectée, et ce respect qu'elle lui a inspiré, par son abnégation et sa vaillance au début, par son intelligence et sa culture, ensuite, par ses charmes et sa confiance en sa protection, a façonné les mœurs américaines, les a fortement imprégnées de l'idée que le respect de sa compagne était pour l'homme l'une des premières conditions de la vie morale. Cette vie morale est son œuvre à elle; elle l'a créée et elle l'entretient. Dans le culte dont elle-même est l'objet, dans l'hommage que l'homme lui rend, il y a plus et mieux que l'attrait que son sexe inspire, il y a l'instinctive reconnaissance d'une grande et solitaire influence noblement exercée."

be told, but certain it is that seventy-five years ago it was universal in these schools in the case of girls of considerable growth, often with the smallest. Indeed, one of the coquetries of girls was made specially manifest in those frequent essays of enforced gallantry. Many a girl did a punishable thing simply in order to make trial of chivalrousness among her boy schoolmates. That she would suffer remorse for such experimenting, or be sensible of acute sympathy for the pain of sacrifice made in her behalf, was not to be expected. She might express some little concern, along with thanks, but the smile on her face and the twinkle in her eyes showed that in her judgment he had only rendered a service that it would have been shameful to neglect. Scenes of this sort not unfrequently later on led to consequences happy to both, unions of hearts and hands in preparation for joint performance of the work and joint experience of the fortunes of life. They had their relative importance among other indications of what might not improperly be called the reverence that was paid by the men in that community to its women. A custom time-honored as this, even a master like the one last mentioned could not wholly ignore. There were some girls, daughters of the humbler sort, plain, uncommonly indocile, whom he would have liked to treat as boys. But these, like their brighter and more respectable companions, went not without substitutes; yet he occasionally railed at them in terms and tones that no brave sane man is ever tempted to employ toward the female sex.[1]

In this same school was a pupil, the recollection of whom, now so far away in the past, suggests thoughts of comparison between him and that character in the courts of absolute monarchs in the Middle Ages known as the fool. Regarding this latter personage, it used to seem strange that he could ever have imparted as much interest. Reflection, aided by considerable reading upon the speculations of critics upon the subject, has served to convince that he was a necessary constituent in the suite of a despotic autocrat. A king whose will is absolute and his authority claiming and receiving unquestioning submission, needs to have about him one whose careerings in apparently independent speech and other deportment serve as a foil against the surfeit that sometimes must come from continuous abjection of servility in the rest of his attendants. The mimicry of freedom and courage, the vauntings, the ludicrous givings and takings of pointless gibes, not only make pleasant diversion, but they contribute to his sense of security when the flatterers around him, even the most aspiring, see in such essays that all thoughts of gainsaying his domination are possible to none but fools. And so this semblance of rivalry is put in fanciful garments, with cap and sword, having access to all knots and companies with a liberty to say and do as may please his little soul.

The person herein alluded to was a young man near full grown, who, not being passionately fond of the work on his father's farm, and persuading the old gentleman that it might be well to have somewhat more added to the little stock of knowledge he already had, came to this school really for the purpose of getting amusement for himself and adding to the entertainment of the teacher, who was his friend. It is not remembered whether he ever recited a lesson. He may have done a little ciphering, advising with the master from time to time touching obstinate problems in arithmetic, all to put some little of cover over his idleness and general good-for-nothingness. But his main service as he is now remembered, as he sat near the master, was to make funny remarks on the exercises, recitations, conning of tasks, Friday evening speakings, and whippings. In all probability he had been beaten habitually and

---

[1] It seems too monstrous to be credited, but in English female schools as recent as the time of the country schools herein described, discipline was more shockingly atrocious than in male. In a letter by an aged English gentlewoman to her granddaughter she tells of some of her experiences in the early part of this present century at Regent House, near Bath, a select school to which none were admitted except young ladies of the "first fashion." One of the instruments of punishment was made of five pieces of whalebone wound around with waxed thread to keep them together, giving what was called by the pupils "Soko," and its fangs were like a cat o' nine tails, spreading over the quivering flesh. The following account is interesting:

"There were two or three degrees of severe whipping. One was in private, with only the Misses Pomeroy and a servant present; another was being publicly prepared for the punishment before the whole school, and then being forgiven, and lastly, there was the public whipping fully carried out." Of her only one private whipping she says: "I was formally bidden by the teacher in charge of the schoolroom at the time to fetch the rod and carry it into a room which the principals called their study. There I found the two ladies, before whom I knelt and presented the rod, which the elder took and drew through her fingers caressingly, as it seemed to me. Then she rang a hand bell which stood upon the table beside her, and one of the maids entered and was bidden to prepare me. This was done by simply turning my clothes up and holding my hands." Further on she adds: "Alas! I got used both to feeling and seeing such floggings before I left Regent House. I have seen marriageable girls flogged for breaches of discipline before all their schoolfellows, the necessary portion of their dress being removed. There was a dress put on for a public flogging, something like a nightgown, and in this the culprit was exhibited before all her schoolmates to receive her punishment. She was made to stoop forward over one of the desks, her hands being firmly held by an attendant, and her feet secured in the stocks on the floor. I remember well a young lady being chastised in this way only a few weeks before she left school to be married." (History of the Rod, p. 456.)

An added zest to these ladies' enjoyment of such inflictions consisted in this: Culprits humbly petitioned for them, and after they were over expressed gratefulest thanks.

sorely during his own early school days, and so was taking this post-graduate course in order to realize fully the reminder that his time for such as that was over, and to enjoy the sight that others' was still on hand. Answers in recitation pronounced unsatisfactory by the master seemed to please him well, and provoked mildly facetious comments. But the highest height of his wit and of its enjoyment was reached when derelictions of any sort were rectified by the switch or the ferule, varied now and then with slaps with the hand upon the cheek, or by blows upon the head with the fist. How long he continued there can not now be remembered, but these exploitings of his could not be forgotten. Not long afterwards the master migrated, and during many years we heard of his doings, his beginnings and endings, his ups and downs, his growth in vagaries and eccentricities, and finally his lapse into insanity. His treatment, so brutal in rigor, was no longer recalled with anger, his pupils grown to maturity reflecting that this infirmity, then unnoticed, may have already begun in the period of infliction. He is dismissed with the following anecdote and one of his rules in spelling:

A plain girl, nearly grown, who had come in but lately, was called upon to read the Partial Judge in Webster's spelling book. Persons familiar with that ancient and intensely revered text-book, recall this impressive story of the farmer and the lawyer, touching the unequal encounter between the bull of the latter and the farmer's ox, in which was made immortal the maxim, "The business could have been concluded without an *if*." This girl had not been made acquainted with the master's rule that one of the words in the spirited account must be omitted and a couple of others substituted in its stead. Having read as well as she could and with becoming solemnity these words, "One of your oxen has been gored by an unfortunate bull——" she was suddenly stopped, looked at with severe displeasure, and thus accosted:

"I'm astonished at you, Betsey——! But I suppose, as you're a new 'un, you didn't know any better, and that the rules of this school is, that when scholars come acrost that awful last word, they've got to drop it, and say man-cow, which it is decenter and shows more manners."

In spelling the name "Aaron" his pupils were required to say, "Big *A*, knock down little *a*, r-o-n—ron, Aaron."

Indeed, very few resentments were afterwards indulged toward these petty despots. On the contrary, this writer, hundreds and hundreds of times, in conversations with persons of all classes, particularly with men eminent at the bar, in the forum and the pulpit, has heard recitals of numberless absurdest oddities, wherein their own, as well as others', school floggings were told amid shouts of heartiest laughter. The idea with all was that in the old times such flagellations were as much an indispensable part in the make-up of a schoolmaster as his head and the thimbleful of brains it contained; that this item had to be held in practical application by habitual exercise just as his physical existence was sustained by daily food; that whipping, the only thing he knew to perfection, must be kept handy, with never a thought of relaxation.

GAMES.

Games in these schools were as hearty as simple. Girls, who always played apart, were fond of "jumping the rope," two holding the ends at distance of about half its length, twirling it on high and beneath rapidly, while, as it struck the ground, one or more standing in the middle of the space between leaped or hopped over. Victory was adjudged to her who did so oftenmost without impeding the revolution.

Checks.—Perhaps the favorite sport was "checks." Providing themselves with pebbles of quartz gathered among the shallows of the spring branch, of satisfactory shape and size (about two-thirds of an inch in diameter), these, five in number, they put through various evolutions, some quite intricate. Kneeling upon the grass or the floor, the player with her right hand kept continually casting in the air one of the pebbles, employing the intervals of ascent and descent in various maneuvering of the others with the left, taking care to catch the fugitive on its return. Beginning with picking up first one and then another, arranged at corners of a square, this performance ended with gathering all at one sweep, the while her quick eyes alternated between these and the traveler in its ascending and descending, 6, 8, 10, and sometimes 12 feet. Then came on other exploits, resting tips of thumb and fingers of the left hand upon the floor, or the ground, when without doors, at proper intervals, various evolutions were done with the right during the unresting movements of the leading pebble; as "cooping the chicken," "putting calves in the cuppin" (cow pen), "carrying the horses to water," "leaping the bars," etc. Any miscarriage during these exercises "put out" the actor, and another took the checks. Interesting was the delight taken by girls in this sport and the adroitness acquired by many.

Another exercise in this game consisted in casting up all the five checks and catching them on the back of the hand. To one fond of tracing things back to their original, this is interesting because of being played by children among the ancient

Greeks, by whom, according to the author of Charicles, it was called ἀστραγαλίσκος, from ἀστράγαλος, a joint bone, from which dice were made.[1]

This account was gathered from Julius Pollux (whose name properly was Polydeuces), a distinguished Greek grammarian, although an Egyptian by birth, who taught in Athens about the middle of the second century A. D., and was much favored by the Emperors Marcus Aurelius and Commodus. He adds that it was more of a woman's game, and this, as well as his whole account, is corroborated by a monochromatic painting of Niobe's visit to Latona, where the girls are represented playing at this game.

In Georgia it was exclusively a girl's play, just as marbles belonged to boys. One of the latter might occasionally be provoked by his sister or other female friend to try his hand, in order to enjoy his awkward displays, just as he did with their essays at his own peculiar games.

Hopscotch.—Another of their games was "hopscotch." A figure of parallelogram shape about 10 by 6 feet was divided into four spaces, the third from the bottom subdivided into four smaller by lines marked and crossing each other diagonally from its corners. A flattened stone being pitched to the fourth, the upper space, a girl hopped into the first, second, and third spaces, alighted with both feet, the right upon one and the left upon the other of the triangular spaces whose bases were on the long sides of the parallelogram, and then hopped into the upper space. Using only her right foot, she sought to pass with it the stone over the lower spaces, the four triangles, and the two parallelograms. This had to be done in due sequence. If a forceful thrust carried the stone over the next space into the one beyond, she must thrust it back and repeat the exercise. In all this while if the stone should rest on any one of the lines, she was thrown out. If at any time during the performance she was disposed to rest her right foot, she was at liberty to substitute the left.

Chickamy, chickamy, crany, crow.—To this game small boys were occasionally admitted, provided among the girls there were any large and discreet enough to repress their proneness to become rude or boisterous. It was played not often, particularly in the sight or hearing of superiors, who objected on account of the liability of clothes to be torn in some of its rather violent evolutions. It went about thus:

Two among the largest were chosen, one to represent a hen and the other a witch, who was of a mind to get chickens for her meal. The rest (who were the brood), each grasping the skirt or jacket of the one in front, beginning with the biggest, ranged themselves in a line behind their parent. This movement was made at the moment when the hen came upon the witch laying down some sticks with which to build a fire. The following colloquy then took place:

Hen. I went to the well to wash my toe
When I came back, one of my chickens was gone;
What o'clock, old witch?

This was repeated as many times as there were chicks. After naming some hour, the colloquy continued:

Hen. What are you doing, old witch?
Witch. Making a fire.
Hen. What for?
Witch. To heat some water.
Hen. What's the water for?
Witch. To scald a chicken.
Hen. Where'll you get it?
Witch. Out of your flock.

At this the witch rose and ran to the right and left alternately, seeking an opportunity to get behind the hen, who spiritedly watched and tried to hinder, the while the line swinging hither and thither like the movements of a snake. It was not very long before one by one they were slung apart from the line, and, falling in the grasp of the witch, were carried off. The colloquy was repeated after each capture. The play ended with the last. Not seldom the captive carried with her a piece of the forerunner's vesture, or left it in need of prompt readjustment.[2]

Grind the bottle, or puss in the corner.—Like chickamy, chickamy, crany, crow, the chief merit of this game with girls was the jostling it contained. Indeed, this

[1] There was another game of skill, not chance, which was played with these astragals, or knuckle bones, and which is still a favorite amusement of schoolboys in our day. Five astragals or pebbles were laid on the palm of the hand; the player then threw them up and tried to catch them on the back of the hand.

[2] In The Girls' Own Book, by Mrs. Valentine, the first word in the name of this play is "Chickany," instead of "Chickamy," and for the "witch" a "fox" is substituted. Another change is described thus: "At these words, the fox starts up and the hen and the chickens disperse and run away in all directions; the fox pursues them, and when she succeeds in catching a chicken that chicken becomes fox, and seats herself in the middle of the room, while the former fox takes the place of the hen at the head of the procession of chickens.

was so pronounced that it was not seldom that during its most exhilarating midst the mother of the family wherein it was held, or her handmaid, appeared at the door with the announcement that no more of it must be had on that occasion, and so they had to stop, blow, and fan themselves for a space, and go into another that was less tumultuous.

Seats, one less the number of the players, were placed around the room or a space outside beneath the trees. The one not provided with a seat, kneeling in the midst and holding a bottle, began grinding it on the floor. Suddenly she let it rest, instantly rose, and made for one of the chairs which the others at the same moment had vacated. Everyone had to change her seat and seek a new one other than either of those next to hers on the right or left. It was against the rule, and if it had not been was not often practicable, for any two by preconcerted movement to exchange seats with each other. In the rush many a couple aiming for the same were jostled in a way that provoked much fun and laughter.

In time the bottle was excluded as a thing inconvenient and not entirely safe to handle, when the name also was changed to that of puss in the corner.

Blindfold.—This game, formerly called blind man's buff, is known to all, having been played, it is probable, from the beginning of settlements wherein families were numerous and contiguous enough to allow children to meet in habitual congregation and acquaintance. It was played by both girls and small boys, separate or together. The only trick to be guarded against was the one with bandage over the eyes, either by his own adroitness or connivance of her who tied it, getting a vacant or thinly covered space through which she could descry and distinguish her captive, and by naming her get released, substituting the latter in her place. Detection led to the guilty one's exclusion by unanimous acclamation. No boy was allowed to tie for another who was known to be one of his particular pals.

Prisoners' base.—Two rival companies were formed, each with its own base. Anyone who, while coursing about the field, was caught by another of the opposite party who had left her base after the former, was carried and held captive within a ring behind the captor's base, with chance of rescue when one of her own, seizing an unguarded moment, rushed to the edge of the ring and succeeded in touching her eagerly extended hand. The game was ended on capture of the last of one party.

Hide and seek.—This game, always played out of doors, went thus: One who was to be the hunter, having a bandage over the eyes, was placed, for further protection to the hiders, with her face leaned against a tree in the arc of the space in which they were to hide themselves. Then the others ran off in various directions to seek their separate coverts. They were supposed all to have found these during the time occupied by the hunter in counting a hundred. When the count was finished, she removed the bandage, turned, and for a moment surveyed the field. Then she moved in her search. When she found one, she gave a shout of triumph, at sound of which the one found and the other hiders all made haste for the starting point, the one reaching there last, as a forfeit, taking the place of the hunter. As all sports must have some of the spirit of disputation, even when without any degree of asperity, not seldom the hunter had to defend herself as well as she could against the charge of one, who, suspecting or pretending to suspect herself to have been too soon and easily found, accused her of peeping from behind the bandage or of making her count with unfair rapidity.

Hide the switch.—This was a more exciting game than the foregoing. All the players except one turned their backs upon her while, a switch being provided, she moved away to seek for a suitable place wherein to hide it. Danger of espionage was well enough prevented by the watch put upon the lookers by one another. Not wholly relying upon that, however, the hider, even when having already in her mind the place of deposit, approached several others as if debating in her mind which was the best to select. When the switch was deposited, the hider, after repeating her rounds, emerged and gave a shout. In order to hinder the play from being conducted with too long and tiresome search, the hider had to expedite to some degree by giving intimations of the uselessness of looking closely at recesses very remote from the one sought. In such cases she uttered the cry "cold," at which the hunters immediately turned away and made for others. As they began to approximate the true one, the cry "warm" stirred to eagerness, and those of "hot" and "red hot" to intense excitement; that of "a blaze of fire" to fury. When in their haste they passed over the spot, the hunter, with tone implying disgust, cried "cooling off." After that the finding was quick and violent. Discovery by more than one was inevitable, and the discoverers each did the best she knew how to grab the switch. During this last struggle the others on either side rose in order to prepare for the retreat home, for the finder had the right to give as many cuts as she could put upon her rivals on the way there. If two or more hands grasped at the same instant, the advantage was with the one who held the larger end. This generally enabled her to jerk it from the others, who were then sure of getting one or more stripes before attaining the place of security.

This game was not very often indulged in because of the anger apt to be excited by a cut which inflicted more pain than the sufferer in her own mind decided to be fair.

Old Sister Phœbe.—This game, despite its simplicity, was a favorite, particularly with young girls, on account, perhaps, of the quaint language and the music in the couplet repeatedly sung during its performance. One, personating the dame, sat in a chair; the others, joining hands, forming a ring and moving around her, slowly chanted:

Old Sister Phœbe, how happy was she,
When she sat under the juniper tree.

At the end of every chant a momentary pause was made to allow one from those behind the sitter to withdraw quietly and hide herself. This was repeated until the last had withdrawn. Sister Phœbe, whose sleeping had been soothed by the music, awakened by the silence, rising and looking anxiously around, called loudly for her charge. At the call all came running back with the joyous cry, "Heigh-ho! says Rolla." Generally girls preferred to play this alone because of the discord occasioned by boys' careless and otherwise unharmonious chanting. It used to be very pleasant to grown persons, heads of families, when, on moon-lit summer nights, children of both races were allowed to play it together in the yard.

Miley Bright.—This play, yet more simple than the other, went thus: The children ranged themselves in line facing the larger space, slightly semicircular. Between the girls at the foot and the one at the head, beginning with the former, was this colloquy:

How many miles to Miley Bright?
Three score and ten.
Can I get there by candlelight?
Yes, if your legs are long as light.

The answer awoke the admonition, "Mind the old witch don't catch you on the way." At that all would run away except those at the extremes, who pursued until all were caught.

Williamson Trimbletoe.—In this game the children each placed the middle finger of one hand in a circle upon some object, a block if out of doors, or someone's knee if within, and one with her forefinger, beginning with her own middle finger, made the circle of touching all alternately in sequence, word by word, of the following verses:

Williamson Trimbletoe,
He's a good fisherman;
Catches his hens
And puts them in pens;
Some lay eggs and some lay none,
Wire, brier, limber lock,
Sits and sings till 12 o'clock;
The clock run down,
The mouse run round
O-u-t spells *out*—
And Be-gone!

At that instant all except the one upon whose finger the last word fell flew away, while she, personating Williamson Trimbletoe, pursued the chickens, and, catching one by one, conveyed her to the pen. There was neither advantage nor disadvantage to the one counting, as her own finger was in equal chance with the others in escaping the final word.

BOYS' GAMES.

Ball.—Of this favorite sport there were several sorts, all of which of late years have given way to the modern baseball.

Town ball.—Baseball certainly has carried batting, particularly catching, to a degree beyond any attained in old-time town ball; but for heartiness in enjoyment of sport, and sport only, for healthfulness of activities, eager but never overstrained, for harmlessness of accidents impossible to become dangerous or seriously painful, for innocence in triumphs in victories, and moderation of discomfitures in defeats, the younger is far behind the one it supplanted. Parties were never continuous in constituent elements. Two lads of equal or approximate fame, after casting at "cross and pile" (throwing three times on high a paddle with a cross on one side and guessing at the fall) for first choice, selection of followers was made alternately from oldest to the very youngest, so that those who were rivals to-day might be comrades to-morrow. Each party had its ins directly following the other. Losses were incurred by catching from behind the ball missed by the striker, or in its flight upon the field from stroke of the paddle, or hitting the runner between bases. An hour or so was generally sufficient for each party to enjoy its ins. The most exciting period in this game was when the ins were reduced to one. In that emergency, if he could make as many as three rounds, he had liberty to call in one of his party.

At such time he called upon one to run in his place, while he stood and rested between the strokes. If the ball was caught in the air or after the first rebound, or if the runner was hit with it on the circuit, or it was thrown and reached home before the circuit was completed, the striker went out. These contingencies had to be faced three runs consecutively. It not unfrequently occurred that a vigorous boy who used a round, heavy bat instead of the paddle cast the ball with such momentum and in such unexpected direction as to achieve success.

The only serious accident at this game that the writer recalls occurred at the hands of the master, the one with the clubbed hand hereinafter described. This man occasionally took part in the game, though he had little alertness. It was done possibly partly for the sake of other society besides his own and of seeming to take some interest in the enjoyments of his pupils, a thing not very easy to make believe. On this occasion, being the last survivor on his side, indulging hope of calling back to life one of his dead comrades, he was not very far from sending another to his grave. His strokes were, of course, with the left hand. After taking his position at the home base, out of a half dozen of little boys proposing to be his runner he selected one about ten years old, and charging him against betrayal of the trust that was placed on him by running and dodging to compass the desired feat, he called for a ball. The runner, one foot in advance of its mate, watched eagerly for the stroke. With all his might the striker struck at the coming ball. Unfortunately he missed it, and the bat, slipping from his grasp, struck his runner upon the cheek, felling him to the ground. The shriek that came from the prostrate boy relieved apprehension that he was killed, yet he bore the scar during the more than fifty years of his after life.

Cat.—In this game two boys who were ins were opposed by all the others. Two bases were taken some 20 yards apart. Immediately behind each of those who occupied them stood two others, whose office was to give the ball to the occupant of the further base and catch it whenever missed by the one behind whom he stood. At every stroke of the ball the ins exchanged places. During this exchange, catching the ball, hitting one of the ins, or casting the ball across the space between him and the base to which he was hastening, threw him out. Also, as was the rule in town ball, a miss of the ball three times, whether caught or not by the one in rear of the hitter, put him out.

Bull pen.—In this game a space about 20 yards square was chosen into which one of the parties entered while four of the other occupied the corners. The ball was thrown from one to another along the sides, and after the round was made and then passed from the first diagonally across to the third, it was said to be "hot." These four, without any fixed order of sequence, but according to probable chances of success, cast the ball at those in the pen. If it missed it counted for naught; if it hit, he and his comrades took to flight, when an insider threw the ball at one of them; if he hit, the latter was out and the one stricken restored. The art of throwing and dodging, rendered keen by much practice, made this game often intensely interesting both to parties and beholders, particularly so when the actors were reduced to two, one running from base to base seeking opportunities and the other keeping at as great distance as possible, the two procrastinating the result sometimes for half an hour.

Socket.—This game was resorted to only occasionally and when time was too short for the others. The ball was cast aloft, and on return whoever got it threw it at his next neighbor, and this was repeated without count of any sort until all were weary. It was a sort of what was called a free fight without rule or reckoning.

The balls used in these games were of domestic make with woolen thread, and tightly covered with buckskin. Lucky and envied was the boy who from a worn rubber shoe, a thing seldom used, got cuttings to be substituted for thread. This writer easily recalls the first introduction of those of solid rubber gotten at the stores, but this was at the village academy to be referred to hereafter.

Jumping.—Of this there were several named sorts—quarter hammond, half hammond, whole hammond, etc. In the first, a boy, standing on both feet, sprang forward, alighting on his right; then hopping, he thrust the right leg forward, at the same time twisting in his left and alighting with its foot on the right side, then jumped with both feet. Little space could be traveled because of the awkwardness in putting the left leg and foot to unnatural use. Half hammond was a hop, a skip, and a jump. Rising from both feet he hopped, alighting upon his right foot, stepped as far as he could with the left, and ended with a jump. In whole hammond there were two hops, two skips, and two jumps. Sometimes the jumper was helped as far as the first hop with weights. These were always used in single jumps, and throughout three jumps, casting them behind in the last. Three jumps backward in some places were called crack backs. All these, except the last, were made both with and without taking a "running start."

Knucks.—The game of knucks was played by rolling marbles forth and back into four small holes, three in a line, a yard or so apart and another equidistant and at right angles from the third. The one coming out last underwent the penalty of holding his fist over the first hole, while the rest, standing as the third, took three

shots apiece at his knuckles. When a shooter's marble, in his too great eagerness to hit plump and hard, struck the victim's sleeve, the latter had a shot at him.

Ring marbles.—This was the favorite. At it, two or three or four played. Sometimes there were six, but not frequently because of inconvenience and liability to confusion. In case of three, each was opposed to the others. In case of four, two were partners against the other two. A ring from 10 to 18 inches in diameter was described upon the ground. In it were put 5 marbles, 4 on the ring equidistant from each other and 1 in the middle. Each player had his own marble (called his "taw") which he shot with his thumb and third finger. The lead was obtained by the one (or his partner) who from the starting point (also called "taw") made the nearest shot at the middle man. This was done by plumping, as it was called to distinguish from rolling. When the sport began, a successful hit at this middle man won that game, the score of which was always an odd number, seldom below 5 or over 11. There were quite a number of rules to be observed. Three out of the 5 marbles struck from the ring, with every subsequent contingency avoided, won the count. Yet, in this while, if his taw was struck by his adversary's, he was said to be killed. If only two were playing, that ended the contest. If more, the dead man's winnings were taken by the slayer. Then he must avoid letting his taw stop in the ring unless it did so after striking out the last. If so, he was made "fat," which was equivalent to being dead, perishing without violence. There was little comfort, however, in this mode of death, for, besides the jeers of adversaries, were self-reproaches for carelessness and complainings against ill luck. If the taw was stopped on the ring itself it was ring bound and became subjected to a shot apiece from adversaries.

After a majority of those in the ring was gotten the others kept themselves as near as possible to the ring so that the holder was forced to shoot at a distance at the others or at his adversaries, and with force enough to keep out of the way of the latter. When the holder had gotten the fourth man, and probability of getting the last became urgent, his adversary in the last resort might call him to track. This was done by placing the last marble at a fit place on the ring, and his taw behind and adjoining. Then at a distance of 3 feet the other, holding his hand on the ground, took a shot at him. If he missed, noting the position, the other struck the marble in the ring on the top, with such force, and no more, as would pass it out of the ring, and thus, as it were, rode on toward his adversary, at whom he could shoot once. If he missed he was vanquished and that count ended. The word most often spoken during a game of marbles was "vence," intended as a premonition to a player against a suspected movement which, without such remonstrance, he had the right to make, as to change his position without diminution of distance from the point he was aiming at. This was called "roundance; lose no groundance." Or a player might "lay up," as it was called, placing his taw near the ring. The monitory word spoken in time hindered. Then if a marble met an unexpected obstruction it was liable to be kicked on the way it was going. "Vence" or "kicks" would decide according to quickness in the call.

This game was practiced much, even by grown men before village and country stores. Some had such fondness for it as to acquire a facility so near perfection that many refused to play against them except upon being given some advantage that might lessen the disparity.

Occasionally girls undertook it, but their crudeness (shooting with thumb and forefinger only) provoked laughter, to which they not often exposed themselves.

In all these exercises was never a piece tending to meanness or serious immorality. The nearest approach was in the game called "sweepstakes," in which players, placing an equal number of marbles in the ring, by common understanding kept each for himself all that he knocked out. It certainly was not as innocent as the others, particularly with very young lads and with uncommonly poor boys with whom it was far less easy and less convenient than now to obtain such playthings as had to be purchased from the stores in town. It tended to acrimonious disputings and unfair playings for prizes of universal desire. For this reason most children were forbidden by their parents to practice it.

Leapfrog.—This game, familiar to all rural people, has been played, it is probable, all over the world from the beginning. This writer lately found a brief account of it in a work, elaborately gotten up in a small edition de luxe by Stewart Culin, entitled Korean Games, with Notes on the Corresponding Games of China and Japan. The account runs thus:

"This game" (toui-ye-nem-ki, meaning jumping over), "is played by several persons, one of whom leans over, putting his hands on the ground, and the others who stand behind him vault over his back by putting their hands upon his shoulders.

"Leapfrog is a very common game in Japan, under the name of 'tobi-koshi,' jumping over."

This description needed the illustration by a Japanese artist to be made to compare at all with the genuine game of the South. Satisfactorily convenient is the attitude

of the boy resting on his all fours, and decent the leisure of him who is taking his time in the leap over. True, the leaper seems inclined to straighten his legs and rest awhile as he is about to pass over the recumbent's neck, but the latter's patient fat jaws show moderate willingness to wait till the trip is made.

In old times in Georgia the game, during the brief space through which it lasted, was quite spirited. It was generally played while on the way to or from school or other place of meeting. Large boys did not care to include those of small size, although, yielding to their eager petitions, sometimes they let them in, and sported with their vain essays at impossible leaps. Passing over them without more than touching shoulders with the tips of their fingers, they put themselves prostrate before their approaches, or rose when they were over their necks and rushing along tumbled them over the next one ahead. In this sport with boys of like size, the one stooping slightly bowed his head, and the following, resting hands heavily upon his shoulders, passed over. A score or more of boys of good size, through half a dozen rounds or more made with rapidity and activity, was an interesting sight.

Clapping hands.—In the same book, account is given of a game in China named "p'ah cheung," which is even less simple than in our region. Two children, sitting face to face, clap first their knees, then their hands, then the right hand of each other, then their own hands and knees and their own hands, then the left hand of each other, and after repeated similar performances upon themselves all four hands are clapped. The process is repeated with continually increasing spirit until one makes a miss and is laughed at for his defeat. While the clapping was going on in our region these verses were rehearsed in time with the consecutive operations:

Peach pie hot,
Peach pie cold,
Peach pie in the pot,
Nine days old.

The last clapping of one's own hands and knees was doubled, so as not to "get ahead of the music."

Tag.—This simple game is found also among the Koreans, Japanese, and Chinese, though on a scale more simple than in the United States. From its name, syoun-ra-tjap-ki, kindly interpreted by the author of Korean Games, etc., to mean "watchman catching," the syoun-ra (Chinese, ts-sun-lo), who is watchman, chases the others, endeavoring to catch them. The one who is caught becomes the syoun-ra. When a boy sits down and says "taik kok" he may not be caught. The one who is to be syoun-ra at first is decided by drawing straws.

In the South there was mutuality between two or more, no one being assigned to a peculiar part. The contest was to get the last "tag," then turn and flee while the other pursued. Each had his own base to which he might repair, either when too hotly pursued or for getting a breathing spell. If while far from his base he found himself likely to be caught before reaching it, he might turn upon his pursuer and crossing his middle finger over his forefinger hold them thus in view. If time were sufficient for the action, he was free.

In studying these games of children among the Koreans one is impressed by the fact that in those in which one participant is placed in undesirable or embarrassing positions, or in one in which he is at comparative disadvantage, his gender for the time-being is ignored, and he instead of "he" is called "it." This is the case in tag, and particularly so in games when one has to submit to have his eyes bandaged, as in "blindfold" and "hide and seek." Yet in Japan the one styled "it" among the Koreans becomes Oni, "Devil," and the play Oni Gokko, "Devil Catching." There, also, the players have bases to which they may run for refuge.

This ignoring of sex may be accounted for thus. Curious as it is, with simple people in the rural districts of middle Georgia, most probably in such communities everywhere, one who is afflicted with a serious infirmity, mental or physical, especially if born so, is called "It," whatever be the sex. Somehow, one born blind, or a deaf-mute, or an idiot, is regarded by humble folk as outside the circle of normal existence, and being doomed to perpetual absence of ordinary individuality, regarded as indistinguishable by sex. The custom has for its foundation the compassion we feel in contemplating a case of ever-during defenseless isolation from mankind. For such solitary lives we are easily led to indulge some affection outside of what may spring from kinship. The same feeling prompts to giving endearing sexless names to those whom we love most tenderly, as "Darling," which is abbreviated from "Dear little thing." Country people call a babe "it"; even mothers so address their own sucklings, and the name is often repeated beyond infancy while extending comforting words in cases of suffering, either in body or in heart. The helplessness, the unconsciousness of sex, the absence of any responsibility, the entire innocence of infancy, all serve to keep out of mind consideration of sex, and the babe is regarded as if it had it not. This is doubtless the reason why the Greeks, whose language was the richest of all, had two words for "child," one of doubtful,

the other of neuter gender; thus παῖς is "a child"; it may be a boy and it may be a girl, but παιδίον, which is neuter, signifies "a little child."

How "it" in tag among Korean children should be transformed by Japanese into "devil" is a question too subtle for this writer to investigate with the hope of getting to a satisfactory solution.

Mumble peg.—This game was sometimes resorted to by two boys when become rather surfeited by marbles and other like games. Its enjoyment to the victor grew out of witnessing the discomfiture of the vanquished at the nature of the penalty to be paid.

It consisted in a trial of skill in throwing an open pocketknife into the air through various evolutions and making it fall with point of the blade foremost and stick in the ground. When it was finished, the victor, placing the sharpened end of a short peg on the ground, drove it down as far as possible by holding in his hand the blade of the knife and hammering with the handle, giving the number of strokes (usually three) agreed upon. Then the other with his teeth drew out the peg. An adroit holder of the hammer could force the peg sometimes to a depth beyond its head, in which case the other was driven to clear away with his teeth the surrounding earth before he could get a bite sufficiently firm to extract. Occasionally, but seldom, a couple of little girls might be detected at this game while supposing that they could keep themselves unseen.

Shinney.—This game in the States farther north is called "hockey," sometimes "bandy." It was never known in Georgia by other name than "shinney." Two parties, providing themselves each individually with a stick, one of whose ends was crooked, contended across a long space, at each end of which was a narrow opening, to drive a ball of usually two or three inches thickness through these openings. It often became intensely exciting, sometimes an ardent player getting a knock on the lower part of the leg, a contingency which doubtless imparted to the sport its name. Contending parties by the rules were not allowed to place themselves otherwise than face to face in their attitudes to each other. Sometimes it might happen to be of advantage to reverse one's stroke in order to get the ball in position to be worked with more ease upon the desired directions, and the temptation was to get upon the opposite side and strike with the enemy's. But the cry of "Shinney on your own side" stopped such movement, or, if it succeeded, the result was declared to be won foully. In such cases, therefore, that sort of work was done by shifting the stick to the left hand.

The sport was so violent and often productive of physical hurt that it was discouraged, sometimes forbidden by parents.

In throwing for the start each party preferred to lose. The party winning had to cast the ball, and so give to his opponent the first stroke. Of this casting there were two sorts. The leader holding the ball asked of the other how he would have it, "high buck, or low doe." If he answered the latter, it was dropped upon the ground; if the former, it was cast up. Occasionally it happened that in the latter throw a skillful player, carrying a stout stick, struck with such aim and vigor as to propel the ball to the goal.

Lap jacket.—In this play, by some called "rap jacket," two boys, providing themselves with a switch apiece, agreed to lay on each the other until one cried "enough" and ceased to strike. They began with gently tapping the shoulders. By and by, when lookers-on jeered at their child's playing and want of pluck, or one made a cut that gave a sting, from which the shrinking sufferer was laughed at by the same lookers-on, he returned it with interest. Then it was interesting to see the amount of utterly useless endurance a boy could exhibit rather than acknowledge himself overcome. Too often the sport ended in closing for a fight, from which they had to be separated by friends.

In one of the counties of this region resided a man, two of whose sons, 10 and 11 years of age, of about the same size, brave, ardent, generous, rather combative lads, although devotedly fond of each other, occasionally fell into disputings which were apt to end in fights, in which sometimes one and sometimes the other got the best of it. Afterwards they soon became reconciled and went about coupled as before. One day the father, while seated in his piazza, saw them engaged in a fight in the front grove. Sending a man servant with orders to separate and bring the combatants to him, he added to those to cut two keen, wiry, hickory switches of not too small length and thickness. When all were at hand he playfully remarked that after such a hard-fought battle, in which neither had shown the white feather and it had to become a drawn battle, he thought it only fair, just, and right that the warriors should be allowed to indulge in a nice, good play, and then make a lasting peace. "Here, now," he said, "is a hickory apiece; fall to lap jacketing and let me see who'll outlast."

They fell in at the word, and from time to time got stimulating words from their father, such as, "You, Jeff, can't you give back as good as he sent in that last lick?" "You Bol, you going to let him lay off corn rows on you that way and not leave a piece of your hide as big as a seven pence?"

When the sport had proceeded as far as he deemed to be about enough, he bade them stop, and taking chairs at the opposite sides of the room face each other. After a few moments they were brought together, made to hug and kiss, and declare that they loved each other better than anybody in the world except their parents.

"Now go to your ma," he said in dismissal, "maybe she'll think up something to do for your backs."

The mother with tearful eyes salved their striped shoulders and gave tenderest admonitions.

The affair effected what was intended. Indeed they needed no special reconciliation, as there was never prolonged hostility between them. Henceforth their fraternal affection went on without interruption.

DRESS.

Dress of school children was almost wholly of home produce and make. Even daughters of people of the better sort, if occasionally they wore gowns of calico or gingham, usually went to school in those of domestic fabric so manufactured and made as to be hardly, if at all, less sightly. The arts of spinning, weaving, and dyeing were carried to a high degree of culture. People of humble means did this sort themselves, but those above them, while all the spinning, reeling, and warping were done at home, had most of their weaving and dyeing done by professionals, some of whose work, yet preserved in old family chests, are surprisingly handsome. These professionals, styled weavers, were usually women, who, failing to marry while in their teens, devoted themselves to these arts and indulged high pride in the number and urgeney of demands made upon them throughout a large circle of acquaintances to repair to their houses for jobs that impatiently awaited them. For these ladies lived not at home, except during brief intervals while working for themselves and other members of their own families; but in all seasons, spring, summer, fall, winter, sojourned at the houses of one and another of their neighbors. At the end of their promised days they went on to other engagements. At these houses they were as welcome and as well treated as the governor's wife would have been. Generally they had given up all thoughts of marriage; but having survived the pain of whatever disappointment may have befallen them, seemed to be about the most contented persons in the community, and carried about with them as large a supply of romantic sentiments as the girls—the youngest, prettiest, and most dreamful. Of all readers of lovers' tales they were the most constant, and most familiar with their pathetic, lovelorn histories. Many scenes they could rehearse word for word, shedding as many tears as they felt like and taking as many liberties as they pleased with long, soul-stirring, heart-rending words. As gossips they were not to be outdone, either in tongues at their command, in the amount and variety of interesting news, or the kindly sympathy with which in general they served it out. Friends of nearly everybody, they loved nearly everybody; becoming acquainted with everybody's affairs, everybody was entertained by their narrations and kind-hearted commentations.

Preliminaries to entry into the outhouse where the loom was kept were precise and elaborate—selections of purest, best thread from hanks, mixings of indigo, walnut, madder, and other dyestuffs, superintending dyeing pots, examinations of looms, sleighs, shuttles, spindles, and reed spools, and readjusting of every blessed thing to absolute satisfaction. When the long warp was carefully wrapped around the beam, the sleighs and treadles properly adjusted, the conscious weaver mounted upon the stool as proudly as Queen Elizabeth bestrode her war steed on Tewksbury Plain. Many of the stripes woven by these experts were notably handsome and held their brightness through long periods of laundering. In gowns made by these, girls attended school; underwear of material, raised at home, were, when well laundered, as nice as that woven in Northern looms. Boys' wear was of stouter materials, those for winter entirely of wool. The summer wear received a bright-yellow color from a dye made from copperas; the winter as fine a brown from the bark of the walnut or woven with mixed threads of white and dark wool. Little girls wore short frocks, with pantalets. Boys wore jackets and trousers reaching to the feet. The present fashion of short trousers and stockings was not then known. Shoes in almost all instances, except those for Sunday's use, were made by the neighboring cobbler of leather tanned at the village tanyard from hides of beasts slain on the several plantations; but during six months, from April to November, all boys, without exception, went barefooted. A boy was eager to doff his shoes in the spring and reluctant to resume them in the fall. This feeling prevailed notwithstanding the "stumped toes," toe itchings, and stone bruises to which they were constantly liable and from which they frequently suffered. One element in their hostility to their use when not needed for protection against inclement weather was that their shoes were made, each pair, on the same last. This was done for the sake of economy, as daily changing from right to left and from left to right secured longer duration and postponed the pleasure derived from possession of a new pair. It was a

proud day for a boy when for the first time he was allowed to be measured for a pair of rights and lefts. His twins, in no wise distinguishable, could be tolerated at home and school, but on Sunday meeting days came the pinch which brought shame and the sense of unworthy treatment that it was funny to grown people to witness.

Seldom a sock was worn that was not knit at home from cotton or wool. The same was the case with most of the stockings. The better sort of women on dress occasions wore those of finest material, not seldom of silk.

In the matter of head covering, girls wore what afterwards were called sunbonnets, a thick pasteboard arched over the head and extending far in front, covered with calico, which behind hung 8 or 10 inches in folds down the shoulders. Boys' hats, when there was no hatter in the neighborhood, were of woolen stuff and purchased from the store. When there was a hatter near by they were manufactured by him from the fur of rabbits.

Yet another sort of work done by these women might be called artistic. This was carpeting and counterpanes both for winter and summer. In the work of weaving such as these several shuttles and several treadles were required. From the kind of figures inwrought names of various sound and import were given; but they were all of historic fame, as Jackson's Victory at New Orleans, Cornwallis's Surrender, Bonaparte a-Crossing of the Rhine, etc. Laid away in chests in some houses may yet be seen counterpanes woven sixty and seventy-five years ago that would grace the finest bedsteads of the most opulent.

SCHOOL BUTTER.

No satisfactory account that this writer has heard has ever been given of the origin of this notable phrase in country schools. Its utterance by a passer-by in tones loud enough to be heard was regarded as the grossest insult that could be perpetrated. The utterer, on making the cry, immediately fled amain, and every boy rushed from the house in pursuit of him. If overtaken, he was either ducked in the spring branch, or, his hands and feet being seized by four of the stoutest boys, he was bumped against a tree until the insult was avenged. Seldom a traveler on foot dared to take the risk. Even a horseman was sometimes overtaken after a chase of several miles by two or more who came to school on horseback mainly for the purpose.

Some persons have speculated upon the phrase having originated from that of "I am your school's better." Whatever its origin, it was the universal custom in old-field schools to regard it an insult, and attempt was made, with the master's full assent, to punish it.[1]

EXHIBITIONS.

Whenever a master remained until the end of the spring term, it closed with an examination of the pupils on the last day and what was called an "exhibition" at night. A rude platform was built in front of the door, and an arbor covered with branches of trees extended far out. Many hundreds attended the examination and many more the exhibition. To the latter people came from all distances up to 10 and 15 miles, often to the number of two and three thousand, and it was curious to see the interest taken in these exercises by persons by whom these were the only histrionic performances ever witnessed. A farce, say Box and Cox, and one or two others of like character, were brought out in a style that certainly was unique in the history of the stage. Women's parts, as in the old English drama, were taken by boys. The idea seemed to be that dresses, talk, and movements should be as unnatural, as eccentric, and as extravagant as possible. It was high fun to those of the audience not in the secret of the various disguises to guess at the names of the players, arrayed as they were beyond all recognition. The females especially, with their rude, gosling voices and unfeminine deportment, often raised roars of laughter that in the still summer night could be heard more than half a mile away. At last,

[1] An amusing instance of boys administering to an outsider of the discipline of the school is mentioned in the History of the Rod, as told by Alexander Pope on Curll, the printer, who, before that time, had printed surreptitiously some of the poet's letters:

"Pope mentions in one of his letters that Mr. Edmund Curll was exercised in a blanket and whipped at Westminster School by the boys. In 1716 Robert Smith, prebendary of Westminster School, died. At his funeral a Latin oration was pronounced over the body by Mr. John Barber, then captain of the King's scholars, Westminster. Curll by some means obtained and printed a copy of the oration without the author's consent, and the boys determined to take vengeance. Under pretense of giving him a correct copy, they decoyed him into the dean's yard, and what followed is stated in the St. James Post: 'Being on Thursday last fortunately nabbed within the limits of the dean's yard by the King's scholars, there he met with a college salutation, for he was first presented with the ceremony of the blanket, in which, when the skeleton was well shook, he was carried in triumph to the school, and after receiving a grammatical construction for his false concords he was reconducted to the dean's yard, and, on his knees asking pardon of the aforesaid Mr. Barber for his offense, he was kicked out of the yard and left to the huzzas of the rabble.'" (Hist. of the Rod, p. 432.)

the principal item of humor was the evident absence of all genuine art. The good common sense of most of the unlettered audience did not fail to detect the flaw so patent. No occasion in that rural region brought more hearty enjoyment to the vast crowds assembled to honor it.

HOLIDAYS.

Holidays, not frequent in the beginning, became less so with lapse of time. In the early settlement of the country the religious sentiment, as always the case in periods after a long war, except among women, was not high. Religious meeting-houses were few, and such as were had not many professing male members. Leading families, for the most part, particularly those from Virginia, had been members of the Episcopal Church, but these, for lack of bishop and clergymen, gradually fell away. Besides, this organization, being of British origin, suffered prejudice for that reason. Dancing and playing cards were not regarded immoral, and at evening parties of pleasure the former was freely practiced. These were frequent, because the settlers, despite their intense energy, were fully sensible of the value and importance of leisure and reunions. Presbyterians were almost none; but Baptist and Methodist clergymen in time appeared, many of whom, although not liberally educated, were of much ability, and labored with zeal and success in the cause of Christian revival. For a considerable time respite, both for school children and negroes, was had on occasions of most noted church festivals. But now, out of the joint hostility, feasts, as Easter, Whitsuntide, Ascension, Epiphany, began to be omitted, and after some years were dropped from the mind as they had ceased to be mentioned by the tongue, and, except by a few, their recurrence became unnoticed.

Yet boys were unanimous against curtailment of what long prescription seemed to them ought to have rendered inviolate. Indulgence, gradually fallen into disuse outside, a master granted or not according to his notions of the will of parents in that behalf. He was suspected of having no special aversion to it, but it was important to the security of his position to appear otherwise, profess reluctance, but at the same time intimate that he would be guided by circumstances. A few who, like Peggoty's husband, were "very near," grudged a day off from a service for which they were paying a whole dollar a month, but the majority were indifferent, and so the schoolmaster gave it sometimes, and sometimes did not. Another ground for hesitation, with a leaning to the side of mercy, was revolving in his mind the degree of eagerness on the part of his boy scholars in any special case, and their strength and resolution to have it gratified, for there was one last resort for the brave and the desperate of which he well knew that, however resolute in spirit and able of body, it behooved to beware. Some account of this ought not be omitted from these sketches.

TURN-OUTS.

It would not be easy to find the original of what in our day was admitted to be fully excusable in school boys in pressing emergencies, to fall back upon an inalienable reserved right of revolution, which, although brief, was decisive. People, old people, even "near" people, did not gainsay exercise of this right, provided it was availed of according to established usages and within set limitations. If the sentiment for a holiday was unanimous, or sufficiently approximate to unanimity to discourage anything like toryism on the part of the minority, the insurgents, by appointment meeting at the schoolhouse earlier than usual in the morning, barred the building against the master's entrance. While no violence to his person was allowed, yet neither was he expected to be too damaging in his siege of property belonging to other people who might not feel like putting in expensive repairs. Forcing a door lock or a window hook would be tolerated, but not breaking of things generally. Nor was unreasonably long time allowed the besieger to be wasted in endeavor. If he could overcome obstruction and effect entrance, the insurrection dissolved instantly and all went to the day's work with no other feeling than disappointment at failure to compass an end entirely legitimate. In case he could not, holiday was granted with cheerful acquiescence. The most acceptable, indeed the most common, way of celebrating the occasion was with a treat by the master. A messenger was dispatched to the nearest place where could be gotten a jug of honest whisky, which the master and the large boys discussed. Afterwards all went their several ways satisfied, the chief sometimes to exuberance with the last result of the day's doings. If after several vain attempts at entrance he persisted in refusing to yield to terms, there remained a further ordeal to which, as it was not pleasant to pass through, he not often forced his subjects to resort. An instance of this kind the writer of this paper recalls with distinctness, although it is long, long ago.

It was on what proved to be the last day in the term of one who was singularly constructed, even for one of his class. Of rather less than medium height, square set from the summit of his rather flat head to his wide feet with little or no instep,

he often dispensed with both rod and ferule, substituting his right hand, whose fingers from his birth were clubbed. He was a rather kind-hearted person, who whipped heartily, but never angrily or cruelly. He whipped because there was no other known mode of punishment for delinquence. He knew that it was expected of him, but he did so without malevolence, being to the very young always particularly kind. Often, instead of troubling himself to reach for the rod or ferule, putting the culprit in an attitude fit for its reception, with his clubbed hand he gave him a cuff under the burr of the ear with a vigor not unreasonably proportioned, yet sometimes lifting him to a height for which he had no sort of ambition.

The incident alluded to occurred in the early fall of the year and only a fortnight or so before his term (being about as much as people cared to have) was to expire, and he was to travel to another community to take the place of one who had been notified that it would content his employers if he would move farther on. Of late he was rather suspected of diminished interest in persons and scenes from whose presence he was about to depart and among whom his face was to be seen no more. One day he was asked respectfully, even humbly, for a holiday, and he gave refusal decidedly and needlessly flat. The school in the item of boys was far undergrown, with the exception of one, tall and athletic, who was more than a match for the master. He was about to leave, having gotten about all that was to be had from that fountain of instruction, but he yielded to the others' entreaties to remain and see that his fellows had fair play in the coming struggle. On the morning set the master was barred out effectually, yet he avowed over and over again that he would stay there the whole blessed day without yielding. After a brief conference the door was thrown wide open, he was seized, pulled to the floor, and covered over and over; persistent still, he was lifted, laid on a bench, and carried, the same as if he were a dead man, to the spring branch, in which was a hole of some depth made by damming the stream for the purpose of bathing. Continuing obdurate, four of the stoutest, grasping his feet and hands, let him slowly into the water. Just as his nostrils were about to be submerged for an entire dip he gave his word and was lifted out. No sooner had he got footing on the bank than he shouted "Books!" and rushed up the hill. At that our big boy sprang forward in pursuit. Overtaking him and seizing his arm, he said:

"Such as that won't do, Mr. Yallerlee; it won't begin to do. The boys have got your word and you've got it to keep. Now, there ain't neither long nor short in the business."

This was enough—just what, as was believed, he desired for precipitating the end. Announcing that the school was dismissed for good, he went his way, and his face was never seen afterwards. Being rather cold and extremely wet, he halted at the nearest neighbor's, where, after wetting himself within as he was without from the sideboard decanter, he was helped to reach the house where he then boarded. In time we heard of him some 20 miles south, on the edge of the region of pine and blackjack, where he had started on another enactment of his brief little drama. Where it ended at last neither annals nor tradition handed down.

Another "turn-out" of some interest was described to the writer by the late Alexander H. Stephens, vice-president of the Confederate States. During the years 1863 and 1864 he spent much of his time at his home in Crawfordville. Disagreeing with the administration on several matters regarded by him of vital importance, and averse to putting embarrassment upon it by his presence, he remained withdrawn from Richmond whenever it was not urgently necessary to his official duties to be there. In these whiles, in order to divert his mind as much as possible from gloomy apprehensions regarding the cause for which the South was making its last struggles and which he believed to foresee would end in disaster, he superintended the work upon his plantation, and when resting from that and from entertainment of the numerous visitors who came from all parts to visit and take counsel with him he amused himself with readings of various sorts on other themes than politics. In the latter part of 1862 a correspondence (outside of what had long been and was yet continued) grew up between him and this writer that was conducted over assumed names. He took that of "Peter Finkle," a supposed constant attendant, alluding to his patron as "Bos," and this writer that of "Giles," similarly related to a person whom he styled "The Colonel." Besides many themes—political, literary, and other—in this correspondence, were habits and customs during the time of his childhood and incidents in his own life of which this friend was intending to write a biography. Among these letters, some of which were of much length, is one that was printed in Johnston & Browne's Life of Alexander H. Stephens, from which extracts are taken for use in this paper.

In the year 1818, when 6 years old, he went to a school kept by an elderly gentleman not far from his father's house. Being uncommonly small and frail of health, he was carried almost daily forth and back upon the shoulders of a stout, kind young man named Bryant, the way from whose home passed by his own. The first is from a letter written about the close of the year 1862. The extract is as follows:

"Bos went to school about three months in 1818 to a Mr. Nathaniel Day. He was

what was called a good English teacher in his day and section of country. His greatest failure was his fondness for a dram. He was not by any means a drunkard, but the temptation to indulge in drinking was great, and he often got 'disguised,' as it was termed. Bos learned to spell in two syllables at 'baker,' in Webster's old spelling book; and, by the by, he says that this is the best spelling book for children and beginners that was ever published in the English language. All the pretended improvements upon it are deteriorations. One incident happened in this school where he was going then that made a deep impression on his mind. It was the 'turning out' of the teacher, as it was called. The boys wanted a holiday at Whitsuntide, and as Mr. Day had told them that he would not give it they entered into a regular conspiracy to go through the forms of turning him out. They—that is, the big boys—were to meet on Monday morning and bar up the schoolhouse door and not let the teacher in, and compel him to make terms. But a little incident interfered with this arrangement and brought events to an earlier dénouement than they expected.

"Henry Perkins, one of the biggest and stoutest boys in school and the ringleader in the plan, on Friday before did something that caused Mr. D. to scold him. Perkins seemed to act insolently in return. D. called him up, switch in hand, and the appearance of being ready to administer it. Indeed, all the school thought that he was about to get a whipping, and this produced no small sensation in that little assembly, for he was full grown. He had not been whipped since the school commenced; he had great abilities; he was a 'cipherer,' and all cipherers in those days had the privilege of going out and staying out when they pleased, and other liberties. The idea of a cipherer being whipped did not enter into the minds of any. So you may imagine expectation was on tiptoe when Perkins walked sullenly up. But what was the consternation when, instead of standing out to receive his whipping, he walked straight to the man with the rod, whose authority was never before known to be questioned, and seized the switch with one hand and D's collar with the other! A short scuffle ensued. D. was thrown upon the floor (a dirt floor it was). All the other boys who were in the conspiracy, upon a signal from Perkins, joined. Many of the little children screamed, thinking their teacher was about to be killed. Bos says he looked on with interest, but without fear or apprehension. He had no idea that the boys intended to hurt the master, although he knew nothing of the object of the revolt. He heard their proposing of terms. It was finally agreed that if they would let him up he would dismiss the school until the following morning and send one of them to Little's store, where this town[1] is now situated, for a gallon of spirits to treat with. They let him up. One boy was sent for the liquor. Ben Bryant, who did not stay for the frolic, took charge of his little crowd and left for home before the return of the messenger. It was about 11 a. m. Bos and his company ate their dinner out of their baskets on the way home. When they went back Wednesday, they heard how the whole matter ended. Most of the big boys stayed until the liquor came; then they and the old man Day heartily enjoyed his treat. They all broke up in good spirits and in good humor. The master, they said, did get a 'little in for it.' He took home the jug and what was left in it after the carousal."

The other extract is from a very long letter giving incidents in the life of his father, for whom, although of very limited education, he had reverence great as affection. The things recorded in the following are in considerable contrast with those common in old field schools:

"He commenced life as a school-teacher when he was a little more than 14 years old, and taught several years before he was married, but never, as I have often heard him say, liked that occupation. He taught, as I remember, more in compliance with the urgent entreaties of his neighbors than in obedience to his own inclination.

"My father's habits as a teacher and his manner of teaching I well recollect. He never scolded, never reprimanded a scholar in a loud voice, never thumped the head, pulled the ears, or used a ferule, as I have often seen other teachers do. He took great pleasure in the act of teaching, and was unwearied in explaining every thing to his scholars, the youngest as well as the oldest. He had no classes, except in spelling and reading, in which exercises he insisted on a clear, full enunciation. He was himself one of the best readers I have ever heard, and he was very particular in making his scholars attend to the pauses and deliver the passages with the proper emphasis and intonation, and to instruct them in this he would take the book and show the school how it ought to be read. In this way even the dullest scholar understood what was required of him and what good reading was. His cipherers, as those used to be called who studied arithmetic, and such as were in higher branches, such as surveying, etc., were allowed to study outside the schoolhouse.

"His scholars generally were much attached to him. He was on easy and familiar

[1] Crawfordville.

terms with them without losing their respect; and the smallest boys would approach him with confidence, but never with familiarity. He had one custom I never saw or heard of in any other school. About once a month, on a Friday evening, after the spelling classes had got through their tasks, he had an exercise on ceremony, which the scholars called 'learning manners,' though what he called it—if I ever heard him call it anything—I can not remember. The exercise consisted in going through the usual form of salutation on meeting an acquaintance, and introducing persons to each other, with other variations occasionally introduced. These forms were taught during the week, and the pupils' proficiency was tested on the occasions I am speaking of. At the appointed hour on the Friday evening at a given signal books were laid aside and a recess of a few minutes given. Then all would reassemble and take seats in rows on opposite benches, the boys on one side and the girls—for he taught both sexes—on the other. The boy at the head of the row would rise and walk toward the center of the room, and the girl at the head of her row would rise and proceed toward the same spot. As they approached the boy would bow and the girl drop a curtsy—the established female salutation of those days—and they would then pass on. At other times they were taught to stop and exchange verbal salutations and the usual formulas of polite inquiry, after which they retired and were followed by the next pair. His leading object was to teach ease and becoming confidence of manner and gracefulness of movement and gesture. He was very particular about a bow, and when a boy was awkward in it he would go through the motion himself and show how it ought to be done. These exercises were varied by meetings in an imaginary parlor, the entrance, introduction, and reception of visitors, with practice in 'commonplace chat,' to use his own phrase, suited to the supposed occasion. Then came the ceremony of introductions. The parties in this case would walk from opposite sides of the room in pairs, and upon meeting, after the salutations of the two agreed upon, would commence making known to each other the friends accompanying them, the boy saying, 'Allow me, Miss Mary, to present to you my friend Mr. Smith. Mr. Smith, Miss Jones.' Whereupon, after Miss Mary had spoken to Mr. Smith, she would in turn introduce her friends.

"These exercises, trivial as the description may seem, were of great use to raw country boys and girls, removing their awkwardness and consequent shyness and the painful sense of being at a disadvantage or the dread of appearing ridiculous; and I have no doubt many or all of them, in after life, had frequent occasion to be grateful for my father's lessons in 'manners.' They were delighted in by the scholars, especially the large boys and girls, and in the old field schools some of these were nearly or quite grown. Frequently, when the weather was fine, parents and neighbors would come to the schoolhouse on these Friday evenings to witness the ceremonies. When such visits were expected, the girls would dress a little smarter than usual, and the boys would fix themselves up at the spring, washing, combing, and giving an ornamental adjustment, popularly called a 'roach,' to their hair; and the conversation, of surpassing politeness and elegance, was extremely amusing.

"My father was very fond of dramatic exercises in school, and while, as I said before, he was never much given to mirth, meaning by that excessive laughter or joke telling, yet he was very fond of the humorous in dramatic form. He seldom had public examinations, but almost always had what he called an 'exhibition' some time during the year. At these exhibitions speeches were delivered by the boys, pieces of poetry or prose recited, and dialogues or dramatic scenes acted. The speeches of the small boys he wrote himself. They were short, and usually took a humorous turn. The larger boys recited pieces of his selection, among which there was sure to be Pope's Universal Prayer, which was a great favorite with him. My brother Aaron had this assigned to him on one occasion, when a short piece of poetry, called The Cuckoo—I forget the author—fell to my lot. I also recited a piece on Charity, by Blair, and took parts in several plays.

"These exhibitions were numerously attended—surprisingly so under the circumstances. At one I think there were at least 3,000 persons, and the crowd was like that of a camp meeting, the spectators having assembled from a circuit of many miles. Indeed, the exhibition was a great gala day, not only for the school, but for all the surrounding country. A stage was constructed at the end of the schoolhouse, and dressing rooms, as I may call them, partitioned off by curtains. The greenroom was in the schoolroom, and was entered through a window behind the curtain. The scenes for action were selected with a good deal of taste. None were chosen from tragedy proper, or from farce, but chosen with an eye to improve manners and morals. Some of the dialogues of this kind he wrote himself. He devoted great care to the rehearsals, showing each performer how his part should be recited and acted. His versatility of talent in this line was surprising, and the scholars used to enjoy the rehearsals quite as heartily as the spectators did the performance. In this, as in everything else, he carried out his principle that whatever was to be done ought to be well done. Halfway modes of doing things, makeshifts, and failures were an abomination in his sight."

"His scholars had a strong attachment for him, and those who had once been his pupils seemed to feel as deep regard and respect for him as for their own parents. This feeling, I have found, adhered to them through life. Whenever in my travels I have fallen in with any of my father's old scholars their hearts seemed to warm into a glow toward me. He talked to them, counseled them, instilled into them principles of sobriety, morality, industry, energy, and honor. Cheating, lying, and everything mean or dishonest he held up to scorn and abhorrence. He was, so far as I know, the only old-field teacher of those days on whom the boys never played the prank of 'turning out.' They had probably too much respect and regard for him."

THE PASSING.

The period during which these primitive schoolmasters had sway has been referred to always with peculiar interest, not only with those to whom it has come down by tradition, but especially among those who had experience of their doings of many kinds. There was something pathetic in the silence with which they disappeared. Precisely whence they came in the beginning was not generally known, because seldom inquired about. The same with their going, in which was some shade of melancholy as men thought of the slender chances before such wanderers of betterment in their conditions. Instances were almost none when their punishments, slight or rigorous, were remembered with resentment, and nobody, parent or pupil, but wished to them as much prosperity as might come within their reach, hardly hoping that it could be otherwise than extremely moderate. They seemed to illustrate Darwin's maxim of the survival of the fittest, and, like the weakest in lower animal existences, gradually subsided into extinction or undiscoverable and never-investigated retirement.

Yet a friend of this writer happened only a few years back to meet with one who reminded him, he said, of the old harper gazing wishful

> Where Newark's stately tower
> Looked out from Yarrow's birchen bower,

once famous for deeds of the house of Buccleugh. Likeness was not. Reminder came from contrast, than which none could be more pronounced than that between the one who was the last to sing of Border Chivalry and him who yet obscurely lingered behind the passing of actions perhaps of all in the past as remote as any from the heroic. The gentleman referred to had occasion to visit a well-nigh deserted village situate in the pine woods some miles distant from a railroad station, whence he was conveyed to the place of his destination. Some days afterwards, when he was ready to depart, he found that the only available means of conveyance to be had was a buggy and horse belonging to a man who occupied a small house behind a dense little grove of black-jack quite a distance from the one street, that, perhaps owing to its obscure retirement, had partially survived the general decay. Repairing thither, a small, elderly, white-haired man came to the door, followed by a tall, elderly, very slim, white-haired woman. Both were surprised and seemed rather apprehensive. The woman spoke never a word. Her husband (there were no children nor servant), in answer to inquiry, said in low, timid tones that he could grant the accommodation asked. It appeared that they maintained themselves with what they could produce on their very thin bit of ground and with their one nag carrying and fetching between the village and the railroad. The nag, like her owners, was small, elderly, slim, and white. The same might be said of the buggy and harness, portions of which had been repaired with cotton bands, ropes, and strings, all kept in their complexion by the white sand.

It was a hot July day. The three travelers began the toiling along through deep sands whose silence was only a trifle below that of the air above. The coachman gave to his beast several low, indecisive clucks, intimating that if she was, the rest were prepared to move. After some hesitation she proceeded. When the village was cleared and they had advanced a hundred yards or so farther, the traveler suggested that it might be well to take a somewhat better step. Answer was that the mare by nature was extremely wild, so much so that on more than one occasion in former time she had run away to the much damage of the vehicle and endangerment of its occupants. Although chances of repeating such reckless escapade seemed remote, yet as further interference evidently would be useless it was not attempted. As they crept along the lines of cultivated fields and others worn out and left fenceless the traveler's umbrella afforded some shelter from the sun, whose blazing heat seemed more intensely oppressive from the intense silence. For quite a time not a word could be gotten out of the old gentleman except low, evasive answers in monosyllables to such questioning as occurred to the passenger to put in order to obtain somewhat of relief, if only delusive, from the ennui of the dense solitude. He appeared not to know or had forgotten whatever he had known outside of himself, even about the former dwellers in the village behind, where he had been living for

several years, and of himself he was evidently averse to speaking. Desire to open this oyster (a comparison admitted by the reporter of this sketch to be remote both in season and place) was rather ludicrously sharpened by the man's persistent reticence as without ever turning his eyes he looked at the wild, dangerous little creature below. At last, when they were about three-quarters of their two hours' travel, after several questions directly but not disrespectfully put, and the passenger's saying that himself had once kept a school, admission was drawn out that in a region and a period indefinite, but very remote, he was an old fielder. Then it was interesting how, with a brother in trade, he replied to interrogations about how he used to catch schoolboys in their pranks and flog them afterwards. He seemed to be oblivious of the names of text-books and was guardedly noncommittal touching his method of teaching, answering mainly yes or no to leading questions. The following is about a specimen of the dialogue between them. T indicates the passenger and D the coachman:

T. "In teaching grammar, can you remember which were your favorite parts of speech? Or did you have any special preference, say as among nouns and pronouns, or as between adjectives, verbs, and adverbs?"

D. "No sir, not as I remember of; I made my scholars get 'em all."

T. "Of course, that was your plain duty. I didn't know but some of those things might have been more troublesome than others. For instance: Demonstrative and distributive adjective pronouns. I well remember what a bother they were to me, and indeed to many others that were very sensible persons, and that not only when at school, but when grown to be men, even schoolmasters."

D. "I s'pose so. Some o' them might been ruther troublesome occasional, but they knewed they had 'em to putt through, and they putt 'em through."

T. "I think articles were nice little things, nicer even than conjunctions and even prepositions. Don't you?"

D. "I don't know if they weren't, some."

T. "Had you any special preference or dislikes among arithmetic rules?"

D. "Not as I remember of now."

T. "I suppose, in your day they were about the same as now; Interest, simple and compound, discount, fractions of all sorts."

D. "Jest about, I suppose."

T. "Can you recall to your mind how they turned an improper fraction into a mixed number, and how they got it back to its original position and condition?"

D. "Well, you see it's been so long that—but one thing I *can* tell you. Them boys—and them girls too—they knewed one thing from the off-start, ef no more, when I told 'em to do anything and that accordin' to the rule, they weren't no two ways about it, and so they done it."

Shortly afterwards the station was reached, and the aged veterans, after a bite of biscuit and a handful of oats, turned back to their humble home.

This period in the pedagogy of that region passed not without leaving some salutary results. Any system, however crude, is better than no system. On the confines of existences so far different from each other, it was as indispensable as elsewhere to get some instruction, at least in elementary education. This was all that at first was sought. Neglect of it had been too long already amid the hardships of one long war and threatenings of another. To read, write, become familiar with elementary rules in numbers, and get some acquaintance with forms of polite speech, these must be gotten after a fashion of some sort from the only persons who came forward to undertake the task of imparting. Weaklings as these generally were, need of subsistence which they were incompetent to obtain out of other vocations, continuance of endeavors to enhance their fitness for this their only, with pressure from outside, begot in time a familiarity with its duties which, if not satisfactory, was tolerable. The very crudeness habitually breaking out in those old schoolhouses contrasted with those in which good sense, manners, and tastes were hereditary, served as a foil to make the latter more clearly recognized and more easily practiced. Superadded to this the habit of entire obedience to authority of however trifling dignity, but taught to be of equal force with that by which it was delegated, tended strongly to the development of generous manhood, of neighborly kindliness, of lifelong friendships, of good citizenship. In a community situate far from cultured circles, activities sometimes too ardent, even degrees of lawlessness, must exist. Among the systems tending to repress them among the young, old-field schools, despite their eccentricities, made their own contribution, and it was respectable. Then their glaring imperfections intensified the sense of need of better, and expedited their introduction.

CHAPTER XLIII.

THE COTTON STATES AND INTERNATIONAL EXPOSITION, HELD IN ATLANTA, GA., SEPTEMBER 18 TO DECEMBER 31, 1895.[1]

BUREAU OF EDUCATION,
Washington, D. C., February 1, 1896.

SIR: A marked difference between the Cotton States and International Exposition and the Centennial and the World's Fair may be found in the fact that the last two were held to commemorate great historical events, while the first was strictly commercial in its conception and aims. Its origin was due to the then unsatisfactory business situation in the South, and it represented an effort to restore the trade of Atlanta to its normal activity. To attract visitors, to increase the amount of money in circulation, to advertise the city, and to extend the market for its wares—these were the means by which it was expected that the efforts in behalf of the Exposition would redound to the commercial benefit of Atlanta.

As originally projected an international affair was not contemplated, but the idea, once started, grew. It was observed that it might be possible not only to add to the trade in the Southern States of the Union, but that the countries still farther south might be brought into such relations with Atlanta merchants as to open profitable intercourse between them by which Atlanta, though far from the seaboard, might even attain international importance. Government aid was early sought and an appropriation was secured of $200,000 for an exhibit of the resources and functions of the United States Government. Commissioners were sent to the countries of South America and of Central America to arouse interest in the objects of the Exposition, to obtain exhibits, and to secure the cooperation of those Governments. Agents were employed to solicit exhibits from Europe also.

Judged by the visible results, these efforts to give the Exposition an international character and significance were comparative failures. Venezuela, Mexico, Argentina, and Costa Rica were represented by commissioners bearing governmental appointments, but their exhibits were meager and unpretentious, since the amount of money at their disposal was insignificant. It is not probable that any one of them had as much as $10,000 for all purposes. None of the European nations were officially represented. The foreign section of the Manufactures and Liberal Arts Building was composed of a number of booths, apparently for no other purpose than the immediate sale of wares.

This paucity of foreign recognition of the Exposition was due, of course, to its provincial and purely commercial character and to the fact that our own Government had no further connection with it than the preparation and display of its own exhibit. Under the circumstances it is only surprising that the managers of the enterprise succeeded in giving it as much of an international character as they did.

GROUNDS AND BUILDINGS.

The site for the Exposition was well chosen. It was about 2 miles from the center of the city and had been previously used for a number of fairs of local character. That, however, was of little significance when the more pretentious Exposition was arranged, for the entire face of the earth was altered by new grades, terraces, and artificial lakes, so that the old Piedmont grounds were absolutely unrecognizable in the new grounds as prepared for the Exposition. Only two of the old buildings were retained. The Main Building was remodeled and became the Transportation Building, while the grand stand overlooking the old race track was transformed into a very acceptable "Auditorium" for the various conventions and congresses held in connection with the Exposition.

---

[1] Report of James C. Boykin, agent of the Bureau of Education.

The principal buildings were devoted, respectively, to agriculture, forestry and mining, machinery, Georgia manufactures, the negro, transportation, electricity, woman, liberal arts, the United States Government, fine arts, the auditorium, and the administrative offices.

Nearly all of them were substantial appearing frame structures, uniformly gray in color, with white trimmings, and shingle roofs stained with an unobtrusive green. The most conspicuous exceptions to this rule among the Exposition buildings proper were the Forestry Building, which was constructed of unhewn logs, the Woman's Building, and the Fine Arts Building, which were plastered with material similar to that used so freely at the Columbian Exposition. Several States, including Georgia, Pennsylvania, New York, Alabama, Illinois, and Massachusetts, erected buildings on the grounds at State expense. The Georgia and Alabama buildings were filled with exhibits setting forth State resources, mainly agricultural in the former case and mineral in the latter. The Massachusetts Building contained exhibits of schools, of the State board of health, and of some State institutions. The other State buildings were merely meeting places for their citizens and contained no exhibits. The building called the California Building was a private enterprise.

The general arrangement of the buildings was around an elliptical plaza a half mile in circumference, on one side of which were two small artificial lakes. The grounds were tastefully laid out and ornamented with shrubs, fountains, and sheet-metal statuary. A decided novelty was introduced by mounting some of the metal figures upon tall Corinthian and Ionic columns.

The walks were of crushed limestone and in general color harmonized well with the color of the buildings, but the stone was crushed just fine enough to present innumerable sharp points and edges to the feet of pedestrians, and it was not laid sufficiently thick to prevent the heavy Georgia mud from oozing through when the winter rains fell. So the walks were not altogether sources of pride to the management.

The general appearance of the grounds and buildings was decidedly pleasing, and during the night illuminations, which were frequent during the first few weeks, the scene from any one of several favorable locations was one of extraordinary beauty.

"THE MIDWAY."

The ethnological appendage to the World's Fair on the Midway Plaisance has had its imitators at every fair that has followed; but at Chicago one of the main objects was instruction of an intensely practical and valuable kind. Amusement and profit were secondary considerations. The experiment was successful there, for the Midway was very popular and profitable, both to the Fair and to the managers of the various "villages." But at the later fairs, including that in Atlanta, the original object of bringing together representatives of widely scattered races for educational purposes seems to have disappeared, and instead there have been presented numerous shows, many of them of rather a low order, for no other purpose than sordid gain.

THE EXHIBITS.

Agricultural Building.—The most conspicuous of the exhibits in the Agricultural Building was the Arkansas State exhibit, which filled the entire building with the perfume of apples. There were also miscellaneous exhibits from South Carolina and Louisiana, two extensive railroad exhibits, several from beer and whisky making concerns, and a great variety of minor exhibits of food products, etc.

The *Forestry and Mining Building* was under the charge of two officials of the United States Government, Dr. David T. Day, of the Geological Survey, and Dr. B. E. Fernow, of the Agricultural Department, who were acting as officers of the Exposition as well as employees of the Government. The building was filled principally with the class of exhibits indicated by its name. An exception was the Venezuelan exhibit, which consisted largely of wools, skins, etc. An effort was evidently made to set forth with a great deal of particularity the resources of the South in the way of forests and mines, for the most striking features of the display were the Southern woods, the illustrations of the turpentine industry, "statistical columns" representing graphically the extent of the production of Southern mines, and a fine collection of Southern gems.

In the *Machinery Building* the most extensive exhibits were those of cotton manufacturing machinery and pumping engines; and the fact that cards indicating that these had been sold appeared early may be taken as an evidence of enterprise in Southern manufacturers, for the mere fact that these machines were exhibited in such a place proves them to be of late design, even if not necessarily of the best. In this connection it may be well to mention as a matter of especial economic interest that there were also exhibited on the grounds a machine for picking cotton, and a new cotton press, which, if they come into general use, will greatly change the methods of handling cotton.

Cotton can not be cut and the fiber separated from the stalk as wheat is thrashed, for all the cotton on a stalk does not ripen simultaneously. The same plant may have upon it at the same time "squares," blooms, unopened bolls, and ripe cotton ready for picking. The last should be picked as soon as practicable to prevent it from being damaged by rain and dirt and from falling to the ground and being lost; but the rest of the plant must not be injured, and the remaining bolls must be allowed to come to maturity in order to realize the full value of the crop. Several pickings are therefore necessary. Heretofore nothing but the human hand has been able to do this, and cotton picking has been necessarily slow, laborious, and expensive. It usually costs a half cent a pound and sometimes as much as three-quarters of a cent. And the cotton as it is picked is worth not over 3 cents, for there are about 2½ pounds of seed to every pound of fiber, and the latter brings only about 7½ cents; the seed is of but little cash value to the farmer, even in this day of cotton-seed oil mills.

Several attempts have been made to devise a machine to do the work of picking, but heretofore none of them has had even reasonable success. The new machine exhibited in Atlanta is an ingenious and intricate piece of mechanism and a description of its details would be out of place here. But it did pick cotton and it did not appear to damage the blooms or to knock off the unopened bolls. Its operation was far from being a complete success, but it demonstrated that the thing could be done, and if finally successful it will result in important economic changes in the cotton belt, and play its part in the upbuilding of towns by lessening the number of laborers required in farm work.

According to the present method each picker carries a bag slung over his shoulders and puts into it the cotton as he picks it. At the end of the row, or when the bag becomes uncomfortably heavy, he empties it into a large "split" basket, which in turn is hauled to a shed or barn to await the convenience of the farmer. When picked the fiber is full of seed, to which it is attached. This seed cotton must be hauled to a gin—which is usually conducted after the manner of the old-time grist-mills—and there the seed is separated from the lint or fiber by a series of fine saws. The lint emerges from the condenser attached to the gin in a broad, fleecy roll. This condenser, by the way, is a modern improvement, for within a comparatively few years the lint was thrown from the gin like a snowstorm into a "lint room," against an opening in the wall of which the gin was placed. At the same time the "feeding" of the seed cotton into the gin was done by hand and was exceedingly dangerous because of the probability of the feeder's hand getting caught in the saws. The automatic feeder and the condenser came into use about the same time.

After coming from the condenser, according to present methods, the cotton is taken by hand to a press, usually operated now by steam but formerly by horse power, by which it is formed into a bale containing from 400 to 550 pounds, the average being somewhat less than 500 pounds. The bale is partly covered with jute bagging and is held in shape by iron ties or straps. If the bale is to be shipped North or to Europe it is usually compressed to about half its former size by means of powerful hydraulic compresses at some central point. This is done to facilitate shipping and to reduce the danger of fire, for in the loosely packed bale a spark may smolder for days, burn the bale to a shell, and be communicated to surrounding bales before it is discovered.

Before reaching its final destination, where it is made into cloth, the bale of cotton passes through the hands of never less than three parties, namely, those of the local merchant, the warehouseman and cotton factor, and the final purchaser. Every one of these takes a sample from the bale in order to judge of its quality and determine the price to be paid. To get a fair sample a generous handful is taken, and to guard against fraud in packing, the sample is taken from as near the center of the bale as possible. To do this the bagging is cut, and the loss to the bale is not only what is taken for the sample, but also that damaged as the result of the exposure of fresh surface to the dust and mud encountered on its travels. The bagging only partially covers the bale at best and the damage from this source is considerable. The loss to the producer from the system of sampling alone may be judged by the fact that cotton factors consider the samples as perquisites of the business and the receipts from their sale usually amount to enough to pay all expense for clerk hire.

The new system of baling, exhibited at Atlanta, is intended to obviate all these difficulties. The cotton as it comes from the condenser is automatically carried to a new type of press where it is rolled under heavy pressure into the form of a cylindrical bale of great density. It is then completely covered with heavy cotton canvas. Samples are taken out during the baling process and accompany the bale with the guaranty of the ginner of its correctness. The density of the new bale is greater than that of even a compressed bale, and it is claimed that it is practically impossible for it to burn, since all the air is pressed out in the baling.

There are three, and probably more, varieties of presses on the new rolling principle, there being differences in the size and weight of the bale produced. But all

of them press the cotton as it comes from the condenser, avoid the necessity of compressing, save the loss from wasteful sampling, lessen the danger of fire, and make a bale that can be handled and shipped more conveniently and economically than the old style, and be used more expeditiously by the manufacturer.

This digression for the description of the two new machines, the cotton picker and cylindrical press, is justified because they seem to be the most important of all the inventions brought into public notice by the Exposition and the most likely to have far-reaching effects.

The Georgia Manufacturers' Building was erected by the manufacturers of the State and was filled with Georgia goods. The impression made upon the thoughtful observer by this building and its contents was more profound than that made by any other building on the ground, for here were found the most striking evidences of "the new South." Georgia is not only manufacturing cotton goods, but she is making, and making extensively and profitably, furniture, coffins, pianos, bicycles, woodenware, plows, machinery, pumps, shoes, clothing, wagons—in fact, nearly every article in the range of human needs. And practically all these industries are the growth of the last twenty-five years.

The Negro Building attracted wide attention and comment. It was the first exhibit ever presented on a similar occasion of the progress and condition of the negro in America. On the whole, the showing was very favorable for a race which was in the darkness of absolute savagery within a few generations and in abject servitude within a single generation. Most of the exhibits, however, were exhibits of institutions, not of individuals or firms. A mantel maker, a shoemaker, and probably one or two other artisans made exhibits, and so did certain social or benevolent societies, but as a whole the exhibit did not show so much what the negro is doing as what is being done for the negro. The building was filled almost wholly with work done in educational institutions and presumably under the eyes of instructors.

The Transportation Building was evidently named before the exhibits were placed, otherwise it would probably have been called the "Miscellanous Building" or something else indicative of variety. It contained farm machinery, trucks, optical goods, wagons, whetstones, bicycles, sporting goods, water filters, electric welding, boats, carriages, pottery, Chilean nitrates, the miscellaneous exhibits from Mexico, Venezuela, and Chatham County, Ga., and a great variety of other exhibits. Not even the Manufactures and Liberal Arts Building could boast of a more variegated assortment.

The Electricity Building, like most of the others, contained many exhibits not justified by the designation of the building, but the number of articles improperly classified was not so painfully apparent as in the Transportation Building. The striking display seen at Chicago was missing here, for there were none of the magnificent light effects that were such an attractive feature of the World's Fair; but there were several very creditable and rather extensive exhibits.

The Manufactures and Liberal Arts Building was the largest on the grounds, and from the variety of its exhibits was, next to the Government Building, the most attractive to the general public. The foreign section was located here, and from the novelty of the articles displayed attracted a large share of attention. The goods, almost without exception, were for immediate sale and were therefore of a class most likely to be desired as souvenirs. There were enameled jewelry in great profusion, Venetian glassware, porcelains, pottery, embroidery, amber goods, marble statuettes, French furniture, fans, and tortoise-shell combs, Russian enamel ware, etc. All the foreign exhibits in this building were without official status and could not be said to be representative of the countries from which they ostensibly came. Many of the exhibitors were, in fact, regular dealers in such wares in larger cities of this country, or were migratory merchants who go from exposition to exposition for the sale of their goods. This, by the way, is a new and peculiar phase of the exposition business that has developed since expositions have become so common. Even the elaborate and beautiful model of the World's Fair, said to have been designed by the builder of the famous Ferris wheel, was constructed with a view to exhibition for profit at one fair after another. This is but the best of scores of schemes with the same purpose in view.

The American exhibits in the Manufactures Building naturally included a curious mixture of articles. Pianos, cod-liver oil, tombstones, sewing machines, ice-cream freezers, rapid-fire guns, eyeglasses, paints and varnishes, artificial legs, office fixtures, bicycle tires, books, shaving stones, drugs, duplicating apparatus, baby food, Pennsylvania natural history, perfumery, magic lanterns, water filters, stoves, writing paper, candy, etc., were to be found under the same roof.

On the second floor of this building were the displays of photographers and the educational exhibits, which will receive separate treatment.

The Government Building was generally considered the best part of the Exposition, and it might have been expected that it should be. The funds for the preparation of the exhibit were ample, and all the magnificent collections of the Government in Washington were at the disposal of the board of management; but more than all

else the officials in charge were men experienced in that line of work. Nearly all had been concerned in the preparation of exhibits at previous expositions, and one, Mr. Earle, of the Smithsonian Institution, had been identified with no less than eleven. The tremendous advantage of this experience was apparent on the opening day, when the Government Building was swept and garnished, its exhibits complete in every detail, while the other buildings were all disorder and chaos, with scarcely anything ready for inspection.

The display of the Fish Commission, with its beautifully arranged tanks of live fish, its hatcheries, nets, sounding and dredging apparatus, etc., was almost constantly crowded with visitors. The Smithsonian Institution and National Museum exhibit was nearly as popular; it contained a great variety of material and was skillfully and attractively arranged.

In the space allotted to the Interior Department were exhibits of mechanical models by the Patent Office; charts, fossils, minerals, casts, etc., by the Geological Survey; books, statistics, charts, and photographs by the Bureau of Education; and Indian school work by the Indian Office.

The Department of Agriculture exhibited a collection of fibers, models of fruit and fungi, specimens of grasses and soils, some injurious birds and insects; the work and methods of the Bureau of Animal Industry of the Weather Bureau and of the laboratory for testing seeds were also shown.

The Treasury Department had a tastefully arranged display of models of lighthouses and light-house equipments, coins and medals, bills, bonds, revenue stamps, weights and measures, and pictures of public buildings.

The Department of Justice had a small collection of legal works, photographs of prisons, and objects showing the work of prisoners.

The Department of State showed a set of official blanks, a number of original Presidential proclamations, some exceedingly interesting letters from foreign potentates to Presidents of the United States, several historic swords, and a few massive medals presented by foreign countries to the United States to commemorate important events.

The Post-Office Department exhibit included models of mail ships and of a postal car, a very complete collection of stamps, curios taken from "dead" letters, articles showing the operation of foreign postal services, etc.

The Navy Department showed models of the vessels of the new navy, a torpedo boat, rapid-fire and machine guns, small arms and instruments used on shipboard.

The War Department had a number of groups of figures showing the uniforms of the army at various periods, siege and field guns, apparatus for signaling, arctic relics, muskets and small arms, flags, war-time wagons, torpedoes, and models of engineering works on the Mississippi and other rivers.

Though all the Departments were entirely separate, the same general scheme of decoration prevailed all through the building, and there was constant interchange of views among the managers, so that there was a certain unity apparent in the building that was not to be seen in any of the others.

The Woman's Building was cut up into rooms of varying sizes, and each room was assigned to some locality or some organization which took charge of the exhibit in it. Needlework and china painting were naturally most conspicuous in a collection of woman's work, but there were also wood carvings, statuary, portraits, and a thousand other things which only a woman could enumerate or fully appreciate. Of course the arrangement was tasteful and the effect was pleasing. In the basement a kindergarten was conducted for a part of the time, and in the "model school building" near by a school was taught. Throughout the ladies exhibited a commendable degree of enthusiasm, energy, and enterprise, and contributed no little to the success of the Exposition.

The Fine Arts Building contained a collection of pictures gathered principally from Northern cities, though many of them were from the easels of European painters. Some of the pictures were undoubtedly meritorious, and though the collection as a whole could not be said to be of the highest character, it was by no means discreditable. But here, too, the commercial spirit of the whole Exposition cropped out; a large sign, conspicuously posted, stated that most of the pictures were for sale, and solicited inquiries as to prices, etc., to be made at the office of the superintendent of the building.

THE GENERAL EDUCATIONAL EXHIBIT.

The educational department of the exhibit was not organized until the spring of 1895, and labored under a great disadvantage because of the limited time that remained in which to work. The department was in the charge of Hon. William J. Northen, who had been a prominent teacher for years, had been governor of the State for two terms, and was and is a man of marked executive ability and high standing. Realizing the difficulties of organizing a satisfactory exhibit so late in

the school year, he worked with greater energy on that account, and when the exhibits were finally installed the educational department made an unexpectedly good showing.

Why it should be so is a mystery, but it has almost invariably been the fate of school exhibits to be put out of the way of the great mass of visitors and in some second story, where they are reached only after an arduous climb of a long stairway. Sight-seeing is hard work, and people who visit expositions are disposed to husband their strength as much as possible. There is always a great deal to be seen on the ground floor, and few care to expend their efforts in stair climbing; consequently the educational exhibits have not many visitors, no matter how attractive they are.

This was the case in Atlanta, and even on the big days, when the lower floor of the Liberal Arts Building was crowded with a bustling crowd of eager sight-seers, one could find quiet and peace upstairs in the school exhibits. Once or twice I was in the gallery on the more quiet days, when the only signs of life to be seen on that floor were in the restaurant and bar at the end of the building.

So much for the unwisdom of "skying" exhibits of this character. It is to be hoped that the managers of educational departments of future expositions will not submit to such undesirable quarters, but will insist upon a location easily accessible without the unnecessary expenditure of muscular force.

I have appended a list of the educational exhibits as it appeared in the official catalogue, but the catalogue was compiled early in the history of the Exposition and the list is far from complete, but it is the best that is available. The number of business colleges represented was unusually large, and their exhibits comprised as a rule specimens of penmanship, sets of books kept by students, and the like.

The Alabama Polytechnic Institute had a modest exhibit of work done by students in the line of machine and wood work, and the University of Tennessee had a similar but somewhat more extensive exhibit.

Harvard University exhibited an exceedingly interesting chart showing the historical development of its course of study, photographs of the World's Fair statues of the average Harvard student, publications of the university, etc.

Johns Hopkins University showed a set of books published by the university and by students and graduates.

The university at Princeton, N. J., among other things, exhibited a model of the grounds and buildings of the institution.

The State of Arkansas made a collective exhibit of school work, comprising examination papers, drawings by pupils, maps, etc., and the city of Cincinnati, Ohio, was represented by specimens of drawing, penmanship, and the like.

The Pennsylvania section was more satisfactory as an exhibit than any other, though it was largely confined to work in the line of industrial training. The Pennsylvania Training School at Elwyn and several Philadelphia institutions were represented.

Besides the exhibits of the educational department proper in the Liberal Arts Building there were others in the Woman's Building and the Model School Building, which was built and conducted by the ladies, in the Negro Building, and in the Georgia and Massachusetts State buildings. The work of the ladies in the educational line is discussed in the article in this report by Miss Nettie C. Sergeant, who was chairman of the committee having that branch of work in charge.

In the Negro Building the general character of the exhibits was educational, and the general character of the education exhibited was industrial. Most of the work exhibited was creditable and much of it was excellent. Among the most conspicuous exhibits were those of Clark University, Atlanta, Ga., Hampton (Va.) Normal and Industrial Institute, Howard University, Tuskegee (Ala.) Normal and Industrial Institute, Spelman Seminary, and Claflin University.

In the Massachusetts Building there were a number of bound volumes of examination papers and drawings, bound photographs, etc., that had formed a part of the exhibit at the World's Fair.

The most prominent of the educational exhibits in the Georgia Building was that of the Normal and Industrial School at Milledgeville.

In connection with the Exposition there were held a number of congresses and conventions, and among them was the Educational Congress, held October 25 to 31. This was organized by Governor Northen as the chief of the department of education, but the meetings of the first two days nominally comprised an adjourned session of the National Educational Association. The programme officially promulgated and some of the papers read are appended to this report. The attendance was not as full as might have been desired. The meetings were held inside the grounds, and though the speakers received free passes, in effect others were charged 50 cents to attend, for they were required to pay admission at the gates. Those who had paid to enter preferred to visit the exhibits rather than to attend the sessions of the congress.

THE EXHIBIT OF THE UNITED STATES BUREAU OF EDUCATION, GOVERNMENT BUILDING.

As a preliminary step in the preparation of the exhibit of this Bureau, a committee was appointed to draft plans for the same. The Commissioner, Dr. W. T. Harris, directed the labors of this committee, which was composed of the chief clerk, Mr. Lovick Pierce, Dr. L. R. Klemm, Mr. Henderson Presnell, and myself. Tentative schemes were presented by Dr. Klemm and by myself, and general discussions were had as to the proper material to be exhibited, the methods of displaying the same, and such kindred subjects as were suggested by the necessities of the case.

The actual preparation of the exhibit fell to my lot, though I was aided by the other gentlemen of the committee whenever their assistance was necessary, and the cooperation of the chief clerk was always heartily given.

As much of the work as it was possible to do in Washington was done before the shipment of the material to Atlanta. Comparatively little remained to be done there, and there was little difficulty in completing the work of installation before the opening of the Exposition.

The primary function of the office is to collect statistics and facts showing the condition and progress of education in the several States and Territories, and "to diffuse such information respecting the organization and management of schools and school systems and methods of teaching as shall aid the people of the United States in the establishment and maintenance of efficient school systems and otherwise promote the cause of education throughout the country." Its only executive duties consist in the management of the schools of Alaska and in the supervision of the expenditure of the money appropriated to agricultural and mechanical colleges under the act of August 30, 1890.

An exhibit, therefore, which displays the operations of representative educational institutions is not only an illustration, but is also an exercise of the main function of the Bureau. This idea prevailed in the preparation of the exhibit of the Bureau at the Exposition at New Orleans in 1885, and the educational department of that Exposition was managed by the agents of this office.

The propriety and practicability of doing this for the Atlanta Exposition was suggested and advocated, both in the committee and by Hon. William J. Northen, the head of the department of education of the Exposition. But in view of the fact that the school year was then drawing to a close, making it doubtful whether the time remaining was sufficient to prepare a satisfactory exhibit of this character, it was decided to show only the Bureau's own characteristic work, methods, and publications, with such additional material of a general character as was then in hand or readily accessible. The limited amount of money available was also a consideration in reaching this conclusion.

In gathering the material it was fully realized that the things most important from the standpoint of educational values are not necessarily most attractive as exhibition material, but it was the aim to make the exhibit sufficiently dignified and substantial to be worthy of the attention of students, and at the same time to make it of such character as to attract the general public.

The work of the Bureau in diffusing information was made the central feature of the exhibit on its substantial side. This consisted of (1) its publications, which were shown in bound volumes; (2) a collection of statistical charts setting forth the condition of education in its various phases in the United States; (3) charts showing the state of education of various foreign countries; (4) maps showing the distribution of educational institutions in the United States; (5) a map showing the percentage of illiteracy in the several States; (6) a large wall chart showing statistically the progress of education in the South during the last twenty years.

The anomalous condition of the Bureau as a Government office charged with the collection of statistics and similar information, but without the power to require reports or funds with which to pay for them, demanded that some means be employed to show how the required data are obtained. Accordingly the exhibit included a collection of manuscript returns which were voluntarily forwarded by the correspondents of the office. These were bound in 24 thick volumes, which contained about 13,000 returns received in a single year from an equally great number of correspondents. When it is remembered that this tremendous mass of statistical information is obtained without cost, this portion of the exhibit becomes an excellent object lesson of the recognition by school men of the usefulness of the Bureau and of the value of its work in relation to their own.

As examples of other sources from which data are obtained there were shown (1) a collection of foreign school reports, embracing all civilized countries; (2) a number of American educational periodicals, nearly all the States of the Union being represented; (3) an extensive collection of reports of State and city school officers, and of catalogues of all classes of institutions represented in the reports of the office. Documents of the last class are characteristic of American education. They

form one of the most valuable means of disseminating educational intelligence and of making the ideas and achievements of one institution the common property of all. They are freely and constantly used in the work of the Bureau of Education, and it was fitting that they should occupy an important place in the exhibit.

Education in Alaska presented the opportunity of making one of the most attractive features of the Bureau's display. The conditions of life in that Territory are so entirely different from the conditions that prevail in this part of the country that it was thought proper to make a display of characteristic Alaskan articles, in order to show under what disadvantages educational work in that Territory is maintained. This portion of the exhibit was very largely the work of Dr. Sheldon Jackson, the general agent of education in Alaska.

A few articles were shown which were intended to give an idea of the habits and customs of the natives. These included totem poles, articles of apparel, instruments for preparing skins for use, dishes and utensils, masks used in their dances, models of canoes, carvings from ivory and horn, and baskets, hats, etc., made from grass and bark. These were supplemented by a number of photographs showing groups of natives in their characteristic costumes, snow houses, dog sleds, the manner of disposition of their dead—it could scarcely be called "burial"—and of typical Alaskan scenery. There were also a number of drawings by natives representing various scenes common in their experience, such as games, dances, fishing, walrus hunting, and seal clubbing.

The flora of Alaska was shown in a number of water-color paintings, which were kindly loaned by Miss E. Leslie Jackson, the artist. Miss Jackson was at one time connected with one of the schools at Sitka, and it was during her residence there that the paintings were made. The schools themselves and their work were represented by statistics, specimens of school work, photographs of buildings, of pupils before and after attendance, of typical civilized and uncivilized families, etc.

The current agitation in favor of improved school desks and the widespread demand for complete adjustability led to the exhibition of a series of models of desks that were in the possession of the Bureau, supplemented by a number of similar kind exhibited in the Bureau's space at our instance by the United States Patent Office.

These were selected with a view to show typical specimens of desks at different periods of progress, beginning with the primitive puncheon bench and ending with the latest patent adjustable desks. Labels were carefully prepared showing the peculiarity of each desk, with mention of those features in which progress was indicated over desks previously made.

In the bay window at one end of the space allotted to this office was displayed a large collection of photographs, illustrating typical educational institutions of the United States. There were represented public schools, academies for boys, seminaries for girls, normal schools, schools for the deaf, schools for the colored race, medical schools, schools of technology, agricultural and mechanical colleges, colleges for women, and colleges and universities.

The photographs were selected to show as far as possible for each institution (1) material equipment, including buildings and grounds, laboratories, apparatus, etc.; (2) professors and teachers; (3) groups of students or pupils; (4) work of pupils; (5) social life and games. These photographs were arranged in wall cabinets by classes of institutions; under each class the arrangement was alphabetical.

As a means of adding to the attractiveness of the exhibit, as well as for its historical and pedagogical value, a series of pictures were prepared and exhibited illustrating various forms of school punishment.

This idea originated with the Commissioner. In its execution Mr. Felix E. Mahony was detailed from the Pension Office and a room was furnished as a studio for him in the building of the Geological Survey. Twenty water-color drawings were made, illustrating nearly all the varieties of punishment capable of illustration which were found in the course of an extensive investigation.

Mr. Mahony did his work well; the pictures were neatly framed and attracted wide attention.

In regard to methods of display a few words may be said. Some of the furniture used had previously seen service at the World's Fair in 1893, but it was all renovated, and much of it was remodeled to suit the special need of this case.

One tall exhibition case, largely of glass, was fitted with shelves and used as a bookcase; another of similar style was utilized to exhibit the models of school desks, and answered the purpose admirably.

Three small bookcases of ordinary library style were purchased ready-made for bound volumes; they were set against the wall and were as neat as any that would have been specially designed. Statistical charts and many of the photographs were displayed in "wing frames," some of which were hung about circular pillars and some on an upright frame above a heavy table that differed but little from ordinary patterns. The frames themselves were of the "single frame" variety. In each

there were two sheets of glass, between which charts were placed, one facing each way; all were held in the frames by means of beads. They are more troublesome to mount than the double frames formerly used, but they are lighter, neater, and cheaper.

There was not sufficient wall space to display the framed pictures, and the need was supplied with two screens 10 feet long by 7½ feet high. The frames were neatly made of polished oak, the body of the screens being of matched pine covered with dark-red felt. One end was fastened to the wall, while the other was securely braced with heavy irons. The upright portions of the braces were made to fit exactly the inside of the posts and the horizontal portions were mortised into the floor, so that the means of support were not visible. All the punishment pictures and the water colors of Alaskan flowers were thus hung, and what threatened to be a troublesome problem was satisfactorily solved.

A case designed for the maps was fitted with large spring rollers, on which the maps were rolled singly when not in use. There were two such cases, each holding four maps.

A large number of photographs were exhibited in wall cases similar to those first used in the New Jersey school exhibit at the World's Fair. They consisted of a series of 15 light frames, each holding a heavy sheet of cardboard, swung in a compact cabinet with a glass door. The photographs were mounted on the cardboard with ordinary paper fasteners. Cabinets of this kind are by far the best means with which I am familiar for displaying such material, and they were admirably suited to our purposes.

For the small curios from Alaska a show case of the so-called "monitor" pattern was built, the taller central portion being used for small totem poles and the lower portion at the ends being filled with smaller articles.

The ornamental effects were secured by the use of (1) portraits of former Commissioners on the walls, (2) small groups of statuary representing school scenes on the low bookcases, (3) peculiar baskets of Alaskan fashion on the higher cases, and (4) globes and telescopes on the pillars of the wing frames.

The colored transparencies of Southern scenery in the windows formed a part of the exhibit of the Geological Survey, but added greatly to the attractiveness of our own.

The exhibit was inspected by a number of prominent educators and other persons of distinction and by several thousand teachers, in addition to the hosts of general visitors who passed through the building during the course of the Exposition.

I was almost constantly in our space to answer any questions that might be asked, and made it a point to engage in conversation anyone who seemed to be especially interested in the exhibit, whether that interest had been shown by questions or not. In this way I learned a great deal of the people who visited us and of their preferences, and the experience thus gained will be useful in the preparation of future exhibits of similar character.

I was especially struck by the fact that teachers visiting an exposition do not as a rule care to spend their time, or at least not much of it, in an educational exhibit. After they have been confined in the schoolroom for months, probably, they enjoy a season of freedom from their labors, and when they visit a place full of strange sights and sounds they avoid reminders of their work at home and give themselves up to the enjoyment of novelties. They not only do not want to "talk shop," but they do not want to "think shop." This is only natural, and is by no means reprehensible. Such an exposition is not like a meeting of the National Educational Association, for example, where professional study is the direct and primary object. The benefit that teachers derive from an occasion of this kind is much broader, for it is in the line of general culture, and its effects upon their efficiency must be at least as great as the same time spent in narrower professional investigation.

I would not be understood as saying that teachers were unmindful of the value of the educational exhibits. Far from it. But I would emphasize the fact that the occasion is not favorable to the serious study of pedagogical questions. This was strikingly shown in the meager attendance on the Congress of Education, for though the speakers were of the highest class and the programme excellent, there were not over fifty persons present at any session.

On the contrary, I was surprised and gratified at the interest shown in educational matters and in our exhibit by the general public and by many persons in whom one would scarcely expect to find such interest. I remember especially two men who were in the exhibit for an unusually long time, and who examined everything in it with interest that almost amounted to eagerness. One of them was an actor at the head of a farce-comedy company then playing in Atlanta, and the other was a young lieutenant in the Fifth United States Infantry, who was locally famous as a football player.

I am convinced, therefore, that the material for an exhibit by this Bureau on an

occasion like that in Atlanta should be selected and arranged with a view to attracting the attention of the public at large and to interesting them in educational work, rather than with special reference to teachers.

I am, sir, very respectfully,

JAMES C. BOYKIN,
Agent, Bureau of Education.

Hon. W. T. HARRIS,
Commissioner of Education.

EDUCATION IN THE SOUTH.

The following table was prepared in the Bureau of Education and was shown in its exhibit in Atlanta as a large wall chart, 3 by 10 feet in its dimensions:

Progress in twenty years of education in the South.

[Comprising the States of Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Louisiana, Texas, Arkansas, and Missouri.]

	1874.	1884.	1894.
Total population	15,687,900	20,087,300	24,135,900
School population (5 to 18)	5,204,100	6,675,940	8,221,330
THE PUBLIC SCHOOLS.			
Pupils registered in the schools	2,279,614	3,773,477	5,260,588
Per cent of the population	14.53	18.78	21.80
Average daily attendance	1,407,830	2,445,959	3,384,050
Per cent of the registration	61.75	64.57	64.33
Male teachers	35,395	51,571	55,600
Female teachers	18,322	36,029	59,056
Whole number of teachers	53,717	87,600	114,656
Schoolhouses	44,695	73,561	86,880
Value of school property	$16,685,960	$26,009,295	$55,894,549
Average value of schoolhouses	$373	$353	$643
Average number of school days in the year	94	94	106
Expenditures for teachers' salaries	$9,200,909	$14,188,657	$22,714,010
Total expenditures	$11,823,775	$17,884,558	$29,170,351
Expended per capita of population	$0.75	$0.89	$1.21
Expended per pupil in attendance	$8.40	$7.34	$8.62
UNIVERSITIES AND COLLEGES.			
Number of institutions	174	210	299
Professors and instructors	1,399	1,880	3,062
Students	10,103	16,304	25,304

The population was about one-half greater in 1894 than in 1874.

In the public schools the number of children and of the teachers was about 2⅓ times as great; three were nearly twice as many schoolhouses, and school property was over 3½ times as valuable; the average school term was twelve days longer; the expenditures were over 2½ times as much.

One hundred and twenty-five new colleges were established between 1874 and 1894; there were 1,663 more professors and 2½ times as many students at the later date than at the former.

LIST OF EDUCATIONAL EXHIBITS AT THE COTTON STATES AND INTERNATIONAL EXPOSITION.[1]

IN MANUFACTURES AND LIBERAL ARTS BUILDING.

Alabama Polytechnic Institute, Auburn, Ala. Collective exhibit.
Arkansas public schools, Little Rock, Ark. Educational exhibit, books, charts, maps, pictures, and catalogues.
Board of education, Chicago. Drawings from public schools.
Connecticut Commission, Hartford, Conn. Educational exhibit.
Harvard University, Cambridge, Mass. Educational exhibit.
Hasbrouck Institute, Jersey City, N. J. Educational exhibit.
Johns Hopkins University, Baltimore, Md. Educational exhibit.
Massey College, Columbus, Ga. School exhibit.
Mercer University, Macon, Ga. Educational exhibit.
Pennsylvania Training School, Elwyn, Pa. Collective exhibit.

[1] From the official catalogue.

St. Mary's College, Belmont, N. C. Illustrations of college work.
State of South Carolina, Columbia, S. C. Educational exhibit.
Staunton school exhibit, Staunton, Va. Collective school exhibit.
Tennessee Industrial School, Nashville, Tenn. Collective exhibit.
University of Tennessee, Knoxville, Tenn. Collective exhibit.
Wesleyan College, Macon, Ga. School exhibit.
Woman's College of Baltimore, Md. School exhibit.

WOMAN'S BUILDING.—KINDERGARTEN WORK.

Atlanta. Miss Allen's kindergarten.
Atlanta. Mrs. Muse, from West End.
Government schools. Indian kindergarten.
Knoxville, Tenn. Free kindergarten, under auspices of the King's Daughters.
Lexington, Ky. Public schools.
Louisville, Ky. Kindergarten exhibit.
Memphis, Tenn. Free kindergarten.
Memphis, Tenn. Miss Wheatley's kindergarten.
Washington, D. C. Mrs. Hailmann's kindergarten.
Washington, D. C. Mrs. Louise Pollock.
Milton Bradley Company, Springfield, Mass. Kindergarten apparatus.

MODEL SCHOOL BUILDING—PUBLIC SCHOOL EXHIBITS.

Athens, Ga. Collective exhibit from public schools.
Atlanta public schools. Collective exhibit.
Birmingham, Ala. Collective exhibit from public schools.
Charlotte, N. C. Collective exhibit from public schools.
Cincinnati. Art exhibit from public schools.
Cincinnati public schools. Penmanship.
Dalton, Ga. Collective exhibit from public schools.
Harlem, Ga. Collective exhibit from public schools.
Hawkinsville, Ga. Collective exhibit from public schools.
Minneapolis, Minn. Collective exhibit from public schools.
Newnan, Ga. Collective exhibit from public schools.

NEGRO BUILDING.

Atlanta Baptist Seminary, Atlanta. School exhibits.
Atlanta University, Atlanta. School work, etc.
Central Tennessee College, Nashville Tenn. Educational exhibit.
Christiansburg Institute, Christiansburg, Va. Industrial exhibit.
Claflin University, Orangeburg, S. C. School exhibit.
Clark University, Atlanta. Sundry articles, school exhibits.
Cook, George F., Washington, D. C. School exhibit.
Cotton, T. L., Darlington, S. C. School work, etc.
Dent, T. M., Rome, Ga. School exhibit.
Emery, W. O., Little Rock, Ark. Farm products; school exhibit.
Florida State Normal and Industrial College, Tallahassee, Fla. School exhibit.
Gammon Theological Seminary, Atlanta. Educational exhibit.
Georgia State Industrial College, College, Ga. Industrial exhibit.
Greenleaf College, Orangeburg, S. C. School exhibit.
Hampton Normal and Agricultural Institute, Hampton, Va. School exhibit.
Howard University, Washington, D. C. School exhibit.
Lincoln School, Meridian, Miss. School exhibit.
Mitchell, Frankie, Atlanta. Penmanship.
Montgomery Industrial School, Montgomery, Ala. Educational exhibit.
Morgan College, Baltimore, Md. School exhibit.
Morris Brown College, Atlanta. School exhibit.
Smith, Philander, College, Little Rock, Ark. School exhibit.
Spelman Seminary, Atlanta. School exhibit.
St. Paul Normal and Industrial School, Lawrenceville, Va. School exhibit.
State Normal and Industrial School. School exhibit.
Steele, Carrie L., Atlanta. School children's fancy work.
Talladega College, Talladega, Ala. Educational display.
Tuskegee Normal and Industrial Institute, Tuskegee, Ala. School exhibit.

PROGRAMME OF THE EDUCATIONAL CONGRESS, COTTON STATES AND INTERNATIONAL EXPOSITION, OCTOBER 25 TO 31, 1895.

[Exposition Auditorium.]

FRIDAY, OCTOBER 25.

10 a. m.—Addresses: President of the Georgia State Teachers' Association; superintendent of education of Georgia; chancellor of the University of Georgia; Prof. Newton C. Dougherty, president National Education Association. The Training of Teachers, Principal F. W. Parker, Cook County Normal, Illinois. Relation of the Normal School to the Public School, E. Oram Lyte, Pennsylvania State Normal. College Degrees, President George A. Ramsey, Louisiana.

2 p. m.—Higher Education in the South, Prof. Edwin A. Alderman, University of North Carolina. System of Education, President William R. Harper, University of Chicago.

8 p. m.—Addresses: Commissioner W. T. Harris, Washington; Hon. A. E. Winship, Boston.

SATURDAY, OCTOBER 26.

10 a. m.—Secondary Education, President Ellen C. Sabin, Milwaukee. Progress in Primary Education, Mrs. Eva D. Kellogg, Boston. Rural Schools, Hon. Charles A. Skinner, Albany.

2 p. m.—Aim of the Elementary Schools, F. Louis Soldan, St. Louis. Aim of the Elementary Schools, Oscar Cooper, Galveston. University Education, President Francis A. Patten, University of New Jersey. Trend of Higher Education in the South, Dr. Charles W. Dabney, president University of Tennessee and Assistant Secretary of Agriculture.

MONDAY, OCTOBER 28.

COMMON SCHOOLS.

10 a. m.—Presiding officer, Dr. D. C. Gilman, president Johns Hopkins University. Introductory address by the president. The Public School System as an Instrumentality of Social Advance, Hon. E. B. Andrews, president Brown University. Discussion: Hon. J. R. Preston, State superintendent of education, Mississippi; Hon. J. O. Turner, State superintendent of education, Alabama. The Proper Scope of Public Education, Hon. James R. Waterworth, St. Louis, Mo.

8 p. m.—Old and New Ways of Treating History, Hon. John Fiske, Cambridge, Mass. General discussion, public school system.

TUESDAY, OCTOBER 29.

SECONDARY SCHOOLS.

10 a. m.—Presiding officer, Col. William Preston Johnson, president Tulane University. Introductory address by the president. The Place and Work of Secondary Schools, Prof. Lawrence C. Hull, Lawrenceville, N. J. The Place of Literature in Secondary Education, Dr. J. H. Abernethy, principal Berkley Institute, Brooklyn, N. Y. Discussion: Prof. Lawton B. Evans, superintendent city schools, Augusta, Ga.; Maj. W. F. Garrett, Peabody Normal School, Nashville, Tenn.

PEABODY MEMORIAL.

3. p. m.—Addresses: Dr. W. H. Payne, president Peabody Normal School, Nashville, Tenn.; Dr. J. L. M. Curry, agent Peabody fund, Washington, D. C.

8 p. m.—Methods of Botany Teaching for the Young, Prof. D. P. Penhallon, professor of botany, McGill University, Montreal, Canada. The Educational Use of Mythology and Folklore, Hon. W. W. Newell, secretary American Folklore Society, Boston, Mass. General discussion, secondary schools.

WEDNESDAY, OCTOBER 30.

HIGHER AND TECHNICAL EDUCATION.

10 a. m.—Presiding officer, Dr. Charles K. Adams, president University of Wisconsin. The Spread of Knowledge Regarding the Mineral Products of the Country, Prof. J. A. Kemp, professor of geology in School of Mines, Columbia College, N. Y.

Colleges for Women, Hon. John F. Goucher, president of Woman's College, Baltimore. Certain Phases of Pedagogics, Prof. A. P. Montague, dean of Columbian University. The Relation of Schools and Museums of Art to the People, Hon. Halsey C. Ives, director of Museum of Fine Arts, St. Louis, Mo.

2 p. m.—The Material Development of the South as Related to the Progress of Scientific and Technical Education, Hon. William M. Thornton, chairman of the faculty, University of Virginia. A Modern Opportunity, Dr. B. L. Whitman, president Columbian University.

EDUCATION OF THE DEAF.

8 p. m.—Presiding officer, Wesley O'Connor; The Education of the Deaf, Hon. Edward M. Gallaudet, president of Gallaudet College, Washington, D. C. Dr. Philip G. Gilbert, president of the American Association for Teaching Speech to the Deaf. General discussion.

HIGHER EDUCATION IN THE SOUTH.[1]

[By Edwin A. Alderman, professor of pedagogy, University of North Carolina.]

Out of the overthrow of a unique and forceful civilization in the Southern States there is slowly emerging a new society. Under the stern pressure of necessity this silent revolution has proceeded so quietly, and has been masked so skillfully by the marvelous material resurrection of a ruined and conquered people, that men have not marked the clashing of old ideas and aspirations and modes of thought with the new strenuous influences of modernism and innovation. All the well-known phenomena of transition are in full play in Southern life—the people as a whole, incited by lack of training and consequent poverty, pressing steadily toward a wider life, but unable to distinguish, in the general clamor, the guidance of true wisdom from the voice of the slave to his prejudice or his sect casting in stumbling blocks, or the raw enthusiast shouting panaceas and prophesying millenniums.

The direction and elevation of this social new birth are the surpassing duty and function of all educational forces, and more especially of the higher education in Southern life. Whether there shall issue from the conflict an enlightened civilization, blending the lovableness and charm of the old with the vigor and freedom of the new, or some unhappy system made up of crudities and ancient prejudices, is the task set for this generation of educated Southern manhood.

Isolated, individual, conservative, the South of the past held itself proudly aloof from the ferments of modern society, went its own way, and created its own dominant dramatic order. This order was a system of contrasts and lights and shadows. It produced neither wealth nor letters. It dishonored labor, arrested immigration, minimized invention, unified industry, and exalted caste. The academies and private schools of the time, administered by scholarly and devoted men, were numerous and effective, indeed, almost perfect instruments for the purposes of the time; but the common schools, branded with the burning badge of pauperism, could not thrive. Yet there issued from this order the smallest, the alertest, the most powerful political force in Christendom. The American Union had sprung from their brains, had been maintained by the valor of their arms, and had extended its territory under their guiding hands. By a strange historic paradox the causes of their weakness became as well the causes of their strength. The dangers and antagonisms of a militant labor system made them masterful in action and persuasive in speech. Baronial life, with its leisure and inherited overlordship, made them as simple as shepherds and as proud as kings. In the placid air of their enlightened mediævalism lingered the brave old ideals of courage and beauty and gracious dignity. There was but one overshadowing Southern question then, and this for its treatment did not so much need universal intelligence and thrift and the spirit of gain and growth, as it did character, principle, oneness of purpose, and chivalric codes of conduct. Hence all the forces of the time concentrated on these lines, and there arose an assertive, sensitive, sincere, dauntless race of men esteeming life less than honor and loyalty more than gold, who wrought with a sad titanic sincerity for their doomed cause; withholding nothing, compromising nothing until the mighty struggle wore to its sublime and pathetic close at Appomattox.

The great war, in the mystery of historic forces, freed the white man, rolled away his burden, and enrolled the South in competition with the great industrial democracies of the world. Its problems, no longer direct and primitive, are their problems intensified by the painful processes of social transformation. The old individualism has given place to combination and capitalism, servile labor to the labor of the free black; and with this the best products are to be raised, the best goods manufactured, and the best routes to market devised. Our first work is to possess the land and

[1] Read at the National Congress of Education October 25, 1895.

subdue it. The care of the body, if not so important as other higher things, must at least take precedence in the evolution of a higher civilization. The law of the passage of society from the patriarchal to the economic stage necessitates the higher organism, the subtler brain, the more cunning hand. Hence, like a belated army, the South is seeking to conquer a place in material civilization; its dreamers become captains of industry, and its doctrinaires lords of trade. We shall lose an element of charm and picturesqueness, but we shall gain in wealth and productive energy, and the change is inevitable.

Our largest work is the wise and just guidance of the irrepressible instinct of democracy, restrained for generations, now asserting itself in the upheaval of the plain people—the third estate—who are everywhere coming to the front, demanding their share in government and challenging the authority of the ruling class. Our untrained men are learning to govern by governing, pedagogically and historically a wise process, for that surely is better than to be governed and remain ignorant. The situation is not without great hopefulness. The rank and file of this popular uprising are the best material in the world for the making of educated citizenship. The civil war revealed their value to the world and constituted their university. Its marches and dangers opened their eyes and gave them their outlook on life. They and their sons, the younger element in the movement, are men of unmixed English and Scotch-Irish blood, inheritors of the Anglo-Saxon consciousness, descendants of men who sacrificed peace and life for principle in three wars, keen-witted, if untrained, their very excesses the result of boundless faith in the majesty of their government. The tasks awaiting adjustment by these men, sure to attain and hold power in the end, are enough to appall the wisest statesmen and the profoundest social scientists—the remodeling of constitutions, the settlement of grave questions of suffrage and property, the reconciliation of classes, and, greatest of all, the problem of the two races.

The sentimentalists and partisans of the reconstruction period fancied that they had settled the question which had disturbed the dreams of Jefferson, which had perplexed and affrighted the national conscience through all its history, and which had just evoked the mightiest moral energies of the century. But their solution was no solution. It was solemn opera bouffe. The problem had just begun, and remains the transcendent sociological problem of the age. Rant will not dispose of it, or ignorant gush, or race prejudice, or the philosophy of the sentimental and the remote; but it must work itself out on Southern soil by the wisdom of Southern men of both races. It must pass into the region of scientific study and investigation. The Southern scholar must make it his province in the still air of the university; the statesman and publicist must ponder it, and the capitalist may well reckon with it amid his gold. What manner of men, then, does the South need in its coming life?

Perhaps in the past we set too much store by wise leaders and neglected to provide for wise followers. If so, the irony of fate is sporting with us, for now, in the threatening danger of these great questions, we are practically leaderless. The old type of leader, softened by fortitude and idealized by woe, has passed away, canonized by love and letters. The voluntary and occult forces of the time are seeking diligently to fashion the new. Now and then we seem to get a glimpse of our leader, as when Henry Grady, with his golden tongue and free, spacious spirit, uprose upon the South, a radiant prophecy of its future manhood, but it is only a glimpse. The mere industrial man will not answer our need, though there are lands to be tilled and factories to be built, and the madness of exalting empty political preeminence and fair-spoken words above the sciences that will dignify labor and procure food can never again curse our life. The mere orator or politician or scholar will not do. There must be a complex of all these—the man of free spirit and constructive habit, the man of insight and effectiveness, of utility and beauty, of action and contemplation. He shall above all have faith and sympathy with the blundering masses, and shall be endowed with that patient wisdom which can await the unfailing rectitude of public impulse and can keep its faith through unpromising days. Like Fichte around the King's council board or Luther to the burgomasters of Germany, he shall plead unceasingly for education in the colleges and schools, in the press, and in the public library. If our laws and institutions are not to become the crude experiments of the ignorant or the bold devices of the corrupt; if the South is to outgrow years of economic misconception; if the teachers in our schools are to be true teachers, educated men, rather than party chieftains or untrained place seekers, must lead our civilization. The potential of trained mind must constitute the test of true leadership in the South hereafter. The popular contempt for higher education and the popular pride in the self-made man is always widespread and strong in democratic communities. The feeling is a sort of retribution upon scholarship and educated power for their cowardice and selfishness, but it is none the less defiance of common sense. The educated man may not always be in place, but he is sooner or later in power. The higher education is the dynamic element in the life of the community, invigorating the schools of the people, bravely struggling to elevate the common

standard of living, supplying the State with its teachers in the schoolroom, the press, the pulpit, the family.

Out of the universities of the world have come its creative movements and men—religious freedom in the Old World and civil liberty in the New. Modern Germany is the child of her universities, and relies more firmly for her permanent power upon them and their 28,000 students than upon her invincible soldiery. Blot out the influences of Harvard and Yale and the colleges of the Atlantic seaboard, and what art can estimate the loss in moral elevation, practical power, or national character? The great Columbian Exposition, with its splendor and beauty, will fade away—aye, has faded away as a dream—but its neighbor, the university, will shape Western life for unnumbered generations. Wherever tyranny has sought to oppress the weak or ignorance to rule the wise, wherever the borders of light have needed to be enlarged, or ancient and prosperous shapes of wrong to be cleansed from the land, the gray walls of the university have yielded up its spiritual battalions—strong in steadfast purpose and cultivated brain, discoverers of thought, conservators of truth, stimulators of mind, sowers of seed that will bear fruit in a fairer time. The feeling is instinctive that men of this stamp and quality must serve a State in epochs of downfall and trial. The South has not failed in this feeling, as its brave efforts to establish and maintain schools and colleges for both races quite eloquently show; but the needs of Southern society are so great, her young men seeking training are so countless, the work of all the colleges is such a fraction of what is left to be done, the disheartening rivalries and bickering among the colleges themselves are such distressing proofs of the need of higher education that it has seemed best for me to leave the questions of technique and administration to wiser men, and to plead for the thing itself.

We are not all of one mind as to how the great need shall be supplied. There are those who insist that this vital thing is not a concern of the State, whose highest functions they declare are symbolized by the policeman's club or the law's penalty. And then there are the prosperous communities with amassed wealth and settled material skill, who say to us that we must wait upon the impulses of philanthropy or the activities of the church for our educational foundations. But the nature of the State is at variance with the limitation of its powers to police regulation, and the instinct of civic self-preservation decides against trusting wholly to individual generosity or ecclesiastical agencies for a universal social necessity. The State is not the government alone, it is the will of the people expressing itself in beneficent institutions as well as in penal or protective codes. The protective function of a State, indeed, may disappear as reason advances, but the loftier educational function will increase as social relations grow in complexity.

From the standpoint of right, there is no power to which the State can delegate its duty and power to educate, for there is no higher power than the State. If there be a higher power in the State than the State, then that power is the State. From the standpoint of political common sense, the agent of social salvation should be at least as potent as the extent of social peril. Our social peril is superlative, involving education or migration or revolution. The most potent conceivable agent is the State, which is concerned about and surely is responsible for its own life. Therefore it is the all-powerful State that must maintain itself against vital danger. If it be conceded that the youth of a Commonwealth have the same right to be educated that they have to be free, then it must also be conceded that the State is responsible for and alone has the power to guarantee the granting of this sacred right. To those who concede the State's right and duty to educate in the primary education and deny it in the higher, it may be answered that an argument for any education is an argument for all education. If the State has a right to educate at all, it likewise has the right to determine the extent and character of that education. All knowledge is comparative, the higher education of one age becoming the lower of the next, and there can be no dead line in learning at which knowledge ceases to be good and becomes useless. The three "R's" are indispensable. But mere reading is not reading with profit, and the one is as indispensable as the other. Higher education simply means more education, better education, completer education for a completer life. It is not a cult for the few or a caste for the wealthy or a college for the exclusive. It is the training ground for the people, and is the essence of democracy in its purposes and results.

In my own State of North Carolina, up to the civil war, there was a widespread feeling that the ruling class was confined to a few families of ability and wealth. In the early days of the century it was true, and necessarily true, for the influential and wealthy classes alone could command the advantages of education, and education finally rules. The enlightened policy of the modern State knowing no class, and knowing that those who most need help are least able to help themselves, cheapens the cost of this priceless thing and offers it to the aspiring of all ranks who feel within them the promptings of power and yearn for the higher life of useful action. As a result of this leveling process, introducing the higher test of fitness

and ability, side by side in the various fields of endeavor and in the high places sit men of all ranks and all degrees of wealth, advancing the life of the State.

Let me not be understood, in pleading for the higher education, as underrating the lower, for there is no essential distinction between the two. The State can not be interested in one and not in the other, for they are one and indivisible. A system of education all universities and no primary schools would be a crime, as a system all primary schools and no universities would be a farce. It is simply a question of sequence. The educative impulse is from above downward and not from below upward, and the two impulses reenforce and enrich each other.

In the old Southern life in every hamlet and community were to be found men and women of the rarest culture; but all around, giving color and tone to the whole, moved the untaught throng. The supremest need of the new life is the lessening of this inequality by the presence in large numbers in all elements of the population of men and women of thoughtful, independent mind, of trained consciences and habits and hands, who can bring things to pass. This can only issue out of the higher education reacting upon the lower, lifting the whole to a higher common level.

The permanent forces in this process are, first and foremost, the State universities and colleges supported by taxation and expressing the Christian tendency of the brotherhood of men, and secondly, the endowed institutions supported by enlightened philanthropy.

There is no call among us for a multitude of new foundations, unless it be for institutions for the training of teachers. We need, rather, to expand and enrich and liberalize the old foundations. There are two obstacles in the way of this result: The popular, abstract hatred of taxation, which enables the enemies of the State schools to confuse the thought of the people and to make them regard all taxation as a curse rather than as organized corporate wisdom, hallowed by Christianity, struggling to secure for the children a needful thing beyond individual power; secondly, the failure thus far in our development to find the golden mean between the individualism which preserves liberty and the individualism which paralyzes concerted action. Still, partially rooted in our life is the fatal thought that every man should educate his own child or leave him uneducated, if it be his will or misfortune.

Emphasized by poverty, this conviction still stays the hand of giving and belittles the glory and gladness of helping others to help themselves. We will do well to labor and pray for the death of this sentiment. We would be mad to cease State effort and demand endowment at the point of a subscription list.

Bishop Potter in a recent utterance has declared that the darkest day for any people would be the day when they did not possess an ideal university, and by an ideal university he meant any group of free, simple, unhampered men seeking truth for truth's sake, "waiting patiently on their bended knees before the shut doors of the kingdom of knowledge," getting their only reward in the thrill of the human soul in its contact with eternal verity, ignorant and careless of the moment when their theoretic truth emerges into fact, and in the form of mighty engines or stately ships or roaring looms blesses the world. There can be no fairer picture on earth than this, and such men are indeed the aristoi of the world. But there is one thing greater than truth, and that is humanity. The Southern university may well cherish this serene ideal and incorporate in its organization the creative impulse and the spirit of inquiry and investigation, but its first thought must be about its environment, out of which it must grow and by which it must do its duty before it can erect a beautiful aristocracy of scholarship. Once we were aristocratic in government and education, but now we are democratic in both. At this stage of our culture, when millions are to be impressed with the importance of knowledge, the Southern scholar must forego his office of prophet and seer and become ruler and reformer, and Southern universities and colleges must do the work of social regenerative forces, reaching out directly into the life of the people, making known how much better light is than darkness, and how sweet it is for the eyes to behold the sun, ennobling the poor man's poverty and spiritualizing the rich man's gold.

I sometimes think that our brethren of the North and West do not fully comprehend how ripe the time is and how hard the struggle for the fruitful doing of such work. Individuals and communities can not be forced into power or culture or effectiveness or skill. The desire for these good things must go before their realization. For a glimpse of the self-reliance, the eagerness, the bravery of the South, one has only to visit a Southern college and see the earnest, thrilling desire for the opportunities which the people believe to be concealed in education. The influences that hinder and obstruct can not wholly restrain or dull this desire, and it grows by what it feeds on. It is something of the spirit, I fancy, that lives for us in the glad, grateful words of young Ulrich Von Hutten, spoken to the bright face of Freedom in the morning of the modern world, "Studies are blooming, minds are awakening; it is a joy to be alive." It is the spirit which will cause history to place our epic period

not in the heroic days of '61 to '65, when our soldiers performed prodigious feats of arms, but in the grinding days from '65 to '95, when they and their sons rose above the stupendous difficulties that followed in the wake of war.

The going of a Southern boy to college is no conventional, quite ordinary stage in the life of a youth. It is always an event, and sometimes a tragedy. It most frequently means that far away in the home the father and mother work harder and rest less, and scrimp here and save there, eating skim milk and oatmeal, and taking counsel in the still hours of the night how they may give their child the privileges they did not know and the entrance into the clearer, fresher, sweeter life denied to them. I have seen a feeble woman's face set with stern resolve and glow with ineffable love at the very thought of her boy putting on his armor at the price of her own life. The dignity and power and political value of childhood and youth as the fittest and ultimate concern of the legislator, the preacher, the political economist, the true statesman, has entered our life as one hundred years ago it entered the life of the French, aroused by the mad earnestness of Rousseau, and aghast at the havoc of revolution, or as it entered into the thought of the English a generation later, to the music of Wordsworth's immortal ode.

Higher education in the South does not exist for its own glory, for the fame of its teachers, for the pride of sect, or for any subjective or selfish reason. Its aims must be pure public aims and its service public service.

In a portentous era, and with inadequate means, it stands for the beneficent force that must transmute the tumultuous, untrained life about it into self-government perfected by education—its material the youth of a new life and a new century, and its strong fortress the self-conscious state, no longer a synonym for rude force, but an expression of Christian sympathy and unity and conscience seeking to realize and show forth the dignity of democracy, the beauty of popular concord and justice, and the majesty of republican citizenship.

WHY THE COLLEGE FOR WOMEN?[1]

[By John F. Goucher, president of the Woman's College of Baltimore.]

Sir Humphry Davy was once asked which was the greatest discovery he had ever made, to which he replied, "Michael Faraday." Greater than the safety lamp with its great economic value, greater than the principles set forth in his treatise on "Some chemical agencies of electricity," with its great scientific import, greater than his decomposition of alkalis and earths with its far-reaching results, was the discovery of Michael Faraday, whose researches, observations, and discoveries as chemist, electrician, and philosopher, broadened the horizon of the knowable and enriched humanity.

So the nineteenth century, with its long record of important discoveries, applications, and achievements, with its unprecedented progress in the mastery of nature and the facilities of communication, in the development of personal influence and the sentiment of humanity, most deserves to be known as foremost among the great centuries of human history for the discovery of woman. Greater than its development of material resources, greater than its multiplication of mechanical agencies, greater than its scientific, economic, and social progress, far greater and more determinative in the development of the race is its discovery of woman, its recognition of her rights and provision for her best culture. Here and there through all the centuries women have shown large capacity and great efficiency, but these, if considered at all, were regarded as exceptional. Appreciation of womanliness, its importance to the race, its determining relation to the development of humanity, the necessity that woman shall have the most thorough and comprehensive culture is the culminating distinction of the nineteenth century.

This discovery was opportune. Man's conquests had so enlarged his opportunities that he needed personal enlargement to occupy them. No nation or people has ever outranked its representative women. Woman gauges civilization. It never outgrows her influence. Let a student of social science know the women of a community, their attitude to moral questions, their standard of excellence, and their motives of action, and he has data sufficient from which to diagnose the present status and prognose the future prospects of that community.

If woman admires cunning and approves cruelty, if she judges of bravery and bestows her favors according to the number of scalps brutal men dangle at their belts, the ambition and occupation of that people will be to capture scalps by cunning and cruelty that their belts may be ornamented in correct style, even though it requires the enslaving of women with debasing drudgery. So pervasive will be the ideal that their children's play will reveal it, the youth will dream of it, the young men will strive to attain it, and the old men and maidens will never weary of

[1] Read at the National Congress of Education, October 30, 1895.

recounting legends of the prowess and success of those who have excelled in realizing it. Let the representative women be foolish, inconsistent, given to dress, fond of show, and self-indulgent, and the men will be foppish, of smooth speech, hollow-hearted, avaricious, and sensuous; but let the representative women of the community be thoughtful, purposeful to help humanity, and given to unselfish living, let them maintain high ideals of personal purity for themselves, and require the same standards of the men whom they receive to their friendship, and the men of that community will be manly, pure, and public-spirited, whose ambition is helpfulness, and whose passion is justice.

That woman has higher ideals than man is generally assumed, and, I think, correctly. This is not due to a nature inherently different so much as to the training which she receives and the standard she tries to realize. Let our daughters live on the street, frequent the saloon or loafing place, associate with the unrestrained, and be under the influence of the impure, and their intenser natures would exceed in evil, as too many sad examples illustrate. Let the women give themselves to the competition of business and politics, as now conducted; let the home be impoverished by the absorption of the mother in other demands and the children be deprived of the high ideal and unselfish example of the patient woman and devoted mother, and the race would suffer irreparable injury, for the home, and not the individual, is the unit factor of Christian civilization.

The home duties of the wife and mother require as much intelligence and ability as the more public occupation of the husband and father. They are more varied, more exacting in detail, and more wearing in routine. Ofttimes the mother, in caring for the children and managing the household, evidences industry and endurance, intelligence and wisdom, financial ability and administrative skill which far exceed the demands upon the husband, who pursues his daily routine and receives his stipulated wage. There are certain duties which she must perform unless the race is to become extinct. These are determined by the laws written in her members. Other duties naturally relate themselves to these. There are well-meaning would-be reformers, nonadjusted females, and others who have not thought on the various phases of this problem to a comprehensive and legitimate conclusion who would indefinitely extend these duties. They say that man has certain elective, legislative, and administrative functions which he ought to use for the best interests of society, but as this is difficult for him to do he has not always been faithful to his responsibilities. Therefore they propose to reorganize the relations between man and woman without changing their natures, and ask woman to jeopardize the highest functions which she and she only can perform to attempt what man has the power and is under obligation to do. Mark you, rarely do you hear mothers talk thus. Maternity makes less conspicuous but higher and more distinctive demands of them, which they loyally accept and are honored in performing.

To multiply functions and confuse relations is contrary to the scientific and historic trend of development. Scientifically, development always emphasizes peculiarities and registers itself in individualization. In the lower orders of life exchange of functions is not impossible. As they advance we find distinctions which were rudimentary and scarcely discernible become pronounced. They determine appearance, character, and adaptations. Historically, in the earlier stages and lower grades of civilization, woman has to do almost everything. She is mother, teacher, agriculturist, purveyor, manufacturer, merchant, banker, and general drudge. Civilization develops increased efficiency and realizes excellence by specialization. Civilization and interdependence develop side by side. As we rise in the scale we find woman's work decreasing in variety and increasing in importance. It becomes more difficult and more potential as it becomes more closely related to those subtile forces which determine destiny. The hope of the race is in the success with which she does this work.

Humanity's greatest need is not for a decrease of man's responsibility and an increase of the responsibility of woman. Neither is it to radically change woman's work by giving her a part of the work now assigned to man unless the change is to be an exchange, man assuming a part of the work now done by woman, from which she is to be released when she assumes the work man is doing. Except within comparatively narrow limits this would be impossible. Humanity's great need is not for more destructive competition, but for more helpful cooperation, not for the evolution of two distinct spheres, a man's sphere and a woman's sphere, moving in separate and independent orbits, but for the development of a single sphere with its hemispheres properly adjusted and revolving in the full enjoyment of perfect oneness. There must be specialization in order to have excellence, limitation to reduce wasteful competition, and adjustment in order to secure cooperation. The goal will be hastened if woman ceases to tolerate shirks, maintains clearly defined and high ideals, and holds man strictly to the fulfillment of his obligations. If the present race of men is incapable of this, the homes and mothers and representative women have failed and the evil must be corrected by providing for wiser mothers, more

attractive homes, and stronger, nobler representative women. Here we find a foundation demand for the thorough college education of women. So imperative is this demand that if it were impossible for both the sons and the daughters to have the opportunity, and it could be given only to one, the best interests of humanity require, except in rare cases, that the daughters shall have the preference in this matter and be given thorough college education. So largely are business and politics absorbing the men that women must become the protectors of the higher intellectual interests in domestic life or the race will deteriorate.

Confusion of thought is the inevitable result of inaccuracy in the use of terms, so let us define what we mean by college education. With a reasonable degree of accuracy all educational work may be classified under four heads: Primary, secondary, collegiate and graduate, university or technical. The primary is addressed to the observational faculties, seeking to develop in them promptness and accuracy; the secondary leads up to and deals with the reflective faculties and causal relations. College education is not secondary education plus something. Its purpose, methods, and appliances are different and more comprehensive. It addresses itself to the discipline and development of every faculty of the intellectual, physical, and spiritual nature in their functional relations. Its object is a well-poised, resourceful, symmetrical personality. Graduate or university education is to train investigators and specialists along given lines.

There are radical differences between man and woman, their adaptations and the demands upon them—differences which contradict the suggestion of oneness and make them necessary to each other and their unity possible. Man's success in life, as it is now adjusted, is through persistence, by concentration and cumulative results. He must of necessity be a specialist, knowing all possible about something. Utility has no more withering characterization of a diffused man than "jack-of-all-trades, master of none." Woman's strength is in her versatility. Her occupation changes with every hour of the day. As wife, which is more than companion; as mother, which is more than teacher; as the spirit and inspiration of the home, determining its atmosphere; as furnishing new revelations of the meaning, beauty, and power of the gospel, enriching the church by her life and ministries; as the embodiment of the highest ideals, giving tone and strength to society, the demands upon her are varied, involved, and numberless. In all these and the various other places she is called to fill she needs to be resourceful and cultured and to have the mastery of herself at a moment's notice. She needs judgment, skill, taste, and tact, a nature enriched with varied and exact knowledge, beautified with culture, chaste and strong through discipline, lofty in ideal, and possessing the incomparable grace of unselfish ministry. Thus and thus only is she qualified for the throne and citadel of her queenly prerogative. All this is included in a symmetrical personality. To aid in the realization of this is the aim of a college education.

The higher education of woman has not yet passed out of its experimental stage. Her ability to receive the broadest, the most varied, and the most exact culture, the importance of thorough and advanced culture to her own best enjoyment, its influence upon the present and future of our civilization, and the necessity that hers especially shall be Christian culture are no longer questioned by intelligent Anglo-Saxons, but its scope and the methods by which and the conditions within which such training will realize the most practical results are still matters of controversy and experiment. The so-called "female college" was tried, but it is fast giving way to the larger requirements of the problem. It was a concession to the times, served a purpose, and marked an important advance. Coeducation was another experiment in this line. It seemed economical, for one institution would require less capital than two. An increase of students without a corresponding increase in the expense account promised well, and the girls were permitted, even invited, to go to the boys' school. But the problem demanded special and more serious consideration. "The question of education has always pointed back to that of vocation and destiny, for education is a process of preparation for an end." There is a deep-rooted feeling, opinion, or judgment—designate it as you please—that young women are not likely to realize the most desirable results in a college planned, organized, and administered for young men any more than one or a dozen young men turned into a woman's college among 300 or 400 young women could reasonably be expected to come out manly men, thoroughly equipped to meet the business demands of life.

That coeducation has not furnished a satisfactory solution to the problem is evidenced by the strong, high-grade, thoroughly equipped colleges for women which have been established at large expense within the past two or three decades, every one of which has had more applicants knocking at its doors than it could accommodate. This demand for the separate college education of women is assuming the characteristics of a movement among two classes in particular:

(1) The thoughtful young women of serious purpose who covet thorough preparation to meet the larger demands of life, recognizing the necessity of leisure and concentration to thorough culture, say that during those months of the few years

which should be devoted to acquiring an education they covet exemption from obtrusive opportunities for social life and full command of their time for study.

(2) The cultured well-to-do, who have social standing and know their daughters need and must have careful preparation to grace the positions awaiting them, are unwilling to place their daughters where they will be required to associate every day of the most impressible years of their lives with young men of whom they know nothing beyond the fact that they have about the same degree of immaturity. They expect their daughters to choose their companions, but protest that they should not be tempted to choose before their ideals are formed and their judgments somewhat matured.

The extent of this movement for the separate college education of women indicates that the colleges for women offer valuable facilities for meeting a felt and rapidly growing demand. According to the last report of the Commissioner of Education there are 36 young women seeking college education in the United States for every 100,000 of the population. Of these, 16.7 are in coeducational institutions and 19.3 in colleges for women. This is the more suggestive when we consider that a few years ago coeducation had the field almost exclusively to itself; that 284, or 90 per cent, of the colleges and universities for men now admit young women; that these institutions are widely scattered throughout the country and have a large local patronage of young women, who are among their students because their proximity secures a saving in cash outlay, home residence, and parental supervision, but who would not go away from home to a coeducational college; while the colleges for women are of comparatively recent origin and remote from a large part of their constituency; yet, according to the latest statistics, of all young women seeking college education, 53.5 per cent are in colleges for women, with only 46.5 per cent in coeducational institutions.

In the colleges for women the young woman is not placed in competition with young men during that stage of her development when, for physical reasons, she is likely to be at a disadvantage.

Great is Love, and propinquity is her highpriest. In the colleges for women, during that sentimental age when young people are likely to be hero worshipers, young women are exempt from the undesirable excitements incident to daily competition with young men and from the temptation to attachments such as they would not form when they are more matured and have higher ideals.

With health conserved and the distractions of society and the abstractions of love removed, students in the colleges for women have most favorable conditions for study and the development of cultured womanliness.

If the relations of men and women are to be competitive, increasing "the restlessness, haste, and intense strain in all relations of life," and the outcome is to be the survival of the fittest, woman needs college training as well as man, and their training should be identical, though not necessarily together. If the relations between men and women are to be complementary and cooperative, if her highest function is not to be a weak imitation nor a brilliant substitute, but a helpmeet for man at his best, the college for women has an important and indisputable mission.

Some are anxiously inquiring what results are realized by the colleges for women. Are their alumnæ healthy and capable? Does a fair percentage of them grace domestic life? Are they realizing the ideal? What are the facts and figures? These are legitimate questions, and satisfactory answers are at hand.

The higher education of woman is in its experimental stage. As in almost every advance movement, the vanguard who did the pioneer work were exceptional people, not to be gauged by the normal standards. Not so large a percentage of the earlier alumnæ have married as could be desired, but a larger percentage have done so than could have been reasonably expected.

In the colleges for women there has been an unjustifiable servility to the methods and requirements set in the colleges for men, and there has not been sufficient time for the development of a consistent individuality; but the evolution is progressing and evidences a strong formative principle. Woman is self-determining and she is leisurely solving the problem. The apologetic female college demonstrated the privilege and benefit to young women of being associated with themselves during their advanced student life, while the inexpensive coeducational experiment revealed that nothing short of the highest and most thorough standards can satisfy the demand. The end sought is determining the scope and the means best adapted to its realization. These later years are showing in the most advanced colleges for women an improvement of health during the student life, a conserving of that indescribable, charming, maidenly reserve, together with the development of the strength and grace of womanliness, which is full of promise.

It may be confidently asserted that he who is to inherit all that is worth possessing of the past and give luster to the future, the coming man whom all await, will not be a woman; but the man of the future, like the man of the present and the man

of the past, will be largely determined by the quality of womanliness characterizing the age which environs him.

The colleges for women, though only in their formative stage, offer exceptional advantages for the culture and development of womanly women, who, when they are united to manly men in wedded oneness, shall be the complement of their husbands, the joy of their children, the inspiration of society, the crown of their age, and the honored coadjutors of everything which makes for the glory of human progress.

ADDRESS OF BOOKER T. WASHINGTON.[1]

[Principal of the Tuskegee Normal and Industrial Institute, Tuskegee, Ala.]

MR. PRESIDENT AND GENTLEMEN OF THE BOARD OF DIRECTORS AND CITIZENS: One-third of the population of the South is of the negro race. No enterprise seeking the material, civil, or moral welfare of this section can disregard this element of our population and reach the highest success. I but convey to you, Mr. President and Directors, the sentiment of the masses of my race when I say that in no way have the value and manhood of the American negro been more fittingly and generously recognized than by the managers of this magnificent Exposition at every stage of its progress. It is a recognition that will do more to cement the friendship of the two races than any occurrence since the dawn of our freedom.

Not only this, but the opportunity here afforded will awaken among us a new era of industrial progress. Ignorant and inexperienced, it is not strange that in the first years of our new life we began at the top instead of at the bottom, that a seat in Congress and the State legislature was more sought than real estate or industrial skill, that the political convention or stump speaking had more attractions than starting a dairy farm or truck garden.

A ship lost at sea for many days suddenly sighted a friendly vessel. From the mast of the unfortunate vessel was seen the signal: "Water, water; we die of thirst!" The answer from the friendly vessel at once came back: "Cast down your bucket where you are." A second time the signal, "Water, water; send us water!" ran up from the distressed vessel, and was answered: "Cast down your bucket where you are." And a third and fourth signal for water was answered: "Cast down your bucket where you are." The captain of the distressed vessel, at last heeding the injunction, cast down his bucket, and it came up full of fresh, sparkling water from the mouth of the Amazon River.

To those of my race who depend on bettering their condition in a foreign land, or who underestimate the importance of cultivating friendly relations with the Southern white man, who is their next-door neighbor, I would say, "Cast down your bucket where you are"—cast it down in making friends in every manly way of the people of all races by whom we are surrounded. Cast it down in agriculture, mechanics, in commerce, in domestic service, and in the professions. And in this connection it is well to bear in mind that whatever other sins the South may be called to bear, when it comes to business, pure and simple, it is in the South that the negro is given a man's chance in the commercial world, and in nothing is this Exposition more eloquent than in emphasizing this chance. Our greatest danger is that in the great leap from slavery to freedom we may overlook the fact that the masses of us are to live by the productions of our hands, and fail to keep in mind that we shall prosper in proportion as we learn to dignify and glorify common labor and put brains and skill into the common occupations of life; shall prosper in proportion as we learn to draw the line between the superficial and the substantial, the ornamental gewgaws of life and the useful. No race can prosper till it learns that there is as much dignity in tilling a field as in writing a poem. It is at the bottom of life we must begin and not at the top. Nor should we permit our grievances to overshadow our opportunities.

To those of the white race who look to the incoming of those of foreign birth and strange tongue and habits for the prosperity of the South, were I permitted, I would repeat what I say to my own race—"Cast down your bucket where you are." Cast it down among the 8,000,000 negroes whose habits you know, whose fidelity and love you have tested in days when to have proved treacherous meant the ruin of your firesides. Cast down your bucket among these people who have, without strikes and labor wars, tilled your fields, cleared your forests, builded your railroads and cities, and brought forth treasures from the bowels of the earth and helped make possible this magnificent representation of the progress of the South. Casting down your bucket among my people, helping and encouraging them as you are doing on these grounds, and to education of head, hand, and heart, you will find that they will buy your surplus land, make blossom the waste places in your fields, and run

[1] Delivered at the opening of the Atlanta Cotton States and International Exposition, September 18, 1895.

your factories. While doing this, you can be sure in the future, as in the past, that you and your families will be surrounded by the most patient, faithful, law-abiding, and unresentful people that the world has seen. As we have proved our loyalty to you in the past, in nursing your children, watching by the sick bed of your mothers and fathers, and often following them with tear-dimmed eyes to their graves, so in the future in our humble way we shall stand by you with a devotion that no foreigner can approach, ready to lay down our lives, if need be, in defense of yours, interlacing our industrial, commercial, civil, and religious life with yours in a way that shall make the interests of both races one. In all things that are purely social we can be as separate as the fingers, yet one as the hand in all things essential to mutual progress.

There is no defense or security for any of us except in the highest intelligence and development of all. If anywhere there are efforts tending to curtail the fullest growth of the negro, let these efforts be turned into stimulating, encouraging, and making him the most useful and intelligent citizen. Effort or means so invested will pay a thousand per cent interest. These efforts will be twice blessed—"blessing him that gives and him that takes."

There is no escape through law of man or God from the inevitable:

> The laws of changeless justice bind,
> Oppressor with oppressed;
> And close as sin and suffering joined,
> We march to fate abreast.

Nearly sixteen millions of hands will aid you in pulling the load upward, or they will pull against you the load downward. We shall constitute one-third and more of the ignorance and crime of the South, or one-third of its intelligence and progress; we shall contribute one-third to the business and industrial prosperity of the South, or we shall prove a veritable body of death, stagnating, depressing, retarding every effort to advance the body politic.

Gentlemen of the Exposition, as we present to you our humble effort at an exhibition of our progress, you must not expect overmuch. Starting thirty years ago with ownership here and there in a few quilts, and pumpkins, and chickens (gathered from miscellaneous sources), remember the path that has led from these to the inventions and production of agricultural implements, buggies, steam engines, newspapers, books, statuary, carving, paintings, the management of drug stores and banks, has not been trodden without contact with thorns and thistles. While we take pride in what we exhibit as a result of our independent efforts, we do not for a moment forget that our part in this exhibition would fall far short of your expectations but for the constant help that has come to our educational life, not only from the Southern States, but especially from Northern philanthropists, who have made their gifts a constant stream of blessing and encouragement.

The wisest among my race understand that the agitation of questions of social equality is the extremest folly, and that progress in the enjoyment of all the privileges that will come to us must be the result of severe and constant struggle rather than of artificial forcing. No race that has anything to contribute to the markets of the world is long in any degree ostracized. It is important and right that all privileges of the law be ours, but it is vastly more important that we be prepared for the exercise of these privileges. The opportunity to earn a dollar in a factory just now is worth infinitely more than the opportunity to spend a dollar in an opera house.

In conclusion, may I repeat that nothing in thirty years has given us more hope and encouragement and drawn us so near to you of the white race as this opportunity offered by the Exposition? And here bending, as it were, over the altar that represents the results of the struggles of your race and mine, both starting practically empty handed three decades ago, I pledge that in your effort to work out the great and intricate problem which God has laid at the doors of the South, you shall have at all times the patient, sympathetic help of my race; only let this be constantly in mind, that while from representations in these buildings of the product of field, of forest, of mine, of factory, letters, and art much good will come, yet far above and beyond material benefits will be that higher good that, let us pray God, will come in a blotting out of sectional differences and racial animosities and suspicions, in a determination to administer absolute justice, in a willing obedience among all classes to the mandates of the law. This, this coupled with our material prosperity, will bring into our beloved South a new heaven and a new earth.

CHAPTER XLIV.

ENGLISH METHODS OF TEACHING AMERICAN HISTORY.

It is of interest for us to know how the history of the American Revolution is taught among other English-speaking peoples, especially in Great Britain. Extracts are presented herewith from twenty-four books of English history used in the schools of the lower grades, usually from the second to the seventh standard. These histories were collected by Mr. Samuel Plimsoll, late M. P. for Derby, and well known for his philanthropic efforts in behalf of sailors. He was instrumental in securing the passage of laws (1871, 1873, 1875, and 1876) regulating the loading of vessels, and in recognition of these services, the point beyond which certain boats can not be legally loaded is known in all British ports as "Plimsoll's line."

Mr. Plimsoll has recently entered upon a serious effort to promote good feeling between the United States and England, and in pursuance of this purpose has begun an inquiry into the method and spirit of history teaching in the elementary schools of the two countries. The English school histories here considered were collected without any discrimination as to those that were favorable or unfavorable, and no effort to sift them has been made in this compilation.

The frequent repetition in almost the same words will be found to be due to the fact that extracts are sometimes made from the successive volumes of the same series.

[From Our Kings and Queens: A reading book in history. Book IV. London. Thomas Nelson & Sons. 1893. 16°. pp. 239. The Royal England Readers Series.]

A quarrel now began between our colonies in America and the Government at home. An attempt was made to force the Americans to pay taxes on tea and other articles carried into the country. This they refused to do. When several ships, containing taxed tea sent from England, arrived in Boston Harbor, some of the people, dressed as red Indians, went on board and threw it into the water. The Government sent out soldiers to force the Americans to pay taxes, and war began which went on for nearly eight years. The Americans raised an army to defend themselves. Their leader was George Washington. Then they declared themselves independent of Great Britain, and formed a union of thirteen States under the name of the United States of America. In 1783 the war ended and a treaty was made, in which Great Britain had to agree that the United States should be a separate country. Since then the colonists, or Americans, have governed themselves. They have no king or queen at their head. Instead of a monarch they choose one of their chief men, who is called the President, to be at the head of the Government. The first President was George Washington.

[From the United Kingdom. James I to date. Book VI. London. Thomas Nelson & Sons. 1892. 16°. pp. 268. The Royal England Readers Series.]

The seven years' war left North America in British hands. Now began a quarrel with our American colonies which caused most of them to separate from the mother country. The Government at home claimed the right of taxing them without their

permission. The late war had cost a great deal of money, and as much of it had been spent on behalf of the colonies, Grenville thought that they ought to help to pay it. A stamp act was passed, by means of which he hoped to raise what he wanted in America. The Americans answered that they were willing to give money of their own free will, but that they would not be forced to pay taxes which they had no share in levying, as they had no members in the British Parliament. Grenville resigned and the stamp act was repealed. Pitt, who was now Earl of Chatham, had warned the Government against the stamp act, and told them what would happen. He was strongly against taxing the colonists at all; but the ministers, who had not yet learned wisdom, placed new taxes on tea, lead, glass, and other things which were sent to America. This soon made matters much worse. Chatham left the ministry, and two years after the Duke of Grafton gave way to Lord North. It was not because the tax was large that the Americans were unwilling to pay it, for it was very small, but because they considered that the home Government had no right to tax them at all. The King was more to blame than any of his ministers. He would not give way in what he thought was his right as Sovereign of the colonies. * * * Chatham said to the Lords that it was folly to force taxes in the face of a continent in arms. Burke bade the Commons take care lest they broke that tie of kindred blood which, light as air, though strong as iron, bound the colonies to the mother land.

It was now ten years since the passing and withdrawing of the stamp act. Everything had been tried to bring about a settlement, but the foolishness of the King made all efforts vain. War began and went on for nearly eight years. The King found that he could get Lord North to do much as he wished, and so he kept him in power during the whole American war. The first fighting took place at Lexington, near Boston, between a few British soldiers and some American riflemen. The colonists, who were used to shooting deer in the forests, soon proved their skill, and they now shot down men with deadly aim. The British lost more than twice as many men as the Americans. The Americans next besieged the British under General Gage in Boston, and a battle took place on Bunker Hill near the town, where the Americans had thrown up earthworks. They were forced to retreat, but they did not lose heart. They now saw that they could hold their own when they met the best British troops on equal terms. The famous George Washington now took command of the American Army. He had done good service for the British in their struggle with the French in the seven years' war. Now he had but one thought, one desire, and that was to secure the freedom of his country. "First in war, first in peace, and first in the hearts of his countrymen" was said of him. He was in favor of union with Great Britain till he saw that it was no longer possible. * * *

For the third campaign help in men and money was sent by France to the Americans. A victory at the Brandywine River and the capture of Philadelphia, raised hopes in Britain that the Americans would be forced to yield. A great disaster changed these hopes into fears. General Burgoyne, who was marching from Canada to join Howe at New York, was surrounded at Saratoga, on the Hudson River, and forced to surrender. This was the turning point of the war in favor of the Americans. Howe was now succeeded by Sir Henry Clinton, who abandoned the city of Philadelphia, in which the British army had passed the winter. It was during this year that Chatham, while speaking in spite of age and illness against a proposal to grant independence to the colonies, fell in a fit on the floor of the House of Lords, and was carried to bed, from which he never rose. During the fifth campaign no event of importance took place. In this year [1780] Sir Henry Clinton took Charleston. Arnold, who commanded a fort on the Hudson River, deserted, and became a general in the British service. Major André, who had arranged the affair, being taken by the Americans, was hanged as a spy by the orders of Washington, although many tried to turn the American leader from his stern purpose. During the seventh campaign Lord Cornwallis was shut up in Yorktown, and forced to surrender with

7,000 men. This was the decisive blow; for although the war went on for another campaign, the American colonies were now really severed from the British Empire. By the treaty of Versailles the thirteen United States of America were declared to be free. They became a republic, and chose George Washington as their first President.

[From The Hanoverian Period. Book VII. T. Nelson & Sons. London. 1895. 12°. pp. 288. The Royal English History Readers Series.]

The stamp act, passed in 1765, caused a quarrel with our American colonies, which ended in their separation from the mother country. The Government at home claimed the right of taxing them without their permission. The late war had cost a large sum of money, and as much of it had been spent on behalf of the colonies, Grenville thought that they ought to help to pay the bill. A stamp act was therefore passed, by means of which he hoped to raise the amount he wanted from America. This act required that all legal documents, such as deeds, wills, notes, and receipts, should be written on paper bearing Government stamps, for which a payment was required. The Americans answered that they were willing to give money of their own free will, but that they would not be forced to pay taxes which they had no share in levying, as they sent no members to the British Parliament. Grenville resigned, and his successor, the Marquis of Rockingham, repealed the stamp act. New taxes were imposed on the American colonists in 1767. Pitt, who was now Earl of Chatham, had warned the Government against the stamp act, and told them what would happen. He was strongly against taxing the colonists at all; but the ministers, led by the Duke of Grafton, prime minister, and Charles Townshend, chancellor of the exchequer, had not yet learned wisdom. They therefore imposed new taxes on tea, lead, glass, and other things which were sent to America. Chatham left the ministry, and two years later the Duke of Grafton gave way to Lord North. It was not because the taxes were large that the Americans refused to pay them, for they were very small, but because the colonists considered that the home Government had no right to tax them at all. The King was more to blame than any of his ministers. He would not give way in what he thought was his right as Sovereign of the colonies. The "Boston Tea Party," as it is called, brought matters to a crisis. In December, 1773, ships arrived in Boston harbor with cargoes of taxed tea, upon which a number of men dressed like Indians went on board and emptied 342 chests of tea into the water. As a punishment, the Government ordered the port of Boston to be closed. The object of this was to ruin the Boston merchants by preventing the landing of goods there. In the following year twelve men, chosen from each of twelve States (to which a thirteenth was afterwards added), met in congress at Philadelphia, and sent an address to the King, asking him to withdraw the taxes; but the King refused. Chatham (Pitt) said to the lords that it was folly to force taxes in the face of a continent in arms. Edmund Burke bade the Commons take care lest they broke that tie of kindred blood which, light as air, though strong as iron, bound the colonies to the motherland. The American war of Independence was now fought out to the bitter end. It was ten years since the passing and withdrawing of the stamp act. Everything had been tried to bring about a settlement, but the foolishness of the King had made all efforts vain. War began, and went on for nearly eight years. The King found that he could get Lord North to do much as he wished, and so he kept him in power during the whole American war. The first campaign began in 1775 at Lexington, near Boston, between a few British soldiers and some American riflemen. The colonists, who were used to shooting deer in the forests, soon proved their skill, and they now shot down men with deadly aim. The British lost more than twice as many men as the Americans. The Americans next besieged the British under General Gage in Boston, and a battle took place on Bunker Hill, near the town, where the Americans had thrown up earthworks. They were forced to retreat, but they did not lose heart. They now saw that they could hold their own when they met the best British troops on equal terms. George Washington was made commander

in chief of the American army. He had done good service for the British in Canada in their struggle with the French in the seven years' war. Now he had but one thought, one desire, and that was to secure the freedom of his country. "First in war, first in peace, and first in the hearts of his countrymen," was said of him. He was in favor of union with Great Britain till he saw that it was no longer possible. * * *

The Declaration of American Independence was made in 1776. Up to this time the Americans had been fighting for their liberties as British subjects, but the war had weaned them from the mother country. On the 4th of July, the Congress of Americans met at Philadelphia and drew up the "Declaration of Independence," in which they declared themselves no longer subjects of King George. In August of the same year General Howe, reenforced by his brother, drove Washington from New York, and planted the British flag on its batteries. The third campaign opened in June, 1777. A victory at Brandywine River, and the capture of Philadelphia, raised hopes in Britain that the Americans would be forced to yield. But a great disaster changed these hopes into fears. General Burgoyne, who was marching from Canada to join Howe at New York, was surrounded at Saratoga, on the Hudson River, and forced to surrender. This was the turning point of the war in favor of the Americans. * * *

The sixth campaign, in 1780, resulted in the capture of Charleston, the capital of South Carolina, by the British. In that year Arnold, an American officer, deserted and became a general in the British service. Major André, a British officer who had arranged the affair, being taken by the Americans, was hanged as a spy by the orders of Washington, though many tried to turn the American leader from his stern purpose. During the seventh campaign, in 1781, Lord Cornwallis was shut up in Yorktown, and forced to surrender with 7,000 men. This was the decisive blow; for although the war went on for another campaign, the American colonies were now really severed from the British Empire. The treaty of Versailles was signed in 1783. In November of that year George III entered the House of Lords, and with a faltering voice read a paper in which he acknowledged the independence of the United States of America. He closed his reading with the prayer that neither Great Britain nor America might suffer from the separation. By the treaty of Versailles the thirteen United States of America were declared to be a free nation. They became a Republic and chose George Washington as their first President.

[From Modern England, 1603 to the present. Historical Reader No. IV. London. George Philip & Son. 16°. pp. 271. Philips' School Series.]

The chief causes of this long and disastrous conflict are to be sought in the high notions of prerogative held by George III, his infatuated and stubborn self-will, and in the equally absurd self-conceit of his English subjects. In her colonies England then acted on what was called the colonial system. According to it they existed for the benefit of the mother country, could export their chief products only to the British Dominions, and could import nothing from Europe which had not passed through England. A great deal of smuggling went on; but there had as yet been no serious quarrel, because the Imperial Government had for the most part hitherto left the colonies to themselves. Grenville, the English prime minister, now determined not only to put down the smuggling of the American colonists, but to tax them for the benefit of the Empire—the mode proposed for raising the revenue being to require that certain documents should be on stamped paper. The colonists at once took alarm, and the colonial assemblies declared against the measure. The descendants of the old soldiers of the Parliament began to repeat the grand lesson of the long struggle of their English forefathers against the crown, and "Taxation without representation is tyranny" became the watchword of the brave patriots who were to fight in America for the selfsame rights that the Englishmen of old had wrung from the tyrant John, the haughty Edward, and the reluctant Charles I. So strong was the feeling, that riots took place at Boston and elsewhere; and the colonists

determined to do without English goods, so as to escape the hated imposition. All was in vain, for the King and people at home were deaf to their remonstrances; and in 1766, although the stamp act was repealed, the English Parliament passed a bill declaring the legislative supremacy of England over her colonies. Shortly afterwards a new scheme of taxation was introduced, by which the revenue was to be raised by port duties, not by internal excise. The feeling on both sides now became more and more bitter; and when the other duties were removed, that on tea was retained, more to mark the superiority of the English Parliament than as a matter of finance. A circumstance in itself trifling brought matters to a crisis. The East India Company had a great stock of tea in its warehouses, and it was allowed to export this to America free of English duties, so that in the colonies it could be sold at a very low rate, but the hated colonial duty had still to be paid. Three ships laden with tea arrived in Boston. A band of men dressed as Mohawk Indians boarded them and flung the chests into the sea.

When the news reached England the commercial classes were eager for a reconciliation, and Chatham wished to withdraw all the recent measures and restore things to their old condition. But the King, the governing classes, and the great body of the people maintained that the time for conciliation was past and that America must be subdued. Accordingly, measures for this purpose were carried without difficulty through Parliament.

On the other side of the Atlantic there was as yet no regular outbreak, but the people were arming everywhere. A congress assembled at Philadelphia, and to this the colonists looked as the real governing power. They still professed loyalty to the King and mother country, but refused to pay taxes imposed by imperial authority, and entered into a rigid agreement neither to consume British goods nor to export a single product of their own. At home one last effort for conciliation was made; Lord North proposed that, as long as a colonial legislature paid a reasonable sum toward imperial expenses, it should be exempted from all imperial legislation. Had this wise concession come earlier all would have been well, but it now came too late. In America the proposal was simply disregarded. Two months later General Gage sent a party to destroy a quantity of stores collected at Concord, but it was attacked and badly treated on its return. The whole population at once rose in arms, and Gage was shut up in Boston. He then fought and gained the battle of Bunker Hill; but his troops reached the height only after being twice repulsed. Congress met on May 10, agreed on various measures for resistance, and made a last effort for peace in a petition to the King which was never even considered. They then ordered an attack on Canada, which failed, and their next important step was the appointment of George Washington as commander in chief. The war was now fairly begun, though it was not till 4th of July, 1776, that the States declared their independence; and even then their action was hurried by England's employment of German mercenaries and their desire to obtain French assistance. To Washington was mainly due the success of the colonists, and he has ever since been hailed by his grateful fellow-citizens as "The Father of his Country." This noble patriot might be described as the type of an English gentleman; a man without eloquence and of great modesty; but having great administrative powers, moderation, and self-control. Further, a certain nobleness of thought and lofty elevation of character distinguished him from his fellows. His character, great in itself, seems greater when placed in contrast with the men that surrounded and the opponents that confronted him. Many of them were barely honest; nearly all were selfish and greedy; even the better class of them were commonplace. Thus George Washington stands preeminent as the one great figure of the American war of independence. The chief events of that war may be briefly told. * * *

France now joined in the war, and was soon followed by Spain and Holland; Lord North wished to resign, but the King was as firm as ever, and he was supported by

popular feeling in England. There were still many variations in the fortunes of war before the end came. The closing event of the conflict was a movement by Lord Cornwallis into Virginia. He expected to be supported from the sea, but in this he was disappointed and was forced to surrender at Yorktown with an effective force of 4,000 men. This really terminated the war as far as America was concerned, although it was not till January, 1783, that the independence of the United States was finally acknowledged.

[From English History Reading Books. Henry VII to date. By Charlotte M. Yonge. London. National Society's Depository. 16°. pp. 252.]

The war in North America had been very expensive, and it was thought just that the colonists should help to pay for it, so they were taxed for this purpose. But the colonists contended that no place ought to be called upon to pay taxes unless it had sent a member to the House of Commons to give his consent to them. Pitt, who had been made Earl of Chatham, thought there was reason in this and tried to hinder the taxing, but he was overruled by the Earl of Bute, who had much influence with the King. The Americans were very angry. They resolved to do without the articles that were taxed, and as tea was among these a number of young men, dressed as red Indians, boarded the tea ships in Boston Harbor and threw all the tea into the sea. Soldiers were sent from England to put down the disturbances, but this only angered the colonists still more. They took up arms in 1775 and besieged the garrison in Boston. The troops tried to break their lines and fought the battle of Bunker Hill just outside the city. The Americans were beaten, but the English suffered heavily, and the siege still continued. On the 4th of July, 1776, representatives from thirteen American settlements met and drew up a Declaration of Independence, by which they cast themselves loose from the mother country and declared that England had no control over them. George Washington, a Virginia gentleman, became the American commander in chief and soon showed himself a great general, as spirited as he was patient. He did not always gain the victory in his battles, but he was never disheartened, and in the year 1777 the English General Burgoyne and 10,000 men were taken prisoners. Such a success as this made the French think it worth while to own the United States of America to be a separate power, and to send out troops to help them. This made the war much more serious, and it was thought that it must be given up, and that the King must renounce his rights to the thirteen States. Lord Chatham was old and in bad health. He would have prevented the war by making terms with the colonists; but he could not endure that England should yield her rights to revolted subjects in alliance with her old enemy, France. So, feeble as he was, he came down to the House of Lords to speak. He made one speech with great force. It was answered and he rose to reply, but at that moment he was seized with a fit. He was carried out of the House insensible and died a few days later in his seventieth year. The war went on, sometimes with victory on one side, sometimes on the other; but the Spaniards and the Dutch both joined the Americans and the French, and England stood alone. The French tried to take Jersey, but were beaten off by a brave young officer, Major Peirson, who was killed in the fight; and the Spaniards for three whole years besieged Gibraltar, which held out gallantly under General Elliot, till they were forced to give up the siege. Moreover, Admiral Rodney defeated the whole French fleet in the West Indies, and brought its commander to England as a prisoner. However, in 1781, the English army, under Lord Cornwallis, was obliged to surrender itself to the allied French and American armies, and it was decided that no more blood should be shed, but that George III should resign the colonies, thenceforth known as the United States. He said to their deputies, "I was the last man to acknowledge your independence, I will be the last man to do anything to violate it."

[From the Royal Story Book of English History. London. T. Nelson & Sons. 16°. pp. 191. Royal School Series.]

Great was the stir in Boston when it became known that three ships laden with tea had arrived from England. The news spread quickly through the town, and the people gathered in crowds around the harbor to gaze on the hated ships. Tea was one of the things on which the English Government had laid a tax; so the people of Boston resolved that not a pound of it should be landed. At first steps were taken in order to have the tea returned to England. The merchant to whom it had been sent went to the governor of Boston and asked him to allow the ships to leave the harbor. This the governor refused to do, saying that it would be to dishonor the laws and the King. Next day the people were gathered in public meeting and were told of the governor's refusal. They were already much excited; but when they heard what the governor had said they became furious. A man in the gallery, who was dressed and painted like a red Indian, gave a loud war whoop. In an instant the people rose to their feet in a mass, and cheered and shouted and yelled. The meeting ended in uproar. The people rushed in a body to the wharf near which the tea ships were moored. Twenty men in the dress of red Indians boarded them. They were really carpenters and sailors in disguise. Armed with hammers and chisels, they broke open the tea chests and emptied them into the sea. While this work was going on, a vast crowd stood on the wharf, watching the harbor growing blacker and blacker with the scattered leaves. The people made little noise. When the last chest was emptied the Indians went on shore, and the crowd separated with a ringing cheer. The quarrel thus begun between England and her colonies in North America by and by grew into a bloody war, which lasted for seven years. In the end the colonies were separated from the mother country, and became the United States of America. It is well to bear in mind that at that time the people of England had not themselves the rights claimed by their brethren in America. Had we then had a House of Commons elected by the people, as we have now, most likely the war with America would never have taken place, and the United States would still have been part of the British Empire. For many years after the war there was ill feeling between the two countries, and quarrels frequently arose; but in our day the feeling is warm and friendly. The British Islands are looked to as the central home of the widespread Anglo-Saxon race, and even Americans own our Queen as the head of the English-speaking peoples of the world.

[Substantially the same account is given in Pictures of English History, another volume of the same series intended for pupils a little more advanced.]

[From The Advanced History of England. London. T. Nelson & Sons. 1894. 16°. pp. 320. Royal School Series.]

Then occurred the events that led to the great American war. Grenville, desirous to meet the cost of the late war, proposed to tax certain documents used in America, such as wills and contracts; and the stamp act was therefore passed. The colonists replied that, since they had no representatives in the British Parliament, they would pay no taxes to Great Britain. At the same time they offered to vote voluntary contributions to the imperial treasury. Grenville at once resigned, and, under the brief ministry of the Marquis of Rockingham, the stamp act was repealed. The Duke of Grafton, and Pitt, now Earl of Chatham, were next called to office, with Charles Townshend as chancellor of the exchequer. Chatham soon fell into bad health, and Townshend recklessly imposed new taxes—in the shape of impost duties on tea, lead, glass, paper, and painters' colors—on the colonists, whose discontent grew hourly greater. * * *

The taxed tea was still sent to America. Some twenty daring spirits, dressed and painted like Indians, boarded the tea ships that lay in Boston Harbor, and emptied the cargoes into the sea (December). The British Government retaliated by shutting up the port of Boston and removing the custom-house to Salem. Then the

States met in Congress at Philadelphia, and sent an address to the King, in which they asked that the offensive taxes should be removed. The petition was slighted. To the eloquent warnings of such men as Lord Chatham and Edmund Burke the ministers closed their ears. After ten years of wordy strife, actual war began. It continued with varying success during eight campaigns. The first outbreak was at Lexington, between Boston and Concord, where a few American riflemen attacked a detachment of English soldiers that was marching to seize some warlike stores. More importance attaches to the attempt of the Americans to seize and fortify Bunker Hill, overlooking Boston. The attempt failed; but it proved to the colonists that it was possible for undisciplined patriots to meet on equal terms the best troops England could send against them. Thenceforth the success of the Revolution was assured. Two days before Bunker Hill Congress had unanimously appointed George Washington commander in chief. He immediately joined the army at Boston. Early in the second campaign General Howe was compelled to evacuate Boston and to sail for Halifax; and then was issued, by the Congress at Philadelphia, the famous document called "The Declaration of Independence." In August General Howe seized Long Island, drove Washington from New York, and planted the English flag on its batteries. At the opening of the third campaign the Americans obtained aid in men and money from France. A victory at the Brandywine River, and the capture of Philadelphia, raised hopes in England that the subjugation of the colonists was not far distant. But a great humiliation changed all these hopes into fears. General Burgoyne, marching from Canada, was so hemmed in by the American troops at Saratoga that he was forced to capitulate (October 16). During the winter that followed the soldiers of Washington were shoeless and starving in Valley Forge, near Philadelphia; but, inspired by the noble patience of their leader, they bore their sufferings bravely; and thenceforward America had decidedly the best of the war.

In the fourth year of the war the venerable Chatham, while thundering, in spite of age and illness, against a proposal to grant the colonies independence, fell in a fit on the floor of the House of Lords, and was carried to a bed, whence he never rose. He died in five weeks afterwards. No event of note occurred after this till the seventh campaign, when a second great disaster befell the British arms. Lord Cornwallis was, by the skillful movements of Washington, shut up in Yorktown, and compelled to surrender with 7,000 men. This was the decisive blow; for, although the war lingered through another campaign, the American colonies were now virtually severed from England. The independence of thirteen United States was after some time formally acknowledged by the treaty at Versailles; and they became a Republic, governed by an elected President, Washington being the first to hold the office.

[The accounts given in the Primary History and the Intermediate History of the same series are substantially the same.]

[From The House of Hanover, 1714–1893. London. Macmillan & Co. 1895. 16°. pp. 271. Macmillan's History Readers.]

The seven years' war had been brought to an end, as we have seen, by the Peace of Paris; but Lord Bute, the minister who was compelled to have this peace signed, soon became very unpopular, and though the King was on his side he was obliged to resign. Bute was not, in fact, at all fitted for a statesman. He had been the King's tutor in days gone by, and in consequence of this people always felt that he exercised a greater influence over George than was desirable. Such an influence might not have mattered so much had it been for good; but Bute was a weak and incapable man, and the nation did not like to see so much power falling into his hands. The next ministry, however, was no more successful than Bute's had been; for in 1763 it got intensely disliked in England on account of prosecuting a certain man named Wilkes, who had been writing articles in a newspaper which were obnoxious to the King; and then in 1765 it passed an act called the stamp act, which was

so important in the results it brought about that we must do our best to understand it. In America there were as yet only the thirteen colonies, which still formed a part of the British Empire. It was necessary to keep a certain number of soldiers there in order to protect them from the possible rising of any of the French people who lived in Canada. Although Canada had been won, and made entirely English, the inhabitants were by no means all in favor of British rule, and it was felt that the presence of a considerable army was necessary in order to prevent the development of any new danger. The question, then, was whether, as the soldiers were kept there for the advantage of the American colonies, the colonists ought not to defray some portion of the expense themselves. This was the view entertained by the Government, and the stamp act was in consequence passed, by which a certain duty was levied in stamps upon all legal documents and writings. But the act met with a considerable amount of opposition in England, Pitt, for one, declaring that the American colonists ought not be taxed, because they were not directly represented in Parliament, and that representation and taxation went hand in hand. Pitt also drew a distinction between taxation and the levying of customs, a distinction which was refuted by Grenville, the prime minister. The opposition to the act, strong though it might be in England, was nothing as compared to the opposition in the colonies themselves. They had been informed a year before it was actually passed that it was the intention of the Government to carry it, and this interval they had spent in discussing the matter and in petitioning against it. It could not be denied that the Government were acting within their rights in passing such a bill; the question, rather, was whether it was expedient that they should do so. The stamp act was repealed in the following year (1776) by another ministry; but certain customs duties were retained and still fresh ones imposed. These duties revived the agitation in America, which had been lulled by the repeal of the act, until, in 1773, they were all done away with except the duty upon tea. During these eight years, however, the American colonists had been feeling their strength. Although legally England was quite within her right, they had seen that a strong and determined opposition made the Government waver. They were, moreover, beginning to develop a feeling of nationality—an idea, that is, that they could get along as an independent body, and could break off all ties with England. When, therefore, the duty on tea was continued they proceeded to extreme measures. Certain ships, laden with tea, arrived at Boston in December, 1773. This tea, if it were landed, would be subject to the duties to which the colonists had so great an aversion. A number of men, disguised as red Indians, boarded the vessels as they lay in Boston Harbor, and, seizing the chests of tea, threw all the contents overboard. This open act of insurrection led the Government to deprive Boston of its charter, a step which the colonists retaliated upon by raising a volunteer army throughout the colonies. Affairs had now gone so far that any retreat was impossible. The matter had passed away from the region of parliamentary discussion and become one which could only be settled by force of arms.

The throwing of the tea into Boston Harbor, and the arming and drilling of the voluntcer army, showed the English Government that the American colonists were determined to proceed to extremes. Parliament therefore passed laws to put down all resistance, and sent troops over to America, thinking at first that the conflict would be a short one. The actual war began at a place called Lexington, not far from Boston, where a certain Colonel Smith had been sent to destroy a magazine, but was met by unexpected opposition. After a long skirmish, he retreated with considerable loss; but on the 17th of June the English dislodged the colonists from their position on Bunker Hill, and it looked for a time as if the Americans would suffer defeat on all sides. Two things, however, assisted them greatly—one being the extraordinary powers as a general developed by a man among them, George Washington; the other being the assistance that was sent over to them from France. England's success in India and Canada had been neither forgiven nor forgotten by

the French, and they were only too glad of an opportunity to inflict some harm upon their ancient enemy. Soon after the war began, the colonists had issued a Declaration of Independence, in which they renounced all allegiance to England and set themselves up as an independent nation. This declaration was warmly debated upon in Parliament; Lord Chatham coming down, ill though he was, to protest against it in the House of Lords. Chatham had held that it was not right to attempt to force taxes upon the American colonies; but it seemed to him far more wrong for a great nation like England to allow her own authority to be wrested from her without offering any resistanee. The declaration was issued on July 4, 1776, and by it the colonies became the United States. The chief remaining events of the war may be briefly told. England conquered New York, and had some other successes in 1777; but the following year the tide of fortune turned, and one general surrendered at Saratoga, followed in 1781 by another surrender at Yorktown. It was after the American success at Saratoga that a treaty was made between Ameriea and France, which virtually ehanged the war into one between France and England. During the hundred years that have elapsed since they broke away from England, the United States have extended in a most marvelous and unparalleled way. Their territory new reaches aeross the whole of the continent of North America, a distance of some 3,000 miles; and while the Dominion of Canada forms their northern boundary, they extend as far south as the tropical distriet of Mexico. They possess a teeming population of some 50,000,000, composed not only of those who have been born there, but of persons from every country in Europe. Their government is republican, and their ehief magistrate is a President, who is elected onee in every four years. Since their formation they have been eonvulsed with many local and internal quarrels, the most desperate being a war which raged about thirty years ago, when a certain number of the States wished to break away from the Union, and did for a time sueeeed in setting up a eonfederation of their own. The inhabitants are fond of business, and elever at making money; wealth, perhaps, oeeupying too high a place in the thoughts of many. The story of the separation of the American colonies from England may well be ended with the account of the interview between George III and the first minister sent over by the United States. This minister was a Mr. John Adams, who attended the King's levee at St. James's on June 1, 1785. The secretary of state presented him to the King. "I think myself more fortunate than all my fellow-citizens," said Mr. Adams to the King, "in having the distinguished honor to stand in Your Majesty's royal presence in a diplomatic charaeter; and I shall esteem myself the happiest of men if I can be instrumental in reeommending my country more and more to Your Majesty's royal benevolence." "Sir," said George III, in answer, "I wish you to believe, and that it may be understood in America, that I have done nothing in the late eontest but what I thought myself indispensably bound to do by the duty which I owed to my people. I will be very frank with you. I was the last to eonsent to the separation; but, the separation having been made, and having become inevitable, I have always said, as I say now, that I would be the first to meet the friendship of the United States as an independent power." Mr. Adams, in writing his account of this memorable interview, adds: "The King was indeed mueh affected and I confess I was not less so."

[To this account is added Paul Revere's Ride.]

[From The Story of England: A Reading Book for Schools. By Rev. Edgar Sanderson, M. A. London. Blackie & Son. 16°. pp. 256. Blackie's Narrative Histories, for standards iv to vii.]

In 1765, trouble began with our colonies in North America. The prime minister, Mr. Grenville, had the stamp aet passed, in order to raise money there on stamps which had to be bought from the government, and put on to deeds and other doeuments. The thirteen colonies, as they then were, containing about 2,000,000 people, spoke out strongly against this. They said they had no members to represent them in Parliament, and that, as British subjects may not be taxed without their own consent in Parliament, they ought not to pay taxes to the British Government at

home. In 1766 the stamp act was repealed, but another was passed declaring that Parliament had the right, if it chose, to tax the colonists. An act was passed in 1767, putting duties on tea, glass, paper, and other articles of use, and riots then took place in the colonies. In 1769 the Virginian house of assembly declared that the colony could be legally taxed only by its own house. Still George and his ministers would take no warning. Lord North became prime minister in 1770, and Lord Chatham in the House of Lords, and the great Irishman, Edmund Burke, in the Commons, spoke strongly in favor of the colonists. Lord North then took off all taxes except that on tea, but this he kept to show the right he claimed for the home country. In all these doings George backed his ministers with his usual dull obstinacy, which he took to be the firmness of a great ruler. In 1773, a party of men at Boston, in America, went on board some ships in the harbor and threw the cargoes of tea overboard. Another great speaker in the Commons, Charles James Fox, joined Burke and Chatham in supporting the cause of freedom; but North and the King could not be moved. Then in 1774 twelve of the thirteen colonies sent men to a meeting at Philadelphia, and they drew up a declaration of rights, which was another strong warning of what was to come. At last, in April, 1775, the war of American Independence broke out. At Lexington, near Boston, a force of colonial riflemen attacked a body of British troops and gave them a severe defeat. Col. George Washington was put at the head of the rebel forces, and, sometimes winning, sometimes losing, he gained undying fame by his cool courage, firmness, and skill throughout the war. On July 4, 1776, the Declaration of Independence was signed by a meeting at Philadelphia of men representing all the thirteen colonies, and the great Republic called the United States began to exist. In 1777, a British force of 6,000 men, under General Burgoyne, was surrounded at Saratoga by a great American army, and forced to lay down its arms. This was the turning point of the struggle. Early the next year our Parliament gave up the right to tax the colonies and wished to make peace. But it was now too late. The French Government of Louis XVI had already made an alliance with the new State, and sent out ships and troops. At last, in 1781, another large British force, under Lord Cornwallis, was forced to surrender at Yorktown, in Virginia, and by the peace of Paris, in 1783, England recognized the United States of America as an independent power.

George III and his ministers claimed the right to impose taxes upon the American colonies, and they accordingly induced the House of Commons to pass the stamp act. This was an act to compel all Americans to put English stamps on all their law papers—such as wills, contracts, and other deeds. But the Americans said: "If we are not represented, we will not be taxed! No taxation without representation!" * * * The King and his ministers were obstinate; and, in spite of the warnings of Pitt, Fox, and Burke, passed the stamp act, and also imposed taxes upon tea and other minor articles of commerce. At length Parliament was induced to yield; and it removed all taxes upon the American colonies, except a very small tax upon tea. This tax was retained as a "matter of principle" and to please the King, who still held fast to his right of taxing his own colonies. The colonists, however, were strong, because they were united; they emptied the cargo of one of the ships sent out with tea into Boston Harbor. And, after this act of defiance, war broke out between them and the mother country. On the news that a British force had been dispatched to America, the colonists ran to arms; from all parts of the country thousands of volunteers came in, who, from their readiness to take the field at the shortest notice, were called "Minute men;" and a long and determined struggle began. The famous battle of Bunker Hill was fought; but the battle was not of much consequence, and neither party gained or lost by it. Our generals were not very able; while the colonists selected as their commander in chief George Washington,

"a man, first in war, first in peace, and first in the hearts of his fellow countrymen." This unhappy war lasted seven years. On the famous 4th of July, 1776, the colonists drew up a Declaration of Independence, in which they declared themselves free from Great Britain, and assumed the title of the United States of America. There were at that time 13 States with a population of less than 3,000,000; there are now 38 States, with an active, enterprising, and ever-growing population of more than 50,000,000. The French joined the American colonists, assisted them with men and money; and from that time our efforts to subdue the young States became almost hopeless. In 1781, Lord Cornwallis, the commander in the British army, was obliged to surrender to the Americans at Yorktown, in Virginia; and the year after, we formally recognized the independence of the United States of America.

[From Simple Stories Relating to English History. Book 2. Henry VII to the present time. London. George Gill & Sons. 1891. 12°. pp. 128. The "Regina" Historical Readers.]

But though he [George III] was a good man, he was not a very wise one. Before he died he quite lost his reason, and became blind as well. At the time he ruled, Britain became the leading nation in the world. All the north of America, of which Canada was a part, was under British rule. France wished to have some of it, and England spent large sums in trying to keep it. The English statesmen thought that the people of America ought to help to pay the cost of the war. They would not do this, and a tax was put on the tea which was sent out in ships. When the ships came into Boston Harbor, some young men, dressed as red Indians, went on board and, threw the tea into the sea. Soldiers were then sent to America to force the people to pay the tax; and a war, which lasted for eight years, began in real earnest. At first the English won, but a great man took charge of the American Army. His name was George Washington, and he made his soldiers as brave and clever as Cromwell did those of England in the time of King Charles. He beat the British in many fights, and the end of it was that in the year 1776 England lost America, which ever since has been called the United States. Still, we must not forget that most of the people in these States are of English flesh and blood. They speak the English tongue, and have grown to be very rich and powerful.

[From Outlines of the History of England. Part II. James I to the present time. Standard VI. By George Girling. London. Blackie & Son. 16°. pp. 242-454. Blackie's Comprehensive School Series, Historical Reader, No. IV.]

The American war of Independence, 1775–1783.—In order to meet the expenses of the late war (seven years' war), which had been mainly incurred by England in defense of her colonies, it was determined to impose taxes upon the American States, and in 1765 the prime minister, Grenville, imposed a stamp duty. This was badly received by the colonists, who urged "that as they had no share in the representation of the British Parliament the latter had no right to tax them." In 1766 the stamp act was repealed and Grenville resigned. He was succeeded by the Duke of Grafton, while Pitt, now Earl of Chatham, had a seat in the cabinet. In spite of the protests of Pitt other taxes were imposed on tea, glass, paper, and painters' colors. These taxes led to great riots in America, and the discontent was universal. In 1768 Chatham retired from office, and in 1770 Lord North became prime minister. The obnoxious taxes had been previously repealed except that on tea, and it was determined as a matter of right to impose a duty of threepence a pound on all t a imported into America. In 1773 a party of Americans disguised as Mohawk Indians boarded some tea ships in Boston Harbor and threw the cargoes overboard. The Home Government took severe measures to punish this outrage, and thus widened the breach which was rapidly growing up between the colonies and England. In 1774 a congress of the States was called at Philadelphia, and a declaration of rights was drawn up demanding that the taxes should be abolished. The Home Government treated this petition with indifference, and an appeal to arms became imminent. Hostilities commenced in 1775 at Lexington through an attempt of General Gage to

seize some military stores collected by the colonists. George Washington was then appointed commander in chief by the colonists. A second engagement took place in the same year at Bunker Hill, near Boston, ending in the retreat of the Americans. In 1776, on July 4, the colonists issued a formal Declaration of Independence under the name of the United States of America. In 1777 Washington was defeated at Brandywine and Philadelphia was captured, but these reverses were counterbalanced by the complete capture of an English force under General Burgoyne at Saratoga. From this period the success of the colonists was assured. In 1778 France, deeming the time favorable for a war with England, acknowledged the independence of the States. It was now proposed in the Parliament that England should acknowledge the independence of the colonies; to oppose this measure Chatham, who was exceedingly ill, came down to the House of Lords, and while speaking fell upon the floor of the House, and a month later the great statesman was dead. In 1779 the Spaniards, deeming the opportunity favorable, attempted in vain to recover Gibraltar, which was gallantly held by General Elliott. The war in America languished till 1781, when the English commander, Lord Cornwallis, was compelled to surrender with all his troops to General Washington. This secured the independence of the States. In 1783 the war ended with the treaty of Versailles, which formally acknowledged the independence of the 13 States of America, which became a republic with George Washington as its first President.

[The account given in Number II of this series is substantially the same as the above.]

[From The Hanoverian Period. Book VII. London. W. & R. Chambers, 1894. 12°. pp. 208. Chambers's New Historical Readers.]

During the last ten years of Chatham's life the most important question was the quarrel with our American colonies. In the early years of the dispute the aged statesman's voice was often heard in the House of Lords pleading for a fair and peaceful arrangement with the colonists. But in spite of his efforts we gradually "drifted into war" with them. As campaign after campaign passed over, and the Americans showed no signs of yielding, a party grew up which held that we should take no further interest in our colonies, and in the session of 1778 a proposal to this effect was made. This was the occasion of Chatham's last appearance in the House of Lords. He was suffering from illness and had to be assisted to his place by his friends. Touching it must have been to see the great statesman, old and worn with disease, rise to address his brother peers. His concluding words were that he "rejoiced he was still alive to lift up his voice against the dismemberment of this ancient and most noble monarchy." Shortly after uttering these words he fell in a fit on the floor of the House. He was conveyed to his residence at Hayes, but the hand of death was upon him and he expired a few weeks afterwards.

The colonies which, since the beginning of the seventeenth century, had been planted in North America by the British had gradually taken root and grown into flourishing States. Their people were distinguished for their sturdy, enterprising character and their love of freedom. But even in their new home, and with the broad Atlantic rolling between, the colonists still retained feelings of good will and affection for the mother country. It was in the year 1765, when George Grenville was prime minister, that the unhappy measures began which were to end in the revolt of our American colonies. For the purpose of making the colonists contribute to the revenue of England a stamp act was imposed upon them by our Parliament. The Americans opposed this measure, holding that as they did not send representatives to the British Parliament, that body had no right to tax them, and asserting that "taxation without representation was tyranny." The best British statesmen took the same view, and the act was repealed. Unfortunately, the British Parliament some time afterwards made a new attempt to enforce a tax upon tea. The colonists were now thoroughly roused, and rather than submit to be taxed declared

that they would do without tea altogether. Several British merchant vessels, which had entered the harbor of Boston with cargoes of tea, were boarded by parties of men disguised as red Indians and the tea chests were thrown into the sea. Notwithstanding the hostile spirit thus shown, prudent and reasonable measures on the part of the British might still have averted a contest. But the helm of the state was in the hands of Lord North, a man whose chief claim to office was his ready obedience to the King. From the beginning George was most resolute in his determination to crush the colonists. His personal power was now firmly established, and in Lord North he found a willing servant, who for twelve years seconded his efforts to destroy American freedom. The first blood shed in this unhappy conflict was in a skirmish at Lexington, near Boston. Our soldiers attempted to seize some military stores which the Americans had collected at the town of Concord. They succeeded in their aim, but on the march back they received severe loss from the colonists. This affair was followed shortly afterwards by the bloody battle of Bunker Hill, in which the British, though victorious, suffered greatly (1775). Indeed, throughout the war, which lasted during eight campaigns, the colonists in every action proved themselves to be sturdy foes, whom every defeat seemed only to brace up to a firmer resistance. The commander in chief of the Americans was the great George Washington, who possessed all the high qualities needed for carrying to a successful close the struggle upon which they had entered. In their civil affairs they were assisted by Benjamin Franklin, who afterwards became their ambassador at the Court of France. Before much progress had been made in warlike operations the Americans issued their famous Declaration of Independence, which declared the colonies to be free and independent States (1776). For a time the American arms were not successful. An invasion of Canada, which had not joined the other colonies in their revolt, was repulsed, and Washington was defeated in several battles near New York. The tide of success at length began to turn in their favor. A British force under General Burgoyne attempted to make its way from Canada into the heart of the States. It had some successes at first, but as it marched farther and farther into the enemy's country it was gradually hemmed in and compelled to surrender, with all its stores, at Saratoga. As the war went on, all the efforts of our generals failed to win any real success against the skill and perseverance of Washington. In their struggle for freedom the Americans were assisted by many Frenchmen of rank, the chief of whom was the Marquis de Lafayette. These men afterwards carried the new ideas of liberty to France, and thus hastened the revolution in that country. In the year 1778 both France and Spain recognized the independence of the United States, and war was declared against England. There was now a growing feeling in this country that it would be better to close the war and grant the Americans all their demands. But the conflict lingered on until Lord Cornwallis was shut up in Yorktown with an army of 6,000 men, and compelled to surrender to a combined American and French force. This was really the closing event of the war, although peace was not concluded till some time after by the treaty of Versailles in 1783.

[From the Newberry Historical Readers, No. 7. London. Griffith, Farran & Co. [1892]. 16°. pp. 191. The Hanoverian Period.]

The wars waged under the influence of Pitt, however glorious, had cost a great deal of money, and there was some difficulty in meeting the expense. One of the means suggested was to raise some revenue from the British colonies in North America, at that time called the Plantations. The idea then prevalent was that colonies existed solely for the benefit of the mother country, and arrangements were made which seemed likely to give us as much money as possible from them. The stamp act, proposed by George Grenville, passed without difficulty, but was resisted by the Americans, on the ground that stamps were a matter of inland revenue. Grenville had unfortunately said in the debate that this measure was only an experiment toward future taxation. On the arrival of the act in America, riots took

place at Boston, New York, and Philadelphia, and the act was publicly burned, and the houses of Government officials attacked. A solemn protest was presented to the English Government against the legislature, and the trade between England and America was interrupted. The question of repealing the stamp act was necessarily brought before the House of Commons. Before this Mr. Grenville's ministry had come to an end, and he had been succeeded by Lord Rockingham. The most distinguished member of this ministry was the great orator and writer, Edmund Burke, who, although he only held a subordinate place, still had great influence with the prime minister. Pitt came up from Bath, where he was taking the water, to attend this debate. He said that England had no right to tax America, and he rejoiced that the colonies had resisted; had they not done so, they would have been fit instruments to enslave the rest. Grenville maintained the absolute right of England to tax the colonies, and he was supported by the King, who contrived, by means of his private friends, to exercise great influence in Parliament. The repeal of the stamp act was carried after much discussion, and accompanied by another act, which declared that the British Parliament had supreme authority over the British Empire in all cases.

The quarrel between England and America was for a time appeased, but it broke out at a later period in a worse form. Lord Rockingham was dismissed from office, which he had held for just a year, and a new ministry was appointed, of which Pitt, now created Earl of Chatham, was the real head, although the Duke of Grafton held the nominal post of prime minister. Chatham, almost immediately after his appointment, was seized with a mysterious illness which entirely incapacitated him from work. Charles Townshend, who was chancellor of the exchequer, took the rash course of imposing a tax in the colonies on glass, paper, paint, and tea. The relations between America and the mother country had never become completely smooth, and it was thought advisable to take precautions against a riot. Ships of war, arriving from Halifax, cast anchor in the port of Boston, and 700 troops, under the command of General Gage, marched into the town with loaded muskets and fixed bayonets.

In 1770 the Duke of Grafton resigned his post as prime minister and was succeeded by Lord North, who was an intimate friend and favorite of the King. Soon after his accession to power the American import duties were repealed, excepting the tax on tea. This produced important results. In 1773 the English East Indian Company sent a quantity of tea to America, which they were permitted to do on favorable terms. Although this would be subject to the new tax, yet the Americans would obtain it at a cheaper rate than they had been accustomed to pay. Notwithstanding this, they received the ships with carefully prepared hostility. A number of men disguised as Mohawk Indians boarded the vessels on their arrival in the harbor, broke the tea chests open, and threw the tea into the sea. The English Government, on hearing of these disorders, took stern measures of reprisal. The port of Boston was shut up, and the customs transferred to Salem, and the charter of Massachusetts was recalled. General Gage, the commander of the garrison, was appointed governor of the town of Boston. These measures, so unwise and imprudent, were opposed by Chatham, Burke, and Charles Fox, but were imposed upon the country by the united efforts of the King and Lord North. The colonies felt the revocation of the charter of Massachusetts as a great attack upon their liberties. A general congress of all the colonies was summoned to meet at Philadelphia. They adopted two measures—a declaration of rights, in which they claimed the liberties of Englishmen, the right to representative institutions, free discussion, and trial by jury; and they drew up addresses to the people of Great Britain and Canada and a petition to the King.

Lord Chatham, seeing the danger which was approaching, used all his efforts for conciliation. He urged the removal of the royal troops from Boston, which was in a state of ferment. In conjunction with Benjamin Franklin, who was much trusted

by the Americans, he drew up a bill which, while it declared the dependence of the colonies on the British Crown and their subordination to Parliament, proposed that no tax should be levied from any body of British freemen without the consent of its own representative assembly. This scheme, which might have prevented the conflict, was rejected in a manner which only served to embitter it. Burke also proposed some resolutions to the House of Commons, which followed much the same lines as those of Lord Chatham; and Lord North was willing to declare that Parliament should not tax America so long as she made provision for the common defense and the cost of government. This proposal was adopted by the House, but it was not likely to be accepted by the colonies. In the meantime the war had begun. * * * In a second congress, held at Philadelphia in 1775, George Washington had been appointed commander in chief. His name has always remained as an example of disinterested patriotism and noble self-denial. * * *

The struggle between the two countries now began to attract the attention of Europe, and many French officers attached themselves to the American cause, the most notable of whom was the Marquis Lafayette. Washington and Howe contended for the possession of Philadelphia. Howe embarked a large force at New York, sailed up Chesapeake Bay, and disembarked his men 70 miles from the city. Washington intercepted him at the river Brandywine, but was defeated with heavy loss, and the English were able to attain the object of their march. This success was more than compensated for by the surrender of General Burgoyne at Saratoga. As he was marching south from Canada, through a difficult country, he was surrounded, by the skill of the American commander, and compelled to surrender. Three thousand five hundred British troops laid down their arms. The convention of Saratoga really decided the fate of the war. France openly joined the American cause, and was shortly afterwards followed by Spain. The opposition to the war in Parliament continued till, in October, 1781, the entire British army, under Lord Cornwallis, amounting to 7,000 men, surrendered themselves prisoners of war, with all their arms, artillery, and stores. Resistance after this was useless. Lord North resigned, and peace was made.

[From Arnold's History Readers. By M. T. Yates, LL. D., Book VII. The House of Hanover. London. Edward Arnold. 12°. pp. 254. Arnold's school series.]

Now let us turn to North America, which was regarded as a province of Great Britain. The New World had been settled by different nations—one part by the British, another by the French, another by the Dutch, another by Swedes, and so on, but in 1765 Great Britain owned almost the whole of it, and the English language was spoken and English law obeyed from Maine to Florida. The river St. Lawrence and the Great Lakes formed a boundary between Canada and the thirteen American colonies, which had from time to time been formed on the Atlantic Coast. The colonists called themselves English and were very proud of this name, for then, as now, England was one of the greatest countries in the world. This extensive region might still have been a part of the British Empire if George III had not been so determined to have his own way, and to insist on being, as his mother had taught him, "King." Each of the thirteen colonies had a legislative body, divided into two houses—a lower house or assembly elected by the people, and an upper house or council appointed by the King or other authority. These two bodies answered to our House of Commons and our House of Lords. The governors of the colonies were appointed by the British Government. All laws regulating the trade between the colonies and other countries were made by the British Parliament. The colonists were obliged to send nearly all their leading products to England for sale. They were not allowed to buy any European goods except in England, and no foreign ships were allowed to enter an American port. Custom-houses were established at all the principal ports of the colonies, and the duties were collected for the King. Duties were levied on foreign goods to exclude them from the colonies, and

compel the Americans to buy English goods. Much smuggling took place both in importing and exporting goods. In their attempts to evade restrictive laws the people learned to disregard the laws of the mother country, and unwise acts of Parliament prepared the minds of the colonists for resistance to British authority. We must remember that many of the colonists had been driven to America by acts of tyranny, and had carried with them the English love of liberty. They were, therefore, always ready to assert their right to "the liberties of Englishmen." Then, too, the hardy, independent life of pioneer settlers tended to cherish the passion for freedom. The governors appointed by the home Government made continued efforts to encroach on the freedom of the people, and as they were the direct representatives of the Sovereign, their action fostered a feeling of antagonism, which at length broke out in open rebellion. The navigation laws were exceedingly unpopular, and were enforced by custom-house officers, who did not scruple to resort to the most objectionable means. The collectors of customs in Boston, in 1761, even asked for "the right to search any house, at any time, for the purpose of finding smuggled goods." This act only served to make the customs more unpopular and increase the anger of the people against them. In 1765 the British Government needed money to pay for the war which had just ended, and to support the army which was required to defend the colonies from foreign foes. It was therefore decided to tax the American colonies by means of a stamp act. This new law required that all legal documents, such as wills, deeds, notes, receipts, and even newspapers, should be written or printed on paper bearing a Government stamp. The stamped paper was sold at high prices by Government officers. The colonists strongly objected to this tax. They saw that if the British Parliament could enforce such an act, they could tax America in any other way they thought proper. At once they raised the cry, "No taxation without representation." This meant that, as the colonists sent no members or representatives to the British Paliament, that body had no right to tax them. They therefore refused to use the stamped paper, and in their excitement they attacked the officers whose duty it was to distribute it. The authority of the King and Parliament was defied, and American merchants pledged themselves not to import any English goods until the stamp act was repealed. Pitt urged the immediate repeal of the act. He had warned the Government against passing it, and when the colonists would have none of it, he said, "I rejoice that America has resisted." English merchants also joined in the cry for its repeal, for while it remained in force trade with America was at a standstill. It was therefore repealed in 1766. Pitt, who had been so successful both in America and India against the French, and had resigned office in 1761, became prime minister in 1766, and was created Earl of Chatham. Shortly afterwards, however, his health broke down, and he resigned in 1768. Though he did not again hold office he continued to interest himself in public affairs.

As the stamp act had proved a failure the British Government tried another plan for getting money from the colonies. Determined to assert its right to tax the colonies, Parliament passed an act which imposed duties on glass, paper, tea, and other articles. The money obtained in this way was intended to pay the governors and the judges in the colonies, the object being to make these officers independent of the people. These new duties aroused the indignation of the Americans, who declared that it was an attempt on the part of Parliament to govern America from England. They therefore formed leagues against the use of taxed articles, and attacked the officers appointed to collect the money. They also encouraged smugglers to secretly land cargoes of the prohibited articles. There seemed to be only two ways of treating the Americans open to Parliament. Either the colonists must be allowed to govern themselves and levy their own taxes, or they must be compelled by military force to obey the Home Government. Soldiers were employed to assist in the collection of the taxes, and a collision between the troops and the inhabitants of Boston ensued. Yielding in part to the storm which had been aroused, Parliament repealed all the

duties except that of 3 pence a pound on tea, but at the same time declared that this tax was retained simply to assert the right of Parliament to tax the colonies. The Americans were just as determined to assert their right to pay no taxes except those they had a voice in levying. In 1773 a number of ships arrived in America containing a large quantity of tea. At Boston a company of men disguised as Indians boarded the ships and emptied the chests of tea into the sea. This is known as "The Boston Tea Party." In New York the tea was destroyed in the same manner. At other ports the ships were sent home again, and in one instance burned in the harbor. * * *

The Congress met in 1774 and agreed that all trade with Great Britain should cease until Parliament redressed the grievances of the colonies. They also sent a petition to the King and Parliament, in which they stated their side of the question. So far the idea of separating themselves from the mother country does not seem to have taken form. Yet the determined spirit in which the opposition was conducted shows that the majority of the people had made up their minds to resist to the utmost the encroachments on their liberty, whatever the consequences might be. They prepared to meet force with force by organizing the militia and collecting military stores. The men who were enrolled were called "Minute men," because they declared themselves ready to take up arms at a minute's notice if required. Up to this point both the Americans and Parliament had believed that a compromise would be effected and peace maintained. If the counsel of some of the wisest statesmen in England had been followed there is no doubt that this desirable result would have been attained. But the King would not hear of making any concession. He regarded the colonists as rebels who must be forced into obedience. In 1775 General Gage, who had been appointed governor of Massachusetts after the Boston Tea Party, received information that a quantity of military stores had been collected at Concord, a town about 18 miles from Boston. He determined to make a sudden raid on the place and destroy the stores. The Americans heard of the intended expedition and prepared to defend their property at all hazards. The British troops were at Charlestown, and a special watch was kept to give warning of their departure. Paul Revere was chosen to ride through the country and alarm the inhabitants. When he received the signal that a movement was taking place, he mounted his horse and rode through the night toward Concord, rousing the people with the stirring cry, "The regulars are coming!" * * *

After the fighting at Lexington and Bunker Hill an attempt was made to bring about a reconciliation, but the colonists refused the offers made by the British Parliament, and the terms of the American Congress were not acceptable in England. While offering terms of peace an army was being raised by Congress, and as soon as it was ready George Washington was appointed commander in chief. Col. George Washington, of Virginia, was an able soldier, who had gained distinction for zeal, courage, and prudence in the French and Indian wars. While a British subject he had bravely defended the British colonies against foreign enemies. Now he was as zealous in defending what he thought to be the rights of his country against encroachment by Great Britain. Washington was noted for his patriotic spirit, his infinite patience, and his absolute unselfishness. When he accepted the post of commander in chief he refused to receive any salary in payment for his services. There can be no doubt that the high character and sterling qualities of such a leader inspired the men under his command, and helped in no small degree to bring the struggle to a successful issue. He at once began to train his army that it might be prepared to meet the British forces on equal terms. In 1776 he besieged the British in Boston and forced them to give up the town and retire to Halifax, in Nova Scotia. He then made his way to New York, that he might be ready for an attack on that city. The struggle which had ended in war had continued for so long a time that the colonists were now quite ready for separation, and on the 4th of July, 1776, the American Congress met at Philadelphia and adopted the Declaration of Independence. This act was a formal separation of the colonies from Great Britain. The

United States, as they now called themselves, were declared to be an independent country, and no longer subject to the British Crown. The Declaration of Independence was received by the colonists with demonstrations of joy, but the leaders were filled with anxiety, for they knew that Great Britain would not give up such wide dominions without straining the might of the Empire to retain them. British troops were being landed in the country, and a large body of German soldiers was hired to assist in putting down the rebellion. The battle of Long Island, fought in 1776, ended in the defeat of the Americans, and they were compelled to leave New York in the hands of the British. Fort Washington was captured, and the Americans were obliged to retreat into Pennsylvania with the British following close on their heels. At this time Washington's army was suffering much from sickness and want of stores. The war continued with varying success for several years, until, with the aid of the French, the Americans defeated Lord Cornwallis at Yorktown in 1781. This surrender took away the last hope of subduing America, and terms of peace were agreed on at Paris in 1782, and a treaty was signed in the following year. The treaty of Versailles recognized the independence of the United States. Washington now felt that his work was done. He therefore resigned the command of the army, and bidding farewell to his troops, returned to private life. His patience, wisdom, coolness, and unselfish patriotism were recognized by his country when he was declared to be "First in war, first in peace, and first in the hearts of his countrymen." When the war was over the thirteen States, which before that time had been independent of one another, adopted a form of government which made them into a nation. They still retained their State governments. The only difference between the new plan and the old was that they were no longer subject to the King. The next step was to form a central government, and George Washington was chosen as the first President of the United States.

On a foggy November morning in 1783 George III entered the House of Lords and with a faltering voice read a paper in which he acknowledged the independence of the United States of America. He closed his reading with the prayer that neither Great Britain nor America might suffer from the separation; and he expressed the hope that religion, language, interest, and affection might prove an effectual bond of union between the two countries. It has been well said that "time has long ago healed the wound caused by the original quarrel of the mother country and the daughter colonies; and if there have sometimes been misunderstandings and suspicions engendered between England and the great Republic, by unwise utterances or by unjust dealings of individuals, or of sections on both sides, the sound sense the cordial feeling, the spirit of kinship, and the community of speech, of interests and of sympathies entertained by the great mass of both peoples have prevented threatened collision and strife. For England and America to go to war would be a calamity to the entire race. It would put back the hand of progress and would arrest the course of civilization, commerce, philanthropy, and religion throughout the world."

[The Standard Author History of England (London. George Gill & Sons. 12°. pp. 407), being one of Gill's School Series, is made up of extracts from various authors arranged in the form of a continuous narrative. The section devoted to the surrender of Cornwallis at Yorktown is copied from Bancroft's American Revolution.]

[From the Senior Standard History Readers. Book III. 1660–1871. By Rev. David Morris. London. Longmans, Green & Co. 1883. 16°. pp. 317-531.]

The seven years' war had been chiefly carried on by England for the protection of the American colonies and had left a heavy burden of debt upon the country. The settlements in North America then consisted of thirteen States, having a population of 2,000,000 whites and 500,000 colored people. Grenville, the English prime minister, proposed to increase the revenue by imposing the stamp act upon the American colonists, by which he expected to receive £10,000 annually. This measure created the greatest opposition in America. The colonists adopted the principle of "no

taxation without representation," and as they were not represented in the British Parliament, they denied the right of the home Government to tax them. A change of ministry brought about a repeal of the obnoxious stamp act in the following year. This administration soon gave way to one under the leadership of Pitt, who was raised to the peerage with the title of Earl of Chatham. The new ministry, in 1767, passed a bill for levying in America import duties upon glass, paper, painters' colors, and tea. The colonists opposed these with the same determination as before and resolved not to pay. In 1770 Lord North became prime minister and repealed all the offensive duties except that on tea, but these concessions did not allay the spirit of opposition in America. Rather than pay the tax of 3 pence per pound upon tea the colonists abstained altogether from the use of the beverage, except when they could get a supply from the numerous smugglers, who drove a good trade on the coast during this wordy strife. In 1773 three ships laden with tea, having entered the port of Boston, were boarded by 20 daring men disguised as Mohawk Indians. They knocked out the heads of 343 chests of tea and flung into the sea their contents, valued at £18,000. The home Government, enraged at this outrage, proceeded to punish the people of Boston by passing a bill to remove the custom-house of the port to the more loyal town of Salem (1774). This measure was followed by the Massachusetts government bill, dissolving the house of assembly in that State and enacting that its members should henceforth be appointed by the Crown. These acts of vengeance were strongly opposed by the Earl of Chatham and Charles James Fox. At the same time Benjamin Franklin, residing in London as the agent of the Massachusetts house of assembly, did his best to effect a reconciliation and avert the dreadful contest which seemed imminent. While troops were pouring into Boston to enforce the laws, all the States except Georgia met in a general Congress at Philadelphia, from which they issued the celebrated declaration of rights, claiming their privileges as British subjects and resolved not to hold any commercial intercourse with the mother country until their grievances were redressed. An address, forwarded to the King from the Congress and supported by the eloquence of Chatham, Burke, and Fox, received no consideration. Neither the Government nor the colonies were disposed to give way, and nothing remained but an appeal to arms. The first outbreak of hostilities was occasioned by an attack of the British troops under General Gage upon the town of Concord, where the defiant colonists were holding a house of assembly and concentrating military stores and raising militia. * * *

A month afterwards a second Congress assembled at Philadelphia and appointed as their commander in chief George Washington, a Virginia gentleman, then about 43 years of age. Meanwhile Gage had allowed himself to be shut up in Boston by 20,000 raw colonial troops, who intrenched themselves on Breed's Hill, an eminence commanding the town. General Howe, arriving from England with reinforcements, took the chief command and proceeded to assault the Americans behind their intrenchments. The battle, called Bunker Hill, from a neighboring height, ended in the defeat of the colonists, but the victory cost the British 1,000 men and taught them to respect the valor of their opponents. About the same time the Americans, under Montgomery and Arnold, invaded Canada, in the hope of persuading its people to join them. Montreal fell into their hands, but an attack upon Quebec failed; Montgomery was slain in the assault, and the invaders, after continuing the siege through the winter, were driven out of the province. Meanwhile in the summer of 1775 Congress made one last effort to conciliate the home Government by sending a petition known as "the Olive Branch." To this appeal the only answer given was a large increase of land and sea forces and a declaration in Parliament to take resolute measures against the conspirators and insurgents in America.

Early in the following year the British troops, compelled to evacuate Boston, sailed to Halifax, and thus enabled Washington to take New York. Then the Congress at Philadelphia, consisting of delegates from all the thirteen States, issued their famous Declaration of Independence. In August Howe left Halifax and effected

a landing on Long Island, where he was joined by the fleet of his brother, Admiral Lord Howe. The united forces defeated Washington at Brooklyn with great loss and recaptured New York. Matters were going on badly with the Americans, when their leader revived their sinking courage by a sudden attack upon the garrison of Trenton and capturing nearly 1,000 Hessian troops. This affair closed the campaign

The year 1777 opened with another surprise of the Americans upon the garrison of Princeton; but Washington's success was cut short by a defeat at Brandywine, which enabled the British to occupy Philadelphia. This victory raised hopes in England that the subjection of the colonies was not far distant, but a serious disaster befell the English arms, and changed hopes to fears. General Burgoyne, marching from Canada with 10,000 men to cooperate with a force from New York, was so beset in the woods by the Americans that he could not get farther than Albany. Disappointed in not meeting with the expedition from New York, and harassed by the enemy, he retreated to Saratoga, where he was soon surrounded. For five days the gallant General resisted the pangs of hunger and the overwhelming masses of his foes, in the hope that relief would come. At length he was compelled to surrender, with all his brass cannon, muskets, and stores. His force, numbering then about 6,000 men, received a free passage to England, on condition of never again bearing arms against the colonists.

The surrender of Burgoyne led France to join the Americans. From the beginning of the conflict the French sent men, money, and munitions of war to the insurgent States, and among the volunteers the name of the young and brave Marquis de Lafayette was the most distinguished. The entrance of France into the quarrel filled the British ministry with anxiety. Lord North saw that Chatham was the only man able to guide the country through the perils which threatened it, and he strongly urged the King to place the veteran statesman at the head of the Government; but George disliked the Earl for his independence, and turned a deaf ear to the advice of his minister. In Parliament many members, alarmed at the serious turn of affairs, implored the Government to acknowledge the independence of the colonies rather than engage in a war with France. To oppose a motion in favor of such a peace, the venerable Chatham left a sick bed to appear in Parliament. Though old, frail, and sick, he spoke with all his wonted fire and eloquence against the dismemberment of the Empire; and when he arose again to renew his attack upon the proposal, he fell in a fit upon the floor of the House of Lords. A month later the veteran statesman and foremost Englishman of the day expired, in his seventieth year. Meanwhile, Lord North had repealed the duty on tea, and had sent commissioners to America to treat with the colonists, but the concession came too late—independence only would satisfy them now. The campaign this year was not distinguished by any great operations. Howe was succeeded in the chief command by Sir Henry Clinton, who evacuated Philadelphia to fall back upon New York. In the latter part of the year, troops sent to Georgia quickly reduced that province. Nearer home, an engagement took place between the English and French fleets off Ushant, but from some misunderstanding between the English commanders, the battle was indecisive, and caused a great outcry in the country.

Our difficulties were increased in the next year by the entrance of Spain into the quarrel. Her part in the war chiefly consisted of an unsuccessful attempt to recover Gibraltar, which, under the able defense of General Elliot, endured a siege of three years (1779–1782). In America there were marches, skirmishes, sieges, and burnings; but no event of importance occurred. The sixth campaign was marked in America by the capture of Charleston by Clinton, and the desertion of the American general, Arnold, who betrayed to the British the fortress of West Point on the river Hudson. Major André, an English officer, who arranged the affair, was seized by some American militiamen and hanged as a spy. In Europe many troubles threatened England. At home, the Gordon riots distracted the Government, and abroad the northern powers took up a menacing attitude. Russia, Sweden, Denmark, and Holland

endeavored to make a profitable trade between the belligerents, and formed an armed neutrality to maintain by force of arms, if necessary, the principle that "free ships make free goods." Toward the close of the year Holland became so hostile that England declared war against her. The following year witnessed a disaster to our arms in America, which virtually terminated the war. Lord Cornwallis, who had almost reduced the Carolinas, was compelled to withdraw his forces to Yorktown, in Virginia. While waiting there for reinforcements from New York, a French fleet entered the Chesapeake, and Cornwallis, finding himself surrounded and in danger of starvation, surrendered his force of 7,000 men to Washington and Lafayette. This misfortune to the British arms decided the war; and, though the Government continued the struggle for another year, scarcely any military operations took place in America. On sea, indeed, the English fleets maintained their supremacy. * * *

Toward the close of the year, negotiations for peace were entered upon with the Americans, and in the following January the treaty of Versailles was concluded by the contending countries, excepting Holland, which made its own terms a few months later. By this treaty England acknowledged the independence of the United States, with the right of fishing on the coast of Newfoundland. To France we restored St. Lucia and Tobago, in the West Indies, and Chandanagore and Pondicherry in the East, and received in return Dominica, Grenada, and four other islands; at the same time, we were to give up our claim for the dismantling of Dunkirk. To Spain we ceded Minorca and the Floridas, and in return, our right to cut logwood in Honduras was guaranteed. To Holland we returned all our conquests excepting Negapatam. The expense of this war added £100,000,000 to the national debt.

[From England during the American and European Wars, 1765-1820. By O. W. Tancock, M. A. London. Longmans, Green & Co. 1894. 16°. pp. 102. Epochs of English History Series, edited by Rev. M. Creighton, M. A.]

England had much fighting to do in America, where she was beaten. She was fighting for a bad cause, and freedom and good government came from her defeat. While America gained very much, England lost little more than the lives and the money spent in the war. * * *

The plan of the ministry proposed to "grant duties in the colonies and plantations of America," stating "that it was just and necessary that a revenue should be raised there." In 1765 the stamp act was passed, requiring law papers in America to bear stamps, much as they do now in this country. This put forward the claim of Parliament to tax a country which sent no representatives to Parliament. Little attention was paid to the remonstrances of the colonies, and few thought that they would resist. * * *

Toward the end of 1774 it was plain that war was at hand. In England the King and his minister, Lord North, who did whatever the King wished, and had a large majority in the House of Commons, were set on harsh measures. A small body of the men who thought for themselves, and thought wisely, such as Chatham and Burke, were in favor of giving way to the colonists. The great trading towns were on the same side. But the Whigs, as these men were called, were not popular; Englishmen in general neither knew nor cared much about the feelings of the colonists. Public opinion on the whole was on the side of the King and the Government. * * *

From this time there was war between England and her American colonies. Ill feeling and even hatred soon grew up between the two peoples. The King was firm in the resolve to reduce "the rebels," and the mass of the English people agreed with him, though they did not care much. In America, while many colonists remained loyal, the help they gave was not great compared with the fierce resistance of the majority in almost every part. * * *

Congress met for its second session at Philadelphia in May, 1775, and the moderate party in it was weaker than before. Measures were taken for raising money, and a commander in chief was elected, George Washington, of Virginia. He had earned

some reputation in the former war, and had a well-deserved character for moderation, public spirit, and honor. It was very needful that the command in war should be given to one great soldier, for a danger which threatened the colonies was that local interests and jealousies should prevent them from holding together as one country, since each colony had been used to manage itself and had been quite independent of the rest. Congress as yet had no real power, and could not do much more than advise what was best. * * *

The colonies now began to listen more and more to the counsels of the extreme men; this was natural when war had once begun. So long as it was only talked about, however bitter the talk might be, there was hope that things might be quietly settled. But when once war had broken out, and Americans were glorying in feats of arms done against the English, the desire of settling matters grew faint and died away. The need of some form of independent government became pressing, and in June, 1776, on the motion of Richard Henry Lee, of Virginia, Congress agreed that "these united colonies are and ought to be free and independent States." * * *

In England the news of the surrender at Saratoga made even the ministers wish for peace. Unfortunately the same news made the French Government ready to enter into treaties of alliance and commerce with the United States (February, 1778). Lord North then passed a bill giving up altogether the claim of Parliament to tax the colonies, and was ready to do anything short of granting them independence. This was a time when the war might have ceased without dishonor to England. England was ready to own that she had been in the wrong. She was willing to grant all that Americans had claimed; freedom, with some slight tie to the mother country, or even independence, as Lord Rockingham thought, might have been conceded. But when France began to interfere in the war its meaning was changed. The honor of England seemed at stake; even those who had been against the war before, now thought that it must be carried on boldly. Thus Chatham, in the House of Lords, declared he would never consent to "an ignominious surrender of the rights of the Empire." "Shall we now," he said, "fall prostrate before the House of Bourbon?" And his death in May, 1778, put an end to the last hope of reconciliation with America. * * *

In 1780 men were made more bitter by a very unfortunate event. General Arnold, a man of mark, who had held important commands at Saratoga and at Philadelphia, was now at West Point, a fort dominating the upper part of the State of New York. This he treacherously offered to hand over to Sir Henry Clinton; the terms were to be arranged with Major André, aid-de-camp to the English general. He visited Arnold, and was taken prisoner on his way back in disguise, and with a pass given by Arnold. Arnold had time to escape to the English lines; André was treated as a spy. His plea of a safe-conduct from Arnold was not unfairly met by the reply that Arnold was a traitor, and a safe-conduct granted for a treacherous purpose was not valid. Washington was unyielding, and André was hanged. It was natural enough that the Americans should insist on making an example of him, but when they hanged him on the charge that he was a spy they were really revenging themselves on him for the treachery of Arnold, whom they could not reach. By the English, André was honored as a martyr to his zeal for king and country. * * *

The treaties were all signed at Versailles in September, 1783. Some men were loud in calling them disgraceful, but those who knew how hardly pressed England was, and how the increase of debt and waste of men were crushing her, saw that peace must be had, and that the terms were fair. England came with honor out of the war against these powerful European foes. She had met with disasters in a bad cause in America, but still her soldiers and sailors had done their duty well.

[From Longmans' 'Ship' Historical Readers. No. II. From the Discovery of America to date. London. Longmans, Green & Co. 1895. 12°. pp. 128.]

We have read about the Pilgrim Fathers and how they sailed away to America and founded a colony there. In the course of time the colonists grew rich and strong.

Their land was ruled over by the King of England. At last quarrels arose because King George III wanted to make them pay him money that they thought they ought not to pay. The King said they must pay him so much money as a tax upon all tea they used. The colonists thought he had no right to make them pay it. So they said that, rather than pay the tax, they would do without tea. Soon after this a ship laden with tea came into the harbor of Boston. The people said, "The tea shall be sent back to the place from which it came. We will pay no tax upon it." One man said, "The only way to get rid of the tea is to throw it overboard." So a number of men dressed themselves like Indians and rushing on board the ship they threw the tea into the sea. After this it was seen that, as neither side would give in, nothing but a war could end the quarrel. Then both sides got ready to fight. It was a sad sight to see men of the same race fighting against each other. The colonists chose a brave and good man named George Washington to be their leader. He did not want to fight against the King, but he loved freedom, and he thought that the King was treating the colonists unjustly. So he was willing to spend his money and his life in the good cause. The war lasted for about seven years. The French helped the colonists, and in the end the colonists won, and so they were free. Since that time they have had no king over them and they have become one of the greatests nations upon earth; for in the land that is now called the United States there are over 60,000,000 people, and the vast country that was at one time the home of bands of roving Indians is now peopled by English-speaking folks.

[From Jarrold's Empire Readers. Stories from English History for Standard III. By Mary Jacomb Wilkin. London. Jarrold & Sons. 16°. pp. 178. The Empire Educational Series.]

The United States of America were at that time English colonies. George III wanted the people there to pay very heavy taxes, but they refused. One was a tax or "duty" on tea. The Americans said they would rather go without tea than pay it. So when ships came bringing tea they threw it all overboard. For ten years the colonists and the Government quarreled about it, and then they went to war. George Washington was the American patriot who led their armies, and the English were defeated. On the 4th of July, 1776, the United States of America became an independent nation. William Pitt, Earl of Chatham, had done all he could to make George III and his Parliament see that it was not fair to tax the American colonists in order to pay for England's European wars. These wars had been of no use to them, and they wanted their money to defend themselves at home. If the King had been wise enough to follow Pitt's advice he would not have lost these colonies.

From Jarrold's Empire Readers. English History. Book III. William III to the present. London.] Jarrold & Sons. The Empire Educational Series.]

While these internal commotions were going on, our quarrels with the colonies in America began. They originated in a great measure with the King himself. With the patriotic intention of reducing the burdens of the people, he insisted on a portion of the taxes being thrown on the colonists. The ministry saw the danger of such a proceeding, but Mr. Grenville, who in 1764 was at the head of affairs, was intimidated into agreement by a threat of the loss of his office, and consented to carry measures of which he disapproved. He first interfered with the paper currency of the colonies by an act preventing colonial bills from being considered a legal tender, and finally attempted to raise a revenue from stamps. This created a ferment in the free legislatures of the different colonies, whose members saw that if the principle were admitted England might impoverish them by taxes to any amount without sharing the burden herself. The attempt was temporarily withdrawn when the results were seen; but in this, as in other instances,

The attempt and not the deed confounds us.

All the ill feeling remained, though the cause was apparently removed. The stubbornness of the King acted, however, on the pliancy of his ministers; the national

spirit became high on our side as well as on the colonists', and it was resolved to carry the supremacy of Parliament with a high hand.

In spite of the energy of Pitt in resisting the measure, and the warnings of other statesmen who foresaw the lamentable consequences of perseverance, the act for imposing stamp duties in the American provinces was carried on March 22, 1765, and opposition at once began. The colonists passed resolutions to abstain from all articles on which a tax was levied, and commerce rapidly felt the effects of a diminished consumption. Scarcity also existed at this time at home, and frequent riots took place in consequence of the decline of manufactures. The King vented his dissatisfaction on his ministers and dismissed them; but who would consent to be their successors under circumstances of such public suffering and court intrigue? Pitt and others declined the task, unless under such conditions as the King and his secret advisers could not agree to. He was therefore forced to throw himself back on the old Whig party under the leadership of the Marquis of Rockingham. The principal service rendered to his country by this nobleman was that of introducing into public life, as his secretary, the celebrated Edmund Burke, a man whose political wisdom and literary powers receive a high appreciation from each new generation, which benefits by the study of his works. But eloquence as great and more effective than Burke's was at work on the other side of the Atlantic, and roused a spirit of resistance which no efforts at conciliation could have allayed. Patrick Henry, an orator of the loftiest order, brought forward resolutions against the stamp act in the assembly of Virginia, which were instantly adopted by all the legislatures in America. Rival manufactures to those of England were established in the towns, and propositions even entertained against the exportation of tobacco, from which so much British revenue was derived. A pause in these proceedings was expected in the following year, when the stamp act, amidst the fiery denunciations of Pitt against its injustice, was finally repealed, and other measures taken for the restoration of harmony between the countries.

The harmony was short-lived. The repeal of the stamp act offended the King, and gave a handle to the demagogues of America to rail against the weakness of the Parliament which had yielded to fear what it denied to justice. The calm wisdom of the great Washington was disregarded or unknown, and his satisfaction with the settlement of the quarrel was of no avail. Open enmity was merely exchanged for secret grudging, and both sides were ready for a renewal of the dispute. The Court considered the victory gained when it obtained the services of Pitt; but the arrogance of the great statesman neutralized the noble qualities he possessed. He offended the members of his party even in the act of calling them into power; he forfeited the confidence of the people by wearing the state livery of an earldom, and soon showed how powerless Lord Chatham was to control the rebellious spirits which had yielded to Mr. Pitt. Disgusted, after a time, with the disobedience of his subordinates, the envy of his rivals, the coolness of his friends, and the loss of his property, the haughty minister kept aloof from public business altogether, and gave way to fits of temper, which he dignified with the name of bad health. He retained his office of privy seal, though the principal place in the administration was filled by the Duke of Grafton. The object of the King was gained—the opposition of the great orator was no longer to be feared, and vigorous measures were resolved on to reduce the Americans to submission. Chatham, foreseeing the increased unpopularity of the ministry, seized a favorable moment for resigning the privy seal, and tried to recover the favor of the public by destroying an administration which he had not been able to support. Freed from the trammels of office, he waited in grim repose for an opportunity of once more showing his transcendent power and trampling on his enemies. Strong opposition was made in Parliament to the attempt at coercing the colonies and extending taxation where representation did not exist; but all opposition was disregarded. Boston, which had been most active in resisting the excise, was garrisoned by troops and blockaded by ships.

Associations were instantly entered into by the other colonies for the defense of their liberties, and the citizens, as early as 1769, were recommended to provide themselves with arms on the transparent pretense of a probable rupture with France—while meetings of infurated colonists were held at Boston, dinners of no less furious enemies of the ministry took place in London. There was a sympathy between the supporters of Wilkes in his prosecution for a libel, and the defenders of the Americans in their resistance to arbitrary power. The cry of "Wilkes and liberty" comprehended the "patriots" on both sides of the Atlantic. Riots broke out in the capital; Ireland became disturbed; the King unbendingly pursued the path he had once taken; Chatham gloomed in ominous silence from his retreat in Hayes; and the anonymous slanderer and experienced politician, who is still known to us only as Junius, attacked the ministry and the King himself with great bitterness and force. These concurrent causes and the renewal in 1770 of Chatham's attendance in Parliament as leader of the hostile phalanx, drove the Duke of Grafton from power, and his place was supplied by Lord North. But the half measures of this minister did not satisfy the wishes of the King. His temper was roused by the struggle, and the battle became fiercer than ever. Chatham directly accused him of personal duplicity and a design to destroy the liberties of the people and the independence of Parliament by bribes. His words were taken down but no proceedings followed. Public meetings were called; the Lord Mayor of London lectured the King when admitted to deliver an address, and the ministry relied all this time on their Parliamentary majority and the orderly habits of the English people. The orderly habits, however, of the American colonists broke down under fresh provocation; lives were lost at Boston in a struggle with the soldiers, and the incident was represented in the newspapers as a deliberate massacre. Passions were roused to such an extent on both sides that it was impossible to prevent an appeal to arms, but when the King's forces were attacked, and the colonists stood in open array against the mother country, the feeling in England began to change. The sympathy which had been so powerful in favor of an oppressed people was turned into animosity against impracticable rebels. Chatham himself defended them no more. Yet there still remained thousands, perhaps millions, in this country who viewed with greater apprehension the success of the King than those of the colonists. Lord Chatham's words were not forgotten, "that three millions of men, unable to defend their freedom, were the fittest instruments to destroy the liberties of the rest" After the display of great bravery on both sides, and consummate skill on the part of the Americans—after alternations of conquest and defeat—the ever advancing tide of resistance to British rule spread over the whole country; the genius of Washington and the wisdom of Franklin guided the strong wills of the resisting millions, and France, in an evil hour for her reigning dynasty, having joined in the fray, even the obstinacy of George was overcome, and the independence of the United States was formally acknowledged, 1783.

[From An Easy History of England. Standards VI and VII. By S. R. Gardiner. London: Longmans, Green & Co. 1891. 12°. pp. 259. Deals more especially with political history.]

Grenville was not a wise man, and he thought that he could make the Americans bear part of the expenses of the last war. He accordingly persuaded the British Parliament to pass a stamp act ordering the Americans to pay money for stamps to be placed on their law papers. The Americans were angry, and said that the British Parliament had no right to tax them. Before it was known in England how angry they were, George III had succeeded in turning Grenville out of office, but he had been obliged to replace him by another Whig, Lord Rockingham. The Whigs, led by Rockingham, were never popular. They would not bribe, and all who wanted to receive bribes took part against him. They offended others, because most of them were wealthy noblemen and gentlemen who did not mix with the people. Rockingham himself was a well-meaning, timid man. The best thing we know of him was that he listened respectfully to Edmund Burke, who was neither

rich himself nor related to rich men, but who was the wisest man in England. By the advice of Burke, Rockingham asked Parliament to repeal the stamp act. As soon as the British Parliament left off taxing the Americans the Americans became once more quiet and loyal.

Before long the King turned out Rockingham. He created Pitt Earl of Chatham and made him prime minister. Chatham might have done great things if he had retained his health, but he became so ill that he was unable to attend to business, and the other ministers were foolish enough to try and get money from the Americans again. This time they imposed duties on the import of tea and other articles at the American ports.

The fact was that the House of Commons only thought of making people do as it pleased, just as Charles I had done more than a hundred years before. At home the Middlesex electors chose a man named Wilkes as their member of Parliament. His character was very bad, and on the ground that he had misbehaved himself the House of Commons not only expelled him, but when the electors again and again persisted in choosing him declared that another candidate who had received only a few votes was to sit in the House as member for Middlesex. Soon afterwards Chatham recovered his health, and declared in the House of Lords that the House of Commons had no right to set aside the votes of the electors of Middlesex, and that Parliament had no right to tax America.

The King would not listen to Chatham's advice. He made Lord North prime minister. Lord North was a Tory. The Tories thought that the King and not the Whig noblemen ought to choose the ministers. Lord North was a sensible man, but he allowed himself to be persuaded to do whatever George III told him to do. He was very fat, and used to go to sleep in the House of Commons whilst the members were abusing him. The House supported him, partly because many of its members were bribed in various ways, but still more because the Whigs were disliked and because most Englishmen thought it quite right that the Americans should pay their share of the expenses of a war which had been fought to save them from being injured by the French in Canada.

The Americans made up their minds to pay no taxes to the British Government. Rather than pay duty on tea a troop of 40 or 50 men disguised as red Indians rushed on board a ship laden with tea, which had arrived at Boston, and threw the whole cargo into the sea. The British Parliament passed laws to put down all resistance, and sent soldiers to America to enforce them. The Americans prepared to resist. In 1775 fighting began. The English people thought it would soon be over, as they were many and the Americans were few. Their soldiers were well disciplined, and the Americans had no regular soldiers at all. The Americans, however, were fighting for their own land, whilst every British soldier had to be conveyed across the sea. The Americans, too, found George Washington not only a splendid general, but, what was better, a man who set an example of patience and self-denial, and who was entirely without ambition.

The Americans had not been fighting long when they issued a Declaration of Independence, asserting their right to be a free nation, no longer in subjection to British rule. At first it seemed doubtful whether they would be able to make good their words. Their army was almost starved to death. The horses died for want of forage, and for six days the men had no meat. There was scarcely a pair of shoes in the whole camp.

When people show that they can defend themselves they often get help from others. This time it was France which came forward to assist the Americans. Lord North was frightened, but Chatham, old and ill as he was, came to the House of Lords to protest against acknowledging the independence of America. He had been wise enough to oppose the folly of those who had attempted to make the Americans pay taxes, but he was too proud of the greatness of England to consent to the separation of America from the mother country. "As long," he said, "as I

can crawl down to this House and have strength to raise myself on my crutches or lift my hand, I will vote against giving up the dependency of America or the sovereignty of Great Britain." Chatham tried to speak again, but he staggered and fell, struck down by apoplexy. After a few days he died.

If Chatham had lived he could not have brought America back into subjection. Fighting went on, and Spain joined the enemies of England. At last an English army under Lord Cornwallis was shut up in Yorktown. The Americans hemmed it in on the land side, and a French fleet blocked it up by sea. Cornwallis was forced to surrender. Lord North knew that it was impossible to struggle longer, and though George III wished to continue the war, Lord North resigned office, and Rockingham became prime minister a second time.

Lord Rockingham at once opened negotiations with France and America. Before they were completed he died, and the King named Lord Shelburne as his successor. Shelburne went on with the arrangements for peace, though the treaty was not signed till after he had left office. In 1783 peace was made with France, and the independence of America was acknowledged by Great Britain. Both then and since many have looked back with regret to the day which put an end to the hope that all English-speaking peoples might continue united under the same government. Yet there can be no doubt that England had received a lesson which she well deserved. The members of the House of Commons had got into a habit of thinking that they could do whatever suited them, without taking into account the wishes of others. The resistance of America had taught them the lesson that, powerful as the English Government was, it could not do as it pleased. From that time there was more consideration for the wishes of the governed in England itself than there had been before.

[The account given of these events in Gardiner's Illustrated English History, Part III, 1689–1886 (London: Longmans, Green & Co., 1896, English History Reading Books series), is practically the same as the above.]

[From Longmans' 'Ship' Historical Readers. No. VII. London. Longmans, Green & Co. 1894. 12°. pp. 240. Devoted to the Hanoverian period.]

The British colonies were divided into two classes, one in which the bulk of the population was not of British race, and the other in which it was. The first of these classes comprised the Indian possessions, where the native population far outnumbered the British; the West Indies, in which the negroes were most numerous; Canada, where the French vastly predominated, and such outlying posts as Gibraltar. In the second class were the old American colonies, where there were only a few persons not descended from British ancestors. Those of the first class were more properly called possessions, those of the second, colonies. For the present, at least, it was easy to govern the possessions. It would be more difficult to govern the colonies, because the men of British race who lived in them had been in the habit of managing their own affairs, and would resent any interference with them. In England, on the other hand, people discovered that the war had cost much money and that taxes had to be raised to pay the interest of the money which had been borrowed to carry it on. In 1765 George Grenville, who was then prime minister, thought that the American colonists ought to pay part of the expenses caused by the late war, because they had been benefited by the removal of all danger of French attacks from Canada. He easily persuaded Parliament to pass a stamp act ordering the Americans to pay money for stamps on their law papers. The Americans were very angry, and declared that an English Parliament had no right to tax them. Before their complaints reached England there was a new prime minister, Lord Rockingham, and at his proposal the stamp act was repealed in 1766. As soon as Parliament gave up its attempt to tax America, the colonists became quiet and loyal.

George III did not like the Rockingham ministry because he wanted to choose his own ministers, and Rockingham, who was the leader of the Whigs, wanted ministers to be chosen who suited the great landowners. George therefore turned out Rockingham and made Pitt prime minister, having created him Earl of Chatham. Chatham did all he could to conciliate the Americans, but he fell ill, and in 1767 the other ministers persuaded Parliament to tax the Americans again by placing duties on tea and other articles imported into their country. George III was in favor of this, and as in 1770 he succeeded in appointing a prime minister of his own choosing—Lord North—there was no longer any chance that the British Parliament would abandon its claim to tax Americans. In 1773 a shipload of tea which had paid duty to the King was sent to Boston. The inhabitants, rather than pay the duty, split open the tea chests and poured their contents into the harbor. When this was known in England the King and his ministers were angry. In Parliament the majority, now composed of Tories or supporters of the King, was also angry, and a law was passed forbidding ships to take or unload cargo at Boston, and another law providing that the colony of Massachusetts, the colony in which Boston was, should be governed, not by its own people, but by persons nominated by the King. Soldiers were sent out to enforce the orders of the British Parliament.

The Americans prepared to resist. They elected a Congress in which men chosen by the different colonies might meet to decide what should be done. In 1775 fighting began. The first serious conflict was that which is usually known as the battle of Bunker Hill. The Americans were posted on the top. Twice the British forces, attempting to ascend, were driven back. The third time the Americans, having fired away all their shot, retreated. In spite of the bravery shown by the Americans the British felt sure of overpowering them. In 1776 the Americans issued a Declaration of Independence, asserting themselves to be a free nation. As the war went on each side gained advantages in turn. The Americans were led by a great man, George Washington. Not only was he a good general, but he was patient and modest, regardless of himself, and ready to endure anything rather than injure his country Yet, after two years of war, the American army was almost starved to death. The horses died for want of forage, and for six days the men had no meat.

In 1778 the Americans were saved by an alliance with France. France was now far stronger than she had been in the seven years' war, because she had now no quarrel with any of the nations on the Continent and could therefore devote her whole strength to her navy. The French fleet was superior to the British, and in 1781 was able to blockade the British army under Cornwallis at Yorktown on the side of the sea, while the American army blockaded it by land. Cornwallis surrendered. When the news reached England in 1782, Lord North resigned and Rockingham again became prime minister and prepared to make peace. Spain had now joined France, but before peace was made the British Admiral Rodney gained a victory over the French fleet, and a large French and Spanish fleet which was trying to take Gibraltar had to give up its task in despair. In 1783 peace was signed and the independence of America acknowledged.

[From the History of England from the Accession of George III to the Present Time, adapted to Standards VI and VII, by the Rev. D. Morris, B. A. London. Wm. Isbister. 1883. 16°. Pages 298.]

During the above war the English prime minister, George Grenville, announced his intention of raising a revenue in America for the partial support of the intended army by enacting a stamp act, by which all bonds, leases, newspapers, legal documents, etc., should be issued on stamped paper, varying in value from a half-penny to £10. He delayed the bill for a year, in order to give the colonists time to express their opinions upon the subject. The latter discussed the project in their provincial assemblies, and denied the right of Parliament to tax them, inasmuch as they were not represented in the House of Commons. They did not want a standing army, they said, and they would not contribute to its maintenance in any form. In New

England the right of Parliament to make laws for America was loudly denied, and active resistance was openly advocated. The stamp act became a law in 1765. The news was received everywhere in America with an outburst of indignation, and, in Boston particularly, with much rioting. The merchants of the chief towns combined to purchase no more English goods until the obnoxious act was repealed. No stamp distributer dared exercise his office, or say that he had stamps in his possession, for the mob seized all that they could find and burnt them. It was found impossible to put the act in force, and while resistance lasted trade was at a standstill.

In the meantime a change of ministry occurred in England. The stamp act was reconsidered and repealed a year after its enactment, but at the same time a declaratory act was passed asserting the right of Parliament to tax the colonies. The news of the repeal of the former measure was received in America with much rejoicing, but the triumph of the colonies had the effect of encouraging the more violent of the agitators in America to further resistance against the supremacy of Parliament. French agents soon appeared on the scene to fan by intrigues the spirit of opposition. Boston and New York refused to supply the British troops with provisions and barracks in accordance with the act of Parliament. Conduct of this kind produced much irritation in England, and led the ministry to take steps to strengthen its authority in America by making the governors and judges in the various States less dependent upon the people. To accomplish this it was decided in 1767 to raise a revenue in America to pay the salaries of the governors and judges. The annual sum required scarcely amounted to £40,000. In order to obtain this amount, a duty was laid upon glass, red and white lead, painters' colors, paper, and tea imported into the colonies. Such imposts were in accordance with the acknowledged rights of Parliament to regulate trade but the colonists now resented this measure as bitterly as they did the stamp act. They strongly objected to have their governors and judges made independent of the assemblies by receiving salaries from a fund over which they could have no control. Under the belief that their liberties were at stake, the various assemblies agreed to abstain from the use of English manufactures, and especially from the articles upon which duties were levied. Opposition was most fierce in New England, especially in Massachusetts. So riotous were the mobs in the seaport towns, and so openly defiant of the trade laws, that troops and warships were sent to overawe Boston, which was the center of resistance. The arrival of a military and naval force supplied another cause of grievance and increased the spirit of opposition. A collision took place one night between a mob of boys and men and a small military patrol. The latter discharged their firearms into the crowd, killing three men and wounding several others. This "massacre," as it was called, created the utmost excitement throughout the colonies and furnished skillful agitators with a powerful weapon against England. Indeed this affray had much to do in bringing about the American Revolution. * * *

Meetings were held in every important place to protest against the action of the British Government, and it was decided to hold a congress of delegates from all the States at Philadelphia to discuss their relations with the mother country. This important meeting, or "Continental Congress" as it was called, took place in September, 1774. All the States, excepting Georgia, were represented. Among the delegates were George Washington, Patrick Henry, and Samuel Adams—all famous names in the story of American Independence. The Congress approved the conduct of the people of Boston, drew up a declaration of rights, moved addresses to the King and people of Great Britain, and finally resolved to hold no commercial intercourse with the mother country until their grievances were removed. No mention was made of separation, or any desire expressed for independence. The King and his advisers, with the support of a large majority in Parliament, refused to make any concession to the colonists. In vain the great Earl of Chatham in the House of Lords, and other statesmen in the Commons, pleaded for conciliation. The Government

was determined to enforce obedience. * * * The Congress appointed George Washington, a Virginia gentleman, as the commander in chief of the American army. Washington had commanded the Virginia militia with great success in the wars against the French, and had attained to the rank of colonel. The success of the American Revolution was mainly due to his appointment to the chief command. Only a man of his skill, firmness, patience, and judgment could overcome the jealousies of the various States, the want of discipline of the soldiers, the lack of money and stores, all of which, on several occasions, threatened the collapse of the revolt. He was always hopeful in the greatest difficulties, and cautious in every undertaking. He was known, besides, as a man of the highest integrity, whose truth and honor were never called in question. * * *

The year 1780 was marked by greater military activity in America. In the spring months General Clinton landed in the neighborhood of Charleston with an army from New York, of which a great number were American loyalists. His object was the subjugation of the Southern States. Charleston was obliged to capitulate. The surrender of its garrison, ships, cannon, and well-stored magazines was a deadly blow to the Revolution in that quarter. Clinton then returned to New York with a large part of his army, leaving Lord Cornwallis to continue the war in the South. The American forces, attempting to check the progress of Cornwallis, were almost annihilated in two engagements, but by a system of guerrilla warfare they prevented the British from conquering North Carolina. The subjugation of South Carolina and Georgia was, however, complete. The Americans, at this time, were in a deplorable state. Money and stores were sadly wanting, and the troops were discontented and rebellious. The desire for peace was general. The continuance of the war entirely depended upon foreign aid, and the most ardent in the Revolutionary cause knew that they would never achieve success unless the supremacy of England at sea could be overcome. The latter country had this year reasserted its claim to be mistress of the seas, for both in America and in Europe she kept the fleets of France under blockade. The gloomy prospects of the Revolution, together with personal grievances, determined the American general, Benedict Arnold, to betray his countrymen. He was in command of the fortress of West Point, on the river Hudson, which was considered to be the key of the American position. This, as well as the army of occupation, he resolved to place in the hands of General Clinton. Negotiations for this purpose were carried on through Major André, a young British officer high in command and of great promise. Having completed all arrangements, André set out on foot from West Point to return to New York, and fell into the hands of some American militia. The treasonable papers were found upon him, and he was arrested, condemned, and hanged as a spy. Arnold fled as soon as he heard of the arrest. He afterwards served in the war as a general in the British army. * * * Loud complaints were made by the opponents of peace about the treatment of the American loyalists, or Tories, as they were called, who had taken service under the Crown, or aided its cause in any way. So bitter was the feeling against them, that 100,000 found it necessary to seek new homes in British territory, chiefly in Nova Scotia and New Brunswick. England allowed half-pay to those who had served as officers in the army, and also pensioned many others in compensation for their losses. The results of the war, after all, were less injurious to England than to her European adversaries. Though her national debt was largely increased, and her Empire shorn of the American colonies, she made rapid progress in trade, manufactures, and general improvement. Very different was the fortune of France.

CHAPTER XLV.

THE PROTECTION OF ITALIAN EMIGRANTS IN AMERICA.

By Luigi Bodio.

One of the most important questions treated at the Geographic Congress in Rome, in September last, was that of the care and protection of emigrants. The resolutions adopted at the Geneva Congress of 1892 were (in substance) that colonization laws should include a small plot of land for the emigrant so that he might, as cultivator, be assigned to proprietorship. The Italian Government should have an office of information so as to keep in touch with the colonization going on in foreign countries, as well as with the actual conditions of the colonists; that, in addition to private associations interested in emigration, a public association should act in concurrence with emigration agents, so as to give aid to the emigrant and help him to acquire land; that the emigration laws of 1888 should be modified as regards agents, subagents, guaranties, etc.

The Congress (of Rome?) recommended that the military laws be made less stringent for Italians living in foreign countries, without, however, interfering with the principle of obligatory military service.

Now, it may be stated that, in the last few years, emigration has been diminishing in intensity, not alone from Italy but from all Europe. The Italian emigrants to the United States numbered about 70,000 in 1893 and only 39,000 in 1894. Emigration to Brazil oscillates, too, from year to year, namely, 40,000 Italians in 1887, 104,000 in 1888; 36,000 in the succeeding years; in 1891, 183,000; with a drop to 43,000 in 1894. In the Argentine Republic the Italian immigration was 75,000 in 1888, and 88,000 in 1889; then in successive years 39,000 and 15,511 in 1891, with a later increase to 37,000.

As the social and economic conditions of the countries furnishing the emigrants can not suffer such mutations from year to year, it is evident that these variations depend upon the prosperity and crises in the countries where colonies are established, hence efforts should be made to protect the emigrants from the obstacles which they encounter. Emigration is a necessity for our country [Italy], and we ought to wish that in the present agricultural and industrial conditions, with so little capital to dispose of, thousands more may go forth where they may find work.

The density of population is 107 to the square kilometer in Italy, the average in Germany is 97, in Austria 80, in France 72. France has abundance of capital, land cultivated to the highest degree, conditions of ease and competency in rural districts, and a third less population than in Italy, where the conditions are so different, the poor peasantry and workingmen having become a peril to the social equilibrium. So that emigration becomes an aid to those who are left, as, with the capital in hand, they can more advantageously carry on manufactures and develop agriculture.

Discussions of the colonization of Eritrea (Italian possession in Africa) are very earnest, and the Hon. Franchetti, who has studied the subject on the spot, states that at least 4,000 lire ($772) capital, to be provided by the Government, is requisite

for a family of seven persons, in order to construct cabins, to obtain proper implements, to develop their lands, to survey the land, to prepare waterworks, etc.

There is also discussion in regard to colonizing Sardinia and of populating the Campagna (di popolare l'Agro romano), but this, too, requires capital, and there are various obstacles, which, especially on the island of Sardinia, complicate matters. [Here follow laws governing taxation, etc., in Sardinia; objections to home colonization, want of capital for waterworks, and proper sanitation.] But in America our emigrants do not require subsidies from the mother country; they are, to be sure, at a disadvantage the first year, owing in part, to want of organization; but they carry with them a little money, a few tools of trade, and do not leave debts behind.

Our duty is to protect and patronize voluntary emigration—the only form of it which bears with it latent energy, the force of initiative, and the resistence to whatever bars the emigrant's road to success in a new country, or in his native country. Our duty is to aid the masses in procuring employment suited to their condition, to prevent interested agents taking advantage of their good faith, to overcome the obstacles, to seek openings for them, to bring the emigrants into the neighborhood of agricultural and mining sections, dockyards, etc., as may be suited to their previous training or condition in life.

The agents for emigration number 34 in Italy; warranty, 2,690,000 lire ($519,170); subagents, 5,172 in 1892, increased to 7,169 to date. They have more than doubled in some provinces within a few years.

In Switzerland the laws restrict the number of subagents; once there were about 400, paid according to the number of emigrants received, so that there developed a kind of propaganda. A law of 1888, modifying that of 1880, imposed a bond of 3,000 lire ($660) and a tax of 30 lire ($5.79). As a result, the subagents decreased to 170. Swiss laws now prevent propaganda, or enforced emigration, as the consent of the federal council is required before closing a contract with any person having to do with the emigrant, to which person money may be paid for the journey by societies, foreign governments, or private corporations of other countries. Our [Italian] laws do not forbid the emigrants going away if the money has been paid down by government or a colonization society, but if the amount has been exacted from the emigrant the agent is to see that the emigrant receives double that amount. In any case, the regulations are nil which require the emigrant to work his passage either on ship or other means of transport. Some of our emigrants are given free passage by the authorities of Brazil, who desire peasants with families in good, healthy condition and capable of taking hold of some class of work. The governmental arrangements are made with banking firms, who take the responsibility of forwarding the emigrant from a European port to a Brazilian port.

[Signor Bodio then goes on to state the methods employed in Switzerland and in Italy to prevent the taking advantage of emigrants, and the punishment awarded to agents, subagents, etc.]

New laws are being made restricting subagents, getting a better class of educated persons in such positions; forbidding innkeepers, liquor dealers, railroad agents, etc., to be subagents. Experience has taught that interested persons are not proper subagents, if the emigrant is to be dealt justly with. In place of closing the contract just as the emigrant embarks, this is to be done (when the laws go into force) at the point of starting out, so that there may be time to see that all regulations are adhered to. No minors are to be allowed to go as emigrants unless an older person is responsible for them at the beginning and close of the journey. If the committee stationed at a place of embarkation refuse to take the emigrant, the agent is to see that he be returned to his home and his goods with him, and that he receive whatever sum he [the emigrant] may have paid out. To date, the public charities have taken such matter in hand. If the emigrant has reached the foreign land, the agent is responsible for his return, if refused admittance by the authorities, because the laws governing emigration are known to him. If the emigrant finds that he is

not being properly treated, he may reclaim his rights from the consul, or from the director of the Italian Aid Society, who is to present such claim to the nearest consular agent. Verbal statements are permissible to consuls, immigrant agents, etc., in the foreign countries, and as a last resort, in case of punishment, the minister of the interior may be appealed to. [These and other regulations are described to prevent the agent tyrannizing over the emigrant.]

As for military regulations: The recruit living in a foreign country submits to the physical examination by a physician before the Italian consul. If received he is sent to Italy, free of expense, on a ship of the Italian Navigation Company. If, for family reasons, health, or study, he desires to go to his country for a three months' period, he can do it with the permission of the consul and of his commandant. The old controversy relative to double nationality should be eliminated in future. The best solution seems to be that which holds between Spain and Argentina. When the person claims to be of one or the other nationality, the matter is to be decided in accordance with the laws where resident. If this seems hardly to agree with the principle jure sanguinis, established by the Italian and other European codes based on Roman law, it is the principle of the nationality jure loci, which—we can not fail to recognize it—is an outcome of the political conditions in the young American States. Thus, if he be born in Argentina of an Italian father, he would be considered an Argentinian as long as he remains in America; should he come to live in Italy he would be considered an Italian.

Now let us see what protection is given to our emigrants arriving in American ports. The minister of foreign affairs, Baron Blanc, has succeeded in obtaining an important concession from the Government of the United States, and has created an office of inspection and protection of Italians at Ellis Island, where emigrants disembark for New York. It is a noticeable fact that even prior to the industrial and commercial crises, a feeling prejudicial to immigration was found among the people, on account of cheap labor, for European workingmen were willing to receive salaries inferior to those of American laborers. Hence American legislation endeavored to limit immigration. The limitation included sick people, paupers, those engaged for contract labor. The majority of those sent back by the Federal immigration agents at Ellis Island are Italians who, poorer than other nationalities, have made contracts to go to work, and state that at once, as they suppose they will be quickly received in America if they are not liable to become objects of charity. Yet they are inexorably repulsed because of the very laws of limitation (contract laws). The American officials frequently turn back our emigrants who have left wife and family in Italy, under the clause of "undesirable immigration," because they [the Italians] make declaration that they have been in America before without naturalizing themselves, and that they do not intend to become citizens; or else it resolves itself into the fact that they have made their money in America and returned to their home, then they come back to the United States again to repeat their former success. The United States welcomes emigrants who may become a permanency and assimilate themselves with the American people, who desire to take part in its political life, learn the language of the country, settle down and have families, the children of which (by aspiration and character) become Americans. But "birds of passage" they do not welcome. It is not so much the quantity as the quality of the immigrant which the United States authorities desire to control, for the nonassimilating elements among emigrants are not in harmony with the social and political conditions of the Republic. In 1894–95 there were 731 Italian emigrants sent back out of 33,902 who reached Ellis Island. The economic condition of our emigrants to the United States is demonstrated by the inquiries made by the American authorities, for the newly arrived individual is asked to show how much money he has. The 33,902 who disembarked at Ellis Island had $362,000, or $10.23 each; included among them were those sent back as paupers and undesirable immigrants. In 1893–94 similar statements hold good. Our minister of foreign affairs interested himself to

protect the emigrants in America and to disarm that prejudice toward our compatriots. And this is in fact the basis of the most loyal cooperation, the effort to suppress enforced emigration, either from within or without. In June, 1894, an American office was opened at Ellis Island in connection with the Federal office of immigration, in which office such information could be obtained as is furnished by State boards of immigration, by railroad lines, by corporations and individuals, inducements for work, etc. The Secretary of the Treasury permitted our ambassador to suggest one or more Italian agents for that office who could give the necessary information and make the needed suggestions to our emigrants. Prof. Alex. Oldrini, a young cultured Italian familiar with the United States from a residence there of ten years, was made the first agent, and Chevalier Egisto Rossi, who wrote a work on the United States of America, was made the second agent.

It is to be hoped that the Italian Government will now do its part by furnishing these agents with whatever is requisite, so that they may be able to aid the emigrants in finding occupations, obtaining lands, etc. The Italian Government has, to date, the expenditure of $500 a month for the two commissioners and their office, but the work of these agents ought not to limit itself to assisting the Italian emigrants in connection with the American office, if that office believes it necessary to send them back on account of one or another law, but the Italian agents should be situated to aid the emigrant in obtaining another hearing so that he may disembark and continue his trip to some other State.

It is not enough that our agents aid the emigrants against unfair treatment, on shipboard or shore, but they should be able to give them information concerning the States where they are best able to obtain work, to settle as agriculturists or in mining districts rather than to remain in New York, where their condition is deplorable. Means are lacking so far to bring the Italian agency in New York to this point of efficiency. For it is necessary that the agents be so situated that they can travel to other parts of the States, so as to determine for themselves as regards climatic conditions, the agrarian conditions, violability of contracts, etc. Of the 34,000 Italian emigrants who arrived in the United States in 1894–95 about 20,000 passed the office of our commissioner (Oldrini) direct for New York and its environs, and about 14,000 were forwarded to other States, where they had families, or to mining districts, etc. It is deemed advisable to aid them to go to the Central States, to the mines of Colorado, to Michigan, Minnesota, to Texas ranches, or to the fruit-growing regions of California. A sum of $10,000 is required to place the Italian emigration office in New York upon a suitable footing, to institute a labor bureau, such as is found at the barge office for Germans and Irish, so that the emigrants will not have to deal with the bosses (or padroni), as is now the case, but will find that they can obtain all information at this bureau, or colonization office. With such a sum at disposal, there might be a savings bank, or bank of deposit, arranged with such securities that the emigrants would not again see the bankers disappear with about $150,000 of their savings, as was done one year. Where are we to find the $10,000 requisite for such purpose? In the green book (libro verde) published by the minister of foreign affairs, in which are found the regulations which led to the establishment of the Italian emigration office at Ellis Island, there is a suggestion which seems opportune. It is suggested that 20 lire ($3.86) be required by the Government, from the agency, for each emigrant. As there were in these last years between 33,000 and 65,000 such persons, this amount would be soon acquired. The minister who foresaw the need of protection for the Italian emigrants in the United States also saw the need of such protection in other countries. In Argentina the Italian is as in his own home. In Brazil there is need of such an office of control, for of the Italians going to Brazil it is necessary to distinguish between the State colonies and those of private enterprise. Many Italians are well placed in Brazil, others have to undergo many hardships ere they obtain tolerable positions. The organization of these colonization enterprises needs modifying, for oftentimes the promises held out are not lived up to.

Monopolies, depreciation of money, exorbitant prices, are among the obstacles to contend with. If a few commissioners, or regularly established governmental agents, were connected possibly with the legations in the different countries, they would be useful to the colonists in many cases, and would render abuses impossible, etc. It will be a fortunate day for Italians going to Brazil when authorized agents are there to aid them at embarkation and on their farther trips inland. It is to be hoped that public opinion in Italy will become more favorable to emigration. The outcome of this will be that the proprietor, in order to obtain help, will pay better wages, and emigration will not be synonymous with untold misery at home.

We may look upon emigration as a step in advance toward the bettering and equalizing of conditions. Rather than solicit the return of the emigrant to his native land, rather than regret that emigration transforms itself from temporary to permanent, we should rejoice that the quality of emigration is improved, the arrangements become more stable, the families are reunited, the mother country influence is strengthened.

Emigration is a good thing for the mother country—we utter this sentiment earnestly. It is the safety valve, or security, against envy and class odium, an efficacious instrument in the equalization of human forces. And for Italy, as for all peoples who are late in entering upon new conditions, emigration is a school for the civilizing processes along scientific lines and in adopting new methods. Thus it is the duty of those who have already entered upon the new phases of civilization to assure vigorous protection to the advance guard, composed in part of youthful blood. Protection, material aid, and guidance should be offered to the emigrant. And I salute with great pleasure that part of our emigration which is going to settle in the midst of a people, superior through their methods, perseverance, and economic power, in the very heart of the dominant people of to-day—the Anglo-Saxon race.

This race is the dominating one to-day, because it is educated to a spirit of reform, which opposes the resigning of one's rights, the frittering away of individual energy, opposes apathy toward work, etc.

It is necessary to take the world as it is, and it should be repeated in the chief towns of communes that the emigrant is the best exponent of his country's needs (the best drummer for his own country), and that after him come the experts sent out from the manufactory, the authors, the diplomatists, and lastly the defense by means of the army.

INTRODUCTION.

When the battle of Koenigrätz was fought, ending with a decisive victory for the Prussians over the Austrians, Prince Bismarck spoke those winged words: "The schoolmaster has conquered." Indeed, that famous battle was an excellent illustration of the great power of education, and the Prussian schoolmaster has shown that his pen could penetrate deeper than the shot and shell of the Austrians. Even the ancients knew of the great influence of education, and Jewish history has recorded a fact which is equal to that of Koenigrätz. "Jerusalem," says the Talmud, "was besieged by the Romans, and the once powerful Hebrew nation was crushed to death by the legions of the pagans. While Vespasian besieged the City of the Lord, wherein civil war and starvation killed more people than the arrows of the Roman archers, an humble Rabbi, Johannes ben Saki by name, knelt before the great victorious Emperor, praying for mercy for his people. 'What shall I grant you?' asked the proud victor. 'Grant me,' replied the sage in a low voice, 'the school of Jabne and its schoolmasters.'" The victor granted the request. He probably never dreamed that from that little school the national spirit of the Hebrews would rise with more vigor. How could he, when it looked as though the whole nation were wiped from the face of the earth. Jerusalem was a pile of débris; her people had been slaughtered by thousands or made cripples. Those

[1] An historical sketch of educational evolution among the ancient Hebrews and other primitive nations.

who escaped death were carried into captivity to be made a show of, serving as living trophies for the home-coming victor in his triumphal march. Under such circumstances and conditions the remnant of the Jewish race was found at the time of the destruction, so that even the best patriots could not dream of an attempt at restoration. Yet fifty-five years after the destruction the national spirit which was kept alive in the little school of Jabne arose with vigor, and the 25,000 pupils of Rabbi Akiba, those penmen drilled by the schoolmaster, restored the national pride to its olden glory. The heroic struggle of Bar Kochba (the Son of the Star), who was proclaimed king of the Hebrews, is known to fame, and the coin he used is still preserved in museums as a silent witness of the successful attempt and the vital power of the nation. Now, who performed this marvel, which seemed an impossibility? The schoolmaster from Jabne. The educator blew into the dry, dead bones of Judah the breath of life, and they were resurrected to activity.

Education is not only a power in a struggle, it is also a preserver of life, and the reason for the preservation of the Hebrew race is its wonderful, early developed education. Every Jew, no matter of what standing or reputation—even those from darkest Russia, where 99 per cent of the natives can scarcely sign their names, even those Jews—is able to read and write in his own language. In America we have a vivid picture of the great power of education, for what has made this country so great in every respect, if not the schoolmaster? Instead of being in the rear guard, it is marching onward—a pioneer of culture, leading the advancing march of progress. All this is due to education. The educational system of the United States is its best bond for its continued greatness. The American schoolmaster may reflect, while sitting at the foot of the Washington Monument, upon the educational system of the ancient Hebrews, two thousand years ago, and be interested in the discovery that there is a wonderful parallel between that and his own, of the nineteenth century. To those who observe the march of civilization it will be of great historical value to know the educational system of the Hebrews, whom Mohammed styled "Rigel el Kitab," i. e., "the people of writing."

PRIMITIVE EDUCATION AMONG VARIOUS NATIONS.

I.—The Chaldeans.

Among the cultured nations of the ancients the first in rank are the Chaldeans, whom we may style the educators of the world. There was hardly a branch of science wherein they did not prove themselves the masters. In the divine arts—music and painting—they were far ahead of the cultured sons of Hellas. The first symphony was sung by the Chaldeans. The Greeks learned from them when they invaded the country under Alexander the Great. The ancient Jewish notations of music, used by the singers of Zion in the Temple, are all called by their Chaldean names. As a proof of this, it may be stated that the Hebrews learned and adopted the Chaldean musical Alpha Beth, as they adopted from them other useful things pertaining to culture and civilization.

In making or in reproducing pictures they reached the highest standard of perfection at that time. Two prophets give evidence of their skill in that fine and divine art. One described their painted pictures on the walls, engraved with an oily color; the other calls their country "the land of sculptured images, of which they are proud."

In architecture and engineering they surpassed the Egyptians, and the fabulous Tower of Babel was built before the corner stone was laid for any of the pyramids. Jewish legends tell us that they built that tower in order to produce rain by beating the roof with hammers, thus causing the air to vibrate. That is another evidence of their far-advanced science and culture. Their canals and other artificial waterways have long been the admiration of historians.

In astronomy, their fame in that truthful science, which requires a knowledge of mathematics, is still renowned. They were the first to look on high and draw a map

of our solar system, dividing the planets in the zodiac. The art of calendaring, for which the ancient Hebrews were renowned—so that in a dispute with Roman astronomers the former claimed that the sun is stationary, while the planets revolve round the fireball (the sun), which argument the latter refused to accept—was learned and adopted from the Chaldeans, as the Jewish names for the months and planets are Chaldean terms, thus telling us plainly in what school the Hebrews had been taught.

In religion they showed themselves far superior to even the Hebrews, as their religion was pure and simple and could not conflict with common sense and feelings. They approached the altars in their houses of worship with silent salutation, and venerating bows, prayers, and music were the offerings, not animal or other kindred sacrifices, as is plainly indicated at the dedication of the great image made by King Nebuchadnezzar on the plain of Dura. Those who understand how to read the Bible between the lines will discover that Jehovah was known to the Chaldeans and worshiped before He revealed himself to Moses in the burning bush, and Nimrod was a mighty hunter before Jehovah; and Jehovah calls the King, Nebuchadnezzar, through the mouthpiece of His prophets, "my servant." It is probable that Abraham, who left Ur of the Chaldees for Palestine, was forced to flee, being persecuted by the Jehovists. (The name Elohim, which means two in one, is mentioned by all the patriarchs until Moses, who restored the ancient Jehovistic cult of the Chaldeans.) The name "Chaldean" means a wise man, and in the Scripture it has the same meaning, where the Chaldeans are termed "the wise men of the East."

Such achievements are impossible without the regular working system of education. Indeed, legend, which is the best informer where history is silent, points in that direction. There is a written Jewish folk story which says that Abraham was when a boy a pupil in the schools of Shem and Eber. Of course there is no historical proof to confirm that legendary statement; still there is a clear passage in the Scripture which indicates some educational progress, when King Nebuchadnezzar orders that children of Hebrews shall be selected, being without physical defect, good-looking, and bright, and taught to write (in the text-book) the language of the Chaldeans. Aside from that record, how is it that the Hebrews, who were in Egypt four hundred years, did not carry away with them a single thought of the land? Not even an Egyptian word, with one exception, is to be found in the whole Scripture, while whole sentences of Chaldean are found. During the stay of seventy years among the Chaldeans the Hebrews seem to have been perfectly nationalized, and the big volumes of the Talmud are treasuries of Chaldean science and literature under the guise of the Hebrew religion. To explain this phenomenon we must think one of two things, either there was a law compelling everybody to read and to write, or the government indirectly offered opportunities even to strangers to be educated, as the enlightened Government of the United States offers educational advantages to all. At all events, there was an educational suffrage, and to it is due the wonderful civilization of the Chaldeans.

The reasons for the early development of education can be given as follows:

1. The nation was not divided into classes and castes (except in the branches of science, as Chartumim, readers of hieroglyphs; Ashofim, secret readers; Measphim, magicians; Chasdim, astrologers). The absence of castes prevented education from being monopolized, as in other nations, by a certain class.

2. Their Jehovistic cult with its fatalistic view that the fate of man is written in the stars; hence, if the horoscope told that the child of a beggar would be one day a prophet or a sage, he was brought up accordingly.

3. The simplicity of their quadrat letters with perfected punctuation and vowels enabled everyone to learn writing easily, and it became a common method of exchanging thought. The Hebrews, after their exile, adopted the Alpha Beth of the Chaldeans, with all its grammar and rules. It is a pity that we have no record; but underlying the whole Rabbinical religion the Chaldean cult exists. The only direct proof of the educational power of the Chaldeans is found in their offspring,

the Nestorians. Those Christians, the few living descendants of the Chaldeans, are superior even to the Armenians, not to speak of the wild Kurds among whom they live.

II.—The Hebrews.

By the Hebrews I do not mean those Jews who claim to be the children of Abraham, Isaac, and Jacob, for there were Hebrews in the land of Canaan long before Abraham was born. Joseph tells in prison his tale of woe that he was stolen from the land of the Hebrews. As Joseph was the third generation from the first patriarch, who, unlike his son, was not blessed with many offspring, he could not have alluded to the farm where Jacob lived with the few souls of his household, when he spoke of the land of the Hebrews. Even the prophet mentions twice to the Hebrews that their father was an Amorite and their mother a Hittite (while Abraham and Sarah were both Chaldeans). Those Hebrews had another language from Abraham and other customs and religious views from those prevailing in the motherland of the patriarch. When Abraham mingled with those Hebrews he was somewhat undecided, jumping, so to say, from the pure Chaldean monotheistic religion of Jehovah to the dual cult of Elohim which was the original religion of the Hebrews. The confusion of views became in time a matter of grave facts when Abraham became their leader and patriarch. That confusion of views runs like a thread through the whole of Jewish history. The Hebrews, like most of the Semites, had no classes or castes, which is very favorable to educational suffrage; but as they lacked the ability to centralize their national power, like the Chaldeans, they were divided and ruled over by family patriarchs or tribal sheiks. The father of the house was the ruler, endowed with the power of life and death in his home, as the patriarch over the family and as the sheik over the whole tribe. The father was the educator of his son; consequently when the father was an ignorant man the son was obliged to live according to his father's standard, there being no one to educate him. Another stumbling block to education was the birthright and the privilege enjoyed by the firstborn son among the Hebrews. Thus the able-minded children would be neglected for the sake of the weaker minded firstborn son, to whom education might be of no use. In the history of the patriarchs may be found such educational methods with their sad consequences. Often the mother, when she felt a love to one of her children who was of able mind, undertook to educate him, as we read in the history of the early patriarchs. In such a case moral and domestic education were better implanted in the heart of the child, as women are, as a rule, better educators than men. Poor as their methods were, still poorer were the subjects in which they were reared and educated. A fabulous, narrow view of the ruling forces, some duties toward parents, some folklore and tales, formed the whole programme of primitive Hebraic education. In addition, there were the new religious views and customs imported by Abraham from the Chaldeans. He also brought with him the letters of his native land, the plain quadrat Alpha Beth. The patriarch soon acquired the simple language of the Hebrews (the language of the Scripture), but he could not find their writings,[1] which are half hieroglyph and half a zigzag outline. So it came to pass that the minority, who were the offspring of the Chaldean patriarch, were brought up in the easygoing Chaldean writing, while the Hebrews were taught in their old imperfect native Alpha Beth. When the patriarchs migrated to Egypt, taking with them those Hebrews whom they governed, owing to their isolated position in the hermit kingdom the confusion still remained, and education was continued on the same lines until the time of Moses.

III.—The Egyptians.

The Egyptians had no inborn, natural culture. Hence education was monopolized by the priests, and its blessings, like all other importations, could not be enjoyed by the poorer class. In spite of the 10,000 mummified cats which are claimed by

[1] The ancient letters of the Hebrews are still used by the Samaritans and on old Jewish coins.

learned men as evidence of their high civilization, I declare that they were only amateurs in culture. There is a land bordering on Egypt known as Ethiopia, which includes also a part of the famous Soudan. In that land once waved the standard of civilization, and, according to the records preserved in the Talmud as well as from Biblical sources, we can see what a highly cultured people once lived in Darkest Africa. The art of hieroglyphs was imported into the land of the Nile from Chartum. Hence the hieroglyphs were called Chartumim. That sounds better than the mew of those 10,000 mummified cats and kings, which was a strange culture, not sprung from the people, but only enjoyed by the higher castes of the priests. The variety of classes and castes prevented the education from penetrating into the heart of the people, and prevented the nation at large from cultivating a national unity, which is the only security for a people's strength and prosperity. The son of a priest was destined to be a priest, no matter whether his mind could comprehend the mystery symbols of the hieroglyphs or not. The child of the soldier was forced to do the fighting all his life from generation to generation. The offspring of the workingmen were by law required to live their time in the line of work, each according to his guild and union, following in the footsteps of their departed sires. Even the thieves formed a class, a registered caste, and their children had no choice but to live up to the profession of their fathers. Under such a caste system true education was unknown, and the few hieroglyphists had their little knowledge inherited with their cats and rites, it being a handing down from father to son. Again, geniuses, if they happened to be born of parents who were not priests, were condemned to live as ignorant and undeveloped beings. No wonder the Egyptians were in their time the target of jesters and mockers. No wonder that the Hebrews, in spite of their staying there for four centuries, could not absorb a single habit or thought from them. No wonder that there was not a national union, as each caste was a stranger to every other, as black is to white. No wonder that we dig out so many mummified cats, the only inheritance left to the world of an uneducated people.

IV.—The Greeks.

The Greeks possessed a national culture with an original civilization framed with the progressive thoughts of other nations. Their religion was that of a smiling, idealistic beauty, answering the sensual emotions, and rousing the sentimental feelings to the highest pitch of inspiration. But, with all the advantages of good government and an inspiring literature, they lacked the best medium which would have made them everlasting, and that was education.

They had an Aristotle, but not a schoolboy. They had philosophical schools, but not a system of education. Plato, in making the plan for his idealistic republic, had it in his mind to place the education in the hands of the government. He was the only philosopher who felt the real need of his people, and that was the want of an education.

Sparta tried to establish an educational system under the care of its republic, but it did not amount to anything, as the sole aim was to train and drill up a republic of soldiers. The consequences of the lack of education were fatal for Hellas. Besides the everlasting fighting among themselves, which has passed into a proverb, "When Greeks joined Greeks, then was the tug of war," they could not maintain their independence, and fell a prey to mighty Rome, then the mistress of the world. What has the Greek culture, so much talked of, left behind it? Nothing except a few busts of shapeless Venuses and the fame of only seven wise men, who bear witness that the whole nation, with its multitudes, remained in darkness so many centuries.

The speculative philosophy of Aristotle is not worth anything, compared to the scientific facts brought to light by the Chaldeans. The sons of Hellas, whose religion, for the sake of its charm, was adopted by other nations, exchanged the gaiety of that old religion for the more meditative one of Christianity, whose worship consists in

prayer and fasting, not in the enjoyment of the wine cup and sensual satisfaction—a religion which even the reasoning Romans resisted so long. How can we explain these phenomena? Paul took them by surprise. They were taken in, not by the grand Apostle, the miracle worker, but by the Jewish boy who, as a child, was compelled to visit the public school, then as a youth sat in the college at the feet of the Rabbi Gamaliel, and the Olympian gods and goddesses fell before Paul, the educated.

V.—The Romans.

The reasoning Romans had no talent whatever for producing anything original. Their religion, cult, customs, and manners were all borrowed, adopted, or absorbed from other nations. They were born prize fighters, yet they had one good quality, a love of system and order, a quality which makes the educator. Indeed, there were more Greek mentors in Rome than teachers in Athens. There were fewer ignorant soldiers in Cæsar's legion than in Alexander's famous phalanx. To be a Roman and free was sufficient to gain the privilege of expanding all one's aspirations and ambitions, no matter who he might be. But as Rome was always busy in maintaining her possessions in all the four corners of the world, she cared more about bringing up her children in the arena than in the school, and the educational department was a private undertaking. Still, there was some sort of an education, and under Christianity Rome became the real educator of the world. Italy's schools and colleges in the beginning of the Middle Ages were renowned all over the world.

VI.—The Norsemen.

Along both sides of the straits of the Baltic there once lived a people known as the Norsemen. That great Teutonic race was the only one which became the tutor of Europe, demonstrating the power of education. In character they were knights of chivalry; in valor they had no equals; their tribes routed the Romans by land under the leadership of Hermann, while their kinsmenn, the Danes, raided the isles of the Britons, the mighty fortress of the Romans. The Danes were a seafaring people and ruled the waves from ocean to ocean, and long before Columbus discovered this blessed country the Norsemen had been here to place their advance posts.

Their religion was in some respect the same as that of the Greeks, but had a more serious aspect. Their Odin (the same as in Hebrew and Chaldean Adon, which means the Lord) was not of the brutal character of a Jupiter, who killed his own children. Odin was, as Carlyle says, a man, a leader, a teacher, who invented the Runes, the Scandinavian Alpha Beth. Their Valkyrs were not demoralized demi-goddesses, like Venus, but were brave maidens with a spear in one hand and the shield of morality in the other. Their Gambrinus was not a riotous character like the Bacchus of the Greek; he was a social and amiable person—a trait still visible in the offspring of the Norsemen when they gather round the cup. Runes were not, like the writings of other nations, imitations or a modified Alpha Beth, after the model of the Phœnicians, but were the letters of their Alpha Beth bearing the stamp of native self-culture. Odin, the teacher and inventor of those Runes appeared in his rôle among the Norsemen 70 B. C. The simplicity of the Runes, in form, and the ethics of the Norse lore as embodied in the Edda, the Scandinavian Scripture, leads one to suspect that the great Odin was a Chaldean, cast away on the shores of Scandinavia to become the educator of that noble race.

No written records have been preserved to tell of their educational work, but there are left living samples, and by the deeds of the offspring from the Norsemen we can see the consequences of their educative ability.

As Odin was the inventor of the Runes, which were the best medium of education, so, according to the Norse lore, he also invented poetry. Indeed the legend only foreshadows who were the people following in Odin's footsteps as educators. These were, among the Scandinavians, the Scalds; among the Germans, the Bards, the Minnesingers, whose sweet melodies reechoed throughout the great German Empire.

Those poet-singers have with their songs educated in a delightful manner the children of the mighty in their castles as well as those of the peasants. Through such mediums—poetry and those singers—the knowledge required was distributed to all alike. That was the way of education among the noble Norsemen whom some historians delight to style ignorant barbarians. Fortunately, divine Providence has preserved their deeds, through which we may come to know them better.

MOSAIC EDUCATIONAL LAWS.

I.—MOSES IN THE LAND OF THE CHALDEANS.

The Bible may describe the Hegira of Moses and make him shelter himself under the roof of a noble priest of Midian, a short distance from Egypt; a legend of the Jewish folklore may place him in the land of Cush, in Abyssinia, as a king ruling there forty years, marked by a peculiar love affair with a dark-brown princess; still, we, by virtue of his deeds, his knowledge, and assisted by some hints of Rabbinical tradition, are of the opinion that his forty years of exile were spent among the Chaldeans, and a man is better known by his deeds than by his fame or name. We will group and array our witnesses. They are:

1. His religious views.
2. His geographical knowledge.
3. His educational laws.
4. His peculiar laws concerning women.

First, then, in regard to his religious views: Mosaic Jehovah *v.* Hebraic Elohim.

When Moses appeared as a redeemer among the Hebrews, in Egypt, the Elohistic party was mostly composed of those native Hebrews who followed the patriarch into bondage from their native land of Canaan. The other was the Jehovistic party, who clung to the Chaldean religious opinions, as imported by the Chaldean patriarch, Abraham. It was not exactly that the direct descendants of the patriarch were Jehovistic or the descendants of the others Elohistic, the confusion of their religious views made a party issue not dependent upon the lineage by genealogy. The Elohists were in the majority, hence the great opposition which Moses met with when he first made his appearance among them. When he first proclaimed the name of Jehovah they were so ignorant of it as to doubt his mission, for they had a tradition that Elohim would remember them.

Moses's geographical knowledge, which could accurately outline every hill, mountain, and stream extending from the border of that country where he intended to establish his great Hebrew Empire to the Euphrates, could not have been acquired by studying a map, which was not at that time in existence, but only by traveling through the places he described. His hostility to the patriarchal institutions, and breaking up of the family and tribal sovereignty, placing the power in a central concentrated force, goes to show that he must have known the Chaldeans' ways and their belief in a centralized government.

His disfranchising of women and excluding them from public as well as from domestic rights was another blow to the Elohists, who looked upon the weaker sex as superior beings, the patriarch having been told by Elohim himself to do anything which Sara should say.

The attitude of Moses toward women was the same as the attitude of the Chaldeans toward them. Moreover, the Rabbinical traditions hint plainly that Moses knew or was in the land of the Chaldeans. The book of Job is accredited to Moses as the author, and that he wrote it purposely in Egypt to show the great confidence of the afflicted man in God and how by faith he was rewarded. The simple, yet poetical style and expression of the book, the manifestation of foreign, scientific views, combined with a local knowledge of Egypt, reveal the author and show it to be one of the scriptures of Moses. Looking upon the book, we must say that it is only a propaganda, advocating the Jehovistic religion and praise of the

astronomical knowledge for which the Chaldeans were famous. His idea was to demonstrate and illustrate the faith in Jehovah, not in Elohim. For that reason the author created a dramatic person, Job by name, whose wealth was plundered by the Chaldeans (the mention of the Chaldeans is suspicious). The scene in heaven, where Elohim gives a reception to the sons of Elohim, and entertains with them Satan (a person never mentioned in Jehovistic prophets), looks somewhat like a satire on the Elohistic cult. The chapters from the first to the thirty-eighth deal with Job's terrible affliction, and the more terrible consolations, by dispute and argument, of his friends, and during the whole controversy, of a speculative philosophical character, the names of Elohim or Shadai are not mentioned. Failing by their waste of words to help to console or to convince that poor afflicted Job, they seem to retire to where they came from, and from the thirty-eighth chapter to the end Jehovah has the floor and from the midst of a storm he argues with Job, not with poetical words and a speculative "perhaps," but with plain words and plainer facts, based on the phenomena of the solar system and its planetary wonders (such astronomy as was taught by the Chaldeans). Job was, through such facts and array of natural phenomena, converted, convinced of the power of Jehovah and he became a Jehovist, and, through his conversion Jehovah again restored to him his health and wealth. This is an outline of the drama of poor Job, and it seems to have been written in a missionary style for the purpose of converting the readers to the Jehovistic cult, and its author could not have been any other than Moses.

Having established in a general outline the relation of Moses to the Chaldeans, we shall give a detailed account of his educational works, which will make that relation more distinct.

II.—Moses and the Bible.

Those who think of Moses as a founder of religion, and his Bible as a religious book, do not fully comprehend the matter. Moses is still called by the Jews "Moshe Rabbina," a term which means, Moses, our teacher. The Bible has no claim to being a religious book, so far as we understand religion to be that religious touch which links us to Infinity, as by prayer, and the belief in the immortality of the soul is not to be found in the whole Scriptures. Nay, more; among the 613 laws there is not one regarding prayer, that foundation of religion. On the contrary, Moses, differing from others, forbade them to build any place of worship except the one place which Jehovah should select. (As among the Chaldeans, whose policy of centralization led them to have only the temple at Babel.) The Bible is an educational code, and its history is the history of education. In order to understand the Scriptures better let the actions of Moses's educational work serve as a commentator.

III.—Moses Breaking Patriarchal Systems and Traditions.

Moses found the patriarchal traditions relating to the creation and to the deluge in the Elohistic style, ascribing all the events to Elohim. Not being able to root those legends out of the minds of the Hebrews, which seemed to be in their blood, he made additions of other versions with a Chaldean color.

To the first chapter of Genesis, where it mentions how Elohim created a couple, he added another chapter of creation how Jehovah created man from dust and his wife from his rib. In the patriarchal Elohistic version woman's equality with man is plainly indicated, while in the monotheistic Jehovistic narrative the degradation of woman is shown.

In the first chapter of the deluge Elohim requests Noah to bring into the Ark of every creature a pair, without distinction of clean and unclean, while in the Mosaic version Jehovah tells him to bring in from the clean animals 7 pairs, and from the unclean 1 pair. In legislating that man shall forsake his father and mother to cling to his wife he broke and removed the power of parents and patriarchal government, by that law placing the sacred personal liberty above obedience. The only concession he made to the Hebrews was in respect to the firstborn, whom, however, he soon deprived of their rights.

IV.—Moses Hoisted the Chaldean Emblem Instead of that of Elohim, and Removed the Hebrew Alpha Beth, Replacing it by that of the Chaldeans.

When the prophet speaks of Elohim, mentioning his angels, he describes the latter with calf's legs (see Ezek., chap. 1). The Apocrypha tells of Bel in Babel, that he was a monster serpent. The calf was the emblem of Elohim, the serpent was the emblem of Jehovah. When the Hebrews made a golden calf, they simply hoisted the Elohistic emblem, their request to Aaron being, "Make us an Elohim." When Moses came down he destroyed the calf, killed the rebels, and hoisted Jehovah's emblem, the serpent, on high, requiring the Hebrews to look upon that. As the body of the firstborn ones played a great rôle in the Elohistic plot he broke their power entirely, placing it in the hands of a selected body of teachers, the priests and the Levites. Another step in educational reform was taken when he removed the old Hebraic Phœnician Alpha Beth, with its zigzag letters, and replaced it by the simple, readable Chaldean Alpha Beth, with its plain quadrat letters.

The Talmud says Moses gave the ten commandments with an Egyptian word (Anohi, I am) with Chaldean letters, and in the Hebrew tongue. That Chaldean style of writing was a great educational medium for diffusing the knowledge to all.

V.—Selecting Teachers.

In appointing judges Moses did away with the patriarchal power, centralizing it in the hands of the law. He employed the same method in education, selecting a special body of teachers, the priests and the Levites, whose aim should be to teach. As he says, "They, those of the tribe of Levi, shall teach thy laws to Jacob and the knowledge to Israel." In order that they might be devoted to their profession, he did not allow them by the law to have any earthly possessions, such as houses and lands. As they were the teachers of the people their income was from the people in the shape of the tithe from the land and from the flocks. Moses, like the Chaldeans, thought that women were emotional and unfit for teaching serious subjects of a scientific character. They were good for telling tales and stories, but not for higher practical teachings, hence he prohibited a woman from even practicing witchcraft under penalty of death. (Such was also the Chaldean law.) As the primitive science was based upon observation and practice, and as there was a demand for teachers more than for pupils, he gave them such a law—to study science. He gave them laws concerning what to eat and what not, in order to have an opportunity to study natural history. The laws of clean and unclean leprosy and other diseases forced them to study medicine and anatomy. The laws concerning the mixed plantation brought them to learn botany. But the most practical subject of study was the laws governing the calendar and the regulation of the festivals, which were regulated on the astronomical plan of the Chaldeans, even to the division of the weeks, days, and months. By such laws the teachers were educated in the branches of science, and were bound to teach the knowledge thus obtained to their pupils at large. From this standpoint the Bible is the educational code of teachers, outlining the subjects to be taught.

VI.—Laws to Teach.

One of the 613 laws is a special law to teach the children. The law in question is as follows:

"Ye shall teach these laws to your children, they shall speak of them always."

Mainonides declares that in that law is included the law to teach in the sacred tongue. Another law in that line says: "That once in seven years to gather all the people, even women and children, in order that they shall hear and learn." That law is rather to indicate the necessity for religious instruction. "Tell and teach your children," is an obligatory law. It was told to the individual, the father as well as to the nation at large, so that in case there were no parents, the nation took the parental responsibility of educating the children. Instead of the old patriarchal

folklore and tales, Moses legislated on subjects to be taught, one history, the other geography, as is to be seen plainly in his request to "Remember the days of yore, to mark the years of generation (history), to ask thy father to tell you; thy elders to explain how the Most High has settled the nations, dividing the sons of man in fixing the borders of nations (geography)." That was the corner stone which the great educator, Moses, laid to his educational structure. How it has grown by other educational architects we will see in the run of history.

THE SCHOOL OF THE PROPHETS.

As soon as the Hebrews invaded Canaan, after the death of Moses, the Elohists by virtue of their majority assimilated themselves with the native Hebrews, whose language they understood and spoke. The consequence of that assimilation was the establishment of the old patriarchal government and the rule of tribal sheiks, as in the days of yore. From an educational standpoint it was the worst period in Jewish history. The adoption of the native Phœnician Alpha Beth made it difficult to study, and the establishment of the Elohistic cult brought in its train the old patriarchal system of government with its endless feuds and tribal wars. The women again came to the front and the educational office was again in their hands, rearing their children on the old system in the oral traditional songs and folklore. No wonder that during the time of the Judges women, as Deborah, Jael, and others, were better educated than the sons of Israel.

The history of education since the invasion of Canaan begins with the seer Samuel, who was the founder of the famous School of the Prophets and the restorer of the Mosaic Jehovistic religion. Samuel made a step of great reform in placing the education in the hands of good, trained teachers not belonging to the Elohistic ignorant sect of priests, as the children of Eli were. The consequence of the restoration of the Jehovistic religion was the centralization in the hands of an absolute king. As the first king, Saul proved unsatisfactory, he was replaced by David. The School of the Prophets was in existence during the four hundred years till the first destruction. The pupils were called "Beni Hanbijm" (Children of the Prophets). The prominent masters of that school were: Samuel, Gad, Nathan, Edow, Achyohu from Shilo, Elijah, Elisha, Jehu ben Chanani, Ebadjah, Michah ben Jimla.

That class of prophets was not the same as the authors of Scripture. The former were prophets by virtue of their training and study, while the latter were geniuses inspired by those hidden forces of nature—the marks of the genius of every age. The former distinguished themselves by deeds, the latter by words and orations. The former were strict, stern Jehovists, while among the latter some had an Elohistic leaning (as Ezekiel and others). The School of the Prophets was not stationary. It was always on the move from place to place as this was the only way of distributing knowledge among the classes. It reminds one of the methods of the Scalds, the disciples of Odin. It is curious to note that the first founder of that school, Samuel, was called "Roe," a term which means the seer in the clouds, while Gad and Edow were called "Chosim," which means stargazers. It seems that in progress of time some of the masters had established colleges, as the name of Edow's College, "Midrash Edow," in whose archives were chronicled the events and history of the reigning kings. The result of that educational department could best be seen in the fact that when King David reorganized the caste of the priests and Levites he appointed, under the direction of Heiman, 288 teachers of music. In spite of that, the gates of education were still blocked to the people by the heiroglyphic Phœnician Alpha Beth, which was without vowels and punctuation. The Talmud tells us that when Joab, the commander in chief to David, was ordered to make war on Amalek with the instruction to kill and to wipe out all the remembrance (Seicher) of Amalek as the law says, he went and killed only the males. When questioned about it he replied that his teacher taught him to wipe out the males (Sachor). Such a misreading and misunderstanding was due to the Phœnician Alpha Beth, which had

neither vowels nor punctuation. This shows what an important rôle the simple quadrat Alpha Beth of the Chaldeans played in the education of the Hebrews.

I.—From the Building of the Temple to the Exile.

The building of the Temple and the reorganization of the priesthood as teachers, which promised to develop education, was also only a promise and of short duration. For no sooner had King Solomon closed his eyes than the unruly party of the Elohists rose as one man, and the ten tribes under the leadership of Jeroboam hoisted Elohim's emblem—that of the Golden Calf. That the separation was from a purely Elohistic point of view we can see by the party issue of its platform, as proclaimed by Jeroboam: "To thy tents, O Israel," which means a restoration of home rule, placing the right over life and death in the hands of parents and tribal sheiks. In spite of the fact that the Elohistic government tolerated to a certain extent the Jehovistic School of the Prophets, the outlook for education was a gloomy one, as it was tempered indirectly by the prophets and priests of Baal. The educational development among the other two tribes who still maintained a Jehovistic sham religion was at a standstill, and during the four hundred years of the Temple's existence the priests were renowned for their blessed ignorance. During that long, sad period of four dark centuries we find only one Jehovistic king, Jehosaphat, who tried to reorganize the priests and Levites, as teachers, as Moses founded them. He, that king, says the Chronicle, sent out the priests and Levites among the people, and with them the book of the written laws of Jehovah, to visit all the cities in Judah to teach among the people. A deplorable case of ignorance can be illustrated: When the High Priest Chilkijah found an old book of Moses in the Temple he could not read it, and gave it to Shapan, the scribe, who, by advice of the King Joshijahn, brought it to the Prophetess Childa for interpretation. It is probable that it was one of the ancient early books of the law, which was written in simple, plain letters with regular vowels and punctuation in the Chaldean Alpha Beth, hence neither the high priest nor the scribe could read it.

To sum up the history of the Jews during the first four hundred years from the building of the Temple to its destruction, we will find that education was better developed under the Jehovistic religion than under the patriarchal system of the Elohistic cult. No wonder that the great Jehovistic prophet, Jeremiah, advocated the invasion of the Chaldeans, who were Jehovists, and he called their King Nebuchadnezzar the servant of Jehovah. The reason for this was that even the last two tribes had come to be worshipers of Elohim. (It is now understood why Nebuchadnezzar favored the author of the Lamentation.) Even the Talmud says "The Almighty did a charitable work in exiling the Hebrews into the land of the enlightened Chaldeans."

II.—In the School of the Captors.

Dr. Karpeles, the present famous Jewish historian, is surprised that the Jews, who were ignorant heathens when they were led into captivity, came out as learned sages after a short stay there. This need not be surprising, as it is probable that they were compelled to be educated by their captors, or were so impressed with the educational institutions of the country that they were indirectly forced to adopt them, as the square Aramic Chaldean Alpha Beth was the best medium for reaching them.

From tablets preserved at the British Museum, to which my attention was called by Dr. Cyrus Adler, of the Smithsonian Institution, we gather that the Chaldeans had, to a certain extent, a regular system of education, assuming the form of educational suffrage. There is a tablet which may be called the exercise or lesson of some Babylonian lad in the age of Nebuchadnezzar. It consists of a list of the kings belonging to the early dynasties, which he had to learn by heart. The fragment of an old primitive folkstory which once formed a part of the First Reader of a lesson book for the nursery shows that the teaching of the child began at the age of 6. The

story therein is this: A foundling was picked up in the streets and taken from the mouths of the dogs and ravens, to be adopted by the king as his own son.

The vast libraries for which Babylon was famous were open to the public, and were placed in the temples by order of the king, which shows that the Chaldeans were educated under the control of the government. As a proof of educational suffrage might be mentioned the fact that one of the librarians was the son of "an irrigator," a child of an unskilled laborer. This is a proof of how and to what extent education was spread among the Chaldeans. No wonder that the Hebrews became enlightened in the land of their captors, which was their school. The Talmud says that the Jews brought from Babylon the names of the angels, as well as the names of the months. By the former we understand the religious views, while by the latter they meant the astronomical science of the calendar. In addition, they adopted the Aramic Chaldean Alpha Beth, with its square letters, and probably had nationalized the educational system of the Chaldeans with many modifications according to the demands of the times and circumstances.

EDUCATIONAL REFORM BY THE GREAT SYNOD, UNDER EZRA THE SCRIBE.

Ezra the Scribe, or, as he is called by the Persian King Artaxerxes, "the Scribe of the Law," at the return from the exile, called a congress of restoration, known as "The Great Synod." This body was composed of 120 members, among them prominent prophets, such as Malachi, Chagi, and Zecharje. The object was to show to the people at large how the chain of tradition was unbroken from Moses to the elders, from the elders to the prophets, and from the prophets to the great synod. Ezra's aim in calling that famous congress was to promote a universal education, as the book says of him, "Ezra has prepared his heart to explain the law of Jehovah and to teach in Israel law and justice."

The first thing that body did was to revise the Bible in accordance with the Jehovistic tradition, and many a book has experienced alteration, while some were excluded from the canon entirely.

The next step was of great educational importance, namely, the adoption of the Chaldean Alpha Beth, and the addition of the five letters, m, n, z, p, ch, which were written at the end of words. The restoration of the Chaldeans' well-regulated and easily read Alpha Beth was of far-reaching benefit to educational development among the people, so that the Talmud glorifies Ezra, making him equal with Moses, being worthy that the law should have been given through him. The grateful Talmud also acknowledges the merit of the great synod, in saying that they restored the crown to its ancient glory. It weaves a sacred garland of tradition around the art of writing, declaring that the art of writing and that of engraving were created on the last day of creation, on the Friday at twilight, thus giving an air of divinity to these sciences, uplifting them to the highest standard of spirituality, and making them the distinguishing mark between the divine man and the lower human being.

By declaring human authority superior to the law they have removed the dead letter, which was a stumbling-block to progress, and enabled the living authorities to act according to the requirements of time and circumstances.

By revising the Bible, declaring only twenty-four books of early inspiration, and shutting out the rest from the canon as "outside books" (apocrypha), they opened the gates of knowledge to everyone, since only scientific skill was required, and not prophetic miracles.

By breaking the power of the priestly caste, in taking out of their hands the judicial as well as the educational offices, they gave an opportunity to every citizen to strive for these places.

The proclamation of the oral law as the real esoteric meaning of the written law—as they said that "eye for eye, tooth for tooth," of the Mosaic law means money fines—has made man more divine and God more humane.

The appointment of a supreme court of 71 members, qualified for that exalted

position only by knowledge, regardless of birth or family disgrace, did away with the patriarchal system of government and the right of might. Nay, more, the members of the supreme court, who had jurisdiction over the whole nation, who were known as the "Sanhedrim," were required to have as qualification the universal knowledge, not only of the Jewish jurisprudence, but also the most living languages and their literatures, so that the whole body, as one man, should know the seventy tongues spoken at that time by the human race. Even an understanding of the black art, or magic, was required of the member of the Sanhedrin. The declaration that a sage is mightier than a prophet, and that by the power of wisdom the Almighty created the world, gave a value to universal knowledge superior to that of the written law of Moses.

With the exception of the Samaritans, whom they fought to the knife, all nations, without distinction of creed or religion, were invited to eat from the tree of knowledge—to be as the gods.

They declared, in the Talmud, that even a heathen, if he studies the law, is higher than a high priest who goes into the Holy of Holies. In another place they say that a bastard a sage is superior to the high priest. Such declarations show that the charitable desire was to extend the blessings of knowledge and education even to non-Israelites. Indeed, the various disputes about religious and scientific topics recorded in the Talmud between learned Jews and Romans, Persians, Chaldeans, and Greeks, where the latter displayed a knowledge of Jewish literature equal to the rabbis, show that they must have accumulated that knowledge through the hospitality of the Jews, by whom it was regarded as a law that they should extend education to everyone. Through such a broad view of education an avenue was opened by which even the pagans could enter the sanctuary, regardless of lineage.

The following may be cited as an illustration, taken from the Talmud: "It was a custom, when the high priest on Atonement Day left the sanctuary unhurt, for the people to give him an ovation as a congratulation upon his coming out safely. Once, while the people were cheering the high priest, the two noted Shmaye and Abtalyon, who were in direct succession to the great synod in the eighth generation, happened to pass by. The former was the Nasi (spiritual prince), the latter Ab Beth Din (president of the Sanhedrim). The crowd, beholding them, left the high priest and followed the sages, cheering them, who were the children of converted heathens. The high priest felt humiliated, and when he met the sages he saluted them, saying, 'Let the sons of heathens come to peace,' alluding to their lineage. They replied satirically, 'Let the sons of heathens come to peace who do the work of Aaron, and let not the sons of Aaron come to peace who do not do his deeds.'" This is the best illustration of what an exalted position education had given them, regardless of their lineage.

The great reform work of that famous congress, which lasted in continuous session for many years, was solely devoted to education, and every work, no matter of what character, had an educational bearing.

The municipal government was taken from the hands of the Elders and placed in the hands of the "Seven Best Men of the Town," elected by the people. These men were under the control of the Ab Beth Din, the head of the city court, whose special duty, besides executing justice, was to care for the educational department of the town. (Such a court in an ordinary town consisted of three members, while in the capitals of the provinces the body consisted of twenty-three members with the power of passing the death sentence.)

The Temple, which, at the time of the exile, had had the appearance of a huge animal slaughterhouse, was rebuilt and made the center of the federal government with various departments, of which one was a department of education, caring for the maintenance of the higher colleges as well as the public schools for the children in Jerusalem. The Temple was placed under the control of a nonpriest, who had the title of "Ish Habaith" (the lord of the mansion—"major-domo"), who, in turn,

was under the control of the Sanhedrim. The high priest, seven days before the Atonement Day, was handed over to two sages, nonpriests, pupils of Moses (which means Jehovists), selected by the Sanhedrim to be trained and drilled for the religious performance. The priests who were instituted by Moses as healers, by the decree of the great synod, ceased to be such. The reason for this was that the priests were not allowed by the law to come into contact with a corpse, and as the science of healing is based upon the knowledge of anatomy, which the priest could not study, that science was cultivated in the colleges by nonpriests, and when graduated, they were recognized as Rofim (healers). From these Rofim one was selected as the "Healer of the Temple," whose duties were the same as those of the modern board of health. The lepers, or other people suffering from skin diseases, who, in former days were cast off from the camp, and were not allowed to join in the Easter feast, being declared by the priests unclean, after the progress of science, says the Talmud, went a day before Easter to the surgeon, who made an operation on them, removing certain worms from under the discoloration, and they were then declared clean and allowed to join in the Easter celebration. By ordering certain prayers and benedictions, the great synod denounced, indirectly, the mode of worship by sacrifice. The famous Lord's Prayer is to be found in the Talmud, with a slight alteration, bearing the air of antiquity. By means of prayers, the great synod gave the Jews that which Moses lacked—a religious education. The decree to build in every habitable place a Beth Hadneseth (a house of worship) and a Beth Hamidrash (college and public library) was of great educational importance. The former gave an idea of Him who is everywhere present, and not only in the Temple; the latter increased the desire for reading. The Talmud says that the great synod fasted twenty-four days, praying that school-teachers and book writers and authors should never accumulate wealth from their profession so that they would be bound by circumstances to live up to a high standard. National congresses for educational purposes were convened ten times in ten different places after the great synod, adding reforms according to time and place. After the great synod there follows an unbroken line of couples or pairs, as registered in the book, The Sayings of the Sires. The bearer of the first name was always the Nasi (the Prince) while his companion was Ab Beth Din (president of the court or Sanhedrim). Rabbi Gamaliel, at whose feet the great Apostle Paul sat as a pupil, was one of the last couples.

The work of the great synod is preserved in the gnomic sayings which they left, in the "Sayings of the Sires," "Be patient in judgment," "Bring forth many pupils and make a fence to the law." Upon that saying, the grand, towering structure of the Talmud was built.

THE TALMUD.

The Talmud, that great written museum containing untold treasures of a civilized world of six bygone centuries, that wonderful and universal encyclopedia, which, with the Mishna and Midrash, which follow in its train, presents twice as many volumes as the Encyclopædia Britannica, that wonderful book, which Orthodox Judaism considers so sacred, written by the inspiration of the Holy Ghost, is not the work of a few individuals, but a work of great scientific importance. It is a work by the whole Jewish nation, as well as by others who indirectly contributed to that remarkable gazette of the world.

The great synod laid the first corner stone to that unparalleled structure, and it was finished a short time before the Hegira of Mohammed. Its various editors in chief, as Rabbi Johannes (who was the first editor of the Jerusalem Talmud), Rabbi Akiba, Rabbi Jehuda, Hanasi (the Prince), who was the editor of the Mishna, were great historians as well as famous scientists. Its contributors were recruited from all the rank and file of society. You will find a contribution from a plain, modest, unskilled laborer, who made his livelihood as a burden carrier, next to an essay of the great Rabon Gamaliel, a homiletic explanation from a rabbi next to a story of a mermaid by an old, experienced tar; a sketch of plant life by a simple farmer

arrayed in line with an essay about medicinal anatomy by a famous medical sage. Not only Jews and early Jewish Christians are among its numberless contributors, but even pagans have acquired some place in its vast volumes. There are contributions from Sadducees, Epicureans, Romans, Persians, and Chaldeans, whose opinions are published even though they are not in harmony with the Talmudical faith or creed. The Talmud is a free trader in thought, its motto being "To know." It wants to know what the Almighty has done since he created the world, and is also eager to know what Rabbi Akiba did when he shut himself up privately with a noble Roman matron. It displays a fair method of criticism, free from any prejudice or favoritism, and there is not a saint on earth or an angel in heaven who is not made the target of the sharp arrows of true criticism. Even Moses is arraigned before the Talmudical bar, which criticises his conduct. Honor is given to whom honor is due, even though he be an opponent. Balaam, who was hired to curse the Jews, is, according to the Talmud, greater in prophecy than Moses.

The Rabbis, in dispute with Gentile sages, frankly admit the truth of the statements of the latter, if their arguments on the subject discussed were logical.

In poetry, the Talmud surpasses the Illiad of Homer, its vast volumes being one grand, long epic song, describing the heroic struggle of the giants of brain who fought the mighty gods of the mountains, as well as the gods of the valleys; the dreadful Druids, as well as the fearful demons. It is a tale of the struggle between light and darkness; between education and ignorance, with the final victory of the schoolmaster.

From an historical point of view, the Talmud may be taken as the record of historical deeds. We can get more information about the Hermit Kingdom of the Nile from it than from 10,000 mummified cats recently dug out from its shores at an enormous expense.

It is a pity that the Talmud has never been made accessible to the scientific world

I.—The Two Talmuds.

Like the Hebrew religion, which is divided into two parts, the Elohistic and the Jehovistic cults, so the Talmud is divided into two parts, the Jerusalem Talmud and the Babylonian Talmud. In spite of the distinctive names there were many Babylonian contributors to the Jerusalem Talmud and many Jerusalem contributors to the Babylonian Talmud. From an educational standpoint, the Jerusalem Talmud is superior to that of Babylon, not only in age, but also in educational principles. The Jerusalem writers endeavored to train the tongue, while the Babylonians aimed to exercise the brain and mental faculties. Both Talmuds are prototypes of the two kinds of Jews, corresponding to the two kinds of religion. The Talmud of Jerusalem has a Jehovistic caste, with liberal toleration toward the Elohists, especially toward the early Jewish Christians, of whom many were in the ranks of its contributors. It is liberal, yet its liberality does not extend over the national border. It reminds one of Peterism of the early Christian period. The Babylonian Talmud has a broader view and has a cosmopolitan tendency, more like St. Paul. Like Paul, the Babylonian Talmud proclaims a heavenly Jerusalem, and, curiously enough, we there find the "missing link" between their views about non-Israelites. To the Babylonian Talmudist, as mentioned in former chapters, the pagan sage who studies the law is superior to the high priest who does not. Paul uttered the words: "If God wants children from Abraham, he can bring them forth from stones." Those who are acquainted with the methods of argument used in the Babylonian Talmud will find a striking resemblance between it and the arguments of Paul. Since Paul came from Tarshish, he must have had a Babylonian education; and also in the school of Gamaliel the Babylonian system was adopted, he (Gamaliel) having been one of the disciples of the great Babylonian, Hillel, whose deeds and teachings resemble those of Christ, who lived one hundred years later.

The Epistles of Peter are written in the style of the Jerusalem Talmud; he was probably trained after the Jerusalem method.

The Talmud of Jerusalem is like the Oriental Jew, while the Babylonian Talmud is the model of a Russian Jew in all his ways and manners.

The Jerusalem Talmud is written in a very plain style, leaving the impression that it was written by people of a high education, people who laid stress upon system and order—the indications of education. Its laws are paragraphed like a modern law book and its sentences are brief and to the point. More care is given to the rhetoric and drilling of the tongue than to the exercise of the brain. It lacks any speculation, and a dim gloom is cast upon it. The same can be said of the Oriental Jew, who is the outcome of his native Palestinian Talmud. To him, "words, words, and words" are more important than reason, and, like his Talmud, he moves in a narrow traditional circle of nationality. Like his Talmud, which condemns every speculation in physical research, he lacks that vigor of brain which has made the Occidental Hebrew, especially the Russian and Polish Jews, famous.

The Babylonian Talmud is the Eidolon of the Russian and the Polish Jew, with whom it grew near the Euphrates and the Tigris. The Russian and Polish Jews are descendants of the Babylonian Jews who entered Europe through Persia and the Caspian Sea. The Russian Jew is of an erratic nature, always of speculative turn, whether in matters of religion or matters of business. He is broad minded and sharp, yet his life is generally in a chaotic state, without order or system. If a Russian Jew is asked a question, instead of replying he will ask you another question, and in conversation he will take a long journey of talk until he at last wanders to the point. He will eat pork, yet, in spite of the fact that he is a lawbreaker, he will fast on the Atonement Day. He is a materialist in the full sense of the word, yet he possesses the mystic inclinations of a Mahatma. His Talmud (the Babylonian) is of the same character. In appearance, the Russian Jew is chaos itself. For him, every subject, no matter of how small importance, must be reasoned about, argued, and analyzed down to the last atomic substance until it is acknowledged as a law. In that respect he differs from Herbert Spencer, who says there is no chemistry for thought. When the Talmud begins to treat of a law—for instance, whether a ship is liable to house leprosy—it never comes to the point, but will wander through the Seven Heavens on high and the Seven Chambers of the Inferno until it comes back again to the starting point, and will then decide, after having employed all the resources of knowledge, that a ship is not a house.

The Babylonian Talmud might be likened to Faust, who wanted to be a saint in the heavenly Jerusalem and at the same time an Epicurean on the earth. It calls the Nazir, who vows to abstain from wine, a "sinner." Life, according to it, is a nuptial celebration, and is looked at from its brightest side. Even Satan appears therein as a gentleman. It approves of slang, which is expressive, though it often rises to the highest point in poetry. A sublime thought will be immediately followed by a vulgar expression, which fact once caused a refined millionaire, Ben Elasha, to leave the house of Jehuda at a nuptial feast. The Babylonian Talmud regards the exercise of the brain as superior to anything else, and he who can produce 150 reasons for purifying the rat, which Moses declared "unclean," is called a sage. He who would be a rabbi had to pass through such a brain examination before receiving his diploma. To speak in the words of the Talmud, they studied 300 kinds of laws upon the subject of "flying lower in the air" (could they have known of balloons?).

No matter how much the two Talmuds disagree, upon one point they agree—that education is the highest attainment of man; and both have mercilessly disfranchised the ignorant from many social rights to which any human being would naturally be entitled.

II.—Disfranchisement of the Ignorant.

The ignorant were, by the laws of the Talmud, expelled from the earthly social sphere, as well as from the heavenly, where a merciful God grants a shelter to any erring soul. Not only was he considered ignorant who could not himself read and

write, but he who had children and brought them up without education was also called ignorant. They were deprived of the following privileges:

1. No witness should be delivered to them, nor
2. Should they be accepted as such.
3. No secret should be told them.
4. They could not be appointed as apotropies (guardians) for orphans or managers of the charitable institutions.
5. They could not be taken as traveling companions.
6. What they lost could not be advertised (it was the custom to advertise "lost and found" articles through a herald).

A man, says the Talmud, who gives his daughter to an ignorant person does the same as though he bound her and gave her to a lion. Every calamity which comes upon a country is due only to the ignorant, according to Rabbinical ideas. A good illustration is found in the records of the Talmud, which shows to what a degree hatred against ignorance was carried: "Once," so says the Rabbinical history, "there was a famine in the land, and the benevolent, spiritual prince, Rabbi Jehuda, called the Saint, the editor of the Michna, opened his granaries with the notice that those who were versed either in the Scripture, or in the oral law, or in the folklore, or in any educational branch were invited to come and be fed. Rabbi Jonathan ben Amram forced his way in, and when he was asked by Rabbi Jehuda, 'Do you know the Scripture?' 'No,' was the reply. 'Do you know the oral law?' 'No,' he answered. He was given food, but when he went out the Rabbi groaned, saying, 'Woe to me, that I gave from my bread to one who was ignorant!'"

The ignorant person, says the Talmud, will not be resurrected. A man shall always sell all his belongings to marry the daughter of a sage. If not, let him marry the daughter of the president of a library or of a synagogue. If he can not find such, he shall try to marry the daughter of the president of the United Charity. If he can not find such, he shall marry the daughter of the schoolmaster, and not the daughter of an ignorant man. On the same page the Talmud declares that an ignorant person is not allowed by the law to eat any kind of meat. In another place it declares that the ignorant are out of place in society and unfit for witnesses.

One rabbi went so far as to proclaim that if it were not for the sake of commerce the ignorant people ought to be killed. (This reminds one of Plato, who wanted in his Ideal State to have only able-bodied and able-minded citizens, while the rest were to be mercilessly shut out.)

In the same degree as the ignorant are despised, the wise are exalted. A sage who falls, says the oral law, should not have his shame made public. He who teaches the son of his friend knowledge, says the Talmud, will sometime be seated in the heavenly college of wisdom, and he who teaches the son of an ignorant person will have power to nullify even the decrees of the Almighty. A sage is, according to the Talmud, superior to the King of Israel, for if the sage dies we can hardly find one like him, but if the King dies every Israelite is fit for the position. The Talmud called the Persian Empire an "unworthy" one, because they had no national Alpha Beth and no grammar. (They adopted both of these from the cultured Medes.)

Everyone is requested by the oral law to salute a sage, even from the heathens, when passing by, by standing up. Rab. Dimi, from Nahardai in Babylon, brought figs once in a boat to the market. The Exilearch (Reish Gola, the prince of the Exile) said to Raba, "Go and inquire if he is a learned man; then give the permit for the market." That illustrates what privileges the learned men enjoyed in the estimation of the editors of the Talmud. The Talmud even says that it would be better to neglect the service of the Lord than to give up the knowledge of the law.

RABBINICAL EDUCATIONAL LAWS.

In spite of the fact that the educational system of Palestine was different from that of Babylon, still, in the general outline of the laws concerning it, both had a uniform code, with slight alterations.

Every community was compelled by the law to maintain a kindergarten—"Makri Dardeki" (teacher of children). Besides these, the community was compelled by the law to maintain a penman, "Sofer" (scribe), whose duty it was to teach the children the art of writing.

A community was compelled to maintain:

1. A synagogue.
2. A beth hamidrash (a public library).
3. A bath house.
4. A kindergarten.
5. A public school.
6. A city penman.
7. A city physician.
8. A public toilet house.
9. A charitable institution.

In the community which had not the above institutions a learned man was not allowed to live.

The teachers of the kindergarten and of the public schools were paid by the city treasurer, who was under the control of the seven best men of the city (Shiwat Tobei Hair), corresponding to our modern city fathers. The colleges were maintained by donations from rich private professors and by college fees.

I.—The Teacher.

The teacher must be of good, moral reputation, and married. Bachelors and women were disqualified by the law from being teachers in public schools or in kindergartens. In regard to his pedagogic knowledge, the Palestinians laid more stress upon educational ability and in possessing a good method of pronunciation, while the Babylonians cared more for their learning. A Galilean was not qualified for the position of teacher in a public school, nor as a reader in the synagogue by the Palestinians, while in Babylon he could get such a position, provided he possessed the quality of learned speculation. Women were excluded from the pupil's bench as well as from the schoolmaster's chair. They could neither teach nor be taught, according to the Talmudical law.

II.—The Public Schools.

These were under the direct control of the city court in all matters pertaining to education, while the financial fairs were managed by the best seven elected men of the city. The schoolhouse, if it were not public property, was rented. The Rabbinical court never recognized the complaints of persons living near the school against the noise of the children which prevented them from sleeping. (It seems that they had night schools also.) The same complaint against the office of the city writer and the city physician was not recognized.

If a city was divided by a river or a stream, the parents were not compelled by the law to bring their children to the school "over the water," unless the bridge was broad and safe.

Makri Dardeki (The School of the Little Ones).—A general law of the Talmud says that when a child begins to talk its father is compelled to teach it. But there is a special Rabbinical educational standard which runs as follows: "At the age of 5, the child is to be taught reading; at the age of 10, Mishna (outlines of the oral law); at the age of 15, Talmud and universal knowledge. If the child was a healthy one, it was brought to the kindergarten at the age of 5. The class in that sort of school consisted of 25 pupils, and if there were 50 the city appointed another teacher, and if the class had only 40 pupils a helper was added. In that class the children were taught in a playing way to read the letters of the Alpha Beth in Babylonian on tablets of clay like those of the Chaldeans, and in Palestine even from rolls of parchment. The writing was required to be plain, simple, and readable, so that the

child should know how to distinguish a dâleth (ד) from a rêsch (ר) which have a resemblance in the Hebrew letters.

At the age of 6 the child was brought into the public school under the care of the "Melamed Tinoketh" (teacher of children). In the Babylonian Talmud we have a record that Raw said to Rabbi Samuel bar Shiloth, who was a teacher in the public school, "At less than 6 years of age do not receive pupils; from 6 and upward feed him with reading matter like an ox." This is the most characteristic educational system of the Babylonians, who cared more for the accumulation of learning, regardless of a systematic order of education, than the Palestinians. The school children were allowed to read the weekly portions of the Bible by the light of the lamp on Sabbath night (which was prohibited to older people).

III.—Punishment.

Bodily punishment was prohibited in Palestine by an act of the fourth synod assembled on Awsha, and neither the parents nor the teachers were allowed to punish a child until the age of 12. The Babylonians had a light bodily punishment with shoestrings. It is mentioned in the Babylonian Talmud that Raw said to Rabbi Shiloth, who was a teacher in a public school, "When thou shalt punish a child, punish him with shoestrings."

IV.—Vacations.

A regular vacation for children was unknown to the Talmud rabbis. For them to learn to study was above all else. "Even for the sake of building the Temple, we do not allow the children to have a vacation," says the Talmud; "and Jerusalem," claims the same book, "was destroyed because they often permitted the schoolmasters to be idle." "The world only exists for the sake of the little ones," says the Talmud. With the exception of the hours for prayer and the festivals, which required the presence of the children, their study went on without pause or rest. Often in times of calamity, as in times of pestilence and cholera, the schools were closed. It was a custom, when the country suffered from drought, to order a fast day, when the children were brought to the market place, where open prayer meetings were held, and the people implored the Most High in sackcloth and ashes, pointing to the little ones, praying, "O Lord, hear us and give us grace for the sake of these school children, who are pure from sin."

On Sabbaths and other feast days the subjects of study were of light matters—for little children, reading exercises; for college boys, homiletics.

Educational Duties of Parents.

The educational duties of the parents were four in number:

(*a*) The father's duty is, by the law, to bring up and rear his children (the male ones) on all the branches of knowledge, even in national folklore.

(*b*) The father's duty is to teach his son a trade.

(*c*) The father is even compelled to teach his son how to swim.

(*d*) The father is to care for his son's religious training and education.

These are the duties of a grandfather to be fulfilled to his grandchild.

The mother's duty was only one, namely, to bring her children into the schoolhouse and to the prayer meeting.

Religious Education.

"Religious training" is not to be found on the calendar of education, yet it is the most important item in it, and the Talmud has separated that part, placing it in the hands of the parents that they may educate that part of the child which is out of the reach of the schoolmaster, ennobling the inner feelings and the emotions of the soul. That portion of the education was in the hands of the parents, principally the father. The Talmud says that we shall accustom the child to the duties of

the laws, even to accustom it to fast. The religious training was conducted at home, not in the school. The child, by virtue of his childish notions, like all children, was eager to know about any strange ceremony which took place in the religious domestic life. For instance, the child asked the meaning of the "Mezuza" (a sort of talisman which Moses requested them to put on the doorposts). The father then explained to the child its meaning as well as its historical advent. Every feast day was an opportunity for the father to give a religious instruction to his son on that subject. For instance, at the Feast of the Tabernacles, when the family removed from the house to live for a week in a tent, the child, of course, was eager to know why, and so the father explained the reason from a religious point of view. On the night of the Passover, before the proceedings of the feast, the child asked four questions of his father in regard to the curious customs in that peculiar feast. That custom still prevails among the Polish and Orthodox Jews. The Talmud says that on the night of the Passover nuts and fruits were given to the children in order that they should be awake and listening to the history of the exodus from Egypt.

The child, according to the Jewish view, is not responsible for the religious law until the age of 13, when he is no longer a minor in religious matters. But there is one duty resting upon the shoulders of the child regardless of his age, to which he is subjected, and that is the kadish (sanctification). The kadish is a short prayer, like the Lord's Prayer, and is distingished from other prayers, as it is said in the very ancient Aramaic language. Its antiquity is beyond any doubt. The kadish is to the Jews what the mass is to the Catholics. If one of the parents dies the child is brought morning and evening into the synagogue to recite the kadish during the first twelve months, in loving remembrance of his departed father or mother. After the elapse of the first year, the kadish is recited by the child or by the grown son each year on the day of the death of the father or the mother. The kadish can only be recited in the presence of 10 male worshipers. Even a female child is subjected to the duty of the kadish. The kadish is calculated to implant into the heart of the child the noblest seeds of gratitude, and it is a very old custom, a transfiguration of the primitive "ancestor worship." What an impression must the Rabbinical lore make upon the sensitive heart of the child, by declaring that when the child recites the kadish, and the worshipers say "Amen," the soul of the departed father or mother, to whose memory the kadish was said, is released from purgatory. The kadish is the only custom still common among all the Jews, no matter whether Reform or Orthodox. You can even find Jews who have thrown overboard the whole Mosaic religion, yet, on the day of death of their parents they will search for 10 male worshipers, and pay them for their time, in order to be able to recite in their presence the kadish. Here we see the powerful effect of that religious training. Why? Because the kadish touches the most delicate threads of the human heart, and it is not merely a religious, but a humane instinct of mankind.

On the same principle of gratitude, the child was compelled by the law, to be enforced by the father, to say the benediction after each meal and to invoke a blessing before tasting any kind of fruit.

BABYLONIAN EDUCATION.

The Babylonians, although in many respects superior to the Palestinians, as they lived in a country which had been a seat of culture from immemorial times, were inferior in regard to education in its full sense and meaning.

The Babylonians were great thinkers, but very poor philosophers. They had an education, but not a pedagogic one. They had a system, but no order. They knew all the languages spoken in the celestial realm, but were very poor linguists in the tongues spoken on the terrestrial sphere. They had school laws, but no regulations, and those which they had were methods and systems adopted from the Palestinians. The Babylonians adopted the kindergarten after the Palestinian model many centuries later than its use began in Palestine. Nevertheless, we will sketch their method,

although the execution of the regulations were different from those of Palestine. In Palestine, for instance, corporal punishment was prohibited, and even a parent could not make use of the strap until after the age of 12. Now, there is a peculiar case recorded in the Babylonian Talmud where a teacher violated that regulation and was left unpunished, as it seems that in Babylon the shoestring was the regulator. The case in question is as follows: The father of the later famous Samuel found him weeping. He asked him, "My child, why do you cry?" He replied, "My schoolmaster kicked me." "For what?" asked his father. "Because I did not wash the hands of his son when I gave him something to eat." "Why did you not?" The child answered, "He eats and I shall wash my hands?" The father simply remarked that it was not enough that the teacher was ignorant of the law (which requires hand washing only if he eats), and he also slapped him. From that case it seems that the Babylonians tolerated the injustice of the teachers. In regard to the methods and application of teaching it was in the "Makri Dardeky" (the reading of the little ones) of the simplest manner.

ILLUSTRATION OF METHODS EMPLOYED.

The child at the age of 5 went to the "Makri Dardeky," which corresponds to our modern kindergarten. The term was one year and the class only 25 children. If more came, helpers were appointed. As in our modern kindergartens, where the children acquire the quantities of words in a playing manner without any mental strain, so in the Hebrew "Makri Dardeki" the child accumulated many words and ideas of domestic use in a pleasant way, without any mental effort. The character of the letters of the Hebrew Alpha Beth is that of an unpainted picture book, and the Alpha Beth was used for that purpose. The child was shown the two-horned letter Aleph א, which means "the Bull," the leader, the teacher. The next letter, Beth ב, means a house, as its figure resembles the primitive houses. The third letter, Gimel ג, means a camel, while the letter D or Dalit ד, means a door, because its shape resembles a door; and the letter S or Sain ע resembles a sword, with the collective meaning of "weapons," "arms," etc.

Besides words and their various meanings and applications acquired by the letters of the whole Alpha Beth during the period of one year, the child also learned to number, as the letters of the Alpha Beth, like those of the Latin, are also signs for numerals.

METHODS EMPLOYED BY THE MELAMED TINOKETH, OR IN THE PUBLIC SCHOOLS.

In the public school, under the direction of the "Melamed Tinoketh" (children's teacher), the Alpha Beth was also used in the first standard, its letters serving as poetical reading matter, the purpose being to awaken the desire of knowledge in the child, and to rouse his feelings for all that is good and noble.

The methods employed bear the stamp of simplicity, yet had great effective force. The child was taught that Aleph Beth means "Learn wisdom" (Aleph means learn; Beth is the first initial of Bina, wisdom). Gimel (*g*), Dalit (*d*), it was explained, as to help the poor. (Gimel means to reward, to extend grace and mercy; Dalit means those in poverty.) The teacher would explain that the reason the face of the Gimel was toward the back of the Dalith (in the Alpha Beth, reading from right to left, as ד (*d*) ג (*g*), was that the good man must always hunt up the poor in order to help them. Why is the face of the Dalith turned away from the Gimel? In order to receive the alms secretly, so as not to be ashamed. The next letters were explained as how God would reward the good, and is always willing to receive the wicked if he repents. The R (ר) is the initial of Racha (meaning the wicked). The K (ק) is the initial of Kadosh, the Holy One. Why is the face of the K toward the R? Because the Holy One looks after the wicked that he may repent. The Alpha Beth in the rank and file of its letters was explained to the child in its esoteric meaning.

The teacher also often combined them. For instance, the first letter, Aleph, with the last letter, Taw, and explained the combination.

The Alpha Beth served as a first reader, and the explanations were calculated to educate first the man in the child, and then the Jewish religious spirit. The Shin (ש) and the Taw (ת), for instance, were explained to the child thus: Why is the Shin, the initial of Sheka (falsehood), resting only on one stem, while the Taw rests on two? Because falsehood can not stand long, while truth stands forever.

Foreseeing the difficulties which grown students would have to encounter in later years, in facing the various contradictions, controversies, and explanations which are always the source of doubt, leading the student astray, the education was arranged to make such impressions upon the child as to form a guide in the religious labyrinth, by the aid of the Alpha Beth, which served as the first reader. The M, for instance, has a double letter, one called the "open" M (מ), and it is written at the beginning and in the middle of words. The other is termed the "closed" M (ם), and is written only at the end of words. Now, the teacher explained that the M which is the initial for Mamar (word, logos) that there is an open word and a hidden word, meaning that each sentence has an open meaning according to the plain words, and another hidden meaning, requiring a deeper study and understanding independent of the language and grammar. By such an educational method the child grew up with that impression, and, as a grown man was prevented from stumbling over the contradictions and unexplainable sentences.

In the public school the child spent from the age of 5 to the age of 10, during which time he acquired the perfect reading with the vowels and punctuations, composition, the art of writing (which was taught by the Lawler, or city penman), grammar, and homiletic explanations of the Scripture.

At the age of 10 the boy was well versed in the Bible from the first chapter of Genesis to the last of Malachi, until he knew the whole by heart and was able to construct sensible compositions without faults, when he was ripe to enter the first standard of the college where the Mishna, a brief outline of the oral law, was taught.

It was not customary to have a vacation in the public school, and the Talmud tells us that Rab Samuel bar Shiloth, who was a public school teacher, had not seen his own orchard for thirteen years, as he could not get leave of absence.

TITLES AND TERMS.

The word "teacher" has three terms in the Hebrew language, corresponding to the three different positions they occupied in the Hebrew world.

The first is Melamed, a term which means a goad, and is translated as the oxgoad. This was applied to the teacher of the public schools, Melamed Tinoketh, teacher of children, as they were goaded by the rigid will of discipline of the teacher.

The second term is More, which denotes the guide, the pointer, and the word often comes in connection with road, path. The same term was applied to the college professor and to the judge, who had only to point out the way or road which should be trod.

The third term was Aluf, a word meaning a bull, or steer, who goes before the flock. It means the leader, the prince, the king (in Arabic, the Chaliph). It means also the unit of thousand (elef), and in the Chaldean jargon, to learn. This term was applied to the director of a college or to a distinguished public man who led the people in any way. The penman who taught the art of writing, from the point of the pen, was called in the Talmudic, Chaldaic jargon, Lawler, meaning plain, penman, while the poet, or teacher of writing of a higher degree, was called Sofer, a term which means the teller, the counter, the scribe. Ezra had the title of Sofer.

Books were called the Megiloth, rolls, and Sefarim, the singular number being Sofer. It is curious that the term of Sofer, book, is mentioned in the five books of Moses, while in the prophets the term Megiloth, rolls, is to be found.

The pen was called "et," a term which means hidden, veiled. It has the same meaning as cheret (the instrument used by the hieroglyphists in Egypt for engraving their mysterious writings).

My friend, Judge Sulzberger, called my attention to the similarity in sound between the familiar English word, "etching," and "et," in Hebrew, and *chrat*, engraving, and the English "cut." The term "et" (pen) was used in the primitive times, when writing was not common, and the Levite poet who dedicated a psalm (Ps. 45) to King Solomon on his nuptial day prefaces his poem with the explanation that his tongue is of the et, or pen, is that of a diligent Sofer, writer-poet.

Later, about the time of the prophets, when the art of writing was more common and had spread among the people, they called the pen, in a poetical way, koseth, which means bow, like kesheth. They then began to understand the power of the pen, which was compared to the bow, and its letters to shooting arrows. The prophet Ezekiel describes the angel who was sent to mark the foreheads of the wicked dedicated to destruction as being armed with the bow of the writer on his loin (Ezekiel, ix, 4).

It was, and is still among the Orientals, the custom to wear the pen girdled on the loins like a weapon.

The pupil was called Talmid, or the disciplined one. The wandering scholars, who, according to the statements of the Talmud, wandered from place to place to teach, were called Talmide chachamin (disciples of sages). It reminds one of the wandering scalds and minnesingers of the Odin school, whom the poet Von Schöffel has immortalized as the "fahrende Schüler," wandering scholars.

A learned man who was not connected with any college had the title of Chaber, which means fellow, and the relation of fellowship to the college was of the same character as the English fellowship to Oxford and Cambridge.

The title of Chaber was also applied to the magician of the Persian type, or a snake tamer.

The graduate of a college received the title of Rabbi, a title which was applied to any leader of any union of workmen; even to the leader of the hangmen, who had a union among themselves. The title of Rabbi did not entitle its possessor to preach or teach.

The judge or the student who devoted his time to the study of law, civil or religious, was given the title of Dajon, judge.

An astronomer, or any learned man in a special branch of knowledge, was called a Chaldean sage, while the special medical man had the title of Chakim (the same as in Arabic to-day). The Talmud often calls him "Asje" (healer), probably after the name of the Essicians, that famous sect whose main object was to heal, and of whom Christ was a member (Essenes).

The title of Rabon (our master) was applied to the hereditary spiritual prince, who was elective also, and often the power was taken from him and placed in the hands of another.

The title of Rabon was also applied to various others beside the hereditary princes. Gamaliel, the teacher of St. Paul, had the title of Rabon Gamliel. The higher grade of Rabon was the mention of the simple name, as Hillel, who was the spiritual prince. Nasi is always mentioned by his simple name, Hillel, as the highest title; hence, Moses and the prophets are mentioned only by their proper simple names. The ranks of the doubles or pairs who succeeded the Great Synod are mentioned by their names as well as the names of their fathers, as Simon ben Sotath (the son of Sotath). The name of the father was added to that of any distinguished person who merited his fame by any great public reform, such as the great educator and high priest Jehoshua ben Gamla. If a sage was unmarried (which was an obstacle in the way of holding office) or some faults were found in him, he was mentioned simply as the son of this or that, as ben Asi, ben Soma—i. e., the son of Asi, the son of Soma. Both their names were Simon, but were omitted on account of their being bachelors and philosophers.

Synonyms are often used in the Talmud, as well as nicknames. The titles were bestowed by the professors of the colleges, and the document was written and testified to by the college seal.

The early authors of the Talmud are called Tanaim (legislators), the later contributors Amoraim (a term which means sea captains, who knew how to swim in the vast ocean of the Talmud). The term also means explainer, as they explained the laws of the Tanaim, or legislators. Those contributors who lived before the final close of the Talmud had the titles of Rabanon Saburai (rabbis of explanations). In Babylon the title of the spiritual prince was Reish Gola, the head of the exile, who got his title through hereditary election and indorsement by the Persian King. The Reish Golas, or the Exilearchs, were far inferior to the spiritual princes of Palestine, although the former executed a more forcible power. The professor of the college in Babylon had the title of Rosh Jeshiba, head of the sitting, as in previous times the students had listened standing to the lectures, and when this custom was abolished they called the college the "sitting."

When the Exilarchy was abolished, a new title was instituted, Gaon, or exalted, a title which was not appended to any office, except as the mark of great learning. One of the most noted of the exalted ones was Rabbi Saadje Gaon, the thousandth anniversary of whose death was celebrated recently in the Jewish world.

The title of Gaon was conferred upon every Jew on the Asiatic and African continents, and on a few of the Spanish Jews who were rabbis during the Moorish reign. Among the European rabbis, only one, Rabbi Elijah Gaon, from Vilna, in Russia, who lived in the eighteenth century, enjoyed the title, and is still mentioned as "the Gaon."

FROM THE GREAT SYNOD UP TO THE TIME OF JEHOSHUA BEN GAMLA, THE HIGH PRIEST, OR EDUCATIONAL HISTORY OF PALESTINE.

When the Great Synod assembled at the call of Ezra the Scribe, the session lasted nearly a century, one of its members being the high priest, Simon the Righteous, who lived at the time when Alexander the Great invaded Palestine.

The work of reorganization was a tremendous one, and the synod had to battle with difficulties of numberless obstacles. The condition of Palestine after the return was not very favorable. Most of the villages were mere piles of ruins; the husbandry was in a state of perfect neglect; the country was overrun with tramps and robbers and other kindred vagabonds; the bulk of the 50,000 who returned from the exile were very poor and ignorant. But the most dangerous foe they had to battle with was the Samaritans, who showed an ugly attitude of hostility toward the Great Synod, and the delay of the building of the Temple was due only to the Samaritans who wrote slanderous letters to the kings of Persia, who had a protectorate over Palestine. In spite of all these difficulties the synod proceeded from the beginning to enact educational laws, as only through them did they hope to revive the ancient national spirit, and improve the material condition of the country. The first law on the educational code was to make the father responsible for the education of his male children; the second law was to establish schools in Jerusalem, maintained by the public treasury of the Temple. As the people for safety flocked to Jerusalem, and the building of the Temple drew a multitude of laborers, the city soon became very populous and strengthened. As soon as the building of the Temple was finished, people flocked to Palestine from the neighboring States and countries, from Egypt, Arabia, and Asia Minor. These people brought with them not only material wealth, but also the culture and civilization of the countries from which they came. Jerusalem was restored and made a national center, from which as a basis operations were extended throughout Palestine to root out those tramps and highwaymen. Order began to prevail, villages sprang up, and husbandry flourished again around the beautiful plains of En Gedi. Hand in hand with the national material progress went marching onward the educational spirit, and the educator

did the same pioneer work as the soldier. By breaking up the priestly hierarchy and by creating new offices, as the supreme court, the sanhedrim, consisting of 71 members, and the creation of the little sanhedrim for the provinces, consisting of 23 members, and the justice of the peace (beth din), of 3 members for every town, the Synod opened new avenues for the laity, spurred on by the educational spirit. (The Sanhedrim sat in the marble chamber in the Temple, having the jurisdiction over the whole nation and controlling all the educational departments and the public treasury of the Temple. No war could be declared without the sanction of that body. Trials of national importance, as that of a king or of the priest or the trial of an individual, which was of national importance, were held before the sanhedrim. The famous trial of Christ was before that body).

Outside of the Temple gate was the seat of the little sanhedrim, as in the capitals of each respective province that body was empowered to pass the death sentence in murder cases. The beth din, or the court of justice, in each town tried only civil cases.

The great knowledge, sacred as well as profane, required by the law of every office seeker, indirectly compelled them to visit schools and obtain the diploma of professor of well-reputed colleges. After the dissolution of the Great Synod, its legislative power was invested in the Sanhedrim, and from time to time synods were called to assemble when some great reform was in view.

At the time of Simon ben Sotach, who lived in the year 105 B. C., and was the president of the Great Sanhedrim and the brother-in-law of King Janai, was made the rigid law that every child must attend the school. The Babylonian Talmud gives the credit of that law to the high priest Jehoshua ben Gamla, who lived in the year 65 B. C., and was executed later by the Zealots. In history the Babylonian Talmud is unreliable, as the Babylonians had a prejudice against the Palestinians and the Alexandrians, so the attitude of the Bablyonian Talmud toward Christ is different from that of the Jerusalem Talmud. No wonder that the name of Simon ben Sotach is not mentioned in the Babylonian Talmud, which has a great prejudice against his brother-in-law, the king, who, according to its narrative, was killing the sages, facts not mentioned in the Talmud of Jerusalem. The Babylonian Text concerning education runs as follows:

"For good shall be remembered the name of that man Jehoshua ben Gamla, for only for his sake the law has been preserved thus far; he who was able brought his child to Jerusalem to attend school, or he whose father was a learned man was taught the law too. So they legislated to establish schools in every capital of the respective provinces. But as this was still insufficient Jehoshua ben Gamla legislated that the children from 6 years of age must attend school in each city, town, or village."

The fact that Simon ben Sotach is not mentioned is rather surprising, and many have tried to make it appear that Simon ben Sotach legislated only for the provincial capitals while Jehoshua ben Gamla extended the law to all communities. From both Talmuds it would seem that they were not the lawmakers, but only enforced the laws already existing in regard to education in a rigid manner—as is often the case with many laws at various times in different ages and in almost every country. Why the Babylonian Talmud does not mention Simon ben Sotach and the Talmud of Jerusalem does not mention the martyr Jehoshua ben Gamla have both an inner historical reason.

At the near approach of the close of the Great Synod, Jerusalem was peopled by nearly a million inhabitants, more than the whole population of the rest of the country at that time, hence the first educational laws legislated by the synod were those relating to suffrage for the whole country, for at that time it could be said that all Palestine was in Jerusalem, as in the seventeenth and eighteenth centuries it was said that all France was in Paris.

The historical evidences of the great educational power are: The six divisions of the Mishna, the two great encyclopedias of the two Talmuds, with the numberless

tractats of the Medrashim (college periodicals). Besides that vast literature, which deals with every imaginable branch of science, there were books and booklets, written at the time of the second Temple, of which all have been lost and only their authors are mentioned in the Talmuds, as "Megilath Chasidim" (book of the pious), probably the Talmud of the Essenes.

The book of Tiglath ben Lana, which the Talmud places among the Apocrypha (I believe the name of the author was only a pseudonym for one of the Apostles), "Megilath Setarim" (the Roll of the Mysteries), probably a cabalistic code, "Megiloth Jachsin" (the Roll of Genealogy), a book which was written in the style of the Biblical Chronicle, and from which the Palestinians refused to teach the Babylonians. The Apocrypha is another classical work of the time of the second Temple, whose authors tried to imitate the style and method of writing of the primitive authors of the Bible.

CHAPTER XLVII.

PUBLICATIONS OF THE UNITED STATES BUREAU OF EDUCATION.

[From 1867 to 1895.]

CHAPTER XLVIII.

SCIENTIFIC TEMPERANCE INSTRUCTION IN THE PUBLIC SCHOOLS.

[Communicated by ALBERT H. PLUMB to the Boston Transcript, May 2, 1896.]

The spring meeting of the New England Conference of Educational Workers in Boston on the 25th instant drew together quite a number of prominent teachers and experts in the science of pedagogy. Superintendent Seaver gave fitting introduction to the speakers. His honor the mayor made an interesting and encouraging address on the way to secure improved sanitation in our schools. Much useful information was imparted by Dr. Durgin, of the board of health, and Dr. Hartwell, who has charge of physical culture in the city schools, and by other speakers. One of these, however, laid down a principle which is violently at war with the enlightened policy and efficient practice of our honored school authorities in this State and through the country. It was a principle which, if carried out according to the obvious intention of the speaker, would sweep away at once the greater part of the scientific temperance instruction now required by law in forty-one States, and in all schools under national control, as at Annapolis and at West Point. The falsity of this principle was at once exposed by a few words from Mrs. Mary H. Hunt, herself an educational authority, and, more than any other person living, personally in touch with educational and legislative authorities on this subject.

As there was no time, however, for any adequate discussion of the topic, it seems desirable that so vicious a principle be held up more definitely to the public view.

It was indeed well said, by the speaker referred to, that the moral attitude of the scholar in regard to conduct is the strong factor in securing right living; that the effort should be to raise the child to the plane where he chooses what is right; though it would have been more accurate to say, the moral attitude is the chief constituent of right living, for the moral attitude includes the choice of the right which is the effect, and not the cause concerning which we are inquiring. And to induce a pupil to take the right moral attitude, to choose the right, is a matter of exceeding difficulty and of indefinite progress—a progress which it is hard to mark. It depends largely on the personal character and influence of the teacher. It is not a matter which can be definitely ordered and supervised by the school authorities, and how far in each case the moral attitude of the pupil has yielded to the teacher's moral exhortation is uncertain. This is not the case in the work of imparting information. The school authorities can order that the teacher impart to the scholar certain definite scientific knowledge—truths and facts—and the teacher can so obey this order as to be sure that the pupil has a clear and thorough apprehension of them. They are his permanent possession thenceforth, and an active force necessarily and always in influencing his life. He may resist that influence. As the speaker intimated, information concerning the evil effects of intoxicants may lead boys to try the experiment of using liquor, to see the effects, and therefore he would draw the foolish inference that such information should be withheld. "Where ignorance is bliss it is folly to be wise" is a good motto indeed as to the experimental knowledge of vice, but not at all as to the scientific and theoretic knowledge of it.

So that when the speaker inquires: "Does information guard against wrong conduct?" and in reply lays down the proposition that information is not a strong factor in promoting right living, he plants himself squarely in opposition to the great principles on which the educators and moralists of the land have established what is known and lauded the world over as the "American educational system of prevention of intemperance," viz, the early instruction by law of all pupils in the public schools upon the nature and effects of alcoholic drinks.

There are three manifest reasons why his position is untenable:

(1) It is opposed to the eternal law that truth has an inherent, impelling force. The moral nature of man has been so constituted by the God of truth that it is impossible to lodge in the human apprehension any proposition, any truth or fact, having any bearing on conduct—and nearly all truth, even philosophical and mathematical truth, has such a bearing, direct or indirect, near or remote—without more or less awakening of the sensibilities in regard to that moral bearing, more or less impulse upon the will toward the choice of the right.

(2) Authority as well as reason is against the position that information is not a strong factor in promoting right conduct. Indeed, the Great Teacher himself is explicitly against this position. "Sanctify them through Thy truth; Thy word is truth." And this affirmation is not limited to religious truth. There are a thousand declarations in God's word which are of the nature of philosophical propositions, or statements of historic fact, or of prudential maxims for worldly success, yet they may have an elevating power, e. g.: "The entrance of Thy words giveth light." "My people are destroyed for lack of knowledge." "He that ruleth his spirit is better than he that taketh a city." "The truth shall make you free." And upon the specific matter under consideration multitudes of educational experts have united in securing the legally enforced instruction precisely because of its moral preventive force. Who is higher authority than Dr. William T. Harris, United States Commissioner of Education? And his opinion was not long ago given in the Pall Mall Gazette, London, in these words:

"Instruction in what is called scientific temperance, conducted as it is under the laws of nearly all the States in the public elementary schools, furnishes a permanent and active means for the dissemination of correct views regarding the effect of intoxicating drinks upon the human body. All pupils will have their attention called to the subject every year, and intelligent pupils will understand with some degree of clearness the results of scientific investigation in this matter. Even the dull pupils who fail to seize the scientific points will carry away an impression in their minds that intoxicating drinks are very dangerous and should not be used even in moderate quantities. * * * Such instruction, too, is sure to furnish the greater portion of the intelligent pupils in schools with a correct scientific notion with regard to the investigations which have furnished the evidence for these conclusions.

"The utter destruction to the body and mind which comes from habitual intemperance, and the danger of moderate drinking in arousing an abnormal appetite for intoxicating liquors, will certainly be seen and understood by the great mass of pupils that attend the public schools. For this reason I do not see how anyone can question the great general usefulness of this scientific temperance instruction, established by law in most of the States of this nation. It may be said that this movement is the most effective one ever devised by the friends of temperance to abate a great evil, perhaps the greatest evil abroad in the land."

(3) Experience joins with reason and authority in condemning this depreciation of the moral effect of early acquaintance with scientific truth. In a number of States the laws requiring this instruction have been in force ten or fifteen years, and there is already a marked superiority in the morality of pupils coming from such teaching to enter collegiate and professional schools, according to the testimony of the faculties of such institutions. Young men have learned why every indulgence in dissipation is calculated to block their path to success, and they are less convivial

in their habits than those coming in former years. Even children now know too much to be caught by the cheap fallacies of tipplers. Take one instance from many. A millionaire brewer, a senator in another State, said to Mrs. Hunt, "I shall vote for your bill. I have sold out my brewery and am clean from the whole business. Let me tell you what occurred at my table. A guest was taken dangerously ill at dinner—insensible—and there was a call for brandy to restore him. My little boy at once exclaimed, 'No, that is just what he don't need. It will paralyze the nerves and muscles of the blood vessels so they will not send back the blood to the heart.' When the liquor was poured out to give the man, the lad insisted on pushing it back. 'You will kill him; he has too much blood in his head already.'" "How did you know all that?" his father afterwards asked. "Why, it is in my physiology at school." It seems the text-books, prepared by such men as Prof. H. Newell Martin, F. R. S., of Johns Hopkins University, had succeeded in giving the lad some definite information which was proving useful. "Senator," said Mrs. Hunt, "are you sorry your boy learned that at school?" "Madam," the man replied, raising his hand, "I would not take $5,000 for the assurance this gives me that my boy will never be a drunkard."

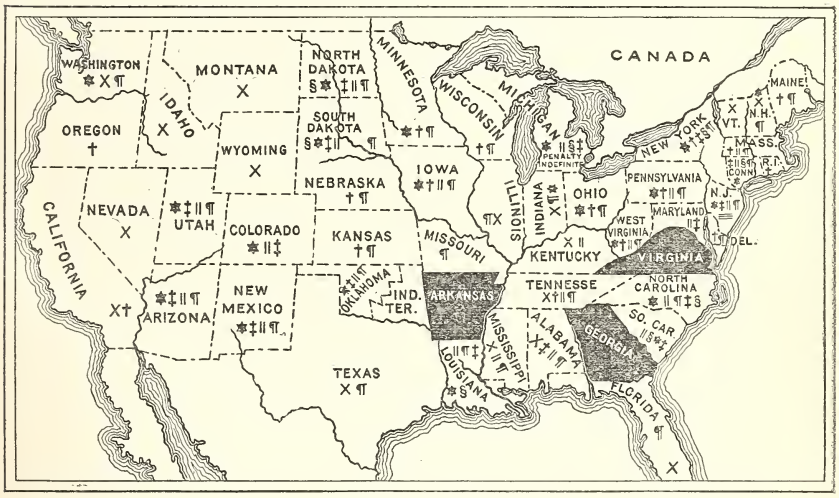
Information not a strong factor in controlling conduct? This kind of information is proving so strong a factor that the liquor dealers are alarmed and are combining in efforts to stop our schools from thus injuring their trade—an injury of which English owners of American brewery stock are complaining; and there are certain punctilious doctrinaires in science who appear more strenuous to preserve a certain theoretical precision in the order of succession of topics in the processes of instruction who seem more solicitous to spare the feelings and protect the self-indulgent tippling habits of the luxurious classes than to save the youth of the country from ruin by drink, who are combining with the brewers in endeavors, in different States just now, to repeal or embarrass and neutralize the enforcement of the temperance instruction laws.

The agents of the brewers in various States are repeating over and over these same hostile arguments which were heard here at the meeting on Saturday last, alleging the inefficacy of such instruction, as if they desired its efficacy, and claiming that it is impossible for the young before they reach college—or certainly previous to entering the high school—to attain any scientific knowledge on these subjects, a rule which would deny to 95 per cent of our school children, who never reach the high school, all definite scientific instruction on these topics, limiting them to occasional moral exhortations by their teachers.

It is contended that it is out of the due order to touch on these subjects until a pupil has thoroughly mastered the science of chemistry and the philosophy of nutrition. What if it is? What valuable interests will suffer if, on account of a great and appalling moral exigency, these all-important practical themes are taken up in advance, since they must be taken up then in 95 per cent of the cases, if attended to at all? At any rate, the people of this country, the parents of our school children, have decided that they shall be thus taken up, because they are determined to use every possible endeavor to protect their children from the awful dangers of intoxicating drinks. And how utterly wrongheaded, and cold-hearted, too, it is for teachers, who are the servants of the people, or for anyone else, to interfere with this great philanthropic movement, which has cost untold sacrifices of time and toil to establish, and on which the future welfare of the nation largely depends!

Doubtless the bulk of our school teachers are not yet equal to our most learned physicians in their physiological attainments, but to despise, therefore, and to decry as unsound, misleading, and morally worthless such instruction as they are able to give on these subjects, is to show recklessness in regard to facts, and indifference in regard to the evils which correct teaching is calculated to prevent, for those evils are so dire and threatening that all wise minds must resolve to use, instantly and incessantly, such preventive means as we have, rather than to postpone all effort to

that indefinite future when means sufficiently perfect to satisfy these extremists shall be provided. Meanwhile it is encouraging to know that the trustees of the new American University at Washington have already taken measures, in response to the request of friends of this instruction, to establish there a College of Scientific Temperance, not as a propaganda, but for original research, and for the training of the "teachers of teachers" on these themes, which the perils of national life in Europe and America are pressing to the front.



The unworthy methods which nearly everywhere mark the opposition to this temperance instruction deserve strong rebuke. Have the distinguished authors of the temperance text-books—some of them known and honored as scientific authorities on two hemispheres—told lies in their books? If so, why does not someone point out the lies? If not, then reputable men should have done with the continual and contemptible insinuation that our children are learning in school what they will have to unlearn in life.

The misrepresentations made in the progress of the recent great contest in New York have been shameful, but all in vain, for by overwhelming majorities last week the house and senate passed the improved law, demanded by the representatives of over 1,000,000 members of churches and other philanthropic bodies in the State. Certainly the victories which are continually attending this hard-pressed conflict are so remarkable as to warrant a reverent conviction that the especial favor of Providence is attending a movement which, in its inception and prosecution, has been largely imbued with a spirit of prayer, which is purely philanthropic, which is accordant with true wisdom and scientific truth, and which, in its wide extent and confessed potency for good, is by far the most promising of all present measures for the prevention of vice.

TEMPERANCE EDUCATION MAP OF THE UNITED STATES AND TERRITORIES.

[Furnished to the Bureau by the Department of Scientific Temperance Instruction of the W. C. T. U., Mrs. Mary H. Hunt, superintendent. Utah was under the national temperance law until it became a State; since then no advice has been received regarding the enactment of a temperance education law.]

States in white have a temperance education law. Those in black have none.

EXPLANATION OF MARKS.

× The cross signifies that scientific temperance is a mandatory study in public schools.

* The star signifies that this is a mandatory study, and that a penalty is attached to the enforcing clause of this statute in the State or Territory to which it is affixed.

† The dagger signifies that the study is not only mandatory, but is required of all pupils in all schools.

‡ The double dagger signifies that the study is required of all pupils in all schools, and is to be pursued with text-books in the hands of pupils able to read.

‖ The parallel indicates that the study is to be taught in the same manner and as thoroughly as other required branches.

§ The section mark indicates that text-books on this topic used in primary and intermediate schools must give one-fourth or one-fifth their space to temperance matter, and those used in high schools not less than twenty pages.

¶ The paragraph indicates that no teacher who has not passed a satisfactory examination in this subject is granted a certificate or authorized to teach.

═ Three lines indicate that text-books on this topic shall give full and adequate space to the temperance matter.

PART III.

STATISTICAL TABLES.

1835

I.—CITY SCHOOL SYSTEMS.

TABLE 1.—*Statistics of population and school enrollment and attendance in cities of over 8,000 inhabitants.*

	City.	Total population in 1894 (estimated).	School population.		Pupils in private and parochial schools (largely estimated).	Different pupils enrolled in public day schools.			Average daily attendance in public day schools.	Aggregate days attendance of pupils in public day schools.
			School-census age.	Children of school-census age.		Male.	Female.	Total.

In addition to the detailed statistics for the year 1894-95, the following summarized statement concerning the work of the American Society for the Extension of University Teaching for the past five years was furnished by Dr. Edward T. Devine, secretary:

Year.	Courses.	Lectures.	Average attendance.	Total attendance.
1890-91	42	298	176	7,392
1891-92	120	715	176	21,120
1892-93	108	625	174	18,822
1893-94	114	679	155	17,614
1894-95	126	723	158	20,000

University of Chicago, Chicago, Ill.—The extension work of the University of Chicago for the year 1894-95 is thus described in the Quarterly Calendar for August, 1895:

"In the lecture-study department there have been given 128 courses, with an average attendance at each lecture of 185, the different people attending numbering 23,628. In connection with these lectures 69 different syllabi were published, of which 16,259 were sold, realizing $1,420.93.

"The university extension lecture staff of the year has numbered just 100, viz, 7 extension professors, 7 extension instructors, 27 university (proper) professors, 20 university (proper) instructors, 17 graduate students, and 22 nonresident lecturers. There have been in all 69 traveling libraries, containing 1,935 volumes. Of these, 27 libraries (828 volumes) have been collected during the year. From the sale of books there has been received $166.05.

"Of the whole number of extension centers established by the university (117), 92 have been active during the year, 25 inactive. The 128 courses have been distributed as follows: California, 1; Chicago, 29; Illinois (outside of Chicago), 45; Indiana, 12; Iowa, 11; Michigan, 23; Minnesota, 3; Missouri, 2; Ohio, 1; Wisconsin, 1.

"These courses, so far as concerns departments, have been distributed as follows: Sociology and anthropology, 39; English language and literature, 37; history, 33; biblical literature, 7; political economy, 4; astronomy, 4; geology, 3; Scandinavian languages and literature, 1.

"In the class work of the extension division 102 courses in 21 departments were given, with an enrollment of 2,193. The average number in a class was 22, and 32 different instructors were employed. These classes were distributed as follows: In biblical literature, 10 classes, with an enrollment of 674; in geology, 5, with an enrollment of 399; in philosophy, 5, with an enrollment of 273; in botany, 8, with an enrollment of 231; in English, 13, with an enrollment of 127; in Latin, 11, with an enrollment of 79; in zoology, 3, with an enrollment of 66; in history, 7, with an enrollment of 56; in German, 6, with an enrollment of 53; in political economy, 5, with an enrollment of 52; in sociology, 3, with an enrollment of 46; in political science, 6, with an enrollment of 41; in French, 8, with an enrollment of 37; in mathematics, 4, with an enrollment of 32; in Greek, 3, with an enrollment of 9; in Scandinavian language and literature, 1, with an enrollment of 7; in physiology, 1, with an enrollment of 4; in chemistry, 1, with an enrollment of 2; in bacteriology, 1, with an enrollment of 2.

"In the correspondence work of the division there have been 64 courses in 17 departments, with an enrollment of 368, pursuing studies under 36 instructors."

University of Kansas, Lawrence, Kans.—There were 10 courses of lectures delivered at 6 different centers by 7 different lecturers. The average attendance ranged 60 to 200, with a total average attendance of 1,260.

Colby University, Waterville, Me.—The following courses of lectures were delivered: Systematic theology, 5 lectures, at Waterville; Italian painting, 10 lectures, at Waterville; and a cooperative course of 4 lectures on The Revival of Patriotism, The City of Florence, Education, and Historic Spots in Virginia, at Fairfield, Me. There were also delivered 17 single lectures.

Brown University, Providence, R. I.—There were delivered during the year 23 courses of lectures, an increase of 7 courses over the number delivered in 1893-94. The attendance has increased from 600 to more than 1,000. The 23 courses were delivered at 8 different centers by 6 different lecturers. The subjects of the courses were English literature, German literature, political economy, mediæval and ecclesiastical history, and social science.

Brooklyn Institute of Arts and Sciences, Brooklyn, N. Y., was founded in 1824 for the purpose of establishing for the apprentices of Brooklyn a free library. The scope of the institute was broadened gradually, so that in the year 1887-88 courses of lectures on art and science were instituted. The number of lectures delivered in succeeding years has increased very rapidly—from 78 in 1887-88 to 2,621 in 1894-95.

The members of the institute now number 3,764, and are divided into departments representing 25 various branches of art and science. The departments with their membership are as follows:

Department.	1893-94.	1894-95.	Order of size.
Archæology	129	133	17
Architecture	266	262	6
Astronomy	156	171	11
Botany	244	247	8
Chemistry	150	138	15
Domestic science	42	63	24
Electricity	237	224	10
Engineering	140	134	16
Entomology	39	52	25
Fine arts	477	535	4
Geography	172	170	12
Geology	159	156	13
Law	87	119	20
Mathematics	51	72	23
Microscopy	143	122	18
Minerology	126	120	19
Music	485	603	3
Painting	94	99	22
Pedagogy	414	485	5
Philology	879	1,013	1
Photography	248	256	7
Physics	159	146	14
Political science	644	673	2
Psychology	178	225	9
Zoology	102	103	21
Total	5,821	6,326	

The growth of the institute is shown in the following figures taken from the Year-Book for 1894-95:

Membership.

June 1—	Members.	Annual increase.	June 1—	Members.	Annual increase.
1888	82	.....	1892	1,782	458
1889	352	270	1893	2,622	840
1890	1,118	766	1894	2,457	835
1891	1,324	206	1895	3,764	307

Lectures, meetings, and class exercises

Year.	Meetings open to all members.	Special meetings and class exercises.	Total.	Year.	Meetings open to all members.	Special meetings and class exercises.	Total.

* Statistics of 1893–94.

a Course of three years just begun.

b No report.

c Ph. G. for the shorter course, and Ph. Chem. for the longer course.

d Approximately.

e Ph. G. to students completing the regular course; a course of two years, of nine months each, gives the degree Pharmaceutical Chemist (Ph. C.); students who complete the general science course, and also the course leading to Ph. C., will receive the degree Bachelor of Science in Pharmacy.

f Any graduate of five years' standing of this college, having been constantly engaged in the practice of pharmacy, and of good moral and professional reputation, upon presentation of a satisfactory thesis may receive the degree Master in Pharmacy (Ph. M.).

g Experience in a drug store not required for Ph. C.; the degree Ph. M. is also given at end of one year's attendance after graduation.

h First year in operation.

i Ph. M. also given at end of one year's attendance after graduation, and Bachelor of Science in Pharmacy upon completion of course in both pharmacy and science.

INDEX.

A.

A-bis-sel-fa, 1706–1708.
Abbott, Lyman, on Chautauqua, 1061.
Aberdeen, Countess of, on university education of women, 910, 911.
Aberdeen University, statistics, 258.
Abiturienten-Examen, report on, by M. E. Sadler, 708–712.
Academies, statistics, 32–35, 2018–2113.
Academy of Seiences, Imperial, Cracow, 765–771.
Accommodation in English elementary schools, statistics, 260, 261.
Adams, Charles Kendall, on admission to university by certificate, 1172.
Adams, Herbert B., Chautauqua, a social and educational study, 977–1077.
Adams, W. H. Davenport, Woman's Work and Worth quoted, 894, 895.
Addis, Wellford, prepares résumé of testimony on secondary education, 605–620.
  On technological instruction in land-grant colleges, 1189–1210.
  On the social unit in the public school systems of the United States, 1457–1467.
Administration of schools discussed, 636.
Administration of secondary education in England, testimony on, 605–620.
Administrators of trusts, women as, 604–605.
Admission, age in Leghorn, 565.
  Discussed, 647, 648, 649.
  To college by certificate, 1171–1188; to law schools, 1247–1249; to the bar, 1249–1250.
Adolescence, G. Stanley Hall on, 1038.
Adouwert monastery, educational work, 478.
African Methodist Episcopal Church, statistics of colleges and universities, 153–154.
African Methodist Episcopal Zion Church, statistics of colleges and universities, 153–154.
Agassiz, Louis, and the Penikese school, 1485.
Age, school, in the several States, xxxvii.
Age of admission, in Leghorn, 565.
  To universities in England discussed, 608.
Age of withdrawal from public schools, 1161–1170.
Agencies for fostering secondary education in England, 599–600.
Aggregate attendance. *See* Attendance.
Agrégation, preparation for, 691, 692, 695.
Agrégé, use of term in France, 687, 689, 691, 692.
Agricultural and Mechanical College for the Colored Race, N. C., statistics, 1206, 1209.
Agricultural and Mechanical College of Texas, statistics, 1205, 1208.
Agricultural College of Utah, admission by certificate, 1180.
Agricultural schools, Belgium, statistics, 315; in Holland, 515–516.
Agriculture, effects of labor-saving machinery on, 3–8.
  Study of, in Swiss normal schools, 433.
Aid Association of Teachers. *See* Teachers' pensions.
Alabama, college presidents, 1135, 1141, 1143, 1144, 1148.
  Education in, 1277–1280; education of the negro, 1332–1339, 1346.
  School laws as to women, 960.
  State and city superintendents, 1127.
Alabama—Continued.
  Statistics of business colleges, 2222–2223, 2224–2225; of city school systems, 14, 15, 17, 1837, 1848, 1859, 1869, 1879; of colleges and universities, 155–158, 160, 162–164, 166–169, 172, 175–177, 181–184, 188–206, 209–214, 216–217, 221–233, 2115, 2132; of colleges and universities reporting teachers' training courses, 111; of colleges for women, 172, 175–177, 209–214, 2158; of common schools, xxv–xlii; of denominational colleges and universities, 153; of dental schools, 240, 250–251, 2188; of institutions for the blind, 2261, 2263, 2266; of institutions for the deaf, 2248, 2250, 2254; of law schools, 237, 245–246, 2179; of normal schools, 123–148, 2193–2199, 2210–2211; of medical schools, 238, 247–248, 2182–2183; of parochial schools, 1664; of private schools, xlviii, 2018–2021; of school houses and property, xlvii; of school income and expenditure, lii–lvii; of schools of technology, 181–184, 221–233, 2166–2168; of schools of theology, 236, 243–244, 2171; of secondary schools, 36, 38–46, 48–57, 59–63, 70, 72–105, 1890–1891, 1998–1999, 2018–2020; of teachers and salaries, xlv–xlvi.
  The school district in, 1465.
Alabama Agricultural and Mechanical College, statistics, 1202, 1204, 1207.
Alabama Normal and Industrial School, statistics, 1202, 1204, 1207.
Alaska, agent of education, 1127.
  Report on education in, 1425–1455.
Albany, N. Y., population, 9.
Albert of Bavaria, grants educational privileges, 478.
Albion College, admission by certificate, 1184.
Alcohol, effects on students discussed, 457–458.
Alcorn Agricultural and Mechanical College, statistics, 1202, 1204, 1209.
Alcott, William A., sketch of his work, 1591.
Alderman, Edwin A., on higher education in the South, 1747–1751.
Alexander II and Poland, 747–748, 749.
Alexandria, Va., population, 10.
Algebra, statistics of students in high schools, 40, 44, 51, 55, 65.
Algiers, statistics, 297.
Allegheny, Pa., population, 10.
Allen, J. G., letter as to regents' examination at Chautauqua, 1041.
Allen, William, on Lancaster school, 1156.
Alley, Henry R., quoted on Manitoba school case, 279–288.
Alsace-Lorraine, statistics of elementary education, 416, 2280–2281.
Altenburg, statistics of public elementary schools, 415, 416.
Altona, statistics of public elementary schools, 416.
Ambulatory schools in Prussia, statistics, 402.
